"takes off" the most complicated work,—squaring the dimensions in his head as he goes along, and dictating the result to his lagging scribe. If the measuring books which this expert artist has filled in his time could be recovered, it is believed that "the whole world would not contain them." The surveyor holds a unique position in the building world. He must possess, amongst other gifts, and sometime exercise, the skill of the advocate and the impartiality of the judge. He acts as a sort of "buffer" between the conflicting claims of the architect representing the building owner and the builder. He has consequently cultivated the art of conciliation, and brought it to a rare perfection. It is pleasant to see the tact with which he conducts a conference on the "variations," as he pleasantly calls the extras, on a contract, securing reasonable concessions from both sides,—giving and taking with wise discretion, and turning aside the signs of rising temper with a well-timed witicism or opportune story. Of these he has a store, decorous and otherwise, adapted to all sorts and conditions of men. He is a court of equity in himself, and a mortal foe to lawyers, whom he robs of an untold amount of "contentious business." His functions have been widely extended by the now universal contract system, and he is the indispensable ally of the modern builder. His services to the architect might be called indispensable but for the fact that so many architects continue to dispense with them, holding that he carries his analysis too far, and that the intervention of the surveyor by suggesting a multitude of small items for pricing tends to swell the builder's estimates. This our friend very warmly repudiates, and we cannot here discuss the vexed question. The young architect will find much help from the surveyor if he be kept within his proper domain. In following the architect's work he will act as a useful check, and his greater experience may occasionally suggest better and less expensive methods of construction. But the young architect who allows a surveyor to write his specifications for him is lost. He scarcely knows what he is supposed to prescribe, and becomes, as it were, a lodger in his own house. The profession of the quantity surveyor has the valuable quality of being quite unattractive to the average youth. The endless squaring of dimensions and dreary years of abstracting are by no means compensated for by the delicious joys of "taking off," even when that happy stage is reached. The youthful temperament has always a tinge of poetry, and there is no such word in the surveyor's vocabulary. He is dry, exact, painstaking, unimaginative,—your only true methodist. A poetical quantity surveyor would be a more astounding prodigy than a tipsy quaker. "Songs and Sonnets," by a Sentimental Surveyor"; "Poems," by a Practical Man." The thing is incredible,—inconceivable. His hard matter-of-fact occupation is repellent to all but specially-constituted minds. Hence the surveyor's profession is free from trespassers, bedged round with a *cheveu-de-frise* of routine; adventurous and unequalled interlopers and pretenders are quickly exposed and expelled. He must, however, be contented to forego the pleasures of fame. The applause of the crowd is not for him. He is as utterly out of the sight of the multitude as the theatrical machinist,—a kind of architectural organ-blower, useful but unseen, and ignored alike by those who produce and those who enjoy the music. But as a set-off, his calling is a more lucrative one than that of his "client" the architect, who is struggling up hill when the surveyor has thought of retiring upon a handsome competence. He rarely does retire. He buys a little property on the borders of the great city, and builds himself a good house. Being a pure Cockney he affects in his leisure hours the *role* of the country gentleman. In moments of extreme wickedness he will sometimes undertake to act as architect to others, performing the duties vicariously with chance success or unaided and therefore badly. But he is far too wise to design his own house. Your duly-qualified doctor does not prescribe for himself; much less so the quack. And the best of quantity surveyors can be but a quack architect.

It should be recorded to the credit of his profession that it is singularly free from black sheep. Delinquencies on the part of his brethren are of the rarest occurrence. With very onerous and responsible duties to perform,

with demands upon his patience which would have taxed a Job to the utmost, and subject at times to great temptations, the quantity surveyor is trusted all round for a skilful, painstaking, intelligent, and honourable man of business. May he continue to reap the fit reward of so much solid and unassuming merit!

PRESIDENT'S ADDRESS,  
ROYAL INSTITUTE OF BRITISH  
ARCHITECTS.

THE following is the address delivered at the opening meeting of the Institute on Monday evening last by Mr. Ewan Christian, the President:—

GENTLEMEN,—On bidding you farewell at the closing meeting of last Session I expressed a hope that in the beginning of this you would come here refreshed both in body and mind after rest from your labours. I trust that hope has been fulfilled, and though it has been said that the enforced recess is a point on which the Institute requires reform, I must say for myself that I do not in any way agree with that opinion. We all work hard, and rest is useful; and to the officers of this Institute, who to their ordinary vocations add the labour of attending to its interests, I can assure you the vacation is uncommonly welcome.

As regards students, the library is only closed for one month, and that the month above all others in which they can be most usefully learning from nature and not from books; therefore, with an easy conscience, I bid you welcome to the work of the opening session.

The year has been a notable one, both as regards this Institute, and the interests of architects. Fifty years of existence have had to be remembered and pondered on. Valuable papers have been read and discussed, especially one with reference to the question of education. Alterations in the government of the Institute have been suggested; an important competition has been entered upon and decided,—a conference has been held between the members of our own body and others outside; and, lastly, we were asked to take part in a conference of importance at the Health Exhibition on matters in which architects ought to be specially interested.

On each of these subjects I shall have a few words to say; and I trust you will hear with me in traversing the ground.

First, then, in this our jubilee year, let us contemplate for a few moments that which, whether for good or for evil, is now irrevocably past; and then consider for a while, whether in all respects, we have fulfilled our duty on the lines laid down by the founders of this Institute. And looking back on the fifty years of our existence, what a wonderful half-century it has been. It has witnessed almost the commencement and the great development of the railway system; the invention and progress of the electric telegraph, the enormous expansion of postal facilities not yet fully developed; the bridging of the ocean by swift and safe steamers of ever-increasing power and convenience; the introduction and development of photography; the conception and execution of some of the largest and most important works of engineering the world has perhaps ever seen; the great series of International Exhibitions, commencing with that of 1851, of which the late Prince Consort was a most ardent and earnest promoter; besides almost numberless achievements in all departments of science, literally fulfilling the prophecy that "many shall run to and fro, and knowledge shall be increased," in a manner that could only have been dimly imagined by the commentators of old; and, not to travel beyond the bounds of our own art and country, it has witnessed a most remarkable revival of ecclesiastical architecture; the rise and full development of the power, happily not yet extinguished, of the great art-critic whose fervid eloquence has done so much, not only to open the eyes of the general public to the beauties of art in all its phases, and of the glories as well as the minutiae of nature; whose writings on the subject of our own particular art have had, and I venture to think, will have, a wider influence on its study and practice than those of any other man who preceded him, for no nobler writings than those of John Ruskin have

We fail to see why September, of all months, should be so described.—Ed.

graced the half-century of which I have to speak.

It has witnessed almost the whole career of one of the greatest architects of modern times,—Charles Barry,—and of another man of genius, architect and writer, Ang. Welby Pugin; the whole career of George Gilbert Scott; and unhappily, also, as regards their termination, those of George Edmund Street and William Burges, whose loss we have so sorely mourned as all but irreparable; not to speak of those who, before its commencement had made their names famous, including our first professional president, the eminently learned and graceful Charles Robert Cockerell, nor of those whose careers commencing within its area, are still happily amongst us.

What the next half-century may produce if the world lasts so long, God only knows; but if I may compare the privileges now possessed by the young men of our fraternity with those with which the great man I have named were familiar in their youth, premming there is in the rising generation as yet undeveloped genius equal to that which has preceded it, much ought to be expected.

I cannot but remember that in the year this Institute was founded I entered the Royal Academy as a student. In those days there was indeed a Professor of Architecture who gave a biennial course of lectures to students read by the Professor of Painting, which, commencing with primitive hints, descended all the dry bones of the art, with but little allusion to its glorious beauties.

When there was only a small architectural library open one evening in the week, and no special architectural journal had as yet been started; when I compare this state of things with the advantages now possessed by students in the fine library of the Institute, almost always open; in the regular instruction at the Royal Academy of a professed teacher of architecture, supplemented by the personal supervision of eminent members of our profession; the courses of lectures given by able professors at the University College, and King's College, which all pupils may attend at small cost, besides the very valuable assistance rendered by a special architectural press, which, commencing with the *Builder* more than forty years ago, has developed so largely, affording opportunities for the acquisition and discussion of every branch of knowledge connected with our art, almost always profusely and sometimes beautifully illustrated; not to speak of the host of other illustrated publications, bringing home to all of us an amount of knowledge of the scenes and buildings of far-off lands, often very valuable, and almost always replete with interest to some of us. When I contrast, I say, these differences, what large results ought to be produced, if the industry of students is at all equal to their valuable privileges!

But notwithstanding this advancement, and in such a period of progress, it would indeed have been surprising had we all stood still; let us turn to our charter and ponder awhile on the position of those who asked for it.

It recites to His Majesty, King William IV., that his "right trusty and right well-beloved cousin and councillor, Thomas Philip Earl de Grey, hath, by his petition, humbly represented unto us that he and divers others of our loving subjects have associated together for the forming an institution for the general advancement of civil architecture and for promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith, it being an art esteemed and encouraged in all enlightened nations as tending greatly to promote the domestic convenience of citizens and the public improvement and embellishment of towns and cities, and have subscribed and paid considerable sums of money for those purposes, and have formed a collection of books and works of art, and have established a correspondence with learned and scientific men in foreign countries for the purpose of inquiry and information upon the subject of the said art."

And I would ask, Is it certain that we have done all that in us lay "for the general advancement of civil architecture, and for promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith"?

Professor Cockerell, in his address of April, 1860 (twenty-three years after the charter was granted), said,—"Hitherto we have looked to the Royal Academy, the Government Schools of

Design, and more recently the museums at Kensington and the two colleges of the London University, for those means (of education) which they command and offer for our benefit. We hope to form schools of our own, together with those advantages, and to offer higher collegiate grades which would reward eminence and recommend by certificates to the public patronage. These last already established in the shape of diplomas in the Colleges of Law and Physic, and every learned society of the present day, prove the advantage of their being also adopted no less in the Institute of British Architects. Our funds, being of our own creation, are necessarily too moderate to embark in such increased means of instruction and usefulness as we have long contemplated, but the time is now approaching for the enlargement of these means to this effect." Whether this hope of the worthy Professor is ever likely to be realised, time alone can fully reveal.

That we as architects, absorbed in fulfilling all the arduous duties of a most laborious profession, can ever become a teaching community in the professional sense, I do not believe; and notwithstanding all that we have been told of the management of these things in France, I venture to think it is not altogether desirable that we should.

I am old-fashioned enough to put faith in the self-reliant qualities of individual Englishmen; and am afraid I must continue to think that the very eminent men whose names I have mentioned would hardly have attained their vigorous stature, had they been drilled and organised in the days of their youth after the Governmental fashion which has been so fully described to us by our secretary, Mr. White.

But those men were giants in intellect and industry, and difficulties for them would only add to the delight of final success; and it is not for such men that such systems are needed.

That the Obligatory Examination for Association with this Institute has been established, is indeed a great fact in our history, and when it is made complete, as in all fairness it necessarily must, by extension, with certain exceptions, to those who, not having passed as Associates, are seeking the rank of Fellows, one of the great results foreshadowed by Mr. Cockerell will, perhaps, in this most valuable sense, have been accomplished.

But Examinations necessarily presuppose preliminary instruction, and the question arises, Can anything be done by this Institute for its development or improvement?

Presuming that all young men proposing to enter such a profession as ours have received a complete and liberal education, I agree with the late Mr. Street in thinking that the system of pupillage which enables men to learn exactly how those who have succeeded in making their mark are in the habit of working, is no doubt the strong point of our English system; and, if it be only of sufficient duration, and is properly followed up by taking advantage during its continuance of the artistic instruction offered by the Royal Academy, and that more practical by the professors of architecture, and, more important perhaps still, the thorough study both at home and abroad of the works of the great masters of old; I believe that as much will be done as is really practicable in giving a man an entrance to what must necessarily be a course of life-long study.

But no instruction that can be devised will make men architects who have not the inborn genius to become so. It may, however, make them well-instructed practitioners, and everything that can be done towards raising the general standard of knowledge must necessarily be in the highest degree advantageous.

Much excellent and highly commendable work has been, and is still being done, by our younger sister the Architectural Association, and if by any means the work of that valuable institution can be supplemented and aided by our elder body, in liberally sharing with them any advantages which our more matured status may enable us to supply, I think it would be desirable for both, and should by us be ungrudgingly given.

The President of that Association is now, happily, a member of our Council, and it is to be hoped we may always have one at least of its most influential members in that position, so that, while working on different lines, the elder and the younger may move harmoniously towards the common goal of each, the end so carefully foreshadowed in the preamble of our charter.

But while advocating, as I would very strongly, the utmost possible strengthening of this bond of mutual assistance, not less strongly would I advise the keeping of the two bodies thoroughly distinct.

Anything that would tend to depress the vigorous elasticity of the more youthful members, would, in my judgment, be a thing to be deplored, but everything that we can do to aid them in qualifying themselves to take their places amongst us, first as Associates, and finally as Fellows, will prove I hope, to be an unmixed benefit.

But that, irrespective of direct teaching, the past years of the Institute have not been unprofitable in result cannot, I think, be denied by any one who takes the trouble to peruse the record of its transactions. Mr. Eastlake's paper on this subject, read in 1860, was an exceedingly interesting and instructive *resumé* of what had occurred before that time, and I do not think the historian of the future will find the later proceedings, when carefully considered, at all less valuable.

As regards our ordinary meetings, we have been told that our proceedings are for the good of architects and not of architecture, which is true in a sense, though possibly not in that it was intended to convey. Solomon says that as "Iron sharpeneth iron, so a man sharpeneth the face of his friend," and I heartily agree with what fell on a recent occasion from our friend William White as regards the knowledge to be acquired, in that sense, from attending our meetings; for many an observation, it may be, casually made in our rooms, has struck, and been valuable to myself for life. But while admitting that, and freely acknowledging the very great value of many of the papers read, and the discussions that followed them, there can be no doubt that in ours, as in every human institution, there is room for improvement, and it behoves each one of us, if we desire the continuance of our society, to put his shoulder to the wheel.

Each member of the Royal Academy, when admitted within its ranks, has, I believe, to present, within the year of his admission, a work of his own, illustrative of his powers as an artist.

Would it be too much to ask of each of our Fellows or Associates, as they join our ranks, the contribution of an essay or paper on some subject connected with architecture or its practice of which he had made a particular study?

I well remember that, at the first meeting I attended as a visitor in the Institute rooms, Mr. George Godwin's valuable essay on "Concrete," which gained him a prize, was read, and I believe on that occasion, or very soon after, he was admitted an Associate. That essay stamped the character of the man, and we all know how shy and honourably it has been maintained throughout the course of a long and laborious life.

Are there none of our younger brethren equally anxious to show what they can do, and would it not be good for them and useful for us, that they should take the opportunity offered by our meetings of testing their powers?

Good papers, and free and full discussions, must continue to be the life of our meetings, and the better the papers the more assured will be the reputation of those who read them; and the criticisms afforded by discussion will be alike useful both to writers and hearers.

Nothing is more important than that our meetings should be always made interesting, and if interesting they can scarcely fail to be instructive. Our aim, as members of this Institute, should be, in the words of our charter, "the general advancement of civil architecture, and the promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith" in every possible way; and so long as we act on these lines, our work will clearly show, that the protection of our own material interests is *not* the great end of our corporate existence.

The honourable practice of a noble profession is what our charter requires, and should be one great object of our lives as architects; and, in my judgment, nothing is more likely to conduce to the attainment of this end, than the free intercommunication of ideas which must almost necessarily result from loyal association with one another as members of this Institute.

As regards our future: in the early days of the Institute, its correspondence was almost entirely limited to the Old World, and naturally so, because there alone are to be found the

glorious structures of the architecture of the past; but when we consider the enormous expansion of the Greater England beyond our shores, and yet within such easy reach; when we see or hear of the wonderful cities that by the energy of our fellow-countrymen have been entirely built since this Institute was founded, it cannot, I think, be doubted, that more active measures should be taken for enlarging the area of our sympathies and our correspondence, and to aid in the development of the work of those younger people, of whom so much may hereafter be expected.

Statesmen are turning their attention to the Federation of the English-speaking colonies, and if the Institute of Architects can do anything to aid the bonds of union, it will, in my judgment, be a mutual benefit. Nothing is more remarkable than the clinging of the colonists of Canada, Australia, and New Zealand to the old country, and anything that can be done to foster this attachment, must, I think, be a step in the right direction. Already there are in Australia and New Zealand members of our body, and we hope that their numbers may be increased, and that in India also we may be more strongly represented than at present.

While speaking on this point, I may remind you that, at our meeting of the 24th March last, in response to application from abroad, a by-law was so altered as to provide that examinations can now be conducted with a view to the admission of any architects beyond the sea who desire to share in the privileges of membership.

But, gentlemen, there is, as you are aware, a further question as to the future which requires to be faced. Hitherto I have spoken chiefly of our past and present existence as a body corporate under a charter, and have said but little as to internal government. I must confess that until I needed it for the purpose of this address, I had never very carefully studied that charter, and consequently did not know as I ought, how much we were really indebted to the men who framed it. Only one of them now remains, the loved and honoured Nestor of our Institute, Professor Donaldson, and, therefore, we cannot now thank them for the pains they took in providing for its settlement: it is a very valuable document, and, for the times in which it was granted, everything that could be desired, and, as I hope I may have shown you, has been useful as a text for myself.

But times and practices have greatly changed since it was framed, and the bonds in which in some respects it holds us, are hardly consistent with the expansion which in others has enlarged our view.

Whereas, in our older days, London architects were almost a class apart, and provincial men seldom wandered beyond their own cities or districts, it may now almost be said that there is no such thing as provincialism.

Our members are to be found everywhere; from the East to the West, from the North to the South, and it should be our aim to bind them all together in one strong brotherhood of mutual regard and confidence, and to make their privileges equal to our own.

Outside our ranks, also, there are able and honourable men who cannot join us, owing to minor technicalities, which we would willingly brush aside,\* were it not for the fetters which by our charter are imposed.

There is, further, a strong section of our body which feels,—and, as I think, justly feels, now that the examination test has been finally settled,—that Associates have a right to a larger share in the management of our affairs than by the charter is allowed them.

All these facts point to the necessity of change, and provided it can be prudently accomplished, I for one shall rejoice in the improvement. Naturally, as Englishmen, I hope we all detest revolution; but the best way of avoiding such catastrophes is by the timely institution of necessary reforms.

With this view therefore, and for the purpose of meeting all questions that have lately arisen with reference to the points I have named, or otherwise, a special committee has been appointed, and is in communication with the honorary solicitor, first, as to the possibility of amending the existing charter, or of supplementing it by additions; and, secondly, failing the possibility of such changes, of ascertaining

\* Surely not that which provides against an architect having any commercial interest in building materials or inventions? That keeps out one or two able men, I know; but there ought to be no talk of raising it.—Ed.

whether a charter with new provisions could be obtained, without sacrificing the traditions of that which we at present possess.

These are important questions, which require time for safe solution; but I think you may rely on the desire of the Council to bring them as speedily as possible to a satisfactory termination.

A charter is undeniably a good thing; it gives to an institution like ours a breadth of base, and solidity of structure, such as we, as architects, ought greatly to prize.

Most of us, I hope, have some reverence for that which is old when it has been proved to be valuable in the times that are past; and if without danger to the future we can amend and retain what we already possess, it will be the part of wise men not to let it slip.

#### Competitions.

On the subject of a recent competition, you will probably expect me to say a few words.

On competitions in general, so much has been, and so often, said, that I need not detain you by further remarks of my own.

That competitions are an inevitable characteristic of the age; that they were not altogether unknown in the earlier days of our art, and that when conducted on the strictly honourable principles, such as should always characterise the practice of the architect, they are evil by no means the unmitigated evil that some would represent, has long been my own opinion; and it has not been shaken by what, from time to time, has been said on the other side.

I cannot myself see why, if we offer prizes to young men for the best designs or drawings produced by them as students, and which most of us think is an incentive to industry in acquiring a knowledge of their art, they should a few years after years be debarred from securing by similar means, that employment in professional life for which their former efforts have been the best preparation.

But, be that as it may, competitions cannot be got rid of; and all we can do in this Institute is to use our best endeavours to get them conducted on sound and fair principles.

I think we are all agreed that no competition should be decided without the aid of a professional referee. This necessity is now much more frequently recognised than was formerly the case, and applications are not infrequently made to the President or the Council for advice as to the appointment of architects as adjudicators; but it must rest with competitors themselves to insist on the adoption of this safeguard to their interests.

Human nature being constituted as it is, it is not to be expected that any decision, however just, will satisfy all competitors; but if, instead of railing against the inevitable, men would cease to search out the reason of their failure, we should perhaps hear less than we sometimes do, as to corruption and unfairness, there none may at any time have really existed.

As regards the Admiralty and War Offices competition, for the decision of which I had the honour to be selected as one of the professional judges, it would not become me to defend the action of the judges, or to criticise the views of those in authority, who prepared the instructions upon which their judgment was to be founded. I will only say this, which I believe may be taken as entirely true, that the sole object of the latter was to get the best possible building for the detailed requirements of the public service, and of the former to discover, without fear or favour, the men best qualified to carry their instructions into effect. Whether that end has been accomplished, it must be left to the future to declare; I can only say that no names were spared by any of us for arriving at just conclusion, and whether our judgment was right or wrong, it was that which each one of us honestly believed to be right, and, right or wrong, it was absolutely and entirely fair.

It had been said that none of the designs selected were of a monumental character; but when a problem is put before architects, not chiefly for the production of a grand national edifice, but for the convenient accommodation of their every-day work of some 1,500 clerks of varying grades, all requiring the primary requisites of light and air, easy access and communications, and comparatively few of the higher officials and chiefs of departments, and practically no rooms needed for State receptions, and all to be got within a very limited area,—it would be a difficult task in-

deed to combine so much of common place with an exterior of monumental character.

Truly to my mind the conditions of the problem were barely reconcilable with architectural magnificence, such as might possibly please outsiders, but be in many respects opposed to the everyday wants of the working bees to be accommodated within. Much has been, and much more will doubtless be, said in criticism of the selected design. I shall not add to those criticisms; but, to my mind, it is little short of wonderful that, whatever its faults of detail may be, so fine a plan, and so good an elevation, should have been entirely wrought out by men, solitary students in a provincial town, with no special advantages, untravelling, unknown to the world of art, and who have produced drawings of the most remarkable delicacy, which may have been equalled, but never, to my knowledge, surpassed for perfect execution; that such drawings as those submitted in each competition should have been prepared in so short a time, as I understand, by two men (one an invalid) and a youth working together without extraneous assistance, excepting as regards perspective and figure drawing, whatever else may be said, is undoubtedly a very remarkable example of that "well-directed labour," to which, as the great first president of the Royal Academy said, "nothing is denied."

I will not refer to any other case of competition, but it may not be inappropriate to say a few words on the treatment proposed for one of the noblest of our ancient monuments; and, just as the Chief Commissioner of Works deserves our thanks for his determination to see absolute fair play in the decision as to the new buildings, so, I think, is he to be congratulated on what he has done with reference to the opening-up and preservation of Westminster Hall.

The clearing away of the old Law Courts has revealed to us a picture such as we could hardly have anticipated, a vision of magnificent simplicity and proportion, which, having once seen, we can hardly hear to lose again.

The appointment of Mr. Pearson as architect for the restoration of the old building, showed a wise discrimination and determination to do the best thing possible, and the very able and exhaustive report presented by him, is a further confirmation of the wisdom of the choice.

But, while there can be no doubt whatever as to the necessity of the structural restoration of the great Hall itself, it is permissible to regret that it should ever again be concealed from view by any new buildings, however correctly designed on the ancient lines, that may not be absolutely necessary for permanent sustentation.

I think in this case the action of Parliament is hardly to be regretted, if it gives further time for the consideration of a subject of no questionable difficulty, and one which so deeply concerns all who care, as we should do, for the preservation of the ancient monuments of this great city.

#### Conferences.

With regard to the conferences held in our rooms in the month of May, complete reports of which will be found in the volume of Transactions, it will, I think, be unnecessary to detain you with many observations.

Admirable memoirs were, as you will remember, read by Mr. Wethered on Viollet-le-Duc; Mr. Beresford-Hope on Street; and Mr. Aitchison on Burges; each replete with interest for us as architects.

Valuable papers also on architectural practice were contributed and discussed by members of our own body, and visitors from various parts, the reports of which have been duly recorded, and will, I hope, be found profitable reading in the future.

Professor Kerr wound up the conference with a paper, which Mr. Beresford-Hope rightly termed "a very brilliant one," on English Architecture thirty years hence; but although it was an essay of very great interest, I am not sure that the learned Professor has drawn aside the veil which covers the future so completely as he would desire; and he would indeed be a bold man who would venture to prophesy what is immediately in store for us.

I cannot but agree with him, however, in hoping and thinking, if I may quote his own words, that "it may not improbably be the destiny of England at a period by no means

remote, in the development of the advancing scheme of Anglo-Saxon civilisation, to assume a leadership,—such as she already possesses in so much besides,—in the illustrious art which it is the pride and the joy of this assembly to represent."

I trust the gentlemen who visited us from the Provinces were not otherwise than gratified with the reception accorded them, and have taken back to their homes a pleasant and profitable recollection of this happy re-union.

The Conference at the Health Exhibition stands on a different footing to that to which I have just briefly alluded, but as many of us took part in it, and a full report of its proceedings will shortly be published, I do not think I need refer to them in detail; most of the subjects treated on were familiar to us as architects, and it was rather for the benefit of the outside public, than for our own instruction, that the papers were prepared.

Let us hope that some few individuals out of the millions who visited the Exhibition may have taken to heart a few grains of knowledge and common sense which may hereafter expand and bear fruit, and be useful to many besides those who were the immediate listeners. Perhaps, however, exception should be made in calling attention to the papers read by Mr. Aitchison and Mr. William White respectively; the former on "The Sanitary Aspect of Internal Fittings and Decoration;" and the latter on "The Hygienic Value of Colour," both ably treated, and valuable alike to the architect and to the general public, if they care to profit by them.

The remarkable success of this Exhibition has indeed, been one of the great features of the year now drawing to a close, and I think it may be gratifying to us as architects to know that the interesting work of one of our own members, Mr. Birch, in reproducing the picturesque features of the streets of Old London, which he has done so learnedly and well, has not been one of the least attractive features of the show.

Before concluding my remarks, it is right that I should say a few words on the losses we have sustained in the thinning of our ranks by death, and the position in which we now stand as regards numbers and financial prosperity.

In respect to the first, we, in common with the whole English people, have had to mourn the untimely removal of a Prince pre-eminent alike in natural gifts and cultivated intelligence,—one whom we had fondly hoped would not only have been an honour to our country, but of great service in all questions relating to our art,—a hope, alas! not to be realised. The Council thought it their duty to present an address of condolence to our patron, H.M. the Queen, which in due course was graciously acknowledged.

We have also had to regret the loss, though in the full ripeness of years, of a most valuable member of our body, Mr. Knowles, a man who, having passed a most laborious life in the active performance of professional duties, might well have claimed in his declining years entire rest, but who preferred to remain amongst us as an Examiner and Member of Council, where I may safely say his presence was always welcome, as his opinions were valuable. His last appearance at the Council-table only preceded by a few days that of his death.

In Edwin Nash we lost a most excellent man and an architect of no mean power,—one always ready to help as a member of the Institute, and a genial and honourable practitioner in our craft. He left an example in his will which may be usefully followed, in devising a legacy of 100*l.* to the insufficient funds of the Architects' Benevolent Society.

Charles Henman, less known to most of us, was one of my earliest professional friends; an able man, who, if he had not been possessed of independent means, would probably have made his mark more strongly than he did. He has left two sons still happily numbered in our ranks.

Many of you will have known, though I did not, William Pettit Griffith, one of our Fellows, who, I believe, was very highly respected.

In Sir William Siemens not only we, but the whole civilised world, sustained the heavy loss of a prince amongst inventors, and a most genial man, always ready to impart to others, as he did to us at this Institute, some portion of that store of knowledge of which he was so largely possessed.

The name of that enthusiastic antiquary,

John Henry Parker, the publisher of the "Glossary of Architecture," and the ardent explorer of the antiquities of Rome, must also not remain unmentioned, but as you will find in the Sessional Paper No. 8 of the present year an interesting notice of him, I need say no more to show how valuable were his labours to architects.

Amongst eminent foreigners our losses have been still more considerable; two Gold Medalists, Professor Lepsius, of Berlin, and Jean Baptiste Lesueur, of Paris, besides two other Honorary and Corresponding Members, Paul Abadie, of Bordeaux, and M. Chenavard, of Lyons. And, lastly, our Honorary Associate, the eminent physician, Sir Erasmus Wilson, to whose munificence I believe, we owe the bringing to our shores of the obelisk now standing on the Embankment.

But, notwithstanding these losses, our numbers have increased, and we may be said in that respect I believe, to be in thriving condition. Also, it may be very safely said, that our financial condition is thoroughly sound.

Finally gentlemen, although there are several other subjects on which I could have desired to speak, I think I have detained you quite long enough.

The past and the future of our own body is to us a theme of no little importance, and in this fiftieth year of our existence I have thought it better to confine myself mainly to its consideration, rather than to wander on the wider field of survey, which might possibly in some respects, have been more congenial both to you and to myself.

We have seen, I think, that the aim of the founders of this Institute was high and noble. Let our standard in the future be reared still higher. Their work was begun in weakness; let ours be continued in strength; and putting aside all petty jealousies, let us combine, not for mere personal advantage, but in the truest and most liberal sense, for the advancement of our art, and the establishment of its practice on that broad basis of honourable principle, which alone is worthy of the noble profession to which we belong.

A report of the discussion which followed, and of the preliminary business, will be found on the opposite page.

#### THE WORK OF THE ARCHITECTURAL ASSOCIATION.\*

In considering how the teaching in our society may be made increasingly useful to the members, the advisability of establishing a class for instruction in taking out quantities will certainly have to be carefully considered. The proposition is no new one: it has been before discussed, but a feeling seems to exist among some members that it is no part of an architect's training. I confess I take an entirely different view, and consider it a very important and useful part. A knowledge of how to take out quantities implies an acquaintance with construction, and those details of the different trades, together with a knowledge of materials, their strength and suitability for the various purposes for which they are required. The care with which quantities must be taken out brings to light and sight what had otherwise escaped notice, and has a distinct tendency to foster that spirit of carefulness and forethought in making drawings which cannot fail in the long run to be beneficial to the pockets of the client. The value of this knowledge in preparing estimates can hardly be exaggerated, and were this necessary part of our profession more generally known, we should not see those great discrepancies which a glance at the tenders in the professional journals weekly discloses. I am not arguing whether architects should take out their own quantities or not; every man must settle that point for himself. I do not think any rule can be laid down, but it is hardly necessary to point out, that if the requisite knowledge is cultivated and gained, a young practitioner may legitimately swell a small income, and if it is his lot to practise in the provinces, the necessity for this accomplishment will soon present itself. We have in our ranks many gentlemen who practise as quantity surveyors, and I am sanguine, that if a class is started we should not lack teachers, and I believe it would

\* Continuation of the opening address, delivered by the President, Mr. Cole A. Adams, at the meeting on the 24th ult. See p. 537, &c. &c.

soon become one of the most popular classes of the Association. If a strongly-supported wish exists that the experiment should be made, I feel sure that the committee, as your representatives, will give the matter the most careful consideration. This, as well as other work in the Association, lies in your own hands mainly, and it is for you to say clearly what your wishes are, so that we may be guided in our judgment by the expression of opinion that is presented to us.

We hear a great deal talked about sanitary science, and I fear the profession is a little weary of the subject; but it is one we cannot afford to ignore, and it would be a most foolish thing to do so. At the risk of wearying you, and repeating what I have said about this matter on other occasions, I must say a few more words on the subject. Every one almost now who takes a house or intends building one asks the question, "How about the drains?" and when we consider that on whether these are right or wrong depends the health or sickness of the household, the importance of the subject from every point of view is brought before one, and unless, as the professional adviser, an architect can advise and carry out sanitary work in the latest and most approved way, he stands a very fair chance of finding that his income will suffer very materially. So putting the matter on those selfish grounds alone, the value of the requisite knowledge will be conceded by most. But let us consider it on the highest grounds, that upon our skill depend the lives and well-being to an almost incalculable extent of the inmates of the houses with which we are concerned. Suppose a young architect, in the face of the information now at his disposal, were to disregard it, and leave all the sanitary arrangements of his building to chance, and that shortly after it was occupied illness should occur, perhaps a death, and that inquiry, which in these days would assuredly follow,—for doctors are fully alive to the evils resulting from defective sanitary arrangements,—should bring to light that these were so badly constructed and arranged in the building we are considering, that the cause of the illness and death could be traced directly to this want of care and skill on the part of the young architect. This is not an unlikely case; it has occurred over and over again, and is too often solely due to culpable neglect. Bring home to your minds the sorrow this must cause in the household, and resolve that the charge of neglect in this respect shall never be laid at your door. In times past no one recognised the full extent of the danger involved in the water-carrying system, until medical science turned its bull's-eye lantern into the dark places of the system, and disclosed what frightful evils might lie hidden in our houses, ruining life, health, and happiness. The principles of house sanitation are now well known, and can be learned with patience and practice. To neglect this branch of the profession is the most foolish policy, and can only end in discomfiture. Bear in mind, also, that a man conversant with modern sanitary science possesses an investment which has a valuable pecuniary interest attached to it, and his employment upon such work may lead to his securing more of another kind, perhaps more congenial to his tastes; at all events, in these days of competition in every walk of life, it is hardly prudent to let any chances slip through our fingers. The study and pursuit of this science is not dull or uninteresting; go into it with thoroughness, and I believe you will find that this is true.

What is the future of the Architectural Association? It was founded several years ago for the same aims that now exist, but I think if we were carefully to analyse the work done, with the number of members that belonged to it in its earlier years, it would be found that the proportion was a larger one than it is at present. We now number all but one thousand members, and, financially, our balance-sheet shows that the amount to our credit is considerable; but is the proportion of workers, and the amount and quality of the work done, in favourable comparison with past years? We are looked upon as a successful Institution, and that very fact carries with it a warning and a danger. Any community in its younger days is simpler in its tastes and pursuits than it is as it approaches maturity, and, little by little, if influence falls to its lot, luxury creeps in, unless the rulers are wise and resist its insidious poison. It is the fashion now in the profession to belong to the Architectural Association, and, in a way, a very

good fashion too; but I think I may say, without being accused of sounding the alarm unnecessarily, that there is at the present time a want of that early vigour and earnestness which was, as far as I can learn and judge, present in this body in the years of its infancy. The proportion of workers to the number of members last session I calculated was just about one-fifth,—that alone is not a very healthy sign,—even making fair deductions for those members who have passed through the classes, and others in practice who still, happily, keep their names on the list. But we want the younger men to come forward, not to be content with being members only, attending the classes and lectures and doing no practical work, but to work in sober earnest and to contribute that bone and sinew to the Society which shall make it strong, powerful for good, and respected. If students, as they join, will do this, then the future of the Architectural Association may be a bright and prosperous one, and we may see it grow, year by year, into an institution which shall possess valuable facilities for instruction far beyond what we have at present. The vision of a college where the art and science of architecture shall be taught, and the services of our greatest architects secured for teaching the various branches of the profession, is a vision that has been before our eyes for many a long year, and when one reads the valuable papers contributed by Mr. William H. White, Mr. R. Phémé Spiers, and others, on the thorough system of art education as carried on in France and Germany, especially in the former, and learns what great results follow and how highly the profession and its professors are esteemed, one's heart sinks and mourns over the want of system and thoroughness which characterises the education of architects in this country. As Englishmen we should perhaps rebel at the strict academic course of teaching which is adopted abroad, but how much we might learn from it, and how valuable it would be if we could adopt some such system, so that the profession should in this country take the high position it does in France, when the State should recognise the duties it owes to art in the education of the people and the pre-eminent position of the Empire in the eyes of the world, and not, as now, entrust their buildings to the engineers and officials of South Kensington, and maintain an office of salaried architects for carrying out public architectural works, but see to it for employment and counsel those architects who have fairly won their reputation. A profession we have been much to blame in the past for allowing this state of things to be brought about; the very want of such a system as for something like 200 years has existed in France, has resulted in want of sympathy and union between the members of the profession and the public, which, had it been otherwise, would have given strength, and that we should have compelled recognition in the highest quarters by the right of having conquered difficulties, and have been able to show that men who had studied the art and science of architecture, and won distinction in their profession, were the men to whom public buildings of importance should be entrusted. The commercial spirit of this country has too little sympathy with the artist. If we are to succeed in turning out architects highly educated in their profession we must have better machinery than at present exists. If we were in thorough earnest as a profession in this endeavour, the good might be accomplished; and at a time when the legitimate prey of the architect is being constantly pounced upon by the culturs, the necessity for combination and self-preservation needs but little argument. We in this Association may do much; and, in honest rivalry of us with another, cultivate the art with ardour, raise it in the eyes of the public, and not rest until it is placed high in the estimation of men, so that they too shall love it and be proud of their public buildings and monuments, and proud, too, of the men who have raised them; so that if the ghost of Sir Henry Cole should arise from the grave, and repeat the question, "What is an architect?" the answer may be taken from the tomb of the great Sir Christopher Wren, and, slightly modified, be, "If you seek to know, look around."

A New Franciscan Monastery will shortly be commenced at Upton, Essex. The architects are Messrs. Pugin & Pugin, of Westminster.

OPENING MEETING,  
ROYAL INSTITUTE OF BRITISH  
ARCHITECTS.

The first meeting of this Institute for Session 1884-85 took place on Monday last, Mr. Ewan Christian, the President, in the chair.

Mr. William H. White (the Secretary) intimated the decease of Mr. John Holloway Sanders, of Derby, one of the Fellows of the Institute. He also referred to the death of M. Paul Abadie, of Paris, Hon. and Corresponding Member. Professor Raschdorf, he stated, had during the recess visited London. The Professor was the architect of the new English Church at Berlin, and the Crown Princess had requested that he might be assisted in his inquiries in London by some English architects. The President, Mr. Grüning, and Mr. William Simpson had therefore accompanied him on several occasions. Mr. F. R. Farrow, the holder of the Godwin Bursary, had been very kindly received in Vienna, by Herr Leonard, the secretary of the Guild of Architects, by Baron von Hansen, Baron von Hasenauer, and the son of the late Baron von Ferstel. Mr. Farrow had spent a week on the works of the new Town Hall, which Herr Schmidt, Royal Gold Medalist of the Institute, was erecting. Mr. Farrow had also been assisted with letters to architects at Buda Pest, and every facility appeared to have been afforded him to study points of construction in some of the new barracks, and in a new hospital now being completed.

Several donations of books were announced. Professor Meldahl, Rector of the Royal Academy of Fine Arts, Copenhagen, sent a folio work on "Mediæval Churches, and other historical Monuments of Denmark." Herr Schmeidler, of Berlin, presented the third part of his illustrated work on "Decoration of Interiors,"—a work commenced by the late Herr Gropius, Corresponding Member. A series of plates, representing the buildings erected by the late M. Rohault de Fleury, were presented by his son. M. Ruprich-Robert sent the second part of his new work on "Norman Architecture"; and the following works had also been received:—M. Viollet-le-Duc's "Drawings and Designs," M. Hénard's memoir of Lesueur, and M. Lucas's memoir of Chenevard. M. Lucas had also forwarded a pamphlet on the proposed rules or statutes of an Association of Architects for the defence of professional interests in such questions as responsibility, public competitions, artistic copyright, &c. M. Questel, the Senior-Architect-Academician, is president of the new body, and the members propose to establish a fund for affording pecuniary assistance in judicial and administrative cases. Votes of thanks were passed to the several donors.

Mr. J. Macvicar Anderson (the Hon. Secretary)—I had the pleasure, some little time since, of intimating that the Council had determined to accompany the prize for the Pugin Studentship with a medal, by way of giving a more enduring memorial than mere money, in recognition of the zeal and ability of the Pugin Students. That medal is in course of preparation. It has also occurred to the Council, with regard to the Godwin Bursary, that it would add to the value of the prize if a similar medal were given with it. The Council has communicated with Mr. George Godwin, and asked whether it would be in accordance with his wish that such a medal should be given; and I have the pleasure of intimating that he has informed us the proposal meets with his entire concurrence. He has also requested that he may be permitted to subscribe towards the expense of the die, accompanying his request with a cheque, which will go a considerable way towards defraying the expense. Mr. Anderson further intimated that he had received a communication from the solicitors of Miss Hannah Jane Jones, the only surviving sister of the late Owen Jones, stating a desire to found an Owen Jones Scholarship, for the purpose of enabling the holder to travel in Europe or elsewhere, for the cultivation and improvement of his knowledge of architecture. The nomination is to be tenable for two years, the scholarship being with the Council of the Institute, and the nominee to be a present or future pupil of some member of the Institute, or of the Professor of Architecture in University College, or of the Birmingham and Midland Institute, to be deemed eligible by reason of proficiency in the leading subjects treated by Owen Jones in his "Grammar of Ornament." Miss Jones contemplated providing for the endowment fund

the sum of 1,250l. Midland Railway Four Per Cent. Debenture Stock, producing 50l. per annum.

The President—I think you will consider these communications as of the very greatest interest to us. Mr. Godwin has shown again how much he is ready to do in everything that can promote the study of art, and I think it is right that this medal should be given to those who fulfil his wishes in terms of the Bursary he has founded. As to what Miss Jones has done, this additional prize will be of the greatest advantage in future to our students, and I am glad that it should be coupled with the name of one whom we must always hold in the highest respect, as one of the most earnest, and hard-working architects this century has seen.

Messrs. Josiah Conder and George Rackstraw Crickmay were elected Fellows, and Mr. Charles H. H. Cazalet an Associate, of the Institute.

Mr. G. Richards Julian then presented a memorial signed by 453 Associates, 308 being resident in London, and the remainder scattered throughout the United Kingdom. The memorial was in the following terms:—"We, the undersigned Associates of the Royal Institute of British Architects, desire respectfully to direct your attention to the fact that, although professional members, Associates under the existing charter and by-laws are debarred from taking any part in the regulation of the affairs of the Institute, and to urge the following considerations:—Every step which renders our Institute more truly representative adds to its influence and its popularity, and any change which improves the position of the Associates will add to the dignity of the Fellowship. Moreover, the authority of the Council will be enhanced by making the electing body consist of all professional members. It should be borne in mind that at present the Associates subscribe about one-half of the total amount contributed by professional members, and yet they have no control over the expenditure. A large number of the Associates are actively engaged as principals, and are, therefore, equally interested with the Fellows in questions of professional practice. In the Institution of Civil Engineers, and in the Surveyors' Institution, professional Associates vote on the same terms as Fellows, and in these kindred societies the practice is found to work satisfactorily. We, therefore, most strongly urge you to determine the best method of giving to professional Associates the right of voting on all matters relating to the regulation of the affairs of the Institute, and suggest, in the interest of country Associates, that the votes be recorded by means of voting papers, transmissible by post."

The President said he was very happy to receive this memorial, which would he laid before the Council with the least possible delay. He sympathised with the memorial, and believed he had anticipated the matter in the address he was about to deliver.

The President then read his address, which we print in this number (see p. 617).

Mr. Mitford, of the Office of Works, and an Hon. Associate, proposed a vote of thanks to the President for his able address. The Institute was to be congratulated on its flourishing condition, and had attained no mean amount of success for so comparatively young an institution. The fact that their young members were now admitted into the body by examination proved that the Associateship and Fellowship was no dead letter, but a real thing, only to be obtained by labour, and that of a severe character. In fact, the Institute now offered what might be termed an Academic degree.

The Right Hon. G. J. Shaw-Lefevre, M.P., the First Commissioner of Works, was glad of the opportunity of stating publicly the great services rendered to the Government by the President and Mr. Hardwicke, in consenting to act as judges in the recent competition. Few besides himself knew the labour this had entailed upon those gentlemen, or the conscientious zeal with which they had devoted themselves to the difficult task of adjudicating on so important a matter. He might take the opportunity of pointing out that the competition involved two innovations, as compared with previous competitions for the great buildings of the Government. In the first place, he might point out that in previous competitions for public offices architects were requested to act, not as judges, but as assessors; while on this occasion the two eminent architects he had named were invited to act as judges with the Chancellor of the

Exchequer, the First Commissioner of Works, and Mr. W. H. Smith. In this respect he thought they would agree that a proper and due position had been accorded to the profession. In the next place, the competition was the first example in connexion with Government work, in which double selections were made. It was open to all the world to send in sketch plans, from which a certain number were ultimately to be selected, and a second competition of a more elaborate character entered upon. Those who entered on the second competition received a premium, which he hoped would be some consolation for the great labour they had devoted to the matter. The profession of architects readily responded to the invitation addressed to them, no fewer than 158 designs being received. He believed he was the only person who was in a position to state that the competition was of a fairly representative character, including in it a certain number of the most eminent members of the profession, though some very conspicuous gentlemen were not engaged in it. The result of the competition was in itself a voucher to the complete fairness with which it was conducted. No one was more surprised than he was with the result of the selection of two gentlemen thoroughly unknown to fame beyond their native town in Yorkshire. This, as he had said, was a voucher that the competition had been carried out with the utmost fairness. One of the chief conditions laid down by the judges was that the designs should answer the purposes for which the buildings were intended,—that they should be suitable for great public offices, and that the interiors should not be sacrificed for external effect or mere architectural display. He regretted to say that a good many of those who failed to appear amongst the first nine, showed defects in the plans. With regard to the style which was finally selected, it might be interesting to architects to state that of the 158 designs sent in not more than five, and he was not quite certain if more than three, were in the Gothic style. Now, twenty-five years ago, when the designs for the Foreign and India Offices were sent in, more than half of them were Gothic; and so again in the more recent competition for the Law Courts nearly all were Gothic. It was, therefore, evident that there was a great change in public opinion. They might accept it as the general opinion of the profession, having regard to the uses for which the building was intended and its position and surroundings, that a Classic design was more suitable than a Gothic one. [This statement elicited different expressions of opinion.] He did not wish to raise any controversy, and he hoped they might be spared a repetition of the hattle of the styles. He believed he might say that on the whole the verdict of the judges had been approved by the profession and the public; and the Government intended in the coming session to submit a vote to Parliament for the purpose of enabling Messrs. Leeming & Leeming to carry out their designs. But these were not the only important works which were being carried out by the Government. Allusion had been made to the improvement connected with Westminster Hall. It had been his duty to clear away the old Law Courts, and to consider how the west front of Westminster Hall should be restored. He had made it his duty to have the advice of Mr. Pearson, an architect recognised as one of the most competent for a task of this kind. His plans were now before the public, and involved the restoration of the west front to the condition in which it existed from the time of Richard II. to the commencement of the present century, when the old Law Courts were built. This involved the building of a double-storied cloister to the flying buttresses of the old Hall, and the principal justification for this was the preservation of the Norman wall of the west front, with its beautiful old work, including the masons' marks. If the front were left exposed, the London atmosphere would produce its effect upon the old wall. There were differences of opinion in connexion with this, and he had determined to refer the question to a Select Committee of the House of Commons during the coming session, when evidence would be heard for or against it. Another great improvement was the work now in progress at the Tower of London. This consisted of two kinds: first, of demolition, and secondly, of restoration. The demolition entailed the removal of the hideous warehouses, which for

many years had interrupted the view of the Tower from the river, while the restoration consisted of the re-building of the inner ballium wall, and the Lantern Tower. The first half of the work was completed. One great block of warehouses had been demolished, and in its place the ballium wall and Lantern Tower had been finished. In the course of a few days the other half of the work would be begun, and the work finally completed. This work had been under the charge of Mr. Taylor, a gentleman connected with the Office of Works, and he wished to express his high sense of the ability and the services rendered to the Government by that gentleman. He believed they would consider that these were no unimportant works now in course of construction, or contemplated, in reference to public buildings in London. He would remind them that there was no city in the world where there was such a field for architectural investigation and study as that of the great metropolis in which they lived. There was no city in Europe where there was such a long and unbroken series of great buildings, containing every phase of architecture during the last 800 years, beginning with the old Norman works of the Tower and Westminster Hall; then proceeding to the Abbey, which showed almost every phase of Gothic ecclesiastical work, from the time of Henry III. to Henry VII. They had two of the most beautiful specimens of Domestic Tudor work in Holland House and Charlton; they had the Renaissance work of Inigo Jones; the splendid series of works by Wren; and finally in the works of Sir Charles Barry and Mr. Street, the completion and possibly the end of the Gothic revival. He meant, of course, as far as secular buildings were concerned. It was quite possible that Gothic architecture might be used for a long time to come in ecclesiastical buildings, but looking at the tendencies of the present day, he believed they had seen its close as regards secular buildings. But who should venture to say what was the immediate tendency or the future prospects of architectural style? In the presence of so many experts he would not venture to express an opinion upon it. He might remind them that the style, especially of our public buildings, was not merely due to the architect, but to the taste, or want of taste, and the requirements of the public. He believed that even Sir Charles Barry was forced by public opinion to adopt the Gothic style for the Houses of Parliament, almost against his natural judgment; and certainly public opinion, in the shape of Lord Palmerston, forced Sir Gilbert Scott to abandon his Gothic designs for the Home and India Offices, and to adopt a style he did not at all like. He would conclude by saying that though the profession had suffered from severe losses of late years through the death, and sometimes the premature death, of many of its leading members, he ventured to hope that it contained within its ranks many able, competent, and willing, to carry on the great work of English architecture, and who would leave behind them memorials as great and beneficial as those which remained from the past.

Mr. Charles Barry seconded the vote of thanks, and referring to the memorial which had been presented, said that, as a member of the Council, he echoed the words of the President. There was every desire on the part of the elders to endeavour to give proper effect to the wishes which had been expressed. They were desirous to initiate several reforms, but not to tend towards anything like revolution. They might congratulate themselves on the presence of the First Commissioner of Works, and his important adviser, Mr. Mitford, who had assured them in no measured terms that they had to a great extent the same views, hopes, and aspirations as the architects themselves, so far as their art was concerned.

The vote of thanks was then carried by acclamation. The President returned thanks, and added that he could not agree with the First Commissioner of Works that Gothic architecture was in a sense dead. He did not agree with him at all. If they had found a Gothic plan of equal merit to that which had been selected, with a really fine and snialt elevation, it would have had the best consideration they could give it. But unfortunately the Gothic designs had not the best plan, therefore they were necessarily rejected, as convenience and accommodation were the first requisites. He hoped that in some future competition, men who had really studied Gothic architecture as it ought to be

treated, in a free way so as to suit every modern requirement, would not be deterred from entering the lists by words used by the First Commissioner. They all knew bow strongly Mr. Street insisted upon the subject of plans, and no man was more careful and more thorough in his production of them. If there were defects in his Law Courts, it was not the fault of Mr. Street, but of those who bound him in iron chains, which he could not burst.

The meeting was then adjourned to the 17th inst., when a paper will be read by Mr. Stannus on the "Architectural Treatment of Cupolas in general, and that of St. Paul's in particular."

## Illustrations.

### MONUMENT TO THE LATE DEAN STANLEY, WESTMINSTER ABBEY.

**A**T the time this monument was placed in its position in the Tudor Chapel, we commented upon its excellence as a likeness and its expressiveness and suitability to the place as a monument. Few recent sculptured portraits have been more successful in giving the character and expression of the original face, and there is a fine breadth of treatment in the drapery. Like Browning's bishop in St. Praxed's Church, the figure lies,—

"Letting the bad-clothes, like a morr-claok, drop  
Late great laps and folds of sculpator's work";  
but there are far other associations connected with it than those which clustered round the life of the gay Renaissance bishop, who was so anxious to have the best nook in the church reserved for his monument. Like him, indeed, Stanley may be said to have "fought with tooth and nail" while living, but it was not to "save a niche" for himself in the Abbey or elsewhere, much as he loved his great historic church, but as a soldier in the battle for good against evil, for breadth and charity against narrowness and bigotry and sectarianism. The subdued light of the stained glass adds to the feeling of repose which pervades the monument and its surroundings, and contrasts strangely, but not unfittingly, with the recollection of the eager and strenuous character of the man who is thus commemorated. The engraving, which, like all the English wood-engravings published in the *Builder* during the present year, is from the atelier of Mr. Cooper, appears to us to convey admirably both the features and details of the sculpture and the rich subdued light under which it is seen; and we are glad he able to add that Mr. Boehm, the sculptor of the figure, has expressed himself much pleased with this translation of his work. The pedestal is designed by Mr. Pearson, the architect to the Dean and Chapter.

### DESIGN FOR WAR AND ADMIRALTY OFFICES.

BY MR. THOS. PORTER, F.R.I.B.A.

We give the two principal plans, and a view engraved from the architect's drawing, of Mr. Porter's design, the last of the nine of the second competition. One of the points of the plan, it will be observed, is the provision of a courtyard to the Whitehall side, throwing the building into two wings at this point. Mr. Porter sends us the following statement of his views and intentions in the working out of the design:—

"The author of this design has adopted the Italian style as being in his opinion the best suited to harmonise with the neighbouring Government Offices, and also as affording the means of securing ample light.

The frontages toward the Park follow closely the boundary-lines of the site, thereby avoiding loss of valuable space.

The narrowness of the street opposite the site in Whitehall induced the author to abandon an unbroken façade on the east side, and to gain additional apparent width by deeply recessing the centre portion of the Whitehall front, and thereby opening up a handsome forecourt screened from the street by a stone balustrade and dwarf carriage gates. The forecourt would afford greater quiet and privacy to the Offices than an unbroken frontage. In the centre of the recessed portion of the forecourt a lofty archway for carriages and side archways for foot-passengers lead to the quadrangle, 282 ft. long by 113 ft. wide. Second archways of

similar character give access to the quadrangle from Spring-gardens.

The whole of the rooms in the building are well lighted, and of comfortable proportions. Long narrow rooms have been avoided, and all important rooms either face the street, or the Park, or the great quadrangle.

The rooms of the principal officers of both departments are placed on the first floor, fronting St. James's Park. The room for the Commander-in-Chief is placed at the south-west angle of the building, and that of the Secretary of State for War faces the Parade. The room for the First Lord of the Admiralty is placed at the north-west angle.

The arrangements of the rooms on the second floor are similar to those on the first floor.

A mezzanine floor (between the second and third floors) is devoted entirely to repositories, lavatories, and water-closets. The latter are well lighted by the inner courts, around which they are arranged. The repositories are intended mainly to be lighted by electric light. The lower basement floor accommodates the repositories not provided for on the mezzanine floor. A lofty crypt under the whole of the quadrangle is also devoted to repositories.

The entrance-halls, saloons, and corridors are well lighted, and would form ornamental features internally.

The buildings are intended to be faced with brown Portland stone.

The first-floor rooms are about the same height as the first-floor rooms of the New Government Offices."

### MONSTRANCE IN THE MÜNSTERKIRCHE AT ROERMOND, HOLLAND.

ROERMOND,\* in Holland, is an interesting town, containing two very interesting churches. The cathedral dedicated to St. Christopher is a large plain brick building, dating from the fifteenth century, with long apsidal transept, a rather short nave, and a rather long chancel.

\* This has been unfortunately mis-spelt "Roermond" in the lettering of the Plate.

*Photoprint, Waterlow & Sons Limited, London.*

HOUSE OF RETREAT, LLOYD SQUARE.

THE MAISON ADAM, ANGERS.

THE BUILDER, NOVEMBER 8, 1884

*Photocoll. Liverpool & San Ewald, London*

HOLMELEIGH COTTAGES, GRASSEENDALE, LIVERPOOL

Messrs. P. & G. HOWE, ARCHITECTS

with aisles the height and width of the choir itself. It cannot be said to be a beautiful building, but it is an excellent plain, common-sense church, very cheap, and very substantial. It serves as the cathedral for the Roman Catholic diocese of Roermond.

The Münster (Minster) at Roermond is, however, a far more interesting building; it is an excellent example of the Transition period and of Dutch First Pointed work. It bears a strong resemblance to the churches of St. Quirinus at Nenss, on the Rhine; St. Cunehert at Cologne, Braunweiler, and Gellenhausen, and is distinctly of a Rhenish type, with two sets of transepts. The lantern over the eastern crossing is crowned by a ridge-and-furrow dome, and it will astonish our English readers when we tell them that Mr. Cuyper, who restored this interesting building, has been blamed by some Dutch critics for retaining this feature, which they maintain ought to have been destroyed because it "only dates from the fifteenth century!" It is probably the only dome of that date north of the Alps!

There is, of course, very little ancient church plate existing in Holland, but one example of rare beauty is to be seen in this church: it is a monstrance, 3 ft. 4 in. high, composed entirely of silver, executed at the end of the fourteenth century. The elaborate nature of the work may be gathered from the fact that the details given in our drawing are the actual size.

Whether this beautiful vessel has always been a monstrance may perhaps be doubted, though Mr. Cuyper, the eminent Dutch architect, is strongly of opinion that it has always served that purpose, and certainly the half-moon receptacle for holding the consecrated host, and the little angels bearing it up, are of the same date as the vessel itself.

Nothing is known of the history of this monstrance. Another, rather more in accordance with the recognised form, and evidently half a century, at least, later than the Roermond example, is to be seen at the Catholic church at Breda. We should notice the fact that the Roermond monstrance takes in pieces, and is fastened together with little pegs attached by chains.

H. W. BREWEE.

SKETCHES BY A DISTRICT SURVEYOR.

IV.

ANGERS, formerly the capital of Anjou, an ancient province and government in France, but now the chief town of the department of Maine-et-Loire, is situated on the Maine. Since the commencement of this century, no town in France has submitted to greater changes; many of her houses, so characteristic of another age, have disappeared, but a good specimen of half-timber construction remains at the Place Sainte Croix, behind the cathedral. This is La Maison Adam, which we illustrate. Right and left of the tree sculptured at the angle formerly stood a figure of Adam and another of Eve. The iconography of this house is a most interesting study. Beneath the flat oriel, on the left side of the sketch, is a sort of dragon, intended to typify the Evil Spirit departing from the premises; and on this side, but higher up, is a very obscene subject. Grotesques abound. The lady and gentleman about the centre, and facing the Place Sainte Croix, appear on very good terms. The figures supporting the door-head, on the right of the view, are a countryman and Scotchman. The Scotchman has stood the wearing effects of weather less successfully than his neighbour; but there are the kilt, bonnet, and bag-pipe distinct enough.

Louis XI. had, like his predecessors, a Scotch guard, and, as at this time our fortunes in France were on the wane, the Scotchman may have been set up at this town house to commemorate the assistance Scotchmen had given in establishing the integrity of the French crown, and in driving out her (auld) enemy, England.

The ground-floor is occupied by a draper, and the floors above are let in tenements.

Before the Revolution, Angers had both University and Academy of great celebrity. In its Military College, both Lord Chatham and the Duke of Wellington studied. Angers was also the birthplace of David the sculptor, and Bernier the traveller.

My drawing was large, and has been reduced for photo-lithography by Mr. A. Beresford Pite.

T. E. KNIGHTLEY.

LLOYD SQUARE CHAPEL.

The chapel is divided into choir and north and south aisles; the choir for the sisters of the order, and the aisles for visitors. It is almost entirely surrounded by buildings, so that the light is introduced, as shown in the roof, by dormers and a lantern light; by this means the building is well and evenly lighted and also well ventilated. It is heated by Grundy's hot-air apparatus. The building was erected by Messrs. Bangs, of Bow, and the stalls (which are made of American birch) were very carefully executed by Mr. Knox, of Lambeth. Mr. Spooner has been the clerk of works for this and the greater portion of the adjoining buildings. The architect is Mr. Ernest Newton.

HOLMLEIGH COTTAGES, GRASSENDALE, NEAR LIVERPOOL.

THESE cottages were erected some time ago for Mr. T. Sutton Timmis as residences for his coachman, grooms, gardeners, &c.

They are arranged in two groups, and have a considerable garden space allotted to each house, and a spacious drying green at the end furthest from the road. A large and cheerful sitting-room or living-room is provided, with a scullery and washhouse, larders, &c., at the back, and three bedrooms on the first floor.

The walls are of grey brick with red Rubon jambs and string bricks; the roofs are tiled, and the porches and some of the gables are of timber framing with cement panels, some of which are enriched. Special attention has been given to the draining and ventilating of these cottages by the architects, Messrs. Francis & George Holme, of Liverpool, whose designs were carried out by Mr. Jones, contractor, of Garston-road.

This illustration, as well as another in the present number, is reproduced from a water-colour drawing by Messrs. Waterlow's "photo-print" process.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual meeting of the members of this Association was held on Monday afternoon, Mr. W. Sapcote in the chair. Among those present were Messrs. T. Barnsley, C. H. Barnsley, R. Mann, H. Heal, J. Bowen, A. S. Smith, J. Dibble, C. W. Barker, W. J. Whitall, Pollard, and E. J. Bigwood (secretary). The committee, in their report, express regret that they were unable to report any marked improvement in the building trade. In October last a notice was received from the stonemasons demanding an increase of wages and other alterations in the working rules. The committee met the representatives of the masons, with the result that their demand for increased wages was withdrawn, and some slight alterations were made in the working rules. A communication was received from the labourers (with whom no rules exist) requesting an advance of wages, but, having regard to the abundance of unskilled labour, the committee declined to accede to their request. The half-yearly meetings of the National Association of Master Builders at Bradford and London were attended by deputations from this Association, and matters of considerable importance to the trade were discussed. The form of contract had been under the consideration of the Council, and it was believed that the negotiation with the Institute of British Architects would settle the matter on a fair and equitable basis. A petition was presented to the House of Commons, on behalf of the Association, by Mr. P. H. Muntz, M.P., against the Employers' Liability Bill, 1884. A deputation from the Association had waited upon Messrs. Martin and Chamberlain with reference to the conditions of contract of the Birmingham School Board, and obtained some slight concessions. Six new members had joined the Association, and the committee hoped at the end of next year to be able to report a considerable increase in members. The committee also drew attention to the "Builders' Accident Insurance Company, Limited." The company was strictly mutual, and the directors had not only reduced the premiums 43 per cent., but also during the first year returned 20 per cent. rebate by way of bonus to insurers, and 12 per cent. for the second year. During the past year the company had insured 3,600,000l. paid in wages, and had paid only

168l. commission on this amount, which was less than 2½ per cent. on the premium income.

The balance-sheet of the Association showed total receipts for the year 90l. 3s. 11d., added to last year's balance of 657. 18s. 11d., made a total of 1567. 2s. 10d., and the various disbursements, including secretary's salary, amounted to 1221. 5s. 8d., leaving a sum of 337. 17s. 2d. to the credit of the Association.

The Chairman, in proposing the adoption of the report, said that there had been no improvement in the state of trade during the year, though a few large buildings were in progress. Generally speaking, there was stagnation in trade, and many men were out of employment. He complimented the new secretary, Mr. Bigwood, upon the great interest he showed in the work of the Association, and went on to say that the depression in trade had increased competition to such a keen point that the work was taken at very small profits indeed, and contracts often resulted in a loss.

Mr. J. Bowen was elected President for the ensuing year, Mr. A. S. Smith vice-president, Mr. W. J. Whitall treasurer, and Mr. E. J. Bigwood was re-elected secretary.

EDINBURGH

ARCHITECTURAL ASSOCIATION.

THE opening meeting of the current session of the Edinburgh Architectural Association was held on Monday evening last, Mr. David M'Gibbon, president, in the chair.

Mr. T. Fairbairn, the hon. secretary, read the report for the past year. The Council, it is stated, were much gratified in reporting that the past session not only was the most useful in the history of the Association, but also was one that held out abundant promise for its future development. The Council, during the session, felt it their duty to memorialise her Majesty's Government in regard to the present state of the hall in Edinburgh Castle; and attention has been promised on the part of the Government to the subject. The report referred with satisfaction to the work in progress of repairing Craigmillar Castle,—a work which would be of great value, tending to preserve what remained of a building rich in architectural features and historical associations. The Association was again placed under obligation to Professor Baldwin Brown, who had obtained an ordinance from the University Court, to the effect that members of the Edinburgh Architectural Association be permitted to attend the Fine Art Class next session on payment of a very modified fee. The membership of the Association continues to increase. It now numbers 270, which shows an increase of 35 during the year. The report by the treasurer, Mr. John Whitelaw, showed that the balances in bank and in hand amounted to 1057. 1s. 11d. The ordinary income during the year was 1354. and the expenditure amounted to 1011. 6s. The reports by the conveners of the Sketch-book Committee and the Work-class Committee were also regarded as satisfactory. In moving the adoption of these reports, the Chairman very warmly congratulated the members on the growing prosperity and the growing usefulness of the Association. A considerable number of new members were proposed for election. Mr. George Washington Browne was appointed president for the current year; Mr. David M'Gibbon was elected vice-president; Mr. Hippolyte J. Blanc, and Professor G. Baldwin Brown were elected vice-presidents; Mr. T. Fairbairn was re-elected honorary secretary; and Mr. John Whitelaw was re-elected honorary treasurer. The retiring president then delivered an address.

Finchley Main Drainage.

—This scheme, as prepared by Mr. G. W. Brunell, engineer and surveyor to the Finchley Local Board, has been sanctioned by the Local Government Board, and permission has been given to borrow money for the works, the estimated cost of which (including purchase of land for outfall site) is 60,000l. Owing to the peculiar features of the district it is necessary to construct a sewer in tunnel 120 ft. deep from its western side to the outfall site on the eastern side. The works are to be carried out forthwith. At a special meeting on the 30th ult. the Board marked their appreciation of Mr. Brunell's services in the preparation of the scheme by remunerating him with the sum of 175l., and an addition to his salary of 50l. per annum.

HEALTH EXHIBITION AWARDS.

We now give a list of that portion of the awards, in Groups 3, 4, and part of Group 5, which were made for work more or less directly connected with building and building trades; and also an engraving of the Health Exhibition Medal, forwarded to us by Messrs. Walter Barker & Son. The classification is as follows:—

Group 3.—The Dwelling-house.

Class 20, Dwellings, Models, and Designs for the same, and Specimens of Buildings erected in the Grounds. Fittings and Accessories for Dwelling-houses. Completely-fitted Apartments. Class 21, Water Supply and Purification: Motors, Filters, Water-Fittings, Cisterns, &c. Class 22, House Drains, their Construction and Ventilation: Sewer disconnection; Sinks, Traps, Gullies, the Disposal and Utilisation of House Refuse. Class 23, Water and Earth Closets, Ash Closets, Commodes, Urinals, Disinfecting Powders and Fluids, Insect Destroyers. Class 24, Grates, Stoves, Kitchens, Ranges, Boilers, &c., for Domestic Use. Apparatus for Heating and Warming, Smoke Abatement, &c. Class 25, Ventilators, Air Inlets and Outlets, Cubic Space of Rooms, Cows, Air Straining and Clearing. Class 26, Lighting Apparatus; (a) Electrical Apparatus for Illumination and Domestic Use, Secondary Batteries, Electroliers, Accumulators, &c.; (b) Apparatus for Lighting by Gas, Gas Producers, Gas Motors, Gasfittings, Chandeliers, &c.; (c) Oil and other Lamps, Mineral Oil, Wax and other Candles, Vegetable and Animal Oils. Class 27, Fire Prevention Apparatus: Extinguishers, Portable Engines, Domestic Fire Escapes, &c. Class 28, Materials for Sanitary House Construction: Roofs, Walls, Damp Courses, Solid Floors, Damp Proof Wall Coverings, Cements, &c. Class 29, Materials for Sanitary House Decoration, Non-poisonous Paints and Wall Papers, Floor Coverings, Washable Decoration, &c. Class 30, Objects for Internal Decoration and use in the Dwelling. Fittings and Furniture. Class 31, Baths, Bathing requisites, Public and Private Wash-houses, Washing Apparatus, Detergents, Appliances for Personal Cleanliness, &c. Class 32, Publications and Literature, Models, Pictures, Diagrams, &c., relating to Group 3. Class 33, Machinery and Appliances relating to Group 3.

Group 4.—The School.

Class 34, Designs and Models of Improved Buildings for Elementary Schools, Infant Schools, and Crèches. Class 35, Apparatus and Fittings for Warming, Ventilating, and Lighting Schools, School Latrines, Closets, &c. Class 36, Special School Fittings for Storing and Drying Clothing. Class 37, School Kitchens and Arrangements for School Canteens. Methods of Warming Children's Meals, &c. Class 38, Precaution in Schools for Preventing the Spread of Infectious Diseases, School Sanitoria, Infirmarys, &c. Class 39, Special Apparatus for Physical Training in Schools, Gymnasias, Apparatus for Exercise, Drill, &c. Class 40, Literature, Statistics, Diagrams, &c., relating to Group 4.

Group 5.—The Workshop.

Class 41, Designs and Models for Improvements in the Arrangements and Construction of Workshops, especially those in which dangerous or unwholesome processes are conducted. Class 42, Apparatus and Fittings for preventing or minimising the danger to health or life from carrying on certain trades; Guards, Screens, Fans, Air-jets, Preservative Solutions, Washes, &c.

List of Awards in connexion with Building Trades, &c., and Sanitary Work.

N.B.—"G." stands for Gold Medal; "S."—Silver Medal; "B."—Bronze Medal; "S.C.T."—Special Certificate of Thanks; "D.H."—Diploma of Honour.

Table with 3 columns: Class, Name of Exhibitor, Award. Lists various exhibitors and their respective awards across multiple classes.

Table with 3 columns: Class, Name of Exhibitor, Award. Continuation of the award list from the previous table, including exhibitors like Bracknell Pottery, British Patent Paper Co., and various international firms.

The remainder of the awards will be given in our next.

**Gwydyr House.**—Gwydyr House in Whitehall, at present occupied by the Charity Commissioners, and for some years previously by the Local Government Board, is at present undergoing an enlargement by the erection of an additional story, which will contain several new offices. The old roof and the attic floor within it have been removed, and the building will be covered in by a new roof. The enlargement (which will add to the height of the building by about 12 ft.) is being carried out under the superintendence of Mr. Taylor, architect to the Office of Works. Messrs. Mowlem & Co. are the contractors.

COMPETITIONS.

**Stockport Baths.**—The Sanitary Committee held a meeting on the 29th ult., at the Pendlebury Memorial Hall, Stockport, to receive the report of Mr. Alfred M. Fowler, M. Inst. C.E. and architect, of Manchester, to whom the matter of selection was referred. On opening the envelopes containing the names and addresses of the authors of the plans bearing the respective mottoes of the designs selected, the following was found to be the result:—First premium, "Sanitas X.," Mr. J. C. Prestwich, Leigh, near Manchester; second premium, "Freshwater," Mr. G. B. Lewis, London; third premium, "Sink or Swim," Mr. James Hunt, Stockport. Ninety-one designs were received. **Lincoln School of Art.**—In this competition (see *Builder*, pp. 473, 517, ante) we are informed that the second premium of 50l. has, on Mr. Barry's award, been given to Mr. Charles Bell, of New Broad-street, London, and the third premium of 25l. to Mr. Guy, of Lewisham. **Llanally (South Wales).**—At a meeting of the School Board, held on the 14th ult., Mr. E. H. Lingen Barker, of Hereford, was unanimously appointed architect, and his plans for the new school buildings in the Lakefield-road, for 750 children, were accepted. Mr. Lingen Barker's design was placed first in the recent competition by Mr. C. H. M. Mileham, of Essex-street, Strand, the professional assessor appointed by the Board. There were sixteen other competitors, from various parts of England and Wales.

CASE UNDER THE METROPOLITAN BUILDING ACT.

HOT-WATER PIPES.

AT Worship-street Police Court on the 30th ult., Mr. W. Shurmur, of Prospect House, Lower Clapton, the contractor engaged in the erection of the Hackney Union, appeared before Mr. Hannay to answer a summons issued at the instance of Mr. F. R. Meeson, the District Surveyor for East Hackney (North), for an alleged irregularity under the Building Act of 1855 in respect of certain hot-water pipes in connexion with the heating apparatus recently erected at the Union by Messrs. Z. D. Berry & Co., of Albion Works, Regency-street, Westminster, as sub-contractors under the defendant. The District Surveyor by his notice had contended that the said pipes were erected in contravention of the twenty-first section of the Act of 1855 by reason of their being within the prescribed distance of certain combustible materials. Upon the summons being called on, the District Surveyor applied for leave to withdraw. The defendant's solicitor, Mr. D. W. Tough, applied for costs, on the ground that the notice of withdrawal had only been received that morning, and the defendant had engaged several engineers and others to give evidence, the contention of the defendant being that the pipes complained of were constructed upon the low-pressure system, and were, therefore, by the sixteenth section of the Amendment Act, 1882 (45 Vict., cap. 14), exempted from the provisions of the section of the Act of 1855, under which the summons was issued. The Magistrate thought that the District Surveyor should have been certain as to the law upon the subject before issuing the summons, and he ordered the payment of two guineas costs to the defendant.

LIGHT AND AIR.

COOPER v. FOSTER, PORTER, AND CO.

THIS important case, occupying nearly six days, before Vice-Chancellor Bacon, was decided on the 31st ult. The counsel for the plaintiff were Mr. Martin, O.C., and Mr. Powell; for the defendants, Mr. Henning, Q.C., Mr. Finlay, Q.C., and Mr. W. B. Heath. The application was for a mandatory injunction to compel the pulling down of the raised partition, about 11 ft., which had been added to a wall about 33 ft. high in Philip-lane, which is of narrow width. There was also a cross-action, Foster, Porter, & Co. against Cooper. The surveyors on the plaintiff's side were Messrs. Walter Greaves, J. P. Smith, Edmund Woodthorpe, Baker & Wilkinson, Christopher & White; for the defendants, Messrs. Gruning, Shingle (of Messrs. Farebrother, Ellis, & Co.), Chaffell Clarke, and Banister Fletcher. The Vice-Chancellor dismissed the second action with costs, and refused to grant the mandatory injunction. **Catford Bridge.**—A stained-glass window from the studio of Messrs. Warrington & Co., Fitzroy-square, London, has recently been placed in Trinity Church. The subject represented is the parable of the Good Samaritan.

WESTMINSTER HALL AND THE TOWER OF LONDON.

SIR,—The Institute fully appreciated the compliment paid to it by H.M. First Commissioner of Works in attending and addressing the opening meeting, and listened with interest to his remarks upon the recent Government competition.

If politeness prevented any open expressions of dissent from his announcements as to the restoration of ancient buildings at Westminster Hall and the Tower of London, it must not be assumed that assent was given to them by the whole meeting. Many of us think that restoration for its own sake is a fatal mistake.

The erection of any building is justified by its intended use; its preservation by our respect for its history and beauty.

Even without having seen the drawings, one may safely assert that the original uses of the destroyed buildings were different from the uses for which they are now required, and that to invent uses for them is merely to play at architecture.

No doubt, the ancient features of Westminster Hall should be protected from further decay and, as far as possible, be preserved for our study and admiration; but, if the Government have made up their minds clearly as to what kind of accommodation is now required, let them, in the name of common sense, erect buildings obviously suited to those uses, and as modern as possible in style, so long as they harmonise as well with the remaining old work as,—let us say,—the prebendal buildings of the sixteenth century harmonise with a cathedral of half a dozen earlier styles.

If it be asked what is modern architecture, it may be answered that it is that style which is left free to express itself honestly and beautifully without being hampered by the mere imitation of any past styles.

EDWARD J. TARVER, Lecturer on the History of Architecture at the Architectural Association.

PAYING FOR THE PRIVILEGE OF ESTIMATING.

SIR,—Last week the Isle of Thanet Gas Company advertised in a local paper for tenders for building a new retort-house, &c., at Margate,—plans, &c., to be seen at the engineer's office at Stepney, E.

On calling there I was informed that the charge to look at the plans was one guinea; for a copy of the specification, half a guinea; and that if tracings of the plans were required, they would be supplied at a further charge. I requested an interview with the engineer, as I thought these payments must be meant as deposits, as it is manifestly unfair that builders should be expected to pay for inspecting the plans as well as he at the expense of preparing their estimates. I was told by him that it was not a deposit, but a payment, that "nobody wanted us to estimate," and that "the Company would not pay for a hundred outsiders troubling about the plans," &c.

If "a hundred outsiders" do trouble about the job, getting in the tenders must be a very profitable concern for some one, as it would yield from 150l. to 200l. in fees, and I am much surprised if the builders of my native town submit to impositions of this kind, which we, in London, have long known how to treat as it deserves.

Is the term "outsiders" the key to the position? K. G. BATTLEY.

THE PLUMBERS' CONGRESS.

SIR,—With great interest I have perused the report of the above Congress, contained in the *Builder* of the 25th ult.

As the statement of Mr. W. P. Buchan (Glasgow) therein reported will have a tendency, if allowed to pass without comment, to deteriorate to a greater or less extent, in the estimation of the architect to whom he is responsible, every efficient clerk of works, I take the liberty of informing your numerous readers that the average clerk of works of the present day is not altogether the cipher which Mr. Buchan would have people believe.

"When a journeyman, he had often to refuse to answer the questions of clerks of works, when under the master's order he had put on 5 lb. lead piping, instead of 6 lb. lead." Now, sir, to any one unacquainted with the qualifications essentially necessary for the efficient discharge of the duties appertaining to the office of clerk of works, the inevitable inference is that the clerk of works of the present day is altogether incapable of distinguishing the difference between 5 lb. and 6 lb. lead without the aid of the plumber. Let us hope that the clerk of works referred to by Mr. Buchan are an exception, and a very rare exception, to the rule. Every clerk of works who knows his duty is conversant with the tendency plumbers have to put in 5 lb.

lead instead of 6 lb., and 7 lb. in place of 9 lb., &c., and therefore takes the necessary measures at his command in order to satisfy himself, without being under the necessity of interrogating the journeyman plumber or any one else regarding the weight.

ROBERT GIBSON, Clerk of Works.

DISTRICT SURVEYORS' FEES.

STR.—In February, 1883, I professionally superintended the erection of four houses within ten miles of London; the works were completed in August of the same year. The district or local surveyor in October, 1884 (fourteen months after the contract was completed), coolly sends to my client his charges for what he terms "surveying," which amount to 10*l.*, with a request for a cheque to be sent on at once. The usual clause, "The builder to pay all fees legally demandable," was duly inserted in the conditions and signed. I may add that within the last few months the builder has been adjudicated a bankrupt.

Will any of your correspondents kindly inform me if the "surveyor" is acting within his rights in sending in his accounts to the architect's client, and whether he can legally recover his fees so long after the buildings have been completed?

SYDNEY B. GROSVENOR.

\* \* \* Pressure on our space compels us to defer several important letters.

The Student's Column.

ON THE CONSTRUCTION OF ROOFS.

Shed Roofs.—Roofs that are to be covered with slates or tiles require to have a slope or pitch of at least 27°, or a rise of one in two. Where one wall is higher than the other the rafters may be laid across from wall to wall as shown in fig. 2, their ends being notched down

on a timber wall-plate, A, B, laid horizontally on each wall, the rafters being spiked to the wall-plates. This is called a *shed* or *lean-to* roof. If W is the load supposed to act at the centre, C, of the rafters, and we represent it on scale by the vertical line C a; by drawing a b perpendicular to C A we get the transverse strain (on the same scale) at right angles to the beam, and can then find the necessary scantling as in the case of floorjoists. It will be seen from the figure that as we increase the angle of pitch we diminish the amount of the transverse strain, since the length a b decreases; therefore a smaller scantling can be used for a high pitch than for a low one, when the length of the rafter is the same; the length, however, increases with the pitch if the span is the same. Thus when the angle of pitch is 30°, a b is W multiplied by .866; but when the angle is 60°, a b is one-half of W.

Supposing the load per foot of roofing to be 66 lb., then the scantling of the rafters placed the following rules:—When the angle of pitch is 30°, dividing the length (in feet) by the cube-root of three times the breadth (in inches) gives the depth in inches; but when the angle

is 60° the transverse strain is less in the proportion of 4 to 7; and the rule is, divide the length by the cube-root of 5½ times the breadth, and the quotient is the depth in inches.

For example, let the length be 6 ft. and the breadth 2 in., then the cube-root of 3 times the breadth, or 6, is 1.82; and 6 divided by 1.82 is 3½ in., the depth required when the pitch is 30°. If the pitch is 60°, the cube-root of 5½ times the breadth is 2.2, and 6 divided by 2.2 gives 2½ in. for the depth.

Suppose the length to be 10 ft. and the breadth 2½ in., then the cube-root of 3 times 2½ is 1.96, and 10 divided by 1.96 is 5.1 in. for the depth, when the angle is 30°. When the angle is 60°, the cube-root of 5½ times 2½ is 2.35, and 10 divided by 2.35 gives 4¼ in. for the depth.

Let the length be 15 ft. and the breadth 3 in., then the cube-root of 3 times 3 is 2.08, and 15 divided by 2.08 gives 7¼ in. as the depth for 30° pitch. When the angle is 60°, the cube-root of 3 times 5½ is 2½, and 15 divided by 2½ is 6 in., which is the required depth.

When there is a parapet at the feet of the rafters, as shown in fig. 2, a gutter G is formed by fixing light pieces of wood, called *bearers*, across from the rafters to the parapet wall, and nailing planks thereon longitudinally, with a slope of about 1 in 60 towards a *cesspool* at the lower end, which communicates with the rain-water stack-pipe. *Drips*, or steps, are formed in the gutter every 10 ft. length, and the planking is covered with sheet-lead turned up and down at the drips, the lead is laid about 9 in. under the eaves of the slates, and turned up 6 in. against the parapet wall.

The *shed* roof is often used over the aisles of churches and where the span is a moderate one. But when the span exceeds 10 ft. it is advisable, instead of increasing the scantling of the rafters, to support them on stronger rafters, called *principals*, at D E (fig. 3), resting on stone templates hewed in the walls at D and E, and following the same incline, but placed a few inches below them, at intervals of about 10 ft., on which horizontal beams, called *purlins* (shown in section at C), are fixed, about 5 ft. or 6 ft. apart, and the *common rafters* notched and spiked thereto. Each *principal* will in this case have to support ten times the load that one of the common rafters has to carry, and as the load is not uniformly distributed, but placed at one or two points, we must find its scantling by a rule similar to that used for girders in the former articles on "Floors." The rule for the scantling of a principal is,—divide five-thirds of the length in feet by the cube-root of the breadth in inches, when the pitch is 30°; and when the pitch is 60°, dividing one-and-a-half time the length by the cube-root of the breadth gives the depth.

For example, let the length be 15 ft. and the breadth 8 in., the cube-root of which is 2; five-thirds of 15 is 25, which divided by 2 gives 12½ for the depth when the angle is 30°; and when the angle is 60°, one-and-a-half time 15 is 22½, which divided by 2 is 11¼ for the depth. The common rafters in this case need only be 4½ by 2, and 3½ by 2, respectively.

Shed roofs require to have a strong wall to support the feet of the rafters or *eaves*, as the outward thrust will be considerable in a roof of long span, and its amount can be calculated in the following manner:—

The line c b (fig. 2) will represent the thrust down the rafter, and the horizontal line b d the horizontal thrust upon the wall at the foot of the rafter, which in roofs of 30° or 60° pitch will be W multiplied by .433. When the length of the rafter is 6 ft., the horizontal thrust on every foot length of wall will be 17½ lb.; with a length of 10 ft., the thrust will be 286 lb.; and with a length of 15 ft., it will be 428 lb. per foot. When principals are used, as shown by fig. 3, and placed 10 ft. apart, the thrust on the walls will be all concentrated at the points where the feet of the principals rest, and will be ten times as great as the above weights, which shows the necessity of building buttresses at those points.

The *purlins* will have to carry the same load as the principals, but it will be uniformly distributed; consequently the strain upon them will be much less, and will depend on their distance apart and length of bearing. The purlin being fixed at right angles to the rafters (as in fig. 3), the cross strain will vary with the angle of pitch, as in the rafters. The scantling can be found by the following rule:—

Divide the distance apart (in feet) by 3 times the breadth (in inches), when the pitch is 30°, or by 5½ times the breadth when the angle is 60°, the cube-root of the quotient multiplied by the distance apart of the principals (in feet) gives the depth of the purlin in inches. For example, let the distance apart of the purlins be 6 ft., and that of the principals 10 ft.; then, if the breadth is assumed to be 4 in., 6 divided by 3 times 4 is ½, the cube root of which is very nearly ⅞, and this multiplied by 10 gives 8 in. as the depth of the purlin for a pitch of 30°. When the pitch is 60°, we have 6 divided by 5½ times 4, equals ⅔, the cube root of which is nearly ⅞, and this multiplied by 10 gives 6½ in. for the depth of the purlin.

A common form of roof used for covering rows of town houses is that called the M-roof, which is a double shed-roof, as shown by fig. 4.

The upper end, B, of the rafters, A B, are supported on the party-walls, while the lower ends rest at A upon two purlins, which run from front to rear, resting on the front and back walls of the house, and on any intermediate partition; the purlins are placed about 1 ft. apart, and form a gutter to carry off the water. If the purlins are 3 in. thick, and the rafters 10 ft. long, the depth of the purlins can be found by multiplying their length of bearing (in feet) by .884, or by .8 if the breadth is 4 in. The gutter is formed by fixing *bearers* between the bottom edges of the purlins, and laying boards thereon laid to a slope of 1 in 60, with drips every 10 ft. of length; this is called a *trough* gutter, and is lined with lead or zinc in the manner above described.

Ridge Roofs.—The most common form of roof is that in which the rafters are fixed in pairs, as AB, AD, fig. 5, and meet at a ridge, A, in the centre of the roof. In order that the

heads of the rafters may be kept in one straight horizontal line, they are made to abut against a plank at A, which is called the *ridge-piece*, and rises horizontally to the whole length of the roof, the heads of the rafters being spiked thereto, while their feet rest upon *wall-plates*, as before described. The action of the forces in this kind of roof is different from that in the case of the *shed-roof*, where the heads of the rafters rested on a wall-plate. Here we have a horizontal reaction, R, of the two rafters at A, a vertical force, W, at C, and an inclined force, F, at B, which is the thrust on the foot of the rafter. Now as the directions of three forces in equilibrium must meet in one point, these three forces must meet at a, so that a B is the direction of the thrust at B. If a b is taken to represent the load, W, on the rafter acting at C, then Bb will be the horizontal thrust at B to the same scale as ab represents W. The cross strain on the middle of the rafter and its scantling can be found by the rules already given for shed-roofs.

When there is a floor or ceiling at B D, the joints are spiked to the feet of the rafters and counteract all horizontal thrust that they might produce on the walls. Sometimes a horizontal piece of wood, called a *collar*, is fixed across from rafter to rafter as shown by the dotted lines C E, the ends being spiked to the sides of the rafters. The collar serves the double purpose of a tie to the rafters and a joist for fixing a ceiling to, where there are rooms in the roof; in this case the useless angles formed between the feet of the rafters and the floor joists may

cut off by upright pieces, H, called *quarters*, which plastering can be fixed. These rafters also help to stiffen the rafters. The top edges of the roof, where the rafter feet on the walls, are called the *eaves* of the roof, and an *eaves-gutter* of wood or iron is fixed to the feet of the rafters or on brackets driven into the wall, where there is no parapet. When there is a parapet the gutter is formed as previously described for shed-roofs.

When the angle of pitch is 30°, the length will be to the length AB (fig. 5) as 866 to 1, the horizontal thrust is W multiplied by 866; AB is 15 ft., W will be 990 lb., and the horizontal thrust 857 lb. per foot length of wall. It will also represent the tensile strain in the tie. BD, if securely fixed to the feet of the rafters. When the pitch is 60°, the horizontal thrust will be W multiplied by 29; if AB is 5 ft., the horizontal thrust will be 287 lb. per foot of walling.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

441, Improvements in Connecting Door Knobs to Spindles. E. V. Bailey, Birmingham. This improved form of connexion is suitable for most kinds of door-bandles, but particularly the movable knobs of lock spindles and cupboard turn-locks. A knob is fixed at one end of the spindle, at the other end of the spindle the knob is movable, the knob at the end of the spindle is screwed to the back with a screw-thread for taking upon the screwed end of the spindle. The front of this hole is square or angular. For determining the position in which the movable knob can be passed on to the screwed end of the spindle a sliding collar is used, which has a square or angular bush, to match or fit the square or angular hole in the neck of the movable knob. To fix the handle the rose is first secured at the end of the fixed knob and the screwed end of the spindle inserted through the door. On the protruding screwed end of the spindle the sliding collar is passed until it reaches the door. The movable knob is screwed up, and a peculiar pattern of rose-plate screwed on to the spindle to prevent the knob being withdrawn from the spindle.

1,738, Terra cotta, Stanley and Sharratt, Knaeuan.

The improvement is in taking marls or clays of various colours and qualities, either in a raw, pressed or burnt state, and after pulverising or grinding the same to dust submit the dust to the action of fire in kilns or ovens. This burned clay or marl dust is then used for dusting the moulds in which clay goods are prepared, or a liquid of a similar nature is used for coating the clay goods to be treated by the improved process.

512, Improved Open Fire Ranges. John Dean, Oxford.

This invention obviates the dependency of the working of the range upon the manner in which it is set in brickwork. It substitutes a metal casing for the usual brickwork, and the chimney and flue are the same to the range. Thus, the range is complete in itself, and is to a great extent self-acting.

1,558, Preventing Smoke in Open Fireplaces. R. Wright, Richmond, Yorks.

A fine powder is sprinkled on the fire by an improved form of dredger. The powder consists of burned limestone and sea-coal compounded. The layer of lime and sea-coal which the fuel is thus covered causes combustion to take place, without the evolution of smoke, and at the same time effects a great economy of fuel.

1,878, Improvements in Steam-boiler Furnaces. Leopold Bregha, Dresden.

Here the improved furnace consists of an inclined grate, formed in steps, on which the fuel is first charged and heated by the heat from the main body of the furnace before being burned on a second or main grate, placed horizontally at the end of the inclined grate, and in such a position that the fuel falls therein at rest thereon. Between the two grates is situated in an iron frame a door, with access to the horizontal grate in order to replace the grate bars when necessary. These parts are enclosed in front by means of an iron frame, in which are arranged blinds made with adjustable louvers intended to regulate and distribute the air entering the furnace. Above the blinds a door is provided through which the progress of the combustion can be observed. The space above the inclined grate is surrounded by an inclined vault of brickwork forming an inclined passage or chamber for charging the fuel, and for giving, at the same time, a downward course to the air entering the furnace, and this allows the grate to be produced and consumed at the horizontal grate. A box turning on its axis carries the fuel, and it discharges the fuel or contents on the first step of the inclined grate. When brought back to its place the mouth of the furnace is closed by a sliding door. A handle attached to a cross-

bar distributes the burning fuel on the lowest bar of the grate, and clinkers are removed by a rake affixed under the bars of the grate.

APPLICATIONS FOR LETTERS PATENT.

## MEETINGS.

SATURDAY, NOVEMBER 8.

*Association of Municipal and Sanitary Engineers and Surveyors*.—Yorkshire District Meeting at Leeds. (1) Mr. Thomas Hewson, Borough Engineer, Leeds, "On Sewering Towns on the Separate System." (2) Inspection of various works. 10.30 a.m.

MONDAY, NOVEMBER 10.

*Surveyors' Institution*.—Opening Meeting of the Session. Address by the President. 8 p.m.

TUESDAY, NOVEMBER 11.

*Anthropological Institute*.—(1) Mr. Francis Galton, F.R.S., "On the Anthropometric Laboratory at the late Health Exhibition." (2) Mr. H. O. Forbes, F.Z.S., will read some "Ethnological Notes on the People of the Island of Buru." 8 p.m.

*Institution of Civil Engineers*.—First Ordinary Meeting of Session 1884-85. Mr. A. Jamieson "On Electric Lighting for Steamships." 8 p.m.

WEDNESDAY, NOVEMBER 12.

*London and Middlesex Archaeological Society*.—Conversations at Skinner's Hall, Doughty-hill. Notes from the following papers will be read:—(1) "Reminiscences of the Church and Parish of St. John the Baptist upon Walbrook," by Mr. J. D. Mathews. (2) "On the Early Municipal History of London," by Mr. G. Laurence Gomme, F.S.A. (3) "On the Recent Discoveries made on the Line of the Inner Circle Railway and at Bevia Marks," by Mr. John E. Price, F.S.A. 8 p.m.

THURSDAY, NOVEMBER 13.

*Society of Telegraph-Engineers and Electricians*.—(1) Mr. J. Hopkinson, F.R.S., "On the Theory of Alternating Currents." (2) Professor W. Grylls Adams, F.R.S. (President), "On Experiments with Alternate Current Machines." 8 p.m.

*Parkes Museum* (74, Margaret-street, W.).—Mr. G. J. Symons, F.R.S., "On Meteorology and Hygiene." 8 p.m.

## Miscellaneous.

**The Cooper "Coal-Liming" Process in Gae Manufacture.**—At a meeting of the Society of Engineers held on Monday evening last, at the Westminster Town Hall, Mr. Perry F. Nurse, vice-president, in the chair, a paper was read by Professor Wanklyn on "The Cooper Coal-Liming Process." The author commenced by citing a number of analyses of coal, and after entering upon several details he arrived at the conclusion that the coal used in gasworks contained about one per cent. of sulphur. He then went on to state that when gas was made, part of this sulphur entered into the gas. To rid the gas of the sulphur cost 8d. or 10d. in labour and material, and 8d. or 10d. in interest on plant per ton of coal carbonised, and entailed upon the gasworks the creation of one of the worst nuisances in the whole range of manufacturing industry. Cooper's coal-liming process remedied this state of things, and enabled gasworks to produce pure gas without creating a nuisance, and with considerable advantage. The process consists in the addition of about half a hundredweight of quicklime to every ton of coal carbonised. The lime is slaked with its own weight of water, and is mixed with the coal when being charged into the retort. The exact *modus operandi* of the oxide purifier was described, and an indirect result of coal-liming mentioned. When the coal-liming process is in full operation, as at the Tunbridge Wells Gasworks, the oxide purifier is transformed into a dry scrubber, the function of which is to bring about a combination between traces of oxygen and traces of sulphuretted hydrogen existing in the gas on its entrance into the oxide purifier. Coal-liming, Professor Wanklyn stated, was singularly free from drawbacks of any kind. The cost of the lime was more than repaid by the extra ammonia. The coke was increased and improved, and the furnace was not injured.

**Northern Hospital, Winchmore Hill.**—The Managers of the Metropolitan Asylums Board having accepted the tender of Messrs. Wall Bros., of Carlton Works, Kentish Town, for the erection of the New Convalescent Hospital, Winchmore Hill, from plans prepared by Messrs. Pennington & Bridgen, architects, the committee met at the site on Friday, October 31st, when the first sod was turned by Dr. Latham, chairman of the committee for this hospital, preparatory to commencing the building operations.

**Building Improvements in Eastcheap and Tower-street.**—The construction of the Inner Circle Completion Railway, and the widening of Eastcheap and Tower-street is being followed by several architectural improvements in those thoroughfares. Conspicuous amongst the new buildings is that which has just been erected for Sir H. W. Peck, and which is now on the point of completion. The building has a frontage of about 60 ft. in length to Eastcheap, and is upwards of 50 ft. in height, containing four floors. It is faced with Portland stone, and has a carved frieze and cornice. At the corner of Eastcheap and Love-lane there is an angular frontage, which is surmounted by a dome. The circular stone work immediately under the dome is ornamented with pilasters, containing carved festoons and devices. The building has a return frontage in Love-lane. Mr. Alex. Peebles is the architect, and Messrs. Chappell & Co. are the contractors. Its cost will be about 20,000l. The old Ship Tavern, on the north side of Tower-street, a portion of which came within the railway line, is also being rebuilt, and on the same side of the street, between Mincing-lane and Mark-lane, a block of office and warehouse premises has been erected on a portion of the site which was cleared for the making of the railway and the widening of the street. These buildings have a frontage of more than 100 ft. The ground-floor portion of the buildings consists of shops, divided by polished grey granite piers, and the upper portion of the elevation, consisting of three lofty floors surmounted by dormers, is faced with red Mansfield stone. At the Mincing-lane end there is an octagonal tower upwards of 90 ft. in height, whilst at intervals along the frontage the elevation is surmounted by gables. Mr. Edwin Crockett, of Mark-lane, is the architect, Messrs. E. Lawrence & Sons being the contractors, and Mr. Chandler the foreman. The Commissioners of Sewers have decided to purchase the freehold of three houses in Padding-lane for 17,175l., and the freehold of two houses in Botolph-lane for 10,000l.

## Architecture in Relation to Landscape Gardening.

—Mr. G. Richards Julian delivered the fifth of his course of lectures on the above subject at the Crystal Palace School of Art on Wednesday last. In the fourth lecture the birth and development of Renaissance architecture in Italy were dealt with; the astylar form of the early Florentine palaces; the further step of the application of the orders,—one to each story,—as seen especially in Venice; and the final one,—the Palladian,—when the order ran through two or more stories, regardless of internal arrangements, were successively sketched. Mr. Julian commenced the fifth lecture with a description of the characteristics of the French style, the "François Premier." Turning to our own country, the well-known forms and details of the Elizabethan style were described, and the subsequent course of Renaissance architecture among us, was traced. Passing to the subject of the architectural decorations of parks and gardens in connexion with buildings of the Renaissance style, the lecturer proceeded to defend such decorations on artistic grounds. Premising that contrast was, of course, one of the elements of beauty, he called attention to the fact that violent contrasts, in any of the fine arts, produce almost invariably an effect of crudeness. On this ground he approved of the use of terraces and the formal garden as tending to soften the contrast between the necessarily somewhat hard lines and regular arrangement of architectural forms, and the irregular and flowing outlines of the natural objects in the midst of which they are planted.

**New Buildings at Charing-cross.**—A block of buildings is at present in course of erection in Charing-cross, for the Hygienic and Sanitary Engineering Company. Although the frontage is limited to about 18 ft., the building has a height of upwards of 60 ft., and contains five lofty floors. The building is faced with Portland stone. The first floor has an oriel window on each side of which are panels filled in with carved foliage. The second floor has similar projecting windows, flanked with octagonal columns (carried up to the cornice). At the foot of the second floor there is a hold projecting balcony. The third and fourth floors have each three-light mullion windows. Messrs. Ford & Heath, of Aldermanbury, are the architects, and the work is being carried out by the Company's employés.

## Stove at the Health Exhibition.

Messrs. Geo. Wright & Co., of Rotherham and Queen Victoria-street, write to say that we were in error in giving (in our article on this subject in the *Builder* for the 25th ult., p. 533) their names as exhibitors at Stand No. 670, for although in some instances their manufactures were shown by other exhibitors, they had no stand of their own, and were not exhibitors. While on this subject, we may add that Mr. William Stobbs, of 16, Duke-street, Grosvenor-square, exhibited his patent "Smoke-Preventer," as fitted to a hob-register-grate. The invention consists of (a) an inner and loose fire-basket; (b) a hood reaching nearly to the top of the fire and excluding all cold air from the chimney; (c) a swinging diaphragm within the hood. It is applicable to any existing grate or open fire range. The loose fire-basket allows of the provision of a channel for the passage of air under and at the back of the fire, thus creating a strong draught. It is claimed on behalf of this arrangement that the hot air and the increased draught ensure nearly perfect combustion of the fuel, so that very little smoke is formed. The smoke and products of combustion from the fire pass through and over the back of the loose fire-basket and within the hood, and, mixing with the hot air whilst at a high temperature, are oxidised. There is no doubt that, to give due and early effect to the important movement for the abatement of smoke, means must be found of readily adapting existing grates and fireplaces so as to secure more perfect combustion than at present obtains in the generality of them, and Mr. Stobbs claims that by means of his adaptation the formation of smoke, even in the combustion of the most smoky "Walsend," is to a very material extent prevented, while it is asserted that by the use of this invention a pleasant and agreeable fire may be had by burning coke, Welsh steam, or anthracite smokeless fuels.

**The Sunderland Misery.**—The distress in Sunderland is lamentable, and needs much more than the off-hand subscription of a 5l. note by true friends of the poor. It is real and widespread, and must be relieved. But it will be a further misfortune if some light is not thrown on its cause. Sunderland up to a very recent period was one of the most thriving and prosperous towns in England. The disastrous inflation of the steamship-building business, which has brought such bad times to sailors and shipowners, brought high wages and plenty of work to Sunderland workmen. Yet, on the very morrow of a reverse, the well-to-do and prosperous workmen appear before the country in *formâ pauperis*, without savings, and even without food. It is really time that this oft-repeated phenomenon should be thoroughly investigated and explained. We commend the subject to the Lord Mayor's attention. If he will deal faithfully with it, he will not only do good to the men of Sunderland, but to the country at large. These violent oscillations of the social pendulum are truly discreditable, not only to workmen, but to those who give a false impetus to industry, only eventually to leave all affected impoverished or ruined. The blame ought to be fairly distributed. Drink and improvidence will need to be fearlessly and faithfully exposed, if they are the real or chief factors in this Sunderland misery. But commercial gambling and mad haste to be rich ought not to escape. It will be well for the country when it wakes from the dreams of political excitement and learns the value of steady work, thrift, temperance, and commercial sobriety and integrity. Statesmen are not without their very special responsibilities for these crises of misfortune.—*Lancet*.

**Obituary.**—The deaths of two well-known West Country builders are announced this week. Mr. N. Kent Verren, of Plymouth, died on the 30th ult., aged 62, at his residence, 5, Kirky-place, in that town; and on the 2nd inst., at Southlands, Exmouth, Mr. James Stephens (late senior member of the firm of Stephens & Son, builders, Exeter), passed away at the age of 75. He was brother to the late Mr. E. B. Stephens, A.R.A., who was a native of Exeter.

**The City of London Court.**—The Corporation have resolved to rebuild the City of London Court, Guildhall-yard, in consequence of the existing court being no longer adequate for the legal business transacted there. The present structure is to be taken down, and the new building erected on the same site.

**Buildings for the Industrial Classes at the East End.**—The Metropolitan Railway Company are about to become the owners of an extensive block of dwellings for the industrial classes. For this purpose they are utilising their surplus land on the east side of the Minorities, near Aldgate. The site has a frontage of 240 ft. in length to the Minorities, with an average depth of about 70 ft. On this land they are about to erect buildings which will have accommodation for a population of upwards of 1,000 persons. Mr. Walter Graves is the architect, and Messrs. Chappell are the contractors for the buildings, which will cost 43,000l. A short distance eastward, in Cartwright-street, Royal Mint-street, the East End Dwellings Company are erecting a similar but smaller block of buildings on a site covering an area of 32,000 ft., which was some time ago purchased from the Metropolitan Board of Works for 4,600l. The buildings will have a frontage to Cartwright-street 370 ft. in length. Messrs. Davis & Emmanuel, of Finsbury-circus, are the architects, and Mr. S. J. Jerrard is the contractor. The estimated cost of the buildings is 13,700l. Another block of buildings for workmen is about to be erected in Stoke Newington. They are designated Gibson's Buildings. Messrs. Davis & Emmanuel are the architects, and Mr. J. Grover the contractor, the contract being 10,843l. The Commissioners of Sewers are erecting five blocks of industrial buildings in Petticoat-square, which are fast approaching completion, one of the blocks being nearly ready for occupation. Mr. W. Haywood, Engineer to the Commission, is the architect, and Mr. Mark Gentry, of the Langthorn Works, Stratford, is the contractor. The cost of the buildings will be about 64,000l. It will thus be seen that in the erection of these several blocks of dwellings for the working-classes in the east and north-east of the metropolis upwards of 130,000l. are being expended.

**A Penny Water Cleaner.**—Take a flower-pot and a brick. You can get three flower-pots for 1d., also three bricks for 1d. However, let us say a flower-pot and a brick for 1d. Break the bottom out of the flower-pot in such a way as to leave edge enough to hold up half a brickbat. Let one corner of the half brickbat stand out through the bottom hole. Break up the rest of the brick into bits about as big as a quarter of a walnut. Throw them into the pot. Soak the whole over night in a pail of water, and let it drain. Let the water you want to clean drop upon the middle of the chips of brick. After a few hours the water which drops from the bottom will be wholesome and fair water. Most filters pretend to purify water mechanically. They clarify rather than purify. Others depend upon some curious property of the medium, like animal charcoal. Such cunning matters have to be frequently renewed. The purifier I suggest combines a rather coarse filtration with an effective aeration and something of a specific chemical action as well. But its beauty is its cheapness. Only one penny, and as good as any other.—Fredk. Guthrie, in *Gardening Illustrated*.

**New Corporation Offices, Dublin.**—The new municipal offices, which are being fitted up in the building formerly known as La Tonche's Bank, on Cork Hill, are being brought to completion by the contractor, Mr. J. J. Leggett. When finished, several of the new offices will greatly facilitate the duties of the most important departments of the Corporation, the accommodation provided for them in the City-hall having been for some years past found very inadequate. The offices proposed to be removed to the new buildings are those of the Public Health Department, Finance and Leases Committee, City Treasurer and Accountants' and the City Architect and Building Surveyor's offices. The additional space gained in the City-hall by the transference of these offices will be utilised by increasing the accommodation for other municipal departments, the space at the disposal of which is at present much restricted.

**Builders' Benevolent Institution.**—The thirty-seventh anniversary dinner of this Institution took place on Thursday evening last at the Freemasons' Tavern, Mr. Stanley G. Bird, President, in the chair, supported by Mr. Ewan Christian (President of the Royal Institute of British Architects), Mr. George Plucknett, J.P., and other friends of the Institution. Subscriptions and donations to the amount of 665l. 14s. were announced during the evening. A report of the proceedings will appear in our next.

**School of Art Wood-Carving.**—We are requested to state that the School of Art Wood-Carving at the Royal Albert Hall, Kensington, in connexion with the City and Guilds of London Institute for the Advancement of Technical Education, has been re-opened for the winter session with improved accommodation for pupils. Full particulars of the classes and the lessons by correspondence, also as to work executed in the school, can be had from the manager. We may add that the school has been awarded a silver medal in the Educational Section of the International Health Exhibition, and the following students have also obtained honours:—Miss M. E. Reeks, Silver Medal; Miss H. E. Walsh, Bronze Medal; Mr. D. Chisholm, Bronze Medal. The school also gained the highest award for wood-carving, a silver medal, at the Art Exhibition held in September last at Eastbourne. The main purpose of the school is to teach the art of wood-carving to students of the industrial class who cannot afford to pay for

instruction, and although the school is to some extent aided by grants from the City and Guilds Institute and fees received from more wealthy pupils, its financial resources are not commensurate with the work which it has undertaken.

**Temple Chambers.**—Amongst other new buildings which are about to be erected on the vacant land facing the Thames Embankment, belonging to the Corporation, is an extensive block of offices and residential apartments, designated Temple Chambers. The site of the intended buildings is at the west end of the vacant land, immediately adjoining the eastern block of buildings within the Temple grounds, overlooking the Gardens. The site stretches southwards from Tudor-street to the Embankment, and the buildings, when completed, will have a frontage of about 400 ft. to one of the new streets which intersect the ground, having also a handsome frontage to the Embankment. Mr. J. Whichoord, of Palace-chambers, Westminster, is the architect.

CONTRACTS AND PUBLIC APPOINTMENTS.

TENDERS.

For alterations and additions to the London Rowing Club-house, Putney. Mr. George A. Dunnage, architect, No. 5, John-street, Adelphi. Quantities by Mr. C. L. Cadney, 57, Moorgate-street:—

Thos. Knight & Sons	2,364 0 0
Chamberlain Bros	1,988 0 0
Langdale & Hallett	1,923 0 0
W. H. Smith	1,900 0 0
J. & P. Hermon	1,792 0 0
Robert Adams & Co.	1,767 0 0
T. H. Atkinson & Sons, Putney	1,730 0 0

\* Accepted subject to certain reductions to be arranged.

For the erection of a residence in the Arkwright-road, Hampstead, for Mr. H. Gosschalk. Mr. R. A. Briggs, architect:—

Barrett	2,530 0 0
Conder	4,844 0 0
Whitely	4,813 0 0
Boyce	4,373 0 0
Poster & Birkme	4,256 0 0
Kirk & Randall	4,028 0 0
Kilby & Gayford	4,010 0 0

For alterations and repairs at the Northumberland Arms, Brompton-road, for Mr. C. Fren. Mr. H. W. Budd, architect, 76, Vincent-square:—

Fish, Prestige, & Co.	2,588 0 0
A. Simpson & Co.	2,512 0 0
Hoare & Son	523 0 0
Penaberton	514 0 0
Lambie (accepted)	487 0 0

New Counters, Petering, &c.

Warne	2,349 0 0
Helling	232 15 0
Sanders & Sons (accepted)	215 2 0

For alterations at 396 and 398, York-road, Camden Town, for Mr. J. Collingwood. Mr. G. McDonell, architect, 2, Arundel-square, N.:—

Austin	2,539 0 0
Osborn	425 0 0
Goodman	417 0 0
Chant (accepted)	391 0 0

For the erection of new schools, on Windmill-hill, Bristol, for the Bristol School Board, on alternative plans:—

A.		B.	
Eastbrook & Sons	28,123	28,304	
T. N. Lewis	8,075	8,350

Heath	459 0 0

For erecting detached villa, at Manor-road, Stoke Newington. Messrs. Bray, Webb, & Co., architects:—

Harris (accepted)	2,430 0 0
-------------------	-----------

For the erection of superintendent's new house, lodge, and other works at the Western Hospital, for the Managers of the Metropolitan Asylums District. Messrs. A. & C. Harston, architects, 15, Leadenhall-street, E.C.

Table listing quantities supplied for the Western Hospital project, including items like W. Hammond, Hill Bros, Good & Brand, etc., with prices.

\* Accepted.

For sewerage works at Barking, for the Local Board:-

Table listing quantities supplied for sewerage works at Barking, including items like Argent, Cornish, Jackson, etc., with prices.

For a dwelling-house, at Beckenham, for Mr. R. R. Gibbs, Mr. Geo. Wymouth, architect:-

Table listing quantities supplied for a dwelling-house at Beckenham, including items like Richardson Bros, Henry Brown, etc., with prices.

For new tower at the Church of Chesham Bois, Bucks. Mr. Geo. Wymouth, architect:-

Table listing quantities supplied for a new tower at Chesham Bois, including items like Taylor & Gray, with prices.

For foundations for assembly-rooms and offices for the New and Latter House of Israel, Gillingham, Kent. Messrs. William Margetts, Son, & Co., architects. Quantities by the architects:-

Table listing quantities supplied for foundations for assembly-rooms and offices, including items like E. B. Brass, Geo. Shaw, etc., with prices.

For building the superstructure of the Jones Memorial Block, at the Royal National Hospital for Consumption, Ventnor, Isle of Wight. Mr. T. Hellyer, architect, Hyde, Isle of Wight. Quantities supplied by Mr. H. P. Foster, No. 5, John-street, Adelphi:-

Table listing quantities supplied for the Jones Memorial Block, including items like Ingram & Sons, with prices.

For the erection of small bazaar, for Messrs. Pierry & Hatching, Bournemouth. Messrs. Kemp, Welch, & Pinder, architects:-

Table listing quantities supplied for a small bazaar, including items like W. Stanley, J. Huxtable, etc., with prices.

[Architects' estimate, 1,435 17s. 4d.]

For pulling down and rebuilding 20 and 21, Little Windmill-street. Mr. D. C. Nicholls, architect. Quantities by Mr. H. P. Foster:-

Table listing quantities supplied for pulling down and rebuilding, including items like Green & Sons, Bangs, etc., with prices.

Accepted for alterations and additions to Nos. 3 and 4, Brunswick-street, Hackney, for Mr. Freeman. Mr. H. F. Simmonds, architect, Cambridge-heath:-

Table listing quantities supplied for alterations and additions to Nos. 3 and 4, Brunswick-street, including items like G. G. Hardy, Bentley, etc., with prices.

Accepted for alterations and repairs to Broke House, Ford's road, Old Ford, for Mr. Macklin. Mr. H. F. Simmonds, architect:-

Table listing quantities supplied for alterations and repairs to Broke House, including items like Bentley, Walthamstow, etc., with prices.

Accepted for alterations and additions to No. 166, Green-street, Bethnal Green, for Mr. R. Preston. Mr. H. F. Simmonds, architect:-

Table listing quantities supplied for alterations and additions to No. 166, Green-street, including items like Delaforce, Bethnal-green, etc., with prices.

For constructing new road sewers, &c., on the Wimbledon Estate, for the Directors of the Birckbeck Freehold Land Society. Mr. Sydney B. Grosvenor, surveyor, 23, Southampton-buildings:-

Table listing quantities supplied for constructing new road sewers, including items like P. Pound, with prices.

For engineer's work in constructing and heating picture gallery, at Fonthill, Wilt., for Mr. Alfred Morrison. Messrs. Gordon & Lowther, architects:-

Table listing quantities supplied for engineer's work in constructing and heating picture gallery, including items like Marshall & Hatch, with prices.

For iron stable fittings at above:-

Table listing quantities supplied for iron stable fittings, including items like Marshall & Hatch, with prices.

For the erection of business premises in Brompton-street, Southwark, for Messrs. F. M. Hudson & Sons. Mr. William Eves, architect, 10, Union-court, Old Broad-street:-

Table listing quantities supplied for business premises in Brompton-street, including items like Boyce, Downs, etc., with prices.

Special Notice.—In the list of tenders for this job printed last week, it should have been stated that the only reason of Mr. Holland's (which was the lowest) not being accepted, was because Mr. Craske offered to complete in ten days' less time.

Special Notice.—Lists of tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, Strand, W.C., not later than four p.m. on Thursdays.

PUBLISHER'S NOTICES.

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under, 4s. 6d. Each additional line (about ten words) 1s. 6d.

FOUR Lines (about THIRTY words) or under 2s. 6d. Each additional line (about ten words) 0s. 6d. PAYMENT IS ABSOLUTELY NECESSARY.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY noonday.

PERSONS Advertising in "The Builder" may have Copies addressed to the Office, 46, Catherine-street, Covent-garden, W.C. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum.

Remittances payable to DOUGLAS FOURDBINER, Publisher, No. 46, Catherine-street, W.C.

TO CORRESPONDENTS.

B. & Son.—T. H. C. (it is probable that some of them may be republished, but it rests partly with the separate authors).

All statements of facts lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.

Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED. We cannot undertake to return rejected communications.

Advertisements and other exclusively business matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

Best Bath Stone. WESTWOOD GROUND, Box Ground, Comba Down, Corsbam Down, And Farleigh Down. RANDELL, SAUNDERS, & CO., Limited, Corsbam, Wilts. [Advr.]

Box Ground Stone Is the Best for Use in all Exposed Positions, being a well-known and tried Weather Stone. 50,000 feet cube in stock. PICTOR & SONS, BOX, WILTS. [Advr.]

Douling Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Douling Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [Advr.]

Douling Free Stone For prices, &c., address S. & J. STAPLE, HAM HILL STONE, Quarry Owners, Stone and Lime Merchants, Stoke-under-Ham, (Ground or Lump), Ilminster. [Advr.]

Asphalts.—The Seyssel and Metallo Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway yards, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. [Advr.]

Asphalts. Seyssel, Patent Metallo Lava, and White Asphalts. M. STODART & CO. Office: No. 90 Cannon-street, E.C. [Advr.]

J. L. BACON & CO., MANUFACTURERS OF IMPROVED STEAM AND HOT-WATER APPARATUS, FOR WARMING AND VENTILATING Private Houses, Churches, Schools, Hospitals, Manufactories, Greenhouses, &c. OFFICES AND SHOW-ROOMS:—No. 34, UPPER GLOUCESTER PLACE, DORSET SQUARE, LONDON, N.W. And at DUBLIN, BELFAST, GLASGOW, and NEWCASTLE. Illustrated Pamphlet on "Heating" post free.

The SILVER MEDAL of the HEALTH EXHIBITION HAS BEEN AWARDED TO CHAPPUIS' PATENTS FOR REFLECTING LIGHT. DAYLIGHT REFLECTORS OF EVERY DESCRIPTION, ARTIFICIAL LIGHT REFLECTORS. WHY BURN GAS?—CHAPPUIS' REFLECTORS DIFFUSE DAYLIGHT.—They are exclusively adopted by and fitted at Buckingham Palace, all H.M. Government Offices, Houses of Parliament, H.M. First Commissioner of Works, the Metropolitan Board of Works, British Museum, South Kensington Museum, Royal Institution, Guildhall Museum, on board H.M. Ships, also Railway Companies' Offices, Hospitals, Institutions, Banks, Insurance Offices, Manufactories, Private Houses and generally from Noblemen's Mansions to Artisans' Workshops. 30,000 in use in London alone. Patronised by leading Architects, Engineers, Contractors, &c., &c. N.B.—For Prospectuses and Diagrams, address Stamped Envelope to P. E. CHAPPUIS, Patentee and Manufacturer, 69, FLEET-STREET, LONDON.

### Recent Criticisms on the Olympian Discoveries.

It is not surprising that in the collection of essays forming the birthday volume\* offered to Prof. Curtius on his seventieth birthday there should be found no less than five,—and these, perhaps, the most important and interesting,—which relate to the Olympian excavations. Other matters are not neglected. We have in our article on the topography of the bay of Salamis, on the history of Attic finance, on the recently excavated Temple of Vesta, on Etruscan ash chests, and many more which we cannot even enumerate. The volume was, indeed, intended to be as widely representative as possible of all the branches of classical learning,—a tribute and testimony to the wide sympathies of the veteran scholar and archaeologist. But it was impossible to forget that to all archaeological Europe the name of Curtius suggests Olympia, that these Olympian excavations had been to Prof. Curtius the inspiration of his early youth, the hope deferred of his middle life, and the crown and glory of his old age. He was only twenty-three when he first went to Athens, when he travelled through the Peloponnese in company with Otfried Müller, the father of modern scientific archaeology; from the time when he first trod the plain of Olympia in the hope,—nay almost the determination,—to unearth her treasures. But the waiting was long and weary. In 1844 he had the good fortune to be appointed tutor to the Crown Prince, a connexion invaluable for the fortunes of archaeology. In 1852 he made his memorable oration in the Berlin "Sing-Akademie," and pleaded with passionate fervour the cause of Olympia. His enthusiasm was contagious, the Emperor and the Crown Prince caught fire, and for a while it seemed that his hope was near fulfilment. But, alas! the war intervened, and the prospect seemed further than ever. Archaeologists, whatever their political convictions, have to be thankful for the issue of that war. Once peace established, the German Government, enriched and elate, lost no more time in undertaking a work that was sure to redound to the national glory. In 1874 Professor Curtius went as delegate to Athens. A convention was arranged, and at last, in 1875, on his birthday, September 2nd, he left Berlin for

Olympia as director of the excavations. This is now just nine years ago; since then Prussia has enriched her national museum by the great find of the Pergamene marbles; and by the sensational splendour of these far more valuable discoveries at Olympia are east, for the popular mind, just a little in the shade. But the work of reconstructing and elucidating the Olympian remains goes steadily on, and some valuable results of this steady continuous labour are embodied in the five papers which fitly form part of the memorial volume before us. Interest in such elucidations has never failed among professional archaeologists, but now that casts of the principal sculptures are to be seen at the South Kensington Museum this professional interest is sure to develop into a wider popularity.

As a specimen of new opinion ingeniously supported, we may select the paper by Dr. Gurlitt, on "Pæonios and the East Pediment of the Zeus Temple," as a welcome contribution to the literature of a most puzzling question.

The puzzle is this. Every one knew before a sod was turned at Olympia that we might expect to find there the work of a certain artist, Pæonios of Mende. This Pæonios, literary tradition said, executed the pediment which contained sculptures representing the contest of Pelops and Oinomaos. Further, we knew that Pæonios was, roughly speaking, a contemporary of Pheidias, and as he was intrusted with the execution of work so conspicuous and all-important we naturally concluded that he was a very illustrious contemporary. Bit by bit, the sculptures by the hand of Pæonios were unearthed, and in eager expectation the archaeologists of Europe rushed to see them. Then came, at first bitter disappointment, later complete bewilderment. Instead of sculptures of ideal beauty, great in conception, noble in execution, we have—well, what every one may now see for himself in the South Kensington Museum,—sculptures profoundly interesting, but to the untrained eye scarcely beautiful at all. Lamentation was followed by criticism and by attempted explanation. The best judges agreed happily on one point; the sculptures of both pediments and of the surviving metopes left on every highly-trained eye one impression,—that of confusion, bewilderment; of a style, that is, perhaps, best characterised as style-less; there was nothing about the sculptures of the high commanding manner of a great master. There was a good deal of liveliness, abundant realism, a certain aptitude for filling space, but nothing that amounted to style. Ingenious conjectures were hazarded to account for work so unsatisfactory,—so, as it seemed, inadequate,—coming, as we were bound to suppose it did, from the hands of masters like Pæonios and (for the

west pediment) Alkamenes. One critic suggested that the work had been designed indeed by the great men, but carried out inefficiently by local workmen; another has invented for us a whole school of "Northern Greece" artists dominated by pictorial influence. Dr. Gurlitt rightly points out that the unsatisfactory character of the Olympian sculptures is due not merely to defective execution,—that rather the designs sin through want of largeness and fineness of conception,—that there are certain inherent defects in the treatment of the human body and in the schemes of drapery, that undoubtedly point to a certain poverty in the original model. With Professor Brunn's theory of the Northern Greece school and its pictorial tendencies Dr. Gurlitt has no quarrel; in fact, his own view is, in some respects, a further development of this very theory. He confines his discussion to the question of the style of Pæonios and his relation to the east pediment. Now about the style of Pæonios the excavations have added a very important piece of circumstantial evidence, the existence of which was unknown from literary testimony,—we mean the famous statue of Nike with the inscribed basis. This Nike has served to complicate the Pæonios question. Its style, superficially considered, is markedly superior to that of the east pediment; is it possible that the Nike and the pediment can have sprung from one and the same brain? The inscription compels us to acknowledge the Nike as the work of Pæonios; must we reject the pediment? Dr. Gurlitt thinks not; and first he turns to the inscription on the basis. This tells us that "the Messenians and Naupaktians dedicated the statue to the Olympian Zeus as a tenth of the spoil from their enemies, that Pæonios of Mende made it, the same who conquered in making the akroteria on the temple (*ἄκροτέρια ἐν τῷ ναῷ*). It has been thought by many that the "akroteria on the temple" might mean the pediment sculptures. This idea is now given up, and the akroteria are understood much more naturally to mean not the space contained within the pediment triangle, but the angles of that pediment, and hence the ornaments which adorned those angles. Pæonios then, according to the inscription, made the ornaments which adorned the pediment angles, the apex, and the two angles at the base. Why, we naturally ask, does the inscription call attention to this fact? And why, if it must mention other works of Pæonios and those connected with the temple of Zeus, does it make no mention of the fact that the pediment sculptures in the east end of the temple,—sculptures at least as important as the akroteria,—were by this same master Pæonios? The reason is obvious enough if we

\* Historische und Philologische Aufsätze Ernst Curtius zu seinem siebenzigsten Geburtstag gewidmet. Berlin: Asher & Co. 1881.

consider the nature of these akroteria; the centre one will suffice. On the apex of the Zeus temple floated a bronze-gilt Nike. The conclusion seems irresistible that the Nike, with the basis,—the sculptural Nike made for the Naupaktians,—was a replica, a second rendering of the original Nike made by Pæonios to decorate the temple. The reason of the mention of the akroteria is obvious. Pæonios did not wish to be regarded as the copyist of another's work when he was, in fact, merely a translator of his own.

Granting this (which few will be prepared to deny), Dr. Gurlitt goes on to say, here we have a remarkable juxtaposition; we possess two out of the three recorded works of the master Pæonios, and one of them is a translation into purely plastic form of what was originally a decorative design. Surely we have enough actual monumental evidence before us by which to judge of the sculptor's style, without troubling ourselves unduly with questions as to whether he worked under the influence of Pheidias or not. Further, have we not in this translation of the decorative into the purely plastic Nike a significant clue to the chief characteristic of Pæonios? This characteristic Dr. Gurlitt believes to be externalism; purely decorative, as opposed to imaginative excellence. No one denies the Nike is pictorial in conception. The conception of the floating goddess in swift motion is about as unpictorial as any conception could be. We have Nikes enough in the Athenian halustrade, but not one is thus daringly suspended, dependent for her support on that very atmosphere which is the essential of pictorial design, and which is for sculpture non-existent. But we might say this Nike is pictorial because she is a mere replica of the akroterian Nike, which necessarily, as a mere decorative adjunct, has a certain pictorial externalism. Dr. Gurlitt concedes this, but he goes on to point out how this decorative externalism is the key-note, not only of the Nike, but of the other work of Pæonios, the east pediment of the Zeus Temple. It is this decorative externalism which distinguishes it alike from the ruder Ægina pediments which preceded as from the finished excellence of the Parthenon. To Pheidias only was it given to combine a perfect decorative fitness with an absolutely plastic idealism. Pæonios was but a bold successful craftsman, probably self-taught, belonging to no particular school, who had seen great works and succeeded in catching something of the outward semblance of things, but who never penetrated beyond appearances, who never mastered that inwardness, that monumental security which was the characteristic of both Attic and Arqui schools, otherwise so widely apart.

Dr. Gurlitt supports this interesting, and, we think, substantially true theory by a careful analysis of the pediment figures one by one, and a comparison of them with the Nike; he also makes the suggestive remark that as the east pediment is to the Nike, so may the Parthenon pediments be to the unknown term,—the great masterpieces in the round by Pheidias. But upon this matter we cannot dwell. We must turn from this original expression of new opinion to a paper by Dr. Furtwaengler, which contains more valuable material still,—the statement of new fact. Dr. Furtwaengler is the one of all Dr. Curtius's able disciples on whom the mantle of his inspiration seems to have fallen, and we are glad that he has drawn the lot of a brilliant and interesting discovery. Every one who has examined the Olympian find of archaic bronzes will remember a fragment of the thinnest possible metal which contains part of a design evidently mythological. The fragment is, from the point of view of the history of art, of the highest importance, but perhaps its special fascination was the difficulty of interpreting it in its mutilated condition. A nude male figure, beardless, stands to the left; a portion of a draped figure, sex quite uncertain, advances with extended arms and seems to be handing some object; between are visible the bent knees of a prostrate figure. The explanation current among archaeologists was that the scene represented Ariadne coming to greet and

crowns Theseus; between them the dead body of the prostrate Minotaur. There is absolutely nothing in the Olympian fragment to make this interpretation unfeasible, but it failed to satisfy some instinct of Dr. Furtwaengler's mind. Fortunately he openly expressed his dissent, and suggested another interpretation. The draped figure might be the aged Priam, the youth Achilles, between them the dead body of Hector. Prohaphly Dr. Furtwaengler had little hope that his conjecture would ever be substantiated. Business took him to Rome to attend the great Castellani sale. There turning over some neglected objects heaped together, forgotten, in a drawer, he came by chance on an ancient Greek mirror, formed in a somewhat unusual way; a small square plate forming the handle and the circular disk. A glance showed him that on this small square was a replica of the Olympian bronze. The missing half was there, and the missing half showed that the design was beyond a doubt not the triumph of Theseus, but the ransom of Hector. The full figure of old Priam came into view leaning on his staff, the rest of the prostrate figure was the human shape of Hector with the bull-headed Minotaur, and to complete the design appeared the god Hermes with his herald staff, who, to do honour to King Priam, guided him through the Grecian tents. No demonstration could be more complete, no certainty more delightful to the fortunate discoverer.

The discovery is interesting as interpreting securely a very ancient bronze, and as such it will perhaps be most widely appreciated; it would perhaps be out of place here to enlarge on the delight that it will give to the specialist in "Vase Types." To have established the earliest type of the "Ἐκτροπὴ λίτρα" is not to have lived in vain, and none knows that better than the discoverer himself, who has made such rich contributions to the history of black-figured vase paintings.

Dr. Furtwaengler made the discovery in the spring, but he wisely kept it *in petto* as a fitting tribute for the autumn festival of his master.

#### WORKMEN'S HOMES AND THEIR ADJUNCTS.

The third part of M. Cacheux's voluminous treatise\* discusses the material and moral welfare of the labouring classes, and opens with pointing out that in every civilised nation there are periodical financial crises which seriously affect the condition of those classes. M. Cacheux believes that if the State would give greater publicity to the commercial information which it possesses, those crises might be prevented; but that is very doubtful,—in this country at all events. However that may be, he is of opinion that a remedy may be supplied by a private Society undertaking such functions as were exercised by certain good men who, in 1848, formed themselves into a central committee for the encouragement of industries in the mountainous tracts in Bohemia. In France, though several similar societies already exist, there is yet much more to be accomplished, especially in the direction of agriculture, which is an industry of great moment. It is well known that France imports very largely foreign produce, and that it must continue to do so unless it can continue to raise the raw material from its own soil. For a long time beetroot and the vine have contributed to the prosperity of many of her departments, but now both those industries are languishing, and it behoves her to seek for fresh productions and to stem the tendency to emigration from the country to the towns. M. Cacheux advocates an extended system of canalisation as one description of useful work which might find ample employment for the workmen who have been thrown out by the stagnation of trade, and instances particularly

a project for relieving the Seine from those inundations which have of late years been so disastrous. The estimated cost of that canal is eight millions sterling, all of which has been subscribed, but the necessary authority has not yet been given for its commencement.

With reference to the amelioration of the condition of the labouring classes, there are two ways by which it may be effected, either by raising their wages or else by supplying them with the necessaries of life at reduced prices. M. Cacheux truly observes that a rise in wages as has, indeed, been proved in our own case is attended with questionable benefit. In France it seems to have operated undoubtedly for evil,—for it has so tended to increase the price of production as to oblige contractors to resort to foreign countries in which the articles they require are produced more cheaply, and consequently the demand for home labour has proportionately diminished. The case of Mulhouse furnishes an apt illustration of which is the better method of improving the workmen's condition. There in order to enable them to compete with the rivals, it has been necessary to keep wages as low a figure as possible; but then care has been taken to make it up in other ways by furnishing them with cheap lodgings, cheap food, and providing for them benefit societies and working men's clubs. It is just because like interest has not been taken in his workmen by the Parisian employer that the labourers in Paris have fallen into the present unfortunate condition,—a condition from which it is impossible for them to emerge, unless by the intervention of cooperative or other benefit institutions they are enabled to procure the bare necessities of life more cheaply than is at present practicable.

M. Cacheux follows up his subject by discussing next the description and scale of diet most suitable for the working classes. Doubtless it is a point deserving consideration, but it must evidently vary according to the description of work on which they happen to be engaged. Again referring to Mulhouse, I state that the workmen there used to consume too large a proportion of farinaceous or liquid food; and when restaurants were first started by their employers they grumbled at the comparative smallness of the rations, but that they soon began to perceive they were equally well up to work notwithstanding that they were consuming a far smaller bulk of food. After discussing the alimentary qualities of various articles of nourishment, the author proceeds to explain the best modes for the preparation, and this leads to an investigation of the different apparatus which have been invented for cooking purposes. Where large numbers have to be provided for, as in Workmen's Restaurants, the general arrangement and the best appliances for the kitchen become matters of great importance, both on the score of efficiency and economy. The relative merits of the different kinds of stoves, whether worked directly over the fire or by steam, as likewise discussed, but it does not appear that gas-stoves have as yet been tried in France at least no allusion is made to them by M. Cacheux. In all the principal establishments in London and the provinces the gas-stove plays an important part, and its superior economy, as well as cleanliness, appear to be generally admitted. The interesting collection of heating and cooking apparatus at the Health Exhibition, lately described in *The Builder*, has no doubt already attracted the attention of intelligent neighbours, but possibly the highest cost of the fuel is one reason why gas-stoves have not as yet been employed in France. The cost of a meal varies apparently at different places ranging from 63d. to 9d. according to the quality or quantity of the viands, but a substantial meal of wholesome food can be had and supplied for less at many workmen's dining-rooms in London.

The next subject treated is that of bathing, the use of which is daily becoming more popular amongst the working classes. In France more elaborate provisions appear to be made than is customary in England. At the ordinary swimming-baths the price charged varies from 1d. to 2d. per head, and is about

\* *L'Économiste Pratique: Construction et Organisation des Crèches, Salles d'Asiles, Ecoles, &c.* Par Emile Cacheux, Ingénieur des Arts. Paris: Librairie Polytechnique; Baedry & Co., 15, Rue des Saints-Pères. (See p. 614, ante.)

the same in both countries. The transition from baths to laundries naturally follows, the latter of which constitutes a very thriving industry, and hence our author devotes a considerable space to describing the various operations connected with it. Without following him through his descriptions it will suffice to direct attention to the ingenious apparatus in which the linen is thoroughly scalded and cleaned by steam, and also to the drying machine shown in Plates 59 and 60. At the laundries in the Health Exhibition similar processes, though not applied in exactly the same manner, have been seen in daily operation. It is, however, generally admitted that France excels all other countries in this particular industry; but, at the same time, as English people well know, the little bill of a French landress is a veritable *article de luxe*.

Societies and associations for the special object of rendering pecuniary aid to operatives come next under review, but the general principles on which they are founded, and the conditions on which they are worked, are much the same as in our own country. In this branch of political economy, however, England is at present the most advanced nation, for in no other country do there exist so many mutual aid and benefit societies. The savings-banks, especially that connected with the Post Office, are amongst the most valuable of our many admirable institutions, and have taken deeper root in Great Britain than on the Continent, notwithstanding that as a nation Frenchmen are undoubtedly much more thrifty than Englishmen.

M. Cacheux concludes his treatise with an examination of several methods of dealing with that class of the community which for one cause or another is unable or unwilling to support itself. "If any work not, neither should he eat" is an Apostolic decree, and were it more rigidly enforced, probably the large number of mendicants who now loiter along our own thoroughfares would soon be diminished; but where there is a large surplus population there must always exist a number of persons who, however willing to work, are unable to procure employment, and it is for such that succour must be provided. There are also many who, owing to physical or mental infirmity, are unavoidably thrown on the care of the public. Asylums for the latter, as well as hospitals for the sick, are to be found in almost every country, but perhaps nowhere do they abound so much as in Great Britain, and yet the efforts made to alleviate the wants of suffering humanity are unable to overtake the numbers who stand in need of help.

M. Cacheux ably discusses the merits and arrangements of the different institutions which have been or ought to be created for the purpose, but it is beyond his power to indicate how or whence the requisite funds for their creation can be obtained. Nevertheless he has done good service by publishing the vast amount of information which he has collected on the subject, and we can only hope that his efforts to ameliorate the condition of the humbler classes of his fellow-men may meet with the appreciation which they deserve, and we would commend his treatise to the attention of the Royal Commission which is now engaged in considering the subject of Housing the Poor.

#### NOTES.

**T**HE loss to the nation by the death of such a man as Henry Fawcett is one which none who are concerned, however imperfectly, in the endeavour to forward the healthful practical work of the world in this generation can pass over in silence, even though his special influence was apart from the province with which they are professionally concerned. The manly resolution with which, in early life, he set himself to contend against a terrible calamity and to rise above what might have seemed its inevitable consequence in circumscribing his career, and the energy and business-like ability which he brought to bear on the working of the important public institution which he directed under the present Government, are qualities which men in all ranks and professions may admire

and aspire to emulate. The universal and almost personal regret which the news of his death evoked from men of all shades of political feeling is a refreshing testimony to the fact that, amidst all the acerbities of party politics, —now, unfortunately, more pronounced than ever,—true nobility of character and honesty of aim will command a respect and sympathy apart from the minor and passing considerations of party tactics. It is, in fact, neither to the politician nor to the Postmaster-General that the homage of universal regret has been especially paid during the past week, but to the personal character of one concerning whom it might be said,—

"That Nature might stand up  
And say to all the world, 'This was a man!'"

**T**WO statements appear on the same page of the London morning journals of the 11th current, which may advantageously be read together. One, dated from Paris, is to the effect that "the slow but steady increase of cholera, especially in the eastern quarters of the city, causes considerable anxiety. . . . There have been 55 cases of cholera, and 22 deaths, in the city and the hospitals from midnight till noon to-day." The other announcement runs, "The Royal Commission on Metropolitan Sewage Discharge met yesterday at 32, Abingdon-street, Westminster." Bearing in mind the semi-official, if not wholly official, expression of the opinion of the noble and learned Chairman of this Commission, addressed to the Home Secretary, to which we recently called the attention of our readers, it is perhaps permissible to express the hope that London may not have much longer to wait for the report of this body of experts. That degree of safety which is due to a thermometric heat below 70 deg. Fahr. is relied on, as we have seen, by the Metropolitan Board of Works. Shall we not observe, until too late, that as this condition has not proved a safeguard in the case of the Seine, it is running an altogether unwarrantable risk to rely on it in the case of the Thames?

**M**R. WATERHOUSE'S design for the new Liberal Club has been the occasion of a little paper warfare in the columns of the *Pall Mall Gazette*, in which the doctors differ not a little. A capital letter, signed "F.R.I.B.A.," published on the 6th, commented on the disappointment felt by some in regard to the design of the building, also stating that Government authority had interfered to compel the adoption of a design in harmony with certain other buildings to be erected on the contiguous site of "Whitehall court," and that Mr. Waterhouse's first and superior design had thus been shelved, against his will. If this be true, it adds one more to the list of the mischiefs worked in this country whenever official authorities meddle with architecture. "F.R.I.B.A." justly describes the general harmony of the district as "a general harmony of dull mediocrity," and refers to Mr. Waterhouse's tower at the angle of the club as the one striking feature left in the design. Mr. Ferguson, in a letter published two days later, fastens on the tower as a specially objectionable object, which "will dwarf everything in its neighbourhood." Well, as far as that goes, we sincerely hope it will. Mr. Ferguson's argument that the most effective point of the interior plan is sacrificed by relegating it to the provision of staircases and an inclined plane we can quite understand, but Mr. Waterhouse says the plan could not well be arranged otherwise; and he is a master of planning. But as to the architectural question, we should be perfectly thankful to see something different from the respectable commonplace of most of the buildings in the neighbourhood, even if it does "dwarf" them. The most important point brought out in the correspondence, however, is the statement that Mr. Waterhouse had designed something much better and after his own heart, and was prevented from carrying it out by the intervention of bumbledom.

**W**ITH a good deal of Mr. Sedding's diatribe against the modern architectural system, printed elsewhere, we are very much in

sympathy; but his criticism is of a very negative description (the very easiest kind of criticism), and too much pervaded by the temper which finds it piquant to say sharp things of other people. "Some people," said Sydney Smith, "think themselves pious when they are only bilious"; and the weakness occurs in regard to architectural as well as moral righteousness. That Mr. Sedding himself has overlooked some branches of knowledge which society imperatively demands from the modern architect, and is in want of the hated "specialist" to help him, is evident from his innocent reference to the "D-trap," as if that were the typical representative of sanitary machinery. He urges that the modern architect should set about training himself more thoroughly. Having regard to the deadly effects of putting unwholesome and inefficient traps into houses, we may reply to the "art-architects" who are guilty thereof, "Que messieurs les assassins commencent." The extraordinary reference to a certain eminent lawyer as the only real architect of the day seems to have been prompted by the reason which Johnson assigned for a certain couplet in Pope. "Why did Pope write that?" "Sir, he hoped it would vex somebody."

**A** SCHEME, called the Wandle Valley Main Drainage, has recently been completed for the Croydon Rural Sanitary Authority. The district served embraces five villages, with a population of 17,000, and covers an area of 10,106 acres. The watershed contains sixty square miles of chalk, from which the Wandle is fed, and whence it runs over beds of alluvium overlying the London clay. The scheme is on "the separate system," the storm-water being provided for in the old sewers and water-courses, which have been improved for the purpose, while the new sewers as completed measure 55 miles, of which 20 miles have been laid with 9-in. Doulton pipes. The system was designed to allow as much of the sewage as possible to be carried to the land by gravitation, and where this was not possible a low-level sewer was laid, from which the sewage, after its arrival at the pumping-station, is pumped up into the gravitation outfall an average height of 20 ft., and then flows into the depositing-tanks. The sewage, after it has been deprived of floating matter, and when the solids have subsided in the tanks, is filtered through a 4-ft. bed of coke, and then passes on to the land set apart for filtration and its final purification. The sludge is first treated with milk of lime, and then pressed into cakes 2 ft. in diameter and 1½ in. thick; and a farmer in the neighbourhood has contracted for the cake produced for twelve months, paying a sum of 42l., and undertaking to keep the works free from sludge cake. Owing to the area, some 29 acres, set apart for filtration purposes being very swampy and liable to be flooded, it was necessary to construct a clay-puddle dam entirely round it, and to 1 ft. below the surface of the London clay. In the upper portion of this area an artificial filter was made of alternate 3-in. layers of burned ballast and porous soil through which the sewage passed first into the natural filter. The land irrigated by the sewage in its passage is devoted to the cultivation of rye grass, for which there is a good demand, the crops realising 30l. per annum.

**T**HE case of "Ex parte Cooper in re Morris," reported in the *Law Reports* of October, though it was decided some time ago, is of a good deal of interest to employers and workmen. A large firm were in the habit of deducting from the wages of their workmen sums in respect of a "doctor's fund" and a "reading-room fund." The sums so deducted were from time to time handed over to the doctor and to the treasurer of the room, and the workmen got their medical attendance and literature without further payment out of pocket. The firm became bankrupt, and at the time there was a sum in respect of each fund in the employer's hands, not yet paid either to the doctor or to the treasurer. In the liquidation the workmen claimed to have a right to be paid back, so to speak, the sums yet unpaid

to the doctor and treasurer, whilst the employer's trustee urged his claim. The Court of Appeal, over which the Lord Chancellor presided, was of opinion that the workmen's claim was a valid one, for, by the Truck Act, the wages were to be paid in current coin, and the wages which these sums represented not having been paid, but remaining, as it were, in the hands of the employers, they fell within the meaning of the Bankruptcy Act, which gave a preferent claim for wages. The Court, however, very carefully guarded itself from allowing the decision to extend to sums which had been actually applied to the purpose for which they were set aside. For, as Lord Justice Cotton said, that "might possibly amount to a payment in cash, not to them, but to their agent or person appointed on their behalf to receive it." There can be little doubt that the workmen could not have a legal claim to any such sum, nor is there any moral reason why they should.

IN the professional papers on Indian Engineering for the month of September there is an interesting article on "Irrigation from Wells in the N.W. Provinces," where three million acres of various crops are watered by their means. When so large a tract is dependent for its water from this single source, it becomes a matter of great importance to ascertain how the surface level is to be maintained; for, as wells come to be multiplied, it is obvious that the water stratum must necessarily become more depleted, and therefore the wells, especially the older ones, will in time run dry. To ascertain the relative level and the rate of inclination of the underground supply, a series of cross sections at five miles apart were run across from the Ganges to the Jumna, and intermediate observations taken at every mile of the surface level in existing wells. The levels were then laid down in the Ordnance Survey Map, and the cross-sections show with more or less exactness the slope of the subsoil water, and point to the conclusion that the supply cannot be derived from the great rivers, or by percolation from the hills, but that it is drawn directly from the local rains, which are collected in adjacent depressions. The author of the paper, Major Clibborn, deduces from this that drainage operations must be carried out with circumspection, or else the subsoil will be so deprived of water as to render existing irrigation from wells very precarious. In the absence of canal irrigation the point in question deserves consideration.

A CORRESPONDENT writes:—"The proposal to hold an American Exhibition by Americans in the heart of the British metropolis during 1886" (to which we have before referred) "is undoubtedly a new departure in Exhibition politics, and if it succeeds in coming to the birth will undoubtedly produce an exhibition 'boom' for that year in conjunction with the Colonial Exhibition; but some of those who are more deeply interested in them than the general public, viz., the exhibitors, do not hesitate to condemn them pretty roundly, as causing themselves, directly, an enormous amount of inconvenience and expense, and, indirectly, a loss of trade, by throwing open to all the world their particular modes of manufacture, without obtaining for them any reciprocal advantages. Unfortunately, the Exhibition system is not likely to decrease, but rather to increase, seeing that it has hit the taste of the English *faneur*, who likes to be amused, while fancying that he is being instructed, and the speculation is usually too paying a one to be influenced by such trifling considerations as injury to national trade and invention." Apart, however, from these melancholy considerations, an American Exhibition in London will undoubtedly be very novel and very attractive; for, to our shame be it spoken, our American cousins know us, and are anxious to know us, much better than we know them; and as the whole Exhibition is intended to be arranged in a sequence or consecutive order, the visitor will obtain a kind of panoramic idea of the country from east to west.

IT is stated in a recent number of the *Lumber World* that the ordinary life of unprotected timber structures is not more than twelve or fifteen years. If they are exposed to moisture in the presence of air, especially in a warm situation, or to alternate wetting or drying, they will decay more rapidly. Sap and moisture retained in timber by painting or closing in the sticks before they are seasoned, will cause decay of a very insidious kind, as it works in the interior, leaving an apparently sound exterior, which, of course, has the first opportunity of seasoning. It follows, therefore, that paint on unseasoned timber is more hurtful than serviceable. Large pieces of timber dry so slowly, that decay may set in before they are seasoned throughout, and for this reason pieces of small scantling are preferable to large ones. The best-seasoned timber will not stand exposure to the weather more than twenty-five years or so.

WE called attention last week to the manner in which the splendid modern Indian gateway sent from Gwalior was left to lie in the grounds of the South Kensington Museum. Since then a paragraph has appeared in the daily papers to the effect that the gate will be lent to the Commissioners for the Indian and Colonial Exhibition to be held in 1886. Till then, we suppose, it is to lie where it is,—not a very graceful recognition of a remarkable gift.

THE *Melbourne Argus* states that surveying operations have been undertaken by a French man-of-war for the purpose of ascertaining the feasibility of laying a submarine cable between New Caledonia and Queensland. It is to extend from Gouven, in the north-west of New Caledonia, to Sandy Cape, a distance, as surveyed, of about 500 miles. As the results of the survey have been pronounced very satisfactory, there seems very little doubt but that the cable will ere long be constructed.

VOL. VII. of the *Magazine of Art*, which has been forwarded to us, is in the main a delightful specimen of an artistic journal; varied in its literary matter, much of which is very good, and signed by good names; and admirable in the execution of its illustrations. We could wish, however, that the examples of architectural writing and criticism were better. Here, for instance, is a certain Mr. Aaron Watson, who indites reflections on "the Lower Thames" and its structures, and while he speaks of Somerset House as a "Philitian structure," refers to Blackfriars Bridge as "beautiful enough in itself," only spoiled by the proximity of the railway-viaduct. Now, worthy scribbler, thou art thyself the Philitian, who canst not discriminate between the merits of really refined classic detail, such as that of Somerset House, and crude, coarse, would-be Gothic, like that of Blackfriars Bridge, which is, besides, a complete sham in its outward and apparent structure.

THE following Committee has been appointed, on the nomination of Mr. Shaw-Lefevre, to consider the subject of the "restoration" or other treatment of the exterior of Westminster Hall:—Mr. W. H. Smith, Mr. Rylands, Mr. Beresford-Hope, Sir John Lubbock, Sir R. Wallace, Sir E. Reed, Sir H. Holland, Mr. Peddie, Lord R. Churchill, Mr. Walter, Mr. J. Huntly McCarthy, and Mr. Shaw-Lefevre. Considering the subject to be discussed, some of these names are truly astounding, and seem to leave one no resource but silent prayer.

**Bristol School Board.**—The architects for the new schools to be erected at Windmill-hill, Bedminster, for which the amounts of the tenders were published in our last number, are Messrs. J. W. Trew & Sons, of Bristol, whose plans were chosen in an open competition. The quantities were prepared by Mr. Wm. L. Bernard, of Bristol. Mr. J. Fletcher Trew, M.S.L., of Gloucester, arranged the sanitary work and supplied the quantities for that section. The architects' estimate for the school, as arranged in scheme A, was 6,500l.

#### THE MODERN ARCHITECT AND HIS ART.

WE give the main points of Mr. Sedding's very piquant but very long paper read at the last meeting of the Architectural Association:—

It is idle to shirk disagreeable questions, and so I begin with a simple proposition which covers much of the ground we shall traverse to-night. Is architecture, as practised by the modern architect, worth living for? To my mind the question is most suitable to the present time. This is a time of felt uncertainty, of stranded purposes, of searchings of heart,—a time when the issues of things connected with the arts of design are hanging in the balances. This is a time, too, of disillusioning alike for architects and for people, when we ourselves are not quite so confident about our method of pushing architectural design forward by means of impulses of an essentially floating nature, and when people are beginning to realise that every branch of architecture is well represented by outsiders, and when they are beginning to question the *raison d'être* of the architect at all.

This question is, then, a practical one, and one which it is desirable to face and to answer. It at once puts the modern architect and his art in their right place. If you take up architecture as your vocation, to be followed with ardour of a religion, I am not sure that you will succeed in gaining riches or fame; you may have to be happy with small opportunities and small gains, and have to live a life of quiet, unnoticed work. But you will be happy and contented and grateful all the same. If, on the other hand, you go in for architecture as a profession which only needs the efficient handling of a T-square and ruling-pen, you may, if you are a good, steady fellow, rise to be an eminent practitioner. And if you are a successful practitioner your rewards are great: you may have access to the best society and to the best columns of the *Times* newspaper; you may be a lion at evening crushes, and wear brown velvetene; you may pose as the patron of the very Fine arts, and be a judge of *bric-à-brac*, and a connoisseur of Queen Anne teapots, Chippendale chairs, and such like; you may even hope to be the F.S.A. and the F.R.I.B.A., and even the P.R.I.B.A., if you have paid your subscription and are alive when your turn comes. But as for art, and the mastery of the crafts, and the power of colour and form, and all that sort of thing, you may neither have any, nor need your friends ever suspect that such things come within the make-up of the modern British architect.

To proceed. I said just now that this question touching the worth of modern architecture as a serious life's pursuit puts our art in its true place. Instinctively one feels that while it is applicable to the modern architect and his art, none but a fool would have put it to William de Sens, Jocelyn of Wells, Alan of Walsingham, William of Wykeham, Thomas Chard of Glastonbury, or of Bramante, Michelangelo, Christopher Wren, Inigo Jones, or Adams or Chambers, and there must be a reason for this.

Again, none but a fool would ask the modern musician, or the sculptor, or the painter or poet, if his art were worth living for. Indeed, here are living arts, each with its ideal conception to symbolise, each with its mission to stimulate, delight, and console mankind, and to raise men's minds out of money-grubbing grooves into a less selfish, less sordid, less common-place atmosphere. It is significant that in each of these cases the artist is his own craftsman; he thinks his own thought, clothes it himself, and spares no pains in the elaboration of the clothing. He keeps no "ghost," and if he does he is not thought to be respectable. But the architect's "ghosts" are legion,—on his premises and off them,—and he is not one whit ashamed.

Again, we must confess that the other contemporary arts I have enumerated have been affected for the better and not for the worse by the influences of the day. Each has won new triumphs, each has found out new chances of appeal, new domains for display. But not so architecture, for while it has gained nothing it has lost nearly all. In respect of the use of iron for constructive purposes and of patent sanitary appliances, which builders and sanitary engineers have devised for us, we score something. Yet, however blessed the iron joists and D-traps [?!] are, and however lucky we are to be able to use them, the architects of

ld, who knew them not, were infinitely more accomplished all-round men than ourselves; and I do not know that, after all, our houses are either more stable or more sweet and wholesome for body and soul to inhabit than the old ones of old England.\*

But further. The practice of these arts of colour, sound, form, and word directly conduce to the development of artistic genius; nor could you be a successful composer if you had no musical genius, nor an eminent literary man without literary genius. Yet you can be counted an eminent architect, and reap all the honours of the profession, without possessing or feeling the want of artistic genius.

In putting the case thus strongly, do not suppose that I am blind to the noble gifts and genius of certain architects working with us, and abetting their helpful influence amongst us at the present time; and, but for my resolve to keep this paper impersonal, I would name them and speak of them with all the genuine admiration and respect I feel for them. Do not mistake me on this point; I speak of the rank and file, and not of these. And I ask whether architecture as now practised ought not rather to be accounted as a "useful" than as an "ornamental,"—or, as some would call it, a "fine,"—art? I ask whether architecture can any longer be termed the "Queen of Arts," when all that remains of her is the skull and the feet and the palms of her hands?

I ask if it be not true that architecture has ignominiously resigned her throne, lost her honours, and hallowed the sceptre of prominence with which she has held sway from time immemorial, and only reserved for herself the sovereign right of levying a tax of 5 per cent. on other men's labours? I ask whether it is not true that the engineer has (whether civilly or uncivilly it matters not, as the thing is done) robbed the architect of one-third of his domain on the one side, and whether the decorator and manufacturer have not between them robbed him of another one-third on the other side? I ask, whether the architect of to-day is, or need he, anything more than a paper-draughtsman, to sit on a stool and invent new sorts of doors and windows? I ask, whether his business in life is not that of a designer of shells of houses for decorators and manufacturers to finish and furnish, and who varies this jackal occupation by occasional jobs for an engineer, who hires him to do the "pretty" upon a bridge or railway station? Yes; and such of us who like to see iron skeletons clothed in shoddy ornament may, after refreshing our bodies, refresh our souls at the York or Bristol railway station, and realise at the same time the mission and scope of the modern architect and his art.

But in order to clear the way for some few practical observations, I must arrange the subject under three heads:—(1) What is architecture, and what were the functions of the architect in old days? (2) When, and from what cause, did the change from the old to the new system take place? (3) Is it possible for architecture under its present conditions to be carried out upon the old lines, and, if so, by what means? Here are three points, each of which would serve as a theme for a long lecture, so that my treatment of each must needs be brief and simply relative to the matter in hand.

As to the first point, although addressing a professional audience, I cannot define architecture as building erected after an architect's design. I would define architecture as imaginative building; in other words, building which expresses the invention or imagination of the builder, and which appeals by this means to the imagination of the spectator. If it is to answer to the description of architecture, the building must have a soul as well as a body. The body is the structure answering to the primary purpose of its erection, and this body should be stable and convenient. The soul is that super-imposed something extra to the body,—that something which is provided beyond the demands of mere utility, and which is really the expression of the builder's thought and his mode of appeal to the sympathy and imagination of the spectator. In this definition you get the three cardinal virtues of architecture represented, namely, stability, which relates to science; convenience, which relates to good sense; and beauty, which relates to taste.

Naturally, the primary purpose of a structure, combined with other like conditions,

settles its character and the fit extent of its decoration; and yet, while it is quite fair to define the word architecture as the art of building nobly and ornamentally, you cannot gauge the value of a structure by the amount of its ornamentation. Dance, who built old Newgate, was an architect, and, although his structure has dead black walls of rough-hewn granite, relieved only here and there with niches and statuary, and a savage repellent air, it is imaginative building, and speaks directly to the imagination of the spectator of violence and doom in the true grim Norman manner. A mere builder would have put plain brick walls. And architecture, all the world over, has the same characteristic qualities,—however different the types and the styles of the art represented, however different the scale of the structure, however different the culture and aims and methods of the builders,—the architecture carries the impress of thought or invention, or imagination befitting an ornamental art. Architecture is truly a human art, a volume, and a record of human thought.

The architecture of the modern world answers, in all essentials, to the architecture of the ancient world, however different its aims and character, and mode of appeal. With regard to the latter point, the Classic is a more intellectual art, and demands a more intellectual appreciation. The Greek architect is a man of complete culture, learned in philosophy and geometry, and he addresses his peers. This explains why it is that some of us find the heights of Classic art cold, and the atmosphere that surrounds it bleak and grey. The modern architect, like the ancient, is the right man in the right place; and, whether he be cultured or uncultured, prince or ploughman's brother, he is the most skilled man in the building crafts upon the job.

Luckily for me, it is immaterial to our purpose to inquire as to the social status of the architect as a person, or whether he had soft hands or hard. One thing is certain about him,—cultured or not cultured, hobsman's cousin or not,—he contributed the requisite amount of knowledge and theoretical science, and did not retain experts; he was in direct contact with the work as it grew up; he saw how things were done, and was not the mere figurer of details at an office; he was the familiar spirit of the building, and not the distant dictator of its details. And besides having a general knowledge of handicrafts, he was master of at least one. Some architects were modellers, some carvers, some workers in marble or in gold or in ivory, and, plainly enough, we can infer that they worked in workshops, and not in offices or studios. "In Greece," Winckelmann says, "the best workman in the most humble craft might succeed in rendering his name immortal."

Let us turn for a few moments to Italian Medieval art, for we know so much more about the architects of Italy than of those of any other country, and they afford us a ready type of men whose functions covered every matter pertaining to construction and ornament. The Italian architect was engineer, builder, painter, decorator, sculptor, modeller, metal-worker, goldsmith, and the rest; or at least you might expect that the same man could paint a picture, carve a subject, draw and model a bit of ornament, make a gold casket or an urn, design a dress or a fabric, build a church, or a palace, or a bridge. Think of Da Vinci, with his superb power of colour and form, of his magnificent designs and projects in art and mechanics, and set this man with his marvellous range, and his almost superhuman grasp of mind and his boundless ideal, against our puny selves poring over our D-traps, and ventilation, and quantity-taking, Metropolitan Building Acts, &c.; and if, after instituting the comparison, you are satisfied with the scope and issues of the modern architect and his art, then I think you are eligible to be a Fellow of the Institute without further ado, and I will give myself the honour of proposing you on the first convenient occasion.

Now you cannot properly account for the high condition of Italian art in the Middle Ages by saying that the Italian people are a phenomenal people with art in the blood. If so, art would be flourishing in Italy at this time, and it is not. The fact is, that whatever art you examine of any period, or of any country, you will invariably find that the excellence of the work is only commensurate with the ideal. There is no luck, no chance about

it, it is a simple matter of cause and effect; and if the members of the Institute had as high an idea of architecture, and of the various arts and sciences connected therewith, as they have of the privileges of the profession and of their professional status, English architecture would be very different to what it is. It needs no prophet to foretell that so long as the modern architect contents himself with grovelling views and consumes his soul in small things, so long will he grovel and do small things. In Italy in the Middle Ages there was a grand ideal to animate the artist and to sustain his art. Of course many things conspired to favour art there and then, beyond the consanguinity with artistic races which doubtless had its effect. Italy was then what England is now,—the world's emporium, the seat and centre of the world's commerce. There was wealth, and the desire to spend it upon beautiful things. There was the ambition of cultured nobles. There was the inheritance of fine traditions. There was a lovely climate and a flowery land. There was the innate passion for beauty of a passionate and beautiful people. But what raised Italy to her high-water mark of art was the measureless value set upon execution. "Design" then meant something more than it at present does in an architect's office, or in our classes of design. It meant the power to do as well as to draw. It meant executive power and technical skill. It meant that what the brain of the man could conceive, that the hand of the man that conceived it could execute.

Coming to our second point. We have to inquire when and from what cause the change from the old to the new system of architectural practice took place. Ever since English architecture was English architecture, it had been born and bred and fostered and propagated in English workshops. The Gothic revival meant not only confusion to architecture, but death to the art of the workshop. I do not mean for a moment that the art of the workshop, or the craft carried on there, were of a high order before the inauguration of the new condition of things, but I speak of one system of design as opposed to the other. People, when they are uncomfortable about the results of the Gothic revival, are fond of pointing to Gower-street as a justification for the annihilation of traditional art. But you may depend upon it, had there been the demand for higher things, there would have been the supply. However homely, or, if you like, however ignoble, the art done just before the new stimulus came, the traditions of the better times still lingered on in the workshops, and the brick-layer, the carpenter, and the plasterer who hung on were men with some notion of style, and some love of detail. The Early Queen Anne had leanings towards the picturesque Elizabethan, and the houses of the period are singularly well adapted to English minds and English scenery, and their fittings are in no wise unworthy of the best traditions of the English workshop.

But I have yet to account for the decay of architecture before the Gothic revival, and also for the change from the old to the new system of architectural practice; and the explanation I offer for the one applies to the other. I cannot see that you could expect that art should engagemen's attention when you remember the vast number of social, political, and religious problems that were then agitating England. Professor Seeley's valuable book on the "Expansion of England" has helped me to see why the faculty for design died out with us in the eighteenth century, for he shows how entirely English interests were then centred in America and her other colonies. Think of the warships that had to be built, the armies to be equipped, the colonies to be fought for and occupied, and, later on, think of the machine-looms and steam-engines to be invented and perfected, and the railways to be made! How naturally does the engineer spring into existence amid the demand for the useful arts! How naturally does the eye of the historian pass on to the record of that noble set of engineers and mechanists, and mathematicians,—Davy, Watt, Cavendish, Arkwright, Herschell, Stephenson, and Brunel! And how natural that the men of genius should gravitate,—not to the ornamental arts as in earlier days, but to the useful arts!

And now, having considered the origin of the engineer, who is one of the cuckoo intruders in the architect's nest, let us turn to the origin of that still bigger bird,—the ornamentalist or expert in the decorative arts. I said just now

\* They certainly will not be if Mr. Sedding puts D-traps to them.—Ed.

that the Gothic revival had inaugurated the change from the old system of architectural practice to the new. Before this revolution of taste took place the architect was the leading spirit of the building he designed, but he did not stand alone. His designs or models for stone, brick, iron, wood, and plaster work were backed by the traditional skill, and types, and methods of craftsmen, each of whom was more or less of an artist. The architect was only the prime minister: the workmen represented the departments. He was only the president for the time being of a little republic of art. From what we know of Wren, Inigo Jones, Chambers, and Adams, the architect was conversant with every branch of the work included in the structure. He supplied the plans and sketch-elevations, and the leading details (as in John Thorpe's case), but the hundred and one odd details required for after-thoughts and emergencies might fall to the conduct of the workman, who, at all events, would be quite competent to deal with them if so required.

The Gothic revival upsets all this harmony of procedure, for the whole of the traditions of the past must be sacrificed, and new types, mouldings, traceries, carvings, groinings, decorations, and the rest of it, are introduced, about which the workman knows nothing, and cares less.

Now my explanation of the origin of the specialist decorative artist is this,—Having destroyed the old system of art, the Gothic revivalist found himself unable to construct a new system that would work; he had accepted a task which he was unable to cope with. He had a strong love of art, a true sense of the intimate relations of the lesser arts with architecture; but he found things too much for him, and, instead of raising an army of fellow-labourers in the workshops, he called into existence certain specialist assistants to aid him in the conduct of his practice, where he lacked time or ability to carry out the work himself. The mischief of the whole business has been that he was only a learner himself all the time he was carrying out works in various styles.

I come now to my third point. Is it possible for architecture under its present conditions to be carried out upon the old lines, and if so, by what means? To the first division of this point my short answer is,—No and Yes. No, if the present conditions are to remain unchanged. Yes, if things change for the better. In dealing with the whole matter before us, I do not want to arraign modern art for difficulties inherent to it, nor do I want to multiply the responsibilities of the architect. That some of the higher branches of an architect's work have been abandoned is undeniable; and I plead for the recovery of these at any cost. In claiming this I do not desire to extend the radius of the architect's proper work. I am even arguing for the lessening of his labours by bringing the handicraftsman into a more active participation in the work he has to do. This was the old system, and it is the only practical solution of the case.

I grant you that, according to the present state of things, specialists must exist to do such things as these,—to superintend the imitation of old work; to carry out decoration in a given style, Pompeian, Egyptian, Classic, or Gothic; to restore or build Gothic or Classic churches; Elizabethan, Jacobean, or Georgian houses, and the like. The question, however, arises here,—Are we to go on imitating the styles of the past? Specialists are necessary if we do go on in our present courses; but if we are to get out of the mists and on to the hill-tops again, we must train ourselves for our future liberty. If we want to perpetuate chaos and will-o'-the-wisp art, I do not know that we can devise a better means to that end than the establishment of representatives of the rival styles and rival trickeries of the day. But surely we do not want practitioners of one accomplishment or one idea! Let us take courage and look forward to the time when the jumble of styles will be cleared away or reduced to a system. Depend upon it that it will not be the one-eyed, or one-legged, or one-armed, or one-idea specialist practitioner that will then be sought for, but it will be the architect with the most individuality, the most culture, the most skill, the most efficient training, that will be sought for, and found most useful to the architect of the future.

May I divert your interest for one moment from that all-important matter, the modern

architect and his art, and ask you to look at the British workman. What is his condition? What are the issues of his life's work? What have you done for him? We left him in the eighteenth century, a magnate according to his personal qualifications in his little parliament of art, the workshop, evolving architectural types, and putting his whole soul into his work. In those days he was an intelligent being, following his craft joyfully because he excelled in it, and knew what he was about, and had a felt place in the world. You have scattered those workmen, you have dissolved these little republics of art that in old days held sway in every town and village in the land, and what have you put in their place? You have drowned the English handicrafts, by opening up the sluices of a ceaseless tide of archaic types, and how has your eclecticism affected the British workman?

Just think of all the sad, bad, and mad architecture that has passed under the British workman's hand, say in these last thirty-five years. In 1850 he was rearing a Norman apse upon the ruins of an old chancel that had been destroyed in the interests of morality and purism. In 1855 he was building a thirteenth-century hotel, with details cribbed from Salisbury Cathedral, and a bank adjoining it in the Ducal Palace style. This took him some time. In 1870 we find him titivating an old Queen Anne house in a Gothic manner; and in 1880 he was titivating an old Gothic house in the Anglo-foreign "Early English" Queen Anne manner; and now, in this year of the architect's salvation, he is satisfactorily completing the memorial of the nineteenth century at the west end of St. Alban's Abbey, under the reputed direction of our all-accomplished, soft-handed, "emancipated," and only truly British architect, Sir Edmund Beckett, Q.C.

Now I want to know if we cannot do something to regenerate the art of the builder's yard and to raise the workman's position; and, if no higher motive affects you, think how it is for the interests of the modern architect and his art that you look steadily into this matter and do your best in it. I am firmly persuaded that there will be no good architectural design, and no good execution, until the craftsman can be brought to participate with the architect in the working out of architectural ornamentation. It is just one of those things about art which marks its divine origin and inherent dignity. You can get faultless mechanical work out of machines, and you can get good mechanical work out of human machines, but noble hand-labour is only found where the workman uses his intelligence, and where he is able to express the individuality of the individual. I would say, then, begin the work of regeneration by throwing away all your petty professionalism. Give the workman his rightful participation in your aims. Let him see into your great mind. Make him something more than the transcriber of your hesitating lines. Lift him nearer to your own level of knowledge so that he may know something of the essential qualities of the style he is working in, and may at least interpret your thought sympathetically, render in his own idiom the things you put before him, and find some way of escape for the soul within him. Thus, and thus only, will you get good architecture and good sympathetic workmanship.

I conclude this paper with two propositions which aim at the amelioration of some of the evils I have here enlarged upon. The first is as to the selection and classification of the architectural types now in vogue. The second relates to the provision of technical education for architects and craftsmen. With regard to the first point, it is clear that no scheme of architectural design has ever been practised without a basis of workshop traditions. Shall we then,—is it worth while to try and formulate our tentative styles, and to systematise our distracted types, with a view to rendering them permanent and to assist the workmen? If so, you must have a grammar and an alphabet before you can form words and sentences. Now it so happens that never since the world began has so much architectural knowledge been accumulated as is now stored up in the brains and on the shelves of the English architect. Why, then, should not these experts be set to work to formulate and render into serviceable shape the leading mouldings and forms and features of the styles in vogue? Why should not the destroyers of old English traditions do penance and make reparation for their naughty

deeds, and build up new traditions? Why should we not have a well-arranged series of details of arches, capitals, bases, plinths, friezes, cornices, staircases, doors, windows, &c., for workshop use?

The second proposition is to have a technical college for the instruction of architectural design, to be for the use of architects and craftsmen. If modern architecture showed itself in as attractive a form to the public as English music does, the scheme would receive the attention which we who know our pitiful state think that it deserves.

What we want is not so much men who can design in many styles of more or less remote antiquity, or men who can sketch well, but men of aim who can lead the aimless, men who by their personal acquaintance with the handicrafts and personal participation in the production of ornamental art can build up new traditions for the workshop, restore the credit of English workmanship, and recover the lost ideal of the English architect.

Of the discussion which followed, we give a report on p. 653.

#### PROTECTION OF LIFE FROM FIRE IN THEATRES, &c.

AFTER the catastrophe at the Ring Theatre, Vienna, the public became a little nervous as to the state of the theatres in the metropolis, and questions were repeatedly asked in Parliament as to what steps were being taken to secure the safety of the public in case of fire or panic occurring while performances were going on, and ultimately pressure was brought to bear upon the Metropolitan Board of Works to put in force an Act which was passed in 1878, but had been lying dormant as far as theatres or other places of public entertainment were concerned until the scare occurred.

In 1882 the Board caused surveys of the whole of the theatres to be made, also including therein some of the principal music-halls, and proceeded actively to put in force the above Act, viz., 41 & 42 Vic., c. 32, s. 11. Section 11, applying only to houses, rooms, or other places of public resort licensed at the time of the passing of the Act, enacts that whenever it appears to the Board that any of the above places which are kept open under letters patent, or other license granted by the Lord Chamberlain or Justices of the Peace, are so defective in their structure that special danger from fire might result to the public frequenting the same, the Board may, with the consent of the Lord Chamberlain, as to theatres under his jurisdiction, or of the Home Secretary, in other cases, if in the opinion of the Board such structural defects can be remedied at a moderate expenditure, by notice in writing require the owner of such house, &c., to remedy such defects within a reasonable time to be fixed by the Board, and if such owner fails to comply therewith, a penalty of 50*l.*, and 5*l.* a day while such default continues, is entailed. An appeal to an arbitrator to be appointed by her Majesty's First Commissioner of Works could be had upon notice being given to the Board fourteen days from the service of the requisitions.

Sections 12 and 13 of the same Act empowers the Board to make regulations as to new theatres, &c., and states that no future new licence is to be granted unless the certificate of the Board is first obtained, and also empowering the Board to grant a conditional licence to any premises about to be constructed when applied for.

Now as to the working operation of the Act under section 11 of the same, applying only to places licensed at the time of the passing of the Act. The first place to try the effect of arbitration was the Royal Music Hall, and, upon the arbitration, it was found for the first time that the Board had no power to make requisitions which would impose the acquisition of land not in the possession of the owners; and, by the arbitration, the owners succeeded in evading an important requisition and the consequent expense by its fulfilment. The next was the Lyceum, and afterwards Drury Lane. In all six theatres and three music-halls have tried arbitration, the Board's requisitions being mostly confirmed with slight modifications, and for a new Act the same seems to have worked very smoothly.

The requisitions of the Board were confined mainly to the providing of efficient proscenium

walls (many of the theatres being without, and others being provided with, walls which in modern days were not thought sufficient to resist a large volume of fire), additional staircases, strengthening existing supports for the public coming in and out, and making all doors, &c., to open outwards. Upon inspection of the theatres many of the dressing-rooms were found to be very objectionable, and that a large amount of rubbish existed; defects which, by the action of the Board, although not coming strictly within the provisions of the Act, have been remedied.

The Board having now dealt with the whole of the theatres in the metropolis, do not propose to proceed further unless a fee is paid. This seems a very objectionable course. Are we to go back in a few years to the old state of things which existed before the Act of 1873 was put into operation?

Owners of theatres will speedily efface what has been done by the Board. Doors which should be kept closed will be left open, and *vice versa*. Exits will be blocked up, gangways will be utilised, and other necessary works will be left undone. Whereas, if the Board still kept the question of further requisitions open where owners had infringed the former ones, their alterations would work permanent good. There is yet one other point, the most important one of all, *viz.*, the acquisition of adjoining property; the Board having been much cramped in their operations through not having the power to compel the owner to acquire property for the purpose of securing a safe exit for the public. This should be done, and can be easily dealt with by the Board under the Lands Clauses Act, directly the necessary Parliamentary powers have been obtained.

#### ART LOAN EXHIBITION AT BRIGHTON.

Vistors to Brighton during the next few weeks may pass an hour or two very pleasantly in inspecting the contents of the Art Loan Exhibition which was opened the other day. The Exhibition is being held in aid of the funds of the Brighton and Hove School of Science and Art. The pictures are, almost without exception, by eminent masters. The Picture Gallery adjoining the Free Library has its walls covered with 130 works, all of them lent by their owners. Sir Frederick Leighton, P.R.A., is represented by three works,—“Summer Moon” (his finest production, to our thinking), “The Sisters,” and “Lieder ohne Worte.” Mr. Millais’s “Dropped from the Nest,” a little girl (apparently a portrait) holding a bird in her hands, has been lent by Mr. W. Cuthbert Quilter, who, with Mr. James L. Ashbury, Mr. J. J. Brown, Sir Julian Goldsmid, Mr. J. H. Trist, Mr. J. Staats Forbes, Mr. Louis Huth, Mr. J. P. Heseltine, Mr. Martin Colnaghi, Mr. A. Morrison, and Mrs. Hill, are amongst the most copious contributors. Space fails us to mention all the notable pictures (of which there are many). Though most of them have been seen in exhibitions within the last few years, there are others which are not likely to be seen for some time to come after the closing of the present exhibition except in the possession of their owners. The collection includes good specimens of the works of John Phillip, R.A., J. D. Watson, John Brett, R.A., H. W. B. Davis, R.A., Mark Fisher, Edwin Long, R.A., B. W. Leader, A.R.A., J. C. Hook, R.A., G. A. Storey, R.A., J. Linnell, Frank Holl, R.A., G. H. Boughton, A.R.A., W. P. Frith, R.A., P. R. Morris, A.R.A., G. Romney, R.A., W. Etty, R.A., P. F. Poole, R.A., W. Q. Orchardson, R.A., H. Stacy Marks, R.A., C. Mason, A.R.A., Keeley Hulsewell, A.R.S.A., R. W. Macbeth, A.R.A., Briton Riviere, R.A., John Pettie, R.A., W. Holman Hunt, Thomas Faed, R.A., R. Ansdell, R.A., Luke Fildes, R.A., E. W. Cooke, R.A., Sir David Wilkie, F. Goodall, R.A., David Cox, Clarkson Stanfield, R.A., Sir Edwin Landseer, R.A., J. Constable, R.A., T. S. Cooper, R.A., George Morland, J. M. W. Turner, R.A., David Roberts, R.A., J. C. Horsley, R.A., Erskine Nicol, Val Prinsep, R.A., F. R. Pickersgill, R.A., and Inhart Herkomer, — to mention only some of the names. Most of these masters are represented by two or more works in the picture-gallery alone, while some of them are represented by additional works on the screens in the Corn Exchange. Rossetti is exemplified by a female head and bust, “Queen of Hearts,” lent by Mr. J. H. Trist. A case of miniatures, by Cosway, is lent by Mr. Josephs. So far we have spoken only of English painters, but amongst the foreign painters of works

exhibited are Millet, Israels, Van Haanen, Diaz, Munkacsy, Corot, Koekkoek, De Nittis, Rousseau, Fortuny, and Boldini.

In the Corn Exchange is arranged not the least interesting part of the Exhibition, including works by Sir Joshua Reynolds, Andrea del Sarto, Raffaele, Sassoferrato, Canaletti, Rembrandt, Van Ostade, Jan Steen, Wouvermans, Sir Godfrey Kneller, Romney, Sir Peter Lely, Gainsborough, E. P. Bonington, John Hoppner, R.A., Hogarth, Zoffany, Turner, Gerhard Terburg, Lucas Kranach, Vandyke, Murillo, and Holbein. On the screens in the galleries are Turner’s plates from the “Liber Studiorum”; etchings by Cruikshank, Seymour Haden, Whistler, Méryon, Rajon, and others. Another exhibit worth looking at is a small frame containing a well-executed coloured drawing by Charles Mathews, the actor, who, as will be known to some of our readers, was educated as an architect. The drawing in question was made by him in 1824, and represents the Loggia of the Palazzo Bolvedere at Naples. It is mentioned in the “Memoirs” of Lady Blessington.

On the ground floor of the Corn Exchange is arranged a series of cases containing selections of porcelain, metal-work, &c., from the South Kensington Museum; while of *bric-à-brac* generally there is a large and interesting display. There are also several good specimens of Chippendale and other furniture. There is a series of rooms intended to illustrate seventeenth and eighteenth-century interiors, and these contain some quaint furniture and utensils. On the occasion of the visit of H.R.H. the Princess Christian to the Exhibition, last week, these rooms were rendered more complete and attractive by the presence of a number of ladies in costumes of the periods represented by the rooms. We may add that Mr. Charles E. Clayton, architect, Brighton, was entrusted by the executive committee with the arrangement of the exhibits in the Corn Exchange.

The exhibition (which will remain open until the end of December) is well lighted at night by the Swan-Edison incandescent electric lights.

#### THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of the members took place on the 7th inst., Mr. Cole A. Adams, president, in the chair.

Mr. J. D. Sedding read a paper on “The Modern Architect and his Art,” a portion of which we print on another page.

The Chairman, in opening the discussion, congratulated Mr. Sedding on his extremely interesting and amusing paper. An onslaught had been made in it upon the doings of the Institute, and Mr. Sedding also appeared to have a somewhat low opinion of the work of the Architectural Association. According to him, the Gothic revival had been an absolute failure, and yet men like Pugin, Scott, Street, and a host of others, had done beautiful work, and erected buildings which were the admiration and study of all,—buildings which would hold their own with what had been done in times past. In a profession such as theirs it was impossible to prevent men crowding into it, and turning out abominably bad work; but the same thing must have occurred in former times. They must all, however, agree with Mr. Sedding in the lesson he deduced from the divorce which had taken place between the architect and the workman. He had referred to the many styles in which the man had to work until he was made like a machine; but there were architects, like Mr. Sedding, who instilled into the workman a love for his art. A workman who understood his work was a man before whom the architect might stand, hat in hand, and learn what he could from him. They saw much that was bad, but how was it to be met? Mr. Sedding, of course, was one of those free lances who charged in all directions with perfectly alarming viciousness; but when he had knocked all these things down, what was he going to set up in their place? What he (the Chairman) had gathered as Mr. Sedding’s conclusion was, that the workman should be instructed in ornament; no one would dispute the desirability of this. A fair and honest attempt had been made of late years to afford that instruction, and the work produced, often by manufacturers and specialists, had shown great results, considering the time that had elapsed. It would hardly be practicable to have a committee which should give forth to the world what cornices and details should be used; such a task would bridle

with difficulties. The look-out was not, however, so dismal as it had been pictured by Mr. Sedding. An immense stride had been made, and he believed that the solution of the question would be found in the establishment of a thorough and systematic course of study. If, in the future, they had a school with some more definite aim than hitherto, which the best men in the profession would help, some practical remedy might be found for the evils set forth by Mr. Sedding.

Mr. J. A. Gotch considered that Mr. Sedding’s idea of educating the workman was an excellent one, if it could be carried out. At the same time this would presuppose an intimate connexion with the workman, which did not exist, and therefore it was the tendency of modern work and procedure which was at fault. They would require to have several rich clients and *cartes blanches*, so that when one job was completed they could go on to another one. The system of contract was to a large extent the bane of modern architecture. Everything had to be settled before commencing, and it was only by the most dexterous manipulation that anything different could be introduced. In old times plans were drawn to a certain extent, but not particularly adhered to, and the architect had a free field. The specialist was not the product of modern days, and he did not suppose that in the Gothic times architects were acquainted with every detail of the buildings. They had only one style, of course, while the number of variations of mouldings was within one or two hundred, and used throughout the length and breadth of the land. What they had now to do was to grasp the present conditions, and do the best they could. If the public cared anything for good architecture, they would have it. But the public did not care; and until there was a change in this respect they would not have the ordinary houses and buildings of that vernacular architecture, the specimens of which, that had come down from old times, pleased them so much. He proposed a vote of thanks to Mr. Sedding.

Mr. Hilton Nash, in seconding the vote, remarked that Mr. Sedding had not dwelt upon the fact that the workman had of old as great a love of his art as the architect had. Mr. Sedding had made out the modern architect to be of chameleon-like inconstancy; but it was one of the signs of the times that everything was changing, and one must make the best of it. There were a great many noble modern buildings in the metropolis.

Mr. Woods said that Pugin had a regular school for the instruction of workmen in carving and handicraft. Mr. Butterfield, also, had exercised a considerable influence, especially in ironwork. Mr. Sedding seemed to speak with some contempt of sanitary knowledge, but it was the want of this which tended to bring architects into disrepute, and brought in the specialist.

Mr. J. M. MacLaren believed that the evil was caused by the architect standing, so to speak, at the top of the stairs, while the workman was at the bottom. Such a college as Mr. Sedding had advocated would do a good deal to redeem the profession from the slur cast upon it. Schools of art should not be confined to drawing and modelling, but might be developed into colleges in which architects and artists could work together with the workmen.

Mr. H. D. Appleton (hon. secretary) inquired whether Mr. Sedding would recommend the admission of workmen into the classes of the Association?

The vote of thanks was put and carried by acclamation.

Mr. Sedding, in replying, remarked that what had been left out of his paper had been said for him. He would only revert to the question he had asked at the commencement, “Is modern architecture, as now practised, worth living for?” He did not think he had drawn too gloomy a picture of the present condition of things. He believed in sticking to one builder, and for the last twenty years he had pursued such a course. The builder he had employed was a Cernishman, who had restored at least a score of churches, and done work for him in many counties of England and Wales. It was a great pleasure to him to shake hands with Tom, Dick, and Harry at different places, as he knew they understood their work, and would be able to carry it out well. It was impossible for the architect to supply by post details of every period and phase from the thirteenth to

the eighteenth century: hence they should revert to the good old system, as far as it could be carried out under the altered conditions,—the system in which the workman supplied certain details himself, and was able to meet any emergency which might arise. In reply to Mr. Appleton's question he would most emphatically say "Yes." He did not know much of the working of the Association, but he hoped to redeem that loss as time went on.

HEALTH EXHIBITION AWARDS.\*

We this week give the remainder of the list of awards to exhibitors connected with building and sanitary matters †:—

N.B.—"G." stands for Gold Medal; "S."—Silver Medal; "B."—Bronze Medal; "S.C.T."—Special Certificate of Thanks; "D.H."—Diploma of Honour.

Table listing exhibitors and awards for Health Exhibition. Columns include Class, Name of Exhibitor, and Award. Exhibitors include Haibara, N. (Japan), Hale, R. W., & Co., Hall, John, & Co., Hall, Thomas, Halliday, J., Hanke, Reinhold (Germany), Hare, John, & Co., Hargreaves Brothers & Co., Martin's Crimson Salt Company, Haslam Foundry and Engineering Company, Ltd., Havre, City of (France), Hawksley, Charles, Hayward Bros. & Eckstein, Hazen, H. H., Heal & Son, Hendrie, Robert, & Co., Hennen & Harrison, Huxart (Belgium), Heburn, R. H., Heron, Thomas, Herring & Son, Highby Machine Company, Hindley & Sons, Hitchens' Fireproof Plastering Co., Hobbs, Hart, & Co., Holm, John, Hooker & Hemings, Horn, T. S., Horne, Andrew, Horse, W. C., Houghton & Co., Howie, J. & R., Hubert, J. (Belgium), Hughes & Lancaster, Humphreys, J. C., Hunt, Harry, Hygienic and Sanitary Engineering Company, Imperial Stone Company, Improved Industrial Dwellings Co., Indestructible Paint Co., Limited, Ingham, W., & Sons, Irish, Symons, & Co., Japan, Department of Education, Department of Music, Department for Imperial Household, Navy Department, Printing Bureau, Finance Department, Sanitary Bureau, Home Department, Senji Government, Woollen Factory, War Department, Jeffrey & Co., Jennings, George, Jones, Frederick, & Co., Joubert et Fils (France), Jowett, William M., & Co., Judson, Daniel, & Son, Kashiyabara, M. (Japan), Kaye, Joseph, & Sons, Keenan, Matthew, Keith, James, Kent, George, Kite, C. & Co., Knight, Henry, & Sons, Knoke, Goscar, Kutsutani, T. (Japan), Kwakuhisa School (Japan), Laisné, N. (France), Lakeman, James B., Lamb, J. M., & Co., Langstaff, Charles, M.D., Latham (Member of Jury) and Way Lawrence & Co., Limited, Layat, Dr. (France), Lecœur (France), Lecocq (France), Lefevre, A. (Belgium), Leggett, W. & R., Le Grand & Sutcliffe, Lewis, H. K., Labotte, N. (Belgium), Liège, Conseil de Salubrité publique de la Province de Liège (Belgium), Lindley, C. & Co., Lisleman Manufacturing Company, Limited, Liverpool, Corporation of, Lloyd, R., Lombart, Jules (France), London, Metropolitan Water Companies, Condition of the Labouring Classes London, Society of Arts, London, South London Dwellings Company, London Sanitary Protection Association, Lord, William, & Co., Lot-et-Garonne, Département (France), Lyon, P., Lyon, Washington, Machinery and Hardware Company, Limited, McCallum, J. B., McCarthy, Rev. E. F. M., McEneaney, Robert, McLennan & Gwen, Mackey, Mackey, & Co., Maignen, P. A., Major, H. J. & Co., Manchester, Corporation of, Manufacturers and Millowners' Mutual Aid Association, Mappin & Webb, Marbaye, Société Anonyme des Charbonnages de (Belgium), Marks, Henry, & Sons, Martineau & Smith, Marten, Edward B., Martin & Co., Masson (France), Masters, Henry, Mased, Marquis (Japan), Melbo, I. R., Merryweather & Co., Metropolitan Association for Improving the Dwellings of the Industrial Classes, Midland Rustless Iron Company, Mignot, F. (Belgium), Mignot, P. (Belgium), Müller, L. M. (Denmark), Moerth, John N., Monthiers (France), Moon, Mrs. Washington, Moore, Josiah, & Sons, Moule's Patent Earth Closet Co., Müller, H. (Austria-Hungary), Müller, H. L., Müller, J. A., C.E., Musgrave & Co., Naim, M., & Co., Namikawa, S. (Japan), National Association for the Promotion of Social Science, National Chemical Company, National Model Dwellings Company, Native Guano Company Limited, Neilson, W., & Co., New Carbolec Sanitary Company, Nemilly, Société de Construction des Ateliers de (France), Neujean, A., & Delaite (Belgium), Newman, Alfred, New York State Board of Health, Nobel Brothers, Norechi & Co. (Italy), Nordenfalk, R., Norman, R., & W., Normandy's Patent Marine Aërated Fresh Water Company, Limited, North British Plumbing Company, Ogura, M. (Japan), Onaga Gas Light Company, Oswald, W. R. (Belgium), Ota, M. (Japan), Owen, Henry, & Co., Kenworthy, E. N., & Co., Kerahaw, A. W., Keyser, A. (Belgium), Kitching, H., King, P. S., & Son, Kite, C. & Co., Knight, Henry, & Sons, Knoke, Goscar, Kutsutani, T. (Japan), Kwakuhisa School (Japan), Laisné, N. (France), Lakeman, James B., Lamb, J. M., & Co., Langstaff, Charles, M.D., Latham (Member of Jury) and Way Lawrence & Co., Limited, Layat, Dr. (France), Lecœur (France), Lecocq (France), Lefevre, A. (Belgium), Leggett, W. & R., Le Grand & Sutcliffe, Lewis, H. K., Labotte, N. (Belgium), Liège, Conseil de Salubrité publique de la Province de Liège (Belgium), Lindley, C. & Co., Lisleman Manufacturing Company, Limited, Liverpool, Corporation of, Lloyd, R., Lombart, Jules (France), London, Metropolitan Water Companies, Condition of the Labouring Classes London, Society of Arts, London, South London Dwellings Company, London Sanitary Protection Association, Lord, William, & Co., Lot-et-Garonne, Département (France), Lyon, P., Lyon, Washington, Machinery and Hardware Company, Limited, McCallum, J. B., McCarthy, Rev. E. F. M., McEneaney, Robert, McLennan & Gwen, Mackey, Mackey, & Co., Maignen, P. A., Major, H. J. & Co., Manchester, Corporation of, Manufacturers and Millowners' Mutual Aid Association, Mappin & Webb, Marbaye, Société Anonyme des Charbonnages de (Belgium), Marks, Henry, & Sons, Martineau & Smith, Marten, Edward B., Martin & Co., Masson (France), Masters, Henry, Mased, Marquis (Japan), Melbo, I. R., Merryweather & Co., Metropolitan Association for Improving the Dwellings of the Industrial Classes, Midland Rustless Iron Company, Mignot, F. (Belgium), Mignot, P. (Belgium), Müller, L. M. (Denmark), Moerth, John N., Monthiers (France), Moon, Mrs. Washington, Moore, Josiah, & Sons, Moule's Patent Earth Closet Co., Müller, H. (Austria-Hungary), Müller, H. L., Müller, J. A., C.E., Musgrave & Co., Naim, M., & Co., Namikawa, S. (Japan), National Association for the Promotion of Social Science, National Chemical Company, National Model Dwellings Company, Native Guano Company Limited, Neilson, W., & Co., New Carbolec Sanitary Company, Nemilly, Société de Construction des Ateliers de (France), Neujean, A., & Delaite (Belgium), Newman, Alfred, New York State Board of Health, Nobel Brothers, Norechi & Co. (Italy), Nordenfalk, R., Norman, R., & W., Normandy's Patent Marine Aërated Fresh Water Company, Limited, North British Plumbing Company, Ogura, M. (Japan), Onaga Gas Light Company, Oswald, W. R. (Belgium), Ota, M. (Japan), Owen, Henry, & Co., Gwyn, Samuel, Gverbury, Henry, Page, Edmund, Paget, Charles E., Papier, Co., Paris, Cercle Parisien de la Ligne de l'Enseignement (France), Paris, Société de Médecine Publique et d'Hygiène Professionnelle (France), Paris, Société des Crèches (France), Paris, Société des Ecoles Infantiles (France), Paris, Société Protectrice de l'Enfance (France), Paris, Union Française de la Jeunesse (France), Paris, Ville de, Prefecture of the Seine (France), Parker, John, Parker, Smith, & Parker, Parkinson, W., & Co., Patent Durable Roofing Felt Co., Company, Limited, Patent Victoria Stone Company, Paton & Charles, Pearce, Robert, & Co., Pearson & Co., Peigniet, Chagnon et Cie (France), Peury, William John, Perkins, B., & Son, Petit et Damouhier (France), Petitjean Fils (France), Pelter, James, Pfeiffer, Carl (United States of America), Phillips, W., & Son, Biggott Brothers, Pignot & Dessert (France), Plunkett, the Hon. John W., Pooock, Alfred, Wilmer, Podger, H., & Sons, Porter, John H., Potter, T. G., Potter, Thomas, & Sons, Price's Patent Candle Company, Limited, Pringle, Robert, W. D., Pringle & Co. (India), Proust (France), Pulham & Son, Quayle, D. F., Quaden, E. (Belgium), Quirk, Barton, & Co., Radcliff, Dick, & Co., Ramsey, William, & Co., Reck, A. B. BUILDERS' BENEVOLENT INSTITUTION.

ANNUAL DINNER.

THE thirty-seventh anniversary dinner in aid of the funds of this Institution was held (as we briefly announced in our last) on the 6th inst. at the Freemasons' Tavern. Mr. Stanley G. Bird, the President, occupied the chair, being supported by Mr. Ewan Christian (President of the Royal Institute of British Architects), Mr. George Plucknett, J.P., and other friends of the Institution.

The usual loyal and patriotic toasts were given by the Chairman, Major Bruton responding for the "Army and Navy," and Major Stedall for the "Reservo Forces."

The Chairman, in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said he remembered the birth of the Institution in 1847. His father was the first treasurer, and the Institution began, like most things, in a small way. A few good and earnest men met at a small public-house in the neighborhood of Marylebone-road, and the Institution was the outcome of their discussions. After a time, Mr. Alderman Cubitt and Mr. Alderman Lawrence took an interest in it, and from that period its success was assured. If such worthy men amongst its founders as Mr. Cozens and Mr. Joseph Bird could see the great work now being done by the Institution, they would be both surprised and delighted. Since its formation the Institution had been managed by a band of earnest workers, and in looking through the lists he saw many familiar names, such as Mr. Stirling, Mr. Bolding, Mr. Bussell, and Mr. Nicholson. He mentioned these gentlemen because they were builders' merchants; and perhaps it was almost a reproach to the builders themselves that, belonging as they did to a trade which was the most important in the world, they should depend upon the support of merchants for aiding the Institution. But if this was a reproach to the builders, it was the greater honour to the merchants, who deserved earnest thanks for their great help and support. It was surprising that more builders did not belong to the Institution, because it might be termed an insurance society for them. One of the most recent of their candidates, Mrs. Austin, had been elected by her own vote, she and her husband having been liberal donors to the Institution. It had been stated that some of the candidates for election were not builders of the style or class they anticipated. He did not know whether people were desirous of seeing their friends becoming candidates for pensions, but, for his own part, he was always sorry to see even any name he knew in the list of applicants. At the present time there were twenty-nine male and twenty-nine female pensioners on the funds. The expenditure was about 2,400*l.* per annum, each male pensioner receiving 37*l.* and each female 27*l.* a year. The Institution had some 22,000*l.* invested in Consols; and if the conversion scheme were carried out they would lose about 60*l.* yearly in the shape of interest. To enable the treasurer to make up any possible loss and something besides, he asked them to contribute liberally to the funds of the Institution.

Mr. Howard Colls, in proposing the "Chairman

and President," said that Mr. Stanley Bird had perhaps done more for the building trade of London than any other man of the time.

The Chairman having briefly replied, Mr. Alfred Smith proposed "The Vice-Presidents and Trustees," coupling the toast with the name of Mr. Thomas F. Rider, who made a humorous speech in reply.

The Chairman proposed, "The Treasurer" (Mr. George Plucknett, J.P.), who, he said, was ever ready with advice and kindly help to advance the objects of the Institution.

Mr. Plucknett briefly responded, quoting words of a former friend of the Institution, Mr. Alderman Cubitt, as to the duty of builders, as of other tradesmen, to support the charitable institutions connected with their trade.

The Chairman next gave "The Architects and Surveyors." As they were favoured with the presence of the President of the Royal Institute of British Architects, he was sure they would join with him in appreciating most highly the kindness of Mr. Ewan Christian in coming to meet them. They might look upon it as a happy thing for the trade at the present time that Mr. Christian was at the head of the Institute, for this year the provincial masters had commenced negotiations to endeavour to bring about a better state of things with regard to the form of contract and tender. He would not enter into these matters, but it was a happy thing that Mr. Christian occupied the post, as all knew the high judicial character of his mind, and his great kindness of disposition. Therefore, when the builders came before the architects they would be met in a way which, he believed, would bring about a fair settlement of the matters they had so much at heart. As to the surveyors he (the Chairman) thought they ought not to be bracketed with the architects, for they were a sufficiently important body to stand alone, and he would be glad when the toasts were given separately. He coupled with that part of the toast the name of Mr. Franklin.

Mr. Ewan Christian, in responding for "The Architects," remarked that they and the builders were brothers in one sense, at any rate, being all engaged in one of the most important industries of the world. The chairman had told them that the builders employed a larger number of men than any other trade did; and in proportion to the number of men employed, so were the risks. Sir William Titie was never tired of saying how great were the risks of the architect, and that his profession was a most hazardous one. How much more did this apply to the builder, who required to be Argus-eyed to see all that was going on in the building he was erecting. Builders would likewise require to be endowed with an enormous amount of placidity in dealing with the highly - extolled British workman. Not that he had not the highest respect for a good workman. There were black sheep in every business. No set of tradesmen were so dependent on their men as were builders; for their good name could be readily taken away by the actions of their workmen. Most of them had read "Adam Bede." He (Mr. Christian) knew the hero of that tale, who was a carpenter by trade, named Evans, and he was so highly respected and sought after that people who had churches or houses to build would wait for years in order that he might do the work. Evans informed him that he always told his foremen on commencing work—"I cannot afford to lose at both ends. If I lose money I may replace it, but I cannot afford to lose credit; and upon that principle you must carry out your work for me." Architects were sometimes spoken of as a sort of policemen; while others thought the value of the architect was to get the most out of a builder. This had never been his principle. The architect should never be the mere tool of his employer, but rather an arbitrator between builder and client.

Mr. Franklin replied for "The Surveyors." If all architects were like Mr. Christian there would be little reason for separating the two professions. The time, however, was rapidly approaching when the necessities of the case would produce the separation which builders demanded and the interest of the public required.

Mr. R. Freeman gave the concluding toast ("The Committee and Stewards"), which was responded to by Mr. Phillips.

In the course of the evening subscriptions and donations amounting to 665*l.* were announced.

## THE ANCIENT PALACE OF WESTMINSTER.

It is not our intention to present our readers with a succinct historical sketch of the ancient palace of our kings at Westminster. This has been so carefully done by Smith & Brayley that, all we could do would be simply to repeat the information to be found in their volumes; but what we propose is to indicate as nearly as possible the localities of the various buildings and apartments mentioned in ancient documents. Some of these can be discovered, but the situation of others is more or less conjectural. The origin of the Palace of Westminster cannot be clearly ascertained, and the first authentic notices of this vast historical edifice refer to the time of Edward the Confessor, who certainly made this his principal residence, and either built or rebuilt the palace, which was both historically and structurally connected with the abbey. It is presumed that the Confessor's holdings surrounded the open space known as "Old Palace-yard" on the south, east, and west sides, and it is not improbable that the old building called the "Jewel Tower" or "Parliament Office" may have formed the most western portion of his palace. There were also portions of the substrucure of his holdings existing underneath the old House of Lords when that building was pulled down in 1832. This cellar gained great notoriety from its being the scene of that idiotic conspiracy known as the "Gunpowder treason."

William I. is said to have added the building known as the "White Hall," or "Court of Requests," and William Rufus erected Westminster Hall and other buildings to the north of the more ancient palace. Henry III., however, rebuilt nearly the whole of the Confessor's work, and even down to our own time, the "Prince's Chamber," the Parliament Chamber (House of Lords), the King's or Painted Chamber, were of his date. In addition to these he erected the Chapel of St. Stephen: the Pilgrimage Church called "St. Mary Le Pewe;" the oratories of the king and queen; the Antioch Chamber; and many other buildings, which were, however, all rebuilt at a later period.

In the year 1293 occurred one of those disastrous fires which have no less than five times reduced the greater portion of the old palace to ruins.

The Chapel of St. Stephen, which had been only just completed and decorated in a most costly manner, was entirely destroyed. Edward I. commenced its rebuilding upon a far more magnificent scale. Some writers have ascribed to Edward I. the credit of having erected this beautiful structure, and others have ascribed it to Edward III. Now the documentary evidence, which is very distinct upon this point, shows that Edward I. certainly commenced the chapel, and the works were continued during the unfortunate reign of his worthless successor, but so little progress had been made that in the seventeenth and eighteenth years of Edward III. the crypt was still in an unfinished condition, as we find accounts paid for paving and otherwise completing "the Lower Chapel." The whole of the upper chapel was certainly the work of Edward III., and the accounts for its building and decoration are still preserved, and form the most interesting series of documents of the kind in existence. Everything, including the costly pictures painted upon the walls, was paid for by day wages, the only exception being some of the statues. The names of the master masons, the painters, the stained-glass makers, and even the workmen, are given. It is difficult to say who is to be accredited with the design of this exquisite chapel, but possibly it may be ascribed to a certain "Master Thomas of Canterbury," who appears for many years to have been master mason, and who received far larger wages than any one else mentioned in the documents, even more than Hugh of St. Alban's, who was the principal painter.

The Court of Requests was almost rebuilt by Edward II., and an open-timber roof added, the walls being cramped with iron to support it. Possibly, also, the Exchequer Chamber, and its attendant apartments, were reconstructed at about this time, as also the "Queen's Hall," the "Gaul," the "Nursery Chamber," the king's and queen's private oratories, and other buildings. Many of these, however, were

greatly altered in the reign of Richard II., Henry VI., and Edward IV.

Richard II., as is well known, nearly rebuilt Westminster Hall, but more of the ancient Norman edifice of Rufus was allowed to remain than is usually supposed. In fact, what Richard did was simply to heighten the walls, add new windows, and the magnificent open roof. Unfortunately Smirke's restoration of the Hall in 1825-30 obliterated nearly every vestige of the old Norman work, and succeeded in robbing Richard II.'s work of much of its interest; and even Sir Charles Barry's addition to the south end of the Hall, though very fine in itself, has rather destroyed the character of this noble apartment. Before Smirke's restoration several of the old Norman windows remained, and the Norman string below the windows could be traced in many places. Until the removal of the Law Courts a year or two back not a single particle of the Norman building was visible; but that desirable work of destruction has brought to light much of the old Norman ashlar work, which we sincerely trust will be retained and preserved.

To the west of Westminster Hall were formerly a number of ancient buildings forming, together with the side of the Hall, a series of irregular open courts. The most important of these was the Exchequer Chamber, which was frequently rebuilt. We find it mentioned in Henry III.'s time. It stood to the south-west of the Hall. To the north of this was the "King's Fishmongery," probably the place where fish was dried and salted for the use of the palace; and still further to the north, on a line with Henry VII.'s Chapel, were three chambers, called respectively "Heaven," "Hell," and "Purgatory." The origin of these names, as applied to these chambers, it is impossible to ascertain. It is, however, not improbable that they may have been derived from some pictures or hangings upon their walls, such representations being not uncommon in the Middle Ages. It is somewhat remarkable that the late buildings of the Court of Chancery occupied their site, and were it not that the name of the first apartment, "Heaven," was inappropriate, one might be led to infer that the two later names were given in anticipation.

It is evident that the west side of Westminster Hall was never exposed to view, except from some small courtyards, where a great flying buttress or two grouped picturesquely with the surrounding buildings, and we cannot help regarding the throwing open to view of this long flank of the Hall as a decided mistake. It is certain always to look too low for its length, and as it was never intended to be seen at a distance, it cannot be regarded as a restoration of any ancient design or idea. Even now we would suggest the erection of a row of buildings to the west, between the Hall and St. Margaret-street, leaving a long narrow court in their rear, from which the walls and flying buttresses might be seen in sharp perspective, which was evidently the intention of the old builders.

To the south of Westminster Hall was and still is New Palace-yard. In olden times it was a vast irregular quadrangle, at first probably only surrounded on the south and west sides by high walls. As early, however, as the reign of Edward I. a lofty clock-tower and other buildings were erected on the south and east sides, and Richard III. built a magnificent and very lofty gateway to the west. The clock-tower and the gateway were both destroyed in 1706-1707. During the fifteenth and sixteenth centuries numerous houses, inns, and other buildings were intruded upon Old Palace-yard, and in the centre a great conduit was erected. The west end or side of New Palace-yard was formed by a series of irregular buildings, amongst which was the "Star Chamber," which gained such a discreditable notoriety in later times. It appears to have been either built or rebuilt in the reign of Edward IV. An ancient water-gate led from this end of New Palace-yard to the Thames; it is said to have dated from the reign of Henry III. All these buildings, however, were pulled down in 1836, and long before that time they had been so transformed by various alterations that it is impossible to speak with certainty as to their various dates.

It will be noticed at once, upon looking at our illustration, that both Old and New Palace yards were regularly enclosed courts, surrounded by buildings and enclosed by gates, so that no street passed through Westminster,

and in fact, King-street,—then the most important thoroughfare in the neighbourhood,—came to an abrupt termination with three gates, at or near to its northern end; that in the centre leading to the abbey precincts and the greater Sanctuary, that to the north leading to the "lesser Sanctuary," and that to the south into New Palace-yard. Old and New Palace yards were connected by a narrow lane, with gates at either end, called St. Margaret's-lane.

Numerous old apartments and buildings connected with the Palace are mentioned in ancient documents, amongst others "Antioch Chamber,"—why so called it is impossible to ascertain. The name, however, is evidently in some way associated with the "Jerusalem Chamber" and "Jericho Parlour" of the neighbouring abbey, probably all these names refer to the Crusades, and pictures of their exploits at the places named may have adorned their walls and originated the names which appear to us so singular.

The "Cage-room" is another ancient apartment mentioned. This is supposed to have been an aviary, and certainly overlooked the river; as a story is told of a parrot falling into the water, when, in imitation of some impatient courtier from whom he had heard the expression, cried out: "A hoat! a boat for twenty pounds!" A waterman hearing this picked up the bird and asked for the reward which it had offered. The matter was referred to the King (Henry VII.), who insisted upon the parrot being brought forward as a witness. The parrot had, however, learned a new saying in the meantime, and, when brought forward, to the intense disgust of the waterman, he called out: "Give the knave a groat!"

The offices of the palace, chandlery, bakery, slaughter-house, &c., appear to have stood to the south of the inner court of the palace, parallel with the Prince's Chamber; and the buildings called the constabulary formed the south side of the Old Palace-yard, with a gateway in their midst leading to the "King's Bridge," and Millbank. The "King's Garden," the tower near the "King's Garden," the "Queen's Hall," the "Maidenes' Hall," &c., are also apartments mentioned, but their site can only be conjectured. All that is known is that they were to the south of the Painted Chamber.

The Pilgrimage Church of "St. Mary-le-Pewe," or "Our Lady of the Pewe," stood to the south of St. Stephen's Chapel, between it and the Painted Chamber, and approached from either the one or the other. In fact, it is evident from descriptions of certain court ceremonials that in passing from the Painted Chamber to St. Stephen's Chapel the way was through the chapel of "Our Lady of the Pewe." A doorway which was discovered in the easternmost bay of St. Stephen's Chapel, was undoubtedly the way of communication between the two. The Chapel of Our Lady of the Pewe must either have been cruciform in plan, or have possessed projecting side chapels, as it contained three altars, which could not otherwise be accounted for in so small a building. The dedication is very peculiar. Some people have supposed that *Le Pewe* is the French "*le puits*" (the title); others that it is derived from "*puir*," "the well," from some spring or well having existed upon its site. We should, however, think that it was probably derived from *Le Puy* in France, where there exists a pilgrimage church of *Notre Dame de la Puy*. That our Norman sovereigns should have established this devotion in England is by no means improbable.

The buildings of the collegiate establishment of St. Stephen stood to the north of the chapel, and the beautiful old cloisters and double oratory are (with the exception of Westminster Hall) the only portions of the grand old historical palace now existing. They were the last works executed before Henry VIII. transferred himself and his court to his new palace of Whitehall, and were erected by the last dean, Dr. John Chambers, in 1526.

Magnificent as our modern palace of Westminster undoubtedly is, every one must regret the loss of such buildings as St. Stephen's Chapel, the Painted Chamber, the Prince's Chamber, and all the historical associations which cling to the ancient Palace of Westminster.

H. W. BREWER.

**BUSINESS PREMISES IN OXFORD-STREET.**

We publish this week an illustration of some new business premises completed in the spring, standing on the south side of Oxford-street, in proximity to the Marble Arch, on the Duke of Westminster's estate.

They consist of three sets of premises, those to the eastward being built for Messrs. Holland & Holland, coach-builders; those in the centre for Messrs. Tantz & Sons, tailors and breeches makers; and those to the westward for Messrs. Peal & Co., waterproof leather manufacturers and boot and shoe makers.

The buildings throughout are faced with red brick, and have Corsehills dressings, string-courses, and cornices. The plasters on the ground-floor are in polished red granite, with specially cast gun-metal caps and bases to Messrs. Holland & Holland's premises, having ornamental pilasters of iron on the upper stories, which have been supplied by Messrs. H. Young & Co., of Eccleston Iron Works, Pimlico.

The premises extend from Oxford-street to North-row, having an average depth of 130 ft. A considerable portion of the flooring is fire-proof, being formed of wrought-iron girders and rolled joists filled in with concrete, finished with asphalt on the surface, the ironwork being protected throughout.

For the purposes of the business of Messrs. Holland & Holland, a hydraulic lift has been constructed from the basement to the second floor, prepared to take the heaviest coaches, and this has been supplied by Messrs. Waywood & Co., of Falmouth-road, Great Dover-street, Southwark. The buildings are lighted in the centre by well-holes and skylights of ornamental character.

Messrs. Tantz & Sons' premises are heated throughout the workshops by hot water, and both this and Messrs. Peal & Co.'s heating have been executed by Mr. W. W. Phipson, of No. 1, Salisbury-street, Strand.

Messrs. Peal & Co.'s building is warmed throughout with low pressure steam, having special coils on each floor; and hydrants are furnished in various portions of the premises in case of fire, in connexion with street mains.

Special attention has been paid to the ventilation of the premises, and the extraction-shafts for the removal of foul air from the premises have proved very effectual.

The whole of the works have been carried out by Messrs. Collis & Sons, of 53, Moorgate-street, and Camberwell, from the drawings, and under the superintendence of Mr. Thomas Chatsfield Clarke, of 63, Bishopsgate-street Within.

**SEAFORTH CAVALRY BARRACKS, LIVERPOOL.**

HOSPITAL WITH CIRCULAR WARD.

The hospital which we illustrate this week, and which will be one of the accessories to the barracks now being erected at Seaforth for the accommodation of a squadron of cavalry, is one of a new type, the main feature in the design being the circular ward,—a form of hospital construction which, although recently used in one or two instances at home and abroad, has never, until now, been adopted by the British Government. The present Inspector-General of Fortifications at the War Office, however, Major-General Sir Andrew Clarke, R.E., has thought it desirable to introduce, as an experiment, this newest principle of construction into a small hospital, believing that the avoidance of angles internally, and the exposure of the external walls, in which adequate window-space is provided, to the influence of the sun's rays throughout the day, are points of the utmost importance in all buildings intended for the housing or recovery of the sick.\*

\* We have ourselves more than once expressed considerable scepticism in regard to the supposed advantages of the circular ward, but of course concur in the desirability of giving it full trial.—Ed.

The external walls throughout the building will be of brick, with a 24-in. hollow space formed in them; and the hospital, as will be seen from the plan, gives accommodation for eleven patients,—nine in the main ward, and two in the ward for special cases. The room for the orderly, or nurse, is conveniently placed between the two wards, with an inspection window into each, and the small ward has a window on each of three of its sides. The "annex,"—so-called,—contains water-closets, bath, wash-basins, and other conveniences, and these are cut off from the hospital in the manner described in the subjoined "instructions." The waiting-room is fitted with a hinged flap, at which such convalescents as are able to leave the ward may dine. There is a store for the sick men's packs, and a general store for clean linen, bedding, medical comforts, utensils, &c. The surgery is centrally placed near the main entrance.

The kitchen department is entirely cut off from the hospital proper, and any cooked provisions must first be passed from the kitchen into the outer air (under cover) before being brought into the main building; by this means no effluvia from the kitchen department can reach the inmates.

The quarters for the assistant-steward in charge are placed on the first floor, and, for the purpose of isolating his family and preventing contagion, are approached by a flight of steps outside the building. The quarters consist of a living-room, bedroom, small scullery, and a yard with accessories.

All rooms intended for habitation are ventilated by the admission of cold fresh air through movable loured ventilators connected with a duct in the external walls and by the admission of warmed fresh air from a chamber at the back of a Galton grate, the vitiated air being carried off by an extracting flue in the chimney-breast, fitted with one of Boyle's ventilators to prevent down-draught.

The circular ward is ventilated in the manner described in the instructions forwarded from the

War Office to the Commanding Royal Engineer of the District for his guidance, and which will also describe the sanitary arrangements.

It may be mentioned, with reference to the elevation, that it had to be worked out in accordance with the features already adopted in the other buildings now in course of construction within the harrack boundary at Seaforth.

#### INSTRUCTIONS.

##### Sanitary Arrangements.

A disconnecting pit is to be constructed at the most secluded spot available for the purpose, near where the hospital drain meets the main drain of the barrack. Such rain-water pipes the heads of which may be near, but not at a higher level than the window openings, should not be connected with the drains, but should discharge over gully traps. These rain-water pipes the heads of which are at a higher level than the window openings near them, or at some distance from any window openings, need not, on sanitary grounds, be cut off from the drains, but should act as ventilators to them.

The wastes from baths, sinks, &c., should discharge over gully traps. Those called "Dean's traps" are considered the best for the purpose. The first length of drain-pipe from such traps should be provided with a socket in which a 2-in. galvanised cast-iron ventilating safety-pipe should be fixed, and be carried up to the roof. Wastes from upper floors should discharge over open hopper heads, and the down-pipes therefrom should discharge over open gullies, as before mentioned.

##### Ventilation.

The upper or domed portion of circular ward to be ventilated by dormers fitted with louvres; each opening being provided with a hinged flap or shutter worked by lines and pulleys. The ceiling to be grouted at these points, and the openings fitted with movable perforated iron gratings, which, for the purpose of cleaning, are to be hinged at the lower, and fixed by screws at the upper, extremity.

The central extracting-shaft in this ward may be constructed in either of the following ways:—

1. In the manner above, viz.—By having two of the sashes at the top of the lantern hung on pivots for opening and closing, with lines and pulleys; and a perforated iron or zinc disc at the bottom, which disc should be made removable for the purpose of cleaning the shaft. This disc should be in two parts, with a hole formed in the centre for the passage of the ventilating pipe of the gas-pendant.

2. By having the openings fitted with louvres, provision being made for partially closing the shaft by a pivoted flap or diaphragm worked by cords or chains attached to a counterpoise weight, and running over pulleys. The counterpoise weight might extend to 10 ft. or so from the floor, and be worked by a hooked stick. This regulating diaphragm must be situated high enough up the shaft to be sufficiently clear of the gas and ventilating pipes of the pendant.

3. By having louvred openings, as before described, and the bottom of the shaft fitted with a box containing Boyle's ventilators on each of the four sides, the bottom of the box being closed and made of some incombustible material, such as fire tile, slate, or a slab of Keenan's material perforated for the passage of the ventilating pipe of the gas-pendant.

4. By a sunlight, the flue-pipe of which should be continued inside the ventilating-shaft, or embodied with it, in which case the construction should be of galvanised iron, together with a spiral of ornamental zinc, of similar character to that shown. The pipe may be packed with Keenan's non-conducting material wherever the heat is likely to produce inflammation.

The space for water-closets and urinal to be enclosed by half brick walls in cement, running up to the ceiling so as to prevent the emission of tainted air, but the partitions between water-closets and urinals may be of slate, and need not be more than 8 ft. 6 in. high.

The water-closets are to have each a hinged seat, with a false seat under, covered with 4 lb. lead, so that the water-closets might be available as slop-basins. The lantern over the lobby outside the circular ward to be formed in two compartments, the sashes of each compartment being made to open on centres.

#### SKETCHES BY A DISTRICT SURVEYOR.

ABBEVILLE, on the Northern Railway of France, is the first town of importance after Boulogne, and is famous as the place of meeting between Francis I. and Cardinal Wolsey, when Francis and Henry VIII. were about to league themselves against Charles V. There are several interesting old houses, with overhanging stories, in the town. The sketch represents the square, with the towers of St. Vulfran, a fine unfinished basilica, rising beyond.

Tours.—The staircase in the house of Tristan the Hermit (a familiar figure in "Quentin Durward") is entirely of brick. The courses I have been careful to give, both in number as well as form. I am not quite certain that the date is correct. I should put it a little later. I give, however, the local tradition as to date.

The other stone staircase is in the cloisters of Tours Cathedral, leading to the priests' room. It was sketched on the spot, but re-drawn from an assumed position, as it was impossible to obtain an actual standpoint from which both the unique handrail and the ceiling design could be combined without a violation of perspective.

T. E. KNIGHTLEY.

Leek.—Mr. Albert Vicars, of Scmerset-chambers, 161, Strand, London, is preparing the design for St. Mary's new R.C. Church at Leek, Staffordshire, for the Rev. Alfred M. Spelling.

#### COMPETITIONS.

Victoria Assembly Rooms, Burnley.—This (limited) competition has been gained by Mr. G. B. Rawcliffe, architect, 8, Ormerod-street. The building is to be erected on the site of Goodham Hill Mill, St. James'-street, the principal thoroughfare of the town. The area of the site is to be increased by means of iron girders carried across the river. The auditorium will be over twenty yards square, and, together with balcony and gallery, will accommodate 2,000 persons. There will be a proscenium and large platform with dressing-rooms and all necessary appliances for operatic and other performances. The total cost is estimated at 6,000l.

#### CROSIER AND PASTORAL STAFF.

Sir,—In reply to Mr. Slingsby-Stillwood's courteous letter on page 606, and to your own editorial comments on the communication with which I ventured to trouble you, may I be permitted to repeat what I have already said, that the distinction between a crosier and a pastoral staff drawn by many modern writers is indisputably erroneous, and is based on a false etymology. No such distinction is known to early lexicographers and writers, who on such a point are the only trustworthy authorities. It is quite beside the mark to quote Mrs. Jameson, Dr. Lee, "The Liturgical Reason Why," and other modern authorities, who simply copy one from another without going back to the fountain-head. Webster's Dictionary is, for such a purpose, absolutely worthless. Even Richardson—a somewhat safer guide, though his etymologies are his weakest point,—goes equally wrong here, deriving "crosier" from *croix*, a cup, "of which," he says, "it has the image on the top."

There is no question of the fact that the distinctive mark of archiepiscopal dignity was a staff, with a cross at the summit, usually borne before him processionally, even as a pastoral staff is borne before a bishop by his official, but also, like the pastoral staff, capable of being carried by himself. On sepulchral brasses or other monuments it is naturally found in an archbishop's hand as a symbol of his rank.

But this cross-headed staff, I repeat, is not the crosier, nor was it ever so called except by modern blunderers. The crosier and the pastoral staff are one and the same thing under different names; and the crosier has nothing to do with a cross. This is a simple etymological fact which no one who knows anything of the history of language will care to dispute. To substantiate what I say, I will quote Professor Skeat's words, "Crosier formed with suffix *er* from Middle English *croce* in the same sense of 'bishop's staff.' Old French *croce* 'a crosier; Cotgrave; modern French *croix*; Low Latin, *crocia*; old French *croc*, a crook, *not* from *cross*, to which it is only ultimately related." If, for convenience sake, people nowadays choose to make a distinction between the "crosier" and the "pastoral staff," they are at perfect liberty to do so, but they must be warned that it is in direct defiance of etymological truth.

EDMUND VENABLES.

The Precentory, Lincoln, Nov. 5.

Sir,—Referring to crosiers, I beg to hand you some extracts from heraldic writers on the subject.

Boutell says:—"Crosier, the cross-staff of an archbishop; distinguished by its form from the pastoral staff (with a crook-head) of bishops." Aveling describes it as "the cross-headed staff of an archbishop."

Cussans speaks of it as "a staff bearing a cross at the top, belonging to an archbishop," and says the bishop's staff is like a shepherd's crook.

On the other hand, Hugh Clark and Ellen J. Millington speak of the crosier as the bishop's or abbot's pastoral staff; and in other works of a minor character it is so described.

Parker says:—"The crosier of an archbishop was surmounted by a cross after the twelfth century."

I am inclined to think that Boutell and Cussans are the best authorities on this subject, but would like to see further notes about it from other correspondents.

JOHN BAGNALL.

Cheltenham, Nov. 5th, 1884.

\* \* \* These letters were unavoidably postponed last week.

#### ADMIRALTY AND WAR OFFICES.

Sir,—In your issue of last week [p. 622] illustrating my design, it is said "we give the two principal plans and a view, from the architect's drawing, of Mr. Porter's design," &c.

Will you allow me to say that my personal energies were devoted to the preparation of the plans, sections, and geometrical elevations, and that the perspective views were prepared for me by Mr. E. F. C. Clarke, of 7, Westminster-chambers, whose ability (as a perspective draughtsman and colourist, and also as an architect) is well known to the profession, and I trust will every year be better known to the world at large! THOMAS PORTER.

#### THE PLUMBERS' CONGRESS.

Sir,—Will you allow me to relieve the mind of Mr. Robert Gibson [p. 641], or any other clerk of works, by stating that as it is now about twenty-five years since I was a journeyman plumber, any remark made by me in reference to my contact with clerks of works then need not cast any depreciatory inference upon "clerks of work of the present day," as a quarter of a century may make a great difference, I do not think I used the word "journeyman," however, but "apprentice," and at the time I referred to many clerks of works, I believe, knew very little about plumbers' work; and even although a clerk of works were able to distinguish readily between "5 lb. and 6 lb. lead," or "7 lb. and 9 lb.," he would not be of much value in promoting good plumbers' work unless he knew a great deal more.

I think Mr. Gibson has been rather hasty with his letter, and drawn a very strained inference from my remarks, and one the context in no way conveys.

W. F. BUCHAN.

#### DERBY LUNATIC ASYLUM COMPETITION.

Sir,—There is a rumour in the air that one of the competitors in the Derby Lunatic Asylum Competition has had his design rejected on account of his estimate, 32,000l., being too high. This, of course, is too good a joke to be true, as I should suppose the Derby authorities would know from experience that nothing like that sum would be sufficient to carry out the work. This competition has remained undecided for a most unreasonable time; and I believe I am justified in saying that the whole of the competitors would feel more justly treated if a competent and independent assessor were called in to advise the committee not only as to the merits of the designs, but also as to the trustworthiness of the estimates. T.

Nov. 12th, 1884.

#### CHURCH BUILDING NEWS.

Bristol.—St. Andrew's Church, Montpellier, has been re-opened, after undergoing alterations and improvements. The work so far carried out under the improvement scheme consists chiefly of a modification as well as decoration of the nave and transept roofs, giving to the interior of the church an effect of lightness and brightness, as well as improving the acoustic properties of the building. The old western gallery, which projected some 23 ft. into the church, has been removed, and a new one constructed extending only half the distance, having a stone front supported on moulded and enriched arches, red Devonshire polished marble columns, foliated capitals, and enriched cornice. The carving has been executed by Mr. Wilmot. The solid partition and doors which originally stood in the entrance under the tower have been removed, and the walls and ceiling decorated by Mr. John Powell. A new staircase has been constructed to the gallery; also a new belfry floor and tower roof. Much, however, remains to be done. The walls of the nave and transepts have been dismantled as a ground for future decoration, and new seating is greatly needed in the body of the church. The contractor for the works now carried out was Mr. W. E. Walters, of Montpellier, the architect being Mr. John Bevan, of Unity-street, Bristol. The cost of the alterations up to the present is about 400l. Mr. Bevan has been appointed architect for the new Church of St. Alban, Ashtongate, Bristol.

St. Kew (Cornwall).—St. Kew is an out-of-the-way place some four miles from Wadebridge. In its old parish church of St. James there are many features which remind the architectural student of Somersetshire handiwork. The fabric was restored a few years ago at an expense of several thousands of pounds, and at that time a rood-screen was erected. It was not, however, rendered complete by the placing thereon of the cross which was so essentially a feature of all old rood-screens. This, how-

ever, has now been done. It is a foliated cross, made entirely of stone, English oak. The upright post and the arms are ornamented by holiday-carved crockets, and the eastern and western faces are panelled with tracery. Upon the one facing west at the junction of the cross-piece are the letters I.H.S. At the base is a triple array of crocketed pinnacles which are connected with and support the main portion by means of flying buttresses. The cross has been made by Mr. Harry Hems, of Exeter, from the designs of Messrs. Hine & Odgers, architects, Plymouth, under whose supervision the general restoration of St. Kew Church took place.

**Cross Inn, Llandeibio (Wales).**—The foundation-stone of the new Church of St. Michael and All Angels, at the village of Cross Inn, about two miles from Llandeibio, has been laid. The church will be Early Decorated in style. The architect is Mr. D. Jenkins, Gorlas, Llanarthney; the builder, Mr. Benj. Jenkins, Brecon; and the cost is estimated at about 1,000.

**Roath (Cardiff).**—St. Germain's Church, Roath, Cardiff, has been opened by the Bishop of Llandaff. The building is Gothic in style. It comprises nave, aisles, and chancel. Its internal dimensions are 120 ft. in length by 62 ft. in width. The chancel arch, from the floor level to the apex, is 55 ft. high. The roofs of the nave and north and south aisles are divided by Bath stone moulded arcades. The arches spring from eight massive moulded columns, 24 ft. high and 2 ft. 3 in. in diameter. The chancel is lighted by five millioned and traceried windows. The six-light east window has moulded millions and transoms supporting rich tracery. This window is a principal feature in the building. The roof of the chancel is carried by three moulded Bath stone columns supported by three-quarter Bath stone columns resting on moulded corbels. The south aisle is to be a chapel. The roof of the aisle is carried on Bath stone ribs springing from moulded corbels. From the aisle are doorways leading into the clergy and choir vestries. The floor of the south aisle is laid with wood blocks and huff tiles, divided by hands of Hopton Wood stone. Here is a small altar, approached by two steps laid between with dark blue slate and Hopton Wood stone. The altar is approached by six steps of slate filled with Hopton Wood stone and slates, the pattern giving the appearance of black and white marble. Under the choir stalls are laid wood blocks for the choristers to stand on. From the chancel arch is suspended a richly-carved rood, resting on a massive moulded beam, supported on two carved corbels, supplied by Messrs. Farmer & Bridley, of London. On the south side of the church is the organ-loft. This is approached by winding stone stairs. Above the chancel arch on the outside starts a small bell turret to the height of 50 ft. above the ridge, surmounted by a cross, in which is hung a bell, weighing about 10 cwt., supplied by Mr. Thompson, of Loughborough. The style of the architecture is thirteenth-century Gothic. The whole of the work is from the designs of Messrs. Bodley and Garner, of London, and has been carried out by Messrs. Shepton & Son, of Cardiff, under the supervision of Mr. David Knight, clerk of the works, at a cost of about 12,000. The church is heated by hot-water pipes, supplied and fixed by Messrs. Fox & Co., London, and the gas-fittings are by Messrs. Watts & Co., London.

**Sheffield.**—The parish church, St. Peter's, is about to be enriched by the addition of a carved reredos. The feature was included in the general idea when the church was restored, and Messrs. Flockton & Gibbs (with the late Sir G. Gilbert Scott, R.A., as consulting architect) then prepared a design for a reredos, which circumstances did not at the time allow of being carried out. The idea was not lost sight of, however, and now we learn that the original design, subject to some minor alterations and additions, is to be immediately carried out in its entirety. The reredos will be made of well-seasoned English oak, and Decorated in style. It will extend the entire width of the chancel,—i.e. some 21 ft.—and will rise at its highest altitude about 9 ft. The lines are all managed so as not to interfere with or block in any way the four-light window above. The central portion has three arcaded panels, separated by niches, above and over which will be a wealth of ornate and pinnacled work. At each side of this are highly ornamental arcades of six bays each, whilst the blank spaces bounding the great window will be

utilised by carrying up another arcade similar in character to that immediately beneath. The work has been placed in the hands of Mr. Harry Hems, of Exeter, whose name is so frequently mentioned in our columns that it may be interesting to state that in his early years he toiled in one of the dirtiest of Sheffield manufactories as a canteen's lad.

**Skelton-in-Cleveland.**—The Archbishop of York has consecrated the new church of All Saints, at Skelton-in-Cleveland, which has cost 13,000. The edifice is in all respects a striking contrast to the last-century parish church which it has replaced. The new church, the site of which is in the village, while that of the old church is some distance away, is capable of comfortably seating 700 adults. Seen from the outside, a striking feature of the church is its freestone tower, 24 ft. square, with large buttresses at each angle, and rising to a height of more than 80 ft. This tower, together with a peal of bells and a clock, has been built at the entire cost of Mr. J. T. Wharton, Skelton Castle, lord of the manor. The bells have been provided by Messrs. Taylor, of Loughborough. They number six, and weigh 79½ cwt., with a tenor bell of 23 cwt. The clock has 6-ft. dials, it strikes the Cambridge quarters, and has been supplied by Potts & Sons, of Leeds. The church was commenced at the beginning of 1881. The plan shows the building to consist of nave, with north and south aisles, choir, chancel, organ-chamber, and vestry. The walls are built of hammer-dressed freestone, principally obtained from a local quarry; the south front, the windows, doors, piers, and arches being of freestone. The principal entrance is at the west end of the south aisle, through a porch connecting the church with the tower. The style of architecture adopted is the Crayke Gothic of the fourteenth century in its later form of transition to the Perpendicular. The chancel has a fine east window of five lights, placed rather high in the wall, and beneath is a carved reredos of oak. The wood-carving has been executed by Mr. Hedley, of Newcastle. The floor of the chancel is laid with marble mosaic by Messrs. Burke & Co., of London. The roof is of pitch-pine. The walls are plastered, relieved with a deep oak panelling, with a moulded and carved cornice running round the building. The architect was Mr. R. J. Johnson, of Newcastle; the contractor, Mr. F. Caldwell, of Durham; the clerk of the works, Mr. Hindmarsh, of Middlethorpe.

**Aveton Gifford.**—The Parish Church of St. Andrew, Aveton Gifford, is one of the most interesting of South Devon churches. Walter de Stapledon was rector ere he became Bishop of Exeter in 1307. The church was generally restored under the direction of Mr. Elliott, architect, Plymouth, in 1869; until then the remains of a pair of fine old carved oak parclose screens occupied the two easternmost bays of the south arcade in the chancel. These were so sadly decayed, however, that they were removed, and have ever since been stowed away in the depths of the rectory cellar. It is to the credit of the rector that he has resolved to have these most interesting specimens of Medieval art workmanship carefully renovated, and once again placed *in situ*. With this end Mr. Harry Hems, of Exeter, has been commissioned to take them in hand. The two screens will each be about 12 ft. long and about the same height. The old work exhibits much delicate manipulation of an unusually clever character. It is all late fifteenth-century handiwork, the carving is crisp and vigorous, and although very much decayed is reported to be by no means past making good.

**Hunslet (Leeds).**—The new Church of St. Cuthbert, Hunslet, has been consecrated by the Bishop of Ripon. It is situated in Kirkland-street, Beeston-road, and is erected in the Early Pointed style, of fine red brick inside and outside, with stone dressings and terra-cotta enrichments. The plan of the church has been specially arranged to meet the contracted nature of the site, which is a short parallelogram. It consists of a nave, with clearstory, choir, sanctuary, and north and south aisles. The stone arcade of the former extends from the west to the east end as far as the sanctuary. The choir is raised four steps above the nave floor, and is enclosed by a low stone wall. The roofs are of pitch-pine unvarnished, covered with hoarding, felt, and light green Westmoreland slating, and having red ornamental Staffordshire ridge cresting. The doors throughout are laid with marble mosaic concrete. The

heating is by low-pressure hot-water apparatus, and the lighting by gas jets arranged along the clearstory. The pulpit is of Caen stone, on a base of blue stone. The font is a circular bowl of solid alabaster on a base and steps of blue stone, and enriched with blue stone and alabaster shafts, with moulded caps and bases. The church will seat 600 persons. The works have been carried out by Messrs. Longley Bros., of Hunslet; and their sub-contractors have been Messrs. Sharp & Harper, sculptors; J. Woffenden, plumbing and hot-water apparatus; J. Bond, lead windows; J. Appleyard, general stone carving, pulpit, and font; Wood & Son, painting, all of Leeds. The air-extractor was supplied by the Harding Ventilating Company; the marble mosaic concrete floors were laid by Messrs. Diespcker & Co., of London; the brass altar standards were supplied by Messrs. Jones & Willis, of Birmingham; the brass eagle lectern by Mr. Hodgkinson, of Coventry. The bell was cast and hung by Messrs. Mears & Stainbank, of London. The architects are Messrs. Perkin & Bulmer, of Leeds.

**Cork.**—An addition has been made to the eastern end of St. Mary Shandon Church, in the shape of a carved oak reredos, extending the entire width of the sacristy. The central part is higher than the two wings, and is divided into five compartments. They are supported by columns carrying carved capitals, over which runs a continuous cuspated arcading. The main cornice is embattled. In the central panels are the words, "This do in remembrance of Me." Each of the other four panels contains in the upper parts circular recesses in which are Tudor roses, whilst below are vesicles. In these latter are carved respectively in high relief Alpha and Omega, as well as wheat and the vine. The reredos has been made by Mr. Harry Hems, of Exeter.

**Walthamstow.**—The Bishop of St. Alban's dedicated on Sunday, November 2nd (the tenth anniversary of the consecration of the church), a chancel-screen, erected in St. Saviour's Church, Walthamstow, in memory of the late vicar, the Rev. T. H. G. Robinson. The interior of the building called for some relief to the unbroken vista looking towards the chancel and the coloured mosaic reredos on the apse walls, and the proposal to insert a screen of alabaster and marble was quite approved by the architect who had designed the church itself. The appearance of the reredos, with its blue background, is much enhanced by being seen through this warm coloured open framework of arches and tracery, the material having been specially selected from the Fand Quarries at Tuthury, in North Staffordshire, by the masons, Messrs. Dyke & Son, of Highgate-road. The pinth is of dark alabaster, inlaid with marbles. Cork red marble being used for the columns. An inscription is cut, in gilt letters, along that portion of the screen nearest to the stall occupied by the late vicar. The central archway is to be flanked by two guardian angels, for which the commission has been given to Mr. H. Armstrong, R.A., the architect of the screen being strongly of opinion that any sculpture introduced in a church should be the best that can be got. The bronze gates have been executed by Messrs. Hart, Son, & Peard, of Regent-street, who have also re-arranged the gas lighting. The whole has been carried out from the designs and under the superintendence of Mr. Edward J. Tarver, architect.

**Aberdeen.**—St. Andrew's Church, Aberdeen, has just acquired one of the handsomest sculptured reredoses in Scotland. It is constructed of Caen stone and Devonshire marble in the Early English style of architecture, and is intended to serve as a memorial to the late Bishop Suther. It has been made from the designs and full-sized detail drawings of Messrs. Pirie & Clynne, architects. The carrying out of the work was entrusted to Mr. Harry Hems, sculptor, of Exeter. The reredos is about 15 ft. high, and fills all the east wall beneath the window. In outline it presents three lofty stilted and crocketed gables, standing on the apex of the central one. At each side,—that is, upon the springing stones of this middle gable,—are other sculptured angels kneeling in adoration. But the most striking portions of the work are the three groups of sculpture in the round, which occur immediately over the super-altar. Immediately beneath this re-table is a tabernacle of delicately-wrought brass work, whilst on either side, in raised letters, is an inscription dedicating it to the

memory of Bishop Suther. The panel on the north side represents Our Lord blessing children. The south panel is about 7 ft. high. It is illustrative of the Sermon on the Mount. The central panel is devoted to a statue of Our Lord as the Good Shepherd.

#### ROMAN CATHOLIC CHURCH-BUILDING NEWS.

*St. John's Wood.*—The Church of Our Lady, Grove-road, St. John's Wood, was the first Roman Catholic Church built in London after the Emancipation Act, and one of the first Gothic churches of the Revival, the contract drawings being dated October, 1832. It was designed by Mr. J. J. Scoles. The church was re-opened on Sunday, Oct. 12th, after thorough repair and the erection of a new stone and alabaster altar, with a rich reredos of the entire width of the nave, and rising so as to form an architectural composition with the large triple lancet window. It is contrived so as to occupy the whole thickness of the wall, with pierced traceried openings to the staircase and passage behind, for access to the throne used in the rite of exposition. The floor of the sanctuary and chapels has been laid with parquet work. The whole of the works has been executed by Mr. Anstey, from the designs and under the superintendence of Mr. S. J. Nicholl, who was a pupil of Scoles, the original architect of the church.

*Clietheroe.*—Special services have been held in connexion with the dedication of the new Lady Chapel of the R. C. Church at Clietheroe. The chapel has been constructed on the right-hand side of the principal altar. In its main features it harmonises with the architecture of the church. The floor is formed of mosaic work, marble, and alabaster, and the pillars, arches, &c., of the chapel are of marble. Mr. S. J. Nicholl, of London, is the architect, and the work has been done by Mr. Anstey. On the right-hand side of the entrance there is an alabaster statue of the Virgin, and within the chapel there are three paintings by Mr. Joseph Bouvier, portraying incidents in her history. The first one on the background beneath the altar represents the "Tomb of Our Lady, and the ten Apostles showing St. Thomas where her body had been laid, but the body was not there, there being only flowers in the tomb." Behind the altar is a picture of the "Assumption." Higher still there is the representation of the "Coronation of the Virgin by the Angels in Heaven."

*Stahannon (Ireland).*—The foundation-stone of a new church at Stahannon, in the county of Louth, was laid on the 5th ult. The estimated cost of the new building is 4,000l., but before it is finished and fully embellished a good deal more than this will have to be expended upon it. The church, which consists of nave, sanctuary, tower, and porch, with priests' and boys' sacristies, is in the style of Gothic known as Early English. The total length of the church internally is 100 ft., of which 78 ft. 6 in. is given to the nave, and 21 ft. 6 in. to the sanctuary. The width of the nave is 28 ft. and that of the sanctuary 20 ft. clear inside measurement. The nave is lighted by eight lancet windows, with trefoil heads in the sides, and three large lancet windows in the west end, over the principal entrance door. The sanctuary is lighted by two lancets in flank, and by a large triplet window in end. The height of the side walls is 20 ft., and to apex of roof 45 ft. The height to top of cross on spire is 97 ft. 6 in. The chancel arch is richly moulded, supported on corbel shafts of polished granite, with angles carved in stone beneath. The roof of the nave is of open timber work, with arched and moulded ribs to trusses; that of the sanctuary is divided by moulded ribs into panels for future decoration. The work is being carried out by Messrs. Matthews & Colligan, contractors, Stahannon, under the superintendence and from the designs of Mr. William H. Byrne, architect, Dame-street, Dublin.

*Castleisland.*—On the 5th ult. the new church of Castleisland, Tralee, was opened for worship. There were seven designs submitted in competition for the erection of the church, and that of Mr. D. J. Coakley, South Mall, Cork, was selected. Mr. John Sisk, of Cove-street, Cork, was the builder. The church is built in the Early Gothic style, and is cruciform in shape. It consists of nave and aisles, chancel and transepts, with side chapels, vestry, porch, and

tower. The length of the building is 136 ft., 81 ft. across the transepts, and 65 ft. across the aisles. It is 60 ft. high. The tower stands at the south-western angle, and will be 150 ft. high. Neither spire nor heltry has yet been erected, and the portion of the tower erected is only the same height as the roof of the church. The church is built of local dark limestone faced, and the dressings are of a light grey chiselled limestone. The organ was built by Mr. Magahy, of Cook-street, Cork.

#### DISSENTING CHURCH-BUILDING NEWS.

*Glasgow.*—The Wellington United Presbyterian Church, in University-avenue, was opened on the 12th ult. The building, which is among the most notable of recent ecclesiastical buildings in Scotland, occupies a highly-favourable site, facing southwards, and overlooking the University grounds and Kelvingrove Park. The site is a corner one at the junction of Ann-street with University-avenue, and it extends to about one acre. The principal front of the church consists of a portico of ten fluted Corinthian columns, approached by an open flight of steps from University-avenue. The church itself is about 90 ft. by 60 ft. and 47 ft. high inside. Its general form is rectangular on plan, with a gallery recess at the south end, and an organ recess at the north, the latter being covered by a half-dome richly moulded and decorated. The ceiling of the church consists of three arched or vaulted spans springing from what have the appearance of two longitudinal beams stretching from end to end of the church, and without pillars. The sides of the ceiling are coved and groined, and the whole is enriched with arched ribs and panels. The construction of the roof is of a novel character, consisting of two malleable iron lattice girders about 80 ft. long and over 7 ft. deep, stretching from one end of the church to the other. Between these two girders the middle arch of the ceiling rises, and between the walls and the girders the side arches spring, and the ceiling is thus supported entirely on the girders and side walls. The roof-principals and purlins are also of malleable iron. The church is provided with side and end galleries, and seats 1,050 persons. To the north of the church are situated the hall, 50 ft. by 35 ft., with an end gallery, the library, 35 ft. by 21 ft., and session-house, vestry, ladies' room, and numerous class-rooms, together with a church-officer's house. The total length of the building, including the outside stair, is about 200 ft., and its width at the north end is 100 ft. The height of the apex of pediment above University-avenue is about 75 ft. The columns of the portico and side walls, of which there are twenty, are 35 ft. high and 3 ft. 6 in. diameter. The total cost of the building, exclusive however of the cost of site, organ, furniture, &c., is 15,000l. The stone used is from Overwood Quarry. The following are some of the leading contractors for the work:—masons, Messrs. James Watson & Son; wrights, Messrs. Allen & Baxter; slater, Mr. Wm. McEwen; plumbers, Messrs. Wallace & Connell; plasterer, Mr. R. A. McGilvray; heating engineers, Messrs. J. Combe & Sons; painters, Messrs. A. & J. Scott; glaziers, Messrs. Wm. Meikle & Sons and Messrs. W. & J. J. Keir; gasfitters, Messrs. D. & G. Graham and Messrs. R. Laidlaw & Son; ventilating, Messrs. J. G. Carrick & Co.; marble mosaic pavements, Messrs. Walker & Emley; wrought-iron railing and gates, Mr. R. A. Stoffert. In working out the iron girders of the roof, the architect consulted with Messrs. Wharrie, Colledge, & Brand, civil engineers, and this contract was carried out by Messrs. Arrol, of Germiston Ironworks. The organ has been built by Messrs. Forster & Andrews, of Hill. Mr. T. L. Watson, F.R.I.B.A., is the architect.

*Newlyn East (Cornwall).*—A new Wesleyan chapel has been opened at Newlyn East. It is Gothic in style. The external walls are of native grey stone with granite dressings. The plan is a parallelogram. The main front has a central gabled recessed doorway with three-light traceried windows over, flanked by buttresses raised somewhat higher than the roof, and finished with ornamental pinnacles. The chapel will accommodate about 600 persons, and when all the details have been completed it will cost about 1,750l., of which nearly three-fourths have been raised. The plans were furnished by Mr. John Emnor, of Newquay,

under whose superintendence the work has been carried out by Messrs. J. Hawkey (Newlyn East), Jury Bros. (St. Austell), and Best & Bennetto (St. Dennis and St. Endor).

#### STAINED GLASS.

*Emanuel College, Cambridge.*—The whole of the windows in the chapel of this college have lately been filled with stained glass. The style of the work is Classic, and the arrangement consists of rich figure work panelled, under canopies, with a framework of elaborate detail. Each window contains two figures of men celebrated in history for their great learning as types of scholarly character. They are arranged to commence at the east end, and read thus:—(1) Origenes; (2) Jo. Erigena; (3) John Colet; (4) Wm. Tindale; (5) Benjamin Whichcote; (6) Peter Sterry; (7) John Smith; (8) Wm. Law; (9) St. Augustine; (10) St. Anselm; (11) John Fisher; (12) Thos. Cranmer. The Rev. A. Rose, M.A., Bursar of the College, lent valuable assistance in providing the authorities with details for the landscape background for this part of the work. Messrs. Heaton, Butler, & Bayne, of Garrick-street, London, designed and executed the work, under the supervision of the architect, Mr. A. W. Blomfield.

*Uxbridge (Middlesex).*—A window in the Late Decorated style has been inserted in the west gable of the south aisle of St. Margaret's Church, and filled with stained glass in memory of the James family. The window was designed by Messrs. Charles J. & C. Herbert Shoppe, architects, Doughty-street, Bedford-row. The stained glass is by Messrs. Clayton & Bell, of Regent-street, the subject being the Ascension. The window is in five lights. The stonework was carried out by Messrs. Passnidge & Son, of Uxbridge.

#### The Student's Column.

##### ON THE CONSTRUCTION OF ROOFS.

III.

**C**OLLAR ROOFS are frequently found over old buildings of moderate span, such as the nave or chancel of village churches, where considerable height is gained in the interior by having the roof open to the ridge. In these roofs (fig. 6) the heads of the rafters R are generally

balanced on one another instead of abutting against a ridge-piece, and the feet are let into a horizontal wall-piece, W, with a mortise and tenon, and stiffened by means of the vertical strut, S, let into the underside of the rafter: the wall-piece itself is notched down on a wall-plate laid along the centre of the wall. The collar, C, is placed high up on the rafters, and also tenoned into them; the collar and rafters being further held together by the oblique braces, B. All these pieces are fastened by means of oak pins driven through the tenons. The strength of such a piece of framing depends upon the unalterable property of the triangle, of which figure there are five in the present example; for it is a principle in geometry that the angles of a triangle cannot change without a corresponding change in the length of the sides. As long, therefore, as the pins hold in the tenons the framework will be perfectly rigid.

*Curb Roofs* are commonly used for town houses, and are formed of two pairs of rafters instead of one pair, as shown on fig. 7. The rafters B, C, D, E, whose ends rest on the top of the wall, are nearly upright, and connected at the feet with the floor joists, C, E; their upper

ends are connected by ceiling joists or collars, B D, and support the rafters A B, A D, which are usually laid at a low angle of pitch. By this arrangement better rooms can be obtained in the roof than in the ordinary collar roof before described, without necessitating the carrying up of the walls higher than the floor level. The name "Mansard" is sometimes given to this form of roof after a celebrated French architect, who erected many roofs of the kind during the seventeenth century. The upper rafters having a low pitch are subjected chiefly to a transverse strain, as described under shed-roofs; while the lower ones having a high pitch may be considered to act as pillars, supporting the load of the upper roof, and to be subjected to a comprehensive strain only.

The amount of this load can be ascertained by adding together the lengths, A B, B C, in feet, and multiplying the sum by 66, which will give the load, W, down each rafter, B C. Then, if we divide W by 1,800, and multiply the square-root of the quotient by the length, B C, in feet we have the sectional area in inches of the upright rafters of fir.

For example, let B C be 10 ft., A B 8 ft.; then W is 18 multiplied by 66, or 1,188 lb., which, divided by 1,800, gives '66, the square-root of which is '812, and this, multiplied by 10, gives 8.12 square inches as the sectional area required, or the scantling of the rafter B C may be 2½ by 3½ for fir.

**Framed Roofs.**—When the span between the walls of a building is considerable, and the strength of the walls insufficient to bear much horizontal thrust, a *truss* is formed of timbers framed together in such a manner as to throw the load perpendicularly on the walls, and on this truss the common rafters and roof covering are placed. We have already shown how the rafters of a shed-roof can be supported on *principals* by means of *purlins*, and the same method is adopted in *framed roofs*. In fig. 8

let A C, B C, be the *common rafters* which carry the roof covering, P the *purlins*, which support them in the middle, and themselves rest upon the *principals* R. Then, in order to counteract the thrust upon the walls of the *principals*, their feet are framed into a horizontal *tie-beam*, T, to which they are securely held by iron straps placed obliquely, and bolted to the beams to prevent them from slipping. But as the tie-beam is liable to sag or bend in the middle from its own weight, and that of a ceiling, which it generally has to support, the upright beam K is introduced, and is called the *king-post*, into the head of which the heads of the *principals*, B, are framed so as to hold it up above the tie-beam. To this king-post the tie-beam is tied up by means of an iron strap passed under it, and bolted to the king-post, which prevents the sagging of the tie-beam. One half of the weight of the tie-beam is thus thrown upon the king-post, which has also to bear one fourth of the weight on the rafters, which is thrown upon it, by the ridge piece, C, resting upon its summit; and all this has to be borne by the *principals*. As the *purlins*, P, bring a heavy load to bear on the middle of the *principals*, a *strut* or *brace*, S, is fixed

between the foot of the king-post and the part of the principal immediately under the purlin, by which means a part of the load is conveyed to the king-post, and the sagging of the principal is prevented. The purlins are usually fixed square with the rafters, and to prevent them from sliding downwards, blocks of wood abutting against them are nailed down on the *principals*. The feet of the common rafters are notched and spiked to *pole-plates*, A and B, which are spiked and notched on the ends of the tie-beam, while at their centre the rafters are notched and spiked on the purlins.

We will now consider the part which each beam in this truss has to play, and the nature of the strain it is required to bear. The purlins have to support about half the weight of the covering, which acts as a distributed load and produces a cross strain upon them, as in the case of a floor-binder. The *principals* have to bear the strain of the king-post and of the loads at C and P, which act mostly in the direction of their lengths as a compressive force. They may, therefore, be considered as long pillars supporting a load acting down their axis. The king-post has to bear the vertical strain arising from the struts and tie-beam, and is subjected to a tensile or stretching force. It also sustains a compressive force at the joints of the struts and *principals*, which press upon its foot and head. The struts are compressed by the pressure they have to sustain of the load on the *principals*, and they may also be considered as pillars supporting a load down their axis. The tie-beam is strained by the outward pressure of the feet of the *principals*, which produces a tensile or stretching force upon the tie-beam in the direction of its length. When the tie-beam has to support the weight of a ceiling or floor the principal strain upon it will be transverse, as in the binder of a floor, in which case the tensile strain need not be taken into consideration, as a beam that can carry the weight of a ceiling will more than suffice to resist the thrust of the *principals*. If there is no ceiling or floor to carry, a wrought-iron rod with nuts and screws at the ends will serve all the purposes of a tie-beam. As the king is entirely under tension a wrought-iron bolt is often used instead of timber, and the heads of the *principals* let into a cast-iron head through which the king-holt passes, while its lower end is furnished with nut and screw to pass through the middle of the tie-beam and sustain its load, with corresponding cast-iron shoes for the feet of the struts.

The relation between the various strains on the timbers of the truss can be ascertained by a simple application of the mechanical principle known as the "Resolution of Forces," by which two forces can be found in any directions equivalent to a third force acting in some other direction. This is done by taking a straight line to represent the magnitude and direction of the third force, and describing a parallelogram with this line as the diagonal, and the direction of the other two forces for the sides. Thus, in figure 8, let P a represent the pressure at P, which is one-fourth of W, if W is the whole weight of the roof which rests on one truss; draw a c parallel to the strut P b, and a b to the principal P c; then P b represents the compression down the strut, P c that down the principal, arising from the load at P. If we draw the horizontal line P K, this will represent the horizontal pressure on the foot of the king at b, which is balanced by an equal and opposite pressure from the strut on the other side; the length, K b, represents the tension down the king-post from the strut, and as there will be a similar one from the other strut, twice the length K b will be the tension in the king-post from this cause. To this we must add half the weight of the tie-beam and any load it has to carry, and we have the total amount of tensile strain to which the king-post is subjected.

The strain on the king-post produces a compression down the *principals*; and if we take b d to represent the total strain on the king-post, the length P d will be the compression down the principal from this cause. There is also the load at C of one-fourth W, half of which is supported by each principal; and if the length K d represents one-eighth of W, and K e is drawn parallel to B C, then d e will be the compression down the principal from this cause. Adding all these amounts together we get the total compression down the principal, and can find its scantling as a long

pillar by the rule given in the articles on "Floors." If the trusses are 10 ft. apart and the load is taken at 66 lb. per square foot, the value of W in pounds will be the length (in feet) of one rafter multiplied by 1,320. The strain down the king-post will be one-fourth of W, together with half the weight of the tie-beam, which latter may be taken at 120 lb. per foot of length when it carries a ceiling only. This is the only part of the roof which is unaffected by the angle of pitch; it may be safely strained with 750 lb. per square inch of section.

The compression down the principal, when the pitch is 30°, will be half W, together with half the load of the tie-beam; and that down the strut S will be one-fourth of W. With these data the student can easily calculate for himself the scantling of the several timbers for roofs of various spans.

The graphic method of showing the strains on the parts of a truss by means of a geometrical diagram, which was introduced by the late Professor Clerk Maxwell, can be readily applied to a roof of this kind; the vertical strains at the several points being known, the other strains are shown by the diagram. To apply the method to a king-post roof, draw the vertical line A F (fig. 9), and take A F to repre-

sent on scale half the weight, W, of roof with its load of covering, &c., together with half the weight, w, of the tie-beam and ceiling. Measure (on same scale) A B to represent one-eighth of W plus one-fourth of w, which is the load at A (fig. 8); take B D to represent one-fourth of W, the load at P; take D C to represent one-eighth W, or half the load at C (fig. 8); take C E equal to C D, and C F to represent one-fourth the load of the tie-beam and ceiling, or half the strain down the king-post arising from the tie-beam.

Draw B b parallel to A C (fig. 8), and F b horizontal, meeting the former line in b; draw D d parallel to B b, and b d parallel to the strut S (fig. 8); draw E e parallel to the rafter B C (fig. 8), and draw the vertical line d e. Then B b represents the compression down the lower half of each principal, while D d is that down the upper half; b d is the compression down the strut, and d e is the tension in the king-post; the horizontal line F b represents the tension in the tie-beam. All these strains can therefore be measured accurately by the same scale as was used for the vertical line A F.

An account of this method, with an example worked out in detail, will be found in a paper on "Building Materials," by Capt. Seddon, R.E., read before the Royal Institute of British Architects on April 22nd, 1872, and published in the "Transactions."

For a roof of 20 ft. span the scantlings of the timbers when fir is used should not be less than as follow:—Tie-beam, 7 in. by 4 in.; principals, 4 in. by 4 in.; struts, 4 in. by 2½ in.; king-post, 4 in. by 2½ in. at the smallest part, and 4 in. by 5 in. at the head and foot; purlins, 7 in. by 4 in.; common rafters, 4 in. by 2 in. For a span of 30 ft. the tie-beam should be 9 in. by 5 in.; principals, 6 in. by 5 in.; struts, 5 in. by 3 in.; king-post, 5 in. by 3 in. and 5 in. by 6 in.; purlins and common rafters as before. In this case there should be two purlins on each side between the ridge and pole-plate, otherwise the purlins and common rafters must be made stronger.

PERSPECTIVE.

SIR,—Some weeks ago there was a paper in the *Builder* on "Perspective as applied to Architectural Drawings," showing a simpler method than that taught in Schools of Art. I am articulated to an architect, and have obtain

my full Certificate from the Department of Science and Art, and should be obliged if the writer of that article would show me how his simple plan could be applied to the plan of a drawing, and I have no doubt there are other readers of the *Builder* who would be equally interested in knowing.

R. M. C.

\*\* The principle as illustrated was really of general application in perspective problems, but we will take an opportunity of illustrating its further application to plan. We hope student readers who wish for further information in regard to any subjects treated in this column will never scruple to ask questions, which we shall always be happy to answer to the best of our power.

### Books.

*British Mining.* By ROBERT HUNT, F.R.S. London: Crosby Lockwood & Co. 1884.

**I**N his comprehensive treatise on the metalliferous mines of the United Kingdom, Mr. Robert Hunt has done ample justice to a subject of great importance, inasmuch as our minerals form a principal source of national wealth. Our mines are also of deep interest to the public at large, from the numbers employed in them and the capital embarked. The mines of England are among the oldest worked in the world, and have for many centuries been a field for the employment of honest labour and speculative capital, and from the earliest times when the Phœnicians came to our shores in search of tin, down to the present day, have been in constant activity, yielding large profits, and producing a mining population equal to any in the world, who have done more than any other miners in discovering and opening out the mineral deposits of new countries. With so vast and varied a subject it is not surprising that Mr. Hunt has written an interesting book, and with the opportunities he has had for obtaining correct information, in the capacity of secretary to the Royal Cornwall Polytechnic Society, and afterwards as Keeper of the Mining Records for many years he has been able to make his work not only interesting but useful, and instructive as well.

The volume is divided into four sections:—Historical Sketch, Formation of Mineral Deposits, Practical Mining, and the Future Prospects of British Mining.

The early history of mining in Cornwall is obscure and uncertain, as we have it carried down by tradition over long intervals of time, and the only records we possess of its past existence are the holes known as "Jews' pits," and the heaps of old refuse called "attal-Saracen." The so-called "Jews" of early times were probably Phœnicians, who may have owned and worked mines for tin. Certain it is that at a very early period the inhabitants of Cornwall were trading with Eastern people. After minutely chronicling the early events in the mining industry of Cornwall, Mr. Hunt says,—"The conclusion to which the examination leads us is that many centuries before the Christian era a trade had been established between the natives of Western Britain and Eastern Europe in the metal tin." Thus we must consider tin as the first article of commerce exported from England, and the Cornish miners the first traders in a country destined to become the greatest trading community of the world. The presence of tin gave to Britain a reputation for mineral wealth among the ancients which probably led to its conquest by Julius Cæsar. Certain it is that the Romans were in Britain, as in every country they conquered, active miners, and traces of their subterranean operations are to be found in every mineral field of the kingdom. Gold and silver were the metals most sought after by the Romans, and in England they knew of and possibly worked the gold-bearing rocks of North Wales, and certainly mined the lead mines extensively. They were in all countries energetic and successful miners, and worked the total absence of mechanical aid. They have left evidence of their mining industry in the old mines of ancient Dacia (Transylvania), Italy, Spain, Portugal, Germany, and, in fact, in every country they ever occupied. In England they must have mined the great heaps of cinders which were found in the Forest of Dean, and which are traced to their occupation. When they left England mining seems to have been

in abeyance, and Mr. Hunt remarks, "After the departure of the Romans from Britain we have for a long period no light to guide us in our endeavour to trace the progress of mining." It may be also said that after the fall of the Roman Empire the art of mining languished all over Europe. During the Early Christian period and Middle Ages the mines were neglected for other pursuits. The monks were not miners. The wealth they acquired was not by burrowing in the earth. The knights and land owners of the Middle Ages did not encourage or value mining. In Domesday Book no mention is made of a mine, yet the tin trade had been long established, and the Stannary Court originated in the time of Athelstane (A.D. 950). The Stannaries, or rights to mine for tin, were in the gift of the Sovereign, and bestowed on court favourites until in 1376 the miners obtained the sanction of Parliament to their rules and regulations. But very little attention was paid to mining until the reign of Queen Elizabeth, who bestowed much attention on them. Among other things, she granted, by letters patent in 1564, permission to certain German mining adventurers to search for and work mines in several counties in England and Wales. These German miners were the first to introduce the diving-rod, which for many years was firmly believed in by the ignorant and superstitious. During the seventeenth century mining progressed, though slowly; but early in the eighteenth it received a great impetus by the introduction of the steam-engine, first in 1705 by Newcomen, improved by Trevethick, and perfected by Watt in 1777.

From the very interesting historical sketch the author passes on to and discusses the abstruse subject of the formation of mineral veins and the question of practical mining. With reference to the latter subject, every practical miner will agree with Mr. Hunt's declaration that, "notwithstanding the attention which has been directed to the laws regulating the deposits of metallic ores, it must be confessed that we are still without any certain guide to the presence of lodes beneath the surface of the earth." The phenomena connected with the existence of mineral deposits in the earth are such that science, based on observation and experience, has hitherto failed to methodise them under any fixed laws, and hence no general rules for the guidance of miners have been successfully laid down. It is really impossible to prognosticate the value of any vein or lode many fathoms in advance or in depth of the actual face which is being worked. Hence the elements of uncertainty and expectation which constitute the charm of mining, but at the same time introduce the chance-like character of results to be obtained from a commercial view. The discovery of lodes is mostly due to accident. In many cases springs of water indicate by their aspect and component parts the near presence of minerals, and frequently veins show at the surface in a decomposed condition. The German miners have a proverb, "There is no lode so good as that which wears an iron hat."

In recent times new appliances have exerted so much influence as rock-boring machinery and powerful explosives. With these modern inventions time and labour are greatly economised. But the old stamp-mill still remains as perhaps the best of pulverisers in its improved form. It is mentioned in Agricola's "De Re Metallica," and is in the present day still employed in the newest gold-dressing plants.

In the last division of the book, "The Future Prospects of British Mining," Mr. Hunt reviews the gradual development of British mining, the necessary exhaustion of some of the fields, and the importation of foreign ores. It must, we think, be admitted that, with this array of facts before us, the prospects of British mining at present are not very promising. Mr. Hunt tells us that "the production of tin-ore, from surface-deposits, cannot much longer be regarded as likely to be of much value." And again, "The quantity of copper ore above 300 fathoms from surface cannot be large." The records of old workings show that the ore lying within easy reach of the surface has been worked out, and that we must be prepared to follow the ore veins to great depths in future. Mr. Hunt, in reference to this, remarks truly that "without great improvements in the principles of mining it will not be possible to work, at a profit, many of our deeper and more extensive mines."

We cannot leave this book without recommending it to all interested in mining. It is

full of facts and information, admirably classified, and the text is assisted by numerous well-executed illustrations.

*Die Lokomotiv-Feuerbüchse, gesammelt von JOHANN PECHAR.* Vienna: Spielhagen & Schurich. 1844.

TECHNICAL education in this country is now happily receiving some of the attention it has long deserved, but when we consider the great efforts made in the same direction by the various nations in competition, much still remains to be done to enable us to maintain successfully our supremacy as manufacturers.

Our attention has been called to the matter by the number of technical books and publications issued on the Continent during the last few years, more especially in Germany, which has in addition translated many English standard works. These books, in most cases, deal not only with the scientific side of the various questions, but enter into practical details. We have one of these before us, "Die Lokomotiv-Feuerbüchse." This illustrates the different systems of constructing locomotive fire-boxes, with special reference to the consumption of smoke and economy of fuel. The author commences with a series of notices, with illustrations of the different English systems of construction, but is apparently unaware that several of them are more or less obsolete. These are followed by others showing various plans pursued in America, France, Germany, and Austria, finally coming to the system Nepilly, which he especially advocates. Amongst the advantages claimed for this system may be mentioned that the atmospheric air necessary for combustion is raised to a considerable degree of heat before passing into the fire, thus allowing it to mix at once with the various gases, and so preventing in a large degree the formation of smoke. The fire-bars, furnace bridge, and draught can be readily adjusted to burn various kinds and qualities of coal to the best advantage, and the admission of the right quantity of air necessary for combustion regulated accordingly. The inclination of the adjustable fire-bars and bridge is altered as required by a lever worked from the foot-plate. Various tables are attached showing the results obtained from actual trials. The book consists of ninety-five pages only, and, even if we take some of the statements of results *cum grano salis*, it should still be of very considerable service to railway companies and others engaged in the construction or working of locomotive engines.

### RECENT PATENTS.

#### ABSTRACTS OF SPECIFICATIONS.

260, Improvements in Fireproof Floors. H. H. Bridgman.

The principle of this invention is chiefly to prevent draughts of air-passages under the flooring by closing up all spaces below the boarding, thus greatly reducing the chance of fire or the danger of burning. At equal distances played wooden fillets are imbedded in concrete. These fillets rest on the iron joists, and are dovetailed into the concrete, the top of the concrete is brought up level with the top surfaces of the fillets. On this upper or top surface, a layer of mastic, such as asphaltum, lime, and hair mixture, or other cohesive material or compound, is spread. As the successive portions of the surface are treated, the floor-boards are screwed or nailed on to the fillets. Of course, when grooved or tongued boards are used for the floor, nails or screws are not necessary, and the mastic material will serve to unite the whole of the floor-substances in one thickness from the floor above to the ceiling below into a solid cohesive and compact mass. Felt, sand, or blown slag may also be used for filling up the floor. The space between the floor and the ceiling may be reduced. The gain in safety is very great, as thus the air-passages under the floor are closed, while the cost of construction has been ascertained to be less, all things considered, than that according to the present method of constructing concrete floors.

661, Improved Ventilator, Edward Woolfeben.

The points aimed at by this invention are simplicity and economy in ventilation. It is chiefly serviceable for workshops or large rooms. A metal casing is fixed in the roof of the building which contains a hollow metal tube or cylinder, the upper and outer end of which projects beyond the casing and terminates in a cap or bowl of the hood form with a feather or tail to keep the opening facing the direction of the wind. The metal tube is perforated at its lower end, and projects into the room, and it is closed near the bottom of the tube by a hinged door or valve which is opened or closed by a chain to admit more or less fresh air as required. The casing round the tube is open and projects down into the room to be venti-

lated. The hot or foul air passes from the room up through this space, and is free to escape under a rain cover into the open air.

108, Improvements in Ventilators. Thomas Jones.

Simplicity is here the point aimed at, to prevent them getting out of order, and at the same time to insure their perfect efficiency. One form is adapted to admit fresh air, and the other to draw off foul air. The apparatus for drawing off the foul air consists of a box or case made of cast iron, with slot or orifices at or near the top of its front side, and a similar one at or near the bottom of the back. The case may be formed with a flange in front made the full width of the chimney, and of a depth equal to the thickness of the brickwork of the chimney-broast to which it is to be applied. The orifices may be covered with fretwork and ornaments with any suitable design. A hole is cut in the chimney-broast at the top of the room to be ventilated, and the chamber or case inserted so that the front side is flush with the inside of the wall of the room, and the back flush with the inside of the chimney, all irregularities and cracks being filled up with plaster and cement. It is maintained that a ventilator so constructed will syphon or draw off the hot vitiated air in the top of the room to be ventilated, and the smoke to enter the apartment. A similar case or chamber is made and fixed for the admission of fresh air, but on this a perforated metal plate is adjusted to form divisions, and cause the air to flow to the outlet leading it to the apartment.

APPLICATIONS FOR LETTERS PATENT.

Oct. 31.—14,393, J. Stansfield, Manufacture and Laying of Asphalt.—14,398, G. H. Brown and A. Brown, Domestic Fireplaces.—14,439, A. B. Joy and J. Lawson, Making Imitation Marble.—14,443, A. Putney, Wood Flooring, Ceilings, and Dadoes.

Nov. 1.—14,463, E. L. Stacey, After-flush to Water-closets.—14,480, H. C. Gilchrist and C. Bellamy, Gas Pliers.—14,482, J. Poireau, Wood-planing Machine.—14,487, H. Thompson, Stoves and Grates.

Nov. 3.—14,511, F. Cantz, Intermittent Flushing Apparatus.—14,514, W. Hentley and G. Hutchins, Raising or Lowering Builders' Materials, &c.—14,521, H. Curzon, Filtering Rain-water in its flow from Roofs to Tanks.—14,522, F. Jupp, Automatic Door-closer.

Nov. 4.—14,554, J. Trolley, Air-tide Ventilator.—14,567, G. Cornell, Dormer Windows.—14,585, W. Buckwell, Boring and Excavating Apparatus.

Nov. 5.—14,611, J. Howard, Automatically Regulating the Closing of Doors.—14,614, W. Corteseu, Opening and Closing Windows.—14,616, E. Shripston, Glazing Tools, &c.—14,618, A. Parkinson, Stench Traps.—14,621, J. Hatfield, Manufacture of Artificial Stone.

Nov. 6.—14,648, J. Samuel, Metallic Roofing Slate.—14,687, W. R. Lake, Supplying Fresh Air to Dwelling-houses.

PROVISIONAL SPECIFICATIONS ACCEPTED.

2,984, F. George, Connections for Lead Pipes, &c.—11,718, R. Stanley, Chimney Tops or Ventilators.—12,942, J. Dixon and G. Appleby, Links for Roofs.—13,018, A. G. Browning, Flushing Cisterns for Water-closets.—13,181, J. Rogers, Temporary Closing of Openings in Fireproof Partitions.—13,339, J. S. Bruce, Apparatus for Opening, Closing, and Locking Ventilators and Casements.—13,355, W. Smith, Waterproof Cement.—13,375, J. P. Main, Iron or other Metallic Roofs.—13,383, H. Smith and D. Smith, Window Fasteners.—13,626, E. Wood, Composition for Washing and Renovating Stonework.—13,684, S. Pooley, Machines for Sawing Timber.—13,700, G. Coultas, Pipe Joints.—13,779, J. Walker, Attaching Door-knobs to their Spindles.—13,907, E. Newman, Window-sash Fastener.—14,010, H. J. Cooper, Manufacture of Portland Cement.—13,379, A. Cliff, Improvements in Balconies.—13,430, P. A. Ames, Construction of Ceilings, &c.—13,364, C. Conzaga, Veneers.—13,692, A. L. Dennison, Cutting Wood for Parquetry and Marquetry Work.—13,914, J. James and C. James, Machinery for Sawing or Cutting Wood.—13,915, P. Rees, Protecting the Edges of Saws and other Tools when not in use.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

46, E. L. Garbett, Fireproof Building.—953, W. E. Bell, Plastering Machines.—1,707, E. W. Hastings, Manufacture of Portland Cement.—1,874, J. Swindells, Slitting Wood transversely or diagonally.—1,884, H. J. Johnson, Manufacture of Portland Cement.—13,021, A. McMillan, Door-springs.—13,053 and 13,054, W. H. Lindsay, Girders for Fireproof Structures.—1,200, P. Scholes, Construction of Fireproof Floors and Ceilings.—1,427, F. Brown, Window-sash Fasteners.—2,173, T. Atkins, Fixing Knobs and Handles, &c., to their spindles.—2,377, W. Beddows, Chimney-pots.—3,393, J. Elliott and F. J. Parsons, Manufacture of Artificial Stone, Paving Slabs and Blocks.—5,222, J. C. Bothams, Chimney-tops.

RECENT SALES OF PROPERTY.

Table with 2 columns: Property description and Price. Includes entries like 'Finchley—Elm Park-road, six plots of freehold land' for £400 and 'Brompton—Edith-grove, Ground-rents of 42l. a year' for 1,480.

Table with 2 columns: Property description and Price. Includes entries like 'Clapham—Thornton-road, Westfield House, and 3 1/2 acres, 40 years, ground-rent 62l.' for 2,125.

Table with 2 columns: Property description and Price. Includes entries like 'Newington-caseway—25 to 43 odd, Uxbridge-street, 24 to 39 even, Devonshire street, 13, 14, and 15, Linwood-place, and a ground-rent of 12l. a year' for 1,230.

Table with 2 columns: Property description and Price. Includes entries like 'Harrow—Palmerston-road, The Pops, freehold' for 560 and 'Bermondsey—32, Jamaica-road, 33 years, ground-rent 4l. 10s.' for 420.

Table with 2 columns: Property description and Price. Includes entries like 'Lillie-bridge—Lillie-road, Ground-rent of 10l. a year, reversion in 48 years' for 255 and 'Lindfield, Sussex—The Finches, and 26s. 3r. 29p. freehold' for 17,100.

Table with 2 columns: Property description and Price. Includes entries like 'Britton—1 to 5, Towally-cottages, freehold' for 1,100 and 'London Docks—80, 81, and 82, Pennington-street, freehold' for 695.

Table with 2 columns: Property description and Price. Includes entries like 'Chiddingstone, Kent—Little Sidcup farm, about 8 acres, freehold' for 800 and 'Hartley, Kent—A plot of freehold land, 4a. 1r. 22p.' for 85.

Table with 2 columns: Property description and Price. Includes entries like 'Limehouse—2, 3, and 4, Wilson's-place, freehold' for 550 and 'South Hackney—25, Gasland-terrace, 61 years, ground-rent 6l. 5s.' for 520.

Table with 2 columns: Property description and Price. Includes entries like 'Westminster—13, Great Queen-street, freehold' for 4,700 and 'Islington—127 and 129, Upper-street, freehold, area 5,600 R.' for 3,350.

Table with 2 columns: Property description and Price. Includes entries like 'Highbury—149, Eichenor-road, 50 years, ground-rent 7l. 7s.' for 670 and 'Upper Holloway—42, Kingsdown-road, 74 years, ground-rent 4l.' for 360.

Table with 2 columns: Property description and Price. Includes entries like '59, Grosvenor-road, 85 years, ground-rent 6l.' for 155 and 'Hamstead—57, Gayton-road, 84 years, ground-rent 8l.' for 780.

Table with 2 columns: Property description and Price. Includes entries like 'Clapham—6, Gaskell-road, 77 years, ground-rent 6l.' for 320 and 'Camden-town—13, Lyme-street, 54 years, ground-rent 8l.' for 560.

Table with 2 columns: Property description and Price. Includes entries like 'Islington—8, Albert-street, 75 years, ground-rent 6l.' for 340 and 'Mill-end—12, Chapel-terrace, 68 years, ground-rent 3l. 10s.' for 380.

Table with 2 columns: Property description and Price. Includes entries like 'Leytonstone—5, Albany-terrace, The Ruby Beer-house' for 400 and 'Stratford—25, Mansel-grove, 475 years, ground-rent 3l. 5s.' for 315.

Table with 2 columns: Property description and Price. Includes entries like 'Bermondsey—29-33, Hickman's Folly, freehold' for 800 and 'St. George's-in-the-East—18 odd, Xyle court, 48 years, ground-rent 17l. 10s.' for 215.

Table with 2 columns: Property description and Price. Includes entries like '17 and 19, Watney street, 13 years, ground-rent 16l.' for 210 and 'Ratchiff—4, White Horse-street, freehold and copyhold' for 345.

Table with 2 columns: Property description and Price. Includes entries like 'Bermondsey—44, Frean-street, 32 years, ground-rent 1l. 10s.' for 170 and '10-13, Drappers-road, 52 years, ground-rent 18l. 18s. 2d., and 25, Drummond-road, 49 years, ground-rent 4l.' for 1,100.

Table with 2 columns: Property description and Price. Includes entries like '23-31 odd, Drummond-road, 49 years, ground-rent 8l.' for 560 and 'Rotherhithe—76 and 78, Rotherhithe-street, freehold' for 560.

Table with 2 columns: Property description and Price. Includes entries like 'Croydon—Thornton-road, Chestnut Cottage, freehold' for 700 and '1 Thornton-road, Vine Cottage, freehold' for 175.

Table with 2 columns: Property description and Price. Includes entries like 'A Plot of Freehold Land' for 200 and 'Bayswater—98, Norfolk-terrace, 50 years, ground-rent 7l. 7s.' for 700.

Table with 2 columns: Property description and Price. Includes entries like 'St. George's-in-the-East—19 and 19A, William-street; 15, 17, and 19, Samuel-street; and 1, 2, and 3, Elijah-cottages; 17 years, ground-rent 32l.' for 580.

MEETINGS.

MONDAY, NOVEMBER 17. Royal Institute of British Architects.—Mr. Hugh Stanger on "The Architectural Treatment of Cupolas in general, and that of St Paul's in particular." 8 p.m. Leeds and Yorkshire Architectural Society.—Mr. J. Wright Common on "The Royal Institute of British Architects." 8 p.m.

TUESDAY, NOVEMBER 18. Institution of Civil Engineers.—Discussion on Mr. Jamieson's paper on "Electric Lighting for Steamships." 8 p.m. Scottish Society.—Inaugural Address by the President, Sir Rawson W. Rawson. 7.45 p.m.

WEDNESDAY, NOVEMBER 19. British Archaeological Association.—(1) Mr. C. H. Compton on "The Roman Bridge recently discovered in

the River Trent." (2) Mr. C. Lyman on "The Excavations of Hulton Abbey." 8 p.m. Society of Arts.—First meeting of the 131st Session. Opening Address by Sir Frederick Abel, Chairman of Council. 8 p.m. Royal Meteorological Society.—(1) Mr. Hugo Leopold on "A New Method of reading the direction of the Wind on Exposed Heights and from a Distance." (2) Mr. Alfred C. Walker on "The Injury by Lightning (April 28, 1884) to the Duke of Sutherland's Monument at Lillohall." (3) Col. the Hon. Arthur Barrall on "The Mechanical Characteristics of Lightning Strokes." 7 p.m.

FRIDAY, NOVEMBER 21. Architectural Association.—Mr. George Aitchison, A.R.A., on "The Prospects of Architecture." 7.30 p.m.

Miscellaneous.

Architecture in Relation to Landscape Gardening.—The sixth and concluding lecture on the above subject was delivered by Mr. G. Richards Julian, A.R.I.B.A., at the Crystal Palace School of Art on Wednesday afternoon. In continuation of that part of his subject which dealt with garden decorations to harmonise with Renaissance buildings, gate piers, bridges, fountains, pavilions, and seats were in succession considered. Modern architecture, commencing with the Greek revival, and tracing the influence of Sir Charles Barry and his introduction into England of the astyler form of the Early Renaissance, was then described, and followed by a short account of the Gothic revival. Coming to our own day, the rise of the so-called "Queen Anne" revival was reviewed, and present tendencies alluded to. In connexion with this, the lecturer said, "There is a strong feeling afloat that any system of design that may be attempted must be one founded on a due recognition of the needs, the habits, and the social circumstances of the nineteenth century." Mr. Julian then expressed his great satisfaction with the protest, which he had prepared in a letter from Mr. E. J. Tarver in last week's Builder, against the proposed execution of sham mediæval work in the building to be added to the side of Westminster Hall. Modern architecture in France was then described, from the time of Louis XV. to the present day. Defining the aim of the art of architecture as being, in common with all the fine arts, "the expression of that sense of heauty which is a part of human nature," the lecturer went on to point out that the lessons to be learned from a study of the history of architecture were,—that if we would be real artists we must be true,—true to ourselves and to the age in which we live. At the close of the lecture, the Principal of the School of the Art of Landscape Gardening, Mr. H. E. Milner, A.M. Inst. C.E., said that he thought on this occasion they must depart from their usual rule and give Mr. Julian a vote of thanks for his interesting lectures.

Builders' Benevolent Institution.—We would commend to the notice of our readers the work of the Builders' Benevolent Institution, some account of which will be found on another page. The Institution has now been in existence for nearly forty years, and has done much good work, but expression has more than once been given to the feeling that it is not so largely supported as it deserves to be by the class for whom it is specially intended, viz., "masters who have been engaged in the building trade and its branches." Some of the risks which are attendant on the pursuit of business by master builders were alluded to by Mr. Ewan Christian, in his speech at their dinner the other evening. The presence of the President of the Institute of Architects on this occasion, and the genial tone of his remarks, were much appreciated by the members of the trade who were present. We understand that a special appeal in aid of the funds of the Institution is about to be made to master builders.

The Royal Arms.—Mr. James Hill, of Queen Victoria-street, E.C., whose locks and patent door-furniture have been for many years largely used by her Majesty's Office of Works and other departments of the Government, has just received official intimation from the Lord Chamberlain authorising him to use the royal arms, coupled with the words "By Appointment to the Queen."

Public Buildings.—Her Majesty's Office of Works have placed the contract for the next three years and a half for the general repairs to all the Palaces, Houses of Parliament, Courts of Justice, Post-offices, and civil buildings generally in the London District, in the hands of Messrs. Perry & Co., of Tredegar Works, Bow.

**Accident at the Midland Railway Extension Works, Birmingham.**—What might have been an alarming and fatal accident if it had happened during working hours, occurred about 3.30 A.M. on Sunday last at the above works. As it is, it has had no worse effect than to stop the traffic on the Birmingham and Worcester Canal for a time and to fill the railway works with water and debris. The canal comes through that part of the town at a high level, and is carried on arches, having a street called the Gullet below. The new railway tunnel runs parallel to this street and at right angles to the canal, and the contractors, Messrs. Firbank, have been obliged to destroy a considerable section of the old water-way and arching to make room for the new tunnel and other works below; hut, for the purpose of enabling the traffic on the canal to be continued, they have formed timber aqueducts of just sufficient width to allow of the passage of one boat at a time, with a passing place in the middle of its length. The water in the canal was well stanked or dammed up with sheet piling and puddled clay. But as the excavations here go to a depth of some 30 ft. to 40 ft., the whole of the ground adjoining has shifted, and on Sunday morning, when a boatman was taking through his boat, the stank gave way, and let the water of the canal into the works. A provision had been made for such a contingency by having at each end of the aqueduct planks fitted in grooves to stop the water; but one of these barriers had been taken out to allow the boat to pass, consequently the canal emptied itself to the Barr Lock Gates, a distance of some 500 yards, filling the workings, which are still blind at each end, about 25 ft. deep with water and some 200 tons of soil.

**Output of Coal in New South Wales.**—The total output of the New South Wales collieries for 1883 exceeded 2½ million tons, the exact figures, 2,521,457 tons 1 cwt., being 412,175 tons in excess of the output for 1882, the average price per ton in 1883 being 9s. 6d., as against 8s. 11½d. per ton in 1882. There has been considerable activity in the search for coal during the year, and there is reason to believe that several new collieries will shortly be opened up. A new coal company has been formed, and has started working a seam of coal between four and five miles from the Mittagong Railway Station; and one has been formed to work a coal seam about three miles from the Erith Colliery; the seam is said to be 7 ft. or 8 ft. thick, and a seam of coal, 5 ft. thick, has been struck by boring about one mile south of the Erith Colliery. The Berrima Coal Company, while working the upper seam, is boring for another seam of coal some 60 ft. or 70 ft. deeper. A seam of coal is reported to have been discovered at Bungawalbin, about twenty-five miles from Lismore, but nothing has been done on it yet. A seam of coal, 2 ft. thick, containing 15 in. of good bright clean coal, was passed through at Grafton, at a depth of 183 ft., while boring for water. Coal of the best quality, and in very large quantities, is said to exist in the Coolah Valley.—*Iron.*

**Birmingham Architectural Association.** The annual *conversations* of this Association was held last week, at Queen's College, to inaugurate the opening of the eleventh session. There was a large loan collection of drawings from London in addition to those contributed by members, together with specimens of tapestry, wrought-iron, and other materials of architectural interest. The president, Mr. F. B. Osborn, opened the proceedings with an inaugural address, in which he entered minutely into the work of the various classes and the general progress of the Association. The following is the list of officers for the ensuing session:—President, F. B. Osborn, F.R.I.B.A.; Committee: Chairman, W. H. Kendrick; ordinary members of Committee, O. Essex, A.R.I.B.A., F. G. Hughes, A.R.I.B.A., C. E. Bateman, T. W. F. Newton, F. E. F. Bailey, A.R.I.B.A., H. H. McConnell, A.R.I.B.A., E. Wood; Hon. Treasurer, A. Reading, A.R.I.B.A.; Hon. Librarian, A. Hale; Hon. Secretary, Victor Scruton, 13, Corporation-street, Birmingham.

**Sanitary Assurance Association.**—At the ordinary Council meeting of this Association, held at 5, Argyll-place, W., on Monday last, Sir Joseph Fayrer in the chair, it was arranged for four lectures to be given on sanitary subjects during November and December, to which admission will be free.

**New Club Buildings in Piccadilly.**—On the north side of Piccadilly, not far from Hyde Park Corner, and overlooking the Green Park, an extensive block of buildings, designated the Badminton Club, is at present in course of erection. The buildings cover a ground area of 8,000 ft. The Piccadilly elevation is in Portland and Bath stone, and is 88 ft. in height to the apex of a bold and lofty gable, flanked with carved finials, at the east end of the frontage. The building contains five floors, the central portion of the ground-floor, to the depth of between 35 ft. and 40 ft., consisting of a large shop. The first, second, and third floors have millioned bay windows, with balconies. The fourth floor is lighted by dormer windows. The entrances lead to a flower court on the ground-floor at the bottom of the central area or well-hole. It is 27 ft. square, and is intended to have a floor paved with mosaic. Adjoining are several bath and dressing rooms, whilst at the rear is a servants' hall, together with kitchens and other apartments connected with the cuisine. On the first floor is the morning-room, an apartment overlooking Piccadilly, 38 ft. by 35 ft., and immediately to the rear, on each side of the octagonal open space above the flower court, are the card-room and smoking-room. At the extreme rear of this floor is the coffee-room, a lofty apartment 48 ft. in length, and 26 ft. in width, which is intended to be very richly decorated. The second, third, and fourth floors have each two sitting-rooms at the Piccadilly frontage, and there are besides upwards of forty bedrooms. The members' and strangers' billiard-rooms are on the second-floor. Mr. R. W. Edis, of Fitzroy-square, is the architect, and Mr. T. Boyce, of the Eagle Works, Hackney, is the contractor. Mr. Gregory is clerk of the works, and Mr. Brunton the foreman.

**International Exhibition, London, 1885.**—Under this title an exhibition is to be held at the Alexandra Palace next year, commencing about the 31st of March next, and remaining open for six months. A prominent feature in the prospectus is that 10 per cent. of the gross receipts from admission-money is to be set apart for distribution amongst the principal London hospitals. For this purpose a committee, composed of the following gentlemen, has been appointed:—Colonel Sir Herbert Sandford, R.A. (chairman), Admiral Sir Edward Inglefield, C.B. (vice-chairman), General Sir Michael Kennedy, K.C.S.I., Sir Henry Pitman, M.D., Sir Andrew Clark, bart., M.D., F. D. Dixon-Hartland, esq., M.P., and George Johnson, esq., M.D. The Exhibition, like those at South Kensington, will not rely simply upon the attractiveness of the exhibits, but will include amusements of a varied nature. The building and grounds are to be brilliantly illuminated by the electric light.

**Glasgow Philosophical Society.**—A meeting for the election of office bearers in the Sanitary Section of the Philosophical Society of Glasgow was held on the 5th inst., Dr. James Christie, A.M., in the chair, who was re-elected President for another year. Mr. W. P. Buchan was elected vice-president in room of Mr. Kenneth Macleod, whose term of office had expired. He was elected a member of Council. Dr. Eben. Duncan, past-secretary, was also elected a member of Council, the new secretary being Mr. William Church, jun. Dr. Christie promised to deliver his presidential address, on zymotic diseases, during the winter, and remarked that he fully expected that Glasgow would be visited by the cholera shortly, and that to make its visit as short and harmless as possible good sanitary precautions must be persevered in.

**West London School of Art.**—In connexion with this school, a travelling studentship, of the total value of 50l., is offered by the Painters' Company, from a fund given by Mr. William List, liverman of that company, for the encouragement of the study of coloured decoration. The conditions of the competition may be obtained on application to the Headmaster (Mr. John S. Rawie), at the School, 155, Great Titchfield-street.

**Dimensions.**—A correspondent in the building trade suggests that dimension-books of every class should be spaced with columns for time of day, wind, weather, and other natural conditions at the time of measuring. There is no doubt the statistics so collected would be very interesting, and probably in the long run useful, but we fear few practical measurers would be properly grateful for such an increase in the bulk of the measuring-book.

**Stamp Duty.**—We have received an official notice from the Commissioners of Inland Revenue, Somerset House, calling the attention of house agents, builders, and the public generally, to the law regulating the stamp duty on agreements for letting lands and unfurnished houses. From this notice it appears that such agreements are chargeable, not, as is often supposed, with the uniform duty of 6d. applicable to ordinary agreements under hand, but with the same rates of duty as if they were actual leases for the term and consideration mentioned, according to the following scale (if the term is definite, and does not exceed thirty-five years, or is indefinite):—

Not exceeding 5l. per annum	20	0	6
Exceeding 5l. and not exceeding 10l.	0	1	0
10l.	15l.	0	1
15l.	20l.	0	2
20l.	25l.	0	3
25l.	50l.	0	5
50l.	75l.	0	7
75l.	100l.	0	10
Exceeding 100l. for every full sum of 50l., and also for any fractional part of 50l. thereof.	0	5	0

Such agreements, if not drawn upon stamped paper, must be presented for stamping within two months after the date of the first execution thereof. After that time, a penalty of 10l. may be imposed. An unstamped or insufficiently stamped agreement cannot be enforced in any Court of Justice, or before any arbitrator or other competent authority. A lease made subsequently to, and in conformity with, an agreement duly stamped is chargeable with the duty of 6d. only. Postage-stamps cannot be used for stamping agreements for letting lands and unfurnished houses (other than dwelling-houses, or any part thereof, for any definite term less than a year, where the rent does not exceed 10l.), but such agreements must either be taken to Somerset House to be stamped with the proper impressed stamp, or be left for that purpose at the office of a Distributor or Sub-Distributor of Stamps, or of a Postmaster.

**Liverpool Engineering Society.**—At the meeting held on the 5th inst., at the Royal Institution, Colquitt-street, Mr. R. R. Bevis, jun., president, in the chair, a paper was read by Mr. W. E. Mills on "Steam as a Mode of Heating." The author began his subject by pointing out the advantages possessed by steam over hot water as a mode of heating large buildings. Steam, from its own elasticity, would permeate every part of the system of pipes in which it was employed equally, while water, being itself inert, required power to drive it, especially if the length of piping was at all extensive, and this involved the use of a boiler of considerable dimensions. Owing to the severity of the winters in America rendering some means of artificial heating absolutely necessary, even in dwelling-houses and buildings of moderate dimensions, more powerful than a hot-water apparatus could supply, steam had been adopted in that country to a great extent.

**Building Stone in Queensland.**—A correspondent writes:—"Hitherto, in the absence of any good building stone within a reasonable distance from Brisbane, it has been the practice to employ bricks, covered with cement to imitate stone, or, when a public building is erected, stone has had to be imported at considerable expense from New Zealand or New South Wales. Within the last few months, however, some excellent building stone has been discovered within fifty miles of Brisbane, upon the estate of Mr. Robt. Wm. Le Grand, J.P., at Wooyumbong, while excavating some cellars for a new house. This stone has been reported upon by the public analyst, and pronounced to be of a very durable and non-friable nature, so there is every prospect of its speedily taking the place of the stucco now so commonly employed. Bricks are now fetching from 40s. to 50s. per 1,000, and cement is selling at 16s. to 17s. 6d. by cask of 400 lb."

**Society of Arts.**—The first meeting of the hundred and thirty-first session will be held on Wednesday next, when the opening address will be delivered by Sir Frederick Abel, Chairman of the Council. Among the Cantor lectures promised for the ensuing session are series on the "Use of Coal Gas," by Mr. Harold B. Dixon; on "Artists' Colours," by Mr. J. M. Thomson; and on "Carving and Furniture," by Mr. J. Hangerford Pollen.

**The Supply of Teak.**—A special prize of 50l. has been awarded by the Executive Committee of the International Forestry Exhibition to Mr. W. T. Oldrieve, of H.M. Office of Works, Edinburgh, for his essay upon "Maintaining the Supply of Teak."

Bedminster (Brisol).—The corner and memorial stones of the new schools in connexion with Hebron chapel have been laid. The premises are intended to accommodate 1,000 scholars. The site is at the back of the present chapel, and, extending north to Lion-road, has a frontage of 40 ft., the depth to the chapel being 116 ft. On the ground-floor there is to be a large room open to the roof, 71 ft. by 25 ft. Here will be the secretary's room, library, boys' and girls' entrances, &c. The first floor is to be arranged in two tiers, providing fifteen classrooms. The front of the new building will be in the Elizabethan style, and the whole will be built of brick with freestone dressings. Mr. A. H. Beaven has accepted the contract for £2,955.

Examination of Local Surveyors and Inspectors of Nuisances.—At an examination held by the Sanitary Institute of Great Britain on the 6th and 7th of November, twenty-seven candidates presented themselves,—eight as local surveyors, and nineteen as inspectors of nuisances. The Institute's Certificate of Competency to discharge the duties of local surveyor was awarded to Messrs. B. R. Phillipson, J. Eworth, and Gilbert Thomson; and Certificates of Competency to discharge the duties of inspectors of nuisances to Messrs. W. Daley, J. Brooks, J. Houghton, J. Keal, T. Wheat, W. Fraser, J. Loach, J. Marshall, F. S. Winsor, J. T. Simpson, A. H. Rollinson, and Ben. Potter.

Fire-resisting Floors.—We have received from Mr. H. H. Bridgman, the architect for the new block of the St. Pancras Workhouse, a report made by Captain Shaw, at the request of the St. Pancras Board of Guardians, on the fire-resisting qualities of the building, which is floored on Clark & Bunnott's "Ligno-concrete" system. Captain Shaw reports very favourably of this and of the fire-resisting properties of the building generally. The St. Pancras Guardians, in asking for a special report by the chief officer of the Fire-brigade, have set an example which might well be followed in similar cases.

Fire at a Builder's.—Early on Thursday morning last, a fire occurred on the premises of Messrs. J. Simpson & Son, builders and contractors, Paddington-street. A building, 50 ft. by 30 ft., and workshops and stacks of timber in the yard, were destroyed.

The Patent Laws.—At a meeting of the executive council of the Inventors' Institute, held at their rooms, Lonsdale-chambers, Chancery-lane, on Monday last, it was resolved "that the first meeting in every month should be devoted to the consideration of the Patents, Designs, and Trade Marks Act of 1853; that the Act should be gone through regularly by sections; and that a report should be drawn up of the result of the discussions; and that visitors should be invited to attend these meetings. The first meeting for the consideration of the Act will take place on Monday, December 8th.

Hydraulic Power.—Messrs. Clark, Bennett, & Co., Limited, have just completed fixing their hydraulic lifts to the General Post-offices at Manchester and Liverpool, and have received instructions from the Corporation of Birmingham to fix one of these lifts at the Smithfield Market, Birmingham.—Messrs. Archibald Smith & Stevens, of Queen's-road, Battersea, have been instructed to erect, for Messrs. Spiers & Pond, at the Windmill Restaurant, Cannon-street, one of Stevens & Major's patent hydraulic suspended lifts, to be worked in connexion with the Hydraulic Power Company's mains.

Hampton's Home for Indigent Blind People.—This institution, situate at Putney Bridge-road, appears to be doing a good work. Provision has lately been made for fifty additional beds for aged blind persons without means, and we are informed that the recipients of its benefits include members of all branches of the building trades. The committee are making strenuous efforts to extend the work, but for this funds are needed. As will be seen by an advertisement in our present issue, a concert in aid of the institution is to be held at the Horns, Kennington, on Wednesday next.

Leeds and Yorkshire Architectural Society.—At the second meeting of this session on the 17th, Mr. J. Wreghitt Common will read a paper on "The Royal Institute of British Architects." Among further papers announced are "English Homes in the Seventeenth Century," by Mr. J. A. Gutch (January 12th); "Architectural Competitions," by Mr. Cole A. Adams (February 23rd); and "The Architecture of the Last Half-Century," by Mr. Walter Smith (March 23rd).

For alterations and new fittings to the ground floor of the Alfred's Road public-house, Newington-causway, for Mr. H. R. Cope. Mr. C. Barnard, architect.

Table with columns: Alterations, Parlour, Mshogany Bar. Includes items like Shurmer, F. W. Gill, Canning & Mullens, Mower, J. Beale, W. & F. Croaker, Saunders & Son, Waine, Heath.

Table for proposed public hall, Greenwich. Mr. W. Rickwood, architect. Columns: Quantities supplied, Mower, Proctor, A. White & Co., Stages & Son, Pack Bros., R. & G. Evans, Lonerag, H. & L. Holloway.

Table for paving Ravensbourne-street, for Greenwich Board of Works, as a new street.—Includes Marshall, Woodham & Fry, Mowlem & Co. (accepted).

Table for making new road at Walkhamstown. Messrs. H. & F. Houghton, surveyors, Gid Broad-street.—Includes Pound, Bloomfield, Wilkon, Bell, Woodham & Fry (accepted).

Table for alterations to the Globe, Goldsmith-row, Hackney-road, for Mr. F. Herbert. Mr. Edward Brown, surveyor, Hanbury-street, Spitalfields.—Includes Kiddie & Sons, J. Anley, J. C. Christopher, C. Marr (accepted).

Table for restoring the Coat and Badge, Chisip-street, Poplar, for Messrs. Truman, Hanbury, Buxton, & Co. Mr. Ed. Brown, surveyor.—Includes C. Marr, D. & A. Brown, S. Salk, S. W. Hawkins (accepted).

Table for pulling down one and making alterations and improvements to five cottages on the new Nisden Estate, Surrey, for the Trustees of the estate. Mr. J. R. Gover, architect.—Includes Scharien & Williams, Jones & Edwards, Wood & Co., Davis, Saunders & Co., Knapton & Harding, Stewart & Co., Watt, Robinson & Miller, Heyes, J. Robinson, Kinsold (accepted).

Table for cottage residence, Sand Tannery, near Woking, Surrey, for Mr. Samuel H. J. Ashford. Messrs. Peak, Lunn, & Peak, architects, Guildford.—Includes R. E. Downes, Guildford, Whitburn, Woking, Christmas, Ripley, Shears, Woking, Bauham, Stoughton (accepted), Wilson, Woking (withdrawn).

Table for pair of cottages and small stable, &c., Martyr's road, Guildford, for Mr. R. Shillingford. Messrs. Peak, Lunn, & Peak, architects.—Includes Butt, Woking, C. & E. Smith, Guildford, Strudwick, Guildford, Billimore & smuth, Guildford, Tribe & Robinson, Guildford, Sayer, Guildford, Gley, Worplesdon, Skuss, Guildford, Elliot, Guildford, Curington & Peto, Guildford, Banham, Stoughton (withdrawn).

Table for new entrance lodge, Summersbury, Shalford, near Guildford, for Mr. Edwin Ellis. Messrs. Peak, Lunn, & Peak, architects. Quantities supplied.—Includes Pink, Milford, Wells, Bournemouth, Mitchell Bros, Shalford (accepted).

Table for rebuilding 59, Broad-street, Ratcliff. Mr. J. Sargeant, architect. Quantities supplied.—Includes Deacon, Parker, Hack, Richards, A. White & Co., W. Holt, Oliver, Jones & Edwards, Doughty, Scharien & Williams, Weir.

CONTRACTS AND PUBLIC APPOINTMENTS.

Epitome of Advertisements in this Number.

Table with columns: Nature of Work, or Materials, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, Page. Includes Street Watering Posts, Blue Gneasy Granite, Main Sewerage Works, etc.

Table with columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in, Page. Includes Assistant Surveyor, Finchley Local Board.

Table with columns: Name, Amount. Includes W. Hodgson, Ride & Son, H. B. Gidrey, S. J. Dainton, G. & W. Watson, W. Gidrey, A. Harris, W. Taylor & Co. (accepted).

Table with columns: Name, Amount. Includes For taking down 174, Commercial-street, Newport (Mon.), Jones & Co., Gloucester, Forsa, Bristol, C. Miles, Newport (accepted), W. Blackburn, Newport.

Accepted for the erection of "Barrack" buildings at Plymouth, for the Salvation Army. Mr. E. J. Sherwood, architect and surveyor, 101, Queen Victoria-street. Quantities by architect: Isaac Foot, Notte-street, Plymouth £2,150 0 0 [Architect's estimate, £2,127.]

For "Barracks" built, Yorkshire, for the Salvation Army. Mr. E. J. Sherwood, architect. Quantities supplied: Wm. Holt, Cheetham, Manchester, £1,750 0 0; E. Chadwick & Sons, Steinstcliffe, Dewsbury, 1,816 0 0; Parker & Sharp, Bradford-road, Batley, 1,599 9 4; Gartwaite & Blackburn, Halifax, road, Dewsbury, 1,532 15 2; Henry Brooke, Knottingley Wells, Batley \* 550 10 0 \* Joiners' and carpenters' work only.

For the construction and erection of a Propagating House at the Abbey Park, Leicester, for the Corporation of Leicester. Mr. J. Gordon, Borough Surveyor—  
 Bowles & Son, Leicester ..... £239 5 0

### Earthquake and English Architecture.

**T**HE shock of earthquake felt in Yorkshire at 5h. 10m. p.m. on the 14th of November current was an alarm rather than a disaster. But it was an alarm, in the true sense of the word (that is, a call to arms), which it would be folly to neglect for fear of being called alarmists. Coming after the more serious shock felt some little time since in Essex, it is enough to show that we have no reason to place implicit reliance on that secular impunity from seismic action which we have so long happily experienced. Geology appears to indicate that the subterranean energy acts through great cycles of time, of the cause and the measure of which we are ignorant. And at all events it is indisputable that the geological strata of England which were deposited before the great upheaval of the North of England (the seventh of the great seismic elevations traced by D'Orbigny), have been in some places shattered by earthquake in a manner to which we know no parallel. When the line of the South Wales Railway, which runs through a district of great geological antiquity, was in course of construction, it became important to utilise the stone of the country for the construction of the railway bridges and stations. Between Carmarthen and Haverfordwest quarry after quarry was opened for this purpose, but opened only to be abandoned. Hard grit stones of the carboniferous series were met with, and on the first baring of the surface it appeared as if the quarrymen only encountered such schistose or laminated beds as often form the upper strata of sound rock, as, for instance, in the oolitic beds of the Cotswold range. But as depth increased, and the expense of quarrying augmented, the desired thick and sound beds failed to appear. Stone there was in abundance, hard and durable, but so shaken in its structure as to yield no blocks fit for the service of the builder. The expense thus caused was considerable; and it ultimately proved that it was only in the mountain limestone, or in those peculiar beds which in Pembrokeshire bear the name of calp, that stone fit for railway bridges could be expected with any certitude. The beautifully coloured sandstones of the trias, which had been used by Nash for the restoration of St. David's Cathedral, were brought, at great expense, from the vicinity of St. David's, for the sills and

quoins of the station buildings at Haverfordwest. These beds, deposited after the period of upheaval to which we refer, were regular and unshaken; they worked freely, and yielded the most beautiful results when freshly wrought. But they had no durability. They began to decay, as they had done in the cathedral, almost as soon as the buildings were completed, and were only saved from crumbling away by being painted over with a liquid silicate. This, of course, is beside the question of earthquake; but it forms part of the experience collected that shows how violent was, at an early period, the seismic action in this part of England. Much the same experience was attained, about the same time, in Cornwall, where quarries of the most beautiful green and red serpentine, bought and wrought at high prices, were found to be so shaken throughout as only to afford materials for articles of very small size; the slabs and columns which were confidently expected being entirely unproducible from the quarries. England, then, at a remote period of time, must have been, at least in some parts, as repeatedly and violently shaken by earthquakes as any part of the world of which we have the geological record. That a seismic period may be again setting in is, although we trust highly improbable, at all events not impossible. As to the effect of any such change on the houses of many of our vast centres of population, it is perhaps useless to inquire. But the case is different when we remember that there are from 30,000 to 50,000 houses now in course of construction in England and Wales, and that, taking the year round, we daily turn out upwards of 200 houses in every successive week. With regard to, at all events, some of them, the architect will do well to inquire, "How do they build in countries known to be subject to earthquake?" The destructive force of earthquake is encountered by the architect in three different manners. In Italy, earthquakes are recurrent. They are nowhere unknown in that peninsula, and Calabria is the very cradle of the scourge. And it may be added, as illustrating the coincidence of the shock of the 14th with a high state of the barometer (which we found to read 30.78 in. at 200 ft. above sea level on the morning of the 15th), that in Italy it is said that earthquakes may be expected if the mercury of the barometer approaches the height of 31 in. The precautions of the Italian architect take the form of giving to his work a solidity to which we are unaccustomed in England. In Naples a house,—most of them are of very large size,—is built with the purpose of standing, without very material repairs, for 100 years. Within that time it is anticipated that it will be more or less damaged by earthquake. But the readiness

with which the Italian mason, commanding as he does such admirable mortar and cement, fills up cracks and underpins settlements caused by earthquake, should be seen to be appreciated. The noble palaces of Naples and of Caserta, the work, if we do not err, of Van Vitelli, show seams and cracks that can readily be referred each to its special year of earthquake. We cannot, at the moment, state the thickness of the walls. But in the palace which, during the Spanish occupation, was reared for the viceroy of Naples, about the time that the straight course of the Toledo high street was run north and south through the whole length of the city, the walls, we can state from personal knowledge, in the basement story are as much as 17 ft. thick. It is true that the immunity that Naples enjoyed from damage by the earthquake of 1858, which killed 30,000 people in Calabria, in which occurred no fewer than twenty-seven shocks, and which raised the whole circuit of the Bay of Naples 8 in. in level, in one night, as indicated by the water-line of the Mediterranean, was ascribed, by the terror-struck inhabitants, to the special interference of St. Januarius and St. Orosius, whose statues are fixed on a bridge, with menacing gestures directed towards Vesuvius. But it may be conceded that the massive structure of the *palazzi* of Naples had something to do with the escape. We may well doubt whether many buildings in London would have survived such a shock as that.

In Japan, which is another earthquake-haunted region, the movement of the earth is neutralised in another fashion. The buildings of the Japanese architect may be compared to our domestic tables. They are framed substantially of wood, but, instead of being rooted in the ground as are the Italian palaces, they are supported on what may be called legs, or portions of converging framework on which the higher parts of the building rest. Thus, in some cases at least, it is conceivable that a building could actually be displaced by the exertion of adequate power without being overthrown. And thus, in point of fact, that mysterious and terrific earth wave, which no one who has not witnessed it can realise, passes underneath the buildings; which may shake, but which do not fall. Even lofty pagodas defy earthquake in Japan.

The third method is rather to encamp than to build. A military tent is tolerably secure against the earthquake. In Algeria, where towns have been observed from the mountains to crumble and disappear,—an experience which led the observer at first to doubt his command of his own senses,—the camps were uninjured. Nor is it only the bell-tent or the *tente d'abris* of the French soldier, or the black goat-skin

lean-to of the Arab, that thus escapes, like the reed in the fable when the oak was overthrown. Huts of cane, walled with mats of grass, form earthquake-proof, though by no means fireproof, cities.

If there be one class of men more than any other which has cause to dread the occurrence of earthquake in England it is the cheap and unprincipled builder. He would soon find his occupation gone when once it was noted how his houses stood, or rather, did not stand, the shocks. But are we quite right in leaving his punishment to the chance of the appearance of such a *doux ex machina*? We might take a leaf with advantage, in this respect, out of the Italian law. The liability of a builder in Italy does not cease with the completion of a house, or even with the payment for the work. We will not state the exact terms without referring to chapter and verse, but for a term of years,—five, we think, or seven,—the Italian builder is responsible for maintenance. Were this plan adopted here it might raise rents, but it would hardly raise the cost of housing a family. Such discoveries, for example, as that the house sewage was conducted through inadequate or ill-laid pipes, would lead to correction at the cost, not of the tenant, but of the builder. The danger, or the fear, of the advent of any of those great scourges in the presence of which man is comparatively helpless, is not to be lightly anticipated. But the policy of the ostrich is not safe, and the echo of the sound which was so alarming at Clitheroe the other evening should not be allowed to die away without the practical result of leading us to inquire—"How are we building the habitations of the people in our great centres of population?"

#### ARAB ART.

MOVEMENT is on foot for encouraging the systematic study of Coptic or Saracenic domestic art in its home and birthplace. It is proposed to form a club of architects, artists, art-students, and others interested in the subject; to appeal to the art-loving public for funds, and with these to send qualified students, male and female, under proper protection and guidance, to Cairo, for the purpose of earnest study of this unique phase of art, for the faithful record of its still remaining, but fast perishing, examples, and for the acquisition and preservation of the movable portions of those Cairene houses whose destruction is either progressing or imminent. The remarkable success of the Egyptian Exploration Society, which is now in the third year of its existence, and beginning with the enthusiasm of a lady (Miss Amelia B. Edwards) is now assuming larger and larger proportions, and doing more and more useful work, has suggested the formation of a similar association for the rescue and record of the later art of the same marvellous people.

Mr. Reginald Stuart Poole, in an address, on Saturday last, to the members of "the College of Working Men and Women," in Queen-square, Bloomsbury, and to a few invited friends, explained, with his wonted grace and facility, the genesis and *rationale* of this Saracenic art, tracing its history and development in both hemispheres, and its fusion with Western art in the countries which border the Mediterranean. His remarks received most valuable illustration and emphasis from a series of exquisite and quite faithful water-colour drawings of the most remarkable Cairene examples by Mr. Frank Dillon, the interiors being of special and remarkable beauty.

Mr. Poole visited Cairo whilst young enough to be admitted with his mother to the interiors of the various harems, and the impression which the extreme beauty of their architecture and decorations made upon his mind has never been effaced. These he dilated upon with an energy and an enthusiasm which he imparted to his hearers, and it is possible that he will be supported by a strong body of followers. An excellent reason for engaging lady students in the work is that they will be accorded entrance into apart-

ments jealously guarded against the approach of man,—apartments which, moreover, receive the larger share of the decorator's attention.

With this new enterprise we are in entire sympathy, and should like to see the fragment of a Cairene house now at South Kensington form the nucleus of a collection in every sense representative of this beautiful art.

But the ladies and gentlemen who share Mr. Poole's desire to investigate and record the beauties of Eastern art will forgive us if we cannot go the lengths of their leader as to its universal applicability to English wants, or believe with him that it will quite satisfy the yearnings of those "seekers after truth" of whom he spoke. Some hard things were said about our houses,—their square box-like rooms, their ever-recurring right angles, their unadorned surfaces, their many constructive shams, and their multitudinous meannesses. Even the blank windows,—which we do not now build,—and other obsolete follies, were once more held up to ridicule, and "thrice he slew the slain."

The horizontal unrelieved ceiling under which we are nearly all compelled to live came in for a large share of vituperation, and its bad habit of occasionally falling down *en masse* having shown itself in the "College for Working Men and Women," itself lent point to his remarks, and brought them home to all his hearers. This is all very well; but when in turn Mr. Poole descended upon the rectitude of the Cairene constructive scheme, he ventured upon dangerous ground and forgot, not being a practical architect, or overlooked, the fact that the beautiful honeycombed roofs of his loved Eastern halls are plaster shams, and neither better nor worse constructively than the detested Palladian "coffering" which provoked his ire. But worse remains behind. It must have struck his Christian hearers that, after all had been urged in praise of the Saracenic scheme of architecture and decoration, it left a great want unsatisfied,—that something was absent which the Western mind looks for instinctively and must find, if its aspirations are to be satisfied,—

"So coldly sweet, so deadly fair,  
We start, for soul is wanting there."

Geometrical patterns, ever so artfully involved and glass mosaics, put together ever so cunningly, carry no lesson to the human heart. They may suit the sensuous languor of the Asiatic, but we want a more robust style, and cannot afford to eliminate that priceless "human interest" which characterises all our native efforts.

The Eastern house was built on lines adapted to Eastern life, and the very completeness with which it fulfilled its object unites it for Western use. We cannot live in enormous tile-lined halls, almost windowless, the light entering furtively through closed clearstory lattices; nor could the active Western mind find satisfaction in dreaming away "the leaden-footed hours" in the midst of the most splendid of divans, and surrounded with acres of meaningless ornament, however gorgeous and costly. A stray example in each important house,—a boudoir, a smoking-room,—we should be grateful for, but nothing more. Let the followers of Mr. Poole set themselves to preserve so much of the art of Cairo as may be in jeopardy, and by patient scrutiny wrest from its Saracenic authors the secret of their wonderful success with a few colours, and having gained this knowledge, let them brighten and beautify our homes to their hearts' content. They have our hearty good will, and shall have our unwavering support.

But no radical change in our native domestic art is wanted from them, and if they attempt such,—as the address hinted,—if they desire to substitute the peculiarities of the Eastern house in its plan, arrangement, and construction for the homes which have grown with our nation's growth and embody, however poorly, our native ideas of comfort, then we say that they are doomed to disappointment and that they imagine a vain thing.

#### NOTES.

THE award of the jury in the competition for the new Exchange Buildings Amsterdam, was sent in to the Burgomaster and Town Council on Saturday last, accepted by them, and the numbers and mottoes of the successful designs published in the Amsterdam evening papers of Monday, the 17th. They are as follow:—*Prizes of 1,000 Gulden (83l.)*.—No. 1, "A. G. R."; No. 2, "La Bourse ou la Vie"; No. 3, "Ne(e)derland"; No. 6, the coat of arms of the town of Amsterdam, with the motto, "Je Maintiendrai"; No. 7, "Mercature"; No. 8, "Perseverance"; No. 9, "Ammercrack"; No. 10, "Lieven de Key"; No. 15, the coat of arms of the town of Amsterdam, with the motto, "In hoc Signo Floresco"; No. 17, "Y." Of these ten designs the authors of the following numbers were selected to take part in the final competition,—Nos. 20, 73, 91, 150, 172. Two hundred designs were sent in, nearly the whole of which were hung in the rooms of the New Museum. They occupied about 6,700 ft. run, and covered about 40,000 ft. superficial. The five designs selected for the final competition are all Dutch or Flemish in style, and consist of a mixture of brick and stone, in harmony with the surrounding buildings as regards material.

THE case of "Fleet v. The Metropolitan Asylums District Board," was decided on Wednesday last in favour of the defendants,—a conclusion which every unprejudiced person must have foreseen from the course of the evidence. The case was, as most of our readers are aware, that the defendants had established a small-pox convalescent camp in such proximity to his residence and house property at Darenth as to be a source of danger. Mr. Justice Pearson found no fault with Mr. Fleet for bringing the action, but found that the defendants had done nothing in which the law was bound to restrain them. It was not, the learned Judge thought, sufficient to prove that infection *might* be conveyed through the air, under the circumstances; it must be proved that it probably would be; and the evidence of the medical experts did not warrant that conclusion. We consider the verdict a right one. No care or precaution seems to have been spared in the construction and regulation of the camp hospital; and, though no one would be particularly anxious to have a camp hospital established a third of a mile from his residential property, it does appear to us that, considering that such hospitals must be somewhere, and their establishment under special circumstances is for the general good, there is a certain amount of selfishness and cowardice in the way in which one owner after another attempts to prove that *here*, at least, where *his* property lies, is not the place for a hospital. We have always believed, and acted on the belief, that those least liable to danger from infection are those who, without neglecting ordinary precautions, think least about it. The persons who are always in a state of scare on the subject remind one of those (spoken of in the Epistle to the Hebrews) "who through fear of death are all their life-time subject to bondage."

WE are informed that the post of Consulting Architect to the Education Department of the Privy Council has been offered to Mr. E. R. Robson, F.S.A., who has undertaken to accept it, as affording more time for private practice than that of Architect to the School Board for London. Of course Mr. Robson has to resign the latter appointment and to undertake to build no more elementary schools. Mr. Robson has carried out, during his connexion with the School Board, an amount of work which furnishes remarkable testimony both to his energy and power of grappling with arduous duties, and his perception for architectural fitness; he has covered London with school-buildings not, we confess, in a style altogether after our own hearts, but, nevertheless, looking eminently like schools, and characterised by sufficient variety, com-

lined with so much general unity of style as may serve to mark them as a class of buildings erected by one special body for one special purpose; and they are all well and solidly built, which is much to say in these days. It is to be hoped Mr. Robson's place will be adequately filled.

**L**ORD BRABAZON, the energetic Chairman of the "Metropolitan Public Garden, Boulevard, and Playground Association," has recently made public two propositions on behalf of this Society, one for the use of the main drainage embankment from Victoria Park to Barking Creek as an East-end boulevard, the other for permission for cricket to be played on a space of 200 by 100 yards on the east side of Kensington Gardens, "between the trees skirting the Serpentine and the semicircular walk from the Magazine to Victoria Gate." Both applications have been refused by the authorities respectively appealed to. The Metropolitan Board of Works, who state that they had already received application from the *employés* at the Beekton Gas Works for permission to use the embankment as a road, do not give their reasons for their refusal. It would have been better if they had done so, as many people will certainly be inclined to think that there were no sufficiently good reasons to give. In refusing to sanction the cricket in Hyde Park, on the other hand, we hold that the Office of Works are perfectly right, and are acting, as Mr. Mitford says, "in the general interests of the public" in refusing the permission. A much more practical and reasonable appeal in relation to open spaces has been made by the Rev. S. A. Barnett in the *Times*, who points out the absurdity of keeping all the Board School playgrounds closed on the Saturday half-holidays, when the children most need a playground. He adds, "At an expense of 5s. a-week the ground around a Board school in this parish has been opened on Saturdays. The streets are clearer and the ground is full. Parents and children are alike pleased." Surely there can be no difficulty in carrying out so sensible an idea in the Board schools generally.

**W**E hope that the idea which has been talked about during the past week of making a large concert-hall in London to seat 3,000 or upwards, so as to reduce the cost to the hearers of high-class orchestral concerts, will not be rashly taken up. For all the highest purposes of the art, concert-halls beyond the size of—say St. James's Hall, as a well-known example,—are a mistake. They mean coarse and forced execution and imperfect hearing. It may be better that people who cannot afford high prices should hear great works imperfectly than that they should not hear them at all. Let there be a large people's concert-room built if it is wanted, but not as supplying the deficiencies of St. James's Hall. It is perfectly true that we are most woefully in want of a better concert-room in London, but that is not because St. James's Hall is too small; it is just about the right size, and its acoustic properties are not bad, considering the monstrous initial mistake of building a music room with a semicircular roof, one of the last shapes which ought to have been chosen. We want a new concert-room, because St. James's Hall is the most ill-planned, awkward, and uncomfortable room, both in its seating, in its approaches, and in the mal-arrangement of its orchestra, that was ever tolerated in a distinctly musical capital, which London is. It is really wonderful how people have borne with it for so long; but whenever the enterprise and the capital are forthcoming for providing London with a really adequate concert-room, do not let the promoters fall into the error of making it larger. It might pay commercially, but it will be a fatal mistake artistically.

**U**NDER the heading "Our Future Watches and Clocks," attention is drawn in the last number of *Nature* to the probability of the extensive adoption for many purposes of

the "more rational method" of counting the hours of the day continuously from midnight through twenty-four hours to the midnight following, instead of the present awkward division into two sets of twelve hours distinguished by "A.M." and "P.M." Our contemporary thinks that the adoption of this method for scientific time-reckonings is not unlikely to be followed, and ought to be followed by its general adoption at no very distant date, and considers the question of the best way of dividing clock and watch faces for the purpose. The division of the circumference into twenty-four hours would, of course, entail a reduction of one-half in the rate of travel of the hour-hand, and therefore could not be applied to any existing clocks or watches; but the addition of an inner circle of figures containing the numbers up to twenty-four would enable the same movement to register the whole number of hours, the outer circle being read in the morning and the inner in the afternoon. Our contemporary seems to doubt if this would not be the best method for permanent adoption, having regard to the fact that most people read the clock rather by the position of the hand than by looking at the figures. We should be disposed to say that if the change is adopted of counting the whole twenty-four hours through, the hour-hand movement should be altered accordingly, as the logical result for permanent adoption, though of course this would render the change from one system to another more difficult for the moment. The dial should then be numbered "II, IV, VI," &c., with a mark for the intermediate hours, so as not to overcrowd the figures, and the main stations of the dial would thus still coincide with the habitual division of the 60 minutes into groups of five for the reading of the minute-hand.

**A** QUESTION was asked on p. 642 as to District Surveyors' fees. Four houses were erected in the case in question; the District Surveyor surveyed them, and sent in his bill for about 10*l.*, with a request for payment. The builder, who was primarily liable for the fees under his contract, was paid in full by his employers, but apparently forgot to pay the district surveyor. The builder became bankrupt, and the bill was sent to his employer direct. It is obviously hard that the building owner should have thus to pay twice over, but the district surveyor would, on his side, consider it a hardship not to be paid at all. None of this would have happened if the receipt for the fees had been shown when the last instalment was paid to the builder. Section 51 of the Building Act is very clear. It enacts that,— "The district surveyor shall be entitled to receive the amount of his fees due to him from the builder employed . . . or from the owner or occupier of the dwelling," and means for the recovery of the fees by summary process are provided. District surveyors are so far happy that they are creditors by order of the law; but though occupying very satisfactory positions in the main, even they have at times their little difficulties. If they press for their money eagerly they are called greedy, and not very much liked; and if they are easy, good-natured critics think they well deserve to be forgotten by their grateful debtors.

**T**HE preservation of wood has been the subject of constant experiment for the last eighteen years by Dr. Joseph Jones, of New Orleans, who has succeeded in developing a method of arresting decay for great periods of time, which, he believes, might extend to centuries. The process is simple enough, and consists in the saturation of wood with certain bituminous, resinous, and antiseptic substances. The sap and moisture of the wood are transformed into steam, and the aluminous constituents coagulated by heat, the wood thus treated being immediately plunged into a boiling solution of asphaltic bitumen and carbonic acid. The combination may be varied according to the age and density of the wood. As the preservative liquid and wood cool, the vapour is condensed, and the

asphaltic solution is driven into the pores and permeates the wood. The solvent of the asphaltic rapidly evaporates from the surface of the wood after it is removed from the preservative fluid, leaving a smooth, polished surface, impervious to all moisture. Even such a heavy piece of work as a railway bridge may be treated in this fashion by keeping the individual parts in the solution for from two to twelve hours, and then coating each part with asphaltic, so that the whole structure presents the appearance of having been carefully painted by hand with durable black varnish. Indeed, Dr. Jones claims for the process that the necessity for painting is done away with, and this would more than equal the expense of treating the wood. The wood may be subjected to the asphaltic solution without preliminary heating. A drying-room for the wood, and a tank heated by steam for the preservative liquid, are the only forms of apparatus needed.

**O**NE of the best furniture woods in India is the Toon wood or Moulmein cedar (*Cedrela Toona*), being light, soft, red, and with no heartwood. As it is impervious to the attacks of white ants it is much valued by builders, especially for door panels and carvings. In Burma, whence it is exported, it fetches 65 rupees per ton, the cost of cutting and delivery being about 44 rupees. In Bengal and Assam it is the wood principally used for making tea-boxes, but it has been in such demand of late years for this purpose that it is getting decidedly scarce, at all events as large trees, a great number of them having been used to make dug-out canoes. The Bhotias use the wood for shingles, wood-carving, and also for rice-peders. If not interfered with, the Moulmein cedar grows to a very large size, with a girth of 20 ft. and a height of 80 ft. to 100 ft. of clear stem; and trees of this description may still be seen in forests which have been little worked, such as in the Chittagong Hills.

**A**T the Madison-square Theatre, New York, the orchestra is placed over the proscenium opening in an open loggia, which is treated in an effective manner architecturally. By this arrangement the space usually occupied by the orchestra is made available for the accommodation of the stall audience. Sketch-plans of the building are printed on the back of the programmes of all theatres in New York, by direction of the municipal authorities, showing the staircases and exit doorways. The value of these plans would be considerably enhanced if they were drawn to scale, which does not appear to be the case in the example before us, in which the size of the staircase and doorways is clearly exaggerated.

**I**N a recent lecture at the Exhibition of the "Union Centrale des Arts Décoratifs," M. Paul Sédille, whose name has been familiar to our readers from various lectures of his from which we have given extracts, gave a summary of the present architectural situation in France,— "l'architecture Française contemporaine,"—in which, sketching rapidly the history of French architecture for the last century, he dwelt on the great influence which had been exercised by the "Ecole de Percier," and the "Ecole romantique," both which occupied themselves too exclusively with the exterior treatment of architectural design, without taking into account the interior causes which led or should lead to the shaping of the exterior forms. After speaking of Viollet-le-Duc as the regenerator of Middle Age architecture, M. Sédille came to the actual French school of the day, of which the leading masters, omitting those now living, were Duban, Labrousse, Louis Duc, and Vaudoyer (we presume Le Sueur was regarded as representing a period previous to the "Etat actuel"). These, and others their pupils and followers, had, he thought, by a better directed and more complete study of antiquity, penetrated to something like permanent principles of an architecture which they would fain see "helle, mais vraie; élégante, mais utile; et portante toujours

dans ses manifestations un reflet de l'âme de l'artiste." This last is exactly what some of our own critics tell us it should not have. According to them, architecture was great in the Middle Ages, because it was impersonal. M. Sédille followed these remarks by a raid against the "collectionneurs," the amateurs who modelled their houses after Mediaeval châteaux, and fitted them with appropriate furniture made on the pattern of the period. Here we do it at present with Queen Anne furniture. This kind of "vanity" has appeared in many periods and in many lands, and seems inherent in human nature,—of the modern world, at least. The worst of it is, that in all its forms it soon palls.

WE have received from the Fine Art Society a copy of a correspondence between them and the Secretary of the National Gallery, in regard to the concessions lately made to both French and German firms to remove pictures from the walls, and to remove the glass from glazed pictures, for the purpose of engraving or otherwise copying them, while the previous request of the Fine Art Society for similar concessions in order to facilitate the reproduction of pictures by photogravure had been denied. On the face of the case, as stated in the correspondence, it appears to us that both the Fine Art Society and their customers, the English public, have some right to complain. The publications of the Society have been of a very high order; and why the copying of pictures by French and German firms should be specially facilitated in the English National Gallery, to the exclusion of English firms, is a thing we cannot profess to understand, unless it is the result of some special wire-pulling.

THE *Pall Mall Gazette*, which is neither so judicious nor so well informed upon architectural subjects as upon some other matters of public interest, publishes in its last Wednesday's issue a kind of illustrated "puff," for it can be called nothing else, of the work done at the Tower under the instigation of the authorities of the Office of Works. The article appears to be an inspired one, and is as remarkable for its extravagant laudation of the Office of Works as for its simplicity in regard to architectural aesthetics. The extent of this simplicity may be imagined when we say that after speaking with enthusiasm of the "new tower and wall," the writer adds that there is still to be cleared away "another eighteenth-century warehouse and the sham Gothic horse armoury" (the italics are ours); in order to clear the view, be it observed, of the other specimens of sham Gothic which have been erected by the æsthetic beneficence of the Office of Works. The *Pall-Mall Gazette* adds that a new and better guide to the Tower is much wanted, and that Mr. Mitford is the person best able to produce it; and if it is not produced quickly the *P.M.G.* will produce one that will be still better. It is to be hoped this interesting competition will come off. Two rival guide-books to the Tower (of course entering into the philosophy of "sham Gothic") by Mr. Mitford and the scribe of the *P.M.G.* will at least be likely to afford amusement, if not instruction.

#### THE TOWN BUILDER—MODERN STYLE.

As you step from the dirt and squalor of the narrow street into his place of business, the wide folding doors closing noiselessly as you enter, you find yourself in a region of warmth, comfort, and comparative silence. The open lobby leads into a vestibule: the vestibule into a hall, spacious, clean, light, and gay with a most elaborate encaustic tile floor. Abutting on the long line of corridor to the right are seen a succession of small enclosures parted from it and from each other by glazed mahogany screens. The companion corridor gives access to the rooms of the principals. A gentleman-like young man steps out to receive you. He takes your card and regards it somewhat critically. Mr. — is engaged just now on an important matter. You guessed as much from the handsomely appointed brougham at the door, with its pair of sleek ponies and dapper coachman. He will not be long. Then you will

wait. You are shown into an adjoining room. It has no outlook, the sashes being filled with ground glass. A series of old almanacs, varnished and framed, with faded chromolithographic pictures on them *à propos* of nothing, adorn the walls. Not very interesting. A good fire is blazing in the grate: a roomy arm-chair invites repose; and the *Times*, cut and dried and neatly folded, is at your service. The musical clink of the masons' chisel is borne faintly from the adjoining yard, reviving the pleasant memories of your youth, and the low plaintive moan of the circular saws, broken by pauses in which they hiss and whirl like a groom at his work, comes muffled through the intervening doors. You yield yourself up to the seductions of these accumulated attractions, and have scarcely got well into a wrangle between a noble lord and a Cabinet Minister when the gentlemanlike young man summons you to the presence. You are not altogether pleased at the interruption. The fact is you are *not* very busy, and could, if left alone, spend half an hour very pleasantly. But if you are not busy he is, and despatches his callers with the celerity of the fashionable physician. He receives you with perfect address, and although you are a stranger to him you feel instantly quite at your ease. He is a pale handsome man of some five-and-thirty years, neat in his attire, with a cautious reserved manner; a clear, cold, grey eye, and a somewhat hard expression of face; altogether more like a banker than a builder. A confidential clerk occupies a seat at a neighbouring table, and notes down in shorthand the material points in the conversation. Documents are required, and he retires for them. The conversation is adroitly turned to the topics of the day. Politics are avoided. Mr. — is not sure as to your bent. He has spent his holiday in the Engadine. Has returned by way of Rome, Milan, Florence, as the case may be, and has cleverly dodged the quarantine regulations of all Europe. He talks with considerable knowledge of art and architecture, and knows all the more prominent painters, sculptors, and architects. Or he has taken a run over to America to see the great Yellowstone Park before it is vulgarised out of all charm. Or again he has been loitering through the bazaars of Cairo in quest of treasures overlooked by previous explorers. The real business of your visit having at last commenced, you find him alive to all the points involved. Though comparatively young he astonishes you by the scope and variety of his experience and his acquaintance with technical matters. But his strong point is administration, and in finance he has few equals. It falls to him to see large undertakings "through" in all parts of the world, providing oftentimes the means in the widest sense of the word. A thousand men do his bidding with the precision and regularity of a vast machine. To him they look for their weekly wages and are never disappointed. They would as soon expect the sun to stand still in the Heavens as that the exchequer upon which they rely should fail. He is rarely seen by them or at the works which are carried out under his name. But his confidential agents are alert and ubiquitous. His Mr. Brown, Jones, Robinson, and the rest are models of diligence and ability. Were they otherwise they would have to seek employment elsewhere. He will undertake work of very modest importance,—replace a fallen slate or drive a railway through the unfrequented desert, and what he undertakes to do he will do well,—at his own price. His profits are proportioned to the risk, and both are sometimes very great. He takes, from the first, an independent position, and keeps it. When a certificate is due he notifies the fact, curtly demanding rather than asking for it. You will not receive from him the conventional fib about the shortness of cash and the large amount which must be made up by next Wednesday. He is the personification of system, and order is his first law. Your errand demands a visit to a neighbouring manufacturer, and he offers to accompany you. He has a round to go, and it will not be out of his way. As you pass into the cold and cheerless street you are surprised to see the brougham still in waiting. He opens the door and waves you in. So, then! it was not a client's after all! He asks your pardon while he peruses and docketts a file of papers placed ready for him. Your business brought to a close he leaves you with a graceful adieu, somewhat suddenly.

He has everything handsome about him,—a house in Cromwell-square and a "place" in

Hampshire, whither he regularly repairs on a Friday evening,—Saturday is a broken day now and not worth coming to town for,—and so he spends it pleasantly in the country with a few friends. City men, Directors of Banks, &c., so that nothing is lost by making it a "holiday." A clerk brings down letters and receives instructions. His master owns some broad acres and half a village, where he has amused himself by building some model cottages. He subscribes liberally to the local charities without distinction of creed, and is himself a staunch Conservative and a sound Churchman. He affects the sportsman and laments himself quite unnecessarily with the stiffest of gaiters and the heaviest of boots as a sort of protest against the enforced primness of his every-day costume. His partridges and pheasants are so useful in his business that they may almost be looked upon as members of his staff, and a well-preserved little trout stream, which runs through his grounds, has before now determined a difference which might else have filled the lawyers' pockets. On Monday morning you will see him at his office punctually at nine, and in an hour the brougham, with the matched and matchless bays, will be again in waiting at his door. He has invested £50,000 in "the concern," and no one will grudge him the luxuries which such a fortune can in almost every walk of life command.

On learning that he is the junior member of the firm, a portentous image of the splendour of the head thereof rises in your mind. You are wrong. The senior partner is a very homely person, belonging,—as is said, apologetically,—to the old school. His clerks rarely see him, though he is known to be about, and they entertain for him an almost superstitious respect. His judgment is always taken in the last resort, and he is, in fact, the main spring of the business, although, like other main springs, concealed by more showy surroundings.

#### DAMAGES OR INJUNCTIONS IN ACTIONS FOR THE INFRINGEMENT OF RIGHTS TO LIGHT.

It has been suggested by some who have given consideration to the subject of the law in regard to what are technically called ancient lights that in all cases where a right has been interfered with such interference should be compensated by the award of damages. It has been said that if the interference with a right to light is to be ground for an action in a court of law it would be much better for the community at large that there should be what may be termed freedom of building, subject only to the award of damages for injuring the rights of a neighbouring building. There is a good deal to be said in favour of this view, but it is, perhaps, of more practical importance and use to discover, if possible, what is the judicial view which now exists of the power of a court to grant an injunction or damages. Since the passing of Lord Cairns's Act there has been an absolute discretion in the Court to grant one or other of these remedies. But every exercise of judicial discretion must be in accordance with some kind of rule, so that the interesting point is to discover by what rule the judges are guided in their judicial action. The rule is formulated in Roscoe's "Digest of the Law of Light" as follows:—"A mandatory injunction . . . will only be granted if pecuniary damages will not fully recompense the injured party." In stating with precision rules which can only be collected from a number of judicial decisions it is very easy to rather overrate a proposition, and, therefore, this rule is coloured by a subsequent note to the effect that its application much depends on the circumstances of each particular case. But, on the whole, a judicial decision on this point since the publication of the work in question seems to show that this is a quite accurate statement of the existing law. This decision also seems to show that the tendency of the judicial mind is in favour of awarding damages rather than injunctions. The case to which we refer is that of *Holland v. Worley*, "Law Reports," 26, Chancery Division, p. 578, which was decided this year by Mr. Justice Pearson. It is a noteworthy case because the judge examines several previous decisions with a view of extracting from them some definite rule to guide him in the matter. And this is the conclusion to which he comes after considering a judgment of the late Sir George Jessel:—"I do not think I shall

be misinterpreting the Master of the Rolls if I say that his opinion (in which I heartily concur) seems to me to be this, that if the defendant is doing an act which will render the plaintiff's property absolutely useless to him unless it is stopped,—in such a case, inasmuch as the rule of compensation which could be given to the plaintiff would be to compel the defendant to purchase his property out and out, the Court will not, in the exercise of the discretion given it by Lord Cairns's Act, compel the plaintiff to sell his property to the defendant. But in other cases, where the injury to the plaintiff would be less serious, where the Court considers that the property may still remain to the plaintiffs, and he substantially useful to him as it was before, and the injury, therefore, is one of a nature that can (without taking away the plaintiff's property) be compensated by money, then the Court, if it thinks right, may exercise the discretion given to it by the Court." Now this exposition of the law seems to amount, conversely to exact the same thing as the rule quoted from the "Digest of the Law of Light,"—a rule which, as we have said, was not, as it seems to us, quite so certain two years ago as it is now.

There is another circumstance which makes this, as we believe, a correct one. In 1877 Lord Justice (then Mr. Justice) Fry decided a case somewhat to the same effect, and the main reason why he awarded damages instead of an injunction was because the injury done to the plaintiff's building was done by an integral part of a very important building scheme. Coupling this fact with the other that though the plaintiff's building was injured, yet that the occupation of the house would not be seriously affected, the judge came to the conclusion that his proper course was to award damages to the amount of 200*l.*, and not grant an injunction. This was a decision of a judge who now sits in the Court of Appeal, and therefore we may accept his opinions, with those of Mr. Justice Pearson, and regard the view of the judicial mind as being now disposed to the giving of damages rather than to the ordering of a demolition of part of the building. It is not out of place either to point out the improvement in legal procedure in late years. So recently as 1865 a case in which, though the Court would not grant an injunction, it considered damages might be awarded, was sent down to a Common Law court for the purpose of the damages being assessed. Now no judge of the Chancery Division for a moment hesitates to assess the damages himself, and thus save the parties both delay and expense.

Returning for a moment to the main point, it is true that there are observations of the Court of Appeal in the recently-decided case of *Newson v. Pender*, which seem to show an approval of injunctions rather than of damages. For it was not certain in that case, which was one of an interim injunction, to what extent the plaintiffs would be injured, or whether they had been substantially injured at all, though there was a *prima facie* ground for saying that they were. Moreover, the defendants offered to give an undertaking to pull down the offending building if it was proved at the final hearing of the case to substantially interfere with the rights of the plaintiff. But the Court of Appeal decided to continue the interim injunction ordered by Vice-Chancellor Bacon, and it did so partly because it could not "feel with confidence that upon the facts coming before the Court the result might not happen which has happened upon other occasions where the Court has felt the destruction of property to be very undesirable, and a view has been taken which the plaintiff has been unable to resist, but he should accept compensation in the form of damages instead of the pulling down of the premises." This expression of opinion seems to show a leaning towards the more violent method of redress, but it has also to be borne in mind that this was a question of continuing an injunction already ordered by a judge of the Court below, and next, that if the rule which we have extracted from the legal work already mentioned, and from recent judicial utterances, be properly applied, a plaintiff is never bound to be satisfied with damages unless they fairly compensate him for the injury done to his property.

**Daylight Reflectors.**—Mr. P. E. Chappin, of Fleet-street, has just received a letter from the Lord Chamberlain appointing him Daylight Reflector Manufacturer to the Queen.

## THE INTERNAL ARCHITECTURAL TREATMENT OF CUPOLAS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE second ordinary meeting of the present session took place on Monday last, Mr. Ewan Christian, president, in the chair.

Mr. Hugh Stannus read a paper on "The Architectural Treatment of Cupolas in general, and that of St. Paul's in particular." He commenced by stating that he proposed to confine himself to Italian or Classic cupolas, and at the outset he would like to amend the title of his paper, and term it "The Internal Architectural Treatment of Cupolas." Referring to the several kinds of cupolas, many would term the square cupola a coved square room. Square unpenetrated cupolas were uncommon. Octagonal cupolas were numerous enough, the most celebrated being that of the Duomo of Florence. Twelve-sided cupolas were less common, and he only remembered that of Siena; while polygonal cupolas must remain unnoticed for the present. Circular cupolas were legion, notably those of St. Peter's and St. Paul's. Elliptical cupolas were sometimes to be met with. At Pisa the ellipse is over the crossing. Mr. Stannus exhibited a model of what he termed an "abscissate" cupola, good examples of which are to be found of the Byzantine period, such as St. Sophia at Constantinople, and St. Mark's at Venice.

The difference between these and penetrated cupolas was that the latter were cut by lines of vaults and the sides of openings, and were not necessarily in a vertical plane. Penetrated cupolas and vaults showed the soffit, which would be as deep as the amount of the over-sailing. The number of good vaults which had been spoiled by the treatment of their soffits was very great. It had become a canon that the penetration should be at axial points, and figure decoration applied to the remaining parts of the cupola surface would be unaxial. Some cupolas pierced with circular windows were exceedingly beautiful. The bull's-eye seemed to lend itself to simple and easy treatment, and circular panels were equally good. When cupolas were penetrated the contour of the penetration should give the *motif* for the architectural treatment. There were three things to be considered in regard to treatment: first, the plan of the cupola; next, the existence or non-existence of any opening or eye at the centre; and, thirdly, the treatment of the remaining portion when the cupola was cut away. There were several courses of treatment suitable in reference to the subjacent architecture; there were cupolas which acknowledged the four axes of the subjacent parts, which was the broadest and best treatment; there were others which acknowledged every axis as St. Peter's at Rome; while some cupolas ignored the subjacent parts altogether. The first typical treatment of cupolas which occurred to one, supposing they had a cupola supported by piers, was to arch from one pier to another. There was a further development where it was succeeded by arches, each springing on the crown of the tier below it. These were vaultings which had evidently been taken from the *motif* of the apeducts.

Ribs had been very much used in cupola treatment. These were found in large cupolas, which would bear subdivision, and surmounted by lanterns, which seemed to demand some expression of rib-treatment to suggest a support for the lantern. It had been said that though ribs and panels were suitable for an octagonal dome, to cut up a hemispherical dome in that fashion would destroy its idea of mystery and infinity, and to parcel it out into measurable littlenesses. Both the experiments made by Mr. Poynter and himself were fragmentary in effect, and presented a more strongly marked ribbiness than a wider section would have shown. He was not strongly in favour of the rib treatment, but had used it because it was part of his commission. He referred to the Sistine chapel of St. Maria Maggiore, at Rome, as an example of ribbing in domes. Its great charm was the articulation between the cupola and the subjacent architecture. There were many examples of the rib treatment, and he might instance that of the British Museum Reading-room, designed by Mr. Smirke. Sub-panelling with circles between ribs was one of the commonest things in Italy; it was a pleasant way of treating the ground, and making a decorative effect. Another treatment was that of intersecting ribs, and stellar cofferings. This was an

essentially Arabic treatment, the Arabs being fond of evolving wonderfully intricate geometrical patterns. The treatment of St. James's Hall by Owen Jones showed his study of Alhambresque work, the oblique ribbing of the ceiling being very beautiful. Applying that treatment to a circular plan they obtained a stellar cupola, like that at Cordova; but this treatment would be unsuitable for St. Paul's.

Mr. Stannus next referred to the treatment of perspective or scenic architecture, which had its greatest development when the art of perspective was first reduced to scientific rules. In more recent times the treatment of the Chapel at the Palace of the Legion d'Honneur was most extraordinary. This was really so much scene painting, and was unworthy of any monumental building.

Another treatment was that of coffering, and here they entered upon a large field. In the Church of San Bernardino at Verona the articulation was very beautiful, and it was one of the most charming examples of articulated coffering. There was another treatment which he termed "coffering with omitted articulation," and Sir Christopher Wren had used it in his beautiful church of St. Stephen, Walbrook. He only knew of one other case, and that was in a Roman church. Coffers of different widths were sometimes used, as were coffers between ribs, as at St. Maria della Salute, Venice, where the ribs were axial with the pilasters, and between these were square coffers. This being so thoroughly articulated, had a beautiful effect. There were hexagonal and octagonal coffers of various kinds, and he instanced Palladio's Rotunda at Vicenza, a circular hall between four square walls. Here Palladio recognised the axiality of the dome by making long and short coffers. The old Stock Exchange had a barrel vault coffered, and the cupola was also coffered. Mr. Cole's magnificent new dome there was a remarkable example of modern cupola treatment. Radial figures might be considered as an application of a frieze all round a cupola: they were much used in St. Mark's, and seemed to loom and brood over one, giving a solemn impression to the spectator. Another method of treatment was seen in the beautiful little mausoleum at Ravenna, where there was an "abscissate" cupola with a line ground and gold stars. It had been suggested to use gold only, the beautiful effect of which might be seen in the charming Arab hall of Sir Frederick Leighton's *palazzo*. Marginal panelling was also a typical treatment, and examples of it were to be found in the Jesuits' Church at Venice and elsewhere. Zones were also used, as those who had seen the Baptistery at Florence would remember. There was a treatment associated with the name of Coreggio. Unfortunately the painter was then thought more of than the architect, and they all knew that those painters who had tried architecture had been conspicuous examples of "how not to do it." Michelangelo set a bad example in the Sistine Chapel. It was a grand thing to have the strength of a giant, but those who followed him set a fashion which had left some terrible results. In some instances limbs were allowed to project over the architecture, and there were churches where the artist had actually put a piece of wood, representing the wings, across the arches.

Good decoration required articulation with the existing architecture at St. Paul's; and if there were any features in the subjacent parts, they should be considered. Certain intercolumniations of the peristyle were blocked up, and any treatment should give a *raison d'être* for these. Then it should give scale to the cupola; it should be subdivided, and not override the architecture; it should provide space for appropriate storiations; it should be original if possible, and treated in such a manner as to be *suu generis* and not a copy; it should emphasise the four axes of the cross; and further, it should suit the gradual unfolding as the worshipper walked up the nave. Articulation might be in actual relief, and hence he had endeavoured to make such a design as could be produced in plaster relief. Canvas plaster was so much cheaper than mosaic, that it would make a difference of about 7,000*l.* in the cost.

In applying anything they had learned from the types of treatment to St. Paul's, they would find the plan was circular, there was an eye, and the cupola was not broken, nor abscissate. The square heads to the windows made a very

abrupt stop, and these might have been treated with arches as at St. Peter's, though it would be undesirable. He had tried the scheme of arching over the piers, but found it would not do. There might be a narrow rib over each pilaster, or a broad rib over each buttress; but it would be better to have the broad rib, especially as it was more suited to cupola treatment than to a polygonal dome. Intersecting ribs or parallel ribs would not do; and then came scenic architecture, which degraded a noble cupola. Coffering was intended by Sir Christopher Wren: there was point and fitness in coffering the cupola, but the result would be rather a want of interest. If the coffering had been in existence, they would have hesitated in altering it, but as it was not in existence they could do something worthier. Coffering could be improved by articulation, but they might dismiss it as not sufficiently important. Then came axial panels and subjects, which might do fairly if well articulated. With respect to radial figures, the size of the cupola would make them inimitable, unless they were of such gigantic dimensions as would dwarf the architecture. Marginal panels, again, were not necessary at St. Paul's, and zones were open to objection, as they dwarfed the apparent height of any cupola. Then there was the treatment, which he would term the plane-section, this being the characteristic treatment of a circular cupola. He claimed the merit of the plain section for the late Alfred Stevens, who adopted circles as the main features of his design. The circle, too, was the characteristic shape for visions and imaginings, and it was only when the painter had a square frame that he filled up the angles. Another advantage to the circle was that though other geometrical figures were distorted by being seen on concave surfaces, the circle made an ellipse only. The gold ground permeating everything he held to be essential. [This statement evoked much applause.] One then felt that the whole surface was going round, without a break in its continuity. Clearness at the base of the cupola was necessary, but if it lost colour and became more golden as it went up, it would preserve the mystery that now existed. But there was a difference between disappearing in the dirty dinginess of Thornhill and melting into the golden light described in Dante's vision. Another matter was the question of scales; whenever Thornhill's work was seen it dwarfed everything, but Stevens increased the apparent size by multiplying, and adding dignity to the fabric. Three years ago he (Mr. Stannus) conceived that the ribs might be omitted, and he submitted a version showing this to the Sub-Committee, who said they had no power to consider it. Mr. Stannus concluded a long paper by some remarks on the storiator of the dome; and by expressing his indebtedness to the Dean and Chapter, Mr. Penrose, Mr. J. O. Scott, and others.

Mr. H. H. Statham proposed a vote of thanks to Mr. Stannus for his interesting lecture and the valuable examples of dome-treatment he had shown, bringing before the meeting really a compendium of the subject. There were two main issues suggested in regard to the decoration of the dome of St. Paul's; the first was, the question upon which Mr. Stannus had dwelt so much, viz., the relation of the decoration to the architecture; the second being the consideration of what in the shape of design should be put there when the first principle was decided upon. The great point brought forward and emphasised by Mr. Stannus was what he very happily termed the articulation of the design with the subjacent architecture. Mr. Stannus's idea,—and on the face of it there was a good deal to be said for it,—was that as the peristyle was divided into so many sections by the solid piers at intervals, the decoration of the dome should carry out the idea and appear to have a special reference to it. In the first place, had they any information as to what Wren's wishes would have been upon this subject? So far as they had them, they went to show that Wren would have discarded that division of the peristyle. He had gone to refresh his memory with a sight of the model of the original design, which showed the dome coffered symmetrically, with no special reference to any division of the peristyle, beyond the ribs of the coffering over each pilaster. Then there was a floating rumour, the truth of which he had not been able to ascertain,—that the dome was coffered before Thornhill painted it. His attention was

drawn to that by Mr. Stannus at a meeting of the St. Paul's Ecclesiastical Society, when he was told that this had been stated in the *Builder*. The statement was, however, only made in a letter printed in that journal, referring to an engraving by Emmett. He had inquired for it at the print-room of the British Museum, where they thought they had seen such an engraving, but could not find it. It was not improbable the dome might have been coffered before Thornhill painted it, and the state of the original model left it probable that Wren contemplated coffering. So that this almost put Wren on one side in regard to the articulating of the dome with the solid pilasters. As to the coffering they might dismiss that from their minds, as on the whole a commonplace and prosaic treatment of a great dome. Then they came to the question whether they should strongly articulate the lines marked by the solid pilasters, by continuing them as ribs. He was inclined to think that to accentuate the ribs strongly was to deteriorate the essential grandeur of the dome. It formed an expanse which had a mystery about it, and to divide it vertically by strong lines was reducing it to so many measurable parts. Letting it then be granted that the dome should not be divided by these strong vertical lines, they came to the second question, what species of decoration should find place there. He (Mr. Statham) had taken great interest in this matter, partly because he had seen Mr. Poynter's great picture in several stages, and thought it one of the finest and most expressive modern works he had seen, but in its present position all its expression was lost. The conclusion this led him to was that it was a mistake to put, in such a position as that, pictures the point of which depended upon expression and differentiation of countenance. And this brought him to the idea with which he wished to close his remarks,—the suggestion that there was one idea in the decoration of domes, which had not been fairly carried out. What he would suggest might be called the Coreggio idea reduced to decorative form, not putting up a series of pictures which could not be examined because of the distance, and the danger of dislocating one's neck, but something which was a grand and simple idea, easily grasped, and not depending upon play of countenance. This sort of treatment should have a meaning which could be easily grasped, and which would be a magnificent culmination for whatever decoration might be applied to the lower parts. Browning's old Renaissance bishop, who "ordered his tomb in St. Praxed's Church," pleased himself with thinking how from his tomb he would

"Look up into the airy dome, where dwell  
The angels, and a sublimity of look."<sup>\*</sup>

He did not want any series of pictures, but just the one idea of angelic glory carried out over the dome, without divisions, and ribs, and lines destroying its grand unity,—a treatment giving a pervading glory to the whole surface, without in any way disturbing or lessening the proper architectural effect of the dome.

Mr. J. P. Scaddon seconded the vote of thanks, and agreed in most points with Mr. Statham. The dome of St. Paul's was left by its architect one vast, unbroken, and sublime vault, and its only decoration should be by the subsidiary art of painting or mosaic. Whatever emphasis might be desirable, and some little was desirable, should be supplied by the painter's craft alone. The dome, spreading above the altar with a baldachino, placed in the centre of the cross, should symbolise heaven, and be painted as such. The dome was quite out of sight of the nave, and could only be seen from underneath, and its decoration should be carried out in proper decorative art. Thornhill's interesting paintings disturbed little of the serenity of the dome's surface, and their translation into colour would deprive them of their principal claim to existence. There was in the National Gallery a design by Botticelli, which gave all that was desirable for the decoration of the dome; but the number of saintly figures would require to be fewer, so that each should stand out distinctly.

Mr. Edward Armitage, R.A., deprecated the architectural division to be seen in Stevens's design. Where there were figures there was this difficulty, that they must be made of different sizes to fill up, with large figures for the large panels and small figures for the small panels, otherwise the latter would be overcrowded. The different sized figures gave an

impression from below of the section of an exhibition gallery, with a lot of pictures arranged biggely-piggely on the wall, and some of the smaller ones "skied" at the top. Therefore whatever was done he would always deprecate the ribs on that account. His suggestion he believed, would form a much grander treatment for the dome, and it might be united with Mr. Burges's design, without having Archaic, Romanesque, or Byzantine figures. A friend of his had made a small design which he understood would appear in this week's *Builder*,\* for which he (Mr. Armitage) had sketched some figures, and he believed it would be very much better than the principle of having eight sections. In his mind there was an insuperable difficulty in painting elaborate figure subjects, such as in the designs they had seen. The dome was extremely dark, and only in bright summer weather could anything up there be seen; therefore whatever was done should be of the very simplest kind, laid in with flat tints, and no modelling. The eye would follow much better if the tint was perfectly flat, and that was the kind of decoration most suitable for the dome. If other portions of the church were decorated appropriately, they would then feel what was really required for the dome. They would feel that they did not want great solid Michelangelesque figures, but small groups or even single figures, with flat tints and gradations. The outlines would be seen, while the modelling of the figures would be quite lost.

Mr. J. D. Crace said that the reason why many domes had been treated in mosaic or with ribs, was that it was the only way in which the vertical section could be explained. The earliest known dome,—that at Ravenna,—was divided by ribs, with the unbroken surface filled by mosaic. He heartily endorsed what Mr. Armitage had said with regard to the figure treatment, which should be of extreme simplicity of form. At the same time, the treatment had not had a complete trial. They took St. Peter's or other domes, and divided them by ribs, they would invariably find that the main vertical line was undisturbed by being interlaced with anything. Wherever Mr. Stannus's circles touched the ribs there was a pinched-in form.

Mr. W. White, F.S.A., felt strongly that the articulation of the vertical lines of the dome was the greatest consequence. At the same time, they should not be treated in too strong a manner, and zonal treatment ought not to be altogether disregarded. Near to the eye a plane surface is minimized, and by painting in chiaro-oscuro is enlarged; the contrary being the effect at distance. In any case a distinct picture on the simplest flat surface painting would be much larger in effect than one painted up to the highest pitch.

On the motion of Mr. G. Aitchison, A.R.A., seconded by Mr. Woodthorpe, the discussion was adjourned, a vote of thanks being passed to Mr. Stannus.

#### THE MANOR OF CULLINGES OR TONG OTHERWISE THEBAUDES, TIBBOLD OR THEOBALDS.†

In the year A.D. 1441, the Manor of Thebaud being then vested in the Crown, was granted by Henry VI. to John Carpenter, Master of St. Anthony's Hospital in London; John Somerset, Chancellor of the Exchequer; and John Carpenter, jun., to be held of the Crown by the annual rendering of a how, value 2s. and a barbed arrow, value 3d.

The next account we have of this manor is the eleventh year of King Henry VIII., when it was conveyed by Cecilia Bedyll, widow, with its appurtenances in Cheshunt and Waltham Cross, to the use of such persons as she should by her will appoint, and afterwards, in the same year she settled it upon Thomas Buryng (described as her son) upon his marriage with Agnes, daughter of James Monkaster, merchant-tailor, of London, from whom it descended their son Robert, who, on the 3rd of April, anno 3 Elizabeth, conveyed it to John Ellyott, of London, merchant; and he on the 10th of June, anno 5 Elizabeth, in conjunction with Eleanor his wife, sold it to the Right Honourable Sir William Cecil.

This Sir William Cecil was the son of Richard Cecil, esq., Principal Officer of the Robes

\* See p. 639.

† A paper read by Mr. F. D. Rees Copstick, at the annual meeting of the Incorporated Church Builders' Society, at Cheshunt Great House.

King Henry III., and his advancement in life is said to have resulted from the following circumstance:—

"Coming to court to see his father, he there met with two chaplains of O'Neil, the famous Irish chief, with whom he entered into a warm discussion in Latin, and acquitted himself with such dexterity and address as highly exasperated his opponents. The king, hearing of this circumstance, sent for young Cecil, and was pleased so with his address and conversation that he appointed him 'Custos-Brevium' of the Court of Common Pleas. In 1541 he married his first wife Mary, daughter of Sir John Cheeke, who shortly after died; and in 1545 he married his second wife, Mildred, daughter of Sir Anthony Cooke, of Geddy Hall, Essex, and received from the Duke of Somerset the appointment of Master of Requests; and in that year he accompanied the duke into Scotland, was present, and nearly killed by a common shot, on the battlefield of Masselborough. Upon his return to court he was appointed to the post of Secretary of State by Edward VI. On the 12th October, 1549, he, with other adherents of the Duke of Somerset, was arrested and committed to the Tower, but was in a short time liberated. Upon the accession of Queen Elizabeth he was re-appointed Secretary of State, and sworn of her Privy Council, and shortly after he built a seat upon his manor and estates of Theobalds, which, says he in a letter dated the 5th of August, 1555, 'was begun by me with a mean measure, but increased on occasion of her Majesty's often coming'" (sic).

The following description of Theobalds is taken from Lysons's "Enviions of London," p. 33:—

"It consisted [temp. James I.] of two principal quadrangles, besides the Dial-court, the Buttery-court, and the Dovehouse-court, in which the offices were situated. The Fountain-court,—so called from a fountain of black and white marble in the centre,—was a quadrangle of 86 feet square, on the east side of which was a cloister, 8 ft. wide, with seven arches. On the ground-floor of this quadrangle was a spacious hall, paved with Parbeck marble; the roof arched over the top with carved timber of curious workmanship. On the same floor were chambers for the Lords Holland and Hamilton, and the king's waiters. On the second floor was the Presence-chamber, wainscoted with good oak, and richly gilded with antique pictures over the same; the ceiling full of gilded pendants hanging down, setting forth the room with great splendour; also with very large windows, and several coats of arms set in the same. These windows opened south on the walk in the large garden leading to the green gates going into the park, where was an avenue a mile long, between a double row of trees. On the same floor were also the privy chamber, the withdrawing chamber, the king's bedchamber, and a gallery, 123 ft. by 21 ft., wainscoted, with oak and paintings over the same of divers cities [sic], rarely painted, and set forth with a fret ceiling, with divers pendants, roses, fleur-de-lis, painted and gilded with gold, also divers large 'stagg's heades sett' round the same. The windows of this gallery looked north into the park, and so to Cheshunt. On the upper floor were the Lord Chamberlain's lodgings, and other apartments. Near the Chamberlain's lodgings, on the east side, was a leaded walk, 82 ft., by 11 ft. wide, with an arch of freestone over it. On the west of the Lord Chamberlain's lodgings was another walk of the same dimensions looking westward into the Fountain-court. At each corner of these walks stood four high large towers, covered with blue slate, with the iron and vaines on the top of each, and in the walk over the Hall one faire and large turret in the fashion of a lantern, wherein hung twelve bells for chiming and a clock with chimes of sundrie work. The walk from the lower gate to the middle of Fountain-court was arranged so that the figures of Cupid and Venus might easily be seen from the highway when the gates were open. The middle court was a quadrangle of 110 ft. square,—on the south of which were the queen's chapel (stained glass windows), her presence, bed, and coffee-chambers. The prince's lodgings were on the north side; on the east side a cloister, over which was the green gallery 109 ft. by 12 ft., well painted round with the several counties of England. On the west of the quadrangle was another cloister on five arches, over which were the duke's lodgings, and over them the queen's

gallery, 109 ft. by 14 ft. On the south side stood 'a large open cloister, built upon pillars of stone, arched over with seven arches well painted with the kings and queens of England, and paintings of many castles and battles and divers descriptions on the walls.'"

Queen Elizabeth visited "Theobalds" in 1566, 1571, 1572, 1578, 1583, 1587, 1591, 1593, 1598, and in the latter year held court here after the death of the great Lord Burghley, who was succeeded in the manor of Theobalds by his second son, Sir Robert Cecil, who soon after the death of Elizabeth had the honour of entertaining King James here on his way from Scotland. In the year 1606 he entertained James I. and Frederick III., king of Denmark. The king, having become enamoured of the place, prevailed upon his minister to exchange it with him for his Palace of Hatfield, which was accordingly done by deed dated the 14th of May, anno 5 James I.

King Charles I. resided occasionally at this palace, and it remained in the possession of the Crown until the thirteenth year of the reign of Charles II.\* when it was granted by letters patent to George Monk, Duke of Albermarle,

The property now called Theobald's Park was bought by Sir Henry Meux in 1832.

Sir Thos. Ahney had a house here; and here Dr. Watts lived for some time before his removal to Stoke Newington.

Lord William Lennox wrote the following *jeu d'esprit* on the name of Meux, some of the family pronouncing their name as if spelt Mews:—

"There's Meux entire, called Mews the swells among,  
Though mews is better in a foreign tongue;  
Tut mews, why change the sounds? 'Tis no myth,  
Taylor was Taylor once, and Smyth he was Smith."

THE DECORATION OF ST. PAUL'S.

SIR,—I should be much obliged if you could kindly allow yet another scheme for the decoration of the cupola of St. Paul's to appear in your valued review.

The architectural framework adopted in Mr. Poynter and Sir Frederick Leighton's design follows, in its main lines, the sketch left by the late Mr. Alfred Stevens (see the *Builder*, 5th July, p. 11), and in the different design exhibited by Mr. Stannus (see the *Builder*,

Mr. Wild's Suggestion for the Decoration of the Dome of St. Paul's.

upon whose death it became vested in his only son Christopher, and by divers conveyances afterwards became vested in Ralph, Duke of Montague, who married the Duke of Albermarle's widow, who sold the estate in 1736 to Letitia Thornhill, and which, upon the trusts of the will of her father, Sir Robt. Thornhill, and in consequence of the deaths of his children without issue, descended to Sarah, wife of Richard Cromwell, esq., one of the sons of Major Henry Cromwell, and to Eleanor Hinde, her sister, who were the daughters and co-heiresses of Eleanor Gatten, the wife of Ebenezer Gatten, esq., the surviving sister of the above Sir Robert Thornhill, from which Sarah Cromwell, her moiety, and that of Mrs. Hinde's under the limitations of her will, it descended finally to Sarah Cromwell's three daughters, Elizabeth, Anne, and Letitia, who by their wills devised it to Oliver Cromwell, esq., their cousin, the last male descendant of the Cromwell line, who, in the year 1795, built a mansion in Brantynghshay, otherwise Cheshunt Park, which property had descended in the same manner as the manor of Theobalds, and which, after his death, became the property of the Earl of Portland, whose son was by George I., created Duke of that name. About the middle of the last century the property was sold to a member of the Prescott family, under whose direction the remains of the old palace were pulled down, and a new house, said to be somewhat similar to St. James's Palace, was erected. A considerable addition and improvement was made to it by the late Sir Henry Meux, who held it for several years, under Sir George Prescott.†

(Sept. 6, p. 331) the space is divided in a somewhat similar manner.

Whether a painted architectural framework dividing the smooth surface of the cupola be advisable is a matter upon which different opinions may be held, but this, at least, must now be clearly seen, that by the division into eight parts by eight broad bands, or ribs, again sub-divided into variously-shaped panels, the spaces left for the figures become so small that they cannot be properly seen or understood by the spectator on the floor of the cathedral.

In the scheme that I now venture to suggest, the space would be divided into four main compartments, respectively opposite to the nave, the choir, and the north and south transepts, where only you can get far enough back to see them in comfort, without throwing the head painfully backward. These four divisions would be filled with figures on a gold ground, and bounded by nimbi bearing inscriptions. The spaces between them would be of a greyish blue, powdered with stars, and bearing the emblems of the four evangelists. Above would be a circle of angels, and the whole would be crowned by golden rays proceeding from the vertex.

The figures shown on the design were kindly sketched in for me by my friend Mr. Edward Armitage, R.A., who suggested that the four subjects should illustrate the "Te Deum Laudamus" from our morning service:—1. "The glorious company of the Apostles praise Thee." 2. "The goodly fellowship of the Prophets praise Thee." 3. "The noble army of martyrs praise Thee." 4. "The Holy Church throughout the world doth acknowledge Thee." The circle of angels above illustrates the verse, "To Thee all angels cry aloud."

## Illustrations.

## READING-DESK: ANCIENT ARABIC.

**T**HIS, and the bas-relief and lamp figured in another illustration, constitute a further selection from photographs of articles in the Museum of the Mosque El-Hakem at Cairo, forwarded to us early in the present year by H. E. Frauz Bey, chief architect to the Egyptian Government; other examples of which have been already published (see *Builder* of July 19 and August 16 of this year).

This illustration shows the side and back of a reading-desk (used for reading the Koran), which formerly stood in the Gismas-el-Ishagi Mosque in the "Derh-el-Ahmar" quarter. It was made in the fifteenth century. The constructive parts are rather coarsely made, but the panelling (greatly damaged), which is inlaid with ivory, and chony, and shells, is of exquisite finish.

## BAS-RELIEF AND LAMP: ANCIENT ARABIC.

THE sculptures in bas-relief are on light grey marble. The two heraldic eagles may probably be ascribed to the Transition period. Their origin is not known. They were found on the floor of the baths at Derh-el-Gamamus.

The centre piece, representing the symbol of Islam illuminating the world, viz., a candlestick and two candles, was found immured in the Kihlah of the Bedredin el Agami Mosque.

The chandelier or lamp of the Sultan el Barkuk Mosque is shown below. Its total height is 37 centimetres, made in greenish glass; the edges and the larger leaves are scarlet; the smaller leaves, the background of the inscription, and the frieze around the handles are cobalt blue. The inscription and the medallions are gilt. This is one of the five lanterns still extant, as to the origin of which connoisseurs remain in doubt. They are attributed by some to Venetian, by others to Assyrian, makers. If this lamp was really made to Barkuk's order, then its date would be the end of the fourteenth century. There are only inscriptions on the upper part of the neck, and they are in the Sals character. The general ornamentation, and the enamel are of the most perfect finish.

## THE HENRY WILSON MEMORIAL CHURCH.

ST. BARTHOLOMEW'S, CARBROOK, SHEFFIELD.

THIS church is about to be erected as a memorial to the late Mr. Henry Wilson, of Westbrook, Sheffield, whose benefactions to church work in all ways and many countries are well known.

The plan, as will be seen, consists of nave, north and south aisles, north and south transepts, chancel, clergy vestry, and organ-chamber, also choir vestry and large parish-room beneath the chancel. The tower at the south-west corner of the nave is 100 ft. to the top of the parapet. Huddersfield stone will be used for the dressings and Oughtibridge stone for the walling. The inside face of the chancel will be of dressed stone. The woodwork generally will be of deal and pitch-pine, and the chancel fittings of oak.

## THURLOW TOWERS, KNOLLYS-ROAD, STREATHAM.

THIS house, the residence of Mr. Michael Pope, lately erected from the designs of Messrs. Batterbury & Husley, architects, of 29, John-street, Bedford-row, and Berkhamsted, is situated on part of land formerly of Edward Thurlow, Lord High Chancellor of Great Britain, who was Lord of the Manor of Leigham Court, and probably of the adjoining manor of Gillians, now called Julians, or St. Julian's. He held other property, and resided at Knight's Hill, Norwood.

The manor of Leigham, or Leigham's Court, in fact, belonged to Bermondsey Abbey till the Suppression, when it was given by Henry VIII. to Henry Dowes, clerk. It was several times transferred, and at length passed by marriage, in 1752, to George, fifth Duke of St. Albans, who, in 1785, sold a portion, and, in 1789, the remainder, to Lord Thurlow.

The staircase window has painted glass portraits of Lord Thurlow, with his arms and motto, "Justitie soror Fides"; also of Homer, Chaucer, Camden, Dante, Scott, &c. In the

The Henry Wilson Memorial Church, Sheffield.—Plan.

dining-room the upper lights exhibit St. Paul's, Westminster, Harrow, and Windsor, indicating the direction whence they can be viewed. The painted glass in the drawing-room illustrates music in the portraits of Beethoven, Mozart, Rossini, Handel, and others.

From the tower can be observed the greater part of Surrey and Berks, Middlesex, and Essex. The north view gives quite a panorama of London and the West End.

The site, which has a very considerable fall, made it necessary that the house should be placed at the highest part of the ground.

The materials used for the exterior are red Ditchling bricks and Box-ground stone. The interior is treated with due regard to the style adopted; the roof over the hall is panelled in wood, and has curved principal rafters with traceried spandrels; the ceilings under galleries around the hall of the tower and entrance lobby are also panelled in wood. The ceilings of the dining and drawing rooms have moulded panels in plaster, the enrichments being modelled by Mr. H. Palm, of 47, Highgate-road. The painted glass already referred to was executed by Mr. E. H. Walden, of 87, Albert-street, Regent's Park. The owner's crest and the enriched panels, &c., over the tower entrance, were carved by Mr. George Frampton, a medallist of the Royal Academy.

The contract for the foundations and the concrete walls, to the plinth level, was intrusted to Mr. H. Potter, of Redwald-road, Lower Clapton. The superstructure was erected by Messrs. J. & C. Bowyer, builders, of Westwood, Upper Norwood, the foreman of the works being Mr. H. Allen. The view of the house here given is drawn by Mr. A. B. Pitt.

**Projected Improvements at Westminster.**—Application is intended to be made in the ensuing session of Parliament for leave to bring in a Bill empowering certain persons, or a company to be incorporated, to make and maintain the following works:—To widen Parliament-street on its western side, between Charles-street on the north and Parliament-square on the south; to widen Charles-street on its southern side, between Parliament-street on the east, and Delahay-street on the west; to widen Delahay-street on its eastern side, between Charles-street on the north and No. 4, Delahay-street on the south; and to construct a new street from Parliament-street to Delahay-street. Powers are asked for the compulsory purchase of lands for the works and additional lands between Parliament-street and Delahay-street, and Charles-street and Great George-street, and the Bill will contain clauses as to agreements with her Majesty, the Commissioners of Woods and Forests, the First Commissioner of Works, the Metropolitan Board of Works, and the Westminster District Board of Works.

## ARCHITECTURAL SOCIETIES.

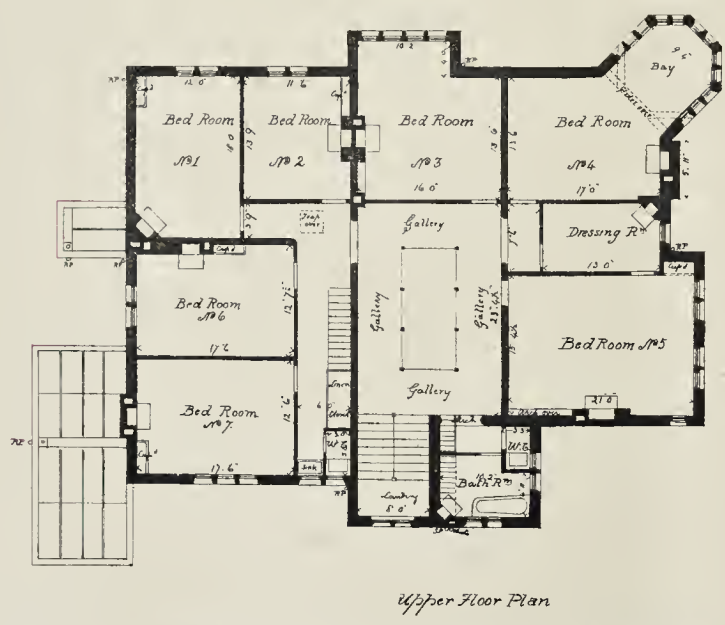

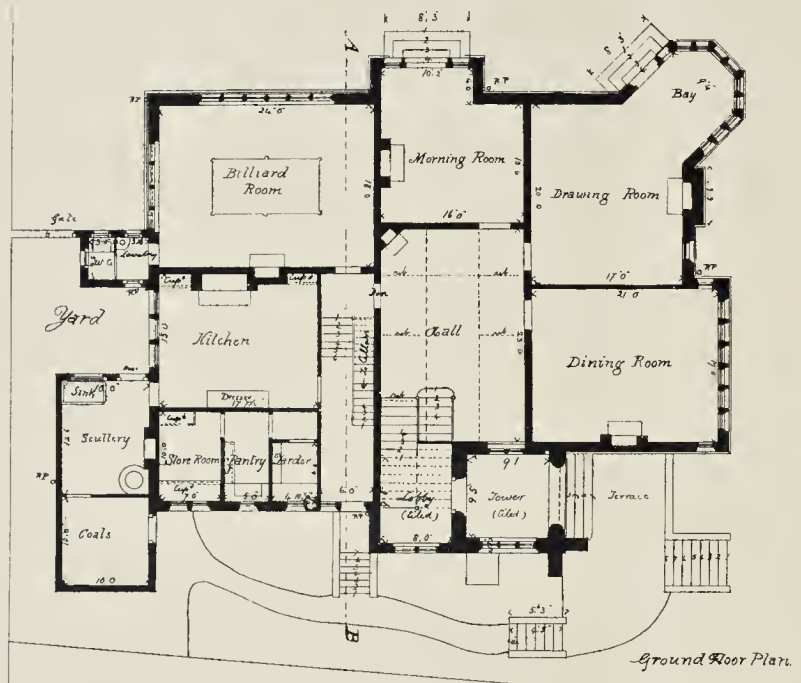

**Edinburgh Architectural Association.**—At a meeting of this Association, held on Monday night, Mr. G. W. Watson, president, in the chair, Mr. James Gowans read a paper on "The Laying-out of Fening Ground and Planning of Houses."

**Manchester Architectural Association.**—The first ordinary meeting of the above Association took place in the old Town-hall, King-street, on the evening of Tuesday, November 11th. The Vice-President, Mr. A. H. Davies Colley, in the absence of the President, Mr. J. Medland Taylor, addressed the meeting. Mr. Colley was of opinion that architects of late years were receiving more public attention, and that people were gradually becoming convinced how necessary the profession was for their daily wants and comforts. The demands on the architect had of late years greatly increased, and he thought that division of labour was very desirable for the production of good work. He was further of opinion that a young man would in the future succeed best if, having mastered the ground work of his profession, he devoted his time to one special branch of his calling. He next referred to a proposal that the Liverpool Society and the Manchester Association should combine together in the publication of a sketch-book. The prizes for the session 1883-1884 were awarded as follows:—Elementary Class of Design, 1st prize, Mr. P. E. Barker; 2nd prize, Mr. T. R. Wrigley.—Elementary Class of Construction, 1st prize, Mr. T. L. Worthington; 2nd prize, withheld. Mr. T. Chadwick supported the suggestion concerning the sketch-book. Mr. J. S. Hodgson supported the proposal concerning the joint sketch-book. Mr. F. W. Mee and Mr. J. H. Woodhouse also addressed the meeting. Mr. T. L. Worthington suggested that steps should be taken to bring the Manchester Society of Architects and the Association in more direct connexion, more especially as regarded the prizes offered annually to students. Mr. J. Brooke opposed such a suggestion, and thought that the two bodies had different motives and interests. He also considered specialism in the case of the architect was almost a practical impossibility.

**Post Office Extension.**—The *City Press* says that it is proposed to make an entire clearance of the buildings between the northern end of the new Post Office and the Money Order Office, thus absorbing nearly, if not quite, the whole of Bull and Mouth-street, with its private business houses and railway booking-offices, with some half-dozen houses also in King Edward-street, while two other large buildings, one of a sacred and the other of a secular character, are also included in the general sweep. These are the French Protestant Church and the Queen's Hotel.

THE LANDING OF ST. AUGUSTINE  
ON THANET.

To an Englishman, and not, as might be expected, to any Roman writer, are we indebted for what has been happily described as the earliest of "Canterbury Tales." Our Anglican Church must ever hold in cherished remembrance its story of the meeting, in the Forum which Apollodorus built for Trajan, of a patrician monk of the great St. Andrew's monastery which crowned the Caelian Hill and three fair slaves from the far-away kingdom of the Northumbrian Ælla. Every incident of the fascinating tale had been carefully preserved in St. Augustine's monastery at Canterbury. Together with other, perhaps less authentic, traditions of the ancient Kentish church, it was related to Bede, for his "Ecclesiastical History," by Albinus, abbot of that convent. So momentous have proved the results of the interview that it were not amiss to briefly recall who formed its chief actors, as well as what was the episode that immediately ensued,—an event about to be commemorated by the dedication of a monument at the landing-place of Augustine in England. We should picture to ourselves one who subsequently played so prominent a part in European history as to almost earn for himself the title of founder of Western Christendom. At that juncture Gregory was but a monk in the monastery which from its high pre-eminence amongst the pines still looks down, across St. Gregory's Church, upon Vespasian's Colosseum. Yet already had he become distinguished for a tenderness and a benevolence which neither knew nor made difference between the Pagan and those of his own new faith. To this day we are shown the marble table whereat from his own resources he used to feed twelve heggars each day. His active courage during one of the terrible plagues that attacked the Eternal City is commemorated in the modern name of Hadrian's Mausoleum. For it was on the summit of the Castle of St. Angelo that whilst chanting a solemn office for deliverance, by the Ælian Bridge he saw the Destroying Angel alight and sheathe his sword. Still it is with Gregory's tender regard for the young, and his lifelong efforts for the conversion of the heathen, that our tale is more concerned. The same solicitude that made him pray for his beloved Trajan prompted the first question which arose to his lips on suddenly confronting the beautiful children from Deira. Are they Pagans or Christians? asked Gregory, who probably had never seen a Briton before. He listened, we are told, with a deep compassionate sigh to the slave-dealer's reply. Thereupon followed the well-known colloquy, during which, inspired doubtless by thoughts of a grand and novel project, he played, as was his wont, upon strange words, with the half-prophetic half-dreaming mystification of the visionary and enthusiast. Obtaining leave from the Pope to attempt an object dearest to his heart, he set out from Rome with a few companions, their departure being made in secret, lest the great love of his people should forbid so hazardous an enterprise. Barely three days have passed when an express messenger overtakes them at a spot whose name of Locusta he construes into a portent of evil omen against the continuation of their journey. His presence was urgently demanded nearer to home; and the populace had attacked the Pope in St. Peter's; they are loudly clamouring for Gregory's recall.

More than ten years elapse, and his purpose is neither forgotten nor fulfilled. But he had not long occupied the Papal chair when he hears of circumstances which offer fair promise of success, or at any rate of a friendly reception to his mission. He learns that Æthelberht, king of Kent, an Ælcing or descendant of Hengest, is married to Bertha, daughter of the Frankish Chariberht, king of the city and county of Paris. The queen, like to her own great ancestor Hlodwig, whom his wife Hlothilda had converted, was a Christian, and had taken the Bishop Luidhard to her new home. There was appropriated for their use a little chapel which stood close to her husband's palace at Longport, overlooking the main road (Watling-street) from Rutupia, along which Plantius had led his conquering legions. This chapel, sent of a departed Christian worship, she dedicated to the saint most popular in her country, St. Martin of Tours; and there on the hill without Canterbury stands its successor, embodying in its walls remain-

of Bertha's church. Taking his opportunity, Gregory sends forth Augustine, prior of his former convent or the Caelian Hill, together with forty associates, to confirm and extend the influence for good of the English queen. A deaf ear was turned to the remonstrances which the chosen band sent back in alarm to Rome at various stages of their voyage. Reinforced by some choristers and interpreters engaged in passing through Gaul they at length reached the coast of what they deemed to be the end or corner of the world,—the *angulus of Anglia*, as Gregory liked to call it. They touched ground in the customary parts; being the same locality whither Horsa and Hengest had come some 100 years before to the overthrow of Vortigern. The precise spot of landing is open to some debate. However, a generally-received tradition,—though the arguments for its acceptance are too complex for rehearsal here,—points to Ebbe's Fleet, by the estuary of the then broad Wensum or Stour, whose wide waters covered most of the now marsh land that lies between Pegwell Bay and Reculver. The Kentish king had stipulated at the outset not only that a river should flow between him and the missionaries, but, with his superstitious dread of enchantment, that no tree should throw its shadow across the ground. So, advancing from their bivouac in the field which is yet pointed out northwards of Ebbe's Fleet farm-house, the monks take station on an elevation in Minster marsh. From that promontory, then extending into the river's mouth, are now dimly visible the distant towers of Canterbury. Æthelberht and his court come forward in turn. The monks are seen to bear before them a big silver cross,—for as yet crucifixes, even as a device, are scarcely known,—with a picture of Christ painted and gilded. They are heard to chant a Litany to a strain which Gregory himself had composed. From their midst stands conspicuous the tall stature of Augustine: by his side are Lawrence, afterwards his first successor in the later metropolitan see, and Peter, first abbot of St. Augustine's in the Minster city. Neither party could understand the ordinary tongue employed by the other. When the interpreters have discharged their office, the king with native candour and in words whose genuineness,—that is to say, as to their having been actually used,—is undeniable, makes response as follows: "Your words are fair, and so are your promises, yet since they are novel and doubtful I cannot give them assent, and leave the customs I have so long observed with the whole of my Saxon race. But as you are come hither strangers from a long distance, and as I seem to myself to see clearly that what you yourselves believe to be true and good you wish to impart to us, we do not wish to molest you. Nay, rather, we are all anxious to show you hospitality, and to give you all that is needed for your support; nor do we hinder you from joining all whom you can to the faith of your religion." Encouraged by this tolerant, albeit dignified and politic utterance, the monks cross the river at the old Roman stronghold of Rutupia, which survives in the ruins of Richborough Castle. Having been accorded another audience by the sovereign, they proceeded to his Kentish capital. On coming into sight of St. Martin's Church they break forth into a supplicating Litany which Gregory had harmonised during the plague at Rome that killed his predecessor, Pelagius. "We beseech thee, O Lord, in all thy mercy, that thy wrath and thine anger may be removed from this city and from thy holy house." Ever and anon they send up the jubilant cry of the older Hebrew worship which Gregory had wrested from the name of the Northumbrian king,—Alleluia! For a first abiding-place Æthelberht gave them Stable Gate, by a heathen temple close to the existing St. Ælphage's Church; and within a few months, on Whitsun-day, June 2nd, A.D. 597, he received the sacrament of baptism at the venerable font in his consort's church of St. Martin.

Transferred from their original grave at Reculver, the remains of the first Christian Brethwalda were deposited next to those of his first wife at the southern end of St. Martin's altar in Augustine's Abbey of St. Peter and St. Paul. There in A.D. 613 the bodies of the great missionary, together with those of Bertha and Luidhard, had also been laid. The several names we have mentioned still live in the ages for which Augustine summoned additional helpers from Rome,—Justus to found that of St. Andrew at Rochester, Paulinus that of St.

Peter at York, Mellitus that of St. Paul in London, whence proceeded another St. Peter's,—our Great Western Minister on Thorney Island. It is surely fitting that the abbey which he dedicated to St. Peter and St. Paul should at this day be represented by that monastery, known by his name, which a recent benefactor has rescued from decay and re-established as a college of missionaries to the Colonial Church. It is as fitting that Lanfranc's vast cathedral, standing aloft over the ruins of St. Augustine's pristine foundation of Christ Church, should bear proud and lasting testimony to the establishment of Christian worship in this country. Nor is it less seemly that some material evidence should be supplied to mark the spot where Augustine first set foot on our island. By Lord Granville's care the stone cross is there being erected of which we gave an account in a recent number.\* It does not appear, however, that the sculptured figures will include, as they certainly should, a figure of Pope Gregory the Great.

## "NEW HOUSE," PAKENHAM, SUFFOLK.

THE following information in regard to this house and its family connexions and associations has been communicated to us, in relation to the references to the house, and to the Spring tomb at Lavenham, in some recent articles on the Architectural Association excursion:—

New House, Pakenham, Bury St. Edmund's, was originally a large brick mansion erected in an elaborate style of architecture by Robert Bright, of Netherhall, Pakenham; † "but some portion of the rear having been taken down many years ago, it is now considerably reduced in size." The date of 1622 over the front entrance refers probably to the year when the house was completed, it having been commenced two years before. Robert Bright willed it in 1630 to his son Henry, who sold it in 1653 to Sir William Spring, bart., M.P. for Bury and High Sheriff of Suffolk. The Springs at this time owned Pakenham Hall, a stone mansion surrounded by a moat which was pulled down at the beginning of the present century, and New House was purchased by this Sir William as a dowry house for his lady, Elizabeth, daughter of Sir Hamon L'Estrange, of Hunstanton Park.

The family of the Springs ‡ (of whom three were made knights and one a baronet) derived originally from Houghton, a village in the bishopric of Durham, which has always been called Houghton-le-Spring. They seem to have settled at Pakenham about the middle of the sixteenth century, but the first of the family who made any figure in Suffolk was Thomas Spring, § of Lavenham, whose monument in Lavenham Church gives the date of his death Sept. 7th, 1486. His son, the wealthy Thomas Spring, had issue Sir John Spring, who was knighted by Henry VII. Sir John had issue Sir William Spring, knight, twice high sheriff of Suffolk. Sir William, by Susan, daughter of Sir Ambrose Jermyn, of Rushbrooke, knight, had issue John Spring, who married a sister of Sir John Selawney, of Devonshire. John Spring's son Sir William Spring, high sheriff of the county, was knighted at Theobald's 1610-11. By Elizabeth, daughter of Sir William Smith, of Mount Hall, Essex, Sir William had a son William, who was created a baronet 1641. The first baronet had issue Sir William Spring, bart., who, by marriage with Sarah, daughter of Sir Robert Cordell, begat Sir Thomas Spring. Sir Thomas, the third baronet, by marriage with Merlina, daughter and co-heir of Thomas, Lord Jermyn, had issue Sir William Spring, fourth baronet, who dying s.p., divided his estate between his two sisters Merollia and Mary. The latter married John Symonds, D.D., of The Mount, Bury St. Edmunds, whose daughter De La Riviere became the wife of the Rev. John Casborne, of Drinkstone, the father of the late Rev. Walter John Spring-Casborne, J.P., who married Anne\* (died June 9, 1884, aged

\* See p. 312, ante.

† His descendants were living in 1860 in Massachusetts, U.S.A. Vide "The Brights of Suffolk," a rare and interesting book.

‡ For pedigree of Spring family, see "Visitation of Suffolk," pp. 166-200. Edited by J. J. Howard, LL.D. 1866.

§ The paw of the Springs, a highly-finished Gothic work, still remains, though decayed; and their armorial bearings are in many parts of the building.

Through her grandmother, Mary Merry, descended from the Gages and Kytsons of Hengrave, and from Thomas d'Arcy, Earl Rivers.

\* See *East Anglian Daily Times*, No. 4,835, for July, 1884, where an account of the Loft family is given.

96), daughter of the well-known *littérateur* Mr. Capel Loft, J.P., of Troston Hall, Suffolk, by Anne, the daughter of Mr. Henry Emlyn, F.S.A., the restorer of St. George's Chapel, Windsor, in the time of George III., and inventor of the so-called "British" style of architecture.

In 1578, when Queen Elizabeth visited Suffolk, "there were," says Churchyard, "200 young gentlemen clad all in white velvet, and 300 of the graver sorte apparelled in black velvet coats and fayre chaynes, all ready at one instant and place, with 1,500 serving men more, on horseback, well and bravely mounted, in good order, ready to receive the Queen's Highness into Suffolk, which surely was a comely troope and a noble sight to behold, and all these waited on the sheriffe, Sir William Spring, during the Queen Majestie's shode in those partes and to the very confines of Suffolke, but before her Highness passed into Norfolke there was in Suffolke such sumptuous feasting and bankets as seldom in any part of the world hath been seen before. . . . The sheriffe, Sir William Spring, and divers others of worship kept great houses, and sundry either at the queen's coming or return, solemnly feasted her Highness, yea, and defrayed the whole charges, for a day or twayne, presented gifts, made such triumphes and devices as indeade was most noble to beholde and very thankfully accepted." In the hall were many interesting portraits of members of the Spring, Jermyn, Firebrace, Barrett, Symonds, Blagge, and other families. In the early part of this century, however, no fewer than sixteen were maliciously destroyed, amongst them one of Dame Elizabeth Spring, *née* L'Estrange, in her weeds. There was also a portrait of Queen Elizabeth, said to have been presented by her Majesty to Sir William Spring when he entertained her in her "progress" through Suffolk, and also a likeness of Charles II.

At the death of the Rev. Walter John Spring-Casborne, *s.p.*, New House was sold, and has now passed out of the hands of the family.

Pakenham Church, which contains many materials of this family, was originally a Norman structure. It was appropriated by Edward I. to the Abhey of Bury, and was granted at the Dissolution to the Spring family.

#### SEWAGE DISPOSAL AND ENSILAGE.

ONE of the papers read at the recent Sanitary Congress at Dublin was on "Sewage Disposal," by Professor Henry Robinson, who observed that experience during the past year or two has proved the feasibility of preserving green crops in a succulent state by compressing them in Silos, so that they can be utilised for cattle fodder in the winter. This system deserves notice in connexion with sewage farming, as it is likely to prove a valuable means of getting over the well-known practical difficulty which is experienced of finding a market for the large amount of green crop which is produced by sewage irrigation. In speaking of this system the term "Silo" is applied to the artificial chamber or receptacle for green crops (such as grass, vetches, clover, &c.). The term "Silage" is applied to the crop thus treated, and the term "Ensilage" is applied to the process of making "Silage." The details of the construction of Silos cannot be referred to here, beyond stating that what is required is to construct a pit or chamber either in the form of an excavation in the ground, with a brick or other lining, or by building it above the ground. The object is to enable the green crop to be deposited in an air- and water-tight chamber, in which pressure can be applied to the crop to compress it. This is effected in some cases by well treading the crop after it is laid in the Silo, and then spreading layers of earth to about a couple of feet and pressing the covering well down. Another way is to construct the Silo with a movable covering of the exact size and shape of its interior. This cover is raised and lowered by suitable chains and rollers. After the crop is placed in the Silo the cover is lowered and weighted, so that a thorough compressing is effected, the weight applied giving about 200 lb. or so per square foot of surface. Salt is sometimes added as the crop is placed in the Silo. A crop thus dealt with is stored for months; when the Silo is opened the fodder is found preserved, and in a state readily taken to by cattle. It is desirable to choose the site for the Silos so that the fodder is preserved

somewhere near the place of consumption; also to lay out the works so that as little handling as possible is required. For instance, the Silo should be on a sidelong ground, so that the crop can be carted and tipped at a high level, and the silage taken out for use at a lower level.

The conclusions arrived at by Professor Robinson on the general question of sewage disposal are,—

1. That chemical precipitation is not so necessary now as it was considered to be a few years ago in cases where land for irrigation is not procurable.
2. That the efforts to profitably remove the manurial elements from sewage by chemicals not having been successful, the system should be adopted *per se* only where a filtration area cannot be obtained.
3. That the success which has attended the construction of filtration areas where the land is clayey, and the successful results which have been obtained from a combined straining of sewage and of subsequent filtration through small areas of artificial filters, point to the adoption of one or other of these systems in many cases where chemical treatment would previously have been advised.
4. That the injurious effects of passing untreated sewage into a river depend upon not merely the relative volumes of the sewage and the river, but chiefly upon the power of the river to oxidise the sewage, which power is in proportion to the extent of oxidation of the river itself.

#### NOTES FROM BIRMINGHAM.

THREE new schools, to accommodate 1,000 children each, are now being built for the Birmingham School Board in Cower-street, Ada-street, and Stratford-road, and additional class-room accommodation is also being provided to eight schools already built; and it is understood that other land is being sought on which to build more schools until provision is made in efficient schools for all children in the borough of school age.

Attention has been paid in the principal school in the town,—King Edward's School in New-street,—to the requirements of physical education, as well as that of mental education, and the governing body have recently expended a very considerable sum of money in erecting and equipping a large gymnasium for pupils of both sexes. The building is erected on land at the back of the school, and a regular professor of gymnastics has been engaged. It is intended to extend the advantages of this physical education to the branch schools in Camp Hill and Aston.

Some time ago a wave of opinion passed over the town, that in spite of all the efforts which have been made during recent years to pull down and repair and drain the worst of the habitations of the working classes, there yet remained a great deal of property of that class which ought to be removed. Occasionally, a coroner's inquest disclosed conditions of life incompatible with decency, or healthfulness, or morality, and public indignation compelled removal of the subject in the Town Council, who appointed a committee of their own body, under the presidency of the Mayor, to sit and take evidence from whoever chose to tender it. A general overhauling of the town took place by members of the Town Council other than the committee, and these amongst the rest gave evidence of what they had observed. This evidence showed beyond doubt that the Health Committee and their inspectors had been very lax in putting into force the powers they undoubtedly possess, and that a great deal of insanitary property was occupied by the working classes. The forefathers of this generation absolutely neglected both public and private improvements, they were so busy making money, and a great legacy of old tumble-down insanitary property has been left for this generation and its successors to remove and replace with decent and convenient dwellings and other buildings; and although much has been done in that direction in providing public buildings, it is worse than needless to shut the eyes to the fact that a great deal remains to be done yet in providing decent dwellings for working people. A proposal was made to the Committee to provide large blocks of artisans' dwellings similar to those in London and elsewhere, but it was shown that the general feeling here is against them, and that Birmingham artisans much prefer small self-contained cottages, which they can occupy entirely with their own families. A further proposition arising out of this discussion was that the new tramways, which will shortly connect the centre of the town with the suburbs, in

all directions, should take passengers at penny fares the whole distance morning and evening, somewhat as the workmen's trains on the metropolitan lines do in London, and an effort to secure this arrangement is now being made. Besides the old tramways connecting the centre of the town with Bournbrook and Hockley, three new lines are already laid to Villa-cross, Birchfield, and Perry Bar, to Moseley village, and to Nechells. These are ready for use, and several others are here contracted for.

The old extensive premises in Fazeley-street, which were formerly used as gas works, have lately been undergoing transformation to fit them for an ice manufactory. There is a large and deep artesian well there which will be utilised for the water supply. It is said that Messrs. Fellows and Morton, the proprietors, are expending 10,000*l.* in fitting up these works, and one wonders whether they contemplate a long succession of such hot summers as we have recently experienced to recoup them for their outlay.

The suburban village of King's Heath, which lies on the Midland line towards Bromsgrove, has lately had a very important building erected in its midst, in extension of a nucleus begun by Mr. Nettelford. This consists of a public hall to accommodate 600 persons, with stage arrangements for dramatic performances, library, coffee and reading room, rooms for working men's club, &c. It is now being decorated, and is a very effective building, and has been erected from the designs of Mr. R. F. Matthews, architect, Birmingham.

Twelve months ago, as was reported in the *Builder* at the time, the Messrs. Tangye, Limited, engineers, of Smethwick, near Birmingham, who employ several thousand men, determined to reward their workmen to a greater extent than was represented by wages. They then issued bonds for 100*l.* each to about one in forty of their men, such bonds to bear dividend the same as their other stock or shares, but to give no voting power in the management of the works. In the case of the death of the bondholder, his wife or children might receive the value of the bond in cash, or in other ways, for their benefit. At the annual meeting of the Company, just held, the chairman, Mr. Richard Tangye, announced that they had determined to issue further bonds, so as to increase the bondholders to one in twenty-five. The accident fund, initiated at the same time, had also been successful; no fatal accident had occurred, and less than fifty accidents of any kind, more than nine-tenths of which would not come under the Employers' Liability Act.

The hoarding has now been removed from the pediment over the principal entrance to the new Art Gallery, disclosing the sculpture therein. The central figure represents Fame seated, with a wreath in the left hand resting on the knee, the right hand held out as addressing a female figure, representing Painting on the one side, and a male figure kneeling on the other, and having a sculptured figure resting on the arm, as representing Sculpture, while two very chubby children, engaged in painting and sculpture, fill up each of the two lower angles of the pediment respectively. Mr. Roddis, of Aston, is the sculptor.

St. Philip's Church has recently been reopened, having had its chancel taken down and lengthened. The works have been carried out under Mr. Chatwin, architect. E. G.

**Hydraulic Door-spring**—Messrs. Archibald Smith & Stevens send us particulars and drawings of Stevens & Major's patent hydraulic spring and check for swing doors, and for regulating the closing of doors so as to prevent banging. This spring is made to fit flush with the floor, and can be even covered with a carpet, and acts as a hinge also. If it does efficiently what it professes, it ought to prove very useful. The patentees give the following general description of the principle of action:—"The spring is placed within a small pump barrel. On opening the door, a charge of oil is drawn from the containing-box into the pump. The spring, while closing the door, has to expel this charge of oil through a small aperture, the size of which is adjustable, and the rate of closing is controlled by the speed at which the oil is allowed to escape. All parts are of metal, and, as oil is constantly passed through, every part is always perfectly lubricated." Simple means of regulating the action for faster or slower closing are provided.

LONDON AND MIDDLESEX  
ARCHAEOLOGICAL SOCIETY.

The recently-announced *conversations* of this Society took place on the 12th inst. at Skinners' Hall, Dowgate-hill, by permission of the Master, Wardens, and Court of Assistants of the Company, wher upwards of 300 ladies and gentlemen, members and friends of the Society, attended. Among the many objects of interest exhibited in the hall were specimens of Roman sculpture excavated in Bevis Marks, and models of some found in Camomile-street.

The proceedings of the evening were commenced by a paper read by Mr. G. Lawrence Gomme, F.S.A., "On the Early Municipal History of London."

"Reminiscences of the Church and Parish of St. John the Baptist-upon-Walbrook" was the title of the next paper, and this was read by Mr. Henry Mathews, architect, who said that for more than five centuries the Skinners' Company had been identified with this parish. The ancient Wall-Brook, as was well known, was navigable for small craft from the Thames to Barge-yard, Bucklersbury, and was crossed by several bridges; one in Cloak-lane was named "Horse Shoe Bridge." Afterwards the Brook was arched over in brick and became a common sewer. This old sewer has for many years been disused, but the relics of it were still to be found in the garden of the Skinners' Hall. In the old church were two monuments of note, one to the memory of John Stone Taylor, sheriff in 1464, and the other to William Comberton. Under an order of James I. in 1610, "that all churches should be repaired and made fit for the service of God," the vestrymen resolved that the mason's work of the church be repaired "from top to bottom," and all things necessary thereto. The first church was probably built not later than temp. Edward III., as the excavations for the District Railway works had disclosed the immense thickness of the rubble work, and particularly the foundation of the original tower. The church was partly destroyed by the Great Fire, though the Tabernacle, as it was termed, was repaired, and used as a place of worship till the church of St. Antholin was built, and the two churches united. The remaining materials were then removed or buried, and the site laid out as a place of interment. Since then it has been laid out as a garden, and so continued till the ruthless hand of the railway contractor would have obliterated every trace of its sacred purpose had not a provision been made by the Act of Parliament that every vestige of human remains should have a receptacle in a new vault 20ft. below the surface, which has been provided, and the whole hermetically sealed. In a few months, a monument will be erected over the crown of the arch as a memorial of the dead and the ancient church of St. John the Baptist-upon-Walbrook.

A third paper read was "On the recent Discoveries made on the Line of the Inner Circle Railway and at Bevis Marks," by Mr. John E. Price, F.S.A., the hon. sec. of the Society. Mr. Price said that in making the necessary excavations for the Inner Circle Railway, the contractors came upon the remains of one of the bastions which formed part of the old London wall. This contained several sculptured stones of much interest. Fortunately, the contractors at once put a stop to the excavations, erected supports under the gas and other pipes which had been placed above it, and allowed the Society to make sketches, *in situ*, and afterwards took means for the protection of the stones. Eight years ago, a gentleman had called upon Mr. W. H. Overell, the librarian at the Guildhall, and told him he had found some extraordinarily large stones whilst making excavations in St. Mary Axe, which appeared to be the remains of tombs, temples, and other Roman buildings. These were preserved and placed in the Guildhall Library. On reference upon Aggas's map, it would be found that four bastions were shown, each with a tower at the top, so that at that time (temp. Elizabeth) they were still standing. During the last six years portions of the Roman wall with these four bastions had been excavated. These bastions seemed to have been built in Mediaeval times for the purpose of strengthening the wall, and that was probably the reason why these large Roman stones were used for their bases. They would have to take whatever material they could find, and these were of such a size that they would not have been

brought from any great distance. The first bastion was discovered in Camomile street, the second also was near there, the third being in John-street, Minories, and the fourth in Castle-street, Bevis Marks. The Society had now examined each of the four bastions. Amongst the objects discovered at Bevis Marks was a sarcophagus, 8 ft. long, and some Roman inscriptions.

## COMPETITIONS.

**Board Schools, Egham.**—We have received the following letter:—

Sir,—The Egham School Board, after long and careful examination of the fifty-four designs forwarded to them in the above competition, assisted by competent advisers and the Education Department, to whom a limited number of designs were sent for approval, have decided to adopt the plans submitted to them under the motto "Four les Enfants," prepared by Edward Harnor, esq., A.R.I.B.A., of 8, John-street, Adelphi. The second premium of 15*l.* has been awarded to J. Sargeant, esq., of Grosvenor-gardens, London, author of design forwarded under the motto of "Measure for Measure." The rejected designs (with the exception of one, on nine large frames, sent under the motto of "Light and Air," without address) have been returned, carriage paid, to their respective owners.—Yours faithfully,

BENJAMIN TICE,  
Hon. Clerk to the Board.

**Beaconsfield Club, Nottingham.**—In a limited competition, the plans of Mr. William Graham Lees, architect, of Nottingham, have been selected for the Beaconsfield Club in that town.

## BAD MORTAR.

## DEMOLITION OF BUILDINGS.

On the 16th of August, 1882, Simeon Murray, a builder, of Hackney, was summoned under section 17 of 41 & 42 Vict. c. 95, by the District Surveyor for East Hackney, for using mortar in two buildings not composed of fresh-burned lime and clean sharp sand or grit without earthy matter, in two houses at Shepscott-road, Hackney, as required by the Board's By-law No. 2, made under the above Act, and was fined 3*l.*, and 2*s.* costs. No alteration having been made in the buildings, the Metropolitan Board of Works took proceedings under the second part of section 17 of the above Act, for an order to demolish the buildings in question, and on the 21st day of December, 1882, Mr. Bushby, sitting at the Worship-street Police-court, made the order.

Immediately upon the order being made, the defendant, who had in the meanwhile mortgaged the premises, instituted an action in the High Court to restrain the Board from putting in force the order; but upon the hearing, the plaintiff did not appear, and the verdict was entered for the Board with costs.

The Board have now proceeded to put in force the order, and have taken down the walls of one house, and the demolition of the other house, which is at present tenanted, will be also at once proceeded with.

The above action on the part of the Board involves a serious loss to the mortgagees, as practically now their security for advances to the mortgagor has vanished.

CASE UNDER THE METROPOLITAN  
BUILDING ACT.

## WHAT IS A PUBLIC BUILDING?

THE Manager of the Metropolitan Asylums Board was summoned to Worship-street Police Court on Wednesday by Mr. Meeson, surveyor of East Hackney (North), for not giving notice of certain public buildings in Brooksby's-walk, Homerton, and for not depositing plans of the same.

A solicitor represented the Board, and the question turned on whether the building in question was a public building within the meaning of the Act.

It was admitted that the building—an extensive range,—adjoined the already-erected fever hospital. Its purposes were for the storage of the ambulances, stabling for the horses, and rooms for the coachmen and nurses of the ambulance service. It was contended that as the public would not be admitted to any part of the building, and as the building was not attached to the hospital, it was not public.

Mr. Meeson contended that the buildings were part of the hospital under the direction of the Board, and were paid for by public funds.

Mr. Hannay (the magistrate) said the Act was difficult to construe, but he came to the conclusion that the building was a public building, therefore he fined the Board 2*l.* A case would be granted for the High Court if desired.

## Paperhangings at the Health Exhibition.

Messrs. William Woollams & Co. write to point out that their name was incorrectly inserted in our list of awards at the Health Exhibition as "Woollams, Williams, & Co." It should be "Woollams, Wm., & Co." The error if uncorrected is likely to lead to confusion, since there is not only another "Woollams," but also a "Williams" in the trade.

## THE NEW NATIONAL LIBERAL CLUB.

Sir,—I am glad to see you have taken "note," as many have done, of the controversy in the *Pall Mall Gazette* over Mr. Waterhouse's design for this important building. You sum up the matter at issue exactly, as it seems to me, in your concluding words, "The most important point is the statement that Mr. Waterhouse had designed something much better and after his own heart, and was prevented from carrying it out by the intervention of bumbledom," and Mr. Waterhouse has never yet denied this. I was about to write to the *Pall Mall* when I noticed they had closed the correspondence; but what I wished to draw attention to is this, that judging from a view of "Whitehall-court" which has recently been published, it seems manifest "Bumbledom" has interfered to some purpose. I have no desire to say anything about the design of Whitehall-court as such, except that it does not promise much relief from "the general harmony of the district," but it must be apparent to everybody who looks at the view that the club has been made a mere cat's-paw of to enhance the size and "grandure" (sic) of the court. The spectacle of their clubhouse, tacked on in this fashion to the end of the company's residential chambers, and made to play second fiddle to assist the company's dividends, must be a humbling reflection for the members, if, in point of fact, this is all they are allowed to get for their 120,000*l.* outlay.

Another question, also, is being pretty freely asked, What is the use of the Institute if it cannot protect one of its most distinguished members,—one of its own vice-presidents,—from being sat upon in this manner? It is always claiming to be the representative of the profession. If what we are told is true, here is a professional grievance. Will the Council take it up on professional grounds, and make a remonstrance against such high-handed procedure? If not, one can hardly wonder why its members are snubbed with impunity by the so-called "Crown authorities." If not, what is the use of being a member? F. S. A.

\*\* The Institute could hardly take up the matter unless Mr. Waterhouse requested them to do so. That gentleman has not, so far, we believe, made any positive public statement of having been architecturally aggrieved in the matter; he has only allowed such a statement to pass uncontradicted. We may, of course, draw our own conclusions, but the Institute could hardly act on "conclusions."

WESTMINSTER HALL AND MODERN  
ARCHITECTURE.

Sir,—Mr. Tarver's definition of modern architecture, in your issue of the 8th inst. [p. 611], is certainly an ideal one; but I fear it is open to serious question. There are certain developments of our architecture to which the epithet "modern" is unfortunately specially applicable. As types of these, take some of our new big hotels, and what I would call generally our "street-corner" architecture, or, as another phase, our shoddy suburban builders' houses. Now all such buildings are very distinctly characteristic of the age we live in; but while certainly "left free to express themselves" (a great misfortune), they can hardly be said to do so either "honestly" or "beautifully," but rather very hideously, and, considering our present opportunities of study and enlightenment, it seems not extravagant to say that they constitute a national disgrace.

Reaching thus a sadly less ideal, but certainly more practical definition of "modern architecture," it is surely a matter of congratulation that the "Great Hall of William Rufus" is not about to be improved by erections "as modern in style as possible," albeit Mr. Tarver does suggest a limit to their lack of harmony.

As a precedent for this limit we are referred to sixteenth-century prebendal buildings around our cathedrals. But is this to the point? We must remember that at Westminster Hall we have only monumental architecture to consider (although the *D. T.* would beautify it with a covering of ivy), and prebendal buildings are not monumental. Again, they are but parasites to the buildings they surround, while the proposed additions to the Hall form part and parcel of itself. In such case, in seeking for a precedent for harmony between old and new work, we must look for one which bears accurately upon the question, and we have not far to seek.

Who but an expert can tell that the nave of Westminster Abbey is of three distinct dates? And who have succeeded best? Its builders, who have not scorned to "imitate a past style," or the builders

of the western towers, who have refused to be hampered by mere imitations." The precedent is good, and applicable, and fully justifies (if justification were needed) the architect's choice of style in his proposed completion of the exterior of Westminster Hall.

I use the word *completion* advisedly, for I believe this view of the question has been entirely overlooked, and is the only right one; and I say this after a most careful examination of the drawings, the site, and all that has been written on the subject.

Mr. Tarver admits he has not seen the drawings, but, if before writing he had taken pains to study the subject as I have, he would have found that the first of his excellent generalities, "that restoration for its own sake is a fatal mistake," never applied less than to this case, and that the remaining two as to "preservation" and "use" testify most strongly in favour of the proposals.

There is more than one way in which generalities are applicable to special cases.

A MEMBER OF THE ARCHITECTURAL ASSOCIATION.

#### SMELL FROM KITCHENER.

Sir,—I should feel greatly obliged if any of your readers could give me any suggestion as to an effectual remedy for above. My kitchen, of about 6 ft. frontage, is in the basement, and when any cooking is going on at all times (but I notice it particularly in the morning), the smell comes up the stairs and all over the house, and is most objectionable. I have enclosed the landing from the basement, and tried to shut it in, but immediately the door is opened it escapes all over the house. I have tried some other means, but unsuccessfully. It is not a question of cost. If any one could inform me how it could be effectually altered, so that there should be no doubt of its success, I should be extremely obliged. It has been suggested to me that a hood over the fireplace, projecting into the kitchen, with a pipe from the top into the chimney, might be successful. Have any of your readers tried anything like this, and if so, would they kindly give me their experience of it? KITCHENER.

#### CHURCH BUILDING NEWS.

**Oddington.**—The parish church here has just been reopened, after restoration. On Saturday, the 1st inst., the church was visited by the Oxford Architectural and Historical Society, who chose it as the first of their term's excursions. Mr. Bruton, the architect, from whose designs the church has been restored, met the members and delivered a lecture, from which the following particulars have been abstracted. "This is a most interesting example of a very simple church, built very early in the fourteenth century, and consists of nave, chancel, and north aisle, to which has now been added a small vestry on the north side. The only internal evidence of a north aisle having ever existed was to be seen on the north side of the chancel arch, where there was a semi-arch of stone springing from the north wall up to, and apparently intended to support, the plaster chancel arch. The external walls undoubtedly led to the suggestion that the arcade of the north aisle had been removed. Admitting this hypothesis, the symmetry of the church becomes apparent. Investigation proved that the north wall had been raised, and a common queen-post roof made to span the entire width. This wall being of less substance than that on the south, had in several places given way, and modern buttresses had been built against it to withstand the thrust. The roof had become very unsound and the ceiling dangerous, and many of the timbers decayed. Above the flat ceiling, and under the roof, was discovered the original water tabling, now to be seen on the tower above the restored roof. The lines of this water tabling conclusively proved the original existence of a north aisle, the centre line of the original roof being central with the tower. When the roof was removed there appeared above the ceiling line at the east end remains of an earlier chancel arch, but further investigation proved that this was not original. In removing the upper part of the north wall, to bring it to the level necessary for the roof, it was hoped that further remains would be discovered. None of the stones, however, which were found could be said to belong to it; but several of an ornamental character clearly belonged to a twelfth-century arch, which was probably removed when the before-mentioned one was built. This, of course, was done to get a wider opening between the nave and chancel. Mature consideration convinced one that this arch and the shafts were part of the north arcade, and, in fact, the before-mentioned shaft

and respond have been replaced at the west end of the restored arcade, where, it is believed, they originally belonged. The stones of the arch and of the shaft had been re-used without any disturbance of the original surface, and several of the stones bear upon their face painted scroll work belonging to the period. There is similar work to be seen at Charlton-on-Otmoor. The bases and capitals were too much mutilated to be re-used, the mouldings having been cut away to receive the framing of the plaster sham arch. These mouldings have been carefully reproduced in all the capitals and bases of the arcade; the new arches are also facsimiles of the discovered one. The windows of the south side of the north aisle had been much mutilated, with the exception of the western window of the north aisle, which is original; the mullions and heads had been removed, and the jambs cut away, and the space covered with a single arch. The new roof has tie-beams, with moulded king-posts, with framed rafters belonging to the period of Edward II., which has been adopted, although belonging to a slightly later period than the walls; because the walls are slightly out of upright, and this kind of roof has no thrust. The original pulpit, upon which the date 1617 can be seen, has been re-used, and new oak benches, facsimiles of some fifteenth-century originals, replace high close pews of the last century. The roof of the chancel is of a similar character to that on the nave, replacing a bracketed plastered ceiling, elliptical in section." The work has been executed by Messrs. Silver, Sons, & Filewood, builders, Maidenhead, at a cost of about 1200*l.*, from the designs and under the direction of Mr. Edward G. Bruton, architect, of Oxford, and surveyor for the diocese.

**London.**—After having been closed for two months for internal decorations and repairs the ancient church of St. Nicholas Cole Abbey, in Queen Victoria-street and Knight-riding-street, has just been re-opened. The original church, erected in 1377, was one of those destroyed by the Great Fire in 1666, and the present church was erected in 1677 from the designs of Sir Christopher Wren. Some twelve years ago the interior underwent a restoration which consisted, amongst other things, of cutting down the high pews and repaving the flooring with tiles of a Mediaeval pattern. Amongst the work which has now just been carried out is the decoration of the flat plaster ceiling, which is divided into fifteen panels; and also the painting and decoration of the walls. The decorations of the ceiling have been carried out in turquoise blue, cream colour, and light reds, interspersed with gilding. The prevailing tones of the colouring on the walls are dull reds and dead gold. The ceiling colours have been partly brought down into the cornice and toned off into the dull reds of the walls and pilasters. By this means the extreme flatness of the ceiling has been overcome. The windows on the north side and at the east end, from which only the church is lighted, have been filled in with stained glass, the upper portion of the windows on the north side having canopy work, with arches, wreaths, and pediments, together with heraldic shields. The three east windows are filled entirely with stained glass, the central window representing our Lord in glory, that on the north side St. Mary and St. Peter, and the one on the south side St. Nicholas and St. Benedict. The old oak reredos, with its fine carvings, either from the hand of Grinling Gibbons or one of his pupils, has been slightly touched here and there with gold. The Tables of the Law have been placed on either side within the chancel rails, whilst the central portion has a square panel, which is intended to contain the Adoration of the Lamb, in mosaic. Above, on each side of the windows, the wall is marked out in panels, each panel containing representations of scriptural figures and characters. Clergy and choir stalls have also been constructed on each side of the chancel. The decorative works have been carried out from the drawings of the architect, Mr. George H. Birch, the designer of the Old London Street at the Health Exhibition, the general decorative contractors being Messrs. Campbell, Smith, & Campbell, of Newman-street, Oxford-street, whilst the internal alterations have been effected by Mr. Spencer, of Knight-riding-street. The cost of the decorations of the east windows and the reredos has been defrayed by the new rector (the Rev. H. C. Shuttleworth) and his friends.

**Goathurst.**—The parish church of Goathurst,

near Bridgwater, has lately undergone an internal as well as external restoration. Dedicated to St. Edward, it consists of nave, western tower, chancel, south porch, south transept, and north chancel aisle, and belongs to the Decorated period of architecture. Considerable alterations were made in the fifteenth century, when the walls were raised, larger windows inserted, and the existing roof placed on the nave. In the course of the execution of the present restoration all the plaster was removed both from the internal and external faces of the walls, and many interesting features were brought to light. The original north doorway, with a portion of the wood and the iron hinges of the door, were brought into view; also the doorways at the foot and at the head of the staircase to the roof-loom. The whole of the walls have now been pointed externally, while internally they have been re-plastered and finished with stucco of the colour of Ham stone, and all the features of the ancient building preserved. The parapet of the tower and staircase, which was in an unsafe condition, has been entirely rebuilt with rag stone and Ham stone dressings, and the roof covered with new lead. The windows of the belfry have been fitted with pierced Ham stone panels. The dressed stonework generally has been repaired and in some cases entirely renewed. The nave has been re-seated, the old oak of the former seats with carved ends having been worked in again. The Tynte monuments in the nave have been taken down and re-arranged, so as not to interfere with the architectural features of the interior. One of these, that to Sir Charles Tynte, is by Nolkeens. All the windows in the chancel have been filled with painted glass by Messrs. Lavers, Barrand, & Westlake, of Endell-street, Bloomsbury. The hot-water pipes for warming have been fixed by Messrs. Culverwell, of Bridgwater. The work has been carried out by Mr. Henry W. Pollard, the general contractor, and Mr. Chas. Green, stonemason, both of Bridgwater, from the plans and under the direction of Mr. Houghton Spencer, of Taunton, architect.

#### The Student's Column.

ON THE CONSTRUCTION OF ROOFS.

IV.  
QUEEN-POST ROOFS are employed in preference to the king-post roofs, described in the last article, where the span is considerable. In this form of roof the heads of the principals are framed into two vertical pieces called *queen-posts*, as Q (fig. 10)

which are each placed about one-third of the span from the feet of the principals. The reaction of the principals is counteracted by means of a horizontal *straining-beam*, S, framed into the heads of the *queens*, which, by this means, are enabled to support the weight of the tie-beam. In roofs of from 30 ft. to 40 ft. span two purlins will suffice on each side of the roof, one being supported on the top of the queen, as D, and the other, P, half way between D and A, as in the king-post roof. The strut, P b, supports the middle of the principal, and its horizontal thrust on the foot of the *queen* is counterbalanced by a corresponding thrust from the other strut at d, which is conveyed along a *straining-sill*, b d, laid on the top of the tie-beam, and bolted to it, without weakening the joint of the queen-posts with the tie-beam. Where the span does not exceed 40 ft., the heads of the rafters at B do not require any support beyond that which they afford each other by being spiked to the *ridge-piece*, and the purlin, D, has to support half the load on the rafters, A B, or one-fourth of W, which we

put for the whole weight on each truss. The purlin, P, will sustain one-third of the load on the rafters, or one-sixth of W, and one-twelfth of W rests on the pole-plate, A.

The strains on the parts of a queen-post roof are similar in character to those of a king-post roof, but different in magnitude. Each queen has to sustain one-third of the load on the tie-beam, while the vertical strain arising from the thrust of the strut is only half that which a king-post sustains. If we represent the vertical load at P by the line Pa, and draw a b and ac parallel to A B and P b respectively, P b will be the thrust down the strut, and the horizontal line P Q will be the thrust along the straining-sill b d, while Q b will represent the vertical strain down the queen. The purlin D presses on the head of the queen, and produces a thrust down the principal, and a compression along the straining-beam S. Let the length b e represent the vertical load at D, and the part of the weight of tie-beam which the queen sustains: draw S b parallel to A B, then S e will represent the compression along the straining-beam, and e c will represent the thrust down the principal R, arising from this force; in addition to which R has to sustain the thrust, P c, arising from the load at P.

For spans exceeding 40 ft., it is necessary to sustain the ridge, B, by means of a king-post truss, of which the straining-beam, S, will form the tie-beam, which is thereby prevented from sagging; or struts from b and d to the centre of S can be introduced for the latter purpose, and the straining-sill, b d, omitted.

Cast-iron heads and shoes, and wrought-iron rods, can be substituted for the timber queen-posts, as before described for king-post roofs.

All framed roofs, with tie-beams, are made upon the principle of either the king or queen truss, or a combination of the two, which may be employed for roofs up to a span of 90 ft.

The scantlings of the timbers for a queen-post roof for a span of 40 ft. should be at least as follows:—Tie-beam 9 in. by 5 in., principals 6 in. by 5 in., straining-beam 8 in. by 5 in., struts 5 in. by 3 in., queens 5 in. by 3 in. at the smallest part, purlins 8 in. by 5 in. For 50 ft. span, tie-beam 11 in. by 6 in., principals 7 in. by 6 in., straining-beam 10 in. by 6 in., struts 6 in. by 5 in., queens 6 in. by 5 in., purlins 9 in. by 6 in. If there are only two on each side, or 8 in. by 5 in. if there are three to a side.

Hammer-beam roofs are frequently found over buildings erected in the fifteenth century, and the form of framing is a modification of the collar-roof described in the last article; only, instead of each pair of rafters being framed, trusses are formed of boavier timber, and the common rafters supported upon them by means of purlins.

The principle of their construction is shown by fig. 11, in which R R are the principal

rafters which are framed into a horizontal beam H, called the hammer-beam, which projects some distance from the wall, in some cases as much as one-fourth of the span. The hammer-beam is supported by the waling-piece, W, fixed upright against the wall and resting on a stone corbel, D; also by a strut, S, fixed between the corbel and the outer end of the hammer-beam. From the outer end of the hammer-beam rises the vertical strut K, which is framed into the principal R. A collar-beam, C, is placed across from one principal to the other, and a pair of braces, B B, connect the ends of the hammer-beams with the centre of the collar, thereby

tying the two hammer-beams together. The rafters are carried by the purlins, P, which are often deeply moulded. If there was no shrinkage of the wood, such a piece of framing ought to be perfectly rigid, and produce no thrust on the walls, as it consists of a number of triangles whose forms cannot be altered without a lengthening or shortening of the pieces which form the sides of the triangles. Practically, however, there is a considerable thrust on the walls which require to be made much stronger than for a tie-beam roof, or else to have buttresses built against them opposite each principal.

In this piece of framing, the hammer-beams are subjected to tensile strain in the direction of their length, and a compression where the struts abut against it; the waling-piece, W, is compressed, and also the struts, S and K; the collar, C, and the braces, B, are subjected to a tensile strain; the principals, R, have to bear a compressive strain down their length, and also a cross strain.

The timbers in these old roofs were generally of large scantling, as compared with those employed in modern tie-beam roofs of the same span; thus we find that in the roof of a small village church in Suffolk, where the span is only 18 ft., the principals, hammer-beams, and collars, are 10 in. by 8 in., and the common rafters, 6 in. by 3 in.; while in another of 20 ft. span, the principals and hammer-beams are 13 in. by 10 in. In modern roofs, constructed after this fashion, it has generally been found necessary to connect the outer ends of the hammer-beams by means of iron tie-rods, so as really to convert them into tie-beam roofs.

The roof of Westminster Hall, which has a span of 68 ft., is the finest specimen of hammer-beam roof now in existence, and is constructed on the same principle as shown by fig. 11, with the addition of a curved rib springing from the corbel, D, and passing between the strut, S, and the waling, W, between the strut, K, and the principal, R, and meeting the braces, B, at the centre of the collar; all the triangular spaces between the timbers are filled up with open arcaiding of timber, which adds greatly to the rigidity of the framework.

The strains on the several pieces of a hammer-beam truss can be ascertained by the "resolution of forces," as shown in king and queen post roofs, and the scantlings of the timbers should be rather more than was found necessary for tie-beam roofs.

Another method of building roofs without a horizontal tie-beam, so as to carry the room up into the roof, is by the use of semi-circular ribs, formed of two or more thicknesses of short pieces of plank bolted together so as to break joint. The ends of these ribs rest upon a plate of timber or shoes of iron, and the weight of the roof covering is supported by means of

purlins placed horizontally from rib to rib. The roof of the central hall of the Pantheon in Oxford-street is constructed in this manner, and a portion of it is shown by fig. 12 (from Tredgold's "Carpentry"). The span of this roof is 38 ft., and the ribs are placed 11 ft. 6 in. apart, each rib consisting of a central plank of oak, 5 in. thick, with a 2 1/2 plank of fir on each side, as shown by the dotted line. The depth of the ribs is 16 in., and they rest at the foot in cast-iron shoes, which also receive the tie-beam of a half-truss forming the roof over the side galleries, which serve as a buttress to prevent the feet of the ribs from spreading laterally.

A large semi-circular roof of wood was erected over the Great Northern Railway station in London, having a span of 105 ft. The ribs were formed of 1 1/2-in. deal planks, laid with their broad side horizontal, and bent to the required curve, the planks being prevented from straightening out by crossing the grain of the wood. The wood ribs were firmly fixed in a cast-iron spandrel built into the wall, and raised to a height of 40 ft. Purlins were laid across from rib to rib, and the roof covering of slate and gins fixed thereto. Details of this roof will be found in the *Builder*, 1852.

The scantling of the ribs for roofs constructed as shown by fig. 12, when the purlins rest immediately on the ribs, should be as follows:—For a span of 30 ft., the breadth should be 10 in. and the depth 17 1/2 in.; for 40 ft., breadth 12 in. and depth 18 in.; for 50 ft., breadth 14 in., depth 19 in.; for 60 ft. span, breadth 15 in., and depth 20 in. Fir is supposed to be the material used in these cases, and the ribs placed 10 ft. apart. These scantlings are obtained from the following rule, which may be considered sufficiently correct for practical purposes. Divide 200 times the radius of the rib (in feet) taken at the middle of the depth, by the breadth in inches, the square root of the quotient will be the depth in inches. The horizontal thrust of the rib at the springing, when the load on the roof is 50 lb. on every square foot, may be approximately found by multiplying the radius in feet by 375, and the result will be the thrust in pounds.

In order to prevent the ends of tie-beams from rotting through contact with the damp of a wall, cast-iron shoes or plates are laid on the walls for the timbers to rest in, and secured with bolts passed through the iron and wood. Wrought-iron straps are valuable to secure joints wherever there is a tensile strain on the beams, as at the junction of a collar-beam with the principals where horizontal straps should be used and bolted to the collar, the back of the principals being notched out to give the straps a firm hold.

LEAN-TO ROOFS.

SIR,—In the "Student's Column" in the *Builder* for Nov. 8, in treating of lean-to roofs, the subject of inclined beams is dealt with, but not, I think, with sufficient detail. If the writer would oblige by replying to the following questions I think he would confer a benefit upon many students:—

1. What is the effect of the inclined beam and its load upon the higher support?
2. Is there not a horizontal thrust acting there equal and opposite to that on the lower support, tending, in fact, to separate the supports by thrusting them apart?
3. What proportion of entire vertical load is carried upon each of the supports?

In the article referred to, it is stated that the horizontal thrust of a span roof of a given angle is double that of a lean-to roof of the same angle. If a lean-to roof is simply abutted against a wall at the top, the outward thrust would be equal to that of a span roof, because such abutment would be equivalent to that of an opposite rafter. I take it, therefore, that if the statement be correct that the lean-to roof has a thrust of only one-half that of the span roof; the fact is only true when the lean-to has support from beneath at its higher end.

Can such theories be proved to ocular demonstration, say, by means of cords and weights passing over pulleys? INVESTIGATOR.

\*\*\* The effect of the inclined rafter of a shed-roof, as shown on figs. 2 and 3, upon the higher support, is simply that of a vertical pressure, and there is no horizontal thrust against the upper wall, the rafter resting upon the plate and not leaning against it. If, however, the lower support should yield at all, the rafter will tend to pull the upper wall over. The vertical pressures on each wall will be equal, which can be demonstrated experimentally by suspending each end of a beam by a cord passing over a pulley, and having a weight equal to half that of the beam hung therefrom; the beam will be found to balance in any position whether level or inclined at any angle.

In the article referred to it is not "stated that the horizontal thrust of a span-roof of a given angle is double that of a lean-to roof of the same angle." We have purposely avoided using all mathematical symbols in the articles for the "Student's Column," but to any one who is acquainted with trigonometry the following investigations will be easily understood. If  $\theta$  is the angle of pitch, then, by the resolution of forces, the thrust down the rafter of the shed-roof (fig. 2) is  $bc = W \sin \theta$ , and

the horizontal thrust is  $bd = bc \times \cos \theta = W \sin \theta \cos \theta = \frac{1}{2} W \sin 2\theta$ ; which is greatest when  $\theta = 45^\circ$ , the horizontal thrust being  $\frac{1}{2} W$  in that case; it is least when  $\theta$  is  $0^\circ$  or  $90^\circ$ , for in either case there is no thrust.

In the span-roof (fig. 5) the horizontal thrust is  $Bb = \frac{1}{2} W \cos \theta$ , which diminishes as the angle of pitch increases, becoming nothing when  $\theta$  is  $90^\circ$ , but getting greater and greater as  $\theta$  diminishes. When  $\theta = 45^\circ$  the horizontal thrust will be  $\frac{1}{2} W$  in both the shed and span roofs.

If the rafter of the shed-roof merely leans against the upper wall, and does not rest upon it in the manner described, then the thrust on the lower wall will, of course, be the same as in the span-roof having the same pitch and length of rafter, and there will also be an equal thrust against the higher wall. In practice, however, shed-roofs are not constructed in this manner.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

790, Improvements in Water-waste Preventers. G. Homewood.

In order to facilitate the rapid filling and discharge of the cistern a new description of valve and syphon is here used, the two being connected, and allowing, upon raising the valve from its seat, an immediate flow of water, which exhausts the air in the syphon. This exhaust causes a continuous flow through the syphon, until the cistern is emptied. A provision is made for admitting air by means of a small hole, and also by a notch in the short leg of the syphon, by the action of which the water is cut off, and prevented from flowing through the syphon till the valve connected with the said syphon is again raised.

12,118, Improved Flooring Clamp. R. & R. W. Booth.

The object here is cheapness in construction and effectiveness in action. The flooring clamp has a vertical worm actuated by a lever handle, which together act on a rack or toothed bar. A washer of a peculiarly serrated pattern is used so as to prevent the return or springing of the clamp.

9,450, Improved System of Ventilation. M. Tobin.

Several modifications of the well known system of ventilation introduced by Mr. Tobin are here proposed. They consist of arrangements for allowing fresh air to be admitted without draught by window sashes, doors, or orifices in the walls of the apartment. In the form best known where ventilation is arranged by tubes in the room if the current of air is strong outside, it would, being admitted vertically, strike, and be deflected from a low ceiling, and produce a downward draught. In the present improvement air is admitted by circular orifices arranged in groups or lines. Immediately in front of the group of lines or holes a vertical baffle is arranged, against which the currents of air strike, and are deflected in a series of vertical eddies. Fresh air is thus imperceptibly introduced throughout the apartment without possibility of draught, direct or deflected outlets for the foul air being provided.

APPLICATIONS FOR LETTERS PATENT.

Nov. 7.—14,697, G. Messenger and S. T. Messenger, Ventilators and Chimney Cows.—14,711, A. Mackie, Machinery for Grinding and Shaping Bricks.—14,712, J. M. Morrath, Sanitary Constructions of Fire and Earthquake Proof Houses.—14,715, W. Nicholls, Painting or Cleaning Window-sashes without risk.—14,721, H. E. Devaux, Manufacture of Cement.

Nov. 8.—14,755, J. Halley, Improved System of Laying Wood Pavements.—14,778, H. C. Webb, Improvements in Door Knobs.

Nov. 10.—14,787, W. Lindsay, Improvements in Roller Blinds.—14,797, C. Spratt and A. Churchman, Universal Cycle Clamp.—14,805, A. De Bourbon and C. De Bourbon, Embossed Wood Grained Paper, to imitate carved wood and stone.—14,816, F. R. Strickland, Opening and Closing of Sliding Sashes and Doors.

MEETINGS.

MONDAY, NOVEMBER 24.

Surveyors' Institution.—Mr. John Shaw on "Farm Tenancy Agreements and the Agricultural Holdings Act." 8 p.m.  
Inventors' Institute.—8 p.m.

TUESDAY, NOVEMBER 25.

Institution of Civil Engineers.—Continued discussion on Mr. Jamieson's paper on "Electric Lighting for Steamships." 8 p.m.  
St. Paul's Ecclesiological Society.—Mr. T. F. Bumpus on "London Churches, Ancient and Modern." 7.30 p.m.  
Anthropological Institute.—Four papers to be read. 8 p.m.

WEDNESDAY, NOVEMBER 26.

Society of Arts.—Mr. Ernest Hart on "The International Health Exhibition." 8 p.m.  
Royal Society of Literature.—Mr. C. H. B. Carmichael on "The Border-Land of the Middle Ages and of the Renaissance." 8 p.m.

THURSDAY, NOVEMBER 27.

Parkes Museum.—Dr. Alfred Carpenter on "Progress and Co operation in Sanitary Work." 8 p.m.  
Builders' Benevolent Institution.—Election of pensioners. Poll open from 2 to 4 p.m., at Willis's Rooms, St. James's.  
Society of Antiquaries.—8.30 p.m.  
Society of Arts.—Mr. W. Atkinson on "The Conversion of Heat into Useful Work." (Howard Lectures.) 1. 8 p.m.  
Society of Telegraph-Engineers.—Adjourned discussion on "Alternating Currents." 8 p.m.

Miscellaneous.

**Re-Opening of the Brixton Public Hall.**  
After undergoing an extensive enlargement, together with the construction of a new minor hall, a Masonic lodge-room, a club-room, and several other additional apartments, the Brixton Public Hall, in Acro-lane, was re-opened on Tuesday last. The hall was originally erected in 1880 for Mr. Chard, its present proprietor, and the extensions just completed, consequent upon the accommodation not being adequate to the public demands, consist of the lengthening of the large hall, and the erection of a gallery at the south end, by which the hall will now seat an audience of 1,000 persons, as compared with 600 before the enlargement. The platform for the orchestra has been reconstructed and enlarged, and a large organ is now in course of erection by Messrs. Gray & Davison. The floors of both halls are laid in pitch pine, specially prepared and polished for dancing purposes. Attention has been given to the ventilation of the halls and apartments, and provision is made for the inflow of fresh air by Robin's tubes, the sun-burners in the ceiling assisting in the extraction of the vitiated air at night. The windows on each side of the hall are made to open at the top when necessary. The whole of the work has been designed and carried out under the immediate superintendence of Mr. Francis H. Fowler, architect. The contract was obtained in competition by Mr. William Downs, of Wallworth, at a sum of about 6,000l. The fire mains and appliances are by Messrs. Merryweather & Son. Messrs. Strode & Co. have re-arranged the whole system of lighting. Messrs. Rosser & Russell have fitted the warming apparatus in the several apartments. The plastic ornamentation in both halls has been executed by Mr. J. M. Boekbinder, of Thornhill-road, Barnsbury Park, who has also been entrusted with the coloured decoration. The acoustic properties of the large hall are very satisfactory.

**The New Police Court for West Ham.**  
The first stone of the West Ham Police Court, Stratford, E., was laid on the 12th inst. by Mr. G. Rivett, Chairman of the Local Board. Mr. Lewis Angell, F.R.I.B.A., is the architect, and Messrs. M. A. Palmer & Sons are the builders.

**Norwich.**—Mr. E. Preston Wilkins, architect, has in the press a book of fifty plates, illustrating and entitled "Quaint Old Norwich." Only 500 copies are to be issued, of which half the number is already subscribed for.

**Capital Entertaining Labour.**—One of those interesting instances of capital entertaining labour, that are not so numerous that they should be overlooked, occurred last week at No. 1, Bolton Gardens, South Kensington, the residence of Herbert Clifford Saunders, esq., Q.C. The learned gentleman having lately bought the house, has had considerable additions made to it. Upon the completion of the works his pleasure was, as a "house-warming," entertain at a dinner all those men who had to assist in the works, whether as skilled hands or otherwise. And as a further compliment to them the Rev. Dr. Forrest, the Vicar of the district, besides several of Mr. Saunders's personal friends, were invited. The architect under whom the work has been carried out, Mr. Henry Godwin; Messrs. Totten & Sons, of South Kensington, the contractors; and Mr. Litchfield, of Bruton-street, were also present. Mr. Saunders, in a few graceful and well-chosen sentences, welcomed the men; expressed his pleasure at seeing them, and his high appreciation of the manner in which they one and all had conducted themselves during the prosecution of the works. Some excellent music, vocal and instrumental, was subsequently provided.

**The Hospitals Association.**—The programme of papers to be read at the general meetings of the Association, to be held during the winter, has been prepared. The following subjects, amongst others, will be discussed:—"On Hospital Ships," paper by Mr. P. Murray Braidwood, M.D.; "A Re-discussion of the Out-patients Question," paper by Mr. J. S. Bristowe, M.D., F.R.S.; "On House Ambulances in connexion with Hospitals," paper by Captain William Joyne, chairman of the Northern Hospital, Liverpool; "The Relation of the Provident Dispensary to the Hospital," paper by Mr. C. J. Radley. The opening meeting will be on the 6th of December, but it will take the form of a *soirée*, and will be held at the rooms of the Medical Society of London, No. 11, Chandos-street, Cavendish-square. We are asked to state that Mr. J. S. Wood, secretary of the Chelsea Hospital for Women, and hon. sec. of the Boleingbroke House Pay Hospital, has been elected a member of the Council of the Hospitals Association, and that he has also joined Mr. J. L. Clifford-Smith as hon. sec. of the Association.

**Social Science Association.**—A largely-attended meeting of the Council of the Association was held last week under the presidency of Mr. Hastings, M.P. The names of representatives of Departments on the Council for 1884-5 were reported, and a complete list of the Council for the ensuing year was laid on the table. The executive committee was also elected. An invitation from the Corporation of Portsmouth to hold the congress for 1885 in that borough was considered, and its acceptance by the committee of Council confirmed. The following among other resolutions relating to the successful termination of the Health Exhibition was unanimously carried:—"That in the opinion of the Council of this Association, the opportunity is a favourable one for establishing closer relations between the various organisations which at present exist for the diffusion of sanitary knowledge and the application of sanitary science."

**Floorcloth Designs Competition.**—Messrs. Bainbridge & Co., of Newcastle-on-Tyne, are offering four prizes of amounts ranging from 100l. to 10l., for the best artistic designs for floorcloth, to be sent in on or before March 1st of next year; which certainly allows plenty of time for maturing designs.

**Royal Asiatic Society.**—At the meeting of this society on Monday last, Sir William Muir, K.C.S.I., president, in the chair, a paper was read "On Recent Archaeological Researches on the Buddhist Remains near Sambhar, in Rajputana," by Surgeon-Major Hentley, M.R.A.S.

**Buildings for Poor-law Administration.** Messrs. A. & C. Harston have been appointed, by the Guardians of Bethnal Green, architects for proposed school building extension at Leytonstone and new infirmary at Bethnal-green.

**Mossend.**—A new Catholic church was opened at Mossend, near Glasgow, on Sunday last, by the Archbishop of Glasgow. The architects are Messrs. Pugin & Pugin, of Westminster. Mr. John Devlin, of Glasgow, was the contractor.

**Zinc in Modern Buildings.**—Those who are interested in the free use of zinc in modern buildings should inspect the now nearly completed *Hôtel Métropole* at Northumberland Avenue. Messrs. F. Braby & Co. (Limited), Euston-road, are carrying out an extensive contract in that metal, the exterior decoration of the two top stories of the immense pile of buildings, as well as the mansard roofs, being entirely in that material.

**Antiquary's Library.**—The second series of the "Antiquary's Library" is nearly ready for issue to subscribers. The volumes consist of the "Life of Harold," translated and edited by Mr. W. de Grey Birch; "Romes and Medals, their place in History and Art," edited by Mr. Stanley Lane Poole; and "Gleanings from the Natural History of the Ancients," by Mr. M. G. Watkins.

**The Proposed Electric Railway beneath the Thames.**—It is stated that the promoters of the Charing-cross and Waterloo Electric Railway, which was sanctioned by Parliament in 1882 for the purpose of constructing an electric railway from Waterloo Station, passing under the River Thames to Northumberland Avenue, have decided to abandon the authorised railway and to dissolve the company.

**Her Majesty's Theatre.**—A summons, returnable on the 24th inst. at Marlborough-street, has been taken out by the Metropolitan Board of Works, under 41 and 42 Vic. c. 32, against the owners of the above theatre for not executing the necessary works required by the Board to be done pursuant to their notice served on the 27th day of February, 1883.

**COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS.**  
*Epitome of Advertisements in this Number.*

COMPETITIONS.

Carter & Co. ....	1,231 0 0
Drew & Cadman .....	1,160 0 0
* Accepted at 1,125l.	

For alterations to windows, at Ingram House, Fenchurch-street, for Messrs. Appleton, Machin, & Co. Mr. Herbert D. Appleton, architect, 157, Wool Exchange, Coleman-street. .... Robinson (accepted) .....

For the Accrington sewerage works. Contract No. 5, Mr. E. Knowles, borough engineer:—	
Richard Louks, Eccles .....	£4,638 0 0
James Parkinson, Blackburn .....	4,000 0 0
Frank Dawson, Bury .....	3,897 0 0
Robert Louks, Eccles .....	3,543 17 8
W. Ramsbottom & Son, Accrington .....	3,249 0 0
Fawkes Bros., Southport .....	3,246 12 11
John Sharples, Accrington .....	2,946 5 11
J. Orrei & Sons, Darwen (accepted) .....	2,616 6 9

For the erection of new stables, provender stores, &c., for the Borough of King's Lynn, from plans by Mr. E. G. Hawley, borough surveyor. Quantities by Mr. E. G. Mawbey:—	
W. H. Brown .....	£1,201 12 3
Lofts & Son .....	1,229 7 4
Bennett Bros. ....	1,114 8 9
R. W. Fayces .....	1,110 18 7
Leach, jun. ....	1,106 13 7
Thring & Spragg .....	1,050 7 8
R. Foreman .....	1,049 0 0
R. Dye .....	1,045 16 1
P. H. Dawes .....	1,015 0 0
Bardell Bros. (accepted) .....	995 0 0
[Architect's estimate, £397.]	

For the erection of warehouse, Clifton-mews, Wandsworth-road, for Mr. J. Broomfield. Mr. H. Wakeford, architect:—	
Stephens .....	£520 0 0
Hunt .....	493 0 0
Carnick .....	325 0 0
Tinsley .....	390 0 0
Rice .....	381 0 0
Lathey .....	377 0 0
Bawden (accepted) .....	333 0 0

Accepted for the enlargement of the East Grinstead Dispensary. Mr. S. W. Houghton, architect. .... W. Pledge, East Grinstead .....

Accepted for the erection of a villa residence at Ton-bridge. Mr. S. W. Houghton, architect, East Grinstead:—	
Geo. Punnett & Sons .....	£730 0 0
Accepted for alterations and additions to 23, The Chase, Clapham-common, for Mr. Arthur Colman. Mr. R. W. Price, architect:—	
E. Triggs .....	£325 0 0
[No competition.]	

For building new factory, stores, cellar, &c., at Bond-street, Vauxhall, for Barrett's Screw Stopper Bottling Company, Limited. Mr. E. Rawlings, architect, 3, Victoria-street, Westminster. Quantities by Mr. Morris Evans, 7, John-street, Adelphi:—

P. Duplock, Wandsworth-road	£29,550 0 0
W. Whiteley, Westbourne-grove	27,140 0 0
D. McGregor, Acre Wharf, Belvedere-road	26,924 0 0
W. Scrivenor & Co., Fitzroy-road, Regent's Park	26,787 0 0
T. L. Green, Eagle-street, Holborn	26,684 0 0
J. Allen & Sons, Palmerston-road, Kilburn	25,790 0 0
Fish, Prestige, & Co., Cambridge Wharf, Finsbury	25,743 0 0
W. & H. Castle, Redcross-street, Borough	25,419 0 0
J. Greenwood, Mansfield, Notting	25,328 0 0
J. T. Chappell, Lupus-street, Finsbury	25,236 0 0
R. & E. Evans, Lisford-street, Fockham	24,770 0 0
G. Stephenson, Belsize-avenue	23,777 0 0
F. Higgs, Loughborough Junction, Welb & Rosser, Beardou-road, Hammer-smith	23,350 0 0
H. & E. Lea, Warwick-street, Regent-street	23,175 0 0
C. Dickinson, Loughborough Junction (accepted)	23,100 0 0
	22,777 0 0

For police buildings, at Newport, for the Magistrates of the County of Monmouth. Mr. William Tanner, County Surveyor, architect. Quantities supplied by the architect:—

King, Gloucester	£4,995 0 0
Jones & Co., Gloucester	4,570 0 0
Hilton & Sons, Newport	4,354 0 0
Martin, Newport	4,290 0 0
Williams, Newport	4,250 0 0
Brind, Newport	4,232 0 0
Burgoyne, Blaenavon	4,200 0 0
Forse, Bristol	4,200 0 0
Church, Bristol	4,179 0 0
Wilkins, Newport	4,140 0 0
Blackburn, Newport	4,130 0 0
Davies, Cardiff	4,100 0 0
Fraser, Newport	4,070 0 0
Miles, Newport	3,943 0 0
Lintou, Newport (accepted)	3,900 0 0

[Architect's estimate, £4,200.]

For alteration and additions to stable and coachhouse, 9, Seamore-place, Mayfair, for the Hon. A. De Tatten Egerton, M.P. Mr. C. Crosse, architect. Quantities by Mr. J. S. Matthews:—

R. Elwin, Mount-street	£1,300 0 0
W. Downs, Walworth	1,198 0 0
W. A. Rhodes, Marble Arch	1,180 0 0
J. & J. Greenwood, Bernandsey	1,138 0 0
J. Horne & Son, Blackfriars-road	1,121 0 0
Higgs & Hill, South Lambeth	1,098 0 0
F. Higgs, Bristol (accepted)	1,050 0 0

For additional store and alteration to workshops, Great Windmill-street, Golden-square, for Mr. J. Balsom. Mr. D. C. Nicholls, architect. No quantities:—

Burridge, Crawford-street	£840 0 0
W. A. Rhodes, Marble Arch	718 0 0
H. & C. Lea	675 0 0
Love, Soho	635 0 0

For shop fittings and sanitary work, &c., 318, Oxford-street, for Mr. D. H. Evans. Mr. Owen Lewis, architect. No quantities:—

W. A. Rhodes, Marble Arch	£150 0 0
Street Bros, Camden-town	142 0 0
Saier, New-st	127 10 0

For alterations at the Black Bull public-house, Levis-ham, for Mr. G. Shaw. Mr. H. F. Bomers, architect:—

H. L. Holloway (accepted)	£275 0 0
---------------------------	----------

For alterations and additions to 126, White-ross street, St. Luke's, for Mr. E. Orgill. Mr. C. R. Winter, architect:—

J. R. Hunt	£442 0 0
H. Dye	360 0 0
D. Webb	335 10 0
Steel Bros	325 0 0

For alteration of shop, for Mr. Gilbert, saddler, New-market. Mr. John Flatman, architect, Newmarket:—

Korridge & Shaw	£599 0 0
Simpson & Son	545 0 0
Saier & Son	539 0 0
Denson	459 0 0
Kent & Savage (accepted)	356 0 0

For completing the drill-hall, armoury, drill instructor's house and offices, Stalybridge, for the 4th C.R. Volunteers (Stalybridge Detachment). Messrs Gregory Gill & Son, architects and surveyors. Quantities by the architects:—

Shaw, Currier, & Co., Stalybridge	£1,040 0 0
Joseph Grayson, Stalybridge	973 0 0
Napoleon Ives, Stalybridge	968 15 0
Garside, Barns, & Co., Stalybridge	869 0 0
Haque France, Stalybridge	857 17 11
Castle Hall Saw Mills Company, Stalybridge	855 0 0

\* Accepted.

Heating Apparatus for the above (Hot-water low pressure):—

John Swain, Hyde	£75 0 0
J. D. Wagstaff, Dukinfield (accepted)	70 0 0
R. Dawson & Co., Stalybridge	68 10 0

For rebuilding 35 and 37, Church-street, Greenwich, for Mr. W. B. Blackmur. Mr. R. W. Crawley, architect, 12, Trinity-square, Tower-hill. Quantities by Messrs. Hills & Fletcher, 149, Bow-road:—

Forrest	£1,694 0 0
Jerrard	1,380 0 0
Hall	1,875 0 0
Redman	1,825 0 0
A. & F. Smith	1,754 0 0
H. Hubble & Trotter	1,740 0 0
H. L. Holloway (accepted)	1,747 0 0

For the erection of aerated water manufactory, at East Grinstead. Mr. S. W. Haughton, architect, East Grinstead:—

J. H. Golly, East Grinstead	£203 0 0
G. Quickenden, East Grinstead	180 0 0
W. Fledge, East Grinstead	150 0 0
Charwood Bros., East Grinstead	150 0 0
J. Morris, Ashurst Wood	160 0 0
G. Beard, East Grinstead (accepted)	116 0 0

Special Notice.—Lists of tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than four p.m. on Thursdays.

TO CORRESPONDENTS.  
M. & R.—R. T. A. Sons.—F. W. S. (It was a tower, not a spiral—Apex—J. G. C. (Below our mark—C. D. (we fully expect your objection)—W. H. C.—C. F. H.—W. D. C.  
All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.  
We are compelled to decline pointing out books and giving addresses.  
Nors.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.  
We cannot undertake to return rejected communications.  
Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED.  
All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.  
CHARGES FOR ADVERTISEMENTS.

### The Westminster Hall Question.

THE committee for considering the treatment of the west side of Westminster Hall has now held two sittings, on Tuesday last, and on the Wednesday of the week previous; and

as persons not members of the committee were admitted to the committee-room to bear the proceedings, we presume that they may be regarded as open to public comment. The names of the members appointed to serve on the committee we gave in a note (p. 650, ante), with some indication of the surprise which we imagine most people conversant with architecture must have felt at the list, which includes only two persons out of a total of twelve, who are generally known to have any acquaintance with the class of subject to be dealt with; namely, Mr. Peddie, the well-known architect, and Mr. Beresford-Hope. Both in the selection of the committee and in the general tenour of the proceedings there seems evident not so much a desire to examine the whole subject dispassionately, as a wish to carry a scheme which the outgoing First Commissioner of Works has taken under his special protection. For this reason we attach much importance to the part taken in the examination by Mr. Peddie, who is really the only member of the committee possessing both theoretical and practical knowledge of architecture; and who, it must be remembered, has during his long professional career held a place and estimation north of the Tweed quite equal to that which Mr. Pearson so deservedly holds in this part of the kingdom. It is desirable to call attention to this, inasmuch as the *Times* report of the first committee meeting omitted all but the barest reference to his name, and gave not the slightest idea of the part he took in the examination, or of the very significant admissions which he elicited.

We have before devoted some space to describing the propositions of Mr. Pearson,\* and the admirable and most interesting plans which he prepared showing the actual condition of the work, and the various dates of building which are incorporated in it. These plans, and the facts collected in his report, are in themselves of great interest and worthy of the reputation which Mr. Pearson enjoys as what may be termed a specially archaeological architect. So far there will be, we imagine, no two opinions. It is when we come to the use

to be made of these investigations that we and many others feel compelled to protest.

To recapitulate the position briefly: the Law Courts have been removed and the west wall and buttresses of the Hall left uncovered. The west wall thus brought to view is found to present much of historical interest. Portions of the Norman wall of Rufus are uncovered, bearing still the Norman masons' marks, and upon this wall are to be seen the traces of a double series of arches, *appliqués*, as one may express it, to the wall between the shallow Norman buttresses, and evidently at the same time as the construction of the large buttresses and flying buttresses built when Richard II. caused the present roof to be added to the Hall. The Norman stonework is of historic interest undoubtedly, though as it is mere masonry, and contains no architectural detail, its value has, perhaps, been a little exaggerated. It is in a condition in which it will not long stand exposure to the weather. The double tier of arches, as well as other indications, leave little doubt of the former existence of a double cloister or range of buildings between the buttresses, either open or closed. Let us then, it is said, restore this double cloister and we shall have the building as it was in Richard II.'s time, and at the same time screen the Norman wall from further injury.

This will, however, cost 21,000*l.* and upwards, and the question must evidently have presented itself at an early stage of the proceedings whether this would not be regarded as rather a costly contrivance for preserving a piece of old wall, of whatever interest. An architectural and practical reason must therefore be found for it beyond this initial one. The architectural justification suggested is that it is an actual restoration of Westminster Hall as it was, and will, moreover, add greatly to the effect of the building; the practical justification, which the whole evidence shows, however, to be palpably an afterthought, is that the lower *porte-cochère*, and the upper story can be divided into committee-rooms, which everybody agrees are wanted.

Taking the architectural question first, we may observe that the style and title of the committee begs the question to begin with, inasmuch as it is entitled "Select Committee on Westminster Hall Restoration"; whereas one of the very things which the committee was appointed to consider was whether there should be a restoration at all, and whether the design suggested by Mr. Pearson amounted to what could be properly called a "restoration." Now, of course, if one or two bays of the double cloister existed complete, even in a dilapidated condition, we could then complete

all the destroyed portions on the same design, and that would be a restoration in the proper sense of the term. But the case is by no means so. Not a single portion of the original design of the double cloister or double gallery is in existence. The marks of the wall arches and a portion of one or two of the arches are in existence. The foundation of the walls is visible, and the height of the parapet is indicated by the returns on one or two of the buttresses. There is a plan, by Wren, of the walls as they existed in his time, showing some windows rather irregularly spaced, some of them two-lights, and some one-light, but hence it is assumed that there were two-light windows. We may observe in passing that the value of this plan as evidence in matter of detail is somewhat impaired by the fact that it shows the building once existing under the name of Queen Elizabeth's bedchamber as having three-light windows, while Capon's evidently carefully-executed view of the exterior shows the same windows as four-light, with two orders of mullions, a centre principal mullion and two subordinate ones; and no draughtsman could have made such a mistake with the windows before his eyes, if they had really been three-light ones. So that in the only point in which we can compare Wren's plan with an undoubted testimony from another hand it is proved to be inaccurate. Then Mr. Pearson says the parapet was battlemented, *teste* a print of Hollar's, "New Palace Yard in 1647." The actual cloister is not shown in Hollar's plate, but a building which must have been in close neighbourhood with it is seen over the tops of the houses as battlemented, and the roof of Westminster Hall itself, on the east side, is battlemented in the plate. As we have before said, faith in Hollar must not be pushed too far, but we have little doubt, nevertheless, that the parapet was battlemented when it existed. All Mr. Pearson's general presumptions we believe to be perfectly correct or probable. What we wish to point out is that, for all that, he has not a single bit of the old *design* to restore. The views taken by restoring architects on this point are most extraordinary. Mr. Pearson says in his report that in fact little or nothing of the restoration is conjectural. Why, it is *nearly all* conjectural. It is only certain, as Mr. Peddie's questions pointedly elicited (and this part of the evidence should be carefully read when it is published), in regard to the section of the moulding of the parapet, the height of the wall, the thickness of the wall, and the fact that Wren's plan, which, as we have seen, is manifestly not to be trusted for accuracy, shows two-light windows in certain positions. Mr. Pearson, by the way, while admitting that

\* See *Builder*, July 26 of this year.

Wren's plan leads to the supposition of one window in each bay, prefers to have two. We have no objection; all we say that it is nonsense to talk about restoring the original design. All that the evidence gives is that something of that sort was there; but that what Mr. Pearson has drawn is really what existed no one can possibly say, and therefore to call it the restoration of the cloister is quite a misnomer: it is pretending to do what there is really no means of doing now at all.

Whether the addition will be one of architectural value as increasing the effectiveness of Westminster Hall is another question entirely, to be considered on quite other grounds. If it be so, then it is to be upheld, on the principle on which true architects in all ages have acted, of doing their very best to better the work of their predecessors. It is on this principle that we entirely uphold the raising of the towers at the north end of Westminster Hall; that is a distinctly architectural attempt to bring the facade more into harmony with its surroundings and to give increased dignity to it, on architectural grounds. But we are quite unable to see that the proposed cloister will have any architectural effect in the least proportionate to the amount to be expended on it. In the first place, do what you will with it, it will appear as sunk in a hole. Secondly, the two ranges of low stories, with their low arches and small windows, would not, we think, add by any means to the effect of the Hall, nor were the original cloisters built with that object. The question as to architectural effect is, of course, matter of opinion; the question as to the original meaning and value of the erection which it is proposed to "restore" can hardly be so. There can hardly be a doubt that at no time was the west side of the Hall standing free as it is at present. The known practice in Mediaeval plan, to surround the great hall with subsidiary buildings, is confirmed by all the plans or views of the site which are obtainable now, and which, though none of them go back to the Mediaeval period, convey the idea that the site west of the Hall must have been long regarded as a place for subsidiary buildings. The First Commissioner told the Committee on Tuesday that Mr. Brewer had informed him that he had "no authority" for the buildings represented to the west of the Hall in the restoration of Westminster, which we published on the 8th. This, we have ascertained from Mr. Brewer, is, as we knew it must be, a misapprehension. What he said was that there is no authority for the architectural style of those buildings.

Then if the original cloister or gallery was probably not seen, or very little seen, from the westward of the Hall, why was it erected? The answer which we believe to be the true one is very significant as suggesting the sharp contrast between the notion of architecture entertained by Richard II. and by the modern Office of Works. The erection was a purely practical one. For reasons of architectural splendour and dignity, Richard II. had put a grand new roof on the Norman hall. For what may be called engineering reasons, it was considered necessary to add large outstanding buttresses and fliers to resist the thrust of the hammer-beam roof, which is by no means in itself a very scientific form of timber construction. The large space between these buttresses was not to be thrown away. Two sets of rooms, or one set of rooms and a covered passage, for practical use, were to be made between the buttresses. The wall of the Hall, having a great additional weight to carry already, was not to be cut into, and the two tiers of wall arches were applied to it between the Norman buttresses, in order to afford a bearing for the ends of the beams, without cutting into the wall. The whole illustrates remarkably that practical spirit which was so far more prevalent in Mediaeval building than we moderns, looking back at it through the mist of centuries, are apt to realise. Even the cutting of the curve of the flying buttresses by the upper roof, done here as frequently elsewhere, is an example of that. If architectural appearance had been the main object, it would certainly have been felt that there was an incompleteness in cutting off part of the flying

arch in that way. No Greek architect would have done anything analogous to that; it would have vexed his aesthetic sense. But the flying buttresses were the engineering part of Mediaeval building, and we imagine were so regarded by those who made them. Looking at the matter now, we should unhesitatingly say that the buttresses and flying buttresses, when repaired and made good where they are dilapidated, which must be done, would present a finer and more interesting appearance to the eye, and tend more to the architectural dignity of the Hall, if this portion were left visible, than the erection proposed to be placed between them. But what we want to emphasise is the radical difference between the motive of the former erection and the motive for the reconstruction of it. In Richard II.'s building the whole motive was obviously a practical one, to utilise space and to combine satisfactory construction with utility. In comparing Mr. Pearson's report and the evidence given before the committee, it is obvious that practical utility was the very last consideration. Mr. Pearson himself makes only a kind of feint of considering it in his original report. In the evidence given before the committee he stated (which ought to be noted) that it was not the case that any pressure had been put upon him by the First Commissioner to adopt this special plan, so that statement, to which we referred the other day as having been publicly made and not contradicted, must be regarded as disposed of. But, then, on the basis of that, Mr. Peddie very pertinently asked what the architect's instructions were, and received the reply "to examine the walls and buttresses with a view to the restoration of them"; and the continuation of this portion of the examination conclusively shows that there was no idea of studying any practical question of convenient additions to the House, until it was found that it would be difficult to carry the matter on antiquarian grounds alone. Mr. Peddie asked further on "if an architect is asked to make additions to a building where utility is to be considered, is it not usual that he should be told what the requirements are, and to provide for them as well as he can consistently with artistic effect?"—a theory which Mr. Pearson, of course, admitted as correct; he could hardly do otherwise without stultifying the architectural profession. "You do not first of all make additions and then find out what the use of them is to be?" continued Mr. Peddie, and equally, of course, received the answer, "No." Yet we say, and we think a perusal of the report and the evidence will satisfy any one who has the requisite knowledge to judge of the matter, that that is precisely the course which has been pursued in this case. And then we come to the question, Of what real utility will these rooms be after all? What is wanted, and what is proposed to be provided?

In regard to this point the evidence of Mr. Charles Barry, given on Tuesday, is very valuable. After stating that Sir Charles Barry had always been of opinion that Westminster Hall had been enclosed, and that the space recently occupied by the old Law Courts had been formerly occupied by the inferior offices of the Palace, he went on to say that his father's plans for the completion of the new Westminster Palace by enclosing the Hall were embodied in a Parliamentary paper which was returned to the House of Commons on May 10, 1855, in a report to the then First Commissioner, Sir William Molesworth. He was thoroughly conversant with his father's views for the enlargement, or what he regarded as the completion, of the Westminster Palace. The scheme was to start with a facade from St. Stephen's Porch, following a line fronting St. Margaret's lane to the corner where Bridge-street, Great George-street, and Parliament-street intersect each other; to construct at that corner a grand gateway, and to carry another new facade from that point to the Clock Tower. "The idea had been to give the whole buildings as much dignity and unity as possible, to conceal the difference of level between Bridge-street and the entrance to Westminster Hall, and, in possible times of tumult,

to give an effective protection to Palace Yard, Westminster Hall, the Speaker's House, and the House of Commons. Sir Charles Barry had attached great importance to having Palace Yard enclosed." Mr. Barry subsequently went on to offer some further evidence of a still more practical character. He said the carrying out of his father's plans was not only the best thing that could be done architecturally, but financially, as it had been officially stated in 1864 that 37,000*l.* per annum was being paid by the Government as rental of various private properties used as offices by Government Departments and Commissions. That sum capitalised at three per cent. would give a million and a quarter of money, and the additions on Sir Charles Barry's scheme could be carried out for half a million. "We hope here he truths" enough.

Such a scheme would provide room for all the functions of the House within its walls. Against this the Office of Works proposition amounts practically to this. We propose to erect some small buildings in imitation Gothic, somewhat like what we believe to have been once there, certainly on the old foundations. They are built mainly to enclose a piece of old Norman wall, which is of interest, but which we are afraid will decay if left exposed. But as 21,000*l.* is a good deal of money to spend on that, we propose that you should have a carriage porch below, with a width barely sufficient to allow two carriages to pass, and height probably not quite sufficient to clear the driver's hat, and we propose that you shall use the rooms over as committee-rooms. True, they are very small in area, and only half the height of the present committee-rooms, but still you can squeeze into them somehow, and it will be such a gratification to think we are in rooms just like those that were there 500 years ago. And the Norman walls, what about them? Oh, they will be left bare, just as they are; it is an uncomfortable finish to a modern room, of course, but then think of the satisfaction of seeing the Norman masonry!

That is what it amounts to, and that is a kind of thing that has never been done in times when architecture was a genuine thing. It is not what Richard II. did. He did what he wanted then; but what he wanted is not what we want now. No people in their senses will be content with low, small, and comfortless committee-rooms, because a use has to be found for a costly piece of archaeological trifling. They will not be content with a "grand committee-room" over a horse-stand, because the foundations of a building which once stood in that position have been found. Is it not pitiful, this kind of solemn triviality? Here is the greatest English building of modern times, the home of the Government, still incomplete, and the necessities of the case demanding a large extension of accommodation: and there is the Office of Works and its architect poking about on the ground, finding a bit of foundation here, and a bit of foundation there, and making plans for building up rooms that are totally inadequate for practical usages, and which, architecturally, are to be nothing but antiquarian shams, because rooms of that size were there once. Contrast this sort of spirit with that which is hinted at in one portion of Mr. Barry's evidence:—"His father had altered the east front of Westminster Hall, and he would not have hesitated in altering the west front if he thought he could have improved it." Precisely so. Sir Charles Barry was the last really great architect we had, and, like all true architects, he worked in the spirit of the present, not of the past, and had confidence in his own genius, and did not want merely to imitate what some one had done, or the traces of what some one did under different conditions centuries before. We are not saying one word in derogation of Mr. Pearson's acquirements as an architect and artist in the Mediaeval style. If a Mediaeval restoration is to be made, we know of no one who will do it better. If Westminster Abbey is to be conserved, we are sure the fabric cannot be in better hands. If a modern cathedral is to be built as like a Mediaeval one as possible, we

do not believe any one now living can do it as well as Mr. Pearson. Our own opinion is that such a building is a complete anachronism, and we believe in a generation or two that will be the general opinion. As long as that kind of revivifying of Mediaevalism is to be carried out, let it be done by those who have thoroughly studied it. But we deny that that is architecture, in any sense in which architecture is worth anything; and after saying so for years, there seems some little indication that a public opinion in that direction is in course of formation; and we hope such opinion will be brought to bear on the present case. If the proposed so-called "restoration" is carried out, money will be thrown away on buildings which are not even archaeologically what they profess to be, which are (one may almost say) worse than useless for any practical purpose, and which will, at the same time, stop the way for real and more important improvements for a long time to come. The one point in Mr. Pearson's propositions which we can endorse, the raising of the towers and the modification of the north end of the Hall, which is really a work of architecture and not of antiquarianism, is contradicted by his proposed north-west building at right angles to the Hall. The raising of the towers seems in itself like the commencement of a grand completion of Barry's scheme, by rendering the front of the Hall at least in harmony with such a scheme. But then, just to gratify an archaeological sentiment, we are to drop down upon this poor and weak-looking building at the prominent angle of the site, the existence of which would be an effectual bar to the continuation of Barry's design. And it is, perhaps, our duty to say openly, as exponents of professional opinion, what we know many people think, that this scheme is being pushed through to satisfy the *amour-propre* of the outgoing First Commissioner of Works. Now, we like to see any one thoroughly believe in himself;

"For thoroughly to believe in one's own self,  
So one's own self were thorough, were to do  
Great things."

Our Poet-laureate happily puts it. But the Chairman of the Committee believes in himself without being thorough, so far as architectural subjects are concerned. He obviously does not understand what "architecture" in its true sense really means. He has got an *idée fixe* which he is determined to push, and his personal feeling in the matter is as obvious enough in his cross-examination of the witness who was most decidedly opposed to him, Mr. Somers Clarke. But, as we are also thoroughly believe in ourselves, and are convinced that something foolish and meaningless is proposed to be done at a considerable expenditure of public money, we must be outspoken in opposing it. That we are not animated by any general desire of opposition must, we should hope, be evident from our support to the proposition for re-modelling the north end of the Hall. That genuine architectural work: but as to the Office of Works has got entirely on a wrong tack. They have made a sham antique of the Tower, and now they want to make a sham antique of the side of Westminster Hall.

#### RAILWAY RATES: A NEW PHASE.

IT has been a matter of considerable surprise to many that the railway companies should have apparently taken so little notice of the agitation which has been going on for a revision of their powers. Mr. Chamberlain's ill-fated attempt to deal with the difficulty did not commend itself either to the companies or the traders. Certain clauses were admitted by both parties to fairly meet the case in particular points, but others were threatened with the strongest opposition, and the Bill, as a whole, was looked upon with disfavour by both. After being printed and circulated and criticised by all parties interested, it fell to the ground, there being but little encouragement proceeding with it, and but little time at the disposal of the Government for discussing it. But the attention which has been directed

to the subject, together with the general depression in trade which exists, has made it a burning question.

The traders have been advised to adopt aggressive tactics by extending the canal systems, and making them, by the use of steam haulage, powerful competitors of the railways. The complaints of the traders, who consider that they can see in excessive and unequal rates an encouragement to foreign competition, and, consequently, a reason for home depression, have been many and loud. Still, the companies (until very recently), made no sign. But those who wondered at their silence have now been still more astonished to find that they were all the while preparing for and considering their next move, and it may be fairly said that they have made a bold one. They have taken the initiative for a fresh encounter by giving notice of their intention to apply for fresh Parliamentary powers next Session, and have thereby quite taken their opponents,—or, their customers, we should perhaps say,—by surprise. The *Times* of the 17th inst., in an able article on the subject, gives an outline of the course which, it is believed, the companies intend to adopt. To put it briefly, they offer to surrender certain powers with regard to maximum rates which they possess, but seldom use, and, in return, ask for sanction to certain charges which they are in the habit of making for terminal services, but which they have not legal powers to enforce. Other minor matters will also be introduced. The maximum rates authorised by the Acts relating to the various companies stand for little or nothing in practice, but have proved very serviceable when complaints have been laid against excessive freight charges; for the companies have frequently been able to show that they have not enforced their full powers, even in cases where the rates have pressed so heavily upon trade as to almost cripple it. The incomplete and inadequate nature of the clauses affecting the rates is well known, and no provision is made in the majority of them for terminal charges; but the companies are generally able to provide for a proportion of the rate charged being put aside for these services, the total charge being still within the statutory limit.

This is the explanation of the remarks sometimes made by railway managers, that the terminals question is one which affects them only, and not the public. The latter, naturally, do not see that they have no interest in the matter. They think that they ought to know how the rates they have to pay are arrived at; while the railway companies,—when the rates charged do not exceed the authorised maximum,—do not see that any one else has any interest in their apportionment. Reform is desired by both parties to the controversy. The traders, finding the high rates defended and allowed by the statutes, seek to have the latter revised; while the companies, finding terminals disallowed by courts of law on account of their not being authorised by the Acts, are endeavouring to have these charges legalised. The remarks just made as to the statutory rates being high enough to allow of a portion going for terminal services, only applies to traffic conveyed for long distances, as they barely cover cost of haulage in the case of short journeys, and it is in these latter instances that the companies feel the necessity for legal power to charge for terminals. It was very soon seen when Mr. Chamberlain's Bill was published that one effect of it would be to confer a certain amount of power upon the companies with regard to terminals; and the traders resolved to oppose the Bill. They seem to have entertained a feeling of mistrust of Parliamentary interference, and this will explain why the recommendation to seek for relief by fresh competition was so favourably received. In answer to this the companies have made this unexpected move, and may be said to have given "check."

The other side having abandoned Parliamentary tactics, the companies have resolved to try them for themselves, and by introducing a number of private Bills, to force the question upon the attention of the legislators. The traders, from past experience of railway legislation in which the companies take the initiative,

are naturally under grave apprehensions as to the result, and have already decided to oppose the Bills. It remains to be seen whether the concessions offered by the companies with regard to their maximum rates for unenumerated goods is a practical one, but as the enforcement of such rates would frequently be ruinous to their customers (and consequently to themselves), it does not appear that they would be sacrificing much. Some alternative classification would have to be adopted if the antiquated and useless ones found in the Acts should be superseded, and it is understood that some, at least, of the railway companies propose to embody such a classification in the proposed Bills. This is a matter which should be carefully watched, as it is highly desirable that any changes in the law on the subject should have the effect of making it clearer and less open to dispute, as well as equitable and comprehensive. With regard to the terminals question there is much to be said on both sides, and it depends upon the extent of the demands made by the companies as to whether uncompromising hostility would be justifiable; for it has been frequently shown that the expenses connected with the handling of goods traffic,—independently of haulage,—are very considerable. When the matter comes before Parliament for discussion there will be plenty of evidence bearing upon it to be found in the reports of the Commissions which have been appointed to consider the subject, and, like every other public question, it will be found to possess two sides. The railway interest is very strongly represented in Parliament, and could carry anything that was not strongly opposed, so that there will probably be a somewhat sharp conflict. The questions at issue have been very fairly and impartially stated by the *Times*, and the hope therein expressed that a satisfactory solution may be arrived at will be echoed by all concerned.

#### NOTES.

THE deputation which waited on the President of the Board of Trade at the close of last week, to urge a modification in certain important clauses of the Electric Lighting Act, did not succeed (to use a phrase which has been applied "in another place") in drawing the badger. The deputation could not have had a more effective spokesman than Sir Frederick Bramwell, or one better up in the facts of the case; but the main point of the deputation, the repeal of the 27th clause, which gives compulsory power to local authorities to purchase the undertaking at the close of twenty-one years, was not gained. They were not, perhaps, sanguine about it, as one of their number candidly admitted that the companies had agreed to ask for the total repeal of the clause in hopes of getting a modification of it. The existence of the clause is a striking indication of the manner in which the public mind, and through it the Government mind, has been impressed by the disadvantages arising from the great gas and water monopolies. They have resolved that there shall be no more such, charm they never so wisely. Sir F. Bramwell argued that this was practically a prohibition against investing capital in electric lighting, and Mr. Chamberlain went so far as to promise to give his best consideration to any clause forwarded to him for so far modifying the operation of clause 27 as that it should no longer act as a deterrent to capitalists. But beyond this he would not move. As to the further questions raised by the deputation, in regard to official regulation of the method of supply adopted, and freedom of contract between the companies and the consumers, although the latter demand is one not to be rashly granted, the method of supply should certainly, in the present stage of electric lighting, be left as much as possible to the skilled professional advisers of the companies. We are not yet in a position to dictate by law what is the best and most scientific method to be adopted in the interests of the public. The thing is still a gigantic experiment.

FROM a question asked in the House on Monday evening it appears that Messrs. Leeming have completed certain alterations to their War Offices design which were recommended by the Office of Works, and that the designs have now been approved by the First Commissioner. No work will be commenced, however, until a vote has been taken, and the final drawings will be exhibited to members.

THE Fine Art Society send us an impression of the fine line-engraving by Mr. Lumb Stocks of Sir F. Leighton's "The Sister's Kiss," which will be remembered two or three years ago in the Academy. This, which has occupied the engraver for more than two years, is a fine example of that forcible and masculine style of engraving in pure line, which is a far higher and more artistic method than that pretty and spotty style for which Bartolozzi deserted line, and which recent fashion has brought so much into notice again. Modelling surfaces by contour lines (which line-engraving really is) takes much more draughtsmanship out of a man than modelling by stipple. The excellent qualities of Mr. Stocks's engraving, however, do not reconcile us to what we have always felt to be a defect of composition in the group,—the position of the right arm of the young woman so that at first sight it appears like a continuation of the figure of the child behind her.

AN interesting relic of London before the Great Fire will probably shortly disappear. Staple Inn, Holborn, is said to have been sold to Messrs. Baxendale (Pickford & Co.), for 80,000*l.*, and will be converted into a depot. The quaint entrance gateway, the picturesque houses in Holborn, and the interesting hall, with its prettily-designed turret, must be very much feared, almost as a matter of necessity, be destroyed in order to adapt the site to its new use. The ancients of the Society have divided the plate belonging to the Society between themselves. The ancients of Barnard's Inn appear to intend to pursue a similar course: they have divided their plate, and propose to let their hall. Barnard's Inn is described by Dickens in "Great Expectations" as "a club for cats," and it was here that Pip took chambers when he first came to London.

THE School Board of Edinburgh have resolved to make certain alterations and additions to the High School buildings. The additions are to consist of a gymnasium and a new janitor's house, the present janitor's house to be converted into a swimming-bath. The gymnasium is to be erected on the playground, to the north-east of the school buildings, and externally will be in keeping therewith. The interior will measure 50 ft. by 28 ft., surmounted by an open-timber roof, 26 ft. high at the apex. The walls, reaching a height of 18 ft., will be lined with pitch-pine. Suitable dressing and retiring rooms form part of the scheme. The new janitor's house will be erected at the western gateway, and will consist of a one-story building, with Greek details conformable to those of the school. The house to be vacated by the janitor, which forms the westernmost of the group of the Grecian buildings, and consists of two floors, is to be gutted and formed into a bath, 32 ft. long by 15 ft. wide, having around it a platform, with dressing-rooms, shower-bath, &c. The High School was the most successful effort of the late Mr. Hamilton, and is considered one of the best adaptations of pure Grecian architecture to modern purposes. The details of the elevations of the new buildings will require careful consideration.

IT is worth noticing, as a sign of the times, the prominence that is being given, in the proceedings of societies dealing with social and financial matters, to the various aspects of the condition of the labouring classes. The programme of the Statistical Society, which we have before us, contains no fewer than five, out of a dozen or so of papers to be read during the session, on working-class questions, viz., by Mr. J. S. Jeans on "English and Foreign

Labour compared"; by Mr. G. Phillips Devan on "Thirty Years' Changes in the Occupations of the People"; by Mr. R. Price-Williams on "Changes in the Trade Population of London"; by Mr. E. W. Brabrook on "Friendly Societies"; by Mr. Ravenstein on "The Laws of Migration." Moreover, a conference will be held some time early in the year, which comes partly within the scope of the Statistical Society, to discuss the wages question and the relations generally between work and pay. The operative classes, whatever may be their grievances, can scarcely complain that their position is not the subject of much anxious thought.

A RECENT number of the *Englishman's Overland Mail* contains an interesting account of the successful working of the "Calcutta Canals." These works were originally proposed by a Major Tolley in 1775, and from small beginnings have progressed so satisfactorily that they are said to be "more eminently productive works than many which are in that category." Like many other improvements in India, they were not allowed to be carried out without much opposition, and curiously enough, the chief opponents were "the Board of Customs, Salt, and Opium," who considered the results were not likely to justify the outlay, and that the whole traffic would not produce a revenue of 5,000*l.* At the present time, however, 55,000*l.* are annually realised. The best proof of the usefulness of these canals is shown by the fact that the goods delivered on the canal banks amount in weight to more than one third of the aggregate deliveries of the three railways which converge on Calcutta, including the great coal traffic of the East Indian Railway, and averaged during the last three years ten million tons annually, valued at five millions sterling.

THE same paper gives, however, a less favourable account of the results of navigable canals in India generally. These works are, for the most part, connected with the great irrigation schemes, in which the primary use of the canals is for agricultural purposes. The revenue derived from the sale of water for irrigation being sufficient to yield a handsome rate of interest, the advantages derivable from navigation are thrown in almost free, and consequently their advantages as means of communication are not to be measured by the amount received from tolls. The following particulars of the traffic are given. In Madras the three principal lines conveyed as follows in 1882-83:—

	No. of Boats.	Tonnage.	Value.	Miles.
The Buckingham Canal	57,118	574,010	2,325,192	260
The Godavery System	31,307	288,391	1,536,900	458
The Krishna System	25,602	121,578	739,046	273
For Bengal the figures are,—				
The Orissa System	83,424	636,900	2,372,560	240
The Calcutta Canals	210,153	2,691,000	6,563,400	32
The Some Delta System	7,615	78,960	379,660	218

For the N.W. Provinces,—  
The Ganges Canal..... 7,134... 90,924... 487,300...412  
Except on the Orissa system the ton-mileage is not accurately kept, and, therefore, a comparison with waterways in other countries cannot be usefully made.

THE case of the obstruction in the roadway at Hammersmith, by the barrows of the costermongers, to which we referred lately, came before the Home Secretary on Friday last, in the shape of a deputation of the ratepayers of Hammersmith to protest against the action of the Fulham Board of Works in committing men who were endeavouring to earn their living honestly. Sir W. Harcourt, while sympathising with the costermongers in their troubles, suggested that it was quite possible for them to arrange their barrows so as to leave sufficient space to escape the charge of obstruction, so we hope this solution of the matter will be arrived at. The nuisance and obstruction constantly caused in certain parts of London by the apparatus of street merchandise is so great, and so unlike what is permitted in other cities, that a practical protest must be made against it.

THE question as to the permission to use the Main Drainage embankment as a boulevard to which we before referred, and to which the Board of Works gave no answer except a *non possumus*, has elicited a somewhat more definite explanation from Mr. Russell Talbot, the Medical Officer of Health to the North Poplar District, but whether he is speaking officially or not does not appear in his letter in the *Times* of the 26th. He says that he has before reported to the Metropolitan Playground Association that as a playground or promenade the embankment would be a failure, owing to its running through land at present entirely occupied by factories of a most offensive character. That, however, is surely for the consideration of those who wish to walk there, unless the Board of Works is going to assume the attitude of an anxious parent watching over the welfare of the inhabitants of Poplar, and forbidding them to do what would disagree with them. It seems rather pathetic that people should ask as a favour to be allowed to walk on the covering of a sewer between offensive-smelling manufactories, and be denied even that slender boon. As giving pedestrians a short cut from Victoria Park to Stratford, it would, Mr. Talbot admits, be useful. Let the people have the short cut, then. They cannot well damage the sewer-arch. The matter was urgently pressed by Lord Cowper in the House of Lords on the 24th.

STATEMENTS which have been made as to the improvement in the punctuality of the Underground trains since their breakdown during the first few weeks of the Inner Circle completion must not be accepted too readily. There is still a great deal of most vexatious delay, not so much on the Inner Circle itself as on the outlying branches, the trains from which have to get into the Circle at various points on the Putney Bridge line it is quite common to leave out a train on occasions, as a quiet solution of the difficulty arising from overcrowding the system of lines and professing to do more than is possible. There has been for some reason a notable deterioration in the gas supply to many of the trains lately, the carriages being miserably lighted. We may call attention also to the absurd mismanagement in regard to notice-boards of the destination of trains. These are all placed, when placed (trains are frequently run without), on the usual platform side of the carriage, the left-hand side looking in the direction of travelling. But at Earl's Court junction a large number of trains are necessarily brought up with the right side to the platform, to allow of easily changing to another train, and as the company cannot afford a notice-board on each side, there is constantly to be seen a train standing with the direction on it, "Victoria and Mansion House," which is really travelling in the opposite direction. The *habitus*, of course, knows it is not going to Mansion House, but he has no clue to where it is going; and this at a crowded junction where there is particular necessity for clear information. The trouble, and busy, and the pestering of the officials with questions, which this piece of blundering causes about every ten minutes of every day in the year, is quite annoying to witness. It can all be remedied at once by having reversible direction-boards on both sides of the carriages, with the "up" direction painted on one side of the board, and the "down" direction on the other, the board to be turned at the close of each journey. If a company cannot attend to such a simple and obvious matter as this, no wonder they fail in larger requirements.

A Correction.—In reference to a footnote in our issue of May 3rd last (page 604, vol. xvi.), to the effect that we were authorised to say that some extracts from the Annual Report of the Institute, which had been published elsewhere, had been obtained "by dishonest means," we have received information whereby we are satisfied that those words, quoted in good faith from a communication sent to us, were not warranted by the facts, and we regret that we should have given them publicity.

PROVINCIAL ARCHITECTS AND THE INSTITUTE.

We have received the manuscript of a paper on the Institute of Architects, read before the Leeds and Yorkshire Architectural Society by Mr. J. W. Connon, and which may be described as a kind of "hitter cry" against the Institute, and like some other hitter cries of which we have heard, it contains, with some truth, a good deal which is exaggerated and unfair. Mr. Connon traces the history of the Institute from its foundation, to a considerable extent on the basis of papers furnished him by the Institute; and as he admits their chivalry in furnishing him with the weapons for what he frankly told them was to be an attack upon them, he might very well have considered whether a character for any sort of chivalry was compatible with some of the charges which he brings against them. Among other things, Mr. Connon is exceedingly indignant with the Institute because when in 1858 they discussed the principle of the system which was then suggested and occasionally put in practice, of the competitors deciding architectural competitions by their own votes, they suggested among other drawbacks to such a system the difficulty of preventing any possibility of collusion for the serving of private interests. He says it is "a matter for shame that any one of the leading members of the profession should have made so gross a charge of want of the commonest sense of honour against the bulk of his fellows." It is Mr. Connon who wants the sense of logic. Such a consideration was not a charge against the bulk of professional architects; it is only a recognition of the fact that the profession has, like other large professions, its unscrupulous members. Human nature is unhappily human nature in all places. It would probably be supposed that a committee of dignitaries of a great university, for instance, might above most bodies be trusted to exercise the right of voting among themselves; yet there is a case which was long a by-word in one of our universities, where a man in that position did gain an appointment by a vote given by himself for himself. But when, after this, Mr. Connon goes on to charge the Council of the Institute with having favoured the principle of appointing a professional assessor to decide competitions, because they hoped to receive commissions as assessors themselves, and furthermore that they had supported the principle of prior sketch competitions, in order to have two commissions instead of one on each competition, he does not appear to perceive that he is making a charge still more unwarrantable and defamatory, and one which so ridiculously improbable and baseless that we hardly suppose any of those to whom his paper was read could have credited it for a moment, or even that Mr. Connon seriously believes it himself. These and other violent and exaggerated charges render a great part of the paper such as it could serve no possible good purpose to print, except to exhibit Mr. Connon's want of temper and moderation in speaking of other people, and to invalidate the force of some of his other charges, which, though expressed with equal violence of language, are not in themselves by any means so unreasonable. That the Institute has throughout its career been very slow, very procrastinating; that it has let pass, over and over again, the opportunities for coming to the front, and initiating good works, for which time and opportunity were crying out, we do think; and we also sympathise with the feeling repeatedly expressed by various provincial Fellows of the Institute, and by provincial societies, in their corporate capacity, that the provincial members have not by any means a sufficiently important part in the work and government of the Institute, and that any steps by which they could be placed in a less disadvantageous position in comparison with the town members would probably be for the good of the whole body, by rendering the Institute more practically a National rather than a Metropolitan body. By way of giving voice, therefore, to what we suppose must be taken to represent the opinion of a certain proportion of the profession in the provinces, we give some of the concluding portions of Mr. Connon's paper:

"The Council must be held to have, in their own imitatively solemn way, always looked with jealous and praiseworthy care after the credit of the body to which they belong, and to have invariably insisted, as far as possible, upon each

member of the Institute holding the honour of his individual conduct with the nicety of conscientious precision. One who with his head-long self-will has done much harm, with much good, to the Institute, Mr. C. Barry, truly said, 'One of the chief objects of its (the Institute's) original foundation was not (alone) to promote professional study, research, and talent, but to maintain and enforce professional honour.' Such was the declared intention when the first address was issued. 'With the object of gaining at the hands of the public a reliance on those professors, who are *bonâ fide* architects, one of the principal features will be the maintenance of a high standard of professional character and honourable practice among the members.' The intention, as usual, was good, but the transference of that into deed was always more than the apathy of the Counciling the honour of the members of the Institute was that of the alleged receipt of illicit commissions by architects. This charge has been a prominent one for all the fifty years that the Institute has existed; it has been reiterated again and again; yet the utmost notice that could be wrung from the Council was the indifferent one of denying the truth of the accusation, or issuing a feeble manifesto threatening offenders with the rigour of By-Law XXIII. Something more than this is demanded from the national centre of architecture. An efficient Institute should be strong enough to stand up boldly for the honour of the profession and for the open punishment of those who violate the laws which regulate the conduct of gentlemen. Year by year the public complain more bitterly of architects; formulate more clearly their charges, more widely publish around their accusations. Attempt after attempt has been made to arouse the attention of the Institute to the true position of things, but in vain.\* The virtuous decision to live down scandal is so much easier than to put on hip and thigh. Vile accusations of the acceptance of fiduciary commissions are repeated with recurring monotony, and are simply met by the comfortable assurance that if some vindictive outsider, who would rather make the charge than support it, will, with infinite trouble and considerable risk, substantiate the accusation, the Institute will promptly, with bell, hook, and candle, but with the greatest secrecy and politeness, excommunicate the delinquent, and no one will be one penny the worse. Such feeble inanities is not enough. A vigorous and earnest Institute would do one of two things, or both; it would compel the accuser either to withdraw or substantiate his shameful charge, or it would consider it its business to search out and discover the member who had disgraced his fellows, at any cost of trouble or expense, and would deal with him in the most public manner,—would expose the iniquity and baseness of his crime,—would, in short, metaphorically, "Hang him to encourage the others." That the Council itself could undertake such a task I do not maintain. I am not so unjust as to expect men who already devote so largely of their own valuable time to unrepaid work to do anything of the kind. But an Institute enjoying the confidence of the profession could easily afford a special and legal Secretary to the Professional Practice Committee, and could then efficiently work over the moral behaviour of the members so far as those affect their connexion with the Institute. To treat such charges with what is called the courtesy they deserve is but the feeble refuge of the idle. "His voice of the sinner who would slumber again." The contempt they deserve falls not on the accuser, but on the indolent accused, who allow judgment to go by default.

When an institute has looked to the honour and to the material interests of its members, it might fairly be expected to give some attention to the claims of those whom unmerited misfortune have brought them within the need of the aid of their more successful brethren. The members of the Institute recognised this claim; and in 1848 a meeting was called 'to take into consideration a memorial submitted to the Council praying for the formation of a Benevolent Fund for the less fortunate members of the profession.' The reception of this petition

\* Mr. Barry, if we remember right, when President, openly said that if any such charge could be substantiated against a member of the Institute, he would see that such member was expelled from it. Could he have said more? —Ed.

was the customary one. For by the light of experience we can now expect confidently the result of any movement submitted to the guidance of the Council. Its suggestion is hailed by them with fervid enthusiasm. They declare their huring desire to see it progress as it deserves, but so serious matter must he dealt with only after reflection and grave consideration, and the members may rely upon their concentrated attention being focussed upon this particular question. Unless pertinacious and objectionally active individuals keep stirring up their sleeping minds, this is all that is ever heard about the matter. If repose is not to be theirs, and they are kept unwillingly awake, in the course of a period varying from two to twenty years, they announce with much pride and satisfaction the appointment of a committee to consider and report. This new body also deliberates for another two or three years, and then duly announces that the matter is one for further consideration. This farce is repeated, until exasperation establishes some other body, who do the work for themselves, and are duly and heartily congratulated by the Institute on the fact, which then proceeds to plume itself on the assistance it has been in the promotion of a movement always dear to the heart of the Council. This procedure is only varied when an immediate mode of quashing the whole thing is discovered. In the case of the proposed Benevolent Fund, this was so, the Council declaring within a month of the appointment of the committee that the idea was inadmissible under the terms of the charter,—a document that has often served to screen the Council from the need of carrying out essential reforms. In 1851 the Architects' Benevolent Society was formed by efforts outside the Institute, and an essential work inaugurated, that it would have been an honour and glory to the Council to have instituted. The claims of charity appealed in vain to the occupants of the Council-chamber, the Architectural Benevolent Institution having to create itself to replace the niggard inactivity of the central authority. When such a fund was established by the engineers, it was taken up, as it should be, by the Council of the Institution of Civil Engineers, the President and two of the Council being, *ex officio*, three out of the seven persons who have control of the invested funds devoted to aiding impoverished members of the Institution. The engineers, while always encroaching on the domain of architects, show also how nearly they come to deserving all they get, by managing their own affairs in all respects better than we do.

The weak place in the management of the Institute has always been the apathy of the Council. We scarcely expect this to be admitted by themselves; yet it is a frequent complaint to be found in the addresses of different presidents. It will be sufficient to quote one, the late Sir Gilbert Scott, who said, 'I also know how our meetings have come, from our lassitude and half-heartedness, to be voted a bore; and how the younger members of the profession fight off from joining us from a feeling that we have allowed our Institute to become too much a perfectly-constructed automaton, and too little a thing of earnest and zealous vitality. It may be worth considering, too, whether the self-elective character of our Council might not be moderated, and a certain number of seats be reserved to be filled by the general assembly.' The recognition of the truth of the last remark has occasionally, at periods of special excitement, when the inaction of the somnolent Council has aroused the patient contempt of the Fellows into active indignation, brought about that some gentleman,—of admitted enthusiasm in his profession, whose vigour of character and earnestness of belief in the future of architecture has drawn around him the well-earned support of those architects whose professional life extends outside their offices and can spare some little interest for the general well-being of the body,—is elected to the select circle of our rulers, and is heard of no more. In some parts of the country are found springs whose dripping waters have the property of depositing a limestone coating over objects placed beneath them, and of petrifying them into a semblance of stone. So when the new member, hot with burning enthusiasm, eager for reform, spurred by the expectations of those who supported him, enters the Council chamber, his ardour is cooled by the perpetual dripping of cold water on all his favourite schemes, his eagerness is damped by the chilly

inanimity of his colleagues; the very life within him is petrified by the effete surroundings, and in due time he takes an equal place with the other fossils round the Council Board.

I have before made allusion to the systematic and continuous neglect of the country members. To that part of the question I will return for the sake of dealing with one or two other points, beyond the grievance mentioned of the lack of representation on the Council. It cannot be alleged that the interests of the country members were neglected because their existence was accidentally forgotten. That lapse of memory only took place when changes were to be made or honours to be distributed, never when funds were wanted and increase of members was sought after. The records of the Institute repeat one continuous complaint of the lack of provincial members,—of the way in which they held aloof from joining the Society. But the records are silent always as to any means being taken to make it worth their while to join,—of any effort being made to place them on an equality with the London men. They are prolific in promises,—barren in fulfilment of them. That the Institute should, amongst its members, count more than a third of provincial men is marvellous considering the treatment that has been dealt out to them. It is now seven years since the subscriptions of London and provincial members were equalised,—an implied promise being inserted in the President's address that an attempt would be made to increase the influence of the provincial members, and to afford them additional advantages corresponding to the new taxation they were compelled to bear: a promise, it is needless to say, that was promptly forgotten when the financial juggling trick was successfully accomplished. Of flattering we have had enough. We demand a food more substantial than the windy nterances that for years have done duty for the attentions we have a right to call for. With a solitary exception or two, so rare as to need most careful research to discover, no country members have served in the many committees appointed at different times for various purposes. Take the later ones only. The examination committee, which settled on the scheme for compulsory examination of Associates, was composed wholly of London men. The Architectural Competition Committee of twenty-two members did not include one provincial name. At the present moment the provinces are unrepresented in the Professional Practices Committee, the Special Light and Air Committee, the Committee for Conservation of Ancient Monuments and Remains, the Finance Committee, and the Library Committee. The first of these, the Professional Practices Committee, is a dead letter without proper provincial representation. This body makes rules, and the Council proclaims the necessity of discipline amongst members of the Institute, and that all should comply with the regulations made. This is impossible when they are drawn up by one section only of the profession, that, too, the smallest, regardless of the opinions and wishes of the majority. The demand, under present circumstances, is an intolerable one, and cannot but be scouted as unreasonable and absurd. The Institute has too long been a mere clique of London architects, a private club of metropolitan Fellows whose aim is peace and profit for themselves, and who would fain be left to the enjoyment of the preprandial chat round the Council Board, and the agreeable dinner which follows, the enjoyment of which is so much enhanced by the feeling that they have previously satisfactorily disposed of the business of the head organisation of English architecture. The clique must be broken up, the Metropolitan Vestry Board of the profession dispersed, and a Council elected that will be representative of the nation and not of a mere city, however important and cosmopolitan that city may be. An infusion of the robust common sense of the North, with even something of its rude outspokenness that says plainly out the true definition of the vacillation and feebleness that have for fifty years characterised the work of the Institute, would be invaluable, and must be brought about. Its policy of meddling and muddling is inevitable. It cannot be otherwise. It affects to speak for the country, and knows nothing of the practice and feelings of architects outside the cab radius of London. One monotonous recurrence of ill advised advance and inexcusable retreat makes the record of what it has mainly

done for architects. The Council of Compromise must make way for the Council of Courage. Of promises and fair words we have had enough, of acts of justice and fairplay none. The hands are the hands of Esau, but the voice is that of Jacob, who stole his brother's birthright.

To conclude remarks, already too long, it may be inquired, What do country members in particular demand? To a great extent an answer has already been given to such a question, but there is one thing in particular which carries within it the possibility of all the others. That is a vote by proxy. Without that all idea of justice to provincial men, of giving them any share in the control of things, is mere nonsense. No influence can be wielded by country members without it. The existing need of the presence of those who vote simply deters any but Londoners from ever troubling their heads about the affairs of the Institute. The vote through which alone they can make their influence felt is too expensive a luxury for any but men of abundant wealth. Let me give an example, my own. Last year I was anxious to exercise my right of franchise in the question of a diploma. Twice I specially journeyed to Town for that purpose, and each time, without notice, the matter was adjourned. Assume, which I have no grounds for doing, that the ballot is taken the next time the question is raised, and that I am foolish enough to try once more to be present as a voting Fellow of the Institute, let us see what that vote will have cost. Three railway journeys to Town at 2l. 10s. 7l. 10s.; three days' hotel expenses at say 15s., 2l. 5s.; three days' time at 5l. 5s., 15l. 15s.; altogether the sum of 25l. 10s., as the cost of exercising the franchise by a country member at the Institute. There is no need to enlarge upon the bare statement of fact, and no need to ask why provincial members take so little interest in an organisation in which they cannot reasonably make their influence felt. The position taken up by the Council has always been that to grant this demand for voting by proxy would be to run counter to the plain directions of the charter. I venture to say that it would not. And I venture to say, too, that the Council has never yet stood in the way of the Council when they wished to break through its clauses. They could stretch their consciences sufficiently to do this when they desired to establish a new class of members under the name of Honorary Associates, in direct defiance of the words "And our will and pleasure is that we further grant and declare that the Institute of British Architects shall consist of three classes of members, to be respectively called "Fellows," "Associates," and "Honorary Fellows." They wanted the guineas of a new class, and no charter was allowed to stand in their way to prevent their getting these. The Council in 1877 got, by fair promises, the guineas of the provincial men, but they have no wish to give them the right to vote, lest they should be speedily called on to dance to a tune that would not be of their own selection. In 1858 the then president (Earl de Grey), along with other members, offered to the Institute shares in the Architectural Union Company. To hold these was distinctly illegal, yet the Council had no difficulty again in overreaching the law for the sake of gain, the secretaries being put up as the nominal holders, and to represent the Institute. On another occasion, the Council desired to alter the mode of election of Fellows, so as to require a majority of four-fifths of the votes given to entitle to success,—a proposal so clearly contrary to the letter and the spirit of the charter, that the consulting solicitor at first plainly ruled it to be inadmissible. A second attempt to persuade their solicitor to more obliging manners was victorious, and he decided that the mention of a bare majority in the clause of the charter was only intended to apply to general meetings and to Council meetings. Ordinary or sessional meetings, on the other hand, not being mentioned in the charter, were not, therefore, considered subject to the clause. The Council profess to feel acutely the difficulty which prevents their granting to country members the right of voting by proxy. Here is a clear way out of the block. General meetings called for the election of officers are subject to the regulations of the charter; ordinary meetings, by the decision of the Institute's solicitor, by the acquiescence of the Council, are not. Let all matters of importance be decided by ordinary meetings, which are not controlled by the charter; let general meetings for the election of officers, which are so

controlled, be preceded by an ordinary meeting, at which votes by proxy will be received, and which will decide in that way what names are to be submitted for formal acceptance by the following general meeting. This plan is simple, is perfectly legal, or else the Council have been acting illegally for years back, and permits of the exercise of voting by proxy, which is the chief demand now made by country members. The proposal is so convenient that it is astonishing the Council should never yet have seen so easy a plan for granting a boon which they claim to have been anxious to give to provincial members. If an ordinary meeting has the right to act contrary to the charter,—and the Council say it has,—there is no reason whatever why an ordinary meeting should not decide what names of officers should be submitted to the general meeting, and the general meeting certainly cannot elect officers against the voice of the ordinary one if only a sufficient number of names to fill vacancies are submitted to it. All other questions of importance outside that of electing officers need never come before any other than ordinary meetings, and, as voting by proxy is admissible at these, they not being under the charter, the whole question rests with the Council. If they still find a way by which to avoid giving this just right to country members, it is because they seek not to grant it, but to discover some plausible excuse for not doing so.

My indictment of the Council is by no means complete, and has omitted mention of innumerable sins of omission and commission. If the list of these is not exhausted, your patience must be, and I have, I think, said enough to sustain my position. It will be urged that I heap up blame too deeply on the Council, and that no amount of zeal or skill could have achieved all that I appear to demand from them. That it is too much to expect that all the reforms in the profession which I have incidentally mentioned should be brought about, I at once freely admit. But so long as none of them have been seriously attempted, I am justified in blaming them for the want of any. The policy of the Institute from the day of its foundation to the present time has been that of shelving all important questions, of adjourning all serious work, of shirking every great difficulty. Beyond all other matters, it is deserving of the reprobation of all true architects for the deliberate way in which it has permitted itself to remain weak and unimportant when it might have been strong and powerful; to be despised and neglected when it might have been venerated and courted; to passively allowing itself to be a Vestry when it might have been a Parliament; to remain a private club when it might have been a National Institution.

It may be assumed that I have no right to blame the Institute for the position of architecture to-day. I cannot concede the point. The Council stand as the recognised exponents of our professional position to the public. As such they must accept the blame if the profession loses ground before the outside world, even as they would arrogate to themselves the praise if the reverse had been the result of recent years. Scant respect must be the inevitable result of the contemptible exhibition of feeble vacillation which the Transactions of the Institute disclose. The burning question of competitions, with its intricate difficulties and its corresponding importance, is handed over to be dealt with by a committee outside the Institute, the Council only interfering to insert a mischievous and uncalled-for clause, and so its plain duty is cheaply shelved. The duty of maintaining some show of student education from year to year met with scurring neglect till a new organisation took up the work so shamefully forgotten, and by its vigour and energy struck a success that might have been the Institute's years before, and showed that the profession had within it a life and earnestness wanting only leadership to be animated into concrete activity. The universal demand that our profession should be brought up to the level of others by the institution of some qualification marking the capability of each member of the Institute, was met by a ridiculous half-measure, which closed the doors of the inferior grade of membership and threw wide open those of the superior to every charlatan who assessed the value of the title of Fellow at four guineas per annum. When contemptuous indignation covered with confusion the absurd attempt to

set up a diploma fore-doomed to ridicule by the very action of its promoters, the Council scared themselves, like children, with a legal bogie, built up by their own ingenuity out of an ambiguous phrase in a worthless charter, and shook their ghost of conveyance parchment, inflated with their own fears, as a justification of their failure to fulfil an admitted responsibility.

Vacillation and procrastination. These are the special characteristics of the Council. Questions of the gravest importance have been before them for years, till every conceivable resource of procrastination has become exhausted in the endeavour to adjourn without rejecting them. Such is not the conduct likely to forward the interests of an important profession, and to maintain the dignity of the Institute before architects or in the presence of the public.

Where lies the remedy? Certainly not in inaction or toleration. Whatever its faults or failings, the Institute is and must be the centre of English architecture. To weaken it by secession or abstinence is to damage the general interests of the profession. The only course, it seems to me, is to join it in numbers sufficient to make the provincial element strong in proportion to its numbers; thus to make it truly national and representative. Then agitate for the right of voting by proxy until the right is forced from the unwilling Council, and then to "Shape our ends, rough-hew them as they may."

#### HEALTH EXHIBITION HANDBOOK ON WATER SUPPLY.

RATHER late in the day there made its appearance (just before the closing of the Exhibition) an important contribution to the series of Health Exhibition Handbooks, in the shape of a voluminous report on London Water Supply, by Sir Francis Bolton. It contains a vast amount of information placed before the public in an intelligible form, and divested of much of the technical phraseology so puzzling to the ordinary reader. It describes the various sources from which the water supply is drawn, and the modes in which it is distributed. The consumer will be able to learn from it the exact points from which the water he drinks is taken, the process which it undergoes before being discharged into the pipes which lead it to his own house, in regard to filtration and purification, its degree of hardness or softness, its chemical constituents, and its standard of purity. He will also learn how easily that purity may be interfered with by the ignorance or indifference of the builder and plumber who arranged and fixed the pipes in his house, or by the carelessness of himself and his servants in not looking to the cleanliness of his cistern. A paternal Government in the course of its legislation has also undertaken to teach him what arrangements to make and what to avoid; in fact, if every consumer of water will only condescend to follow out all the precepts which are inculcated in the regulations made under the Metropolis Water Act of 1871, he may rest assured that everything possible has been done to secure him and his family from falling victims to "moving organisms," or "moribund germs." With regard, however, to the vexed question of water purity, Sir Francis Bolton does not profess to pronounce a definite decision, preferring to let the various distinguished experts speak for themselves in the Reports of Dr. Frankland on the one hand, and of the Companies' professional examiners on the other. As these reports have already received considerable attention in the *Builder*, we do not propose to enter on their respective merits again, but merely to point out that in Chapter VI., which is devoted to the quality of water and water analysis, the reader will find the chief points laid down, from which he can form his own deductions as to the meaning of the term "organic impurity." In regard to that term, it is said "that not only is the amount present in filtered Thames water infinitesimal in actual quantity, but the Royal Commission on Water Supply recorded the distinct opinion that the presence of a small quantity of organic matter in drinking-water is not necessarily prejudicial." On filtration as one means of remedying impurities in water, Sir Francis Bolton gives some interesting explanations not generally known. Until lately it has always been supposed that the action of filters was merely mechanical, and simply served to strain off such particles as were held in suspension; but it has been discovered that they play a more

important part in the removal of chemical substances, as will be seen from the following description:—

"Decaying organic substances poured with the water into a filter-bed, are not merely arrested, but are rapidly decomposed and resolved into their elementary constituents, which again are promptly recombined in other forms. This chemical change is scientifically explained by the theory that every particle of sand is closely enveloped in a film of condensed air, and that the particles of organic matter being thus brought into close contact with a body of oxygen, undergo rapid decomposition. It is well known that all solid bodies attract about them an atmospheric film, and, therefore, as a bed of sand and gravel is an agglomeration of minute stones, each with its coating of compressed air (or, in other words, compressed oxygen and nitrogen), the water filtering through the interstices has to pass through a concentrated body of oxygen capable of rapidly decomposing it, and forming other compounds. . . . Following out this theory, it has been asserted by chemists that when some of the London companies drew their supplies from the tidal portion of the Thames where it received all the sewage of London, their filter-beds did not clog up nearly so fast as might have been expected. Scientific experiments showed that the filter-beds must have intercepted considerably more impurity than was actually found in them, and the phenomenon was explained by the theory that filtering was not merely a mechanical straining process, but one also of rapid chemical action, by which the polluting matter intercepted was destroyed and converted by oxidation." The process which takes place in the large filter-beds of the water companies goes on of course similarly in the small domestic filter, but just as it becomes necessary to renew the substances comprising the large filters, so is it necessary to cleanse the small ones, a precaution which householders ordinarily are not in the habit of taking, and consequently the very article on which they rely as a safeguard may, and often does, turn out just the opposite. No filter, therefore, can be depended upon indefinitely for the purification of water, for it "gets gradually choked up by the pollution which it is continually abstracting from the water passing through it, and the air coating upon which the chemical action depends becomes exhausted, and the oxidising process gradually ceases." It behoves every household, therefore, to bestow special attention to two points: first, to the periodical cleansing of his cistern, and next, to the renewal of his filters; as also to give heed to other important matters which are particularised in Chapter IV. The second part of the treatise is occupied with the history and description of the various London waterworks companies, with very complete statistical tables of their financial position. As similar information was embodied in Mr. Alfred Lase's Report, which was lately reviewed in our columns, it is unnecessary to say more than that all who are interested in these particulars, as well as in the legislative enactments under which the several companies raise their revenues, will find them all clearly detailed therein.

The description given in Appendix II. of the Water Pavilion, and of the way in which those marvellous effects were produced in the illuminated fountains, will doubtless be eagerly read and appreciated by thousands of those visitors to whom that part of the Exhibition proved a never-failing source of wonder and pleasure. For the small price of One Shilling they will find themselves initiated into what, until it is explained, appeared a veritable mystery of science, a marvel which led the beholder to imagine for the time being that he was under the spell of the geni whose wonder-working powers of magic formed so favourite a subject of description in Eastern lore.

**East Dereham.**—The parish church of St. Nicholas, East Dereham, is about to be restored, according to plans and specifications which were approved of at a vestry meeting held last week. The scheme of restoration, for which 3,000*l.* is required, includes the removal of the plaster ceiling over the nave, the renewal of this roof to its original state, and the removal of the galleries, which now obstruct some beautiful windows, especially in the north aisle. The architect for the restoration is Mr. E. Preston Willins, of Norwich.

#### MR. G. AITCHISON, A.R.A., ON THE PROSPECTS OF ARCHITECTURE.\*

As I understand, there are certain conditions without which architecture, as an art, is impossible; there must be the laid-up wealth, much building on a large scale, and a taste,—nay, a passion,—for beauty, for spliminity, and magnificence, amongst the public; and there must be those conditions of law and custom that will not thwart the desires of the owner of the building. There must be the architect, honest, skilful, and inventive. I think we cannot doubt that the laid-up wealth exists, nor the need of buildings, some, at least, of large size, nor a sort of sluggish taste for work good of its kind; but I think we may safely say there is no overmastering passion in the public for architectural beauty or magnificence. There is, of course, discernment enough to know a good building from a bad one, but the inclination is rather to pick holes in the best building than to thank God that anything so beautiful could be made by man.

There are, however, laws and customs that, perhaps, do more than general apathy itself to check the development of the rising taste for beauty, for instance, "leasehold tenure." Who will build magnificently for some one else? Is it credible that any one will secure enperb workmanship, the most enduring materials, and all the art that the best architect, sculptor, and painter can supply, if the building is to pass to a stranger at the end of sixty, eighty, or ninety-nine years? Besides, the freeholder will look to see that what his tenant wants to make his house perfectly fitted for himself is also fitted for after-tenants, even when he does not force upon his tenant some of his own views of propriety and beauty.

There is a fashion now for buying pictures, and an excellent fashion too, so far as it goes, but I fear it is not altogether separable from the idea, that if the pictures are skilfully chosen they are better investments than any known on the Stock Exchange; else why are there so few friezes, wall pictures, and mosaics, in buildings that are not leasehold? I merely mention this because it might otherwise seem that architecture had been outstripped in the race by the sister art. I am by no means sure that this is not the case; and if it be so, let us again draw up to the painters, and pass them if we can; no one objects to generosus rivalry.

I ask, if painting be truly and honestly admired for its own sake, how it comes about that none of the paens sung in its praise are sung in praise of our art? And why the architects who build more excellently than their fellows are not run after like the celebrated painters. On the whole we may say that the first half of the last 100 years was a very artless one. We escaped from perhaps a worse fate than once threatened Greece, but no temples rose, and few monuments recorded our thankfulness and our victory. When we had modestly housed the Duke, put up a bronze Achilles in his glory, named Waterloo-place, Waterloo Bridge, Waterloo-road, and Waterloo blue, our thankfulness and our enthusiasm expired.

If we compare the spirit of the Florentines in the thirteenth century, only just emerging from barbarism, and owing but one tiny city, determining that their new cathedral, St. Mary of the Blossoms, should exceed in magnificence any building that Greeks, Romans, or the proudest people of the earth had built, what a contrast they make with us, possessing an empire on which the sun never sets, but doubting whether we have enough courage, energy, and industry to keep what our fathers won for us, and when the supreme aim of the Government is to see if it cannot save three-halfpence off the architect's commission. So much for the public; now for ourselves. It would be as insulting as untrue to doubt the honesty of the generality of architects. I do not doubt that amongst the whole body of them there is much more skill than could have been found for a century or more, and it would be invidious to compare the individual excellence of living architects with the great who have passed away. We have reburnished the rusty armour, and weapons of antiquity and the Middle Ages are fairly skilful at the old fence, but I fear we lack the heart and the inventiveness of the old Paladins. *No coup de Jarnac* seems to be

\* From a paper read before the Architectural Association on the 21st inst.

invented now. We bear too much resemblance to the men in armour at the Lord Mayor's show: the armour and weapons may be as good, and as bright as armour or weapons ever were, the men may be bigger and their thews as strong, but their hearts have not the ancient courage, nor their souls the same devotion; and even if the men were our modern Paladins, they would not fight in that armour, nor with those weapons. Do not fancy that I suppose that any man can evolve a style: there must be something to start from, and a multitude striving in the same direction, every one of that multitude anxious to solve the pressing problems of the day, and several generations to bring the new thoughts to anything like completeness; but what we all feel is the absence of the first step. You know Viollet-le-Duc's comparison of the architect to an opera chorus singing "Let us go," though they all stand still.

It may be that the grand gift of architectural invention is only to be found in what we call new races; barbarous races that have suddenly emerged from their homes, who find themselves conquerors, and face to face with a higher civilisation, and in the possession of unheard-of wealth, such races as the Arabs and the Normans.

Amongst civilised nations, the Roman was the only one I know that slowly evolved a style. Unless one were a prophet, a necromancer, or whatever he be called, who can depict the probable development of past possibilities, it is impossible to say whether the Romans would have created a style of their own, could they have increased in wealth and civilisation without the subjugation of the known world. All we know is, they did not; they were born constructors, and had cultivated this native gift to great perfection even before they conquered Greece. The artistic excellence of Greek architecture dazzled their eyes and enslaved their minds; like ourselves, they wanted excellence ready-made, and would not wait for its growth, but they were too practical a people to give up their advanced system of construction for the primitive one of Greece. They were not artistic enough to apply at once Greek principles of beauty to their own new forms of construction,—the arch, the vault, and the dome. So apparently the art-architect was created. He stuck vulgarised imitations of Greek work on to Roman construction, and it was not till five or six centuries had elapsed that the Romans possessed a real style, one that ornamented their own native construction with appropriate forms. This style we now call the Byzantine.

The Greeks carried the old style of construction,—the post and lintel,—to the highest artistic perfection, and in a style differing from the Egyptian, Assyrian, or Indian; so a new system of construction is not necessary for a new style. The Romans having new constructive elements gradually learned how to clothe them in forms of beauty that neither hid nor belied constructive truth.

The Arabs,—for we call the conquered people by the name of their conquerors,—somewhat improved on Roman construction, and certainly clothed their construction with forms that were wholly new and original. One of the most striking features of Arab architecture is the stalactite or honeycomb work, and, if Owen Jones's assertion is to be believed, this was gradually evolved from the attempt at copying series of superposed eggs and tongues that took their fancy. Here, to say the least, is the one step forward from which came such wonderful results. Before we have analysed the elements of it, an Arab honeycombed dome does not seem to be the work of man's hand but to be the work of some superior being. Though I hope I may be wrong, I do not see this tendency towards development in modern architecture.

The Normans, with examples of Roman and Byzantine work at home, and with reminiscences of Syrian and Arab work abroad, gradually evolved a wholly new style. They, or some of the people they conquered, and animated with their resistless energy, developed the arch and vault to their uttermost perfection, and I think we may say they evolved and developed tracery.

If you think of the continuous invention implied in passing from columned and arched windows to the fantastic tracery of the Flamboyant, at first sight it seems that there was more invention then than now, perhaps because we can now see the transitions at a glance, though it really took four or five centuries to

complete the development. Phases of plant growth, before overlooked or disregarded, took their fancy, and they piled the pyramid on the tower, and so gave what we suppose to be a novel aspect to buildings. At any rate, we know that the Christian cathedral is very different from the Pagan temple. Whether in the babel of architecture that now exists we are slowly evolving a new style, no one who lives in it can say. We must not forget the almost frenzied energy with which the English architects of fifty years ago threw themselves into Gothic, how perfectly they mastered its apparent intricacy, till a Medieval, revisiting the earth, might believe he had come back to his own time again. This training, with the Roman Classic forms ingrained in the people and revived, points to a new style partaking of both elements.

All I can do is to point out to you what little observations I have made. You have often heard me say that I believe that what taste there is, that is not antiquarian, lies in the direction of simplicity, and as I am sometimes charged with paradox,—that is, saying that which though true is strange,—I will now explain my reasons. The old sailing-ship of my youth was of the uttermost complexity, with masts, yards, booms, and bowsprits, with shrouds, ropes, and dead-eyes, sails, and pennons, a sculptured figure-head, and carved stern, while that modern monster of the deep,—the ironclad,—is as simple, and hick as a dolphin, with nothing but a funnel for its back fin. The old dinner-knife, curved like a scimitar, with its blotted end to prevent stabbing and to eat peas with, its conical handle coloured green, and bossed with silver, has made way for the rectangular blade, in its oblong haft. The many-runged chair, ornamentally turned and fancifully carved, has been supplanted by one of four plain legs with two rounded uprights and a slightly curved top. I am not now speaking of art furniture. Every wheeled carriage that is turned out aims day by day at being more perfectly simple, and harness becomes less and less without a stitch or a rivet that is not for pure use. So much so, that the old wagons we sometimes see, all chamfered curiously, the horses' harness covered with jingling brass plates, pierced and engraved, and with ornamental stitching, remind one of Medieval days. And what can be of sterner simplicity than the new carriage of our time,—the bicycle,—which, when hestridden, presents us with the centaur of the nineteenth century. Take these observations for what they are worth: to me they point to simplicity of taste. We have two absolutely new materials,—iron and cement concrete,—and both these materials almost force us back to the pure post-and-lintel construction of the early days of our race. The use of iron should, at least, be marked in some way; but hitherto we have adopted the Roman plan. The girders with their vaults are covered up with a false ceiling in imitation of wood framework; and we cannot as yet he said to have turned ironwork to much aesthetic use. Of ornament we have no lack: does it point to anything in the heavens above, the earth beneath, or the waters under the earth, that the cultivated man of the nineteenth century cares for? We have our sacred animals, those devoted to sport,—the fox, the roe-huck, the red-deer, the pheasant, the partridge, the grouse, the woodcock, the trout, and the salmon. Do we ever see one of these put on a horse because the owner is a hunter, a sportsman, or a fly-fisher? Do we see domestic pets,—a cat, a dog, a canary, or a squirrel,—carved on a house? Though there was one squirrel immortalised by figuring in the centre of each drawing-room frieze of a speculative builder's row of houses. This squirrel would "have cracked his nuts in liberty" had not both been of plaster. Lions' heads we see by scores because the Egyptians, Greeks, and Romans liked them; nay, I have seen bullocks' heads on a Bank, but I took that for the architect's monogram.

There are two emblems that the modern architect has taken under his especial protection, the stone cannon-ball and the flower-pot, and these are now receiving their apotheosis. The flower-pot I think I understand, but why the cannon-ball? Figure sculpture of this century we cannot have; our dress is too ignoble to be represented in any lasting material of one colour, and this is a terrible misfortune for the bulk of mankind care for nothing but the present. The architect, like the poet, is born, and

not made; though when either is born he takes a good deal of making; but in one respect the architect is more like the soldier than the poet, for after he has endured his training, and learned his drill, it is from the teaching of the actual strife that great generals and great architects are formed. Since the incubation of the Renaissance it is curious to note how few great architects there have been who have not measured some of the celebrated ruins of antiquity, at least of those who have succeeded in making fine monumental buildings.

The close communion with antique greatness seems in some measure to impart that greatness to those fitted to receive it. So, few great modern poets have not been classical scholars; those grand exceptions,—Shakespeare and Burns,—were not unconscious of this misfortune, and repaired it by studying the antique master-pieces at second-hand.

Drawing is doubtless a great art; not only does it enable us to show completely and brilliantly what we mean to do, but the training to eye and hand is invaluable, and we can mostly distinguish between the works of the architects who can draw, and those who cannot; and if we cannot, the architect who is a brilliant draughtsman can, for he sees the improvised turns that the mere art of drawing suggests: still this brilliant achievement is being carried in the present day beyond its legitimate end, or rather, I should say, it is made too much of to the exclusion of more important things; though it helps us by forcing us to observe, and reveals to us some of the causes of excellence in buildings, though it enables us to have a useful gallery at hand for our study, though it commands immediate recognition, some flattery, and frequent success. It is scarcely studying architecture, and is too apt to draw us away from more tedious studies, such as measuring fine examples and calculating their proportions, and which are apt to call down on us the contempt of our friends and the gibes of painters, though the end of these studies is to increase our knowledge, and to enable us to acquire that skill which is the peculiarity of the architect as distinct from the builder, the engineer, the draughtsman, or the designer. Paradox as it may seem, architectural invention is not the one distinguishing characteristic of the architect. His distinguishing characteristic is the knowing how buildings and their details will look at the height and distance at which they are to be seen; and this can only be learned by actual practice, if it be not learned by the measurement of existing buildings. Pheidias was a monumental sculptor, and in the competition for the pediment of the Parthenon his work was judged to be the worst; but he insisted that as the sculpture was to be in a pediment, not on the ground, it must be seen at the proper height, and when this was done, his was seen to be the best.

Mr. Ruskin, after one of his brilliant descriptions of an atmospheric effect on a distant hill, argues *a priori* on the probabilities of what the substance was which produced that effect, whether it was marble, ice, snow, or gold. He then walked up the hill, and found it to be caused by a wood of pine trees, and expatiates on the strangeness of the material chosen by Nature to produce such an effect. This is just our case. We have sketched something in a building which we consider successful, and are surprised when we try to produce a similar effect that our work is a failure. It is so because we have used the ice or gold instead of the pine wood. When you learn to draw freehand learn figure drawing, for not only does the padding out of the ghostly bones with the necessary flesh give lessons of how the purely necessary can be clothed with beauty, but the figure gives the best lessons in form, and the exquisite refinements that Nature resorts to, and it also teaches us the comparatively small difference between the curves that make beauty and those which make ugliness.

One form of wisdom, however, consists in proportioning our efforts to the task we have to do and the time and strength at our disposal, and it is not wise to make our plan so vast that we shall have neither time nor materials to rear the building.

The three great divisions of architecture are: arrangement, construction, and beauty; each division is transcendental, and no man that ever lived could say he had perfectly mastered one of these subjects. Construction alone has of

late years been raised into a profession, and no engineer could say that he had mastered it, and yet we have in that profession men of special, and extraordinary ability, who have devoted their whole time to its study, who have won by it fame, titles, and fortune. And though M. C. Garnier's joke is not quite true that engineers are only architects who have not finished their education; yet to gain the name of architect we must combine in some degree all three. That this combination, with extraordinary excellence in each branch, has not been beyond the powers of some giants who have added to it sculpture, painting, and poetry, is a reason why giants should not despair. All I say is, let us be sure we are good architects before we become painters, sculptors, and poets, and let us not lose the substance for the shadow. To aim at everything and to do nothing well is not, in my opinion, to win self-respect, not even fame.

Some of you may recollect Martial's epigram on Attalus, who did everything prettily:—

"He that doth nothing well all prettily  
A very idle-busy-man must be."

No country, however, wants the aid of the real architectural sculptor so much as England. And if your taste leads you to abandon architecture, and become an accomplished architectural sculptor, every wise architect will hail you with delight. I may also mention incidentally that France has almost the monopoly of architectural illustration, the whole world is supplied by her, at least when the books are illustrated with fine steel engravings. Here at least is an opportunity for the highly skilled architectural draughtsman, for France only has this monopoly by reason of her superior industry and skill.

We may say that geometry is the mother of architecture, yet how few study it. Read Prof. Willis's paper on "Stoneworking in the Middle Ages," and see the great acquaintance there was then with it.\*

In the Arab writings, when a town or a palace is to be built, the king sends for the geometers and mathematicians, and those mysterious and intricate interlaced patterns, the real arabesques, are founded on pure geometry. Proportion is the soul of architecture, though every style gets some of its flavour from a tendency to some particular proportion.

The Reform Club is, I think, the most perfectly-proportioned building that has been built in Europe since the Italian Renaissance, and the story goes that Sir Charles Barry had the proportions of every celebrated Italian palace taken out, and took a mean for the club.

We know from Vitruvius that the Greeks had established a canon for proportioning their works, which the Roman architects imitated. We try to extract from old buildings the secret of their success, and we can in some cases obtain their proportions; but those proportions must be applied to some definite form, and it is just this definite form that we lack.

Like the fever-tossed patient, we try to get rest and ease by constant turning. We in this century have tried Greek, Egyptian, Italian; every period of English Medieval from Norman to Tudor; Italian, French, and Flemish Gothic, Elizabethan, and the Dutch Renaissance; but no sooner have we mastered the style, and in some cases long before we have mastered it, than we abandon it for something else. This passion for change prevents us from exercising that power of modification on any style which might make it suit our wants and likings.

Our friendly but grumbling critic, Mr. Fergusson, has written high praise of us in his "Modern Architecture"—"As a body, the architects of this country have never been so numerous, so well instructed, nor so earnest in the exercise of their vocation as at present." Yet he is always insisting on his text that "modern architects do not think, they only copy,"—a saying seized on with pleasure by the ignorant multitude, but *we* know how far it is from being the case. I dare say we think as much as architects ever thought, and copy less. I think that if you compare the buildings of one style that have been done in the last thirty years, and take thirty years either of genuine Gothic or Renaissance, you will see that the modifications of the latter are not much more than the former; although in the former case these buildings of one style have mainly been the production of a small hand of architects

only, while the latter were of the whole body. I shall show hereafter the absurdity of supposing that a new style perfected in every part, and precisely adapted to present use, can issue from the brain of any one architect like the armed Minerva from Jupiter's. Every architecture we know has gradually proceeded from the small modifications each age has made; and that, too, at times when more attention was paid to architecture than has been the case for the last century, when men's thoughts have been occupied with the discovery of the powers of nature and the invention of machines to utilise those powers. We must, at least, begin by modifying or paraphrasing some known style or by applying the mouldings and parts of something we do not know to the rectangular brick box with holes in it.

If this paraphrasing of by-gone styles were confined to England alone it would not so much matter, because then we should know it resulted from idleness or natural incapacity, but it extends to civilised man. France, Belgium, Switzerland, Italy, Germany, Austria, America, and Australia have nothing absolutely new to offer, so it is clear that neither race, climate, nor language can affect architecture; the defect must lie in the present civilisation.

I am inclined to believe, in spite of Dr. Johnson, that "Poets are but the tailors of other men's thoughts," and that which is true of poets is true of all artists. They are the men pre-eminently gifted with the spirit of their age, and blessed with the power of expression. If, then, the people of their time are heroic, you have heroic poetry; if the passions run riot you have passionate lyrics; if cansticity and sarcasm prevail you have satire; but if the people have nothing poetical about them, the poet is driven to old themes. If the people are fat and shapeless they afford no scope for the sculptor; he tries ever so beautifully made and in ever so fine a condition they will be useless to the sculptor if they wrap themselves in ugly garments that conceal their shape, and sculptors must revert to antiquity or die out. If the public care not for grace, dignity, or elegance in their habitations or public buildings architecture dies, and dies more completely out than any other art. Poets may sing, painters may paint, and sculptors model, but it is a rare case when an architect could afford to build even the Reform Club House for his sole use and delight.

If the public desires some sort of grace, dignity, or elegance, but does not much care what, and has no particular liking, as we have no style of our own an old style is paraphrased till the public are tired of it, and then another style is paraphrased; in short, architecture, like the other fine arts, closely portrays the spirit of its age.

Some ancient nations called themselves "Autochthones," or sprung from the soil, and if the story of the Doric temple is true, that it was suggested by the native wooden hut of Greece, the Doric temple may be said to have sprung from the soil, and after centuries of gradual perfecting, culminated in the Parthenon. We know that the Romans with building, but as we suppose without architecture, tried to imitate that of the Greeks, and after five, six, or seven centuries created Byzantine; we know that the Normans copied as well as the Gothic Roman and Byzantine buildings, and when touched by Arab art during the course of five or six centuries began and ended Gothic. The wave of Classic feeling that passed over Europe, at first only wetted, as it were, the surface of things: the buildings remained Gothic, but with a savour of Classic, the mouldings, ornaments, and sculpture only were of Classic inspiration. Architecture then became as purely Roman as it could, and gradually losing all vitality, again made way for revived Greek and for revived Gothic. Many variations of Classic and Gothic have been introduced and practised, not to speak of flavours imported from Arabic, Moorish, Hindoo, Indo-Arabic, Chinese, and Japanese sources.

It is the easiest thing possible to imagine the throwing away of all former thoughts, traditions, and knowledge, the arrangement of buildings on purely rational principles with new and splendid effects, the whole clothed in new and beautiful proportions, adorned with new mouldings and ornament absolutely different from the past, and with figure-sculpture and painting animated by a new spirit, and that this combined perfection shall excite the admiration of the multitude, and satisfy the fastidious taste

of the cultivated. The only objection to this charming vision is that nothing of the sort has ever yet occurred in the history of our race. We should hear of African savages, who had heard nothing but the tom-tom, writing operas that surpassed those of Rossini or of Wagner; or North American Indians, who had seen nothing but a wigwam, erecting temples that surpassed the Parthenon or Notre Dame de Paris.

This visionary scheme was once put in practice. Brunel and Sir Digby Wyatt agreed to do the interior of the Great Western Railway on this principle. Brunel found the construction, Sir Digby the art; and every moulding was to be brand new, and no ornament was to be used as ornament, but only where necessity demanded it. You have the monument now before you of what one clever man can do.

It is admitted that without the *Iliad* we should not have had the *Æneid*, nor the *Divina Commedia* without the latter; yet each had the favour of its time.

The Gothic foisted cap is a Medieval paraphrase of the Corinthian capital; the stellar vaulting is but the outcome of the Roman groin. We adapt our buildings to our present wants, and use the iron construction of to-day to meet our needs; and it is only when we seek to give our buildings the æsthetic flavour of the age that we fail, and I think the solution is that there is no æsthetic flavour in the age to give; the public are just affected with the slight flutterings of taste, and are beginning to think they ought to have something more sightly than the old brick box of their youth, with holes in it for doors and windows.

The twelfth century was the incubating period of Gothic; and it is quite possible that the nineteenth may be that of a new style; we have not only been gathering specimens of architecture, and architectural art from all parts of the world, but different architects, or groups of architects, have more or less assimilated the spirit of each. Let but the people of England, or of Europe, of America, or of Australia, have some definite taste and desire, the creative genius arise, and all this apparent chaos may form itself into an organised shape, embodying the sum of all the art and charms that characterise each one, and proceeding to develop itself in as logical a way as Gothic did.

Maybe we have been making a hed of leaf mould,—with leaves, too, from every part of the earth,—from which the new tree may spring. Although I am no prophet, it seems not so unlikely that this so-called Queen Anne's style may be the germ from which the tree is to spring, adapting itself to the outline, and freedom of Gothic with the Classic detail,—and when I say Classic, I mean excellent. Even now it does not refuse alliance with the best sculpture and painting that this age affords, as Gothic does.

The first thing wanted is for you to train and drill yourselves, and when the power of expression is attained, to observe the temper of the age, and to work out the style which will suit that temper, and seize on the budding aspirations of the age. My own notion is, that this will be found to be perfectly proportioned and graceful simplicity, almost free from ornament, but enriched with the finest sculpture and figure pictures that the age can afford. When you have done this, you want to convert the nation, if the nation will then require any conversion. For if a national taste arise, you, as a part of the nation, must be imbued with its spirit, and be sure that, if you can give tongue to that aspiration, the pack will follow you. Probably there is no profession requiring so much study, so poorly paid; so the architect works mainly for reputation and for fame.

Besides the hints about study that I have dropped in the course of this lecture, I want to direct your attention to the claims your art has on every age, in every nation. It is at least a lasting record of that age's taste and temper. From the durability of its works it to some extent supplies the want of those more brilliant and lasting records, eloquence and poetry. The illiterate nations of the past would be as last year's snow were it not for their architecture, and its enshrinement of the cognate arts. Let us suppose that the ancient Egyptians had contented themselves with houses, tombs, temples, and palaces of reeds and Nile mud, with all their glory and achievements, they would be as utterly gone from human remembrance as the men who built the lake dwellings. We know

\* Transactions of R.I.B.A., vol. 1, part 2. On the Construction of the Vaults of the Middle Ages, by R. Willis, M.A.

that Egypt must have been great, because we see how vast, sumptuous, and artistic are its structures, while its sculptures tell of achievements in war and peace. When we consider the power of our art to endure buildings with sublimity, grace, elegance, beauty, or even with appropriate gloom or horror,—when we consider that our art is enshrined in holdings of vast size and of long endurance,—when we consider, too, that they reflect the character of the age in which they are built,—I cannot for a moment doubt that architecture is worth living for, although I must admit that we are at this moment beset with so many depressing influences that it is not surprising that some of us are tempted to despair,—to throw aside our high aspirations, and to see if we cannot win in the race for fortune when we have lightened ourselves by throwing away the desire for fame. But I say, despair not; black and tempestuous as may be the sea on which you are about to venture, let your courage and endurance rise superior to the danger, and some of you at least will weather the storm. I believe that no good piece of work is ever thrown away, but, even if you can do no more, you will help to hand down the tradition of your art unimpaired to happier times and more sunny days.

Master the art of architectural expression, master construction and arrangement, master a cultivated style, and then set yourselves to resolutely adapt it to present requirements. Cut off all the redundancies, all that is not called for by actual needs, either practical or æsthetic; recollect, too, that iron must enter even more largely than at present into every building that is not of the most modest size. Consider that though the bones of the mammal are ghastly they are hidden, and that the bones of the crustacean are outside. Nothing, for instance, can be more elegant in treatment than the shell of the king crab. Mountains, rivers, rocks, and forests all abound in lessons for the architect. Every leaf and every plant may give him inspiration for a form, a moulding, or an ornament.

Reputation, honours, and fortune are the prime movers of the second-class spirits of the world; and if we do not wish mankind to relapse into sloth and barbarism, we should do what we can to uphold these incitements to exertion, and not let the envious, the dull, and the British abolish them, in the hope that when all are reduced to the condition of swine, they will be indistinguishable from the rest of the herd. Higher motives, however, have actuated the noblest of our race; men of brilliant genius and overwhelming power have devoted themselves to the good of the world, of their country, or their creed, for no greater need than have subsistence and a sense of duty. It is this spirit that I want you to adopt; perfect yourselves in your art, and then preach a crusade against the apathy and tastelessness of our age, and so confer on your country and your art a benefit of incalculable value. Did I not think this reward coupled with the feeling of having done one's duty was so much higher than any other, I might have pointed out the cases when pious monks, with no aims but the improvement of mankind, have ended their lives as popes.

In the course of the discussion which followed, The Chairman (Mr. Cole A. Adams, President), said he was glad that Mr. Aitchison, speaking from his long experience, had laid such stress upon the subject of drawing and its relation to architecture. One could not help also being struck with the wisdom of the remarks upon the little progress made by architecture in this country through the decadent operation of the law of leasehold tenure.

Mr. Stannus agreed with what had been said about pictures being bought as investments. He knew instances of City men who had almost the ascendency and judgment of an Agnew for buying pictures, and who, after holding them for a few years, had realised more than 5 per cent. per annum (on the money thus invested) by their sale. At the same time one could not help feeling that the diversion of capital from ordinary mercantile pur-making, while preventing outlay upon architecture. With regard to the disappointment often resulting from the attempt to reproduce some feature which looked well from a mere sketch, he believed the old men did much of their designing *in situ*. The architect in those days was merely a superior kind of workman, and as

the detail was wanted, he sketched it on a board with chalk or charcoal. Designing *in situ* was the grandest form of training any young fellow could have. The modern tendency for simplification was a hopeful sign. It was as if they were throwing over, bit by bit, the worthless portions of the cargo, so that the good ship *Architecture* might weather the storm. An eloquent writer on architecture had termed these the "trimmings," and they were what Mr. Aitchison had said should be thrown overboard. The great desire of the age seemed to be for classification, and in the case of architecture it would enable people to distinguish the evanescent from that which was eternally true. Mr. Aitchison had referred to new materials, and one of those with which his name had been associated was iron, which had never had a fair trial. The whole paper was really an inspiration to younger men. He concluded by moving a vote of thanks to the writer.

Mr. Hilton Nash seconded the vote, adding that it was a pleasure to the members to hear such an elevating paper. He believed that leasehold tenure only existed to any great extent in the South of England. They all deplored the rows of rotten and ugly houses in and around the neighbourhood of London.

Mr. Aitchison, in returning thanks, said that the prospects of architecture seemed very hopeless, and that was what he meant by the "black and tempestuous sea" they were venturing upon. Nothing could be more damping to the spirit than the idea that one's client did not care whether his house was good, had, or indifferent, and every effort should be made to remedy this state of things. As to iron, it was a material which was pressing itself forward for the use of mankind, and it would enter more and more largely into buildings as time went on. With regard to style, this would not be invented by one man, but by a gradual concentration of the capacities and tastes of men working in general concurrence with the thoughts of others.

#### BRITISH ARCHÆOLOGICAL ASSOCIATION.

The opening meeting of the present Session, 1884-85, was held on the 19th inst., Mr. Thomas Morgan in the chair. Mr. H. Rolfe, C.E., sent some interesting drawings showing the construction of the piers of the Roman bridge recently discovered in the bed of the River Trent during the works of widening and deepening the navigable channel. Two of the piers were found, strongly framed, there being a solid plate from end to end in the centre of each pier, from which lateral timbers extended to take the uprights of the roadway. It is supposed that five other piers remain embedded in the river. The spaces between the timbers of the piers were packed with freestone, similar to Ancaster stone. Mr. Loftus Brock, F.S.A., exhibited, by permission of the Rector of West-here, Kent, a large number of fragments of stained glass of the fourteenth century, recently found in the Rectory-house, where they were deposited many years ago during the repair of the church. They will be replaced in one of the windows. Mr. C. Roach Smith, F.S.A., sent a paper on a remarkable oppidum of ancient British date on Hayling Island. It is surrounded by deep ditches, some of which are still filled with water. The site is a strong one, and, although the existence of a large earth-work is known in the locality, but little attention appears to have been given to it, and its extreme antiquity does not appear to have hitherto been recognised. A paper was then read by Mr. C. H. Compton on the Roman bridge found in the Trent.

**Builders' Clerks' Benevolent Institution.** A special general meeting of the donors and subscribers was held at the offices of the Institution, 21, New Bridge-street, Blackfriars, on Tuesday, the 25th inst., on which occasion Edith A. M. Friend was elected by show of hands to succeed to the benefits of the orphan fund, in place of Ethel M. Jeffreys, whose school term will expire at Christmas. At the close of the proceedings a vote of thanks was presented to Mr. Joseph Randall, the president (who was supported by Messrs. E. Brooks, treasurer, J. Rohson, E. C. Roe, E. Graytons, and other gentlemen). Mr. Randall, in reply, expressed the pleasure it had afforded him to assist in the work of so good an institution.

#### Illustrations.

##### MONUMENT IN WESTMINSTER ABBEY TO THE LATE REV. LORD JOHN THYNNE.

**M**E give an engraving of this monument, which is in the north choir aisle of Westminster Abbey. The subject of it, the Rev. Lord John Thynne, was for fifty years Canon and for forty-six years Sub-Dean of Westminster. Mr. Armstead, the sculptor of the figure, writes: "During the last sixteen years I knew him well, and have tried to represent the aged priest peacefully at rest, his long day's work done, clothed in the elaborately ornamented cope which he wore when officiating at her Majesty's coronation. The reindeer, at his feet, is the family crest."

The architectural portion of the monument, like that to Dean Stanley which we illustrated a few weeks ago, is designed by Mr. Pearson, the architect to the Dean and Chapter.

##### THE LADY CHAPEL: TREVES CATHEDRAL.

THERE are very few churches north of the Alps which retain so much undoubted Roman work about them as does the Cathedral of Treves. Tradition asserts that it was erected by St. Helens, mother of Constantine. It was, however, almost rebuilt in the sixth century, largely added to at the commencement of the eleventh century; vaulted, and the choir enlarged, in the thirteenth century. Of the earliest building traces are still visible in the east capital, built into the walls of the transept, which appear to have supported the "crossing" of the church, and the brick arches visible in the walls of the choir aisles, especially that which forms the "Lady Chapel." Our illustration represents the south choir aisle of the cathedral at Treves, and shows some of the old Roman brickwork, together with additions of the eleventh and thirteenth centuries. The curious gallery to the left is a very singular example of Romanoesque work; if, as there seems every reason to suppose, it was erected as an organ-loft, it is a remarkably early example of that feature. The screen at the back of the altar is also curious; it is of late Romanoesque work, and consists of a series of stone panels, enclosing small slabs of black marble. The altar is an elegant specimen of late German Renaissance work, and presents a handsome appearance from its being entirely constructed of marble.

##### DESIGN FOR WAR AND ADMIRALTY OFFICES.

BY MR. WATERHOUSE, A.R.A.

WE give this week the design and the principal plans made by Mr. Waterhouse for the first competition for the Law Courts. A comparison of the plans with some of those which were selected from the final competition, will not be without interest, and perhaps instruction. We append Mr. Waterhouse's report in full:—

"*Central Court.*—The accompanying design has been so arranged that every important room looks either into the spacious central quadrangle, or outwards into St. James's Park, or the surrounding streets. Besides this central quadrangle (rather larger than that in the Foreign Office, it being 258 ft. by 175 ft.), are two smaller ones, each divided by a block of closets, lavatories, &c., which do not rise so high as the main buildings, so that in no case does any business room get its direct light at a steeper angle than one of 45 degrees with its window-sill, unless it be a few of the lower windows looking south into the courtyard of the Horse Guards. In the majority of cases the angle of incidence gives an amount of light very greatly in excess of this. In fact, owing to the nature of the site, the great problem of how adequately to light so great a building seems to admit of unusually easy solution. No room has less than 10 square feet of window area to every 100 square feet of floor space. In most cases much more is given, the average being 14 ft. per 100 ft. As a rule I have placed the windows 16 ft. 6 in. from centre to centre, so as to make the small rooms 23 ft. by 15 ft. 4 in., giving an area of 350 ft. of floor space; and the larger rooms 32 ft. by 23 ft., or about double that area.

*Iron Construction avoided.*—Wherever possible, I have carried up the walls continuously

from foundations to roof to avoid the introduction of much constructive ironwork. I am aware that consequently my design is placed at some disadvantage, from the areas of some of its rooms not exactly agreeing with those suggested in the schedules. I hope, however, that will be considered a less evil than the free introduction of walls on girders, especially as the deviations have been almost always to give more than the prescribed amount of space. At the same time, there can be no difficulty in adopting a more elastic arrangement of division walls if desired;—the space is there.

**Corridors.**—The corridors, 12 ft. wide, are on plan as simple and as straight as possible, without any needless angles, so as to ensure ease in going from one to another. There are only eight lengths of corridor in the entire building, and they are lighted in a varied way, so as to destroy what would otherwise be their somewhat weary monotony. The light comes either from the ends of the corridors, or from side windows looking into the smaller courtyards; sometimes, however, it comes across staircases, or down from above, the corridors being in such case carried around the well, with an arcade between. In this way I believe well-lighted, ventilated, and cheerful corridors have been secured.

**Staircases.**—The staircases are placed so as best to serve the departments which are necessarily put on more than one floor. Most of them are 8 ft. wide, and all have steps 12 in. by 6 in., or easier. In every case winding steps have been avoided.

**Number of Stories.**—In order to secure the maximum amount of light and air (to which I considered the great internal square would conduce) it has been necessary to devote five stories almost exclusively to the occupied rooms enumerated in the "schedules," and to put the repositories principally in a sub-basement story which can be kept perfectly dry by means of a through draught of air carried everywhere under the building, and he lighted from the surrounding areas. In the case of the Admiralty two thirds of department F, and the general repository of B are placed above the third floor. The basement story is surrounded by an area 6 ft. wide, and from its general elevation above the ground almost attains to the dignity of an ordinary ground-floor.

The different stories are in height, from floor to floor, as follows:—Basement, 13 ft.; ground-floor, 14 ft.; first floor, 21 ft.; second floor, 14 ft.; third floor, 13 ft. (to ceiling).

**Main Entrance.**—The main entrance from Whitehall consists of a double carriageway under a single arch leading into the centre of the great court. On either side are separate arches for footways. These arches are 10 ft. 6 in. wide, and the central one 20 ft. Opposite the visitor at the west end of the great court, and under a clock-tower of modest dimensions, is a *porte cochère* leading to a State entrance common to both Admiralty and War Office.

**Business Entrances.**—The principal business entrances, however, are under the vaulted arches of the carriageway out of Whitehall, that of the War Office being on the south, that of the Admiralty on the north, and facing each other. This is in order to give the quickest route from the street to any particular office. The entrance opens at once in each case into a cheerful waiting-hall, with messengers' rooms adjacent, and staircase leading to every floor in the building. Passenger-lifts to the different floors are at hand in each case. Other business entrances at the south-western and north-western corners of the great court would probably draw off traffic from the corridors in fine weather.

**State Entrance.**—The State entrance leads to the foot of the grand staircase, the central flight of which is 13 ft. wide, and is divided by a double arcade of glazed majoлика from the side flights, which are each 8 ft. wide. This State entrance directly communicates, by means of a spacious hall, with a private entrance from the Park, to be used,—like the State entrance and staircase,—only by the heads of departments. The staircase terminates on the level of the first floor by giving access to the central council-chamber overlooking the Park. This council-chamber, not in the schedule, is intended to be common to both the great departments for which the building is devoted; the Lords of the Admiralty having their rooms to the north of it, overlooking the Park; while the Secretary of State, the Commander-in-Chief, and the

heads of the War Office, are to the south, likewise looking on to the Park.

**Privacy.**—Care has been taken to prevent through traffic along the first floor corridor leading to the principal apartments. The public staircases at the north-western and south-western corners are arranged to pass up from the ground to the second and upper floors without in any way interfering with the privacy of the corridor on the first floor. In like manner the corridor on the ground-floor is diverted on to a balcony overhanging the Park entrance-hall in order to take the public clear of the State staircase.

**Arrangement of Departments.**—The arrangement of the different departments will be easily understood from the plans. Each department is kept as compact as possible, and its rooms, if on different floors, are connected by frequent staircases and paper lifts. The living-rooms are placed on the basement or third floor stories. These are private and tradesmen's entrances to these rooms from Whitehall and Spring Gardens. In the neighbourhood of these entrances are the refreshment-rooms and kitchens. These, however, can be placed on the third floor if preferred.

**Fireproof Construction.**—The whole of the floors are "fireproof," the rolled iron joists being in all cases totally encased in cement concrete to lessen the chance of injury in case of fire.

**Heating and Ventilation.**—Should circumstances favour the northern portion of the building being first erected, I should propose to warm it by low-pressure steam, the heating surfaces consisting of wrought-iron flanged pipes in channels under the whole width of each corridor. Fresh air, warmed thus in winter, but cold in summer, would be driven along these channels by fans worked by electro-motors, which would be driven by an engine receiving its motive power from the heating boilers. From the fresh-air channels under corridors, upcast flues would be carried into each room, the amount of heat and air supplied being under control by regulators, and the vitiated air passing out through flues near the ceiling of each room. The boilers and engine (which I have placed near Spring Gardens for convenient supply of fuel and removal of ashes) would be available for any motive power required for other purposes. Should the southern portion of the building be the first erected, the heating apparatus could be removed to that side of the building, or two heating centres could be arranged instead of one.

**Retiring-rooms.**—The closets, 101 in all, are placed principally in two blocks in the centre of the smaller courts. In order to supply these courts with abundance of fresh air, wide channels are brought to them under the building from each side; so as to prevent stagnation of air in the lower parts of the courts. The messengers' closets are in a mezzanine story between the first and second floors, and in retired positions. There are also some extra closets on the fourth floor. In certain exceptional cases, near the rooms of the chief of a department, an occasional closet has been introduced, but I consider this undesirable as a rule.

**The Style.**—The style adopted will, I think, admit of abundance of light, and at the same time be in harmony with the surroundings of the building. I had at one time hoped that these great Government offices would have afforded an opportunity of realising to a certain extent the magnificent dream of Inigo Jones in his design for the Palace in Whitehall; but a glance at the schedule of requirements with its 500 or 600 rooms of small size made it apparent that if they were kept of proper height for comfort and due regard to economy of construction, it was impossible to have in the new Admiralty and War Office such grandeur of proportion as exists in the Banqueting House opposite; and that a building of five important floors, each with windows of good dimensions placed at the proper distance from ceiling and floor, could not be forced into a dress suited only for two floors and an unimportant basement. A glance at the diagrams showing three bays of the Banqueting House, three bays of the Home and Colonial Office (the other most important building in the neighbourhood), and three bays of my own design, will explain my meaning better than words can do.

I have resisted the great temptation which the style adopted offers to introduce deep

arcades in front of my windows, feeling sure that in our climate such aids to darkness, however beautiful in themselves, should be very sparingly introduced.

**Materials suggested.**—The material for the exterior I propose should be Portland stone, as the most durable stone which can be used in London, and as harmonising more with the architecture of the neighbourhood than any other material; though I believe that terracotta might be employed with advantage, both as to durability and economy. Internally I should be disposed to recommend glazed terracotta in the walls of the staircases and principal corridors.

**Cubic Contents and Cost.**—The cubic contents of my building, from 10 ft. below the basement floor to half way up the roofs, including all high roofs and other exceptional features, amounts to 10,131,641 ft., or from 15 ft. below the basement floor (as I think my design ought to be measured), 10,757,615 ft. I estimate its cost from the lower level at 543,880. This price is less than such work would have cost some years ago; but not less than recent contracts warrant if the work be proceeded with at present prices.

**Divided Contents and Cost.**—The Admiralty and War Office interlock to a certain extent in my design, on the different floors. This occurs on the upper floors above the main entrance, and very slightly near the State staircase. Should it be desired to make each department entirely self-contained, so as to build one before the other, it will be easy to completely divide them by a vertical line drawn from foundation to roof at the walls south of rooms 344, 335, 300, and 301 on the first floor, giving the Admiralty everything north of this. The slight rearrangement thus involved would cause a loss of spare rooms to the extent of about 1,500 square feet on the part of the Admiralty; but would increase the spare accommodation of the War Office to a similar extent.

The contents of the Admiralty measuring from 15 ft. below the basement floor, would thus be 5,628,927 cubic feet, and its estimated cost 284,647; whereas the cubic contents of the War Office would be 5,128,688 ft., and its estimated cost 259,234.

**Amount of Accommodation.**—In almost every department a substantial increase in the amount of accommodation has been given over and above the areas specified. Thus, to the Admiralty has been allotted 111,334 square feet of 'carpet space,' against 102,830 specified in the 'schedules,' besides 27,565 square feet devoted to residences and miscellaneous accommodation (given in the instructions, but not in the schedules), and 24,520 square feet more in interview, waiting, and spare rooms; while to the War Office has been given 122,339 square feet, against 110,470 specified in schedules, besides 26,689 square feet devoted to residences and miscellaneous accommodation, and 26,662 square feet more in interview, waiting, and spare rooms.

These figures, with 6,150 square feet of accommodation, common to both War Office and Admiralty, give a total for the whole building of 344,259 square feet, exclusive of corridors, messengers' rooms, and retiring-rooms.

Owing to the small scale of the drawings, I have contented myself by merely showing the building in geometric outline, leaving the scheme for such decoration as appears to me to be compatible with its objects to the further development which my design would undergo, should it be so fortunate as to obtain a place in the select competition."

## THURLOW TOWERS, STREATHAM.

We published last week a view and plan of this house, with a description. We give the present view, drawn by Mr. Knight, as an admirable example of free pen-drawing of building combined with landscape, which we believe our readers will be glad to possess for its artistic value.

## THE TOWER OF LONDON AND WESTMINSTER HALL.

SIR,—The "Member of the Architectural Association" [p. 709, ante] has not shaken the self-evident proposition that I endeavoured to lay down in your issue of the 8th instant to the effect that true architecture consists in knowing what you want, and doing it.

There is no need to see the drawings of the intended restoration,—or restored completion,—of Westminster Hall for the purposes of this argument, much as I should enjoy the intellectual treat of seeing such expert knowledge displayed on paper.

The amount of study that your correspondent has devoted to the subject merely shows that there does not exist in this case the only excuse for completing an ancient building according to its original intention,—namely, the fact that the actual design has been preserved.

Cologne Cathedral is a rare instance of this, and the public are always informed of the fact by the guides to that magnificent, but comparatively uninteresting, building.

The instance of Westminster Abbey, quoted by your correspondent, most clearly hears out my argument.

First, we read that there was a Saxon church.

Then that Edward the Confessor wanted a better one, "Monasterium est dirutum ut surgeret nobilius" (Scott's "Gleanings," p. 67), and that he built it in the *then modern style*.

Then that Henry III. wanted a better church still than the Confessor's, although that must have been a peculiarly sacred one: so he started it by building that most beautiful choir and chevet, to which the well-known words might be adapted, "the glory of England and the shame of the rest of the world": and we see that it is designed in the *then modern style*.

Then Edward I., who was probably satisfied, as well he might be, with the form and dimensions of this beginning, wanted to extend it, and he did so, using the *then modern details*.

Then Henry V. wanted to rebuild the nave, in doing which nothing was to be gained by altering the above-named form and dimensions, and he did so, using the *then modern details*.

Then Henry VII. wanted a mortuary chapel, and he actually pulled down Henry III.'s lady-chapel (Scott's "Gleanings," p. 53), and built an utterly different one in the *then modern style*.

Then western towers were wanted, and Sir Christopher Wren, who appreciated Gothic work sufficiently to make a harmonious group, proportioned them to the Abbey, using the *then modern details*.

I might add that we want a central *flèche*, and hope that the eminent architect in charge of the Abbey may add one as well proportioned to it as the western towers, and as recognisable in date as the Early Renaissance *flèche* that surmounts the Early Gothic cathedral of Amiens.

So much for the history of the Abbey. Now, your correspondent justifies the present proposal to complete Westminster Hall, according to Richard II.'s design, by comparing the case with Henry V.'s nave of the Abbey. Surely, if the rage for restoration had set in at the time, Henry V. would have pulled down the comparatively recent choir and transept in order to complete Edward the Confessor's design! For the nave of that church then extended, we are told, as far west as the present one, so that he had as much to go upon as we have in Westminster Hall.

On the contrary, he built a new nave suited to his wants, while the Office of Works propose to restore a bygone building for the sake of restored completion. This is what I have ventured to call a fatal mistake.

Your correspondent calls this expression a "generality." It is, to my mind, a fixed principle, and I speak from over twenty years' practical experience of work on old churches, and know that there are several ways of making new work tell its own story, such as the use of distinct forms and details or of different materials, without disturbing the harmony of the entire building. When replacing any missing portion, it is a safe rule to draw a rigid line at the word "probable." For instance, there can be no harm in filling up a shabby gap in an otherwise perfect moulding,—so long as the gap does not tell some valuable story, such as the insertion of a hygone rood-loft,—but, if a feature has disappeared entirely, however probable its former shape may be, it is, to my mind, an architectural "taradiddle" to put the shrewdest guess into stone for the sake of restoration.

No one can deny the evidence of his eyes as to the disappearance of Richard II.'s outbuildings between the flying buttresses of Westminster Hall,—they are, therefore, past "preserving for our study and admiration." Whatever scattered signs and vestiges there may be left of their hygone forms, surely, for us, the first thing to consider is what is now wanted, and to build that, and nothing else, under the direction of the architect in charge of the building, whose eye may be safely trusted to produce no discord from the rest of this noble monument.

Your correspondent, like many other people, shudders at the mere mention of modern architecture, and singles out certain buildings that do not please his taste. There is, alas! no safer way of raising a laugh than by a long string of sparkling abuse of modern buildings and practice. I am sure that such criticism might be directed into nobler channels by seeking out the good points of our art at the present day, and seeing whether these cannot be strung together into a recognisable style. A paper on this subject might be profitably discussed at the Institute, but that the numerous diagrams necessary for illustrating it might never travel further than the pages of the Proceedings, and their usefulness be thus limited.

If I may be allowed to speak of one so much my senior as Mr. Butterfield, I would say that there is no actual precedent for most of his work, which commands our admiration for its fearless originality, and free use of modern improvements; and yet I believe that no man has a deeper respect for old work and for every link in its history.

It is this very respect that should prevent us from forging,—in either sense,—Mediæval links at the present day, when it is impossible and undesirable to Mediævalise ourselves as well, in order to complete the completion of such buildings as the Tower of London and Westminster Hall. Modern appliances must surround these sham antiquities, and one is tempted to reverse the picture and to imagine a real Mediæval soldier or citizen waking up, after a sleep of centuries, to find himself confronted, in one of these restored buildings, with all the surroundings of modern life,—a subject ludicrous enough for one of Mr. Gilbert's plays or of M. du Maurier's drawings in *Punch*.

In spite of the Society for the Protection of Ancient Buildings, on the one hand, who piteously cry, "Don't alter your churches for more decent worship, but leave them alone for us to sketch and moon over, and treat in other secular ways;" and of the restorers, on the other hand, who say, "Don't pretend to have any architecture of your own, but give us the past over again;" I believe that architecture is alive again, and that common sense will prevail.

I have endeavoured to comprise my views on the subject in this somewhat lengthy letter, in order not to inflict myself again on your readers' patience, but to leave the matter in abler hands for further discussion.

EDWARD J. TARVER.

P.S.—If the Government want a restored completion of Westminster Hall, there must be thousands of taxpayers who don't want to pay for it.

SIR,—Your correspondent, "A Member of the Architectural Association," is trying to set up an analogy between the nave of Westminster Abbey and the proposed work on the west side of Westminster Hall.

The nave of the Abbey was carried westward upon lines already laid down, and differs in all its details from the eastern end. The elevation of each bay, and the section of the building, follows the work to which it is attached, but pretends in no way to be a "restoration." The building was also constructed to be of use. What your correspondent chooses to call the completion of the hall is set forth officially as a "restoration." The spectator is to believe that he sees the building as it may have been in the time of Richard II.

The details are carefully copied from work of the period, and so far as deception can be carried out it is intended that it shall be done.

This is not done for use. The purpose to which the rooms can be assigned is not yet decided.

First make your faithful restoration, and then see what you can use it for.

JONES.

## A SYNDICATE OF TASTE.

SIR,—Two competitions for the sculpture to crown the four pedestals of the approaches to Blackfriars Bridge have already fallen through; three and four and many more may possibly share a similar fate. That the worthy and hospitable citizens of London have some notion that such competitions may possibly be expensive to the competitors is shown by their vote of compensation; nevertheless, they do not seem to be in the slightest degree aware that there can be no possible compensation to a sculptor for the loss of an important commission which has been permitted to be gazetted as awarded to him. There is generally something unsatisfactory in all the attempts to adorn the metropolis with sculpture, for the determination of such matters is generally committed to men who are, practically, unacquainted with art. Would it not be advisable therefore, to institute a Syndicate of Taste, to which all art questions of public import should be referred,—a syndicate composed of professional men, painters, sculptors, and architects,—a recognised public institution whose members should be paid? This syndicate should be held responsible for the selection of the proper kind of design for a purpose, and of the best talent for carrying it out. This syndicate should in all cases, as a first step towards the embellishment of any spot in the metropolis, invite suggestions; for non-professionals are very frequently capable of offering very good ones, and the public should feel that the determining of the right kind of art for any position is a matter of national importance. Besides, the question as to the fit adornment for any position should be talked out and decided before "taking thought" as to the selection of the artist for carrying out the work. The three kinds of memorial upon which the changes are commonly rung are those of bust, equestrian statue, and statue. Surely there is something more novel to be thought of than that of placing equestrian statues on the four colossal pedestals of Blackfriars Bridge, like four troopers on outpost duty. The four piers present splendid opportunities for the realisation of four grand sculptural compositions,—for four groups of sculpture which should be distinctive features of the great City of London. Ought such opportunities to be thrown away upon commonplace notions?

Should not the profession, as a body, regard the embellishment of four such remarkably prominent positions as a common cause; should

they not combine to determine the right kind of design for such positions, and also co-operate in order to carry out such works to a successful issue?  
W. CAVE THOMAS.

"ARAB ART."

SIR,—I should not ask for space to comment on the article on Arab Art in your last number, [p. 684] dealing with a lecture I lately delivered, had not the writer misunderstood me and been thus led into unconscious error.

I was careful in my lecture to specify that the ceilings of Cairo houses are of wood, not of plaster, and I might have added that the domestic architecture of that city is not to be confused with the mosque architecture in the reckless use of plaster for decoration. I did not urge the introduction of Arab art into England, but the study of its principles. Copies come to no good end. Principles produce results worth the having. I deny, however, the unsuitableness of a Cairo room to modern needs in our climate, as I know two artists, Mr. Frank Dillon and Mr. James Wild, to have built rooms of this kind as working studios.

If your able contributor is content with the houses we are, in his forcible words, compelled to live in, I can only compare him to the old prisoner who, in his release, begged to be returned to his cell in the Bastille. I preach a noble discontent with a domestic art, defended only on the plea of necessity, a plea in art invalid.  
REGINALD STUART POOLE.  
British Museum, November 26, 1884.

"SMELL FROM KITCHENERS."

SIR,—A simple and thoroughly reliable method, which I always adopt, is to fix in the top register plate a short conical pipe, with a cap over, to prevent any soot falling through on to the hot plate, thus:— Mind, this only applies to the kitchen, and assumes all the upstairs rooms to be properly ventilated. Should there be any deficiency in this particular, they would probably draw from the kitchen: hence the smell. Consult your architect.  
ROBT. CRANE.

SIR,—I should imagine from "Kitcheners'" (p. 710, ante) that his house above hasenent line is level of proper ventilation. Consequently, on the landing-door being opened, there is an upward rush of air, bringing with it all the fumes from kitchen, &c. If this is so, nothing done in the kitchen would, of itself, be of any use. The remedy seems to me to be the proper ventilation of the house above hasenent-line, and independently of basement, and then treating the kitchen, &c., locally by providing an exhaust flue or flues, taken into kitchen-flue or elsewhere, as the case will admit. This plan, skillfully carried out, would, I am positive, give satisfaction.

I have seen good effects resulting from hoods fixed as suggested, but with the addition of a valve for preventing back-draught; but I think kitchens can be ventilated better without them, and they are so ugly. Hoods are very well for fried-fish shops, where the process of cooking is confined to a place immediately under them; but in kitchens one as often sees steaming vessels on the various tables and sideboards as on or near the stove itself.  
J. KEMSLEY.

SIR,—"Kitcheners" asks for a remedy to prevent the smell of cooking finding its way all over the house. I have had many years' varied experience in such matters, but have not yet come into possession of a panacea; for I have generally found it necessary to take the diagnosis of each case, and treat it accordingly.

Now I will suggest that your correspondent first turns his attention to the kitchen chimney. Is there a thorough good draught? It may be that the chimney is not high enough, or is not of sufficient capacity all through.

Let him have two conical ventilators fixed in the register over the kitchen leading into the chimney. The bottoms of each should be about 12 in. or 14 in. in diameter, and fixed flush to the register. The tops should project into the chimney about 12 in. or 14 in., and should be about 3 in. in diameter, with an arrangement for closing when desired. Also see that the ovens are ventilated into the flue.

The kitchen should have an inlet and outlet ventilator; also place an inlet for fresh air in the hall, and so prevent the staircase drawing its air from the kitchen.  
W. DUNKIN.

WALLING.

SIR,—Will any of the readers of the *Builder* kindly inform me if there is such a work published as a history of walling, say from the time of mud or adobe construction to the latest in concrete or terra cotta?  
FRANK WEST.

BIRMINGHAM ART-GALLERY.

SIR,—I see in a paragraph published in your last issue (p. 708), your readers are informed that I have executed the large group over the portico at our new Art Gallery here. The mistake probably arose from the fact that all the other carvings on the exterior of the building were entrusted to me. The group referred to is by Mr. Williamson, of Esher, and I take the present opportunity of congratulating him upon having produced one of the best examples of architectural sculpture we have seen lately.  
JOHN RODDIS.

BOMBAY MUNICIPAL BUILDINGS.

SIR,—Will you do me the favour of permitting me to acknowledge through you the receipt of the following competitive designs for the new Bombay Municipal Buildings:—  
*Motto or Device.*

1. Kohnoor (A).
2. A thing of beauty is a joy for ever.
3. Drawing-pen.
4. Corinthian grace to nought gives place.
5. Andaeos Fortuna juvat.
6. Queen-Empress.
7. Where gloam and gloom their magic spell combine.
8. Chiban.
9. Ferieo tego.
10. Stet Fortuna Domus.
11. X in a circle.
12. Kohnoor (B).
13. Bell's-ears.
14. Pervoverando vinces.
15. R in a circle.
16. Ritaly.

E. C. K. OLLIVANT,  
Municipal Commissioner.

Bombay, Nov. 6.

CAPE TOWN DRAINAGE COMPETITION.

SIR,—Many indignant letters have appeared in the English and Cape Town papers from English competitors respecting a recent award by the Town Council of Cape Town *in re* the sewerage and drainage of Cape Town, and as there has appeared no reply to these letters by those who have been accused of mal-decision, I trust you will keep open the question.

On calling for plans of the proposed sewerage of the city, certain rules were laid down for the guidance of the competitors, and every competitor, with the exception of the person who obtained the prize, acted on these instructions; the award was made to the one who disobeyed the conveyed intimations.

This man, previously unknown here, had been appointed clerk of works at a new reservoir, where, under the instructions of the engineer, he was then employed.

The committee to whom the plans were referred were Mr. J. G. Gamble, Hydraulic Engineer for the Colony; Mr. Wood, engineer sent out by Mr. Eaton, hydraulic engineer, or recommended by him as engineer for reconstructing the Molteno Reservoir; and Mr. Cairncross, the City Engineer.

Of course, a storm was immediately raised, when the Town Council, in their immaculate wisdom, consented the award of the referee as final, and paid the money, although earned by disobeying the instructions issued through the City Engineer.

The Medical Board met and condemned the plan, but the money was paid, and the Town Council gave no sign.  
A CIVIL ENGINEER.

COMPETITIONS.

*United Methodist Free Church, Headingley.*—The building committee of this church have, after a limited competition, selected the designs of Mr. W. S. Braithwaite, architect, South Parade, Leeds, for the proposed new chapel to be built in Victoria-road, Headingley. Sitting accommodation is provided for 600. The estimated cost is about 3,000.

*Vicarage, York-road, Leeds.*—In a recent competition for St. Alban's New Vicarage, York-road, Leeds, the plans of Mr. W. S. Braithwaite, architect, have been accepted. The cost is to be 1,250l.

**Door-lock Furniture and a New Sash-Fastener.**—Messrs. Jelley, Son, & Jones, manufacturing ironmongers, of Blackfriars-road, are introducing to the notice of builders Jones & Cunningham's patent self-adjusting door-lock furniture, which embodies a very excellent though simple improvement. It can be adjusted to any thickness of door, being provided with a toothed spindle into which a rocking lever is pushed and secured by a sliding rose. Jones & Cunningham's patent guarded-lever sash-fastener is provided on the hook-plate with a slide or shield for the protection of the arm or bar of the fastening.

HER MAJESTY'S THEATRE,  
HAYMARKET.

THE owners of the above theatre were summoned under 41 & 42 Vict., c. 32, s. 11, by the Metropolitan Board of Works, for not complying with requisitions served upon them by the Board to remedy certain alleged structural defects in the building, so as to prevent danger from fire resulting to the public frequenting the same.

Mr. Besley, instructed by Mr. Thomas Burton, appeared for the Board; and Mr. Pollard for Mr. Tod-Healy, the present owner.

Mr. Besley having stated the case for the Board, Mr. Pollard raised a preliminary objection that the theatre was the property of the Crown, and, therefore, the consent of the Commissioners of her Majesty's Woods and Forests should have been obtained before these proceedings were commenced.

Under these circumstances, the magistrate adjourned the summons until the 15th of December, expressing a hope that in the meantime the parties would come to an arrangement to get the works done.

WOODEN BUILDINGS.  
KNIGHTLEY v. SMITH.

THIS case, under the Metropolis Management and Building Acts (Amendment) Act, 1884, s. 45, Vic., c. 14, sec. 13, was heard at the Hammersmith Police court, on the 21st inst., before Mr. Paget.

Defendant, who is a coal agent, had caused to be erected a movable wooden office on surplus land in Uxbridge-road, Shepherd's-bush, adjoining the Hammersmith and City Railway, without a license in writing from the Metropolitan Board of Works, whereby a penalty not exceeding 5l. had been incurred.

The plaintiff (the District Surveyor for Hammersmith) did not press for a penalty, his desire being merely to enforce obedience to an Act which about two years since the Board obtained with a view to the suppression of wooden buildings.

The Magistrate concurred in this view, and there being no defence, fined the defendant in a nominal penalty and costs. The defendant then undertook to apply to the Metropolitan Board of Works for the necessary licence.

Mr. Haynes appeared for the defendant.

OWNERSHIP OF PLANS.

GOODING v. EALING LOCAL BOARD.

THIS was an action brought by Mr. J. B. Gooding, residing at Ealing, against the Ealing Local Board, to compel the return to the plaintiff of certain plans and sections relating to a proposed new building, which had been sent in by him to the Local Board for approval, under their by-laws.

The plans, not being in accordance with the by-laws, were disapproved by the Board. Plaintiff then applied to them for the return of the plans. This was refused; hence the present action.

The case was tried on the 13th inst. in the Queen's Bench Division, before Mr. Justice Mathew, without a jury, and resulted in a verdict for the defendants, with costs.

The Judge was of opinion that the regulation on the back of the building notice signed by the plaintiff, viz., that "all plans will be retained in the surveyor's office for record" was a just and reasonable one, inasmuch as he considered that all plans, whether approved or disapproved, might be required by the Board as documentary evidence.

**Suggested City Improvements.**—Mr. A. B. Hudson, writing to the *City Press*, says:—The proposed extension of the Post-Office Savings Bank on land situated on the north side of Knight-riding-street, extending to Carter-lane, and from Adde-hill on the west, to Bell-court on the east,—for which the Parliamentary notices for the necessary powers to acquire the land are now before the public,—suggests the opportunity of carrying out an important improvement, which could be undertaken by a confined arrangement between the Commissioners of Sewers, the Postmaster-General, and Messrs. Pawson & Co. (Limited). The outline of the scheme is as follows:—To extend the compulsory powers so as to embrace the whole block of buildings within the area of the four streets, viz., Carter-lane, on the north; Knight-riding-street, on the south; Godliman-street, on the east; and Adde-hill, on the west. These four streets could then be widened to the extent considered advisable by the Commissioners of Sewers. The Commissioners also to acquire part of the premises of Messrs. Pawson, next to Paul's-chain, so as to widen that important thoroughfare. The widening of Paul's-chain would prove a great improvement; the too close proximity of the present warehouses would be remedied; the spread of a conflagration would be cut off, should a fire occur on either side of the street; and an improved view of St. Paul's from this side would be opened up.

## The Student's Column.

## IRON ROOFS.—I.

**T**HE introduction of iron as the material for the framework of modern roofs has enabled the architect to construct them of spans that make even that of Westminster Hall appear insignificant, the span of which is hardly one-third of the iron roof over the New-street Station at Birmingham, and little more than one-fourth of that over the Midland Station in London. Its use, however, has only been gradually adopted for roofs, owing to the supposed dangers arising from the expansion and contraction of the metal by changes of temperature, since a bar of iron 100 ft. long will expand nearly  $1\frac{1}{2}$  in. while the temperature rises from the freezing to the boiling-point of water, and will contract the same amount as the temperature falls again. Expedients have, however, been devised and adopted of preventing the mass of ironwork which forms the framework of these roofs from having any dangerous effect on the supports consequent on a rise or fall of the temperature.

As iron was first used for constructive purposes in the form of castings, it was natural that cast iron should be employed for the earlier iron roofs. Thus we find a roof of this material erected about fifty years ago, over the model-room at the Butterley Ironworks, the span of which was 34 ft. The framework of this roof consisted of cast-iron principals in the form of a curb roof, the arrangement of the parts resembling that of a queen-post roof of wood. The principal frame was cast in four parts, screwed together by strong bolts, with a horizontal bar of wrought iron going from foot to foot, which appears to be quite unnecessary, as the framework was supported on a horizontal cast-iron girder. Details of this roof will be found in Tredgold's "Carpentry" (Appendix to 3rd edition). The purlins which carry the common rafters are fixed in sockets cast on the framework. Another roof of 40 ft. span, erected over the Smithery at Butterley (also illustrated in Tredgold), is constructed on the king-truss principle, the parts under compression being of cast iron, and those in tension of wrought iron; the principals are of cast iron of the "fish-belly" form, supported by two cast-iron struts on each side; the wrought-iron tie-rod is held up in the middle by a king-bolt passing through the heads of the principals, and there are two other vertical bolts, one on each side, passing through each principal at one-third its length from the vertex, the lower end passing through the foot of the lower strut, and also the tie-rod. The struts have a cross section, and the principals a T-section, the cast-iron purlins are L-section, and the timber rafters are spiked to them. In the same work will be found an illustration of a queen-post roof of cast-iron, with a span of 27 ft., erected at the Nottingham waterworks; the principal, queen, and strut are cast in one piece for each side, and are connected by a hinged joint, with a horizontal straining-beam; while a horizontal wrought-iron tie-rod passes through the feet of the principals, and also those of the queens. The principals are of T-section, and the other parts of cross-section.

The use of cast iron in framing roofs has of late years been discontinued, except sometimes for struts which sustain a compressive strain; all the other parts being made of rolled iron, either round, flat, or of L, T, or I section. The Mansard roofs of the Houses of Parliament were constructed with flat wrought-iron horizontal tie-bars and vertical tension-rods; the principals are of T-section; the struts are cast-iron of cross-section. Cast iron was also used for the purlins, and for the sockets and shoes by which the ends of the pieces were held together. Cast-iron tiles were used for the covering; these were of  $\frac{3}{4}$ -in. metal and galvanised to prevent corrosion, and were bolted to the rafters. No timber is used in any part of these roofs, which are wholly of iron.

In roofs of iron it is not necessary that the tie-beam should be horizontal, as in trusses of timber, unless it is required to carry a ceiling or floor; and where extra height is required, as in a railway station or workshop, the tie is made to slant upwards from the supports, so as to increase the clear height in the middle. A common form of roof for spans up to 50 ft. is shown by fig. 1, where the principals A B, A D, are usually of rolled T-iron, the ties B F, F E, E D, A F, and A E, of flat or round iron, as being

mainly subjected to tensile strain in the direction of their lengths. The struts C F, E G, being under compression, are sometimes made of cast iron, either round and hollow, or of T section, and made with a swell in the middle. If wrought iron is used for the struts it is of L or T section.

Upon examination, it will be seen that this roof consists apparently of two trusses similar in form to a king-post truss, only inverted; thus A F B C and A E D G appear each to be a king-truss, having, in the former case, A F, F B for the rafters, A B for the tie-rod, and C F for the strut. But in this roof the struts to which these parts would be subjected in a king-truss are reversed, as A F, B F, and A B are stretched instead of being compressed, while C F is compressed instead of being stretched. Each of them, however, forms a complete truss as it stands, and the two are united by the horizontal bar EF, which prevents any horizontal thrust on the walls.

For wider spans a similar form of roof may be employed, but with a larger number of struts and ties, as shown by fig. 2, where G H and D I

are struts under compression, and C H and C I are tension rods. The bending of the tie-rod E F may be prevented by a light king-bolt, A K, passing through the head of the rafters and bolted under the tie at K.

A variety of the same kind of roof is shown by fig. 3, where the tie-rod is in five distinct

parts, coupled together at E, F, G; the struts C E, D F, G H are under compression, while A F, A G, and D E act as ties.

In a roof of either of these forms the scantlings for a span of 50 ft. may be as follows:—Principals of  $\frac{3}{4}$ -in. T-iron 4 in. deep by 4 in. wide; struts of hollow tubing, D F being 2 in. diameter, and C E  $1\frac{1}{2}$  in. diameter, or else of  $\frac{3}{4}$ -in. L-iron, 3 in. by 2 in., and 2 in. by 2 in. respectively; the tie-rods A F and D E of  $\frac{3}{4}$  in. round iron, or  $\frac{1}{2}$  in. flat iron 1 in. wide; the tie-bars B E, E F, F C of  $1\frac{1}{2}$  in. round iron or  $\frac{3}{4}$  in. flat iron 2 in. deep. The feet of the rafters are made to rest in cast-iron sockets fixed to the wall or other support, and the tie-rod is attached to the feet of the rafters by the end being flattened out and held by key wedges between two plates bolted on the sides of the rafters. The ends of all the ties should be screwed into a union or socket-piece, so that they can be tightened up as much as may be required in order to give stiffness to the truss. The purlins are usually of L or T iron, the size of which will depend on the distance apart of the trusses, if 10 ft. apart the purlins may be about 4 in. by 3 in., and of  $\frac{3}{4}$ -in. or  $\frac{1}{2}$ -in. metal.

The strains on the parts of these roofs can be ascertained by means of a diagram, as before described for king-post roofs of timber (see page 677). In fig. 4, let the vertical line A C represent, on any scale, the pressure, W, on one side of the truss shown by fig. 1; take A B for the pressure at B (fig. 1), which we may suppose to be one-

fourth of W; take B D equal to half W, or the pressure at C (fig. 1); draw B b, D d, parallel to A B (fig. 1), C b parallel to B F, b d parallel to C F, d c parallel to E F, and C c parallel to A F. Then the lines in fig. 4 will represent on scale the strains to which each of the parts of the truss to which they are parallel will be subjected in the direction of their lengths. Thus B b is the compression down B C in the truss, and D d that down A C; b d is the compression down the strut, C F; C b is the tensile strain in B F, C c that in A F, and c d that in E F. Therefore, by means of the known rules for the strength of materials the scantling of each piece can be determined.

We will suppose, for example, that a roof of the design shown by fig. 1 has a span of 30 ft., and a pitch of  $30^\circ$ , the distance apart of the trusses being 10 ft. Then the length of the rafter will be  $17\frac{1}{2}$  ft., and if the load to be supported is put at 40 lb. per square foot, we have 400 multiplied by  $17\frac{1}{2}$ , or 6,932 lb. for the value of W, which we take approximately as 60 cwt. Then the load at A is 30 cwt.; that at B and A, 15 cwt. each, for one rafter. Tako A C (fig. 4)

to represent 60 on any scale, A B to be 15, and B D to be 30, then we shall find by measurement that B b is 163, D d is 150, C b 147, C c is 86, c d is 67, and b d is 26, all these numbers representing in hundred-weights the strains along the several parts of the truss (fig. 1) to which these lines are parallel.

Allowing 5 tons, or 100 cwt., per square inch as the utmost tensile strain to which wrought iron should be subjected in a truss, we see that the tension rod, B F, which is strained with 147 cwt., must have a sectional area of nearly  $1\frac{1}{4}$  square inch, while the tie A F, which is strained with only 86 cwt., need not be more than  $\frac{1}{2}$  square inch of section, and the tie E F, being strained with 67 cwt. will only require to be  $\frac{3}{4}$  in. in section. The rafter, B C, may be considered as a long pillar sustaining a load of 163 cwt. in the direction of its length, and will require a sectional area of 4 square inches; the strut C F is also a pillar sustaining a load of 26 cwt., and will require a sectional area of  $1\frac{1}{2}$  in.

In order to allow for the expansion and contraction which takes place in iron roofs of large span, the feet of the rafters are secured to a cast-iron shoe, which is placed upon iron rollers, so that it can move freely on a cast-iron template laid on the wall. By this arrangement, full play is allowed to the truss, and no injurious thrust is brought on the supports when the iron expands by rise of temperature.

We have all along considered the load as acting vertically on the truss, but there are occasions when it may be strained by an oblique force, as in the case of a gale blowing strongly on one side of the roof, in which case some of the tension bars in the roof, fig. 2, may be temporarily subjected to a compressive strain. Thus, if the rafter A B yielded at all at C it would tend to thrust along the tie-rod F E, and if this bent upwards it would produce a compression in the bolt A K. A certain amount of compression would also be produced from the same cause in the tension rods C H and C I. The several parts must, therefore, be made of sufficient strength to prevent them from yielding under a temporary alteration of strains, for a long rod of iron that would bear a heavy tensile strain will lend under a very moderate amount of compression.

**Enfield, Middlesex.**—The memorial stone of a Mission Hall, situate at New Lane, Enfield, was laid on Tuesday afternoon by Mr. J. Holborn, J.P., chairman of the Congregational Union. The architect is Mr. W. D. Church, of South-place, Finsbury, and the builder is Mr. E. Tinson, of Kensington.

RECENT PATENTS. ABSTRACTS OF SPECIFICATIONS.

298, Improved Apparatus for Opening and Closing Casements and Ventilators. J. Bruce. For all casements and for the louvres of ventilators. The improvement consists in attaching to the frame a metal bracket-piece carrying a rotating bar, with a screw thread, upon which travels a block with a guiding piece working on a slot along the bracket to one end of the rotating-bar is attached a pulley, so that by the action of an ordinary blind coal over the pulley the bar is rotated, and the block is caused to travel up the rod. A lug upon the block-piece works on a slot upon a plate attached to the casement or ventilator, so that the travelling of the block up or down causes the casement or ventilator to open or shut. Thus the casement is always locked whether open or closed.

1,504, Cements. F. W. Gerhard. Near Wolverhampton there is found a compound locally known as "rotch," "hat," or "bovin," an impure silicate of alumina and lime, comparatively inexhaustible, which has hitherto not been utilised. It is deficient in the necessary quantity of lime; but by adding twice its weight or thereabouts of di-carbonate of lime, and burned with the hat, either separately or together, it forms, when reduced to powder and mixed, an excellent cement. Black lime, which is found in a lower stratum, is also treated so as to be available for cement.

512, Improved Polish for Furniture or other Articles of Wood, Brass, &c. E. A. Russell. This consists in the combination of vinegar, methylated spirit, and lincsed oil, to which is added a small quantity of the aniline dye, known as Bismarck brown. These ingredients, when combined in suitable proportions, give not only a polish for furniture, &c., but will extract ink and other stains from the articles on which it is used.

351, Improvements in Brick Kilns. H. Knowles.

These improvements are applied to continuous or semi-continuous action kilns for drying and burning bricks. It applies to down-draught kilns, and gives the burner more effectual control over the working of the kilns in transmitting the waste or surplus heat from one chamber to another. It also secures greater economy in fuel and labour and consumption of smoke by passing the products of combustion from chamber to chamber in as direct a manner as possible. It also provides for effectually closing the connection between the chambers when necessary. The chambers are separated from each other by an improved partition wall, at the bottom of which on one side are constructed fire openings, which lead into damp chambers. The dampers are worked from outside the kiln, and the flues closed when necessary. A series of openings or perforations lead the heat into a next chamber, where goods on each side are heated by radiation and diffusion of heat. Great economy is claimed, and the smoke, especially when burning the best class of goods, is thoroughly consumed.

APPLICATIONS FOR LETTERS PATENT.

Nov. 14.—14,989, R. L. Love, Cement or Composition for Laying Floors or Pavements.—14,997, W. H. Burdock, Glazing Skylights, Horticultural Buildings, &c.—15,014, J. Thompson and J. H. Bryant, Improved Artificial Stone.—15,019, W. Stewart, Stone-cutting Apparatus.—15,037, R. Anderson, Improvements in Fishing Apparatus.—15,042, A. Waters, Hot-water Pipes for Heating Buildings.—15,047, W. Macrone, Machinery for Varnishing or Staining Paper preparatory to Decoration.—15,048, W. Macrone, Varnishes and Sizes.—15,063, A. Emanuel, Cleansing Pipe to Overflow of Water-closet Basins.—15,070, S. S. Phillips and H. P. Green, Water closets.—15,071, D. Tennant, Drain pipe Trap.—15,077, J. Halley, Public Urinal.

Nov. 17.—15,086, J. Inshaw, Domestic Fireplaces.—15,088, E. Jones and J. Calcott, Cheeks for Register Stoves.—15,090, W. Fullelove, Improved Heating Stove.—15,095, A. Larwood, Safety Valve for Doors.—15,115, J. W. Howard and J. L. Howard, Manufacture of Cut Nails.

Nov. 18.—15,124, T. Pickles and B. Blakey, New Process for Treating Timber.—15,157, A. H. Kendall, Disconnecting Soil-pipes from Sewers, and Ventilating same.—15,161 and 15,162, W. S. Morton, Embossing Convex for Roofing Walls, &c.—15,188, C. Wiltshire and J. Wiltshire, Glazing Skylights, Windows, &c.

Nov. 19.—15,192, W. Russell, Over-mantels and other Ornamental Frames.—15,193, W. Wright, Heating Apparatus for Mansions.—15,197, E. W. Turner and J. Reynolds, Circular Rack and Band Machine for Sawing Timber.—15,200, J. Matthews, Electric Hinges and Beads.—15,204, W. Chynoweth, Stop Chamber, and other Planes.—15,228, H. A. Stuart, Ratchet Drills or Braces.—15,262, R. H. Hayhurst, Gully for Sanitary Purposes.—15,265, A. Gerlach and H. Unger, Improvement in Kitcheners.

Nov. 20.—15,266, A. B. Milne, Stay for securing Fire Casements and other Hinged Sashes.—15,285, J. M. Welch, Manufacture of Bricks and Tiles.—15,301, L. Coppard, Improvements in Hang-

ing Sashes.—15,314, J. C. Spooner and P. S. Spooner, Apparatus for Supplying Water Cisterns with Disinfectants.

PROVISIONAL SPECIFICATIONS ACCEPTED.

10,164, S. Bivort, a New Method of Flooring.—12,757, W. Corbett, Opening and Closing Windows.—13,122, B. Harnrup, Grates and Kitcheners.—13,817, F. W. Turner, Flushing Tanks or Cisterns.—13,891, W. Elkin and C. J. Elkin, Improvements in Ventilators.—14,036, F. C. Cramer, Manufacture of Glua.—14,196, F. W. Rees, Ball Castors.—14,324, R. M. Justice, Furnaces for Burning Cement.—14,365, W. Dawson, Mills for Reducing Cement, &c.—14,040, J. Gilmour, Ventilating Apparatus.—12,965, W. H. Vivian, Syphon-flushing Cistern.—13,243, E. Sherwood, Manufacturer of Rolled Cathedral Glass.—13,422, A. Caspar, Imitating Stained Glass.—13,864, A. Finch, Preventing Draughts Under Doors.—13,912, C. Smith and F. Smith, Opening and Closing Panlights, Window Skylights, Ventilators, &c.—15,381, A. Yates and W. Smith, Adjusting the Table of Circular-saw Frames.—14,480, H. Gilchrist and C. Bellamy, Gas Pliers.—14,687, W. R. Lake, Regulating the Supply of Fresh Air to Houses.—14,687, G. Messenger and S. T. Messenger, Ventilators and Chimney Cows.—14,863, A. Spencer, Holding Sliding Windows in Closed or more or less Open Positions.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months. 625, E. Norcombe, Lock Furniture.—728, F. Alford, Floating Flushing Valve.—1819, J. Noble, Glazing Street Lamps.—2,000, J. Inmyr, Improved Water Meter.—2,129, W. Bennett, Automatic Flushing Apparatus.—2,404, G. Harrington, Ventilation.—2,650, A. Guattari, Manufacture of Marble.—2,805, H. Renold, Cutting or Turning Tool.—6,375, J. Lamers, Combined Pocket Tools.—10,975, H. Blyth, Manufacture of White Lead.—10,723, H. Tunis, Planing, Tonguing, and Grooving Machine.—12,434, C. Watkins and W. Sutton, Dampster and Ventilator.—13,821, H. Kitchen, Chimney Top and Ventilator.—13,770, T. Easley, Metal Frames for Casement Windows.—2,787, A. Guattari, Manufacture of Marbles.—2,847, A. Guattari, Manufacture of Imitation Marble.—2,920, J. Lorrain, Ventilators.—2,950, W. Fawcett and H. Ashley, Improvements in Fireplaces.—3,056, T. Auld, Chimney Brushes.—13,821, H. Kitchen and Cooking Ranges.—13,875, T. Easley, Metal Frames for Casement Windows.—13,943, E. Clark, Floating Breakwaters.—13,947, W. R. Lake, Metallic Lathing.

RECENT SALES OF PROPERTY.

NOVEMBER 20. By FELLERS, MOON, & FULLER. Corydon—1 to 6, Cairo-cottages, & 6 to 15, Lower Drayton-place, 874 years, ground-rent 40l. .... £2,050 Nos. 1 to 12, Upton-cottages, freehold ..... 1,630 Biddington Corner—Two cottages, 299 years, no ground-rent ..... 425 Two cottages, partly leasehold and freehold ..... 489

NOVEMBER 21. By G. A. WALKINSON. Somers-town—17 and 19, Charrington-street, 38 years, ground-rent 132. 10s. .... 970

By BARRS, VAUGHAN, & JERMINSON. Blackheath—15, Vanbrugh Park, 73 years, ground-rent 10l. .... 1,740

By REYNOLDS & EASON. Blackheath—7, Vanbrugh Park-road, 73 years, ground-rent 12l. 5s. .... 900 Crouch End—1, Crescent-road, 84 years, ground-rent 15l. .... 865

By GREEN & SOO. Vauxhall—Prince's and Clarence Wharfs, 42 years, rent 600l. .... 945 Acton—273, 275, and 277, Uxbridge-road, 78 years, ground-rent 182. 10s. .... 855 Blackheath—1 and 2, Richmond-villas, 82 years, ground-rent 32l. .... 1,920

By BAKER & SON. Rudwick, Sussex—the freehold residence, Hermongers, and 274 acres ..... 12,400 Marylebone—11s and 116, Lisson-grove, freehold. Ground-rent of 34l. a year, reversion in 15 years ..... 3,310 Sutton-at-Home, Kent—A plot of land, 2a, 4r. 7p., freehold ..... 1,210 Finchley—39 plots of freehold land ..... 3,345 Hendon—15 plots of freehold land ..... 620 New southgate—16 plots of freehold land ..... 387

NOVEMBER 24. By W. SIMMONDS. Camberwell—45 and 47, Albany-road, freehold ..... 1,480

By FOX & SON. Dalston—39, Wilton-road, 65 years, ground-rent 5l. 570 Peckham—18, Staines-street, freehold ..... 620 Old Ford—16, Milton-road, 76 years, ground-rent 3l. 10s. .... 235 Nos. 145 and 147, Armagh-road, 65 years, ground-rent 6l. .... 450

NOVEMBER 25. By J. HERRARD. St. Luke's—2, Maclesfield-terrace, freehold ..... 610 Stoke Newington—Church-street, Ivy House, copyhold ..... 500

By S. HERBICK. Marylebone—22, Manchester-street, 31 years, ground-rent 8l. 8s. .... 185 Clerkenwell—30, Abchurch-lane, 25 years, ground-rent 1l. 10s. .... 190

## MEETINGS.

MONDAY, DECEMBER 1.

Royal Institute of British Architects.—Adjourned discussion on Mr. Stannus's paper "On the Internal Treatment of Cupolas in General, and that of St. Paul's Cathedral in particular." 8 p.m.

Clerks of Works Association.—Monthly Meeting at 31, Spring-gardens, 7 p.m.

Society of Arts (Cantor Lectures).—Mr. Harold B. Dixon, M.A., on "The Use of Coal Gas."—I. 8 p.m.

TUESDAY, DECEMBER 2.

Institution of Civil Engineers.—(1) The Hon. R. C. Parsons on "The Working of Tramways by Steam." (2) Mr. W. Shellshear on "The Sydney Steam Tramways." 8 p.m.

Society of Biblical Archaeology. 8 p.m.

WEDNESDAY, DECEMBER 3.

British Archaeological Association.—(1) *Résumé* of the Tenby Congress, by Mr. Thomas Morgan. (2) Mr. C. Lyman on "The Inscription on the Cross at Carew." (3) Mr. G. R. Wright on "The Maudslayi Distribution." 8 p.m.

Sanitary Assurance Association.—Dr. Norman Chevers on "House Sanitation." (Parkes Museum.)

Society of Arts (Howard Lectures).—Mr. W. Anderson on "The Conversion of Heat into Useful Work." II. 8 p.m.

THURSDAY, DECEMBER 4.

Royal Archaeological Institute.—(1) Mr. W. H. St. John Hope "On the Augustinian Priory at Repton." (2) Admiral Fremantle "On the Menhir Autel at Kernuz, Finistère." 4 p.m.

Parkes Museum.—General Meeting of Members to receive Report from the Council." 5 p.m.

Society of Antiquaries.—8.30 p.m.

Society of Arts (Howard Lectures).—Mr. W. Anderson on "The Conversion of Heat into Useful Work." II. 8 p.m.

FRIDAY, DECEMBER 5.

Architectural Association.—Dr. Dresser on "Some Features of Japanese Architecture and Ornament." 7.30 p.m.

Institution of Civil Engineers (Students' Meeting).—Mr. H. H. Dalrymple Hay on "Trigonometrical Surveying." 7.30 p.m.

## Miscellaneous.

## New Buildings in Finsbury Pavement.

Extensive new premises are at present being built by the Finsbury Estates Company, in Finsbury-pavement, at the corner of Cross-street. During the progress of the excavations the original level of the ground surface of old Finsbury Fields was found to be between 13 ft. and 14 ft. below the present surface of the roadway. The new buildings, at the basement level, will cover an area of 13,000 superficial feet, and at the ground-floor level 7,500 ft. The new basement, about 15 ft. in depth, is constructed with massive iron columns, girders, and concrete, and will, together with a suite of offices on the ground and first floors, be occupied by Messrs. Probyn & Co., ale and beer merchants. The buildings will have a frontage to Finsbury-pavement 46 ft. in length, with a return frontage in Cross-street 119 ft. long. The Finsbury-pavement elevation will be 62 ft. high, and will be faced with white Suffolk brick, and Portland and Dumfries stone, with polished Aberdeen granite for window dressings and ornamentation. At the corner of Finsbury-pavement and Cross-street the buildings will be surmounted by a lofty gable. The Cross-street frontage will be 52 ft. in height, and, like that in Finsbury-pavement, faced with white Suffolk brick and Portland and Dumfries stone. All the upper floors are intended to be arranged in suites of offices and chambers. Mr. J. W. Brooker, of Railway Approach, London Bridge, is the architect, and Mr. W. Downs, of Hampton-street, Walworth, the builder, whose contract amounts to 14,967*l*. Mr. W. W. Game is foreman of the works.

**The Nail Trade.**—In consequence of the heavy and differential charges, &c., made by the railway companies coming to Birmingham some of its prosperous trades are leaving the town. It was pointed out in the *Builder* some time ago that there had been an amalgamation of the wrought nail-makers, and that they had removed their works to Chestow, on the sea-coast. Now we find the wire and wire nail trade following suit, and removing out of the country altogether to Belgium and Germany. These nails appear to be superseding cut nails everywhere amongst builders.

**Builders' Benevolent Institution.**—At a general meeting of this Institution, held on Thursday afternoon at Willis's Rooms, Mr. Stanley G. Bird, president, in the chair, five pensioners were elected,—four men and one woman. There were nine male candidates, viz., William Humphrey, of Barnes, aged 66 (fourth application); Matthew Harrison, of Exeter-street, Lisson-grove, aged 74 (third application); John Richmond Bisley, of Lynton-road, Bermondsey, aged 74 (second application); George Shearug, of Ingatestone, aged 65 (second application); Renhen Hurren, of Dartmoor-street, Notting-hill, aged 66 (second application); William Charles Allen, of Kilmour Park-road, aged 61 (second application); William Hutton, of Harewood-place, Marylebone, aged 63; James Robert Rawley, of Downham-road, Kingsland, aged 64; and William Thornton, of St. John's-hill, Wandsworth, aged 62. The female candidate was Harriet Shapland, aged 66, widow of James Shapland, late of York-road, Lambeth. The poll opened at two p.m. and closed at four p.m. Shortly after the last-named hour the scrutineers (Messrs. Thomas Stirling and Thomas F. Rider) declared the result of the voting to be as follows, viz., Humphrey, 835 votes; Harrison (dead since the voting papers were issued), 248; Bisley, 183; Shearug, 1,313; Hurren, 403; Allen, 1,426; Hutton, 1,036; Rawley, 356; Thornton, 94; and Shapland, 103. The chairman therefore declared the successful candidates to be Messrs. Allen, Shearug, Hutton, and Humphrey, and Mrs. Shapland,—Messrs. Shearug and Allen owing their election to a great extent to votes allotted to them in respect of their having been formerly subscribers to the Institution.

**Trial of Steam Fire-Engines.**—During the past week a trial has taken place at Messrs. Merryweather & Sons' works of what are described as "two of the most powerful steam fire-engines in the world." They have been constructed for the Corporation of Liverpool. Capt. Nott Bower (chief constable of Liverpool) visited the works when the new engines were displayed. Steam was raised in the boiler of No. 1 engine (which indicates 100 horse-power) in nine minutes and a half, and the steamer was tested for its fire-extinguishing powers. A jet being capable of working twelve streams simultaneously. At the same works trial has also been made of one of the fifteen steam tramway locomotives now being constructed for the North London tramways. These engines have cylinders 7½ in. diameter, and 12-in. stroke, and it is stated that each is capable of drawing three loaded cars at a speed of eight miles per hour, at a working cost of 80 per cent. less than these engines will be running in the course of the next two months.

**The Sanitary Condition of the East End.**—At the meeting of the Whitechapel District Board of Works last week, it was moved by Colonel Munro, seconded by Mr. Catmur, and resolved, that a small committee be appointed by the Board to consider the charges made by the Jewish Board of Guardians against the sanitary administration of the district, and to investigate the whole circumstances; and that the committee be empowered to employ such assistance as in their opinion may be necessary to prosecute their inquiry. In the course of the discussion, Mr. Harris urged the appointment of two more sanitary inspectors as the most efficacious way of meeting the complaints. Mr. Barham said that although that might be one of the results of the committee's investigations, it was only a part of the question, and did not dispense with the necessity for investigation. Mr. Struthers did not see how the appointment of two more sanitary inspectors could alter the superstructure of the houses complained of.

**The Uses of Coal-Gas.**—A course of three Cantor Lectures, on "The Uses of Coal-Gas," will be delivered at the Society of Arts, by Mr. Harold B. Dixon, M.A., on December 1st, 8th, and 15th. The subject of the first lecture will be on "The Composition of Coal-Gas, its Properties, its Combustion;" the second, "Coal-Gas as a source of Light;" and the third, "Coal-Gas as a source of Heat."

**Working Class Thrift in New South Wales.**—During 1883 the number of deposits in the Post Office Savings Banks was 147,627, representing £922,503. This is exclusive of the large sums deposited in other Savings Banks, or invested in Land or Building Societies.

**Housing the Poor.**—The principal facts that have been elicited after all that has been written and said on this subject, may be thus summarised:—1. That the poor of the labouring class, out of their limited resources, cannot afford to pay more than a rental of from 1*s*. to 2*s*. per week for their dwellings, of whatever size and construction, and wheresoever situated. 2. That no practical plan has yet been devised by which dwellings can be built, which, after paying a fair market price for land, labour, and material, can be let at these low rentals, and prove remunerative to the builders. 3. If this desirable end is to be accomplished, it must depend to some extent on philanthropic aid, either from Government, corporate authorities, or private individuals. 4. The most efficient aid that the Government can give is to grant loans at a low rate of interest,—say 2½ per cent.—to companies who erect dwellings at a low rent for the *bona-fide* poor, the repayment of such loans to extend over a longer period than is now the custom (thirty years). 5. That it shall be incumbent on corporate authorities, as the appointed guardians of the public health, where the want of proper dwellings for the poor is shown to exist, to provide sites for the erection of such dwellings; and, in order to encourage such erection, to grant a reduction of rates, or afford such other aid as may enable the promoters to secure a satisfactory return. 6. That the sanitary officers should take more vigorous action under the powers already conferred upon them to improve the condition of existing dwellings and the removal of nuisances, whether caused by bad tenants, or the neglect of unscrupulous landlords, care being taken to reach the real offenders.—*Sanitary Record.*

**Railway Progress in Australia.**—From the *Melbourne Argus* we learn particulars of the scheme of railways proposed in the Bill before the Legislature, for providing the colony with about 900 miles of new lines. When the Bill for raising a loan for the purpose was introduced in 1882 a sum of 2,700,000*l*. was set apart as sufficient to meet their cost. It appears, however, that that sum has disappeared without one inch of the lines in question having been constructed. But now it is said that a sum of no less than 7,700,000*l*. will have been expended before the lines proposed in 1882 are constructed. Such varying estimates, it is added, amount to trifling with the public, and their inevitable tendency is to discredit the railway cause. "Worthless political estimates" are considered to be the secret of the evil. Surely there must exist some remedy against such an evil if those in authority would only seek for it.

**Messrs. Jones & Willis,** the well-known art metal workers and church furnishers, have recently had erected for them new business premises in Edmund-street, Birmingham, from the designs of Mr. Phipson, architect, of Birmingham. The elevation is of a Gothic character, and is chiefly remarkable for having above the shop story an oriel window of two splay only, meeting in a central angle. The effect is, for a central window, somewhat thin and weak. The land on which their old premises stands in Temple-row has been taken by the managers of the Conservative Club on which to erect a new clubhouse. Some eight architects were invited to send in designs in competition, to which six responded, and those of one gentleman were selected. On these being exhibited to the members so much dissatisfaction was expressed, that a general meeting of members was called, when both plans and site were condemned, and the building committee are reported to have resigned in a body.

**Wandle Valley Main Drainage.**—We may mention that these works, to which we referred in a recent "Note," were carried out under Mr. Baldwin Latham, C.E., for the Croydon Rural Sanitary Authority. Nearly ninety miles of pipes, &c., have been used, supplied by Messrs. Donlon & Co., and about two miles of concrete tubes, supplied by Messrs. Sharp, Jones, & Co. Bricks by the Aylesford Pottery Co. The whole of the manhole-tops, valves, sluices, &c., have been supplied by Messrs. Stone & Co. The works were constructed by Messrs. B. Cooke & Co., of Battersea, whose contract amounted to about 110,000*l*., this sum including the whole of the house connections, which were constructed under the local surveyor, Mr. R. M. Chart. The resident engineer was Mr. Wm. Santo Crimp, C.E., F.G.S., Surveyor of Wimbledon; and the clerks of works, Messrs. Snook, Wren, & Brown; the contractor's representative being Mr. T. Wilkinson.

**New Workhouse Buildings at Shore-ditch.**—Extensive additions have just been made to the workhouse at Shore-ditch, and the new buildings are intended to be opened for the reception of inmates in the course of next month. They are situated in Reeve-place, contiguous to the present workhouse buildings, and occupy a ground area of nearly 9,000 superficial feet. They consist of three separate blocks, one block being for able-bodied inmates, male and female; another block is for children; and the third block for casuals. The several blocks are all in picked stock brick, with red Farnham bricks for dressings. The principal block is that for able-bodied paupers. It covers an area of 3,120 ft., and is 70 ft. in length, the front elevation being surmounted by a central pediment, rising to a height of about 80 ft. It contains four floors, in addition to a basement devoted to work-rooms. The ground-floor contains day-rooms. All the upper floors are arranged as dormitories. This block has accommodation for 150 inmates, seventy-five males and seventy-five females. The children's block occupies an area of about 1,200 ft., in addition to which there is a recreation space of 800 ft. The casual ward block covers an area of 3,000 ft. The casual wards are built on the cellular principle. Messrs. Lee & Smith, of Queen Victoria-street, are the architects, and Mr. T. Boyce, of the Eagle Works, Hackney, is the contractor. Mr. Birtchnell is clerk of the works. The cost of the buildings is 20,000l.

**Sanitary Assurance Association.**—The first of a series of lectures on sanitary subjects was given on Wednesday evening last, at the Parkes Museum, Margaret-street, W., when Mr. Henry Rutherford, barrister-at-law, lectured on "Sanitary Assurance, from a Householder's Point of View." Dr. R. Farquharson, M.P., presided. Mr. Rutherford began his lecture with an allusion to the apathetic attitude of a large portion of the public in regard to sanitation. He spoke of the absence of efficient sanitary arrangements in large houses as well as in smaller dwellings, and referred to his own experience as a householder who had sought the advice of the Sanitary Assurance Association, which led to his ascertaining the fact that instead of the drain from his house going into the main sewer as he had imagined, it ran in an opposite direction and discharged itself into his neighbour's garden; and further, that the drain was not in any way disconnected from the house. In speaking of the Association, he said that sanitation had become a science in itself, only to be mastered by special study and actual experience. He did not recommend the compulsory inspection of dwellings; the intrusion into our houses of officials who merely came to see if any evils existed, was a form of paternal government which we were not as yet disposed to encourage. At the same time, he suggested that every house ought to possess a sanitary certificate, obtained from a properly-qualified person.

**An Improvement in Stoves.**—According to a correspondent, a Birmingham engineer has recently patented an arrangement by which a greatly-improved result may be obtained in our parlour stoves. In the case of one with a semicircular arched front, and a fire-brick back, but no register, he makes a narrow cast-iron frame to fit over the fire around the back and across the front, and tilted to an angle, say of 30 deg., with the horizontal, the front part of the frame being at the springing of the arched opening or thereabouts. To this front bar is binged a valve which can either be fixed upright against the back of the arched opening, when it acts upon the fire as a blower, or it may be shut down upon the frame, so as to stop the direct draught with the chimney; the smoke and flame striking the under-side of the valve, and is deflected forward with its attendant heat, the smoke is met at the front edge of the frame by the draught and carried over up the chimney. The valve can be worked with a hooked poker, or more elaborately by a screw arrangement. The heat radiated into the room is about doubled by the use of this valve. Mr. John Inshaw, who has made this invention, is now over seventy-seven years of age, and is the same gentleman who got the prize for the first passenger steamer on the Thames,—a vessel which he made in Birmingham and steamed to London through the canals.

**Erratum.**—On page 688, ante, first line of first column, for King Henry "III." read "VIII."

**Manchester Architectural Association.** The second ordinary meeting of the above Association was held at the Old Town-hall on Tuesday last, Mr. Colley in the chair. Mr. J. S. Hodgson read a paper on "Sewage Farms," in which he said:—Sewage farms at one time were looked upon more as the invention of speculators for the utilisation of the manure than for the speedy removal of the filth from the neighbourhoods of habitations, but are now admitted to be the only true means of disposing of liquid sewage from inland towns. These farms are often spoken of in no very flattering terms, but, properly constructed and managed, are very satisfactory. There is great prejudice against them, from the notion that they are injurious to health, which is contradicted by the report of the Rivers Pollution Commission, Dr. Littlejohn, Medical Officer of Health to the City of Edinburgh; Professor Christison, of the Royal Society of Edinburgh; Dr. A. Car-

pentier; and many others. A discussion followed, in which Messrs. Colley, Oldham, Brooke, Chadwick, Talbot, Worthington, and Preston took part.

**Porthleven (Cornwall).**—The picturesque village of Porthleven, Helston, Cornwall, has received an addition, both useful and ornamental, by the erection in the tower of the Institute of a new clock, manufactured by Mr. J. W. Benson, of Ludgate-hill, London. The clock has four dials of upwards of 4 ft. diameter, one of which on the land side is illuminated. The bours are struck upon a bell of 4 cwt. of a full rich tone. The clock and tower have been erected at the sole cost of Mr. W. Bickford Smith, of Helston.

**Market Weighton.**—A company is being formed for supplying Market Weighton with water. Mr. J. F. Fairbank, M. Inst. C.E., and engineer for the Beverley and Driffield Water Companies, is the engineer.

**COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS.**

*Epitome of Advertisements in this Number.*

W. Johnson,* Wandsworth-common	4,238 0 0

\* Accepted.

For the construction of a reservoir at Crosby Meadows, Dartmouth, and for providing and laying iron water-mains, for the Town Council. Mr. E. H. Back, C.E., Borough Surveyor:—

Hawking & Best, Peigimouth .....	2,662 12 6
Shaddock Bros., Muteley, Plymouth .....	844 0 0
Hawkins, Davlish (accepted) .....	647 0 0

For alterations to the Victoria Tavern, Grove-road, Mile-end. Messrs. Hammack & Lambert, architects.—  
 Hearle & Son..... £1,683 0 0  
 Coeks & Co. .... 933 0 0  
 Lascelles & Co. .... 580 0 0

For seven cottages on the Artillery Field Estate, Guildford, for Mr. G. W. Cole. Messrs. Peak, Lunn, & Peak, architects, Guildford. Quantities supplied:—  
 Pink, Milford ..... £2,779 0 0  
 Nye, Guildford ..... 2,459 0 0  
 Garnett, Guildford ..... 2,449 10 0  
 Mitchell, Shaftord ..... 2,413 2 7  
 Martin Walk & Co., Aldershot ..... 2,403 0 0  
 Kinglerie, Oxford ..... 2,390 0 0  
 Peters, Horsham ..... 2,235 0 0  
 Strudwick, Guildford ..... 2,195 0 0  
 Bottrill, Reading (accepted) ..... 1,973 0 0

For shops and offices, Broad-street, London, for Mr. Edward Lukyn. Mr. Edwin T. Hall, architect, Moorgate-street. Quantities by Mr. O. A. Fryce-Cuxson, Westminster-chambers, and Mr. E. Overall, Henrietta-street, Covent-garden:—  
 W. Brass ..... £6,371 0 0  
 Clarke & Bracey ..... 3,280 0 0  
 J. & J. Greenwood ..... 6,197 0 0  
 Colls & Son ..... 6,176 0 0  
 Holland & Hannay ..... 6,575 0 0  
 Foster & Dicksee ..... 5,659 0 0  
 J. Woodward ..... 5,928 0 0  
 Bangs & Co. (accepted) ..... 5,690 0 0

For repairs, &c., 15, Green-street, Grosvenor-square. Mr. Edwin T. Hall, architect:—  
 Lynde ..... £199 0 0  
 Tavenor & Sons (accepted) ..... 182 0 0

Accepted for alterations, and building new wing, to Alerton Hall, near Leeds, the residence of Mr. W. L. Jackson, M.P. Mr. Thomas Winn, architect, 15, Park-lane, Leeds. Quantities by the architect:—  
 Bricklayer, Mason, and Joiner, Nicholson & Son, Leeds ..... £1,732 13 6  
 Plasterer, Franks & Evans, Leeds .....  
 Plumber, Joseph Lindley, Leeds .....  
 Slater, James Seasons, Leeds .....  
 Builder, James Simpson, Leeds .....  
 Ironfounder, Dawson & Kinsey, Leeds .....

Accepted for building new offices, model-making and stoving shops, new foundry, and drawing offices, at the Old Foundry Steam Crane Works, Rodley, near Leeds, for Mr. Thomas Smith, Mr. Thomas Winn, architect. Quantities by the architect:—  
 Wm. Nicholson & Son, Leeds ..... £2,315 0 0

For alteration of premises in Albion-street, Leeds, for Mr. Samuel James Brown. Mr. Thomas Winn, architect. Quantities by the architect:—  
 Irwin & Co., Leeds ..... £849 0 0  
 Longley Bros., Leeds ..... 622 0 0  
 Tomlinson & Son, Leeds ..... 670 0 0  
 J. A. Thorp, Leeds ..... 599 0 0  
 Franks & Evans (accepted) ..... 554 0 0

For the continuation and completion of the Wightman-road sewers, surface-water drains, &c., on the Harrington Park Estate, Hornsey, for the British Land Company, Limited. Mr. Henry E. Mitchell, surveyor:—  
 Nowell & Robson, Kensington ..... £2,817 0 0  
 Harris, Camberwell ..... 2,700 0 0  
 Keeble, Regent's Park ..... 2,627 0 0  
 Killingback, Camden-town ..... 2,357 0 0  
 Pizey, Hornsey ..... 2,377 0 0  
 Bloomfield, Tottenham ..... 2,280 0 0  
 Wilson, Walthamstow ..... 2,150 0 0  
 Jackson, Leyton ..... 2,054 0 0  
 Feill, Bromley, Kent (accepted) ..... 1,529 0 0

For alterations to the Craven Hotel, Lavender-hill, Wandsworth, for Mr. Edward McKinnell. Mr. Henry E. Tyack, architect, 5, Bloomsbury-square:—  
 J. Dodson ..... £402 0 0  
 S. Hayworth ..... 484 0 0  
 Burch & Co. .... 417 0 0  
 J. Watkins ..... 479 0 0  
 Wm. Ellis ..... 399 0 0  
 J. W. Taylor (accepted) ..... 311 10 0  
 W. H. Thorn ..... 297 10 0

For rebuilding at 8, Blackfriars-road, Mr. Richard Groom, architect, Bridge-chambers, 172, Queen Victoria-street:—  
 Stains & Son ..... £516 0 0  
 Marsland ..... 505 0 0  
 Oldis Bros., Wilson-street ..... 452 0 0

For the construction of about 4,903 lineal yards of brick, stoneware, and cast-iron sewers, with all necessary junctions, manholes, lamp-holes, and the outfall and intercepting tanks, for the Strand Rural Sanitary Authority. Mr. J. P. Lofthouse, C.E., engineer. Quantities by the engineer:—

Contract No. 1.  
 T. Small & Sons, West Bromwich ..... £2,727 0 0  
 Bottoms Bros., Battersea ..... 2,713 0 0  
 J. Greenslade, Stroud ..... 2,685 0 0  
 J. T. Whettam, Weymouth ..... 2,495 0 0  
 B. Cook & Co., Battersea ..... 2,364 0 0  
 H. Webb, Hereford ..... 2,358 0 0  
 J. Young & Co., Hertford ..... 2,288 0 0  
 Thos. Williams, Swansea ..... 2,285 0 0  
 G. Cowdery & Sons, Newent, Gloucester ..... 2,274 0 0  
 J. Dickson, St. Alban's ..... 2,156 0 0  
 J. Hawkins, Dawlish ..... 2,197 0 0  
 Ambrose & Son, Bath (accepted) ..... 1,948 0 0  
 Engineer's estimate ..... 2,465 0 0

For the erection of a shoe factory at Starch-green, W., for Messrs. Peal & Co. Mr. T. Chattfield Clarke, architect. Quantities by Mr. H. H. Leonard:—

Wrought Timbers. Total.  
 Colls & Sons ..... £2,985 ..... £117 ..... £3,102  
 J. Grover ..... 2,934 ..... 150 ..... 3,084  
 J. Woodwards ..... 2,865 ..... 115 ..... 2,980  
 J. T. Chappell ..... 2,815 ..... 85 ..... 2,900  
 Brown, Son, & Blomfield ..... 2,775 ..... 110 ..... 2,885  
 J. & Greenwood ..... 2,759 ..... 110 ..... 2,869  
 Ashby Bros. .... 2,669 ..... 134 ..... 2,833  
 P. Lawrence & Sons ..... 2,695 ..... 78 ..... 2,773  
 Hall, Biddall, & Co. .... 2,620 ..... 98 ..... 2,718  
 B. Nightingale ..... 2,620 ..... 70 ..... 2,690

For alterations and shop fronts, &c., at Nos. 30 and 31, Peter-street, Soho, for Mr. E. Saville. Mr. Frederick H. Culterhouse, surveyor:—  
 Gould & Brand (accepted) ..... £298 0 0

Accepted for sundry works, decorations, &c., at the Walford Arms, Stoke Newington-road, for Mr. G. O. Busley:—  
 Oldis Bros., Wilson-street ..... £173 0 0

Stables, Seamers-place.—The architect of this work is Mr. E. Cross, not C. Crosso. The list as inserted last week was (we suppose inadvertently) sent to us by one of the builders a second time, it having already appeared some weeks ago.

Special Notice.—Lists of tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than four p.m. on Thursdays.

PUBLISHER'S NOTICES.

CHARGES FOR ADVERTISEMENTS.  
 SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under ..... 4s. 6d.  
 Each additional line (about ten words) ..... 6s. 6d.  
 Terms for Series of Trade Advertisements, like for Special Advertisements of front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.  
 FOUR Lines (about FIFTY words) or under ..... 2s. 6d.  
 Each additional line (about ten words) ..... 6s. 6d.  
 PREPAYMENT IS ABSOLUTELY NECESSARY.  
 \*S. CHANGE must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDRINER, Publisher.  
 Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before FIVE o'clock p.m. on THURSDAY.  
 The Publisher cannot be responsible for DRAWINGS, TESTS, MONIALS, &c. left at the Office in reply to advertisements, and strongly recommends that of the later COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS or ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY evenings.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, Covent-garden, W.C. free of charge. Letters will be sent to the address enclosed envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.  
 "THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, FREEPOST. To countries within the Postal Union, 26s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher No. 46, Catherine-street, W.C.

TO CORRESPONDENTS.

F. C.—A. B. M.—D. J. M.—C. L. (copy forwarded).—"Improvement" had better improve his spelling before he next writes—"Highlander" (can be obtained from Messrs. Boulton's, Laminated Pottery). ### Leonardo da Vinci as Architect.

UNDER this title comes to us a publication of great interest, though in a form which is somewhat puzzling to the reader. There are some things which we manage best in

England, and one of them is the arrangement and "entitling," if we may use the term, of architectural publications. We can generally at least make it clear who a book is by, and what it is about; but French and German editors and publishers despise these ways of pleasantness. They delight in preparing puzzles for the reader; in sending out the last part of a book first, placing the title-page at the end and the index in some unexpected place in the middle, and so on. The present volume\* is no exception to this pleasing rule. The outside cover bears the title as given below, but no date or publisher's name, only an announcement that "this treatise forms part of the literary works of L. da Vinci, by Jean Paul Richter, and has not appeared separately." On the inside title-page we find this latter title, and the notification "Vol. II.," the name of Messrs. Sampson Low & Co., as publishers, and the date 1883. Then follows the table of contents of "Vol. II.," which, however, is not the table of contents of the volume before us, and seems to have nothing to do with it; and then an index of the contents of plates from numbers LVI. to CXXII., whereas the plates actually appended to this volume range from LXXVII. to CVI., and the contents of some of them correspond to the descriptions under the same number given in the index, and in other cases do not. After this we give it up, and have to be content with the vague conviction that it is a volume containing a number of fac-similes of rough sketches by Leonardo, of great interest, preceded by a good many pages of desultory remarks, some of which obviously have some reference to the plates; but further than that we cannot get.

What can be extracted from these facsimile sketches, and the hasty memoranda of Leonardo, which latter are printed in double columns of Italian and English, is of much interest, partly in its inherent suggestiveness, partly as throwing light on the character of Leonardo and his way of regarding things architectural. Baron de Geymüller remarks in some prefatory notes, that in spite of the prevalent idea as to Leonardo's architectural acquirements, partly

based on the famous letter in which he practically undertook to do everything that could be required and some other things besides, no building is known to have been planned and executed by him. But certain documents, preserved at Milan, show that Leonardo was not only employed in preparing plans, but that he took an active part as member of a Commission on public buildings (which in those days seems to have presupposed some knowledge of the subject); and that his name is linked with the history of the building of the cathedrals both of Milan and Pavia. The evidence that he gave a great deal of thought to architecture is obvious enough from the sketches and the notes included in this volume, though they are very desultory and the sketches in many cases exceedingly slight. The compiler observes:—

"Leonardo's writings on architecture are dispersed among a large number of MSS., and it would be scarcely possible to master their contents without the opportunity of arranging, sorting, and comparing the whole mass of materials, so as to have some comprehensive idea of the whole. The sketches, when isolated and considered by themselves, might appear to be of little value; it is not till we understand their general purport, from comparing them with each other, that we can form any just estimate of their true worth. Leonardo seems to have had a project for writing a complete and separate treatise on architecture, such as his predecessors and contemporaries had composed,—Leon Battista Alberti, Filarete, Francesco di Giorgio, and perhaps also Bramante."

The compiler, however, seems doubtful about this, and certainly there is nothing in most of the notes here printed to suggest any such general and comprehensive scheme. They seem rather the thoughts and jottings of an eager comprehensive mind that could never be without employment and speculation, and was constantly trying to solve some knotty point in art or science as it presented itself to him.

The contents of the work divide themselves naturally into two sections—sketches, and theoretical investigations and memoranda. In both we find plenty of traces of what we venture to think a characteristic of Leonardo's genius and character, viz., a certain eccentricity, a bent towards out-of-the-way solutions and unusual methods, a tendency towards ingenuity rather than really practical invention, which argues a certain want of the true *mens sana*. In these sketches, for instance, the remarks and comments are nearly all written backwards way, from right to left, so as to read right only in a looking-glass. That is Leonardo da Vinci all over. He never could be content to do an ordinary thing in an ordinary way: he was always wanting to outshine others in mere cleverness, even when nothing was to be gained by it. So with some of the constructional ideas, the sketches for which are reproduced.

One of the first is a design for a system of navigable canals under the streets of a city, the canals communicating with the basements of the houses, which are flooded with water and vaulted. Another sketch shows a kind of tower loggia built over water, with a fountain in the middle of the upper floor, which is to be kept supplied by a turbine-wheel outside, actuating, by long levers, pump-rods, which are carried down the insides of the columns of the loggia stage. Apparently, the pumps deliver first into a large cistern on the top, over the whole area of the building, and carried only on the rather widely-spaced colonnade of the loggia; an incident which seems to show that Leonardo had very indifferent notions as to the weight of such a mass of water. Some of Leonardo's practical drawings for engines of war and other such things were shown at one of the Winter Exhibitions at Burlington House some years ago, and we commented on them at the time. The practical designs in Baron de Geymüller's book produce the same impression which the Burlington House drawings did; they seem the productions of a very active and inventive, but certainly not a soundly practical mind. They are all very interesting on paper, yet they all leave a doubt whether they would work, or whether they would be of any good use if they did; and in many cases, as in that of the fountain loggia aforesaid, the elaboration of the means is ludicrously disproportionate to the end to be attained. The written memoranda on practical architecture which are here published form a curious mixture of really practical suggestion with often illogical and untenable theory, introduced by his favourite formula "and this can be proved" (*e questo si prova*); the "proof" consisting usually of a simple statement of supposed facts evolved out of his fertile and imaginative brain. The memoranda on the value of the arch are very curious in regard to their generally true conclusions and the empirical way in which these are expressed. "The arch is nothing else than a force originated by two weaknesses [*causata da due debolezze*], for the arch in buildings is composed of two segments of a circle, each of which being very weak in itself tends to fall, but as each opposes this tendency in the other, the two weaknesses combine to form one strength." Elsewhere he puts it differently; if the space to be bridged over be 20 in measurement, and the material of the arch 30, it is obvious that 30 cannot fall through 20. From some memoranda on the pointed arch it is evident that he was alive to the fact of the superior resistance of the pointed arch at the crown, as compared with the round arch. Some of the numerous notes on cracks and fissures in walling are of interest, and are more practical than the other practical

\* Leonardo da Vinci as Architect. By Baron Henry de Geymüller, architect.

memoranda. "A wall which does not dry uniformly in an equal time always cracks. A wall, though of equal thickness, will not dry with equal quickness if it is not everywhere in contact with the same medium. Thus, if one side of a wall were in contact with a damp slope, and the other were in contact with the air, then this latter side would remain of the same size as before; that side which dries in the air will shrink or diminish, and the side which is kept damp will not dry." Another remark to be noted is "When the crevice in the wall is wider at the top than at the bottom, it is a manifest sign that the cause of the fissure in the wall is remote from the perpendicular line through the crevice," which in a general way is true enough. Leonardo does seem to have projected an elaborate essay on this subject of cracks, as the notes commence with the mem.—"First write the treatise on the cause of the giving way of walls, and then separately treat of the remedies." He contradicts himself rather about the method of building walls to ensure stability, in one place stating that "walls must be built up equally, and by degrees, to equal heights all round the building, and the whole thickness at once, whatever kind of walls they may be"; but in the very same chapter he lays down positively that "walls should always be built first and then faced with the stones intended to face them, since the wall settles more than the stone facing,"—a direction which at once carries the mind to that architecture of veneering so prevalent in Renaissance Italy. In another place, in regard to the resistance of beams, he carries us to the subject of building to resist earthquakes, on which we said a few words the other day. After observing that "the part of a beam built into the wall should be steeped in hot pitch and filleted with oak boards [*fasciata d'asse di quercia*] likewise so steeped," he continues, "Each beam must pass through its walls and be secured beyond the walls with sufficient chaining, because in consequence of earthquakes the beams are often seen to come out of the walls and bring down the walls and floors, whilst if they are chained they will hold the walls strongly together, and the walls will hold the floors."

On the whole, it does not seem that the suggestions of Leonardo on constructional matters will be of more value to modern students than as curiosities of a great man's mind. Where they are at all novel they are mostly rather doubtful; where they are not they serve now only to show how much, with all his wild and ambitious genius, he was alive to and interested in small practical details, as in his direction that "all privies should have ventilation [by shafts] in the thickness of the walls, so as to exhale by the roofs"; and "the privies must be numerous and going one into the other in order that the stench may not penetrate into the dwellings, and all their doors must shut themselves off with counterpoises"; swing doors, in fact, with spring hinges. But the interest is much greater when we come to the artistic side of the architectural notes. Here we are at once struck by the holdness of many of the sketched suggestions, and the genius which shines through these rough and sometimes hardly intelligible pen sketches, which are accurately reproduced in Baron de Geymüller's plates, even down to the tone and the stains on the paper. A considerable number of the plates are occupied with studies for various treatments of the dome and its substructure. They are almost all based on the Greek cross idea, Leonardo evidently regarding the dome as the proper culmination of a wide rather than a long plan, spaced equally on all sides, and nowhere advancing far in front of the base of the dome. He places the dome as the culmination of a square, a circle, an octagon, in various ways; he surrounds it with semi-domes, niches, and minarets, leading up in pyramidal composition to the central cupola. These combinations are not all equally happy; but they nearly all suggest ideas capable of being further worked out. They are in nearly every case accompanied by carefully sketched plans, sometimes by perspective sections. Some of them are rather Oriental in appearance; the combina-

tion of the dome with various semi-domes almost inevitably leads to this Eastern feeling. He has one or two sketches for a dome over a Latin cross plan, but this is evidently no more a favourite combination with him than it was with Wren, who would have so much preferred to carry out the Greek cross plan for St. Paul's. One or two points in connexion with these dome studies are worth notice, as of special interest in relation to St. Paul's. One is a section, on larger scale than usual, of a lofty domical lantern of elliptical outline, the larger axis of the ellipse placed vertically, surmounting a dome the upper portion of which only is shown. The space behind the haunches of the dome, from which the inner cupola of the lantern springs, is apparently treated on the cellular system; the vousoirs of the dome are shown carefully joggled together; but the remarkable point is that Da Vinci seems here to have partially anticipated Wren's contrivance of the cone to carry the lantern, for from the lower part of the haunches of his dome springs a straight course of masonry, forming an oblique line from the haunch of the dome to the base of the inner cupola. The cupola lantern, again, is in two masonry domes, one within the other, of slightly differing section (the outer one spreading more widely at the base), and again there is this oblique wall from the haunch of the inner cupola to the drum of the outer cupola, carrying part of the weight of the inner cupola to the outer part of the dome. Another point to which the compiler calls attention is that in some of these dome sketches not only are the domes decorated externally with vertical ribs, but also with horizontal courses or strings one above another. It is true these are in most cases very slightly marked, and the compiler, perhaps, makes a little too much of the point; but it is of some interest at the present moment in reference to the "zone principle" of decorating domes which is being discussed.

Baron de Geymüller considers Da Vinci to have been in considerable architectural relation with Bramante, and to have been influenced by him in the style of those architectural compositions of which he has left sketches, but which, so far as we know, were never carried out. There are certain sketches for bits of arcuated and dome architecture which certainly recall the manner of Bramante as shown in that remarkable collection of drawings and studies for St. Peter's, the publication of which some time ago we owed to Baron de Geymüller, and which we fully noticed at the time. But these are only a small proportion of the dome studies in the volume; and the majority, except in so far as the dome and semi-dome forms were, of course, there ready to Leonardo's hand, appear to us to display the most remarkable originality, and to be little indebted to the suggestions of other men. The working out of some of them in more finished form would be an interesting task, and we might suggest that it would be a very good subject for an architectural student's competition for the Institute, if Baron de Geymüller, or the publishers, or whoever has the copyright of the sketches, should be willing to permit a limited reproduction or copying of some of them for the purpose.

Among the boldest conceptions in the book is one for a monument. On the top of a great artificial conical mound or hill, suggesting a recollection of the Japanese pictures of Fusiyama, is a circular temple with a colonnade and a central cupola. About one-fourth of the descent the slope is interrupted by a terrace cutting a channel round the hill, with a wall and eight doors, two of which give access to the steps up to the temple, the other six to a series of vaults under the surface of the hill, and not visible in the external design except by their doors of entrance in the wall. The plan of the whole is given beneath.

Some designs for domes, by Leonardo, somewhat similar to those in this volume, were given as a kind of appendix page to the work on Bramante to which we before alluded. We commented on them at the time. Baron de Geymüller is doing most useful and interesting

work to architectural students of the Renaissance in thus bringing out to the light the architectural memoranda of the giants of the Italian Renaissance. He has apparently special means of information, and plenty of time to devote to the work, and is doing it in a manner which cannot be too cordially recognised. We are glad to learn that he is engaged on a life of Bramante, which will be a desirable supplement to the drawings previously published.

#### THE STORAGE OF WATER.

ALTHOUGH it is not often that England suffers from a scarcity of water, such was the case during the past summer in many parts of the country. Instances occurred of water having to be carried long distances for domestic use, and in one case the sum of eighteen shillings per diem was paid for its carriage.

Much might be done in the collection of rain-water to come in usefully at such times of need. In the first place, rain-water is the most useful for household purposes, whether it be for cooking, washing, or bathing, and, when quite clean and pure, it is excellent for drinking. The difficulty is to obtain it clean, for, as the collecting surface is generally the roofs of houses, the water is apt to be tainted with soot, the *débris* of sparrows' nests, dust, and so on. Filtering, however, may do much to remedy the difficulty, as well as such expedients as the rain-water "separator," of which an illustration is given in another column this week.

As the storage of rain-water has been a general practice in the South of France from time immemorial, we propose to give an account of it from our own personal observation, both as regards what may be called the ancient and the modern system of collection. For house use one plan was to collect the roof water and lead it into a tank underneath the house, often made round like an ordinary well, from which it was pumped up as required. This water was beautifully cool and pure, owing to the cleanliness of the house roofs where coal is not used and where fires are comparatively few.

Some months since we went to inspect a large tank that had been made to collect water for irrigation. This tank was about 30 yards by 24 yards and 17 ft. deep. The water coming off a large hill-side was led into it, and the quantity was very great. The tank had cost about 600*l*. The water, coming as it did from the surface of the land, was much discoloured and only useful for irrigation.

We have, however, another property in view where the storage of water, both for domestic use and for irrigation, has been carried out completely, so that an account of the plan there adopted will be the best way of making the matter clear.

Some years ago an English proprietor residing in France built a house on the side of a hill, the geological formation of which was limestone overlying a bed of gypsum and the Red Sandstone. There was a well at the lower part of the property in the gypsum bed, but it was far from the house, and the water was so hard as to render it practically useless for household purposes. It was decided to rely chiefly for water on the rain falling on the roof, and with this object in view a tank was constructed on the hillside some twenty yards behind the house, and a little lower than the level of the roof. Its position was ingeniously fixed so that while it received all the roof water from the house by means of a cast-iron pipe, 4½ in. in diameter, the same pipe delivered the water on the upper floor of the house, whence it was distributed wherever required. After a few years' trial it was found that the roof surface,—some 150 square yards,—was insufficient in a country where rain often ceases to fall for months together, and it was decided to add to it. It may here be mentioned that the house gutters are all covered with galvanised wire netting to keep out dirt as much as possible.

The first point decided was to utilise the surface of the tank itself. This surface, walls

included, being 9 yards by 5½ yards, gave nearly fifty additional square yards. The inside measurement is a little over 23 ft. by 13 ft., and the depth over 6 ft. 6 in. The capacity may be taken at over 12,000 gallons. Experience having shown that still more surface was required, it was provided in the following manner:—The surface of the tank itself was composed of light brick arches on iron joists, covered with rough mortar, which was always coming off in flakes. This, wherever loose, was scraped off, and a coat of the best cement, with a proportion of sand to prevent cracking, was laid on. A fall was made from the four sides to the tank lid, which is about 2 ft. square, and in the centre, slightly above the surface of the tank. Four holes were made in the brickwork below the lid for the water to pass into the tank through galvanised wire netting fixed in the holes to prevent any leaves, &c., from passing. Thus, as before mentioned, an area of 60 square yards was added. It was now proposed to add another area of the same size.

The trees and brushwood having been cleared away from the ground above the tank on the hillside for a distance of about 5 yards by 9 yards, corresponding to the length of the tank, a wall about 3 ft. high was built on the edge, to retain the earth from falling, and for a purpose now to be described. The wall having been completed, a row of tiles projecting about 3 in. beyond its face was bedded in mortar on it, and laid with sufficient slope to enable water to fall clear on to the cemented surface of the tank. A strip of galvanised iron wire netting was laid under the tiles, and turned up in front of them some 4 in. in height, so as to catch any leaves or debris of any kind that might fall from time to time. The cleared surface was then covered with sheets of corrugated iron, slightly raised above the ground to prevent injury. These sheets of iron, and the row of tiles provided nearly fifty more square yards surface. Thus the total area gained is equal to nearly 100 square yards. The tank contains between 12,000 and 13,000 gallons; and as the roof-surface has, at times of heavy rain, more than half filled it, it is presumed that the additional surface now described will quite fill it. For a consumption of 60 gallons per diem, which experience has shown to be the ordinary quantity for a family of five or six persons, there would be sufficient water for 200 days, supposing even that no more rain fell. The figures above given are very nearly correct. Any slight discrepancies will be accounted for by the measurements having been taken in metres, and the contents in litres, in the first instance.

The supply for the house being provided for, it was thought well to have another tank to supply water for the garden, poultry, &c. This tank is about five yards and a quarter square, and not quite 6 ft. in depth, and holds nearly 10,000 gallons. It is situated about 150 yards from the house, and is supplied from the water running off three roads on the property, sloped to one side, where a paved channel receives the water. There are two small settling-tanks in front of the receiving-tank, notwithstanding which the water is much discoloured owing to the soil being very red in colour. It is, nevertheless, a very useful supply for the purposes for which it is intended, and prevents the house tank being drawn upon for any purpose not strictly household. This tank was exceedingly cheap; the walls were built of the stone taken out in excavating, and were faced by a brick on edge and a coating of cement. The bottom was lime concrete, with a coating of cement. The whole of the mason work was done by a handy labourer, so there was no skilled labour to pay for. Stone being on the spot, there was no outlay beyond bricks, lime, cement, and labour. No top has yet been added, and the cost has not exceeded 20l. The cost of the house-tank has not been reckoned, as it was a necessary appendage to the house in any case, but the work with materials for adding the additional surface of one hundred square yards may be put down at eight pounds, corrugated iron included.

We think we have been able to show that in many cases a good supply of rain-water is easily

attainable, and very serviceable. In the instance we quote the comfort of using soft water for bathing and washing is so great that when the supply runs short, and hard water has to be accepted, a general outcry is made. As regards economy, all is in favour of the tanks. The cost of laying a pipe from the water company's main, about 350 yards distant, would have been very considerable, and as, owing to the level, it could not be brought nearer than 100 yards distance from the house, and 60 ft. below it, the difficulty was insuperable.

The question resolves itself very much into the cost of providing tanks; but on hill-sides, where the collection of rain-water is comparatively easy, and at the same time is most required, stone will in most cases be found in the excavations that will serve for the walls of the tanks.

#### ARCHITECTURAL DISCOVERIES AT DELOS.

N a recent number of the *Builder* it was remarked that "architectural subjects do not at present occupy a very large portion of the attention of the Hellenic Society." The reason, perhaps, is not difficult to understand. The Hellenic Society has been, unhappily, up to the present time too poor to undertake extensive excavations, such as are necessary to lay bare the foundations of ancient buildings and recover the scattered fragments which may lead to conjectural restorations. The members of the Society have, for the most part, been compelled to content themselves with working upon the already existing material in their own and other museums, and the *Journal* has published, in the main, small objects of art, vases, painted sarcophagi, inscribed armour, and the like. But for their architectural studies better days are already dawning, and wider fields opening. Once let the Society establish its archaeological school at Athens, and England will no longer be backward in the work in which Germany, France, and America have already reaped such rich harvest.

The main work of the French school at Athens has, as is well known, been carried on at Delos, and certainly the "Bulletin de Correspondance Hellénique," issued regularly by the School, does not err on the side of neglecting architectural topics. By far the longest and most interesting article in the latest number now before us is devoted to the elucidation and reconstruction of the architectural remains of a temple discovered in the sacred enclosure (*temenos*) of Apollo.

This temple, M. Homolle thinks, may, almost without doubt, be identified with one of the most famous monuments of antiquity, i.e., the temple containing the celebrated "altar of the horns" (*keraton*). Of the fame of this temple we have abundant literary evidence. Callimachus tells us the story of the building; how Apollo, who delighted ever in the founding of cities, built for himself with his own hands an altar, laying the foundations in fair Delos, near to the wheel-shaped lake, and how Artemis brought to him from her hunting the horns of wild beasts, and of them Apollo wove the texture of the altar, and round the altar made walls of the horns to enclose it. Ovid, again, makes his heroine Cydippe tell in her letter to her lover how she lauded at Delos, and how, while sacrifice was being offered to Apollo, her careful nurse led her through the temple enclosure and showed her the wonders of the place, and chiefly the great altar made of countless horns.

"Miror et innumeris structam de cornibus aram."

Some even think that it was this ancient altar that Homer knew,—“Yet in Delos once I saw as goodly a thing, a young sapling of a palm-tree springing by the altar of Apollo.” Martial reckons the altar of horns among the wonders of the world. He counts it with the Pyramids, with Babylon, with the Mausoleum.

"Dissimulæque deum cornibus ara frequens."

Many legends gathered about its construction.

Plutarch implies that, made of horns only, and of the horns of the right side of the stag's head only, it yet held together in an almost supernatural manner, without any apparent means of fastening. An anonymous author gives another tradition. The altar was made, he says, of the right-hand horns of victims offered to Apollo in a single day. It is needless to say that an altar of so fragile a construction has perished utterly. What M. Homolle thinks he has discovered is the ruin of the building which enclosed the altar, and, no doubt, shared its fame. He has undoubtedly laid bare the complete foundations of a rectangular building, divided into three distinct portions,—a sanctuary and a pronaos, between them a very long gallery, the floor of which is of a lower level. The building is of the Doric order, the noticeable part of it being this long gallery. If M. Homolle's supposition is correct, its presence would be easily accounted for. He supposes that the altar itself stood in the sanctuary; huge blocks of stone still remain there which may well have formed its foundations. The gallery, M. Homolle thinks, was built of such unusual length for the convenience of certain ritual observances. A sacred dance of a peculiar nature was performed in front of the altar of the horns. Tradition said it had been instituted by Theseus on his return from Crete in memory of his escape from the Labyrinth. The dance consisted of certain complicated labyrinthine figures, and was known as the crane dance (*geranos*), probably from a supposed analogy to the movements of flocks of cranes in the sky. A bas-relief, which has unfortunately perished, was found at Delos representing a dance of this nature. The architectural arrangements of this gallery are well suited for a dancing-place,—the sunken part in the centre for the performers, the raised dais all round for the judges and spectators. The general arrangement of the temple will be best understood by reference to the plates which accompany M. Homolle's article. He gives a plan of the actual state of the ruins and a proposed restoration; also a restored elevation of the interior and a restoration of the roof. About the general arrangement of the temple there can be no doubt, as the foundations are, with some very slight exceptions, intact. Besides the architectural remains a considerable number of sculptured fragments have been discovered, and two immense blocks of marble, part sculptured, part architectural, of the utmost importance. Each of these forms on the one side a Doric half-column, on the other the capital of a pilaster, surmounted by a kneeling bull. A Doric column surmounted by a kneeling bull is, in Greek architecture, a startling and unique phenomenon. In Oriental architecture it would not surprise, but the Greeks, as a rule, used sculpture only in the non-operative portions of their buildings; it served for them a decorative, not a tectonic purpose. So startling an exception demands an explanation, and such an explanation is given by M. Homolle's supposition that we have here the ruins of the temple which had contained the marvellous altar of the horns. There seems little doubt that M. Homolle has given back to us all we shall ever know of one of the wonders of the world. The plans and restorations he gives are an anticipation of a larger work undertaken and approaching completion by the architect M. Nénot.

#### NOTES.

HE Committee on the treatment of Westminster Hall sat again last Tuesday, when the examination of Mr. Charles Barry was continued. He produced a plan showing the buildings to front St. Margaret's-lane, as designed by Sir Charles Barry, but carried a little further in towards the Hall, so as to allow of a greater width of roadway. This left a court between the proposed new buildings and Westminster Hall of about 60 ft. width at the northern, and 40 ft. width at the southern end, which seems rather too narrow. An alteration in the plan might remedy this. The building

Sir Charles Barry had proposed was of very much the same character architecturally as the present House of Lords building. Mr. Barry expressed a strong opinion as to the insufficiency of the proposed committee-rooms between the buttresses. Mr. J. J. Stevenson was the next witness examined, and gave expression to his well-known views against every sort of restoration, saying that even if Mr. Pearson had authority for every detail, he would oppose the carrying out of the project. The Chairman had the had taste to ask this witness "whether he had written the article in the *Builder*" (referring to our leader of last week). The incident is amusing, as showing how much at sea the authorities are on these points, as we have always opposed Mr. Stevenson's extreme views, and part of his evidence was in direct opposition to our article; but we think most people will agree with us that it was hardly a fair question to put to a witness.

THE subject has elicited four letters in the *Times* since our last issue, from Mr. Pearson, Mr. Butterfield, Precentor Venables, and Mr. E. W. Godwin. Mr. Pearson's letter is, of course, a defence of his own views, in which he bestows far more attention than was necessary on a foolish letter of Mr. Loftie's some days previously, in which that self-constituted authority asserted that the original architects had "carefully avoided" allowing the roof of Westminster Hall to be seen, which is, of course, simply nonsense. All we complain of in Mr. Pearson's letter is his defence of his committee-rooms, as "large and well-proportioned," which they most assuredly will not be, and his assertion that the adoption of his scheme will be no impediment to the completion of Sir C. Barry's plan. It certainly would be; his north-west building comes right in the way. Mr. Butterfield writes a thorough architect's letter. He says, the roof at present is overpowering, the windows below it mean, the west side sunk in a hole. He would lift the roof and lengthen the windows upwards. He confirms the view that the west side of the Hall has never before been seen as it is seen now. It "must be made presentable," but the particular question of Mr. Pearson's proposals he avoids. We do not think his proposition of raising the roof will be carried out. We quite agree with him that new buildings should not be put up for the mere sake of concealing Westminster Hall. The connexion between the two subjects is only indirect. The Office of Works and Mr. Pearson say "new committee-rooms are wanted,—here they are." We say, those are not enough and are bad in themselves; if you are going to increase accommodation to the extent to which it is really wanted, do it in the proper and only efficient manner, by completing the design of Sir Charles Barry. Precentor Venables's criticism is purely negative, and he, with others, falls into the mistake of confounding the *porte cochère* under the cloister with the horse stand under the grand committee-room. Mr. E. W. Godwin is shocked at Mr. Butterfield's suggestions.

A PART from the political effects, to which it is not our province to refer, of the new electoral division of the country, it may be regarded as a step towards what may be called the urbanising of England. The rapidly increasing pressure of population on area must,—if continued long enough,—in time convert a populous island into a group of towns. But the rate of agglomeration varies very much. Towns with fewer than 10,000 inhabitants, as a rule, are now hardly increasing in population. Some of them are actually decreasing, as are some rural districts. As a general rule, the outer ring of the metropolis, and the towns of between 100,000 and 200,000 inhabitants, are most rapidly increasing. Most marked of all is the increase of certain seaports and water-side towns. In twenty-five towns classed as seaports, the increase of houses from 1871 to 1881 was 16·6 per cent. In Great Grimsby it was 71 per cent., and in Barrow-in-Furness 145 per cent. in the decade. This determination of the population towards

certain centres of activity is a matter of primary importance as regards the building industry of the country, with a general increment which would double the population enumerated in 1881 by the year 1936. The actual rate of urban increase in the number of inhabited houses was 15·6 per cent. in ten years against a rural increase of 11·0 per cent., and in the sixteen towns with populations between 100,000 and 200,000 each, which contain in all 408,000 houses, the increase in the decade has been on the average 21·5 per cent. The town builders are thus those whose activity is most apparent.

THE proceedings of the Boundary Commission, which held its first sitting on December 2nd, will be watched with no little interest by all persons concerned in domestic architecture. The principles laid down for the guidance of the Commission include the maintenance, as far as possible, of existing boundaries; those of parishes being in no case intersected. With this provision, the object of the Commission is to divide the country, as far as practicable, into districts of equal population,—the unit proposed being 54,200 inhabitants per division. It is possible that the influence of this change, as far as it goes, will tend to the multiplication of houses in rural rather than in urban districts. At all events, the stimulus to urban building which is afforded by the desire to obtain a borough vote, will be weakened. More important, perhaps, than this will be the influence of the new districting of the country in the way of promoting self-government in matters connected with building. At the present time there are instances where the distance of a few yards,—as bringing a site within or without a borough,—makes all the difference as to whether a proprietor can build as he chooses, or whether he is subject to the control,—possibly vexatious,—of some urban authority. These differences will now tend to disappear, and that, we think, to the benefit of domestic architecture.

MR. FERGUSSON writes an article in the current number of the *Nineteenth Century* on the "New Cathedral for Liverpool," dealing with other matters also, but, as far as the Cathedral is concerned, advocating the adoption of a Classic type, and recommending a plan which he had drawn out years ago, as a kind of typical plan for a modern Renaissance church, before any talk had been made about a Cathedral for Liverpool. He places a shallow cupola on a crossing which is nearly a square, the angles only being slightly cut off, and which provides a larger arch on the cardinal sides, in relation to the diameter of the cupola, than in St. Paul's; and he proposes two western towers, somewhat on the type of Wren's Bow steeple, in place of a lofty dome at the crossing. We have a letter also which appeared in one of the *Liverpool papers*, expressing an earnest hope that "the committee will decide on having a cathedral designed on primitive lines, rather than a mere reproduction of a Medieval church." We have already urged the same course, both in regard to the architectural surroundings of the site, and the religious feeling and spirit of the present day, which a Medieval cathedral does not represent. Two things in Mr. Fergusson's article puzzle us; first, why he should depreciate, as he does, Wren's earlier design for St. Paul's (that of the model) which Wren preferred, and which we certainly think a finer design than the executed one; secondly, why he should go out of his way to bring in the west front of St. Alban's, and why he should appear so completely unconscious of its exceedingly bad detail. In spirit, we agree, it is the sort of thing that modern architecture should do; in detail it is, in many respects, coarse and vulgar in the extreme, and bad as it is, there is no proof that the person who claims the credit of it can "design," or ever has "designed," anything at all, or done anything else but pay the money and boast of his achievements. If Mr. Fergusson can appreciate the excellent Gothic detail of the Law Courts,—which, nevertheless, we agree with him in thinking a failure as a whole,—surely he

might have been expected equally to appreciate the exceedingly bad Gothic detail of the St. Alban's front.

IN the annual address at the Royal Society on Monday last, Mr. John Evans, who presided in the absence of Professor Huxley (who has gone abroad for his health), touched on the subject of metric weights and measures, recognising the value of the metric system scientifically, but intimating that the superior practical usefulness of the duodecimal system for everyday use was still a matter for argument. On the vexed question of a prime meridian, he suggested that France might meet the case by selecting some place on the same meridian as Greenwich—such as Argentan—as her nominal starting-point. The French objection to accept Greenwich, merely because it is an English town, is one of the most foolish pieces of national *amour-propre* on record. The chairman also referred to the proposal, at the Geodetic Congress at Rome last year, for a universal solar day of twenty-four hours, but expressed no opinion. The idea will furnish *Punch* with a few jokes for a time, and will probably in the end be quietly adopted.

WE learn from the *Gazette des Architectes* that the "Société des Amis des Monuments Parisiens" has resolved to demand from the Government a law visiting with decisive punishment the injury to, or "dégradation" of, works of art,—a kind of law which, we venture to think, they will find it more easy to talk about than to formulate in any practical manner. A committee of the Society has collected the remains of the former sculpture of the Pantheon and Ste. Geneviève, and another committee has been named to carry out a classification of works of art,—a very useful piece of work, which, we should say also would be a necessary preliminary to the talked-of legislation. The Society has recognised the necessity of asking the authorities for a sum of 50,000 fr. to prevent the destruction of the Porte St. Denis. Altogether, the society (of which M. Chas. Normand, 215, Boulevard St. Germain, is the hon. secretary) seems to be commencing its career in an energetic manner. We only hope it will not—like our analogous society—lose its head, and run into extremes.

THE Cambridge University Town and County Fine Art Association held its opening meeting on Saturday evening last, in the new Studios, St. Andrew's-street, Cambridge. Dr. Waldstein afterwards presided at a meeting in the adjacent Theatre Royal, at which Mr. Seymour Haden and Mr. Sparkes were present and made some remarks. We quite concur with the latter gentleman in his three great principles in the study of art, viz., to draw, and to draw, and to draw. It is a pity Mr. Seymour Haden should have committed himself to the statement that it was "a notorious fact in the profession that surgeons who could draw were the best operators." Some of the greatest surgeons of the day cannot draw a stroke, and no good purpose is served by making *ad captandum* statements of that kind.

A CORRESPONDENT writes:—"The care which is sometimes taken to recover facts about the dead who have died long ago is out of proportion to that which we take to preserve a record of the lately dead. On the 19th of last October there passed away, after some months of great suffering, an architect whose talents would have entitled him to a far more prominent place in his profession if he had thought the prize worthy of the struggle which must nowadays precede success, and who excited the most sincere respect in all who had dealings with him. Mr. Major Rhode Hawkins was the son of Mr. Edward Hawkins, sometime Keeper of Antiquities at the British Museum, and a prominent figure in literary and artistic circles of his day, and was born in 1821. He was educated at the Charterhouse, and passed thence first to the great building establishment of Mr. Cubitt, where he grounded himself in practical knowledge, and afterwards to the office of Mr. Blore. He then accom-

panied Sir Charles Fellowes to the East, and returning to England, commenced the practice of his profession as an architect. Amongst his works the Royal Patriotic Asylum at Wandsworth Common, the Church of St. Michael and All Angels in Præd-street, a church at Exeter, St. James's Church, Vicarage, and Schools at Birtswich, Yorkshire, and numerous smaller churches, schools, and parsonage-houses attest his constructive skill and artistic taste. For thirty-one years he was the professional adviser of the Committee of Council on Education. He was an assiduous collector of beautiful things, and the Surrey home in which he died was a very storehouse of examples of precious art selected with rare knowledge and discrimination. The writer knew him well, and only records the general sentiment in saying that he was both a skilful artist and a thorough English gentleman."

ONE of the most dangerous places in London is the junction of Northumberland Avenue with the Thames Embankment. During the daytime it is bad enough when cabs and carts fly over the wide crossing in all directions. We ourselves have seen one horse killed in a collision on this spot. But after dark the danger to foot-passengers and vehicles is further increased. All this arises from the want of a proper "refuge" in the centre of the roadway. This would not only be a place of safety for foot-passengers, but would regulate the vehicular traffic, and the Board of Works should place such a refuge in this thoroughfare without delay.

IT appears that a few days since there arrived, by the P. & O. steamer *Brindisi*, the first detachment of native Japanese who are to colonise a Japanese native village, to be opened shortly at Albert Gate. The affair seems to us to be a foolish one. Show villages got up in that way rarely show the real life or manners of a people, and the only effect will be probably to get up another little and local Japanese craze, just as the big one is dying out, and most people are beginning to come a little more to their senses on the subject. The Japanese, it appears, are now doing all they can to imitate English customs and dress, while people here will probably get the mania for imitating things Japanese,—a foolish paradox on both sides.

A LETTER in the *Times* of Thursday, signed "X," in relation to the decoration of the cupola of St. Paul's, takes the line that all the propositions made have been deemed undesirable, and that it will be "no matter for surprise if the Committee should, for a solution of their difficulties, and a satisfactory discharge of the semi-public duties confided to them, turn to the original plan of cowering the cupola of St. Paul's in accordance with the recorded mature experience of the architect of St. Paul's Cathedral." Concerning which we need only remark that, in the first place, to obliterate Thornhill's work, which has a certain artistic value, for the purpose of replacing coffers, which are a mere semi-mechanical expedient for breaking up a surface, would be a retrograde step little short of contemptible; secondly, that "the trace of Wren's pristine ideas now to be seen in the coffering above Thornhill's gloomy paintings" is a delusion, inasmuch as these cofferings are not real, but only painted imitations.

THE collection of Venetian drawings by F. N. Roussoff, now on view at the rooms of the Fine Art Society, should by no means be missed. Though M. Roussoff shows himself a good figure-painter, the majority of the paintings are mainly architectural in their subject and interest; and they exhibit a union of breadth and force of style with architectural truthfulness, such as is not often met with.

MR. WATTS'S grand but rather inexplicable painting, "Time, Death, and Judgment," has been reproduced in mosaic on the outside of the tower of St. Jude's Church, Whitechapel, forming an important incident in Mr. Barnett's admirable efforts to bring art

home to the East-end population. We should have thought a painting more simple in its idea would have been better suited to the occasion; and, for mosaic to be effective, it should have been further from the eye. With tesserae of the usual size it is impossible to model a face properly to be seen at only a few feet from the eye. The work was unveiled on Saturday last, when Mr. Matthew Arnold gave a very beautiful address in relation to it in the adjoining schoolroom.

#### THE COUNTRY BUILDER.

HE lives on the verge of a breezy common, bright with golden gorse. A shallow river of clear water courses swiftly by over its gravelly bed, and is seen in flashes of light between the trees whose drooping boughs frame the squat church-tower, and half obscure the sacred structure with their lace-like veil of now almost leafless branches. His house stands a little back from the skirting road, and the intervening "waste" is littered with the fantastic trunks of fallen elms,—monarchs of the forest and hedge-rew. Originally a simple weather-boarded cottage, his dwelling has expanded with the increasing family and fortune of its owner, and now forms a long irregular line of straggling structures, partly in wood, partly in ruddy brickwork, and partly in the bravely of freestone, "credits" from a neighbouring mansion, which he remodelled some years ago. The office, stable, and workshops continue the series, the latter gay with dabs and smears of bright colour with which the painters have experimentally adorned their sides, and which have a value in the general effect never contemplated by those artists. The yard is a medley of stone, brick, drain-pipes, tiles, cretings, and old lead. In the midst stands a sun-dial on a stone haluster-pedestal,—a perpetual reminder of the fleeting character of man and his works. The yard dies away imperceptibly into the orchard beyond where the saw-pits are, and where the children have established their swings and seesaws, partly for the comparative quiet and security of so remote a portion of the establishment, and for other reasons. There are apples on the trees, and blackberries in the enclosing hedges, and the railway runs along the further corner, and affords the youngsters opportunities for that shouting and waving of kerchiefs in which all country children delight. The office is a tight little apartment, 7 ft. by 6 ft., and by some artful adjustment and much mutual forbearance, it accommodates the jolly builder and his slim clerk. It has the smallest fireplace in the world, and one of the most primitive construction. The furniture is necessarily sparse, and intentionally far from sumptuous. A couple of wooden stools, home-made, very high, and uncompromisingly hard. Two deal desks, also home-made; a penny bottle of blue ink, and one ditto of red; some scraps of dusty blotting-paper, quite obsolete; memorandum-books and ledgers, some showy trade-cards, and a perfect forest of plethoric "files." Everything which is not huddled unceremoniously into the desk is impaled upon a "file," and hooked up to a nail in the rafters, whence the files depend like some new form of stalactite. The worthy builder is a manly man, of noble presence and proportions, so noble, indeed, that he has to sidle through his office-door to greet you. He was selected to serve on a local committee, on the ground that he complied expressly with the qualification, "a substantial householder." He probably weighs some seventeen stone, when "disarrayed as to his rest." What he may weigh as he stands is not to be conjectured. As he steps into that light spring-cart his horse steadies himself resolutely, spreading out his fore-legs as buttresses against the thrust of the deflecting shafts, and shows a sensible relief when the seat is safely reached and the general balance restored. Our friend's great coats are voluminous, vast, and weather-defying. One favourite garment would, he boasts, turn a week's rain. The pocket-books which he stows away in the recesses of his costume are big and bulky beyond all belief. It costs him a struggle to fish them up from their hiding-places deep down in his capacious pockets, and when caught and landed, with much accelerated breathing and redness of face, the wrong one generally comes first. His honest, wholesome face is brimming

over with good health and good spirits. Nature has carefully passed over it a flat tint of her choicest "rude," and the rich colour is preserved by draughts of home-brewed and daily drives in the brisk country air. His jovial countenance is set in a stiff frill of bristly brown hair. He shaves a square inch or so in the immediate region of his mouth, and lets the rest take its course. He has a pair of piercing brown eyes, full of bright intelligence, and not without a suspicion of a latent humour. At the penny readings over which the vicar presides, he will recite pieces of a sentimental and even savage cast, but on club nights, or the annual boan-feast, no one can sing a rollicking country song better than he. His humorous anecdotes would be effective but for their extreme antiquity. After some years they are received with impatience by his hearers, but they never fail to throw the good man himself into fits of laughter. He is a man of property, owning assual patches of land here and there,—to which he is continually adding,—and not a few of the cottages in his neighbourhood, building them in slack times rather than discharge his old bands. His men have an unbounded admiration for him,—a chance remark on his great depth of chest elicited the startling rejoinder that "It is not only in the chest as master's deep. He's pretty deep every way, sir, he is!" And by depth the speaker meant not cunning, and not guile, but wisdom. If a man cannot be a hero to his valet it is certain that he can be one to his foreman of bricklayers, which is just as good or better. During working hours and about his work he is reserved and even stern, as becomes a man of his occupation. His children meeting him in the yard fly before him like the fowls, and even the partner of his joys ventures upon no familiarities in business hours, but devotes herself silently to the house affairs. He is known in every town and village for twenty miles round, and respected wherever he is known. It has been his interest to cultivate the acquaintance of the agents, stewards, butlers, and housekeepers of all the great houses within his radius, and he has contrived to conciliate them all. The county gentry meeting him driving through the green lanes of Dampshire tilt the ends of their whips, and nod in passing. The slowness and deliberation with which he will, when on his rounds, conduct a conversation about nothing with the innkeeper or the blacksmith must be witnessed to be believed. If you want to know where the best ale is to be had in Dampshire and the neighbouring counties you may consult a less trustworthy authority than he. Needless to say that he is the soul of hospitality, and in more than one sense a cheerful giver. Once upon a time, calling by arrangement at his house we found him not,—bald thence by a summons he could not deny. A note awaited us, full of confused but sincere apologies for his enforced temporary absence. We were shown into the "parlour," where this embarrassing array of good things had been extemporised for our behoof, viz., about 2 lb. of biscuits; one bottle of port, freshly decanted; one ditto of sherry, ditto; one jug of foaming ale (strong, no doubt, and old); one bottle of whiskey; a plate of apples; one of oranges; one of nuts; a box of figs; a box of cigars,—quite new; one ditto of cigarettes,—ditto; a half-pound packet of tobacco (some used), and, prettily tipped with sealing-wax, a long, long pipe of the virgin clay. With trifles such as these, be thought, good soul! that one might beguile a brief half-hour. Nor was there the least suspicion of satire in this amazing preparation for the casual refection of a poor dyspeptic Cockney. The alternatives were offered with the instincts of a true gentleman, and we have never ceased to reproach ourselves for our want of breeding in leaving the whole untouched.

The good man is not without his weaknesses, but they are neither discreditible nor mean. He prides himself upon an accurate and minute acquaintance with London and its ways. He has been at much pains to inform himself of the geography of the less known portions of the great city, and the record character of his knowledge of out-of-the-way localities gives him a great importance in the eyes of the local butchers and grocers who confine their travels to Oxford-street, the Strand, or Cheapside, never in their annual visits deviating further than the Agricultural Hall on the one side or Kennington Oval on the other. These he looks upon as "home-keeping youths," and receives their

attempts to interest him in London and its doings with a supercilious smile which means that he should like them to tell him anything on that subject which he is not already "up to."

Another of his weaknesses is connected with his business. He has retained a special liking for the descent of wells, and will in this department admit no rival, looking upon young aspirants (wanted, a word of equivalent force with a minus sign) as upstarts (or ? downstarts) and nincompoops. He knows the depth, capacity, and idiosyncrasies of every well for twenty miles round, and many are the strange stories he can tell of the perils of those who go down into the earth in buckets and do business in deep waters. It is a fearful thing to watch him descend, candle in hat, down, down, down, until the light dwindles to a scarcely distinguishable spark, and the wearer is lost in gloom. A discreet helper accompanies him in all these expeditions who may be depended on to understand and obey the signals of his master. They go about their work silently, with set faces, as though they were engaged in some wicked trade, with consciences burdened by the accumulation of untold crimes. But there is a fascination to both of them in the risks run, and they court rather than shrink from fresh opportunities for their solitary enjoyment. Strange things are brought up in these excursions,—things which we cannot here describe. Not truth only,—or not only in the accepted sense,—lies hidden in wells, and when next the *Daily Telegraph* young man is in want of a basis of truth for his imaginative flights he cannot do better than spend an hour with our friend and "draw" him on the subject of wells.

Adieu, honest friend! We have known and loved thee from our youth up! "Such men as thou art England's pride," and long may your race be spared before it makes way for the inevitable mercantile gentleman with his machinery and "improvements" and new-fangled ways. We had rather explore thy rugged and picturesque "yard" than the most scientifically-arranged "contractor's" establishment, and the peace and quiet of your uneventful home-life has for some of us more attractiveness than all the joys that South Kensington itself can offer.

#### THE APHRODITE OF CNIDUS.

THE attempt to reconstruct in imagination the masterpieces of Greek antiquity from the dim distorted shadows preserved for us in Græco-Roman copies is heart-breaking work, and yet, however certain and painful the failure, so potent is the fascination that we cannot withdraw our hand. Praxiteles made a statue of Aphrodite which the goddess came over the waves from Paphos to see, and, seeing, approved,—a statue which the Cnidians themselves refused to sell for the payment of their city's debts. The marble image perished, but the memory of the statue of the goddess in her matchless, unveiled heauty has haunted men's minds, and goaded them to hunt through the museums of Europe for some echo, however faint, in statue, coin, or gem, of this masterpiece of Praxiteles. What they have found is briefly this: five statues, three belonging to the Vatican, one in the collection at Lowther Castle, one in the Glyptothek at Munich, all of them reproducing the same motive, Aphrodite standing near a water-jar, on which she lets fall from her left hand the drapery she has just cast off. She is about to enter or leave the bath, or possibly, as some have poetically suggested, the sea from which she rose. Add to these five statues three coins struck at Cnidus under Caracalla, the design of which is indubitably copied, however roughly, from the famous statue. Of the five statues the two best known, and on the whole, we think, the nearest to the original, are the Munich statue and the Vatican replica distinguished as Museo Pio Clementino, No. 574. We are glad that casts of these two have been chosen to represent the goddess in the new Cast Museum of the South Kensington Museum, not because we consider that the two statues are by any means of equal merit, but because their juxtaposition as replicas of the same original suggests certain reflections. We hold that the Vatican Aphrodite (in the catalogue No. 115) is far the finer of the two, and that the Munich copy represents a downward step in the degradation,—only too speedy,—of the Praxiteles Aphrodite type. Briefly for these reasons. First, the Vatican Aphrodite is distinctly letting fall her drapery;

it is just about to escape from her hand, the folds of the stuff all witness to the downward motion; there is no dragging, upward tension. This is further witnessed to by the distance between the figure of the goddess and the water-jar; she has evidently not advanced to pick up her robe, but turned away, and is dropping it negligently as she goes. All the intention of her posture is away, not towards, the drapery. Now, in the Munich copy, No. 116, the goddess is close up to the water-jar, and we should incline to say she was, or, at least, might be, catching up her drapery. One sees at once what a gulf there is between the two thoughts. In the one, Aphrodite is a goddess, who in her fearless innocence casts aside her robe and simply and unconsciously unveils her peerless beauty; in the other, she is a timid Susannah, catching up a garment to screen herself from the eyes of peering Elders. The authorities of the South Kensington Museum are to be congratulated for their good fortune in possessing a cast of the Vatican statue in its original simplicity, no longer disfigured and degraded by the stucco drapery imposed by the mock modesty of a prudish Pope. A second point of superiority we claim for the Vatican goddess: she is looking down quite simply and unconcernedly in entire unconsciousness; the Munich Aphrodite is looking down about her, as if on the alert for a possible spectator. Of course, in deciding the question which statue is nearest to the original of Praxiteles, we naturally claim the higher conception as his,—a copyist frequently degrades, rarely, if ever, improves. We naturally, also, refer to the Cnidus coin. We find the distance between the goddess and the hydria accords with the Vatican statue. Of the direction of the eyes we can scarcely judge, as the face is turned profile-wise, after the usual custom of coin art.

We think, then, that in the Vatican statue we have the highest nude Aphrodite ideal, and that nearest to Praxiteles. We cannot enter here into the question whether by thus representing the goddess entirely undraped, Praxiteles degraded the conception of the goddess altogether, and showed himself a near precursor of the downfall of art. Our own conviction is, that he did. There is about heauty undraped a certain sense as of a thing overdone,—a charm overrated, a last word said which vexes even sensuous enjoyment if it be refined,—we long for a little reserve, a little holding of the hand. M. François Lenormant makes the ingenious suggestion that the worship of the nude Aphrodite came in with the worship of the nude Anaitis, which was revived under Persian rule by a decree issued about the time of Praxiteles. We would gladly find any excuse for what seems slight reverence to an awful goddess. Be that as it may, we may safely welcome the Vatican Aphrodite and even the Munich goddess; for, though conscious, she is still delicate and refined. Surely these examples of the type might have sufficed. In a museum where space is very precious, and where, if our object were general criticism, we could note some glaring omissions, why is place to be found for a statue so utterly vulgar as the Venus de Medici? Winckelmann, who desired so earnestly to see the day that we see, and did not see it, has called this statue "a rose which bursts at sunrise after a beautiful dawn," but had he ever been allowed to see for one moment any fragment of the Phœidian age, how swiftly would he have unsaid his words. It is too much that a nation that possesses the maidens of the Parthenon frieze should be taught, in the words of the South Kensington catalogue, that this self-conscious, prurid, suggestive statue is "the embodiment of the highest ideal of a lovely woman in the early springtime of her beauty, arrayed in all the external attractions which can charm the senses and fascinate the heart. . . . it appeals at once to the senses and the hearts of all." If this Venus were considered too prominent an example among the known works of antiquity to be omitted, at least she need not have been thus disproportionately and insultably extolled.

**Building in Toronto.**—The Canadian correspondent of the *Liverpool Journal of Commerce* says that Toronto in building operations is getting ahead. Last year the total value of buildings erected was about 1,500,000 dols., but this year the amount is over 2,000,000 dols., exclusive of St. Mark's and St. Matthew's wards, annexed this year.

#### THE SOCIETY OF PAINTERS IN WATER COLOURS.

FOR once we do not feel quite inclined to join in the enthusiastic verdict which this exhibition usually tempts people into, that this is one of the best exhibitions they have ever had. It is not so good as some; it is a little quiet. Mr. Hunt exhibits nothing,—a great gap in itself. The loss of Mrs. Angell's exquisite work seems more felt every time the exhibition comes round. Mr. Tadema is not represented, and Mrs. Allingham is not at her best. We cannot get over these facts; but there is a great deal to be seen.

In the absence of Mr. Hunt, there is no doubt that Mr. A. Goodwin takes the highest place as an original water-colour artist; one who has risen above manner and escaped from the clogs of paintiness. "The River at Rest, Stratford-on-Avon" (90), is an exquisite piece of landscape steeped in warm, misty sunlight, and looking rather like a vision than a material work of the brush. Other works by the same artist show the variety of his powers; also, perhaps, a tendency to idealise nature a little too much, in scenes which do not profess to be those of fabric-laid. Mr. North is another idealiser, but with only one way of doing it, though that is a very beautiful way; still, the first question one asks before his "English Water-mill" (30) is, Can that be called "English" in any sense? Among landscapes of the more sober and real type, yet broad in handling, those of Mr. T. J. Watson stand out pre-eminent, especially "An Autumn Landscape, Surrey" (270). A very fine work of a more idealised class is Mr. Tom Lloyd's "Through the Barley Field" (220), an evening landscape finished down to the most delicate demi-tint effect, with two small children coming between the barley in the middle of the foreground. This is a very taking picture, but produces on one rather the same feeling as over-papered and polished up carving; in seeking after high finish and delicacy, force has been lost. There is plenty of the latter quality in Mr. Lockhart's "Auld Kirk of St. Monance" (51), where the old building is a solid heavy brown mass against the very distant and aerial sky; the broad manner in this and other works by the same artist, which leaves washes nearly untouched in texture and trusts to truth of tone for definition, is noticeable. Mr. H. M. Marshall continues his admirable views of London streets and localities; a very good one of Whitehall is seen in the present exhibition, besides a number of other drawings, among which "The Fish Pier, North Shields" (27), is, perhaps, the best. Mr. Thorne Waite sends a considerable number of small studies, he being one of the few who keep to the original idea of the Winter Exhibition as a "sketch and study" exhibition. The Princess Louise sends a very good drawing of the "Schloss Heidelberg" (97), a well-known Turner subject taken from the same point of view as Turner's drawing, and also a pencil sketch portrait of the Princess Victoria of Wales (142). Mr. Wilmot Pilebury's works present the same admirable qualities and the same limitations which we have before noticed. Among other good landscapes are those by Mr. Brierley, Mr. Eyre Walker, Mr. Naffel (especially 251); some architectural sketches in Rome by Mr. H. P. Riviere, and a subject by Mr. G. H. Andrewe, "The Temples of Selinuntum, Sicily" (253), exhibiting chiefly the huge drums of fluted columns lying about on the ground, which is of some interest to architects, and is a good work in itself. Mr. Wallis's "The Bishop's Tomb" (31) is another good architectural bit. Miss Mary Forster, the new Associate, has some beautiful drawings in true water-colour style, especially "Pembroke Castle" (286).

Among the figure subjects, the most pathetic is Mr. A. H. Marsh's "When Work is O'er" (57), which has a little of the inspiration of Masou in it, and, like Masou, shows us rather idealised nastics; but it is a fine thing, good to look at. Equally good in the most opposite way is Mr. Arthur Hopkins's "The Result of the Races" (209), a crowd of betting men, grooms, and other varieties of horse persons listening to the announcement by a coarse and forbidding person under a portico. There is character in every figure. Mrs. Allingham's best is the "Apple-tree Seat" (118). Two figures by Mr. J. D. Watson, "The Sliding Panel" (127), where a bravo, with sword drawn, is entering, and "Ash Wednesday" (168), a figure bowed over a chair in grief, are both exceedingly ex-

pressive in their way. Sir John Gilbert's "A Retreat" (172) is spirited, but like many other things he has done. Mr. Barker sends a pretty figure under the title "Scraps" (197); Mr. Poynter, some studies of heads (305, 310); Mr. Marks, two figures, entitled "An Argument" (324), oddly divided in the mounting, though they belong to the same subject; Mr. Walter Duncan, a couple of studies of foliage; and M. Du Maurier, two coloured drawings, which make us wish he would restrict himself to Black and White.

#### THE INSTITUTE OF PAINTERS IN OIL-COLOURS.

This exhibition, which is "like Cerberus, two gentlemen at once," for it is the "Institute of Water-Colour Painters" in summer and the "Institute of Oil Painters" in winter, opened as usual on the same day as the Society of Painters in Water-Colours, Monday last to wit. There are some pictures of great merit, with a fairly good average, but including a good many works of very little interest. The wall space is too large, in proportion to the objects and scope of the exhibition, to leave any chance of filling it worthily.

As in the case of the Society, some strong names are wanting or little represented. Mr. Abbey contributes nothing; Mr. Collier only two small drawings looking a good deal like replicas of former ones; Mr. Linton only a single figure, "The Knight" (352). Among the more important works, perhaps the very finest is Mr. Arthur Severn's sea-coast scene, "A Glean of Sunshine after Rain" (145). Heavy clouds float over the sea, just rendered lurid rather than bright by a touch of red light from a low sun; the sea, with its wave faces all turned away from the light, still retains the cold brown gleam of sea under a rainy sky. The attempt is bold, but successful, and the painting is full of poetic feeling. After this perhaps the works which are likely to attract most notice are Mr. H. J. Stock's imaginative or allegorical subjects, "He giveth His Beloved Sleep" (46) and "Two Lovers meeting after Death" (139). In the former a nude angel, not specially suggesting the idea of sleep, but fine in attitude, kneels beside a sleeping figure; in the latter two figures rush to embrace each other in a landscape which is purposely kept rather vague in its incidents. The colour of the first-named work is fine. In the two lovers the expression of the female, who has evidently been the first to enter into everlasting life, is very beautiful; she floats in the air and stretches out her arms with a calm and tender welcome; the other figure, still treading the ground, rushes towards her in rapture. Both works belong to that type of painted allegory which is dangerous ground, and in which some may perceive a certain ludicrous element; yet, with all the prosaic materialism around us in the painting of the day, we cannot but sympathise with an artist who aims at least at speaking to the heart and to the imagination. To aim high is to strike high; and Mr. Stock may end in accomplishing higher things yet. Mr. John Parker sends a life-size head of a young woman, entitled "Steady" (12), which is painted with much power. Among figure groups Mr. Joseph Clark's "An Appreciative Audience" (504) is in his best way as a study of "cottage life," and has the merit (not uncommon in his work, though) of being singularly well composed without obtruding "composition" on the spectator. Mr. Seymour Lucas has a large work under the title "Eloped" (517), not quite in his best vein, but among the leading pictures of the collection. To say truth, we have not, after all, been able to note much that gave one the higher kind of satisfaction that painting at its best affords. Among things that have a certain point and speciality we noted "A Woman of the Fields" (22), by Mr. G. Clansen; "Amateurs" (71), an "impressionist" work by Mr. E. Stott; "Salome" (84), by Mr. Melton Fisher; "St. Kilda" (222), by Mr. MacWhirter; "Portrait of A. J. Lloyd, Esq." (447), by Mr. Shannon; "Anticipation" (460), a capital study of cats and "still life," by Mr. G. E. Waller; "Afternoon, Early October" (465), by Mr. Mark Fisher (only, heaving Mr. Fisher's pardon, his tone for "early October" is precisely the same as in the works he calls "Early Spring"); "Here lies Captain Nicholas Comfrey, Master Mariner, Rother-

hithe, 1678" (525), a study of a delightful old tombstone with scrolls at the angles, by Mr. F. Murray; "Study of a Lion's Head" (641), by Mr. Heywood Hardy; "Sea Urchins" (669), by Mr. Wetherbee; and "De Gustibus" (698), by Mr. Dendy Sadler, a capital painting both in execution and character. In the interests of architecture we may note that Mr. P. Morris sends "A Wedding at St. George's" (766), in which the columns of the portico are only five-and-a-half diameters high. Odd that the eye sees only what it is trained to see. To an architect the column looks ridiculous at once, and yet here is a painter who has probably made a study from it on the spot, who deliberately paints it all out of proportion. He would never make a human figure so out of proportion, and a column is ever so much easier to draw; but he has not been in the habit of noticing its proportions. So we are made.

#### THE INTERNAL ARCHITECTURAL TREATMENT OF CUPOLAS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the third ordinary meeting of the Institute, on Monday last, Mr. Ewan Christian, president, in the chair, the discussion on Mr. Stannus's paper on "The Internal Architectural Treatment of Cupolas" was resumed.

Letters were read from Mr. Edmund Woodthorpe and Mr. J. G. Grace regretting their inability to be present. The latter thought that the decoration of St. Paul's should be strictly in accordance with its simple dignity, and any exuberance of subjects would be out of place. He agreed with Mr. Armitage that there should be a grand design, clearly defined, and almost flat, with slight shadows.

Mr. George Aitchison, A.R.A., said it was hardly necessary to repeat the thanks which had been already given to Mr. Stannus for his exhaustive treatise, which was one of the most valuable ever submitted to the Institute. As regards the proposed decoration of the dome of St. Paul's, he could only say that nothing would, in his opinion, be so disastrous as the postponement of the work. Our public buildings were crying in vain for completion by sculpture and painting, and if the work be now indefinitely postponed until the best of all possible designs can be got, a blow will be given to decoration from which it may never recover. Who can say that we should not become involved in a great war, and the adornment of our public buildings be postponed for a century, or perhaps for ever? Whatever might be said of the late Alfred Stevens's design, it was undoubtedly that of a man of genius. Owing to objections of the Committee to portions of this design, Mr. Poynter was asked to make certain modifications of it, and this modified design was now to be seen *in situ*. Sir Frederick Leighton undertook as a tribute to Stevens's memory, to make the cartoons for the larger circles at such a cost as would involve him in heavy pecuniary loss for a series of years; but this sacrifice could not be well asked for if some other design were substituted for Stevens's. When the country was able to secure the services of such eminent men for a nominal sum, it appeared to him to be the very height of madness to reject the offer. But some wisecracks said that our buildings should not be decorated until we could secure the services of an English Titian, and this reminded one of the Greek who swore he would never go into the water until he learned to swim. The triumphs of Titian, Tintoretto, Paul Veronese, Correggio, Raffaele, and Michelangelo were due to the antecedent century, when decoration was applied to every public building. By this means a school was formed, from which these transcendent geniuses were evolved, and we should be putting a stop to further excellence in mural decoration if we neglected the work of the greatest extinct genius this century had produced in England, carried out as proposed by two of the ablest painters of the day. If Stevens's design was to be rejected, and a fresh one made, in common courtesy Mr. Poynter and Sir Frederick Leighton should be first asked to give their views of what was appropriate, and the committee must be prepared to pay the current price for that design, and the subsequent cartoons.

Mr. Frampton contended that if panels were used they should be egg-shaped. The pictorial

work of the dome might be in fresco. A gold background, with either light or dark figures, would not produce an aerial effect. Gold was terribly opaque; it contracted the appearance of vastness, and as the glittering enemy of all solemnity, was unsuitable as a means for decorating the ceiling or dome of a grand cathedral. It might be used with effect in secular buildings where a gorgeous result only was desired. The dome of St. Paul's should be an ideal of the great azure canopy formed over this wondrous world, with a blue background representing the heavens, and the figures should be draped in whitish raiment, placed in spiral groups, and of majestic size. A magic lantern might be used for throwing the designs on the dome, and determining which was most suitable. He hoped the decoration would be carried out in accord with the sacred character of the building.

Mr. Emerson referred to what Mr. Stannus had said as to the necessity for the articulation of the dome with the subjacent architectural features. An attempt to carry out this proposition might lead to difficulties. Out of twenty-six of the most important domes, in only three did the internal decoration articulate with the enjacent parts, and in each of these cases the lines were carried down to the ground. Out of the twenty-six examples only four articulated with the axis of the architectural features under the vault, and in all the rest there was no suggestion of articulation with the subjacent parts. A subdivision of the surface into ribs seemed to hint at some constructive feature behind, which was a suggestion of false domical construction.

Mr. Edward Armitage, R.A., referred to the design by Mr. Wild which had appeared in the *Builder* (see p. 689, ante), and which, as a painter, he preferred to those which were cut up either by vertical ribs or circular panels. In Mr. Wild's design the painter had fair play; his groups and figures, whether good or bad, would at any rate be seen, and not smothered, as Mr. Poynter's were, by very questionable painted architectural details. No one blamed Mr. Poynter or Sir Frederick Leighton for this; the only regret was that so much good work should be thrown away where it could not be seen. The better the work, the greater would be the regret if this unfortunate arrangement of Stevens's should be adopted. He was not in favour of a revival of Gothic or Romanesque stiffness in the figures, but considered that the personages depicted in a Christian cathedral should be simple, calm, and dignified. This could only be attained by allowing the artist plenty of space to develop his groups. Where this was not allowed, he was forced to give unnatural attitudes to get them into the small panels allotted to them. In Mr. Wild's design he found four unbroken segmental spaces, each about 60 ft. long by 24 ft. perpendicular height, and this was a magnificent field for a painter. The figures he (Mr. Armitage) had sketched in were probably too upright, but he had exaggerated their perpendicular form to show the general nature of the composition, which might be termed a sort of zonal treatment. These figures would be found 13 ft. to 14 ft. high, and would be sufficiently large to be seen from below. When grouped in masses the angles at the top of the cupola would radiate from the centre and be about 11 ft. high. These arrangements might have to be considerably modified if the subjects were different, but he felt strongly that if figures were to be introduced at all into the dome there should be ample space left for their free development. It might happen that some day the dome might be brilliantly lighted by electricity, but even then the figures would be much better seen from below if grouped in large masses and not mixed up with painted architectural ribs and panels. He had no objection to ribs in a dome if treated architecturally. What he did deplore was their union with figures. The painted architecture chilled the figures, and the figures injured the architectural decoration. In spite of the authority of Michelangelo there seemed to be a want of reverence in making angels and apostles do duty as caryatides in holding up the architectural features. Before the decoration of the dome was settled he hoped the incubus of Stevens's design would have ceased to overawe the minds of those who had to deal with it. He was convinced that any arrangement founded upon it would prove impracticable and unjust to those who might be commissioned to carry it out.

\* See p. 637, ante.

Mr. Ralph Neville thought it was rather late in the day to pick holes in other people's designs, when they had come to discuss the question of the decoration of cupolas generally. The gold mosaic was always the valuable part in decoration wherever it was used, and anything put on it should be looked upon as a framework and ornament to it. No figures showed against the strong light of the gold mosaic, and it was the one thing which struck the eye. In all the earlier examples this was very much attended to, and little colour put upon it. One fine example was the beautiful little Church of St. Praxed, which Mr. Statham had referred to on the last occasion. No figure subjects would show up in the dome of St. Paul's under ordinary circumstances, and even gold mosaic would only show where the light caught it. The earlier examples showed that little colour should be used on gold mosaic. The rib treatment seemed to be a false treatment, and the only reason for introducing it was that as it was a serious thing to make a design for a whole dome, it was easier to divide it by ribs and treat each section separately.

Mr. Woodward could not understand how a man possessed of so much information as Mr. Stannus was could have connected himself with the two cartoons now hanging in St. Paul's. Three points had been enforced, viz., scale, originality, and articulation. It only required a moment's study of the designs now exhibited in the dome to see that they were utterly destructive to scale, not only bringing down the dome, but also destroying its glorious concavity.

Mr. F. C. Penrose, in reference to a remark of Mr. Woodward's, said that Mr. Poynter had nothing to do with the design on the podium.

Mr. Woodward contended that the ornament on the podium was of a vulgar character. In regard to the treatment of the upper portion, the circles were quite destructive of articulation, and discorded with the architecture. He had gone up to the Whispering Gallery, and even there it was impossible to distinguish what the figures were. They did not want pictures. Give the dome three coats of paint, and then distemper. [This seems to have been meant for a joke,—and a very poor one.]

Mr. G. A. Audsley could realise nothing in the conditions of the dome to call for the articulation of its design with the adjacent architecture. When they had got strong corner lines over the peristyle they had surely done with the substructure. If the divisions were vertical and few in number a grand design was impossible, and all mystery as regards form and dimension would be done away with. The details consistent with eight divisions again would produce a dwarfed effect, and the introduction of a few colossal figures would also help in this direction. The proper scale for the figures became a work of the greatest importance, and one worthy of exhaustive study and experiment. He would lay down the following propositions as to the decoration of the dome:—

(a) That the internal surface of a dome, circular in plan, must not have a vertically divided treatment; (b) that the surface of a circular dome, being uniform and unbroken, must not have any decoration calculated to impart a different character to it; (c) that if the surface of the circular dome must be divided by its decoration, it must be in the horizontal or zonal manner; (d) that the zonal treatment must not be so pronounced a character as to call special attention to the lines of division; (e) that subject decoration must admit of the introduction of a great number of details of moderate size, so that the dome may be increased in appearance to the eye of the observer; (f) that the subject must form one grand composition rather than be disconnected and isolated in its constituent parts; (g) that the subject must be one which, transferred to the domical surface, will not strain the eye of the observer, or strike it with a feeling of absurdity; and (lastly) that the subject should be one in which a certain mysterious and supernatural character prevails, and which should call forth the highest powers of imagination. The subject which presented itself with most force to his mind, as full of the most solemn mystery and grandeur, would be the glory in heaven immediately following the Last Judgment. Mr. Audsley read a description of his proposed scheme, arranging the figures according to the Mediaeval idea of the divisions of the heavenly hierarchy into Cherubim, Seraphim, Thrones, &c.

Mr. Blagrove considered the coffer treatment

was not only appropriate, but that intended by Sir Christopher Wren. He objected to any paintings of a Mediaeval character such as had just been described, and thought the subjects chosen should be in accordance with modern feeling and modern belief.\*

Mr. J. Douglass Mathews thought that the dome should be treated as a vault. The hemispherical form suggested the firmament, and it should be cut up into three horizontal divisions, indicating earth, sky, and heavens. A first-class fresco-painter would be more suited for the work than a painter like Sir Frederick Leighton or Mr. Poynter.

Mr. William White, F.S.A., believed that the picture of the Heavenly Jerusalem was the proper representation for such a dome. With reference to the employment of blue and gold, blue for distance was calculated to enlarge the scale, and anything in the shape of yellow or gold brought the distance nearer and lessened the scale. In such a dome as that, there ought to be a blue background, but on account of the bad light, it might have to be of the very palest tint. Large figures would be out of place, and life-sized figures would have no effect.

Mr. Penrose wished to remind the meeting that the Apocalypse was the subject now being carried out so far in the designs which had been put up.

Mr. Dawson thought that to picture the dome as the vault of heaven would be a delusion. It should be decorated so as to show itself as a dome supported by the peristyle. There should be no vertical lines to cut up the dome and diminish its size. It should receive, as far as possible, a free treatment, somewhat, perhaps, in the way of zones, and there should be no large figures to diminish it. He believed that gold would give the brightness which was required, and primary colours on white might be introduced with effect.

The Right Hon. G. C. Cavendish-Bentinck, M.P., said he was one of the members of the Committee on the Decoration of St. Paul's, and was one of a small minority who had persistently prevented its destruction by the late Mr. Burgess. No man had a greater admiration for Mr. Stevens than he had, but he did not approve of his design for the dome, as it was too ornamental. His own opinion was that it should be treated in a broad way, with pictures which would strike the eye, and not coffered. Far be it from him to depreciate the skill of Mr. Poynter or Sir Frederick Leighton, but few in the room would consider it desirable that the designs now exhibited should be put up in St. Paul's. It was much better that they should be rejected. [This statement was received with partial applause.] Sir James Thornhill's designs were not so bad, after all, when they were compared with the attempts which had since been made, and until somebody was found to surpass Thornhill, they should ask the committee to sit still.

Mr. Brydon agreed with the last speaker. Before they displaced Thornhill's designs they should have something very much better. The Committee had made a mistake in altering the original treatment by Stevens, which was better than the present design. The circles contracted the subjects and gave a certain restlessness which was not found in Thornhill's treatment. The present treatment of the podium was hardly what it ought to be. He thought they were beginning at the wrong end. If they had commenced with the decoration of the choir and nave they would have acquired greater experience for carrying out the important work of the dome.

Mr. Seddon said that he thought Mr. Stannus was to be congratulated, that one at least of the many who differed from him as to the principles for the decoration of the dome of St. Paul's, had had the temerity "to write a book," that is to say, to put on paper some realisation of his idea. The time since last meeting had been short for the purpose, but Messrs. Belham had kindly permitted their artist, Mr. H. Murray, whom he (Mr. Seddon) could claim as having been his pupil as to decorative art, to work out a scheme from his sketches and directions, on the basis of the picture by Sandro Botticelli, that he had referred to. Such as the drawing was, he left it, with deference, for criticism, aware that it must be abundantly open to such; nevertheless, he maintained that he felt confident that the principles upon which it was founded were the correct ones.

\* We entirely agree with Mr. Blagrove on this head.—Eu.

Mr. Stannus, in replying, said that in most cases the several speakers seemed to have answered each other. Zonal treatment was an superficial way of treating a great dome; it destroyed all sense of a cupola; and zones were common to cones as well as to hemispheres. He had seen most of the cupolas in Europe, and his experience was directly contrary to that of Mr. Emerson; nearly the whole of them were articulated, and the exceptions only proved the rule. With regard to the effect of a gold ground, he would ask them to go to St. Mark's and say whether it was undignified or irrelevant? Mr. Audsley had suggested several inside zones, but where were they to get room for them all? It would be like the man who wore breeches with horizontal stripes. With regard to the decoration of the podium, he had already stated that the apostle was too large, but this could be corrected. They all agreed with Mr. Armitage as to the necessity of simplicity in the figure drawings. This was essentially an architectural question; and the first thing was to do the best they could for the church in the sub-division. It was beginning at the wrong end to treat it as a gallery for painters. If they took care of the architecture the decoration would take care of itself. The way in which the speakers had differed among themselves, and the ill-considered and unsuitable treatments suggested, only showed that Stevens was not far wrong in what he had suggested. *Quid* scale, the characteristic treatment of hemispherical cupolas and originality, Stevens's design was incomparably superior to every other. The treatment most suitable for the cupola, they would find, if it were reasoned out mathematically, was the plane treatment of sections which gave circles. This, if carried out, would confer a dignity and distinction to their grand dome, which every other dome in Europe lacked.

The President, in closing the discussion, said he fully agreed with one remark in Mr. Stannus's reply: if they wanted to see how to decorate a dome, he also would say, "Go to St. Mark's!"

Votes of thanks were then passed to Mr. Stannus for his paper, and to the Dean and Chapter of St. Paul's, to Mr. Penrose, and others, for the loan of drawings and models.

At the next meeting a paper will be read by Mr. Lawrence Harvey on "The late Professor Semper's Theory in Relation to Architectural Ornament."

**The Drainage of Private Houses.**—The near approach of cholera has once more awakened public attention to the necessity of drainage improvements. The newspaper-reading community are called upon to "put their houses in order," and the assurance is given that then the cholera need not be feared. This advice, however, is far easier to give than to carry out. A great number of tenants in London and in many other large towns hold their houses on merely a three years' lease. It is not to be expected that they should incur any considerable expense for improvements which at the end of the short lease would enable the landlord to augment his rent and oust his tenants. On the other hand, the landlord almost invariably refuses to make the required improvements; nor do the sanitary authorities move in the matter unless the nuisance be of a very flagrant description. Finally, there is no fixed official standard as to what constitutes a well-drained house. In this respect the sanitary administration of Brussels is better organised than anything we possess on this side of the Channel. At the Hôtel de Ville of Brussels may be seen specifications given by the Service d'Hygiène of what the law imposes. If any lodger, tenant, or other person have reason to suppose that in any particular house the principles laid down by these specifications are not carried out, he has only to report the fact. An official inspection is at once made. If the landlord inquires from what source the complaint emanated, he is politely informed that that has nothing to do with the question. Either his house is in order, and if so there could be no objection to the fact being confirmed by the official inspector of the town; or the drainage is not in proper condition, and of course it would be only right that he should conform to the general regulations. Thus it is well known what should be done, who should do it, and how that person may be compelled to act, without the tenants or others being involved in any unpleasantness.—*Lancet*.

## Illustrations.

## CARVED BOSSES FROM LA MADELEINE, VÉZELAY.

THESE hold carvings, representing the symbols of the Four Evangelists, are from the roof of the "basse-chapelle," which was formerly the sacristy of the great Romanesque Church at Vézelay. They are reproduced from pen-drawings by M. Adolphe Guillon, the painter, who makes his summer home at Vézelay, and has paid much attention to the history and details of the church. M. Guillon has kindly furnished us with some drawings of other carved work in the church, accompanied by some notes on them and on the building generally, which will appear in our next or in an early number.

## SHANDON COURT, TUNBRIDGE WELLS.

THE additions to this house, as well as the stabling and lodge, are being carried out in red brick and stone, with Westmoreland slating. The interior of the house has been entirely remodelled, the main feature being an oak screen and staircase. The work, which is still in progress is being executed by Messrs. Foster & Dicksee, of Rugby, under the direction of Mr. Macartney, the architect.

## TRIFORIUM, WESTMINSTER ABBEY.

THIS careful-measured drawing of an exquisite bit of architectural design was one of those which gained its author, Mr. G. J. Oakshott, the Architectural Association Travelling Studentship earlier in the present year. Well known as the work is, a geometrical drawing of it to scale will not be thought a superfluous publication.

## EAST SUSSEX, HASTINGS, AND ST. LEONARDS INFIRMARY, HASTINGS.

THE design which we illustrate to-day is a modification of that submitted by Messrs. Young & Hall, in competition, two years ago, and which obtained the first premium. The original intention of the committee was to erect upon the site of the present infirmary a hospital, with accommodation for 100 beds, and an out-patient department; but in view of the very restricted nature of the ground, and the impossibility of extending it in any direction, it was decided to reduce the number of beds to seventy-five.

The principle frontage of the building faces the sea almost directly opposite the pier, and looks, therefore, almost due south.

The building is four stories in height, with a basement under a portion devoted to stores, cellars, &c.

On the ground-floor the out-patients' department is placed at the west end, advantage being taken of the road which runs at the end and back of the building, to obtain separate entrances and exits. Two rooms for each medical officer in attendance are provided, and in close communication with the waiting-hall are the secretary's office and the dispensary.

At the eastern end of the building is a ward for ten men, with ward scullery (or duty-room) adjoining. The central portion is devoted to the entrance-hall, house surgeon's rooms, and board-room. At the rear is a room for the reception of casualties or accidents, adjoining which is the operating-room. The latter is lighted and ventilated by a large lantern light, and has adjoining it a lavatory and store cupboards, for preparations, &c. In the casualty room is a large cupboard for instruments.

A projecting wing, corresponding to the casualty room, contains a separation ward for two beds, with water-closet and sink. This ward is isolated from the rest of the building by a cross ventilated lobby, and is intended to be used for doubtful cases, or those requiring isolation.

The mortuary and post-mortem room are placed in the north-west corner of the site.

The first floor contains a ward for ten men, a similar one for ten women, and two isolation wards as described above. The water-closets, &c., are placed in the angle towers, and cut off from the wards by cross ventilated lobbies. To each ward is provided a bath-room and lavatory, a food store, and cupboard for brooms, &c., and a ward scullery, or duty-room. The central portion of the front is occupied by the matron's rooms, and two day-rooms, one for each sex,

which can be thrown into one for use as a chapel, or for entertainments. On this floor access is obtained to the road at the back.

The second floor is similar to the last, except that the central portion is devoted to two children's wards, with nurses' room between.

The top floor contains one women's ward and a separation ward, the kitchen, offices, and the nurses' and servants' sleeping apartments and day-room.

Balconies are provided to all the wards, except the separation wards.

The large wards will all be warmed by double ventilating grates, specially designed by Mr. D. O. Boyd, with glazed tile sides and ascending flues. The smoke-flues and extraction-flues are all carried up on the exterior wall, and so arranged as to be swept from the outside. The corridors and passages, out-patient department, will all be warmed by hot-water coils, and the grates in all the smaller wards will be Boyd's Hygienic Grates.

Two lifts are provided, one for the conveyance of coals from the basement to the several floors. This lift will be a framework of ironwork, without any enclosure, the other for the conveyance of stores from the basement to the kitchen. This will necessarily be enclosed, but will communicate with the basements and third floors only, thus avoiding any possibility of its being a shaft for the conveyance of air from one ward floor to another.

The principal front is intended to be faced with red brick and Portland Stone, and from its prominent position is designed in somewhat more ornate a manner than is generally the case with hospitals.

## THE PLUMBERS' COMPANY AND TECHNICAL EDUCATION.

MR. GEORGE SHAW, C.C., and the Wardens of the Plumbers' Company, entertained a large number of gentlemen to dinner at the Albion, Aldersgate-street, on Wednesday evening, in commemoration of the Company's recent action in regard to the technical education of plumbers, and with especial reference to the Plumbers' Congress, which was reported by us at some length a few weeks ago.\* Many of the gentlemen who came from all parts of the United Kingdom to attend that congress were present at the banquet.

The Right Hon. A. J. B. Beresford Hope, M.P., in replying to the toast of "The Houses of Parliament," congratulated the Company upon its efforts to make the Guild a reality, and referred to the prominent part which the Master took, in conjunction with representatives of other City companies, in carrying into effect that piquant and delightful feature of the recent Health Exhibition, "Old London."

Among the other toasts was "The Plumbers' Congress," in proposing which the Master observed that for seven years past the Company had given attention to the promotion of technical excellence on the part of workmen in the craft with which its name was identified, and had instituted a system of examinations for workmen, by passing which a man might become entitled to the freedom of the Company, and to receive a sort of diploma or certificate of competence. The Company had also assisted in the formation and support of the City and Guilds of London Technical Institute; and, lastly, under its auspices was held the very practical Congress of Plumbers, attended by representative craftsmen from all parts of the kingdom. At that Congress important resolutions were passed, and steps were now being taken to give practical effect to them. In this work he believed the Company would be able to take an active part, for some of the powers which had been conferred upon it by charter centuries ago were applicable to the circumstances of the trade in the present day, and if the Company could secure the co-operation of the Metropolitan Board of Works, and of other local bodies, it would be able to do much to ensure good plumbing,—one of the most important elements in a healthy house. The full official report of the Congress was now issued, and would be found full of valuable and suggestive matter. With the toast he had great pleasure in compiling the names of Mr. George Godwin and Mr. Philip Magnus. Mr. Godwin had done so much for many years past in furthering the main object of the Congress,—i.e., in promoting the health

of the people,—that it was only right to associate his name with the great cause of sanitary reform. Mr. Magnus was well known as the Director of the City and Guilds of London Institute.

Mr. Godwin, in the course of his reply, said it was impossible to over-estimate the importance of the deliberations of the Plumbers' Congress, just as it was impossible to estimate the damage and loss of health and life caused by bad plumbing. The late Sergeant Parry and his wife owed their death to a bad joint in plumbers' work. Plumbing was called an "art and mystery" when the Company received its charter, and certainly since that time the plumbers had contrived to keep their work a "mystery," by hiding it up to an extent that very often made it impossible to get at without incurring great expense. He trusted that the Congress would bear good fruit. The report of its proceedings was exceedingly valuable, and ought to be distributed all over the country. If any special fund were raised for that purpose, he should be pleased to contribute.

Mr. Magnus said that if there was any practical branch of industry to which the principles of science might be considered applicable, it was plumbing.

Mr. Digby Seymour, Q.C., in an eloquent speech, proposed the health of the Master of the Company, to whose energy were to be attributed the steps which had been taken by the Company in promoting technical education for members of the craft. It had been due to the elevation to the chair of the Company of so practical and experienced a plumber as Mr. Shaw that some of the powers which were conferred upon the Company by its charter had a good prospect of being revived, to the benefit, not merely of the trade, but of the public at large.

The Master, in proposing "The Plumbers' Company," quoted from a handbill which had been distributed by a man who expressed his willingness to undertake "plumbing or general house repairs," and to take "any old lumber in payment." Such offers as this showed the great importance to the public of the steps which had been taken by the Company to secure competent plumbers.

## BRITISH MUSEUM LECTURES ON ASSYRIAN ANTIQUITIES.

IN the galleries of the British Museum, Mr. W. St. Chad Boscawen commenced on Wednesday afternoon a series of six afternoon lectures on the history and antiquities of the Assyrian and Babylonian empires. The subject of the opening lecture was the "Origin, Development, and Decipherment of the Cuneiform Inscriptions," and in addition to the inscriptions exhibited, the lecturer had a number of maps and diagrams to explain the subject. Mr. Boscawen said that the inscriptions in the cuneiform character have carried us back to an antiquity so remote that it would seem as though we were within measurable distance of "the threshold of history." In the simple, un pictorial, characters of the cuneiform syllabary we have a picture of the home of the inventor, his natural surroundings and animal companions. The lecturer then proceeded to show that the evidence afforded by the analysis of the character of the syllabary showed the inventors to be a people dwelling in caves in a mountain land where the pine and the vine grow, and where the bear and the wolf were the enemies of man; and where snow-capped mountains formed the resting-places of the gods. That this was not Babylon was at once apparent. The lecturer then proceeded to show that it was a tribe called the Akkadians who first worked out the elements of civilisation in the mountains of Southern Kurdistan, and brought them thence to the fertile plains of Shinar, and founded the tetrapolis of Nimrod. Some indication of the great antiquity was afforded by the fact that the inscription of Sargon of Agadhe, the date of which is now firmly established as B.C. 3750, was written in phonetic characters, thus indicating remoteness of growth and development prior to that remote time. Mr. Boscawen then described the way in which the cuneiform writing was borrowed by the Semitic people who had left their desert home to come and dwell in the cities of Chaldea. It was evident that trade had been the incentive, and that in adopting the writing they had exercised the same power of analysis and simplification as that which had enabled them to

\* See *Builder*, p. 553.

develop the Phœnician alphabet from the hieratic of Egypt. It was for these early traders that the syllabaries and bilingual tablets, full of the phrases of the market and the law court, had been drawn up. The cursive writing found in the valuable commercial and legal tablets from Waska—discovered by Mr. Loftis—was evidently the basis of the script of Nineveh and of the later Babylonian Empire. Mr. Boscawen then proceeded to show how the writing was transmitted from one nation to another. The Semites who left Babylon took with them the writing which became the beautiful court-hand of Nineveh. The lecturer then proceeded to show how the great linguistic families were represented in the cuneiform literature.

The remaining five lectures of the course will be delivered on the following dates, viz., December 10, 17, and 31; and January 7 and 14,—each day at 2.30 p.m.

#### ARCHITECTURAL SOCIETIES.

**Birmingham Architectural Association.**—The first ordinary meeting of the current session was held at Queen's College on Tuesday evening, December 2nd. The vice-president, Mr. W. H. Kendrick, was in the chair. The hon. secretary (Mr. Victor Scruton) read the report and balance-sheet for the past session, and pointed out that the financial position of the Association had never been so satisfactory as at the present time. The following gentlemen were nominated for membership:—Mr. F. J. Yates as an honorary member, and Messrs. W. S. Midgley and S. Payton as ordinary members. A paper was then read by Mr. T. W. F. Newton, entitled "The English Villa." A discussion ensued, and, after a hearty vote of thanks to the author, the meeting terminated.

**Leeds and Yorkshire Architectural Society.**—At a meeting of this Society, held on Monday evening, Mr. T. Prigdin Teale delivered a "conversational address on fire-places." Mr. Teale said he had accepted the invitation to lecture in connexion with that society in the hope of enlisting the judgment, the sympathies, and the active help of a profession which could do more than any other body of men to further the object he had set before him. That object was to revolutionise the fire-places of the kingdom, whereby coal could be burned more effectively and economically as a producer of heat, and at the same time the production of smoke be very materially reduced. In the national work of smoke abatement the architectural profession could give most efficient aid, as in its hands rested almost invariably the designing of the fire-places of new buildings. He had discovered that nearly every existing fire-place could be made more effective, more perfect in the combustion of cinders, and more cleanly, without any structural alteration, by the simple expedient of closing the hearth chamber with a movable shield, which he had called an "economiser."

**Edinburgh Architectural Association.**—The usual fortnightly meeting of this Association was held in the Professional Hall on Monday night. The President, Mr. G. Washington Brown, was in the chair, and after some preliminary business, introduced Mr. James Anderson, who read a paper entitled "Roofing Slates and Slating." The lecturer, having treated of the geological nature of slate, proceeded to treat of slating, as to which he said the English and foreign style was to use slates of one size from eaves to ridge, fixed to laths, and pointed with lime inside, the slates being of the lightest description. The Scotch style was to use thick slates of various sizes, arranged before commencing, and fixed to sarking-boards. The largest slates were put on at the eaves, and then diminished in size to the ridge. The tile-stones, or grey slates of Forfar and Caithness, were those with which a large portion of Old Edinburgh had been slated. They were hung on laths, with pins of oak, pine, and other woods, as well as with the bones of small animals. There were three most important points to be looked to in slating,—the pitch of the roof, the cover, and the bond of the slates. The pitch should be as nearly square pitch as possible. The cover should be, on a good pitch, from 3 in. at eaves to 1½ in. at ridge. Should the roof be deep or the pitch flat more cover ought to be given. Sometimes 7 in. to 8 in. of cover was necessary at the eaves where the wall-head was broad. It was impossible to give short and thick slates more than about 2 in. cover, as the tails would be tilted. The

bond was quite as important as the cover in keeping roofs water-tight, for, if the bond were insufficient the cover was of no avail. The bond on the slates should not be less than 3 in. or 4 in. at eaves to 2 in. at ridge. In conclusion, the lecturer said he would impress upon architects the necessity of providing easy access to chimney-heads and avoiding traffic on the slates. These accesses need not be unsightly to be efficient, and roofs so protected would not require repairs for many years.

#### ROBERTS'S RAIN-WATER SEPARATOR.

We give a section of this clever contrivance for approximately separating the foul from the cleaner water of rainfall. The detailed description is as follows:—

A. Removable strainer with perforated plate to prevent rubbish passing into separator. B. Outlet for water to pass to separator. C. Separator balanced on pivot. D. Small compartment into which the rain-water first falls. E. Small hole fitted with washer proportioned to size of roof. F. Larger hole to take the overflow from D during moderate rain. G. Discharge-pipe. In a storm the water fills the compartment D, and flows over the top of this pipe. H. Small holes at back of G between compartments. When the rainfall exceeds the discharging capacity of hole B, the water rises in compartment D, and passing through holes H, slowly fills compartment F. When the weight of water in F overbalances the separator, it is canted (as shown in drawing), and the water (by that time pure) directed by the discharge-pipe G into the storage-pipe K. L. Small hole at bottom of compartment J. M. M. Auxiliary-pipe for keeping compartment J full after the separator is canted when the rain is leaving off, so that the last drop of rain may be stored. By raising the slide N a third and a fourth hole can be opened at H; this will cause the compartment J to fill more rapidly. The whole of the water passes through the discharge-pipe G which conveys it into the waste-pipe O so long as it remains uncanted. The length of time it remains in this position, running the water to waste, is regulated by the slide N to suit the smokiness of the locality. The dotted lines down the centre indicate the position of the iron frame to which the apparatus is attached, provided with holes for fixing to the wall.

Section of Separator in action: Pure Water passing to storage.

**The State of the Thames.**—The condition of the Thames at Twickenham has become very bad, and the Twickenham Local Board, dissatisfied with the steps taken by the Conservators, have unanimously resolved to request the Local Government Board to receive a deputation upon the subject, and to ask the county members and all other Parliamentary representatives interested in the matter to accompany them. Strong remarks were made upon the alleged apathy of the Conservators in allowing so great and dangerous a nuisance to exist, the vast accumulations of sewage mud on foreshores being specially referred to.—*Times*.

#### MR. COMMISSIONER KERR ON ARCHITECTS' COMMISSIONS.

At a meeting of the St. Pancras Board of Guardians, held at the Vestry-hall on the 27th ult., on the question of warning the St. Pancras Infirmary at Highgate a desultory conversation occurred over the proposal to ask Mr. Bridgman, the Guardians' architect, to propose a plan for the new warning apparatus.

The Chairman (Mr. Commissioner Kerr), repeating an observation he has several times made respecting "the waste of the ratepayers' money in paying architects these commissions," said this job would probably cost 2,000L., and five per cent. upon that would just put about 100L. into Mr. Bridgman's pocket, which might all be saved if the Board did as any private person would do, viz., lay out 5s. in an advertisement for plans and estimates, and they would get dozens without costing the parish a penny. (1)

Mr. Robinson and Mr. Drew thought it would be dangerous to let strangers come in and pill the workhouse to pieces without an architect's supervision.

Ultimately it was explained that though the Committee had given partial instructions to Mr. Bridgman, the parish would not be liable if the work was not done.

#### ARAB ART.

SIR,—In your notice [p. 684, ante] of Mr. Reginald Stuart Poole's very interesting lecture on the domestic architecture of Cairo, you were kind enough to speak in terms of approval of some drawings of mine to which Mr. Poole referred in illustration of his remarks.

Fully conscious that these drawings, partly from smallness of scale, do not adequately explain the materials employed in the construction of the ceiling, and in the mural decoration of Cairo houses, I trust you will allow me to supplement them by a few observations tending to show that in strength and solidity they yield in no respect to European structures, and that they are, in many respects, more calculated to resist the vicissitudes of a Northern climate than our own dwellings.

I am fully aware of the difficulties which beset a layman in discussing questions relating to architecture; it is, therefore, with great diffidence that I venture to dissent from some of your remarks concerning the construction of Saracenic buildings in Egypt. The ceilings, so far as I can recollect, were never of plaster, but of solid wood, the beams being in some cases exposed to view, and richly decorated, or, in other instances, planked and enriched by thin laths nailed upon the surface in geometrical patterns. The stalactites and honeycombed recesses were also of wood, thinly plastered and then gilt. Good examples of this work are to be seen at South Kensington, in a collection the value of which it is to be hoped will some day be enhanced by sufficient space being allotted to it.

The use of tiles for wall decoration is by no means universal in Cairo; but where they occur their value in the general scheme of colour is incontestable, and the facility with which they admit of cleaning would render them peculiarly appropriate for use in our smoky cities.

The use of plaster for mural decoration seems to have been adopted by that branch of the Arab race which settled in the Barbary States and in Spain, where, as in the Alhambra, it is employed perhaps to excess, but with such exquisite taste that few could cavil at its adoption.

A style at once more manly and better adapted to domestic architecture prevails in Cairo, and it is with special reference to the conservation and the better understanding of that branch of the art that the promoters of the movement, with which I am glad to see you sympathise, now desire to call attention.

I trust that you will afford me the opportunity of bearing testimony to the soundness of Mr. Poole's views as to the value of the study of Saracenic art. FRANK DILLON.

\* \* \* The value of the study we never questioned; only the application which seemed to be suggested.

**Letts's Diaries.**—The series for the year 1885 is now out, and fully sustains the character which this collection of business memorandum books has long enjoyed for constantly-increasing excellence and completeness.

## THE DOME OF ST. PAUL'S.

SIR,—If you are publishing the discussion which took place at the Institute on Monday last I should be obliged if you can find place for the following notes on Mr. Stannus's winding-up speech.

He dismissed the remarks I had made with the statement that I was unfair in my sweeping assertions and in quoting the examples I did, as his outline illustrations on the wall showed distinctly articulation, and that he had purposely kept out of the discussion Oriental domes, the question referring only to Occidental domes.

The examples quoted by me were all the largest and most important domes in the world, while of the few he had drawn with which to illustrate his supposed axiom, there were only two of any size or importance, and most of them articulate with the parts immediately under the cupola, and not particularly with the main adjacent divisions or axes, which is the real point of my argument, as I maintain this principle throws the cupola out of scale.

Again, whatever in principle applies to one large dome applies to another, but what applies to a small dome is absolutely inapplicable to a large one, whose effect depends upon its size.

Also to discard Oriental domes is absurd, and evidently a sign of weakness, for the principle applies equally to Oriental and Occidental domes, and the East has supplied us with infinitely more examples of broad domical treatment than the West. It is not a question of detail, but principle.

I may say I have been obliged to study the question of domes, having had to design three, which have been erected; and with the exception of four of the examples quoted, I have seen them all.

With regard to the drawing of eccentric circles on a black-board, put forward by Mr. Stannus as illustrating the effect of a zonal treatment, it was simply puerile, for without the most wonderful shading and aerial perspective, the effect of a dome could not be shown in that way at all; and without the adjacent parts,—which the eye cannot help seeing in a measure,—in reality, even the faintest true relative effect could not be obtained. This was clearly demonstrated by the clever water-colour drawing on the same principle exhibited in the room.

I feel constrained to put forward these few remarks, being sure that no one competent to judge can help feeling that Mr. Stannus's design is simply a bad emasculation of Stevens's, which latter, whether correct in principle or not, would at least be in scale with the cathedral, being divided into more parts.

It is a broad fact that if large figure subjects are introduced in connexion with false architectural lines, the dome will be utterly spoiled as to its grandeur, for the divisions must be too large and out of scale, and Stevens evidently felt this.

WM. EMERSON, F.R.I.B.A.

## THE WATERLOO WELL, KILBURN.

SIR,—Many of your readers, in taking a trip by road to rural Wilsden, will miss the Waterloo Mansions which extended along the high-road from Wilsden to the Brewery, Kilburn. The mansions are fast disappearing, and the estate will soon be offered to the public for building purposes. They belonged to the Buckley family, of which the late Rev. — Buckley, vicar of St. Mary's, Paddington-green, was a prominent member, and were built about the Waterloo year and named after the victory that destroyed the power of Napoleon Buonaparte and established the prestige of England. Among the rest of the well that specially commemorated the event and supplied the estate with water until superseded by the mains of the West Middlesex Waterworks Company, is doomed, and, in due course, is to be filled up. Can nothing be done to preserve a historical monument mentioned in "Old England"? Last week, Mr. Benjamin Barlow, Plastow, and Mr. George Austin, London, the gentleman superintending the demolition, descended the well to make a survey. To their courtesy I am indebted for the following information:—

The well throughout is built of brick and cement. It is 8 ft. in diameter and 400 ft. deep. From the surface to the level of the water the distance is 170 ft., while the water measures no less than 230 ft. to the bottom. At 330 ft. there is a bed of chalk. This had to be bored some 70 ft. before the spring was gained. The well was supplied with pumping machinery and a pump. The latter is fixed 50 ft. under the water. When originally sunk a man was sent down at the week to pump for the estate, and supplemented his income by charging 1d. to every visitor for water to the well, and 1½d. for

distribution among the cottages in the neighbourhood. The well adjoins the pavement in the high-road, and is between the garden-wall of Nos. 3 and 4, Waterloo.

WILLIAM GEORGE DE GRUYTERE.  
Kilburn, Nov. 26, 1884.

## LEASEHOLD AND FREEHOLD TENURES.

SIR,—It is very much the fashion to attribute the evils of modern housebuilding to the restrictions of leasehold tenure. After some experience of building estates, I have arrived at the opposite conclusion. Many years ago, hoping that freehold tenure might induce builders to erect a more substantial class of house, I advocated the adoption of that system. The result has proved that the builder, left to himself, even with restrictive covenants, runs up worse buildings on freehold than on leasehold land. He will build that which will produce the highest price at least cost to himself. *Caveat emptor.*  
ARTHUR J. BAKER.

## STONE BRIDGES.

SIR,—Would you, or any of your correspondents, kindly oblige me with information on the following points?

1. Which were the earliest stone bridges built in England and in Scotland?
2. Which are the oldest stone bridges now existing in England and Scotland?
3. What are the best books to consult regarding them?

W. S.

## CHURCH BUILDING NEWS.

**Birmingham.**—The Bishop of Worcester has consecrated the first portion of the Church of St. Agnes, Moseley, near Birmingham, which has been erected on a site given by Mr. F. Willmot. The portion of the church now finished includes the chancel, clergy and choir vestries, organ-chamber, and about one-third of the nave. The style of the building is Gothic, of the Geometrical character, with somewhat elaborate ornamentation. The extension of the nave and aisles, and the erection of a north porch with tower and spire, are left to the future. The architect under whose superintendence the church has been carried out is Mr. William Davis, of Colmore-row, Birmingham, whose plans were selected in competition; the builder is Mr. W. Moore, of Aston New Town.

**North Berwick.**—The Bishop of Edinburgh has laid the foundation-stone of the new chancel of St. Baldred's Church, North Berwick. The sum of 1,000l. having been collected by the incumbent, the trustees sanctioned the commencement of the work, which includes a chancel of 18 ft. 6 in. long, the widening of the old apse on each side, the construction of an organ-chamber and a clergy vestry on the north side of the chancel, and the moving of the belfry from the west to the junction of the chancel and nave. The following improvements are to be carried out under the direction of Messrs. Seymour & Kinross, Edinburgh, and it is hoped that they will be completed by Easter.

**Pennycomequick (Devonport).**—A meeting of the parishioners has been held to consider the steps to be taken to provide church accommodation for the new population which has sprung up in the eastern side of the parish of Stoke Damerel. The Rev. W. St. Aubyn, the rector, presided, and explained that it was proposed to build in sections a new church on a site which would be given by Sir John St. Aulay in the land opposite Stuart-terrace, on the Pennycomequick-road, and that he had funds at his disposal which would meet the greater part of the cost of the first section. Plans prepared by Mr. J. P. St. Aubyn were examined and considered. It was resolved that it was desirable that the proposed church should be built, and the first section proceeded with as soon as practicable.

**Birtley.**—Birtley Church, North Tyne, has been opened by the Bishop of Newcastle, after having been closed for six months for restoration. The total cost of the work executed has been 1,900l. Mr. Arthur B. Plummer, of Newcastle, is the architect; Mr. William Welton, of Birtley, is the contractor for the masonry, &c., and Mr. William Knox, of Consett, for the carpentry. The east end has been entirely rebuilt, and Mr. Coppin has presented stained-glass windows by Messrs. Powell, of London, for the three lancet lights. A stained-glass window by Messrs. Wailes & Strang, of Newcastle, has also been presented by Messrs. A. & W. and Miss Robson for the nave. An ambury and other ancient

remains were discovered in the course of the work. The tiles in the chancel have been laid by Messrs. W. B. Wilkinson & Co., of Newcastle, and the ironwork is by Mr. Smith, of Hexham.

**Blackburn.**—The foundation-stone has been laid of a new church in St. Paul's parish, Blackburn, dedicated to St. Barnabas. The building will be in the Early English style of architecture, and will contain 722 sittings. The estimated cost is about 7,000l. Mr. Varley, of Blackburn, is the architect.

**Staverton.**—Staverton Church has been reopened after restoration. The cost of the work has been 900l. The present church consists of a fine and lofty tower, with a nave, north aisle, and chancel, erected probably about A.D. 1350-1370, some of the windows, however, being of an earlier, and some of a later date. The restoration has comprised a new nave roof, new wood and tile floors in the nave, and new stone floors in the chancel, open bench seats of pitch pine being provided for the nave in place of the old pews, and choir stalls of the same material for the chancel. The western gallery has been removed and the tower arch opened out, the ringers being provided for by an intermediate floor. The plastering of the walls has been removed, the masonry being neatly pointed instead, which gives a pleasant effect to the interior. A warming apparatus, by Porritt, of Leicester, has been fixed under the nave floor. The works have been carried out by Mr. Gee, of Daventry, under the superintendence of Mr. H. M. Townsend, architect, of Peterborough.

**Ongar (Essex).**—The old church of St. Martin, at Chipping Ongar, has just had a new south aisle added to it, from the designs of Mr. C. C. Rolfe, architect, Oxford. Much of the ancient edifice dates from a remote period, and the south wall, which was taken down to make way for the extensions, was over 3 ft. thick, and composed in the main of old Roman tiles, measuring 1 ft. 3 in. by 7½ in., and varying from 1¼ in. to 1½ in. thick, and flints, all so firmly concreted together that their tearing asunder was a work of great difficulty. The new aisle is Early English in character, and built of red brick, with Bath stone dressings. The windows are triple lights, and the roof is covered with sheet lead. A stone arcade now divides the nave from the new aisle. The roof is exceptionally massive in its construction, and entirely of English oak. It is ornamented by bosses, spandrels, and paterae, carved in the solid wall-plates, and the sculptured oak angels, each projecting 4 ft. 6 in., and bearing shields on which are carved the emblems of the Passion, form a conspicuous feature. These figures, and the stone and wood carving generally, have been carried out by Mr. Harry Hems, of Exeter. The new seating is of oak, the bench ends having foliated terminations. Mr. F. Noble, builder, of Ongar, carried out the masonry and brick-work, and Mr. H. Barlow, of the same place, the woodwork.

**Aston Rowant.**—The parish church of St. Peter and St. Paul, which has been recently restored, consists of nave, chancel, and western tower, with short north and south aisles. The walls of the nave are of the twelfth century, and there are remains of the twelfth-century windows and a door. Previously to the restoration it had become much mutilated, and at the western end the walls were tied together with iron bars. There was a western gallery blocking up a very beautiful and early fourteenth-century arch leading into the tower. An interesting feature in the work was the discovery of the original altar slab with the consecration crosses thereon still visible. This massive slab of stone has been mounted upon an oak frame and now stands a "movable table," though weighing scarcely anything less than a ton. The walls of the church are mostly of flint, and some excellent work has been done in the way of faced flint work by the builders. The work to the chancel was done by Mr. A. Groves, of Milton-under-Wychwood, and the remainder by Messrs. Silver, Sons, & Filewood, of Maidenhead, the whole being from the designs and under the direction of Mr. Edward G. Brnton, of Oxford, architect, and surveyor for the diocese.

**Female School of Art.**—Her Majesty the Queen has shown her appreciation of the work done in the Female School of Art, Queen-square, Bloomsbury, by purchasing seven fans of original design painted on silk, which were included in the late Exhibition of students' works.

## DISSENTING CHURCH-BUILDING NEWS.

**Croydon.**—A Congregational church is about to be erected in the London-road, West Croydon, for the Rev. J. P. Wilson, from designs prepared by Mr. W. D. Church, architect, South-place, Finsbury. Accommodation is provided for nearly 1,000 persons. The building will be in the Early Decorated style.

**Edinburgh.**—The foundation-stone has been laid of a new church in Drumsheugh-gardens, for the congregation of Free St. Andrew's, which is to supersede the present church in George-street. The new church is to be Renaissance in style, from the designs of Messrs. Douglas & Sellar, of Glasgow. It will have an imposing frontage, rising to a height of 100 ft. Three arched gateways open into a large vestibule from which branches off a corridor encircling the whole interior, affording ready access to all parts of the area. A large gallery is placed over the vestibule, and narrow galleries will pass along two sides. The interior is to be lighted by sixteen large windows, placed in a clearstory. The cost of the new building will be about 15,000*l.*

**St. Stephen's-by-Launceston.**—A new Wesleyan Mission Chapel has been opened at St. Stephens-by-Launceston. The walls are of local stone with Portland dressings, and the roof is covered with Delabole slate. The building has been erected by Mr. William Burt, contractor, from plans, &c., supplied by Messrs. Wise and Wise, architects, Launceston. The estimated cost is about 340*l.*

**Seacombe.**—The memorial stone of a new chapel for the accommodation of the United Methodist Free Church congregation at Seacombe has been laid. The total cost of the new chapel, including the price of the site, will be about 800*l.* and 900*l.* It will accommodate 300 worshippers, and is expected to be opened about February next. The contractors for the work are Messrs. E. and R. M'Gloch, Seacombe, the joiner work being entrusted to Mr. J. W. Clarke, Seacombe.

## STAINED GLASS.

**Upper Norwood.**—Two more two-light windows of a series of ten in All Saints' Church, Upper Norwood, have just been filled with stained glass. They illustrate the presentation of Samuel David slaying Goliath, Elijah restoring to life the Son of the Widow, and David in the Lions' Den. The artists are Messrs. Mayer & Co.

**Norwich.**—A new memorial window has been inserted by Messrs. H. & F. Enlard in the east end of the chancel of the church of St. Michael at Coslany, Norwich. The window is of the Decorated period, and has been copied from the old stones found embedded in the wall during the recent alterations. The central subject is the Descent from the Cross, and above the lights are to be filled with the four Evangelists. The glass has been prepared and fixed by Messrs. Heaton, Butler, & Bayne, of London. The architect for the work was Mr. E. Preston Wilbns, Norwich, the builder being Mr. Hubbard, of East Dereham.

**Bishopscourtne.**—The memorial window erected in Bishopscourtne Church to Richard Hooker, "that learned and judicious divine," has been unveiled. Richard Hooker was rector of Bishopscourtne at the time of his death in the year 1600; and the only known memorial of him was a very poor slab monument in the south wall of the church, erected in 1633 by Sir William Cowper. The idea of a memorial window originated with the present rector, the Rev. T. Hirst. The glass has been executed in accordance with the style of art prevalent during the fourteenth century. The window is a large one of five lights, and the subjects illustrate incidents from the latter part of our Lord's life, beginning, in the left-hand light, with the "Entry into Jerusalem," and continuing with "The Last Supper," "Agony in the Garden," "Bearing the Cross," "Crucifixion," "Taking down from the Cross," "Entombment," "Resurrection," "Descent of the Holy Spirit," and finishing in the upper part of the centre light with "Our Lord in Majesty." In the lower part of the window is a predella of smaller subjects, forming types of those above. The work has been designed and executed by Messrs. Lavers, Westlake, & Co., of London, at a cost of about 430*l.*

**Loughor.**—A new window is to be placed in the church of Loughor, in memory of the late

Canon Powell Jones, of Llantrisant, and some time of Loughor. The window, representing the Transfiguration, was executed by Messrs. Heaton, Butler, & Bayne, of Covent-garden, from the design of Mr. J. B. Wilson, of Swansea.

## PROVINCIAL NEWS.

**Exeter.**—The first section of the extension of the Devon and Exeter Albert Memorial Museum, which was commenced in August, 1882, is now completed. The extension necessary to complete the whole of the buildings will entail a cost of between 5,000*l.* and 6,000*l.*, but the outlay on the section just completed, which was all the Extension Committee felt justified in undertaking at the time, will be somewhat in excess of 2,000*l.* The buildings just finished complete the north wing, and consist mainly of two large rooms, one on the ground-floor, which will be used for the extension of the library, where space is much needed; while the first floor will form a fine-art gallery. Each of these two large rooms is 65 ft. 6 in. long by 29 ft. 6 in. wide, and both are admirably lighted, the ground-floor by means of side-windows, and the art-gallery from the roof.—A new building has been added to the Devon and Exeter Hospital, in the shape of an out-patient department. The building lies at the end of the hospital near Magdalen-road. The builders are Messrs. Scadding & Son, and the architect is Mr. Medley Fulford.

**Newcastle-on-Tyne.**—The new Branch Post-office on Newcastle Quayside has been opened for business. The new office occupies the lower part of a block of buildings occupying a site on which several old offices formerly stood. The block of buildings, in which the new post-office is placed, is the property of Mr. Thomas Harper, and the architect was Mr. J. C. Parsons, of Newcastle.

**Stockport.**—The new building for the Higher Hillgate Liberal Club has been completed and opened. It has a frontage 47 ft. in length to Charles-street, off Higher Hillgate. The outside walls are 17 in. thick, cased. Stock brick is used in the front, and stone dressings. The building has been erected from the designs and under the direction of Mr. George Atkinson, architect, of Stockport, who also devised the special arrangements for heating and ventilating. The contractor for the building was Mr. Barlow, and the sub-contractors Messrs. Froggatt & Briggs, timber and stone; Mr. Henry Torrington, plumbing; and Mr. Charles Clarkson, slating.

**Hastings.**—The foundation stone of a new concrete groyne for the protection of the Fishery, was lately laid by the Mayor. The cost of the work will be about 10,000*l.* Sir John Cooke is the engineer. Messrs. Lee are the contractors.

**Birmingham.**—Before the alteration and extension of the Midland Institute buildings took place, some very useful and costly instruments for meteorological purposes had been made and presented to the Institution by Mr. Pollett Osler, F.R.S. These consisted of self-registering gauges for wind and rain, the former showing not only its direction, but its force; and also a barograph, or self-registering barometer. This latter is a most peculiar instrument, having its inches and parts three times lengthened, so that very minute changes of pressure are easily recognised. The alterations to the buildings necessitated the removal of the whole of these instruments, and no place was found convenient in which to re-erect them, as the lofty new buildings overshadowed the vanos. No doubt this ought to have been foreseen, and provision made by the erection of a proper tower. This, however, was not done, and, excepting the barograph, which is an independent instrument, they have all been out of use since, much to the regret of many in the town. Recently it has been found possible to utilise the old monument in Monument-lane, near the reservoir, for the purpose of these instruments. It is hoped the curator will find it convenient to record the daily readings in Paradise-street in the very graphical manner in which they were formerly presented, and which was so much appreciated. Mr. Alderman White signalled his year of office as Mayor by placing a barometer and thermometer, in bronze metal case, at the side of the principal entrance to the Council House, and it would be a very useful addition to the conveniences of the town if some standards of length (from a chain downwards) were placed where our tapes, chains, and rules in every-day use could be readily tested.

## The Student's Column.

## IRON ROOFS.—II.

**B**OWSTRING trusses are commonly employed for roofs of large span, especially for those of railway stations. The bow consists of an arched boom or rafter of I-section generally formed of a wrought-iron plate web, to which another plate or flange is riveted at top and bottom. A roof of this kind is shown by fig. 5, where A, B, C, D, E is the boom or curved

Fig. 5.

rib above described; B F, C G, D H, E K being struts of cast or wrought iron of cross-section which are in compression, and are attached to the tie-rods A F, F G, &c., by means of couplings; the braces B G, C F, &c., are in tension and may be of round or flat bar iron.

One of the earliest roofs of this kind was that erected in the year 1847 over the Lime-street Station at Liverpool, which has a span of 153 ft., and a rise of 30 ft., the depth of the truss at the middle being 12 ft. The boom is of I-section 9½ in. deep and 10 in. wide; the cross-braces C F and D G are omitted in this truss. The trusses are placed 21½ ft. apart and the purlins are 12 ft. apart. The struts B F, C G are wrought-iron of I-section 7 in. deep, the tie-rods have a sectional area of 6½ in., and the cross bracing is of round iron 1½ in. diameter.

A somewhat similar roof of much wider span was afterwards erected over the Birmingham station, of which the span is 212 ft. and the rise 40 ft.; the boom is of I-section 15 in. deep and 12½ in. wide. The struts B F, C G, &c., are twelve in number and are all vertical, each being of cross-section formed of four L irons bolted together at top and bottom and made to swell out in the middle by pieces of cast iron inserted to keep them apart. The cross-bracing B G, C F, &c., is of flat bar iron ½ in. thick and from 3 in. to 5 in. in depth. The tie-rods A F, F G, &c., are of round iron 4 in. diameter, and screwed into couplings at F, G, H, &c. The depth of the truss is 23 ft. at the middle.

The roofs of the Cannon-street and Charing-cross stations in London are good examples of the bowstring truss, the former having a span of 188 ft. with a rise of 60 ft., and a depth of truss at the centre of 30 ft. This roof has a boom 21 in. deep and 14 in. wide of I section; there are eight vertical struts of cross section formed of pairs of T-iron bars; the diagonal bracing is of flat bar iron, 6 in. deep and ½ to 1 in. thick. The tie-rods are of round iron 5½ in. diameter.

The Charing-cross roof has a span of 164 ft., a rise of 45 ft., and the depth of the truss at the middle is 20 ft. The boom is 18 in. deep by 12½ in. wide. The vertical struts are of ½ in. T-iron, 6 in. by 3 in., and the diagonal bracing of ½ in. flat bar 4 in. wide. The tie-rods are of round iron, 4½ in. diameter at the centre, and 4½ in. at the ends next the wall.

The diagram of struts can be drawn for a bowstring truss in the manner described in the former article, by assuming the lines A, B, C, D, &c., to be straight lines or chords of the arc, which will be quite near enough for all practical purposes.

In some cases the arched boom or rib is made of sufficient depth to dispense with the struts, a tie-rod being placed across from foot to foot of the rib, and held up by ties suspended from the rib. An example of this kind of roof is to be seen at the Victoria Station, London, where the roof of that over the Chatham and Dover Railway has the rib formed of lattice work with a span of 123 ft., and a rise of 41 ft.; the depth of the ribs is 4 ft., and the tie-rod is 19 ft. below the bottom of the rib at the middle, being held up by fifteen oblique ties. The rib is built on the lattice principle, and is divided into thirty-two equal compartments by double struts of T-iron at right angles to the arch, between which are cross braces of flat bar iron riveted to the top and bottom booms, which are each formed of a pair of angle irons riveted together. The tie is formed of three bars of flat iron, 4 in. deep, placed side by side, and jointed where the

non-rods from the rib are attached. One end of the rib is supported on rollers to provide against the effects of changes of temperature. The roof of the Queen-street Railway Station, Glasgow, is on this plan, the span being 170 ft. and the rise 44 ft.; the middle of the tie-rod is 15 ft. above the springing, and is held up to the top by six suspension rods. The ribs are 4 ft. deep, and latticed with a single brace between each strut, on what is termed the "Warren" principle.

Sometimes the arched rib is employed for a roof without any apparent tie to prevent it from rusting out the supports, as in the case of the great roof of the Midland Railway Station in London. Here the span is 240 ft., which is covered by a rib in the form of a pointed arch, having a rise of 102 ft. The lower part of the rib is shown by fig. 6, and is solid up to D, E,

Fig. 6.

and of open lattice work above, with a depth of 4 ft., and width 1 ft. 4 in. The tie, however, in this case is obtained by means of continuous iron girders laid under the railway, and supported on columns in the basement story. These being fixed to the feet of the ribs prevent any thrust from acting on the outer walls. The base is fixed on an iron shoe, A C, bolted down to the bottom of the wall; the horizontal girder, B C, which acts as a tie, being connected with this shoe.

When the metal of the rib in this roof expands by heat the rib will rise at the centre, and fall again as it gets cold. It is calculated that the utmost pressure that can be thrown on this roof will not produce a greater strain than 1/4 tons per square inch of section of any portion. The main ribs are placed 20 ft. apart, and there are three intermediate ones between each pair: the purlins are 18 ft. apart and 4 ft. in. deep, framed with top and bottom of T-iron and braced between; these being fixed between the upper and lower flanges of the curved ribs serve to give them lateral support.

The roof over the St. Enoch station at Glasgow is constructed on the same principle as the above; the arched rib, which is elliptical and has a span of 198 ft., being held in at the feet by a base-plate 13 ft. long carried under the platform and held down by bolts. The rise of this arch is 80 ft. and its depth 5 ft., the construction being that of a "Warren girder."

Another roof of similar construction is that over the Manchester central station, having a span of 210 ft. and a rise of 85 ft.

Arched roofs without horizontal ties are frequently erected where sufficient strength of abutment can be obtained to contract the thrust. The central roof of the Agricultural Hall, Islington, is a good example of this kind

of roof and has a span of 124 ft., the ribs being formed of wrought-iron lattice-work and cast-iron struts with purlins of similar construction. Each rib is supported on two cast-iron columns to which the girders of the side galleries are attached and form an abutment for the central roof.

The roof of the Derby Market-hall is another specimen of the same form of arched roof, the span being 86 ft. and the ribs semicircular, their depth being 28 in. and consisting of a web of plate-iron perforated with quatrefoils, riveted to pairs of angle-irons at top and bottom. The purlins are 18 in. deep and of open lattice-work with top and bottom flanges formed of angle irons. The ribs rest on cast-iron columns, and the abutment is formed by cast-iron spandrels which support the side roofs on a level with the springing of the ribs.

The semicircular roof over the central transept of the Crystal Palace, which has a clear span of 104 ft., is so constructed as to cause little, if any, thrust on the abutments. The height of this roof above the ground-floor being over 100 ft. to the springing, and the situation being much exposed to the wind, it was necessary to give it great stiffness. This has been done by making the ribs 8 ft. deep, with double lattice bracing between the booms, which are formed of pairs of angle-irons riveted to a 1/2-in. plate, 10 in. wide. A portion of the rib is shown by fig. 7. The rib rests on the top of a pair of cast-iron columns at A and B, united together by a circular cast-iron frame, G, and strongly braced by the cast-iron girders H K, which carry the floors of the galleries. The struts at C D are of wrought iron, and those at E F, of which there are ten in each rib, are of cast iron, and have the purlins attached to them. The purlins are 6 ft. deep, and of lattice-work, similar to the ribs. The main ribs of this roof are 24 ft. apart, their great depth giving them all the stiffness of a girder, and the lateral abutments being only necessary in order to resist the action of the wind when blowing upon one side of the roof.

Fig. 7.

In the examples we have quoted of arched roofs, the ribs have had the same depth throughout. This is not always the case, however, the depth at the haunches being often greater than at the crown, which is the correct form of a rib, since the strain is least at the crown and greatest at the haunches. In the arched roof of the Dublin Winter Palace the depth at the haunches is double that at the crown, the span being 50 ft., and the depth at the crown 18 in. The arched ribs of the Paddington Station are also made deeper at the haunches than at the crown, the span of some of them being 102 ft.

Another kind of iron roof sometimes used for covering railway stations, is that formed of horizontal lattice girders thrown across from wall to wall, with longitudinal girders resting

upon them. Upon this framework is constructed an ordinary ridge-and-furrow roof, covered with glass or slate. The largest roof of this kind is over the central station, Glasgow, of which the span is 213 ft., and the depth of the girders is 20 ft. A similar roof covers the Citadel Station, Carlisle, where the span is 154 ft., and the depth of the girders 15 ft. The pressure of the wind on a roof of this kind is much less than on one of high pitch.

An article on "Iron Roofs" will be found in the Builder for June 21 last, p. 883, vol. xlvii.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

46, Improved Fireproof Building. E. L. Garbett.

The tabular bricks or courses which are here used are made in various curved patterns, and their resistance is strengthened by iron ties. The sections of the moulded brick-tubes are varied according as they are to construct stairs, a floor or terrace, a gabled or a hipped roof. The claims do not set forth any improvement in fireproofing, only dealing with construction according to the inventor's ideas.

2,377, Improvements in Chimney-pots. W. Beddows.

The improvement here is in the fixing of a stay fastened inside or outside of the chimney to which the chimney-pot is afterwards affixed. The security against damage by reason of high winds is very great, as the fastening, although simple, is effective. Projections or snugs are moulded on the ordinary terra-cotta chimney-pot, and holes or slots are made through these to receive the top of the iron stay, which is then either cottered or fastened by a bolt and nut. In building new chimneys the metallic stays can be built in as the work proceeds, the top ends being bent under from the inside to the position of the hole or slot in the snugs or projections on the outside. If the improvements are applied to existing chimneys the pots are placed on as usual, the metallic stays being fixed on the outside of the chimney. The lower ends of the stays are bent and driven into, and the brick or stone work being strengthened and fastened by nails in the various joints in the brick-work of the chimney.

153, Improvements in the Manufacture of Cement, &c. R. Stone.

The object is to effect improvements in the manufacture of cement by crushing and grinding the same while in a red hot state, and also to effect improvements in the machinery to be used in such manufacture. Kilns are built with air-chambers or reservoirs surrounding them. Into these reservoirs cold or hot air is pumped or forced by machinery. Special machinery is designed for grinding and crushing the material to a fine powder. Corrugated rolls are first used, then fine grinding rolls, and an adjustable bed plate. An improvement is also made in the form of the pestle and mortar; the mortar being formed of chilled cast iron, with grooves cut in. The pestles are of similarly hard material, solid or hollow spheres, and they work without the inconvenience of lower bearings and their lubrication is avoided.

APPLICATIONS FOR LETTERS PATENT.

- Nov. 21.—15,324, G. W. Usill and W. Fyfe, Pipe Joints and Jointing.—15,325, W. Watson, Decorative and Ornamental Designs.—15,324, F. Hobbs, Set Cement for Lead Light Glazing.—15,333, T. S. Lamb, Ventilators and Chimney Cowls.—3,243, W. Vincent, Roofing Tiles.—14,230, H. J. Allison, Rendering Buildings Fireproof.—14,368, H. Holroyd and J. Lang, Automatic Flushing Syphons.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

Table with columns for property address, date, agent, and price. Includes entries for Wandsworth, Dover, Battersea, Stockwood, Westland, Croydon, Old Bond-street, Deptford, Brockley, Harpenden, Belgravia, St. John's Wood, Islington, Russell-square, Old Kent-road, Lamber-18 and 19, Kingsland-road, Bernamsey, Notting-hill, Milton, Parrock-road, St. John's Wood, Fortis-green, Barnsbury-square, Islington, 76, Upton-road, and York.

Table of property sales with columns for address, agent, and price. Includes entries for Kensington, Notting-hill, Haymarket, Stratford, Holloway, Hammersmith, Southwark, Regent-street, Mile-end, Spitalfields, Victoria Park, Mile-end, Kennington, Kentish Town, Islington, 27, Brewery-road, Marylebone, Enfield, Dalton, Lower Sydenham, Laurel-terrace, Albert-terrace, and various other locations.

Table of property sales with columns for address, agent, and price. Includes entries for Enfield, Dalton, Lower Sydenham, Laurel-terrace, Albert-terrace, and various other locations.

Table of meetings with columns for date, time, and location. Includes entries for Monday, December 8 (Surgeons' Institution, Mr. Shaw's paper, Mr. E. Smyth on Arithmetic of Compensation, Parke's Museum), Tuesday, December 9 (Institution of Civil Engineers, Dr. Peal's Ecclesiastical Society, On Modern Ecclesiastical Art, Anthropological Institute), Wednesday, December 10 (British Museum, Parke's Museum), and Thursday, December 11 (Parke's Museum, Society of Antiquaries, Society of Arts).

Miscellaneous. Highbury.—A parish room for Christ Church, Highbury, has recently been built by Mr. Nightingale, of Lambeth, from the designs of Mr. J. Douglass Mathews, of Dowgate-hill. It consists of a hall to seat 300 persons, with large class-room in rear, and scullery, &c. The interior, as well as the exterior, is faced with yellow bricks and redbrick bands. The roof is open-timbered and hoarded, with ventilation chamber in upper portion. The total cost will be about 1,400l.

The New Railway to Gravesend.—The new line of railway which will give the London Chatham, and Dover Company direct access to Gravesend has just been completed, and is intended to be opened for traffic at the commencement of the new year. The railway leaves the Company's main line at a point between the Farningham-road and Fawkham Stations, about twelve miles from Rochester passing for a considerable distance through a chalk cutting, the remaining portion of the line to Gravesend being, for the most part, on embankment. There are three stations on the line, namely, Southfleet, Rosherville, and the terminal station at Gravesend, which is situated within about 150 yards from the margin of the river. In connexion with the line a strong pier has been constructed. It extends out into the river for a distance of 200 yards, where the depth of water is about 20 ft. at low tide, and where vessels of 5,000 tons' burthen will be enabled to come alongside. The pier is opposite the new Tilbury Docks, now in course of construction. The works have been carried out under the superintendence of Mr. Charles Douglas Fox, the engineer, Mr. G. B. Bruce jun., being the contractor.

Novel Method of Strengthening a Bridge Pier.—When the Chestnut-street Bridge over the Schuylkill river, at Philadelphia, was built a score of years ago, the foundations of the piers were laid on piling, and not upon the rock, which at this point is about 50 ft. below the surface. The soil is a clayey mud, and almost from the very beginning this slippiness made slid gradually year by year, carrying with it the piles and heavy stone pier above. The stonework shows cracks and fissures, and the settling of the ironwork is apparent. In the hope of preventing any further sliding, a novel plan has been adopted, which consists in sinking four cylinders at an angle of 45 degrees and extending from the rock to the foundation of the pier. These cylinders are of 4-in wrought-iron, 8 ft. in diameter, and when completed and in place, they will be filled up solid with concrete. They are built underground, each segment being about 3 ft. long and 2 ft. high, backed by heavy angle iron on all sides to allow of bolting together. The scene of operations underground is reached through an iron shaft leading to the surface and covered by an air lock. Operations have to be carried on in compressed air, to prevent the influx of water.—Iron.

Antwerp International Exhibition 1885.—The Lords of the Committee of Council on Education have received information through Her Majesty's Principal Secretary of State for Foreign Affairs that Her Majesty's Consul at Antwerp has been appointed British Commissioner for the International Exhibition which is to be held at Antwerp next year and that Mr. P. L. Simmonds has been appointed by the Executive Council of the Exhibition at Antwerp their Agent-General for Great Britain and Ireland. The Exhibition in question is a national undertaking under the immediate patronage of His Majesty the King of the Belgians and of the Belgian Government. The President of the Exhibition is H.R.H. the Count of Flanders, and the Vice-President the Minister of Agriculture, Industry, and Commerce. The office of the Agent-General is at 35, Queen Victoria-street, and communications from intending exhibitors should be addressed to him there.

A National Park for New South Wales.—The Government of New South Wales have reserved one of the finest and most picturesque portions of the colony for a national park. It is situated in the Illawarra district, and embraces an area of 36,000 acres, having a frontage of 7 1/2 miles to the Pacific Ocean. The park generally may be described as high table-land from which, at numerous places, excellent and extensive views are obtained of the ocean, Port Hacking, Botany Bay, Sydney, Randwick, &c., with deep gorges, and rich flats covered with beautiful foliage, bordering running streams of the purest fresh water. The high table-land to some extent consist of comparatively barren stony heaths and of fair to good land, the latter in areas suitable for formation of recreation grounds, and encampment grounds, or of plantations of ornamental trees, &c., situated at elevations of from about 350 ft. to about 900 ft. above high-water mark. The park will be made easily accessible from Sydney by the Illawarra Railway, now in course of construction.

R. Daves, Norwich .....	899 9 8

\* Accepted.

For making and draining, with sewer and surface-water drains complete, certain new roads on the Grove Estate, Muswell-hill, for the Imperial Property Investment Company, Limited, 57, Moorgate-street, E.C. Mr. G. H. L. Stephenson, surveyor:—

Flacey, Hornsey .....	£5,475 0 0
Bell, Tottenham .....	4,700 0 0
Wilson, Welhamstow .....	3,992 0 0
Dunmore, Crouch End .....	3,529 0 0
Adams, City (accepted) .....	3,440 0 0

For new house at Moseley, Worcestershire, for Mr. Walter Clarke, Mr. T. W. F. Newton, architect, Waterloo-street, Birmingham. Quantities by Mr. Henry Clere, Bennett's-hill:—

Barker & Sons .....	£2,969 0 0
F. T. Erley .....	2,968 0 0
Spagote & Sons .....	2,599 0 0
T. Rowbottom .....	2,559 0 0
J. Bower (accepted) .....	2,497 0 0

For block of four seven-roomed cottage villas, with iron fencing and Stafford blue brick paving, at Chesham, for Mr. A. Hinson. Mr. T. Foster Woodman, surveyor, St. Albans:—

C. Monk .....	£774 0 0
---------------	----------

For new mahogany and plate-glass double shop front to premises in the Old London-road, St. Albans, for Mr. T. Hunt. Mr. T. Foster Woodman, surveyor:—

Harris .....	£115 0 0
--------------	----------

For forming a hard road with grips at Batlow, Tring, for the executors of the late Mr. H. Cox. Mr. T. Foster Woodman, surveyor:—

Rowland Bros. ....	£245 0 0
--------------------	----------

For the erection of Wesleyan Chapel, Ashbourne-road, Derby, for Mr. John Wills, architect, Derby. Quantities by Mr. Robey E. Carpenter, Horninglow-street, Burton-on-Trent:—

W. Fletcher .....	£4,504 0 0
Edward Wood .....	3,900 0 0
Isaac Porter .....	3,800 0 0
Thos. Bakewell .....	3,850 0 0
John Wood .....	3,831 0 0
Walker & Slater (accepted) .....	3,595 0 0

For erection of Wesleyan Chapel, Frye Crosses, Frosham. Mr. John Wills, architect, Derby. Quantities by Mr. Robey E. Carpenter, Horninglow-street, Burton-on-Trent:—

J. Littler (accepted) .....	£1,400 0 0
-----------------------------	------------

For the erection of two houses in Pemberton Gardens, St. John's Park, Upper Holloway. Mr. Marshall N. Inman, architect, 7, Bedford-row, W.C.:—

One house.		Two houses.	
W. Sayers .....	£905 0 0	£1,888 0 0	
Horne .....	836 0 0	—	
G. Pearce .....	773 0 0	1,693 0 0	
G. Stephenson .....	760 0 0	1,431 0 0	
Priest & Stephenson .....	759 0 0	1,370 0 0	

\* Accepted.

For the restoration of Cannington Church, Somerset. Messrs. Down & Son, architects, Bridgwater:—

Peares, Minehead .....	£1,635 12 0
Kitch, Bridgwater .....	1,693 0 0
H. W. Pollard, Bridgwater .....	1,489 0 0
Merriett & Son, Glastonbury .....	1,475 0 0
Harris & Tapscott, Bridgwater .....	1,367 10 0
Spitzer, Taunton (accepted) .....	1,350 0 0

Accepted for new shop-front for Mr. Alfred Hays, New Bond-street:—

F. Sage & Co. ....	£210 0 0
--------------------	----------

Accepted for new shop front and fittings at shop under the Royal Exchange, for Messrs. E. Dent & Co.:—

F. Sage & Co. ....	£118 10 0
--------------------	-----------

**The Rowland Hill Benevolent Fund.**—The Lord Mayor makes a special appeal to the public on behalf of the Rowland Hill Benevolent Fund, of which he is a trustee, and which has for its object the relief and assistance of Post-Office employes distressed from poverty, age, or infirmity, and of their widows and orphans throughout the United Kingdom. When it is remembered that the number of persons employed in the Post-Office is over 53,000, and that the absolute need of some such organisation as this becomes apparent. As a memorial of the late Postmaster-General, it has been determined to set apart a limited portion of the Fund,—to be called "The Farwell Memorial Fund,"—for the benefit of those employes or their widows or orphans who may be afflicted with blindness. Subscriptions for this special purpose should be sent to the Lord Mayor, at the Mansion House.

**Bedford.**—Now class-rooms in connexion with the Harpur Trust Grammar School have been opened by Earl Cowper, the Lord-Lieutenant of the county. The new building contains a useful suite of class-rooms, which have been in use since the beginning of the present year, and provides accommodation for about 300 boys,—a necessary provision for a school that has risen under the present headmastership from 270 in 1875 to 584. Mr. Basil Champneys, the designer of the new schools for girls on the Bromham-road, was the architect of the new class-rooms, and the work was successfully carried out by Mr. Samuel Foster, of Bedford and Kempston.

**Tramway Depot at Camberwell.**—The skating rink in Camberwell New-road, which has been closed and standing idle for some four or five years since the skating-rink mania collapsed, has just been purchased by the London Railway Company, who are about to erect an extensive carriage depot and stables on the site. The property, which adjoins the London,atham, and Dover Railway, covers an area of about three acres. The materials of the buildings on the site have been sold during the present week. The new buildings will include labelling for about 100 horses.

**Ward & Lock's "Technical Journal."**—We have received an advance copy of Part I. of this periodical, which is to be a kind of encyclopaedic journal of technical science and industrial arts and processes. It promises a great variety of technical information in a popular form. We hope the promoters will not fail by attempting too much. They give with the first number a folding supplement sheet containing "about fifty types of different styles of domestic architecture." These are very bad, and had much better have been omitted. The letterpress seems fairly written.

**Exeter.**—The Church of the Sacred Heart, erected from designs by Messrs. Leonard Stokes, of London, and Charles Wray, of Exeter, as opened on the 18th ult. It is built of 'estleigh stone'; and for the internal facings pounce stone has been principally used. The windows are filled with tinted glass, and the seating is supplied by a Musgrave patent stove. The floors throughout are laid with wood blocks on the patent system of Messrs. Geary & Walker, of Manchester. Exclusive of the site the cost is about 10,000*l.*

**"Old Japanese Art."**—This was the subject of a paper read on Tuesday evening by Mr. Robert M. Young, architect, before the members of the Belfast Natural History and Philosophical Society. The subject was discussed by Mr. F. H. Patterson, M.R.I.A. (hon. secretary), Rev. Canon Grainger, Mr. J. J. Murphy, and the chairman, all of whom expressed the indebtedness of the society to Mr. Young for his interesting paper.

**New Process of Photographic Printing.**—Messrs. Marion & Co. have just introduced a new photographic printing-paper, by means of which prints can be obtained from a negative during the winter in a few seconds, which would require by the ordinary photographic paper process at least half a day. Here is the new paper puts a new power into the hands of photographers.

**Widnes.**—A new Catholic day school for boys, in connexion with St. Bede's Catholic chapel, Appleton, Widnes, and capable of accommodating 400 scholars, has been opened. The school is two stories in height, substantially built, and provided with several class-rooms. The style is Gothic, and the architect is Mr. Colow, of Liverpool and St. Helens.

For the erection of warehouse and stabling for Mr. Robert Seely, Balgait, Lincoln. Messrs. Bellamy & Hardy, architects. Quantities supplied:—

Table listing quantities supplied for warehouse and stabling, including items like Codd & Eberger, Cowen & Landow, J. Greenwood, etc.

For erecting new mission hall and schools, Mere-road, New Erington, Leicester. Mr. W. S. Burton, architect and surveyor:—

Table listing quantities supplied for mission hall and schools, including items like E. Walker, J. Ellingworth, J. Maston, etc.

For town-hall and market-place, Carlow. Mr. William Hagan, architect, Dawson-street, Dublin. Quantities prepared by Mr. Frederick Morley, Commercial Buildings, Dublin:—

Table listing quantities prepared by Mr. Frederick Morley for town-hall and market-place, including items like Patrick Nolan, Monahan, J. Pemberton & Son, etc.

For the erection of dwelling-house and shop in Regent-street, New Swindon, Wilts, for Mr. Coroner Baker. Mr. William Drew, architect, Swindon. Quantities by the architect:—

Table listing quantities by the architect for dwelling-house and shop, including items like Barrett, Williams, Wiltshire, Swindon (accepted), etc.

For works to be done in fitting-up new loose boxes, &c., at Stratton St. Margaret, near Swindon, Wilts, for Mr. Edward Burrow. Mr. William Drew, architect, Swindon:—

Table listing quantities for works at Stratton St. Margaret, including items like Williams, Phillips, Barrett, Colborne, Wiltshire, etc.

For the erection of new house, &c., Ladywood, Sherton, Wilts, for Sir Thomas Dancer, bart. Mr. W. Havenscroft, architect, Reading. Quantities supplied by Messrs. Cooper & Sons, Reading and Maidenhead. General work, including deal dado in hall and vestibule:—

Table listing quantities supplied by Messrs. Cooper & Sons, including items like Sealte, Reading, Rider & Son, London, Higby, George, Smith & Light, Chippenham, Barrett, Swindon, Margate, Reading, Brock & Bruce, Bristol, etc.

Accepted for the reconstruction of Bucker's Hotel, Finsbury-square, for Mr. G. Hohly. Mr. J. Groom, architect, 1, Broad-street Buildings:—

Table listing quantities for reconstruction of Bucker's Hotel, including item like J. R. Hunt, No competition, £2,850 0 0.

For making-up two roads for the Wandsworth District Board of Works, including channelling, kerbing, and pathways. Mr. J. T. Pilditch, C.E., surveyor:—

Table listing quantities for making-up roads, including item like Bealby-street, Wickesley-road, Bealby Bros., £648 0 0.

Accepted for new shop-fittings, alterations, and repairs to No. 42, Clapham-road, for Mr. W. S. Chapman:—

Table listing quantities for shop-fittings, including item like W. Wilson, (late Wilson & Exton), Aldersgate-street, £494 0 0.

For alterations to the Ranelagh Arms, Old Ford-road, for Mr. N. Argent. Mr. Edwd. Brown, surveyor, Hanbury, street, Spitalfields:—

Table listing quantities for alterations to Ranelagh Arms, including items like S. Salt, Kiddle & Sons, J. Hughes, C. Marr, S. Hawkings (accepted), A. Smith, etc.

For alterations at the Salmon and Compasses, Dorrington-street, Leather-lane, Messrs. Rayment & Webb, architects. Quantities by Messrs. Batstone Bros.:—

Table listing quantities by Messrs. Batstone Bros., including items like W. S. Barr, F. & F. J. Wood, W. Oldrey, Burch & Co., Jackson & Todd, Dixon & Jones, J. Walker, etc.

For enlargement of Schools at Laywall-street, Gray's Inn-road, for the London School Board. Mr. E. R. Robson, architect:—

Table listing quantities for enlargement of schools, including items like D. Kearley, J. Williams, F. & F. J. Wood, W. Bangs, G. S. Pritchard, W. Shurmur, Turtle & Appleton, J. Goodman, Holloway Bros., Lathby Bros., J. H. Johnson, T. Evans, Wm. Brass, Kirk & Baudall, H. L. Holloway, Wall Bros., Stimpson & Co., E. C. Howell & Son, Scrivenor & Co., T. Oldrey, C. Wall, C. Cox, S. J. Jerrard, etc.

For erection of new schools at Ecclebourne-street, Islington, for the London School Board. Mr. E. R. Robson, architect:—

Table listing quantities for new schools at Ecclebourne-street, including items like B. Kirby, Dove Bros., W. Downs, W. Brass, J. H. B. Johnson, J. Grover, J. Goodman, Scrivenor & Co., T. Oldrey, H. L. Holloway, Wall Bros., W. Bangs & Co., J. H. B. Hunt, W. Shurmur, H. Clark, Kirk & Randall, W. & F. Crocker, Stimpson & Co., C. Wall, E. C. Howell & Son, W. Bangs, Atherton & Latta, S. J. Jerrard, etc.

For fitting-up the new wing of the Chelsea Infirmary, Cole-street, Chelsea, with hot-water, warming, and supply apparatus, &c., for the Guardians of St. Luke's, Chelsea. Messrs. A. & C. Harston, architects, 15, Leadenhall-street, E.C. Quantities not supplied:—

Table listing quantities not supplied for Chelsea Infirmary, including items like Penycook & Co., Clark, Bunnett & Co., W. G. Cannon, W. S. Fraser & Co., J. & F. May, Strode & Co., E. Crane, Clements, Jeakey & Co., J. Knight, Goddard & Massey, Kinnell & Co., Bradford & Co., High Holborn, [Architect's estimate, £500].

For alterations and additions at Green-hill Farm, Harrow. Mr. E. Tyler, architect. Quantities by Mr. W. Barnett:—

Table listing quantities by Mr. W. Barnett for alterations at Green-hill Farm, including items like Rider & Son, Stimpson & Co., J. Chappell, F. Lawrence, J. O. Richardson, W. Shurmur, etc.

For stables, &c., Laburnum-street, Kingsland. Mr. G. Smith, architect:—

Table listing quantities for stables at Laburnum-street, including items like Chestam, S. Hayworth, Allard, Forest, Stimpson & Co., T. Boyce, W. Shurmur, etc.

For the erection of the Shipwrights' Arms public-house, Bernonday. Mr. G. Treacher, architect:—

Table listing quantities for Shipwrights' Arms public-house, including items like Haber Bros., W. Shurmur, Hill, Ganning & Mullins, J. Beale, G. S. Pritchard, Jackson & Todd, Parker, etc.

Special Notice.—Lists of tenders frequently reach us too late for insertion. They should be delivered at our office, 48, Catherine-street, W.C., not later than four p.m. on Thursdays.

TO CORRESPONDENTS.

C. B.—E. F. Düsseldorf.—Dr. H.—H.—C. L., Paris (thanks).—T. C. M.—E.A.—Architect (the matter has got quite beyond the stage at which your letter was written).—M. F. B.—A.—E.—F.—C. W. (we cannot advise, especially without knowing all the circumstances of the purchase of the bricks, &c. It is a legal question really).—G. H. A.—J. M.—J. B. E. (see exclusively parochial).—W. F. P. (some what wide of mark).—D. R. D.

All statements of facts lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.

Not.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under, &c. 6d. Each additional line (about ten words) or under, &c. 5d. Terms for Series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

FOUR Lines (about THIRTY words) or under, &c. 2d. 6d. Each additional line (about ten words) or under, &c. 2d. 6d. PREPAYMENT IS ABSOLUTELY NECESSARY. \* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOUBURNIER, Publisher, Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY. The Publisher cannot be responsible for DRAWINGS, TESTS, MONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same must reach the Office before TEN o'clock on WEDNESDAY MORNINGS.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, Covent-garden, W.C. Free of charge. To countries within the Postal Union, 5s. per annum. Remittances payable to DOUGLAS FOUBURNIER, Publisher, No. 46, Catherine-street, W.C.

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied direct from the office to residents in any part of the United Kingdom at the rate of 19s. per annum. To countries within the Postal Union, 5s. per annum. Remittances payable to DOUGLAS FOUBURNIER, Publisher, No. 46, Catherine-street, W.C.

Best Bath Stone. WESTWOOD GROUND, Box Ground, Combe Down, Corsham Down, And Farleigh Down. RANDELL, SAUNDERS, & CO., Limited, Corsham, Wilts. [ADVTE]

Dry Corsham Stone. 150,000 FEET CUBE. PICTOR & SONS, BOX, WILTS. [ADVTE]

Doubling Freestone. THE CHELYNCH STONE. (The stone from these quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England. It is the same crystalline nature as the Chelych Stone, but finer in texture, and more suitable for fine moulded work.)

HAM HILL STONE. Greater facilities have been provided for working these quarries, and the stone can be supplied in large quantities at short notice.

Prices, and every information given on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, near Ilminster, Somerset. London Agent—Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [ADVTE]

Doubling Free Stone For prices, &c., address S. & J. STAPLE, Quarry Owners, Stone and Limestone Merchants, Stoke-under-Ham (Ground or Lump), Ilminster. [ADVTE]

Asphalts.—The Seyssel and Metallic Lava, Asphaltic Compound (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tin-rooms, and terraces. [ADVTE]

Asphalt. Seyssel, Patent Metallic Lava, and White Asphalts. M. STODART & CO. Office: No. 90, Cannon-street, E.C. [ADVTE]

J. L. BACON & CO., MANUFACTURERS OF IMPROVED STEAM AND HOT-WATER APPARATUS, FOR WARMING AND VENTILATING Private Houses, Churches, Schools, Hospitals, Manufactories, Greenhouses, &c. OFFICES AND SHOW-ROOMS:—No. 34, UPPER GLOUCESTER PLACE, DORSET SQUARE, LONDON, N.W. And at DUBLIN, BELFAST, GLASGOW, and NEWCASTLE. Illustrated Pamphlet on "Heating" post free.

### Unpublished Documents on the Baths of Agrippa.

LAST week we drew attention to the publication by Baron de Geymüller of facsimiles of the original architectural sketches and studies of Leonardo da Vinci.

From the same author we have the small but interesting publication, the general subject of which is indicated above.\* The work includes also some details and sketches relative to the Pantheon, which of course, strictly speaking, is included in the subject of the Baths of Agrippa, to which it was the entrance-hall, and also some old sketches of portions of the Baths of Diocletian.

It was during the winter of 1881-82 that the author was engaged in examining, at the Uffizi at Florence, the various original drawings and sketches by Italian architects which are preserved there, and in turning over a portfolio of drawings by Baldassare Peruzzi, his eye fell on the words "Therme Agrippine," scrawled in a red-ink autograph, of which he gives a facsimile, on a large sheet containing no other drawing or writing except the words "Per il conte di Pitigliano," in Peruzzi's hand. The portfolio apparently, however, contained only some plans of a palace for the Count Pitigliano, and Baron de Geymüller began to think the words "Therme Agrippine" were an accidental scribble meaning nothing, when he lighted on a part of a plan drawn lightly in red ink, whereon he saw an *exedra* partly supported on four columns arranged on a segment of a circle, in the manner so common, in one form or another, in the plans of the Roman Baths. Examining this further he found some of the lines of the plan coincided with those of the projected plan of Count Pitigliano's palace, and it flashed upon him that the palace was to be built on part of the site of the *Thermae*; and the comparison of the sketch plan of the palace, of which a facsimile is given, leaves no manner of doubt that this was the case. The portion of the plan of the baths included in the red-ink sketch is rather more than half of the central buildings on the axis of the Pantheon, and at the opposite end from the Pantheon. The circular and, apparently, domed hall, indicated as a probability in this portion of Canina's restoration of the plan, is drawn here distinctly in the red-ink plan, and is adapted

as a special feature in the plan of this portion of the projected palace, which was, in fact, evidently intended to be built in part on the very walls of the ancient baths. In this circular hall is shown an internal circular colonnade of coupled columns, which would, no doubt, have carried the drum of the cupola.

In regard to the real interest of this drawing, the important question arose, did Peruzzi, in his red-ink outline (the walls are only outlined, and not shaded up) intend to represent what was actually existing of the baths at that time, or was he partly making a drawing of the actual remains, and partly trying upon it here and there the lines of the proposed new structure? Of course, in the former case the value of the red-ink plan is made greater, as an archaeological record, than in the latter. In the completed plan of this portion of the palace parts of the walls are shaded in bistre, and parts, to quote the author's words, "foncées d'une couleur lie de vin." These latter portions are evidently intended to distinguish those portions of Peruzzi's new plan, in which he intended to make use of the old remains of the baths; there can be no doubt of this on comparing the two. But are all the columns shown on the red-ink plan representations of columns existing in Peruzzi's time? If so, we now know positively that at the opposite end of the baths from the Pantheon there was a circular hall with an interior colonnade. Baron de Geymüller regards the columns, however, as doubtful, because three of them in another part of the plan do not seem as if they would unite properly with the adjacent portions if the plan were completed; and regards them as only a tentative suggestion for the new work, put on the plan of the old. We may observe, however, that on the plan of the palace these columns are coloured in the same way with the rest of the old work, which was to be incorporated in the new. Then in the palace plan Peruzzi shows in the circular hall the internal colonnade of coupled columns on one side of the plan only, the other side showing an alternative arrangement of solid piers with two pilasters and a niche between. Baron de Geymüller's argument is, if Peruzzi was utilising as much as he could of the old work, would he have proposed this alternative design of piers and pilasters if the colonnade had been still standing? We see no reason why he should not. It would have been a matter of easing the columns, the outlines of which are in fact shown on the palace plan, within the new piers; and one reason for doing this, as the author himself suggests, might have been to give scope for the use of coloured marbles in the new building; besides, of course, that the columns, though *in situ*, may have been

too much damaged to be retained in their then condition. The *exedra* which first attracted the author's attention to the drawings is merely shown in line on the palace plan, in the same position as on the red-ink plan, but not adopted in any way in the new building. We can hardly believe, however, that it would have been inserted by Peruzzi except from actual fact, though it probably did not conveniently suit the new plan.

In brief, our impression is, from our study of the facsimiles published by Baron de Geymüller, that he has been more sceptical than he need have been; though that is a fault in an archaeological student as admirable as it is rare. The comparison of the two plans leads us to the conclusion that what Peruzzi put down in red ink were facts obvious in the plan of the baths as existing in his day, as we cannot otherwise see any sufficient reason for their appearing on the red-ink sketch at all. This is especially the case in regard to the aforesaid *exedra*, as this was not any part of the Pitigliano Palace plan, and can only have been put on the drawings because it was there in fact, or sufficient remains of it; and as it is shown in just the same way as the older columnar features on the red-ink plan, this would lead to the conclusion that all these details were equally genuine.

The Baron de Geymüller does not attempt restoration in this volume; he leaves that to those who have more time and more capacity, as he says, for that class of work, and has aimed at stating his facts with great brevity, mindful of the time of others as well as of his own. The effect of the Peruzzi plan, if accepted, would be to modify Canina's plan in several important points: more particularly, the apartments with apsidal ends, which on Canina's plan are shown at right angles to the axis of the Pantheon, must obviously, whatever their precise shape and proportions, have been placed parallel with the axis of the Pantheon and of the centre line of the bath buildings. On the other hand, Canina's central circular hall, intermediate between the Pantheon and the opposite end of the axis, seems confirmed by the remains of two jambs shown on Peruzzi's red-ink plan at some distance from the rest of the walls, and coinciding almost exactly with the position of the door in Canina's plan.

The remarks in regard to the Pantheon in Baron de Geymüller's book refer to certain sketches attributed to Philibert de l'Orme, and in the possession of M. Chevignard, of Paris. Whether by De l'Orme or not, they are studies of his period by some architect making memoranda of the remains of Classic architecture in Rome. These sketches have special reference to the great circular light in the top

\* Documents inédits sur les Thermes d'Agrippa, le Panthéon, et les Thermes de Dioclétien. Par le Baron Henry de Geymüller, architecte. Lausanne: Georges Bridel. Paris: J. Baudry. 1883.

of the dome, and furnish the evidence which was evidently at that time existing as to the former treatment and decoration of this portion. They show the section of a cornice of four principal members; an ovolo with a leaf ornament at the top, next a dentil course, beneath that an egg-and-tongue moulding on a convex section, and below a common form of fluted ornament on a concave section. All this is executed in metal (bronze, of course), as shown on the section, where the thickness of the metal is indicated. Below this is the place where there were the plates of a decorative frieze, but of which there was only left, at the time the sketch was made, a set of upright metal bars at regular distances, with hooks or pins welded on them at the sides, evidently for the purpose of attaching the plates. The same hand gives a rough perspective sketch of the opening, but quite out of proportion; the external outline of the whole dome is roughly scrawled on this sketch. The successive bars for attaching the frieze are also shown in a still slighter sketch by Antonio Sangallo, of which a fac-simile is also given. There is a fac-simile of another sketch, also attributed to De l'Orme, at all events by the same hand, whether his or not, which made the others,—showing the bronze covering of the roof of the dome externally. Part of the sketch shows the step arrangement of the exterior surface, but carried much further up the dome, and in a greater number of steps, than we now see it; and another portion shows it covered with a ridge-and-furrow arrangement of metal in convex curves or waves, with a fillet at the crest and trough of each undulation. It seems difficult to determine whether this was made from any indications then existing, or whether it is an imaginary restoration by the sketcher. But the careful and realistic manner in which the bronze supports of the frieze before mentioned are shown, indicates plainly that they were drawn with the object before the eye, and it seems hardly likely that the same hand in a sketch made at the same time should have treated the matter in such a different way, and jumped immediately from realistic to imaginary sketching.

The volume concludes with the reproduction of some sketches by an Italian architect, somewhere between 1450 and 1520 (the author does not tell us how he fixes the date), of the Baths of Diocletian, of more elaboration than any other of the sketches given, but of which the chief interest lies in the insertion of a solitary column in the plan, forming the centre of the great semicircular sweep in the outer boundary, which is a characteristic of the Baths of Diocletian. This column is found in no other representation of these baths. Palladio, who (born in 1518) came in the period immediately following that to which these sketches are ascribed, gives not a hint of it in his restoration. It may have disappeared in the interim. It is a probable enough feature in itself; it is given with measurements by the unknown architect, who must have had something to measure; and the probability is that it did exist, and that either Palladio overlooked it, or that some one had "looted" it before he came upon the scene.

Take them as we will, the facsimiles in the volume, and the suggestions thrown out, are of great interest to students of classical architecture. The book in which they are given, with its large type and wide margins, forms an addition to the architect's library, which, though small in bulk, is to be valued both for its contents and the setting in which they are framed.

**The Hospitals Association.**—The session of 1883-5 was opened with a *soirée* at the rooms of the Medical Society of London, on Saturday evening last, when, notwithstanding the inclement weather, a large number of guests responded to the invitation issued by the Council. There were present the lady superintendents and secretaries of most of the principal hospitals in the metropolis, besides other guests, and a very successful and enjoyable evening was spent.

## THE DEFENCES OF THE FORTH ESTUARY.

INCHEKEITH FORTRESS.

**P**UBLIC anxiety has of late been in rather an acute stage with regard to the great question of coast defences, and this anxiety, as we have seen, has given birth to solicitude and action on the part of the Government. The cry is somewhat vehemently raised that the British Navy has fallen away from its former high estate of arbiter of the seas, and that as now constituted its power of attack or defence is no greater than, if so great as, that wielded by at least one other of the world's Imperial naval armaments. The partial alarm thus created, while calling us to a closer examination of the actual relative condition of our Navy, is inciting us also to a more solicitous scrutiny of our second line of island defence, represented by combined land fortification, and floating battery, gun-boat and torpedo services. Time was when it suited the British fashion to hold the inner defensive *coeur* as but of light consequence; but times and armaments and modes of ship propulsion have changed, and the national estimate with regard to the several offensive and defensive values have changed with them. We have grown in solicitude, especially of late, with regard to the efficiency of stationary batteries round the coast, and have come to a tacit admission of the possibility of some such contingency as that of

water is abundant and of excellent quality, coming as it does from strata of the coal formation, the same as those found on the neighbouring mainland of Fife. It was largely from this source, at one time, that, when weather permitted the approach of small boats, the vessels brought up in Leith Roads used to procure their watering. The island is barely five miles distant from the city of Edinburgh, off whose various points of elevated vantage it is distinctly and familiarly descried whenever the atmosphere is unobscured, the white tower of the lighthouse and the dark brown heath and rock showing by day, and the ever-recurring flash of the powerful reflectors taking up the signalling by night. Between nine and ten miles higher up the Firth, at the ancient Royal or Queen's Ferry, are situated the massive engineering works under the slow but sure operations of which the wide estuary itself is being spanned by a high-level mast-freeing railway bridge, in two principal arches of about one-third of a mile each in stretch, and representing one of the most gigantic engineering enterprises of any time. It will form part of the defensive functions of the new Inchkeith fortress to hold this great structure safe from the enemy's guns in time of war.

Inchkeith has figured as a place of a certain mark from very early times. The ancient northern trunk ferry route from Leith to Kinghorn grazed the coast-line of the rock, which thus became a subject of constant notice on the part of the frequently passing traveller.

having to rely upon these alone for the "guarding of our native shores." Various new works have been executed from time to time, and these, under the present accentuation of anxiety, not to call it alarm precisely, we are examining somewhat crucially, while seriously contemplating extensions and additions in various quarters.

Perhaps the most important of those coast defence works which are of more recent construction is that series by which the entrance to the inner section of the Firth of Forth is now guarded, and to which in August last, as may be remembered, was applied the very novel test of a bombardment from the guns of a friendly ironclad. The island of Inchkeith, on which the main portion of the defensive work is constructed, lies twenty-five miles within the wide channel of the outer Firth, at the very throat of which the Isle of May stands sentinel-wise and lonely. It is distant from the port of Leith rather less than four miles in a direction almost right across the estuary. From Kinghorn Ness, on the Fife-shire coast, it lies about three miles nearly due south, occupying a portion of the mid-section of the estuary, with the rather narrower passage channel, though much the deeper of the two, bearing to the north. It extends about a mile in length, by an average breadth of one fifth, its rocky coast line enclosing in all 70 acres of pasture land, which formerly was so much prized for grazing purposes by the Gallic allies of the Scots as to give rise to the French christening of "*Dis des chevaux*." Spring

It owes its present name to the old family of the Keiths, upon whom it was bestowed by Malcolm II. Towards the close of the fifteenth century it figures as a lazar refuge for the city of Edinburgh, during a prevalence of the pest. Protector Somerset of England, after routing the Scottish army at Pinkie in 1547, had his eye caught by the commanding position of Inchkeith, and ordered the erection of a temporary fort there. On retiring he left it but lightly garrisoned, and the island was soon thereafter recaptured by the allied Scottish and French. The English initiative was followed forthwith however, and improved upon; Somerset's temporary works being thrown down and regular and permanent—as then designed—fortifications erected, under the direction of competent French military engineers. These consisted of several bastions of powerful model, as estimate of power then went, connected by a strong wall of circumsvallation, which at stated points attained a height of 20 ft. In 1560 the place was attacked by the English fleet unsuccessfully. At the peace which was soon afterwards concluded three score French artillerymen were appointed to the permanent care of the works; but the Scottish subsequently became jealous of this arrangement, dismissed the garrison, and destroyed the fortifications, to make sure, as they stated, that there should be no further temptation there for the stepping in of the foreigner to seize and possess. Only one fragment of the original ashlar masonry remained above ground after this rather drastic cure had been applied, and

the same was to be seen by the few visitors to the rock down to the beginning of the present century, with the monogram of Queen Mary lettered on one of the blocks. In 1639 the Marquis of Hamilton, an adherent of Charles I., sailed into the firth and landed on Inchkeith the raw and sickly English soldiery (lads mostly) he had brought with him. These were almost directly reshipped and sail made south home again, with no incident except that of landing on the dismantled rock alone; and after this, Inchkeith figures not at all in the annals, until eighty years ago when it became chosen as a lighthouse station. The highest point of the rock stands 180 ft. above high-water mark. Upon this, in the year 1803-4, a tower was erected, and a light first exposed. Ten years subsequently the original conception was improved upon, and a revolving light from powerful lenses began, and still continues, to flash all around at a height of 235 ft. above sea level.

Although no attempt was actually made towards the erection of a successor in kind to the French fortification of the sixteenth century, the subject remained one of stock talk and speculation over the whole of the 300 years, periodical scares from time to time galvanising the topic into a fevered though unsustained activity. An instance in point is the descent of that daring renegade Scot, Paul Jones by adopted cognomen, in 1779, the year after he had surprised the port of Whitehaven on the west coast, captured two forts with thirty guns, and set fire to the ships there. At the head of a squadron in the year named, he entered the Firth of Forth with a special and even previously avowed eye on the port of Leith and city of Edinburgh, and had actually brought to under the lee of Inchkeith and lowered and manned his flotilla of cutting-out boats, when a vicious land squall descended from the south-west, compelled instant re-embarkation, and literally blew the hostile fleet from the narrow waters out to sea, upon which a few days afterwards, off the York-shire coast, the daring Jones fought and captured the English frigate *Scraps*, thus showing that the menace from which the Forth ports and towns had been preserved was no empty one. The call for defensive works was loud at this crisis from all points of the coast; and especially loud from the neighbourhood of Edinburgh when the fact of its miraculous escape became known; but the peace came, and the Scottish estuary had for a further term to put up with such a defensive show as that furnished by a shore battery and Martello tower at Leith, together with whatever floating armament might for the time be in commission towards the safeguarding of this particular part of the coast.

To the Cabinet immediately preceding that now in power fell the actual initiative with regard to the works thus so long talked of, and, after the final resolution was framed, it cannot be said that, whether in the case of the late Government or that of their successors, there has been other than all due diligence in the prosecution of the design. The island of Inchkeith, which anciently, after the termination of the Keith possession, reverted to the Scottish Crown, and subsequently fell to the proprietorship of the noble family of Buccleuch, was once more acquired by the Crown as a first step. Works were commenced, and the difficulties of construction proved from the outset far from contemptible. The steepness of the activities upon which the fort works were to be raised was found so great as to preclude the employment of horses for draught or carrying purposes, and compelled recourse to mule power exclusively. The only available landing also was found in a high degree insecure, opportunities of favouring tide and weather requiring assiduous watching, even after the erection of a new jetty of considerable size and strength. The defensive works resolved upon consisted of three separate forts on the island itself, conjointly with one on the mainland at Kinghorn Ness, fully three miles to the north. Once entered upon, operations continued unceasingly for several years, attracting but trifling public notice until towards Midsummer of 1881, when the forts were announced as almost in readiness for the heavy guns with which it had

been decided they were to be armed. The island in map shape has the appearance of a roughly lined isosceles triangle, with the sharp angle pointing south and by east in the direction of Leith generally; the others bearing to the right and left on the north and pointing generally in the direction of the Fife coast, the separating channel—and the favourite one for shipping, as the deeper—running at this point to a breadth of about three miles. A tort of combined earthwork, stone, brick, and concrete now occupies each of these island angles. They are in principle the same, though differing slightly in detail, being constructed on what may be termed a modification of the polygonal system, features of the bastion type being admitted into and incorporated therewith. The emplacement for the gun is of concrete, and takes the form of a turret on the Moncrieff system, the firing being on the barbette principle, that is, not out of an embrasure, but right over the parapet itself, an arrangement possessing the immense advantage of allowing the gun an unimpeded sweep of nearly half a circle. The parapet is cut with a slope downwards on the outside to admit of firing at extra close or depressed range. A trench within the concrete pediment of the turret runs round the emplacement of the gun, affording shelter to the gunners when in action. The magazines, floored with wood, furnished with lifts and speaking-tubes, and lighted under strictest precautions, are all casemated and bomb-proof; the covered ways and inside chambers are of the strongest masonry, and earthworks surround the whole; the ditches of these being under the extra defence of intramural casemated vaults pierced with musketry loopholes. The forts are numbered one to three, north-west, north-east, and south respectively, the last being turreted for two guns (as is also the case with the mainland fort on Kinghorn Ness) and the others for one each. Towards the close of 1881 the armament for the new Forth estuary defence works arrived from the arsenal. It consisted of six 18-ton muzzle-loading 10 in. rifled guns of wrought-iron with steel tubes, and of power equal to sending a 400 lb. shot through a 12 in. wrought-iron plate at 1,000 yards. They were forged in 1868 and are sighted up to 4,800 yards of a range,—three miles nearly, though destructively effective at a greater distance than that. These monsters,—in Scotland there are no other guns approaching them in calibre,—as settled now in permanent position, are found mounted on wrought-iron sliding carriages working upon an iron platform, and set in motion by the action of four movable trucks with winch handles. The altitude of the three Inchkeith batteries varies considerably. No. 3, over against Leith and Edinburgh and furnished with two guns, standing at 39 ft. only; No. 2, on the north-east, at 85·5; and No. 1, on the north-west, at 129·75 above high-water mark.

The efficiency of guns and emplacements, as above described, was first tested in September of last year, in presence of Major-General Alastair McDonald, Commander of the Forces in North Britain; Sir Andrew Clark, Inspector-General of Fortifications; Col. C. H. Ingolby of the Royal Artillery; and others, when, from the throat of the 18-ton gun on No. 1 Battery, came the roar of a blank-cartridge salvo, forming the first artillery report sounded from off that rock for over 300 years. On that occasion each of the four guns on the island fired three rounds, the charge consisting of 44 lb. of pebble powder. The action of the guns under this partial test was held as satisfactory. Towards midsummer of the present year the island armament was for the first time tested with ball firing, the missile used being a 400 lb. Palliser shot under a charge of 70 lb. pebble powder. The result was also in this case satisfactory. Contrary to expectation it was found that the lighthouse suffered not at all, either from concussion or from any other cause. At about this time a proposal had been mooted for the utilisation of the fortress in volunteer big-gun practice, the suggestion finally falling through for the time, though possibly under the present revival of coast defence discussion in its acute stage, the matter may come up for reconsideration, and

with better prospects of a more practical result. Last August the new works were subjected to the severe test of an actual bombardment from floating battery-guns of various powerful types, a thing altogether without parallel in the history of the country's progress in the science of attack and defence. The passively defensive qualities of the Inchkeith fortifications were pitted against the actively exerted destructive forces of a ship-of-war of the first rank, the *Sultan* being the vessel chosen thus to make trial of her powers. War Department experts were present in considerable force, taking careful notes of firing results, the operations being understood to rank as of the highest importance in the official mind, although, of course, the sum of the conclusion finally arrived at has not been given to the public. The opening of the bombardment was fixed for August 7th, previously to which date all conceivable precaution had been taken against possible mistake or disaster of a serious kind. The lantern of the lighthouse was strongly sheathed in timber, but in case this might not suffice for the prevention of damage of an extensive description, an iron lighthouse of temporary construction was held in reserve, and ready for entering upon the necessary service of the night in the event of the permanent tower or its lantern, or revolving machinery, becoming disabled. No. 2 battery was that selected for the attention of the *Sultan*, that vessel taking up position in the deep water of the channel to the north. The men of No. 2 battery retired within the lines of its neighbour, No. 1, their places being supplied with wooden dummies, so as to test the probable loss of life incidental to such an attack as that arranged. The lighthouse people were received in temporary quarters at the southern battery. The object of these hold experiments was, according to common belief, to ascertain the effects produced by the discharge of machine and rapid-firing guns on a 10-in. rifled muzzle-loading 18-ton gun, mounted on barbette, but probably the ends of experience and test aimed at were more general in their scope. Operations lasted over some days. In the earlier part of the assault the machine gunnery tried their powers of swift firing at 1,000 yards, and subsequently came the heavy metal firing at from 1,500 to 3,500 yards. The authorities have been wisely reticent with regard to the impression they carried away, but it is held as accepted that the fort in its rôle of passive resistance gave fair satisfaction. The turret sustained trifling damage only, considering the masses of projectiles of all kinds hurled against it, while only six of the dummy gunners were put *hors de combat*. The lighthouse sustained no hurt at all. The counterpart or complement of the experiments of August last would be the mooring of an ironclad two miles off in the deep fairway channel, and letting the 18-ton gun of Battery No. 2 have its will of her; but the greater scope for wholesale destruction of costly war material, involving possibly the total loss of one ironclad, with armament and furnishings complete, bars the way to a cut-and-dry realisation of the kind, and the sleeping lions on Inchkeith must bide their time. The menace they silently hold out may happily prevent that time from ever maturing.

## NOTES.

 THE thirteenth Report of the Local Government Board, 1883-84, has just been issued. It forms no exception to the rule of the annual increase of the importance of the portion of the national progress that comes under the purview of the Board. As on former occasions, the Report is divided into the three heads of the Administration of Laws relating to the Relief of the Poor, the Administration of Laws affecting Local Government and the Public Health, and Local Taxation and Valuation; followed by a copious appendix. Under the first head it is satisfactory to learn that the number of paupers, both in-door and out-door, in England and Wales, is less, absolutely than, in any year since 1870, and less, relatively to the number of the population, than in any year

of the decade, except 1877 and 1878. The year 1849 is the first year for which the actual number of persons receiving relief on a given day can be returned. The largest number ever since then tabulated was in 1863, when a total of 1,142,624 paupers, or 55·6 in every 1,000 of the population, is recorded. In 1883 the total number was 782,422, or 29·6 in every 1,000. The lowest number on record was in 1877, being 719,949, or 29·4 in every 1,000 of the population. But while there is a reduction in the number of paupers, the reverse is the case as to the cost of their support. The sum expended in relief in 1863 was 9,325,071*l.*, or 8·19*l.* per pauper. The sum expended in relief in 1883 was 8,353,292*l.*, showing a steady annual increase since 1876, and being at the rate of 10·67*l.* per pauper, against 10·45*l.* in 1882. The incidence of the poor-rate on the population in 1883 was at the rate of 6*s.* 4*d.* per head, or of 1*s.* 2·2*d.* in the 1*l.* of rateable value. The number of paupers in the metropolis was larger than in any year since 1875, being 102,193; or 26·2 in every 1,000 of population. Each of these paupers cost 21·33*l.*, making a charge of 1*s.* 6½*d.* in the 1*l.* on the rateable value.

THE expenditure of the local authorities throughout the country shows an increase which, considering the utter want of guidance as to the principles and details of expenditure which is so peculiar a feature of our legislation, can only be called alarming. In 1874-75 these bodies borrowed 11·9 millions sterling. In 1881-82 they borrowed 15·3 millions sterling. The amount of loans outstanding in 1874-75 was 92,820,100*l.* In 1881-82 it had risen to 151,704,640*l.*, or by 63 per cent. in seven years. The proportions of national and local debts were as follow:—

Year.	National Debt.	Local Debt.	Total.
1872 ...	478,198,837 ...	220,259,839 ...	698,458,676
1882 ...	783,945,949 ...	151,704,640 ...	935,650,589

In the former year the total debt was 8·7 per cent. of the National Debt. In the latter it was 19·8 per cent. The rates made and expended by these local authorities show an increase corresponding to the activity of their borrowing powers. For the year 1871-72 they amounted to 17,977,660*l.*; for the year 1881-82 they amounted to 27,959,953*l.*,—an increase of 55·8 per cent. in ten years. The comparison with the imperial revenue is as follows:—

Year.	Imperial Revenue.	Local Revenue.	Total.
1872 ...	474,708,314 ...	217,977,866 ...	692,686,180
1882 ...	85,832,252 ...	27,959,953 ...	113,792,205

Thus, while the imperial revenue for the last-named year is at the rate of 2*l.* 9*s.* per head of the population, the incidence of rates and taxes together is raised, for England and Wales, to close upon 3*l.* 9*s.* per head, more than a third of the imposition on the pages of Rates and Taxes being thus withdrawn from Parliamentary control.

THE increase in the rateable value of property in the decade 1872-1882 very closely follows the remarkable and important law (*Builder*, vol. xvi., p. 922) that national wealth, in so far as all events as it is measured by rental or by the rateable value of property, is proportionate to the square of the density of population. The rateable value of all England in 1872 was 109·4 millions sterling; in 1882 it was 141·4 millions sterling. The corresponding totals of population were 23·0 millions and 26·4 millions. The increase in the rateable value will thus be seen to tally very closely with the increase of the square of population; which, as the area of the country is fixed, is the same thing as the increase of the square of their density on the ground. It was shown in the article before cited that a comparison between the relative densities and rateable values of urban and rural districts gave results of the same nature as comparisons of the same values, in the same districts, at different periods. This last calculation is fully borne out by the figures now given by the Local Government Board.

AT the last meeting (before the recess) of the Westminster Hall Committee on Friday, the 5th inst., Mr. Pearson brought

forward a new design for making a ground-floor cloister lower than the first one (8 ft. high only), and an upper range of rooms 16 ft. high. The ground-floor cloister he "had not appropriated to any special purpose." The whole building would be about 6 ft. lower than the former one, and would allow the flying buttresses to be seen; "the buttresses," the *Times* report gives it, but evidently the sense is that the flying buttresses would be left visible, and not cut across by the roof. This is an alteration entirely in the direction we have been advocating; in favour of architectural effect rather than mere archaeology. Messrs. Waterhouse, Ewan Christian, A. W. Blonfield, J. Oldrid Scott, and James Brooks gave evidence mainly in support of Mr. Pearson's scheme. Mr. Christian spoke contemptuously of the proposal to place "a trumpety post-and-pan work screen before the wall"; but was it proposed by any one to do this as the permanent settlement of the point? If so, that would never do. We understood Mr. Stevenson's proposal of this nature to be for protecting the exposed Norman wall for the time, pending the question of new buildings. Mr. Ayrton was called as a witness at the opening of the sitting, as a former First Commissioner, in order to state that other First Commissioners, himself included, had not thought it necessary to entertain the idea of completing the Houses of Parliament according to Sir C. Barry's design. He began, however, to give more evidence than the chairman wanted, being indiscreet enough to talk about not wishing Westminster Hall to be unduly exposed, and also admitting that if more room was really wanted, Sir C. Barry's scheme was the best. Upon this he was promptly suppressed, in accordance with the tactics which seem to have been carried on throughout, as far as the chairman is concerned.

IN the report of the same committee meeting we read:—

"Mr. C. Barry, recalled, stated that since he had expressed his belief that the floor of Westminster Hall had not been raised within the memory of man he had received a letter from a Mr. Adams, some sixty years ago a clerk in the Office of Works or Woods and Forests, stating that Sir Robert Smirke had raised the level of the floor 2 ft. or 3 ft., for the reason that the tide used sometimes to enter the Hall, obliging barristers to use boats to get to the Courts. This was some years before the fire in 1834."

The memory of Mr. Adams must have deceived him. The statement of the matter in Sydney Smirke's communication to the Society of Antiquaries on February 4, 1846 ("Archæologia," vol. 26), is as clear as anything can be:—"In forming the new pavement it has been necessary to remove the ground everywhere to the depth of at least three or four feet below the level of the Yorkshire flagstone floor laid at the latter end of last century: about 1 ft. 4 in. below that level another floor of Purbeck stone was found, the level of which appears, from the door-jambs finishing down to it, to have been that adopted in Richard II.'s time. This level has, therefore, been fixed for the new pavement, and the addition thereby given to the walls of the Hall much improves its architectural effect, at the same time that the original proportion of the building is restored." Mr. Butterfield, in a letter commenting on the same fact, says:—"I am not sorry to see, as this document of Mr. Adams's implies, that people are ready and anxious for still further height by some means. They will not get it, however, by internal excavation, if Mr. Smirke's account is the true one; nor will they get light as well as height by going downwards, and light is more needed than height. They can only get it by lifted roof and lengthened windows, as I have proposed."

WE are glad to learn that Mr. G. J. Symons, to whose persistent energy we owe most of our definite information as to British rainfall, is turning his attention to the collection of data with reference to the damage annually caused by lightning. Our want of any systematic observation as to a class of misfortunes which are to a great extent preventable, contrasts very disadvantageously with the careful

investigations that have been carried on in some other countries. The notes now brought forward only extend over about three months, but they include some 600 cases, in which buildings of different kinds, haystacks, men, or animals have been struck by the electric fluid, and the damage thus caused is estimated at upwards of 30,000*l.* Most of these fire-strikes, moreover, occurred in two days out of the three months; of which the 12th of August last was the most disastrous. The frequency of fatal thunderbolts in England and Wales is far less than in many other parts of the world,—even limiting the comparison to the continent of Europe. Yet from 1861 to 1871 one person out of every million of our population has been annually killed by lightning. The instances have been most numerous in the counties of Leicester, Rutland, Lincoln, Nottingham, and Derby, in which 13 persons out of every 10,000,000 were annually killed. In the metropolitan district the annual rate was as low as 2·92 per 10,000,000 per annum. The proportion of cases on record is much higher from 1871 to 1878 than from 1861 to 1871; but it is most probable that this is due to a fuller record being kept in the later period than in the former.

SOME fifty scientific men enjoyed a very pleasant excursion, on the 6th current, to visit the Brighton Water-works. With the terms of admiration as to the success of these works, and the skill and happy forethought of the engineer, in which the reporter of the *Times* indulges at some length, we are disposed very candidly to agree. There is, however, more to be said on the subject. The cost of the works and the cost of water to the inhabitants of Brighton are as essential points to ascertain as either the purity or the copiousness of the supply. The cost of the works, per million gallons (taking the figures for 1879) was 38 per cent. higher than the cost of the water-works which supply London. And although the working cost at Brighton, owing in great part to the careful utilisation of differences of level, is 27 per cent. less than the average in London, the price of water to the inhabitants is the same, within one pound in the million gallons; while the proportion of the water-rate to rateable value of houses is 18 per cent. higher at Brighton than in London. Another point overlooked in the account is this. Situated as Brighton is on the verge of the chalk cliffs, she is in an unusually favourable position for the interception of the subterranean outflow to the sea. The places are few in which such results are attainable. With regard to London,—as, of course, everything said as to water-supply is at once read in this light,—the nearest parallel is to be found in the locality of those springs which, in the neighbourhood of Grays and some other spots, escape into the Thames. That a valuable supply of water may there be intercepted is not improbable. But the first lesson to be borne in mind is the need of an adequate hydraulic survey of the country. In the absence of this no proposal for improved water-supply can be much more than guess-work.

THE Railway and Canal Freighters' Association received a reply from the railway companies last week to their application for reductions in rates to and from the Midland district. Various concessions are made,—notably the removal of hoop-iron from the "damageable" class, the reversion to the old charges for returned empties, and reductions in the rates for cut nails, iron-ore, coke, pig-iron, and cinders, from various places. The applicants are still very dissatisfied, however, in consequence of the railway companies not yet being prepared to give them an answer as regards the rates to ports,—Hull, Liverpool, &c. They also decline to make any alteration in the "private siding" system, or in the charges for "smalls" (a subject which, it will be remembered, was recently treated of at length in our columns), and the traders appear to consider the reply, taken as a whole, to be unsatisfactory. It is, however, a sign that the railway companies are prepared to give coun-

plaints their consideration, even though the result may be somewhat disappointing. It was hardly to be expected that each of the thirteen points embodied in the requisition would be conceded, however reasonable they might have been. The companies would be very chary of exhibiting such wholesale graciousness, as a precedent would thereby be created which would result in their being flooded with similar applications from all quarters, and the traders may be wrong in their assumption that the deferring of the most important question (which, it must be remembered, is a momentous one to both parties) is an evasive way of shelving it altogether.

**T**HE collection of seven works by M. Bouguereau, now on view at the gallery of Messrs. Boussett, Valaston, & Co. (late Goupil), in New Bond-street, should be visited by those who enjoy splendid technique in painting, and who wish to see the other side of the work of an artist who is chiefly known in this country as a painter of rustic figures. M. Bouguereau is, in fact, two artists. He is by turn a painter of rustic idylls, of very refined and expressive type, and one of the most learned draughtsmen and colourists of the day in the painting of the nude figure. His great picture in Bond-street (great in material dimensions) is "The Youth of Bacchus," a canvas the size of the room, with a number of life-sized nymphs and satyrs, and old Silenus, and all the rest of them,—a thoroughly pagan subject in idea, with the defect in treatment that it is not pagan enough. It is respectable and academic. The painter's higher powers are shown in the single-figure painting called "Byblis," a masterpiece of drawing, and not without poetic sentiment. Opposite to this is "Les Baigneuses," a purely realistic work, but of the most wonderful realism; the two figures seem full of life and warmth,—as Blake said (not quite truly) of his own figures, "the blood is seen circulating in them"; and this is all got by genuine solid painting; there are no tricks of any kind. Among the works exhibited is also an exquisite title painting by the other Bouguereau, "Ma Leçon difficile," a seated figure of a child with peculiarly expressive countenance. As far as the higher ends of painting are concerned, this is the best thing in the collection; and we must remember that the technical difficulties surmounted are not nearly so great as in such a work as "Les Baigneuses."

**T**HERE is a move in Liverpool for having a gallery of historical casts of sculpture and architectural ornament, to which the lower rooms of the Walker Art Gallery would be devoted. Mr. J. P. Seddon, in his capacity as honorary secretary to the Architectural Museum at Westminster, has been speaking in support of the movement at Liverpool, both at the annual dinner of the Architectural Society of that city, and also in a special lecture given in the Free Library lecture-hall, and which seems to have attracted much interest. Mr. P. H. Rathbone, who has done so much to awaken and revive artistic interests in Liverpool, is also interesting himself in the matter, and previously to Mr. Seddon's lecture before named, Sir James Picton spoke in favour of it, mentioning that the Town Council had set aside a fund for enlarging the building, but this having been rendered unnecessary by the liberality of Sir A. Walker, who had defrayed the whole cost of the new buildings, it was desired to employ the sum that had been set apart in promoting further the usefulness of the institution, and they proposed to do so by forming the commencement or nucleus of this historical museum of casts. The money, certainly, could hardly be better or more appropriately employed, and we hope the new idea will be successfully carried out.

**MR. MILLAIS'S "Waif,"** to be seen at Mr. White's King-street Galleries, is a painting of a little chubby-faced comfortable child seated on a doorstep, whose countenance, in its well-fed healthy rosiness, contrasts oddly with the rags in which she is dressed and with the idea conveyed by the title of the work.

We should very much doubt the figure having been painted from any child of the social order and conditions indicated; it looks as if painted from an upper-class child, and then named and clothed according to the painter's fancy. The face, however, is one of the most admirable things we have had from the artist. Mr. Orchardson's "Her First Ball," in the same gallery, portrays, in his well-known style, a scene where a very shy young girl, looking still more awkward from the pinched up and ungainly dress she wears, is preparing to go through a minuet with a most dashing and exuberant young gentleman, whose manners are intended as a foil to hers. In the background are spectators, in each of whose countenances there is expressed some sort of interest in the performance about to take place, running the gamut from spite to mere curiosity or idle indifference. The painting is an excellent example of the painter's peculiar technique, and in action and expressive grouping it is not inferior to some of the best of its predecessors.

**A**NOTHER new theatre is proposed to be built in London, in the rear of No. 121, Regent-street, on the site of the unsuccessful Military and Naval Stores, with entrances from Regent-street and exits into Heddon-street. The theatre, which will be of rather unusual construction, will consist of a ground-floor which will be entirely devoted to stalls, with a balcony over, and will accommodate about 800 persons. The architect is Mr. J. M. Brydon.

**H**AMMERSMITH Bridge, which is about to be replaced by a bridge of much less graceful design, was designed and built by Mr. Tierney Clark, engineer to the West Middlesex Waterworks Company, who have extensive works at Hammersmith. The cost of the present bridge was 45,300*l.*, or a little more than half the cost of the proposed new structure. We can ill afford to lose a well-proportioned bridge, and it is a pity some means cannot be devised to make use of the present bridge upon another site, as was done with Hungerford Bridge, which is now at Clifton.

**A**CCORDING to a Liverpool paper, Mr. B. H. Thwaite has proposed a new system of dealing with the Plucking Bank, which is causing so much trouble in the Mersey. He objects to the sluicing system that, when the greatest head or elevation of the flushing water is obtained, the ebb current of the tide is almost terminated and has not sufficient velocity to carry away the silt, which is not held in suspension, except with a certain minimum velocity of flow. His expedient is the use of a heavy pressure of water produced by turbines and led through pipes to immediate contact with the silt, so as to drive it into the tide current at the time when that is strongest and most able to carry away the silt. We gather that it is proposed to try this at Liverpool. We never had much faith in the efficacy of the sluicing system as proposed there, and, in fact, were somewhat surprised that it really had for a time exercised an appreciable though apparently not a permanent, influence on the bank.

**The Sea Defences at Hove, Brighton,** consisting of a sea-wall and groynes, for which Sir John Coode and Mr. Ellice-Clark are engineers, were put to a severe test on the 4th inst., when a heavy gale occurred concurrently with a high spring tide. The sea was very rough, and caused considerable damage at other parts of the coast, but the Hove works did not sustain the slightest injury, although the work is in a "green" state, and the filling has not yet been covered with the bituminous concrete which is to form a kind of deck to receive the weight of water which falls on the Esplanade in great force when the seas strike the wall. These works have been pushed on with great rapidity during the past few summer, upwards of 30,000 concrete blocks having been made and fixed, and 16,000 cubic yards of concrete masonry fixed *in situ*. The Hove Commissioners are to be congratulated upon having their works so far completed as to have successfully resisted the trial of Thursday week.

#### ROYAL ACADEMY PRIZES.

The medals and prizes awarded by the Council of the Royal Academy were distributed to the successful students on Wednesday evening last, December 10th, by Sir Frederick Legh, the President. This being the off-year, in which the prizes are of less value and importance, there is no special address given. Sir Frederick remarked, however, that the drawings exhibited in competition in these off-years are deemed by the members of the Academy to be of great importance, as they indicate more clearly the training through which future Gold Medalists have to pass. Some of the competitions this year are of unusual excellence,—that for the painting of a figure from the life being so good that an extra medal has been awarded.

The competitions in modelling again come to the front, showing that the students value the reorganisation in the School of Sculpture, which took place three years ago, and in one of the prize subjects, "The Model of a Design," an extra reward has been given. The Armitage competition was also a little above the average. In architecture the Travelling Studentship was not so well competed for this year, and it is probable that some change will have to be made in the regulations to cause this prize to be more keenly contested.

The President then awarded the following medals and prizes:—

#### Painting and Drawing.

Cressick Prize, Landscape Painting in Oil. Subject—"A Village Common." Prize, 30*l.*, E. T. Lingwood.  
Painting of Figure from Life. First medal, Arthur J. Foster; second medal, H. S. Percy; extra, J. E. Brennan.  
Painting of Head from Life. First medal, P. E. Oarvie; second medal, Theodoros J. Noyes.  
Copy of an Old Painting. Subject—"Portrait of an Old Woman," by Rubens. Silver medal, T. L. Hughes.  
Copy of Landscape. Subject—"The Lock," by John Constable, R.A. Silver medal, Frederick Everett.  
Cartoon of Draped Figure in Chalk or Charcoal. Life size. Subject—"Virgil reading to Augustus and Octavia." Silver medal and 25*l.*, H. S. Percy.  
The Armitage Prize. Design in Monochrome for a Figure Picture. Subject—"The Return of the Ark." First prize, 30*l.* with bronze medal, C. D. Richardson; second prize, 10*l.*, J. L. Davis.  
Design in Water-Colour for the Decoration of a Portion of a Public Building. Subject—"An allegorical illustration of Poetry. To form part of a contemplated series of eight designs for the lunette in the central Octagon Hall of the Exhibition Galleries; four of these designs to be allegorical figures or groups, representing respectively the Arts and Poetry, and the other four illustrative subjects. Size of lunette, 12 ft. 6 in. wide by 6 ft. 6 in. high. Prize of 40*l.*, W. S. Paget.  
Drawing of Figure from Life. First medal, J. E. Brennan; second medal, W. H. Margston.  
Set of Six Drawings of Figure from Life. First prize, 50*l.*, A. T. Nowell; second prize, 25*l.*, W. H. Margston; third prize, 15*l.*, Sidney Paget; fourth prize, 10*l.*, H. S. Percy.  
Drawing of Head from Life. First medal, Nelly Erichsen; second medal, Minnie J. Shubrook.  
Drawing of Statue or Group, with Head, Hand, and Foot. First medal, W. F. Litterer; second medal, Victor Hobson.  
Drawing of Statue or Group. Prize of 10*l.*, T. L. Hughes.

Respective Drawing in Outline. Subject—"Entrance to the Exhibition Galleries, as seen from the Door of the General Assembly Room, and Specimen of Sciography." Silver medal, F. C. Robinson.

#### Sculpture.

Model of a Design in the Round. First prize, 30*l.*, C. O. Richardson; second prize, 10*l.*, F. W. Pomeroy; extra, 5*l.*, A. O. Walker.  
Restoration of a Mutilated Statue. Subject—"The Torso." Silver medal; no competition.  
Set of Three Models of a Figure from Life. First prize, 60*l.*, F. W. Pomeroy; second prize, 20*l.*, H. A. Pogram.  
Model of a Statue or Group. First medal not awarded; second medal, W. H. T. Verner.  
Model of a Statue or Group. Prize of 10*l.*, W. G. John.  
Model of Figure from Life. First medal, G. J. Frampton; second medal, A. G. Walker.

#### Architecture.

A Travelling Studentship of 60*l.* for a Design in Architecture. Subject—"A Block of Three Houses." Prize of 60*l.*, Break Simpson.  
Set of Architectural Measured Drawings. Subject—"The Chapel of St. Stephen, Walbrook." First medal, B. H. Sedding; second medal, H. D. Walton.  
Set of Drawings of an Architectural Design (Upper School). Prize of 25*l.*, J. A. Blater.  
Set of Drawings of an Architectural Design (Lower School). Prize of 10*l.*, E. Guy Dawber.  
Perspective Drawing in Outline. Subject—"The Choric Monument of Lysistrates, and a Specimen of Sciography." Silver medal, S. B. Russell.

There were only two competitors for the English travelling studentship this year. Considering that 60*l.* is offered, and that it is only expected three months should be devoted to travelling, it seems strange so few should come forward. The possible cause lies in the fact that the drawings must be made during the day-time, in a period of three weeks, and the class of students who could compete are perhaps in that position that they cannot be spared from their office duties. It is to be hoped, therefore, that the changes in the regulation which the

President spoke about may be a return to the old rule which obtained in the case of the Gold Medal, for which prize students were allowed to work out their designs at home, as is still the case with the painters and sculptors. In No. 282,—Mr. Simpson's design, to which the prize has been awarded,—the author has endeavoured to give a distinctive character to each of the three houses. The area given was 90 ft. frontage and 150 ft. depth, of which it seems 40 ft. might be taken off for stabling at the back. Mr. Simpson's plans are of the ordinary London type, in which the staircase is placed at the back. On one side there is a novel and pleasing feature in the design, viz., the introduction of a reception-hall on the ground-floor, in the place of the usual morning-room facing the street. The dinner guests, therefore, would not have to go upstairs to the drawing-room. This arrangement was a favourite one in the houses of the beginning of last century. There is one defect in it: the coming guests have to run the gauntlet of those already assembled before they can get to the cloak-room. The introduction of a covered balcony on the first floor, obtained by setting back the wall, destroys the drawing-room for dancing purposes, though for other reasons it might possess advantages. The elevations of the three houses are designed in the Early English Renaissance of the beginning of the seventeenth century, and contain many pretty features. The author has been fairly successful in reproducing what a seventeenth-century architect, with very imperfect knowledge of the Classic orders, might have designed. How far a nineteenth-century student is justified in such reproduction, willful or otherwise, is perhaps a matter of sentiment.

In the other design, No. 281, its author has treated the three houses as one block, and from an academical point of view (not Royal Academical, however,) his design is the most studied, and shows a more correct knowledge of architectural proportions. The plans of the three houses are similar. The staircase in each is placed in the centre and is lighted by an internal area, the dining-room being placed beyond and a morning-room or library in the front by the side of the entrance-hall. The author has made what seems to us to be a great mistake in the plan of the centre house by insisting on placing the door in the centre for the sake of the symmetry of his elevation; the library is thus confined to a narrow space with one window only, and much space is wasted on vestibule and passage. The ground-floor, as treated in the elevation, would not have suffered by the entrance doorway, the centre house being out of the centre. The elevations are designed in the style of the French Renaissance of Francis I.'s period, and are well drawn and composed.

The measured drawings of St. Stephen's, Walbrook, do not call for any special remark, except that they are well drawn by students who have caught the feeling of the work of that period.

Looking at the designs submitted in competition by the students of the Upper and Lower School for the 25*l.* and 10*l.* premium respectively, there is no doubt that the latter, as a whole, and (taking the three best) separately, are much better designs than those of the former and upper school, which speaks well for the future of the Academy school. Nos. 301, 299, and 298, might either of them have taken the 25*l.* in preference to the one selected.

Mr. Slater's design (No. 286) is picturesque but incongruous, carelessly drawn, and clumsy in its details. The capitals of the piers or columns in the front view are not the same as shown in the section, and neither agree with the wall ante. The author's attention seems to have been mainly devoted to the design of a piece of Byzantine or Early Persian tapestry, which is not architecture. The arrangement of the plan is picturesque and good, and one is disappointed it should not have been worked out in a more reasonable and better style of architectural design.

No. 887, "Design for a Lodge and Gates," in the Early Italian Renaissance, is well designed, the monumental character given to it being possibly due to the author's intention that it should be in keeping with the mansion to which it forms the frontispiece.

No. 283, "Design for a Railway Station," must have been prepared for a very rich railway company. The carriage-drive runs under a magnificent peristyle of Ionic columns,

flanked by wings, with large niches and fountains, surmounted by Michelangelesque figures. The whole design is carefully studied, of good proportions, and well drawn, and the only exception we have to take is to the clock turret, which is poor, and unworthy of its neighbour the peristyle.

Mr. Guy Dawber's design (to which the 10*l.* premium is awarded) is for a gateway and bridge, forming an entrance to a town. The bridge, of three arches, spanning the river, and the gateway with its octagonal staircase-turret, are all admirably designed in brickwork in the Flemish style, and show considerable acquaintance with the best types of Late Gothic brickwork in Belgium.

No. 300 is a design for the same subject, in which the author has treated his gateway as a triumphal arch. He has given too much importance to the first floor, in which on one side of the arch is the residence of the gatekeeper, and so far has destroyed the monumental effect. The cornice of the ground-floor becomes the impost moulding of the great arch, and he has made this ground-floor the podium for an order which flanks this arch,—an incongruity which is entirely out of keeping with good Classic design.

No. 299 has a well-designed bridge of two arches with a good characteristic fifteenth-century gateway. The octagonal turret at the angle on the ground and first floors might, we think, have been omitted with advantage, and the staircase carried up in the tower.

No. 298 has apparently been unable to complete his drawings; the detail of his elevation, in fifteenth-century Flamboyant Gothic, is well designed, though we must take exception to the heavy mass of brickwork above the arch, which should have been decorated with panels unless the windows, which are now at the back, had been brought to the front.

No. 289, also for a gateway and bridge, is in the Francis I. French Renaissance, and of fair design.

#### DR. JOHNSON'S HOMES IN LONDON.

"Nam quis inquit  
Tam patiens urbis, tam ferreus, ut tenet se?"

JUVENAL.

"Mais moi, virez à Paris! eh! qu'y vendrais je faire?  
Je ne sais ni tromper, ni feindre, ni mentir."

BOILEAU.

On the morning of Tuesday, the 2nd of March, 1737, an ex-schoolmaster, and one of his only three pupils, started from Lichfield to try their fortunes in London. The latter, grandson of one of the cathedral vicars, purposed to qualify for being called to the Bar; but following his genius into another field, and having first acted at Ipswich under the pseudonym of Lyddal, drew the whole town (October, 1741), to see David Garrick as *Richard III.* at Giffard's theatre in Goodman's-fields.\* The former, his wife's little fortune lost in the unsuccessful venture at Edial, had no other resources than an unfinished play and his fellow-citizen Gilbert Walmesley's letter to the Rev. John Colson, in whose school at Rochester his companion was to be placed.

This was not Samuel Johnson's first visit to London. He was taken thither in his infancy to be touched by the sovereign,—and ever retained a solemn recollection of the Queen's diamonds and black hood,—for a disorder whose congenital symptoms darkened all his life. On this second occasion his first lodging was a garret in Exeter-street, Strand, at one Norris, a stay-maker's; his customary resort, the Pine Apple in New-street, Covent-garden. As originally planned, Exeter-street ran behind Exeter-change, from the northern end of Brnleigh-street to Katharine-street; Wellington-street being of much later date. The oldest map wherein it assumes its present form is Bowen's, published 30th of August, 1735. The western extension, cut off by the former garden wall of Bedford House, together with the return southwards into the Strand, was then styled Denmark-court. We next hear of Johnson at Greenwich, under date and address of 12th July, 1737, next door to the Golden Heart, in Church-street. He writes to Cave, of St. John's-gate, Clerkenwell, proposals for translating from the Italian, Paul Sarp's "History of the Council of Trent." Here he laboured with the last two acts of his Eastern tragedy. This same summer he returns to Lichfield, stays there some weeks, and finishes

his play.\* Johnson then brings his wife to town, settling first in Woodstock-street, next westwards of New Bond-street (where there are a few houses of that date), and then at No. 6, Castle-street, Oxford-market. The latter is now Castle-street East. The Market House, built by the second Earl of Oxford, in 1731, was replaced three years ago by Oxford Mansion.

We next trace Johnson from Castle-street to his lodgings (in the order given) in Boswell-court, Fleet-street; "The Black Boy," opposite to Durham-yard in the Strand; Bow-street; Holborn; and Fetter-lane; though the dates severally applicable to these migrations cannot with certainty be given. The interval is a fairly busy one; it is marked by various Lives, histories, translations from the French, a beautiful epitaph on Philips the musician, an ode to friendship, with a masterly albeit unremembered account, in Latin, of Lord Oxford's library. The collection of Robert and Edward Harley, first and second Earls of Oxford and Mortimer, had been stored in the house which is at this day occupied by Messrs. Tibbary, High-street, Marylebone. Osborne, the bookseller, having purchased the library for 13,000*l.*, employed Johnson in preparing a catalogue. The book with which Johnson is said to have knocked Osborne to the ground for insolence was a copy of the "Biblia Græca Septuaginta," fol. 1594, Frankfurt. Mr. Leslie Stephen says it lay in a bookseller's shop at Cambridge in 1812. The Government debates, under the guise of the Senate of Lilliput, ran from November, 1740, to February, 1743. In 1744 appeared one of his greatest biographical achievements,—the "Life of Richard Savage." But about this time absolute poverty compelled him not only to ask Cave for a guinea in advance,† but to keep in the streets by night, his wife the while, says Hawkins, finding shelter with a friend by the Tower. For the opening of Drury-lane Theatre by Garrick as joint manager and patentee (1747) he composed one of the two best prologues in our tongue. This same year he addresses from the Golden Anchor, Holborn-bars, to Lord Chesterfield his plan for a Dictionary of the English Language. Robert Dodsley, the Longmans, and other booksellers, agreed to pay him 1,575*l.* to cover all the author's expenses. Singularly enough five of the six amanuenses came from beyond Tweed-side. When we are reminded of their employer's prejudice against the Scots let it not be forgotten that amongst his numberless objects of charity were included these, even long after their labours for him had concluded.

For the better progress of his enterprise he removes (1747) to the house, No. 17, which forms the western side of Gough-square, Fleet-street. In the three garrets on its third floor he endured for nearly eight years the drudgery of dictionary-making. A resident here, he made acquaintance with Reynolds. They met at the Misses Cotterell's, in Castle-street, Oxford Market (a street also memorable as the home of Barry), when Reynolds fixed Johnson's attention by remarking that the death of a person to whom these ladies professed great obligations would, at any rate, remove the hurthen of gratitude.

Reynolds is commonly stated to have permanently settled in town in the year 1752 in a house opposite to May's-buildings, St. Martin's-lane. Mrs. Thrale, however, says that Johnson composed the fine "Rambler" on Procrastination (No. 134) in Reynolds's parlour, the printer's boy waiting for the copy. That paper bears date Saturday, 29th June, 1751. In Gough-square he provided a retreat for Dr. Levett and the blind Anna Williams, and could reckon amongst his intimate visitors such men as Garrick; Dr. Hawkeworth; Lord Southwell, F.R.S.; the Earl of Orrery, author of the "Life of Swift"; Strahan, the printer; the "very good hater," his dear Dr. Richard Bathurst; together with the no less beloved Bennet Langton and Topham Beauclerk. In 1748 he founded a club at the King's Head beef-steak house in Ivy-lane, where, according to Hawkins, he at once, and by common consent, presided as symposiarch. The tavern was burned twenty-five years ago, but the extensive cellars remain beneath No. 4, Aldis's dining-rooms, on the eastern side. The year following Garrick, Barry, Mrs. Cibber, and Mrs.

\* On the northern side of Great Ayle or Ayliffe street, between Zoor Chapel and Half Moon-yard. The Tenet ground or fields lay to the south of the street.

† The original MS., with various readings, &c., was presented by Bennet Langton to George III., and is deposited in the King's Library, British Museum.

† Letter to Cave, August, 1743.

‡ Distinguished by a Society of Arts' plaque. For papers *ad hoc* see the *Builder* for 1861.

Pritchard lent all their art to gain popularity for "Irene," enriching its author with about 300*l*. Nevertheless the necessity which he was always ready to alleviate in others is still no stranger to him, and on one occasion (1756) he is indebted to Richardson's loan of six guineas for release from a spounging-house.

Johnson's removal from Gough-square was due to the completion of his "Dictionary" and the breaking up of his household by the death of his wife, than which latter, however hard her blows, Fate could deal him none heavier. Though the "Dictionary" brought him little profit its publication gained him many friends,\* amongst them Dr. Burney. Continuing to publish the "Idler" in *Payne's Universal Chronicle* (April 15th, 1758—April 5th, 1760), he, after a brief sojourn in Gray's Inn, took rooms on Friday, March 23rd, 1759, in Staple Inn. Here he set about and finished in six evenings his "little story book," as he called it ("Rasselas"), wherewith to defray the funeral expenses with some small debts of his aged mother, who had died in January of this year.

In 1760 he migrates to No. 1, Inner Temple-lane; † is busy more or less with an edition of Shakespeare, forms acquaintance with Murphy (who edited his works), and warmly espouses Wynn's scheme for semicircular, as opposed to Wynn's elliptical, arches in the construction of old Blackfriars Bridge. The accession of George III. opened a new and brighter prospect, says Boswell, to men of literary merit who had been honoured with no mark of royal favour in the preceding reign. At the instance of several of Johnson's friends, amongst whom Thomas Sheridan and Murphy claimed to have taken, *ad hoc*, the initiative, Mr. Wedderburne (since Lord Inchiquin) recommended him to Lord Bute, with the result that Johnson was compelled to acknowledge that for once a Scotchman (besides Buchanan) had written well, when Lord Bute signed his order for the pension. His circumstances thus rendered easy by the award of an income exceeding 600*l*. a year at the present time, Johnson could surrender himself to the allurement and more solid delights of society. Henceforward, of course, his career is only to be followed in the pages of Boswell. Him he first met in Tom Davies's shop, Russell-street, Covent-garden, on the evening of Monday, the 16th of May, 1763. The house is No. 8, on the southern side, adjoining what was Buttons'; and, lately known by a strange coincidence as the Caledonian Coffee-house, is now a fruiterer's. A few evenings later they supped together for the first time at the Mitre, Fleet-street; and on the night of Thursday, the 21st of July, at the Turk's Head, Strand (since rebuilt), the idea was first mooted which has given us one of the most delightful books of travel: the journey to the Western Islands of Scotland. It was in Green-wich Park on Saturday, the 30th of July, that Johnson avowed his preference for Fleet-street over all the charms of a rural prospect. In 1764 he and Sir Joshua Reynolds founded the club, named, at Garrick's funeral, the Literary Club, at the Turk's Head, Gerrard-street, Soho. The sign alone survives at No. 48, corner of Little Newport-street. The club has occupied in turn Prince's, Sackville-street; Telier's, Dover-street; Parsloe's, St. James's-street, one of the earliest of West End hotels; and (1799) the Thatched House, St. James's-street. A former home of the Dilettanti Society, the Thatched House, together with the two adjoining houses on its northern side, has since given way to the Conservative Club. On the 8th of July, 1765, Johnson is voted the unsolicited academic distinction of their LL.D. degree by Dublin University; but though he received similar honours from his own University, it does not appear that he at any time assumed the style of "Doctor." About this period morbid melancholy more than usually marked him for her own. There exists a painful picture of the distressing mental condition in which the Thrales found him one morning in his chambers (1765). Literally closing his lips, they carried him to Streatham forthwith, where for several years he found grateful distraction from the ills of life. In 1765 he leaves Inner Temple-lane for No. 7, Johnson-court (not, however, named after him) in the small paved yard that lies between Gough-

square and Fleet-street. Unless, indeed, the numbers have been changed, this is the white house on the eastern side of the yard, and occupied by the servants of Anderson's Hotel, Fleet-street. Yet in J. Smith's view, engraved for Bohn's edition of Croker's Boswell (10 vols. 12mo. 1848), the figures are pointing to the corner house on the southern side, which is now numbered 8. The proprietor of the hotel informs the writer of this article that the unnumbered premises between Nos. 6 and 8 is the house in question. Having lived here for eleven years,—an interval chiefly memorable for his friendship with Goldsmith, his interview with the King in Buckingham House Library, his tours in Scotland, Wales, and France, and a visit to Burke at Beaconsfield,—he changed in March, 1776, to No. 8, Bolt-court, hard by, where he wrote his "Lives of the Poets." The present Stationers' Company's School is generally pointed out as the house in question. At his death the house passed to a son of the printer Bensley, who carefully preserved it, and re-roofed it in 1817. A fire that broke out in 1807 did not injure any of Johnson's rooms. But in 1819 another fire consumed the whole premises, and no building has since been erected over the precise spot. The freehold of what had been four houses and a large garden was sold by the Bensleys to the Company some years ago, who, pulling down the offices erected after the fire, built the existing school-house, being No. 6 in the court. It was to No. 8, Bolt-court that Samuel Rogers came one day, but could not summon up confidence to await the opening of the door; and here too the elder Disraeli, having sent a poem for approval, called just a few hours after Johnson's death.

Here, in the back room on the first floor, on Monday evening, this date exactly 100 years ago, Samuel Johnson died, his last articulate utterance delivered to Miss Morris, daughter of his old friend. Thence by the very thoroughfares whereto, like to Charles Lamb, he loved to feed his humour, in sympathy with their multitudinous moving picture, his remains were carried to the southern transept, West Minster, there to lie beside the grave of Garrick at whose interment he had stood bathed in tears. Boswell cites his satisfaction when, to his inquiry on this point, Sir John Hawkins, his executor, replied, "Doubtless in Westminster Abbey." Yet in Hare's "Walks in London" (1878) occurs this passage:—"He was buried here by his friend Garrick, contrary to his desire that he might rest at Adderley, in Shropshire, which belonged to his friend Lady Corbet, cousin of Mrs. Thrale." In 1851 a tablet was placed against the pillar by his pew (No. 18), in the northern gallery of St. Clement Danes. The inscription omits to mention his shoubling charity and earnest piety. Much will be said and thought this day of Johnson as a scholar, a moralist, and a poet, of his courage and sturdy self-reliance; much could be said of his tender heart, his affection for his friends, his great humour, his genuine enjoyment of honest sport. That he did not on all occasions cultivate the *teniores virtutes* which lend a grace to social intercourse, may assuredly, with his bodily afflictions, at this distance of time be overlooked; for, as he himself writes of Goldsmith to Bennet Langton, "Let not his frailties be remembered; he was a very great man."

#### JAPANESE ARCHITECTURE AND ORNAMENT.

##### ARCHITECTURAL ASSOCIATION.

The fourth ordinary meeting took place on Friday, the 5th inst., Mr. Cole A. Adams, president, in the chair.

About seventy new members were elected, and Mr. James Brooks was elected a member of the Association by acclamation.

Dr. Dresser, Ph. D., F.L.S., delivered a lecture on "Some Features of Japanese Architecture and Ornament." Japanese architecture, he said, was in part native and in part foreign. Japan was very similar to Great Britain in the fact that it consisted of three parts. The northern division is inhabited by a simple, kind-hearted race, having the most primitive of manners, whose dwellings are of a rude character, and whose temples are scarcely of a more advanced nature. The also temples consist simply of trunks of trees fixed into the ground, more or less vertically, on which are arranged horizontal members, arranged for forming a sort of roof.

These members are covered with a very rude hatch. The main feature in this building is the roof, which is intended to give shelter from sun and storm, and is supported in a number of uprights. This was the earliest type of all the Japanese dwellings, because the most highly finished edifices consist of little more than uprights of some description, tie-pieces, and very elaborate roofs. Japan derived a great portion of its architecture from the continent of Asia. At an early period direct communication existed between Japan and Corea, the latter being made tributary not long after the commencement of the Christian era. Some of the Japanese architecture was brought from India by Buddhist missionaries. A temple about twelve miles from Kioto, was decidedly Indian in character, and the priests who had charge of it said it was built by Indian Buddhist missionaries about six centuries ago. As all the nobility studied the works of Confucius, great Confucian temples have been erected, but the greatest of these, built on a Chinese model, has now been converted into the National Library. Here they got Chinese influence brought to bear directly on Japanese architecture. Chinese architecture had two sources. The Chinese had resided in boats from time immemorial, and he would point to an example of a Chinese building which showed its boat-like architecture. The Chinese source was the tent, and there was some Chinese buildings which consisted of right lines. The Japanese, so far as he knew, had never adopted the junk-like architecture, but they had adopted the tent-like form in many instances, while in not a few they had adopted the right-line character also. There were many proofs to show that the architecture of Japan was derived to a great extent from China. The columns of many of the temples were intertwined with dragons, and the same lattice work was used in both countries. The pagoda was also common to both China and Japan. It was said by many Europeans that the Japanese had invented nothing, but had improved in everything they had derived from other sources. [The lecturer here showed several photos of the central shrine of the Shinto religion. This, the oldest structure in Japan, was erected more than 1,800 years ago; and although the buildings composing it were razed to the ground periodically, yet exactly similar ones were erected in their places.] The next most ancient building was composed of huge triangular logs, and had for more than 1,200 years contained the treasures of the Mikado. An inventory made 1,200 years ago was said to represent the things now in this building, many of which were certainly from Central Asia. Style in architecture is influenced by religion, climate, and material. The mirror is the great symbol of the Shinto religion, the idea being that everything should be capable of being revealed to the world, as one's image is reflected in a mirror. A great deal in Japanese architecture was due to this religion, enjoying as it did the most perfect workmanship, and no "scamping." The Mikado is the god incarnate of the Shinto church. In every house there is a little altar or *dais* for the Mikado, with a shelf for a flower or vase. This niche is treated with the greatest reverence, and constructed with the utmost care. Even in the poorest houses the wood, which is without lacquer or coloring, is so beautifully smooth that he used to delight in stroking it. Dr. Dresser next referred to some length to the sun and fire worship, to Phallic worship, and to the worship of heroes. The Shogoon, with whom Great Britain made a treaty, was a Buddhist, and under his power the most gorgeous Buddhist shrines had been erected and maintained throughout the land. Buddhism introduced the greatest harmony between man and all created things, and this would explain the influence such a religion had brought to bear upon Japanese architecture and art. As to climate there was a wet season, with a continuous downpour lasting some six weeks. In the south the climate was tropical; in the middle, semi-tropical in summer, with great cold in winter; and in the north the cold in winter was intense. The Japanese climate, therefore, demanded a roof over one's head; at the same time it was a land of earthquakes, which was one of the greatest difficulties the Japanese architect had to overcome. He (Dr. Dresser) was the first to enunciate the plan on which the Japanese pagodas were built. The central upright, he found, was not continuous, but, like the clapper of a bell, it was really dependent from the top,

\* As also a diploma as M.A. of his University, dated the 10th of February, 1755, and the offer of a benefice.

† See his letter of that date to his step-daughter, Lucy Porter. The writer fails on careful inquiry to identify his rooms in Staple Inn.

‡ Pulled down 1857—now site of Johnson Buildings.

so that when an earthquake took place it swung always keeping the centre of gravity within the base. For this reason no pagoda had ever been known to be upset by an earthquake. Japanese houses were not fixed to the ground, but were built of uprights, horizontal tie-pieces, a roof and a floor, so that, in case of an earthquake, the houses rocked about and then settled down again. Then they had the rain to deal with. The Japanese only built their castles of stone, in enormous blocks, leaning inwards, and fitted together in a peculiar manner. As the ordinary buildings, therefore, were of wood, they had to be protected from water, and the lower part of every wooden column was encased in bronze, so that the water should not get into it. The walls, palings, and even clothes-props had roofs to protect them from the weather. The material used for building was, as he had said, chiefly wood, but the English in Japan had been trying to persuade the people to use brick. If they did so he believed the first big earthquake would bring them down. It was difficult to understand the nature of Japanese architecture because there was an etiquette in it. If a man wished to build a house, he had to go to the master of the ceremonies for a plan, which bound him down to the number of doors, &c. There were a great many different kinds of roofs. The lecturer here referred to the photographs exhibited on the wall, drawing special attention to a thatch roof with a curious bit of gable, similar to the houses of Sumatra and Java. Roofs are in some cases covered with thatch, and in others with tiles. The thatch consists chiefly of rice-straw, and in the great temples the inner bark of a coniferous tree is used, the little plates of bark forming an exquisite thatch. The roofs are of various kinds, but the pitch is never very high. There is the right-line roof and there are curious curved roofs. Roofs are supported by a system of bracketing. The roof is brought out gradually by brackets, and in some cases the brackets used are of a simplicity and correctness which are really charming. In other cases this is carried to such a degree of complication that it is almost impossible to understand it. The ceilings are generally coffered, some being of great beauty. The ceilings of the temples are of a coffered character, sometimes richly decorated with flat ornamentation, and in other cases with carved woodwork. Circular columns are most frequent, but there are also octagonal and many-fluted columns. The columns are occasionally enriched by a dragon twining round them, or by sprays of the black-thorn or other plants. In other instances the columns are covered with very fine diaper-work in relief. The walls used were to be especially noted, one example being formed of tiles placed one on another, covered with cement, and topped by the roof. Some roofs consisted of stone at the bottom, then came uprights with tie-pieces, and below these were carvings of water-fowl. Walls were often enriched by carvings, especially in the upper part, where they were sheltered by the roof. Dr. Dresser then gave a graphic description of the great shrine of Niddo, which is approached by an avenue, forty miles in length, of coniferous trees. With regard to ornament as springing out of the architecture of the country he could say very little indeed. Japanese ornament was of a peculiar kind, and they had a distinct conventional ornament which did not consist simply of the representation of natural objects. Dr. Dresser showed several circular ornaments in imitation of crests, and others which sprang from fire. He also exhibited a series of drawings he had had made in Japan by a native artist. There were surface drawings, but the carvings they depicted were as highly coloured as the drawings. The Japanese in their temples used a high colouring, owing to the fact that the roof very much overshadowed the building, while the floor was polished black, all the light the decoration received being reflected from the black floor. Water was the decoration used on most of the columns. Some time ago the *Builder*, in devoting six columns to a review of a work of his, made the following remark:—"What could be more absurd, more contrary to the whole meaning of ornament as applied to architecture, than to sculpture conventional water all over a wooden column?" The author seems to have some difficulty in swallowing this water." Well, this was what the *Builder*, 1878, page 635, said, speaking of some terra-cotta piers

in the Natural History Museum at South Kensington:—

"The design of these piers is certainly novel and pretty. They are oblong in plan, the longer side parallel with the length of the room, and consist of a kind of pedestal about three-fourths the height of the room, the remaining portion breaking into four pilasters square on plan, and with foliage ornament on the outer faces and the capitals; the pedestals in the room devoted to marine fossils are decorated in a very pretty and piquant manner by very low reliefs of fish and other aquatic creatures, worked on various blocks here and there in an accidental sort of manner, and as if from the inspiration of the moment in working the material, the general face of which is relieved also by waving lines symbolical of water, with an ornament of conventionalised aquatic plants delicately modelled in very low relief just over the pilasters. The effect of this treatment is very refined and unusual, and gives a picturesque interest to what would otherwise have surfaces of bare fluted terra-cotta."

He might say that he did not swallow the water. He had intended to say a few words about the beautiful poetry of Japanese art. There was a poetry and meaning about almost everything, the Japanese did, and there was scarcely a thing in a Japanese building which did not remind the people of something they loved. There was nothing in connection with the great shrines which was not lovely in colour and harmonious in its general effect.

The Chairman, in opening the discussion, said it was interesting to trace in Japanese art, as in all other arts, the influences which had given rise to, and formed it. The beauty and care which the Japanese bestowed upon their art, making it a part of their religion, was a proof of the likeness between Japanese and Greek taste. In Japanese art they could see that precision of hand and eye which gave it a certain fellowship with Greek art. The Japanese, while approaching nature, yet preserved an exact conventionalism. The old Greeks, like the followers of the Shinto religion, believed that the gods saw everything that was done.

Mr. H. H. Statham rose to propose a vote of thanks to Dr. Dresser for his interesting lecture. He did this with the greater pleasure as he had spent several hours with Dr. Dresser, looking over his photographs and inspecting many of the interesting objects for which the Association had been unable to find room. One thing which had particularly struck him was the remarkable way in which the Japanese made use of the products of nature close to their hand. Whatever was round about them they seemed to lay hold of, turning it to the best artistic use, and putting upon it a finish which was most extraordinary. They showed an example of thoroughness and painstaking which was difficult to find in any other art of the present day. One or two of the objects he had looked at reminded him of a very excellent sentence of John Stuart Mill's, who said that if he were asked to define art he would term it the endeavour after perfect execution. If a man had done a thing in the very best possible manner, although a less complete way would have answered for practical purposes, that man had worked as an artist. Dr. Dresser had shown him a minute butterfly-cage, bound round with little tie-pieces of bamboo, turned round, cut, and joined, and had defied him to tell where the joint was. This was a most extraordinary instance of perfection in workmanship, for the sole purpose of doing it well. On the other hand, there was something curious and extravagant in the manner in which the Japanese artist had got up the coloured drawings. These were intended purely to show the construction and method of decoration, but the painter could not be satisfied with simply doing that. He could not see a column going up one side of his paper without putting in something perfectly irrelevant for the purpose of balancing the work. That showed a sort of illogical mind, and appeared to be the one defect in Japanese art, with all its beauty, its finish, and its exquisite fancy. It was not the logic which belonged to Greek art; and was hardly a thing for people to be always imitating. Ornament should have some connexion with the member in which it was placed, and the position in which it was. Dr. Dresser had called attention to this in bringing forward the coloured ornament with the diaper on the beam so exactly fitted to it. He was bound to notice the lecturer's little reference to the *Builder*. The water decoration upon the walls of the Natural History Museum at South Kensington was, he believed, put in the Fish Museum, as symbolical. All ornament ought to have a meaning, and if the Japanese water ornament was in a fish museum it would be excellent; otherwise it had no meaning. A column was a thing to support a weight, and should be made

to look as strong as possible. The Greek artist did this, by fluting it up vertically, to give it nerve and sinew, while the Japanese artist amused himself by drawing water-lines upon it; therefore, the Japanese artist made a mistake in that way. Mr. Waterhouse, or whoever did the decoration at South Kensington, seemed to have wished to emphasise the fact that it was a fish museum. He (Mr. Statham) could see no reason for water on the Japanese column, and until he could he would maintain he was right.

Mr. Osborne Smith remarked that the wave-like marks upon the piers at South Kensington were not in the Fish Gallery.\*

Mr. Stannus thought that the decoration of water might have had its rise through a poetic and imaginative people owing so much of their safety to columns going down into the water. Mr. Statham had referred to the want of logical ornament; there was also a want of reticence in Japanese ornamentation. The Japanese artist never knew where to hold his hand, whereas the Greeks put the ornament in its proper place. This temperance, as he might term it, was a virtue which was lacking in Japanese art, lovely and interesting as it was. He had much pleasure in seconding the vote of thanks to Dr. Dresser.

Mr. Burrows inquired if the Japanese went in for quarrying at all? Also if the central staff of the pagoda was free?

Mr. A. B. Pite remarked that Mr. Stannus's idea of the derivation of the water-decoration was a charming one, but, at the same time, slightly far-fetched. As to the application of ornament, Dr. Dresser had already said that architectural style was not only influenced by people and climate, but also by material. It would not do, therefore, to judge Japanese wood-work by the same rules of decoration and support which would apply to the marble architecture of Greece and the granite architecture of Egypt. They could not apply the European orders of architecture to the Buddhist element, which was beyond the pale of modern civilisation, and, until some wonderful being had compiled a grammar of the whole thing, they would not be able to apply any rules of logic to it.

Mr. H. D. Appleton (hon. sec.) wished to know whether the Japanese prepared plans for the erection of their buildings at the present day.

The vote of thanks having been carried by acclamation,

Dr. Dresser, in replying, said that when Mr. Waterhouse designed the water-columns, which were both pretty and piquant, it had not been settled which rooms were to be devoted to the different classes of creatures. He contended that nothing had been said about beauty and appropriateness in the *Builder*. As to appropriateness, the water was not a general decoration in the case of columns. The temple in which he had seen it had been, he believed, dedicated to the fish god, hence they would see the appropriateness at once. He had no knowledge of quarrying taking place in Japan. Some of the stones used in the construction of the large castles had been brought over 200 miles, and the curious thing was how this had been done when there were no roads. The central rod of the pagoda was absolutely free, with a considerable space round it. The Japanese plans for the temples and large buildings were carefully drawn. They drew elevations, but put in little bits of perspective to help them out.

**Art Union of London.**—The Art Union have sent us an impression of the line-engraving by Mr. Willmore, from Mr. Brierley's picture of the "Attack of the *Invincible* on the Starboard Wing of the Spanish Armada." The work, which is the print for 1885, is a spirited one, and Mr. Brierley has studied the historical aspect of the subject thoroughly; but it has the old fault of being over large, as are most of the engravings issued.

\* The fact that the specimens were not ultimately deposited in accordance with what appeared to have been the original intention does not much affect the argument. But it is odd that all the speakers seen for the moment to have forgotten the essential distinction between the two cases: the visible surfaces in Mr. Waterhouse's building are only an ornamental fire-proof terra-cotta screen for the iron columns. The parallel case would be, if the terra-cotta screen were removed, and the iron columns and spires painted over with conventional water. That we should call an absurd style of architectural decoration, whether it were done in England or Japan. The treatment of a mere screen surface does not strike the eye as absurd in the same way, though we are not particularly concerned to defend it.—Ed.

\* See *Builder*, Nov. 25, 1882.

## A CASTLE SKETCH.

WITH what sublime indifference and superiority does not the material man for the most part regard the antiquary! To him walls are a mere patchwork of bricks and plaster, and arches mere heaps of stone piled together in certain conventional shapes. A Saxon window has no charms for him, and the mystic B. S. H. M. is in his eyes a cypher, and nothing more. He cares for none of the enjoyments that spring from even the most superficial study of history, architecture, or natural surroundings; his thoughts are centred, perhaps, on a dinner prospect, or, more probably, on the self-satisfaction which he feels at having seen something, though what that something is it matters little.

The antiquary's spectacles, again, are often the subject of derision; not only are they charged with possessing a pinkish hue, but even of being tinted with that brightest of all colours,—imagination. Still, what an additional amount of pleasure do they not bestow upon their wearer! They should, indeed, rather be said to consist of that sombre and dignified dark glass through which things are to be seen steadily, in their true aspect, and without the glare and dazzle of deceiving sunlight. Many an old building may be seen to advantage through them; for they not only facilitate a sketch of its contour, but are of immense use in reading the history and true life of the most ancient pile of bricks and mortar, and in imagining its past scenes and surroundings.

Of all the Welsh castles to which the antiquary's glasses may be applied with the greatest advantage, Carnarvon is the most imposing and the most worthy a sketch, whether mental, or pictorial, or descriptive. There is so much to think about when we look at this mass of masonry surrounded by a glorious landscape, and rich with the legends of bards and warriors. A thought is but a sketch, and where the one is tossed off into the sketch-book or on to the canvas, the other is painted, with the colours of impression, on the mind: so that the genuine antiquary, who should have in him a touch of the poet and the artist as well as of the historian and the old-world lover, will have before him as good an opportunity for the contemplation of the landscapes of art and the vistas of history, as of the angles of architecture and the mazes of romance.

Viewed from various points,—from the streets of the town itself, from the shore, and from the Menai Straits,—the fortress of the Arvon presents an equally grand appearance. Externally in a most complete state, its ramparts and walls, with many towers and turrets, look as if they still had some of those duties to perform for which they were originally intended. To take in the idea of the size of the building and the extent of ground it covers, a walk around its base, down the street that leads to the quay, and then round the north side of the building, is sufficient. Though not possessing as much grace as Conway Castle, and deprived of as favourable a situation, it nevertheless surpasses it in stateliness, and may be taken as the best specimen of the Edwardian style of Gothic. The great difficulty in a building of this kind,—the difficulty of giving beauty to massiveness, and useful decoration to so strong and vast a piece of military architecture,—has been overcome in a masterly manner by the pentagonal, hexagonal, and octagonal turrets that surmount its towers, and by the irregularity of its plan, as well as by the grace of its windows, whose form, among many other things, was, no doubt, suggested to Edward I., its founder, on his travels to the Holy Land, where he much admired the castles of other countries, and brought home fresh ideas which found expression in the building of such fortresses as Beaumaris, Conway, Harlech, and Carnarvon.

Turning from the contemplation of the larger effects, to a sketch of the more prominent and noteworthy of the isolated bits for which the castle is famed, we might take, for instance, the Eagle Tower, which our friend the antiquary would select at once as the most prominent feature of the building, and the most interesting point in his series of sketches. Viewed from the quay, it is to be seen to the best advantage; and the skill with which the architect has made such a mass of square stone appear light and graceful is especially to be admired. This lightness is due to the three angular turrets that rise from the summit of the towers, and to the little statues of eagles that are placed here and

there on the parapet, and give their name to the edifice. Below, at its foot, is a small water-gate, and, breaking the fine of square-cut stones that runs from the summit to the base of one of the angles, is a small group of fisher-hamlets built up against the wall. On the ramparts are the stone heads of cross-bowmen, that look as if they were peeping over the parapets: a strange device for misleading enemies, and a detail in the building which, though strikingly out of place amid the dignity of its other surroundings, still recalls forcibly the character of the man who placed them there,—a character in which the sublimity of soul was blended with the cunning of the fox. Then, again, there is the Queen Eleanor's Gate, a handsome circular arch, which, used, in all probability, to serve as an entrance or postern to some drawbridge, connecting this portion of the castle with a row of outworks. It is seen at its best some distance off on the other side of the water, from which we also get a view of the expanse of the whole southern side of the building. This is the favourite view of Carnarvon Castle, and the one most aptly chosen by artists as conveying the best impression as well of the beauty and lightness as of the massiveness and strength of the building. Among its rows of towers, pierced with small long windows and outlets, the Eleanor's Gate shows with wonderful effect on the eastern side, and seems to spring straight from the ground and rise to within some 20 ft. or 30 ft. from the summit of the tower.

The series of mental sketches that spring from the contemplation of these different points is almost as varied as the string of natural details and art adornments that surround the building. We think of Edward the "Longshanks", of his conquest of Wales; of the pride and valour of the conquered Welsh, whose devoted historians even to this day insist on tracing the pedigree of Victoria through Lewellyn the Great, Constantine the Great, Lud, King Lear, through Æneas of Troy, Jupiter, Saturn, and Uranus, to Gomer, Japhet, and Noah, the forefathers of the Cymry. We think of the beloved Eleanor in whose honour the gate is named, how she visited Carnarvon before the castle was being built, and of the cunning fraud of the king, who held his baby up before the Welsh princes, presenting to them a lord who was born in Wales, who was innocent of all treason, and who could not speak a word of English. Then, again, we glance at the tower on our left,—the Dungeon Tower,—where the redoubted author of the "Historio-Matrix" was confined by the bigotry of Land and Charles I., and whence he was borne amid the joy of vast multitudes, to London on the triumph of the Parliament, with the "stigmata Landis" branded on his cheeks. Or another historical side-light shows us the last of the Welsh heroes, so hardly handled by Shakspeare,—Owen Glendower, for the last time calling to arms the hardy mountaineers of Wales, and by the fire of his eloquence and the greatness of his boasts igniting again the slumbering embers of hatred against the Saxon.

The portion of the castle, however, which, from its structure, gave rise to the greatest amount of ill-feeling in the hearts of the conquered nation was probably the entrance tower; and whereas in former days the Welsh people made the statue of Edward I., which surmounts the gateway, the object of their hatred and their theme for calling each other to arms, so in our own times, now that the expression of the statue has faded, and the meaning of its position been defaced by age, the Welsh antiquaries keep up the quarrel with one another as to whether the King is triumphant or menacing, gentle or conciliatory. But even if the features are somewhat faded by age, the rest of the grand entrance remains complete, and the work of Henri de Elreton is here to be seen at its best. Dallaway, who affirms that this portion of the castle is the most handsome structure of the age of Edward in the kingdom, describes it as "at least 100 ft. high; and the gateway, of very remarkable depth, is formed by a succession of ribbed arches, sharply pointed."

So we may wander on, recalling picture after picture, and jotting down sketch after sketch: whether it be a fragment of an arch shrouded by drapery of trailing creeper, or the relic of an old stone eagle, famous for the quarrels of antiquaries; whether it be wandering through old halls of which the walls have long crumbled; or climbing upon the ramparts and among the towers to see below us the

life of to-day. On the summit of the Eagle towers we see beneath us the lovely land of Wales; before us, the Menai Straits and the Isle of Anglesea; to the north-east lies Bangor; and to the south, as far as eye can reach, rise the lofty peaks of Snowdon and Moel Shabod, with the noble range of hills and valleys that surround them,—lands rich with song and the wealth of overflowing romance; while just beneath, at the foot of the castle, are a number of noisy school children let out from work, playing among the sand and stones, and paddling with their little bare feet in the water. And then, somehow, there springs up another thought, suggested by the words of Mr. Rnskin in one of the late numbers of "Fors Clavigera," concerning an incident at the school of Coniston. "And now, suppose," he says, "that there were any squire's sons or daughters down here for Christmas, from Christchurch or Girton, who could and would accurately and explicitly tell these children 'all about' the Queen's arms; what the Irish harp meant, and what a bard was, and ought to be; what the Scottish lion meant, and how he got caged by the tressure of Charlemagne, and who Charlemagne was; what the English leopards meant, and who the Black Prince was, and how he reigned in Aquitaine; would not all this be more useful, in all true sense, to the children, than being able, in two seconds quicker than the children outside, to say how much twenty-seven pounds of bacon comes to at 94d. a pound?"

## PROPOSED NEW STREET FROM GRAY'S INN ROAD TO ST. JOHN'S STREET ROAD.

THE proposed new street from Gray's Inn-road to St. John's-street-road for which plans have been deposited by the Metropolitan Board of Works will start from a point in Gray's Inn-road, opposite Theobald's-road, and will be carried in a curved direction through Warner-street and Coldbath-square to Farringdon-road at the junction of that road with Exmouth-street and the highest part of Mount Pleasant. The valley between Vine-street and Coldbath-square will be bridged by a viaduct about 150 yards long and about 26 ft. high at the highest part. Tothill-street, Vine-street, the south side of Coldbath-square, together with some other smaller streets will be stopped up. The salient angle of the Middlesex House of Correction at the corner of Farringdon-road and Mount Pleasant is proposed to be rounded off in order to improve the entrance into Farringdon-road from the new street. From Farringdon-road the road is carried by a short curve to John-street, which will be widened on its east side. From John-street the road is carried across Tysoe-street and Rosaman-street into Garnault-place, and thence in front of the New River Company's Offices to Sadler's Wells Theatre, which it passes on the eastern side. The new street will absorb the Middleton's Head public-house and Deacon's Music Hall adjoining, both of which are included within the limits of deviation. The new street will terminate in St. John's-street-road, opposite the Clown public-house, a short distance to the westward of the course of the New River for a length of about 100 yards to the westward of St. John's-street-road.

The whole of the open space in front of the New River Company's offices, Lloyd's-row, is included within the limits of deviation, and will in all probability be absorbed for building purposes in order to recoup some portion of the expense of forming the street. Clerkenwell is a poor and densely-populated neighbourhood, with but few open spaces, and it is perhaps not asking too much that if this space is acquired by the Board it should be planted and dedicated to the public. The street is throughout of a utilitarian character, no attempt being made to give it anything approaching a monumental appearance, and such an opportunity as is presented by the occurrence of this open space in the line of the proposed new street should not be thrown away. It is perhaps too much to hope that the New River Company's buildings should be set back and a place or turning-place formed in the middle of the street; but this would certainly be done in any other capital in Europe, and the poverty of the neighbourhood would be held to be a justification for such an expenditure rather than the reverse.

The street at its southern end will be carried

on a viaduct, the inclination of the roadway for this portion of its course being at the rate of 1 in 503, which appears to be satisfactory, but for a short distance, namely, between Mount Pleasant and Great Bath-street, the inclination on cross section is 1 in 20. The present inclination is, however, 1 in 14, and this alteration must be looked upon as an improvement. Between Farringdon-road and St. John's-street-road the new street closely follows the present surface-levels.

The old bathhouse or bagnio in the centre of Coldbath-square will be destroyed by the formation of the new street; the bath is ancient, but the premises are not interesting except from a topographical point of view. Myddleton's Head and Deacon's Music Hall mark the site of a tea-garden much frequented by the fashionable world in Charles II.'s time. It is alluded to by Peeps, and a portion of the house attached to the gardens is shown in the background of Hogarth's "Evening," in the series of engravings entitled the "Times of the Day."

The street crosses Rosaman-street a short distance to the westward of Clerkenwell Vestry-hall, but the hall is not included within the limits of deviation shown upon the deposited plan.

The improvement which will be effected by the new street in the means of communication between Holborn, Clerkenwell, and Islington, is one which has long been urgently demanded on grounds of absolute necessity, and its execution has been frequently urged in our columns. The existing route via Elm-street and Mount Pleasant is both steep and tortuous.

#### RAILWAYS IN ASIA MINOR.

THAT Asia Minor is destined sooner or later to become a field for railway enterprise there can be little doubt. Now that the continent of Europe has been covered with a network of railways, and the benefits consequent upon such means of intercommunication have been practically proved by the material progress of those countries, where they have been judiciously carried out, and now that in India also the railway system has been so largely extended that the extreme limits from North to South, and from East to West have been bound together, it would certainly seem as if the time had arrived when the countries which intervene between Europe and the Far East can no longer continue to remain isolated. Hence railways in Asia Minor have of late been more prominently brought before the capitalists of this country. For many years past it has been the dream of the more enthusiastic among railway projectors to connect Europe with India by the Euphrates Valley route, but that project has scarcely gone beyond the region of dreams. As usual in such questions, distinguished men are found ranged on opposite sides. Possibly in the distant future it may be found expedient to connect the extreme points whenever the intervening countries have advanced to the requisite stage of civilisation, and become themselves sufficiently developed to require being linked one with another, and with the greater world beyond them. As a first stage towards that end, the construction of local lines from the coast into the interior, so as to afford a cheaper and more expeditious mode of transit than at present exists, is a step in the right direction, and therefore, the scheme of the Mersina-Tarsus and Adana Railway, to promote the furtherance of which a meeting was, with the Duke of Sutherland's permission, held at Stafford House last Saturday, may be deserving of the attention of English capitalists. The meeting was well attended, and several distinguished men from the various classes of society responded to the invitations which were issued by the promoters. The speakers who moved and seconded the resolutions were, as a matter of course, advocates, not only of the particular project, but also of the more ambitious and extended scheme above alluded to, and as no one rose to call in question the views propounded, it is to be inferred that the measure met with general concurrence. One voice was, however, raised in doubt of the fiscal arrangement by which the promoters of the Mersina-Tarsus-Adana railway have been induced to lay it before the public. To say the least, the mode in which the capital is sought to be raised is entirely novel, so much so that the gentleman in question was doubtful

of the possibility of the scheme ever realising a quotation on the Stock Exchange. The "Short Statement" with which it is introduced certainly required the special explanation devoted to it, in order to clear up the seeming intricacy in which it is involved. It may be briefly described as a company within a company, "for inside the railway company," which "has been authorised by a firm of the Imperial Ottoman Government," there is to be a "Construction Company, Limited," with a capital of 95,000*l.* A shares (without voting powers), 8,250*l.* B shares (with voting powers), with 165,000*l.* six per cent. First Mortgage Bonds, and which is to "subscribe for all the shares of the railway company, to procure and pay for the assignment of the concession, and to construct and equip the railway for 165,000*l.* in cash, and all the 165,000*l.* First Mortgage Bonds of the railway company." In return for this, "for each 100*l.* now subscribed, the subscriber is ultimately to receive:—

£100 six per cent. First Mortgage Bonds.....	£8 0 0
40 in shares commencing at nine per cent. ....	3 12 0
£140, yielding per annum .....	£9 12 0

And, in addition, a share in the distribution of the final assets.

With the prospect of such a return there ought not to be any difficulty in procuring the requisite funds. Indeed, it is not clear why, with the probability of such ample returns for the investment, so circuitous a method of raising the capital should be resorted to. The proposed railway is 42 miles in length without, it is said, any serious engineering difficulty to encounter, while the existing local traffic is stated to be sufficient to insure its commercial success.

#### Illustrations.

##### JAPANESE CARVED FRIEZES.

THESE are from photographs which were exhibited at Dr. Dresser's lecture at the Architectural Association, and were lent us by him for the purpose of illustration. They are examples of the exquisite wood-carving which is frequently to be found occupying the space which answers to the frieze in Western buildings, as far as anything in Japanese architecture can be said to answer to anything in Western architecture. They are, as will be seen, open in some places. Some of these partially open-work friezes are found carved so as to give different subjects on the two sides, as in the open carving which adorns the crooks of some Mediaeval crossiers.

##### JAPANESE ENTABLATURE AND PART OF COLUMN.

THIS profusely-decorated piece of modern construction is, in the original, a blaze of gold and colour, of which the black and white drawing here necessarily conveys only an imperfect illustration. The construction is, a circular post carrying a joist placed on edge (the lowest member of the entablature) supporting a tolerably thick beam placed on the flat and diapered, as shown; then a cross-head construction of brackets carrying two more beams, with blocks between them in bracket form. It must be observed that the half shield and the floral ornaments straggling about between the upper and lower beams do not exist at all in the building, but were put in by the Japanese artist who made the drawing to fill up the blank space on the paper: a thoroughly Japanese idea.

The top portion of the column shows the survival in permanent form of an ornament originally derived from drapery hangings. The round part and the lower joist are painted over with a conventional imitation of water,—a characteristic whim worth illustrating, but utterly unsuitable for its position as architectural decoration.

##### DETAILS FROM THE CHURCH OF LA MADELEINE, VÉZELAY.

THESE drawings, which, like those published last week, are made by M. Adolphe Guillon, show another of the boss-carvings of the ancient sacristy, and a fragment of carved ornament, in which we can almost see the transition from Classic to Gothic foliage, in actual progress or growth.

#### TOKIO UNIVERSITY, JAPAN.

THE erection of this building was commenced in 1879 for the Japanese Government, from the designs, and under the superintendence, of Mr. Josiab Conder, architect to the Japanese Government, and the building has proceeded in blocks. The immense area of the building, as well as the necessity of erecting only portions at one time, required the dividing up into these blocks, as will be seen from the plan. The scheme for the entire university includes theoretical and technical sections. In the former are included law, literature, language. In the latter, geology, mineralogy, metallurgy, biology, botany, mathematics, physics, civil and mechanical engineering, architecture, astronomy; with museums, libraries, lecture-hall, and laboratories. It is proposed also to add at some future time a medical school, with a small hospital. The central portion forms the administrative block, and the various sections are placed with a view to the best aspect for each, and convenience of their proximity to kindred sections having classes in common.

Of the two end towers, one forms an astronomical observatory, and the other it is intended to use for physical experiments with pendula or weights, requiring a considerable height. The buildings are in brick, with stone dressings. The style is Early Gothic, but the details have, where possible, without incongruity, been infused with a Japanese spirit, more especially in the internal architecture and fittings. The great difficulty that a European architect has to contend with in attempting to imbue brick and stone buildings in Japan with the spirit of the native architecture is that, throughout the entire country, the architecture is wooden; every quaint form, such as the bracketing under the eaves and on posts, attenuated lintels, supports, &c., are entirely illogical, weak, and meaningless translated into a stone or brick or other solid material. The only constructively decorative forms at all compatible with an arcuated style, such as is necessary in building in brick or stone, are in certain ogee-curved panels and window openings. With regard to decoration pure and simple, such as carving, casting in bronze, mural and ceiling decoration, carved and pierced panels, diapers, &c., the whole spirit of such work is in keeping with the works in Europe in the Middle Ages. The conventional treatment of foliage much resembles the Early Gothic and Late Romanesque.

In addition to the difficulty of transferring wooden features to a harder material, there is in Japan the still greater difficulty to be met of the frequent and oftentimes severe earthquakes that occur there, a difficulty that naturally makes an architect look to iron construction as one most likely to serve him; but the Japanese authorities have not as yet taken kindly to the idea, although this mode of construction would undoubtedly enable an architect to more fully interpret the Japanese architectural spirit.

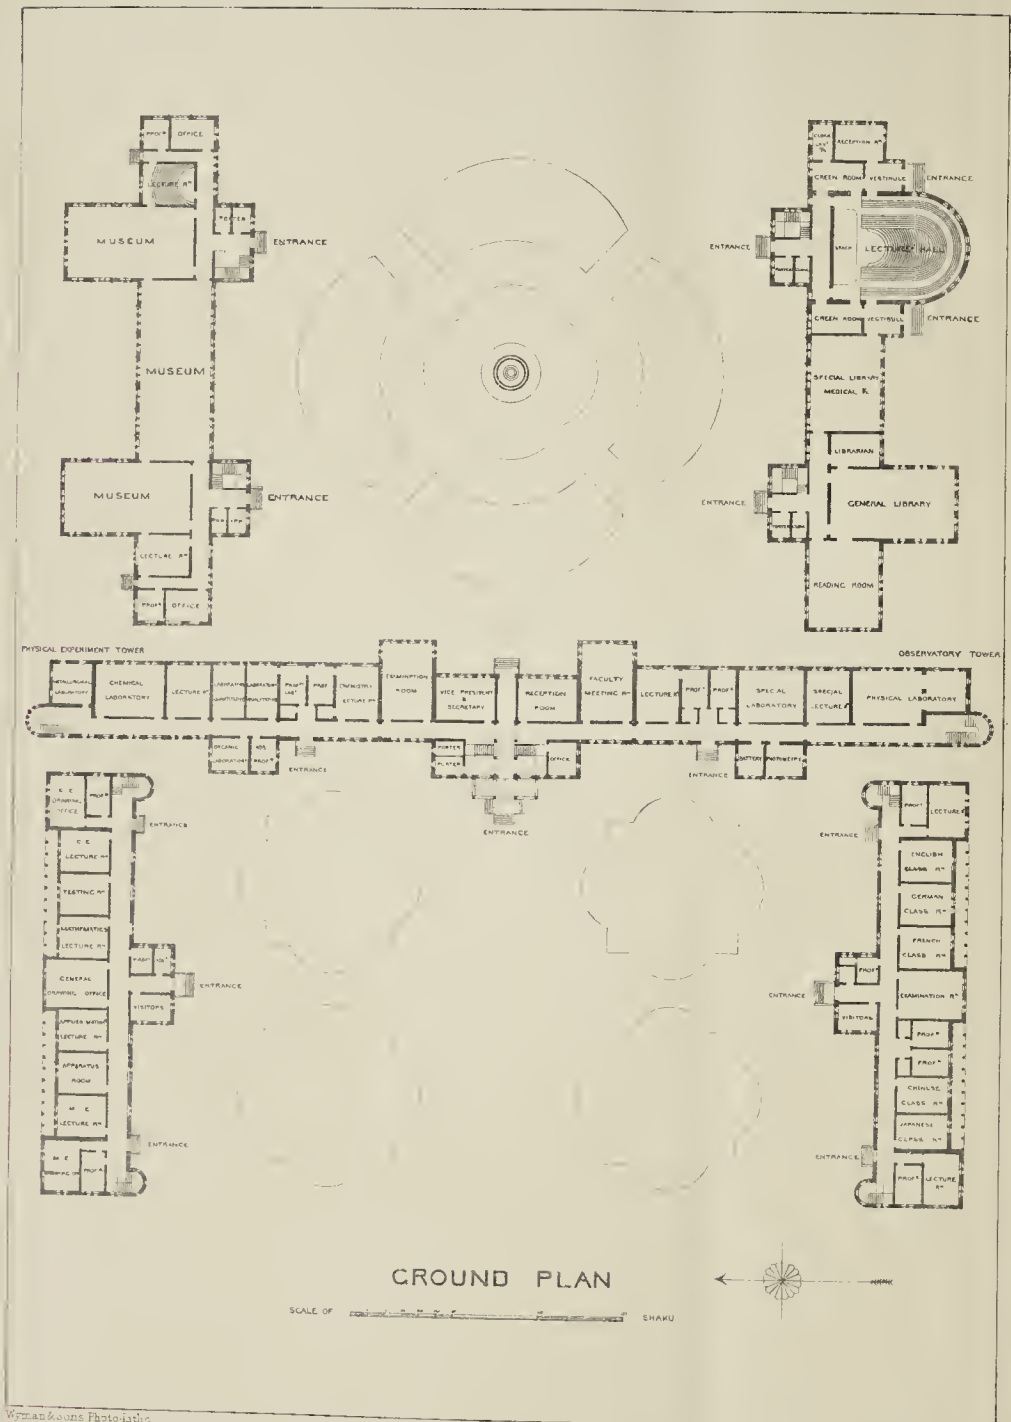

#### STABLES, SWARLAND HALL, AND ENTRANCE OF A HOUSE AT BEDFORD PARK.

THESE illustrations are reproductions of sketches in this year's Royal Academy. The part of the stabling shown in the first drawing is entirely new; the rest, forming a large courtyard, are old buildings remodelled and very much altered. The new buildings have been built with a rich buff-coloured stone quarried on the estate. The house at Bedford Park, of which part of the front is shown, was completed early last year.

E. J. MAY.

**Brick-making in Queensland.**—The *Brisbane Courier*, of September 27th, contains an account of the proceedings at the formal opening of the works of the Queensland Brick and Tile-making Company (Limited), near Brisbane. The brick-making industry had, says our contemporary, been previously carried on in the colony under conditions which seriously impeded its progress. Now, however, they are to be manufactured in a style hitherto unknown in the colony, and on the most approved scientific principles. The machinery selected was the Plastic brick machine of Messrs. Bennett & Sayer, of Derby, which has been fitted up in a shed measuring 56 ft. by 80 ft., and turns out from 15,000 to 16,000 bricks per day of eight hours.

Sir Charles Barry's Plan for the Completion of the Palace of Westminster, as modified by Mr. C. Barry.

**THE WESTMINSTER HALL QUESTION.**

THE accompanying plan shows Sir Charles Barry's scheme for completing the Houses of Parliament, in the slightly modified form submitted by Mr. Charles Barry to the Westminster Hall Committee. We subjoin Mr. Barry's memoranda on the subject:—

"It having been suggested that, in order to carry out Sir Charles Barry's plan of 1855 for a suitable completion of the new Palace at Westminster by a block of new buildings at the east side of St. Margaret's-street would narrowly narrow the roadway between it and St. Margaret's Church, Mr. Charles Barry, at the request of one of the members of the Committee, has prepared a plan showing that, by a slight receding of the line of the proposed façade at the south end only, a width, for carriage-way and footways, of 83 ft., can readily be provided, which is deemed ample for all possible requirements. This can be done without reducing the court which would intervene between the back of the new buildings and the west front of Westminster Hall to any damaging extent. All the old buttresses, except the southern one (which would be incorporated in the new building) would be preserved, and there would be no difficulty in erecting along the lower part of the west side of Westminster Hall such a cloister or gallery as would preserve the Norman wall there from injury by weather; and as this would not be seen, except from the court-yard, it may be built at moderate cost, without pretending to be a restoration of the old building there, for which there is really not sufficient authority. Such cloister or gallery would, moreover, form a useful passage of communication between the new buildings (proposed by Sir Charles Barry) at St. Stephen's Porch and the new building (also proposed by him, and part of his plan of 1855), completing the façade to New Palace Yard on its south side, of which the gable or raised towers of Westminster Hall would form the most important feature.

The cloister or gallery would, of course, be one story only in height, and in no way interfere prejudicially with light and air in the proposed new court, called in Sir Charles Barry's plan 'The Hall Court.'

It may be mentioned that the width of the carriage-way east of St. Margaret's Church is here (exclusive of footways) only 37 ft. 3 in., whereas by the modified plan, proposed by Mr. Charles Barry, it would be 53 ft."

**THE ENLARGEMENT OF MIDDLESEX HOSPITAL.**

THE new wing to the Middlesex Hospital, which has for some time past been in course of construction, is now completed, and is intended to be formally opened on Tuesday next by the Princess Christian. The object of the extension has been to provide additional accommodation for the out-patients, and, at the same time, to increase the residential accommodation for the medical staff, nurses, and domestics. The new wing has been erected on the east side of the quadrangle, having three frontages, one within the quadrangle, another in Mortimer-street, and a return frontage in Cleveland-street. The principal frontage is that in Mortimer-street, which is 52 ft. in length, and 43 ft. in height, containing four floors and a basement. The elevation is faced with Portland cement, the ground-floor portion as well as the angles from the street level to the cornice being in rusticated work. The return frontage in Cleveland-street is carried to a depth of 87 ft., of which 18 ft. is faced with Portland cement, and otherwise uniform with the Mortimer-street elevation. The remaining portion of this frontage is faced with stock brick and red brick bands and dressings. The new buildings cover a ground area of about 4,500 superficial feet. The entrance to the buildings for patients is by a newly-erected porchway on the east side of the quadrangle, and here it should be observed that that portion of the old building on the north-east side of the quadrangle has, to a great extent, been rebuilt and re-modelled. The entrance leads into a corridor, 7 ft. in width, with several other corridors of similar width at right angles, the floors of the whole of these corridors, together with several narrower passages, being in mosaic, whilst the walls are faced with buff and white glazed brick. The ground floor is mainly devoted to the outpatient department, and contains the dispensary, men's and women's waiting rooms, surgeons' consulting-room, operating-room, and dressing-rooms. The walls of the men's and women's waiting-rooms, which immediately adjoin the dispensary, are, like the corridors, faced with glazed brick. Light and ventilation to the whole of the apartments on the ground-floor, as well as the corridors, have been amply provided for. At the first-floor level, over a central open area, there is a flat asphalt roof. This roof contains twelve lantern

lights, affording light and means of ventilation to all the apartments named. All the upper floors are intended for the occupation of the medical officers, nurses, servants, porters, and others connected with the domestic arrangements of the hospital. Amongst other apartments in the basement is the dispensers' dining-room, together with dispensary and general stores. The walls of all the staircases leading to the upper floors are faced with a dado in glazed brick, 5 ft. in height. All the floors from the basement to the top of the building are of fireproof construction. Mr. Matthew Wyatt is the architect, and Messrs. Higgs & Hill the general contractors. Messrs. Haden & Sons, of Trowbridge, supplied the boilers, warming apparatus, and all the engineering work. Mr. Barrett, of York-buildings, Adelphi, furnished the ironwork; Mr. Johnson, of Wandsworth, the lifts; and Mr. Ebner, of Clerkenwell-road, laid down the mosaic floors. Mr. W. Tooke is clerk of the works, and Mr. W. Swain the general foreman. The estimated cost of the building is 16,000.

**CHARGING ORDERS.**

By Section 17 of 45 Vic., c. 14, where a building is ruinous or so far dilapidated as thereby to have become and to be unfit for use or occupation, or is from neglect or otherwise in a structural condition prejudicial to the property in or the inhabitants of the neighbourhood, the Metropolitan Board of Works is empowered to issue a summons calling upon the owner and occupier of such neglected structure to abate the cause why the structure should not be taken down, repaired, or rebuilt, and upon the order being made, if the same is not obeyed, the Board are empowered to enter and execute the same. If the order is to take down the structure, the Board may sell the materials as they think fit. And by Section 18 of the same Act the Board may, after notice served, apply to a magistrate for an order for payment of any expenses which they have incurred in respect of dangerous or neglected structures, such order directing that until such expenses are paid no part of the land upon which such dangerous or neglected structure stands or stood shall be built upon, or that no part of such neglected structure, if repaired or rebuilt, shall be let for occupation until after payment of the Board's expenses.

A great number of orders of this character

have been and are being obtained, and, as will be seen from the above-quoted sections, the same seriously affect builders and owners of property in the metropolis. Any one may purchase a piece of land upon which one of the above orders has been obtained, and find himself liable to pay a very large amount in addition to his purchase-money, and as both builder and owner are liable to heavy penalties and imprisonment if they commence to build upon property so charged, it would be well, where there is the slightest suspicion of a charge, for both builder and owner to search the Register of Orders made, kept at the Offices of the Board, and which can be inspected without fee.

#### CASE UNDER THE METROPOLITAN BUILDING ACT.

##### TEMPORARY BUILDINGS.

This case, which came up in the Court of Appeal, before Mr. Justice Mathews and Mr. Justice Day, was an appeal from the decision of Mr. Marsham, sitting at the Woolwich Police-court, by the Metropolitan Board of Works, upon a complaint that Messrs. Anthony & Co., of Lonsdale-chambers, Chancery-lane, had erected, without the licence of the respondent, a wooden building for the purpose of advertisements, contrary to 45 Vic. c. 14, sec. 13. The complaint, after several arguments, was finally decided on the 3rd day of May, 1884, when the learned magistrate dismissed the summons on the ground that the building having been completed six months before the taking out of the summons, the complainants were out of time in taking their proceedings, according to Jarvis's Act, 11 & 12 Vic. c. 43, s. 11, which enacts that the complaint shall be laid within six calendar months from the time when the maker of such complaint or information respectively arose.

Against this decision the respondents appealed. Mr. Bealey and Mr. Ivory appeared for the appellants, and Mr. Fox for the respondents. After hearing the arguments on behalf of the appellants that this was a continuing offence, and counsel for the respondents, the Court directed to allow the appeal, and ordered the case to go back to the magistrate with the decision of the court that the application should not have been dismissed, and that he must proceed to deal with and inflict the penalties of 5s. and 40s. for every day during which the default in removing the erection continued, hearing in mind the power he had in dealing with the penalties to remit same if the respondents would undertake to remove the erection.

Costs of the appeal allowed.

#### THE DECORATION OF THE CUPOLA OF ST. PAUL'S.

SIR.—The important question that has now to be decided is, whether the cruel injustice done to Thornhill by his dismissal, in 1718, from the Office of Works, where he had so long occupied an honourable position, is to be followed up by the erasure of his decorations, and by the annihilation of his artistic reputation? Let us be somewhat consistent. The Legislature has recently made enactments for the preservation of rude stone monuments, &c., and there exists a very active organisation in England to prevent foreigners doing what they like with their own cathedrals. Yet in the very face of, and notwithstanding, all this, it is coolly proposed to utterly efface the most important work of a distinguished artist, who has been entitled "The Father of the English School of Historic Painting." Moreover, I do not stand alone in thinking that Thornhill's designs are, in their general arrangement, far better adapted to their purpose than any others recently suggested. A writer in the "Encyclopædia Londoniensis" (1815), article "London," thus states the case:—

"We cannot leave this subject without expressing most earnestly our wish, which is common with that of all those who look up to the paintings of the cupola, that they may either be repaired or the subjects entirely repainted, preserving, out of respect for the original designer, the outlines of his compositions. But then we would advise the giving up of the idea of chiaroscuro. The dome is rather indifferently lighted, therefore the more glowing the colours might be and the more glaring the ornaments might blaze in burnished gold, the greater would be the effect."

The heaviness of Thornhill's monochromes is frequently condemned, but those who condemn it forget that neither Wren nor Thornhill would have willingly limited the decorations to monochrome; the introduction of colour was opposed by the Puritanical prejudices of their time, as

it was subsequently, and for the same reason, when the Bishop of London rejected the offer of Sir Joshua Reynolds, West, &c., to pictorially decorate St. Paul's. W. CAVE THOMAS.

#### STATUARY FOR BLACKFRIARS BRIDGE.

SIR.—In your issue of Nov. 29th [p. 742], Mr. Cave Thomas comments on the Blackfriars Bridge competitions.

As the recipient of a premium in the open competition, may I be permitted to add a few remarks?

The Blackfriars Bridge *fiasco* illustrates in a striking manner the relations of sculpture and patronage. Some means are certainly required to bring those with commissions to bestow into immediate relation with capable sculptors willing to execute them.

The open competition resulted in six premiums being awarded, and in the committee being able to determine the kind of work they thought most suitable for the purpose; and having decided on this point, the natural course would have been to request the winners of the premiums (and other artists, if the committee so desired) to submit further designs.

Instead of which, a fresh competition was arranged, and the winners of the premiums were excluded.

The instructions in the open competition were extremely vague, and consequently the sketches were slight, as with the uncertainty of a large competition before them, sculptors cannot afford the time and expense necessary to make highly finished works; while the limited competition was much more favourable to the artists, as they knew exactly the subjects the committee desired, and possessed other advantages.

Why in a second competition the winners of premiums in the first were expressly shut out, and refused permission to submit any further designs on any condition whatever, I am at a loss to understand. As a natural result the affair collapsed on being submitted to the Court of Common Council.

The entire proceeding is most unsatisfactory, and points to the urgent necessity of some such body as suggested by Mr. Cave Thomas (at least as far as sculpture is concerned) capable of advising in these matters.

An Association of Sculptors, comprising the entire body, and having degrees such as member, associate, and lesser grades, that could meet and discuss the position of sculpture, and use their combined influence in advancing it, would not only be employed in the healthy occupation of looking at matters as they affect the art, instead of the individual; but would do much to raise it to its proper place in public estimation, and gain for it the position of dignity it should undoubtedly occupy.

W. S. FRITH.

#### THE MERSEY TUNNEL.

##### GEOLOGICAL PREVISION.

SIR.—All who are interested in the success of a great engineering work will be pleased to hear that the Mersey Tunnel is now completed under the river and arched in. This is cause for congratulation all round, and especially to Liverpool people, for it has been an undertaking of great boldness both in conception and execution.

The work has been pushed on with great spirit, and much praise is due in the first place to the skill of the engineers, Messrs. Brunlees & Fox; and secondly to the energy of Mr. Waddle, the contractor; and to their efficient assistants, the resident engineer, Mr. Irvine, and the contractor's engineer, Mr. Prentice.

Having ventured a prediction as regards the strata likely to be met with, in a paper "On the Buried Valley of the Mersey," published in the "Proceedings of the Liverpool Geological Society" as far back as 1872, I think it is well, now the work is secure beyond a doubt, to call attention to the actual facts. In my paper of 1872 I stated the grounds of my belief that, notwithstanding the prevailing opinion that a shelf of rock extends across from Seacombe Point to Prince's Dock, it would be found that there exists in the bed of the river between Liverpool and Birkenhead a "deep rock channel or gully filled with drift."

In a paper on the "Drift Beds of the North-West of England," Part II. (Quarterly Journal of the Geological Society, May, 1883), I restated this view; and in the columns of the

*Builder*, February 4th, 1882, I further called attention to and insisted upon it. I may also add that my views were published in the face of two sections in my possession at the time (1872) which professed to give the actual surface configuration of the rocky bed of the river as ascertained by borings for the projected tunnels; one on the site of that now carried out, the other higher up the river, between the south end of the city and New Ferry, both of which showed a thick covering of rock over the tunnels the whole way across the river.

The actual facts are these. The tunnel works have shown that the rocky bed of the river at its deepest point is, some 300 yards from the Liverpool side, deeply buried in drift. About 100 yards of this gully or pre-glacial bed has been intersected by the upper part of the tunnel. Before this part was finally arched up I had permission from the engineers to inspect it, which I did in company with my friend Mr. Frank Archer, of the firm of Messrs. Gill & Archer, solicitors to the company, who have done so much to insure the success of the undertaking. Mr. Archer, having a good knowledge of geology, has always felt the greatest interest in the geological aspects of the tunnel works. We found the upper part of the tunnel section was in stiff, hard, boulder clay, resting, excepting in one place where there was a thin patch of yellow sand, upon the hard surface of the homogeneous triassic rock. There was no doubt of the nature of the strata, the clay was of the true glacial-marine type, and numerous boulders of granite, trappan rock, and greywacke were strewn about,—specimens of these are now in Mr. Archer's possession. All that I saw were rounded, and not striated, having the character usually possessed by the lower beds of the low-level boulder clay as described in the account of the Atlantic Dock excavations.\*

Very strong timbering had to be resorted to to support the roof of the tunnel, which was, however, the driest in this of any length. In fact, given the gully, it could not possibly have been filled with better material for tunnelling through had it been made to order.

I think I have now stated enough for the present to show that geology is of considerable service to engineering. The fact that the hard rock surface was swept clean and bare, the hard boulder clay resting directly upon it, shows that this was the veritable bed and outlet of the river; for in most sections we find much broken or disintegrated rock between the true rock and the boulder-clay.

At the present moment further borings are being made in the upper reaches of the river, so I shall reserve a discussion of the levels and further aspects of this exceedingly interesting geological problem until they are completed. T. MELLARD READE, F.G.S.

Liverpool, Dec. 5, 1884.

#### ARCHITECTS' COMMISSIONS.

SIR.—The proceedings at the meeting of the St. Pancras Board of Guardians, on the 27th ult., reported in your last issue [p. 774], is, it appears to me, an instance of the absurdity of architects making a uniform charge of 5 per cent. for all kinds of work. If it had not been for this irrational mode of payment, I doubt very much if Mr. Commissioner Kerr would have questioned for a moment the employment of an architect. I have long been convinced that the payment of architects by commission is not considered by people in general a fair mode of payment, and that this apparently small matter is the cause of a great deal of work, which should by right go to the architect, being taken out of his hands. C. E. M.

\* \* \* We are very much in sympathy with our correspondent's views, but have not felt that we were quite called upon to attack a system which the profession have so generally adopted and seemed satisfied with.

#### SEWAGE DISPOSAL.

SIR.—If you have space in your valuable paper for the following, it may be of interest, in consideration of the above often troublesome problem, to many of our inland towns and villages.

Could not the formation of trunk sewers, with a satisfactory outlet at the coast, be promoted by our Government, and made to pass through large centres of our population, to which all available districts should be made to radiate, with charges *pro rata* for cost and maintenance?

Our own town in particular, with an effective trunk from the east coast, would be equal to the wants and collection of the different towns and villages on the route, and might embrace the town of Bradford in its capacity. JOSEPH BENTLEY. Leeds, Dec. 5, 1884.

\* "Drift-beds of the North-West of England."

## WESTMINSTER HALL.

SIR,—I have just had the honour of seeing my humble name in your columns [p. 752, ante]. You speak of my "foolish letter" to the *Times*, and say further that I am a "self-constituted authority."

I have nothing to say in mitigation of your first adjective. The foolishness of my letter is a matter of opinion. It is not my place to estimate the value of my own opinion. For this reason I did not reply to Mr. Pearson's letter in the *Times*. He sheltered himself behind an anonymous journalist in order to attack me, and I naturally concluded that if his case was so bad as to need this kind of advocacy, I might safely leave it to some one else to reply, the more so as Mr. Pearson made no attempt to reply to my facts,—I do not say "arguments,"—as it requires some one who knows as much, or nearly as much, as Mr. Pearson, to make arguments out of such facts.

But when you use the second adjective or adverb, "self-constituted," you fall into a certain amount of error, which, no doubt, with the usual "justice without mercy" which I have received at your hands, you will allow me to clear up. In this case, certainly, I was not a "self-constituted authority." Very unwillingly on my part, I was the spokesman of two antiquarian committees. I am unable, for reasons which I need not mention, to enter here to offer to give evidence before Mr. Shaw-Lefevre's Committee; and, in default, I undertook to write the letter which you characterise as "foolish." As that letter contains the result of the researches of many non-restoring antiquaries, I do not greatly distress myself at the reception it has met with.

W. J. LOFTIE.

## PROVINCIAL NEWS.

**Newcastle-on-Tyne.**—New premises for the Young Men's Christian Association were opened by Earl Cairns on Dec. 5. The architects have converted the interior of what was St. James's Congregational Chapel into a convenient set of apartments. The whole of the interior was, in the first place, cleared out (retaining only the chapel floor and ceiling), and an entirely new floor was constructed across the building at the level of the former galleries, thus obtaining a large hall, the full area of the interior, and the capable of seating about 450 persons. The contractors were as follows:—For the structural works, Mr. Sidney Millard; for the plumbing, steam-heating, and ventilating, Messrs. Walker & Emley; for the decorative work, Messrs. J. Richardson & Co., for whom the stained glass was executed by Mr. G. J. Baguley. The architects from whose plans and under whose superintendence the whole has been carried out, are Messrs. S. Oswald & Son, of Newcastle.

**Sidmouth.**—A handsome staircase in oak and walnut is about to be erected at Primley, Sidmouth, the residence of Mr. R. Taylor. It is in three flights; the newels carried to the ceiling on the ground-floor, in order to form a parlour, and on the landing supporting the beam carrying the roof. The main portions are oak; the brackets between the balusters, the panels of the spandrel, and doors being walnut. The work is being carried out by Messrs. Goff & Co., of Exeter, from the designs of Mr. Octavius Ralling, architect, Exeter.

**Marlow.**—The new waterworks at Marlow, Bucks, have been opened. The company, at the commencement of the year, purchased land from Major Carson, near the Old Chalk Pit (where a well has been bored). The building comprises an engine-room and boiler-room, with the necessary appurtenances. The shaft of the well is 6 ft. 6 in. in diameter, and 90 ft. deep. The boring at the bottom is 9 in. in diameter, and 260 ft. from the surface, and from this boring an ample supply of very fine water is obtainable. The reservoir at the top of the hill will hold 160,000 gallons. The engine for pumping is 12-h.p. nominal, indicating up to 30-h.p., with 24-in. stroke. The pumps have two throws and 24-in. stroke, and are 9 in. in diameter. Three miles of main, 5½ in. pressure to the square inch, are already laid, and it is hoped before long another three miles will be added. The engineer was Mr. Jabez Church, M.I.C.E., of Westminster, and the contractor for the well was Mr. R. B. Paten, of St. Albans. The rest of the work has been carried out by Messrs. H. Young & Co., of Pimlico. The cost of the works has been about 6,500l.

**Lancaster.**—An extensive range of conservatories is being added by Mr. James Williamson to his residence, Ryelands, Lancaster. A glazed corridor, skirting portions of two sides of the house, connects the sitting-rooms with the large conservatory, which is 40 ft. long by 18 ft. wide, covered by a curved roof with lantern. This conservatory is lofty, and is intended for large plants. Leading from this is a smaller and

lower conservatory, 31 ft. by 23 ft., roofed by a double-span roof, hipped at the ends, for ordinary greenhouse plants. A porch entrance, carried up as a tower, with Mansard roof, forms a connecting-link between the two conservatories and a storehouse, of less height, 32 ft. by 14 ft. The range has been designed by Messrs. Paley & Ansting, architects, of Lancaster, and has been carried out under their supervision by Messrs. Messenger & Co., horticultural builders, of Longthorpe, all the latest improvements in ventilating gearing having been introduced. The heating is on the low-pressure system.

**Ludlow.**—At the meeting of the Rural Sanitary Authority of the Ludlow Union, last week, the question was discussed of the payment of the railway fares to and from Ludlow of the candidates for the post of engineer and surveyor in connexion with the water-supply and sewerage of Craven Arms. The four candidates selected to appear before the Board were Mr. Parker, city surveyor, Hereford; Mr. G. J. Stead, Southport; Mr. F. S. Stooks, Shrewsbury; and Mr. W. Wyatt, Ellesmere, and it was decided to allow them second-class fares. There were eighty-three applications for the appointment.

**Leamington Spa.**—The spirit which has moved Bath and Harrogate to an appreciation of their own merits as English Spas has at length extended itself to the pretty Midland town of Leamington. The Corporation, which has in the past been too unmindful of the interests committed to its charge, has recently been strengthened by an accession of professional men, who are determined to restore Leamington to popular favour. On Monday last, with only one dissident, the Corporation decided to embark in a very considerable expenditure on the improvement and modernising of the Pump Room and Baths, and so endeavour to obtain a share of the tide of fashion which has already begun to turn in favour of our own English watering-places.

## CHURCH BUILDING NEWS.

**Highgate.**—The committee for erecting the Church of St. Augustine, Highgate, have placed the work in the hands of Mr. Scadding, of 447, Oxford-street.

**Upleatham.**—Upleatham Church, Yorkshire, is about to be re-seated and restored, from designs prepared by Messrs. Clark & Moscrop, architects, Darlington.

**Islington.**—The church of St. Peter, Islington, erected about forty years ago by Sir Charles Barry, has lately undergone considerable repairs and alterations internally. The floor, which was attacked by dry rot, has been removed, and the entire church has been re-floored. The eastern portions of the north and south galleries have been removed, and also the children's galleries in the transepts and west end. The old lead lights have been replaced with new windows in geometrical designs, glazed with tinted glass. The works have been carried out under the direction of Mr. J. Douglas Mathews, of Dowgate-hill, by Messrs. Dove Bros., Islington. The cost, including lighting and warming, will be about 1,500l.; but, as the funds in hand do not reach this sum, the external work has to be postponed.

**Netley.**—A new church is shortly to be built at Netley, upon a site (given by Colonel Crichton) overlooking the ruined abbey. The designs are by Mr. J. D. Sedding.

**Pallion.**—The whole of the walls and roof of the chancel of Pallion Church, Sunderland, have now been completed in colour decoration to harmonise with the portions done some little while since. The work consists chiefly of diapers and ornamental bands emphasising the architectural work here and there, and in some delicately-traced work upon the roof-panels, which are divided by the rafters done in black and gold. The reredos has also received some little colour and ornamentation, and figures of the Evangelists have been painted in the panels. The work is from the designs of Messrs. Powell Bros., of Leeds, and has been executed under their superintendence.

**Burston (Surrey).**—The parish church of Burston has lately been re-opened, after very extensive repairs and re-arrangement of internal fittings. The building is a good and characteristic specimen of a Surrey church, possessing work of the twelfth, thirteenth, fifteenth, and sixteenth centuries. The chancel is of considerable length in proportion to its width, and contains, on the north side, a little Norman window

and a trefoil-headed Early English one. The nave was considerably altered in the fifteenth century, retaining, however, a small Norman window, now blocked up, on north side. In the sixteenth century an aisle was added on the south side. The old nave roof has rude oak massive tie-beams, with moulded king-posts and braces, the ordinary rafters being what is called trussed construction. At the west end stands the tower, of a construction by no means uncommon in this part of Surrey, i.e., there are no stone walls, as the tower from the ground-line is formed of most massive oak timbers, framed with oak stud-work, covered externally with weather-boarding, crowned by an oak shingle spire. The piers on each side of the chancel arch, and on the nave side, contain niches. The windows to the north nave and south aisle walls are of Perpendicular character. The rich octagonal font is of the same period. Several portions of the walls, some of the buttresses, and upper part of chancel arch, have been rebuilt. Nearly the whole of the walls had to be carefully under-pinned. A new oak trussed rafter-roof has been put to the chancel in lieu of the lath-and-plaster ceiling one of same form, which was thoroughly decayed. This was also the case with the nave roof, which has been renewed in oak, save the old trusses. The south aisle roof is also entirely new, founded on the old lines. A vestry, with lean-to roof, has been added on the north side of the chancel. The modern unsightly south porch has been replaced by an open oak porch, with cusped ornamental tracery panels and barge boards. The main gables have been furnished with carved oak barge-boards and floriated crosses. Externally the roof has been covered with Broseley tiles. Proper eaves gutters and down-pipes have been supplied, as well as a sunk hrick channel course round the walls, after the ground had been lowered. Entirely new windows, to replace the incongruous modern ones, have been inserted in the east and west walls of the south aisle; the other windows having been repaired where necessary, and the westernmost window on the north side of the nave restored to its original length. New oak doors with floriated hinges have been put up. A handsome moulded stone archway and glazed traceried screen, with doors, has been inserted in the west end of the nave, thus opening to view the interesting timber construction of the lower part of the tower. The modern high pews have given place to open pitch-pine benches, with oak prayer-desk and chancel seats. The communion-table has been raised on a platform, and new oak altar-rails fixed on octagonal moulded shafts. A new oak pulpit, with traceried panels, partly open, on a pedestal of red Corshill stone, has been fixed. The font has been reset on a new platform, with ornamental oak iron-bound cover. The windows have been glazed with rolled cathedral glass, in various lead quarry patterns, mixed with clear white glass, arranged by the architect. The hot-water apparatus is by Messrs. Rosser & Russell, of London. The total cost of the works is about 1,900l. Mr. B. Edmund Ferrey, F.S.A., was the architect; and Mr. Alfred Gny, of Camberwell, the contractor.

**Bradford-on-Avon.**—Christ Church, Bradford-on-Avon, which was re-opened recently, after restoration, carried out from the designs of Mr. John Oldrid Scott, has just received a handsome addition (embraced in the original design), consisting of an ornate font cover, of carved English oak. The cover is octagon in plan, and rises to a considerable altitude. The base is boldly moulded and embattled, and from this rises the spiral canopy of graceful ogee outline, which has upon every angle richly-carved crockets. The spandrels of very cant are of flowing tracery, and these panels are each respectively broken half way up by an embattled string running right round the entire cover. On the summit is a finial of crisp foliage, carrying above it a sculptured representation of the pelican feeding her young. The work has been executed by Mr. Harry Hens, of Exeter.

**London.**—St. Mary's Church, Spital-square, has been re-opened, after having undergone extensive alterations and repairs under the direction of Mr. D. R. Dale, architect. The ceiling and cornice are entirely new, and the windows have received the addition of architraves. The galleries, which could not well be dispensed with, have been considerably altered to meet special requirements. The old-fashioned

pulpit and reading-desk have been replaced by furniture of better material and more artistic form.

**Shilton.**—The first roof erected in the diocese of Oxford since the Reformation was unveiled on the 4th inst. at Shilton Church. It stands above a new chancel-screen of Perpendicular character, all the work being in British oak. The whole has been designed by Mr. Clapton G. Rolfe, architect, of St. Michael's-chambers, Oxford. The central figure of Christ forms part of the upright portion of the cross, being all wrought out of the solid beam. The ends of the cross are foliated, and contain sculptured emblems of the four evangelists. This roof is the work of Mr. Harry Hems, of Exeter.

#### DISSENTING CHURCH-BUILDING NEWS.

**Newcastle-on-Tyne.**—The new Wesleyan chapel at Heaton, of which the memorial stones were laid on November 26th, will be situate on a commanding site at the corner of Heaton-road and Tynemouth-road. It is being built of stone, in the Early English style of Gothic architecture, from the plans and under the superintendence of Messrs. S. Oswald & Son, architects, of Newcastle-on-Tyne, whose designs were selected in competition. The contractors are Messrs. Greason & Stockdale, of Gateshead, for whom Mr. T. H. Hutchinson, of Gateshead, is executing the mason work. The clerk of works is Mr. James Grant. The edifice comprises a chapel capable of seating from 900 to 1,000 persons; a lecture-hall for 350; and five vestries and class-rooms. In plan, the chapel consists of a nave and side aisles, with shallow transepts. There will be galleries all round the interior, that for the organ being behind the platform in an apsidal recess. The principal front is towards Heaton-road, and comprises the lofty east gable of the chapel flanked by the gallery staircases, and terminated at the north-east angle by a tower 90 ft. high. South of the chapel the end of the lecture-hall, which is one story high, also faces Heaton-road. Internally, the nave and aisles will be divided by timber arches, with traceried spandrels, carried on metal columns.

**Cheltenham.**—The memorial stones of a new Wesleyan Chapel were laid at Winchcombe, near Cheltenham, on Wednesday, the 3rd inst. The chapel, when completed, will provide sitting accommodation for 350 persons. The design is Early English. The central feature in the front elevation will be a four-light window, with traceried and cusped head, and in the gable over it a quatrefoil cut, sunk, and perforated Bath stone panel. The dressings are of Bath stone; the main walls will be of Cleve-hill stone; and the roofs are to be covered with blue slates. The internal fittings are to be of varnished pitch pine. The roof will be open-timbered to about two-thirds of the height. A gallery is to be erected at the front end of the chapel only. The total cost, when completed, will be about 1,200l. Mr. Herbert J. Jones, of Bridge-street, Bristol, is the architect; and Mr. Geo. Essex, of Swindon-road, Cheltenham, is the contractor.

**Hull.**—The restoration of Albion Church, Hull, has been completed, and the edifice was reopened for public worship on the 30th ult. The building, which was erected in 1842, at a cost of about 8,000l., to accommodate 1,600 persons, is on plan a parallelogram, 110 ft. in length and 62 ft. in breadth. The principal front, which is executed in Harchill stone, represents a Grecian-Doric hexastyle temple, of bold proportions, the diameter of the columns being 4 ft. 6 in. The alterations effected have been carried out without materially changing the original construction of the interior. In the new arrangement of the pewing to the body of the church the three original aisles have been retained for about a distance of 35 ft. from the entrance lobes. At this distance is a cross aisle connecting them, and at which the centre aisle terminates. It was the wish of the Church Committee to entirely dispense with the centre aisle, but as, in the opinion of the architect, to have done so would have been to remove what is beyond doubt a leading feature in the original design, the present arrangement was suggested as a compromise. From the cross aisle before mentioned the side aisles converge to the Communion dais, around which is a semi-circular aisle of good width, and from which four smaller aisles radiate to the seats under the side galleries. New pulpit gaslights and

other gasfittings have been supplied by Messrs. George Clark & Sons, brassfounders, of Hull. The old low-pressure warming apparatus has been removed, and Messrs. King & Co., of Hull, have been entrusted with the heating of the building on the high-pressure system. The plans for the restoration were prepared by Mr. W. H. Bingley, under whose supervision the alterations have been made.

### The Student's Column.

#### DOMICAL ROOFS.

**HIS** name is applied to roofs which cover a circular, elliptical, or polygonal area, and is a very ancient method of roofing. In the domical roofs of former times the material used for the covering was either brick or stone, as in that over the Pantheon at Rome, which has a span of 142 ft., and the hemispherical dome of St. Sophia at Constantinople, having a span of 110 ft. The inner surface of the dome of the Pantheon is hemispherical, and divided into deeply-recessed panels or *coissons*, by means of vertical and horizontal ribs. This dome was built of great solidity, being 4 ft. thick at the thinnest part near the summit, and increasing to 15 ft. at the springing; it forms the roof of a circular building, of which the walls are about 70 ft. in height. The Temple of Minerva Medica at Rome was covered with a dome of similar construction to that of the Pantheon, the diameter being 80 ft.

The thickness given to the dome of the Pantheon involves a great waste of material, and we find that the domes of Constantinople are much lighter. The dome of St. Sophia covers a square building, or, rather, it rests upon four arches built at right angles to each other and supported on four corner piers. The angles between the springing of the arches and that of the dome are cut off by curved surfaces called *pendentives*, which act as *corbels*, and form a uniform circular base for the dome to rest upon. The contour of the dome is nearly a hemisphere on the inside, and its thickness is about 2 ft. for about three-fourths of the distance from the crown; but at the springing the thickness is greatly increased. The dome is elevated 130 ft. from the ground.

The domical roof has been very generally used for dwelling-houses in the South of Italy, Turkey, and many Asiatic countries. Such a covering can be constructed of two or three courses of tiles bedded in cement, with a rendering of cement on the outside to render it weather-proof.

The domes built in India about the sixteenth century were often of great thickness, that of the Gol Gorumuz at Bangalore being 10 ft. thick. It is nearly hemispherical, and erected over a building 135 ft. square. A description of it will be found in the "Transactions of the Royal Institute of British Architects" for 1854.

In the Middle Ages we have in Europe the domes of Florence and of St. Peter at Rome, with a span of 139 ft., built of brick and surmounted with a heavy lantern, the former being octagonal on plan and having a pointed arch for its section, and the latter being nearly hemispherical. These domes differ from most of the Eastern ones in being elevated on a lofty *drum* so as to form an important architectural feature when viewed externally; and, as they support the weight of a heavy lantern placed on their summit, the strength of the dome has to be proportionally increased. They are built with vertical ribs having a solid mass of brickwork filled in between them. To prevent outward thrust upon the walls of the supporting drum domes of this form are generally secured with iron belts placed round them near the springing. In a hemispherical dome of uniform thickness the greatest outward thrust is about 20° from the base, and it is at this part that the belt should be placed; but in a pointed dome the belt may be rather lower down.

The Pantheon at Paris is surmounted by a panelled dome of stone, nearly 80 ft. in diameter, the thickness of the ribs being 2 ft. 2 in. at the base, and decreasing by one-half at the top. This dome, however, does not carry the weight of the stone lantern at the top, the real support of which is a brick cone built on the inside of the stone dome.

In modern times buildings of this form have been generally roofed in by a structure of timber and iron, and it is to these materials that we shall now confine our attention. St.

Paul's Cathedral in London has a dome which is a combination of brick and timber, the inner dome being of brick and hemispherical, surrounded by a brick cone, on which latter rests an elaborate framework of timber to receive the covering of the outer dome. A series of curved wooden ribs form the contour of the outer dome, with purlins fixed between them, to which the boarding for the lead covering is nailed. The curved ribs are supported by horizontal timbers, whose inner ends rest on stone corbels built into the brick cone, and are strongly braced and strutted.

Philibert Delorme, the architect of the Tuileries who flourished in the sixteenth century, introduced a method of constructed domical roofs with ribs of timber by placing side by side two or more thicknesses of planking, as before described for the curved ribs of semicircular roofs. The feet of the ribs are let into a curb of timber which goes all round the top of the wall; the planks are in short lengths of 3 ft. or 4 ft., cut to the required curve, and are bolted together side by side. The ribs are placed about 2 ft. apart at the base, and meet together at the vertex. For a dome of 60 ft. span the ribs should be of two thicknesses of 2 in. planks 13 in. deep, and for 100 ft. span two thicknesses of 3 in. planks, or three of 2 in. A dome of this kind was erected over the Halle au Blé (corn-market) at Paris about a century ago, with a clear span of 130 ft. In this case the ribs were made of three thicknesses of 3 in. planks 9 ft. long and 13 in. deep, bolted together in such a manner as to break joint. After standing for twenty years it was destroyed by fire.

The outer dome of the Church of St. Salnte at Venice, which is 80 ft. external diameter, has ninety-six curved ribs 5½ in. thick, each in four thicknesses 8½ in. deep, which are held in by a strong iron hoop placed round them at some distance above the springing. The lantern which surmounts this dome is carried on an internal dome of brick.

In domes of this construction, the purlin which receive the covering are placed horizontally all round the ribs, and notched upon their backs, to give them stiffness; similar purlins being notched on the inside to receive the plastering of the ceiling.

**Pyramidal roofs** over square or oblong buildings are constructed in the manner described above, either with straight or curved rafters, which form the external angles or *hips*. The hip rafters meet either in a point or ridge, or else abut on a rectangular frame, as in curb roofs; purlins are laid horizontally across the main ribs or rafters to receive the common rafters and the roof covering. Timber spires are formed in this way, either square, round, or polygonal on plan. Many of the spires of Sir C. Wren's City churches are constructed in this manner.

The domical roofs of modern times are generally constructed of iron, that which covers the elliptical area of the Albert Hall, at Kensington, being formed of thirty half-trusses on the bowstring principle, as shown by fig. 5 of the former article on "Iron Roofs" (p. 777, ante). These trusses are united in the middle to a central iron curb, elliptical on plan, and having the full depth of the trusses. The boom of each truss is of T section, 11 in. wide by 9 in. deep, and the tie-beam is of similar form and dimensions; the half-truss is divided into seven parts by radiating struts of cross-section, between which is diagonal cross-bracing of round iron. The heel of each truss is rounded, and rests in a cast-iron shoe, which is securely fixed to a wrought-iron wall plate, 3 ft. 8 in. wide, made in the form of an I girder, and laid all round the top of the outer wall of the building. The depth of the trusses at the centre is 17 ft. 6 in., and the span varies from 185 ft. to 219 ft. Between the trusses are seven rows of purlins, six of which have a depth of 5 ft. 11 in., and the lowest just above the springing is 2 ft. 3 in. deep. They are formed of lattice bracing and struts, riveted to top and bottom booms. A description of this roof will be found in the "Transactions of the Royal Institute of British Architects" for 1872.

The usual modern method of forming domes is by fixing curved ribs of iron, springing from the top of a wall and uniting in the centre, or in a central curb, as in the reading-room of the British Museum, which has a span of 140 ft., and is 105 ft. high. The ribs in this case are of wrought iron, twenty in number, and unite at

top to an iron ring, 40 ft. in diameter, which forms the opening for a skylight.

The roof erected over the Vienna Exhibition building in 1873 is a dome of conical form, circular in plan. The span is 360 ft., and the one springs at a height of 80 ft. from the ground, resting on thirty cast-iron stanchions placed 36 ft. apart. The cone is inclined 30 deg. to the horizontal, and is truncated at the top, leaving a circular opening 96 ft. in diameter. It is constructed of wrought-iron plates, 1 in. thick, riveted together, bent to the curve, and tapering towards the top. Vertical ribs of lattice work are fixed on the outside, running from the top of each column to the summit, with four rows of purlins fixed between the ribs.

On the top of this cone a drum is erected 14 ft. in height and 100 ft. in diameter, which is surmounted by another truncated iron cone, having an opening at the top 24 ft. in diameter, on which stands a second drum, 28 ft. high, carrying a hemispherical dome and lantern. Mr. J. Scott Russell, the designer of this structure, claims for it a maximum of strength combined with a minimum of weight and material, the greatest amount of strength being provided where there is the heaviest strain, and the least strength where the strain is lightest, so that there is no waste of material or strength; every part of the structure combining with the rest for their common support, and each part not only performing its own particular duty, but also assisting the others where necessary in the performance of theirs.

Domes of wrought-iron plates might be constructed of spherical forms, but the expense would be greater than in the conical form, as the plates would have to be curved vertically as well as horizontally; they would also require to be of greater strength, as the resistance to crushing would be much less in a curved plate than in a straight one.

Mr. Scott Russell's account of the Vienna dome will be found in the "Transactions of the Royal Institute of British Architects" for 1874.

Books.

A Treatise on Earthy and other Minerals and Mining. By D. C. DAVIES, F.G.S. London: Crosby Lockwood & Co. 1881.

MR. DAVIES is already favourably known as the author of several useful books on mining subjects. His last treatise on earthy and other minerals is intended as a companion volume to his work on "Metallic Minerals and Mining," under the classification of earthy minerals and a number of substances of great importance in the arts and manufactures. Firstly, the useful compounds of alumina, magnesia, lime, and the various clays; secondly, what Mr. Davies terms the haloid minerals, or compounds of earths and alkalis, such as common salt, nitrate of soda, borax, alum shale, phosphate of lime, &c.; thirdly, carbon and the compounds of carbon, sulphur; and, lastly, some metallic minerals such as arsenic, antimony, and manganese. This is a wide range of subjects to cover in one volume, yet each mineral of importance is sufficiently noticed to convey some information.

It is interesting to learn that the china clay trade of this country is of comparatively recent date, having been founded by Mr. William Cookworthy, of Plymouth, in the year 1758. In 1809 the export of this clay from Cornwall amounted to 1,757 tons, and in 1881 it had risen to 241,458 tons, besides a further quantity of 30,479 tons from Devon. China clay is derived from the decomposition and wearing down of granite rocks, and consists almost entirely of silicate of alumina. Among the haloid minerals worked in England, common salt is the most important. According to ancient records, salt was worked by the Saxons kings, and since those early days it has been continuously and increasingly worked until in 1881 the production amounted to 166,740 tons in Cheshire, and 20,891 in Ireland. In early days the trade in England was hampered by taxation long since removed. It seems strange that Mr. Davies does not refer to the great salt luggens of Cyprus, nor to the value of the potassium salts derived from certain salt beds. Nitrate of soda and borax, also haloid minerals, are not mined in England, but largely imported.

Considerable space is devoted to the consideration of the phosphate deposits of the world, forming a very interesting chapter. The

next section treats of carbon, compounds of carbon and sulphur. All carbon-containing minerals are included except coal. First comes the diamond, the most singular crystallisation of a black and opaque substance.

Although diamonds have been used by the lapidary from time immemorial, it was not till the end of the last century that Lavoisier demonstrated that the brilliant and transparent stone was composed of carbon. India was for a long time the only source of supply of diamonds, but in 1726 they were discovered in Brazil, and lately, in 1867, in South Africa. The news of the discovery was at first received with great suspicion, and in 1868 a writer in the *Geological Magazine* ends an article on the discovery in the following words:—"I can only now conclude by expressing my conviction that the whole diamond discovery in South Africa is an imposture, a public scheme." New discoveries are frequently thus treated by irresponsible writers who have not the knowledge of facts necessary to form a correct opinion, and very often are not capable of forming a correct judgment, even with the facts before them. The result of the discovery so far has been that in 1881 the value of the diamonds sent through the Post-office from South Africa amounted to 3,685,000*l.* We have not space to follow the author in his notices of plumbago, oil shales, and other carbonaceous minerals. The chapter devoted to metallic minerals includes manganese ores, so important to the chemical and iron trades.

The volume closes with a classified list of the mineral substances. This book contains a great deal of useful information, succinctly given. It is more an epitome than a treatise, but as such is useful for reference, especially to students. The subjects are somewhat unequally treated. There is very little said about some, and nothing at all about others. For instance, the oobres so largely used in the manufacture of paint, and meerschaum, from which tobacco-pipes are made, are not noticed. The volume is well illustrated, which is an important feature in such a book, and greatly assists the text.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

1,636, Improved Method of Laying Bricks. H. W. Hart.

This invention is designed principally for use with the patent bond bricks devised by the patentee, in which the bricks are formed alternately with joggles and recesses on their bedding and lining surfaces, and the invention has for its object the laying of such bricks without mortar or cement. It consists in the application of a thin layer of waterproof or asphaltic mixture laid on a fibrous material. These layers are stamped out in the pattern of the brick, and are first stepped in a solution of tar cement. The joints are thus neatly and carefully laid without skilled labour, and quickly dry, even during bad weather.

2,539, Improvements in Paints. O. Fischer. The materials are so devised as to produce a paint which is applicable as priming or body colour, but by mixture with some added material it becomes a substitute for linseed oil.

386, Improvements in Artificial Marbles, &c. Shaw Bros.

The natural operations in the formation of stone or marble are imitated. A piece of clay is rolled or beaten out on a board or slab into a bat, which is then dried in the sun or an oven until it cracks or splits. Into the fractures a slip is poured between. The slip being composed of coloured clay, minerals, &c., so as to form the shade, colour, and veins of the marble imitated. Granite or other stones are also imitated, and the articles are glazed or fired in the usual way.

132, Improvements in Ventilation. J. S. Sweet.

Between the floor and ceiling an air-tube is carried into a shaft, the centre-piece of the ceiling forming an outlet. On the shaft the ventilator is fixed. The inside of the ventilator is made in sections or tubes, which causes a strong up-current of air. Under the roof a tapered injector is fixed, so that the smaller end enters the air-shaft, while the outer is all impure air, and the ventilation will then be rapidly and effectively carried out.

APPLICATIONS FOR LETTERS PATENT.

Nov. 28.—15,662, P. E. Ayton, Improvements in Door Chains.—15,682, H. Gratix and J. Best, an Improved Size.—15,701, S. B. Goslin and J. J. Brown, Water Waste-preventer and Flushing Apparatus.

Nov. 29.—15,726, W. D. Cliff, Constructing

Glazed Brick Walls.—15,729, M. J. Adams, Ventilating Apparatus.—15,737, Scouring Sign-plates to Walls, &c.—15,739, W. G. Margrett, Manufacture of Portland Cement.—15,745, E. Reese, Decoration of Chimney-pieces and other Ornamental Work.—15,751, J. Howie, Improvement in Drain Traps.—15,753, J. Campbell, Improvements in Ladders.—15,755, T. Durran, Gully Traps.—15,758, J. Bartlett, Improvements in Stencils.

Dec. 1.—15,782, W. Sanderson and T. A. Moffitt, Lock and Latch Furniture.—15,803, J. B. Robinson, Improvements in Sashes.—15,805, G. S. Buchanan, Improvements in Ventilators.

Dec. 2.—15,846, H. Benson and E. H. Kent, Locks or Fastenings.—15,857, H. Gardner, Surfacing Compounds.—15,863, B. J. Mills, Extension Ladders.

Dec. 3.—15,871, W. H. Withington, Water-closets.—15,875, W. A. Leiper and C. Brotherwood, Electric Bell Pushes.—15,894, P. Quigley, Double Mitre Sawing-machine.

Dec. 4.—15,927, J. T. King, Apparatus for Closing Doors and preventing the Slamming of same.—15,928, G. Howard, Cooking and Kitchen Ranges.—15,945, J. J. Tamm, Attaching the Handles of Door Locks to their Spindles.—15,954, M. Ker, Raising and Suspending Venetian Blinds.—15,955, W. H. Willett and T. C. Wakeling, Improvements in Fire-grates.—15,963, W. R. Lake, Manufacture of Bricks.—15,966, J. Shaw, Combined Level, Plumb, and Angle Indicating Tools.—15,973, W. Teague, Rock Drills.—15,976, E. R. Hollands, Open Stoves or Fireplaces.

PROVISIONAL SPECIFICATIONS ACCEPTED.

5,888, R. A. Lowe, Sash Windows.—13,068, S. Willett, Securing Door Handles on their Spindles.—14,316, R. Willis, Preparing Wood previously to Painting and Varnishing.—14,346, G. Kinnaird, sen., C. Kinnaird, jun., and J. Kinnaird, Combined Open Close Fire-ranges.—14,393, J. Stanfield, Asphalt Pavements.—14,417, J. Ball, J. H. Rawson, and F. P. Rawson, Combined Ferrule and Bolster for Chisels and Goggles.—14,433, A. Joy and J. J. Lewen, Imitation Marble.—14,439, A. Farney, Wood Flooring, Ceilings, and Dados.—14,616, E. Shrimpton, Glazing Sashes, &c.—14,615, A. Parkinson, Stench Traps.—15,086, J. Inshaw, Domestic Fireplaces.—15,194, W. Gadd, Joining Lead Pipes.—15,301, L. Coppard, Hanging Sashes.—14,074, G. W. Webb, Exhaust Ventilators.—14,711, J. Mackie, Machinery for Grinding and Shaping Bricks.—15,088, E. Jones and J. J. Calcott, Checks for Register Stoves.—15,192, W. Russell, Improvements in Overmantels and Ornamental Frames.—15,289, J. Eudean, Syphons and Cisterns for Water-waste Preventers.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

2,374, J. Mould and J. J. Mould, Improvements in Zinc Roofing.—2,687, N. Frère, Joints for Metal or other Pipes.—2,907, H. W. Hart, Manufacture of Bricks and Tiles.—3,329, G. Kay, Fixing Roof Tiles—water Gutters.—9,638, W. Finch, Roofing Tiles—other Parts of Buildings or Structures.—3,279, J. Heywood, Machines for Painting, Varnishing, Sizing, and Washing Laths.—3,957, A. J. Boulton, Manufacture of Wood Screws.—13,284, F. George, Connections for Lead and other Pipes.—14,241, A. M. Clark, Improved Composition Mastic.—14,511, F. Canty, Intermitting Flushing Apparatus.—14,521, H. Curzon, Filtering Rain-water in its Flow from Roofs to Tanks.—14,621, J. Hatfield, Manufacture of Artificial Stone.

MEETINGS.

MONDAY, DECEMBER 15.

Royal Institute of British Architects.—Mr. Lawrence Harvey on the late Professor Semper's Theory of Architectural Ornament." 8 p.m.

Society of Arts (Lecture).—Mr. Harold B. Dixon, M.A., on "The Use of Coal Gas." III. 8 p.m.

TUESDAY, DECEMBER 16.

Institution of Civil Engineers.—Continued discussion on Steam Tramways. 8 p.m.

Statistical Society.—Mr. A. S. Jeans on "English and Foreign Labour Compared." 7:45 p.m.

WEDNESDAY, DECEMBER 17.

Society of Arts.—Mr. F. L. Simmonds on "The Present and Prospective Sources of the Timber Supplies of Great Britain." 8 p.m.

Parkes Museum of Hygiene.—Mr. Mark H. Judge on "Public and Private Responsibility in Sanitary Matters." 7:30 p.m.

British Museum.—Mr. W. St. Chad Boscawen on "Assyrian and Babylonian Antiquities." 2:30 p.m.

Royal Meteorological Society.—Three papers to be read, including one by Mr. Charles Harding on "The Diversity of Scales for Registering the Force of the Wind." 7 p.m.

The Hospital Association.—(1) Professor Marshall, F.R.S., on "Hospital Circular Wards." (2) Mr. Keith D. Young on "The Miller Memorial Hospital."

FRIDAY, DECEMBER 19.

Architectural Association.—Mr. W. H. White on "The Ante-Chamber, to-day and yesterday, in French and English Plans." 7:30 p.m.

Institution of Civil Engineers (Students' Meeting).—Mr. F. H. Hebblethwaite on "The Difference in Design of British and Foreign Locomotive Engines." 7:30 p.m.

Miscellaneous.

**Society of Engineers.**—The thirtieth annual general meeting of the Society of Engineers was held on December 8th, in the reading-room of the Society, Victoria-street, Westminster. The chair was occupied by Mr. Arthur Rigg, the president. The following gentlemen were balloted for and duly elected as the council and officers for the ensuing year, viz. :—As President, Mr. Charles Gandon; as Vice-Presidents, Mr. Perry F. Nursey, Mr. Henry Robinson, and Mr. A. T. Walmisley; as Ordinary Members of Council, Mr. Robert Berridge, Mr. T. H. Hovenden, Mr. A. F. Phillips, Mr. W. Schünheyder, Mr. M. Ogle Tarbotton, Mr. J. Waddington, Mr. W. Barnes Kinsey, and Mr. William Macgeorge, the two last-named gentlemen being new Members of the Council; as Honorary Secretary and Treasurer, Mr. Alfred Williams; and as Auditor, Mr. Alfred Lass.

**British Museum Lectures.**—Mr. Boscawen gave the second of his lectures on Assyrian and Babylonian Antiquities last Wednesday. We will give a brief report of it in our next.

**A Water-Pipe Shock.**—A singular occurrence, which is stated to have recently taken place at Ithaca, N.Y., illustrates the dangers attendant upon the universal introduction of electricity. As a lady was turning on the water from the faucet over the sink in her kitchen, using her right hand, her left hand being in contact with the iron lining of the sink, she was suddenly prostrated by a severe shock. Her impression was that she had been stricken with paralysis or apoplexy, but a physician who was summoned found that the inside of the thumb of the left hand had been blistered in several places. This led him to believe that she had received a strong electric shock from some source. A few minutes subsequently the lady's daughter, in drawing water from the same faucet, was similarly affected, though not so severely. The family then became convinced that the trouble existed in the water-pipe and sink. The manager of the Telephone Exchange, after a brief examination of the premises, found the secret of the trouble. The residence was connected with the Ithaca Hotel by a "dead" private telegraph wire. This wire had been crossed by the electric-light wire. The dead wire was connected with the metallic roof of the dwelling-house, which in turn was connected by a tin water-conductor with the water-pipe leading to the sink. When the dynamo machine of the electric light company was in operation the current passed over the dead wire to the tin roof, and thence to the water-pipe. It needed only the completion of the circuit by some person drawing water.—*Scientific American.*

**The Foreign Iron Trade.**—Business is still slow in the Belgian iron market, and prices are going down as low as the cost of production will permit. Owing to scarcity of orders, works are discharging a portion of their hands. The Belgian hoop-iron syndicate will cease to exist by the end of the year, and the result will be a depreciation of that product. England, and especially the London market, is expected, will be benefited by this collapse; that is to say, Belgian manufacturers will throw their special articles on our markets at a ruinously low price. Values of other kinds of manufactured iron are nominally unchanged, but joists, angles, &c., are sold much below official quotations, principally to England. There is no change for the better in the French iron market. At Paris, manufactured iron is still sold at 140 fr., and in the Nord no more than 130 fr. and 135 fr. can be obtained, some large sales having even been effected at 125 fr. in the Haute-Marne, coke iron is still held at 155 fr., and mixed brands are treated at 170 fr. to 175 fr. In the German iron market the improvement of recent weeks has not been maintained. Pig-iron remains unaltered, but the prices of manufactured iron continue depressed, although orders cannot be said to be scarce. The American iron market continues in the heavy condition of the last few weeks.—*Iron.*

**Liverpool Engineering Society.**—The annual general meeting of this Society was held last week at the Royal Institution, Colquhoun-street. Mr. R. R. Bevis, jun., president, in the chair. On the conclusion of the ordinary business and the election of officers for the ensuing year, the President delivered his retiring address. Some of the local events of engineering importance were first considered,—particularly the Mersey Tunnel and the Manchester Ship Canal. The fact was referred to that it was only in the early part of this year that a practical hope was given of the speedy realisation of the former project, and as the work is now approaching completion some of the possible changes and developments likely to follow were also remarked upon. With regard to the Manchester Canal, it was observed that even in its lately submitted form, and apart from all consideration of its ultimate commercial success, it, at all events, would have the merit of providing a large amount of work during its construction. Recent developments of ocean steam navigation were next dwelt upon. The latter portion of the address was devoted to matters more particularly relating to the Society. The President congratulated the members on its continued success.

**Proposed Club-house at Streatham.**—A meeting of Conservatives was held at Streatham last week when it was resolved to build a Conservative Club-house, at a cost of about 2,500l., and a committee was appointed to obtain subscriptions and confer with the architects, Messrs. Wheeler & Hollands, as to the cost of future extension, &c.

**British Archaeological Association.**—The second meeting of the session was held on the 3rd inst., Mr. Thomas Morgan, F.S.A., in the chair. Mr. Roach Smith, F.S.A., communicated the discovery of a curious Anglo-Saxon huckel found in North Wales. It has three bronze hinges, and on the woodwork between them have been scratched mystic inscriptions. It has been deposited in the ground near an upright stone pillar, placed, apparently, to mark the spot. Dr. Woolhouse exhibited some medals relating to the troubles in France during the Reign of Terror and of the period of the Russian Alliance, of much interest. Mr. Romilly Allen, F.S.A. Scot., reported a remarkable discovery at Ilkley. During some works of enlargement of the gardens of the Rose and Crown Hotel at Ilkley, an old wall was met with by the workmen, and demolished. A large stone was noticed in the foundation, which, on being raised, was found to bear sculpture and an inscription. It is a Roman sepulchral stone, having the figure of a female seated, with two long plaits of hair one falling on each side of the face. There are four lines of inscription, the sepulchral character of which is shown by the common termination H. S. E. The stone had been used as old building material, but had evidently been removed from the cemetery of the Roman station of Olicana. The Chairman then read a paper on the results of the recent successful Congress at Tenby.

**The Smithfield Club Show.**—Among the machinery and implements exhibited at the Cattle Show this week there were a few exhibits of special interest to some of our readers. Samples of ensilage were in great force at the stands devoted to farm produce, and Messrs. F. W. Reynolds & Co., of Acorn Works, Blackfriars-road, showed a very interesting and instructive series of models of pit and barn silos, some with sliding roofs, and all provided with Messrs. Reynolds's appliances for compressing the silage. Mr. E. S. Hindley, of Bonrton, showed in addition to his well-known combined vertical engines and boilers, a new form of portable engine, running on two wheels only, and designed specially for use in India. The St. Pancras Ironwork Company, amongst their exhibits of stable, cowhouse, and piggery fittings, showed a stall well suited for a heavy draught-horse, with ventilating ramp and safety manger fitting; also a vertical fodder-rack for cowhouses, as executed for the Duke of Bedford's model farm at Woburn. Messrs. Barrows & Stewart, of Banbury; Clayton & Siblethorpe, of Lincoln; Marshall, Sons, & Co., of Gainsborough; Davey, Paxman, & Co., Colchester; and F. Morton & Co. (Limited), of Liverpool, were amongst other well-known exhibitors.

**Civil and Mechanical Engineers' Society.** The opening meeting of this useful and rising Society was held at the Society's rooms, No. 7, Westminster-chambers, on the 3rd inst., when the newly-elected president, Mr. Thomas Cole, A.M.I.C.E., delivered his inaugural address, taking for his subject the progress of sanitation and of sanitary legislation during the last fifty years,—a period including the rise and growth of what may almost be termed a resolution in the matter of things sanitary, and culminating in the Public Health Act, in which is incorporated the fifteen main Acts and ten subsidiary Acts which form our sanitary legislation. Mr. Cole then pointed to several of the permissive clauses of the Public Health Act which should be compulsory, and alluded to the necessity of town surveyors being placed in the position of independence enjoyed by medical officers of health; and, in conclusion, pointed out the duties of private individuals and of public authorities to further diminish the decreased death-rate that has followed from the sanitation of fifty years.

**Egypt and the Soudan.**—We have received from Mr. Jas. Wyld, of Charing-cross, a map of considerable interest at the present moment, of "The Nile, Egypt, and the Soudan," being No. 11, of his Egyptian series. The map seems very complete, and in addition to the localities, gives heights above sea level, and telegraph lines, land and submarine.

**Wood Chimney-pieces.**—Messrs. Walker & Sons, of Bunnhill-row, issue an illustrated catalogue of their carved wood chimney-pieces, mostly in the modern "Free Classic" style. The designs are mostly of an appropriate character, and suitable for execution in wood work. The name of the designer or designers is not given.

**The Parkes Museum of Hygiene.**—The ordinary general meeting of the members of the Parkes Museum was held at the Museum on Thursday, December 4th, Capt. Douglas Galton, B., F.R.S., in the chair. The meeting was held to consider the report of the Council for the tenth year, and to elect officers. The report set forth the work done in connection with the Museum during the past year, which had included lectures by the Council of the Sanitary Insurance Association in addition to those arranged by the Council of the Museum. The accounts showed that there was urgent need for increased subscriptions if the museum was to be continued, for the small invested capital had had to be made use of this year to meet the current expenses. The report was adopted on the motion of the Chairman, seconded by Mr. Rogers Field, M. Inst. C.E. Mr. Mark H. Judge, R.I.B.A., then proposed "That the report be printed, for circulation, with a detailed statement of the financial position of the museum, and that a special meeting of the members be convened within two months to consider the same." This was seconded by Mr. E. C. Robins, R.I.B.A., and carried unanimously. Sir R. Lloyd Lindsay, K.C.B., M.P., Professor J. Marshall, F.R.S., and Mr. Alfred Waterhouse, R.A., were elected vice-presidents. Six new members of Council were elected, and the meeting closed with a vote of thanks to the Chairman, proposed by Dr. J. C. Steele, of Guy's hospital.

**New Mission Hall, Westcombe Park, East Greenwich.**—This building, erected in the parish of Christ Church, East Greenwich, was opened on the 29th of November by the Bishop of Rochester. The vicar and committee found it necessary to meet the religious wants of this growing district, and so secured a site in the Coombe Farm-lane. The building provides accommodation for 400 persons, and consists of a large hall and class-room contiguous and communicating. The latter, which holds sixty, is so planned that from nearly the whole of the floor space a view of the speakers on the platform in the large room, may be obtained, and a shutter, by Salmon, Barnes, & Co., is provided to separate the rooms when required. The plan has been so arranged that an extra class-room may be added at a future period. Adjoining the class-room is the Vestry, which is fitted with a large boiler, to be used at tea meetings, &c.; a sink is also provided with a flap top to form a table. The clergy and teachers' lavatories and water-closets are accessible both from hall and class-room. There are also separate conveniences for boys and girls at the end of the building. The floor is of Gregory's wood blocks, laid on solid concrete. The building is heated by small bore pipes. The whole work is substantial, though simple, and the total cost is 1,102l. The works were carried out by Mr. R. L. Wood, of Greenwich. Mr. V. Hibbins acted as clerk of the works. The architects are Messrs. Romaine-Walker & Tanner, of 13, Buckingham-street, Adelphi.

**Needless Noises in London.**—At the very time when a medical officer of health is we regret to find, "putting up" local authorities to refuse permission for laying straw in the streets for the salvation of the sick who are racked on their beds of suffering by the rattling of cabs and wagons, a layman has started the excellent notion of forming a fund for the prosecution of engine-drivers, or their employers the companies, for needless whistling. A contemporary, applauding the idea, and predicting that a fund will be quickly accumulated, suggests that a reform of aera should be extended, and that the incessant ringing of church-bells should be put down with an equally strong hand.—*Lancet.*

**A New Cupboard Fastening** has been patented by Messrs. Brendon Bros., of Callington, Cornwall. It embodies a valuable improvement on the ordinary "cupboard turn," simply by making a slot in the sunk portion of the face of the escutcheon for about one-third of its circumference. A stud attached to the knob runs in this slot, and thus prevents the blade of the fastener from falling below a horizontal line.

**A Memorial Brass** is about to be erected in the Parish Church of Morchard Bishop, Devon, by the parishioners, to their late rector, the Rev. J. J. Rowe, M.A., Oxon. It measures about 3 ft. by 2 ft. 3 in., and is being carried out by Messrs. William Damorel & Son, from the design of Mr. Octavius Ralling, architect, of Exeter.

**International Inventions Exhibition.**—The applications for space have now all been examined by Sub-Committees of the Council, and a selection has been made of the most promising. The number of applications has been so great that it has been decided to limit very strictly the admissions in those classes which may be considered to have been fully represented in the Exhibitions of the present and of the past year. The Council will, therefore, be obliged to refuse many valuable exhibits in such classes as those relating to Food, Clothing, and Building Construction. The Guarantee Fund now amounts to 48,280l., a sum considerably in excess of that subscribed for the Health Exhibition, or for the Fisheries. *Journal of the Society of Arts.*

**Home for Female Inebriates.**—The foundation-stone for the extension of these premises, which are situated at Ebenezer-terrace, Kennington, was laid on Wednesday last by Mr. Samuel Morley, M.P. The object sought to be attained by the promoters of the Institution (which, we believe, has done much useful work) is, by building a commodious steam laundry, to make this valuable institution for the reform of drunkards self-supporting. The architect is Mr. Banister Fletcher. **A Mace**, erected in silver-gilt, and designed by Mr. Henry Perkin, architect (Messrs. Perkin & Bulmer, Leeds), was presented by the ladies of Harrogate to the Mayor and Corporation of that newly-incorporated borough, on Saturday afternoon.

**COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS.**

*Epitome of Advertisements in this Number.*

**COMPETITIONS.**

Nature of Work.	By whom required.	Premium.	Designs to be delivered.	Page.
Additions to Vestry Hall Buildings.....	Chelsea Vestry.....	100 guineas, first } 50 " second } 30 " third }	Feb. 23rd	ii.

**TENDERS.**

For construction of about one mile of brick sewer, with manholes, sight-holes, &c., for the Kingsthorpe Sanitary Authority, Northampton. Mr. Wm. Hull, engineer to the authority. Quantities by the engineer:—  
 C. Huttin, Shrewsbury ..... £2,737 10 0  
 H. Hickman, Northampton ..... 1,612 14 0  
 R. C. Gordon, Nottingham ..... 1,485 16 0  
 G. Branson & Son, Northampton ..... 1,480 0 0  
 G. Chapman, Northampton ..... 1,333 10 0  
 D. Cosford, Northampton ..... 1,337 10 0  
 R. Finnegan, Northampton ..... 1,335 0 0  
 J. S. Wingrove, Northampton ..... 1,180 0 0  
 H. Martin, Northampton ..... 1,270 0 0  
 G. White, Northampton ..... 1,221 0 0  
 Green Bros., Northampton (accepted) 1,154 0 0  
 [Engineer's estimate, £1,248]

For shop front and fittings, 174, Oxford-street, for Mr. Hancock. Mr. Lewis Solomon, architect, 7, Gray's Inn-square:—  
 Yaxley & Sons ..... £439 0 0  
 Drew & Cadman ..... 428 0 0  
 Sage & Co. (accepted) ..... 398 0 0

For works in the formation of a circus at Corent Garden Theatre. Mr. Frank Matcham, architect, Rugby Chambers, Bedford-row, W.C.:—  
 Patman & Fotheringham ..... £1,973 0 0  
 Roush ..... 1,520 0 0  
 Shoobred & Co. .... 1,249 0 0

For the erection of a shop and residence, Union-street, Aldershot, for Mr. T. Fountain. Mr. S. Friend, architect, Grosvenor-road:—  
 W. Gardiner ..... £497 0 0  
 J. Cranston ..... 495 10 0  
 W. J. Snuggs ..... 458 10 0  
 J. Hughes ..... 480 0 0  
 G. Kemp ..... 435 0 0  
 J. Batchelor ..... 404 0 0  
 J. Seabright (accepted) ..... 397 0 0  
 All of Aldershot.

For the erection of residence, Hemden-hill, Caversham, Oxon, for Mr. C. H. Havell. Messrs. Brown & Albany, architects:—  
 Geo. Werham (accepted) ..... £1,400 0 0

For new billiard-room at Balmore, Caversham, Oxon, for General Radcliffe. Messrs. Brown & Albany, architects:—  
 Geo. Werham (accepted) ..... £750 0 0

For the erection of new billiard-room, &c., Reading, at the Wheatsheaf Hotel, Blagrove-street, for Mr. John Gosling. Messrs. Brown & Albany, architects:—  
 Strong Bros. .... £588 0 0  
 W. H. Simonds ..... 839 0 0  
 W. Woodroffe ..... 797 0 0  
 H. & A. Lewis (accepted) ..... 755 0 0

For alterations and forming billiard-room, at the Vine, Reading, for Mr. John North. Messrs. Brown & Albany, architects:—  
 Geo. Werham ..... £258 0 0  
 Patience & White ..... 245 10 0  
 O. Brown ..... 245 0 0  
 W. Woodroffe ..... 245 0 0  
 H. & A. Lewis (accepted) ..... 229 16 0

For the erection of business premises, 22, Minister-street, Reading, for Mr. J. B. Day. Messrs. Brown & Albany, architects:—  
 J. Sims (accepted) ..... £925 0 0

For fitting up club-room at the Cross Keys, Reading, for Mr. C. P. Shadbolt. Messrs. Brown & Albany, architects:—  
 Geo. Werham (accepted) ..... £158 10 0

For alterations to Surrey House, Collingwood, Surrey, for Mr. H. G. Poulier. Messrs. Brown & Albany, architects:—  
 George Lutter, Camberley ..... £700 0 0

For enlargement of schools, Globe-terrace, Tower Hamlets, for the London School Board. Quantities by Messrs. H. F. Northcroft, Low, & Neighbour. Mr. E. H. Robson, architect:—

Table listing quantities and prices for school enlargement, including items like Kearsley, Godman, Perry & Co., Brass, Will Bros., Kirk & Randall, Jerrard, Pritchard, Smith & Son, H. L. Holloway, Shurman, Howell & Son, Bangs & Co., Stimpson & Co., Grover, Wm. Oldrey, Croaker, Cox, Jackson & Todd, W. Johnson, Atherton & Latta, C. Wall.

For shop and dwelling-house, No. 14, Bridge-street, Exeter, for Mr. J. C. Tuckwell, Messrs. Best & Commis, architects, Exeter. Quantities supplied (to contractors marked \*) by Mr. T. Mullins, surveyor, Exeter:—

Table listing quantities and prices for shop and dwelling-house in Exeter, including items like Moas, Exeter, Sharland, Exeter, Gooding, N. Thomas, Gibbard, Exeter, Styles, Exeter, Sanford, Exeter, Cummins, Exeter, Holmes, Alphington, Gibson, Exeter (accepted).

For fixing a steam boiler and fittings and for other work in connexion with the same, at the schools, Mitcham, for the Guardians of the Poor of the Holborn Union. Mr. H. Saxon Snell & Son, architects:—

Table listing quantities and prices for steam boiler and fittings, including items like W. J. Fraser & Co., Wm. Bamford, Fraser & Fraser, May Bros.

For the erection of shops in the forecourts of houses known as Woodland Villas, Woodland-road, Greenwich, for Mr. John Dyer. Mr. John Rowland, architect, Charlton:—

Table listing quantities and prices for shops in Greenwich, including items like Hayward & Son, George Lee, Thos. A. Hollis, Holloway Bros., John Blow & Son, Edwin Blow.

For the paving (with scoria blocks), flagging, draining, &c., of a number of streets within the district of the South Stockton Local Board. Mr. S. E. Thorold, C.E., surveyor:—

Table listing quantities and prices for paving and flagging, including items like Robinson, Stockton, John Dixon, Eaglescliffe, Thos. Hentley, Stockton, Richd. Jones, Stockton, Thos. Hunt, Thornaby (accepted).

For alterations to the King's Head, 128, Commercial-road East, for Messrs. Gerlach & Cox. Mr. R. A. Lewcock, architect, 48, Bishopsgate-street Within:—

Table listing quantities and prices for alterations to King's Head, including items like Toms, Marr, Jackson & Todd, Shurman, Oldis Bros.

For air-tight cases and fittings for new show-room, for Messrs. James Deakin & Sons, Sheffield:—

Table listing quantities and prices for air-tight cases and fittings, including items like Fredk. Sage & Co., London (accepted).

For altering the old Court House, Bridgwater, to convert same into Municipal Offices and Free Reading-rooms and Library for the Bridgwater Town Council. Mr. G. B. Luffin, Borough Surveyor:—

Table listing quantities and prices for altering Court House, including items like Harris & Tapscott, Chas. Sendell, R. Escott, Thos. Searle, J. H. Kitch, Jas. Palmer, H. W. Pollard (accepted).

For erection of a villa residence, at Bedford, for Mrs. Elgee. Mr. J. G. Galpin, architect:—

Table listing quantities and prices for villa residence at Bedford, including items like Watts & Lester (accepted), £500 0 0.

For house, bakehouse, and shop, at Bedford, for Mr. A. Mann. Mr. J. G. Galpin, architect:—

Table listing quantities and prices for house, bakehouse, and shop at Bedford, including items like Watts & Lester (accepted), £300 0 0.

For alterations at Duffield, Stoke Poges, Bucks, for Mr. A. Gilliat. Messrs. Edginton & Summerbell, architects, Windsor. Quantities by the architects:—

Table listing quantities and prices for alterations at Duffield, including items like Willis, Windsor, Bowyer, Slough, Deverill, Slough, Watson, Ascot, Hann & Co., Windsor, Turtle & Appleton, Wandsworth\* (Accepted).

For new drawing-room to High Broom House, Crowborough, Sussex, for Miss Wolfe. Mr. E. P. Loftus Brock, architect:—

Table listing quantities and prices for drawing-room at High Broom House, including items like Sweeney, Norman, Nightingale Bros., Chawwood Bros., Morris, Godly.

Alterations at Salmon and Compasses, Dorrington-street. Messrs. Burch & Co. write to say that the amount of their tender was 963l., not 963l.

Special Notice.—Lists of tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than four p.m. on Thursdays.

PUBLISHER'S NOTICES.

Christmas Week.—The BUILDER for the week ending December 27th will be published on Wednesday, 24th inst., at the usual hour.

Advertisements for insertion in that issue must, therefore, reach the Office before Three o'clock p.m. on Tuesday, 23rd inst.

ALTERATIONS IN STANDING ADVERTISEMENTS, or ORDERS to DISCONTINUE SAME, cannot be attended to if received after 12 (noon), on Monday, 22nd.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under..... 4s. 6d. Each additional line (about ten words)..... 0s. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY. \* Stamps must not be sent, but all small sums should be remitted by Cash, in Registered Letter, or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDRINEE, Publisher.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY. The Publisher cannot be responsible for DRAWINGS, TESTS, MONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter OFFERS ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS or ORDERS to DISCONTINUE SAME, must reach the Office before TEN o'clock on WEDNESDAY MORNINGS.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, Covent-garden, W.C. Free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied twice from the Office to readers in any part of the United Kingdom at the rate of 12s. per annum, in Advance. To countries within the Postal Union, 5s. per annum. Remittances payable to DOUGLAS FOURDRINEE, Publisher, No. 46, Catherine-street, W.C.

TO CORRESPONDENTS.

T. M. R.—G. H. J. Florence.—H. M.—J. P. S.—T. M. R.—F. W. B. J. D. S.—E. E.—K. V. All statements of facts lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications.

Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

Best Bath Stone. WESTWOOD GROUND, Box Ground, Combe Down, Corsham Down, And Fareleigh Down. RANDALL, SAUNDERS, & CO., Limited, Corsham, Wilts. [Adv.]

### Circular Hospital Wards.

ON Wednesday afternoon there was opened at Greenwich the Miller Memorial Hospital, founded as a practical memorial to the late Canon Miller, of Greenwich, who invented "Hospital Sunday." The hospital is a small one, and only one half of the ward portion of it is as yet built, but it acquires importance inasmuch as it is the first hospital with circular wards to be put into actual working. Its opening was followed, appropriately enough, by a meeting at the rooms of the Social Science Association on the evening of the same day to consider the subject of circular wards generally, when Professor Marshall, who first started the idea of the circular ward in this country, gave a short address, summing up, in an admirable and lucid manner, his views as to the superiority of the circular form and his reasons for them, and Mr. Keith Young, who, conjointly with Mr. Hall, was the architect of the Miller Memorial Hospital, read a short paper descriptive of the building and the objects which have been aimed at in its plan and construction.

The ultimate reception of the circular ward system will depend on the practical experience of the medical profession in regard to its working; but this seems a convenient moment for referring to and summarising the reasons for and against it, as well as alluding to one or two of the statements made at the small, but, as far as it went, very representative meeting at Adam-street, at which Dr. Buchanan presided.

Although Professor Marshall claims to have started the idea of the circular ward in England, his attention having been directed to it by considering the method of carrying out future extensions to University Hospital, the idea seems to have sprung up almost simultaneously in other quarters, and he found that the circular ward hospital at Antwerp (M. Baeckelmans and MM. Bellmeyer and Van Kiel, architects), of which mention has been made before in these columns,\* had been designed as long ago as 1872, and that previously to that Sir Andrew Clarke, whose circular ward military hospital at Seahforth (not yet in working order) we illustrated a few weeks ago, had before that designed a circular ward hospital for Madras, which was not carried out, owing to objection mainly on the

ground of costliness. Sir A. Clarke, speaking afterwards, carried the history of the matter a little further back. He disclaimed originality, and said that the idea had been first suggested to him in 1854 by Dr. McKenna, of Melbourne, a military doctor, who had found in the course of active service elsewhere that when the wounded were placed in convent rooms, hospital gangrene usually set in; when they were placed in a circular church, hospital gangrene seldom set in, and in a much milder form when it did. In 1858 Sir A. Clarke was reminded of this by the experience with the wounded at Rome in Garibaldi's campaign, when the Pantheon was made use of as a military hospital with the most favourable results; while, again, the convent rooms which were utilised as hospitals, turned out very unfavourably. We may just remark in regard to this piece of experience that too much stress cannot be laid on the operation of the circular and domed form of building unless we know also a little about the other constructive details of the buildings utilised, and the manner in which they are kept. The churches were very likely the cleaner places, and in most cases would be built of more favourable, because harder and more impervious, materials, besides the larger cubical space in proportion to floor area,—considerations which, of course, apply especially to the case of the Pantheon. This argument, therefore, must not be pushed too far.

The historical side of the subject was further brought out at the meeting we are referring to as follows. The Antwerp designs have been referred to. There is in a hospital at Bristol an octagonal ward, a form which, it may at once be said, combines nearly all the disadvantages of the circular form with some others peculiar to itself. Not long after the initiation of the circular idea in this country by Professor Marshall, an attempt was made to get it carried into practice at Spalding. Medical opinion was not adverse to it, but caution prevailed with the Committee. It was an untried experiment and a costly one, and they would not sanction it. At Burnley the authorities were less timid, and a hospital with circular wards of one story, but with a "sun-room" above, is in progress there, and is likely to be opened about October next. Then the necessity for adding an Infirmary ward to the Hampstead Workhouse, on a very irregular and confined site, led its architect, Mr. Charles Bell, to the idea of getting over the difficulty there by the circular form, and hence arose the three-storied circular building, not yet opened, which we illustrated in the *Builder* for Feb. 2 last. The Seahforth Barrack Hospital we have already referred to and illustrated (*Builder*, Nov. 15 last); this is also in progress, and Sir

A. Clarke has plans in preparation for a somewhat similar one at Milltown, near Greenwich, and for a much larger one at Valetta; these two latter may be regarded as works to be carried out, as their form is decided on. We have thus at the present moment one circular ward hospital actually opened, and five which may be regarded as practical schemes to be completed before long, viz., Antwerp, Burnley, Seahforth, Milltown, and Valetta; so that the circular ward system is now getting fairly past its theoretical stage.

Let us now consider the arguments for and against, as they appear at the present moment and in the absence still of the only sure test, that of experience. The arguments for the circular form in itself, irrespective of the nature of the site (which, as we shall see, is really a most important factor in the matter), Professor Marshall puts thus:—A circular ward gives a larger floor area per run of wall than a rectangular one, consequently also a larger cubical content. The action of the wind against the exterior surface, in the matter of affecting temperature and producing draughts, is much less powerful and direct than against a straight wall; whatever the direction of the wind, it can only operate fully against a small portion of the building, and is carried round in a circular current over all the rest of the surface. When the state of the weather is such that opening the windows is possible and desirable, the advantage is felt internally in the escaping of direct draught and the promotion of a gentle circular current round the room; whatever current of air strikes the wall having a tendency to continue round its inner circumference. The avoidance of all angles in the walls is an obvious advantage, it being now a recognised principle in hospital building to avoid angles of every kind that can hold dirt and render cleaning difficult. The advantage becomes greater and more marked when any angle at the junction of walls and roof is also avoided, and the ceiling is carried up in a more or less domical shape as a continuation of the wall. As Professor Marshall states it, fouled air has a tendency to mount up along the domical ceiling towards the centre, as certainly as water has a tendency to run down towards the centre of a dish with a bottom sloping to the centre. This is put a little too strongly; there are so many influences affecting currents of air which do not affect the action of water by simple gravitation; or, to put it more correctly, the superior lightness of the fouled air, which leads to its upward gravitation, is not nearly so marked as the superior weight (in comparison with surrounding air) of the water, which leads to its downward gravitation. Theoretically, however, no doubt the conclu-

\* For plan see *Builder*, July 7, 1883.

sion is correct, and part of the advantage of the circular ward is lost whenever the ceiling is made flat.

These are the advantages supposed to be inherent in the circular ward *per se*. But practically the most important and undeniable one so far is in its special adaptation to the difficulties of special sites, which has mainly led to its adoption in the Hampstead and the Greenwich cases. In regard to this, we cannot do better than put the matter in the words of Mr. Keith Young's paper on the Miller Hospital, which followed Professor Marshall's address. He said:—

"The site occupied by the buildings already erected, consists of a rectangular piece of ground immediately in rear of the Royal Kent Dispensary; in length about 63 ft., in width 46 ft., or about 2,868 square feet in area. On the north it adjoins the dispensary building just mentioned; on the east a large garden or yard, belonging to a chapel; on the west a blind road or *cul-de-sac*, by which access is obtained to the hospital; and on the south the ground on which the future extension is to be built. It is not, I think, very difficult to see that to plan a hospital at all on a site so restricted as the one before us is by no means an easy task; the position of the dispensary, and the fact of its having windows overlooking the hospital site, whose light must not be unduly impeded, present obstacles of a very serious nature to the efficient lighting and ventilation of the wards. Careful study led us to the conclusion that wards of the ordinary rectangular form were entirely impracticable, and that the only possible way of overcoming the difficulties of site, was to adopt the circular form for our wards. To illustrate my meaning more clearly, let us suppose the circular ward nearest the dispensary to be removed, and to be replaced by a rectangular ward for the same number of beds, and the same floor area per bed; the result of this would be, that when the ward was placed in position, its north wall would fit close up against the back wall of the dispensary. I should mention that, in view of the intended future extension southwards, the position of the administrative building is necessarily that which it now occupies."

To these advantages we will add one other of a distinctly architectural kind, namely, that the circular form gives an architect better chances of imparting a certain degree of picturesque effect to a hospital, as was evident in some of the drawings that were exhibited of hospitals that have not been carried out. This is a consideration which can only be advanced after it has been satisfactorily shown that the practical advantages of the form are paramount; but, that granted, it counts for something additional in its favour.

The disadvantages of the circular form, as admitted by its supporters are, first, increased cost. One or two supporters of the system deny this, but, of course, no practical architect will question it for a moment. It means increased cost in walls, floors, and roofing; and the superior cost of the two latter elements increases in ratio as the size of the ward increases. There is a wide area to cover instead of a comparatively narrow apartment. The second is that, although the area per run of wall is slightly greater, the actual amount of ground on the site is not utilised to the same extent as with rectangular buildings; considerable areas outside the circle are lost. When, as in the case of the Miller and Hampstead Hospital, the filling-up of this area would have brought the Hospital too close up to adjoining buildings, this cannot be considered a loss, so that this is obviously a question depending upon the special character of the site. An objection unaverted by medical opponents is that the windows opposite the bed where an operation or dressing has to be performed or a minute examination made, are too far off to give sufficient direct light. This Professor Marshall denies, and states that the diffused light obtained from all sides is equal, if not superior to, that derived from the single near window opposite to the bed in an ordinary rectangular ward. This is a point on which only practical surgeons can speak, and architects must in such a matter bow to their decision. We may reasonably suppose that the opinion of Professor Marshall would be a little biased in favour of his form of ward, and that it is only wise to wait for further surgical evidence on this point before feeling satisfied about it. The further disadvantages incident to the circular form which occur to us are, that each patient has a

fuller view of all the others than in any other form of ward, and this is a condition to be avoided as far as possible; that the plan necessitates, almost, a large central block or column for fireplaces and ventilation, and this is in the way of complete surveillance of all the beds by the principal nurse; and that the arrangement brings the feet of the beds inconveniently near to each other, except in a ward of larger radius than on other accounts it would be desirable or even possible to adopt. The full advantages of the plan in regard to warming and ventilation can only be realised with the central arrangement referred to, and we doubt if this central mass blocking the middle of the floor can ever be felt to be otherwise than an inconvenience; though we do not suggest this as a very serious drawback. Still, we hold that the rectangular ward will be found the most convenient for inspection and administration; and although Sir A. Clarke said that when inquiring where any hospital disorder had first broken out he had always found it was at the beds in the angles, "where there was no ventilation," it may be replied that it is surely possible to build a rectangular ward so that ventilation should be complete in the angles.\*

It appears to us, therefore, that the absolute superiority of the circular ward is at present established only in regard to sites where a rectangular form would bring the ward too closely into contiguity with adjacent buildings, and leave insufficient space for light and external circulation of air. In regard to the latter object, the circular ward in situations confined by buildings, no doubt, offers special advantages which no other form can equal. In other points and apart from site, although we are disposed to feel much less doubtful about the circular ward than formerly, it appears to us that advantages and disadvantages are, so far, about balanced, and that there is not yet ground for adopting the circular ward as the ward of the future. It must be compared with the rectangular ward on the best construction and with the best appliances, not with wards built merely on what are sometimes called "common-sense" principles; a vague phrase, which often means avoiding the trouble and difficulty of investigating details. "Common-sense" on such a matter consists in studying the question in all its details, in the light, first of theory and then of experience, and adopting the form which best stands the test of investigation.

In regard to some practical details, Mr. Keith Young considers the diameter of 35 ft., that of the Miller wards, the smallest that can be adopted without giving a feeling of confinement in regard to the central floor space (besides, we may add, bringing the feet of the beds too close,—for it must be remembered that the size of bed is a "constant"), and Sir A. Clarke regards 60 ft. diameter as the largest desirable. This is also probably correct: a larger size would lead to waste of floor space. In the Miller wards, of 35 ft. diameter, there are ten beds, giving a wall space of about 10 ft. per bed, which is liberal. In the Hampstead ward there are twenty-four beds, giving 6 ft. per bed, which is certainly the very least there ought to be. It is noteworthy, however, that although the wall space to be allowed at Hampstead is so much less, the cubical contents still leaves 1,000 cubic feet of air per bed, as against 1,100 cubic feet in the Miller ward. In other words, as the circular ward increases in size the wall space can be more closely occupied. In a ward of smaller size, the radiating position of the beds would also inevitably prevent their being put much closer than a 10-ft. spacing.

It was mentioned incidentally at the meeting that the Miller Hospital would probably be used in part at least as a hospital for paying-patients, and that curtains were arranged between the beds their full length; and another speaker suggested that curtains coming forward 4 ft. from the wall would secure sufficient privacy. Now, it is just in this form of ward that they would *not*. In a rectangular ward, with the beds in a line, short curtains would secure

privacy in regard to all except the opposite occupants; in a circular ward they would not. But is it not a serious question whether this array of curtains would not do away with some of the very advantages claimed for the circular ward, by checking ventilation and holding effluvia? This is more a doctor's than an architect's question; but so it appears to us. The proper sort of screen would appear to us to be one of some such material as thin enamelled iron, hung on a rail so as to leave about 3 in. between it and the wall, and not interrupt ventilation; and to be removable and washable. Bedclothes there must be; but surely it is not desirable to increase hanging stuffs in a hospital ward more than can possibly be helped.

Towards the close of the meeting we have been referring to, Professor Marshall received and read an interesting letter from Lady Strangford, accompanied by a plan of a hospital with circular wards which she had designed to be carried out in Egypt, with circular domed wards with top light and ventilation, a manner of building in keeping with the habits of the country in domestic architecture. Lady Strangford added that in her hospital at Cairo, where there was an inner domed room, the patients were found to do better than in any other ward. This was certainly an interesting and opportune testimony in favour of Sir A. Clarke's view as to the domed form. These wards, it must be observed, have the central floor-space unencumbered in any way.

#### ON TYPES OF BEAUTY IN NATURE AND IN ART.

 In a previous article\* some progress was made in setting forth the analogies between structure and function in the organisms of nature and in works of art. The subject admits of further and extensive development, and is already in the way to be greatly assisted by what is becoming the important study of anthropometry. The subsidiary science is of too recent an origin to have realised all its capabilities, but zeal and sagacity seem not likely to be wanting to make the most of them.

Anthropometry has for its object the investigation, record, and study of the measurements of the human body in respect of its dimensions, weight, and the strength of its various physical powers. It is thus ancillary to anthropology, the natural history of man, so far as this science is concerned with man's physical development. Now, the assistance which the anthropometrist may be called on to supply falls generally under several heads. In the first place, he has to undertake the functions which are akin to those of the pure statistician. To him we must look for accurately compiled accounts of the physical conditions of the population in respect of growth and force, as it is distributed in districts, or in diversity of occupations, or at different ages. The value of the knowledge which is so obtained has appeared in the observation that a serious fallacy lies in making one standard height the test of suitability for military service for Englishman, Welshman, Scot, and Irishman. It is manifest also that conclusions can scarcely be brought out which will have important bearing on the conditions of health and vigour. A very considerable mass of statistics has already been accumulated and cannot be glanced over,—as in the "Manual of Anthropometry," by Dr. Charles Roberts, and the report of the committee,—without suggesting a variety of lines of study and comparison. We must look, however, to the anthropometrists themselves for reaping the full harvest of knowledge from their laborious preparation of this scientific ground. What we are concerned at present to indicate is that their ground admits of extension, and in a direction as interesting to art as it is to science.

What interests artists in anthropometry is not the general average of human forms, or

\* The actual "angles" should, of course, be rounded off.

\* See p. 531, ante.

even of special classes, but the most perfectly characteristic type of such classes, which will never be brought out as the result of an average. It is in this respect that the observations of Sir Joshua Reynolds have proved, perhaps in consequence of his qualifications not being duly allowed for, somewhat misleading. "From reiterated experience," he says, "and a close comparison of the objects of nature, the artist becomes possessed of a central form from which every deviation is deformity." Accordingly, Dr. Roberts pursues, "The distinguished mathematician, Quetelet, like the artist and the physiologist, recognises the existence of a central or typical form in man; but while theirs are ideal forms, his is a real one, and is the mean result of a large number of actual measurements of the living body. Hence the 'central form' of Sir Joshua Reynolds and the 'canon' of typical proportion of Professor Carns become the 'mean man' (*homme moyen*) of M. Quetelet." It is true, no doubt, that all men have been, to a certain extent, cast in the same mould, and so far the race admits of a type or model having certain universal characteristics and proportions. This general type, however, can be little more than a diagram or a formula, valuable for certain applications, but utterly characterless in any artistic sense,—as little to be taken as "a central form from which every deviation is deformity" as the archetype vertebral skeleton defined by Professor Owen. Sir Joshua, to do him justice, no sooner has uttered his dictum about the central form than he is struck by its difficulties and proceeds to make admissions rather than qualifications which are, in truth, equivalent to withdrawal in favour of a more defensible scheme. "To the principle I have laid down, that the idea of beauty in each species of being is an invariable one, it may be objected that in every particular species there are various central forms which are separate and distinct from each other, and yet are undoubtedly beautiful; that in the human figure, for instance, the beauty of the Hercules is one, of the gladiator another, of Apollo another, which makes so many ideas of beauty. It is true, indeed, that these figures are each perfect in their kind; but still none of them is the representation of an individual, but of a class."

But here again we find the great president going astray; the statues referred to are as absolutely individual as figures can be. Hercules is as absolutely Hercules as the president's own portrait of Lord Heathfield is Lord Heathfield, and the Apollo is as exclusively Apollo as his Dr. Johnson is Dr. Johnson. A figure is a type of its class in two senses,—first, as having all the characteristics which are present in every member of the class and none other; to decide this type it is necessary to exclude all details not common to all examples, otherwise any individual might be taken as a type; guidance, therefore, must be obtained by a comparison of large numbers. Such comparisons have this advantage, that they bring into view the points in which the largest numbers of agreements occur.

But the type of a class in the most important and valuable sense is an example in which the special characteristics are combined in the greatest perfection; if we are to gain a conception of this we must apply ourselves to study what those characteristics are and their relative value, and then to search for the exceptional individuals which exhibit them in the most admirable development; practically it may be safely said they are never to be found in nature assembled in a single individual, and thus it is that when associated and fused by fancy the type of a class is appropriately called ideal.

Naturalists have accepted this rule,—that the type of each genus should be that species in which the characters of its group are best represented and combined in happiest proportions. In the case of a national type this is the proportion which gives most efficiency to an organisation which is limited by certain permanent conditions, and especially by whichever is most important.

When this type is ascertained, it is for the anthropologist to press to the utmost his investigation of the factors which deter-

mined the model. Climate, elevation, as flat or mountainous, hot or cold, wet or dry; prevalent food and drink, occupation, and so forth, are taken into consideration, and still leave a remainder to be assigned to race,—to primeval influences affecting race,—and to the generally unknown.

The character of a perfect type is perfect suitability of a complex assemblage of organs to the requirements of functions which have reference to an end or general purpose of some certain complexity and dignity. Every natural organism, plant, or animal in the wild state conforms to a certain type which is in some degree explainable by the conditions of its sustenance and growth, preservation and propagation. And physiologists have much more to do before they will be able to explain how the original adjustment of the organism and instincts to surroundings first came about.

But beyond this original adjustment a species is found to be susceptible more or less of alteration, to be plastic, and to develop into modifications of a type which are again very specially defined. Cultivation will take such effect upon a flower as to evolve most extraordinary varieties of beauty. Again, the marvellous variety of highly characteristic types of the dog must spring from a natural plasticity, and, more than that, from plasticity having a special bias in certain directions. The natural instincts of the animal respond to characteristics of environment in the differences of prey to be pursued, or fought with, as absolutely as its coat is suitable to exposure in weather, and its digestive organs to the food which its teeth are suited to grasp and to masticate.

In the same way every characteristic type of man is the expression of response to characteristically defined influences and exigencies. The anthropometrist may be not unworthily occupied in determining what is the true type of a perfect equestrian. It would certainly be something very different from the type of a sailor, or a navy, or a coachman.

What perfection of type is in nature perfection of style in art, and much the same principles are involved in appreciating the characteristic types of style as of organism in the animal or vegetable kingdoms. If we compare the average of the proportions of Ionic columns with the average of Doric we shall, no doubt, obtain a result which exhibits very decidedly the main contrast of the two styles to this extent,—and so far we should be directed, if the matter were not self-evident already, to a point of difference in the two styles which is of vital importance. But our average column would only by accident coincide with an example of peculiar excellence, and so far must be less instructive than the individual extreme examples from which the average was obtained. The mean between two admirable examples may be as unsatisfactory as between two that are admirable in no respect. Whether we take a general average, or an average corrected by exclusion of extreme or insignificant groups, the mean of Quetelet and Dr. Charles Roberts, we, in either case, obtain a somewhat bald abstraction, as none of the details that give special interest to individual examples are represented in the result.

A mischief of an opposite nature is incurred when the value of subordinate types is as much neglected as the general type, and composition in a certain style is indiscriminate in its adoption of whatever details occur in any of its examples. Special character is not only distinctive of a style at large, but is demanded for every several variety of the style,—nay even, in due subordination, for every specimen of a variety which shall claim to be a work of original art.

The thoughts of an architect are familiarly conversant with a great variety of types of structures, from a palace to a shooting-box, from a metropolitan hospital or a theatre to a country-house or a Wesleyan chapel. They dwell in his mind as disembodied shapes, ever ready to assume varied proportions, dimensions, adjuncts, even in conception, but only to be fixed as definite designs upon presentation

of local and all other definite conditions. An executed work, so far as it fully and worthily satisfies such conditions, conditions which include a requirement for characteristic beauty as well as serviceableness, is then a type, and may take its place at the head of a class including numbers, every one of which shall make clear admission of affinity, though not abrogating subordinate characteristics purely its own.

It is perhaps in sculpture, which strangely enough exceeds other arts in the proportion of its failures, that, thanks to the genius of the Greeks, we find not a few examples of success which have every claim to the high distinction of characteristic types. In painting, again, the works are numerous, of which we may truly say that they represent their classes with all the perfection of which they are severally capable. How far can the same be said of architecture, and what is the explanation if we cannot speak quite so confidently? Architecture would not be the source of delight that it is, both in study and contemplation, if numerous structures did not at once start up in memory to answer to the challenge. But let us be cool, and let us, above all, be fair. In demanding an example which is entitled to the honours of a perfect type of its class, we must hethink ourselves, before awarding such honours, as to what is meant by perfection. We pass rapidly in review before the mind a series of renowned and admirable buildings with which we are familiar as existing in full or not seriously impaired preservation, works of our own time, and works of predecessors; but of which, or let us say of how many, are we prepared to say that they give us perfect satisfaction,—that in them a given style, or a truly worthy ideal, is carried to the ultimate development in all parts and consistently,—that we wish in them nothing to be otherwise than as it is, and miss nothing which would give an enhanced charm, or that we are not left with an uneasy sense of defect or deficiency of some sort, we know not what?

If this is the case, notwithstanding the labour and the genius of which these works are the monuments, it may be taken as a warning to the world how difficult are the problems for the combination of beauty and dignity with serviceableness that it requires its architects to solve; and the thought is not altogether discouraging for architects, as it implies that,

"Much has been done, but more remains to do."

#### NOTES.

**T**HE conclusions to which the Royal Commission on Metropolitan Sewage have come in their final Report, whatever may ultimately be thought of their practicability, are in strict logical accordance with the main tendency of the evidence so far as it is summarised in the Report. The conclusion seems inevitable that, however sewage may be usefully and remuneratively employed by irrigation on a smaller scale, and under favourable circumstances of site, the London sewage is a special problem; it reaches to so large an amount, and would require such an extent of land for utilising it, and such immense machinery for carriage and distribution, that the problem must be regarded as one that cannot be met in this way. The conclusion of the Commission is in favour of chemical precipitation of the solids, the solid matter "to be applied to raising low-lying lands, or burned, or dug into the ground, or carried out to sea," the liquid portion, as a preliminary and temporary measure (words in italics in the Report), to be allowed to escape into the river, but with the ultimate intention of treating this by intermittent filtration, which requires a much less area of land than broad irrigation. The Commissioners set their face against permanently sending even the effluent into the river without filtration through land. The great advantage put forth by the Commissioners for this system is that the most important part of it, the precipitation, can be applied without delay and in contiguity to the present outfalls. There is a gleam of hope in this, at

all events. Some of the suggestions of important witnesses may be considered when the evidence is published in detail. The Report as it stands is a very long, and, we may add, a very interesting one, worth the careful perusal of all concerned in the subject.

THE question of the construction of an underground railway from the Marble Arch to Cornhill is one that should be decided by one tribunal alone,—the deliberate choice of the metropolis. To remit the decision of so grave a problem to the toss-up of a couple of Parliamentary committees would, as in the case of the Manchester Ship Canal, be little less than a public scandal. Such a project may either be a well-digested effort to supply a public want, or a predatory attempt to fitch the traffic of an existing line, at the cost of the residents along the suggested route. London, and London alone, has the right to decide which it is. But one or two considerations occur at this stage of the ventilation of the project. The first is that the first need for additional railway communication through London is from north to south, from Charing Cross to Euston or St. Paneras. This line should take precedence of a third route,—or indeed, a fifth route,—from east to west. The second point is, that as electric traction is proposed, it would be well to delay the authorisation of a new sub-metropolitan railway until electric traction has become practically established. And, thirdly, we have to suggest that in the case of any new line through London we should borrow a hint from the engineers of Paris, and pierce the tunnel at so low a level as to avoid all interference with drainage, gas and water mains, and foundations; so low, in fact, that with an improved traction system, the line should not be a destructive nuisance to the householders whom it undermines. And if the public will not descend, by lift or otherwise, to this requisite level, they can be in no crying need of the line. Had we not better set our streets in order first?

THE long-delayed improvement at the corner of the Poultry and Princes-street will shortly be completed, the lease of the European Tavern, which occupies a portion of the site, having recently expired. The old materials of the public-house and a portion of Bank Buildings adjoining, recently occupied by the Azienda Assurance, have been sold by auction, and the premises will shortly be pulled down. The estimated cost of the improvement, exclusive of professional services, is 21,600*l.*, which is at the rate of nearly 50*l.* per foot superficial.

AN interesting "find" has been made at Purwell Mills, near Hitchin, on the property of Mr. Charles Willes Wilshire. Roman bricks, shards of Samian ware, and coins of the lower empire having frequently been found in this neighbourhood, it was determined during the last month to excavate in a field near the Mills. The examination has brought to light the foundations of a Roman building; several rooms have already been unearthed; in one is the remnant of a rough tessellated pavement, red, relieved with a white pattern; in another the usual hypocaust, or apparatus for heating the house by hot air; some coins of Constantinus Secundus (eldest son of Constantine the Great) and Magnentius, have been found, which are presumptive evidence that the house was inhabited about the middle of the fourth century; a great deal of broken pottery, both fine and coarse grained, has turned up; also fragments of some glass vessel. The tiles from the roof lie in position as they dropped when the wooden superstructure gave way. The foundations are built of roughly squared flint blocks, set in excellent mortar. In breaking a detached piece, the stone was found to give way before the cement. It is premature to form any conclusions as to the size of the building until further examination has been made, but from the small dimensions of the rooms, the rough nature of the pavement and the pottery, some of the explorers are disposed to think that here we have the remains of a Roman middle-class house, rather than those

of some great man's villa, like that discovered at Brading. Should future examination confirm this view, it will add considerably to the interest of the discovery. We understand that the excavations are to be carried on until the whole ground-plan is laid bare. Considerable interest is taken in the work, and a great number of folks have visited Purwell Mills during the last fortnight.

WE are informed that the plot of ground at the commencement of the proposed new street from Piccadilly-circus to New Oxford-street, which forms a portion of the improvement authorised by the Metropolitan Streets Improvement Act, 1877, upon which the London Pavilion Music Hall is intended to be rebuilt, will have frontages upon what is now called Tichborne-street and Great Windmill-street, and the ground-floor will be utilised for shops where the land abuts upon those streets. The total area of the ground is 12,000 ft., and the rent to be paid is 3,000*l.* per annum, which is equivalent to 5*s.* a foot for the whole area. The lessee is to have the option of purchasing the ground-plot at twenty-seven years' purchase, which makes the value of the land in fee simple 394,036*l.* The lessee agrees to expend a sum of not less than 40,000*l.* in rebuilding the premises, and to pay the Metropolitan Board, who are the proprietors of the present Music Hall, 15,000*l.* on the transfer of the licence to him. The Metropolitan Board acquired the Pavilion Music Hall some years ago under an award by Sir Henry Arthur Hunt, who fixed the sum to be paid by the Board in compensation at 109,000*l.* The hall is at present let to Mr. E. Villiers at a rental of 7,000*l.*

WE cannot doubt that the explosion of the 13th December was a serious attempt at the destruction of one of the noblest monuments of London. The distance at which the explosion was heard, if compared with that at which such a noise as that made by the blowing up of a powder-mine, or the discharge of very heavy artillery, is audible, is enough to show that the charge of the deadly fulminant employed was enough, if directed with precision, to have blown out an arch, to say the least of it, of the bridge. But fortunately for civilisation, the precision of place and of time, without which the more rapidly exploding destructive preparations are really less dangerous than a more slowly expanding powder, are almost impossible to those who seek to perpetrate such outrages. From the latest reports, however, it would seem that the bridge has been in more danger than was at first supposed, and that every attempt had been made to plant whatever explosive force was used in a peculiarly effective manner at the base of the pier, and not above water.

THE Institute of France, on the 13th, nominated M. Diet as member of the Section of Architecture, to fill the place left vacant by the late M. Abadie. M. Diet is a former holder of the "Grand Prix de Rome," Honorary Architect and Member of the Council of Architecture of the city of Paris, Inspector-general of the Conseil des Bâtimens civils, and was the architect of the new Hotel Dieu and of the buildings for the Prefecture of Police, on the Quay, at Paris. M. Diet also completed the "Musée Napoléon" at Amiens, and carried out the enlargement of the Maison de Santé at Charenton, and other works of importance.

FROM *La Nature* we learn that, though electric lighting is carried out in several ways in private dwellings, it is always rather costly. One of the best systems is that of Gaston Menier, in which 150 Swan lamps are used of 40 volts and 0.7 ampères, supplied by a series of 22 accumulators. These nominally yield from 40 to 50 ampères, which are sufficient to supply 60 lamps at a time, a number more than sufficient for any ordinary purpose. The accumulators are charged each day by a continuous-current Gramme machine, excited in derivation, which is regulated by resistances introduced into the circuit. The machine is driven by a 5-h.p. "Otto" gas-motor. With

a little practice, the servant who has charge of the lighting can estimate the consumption pretty accurately, and re-charge the accumulators, allowing an excess of 10 or 12 per cent. for loss,—possible errors. When it is necessary to use all the lamps, the direct supply from the machine is added to that of the accumulators.

IN a recent number of the *Bulletin Technologique* is described a new ceramic product from the waste sands of glass-factories, which often accumulate in immense quantities, so as to be an occasion of considerable embarrassment. The sand is subjected to immense hydraulic pressure, and then baked in furnaces at a high temperature, so as to produce blocks of various dimensions and of a uniform white colour, composed of almost pure silica. The bricks, when plunged into chlorohydric or sulphuric acid, show no trace of alteration, have remarkable tenacity and solidity, and are not affected by the heaviest frosts or the action of sun and rain. They have strong resisting powers to high temperatures, provided no fluid is present, and are also very light, the specific gravity being only 1.5. The pure white colour allows of many architectural effects in combination with bricks and stones of other colours.

WE have received the second annual report of the Metropolitan Public Garden, Boulevard, and Playground Association, for the year 1884. Under the head of "Successful Work" the Association shows a fair amount of achievement in what must be at present a very up-hill labour, and the list of propositions attempted, under the head of "Unsuccessful Work" shows that the Association keeps itself on the alert for all reasonable opportunities of putting its views into practice. As its objects become better understood the Association will, no doubt, find the items under the head "Successful" increasing, and those under "Unsuccessful" diminishing.

THE decision in the case of "Blashill v. Chambers," which we report elsewhere, is certainly one more in accordance with legal than with surveying and sanitarian interpretations. It appears from this that the presence on a building site of coffins filled with the remains of dead bodies does not constitute "material impregnated with animal matter"; and that the defendant, having put a shield of 18 in. of concrete over this conglomeration, had done his duty according to the letter of the law. In that case, the letter of the law had better be modified. We do not say that 18 in. of concrete is not a sufficient sanitary defence as long as the concrete remains solid and impervious; but it may be a considerable question how far the concrete is liable to crack from partial displacement when put on such an insecure style of foundation; and in that case the inhabitants would have to face the chance of mechanical and sanitary injury to their habitations at the same time.

**British Association.**—At the close of the British Association meeting at Montreal, the suggestion was brought forward that, in commemoration of the meeting, and as a recognition of the hospitality with which the members of the Association had been treated in Canada, it would be a graceful act to form a fund for the purpose of founding a gold medal at the McGill University at Montreal. After consultation with the authorities of the University, it was agreed that, subject to further consideration, the medal should be given annually, in the Faculty of Applied Science, in which there is at present no prize of this sort. Lord Rayleigh, the president of the Association, undertook to act as treasurer, and Mr. W. Topley and Mr. H. Trauman Wood as hon. secretaries. In answer to an appeal circulated amongst the members in Canada, and to a circular which has been issued in this country since the return of the Association, a sum amounting at present to 75*l.* has been subscribed. Deducting the necessary expenses of printing and postage, there will remain an amount of something over 500*l.* to provide the medal.

A CORNER OF WILTSHIRE.

Quite close to the western boundary of Wiltshire, and about half way from north to south, lies the little town of Bradford-on-Avon. The river from which it takes its name rises in the northern part of the county, and, after flowing hence Malmesbury Abbey, and through Chippenham, finds its way among pleasant pastures to the factory chimneys and deep-dyed contributions of Bradford: thence it passes by way of Bath to the great town of

Bristol, and, creeping at a dizzy distance beneath Clifton Suspension Bridge, it finally loses itself in the Severn River. At Bradford it flows at the foot of a considerable hill, upon which the little town has perched itself, terrace upon terrace; while the banks of the stream are, for the most part, occupied by cloth-mills, which avail themselves of its help, and, in return, deliver into it most of what they do not want themselves. The mills, however, are not offensively obtrusive. Their presence serves to give a feeling of life and animation to the

scene, without entirely monopolising both bank of the river to the exclusion of the seeker after the picturesque. Away from the water their influence is hardly perceptible, and one may toil up the steep streets, or climb the winding flights of steps which insinuate themselves between the houses, without being in the least reminded of anything so prosaic as cloth-making.

The centre of Bradford is its bridge. Here the road is tolerably level; here, if anywhere, there will be some life to be seen; the broad and shallow stream gives a feeling of space which is vainly sought for in the narrow streets; while the parapets being, as John Thorpe remarks of certain walls on one of his plans, "coped leaning-height," afford comfortable quarters to all who are fond of a good gossip indulged in to the soothing murmur of the water, and under the continual expectation of meeting one's friends. But it is not only for the unemployed, contemplative natives that the bridge has attractions. It has the great merit of being picturesque when seen from below, and of possessing, above, an unusual feature demanding attention from every stranger who merely crosses. This is a great point in a bridge. A bridge is usually a modest beauty whose charms only become apparent when sought for, and which are often unrecognised by ordinary acquaintance. But Bradford Bridge has a beauty-mark in the shape of a small building resting on one of the piers. Curiosity is naturally excited as to how this building is supported, and in settling the point, the whole series of Leland's "nine fair arches of stone" becomes visible. The building itself, which does this good service, is said to have been a chapel for mass, but it has undergone such changes that nothing of its original purpose could be guessed now from its outward appearance.

Bradford has two churches, one old and one new. The old church lies in an out-of-the-way corner, "byneath the Bridge on Avon Ripe," and attracts but little attention. It is a large structure, of various dates, but of no great interest to the sketcher. The modern world seems to attend the new church on the top of the hill. To the north of the old church is a small building of great interest to the antiquary, being nothing less than a real Saxon chapel. Many buildings used to be called Saxon which closer investigations have shown to be Norman; and even to this day vergers and other officials whose monotonous information was learned some twenty years ago, and has not been corrected up to date, will rise up in wrath if any doubt is cast on their cherished "Saxon" traditions. But this building at Bradford is a genuine example, and certainly no other style would care to claim a building so crude in design and so devoid of detail. To the historian or the antiquary it is full of interest, as being probably a relic of the Abbey of St. Aldhelm, founded here early in the eighth century.\*

In the present day, and to the modern sketcher, more interest will probably attach to the house a little further west, now inhabited by the schoolmaster. It is a small but charming example of a Renaissance front. Nothing could be simpler or less pretensions, and yet we have here a house, hardly larger than a cottage, treated in a monumental manner.

One of the chief sights of Bradford is the "Duke's" or Kingston House, built by a family named Hall about the end of the sixteenth century. Leland says that in his time "Halle dwelleth in a pratie stone house at the este ende of the toune in dextra ripa Avone," which would agree, so far as such a vague description can, with the site of the present house. The "pratic stone house" which Leland saw was an earlier building than anything we see now, for Kingston House is a very respectable example of the early Renaissance style, and Leland lived when Gothic was only just beginning to succumb. The Halls had lived at Bradford for a good many generations. Having started with a Reginald de Auld, they came, by way of the French equivalent De la Sale, to be plain Halls of Bradford. It is not known whether they were ever engaged in the historic trade of their town, nor can any one say with certainty which of them built the Jacobean house. They eventually died out, and through the female branch their house came into

\* Plan, sections, and elevations of this chapel are to be found in vol. v. of the *Wiltshire Archaeological and Natural History Magazine*, partly illustrating a very exhaustive paper on Bradford-on-Avon, by the Rev. W. H. Jones.

possession of the Dukes of Kingston, of whom there were but two. The second married a lady with a reputation not altogether to be envied. Princes and nobles were enamoured of her, but it would hardly be worth while to attempt to schedule her suitors together with the meed of success that attended their suits. It is quite enough for us to know that she sometimes lived in her husband's house at Bradford; and let us trust that she did not find it too dull. She married the Duke of Kingston before her first husband died; and, on the death of the duke, his relatives, in vindication of the eternal claims of morality and of needy connexions, caused the widow to be impeached for bigamy before the House of Lords. The trial was most magnificent, and attracted the exclusive attention of the fashionable world. In spite, however, of every proof, the enchanting duchess escaped without serious penalties and without losing her wealth. If, among the "Honourable House" who determined the case, were many of her rejected suitors, her escape is a great tribute to her fascinations.

Her house in Bradford was sold at the beginning of this century to a gentleman who erected a woollen-mill in the grounds by the side of the river. It was cut up into tenements and threatened to become completely spoiled, when, in 1848, it was bought by its present proprietors and carefully restored. Standing, as it does, on a terrace overlooking the valley, it presents a striking example of its style. Quite at the other end of the town, in a little suburb called Barton, stands a fourteenth-century barn, said to have been a tithe-barn, but which is also ascribed to one of the Hall family. If Mr. John Auhrey, who saw the place in the latter part of the seventeenth century, is right in thinking he saw on it the device of a hand holding a battle-axe, it is not at all improbable that a Hall did build it, since the hand with the battle-axe is their crest. The barn is like most others of the same date, well furnished with bold buttresses and long narrow slits to admit light and air. It has two transepts, each containing a large pair of doors, and a little one at the side, now fastened up. The whole building is striking and stately, though not so elaborately ornamented as those at Glastonbury, Pilton, or Doolittle. Its enormous size serves to bring vividly before the imagination the fact that at one time tithes were paid in kind.

Besides these particular beauties, Bradford possesses a great number of eighteenth-century stone houses with handsome fronts,—an echo, probably, of the prosperity of the city of Bath, which is only some eight miles off. There is also, both here and in all the neighbourhood, a good deal of unpretentious ironwork, chiefly displayed in public-house signs. It all shows marks of the taste of last century (fig. 1).

Another feature of frequent occurrence is a stone porch or hood to the cottage doors. It consists simply of a moulded slab supported by two shaped brackets. The moulding of the slab and the shape of the brackets vary to a certain extent, but the type is the same everywhere, and frequently occurs in very small cottages which have no other architectural pretensions whatever.

About three miles to the north of Bradford is the village of South Wraxall, where the church, with its foreign-looking tower, at once attracts attention. The tower is the most picturesque feature of the building. Inside there is little of interest; but nevertheless every church ought to be entered, for what pleases one man has no attraction for another, and vice versa. This church has been restored, and that might delight some people. Beyond the church, across some fields, and so far away as to engender a feeling of resentment at its being called South Wraxall at all, lies the Manor House. This was for many generations the seat of the Long family, some of whom lie obscurely buried in South Wraxall Church. The Longs seem to have owed their existence primarily to the Hungerfords, a powerful family living some five or six miles away at Farleigh Castle. Leland says that "one Long Thomas, a stout fellow, was set up by one of the Lords Hungerford; and afterwards, because this Thomas was called Long Thomas, Long was usurped for the name of the family." But whether this be so or not, it is very clear that the Longs were quite capable of taking care of themselves, and had a strong determination to see themselves well housed. The Manor House is a large

rambling place dating chiefly from the fifteenth century. It is entered by a gateway having an oriel over it, and leading into a large quad, on two sides of which spread the buildings with cusped and mullioned windows. Most of them are empty, and may be visited on payment of a small fee. The exterior cannot boast much delicacy nor picturesque. The detail is a little clumsy, and the general effect appeals more to the artist than the architect; but inside there is a rich mine of work,—very late, it is true, but of great interest to all but unhappy puro Gothicists.

There are four or five fine chimney-pieces; a beautiful Jacobean screen, *in situ*; much wood panelling, stone niches, iron casement fasteners (figs. 2, 3, 4), and other delights, all to be sketched without let or hindrance so soon as the palm of the attendant sybil has been crossed. The chimney-piece in the hall bears the date 1698, which probably marks the time of the erection of all the late work. Another chimney-piece, upstairs, is an elaborate and handsome affair, reaching from the floor to the panelled plaster ceiling. It is throughout a mass of carving treated in a strictly architectural way, though much might be said as to the forms which have been used. In the over-mantel are four figures representing Prudence, Justice, Arithmetic, and Geometry. Arithmetic is thinking hard, while Geometry is very busy measuring a globe with some robust dividers. Two other rooms on the same floor have remarkable chimney-pieces, and over them all is a plentiful sprinkling of sententious Latin mottoes or posies, of which one states the well-known fact that "Death seizes all." In another part of the house is a panelled room in which are various pilasters with pedestals bearing a very charming design. The legend goes that Sir Walter Raleigh used to live here when he visited South Wraxall, and that it was in this very room that the first tobacco was smoked in England. But that reflection, though it may add interest to the house, in no way affects the detail. In this room, too, there is a good chimney-piece, at whose yawning chasm Sir Walter may possibly have lighted his pipe; and perhaps he knocked the ashes out against the little shields in the spandrels.\*

#### THE "CAISSE DE DÉFENSE MUTUELLE" IN FRANCE.

THE following *resumé* of the position among French architects in regard to the idea of a combination for the mutual defence of their professional interests was actually laid by M. Achille Hermant before the Congress of French Architects some months ago, the proceedings of which we reported at the time at some length,† but were compelled to omit some papers of much interest, for the report of which space could not be spared at the time. The interest of this view of the subject by a French architect is, however, exactly the same to our readers as it would have been then; it may furnish hints to English architects in regard to what should be their attitude towards each other and towards the public, and we need, therefore, make no apology for printing it now. We may premise that the full definition of the subject is "La Création, sous le patronage de la Société Centrale, d'une Caisse d'Assistance judiciaire, ou mieux de Défense mutuelle, destinée à venir en aide à ceux des membres de cette association qui se trouveraient engagés dans un procès par suite de faits relatifs à l'accomplissement de leur mandat, lorsque de ce procès pourra résulter une décision judiciaire sur une question de principe ou d'intérêt général pour la profession d'architecte."—

Before entering on the main question itself, M. Hermant showed that it was naturally connected with the views expressed by M. Wollon at the last conference on the subject of public competitions, and he pointed out how unfortunate it would have been for the whole body of architects if, through hesitation or want of means on the part of those immediately concerned, MM. Malpiau and Montier, in 1846, and M. Henri Parent in 1882, had not obtained the two remarkable decrees of the "Cour de Cassation," so valuable to our profession, in that they limit the responsibility of the architect and the time during which he may be sued. M. Hermant reminded his hearers that the case of the "Comte de Bearn contre Henri Parent"

lasted nearly ten years, and that the defendant was obliged, with varying results, to go before the "Tribunal civique de la Seine" and the "Cour d'Appel de Paris," and afterwards to the "Chambre civile de la Cour de Cassation," then to the "Cour d'Appel d'Amiens," to return to the "Cour de Cassation," but before the "Chambres réunies," which last issued at length a decisive decree.

What, said M. Hermant, would have been the result if in the place of M. Parent, a man of distinguished position, there had been a young man of little experience and unable to defray the expense of such a law-suit, and who, after gaining more or less advantage in the course of the transaction, would have been forced to withdraw without bringing the Supreme Court to a decision?

The proposed "caisse," on the board of which are Messrs. Rolland, president, and Cbas Lucas, secretary, involves the formation of a society with a special aim, and distinct from the Central Society, though supported by it and including a great many of its members.

We give below the principal articles of the proposed statutes:—

Art. 1.—An association of professional architects is founded, by application of the law of March 21, 1884 (law of professional syndicates), under the patronage of the central Society of Architects, for the defence of professional interests involved in suits by or against members of the association before judicial or administrative tribunals. This association will be entitled:—"Caisse de Défense mutuelle des Architectes." It will be constituted when it shall have received the adhesion of 300 members. It will have its centre in Paris.

Art. 2.—This association has for its object to defray the costs incurred in defence of their rights by those of its members engaged in legal proceedings,—by reason of the exercise of their profession of architect,—when the proceedings relate to a question of professional interest. The association will hold aloof, on the other hand, from disputes relating to questions purely personal.

Arts. 3, 4, 5, 6, 7, 8, 9, 10, 11, and 12 relate to the recruiting of the Society and its resources, and to its administration by a committee.

Art. 13.—Every application addressed to the association must be accompanied by,—1st, a memorandum containing a complete statement of the subject; 2nd, all documents necessary for the examination of the same. The candidate may offer explanations in person to the committee, or appear through a representative of his own choice. The decision of the committee will be given, at latest, during the month following the receipt of the formal application, unless a delay be necessary to ensure more ample information.

Art. 14. The application may be preferred at any stage of a suit, and on any ground which the candidate may think proper in the case in which he is interested. If a valuation has been directed, the applicant may demand the appointment by the committee of one of their members to assist in the valuation, and to draw up a report to the committee before it decides on his application.

Art. 15. The committee will decide to accept or reject the application; but it may, in exceptional cases, admit it in part. In all cases it will reserve the right of adjusting, in due proportion, the expenses to be defrayed by the "Caisse de Défense mutuelle." The decision of the committee will be final.

Art. 16. The acceptance by the committee of an application will bind the "Caisse de Défense mutuelle,"—first, to contribute to all judicial expenses, fees of advocates and attorneys, and the cost of the valuation or survey which the associate may have brought forward on his account; second, to indemnify him for judgments in costs, and expenses of the valuation or survey made by the other parties, and operating against him. If, after a negative decision of the committee, the character of the suit should be modified so as to raise a new question of professional interest, the associate interested may renew his application, which must be re-investigated; or the committee may in this case make a new decision without the application being renewed. The committee should have the new question brought under its consideration before the associate interested carries or accepts discussion before a new jurisdiction. In this case, the application and documents should be addressed to the committee, and it will decide

\* To be continued.  
† See *Builder*, vol. xlv., pp. 863, 841.

with the least possible delay, so that the applicant may be able to act in good time.

Art. 17. Associates reserve the free choice of council under all jurisdictions.

Art. 18. The costs of judgments pronounced against associates on the main points will in all cases be defrayed by themselves. Judgments for costs which they may obtain should, after being paid in, revert to the "Caisse de Défense mutuelle," to the amount of its advances.

The projected statutes terminate by divers articles relating to the modification of the statutes and the dissolution of the Society, and after the reading of them, M. Hermant proposed that, as was done by the Central Society of Architects met in council and general assembly, the Congress should also adopt the principle of co-operation applied to the defence of professional interests, reserving discussion of the question and its details to a future occasion.

The question was raised at the time by a speaker, who in general supported the project, whether there were anything analogous to the proposed "Caisse" in other professions, and in reply, the existence of the "Chambres syndicales de Patrons et Ouvriers" was cited, and also of other professional syndicates, which were established with the view of defending the general interests of the profession, or the special interest of members; and further, the great moral support given by the order of advocates to each of its members, as against the magistracy. In a somewhat similar manner the *esprit de corps* of the profession of the Bar in England has been cited as an example which might be well followed by the architectural profession in this country.

Since the French Congress at which the subject was discussed, the rules and statements of the method of action of the proposed society have been printed for circulation, and probably we may hear further of the subject before long.

#### SEMPER'S THEORY OF ARCHITECTURAL ORNAMENT.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary meeting of this Institute on Monday evening last, Mr. David Brandon, vice-president, occupied the chair, in the absence of the President, who had accepted an invitation from the Architectural Society at Leeds.

Mr. Lawrence Harvey read a paper on "The late Professor Semper's Theory in Relation to Architectural Ornament." Semper, he said, before beginning his book, gives his theory of beauty, so that his readers may know the exact meaning he attaches to the terms he employs. After giving his definitions of science, religion, and art, he states that on the general lines of nature are founded architecture and music, which are therefore cosmic, and not imitative, arts. The imitative arts, even the feeling for the beauties of nature, he contends, are dependent on these cosmic arts. A man of culture, in looking at nature, conjures up a scene, by which he completes what he sees into a harmonious whole; this is exactly what the painter, the sculptor, and the architect do for us, and as we gaze at their creations we forget for a moment our own selves, and are lifted above the imperfections of existence. In nature and art an object stands out clearly before our attention, when it has individual characteristics; but when the object is scarcely distinguishable from its surroundings, our impression is blurred. In the lowest forms of creation,--crystals, for instance,--the individuals are entirely disconnected with the rest of the universe; they have nothing in their shape which relates to surroundings. The centre of a crystal is the centre of an attraction to which all its parts converge, and around which they distribute at regular intervals, thus illustrating the law of Eurythmus, which we obey whenever we wish to cut off an object from its surroundings by a frame, and thereby heighten its importance, he the object framed the neck of a fine lady, or the rude mystic symbol of a Druid's temple. A Eurythmical object raised on one of its sides forms, in relation to its basis, a symmetrical figure. Plants give us the idea of proportion as the result of the conflict between their vital power and the attraction of the earth. In animals we find another characteristic of individuals, viz., direction, a result of the conflict between their will and the resistance of either inertia or the medium in which they move. Euryth-

mus, symmetry, proportion, and direction are the fundamental elements of form. In nature is also found the law of subordination, and artists, like nature, are wont to indicate the purpose of their works by subordinating symmetry to proportion and attraction, or *vice versa*. Many authors, in searching for the origin of architecture, have started with the idea that simplest forms are the oldest; but just as it has been found in the comparative study of languages, that our poorer dialects are the descendants of richer stocks, so it is with architecture, what seems to be primitive is only derived many times over. In the research into the origin of architectural forms, chronology is no guide,--a primitive form of art may endure in one country centuries after it has entirely disappeared from another. The Egyptian bas-reliefs, which are older than those of the Assyrian palaces, yet belong to a later development of art; their apparent stiffness and primitive simplicity are designed in accordance with the religious principles of the Egyptian priests. Wherever traces of monuments are to be found, of whatever time and country, certain features can be observed, which, however modified, are essentially the same. We may conclude therefore, that these features are older phases of social organisms, consequently the primitive features were borrowed from the processes of the technical arts and trades. They obtained a symbolical meaning, religious or ornamental, but nevertheless their original purpose has never been entirely forgotten, and still influences the architectural features of our day. To the study of the formation of these types we must turn our attention if we want to catch architecture at its source. Every work of man is the result of two primal conditions,--firstly, the purpose he wishes to serve, and secondly the stuff or material, and also the construction and technical processes, be employs. As the purpose of all work remains the same in all times, being based on the wants of men, which change not, the study of the influence of purpose on the form of the objects leads to the consideration of their general shapes. On the other hand, the materials and the technical processes change in the course of time. In discussing how they modify our works we discover what we call style; that is to say, rules special to each case. A hand, for instance, is a strip of stuff wound round something to bind it. This is the general character of a hand; but how a band is to be fashioned, according as it is made of flax, leather, or metal, is a question of style. There is a third element which enters into the formation of the works of men, an element which varies infinitely, and therefore affects style; that element is the degree of culture, particularly the religious, philosophical, and political theories of the men for whom and by whom different works and objects are made. This is a big question, which Semper reserved for the second part of his work on Style, which has never been published. The writer then went on to classify the technical arts and trades, dividing them into technical (1) the Textile Arts, (2) Ceramic Arts, (3) Tectonic (Carpentry, Joinery, &c.), and (4) Stereotomy (Masonry, Carving, &c.). Carpentry, according to Semper, is applicable not only to works in wood, but to some structures in stone, as in Greek architecture, and to some forms of metal construction. Stereotomy comprises carving of any hard metal, and even modelling. As for the textile arts, they are connected with ceramic art in tile pavements, with carpentry in lattices and wainscoting, and, in fact, with all parts of architecture by the principle of clothing constructional parts, a principle which is the primary idea of all decoration. Semper succeeded in showing that the clothing principle governed the arts,--and especially architecture,--up to the Gothic period, when, according to him, the building principles of antiquity were abandoned. The ancient Gothic architects emphasised the constructional parts of a building by making it wear, according to Semper, its ribs outside its skin. When textile products are used in the form of surfaces they serve the purpose of covering, protecting, and inclosing, and as such are the oldest representatives of those abstract ideas. They are, says Semper, the primitive models of our floors, ceilings, and walls, and, starting from this point of view, he devotes many chapters to the treatment of architectural details. In any room the most brilliant effect of colour, he maintains, should be reserved for the ceiling. There are many reasons for this; firstly, the surface of the

ceiling is not disturbed by any utilitarian purpose such as are the walls. Thus a painting on the ceiling is never too close for proper inspection; hypercriticisms cannot pry into details, and the impression on the spectator is as vivid as it is necessarily cursory. Pictures on the walls, on the contrary, are blurred by the chromatic spectrum of complementary colours, which we perceive whenever we fix any given colour too long. Speaking of colours, Semper says, there are only two systems of decoration; the one rests on the equiponderation of colours by which a richly homogeneous, yet quiet, effect is produced; the other is the Greek principle of subordination, wherein colours are toned so as to bring out a culminating effect or climax. The process of sewing teaches us an important principle of design, never to place pictorial subjects, he they painting or sculpture, in a part which has a constructional purpose, but to reserve them for neutral fields, such as the pediments and metopes. The knowledge of the knot probably preceded that of sewing, and, curiously enough, the knot is to be found in all countries as a religious symbol. The hutton is also a kind of seam, and may be the prototype of rivets and rosettes. To the wearing of skins of beasts can be traced the heads of Egyptian gods, as well as the masks and other animal attributes used in antique architecture and furniture. A comparison of ornamental leather wares with our own is an excellent study to initiate us into the refinements of good style, and, thereby, is indirectly useful to the study of architecture. To the introduction of silk from Babylon we owe the mystic beast-ornamentation; gold brocade in which there is a brilliant surface as a background to a still more brilliant pattern; damask or ornamentation based on gradations of gloss, reminding us of Moorish architecture; satin and velvet, the special delight of the Renaissance, as shown in the paintings of Titian, Paul Veronese, and Holbein. The textile products are the leaders which have fixed the chromatic scale of coloured decoration. The connexion between costume and architecture is of two kinds: on the one hand, architecture derived the style of its ornament from dress; on the other hand, it hears with dress the impression of analogous influences, such as the taste, character, and civilisation of a people. The paper then referred at some length to the clothing principle in architecture and to the important position which China holds in regard to the study of the origin of art. Could we see Pompeii as it was 1,800 years ago it would strike us, in many respects, as very Chinese! The opinion that India is the cradle of mankind does not agree with the tale told by its architectural remains, which point to a mixed style derived from various sources. When the oldest written documents are consulted it is found that Indian art was most complicated and rich in forms; wood, brick, stone, metal, and stucco were already in use, and each of these materials brought its contingent and special features. But the one which seems to have had the greatest influence on Indian architecture is stucco, for the over-laid ornamentation on Indian monuments is nothing but stucco work laid in stone. The paper described a Buddhist Convent in Ceylon, built about 200 years before Christ,--brick buildings supported on stone columns 12 ft. high, portions of the structure being covered with the most precious materials; the columns decorated with sculptures of lions and other beasts, as well as gods. At the present time one could see these columns with traces of stucco, which proves that the sculptural ornamentation spoken of in the description was obtained by stucco. Semper is induced by this discovery to enunciate the very bold hypothesis that the domes and stone circles of Stonehenge and Brittany were but the kernel of stucco structures. They are, to what existed, just what the iron framework of a clay statue in a sculptor's studio is to the statue itself. Referring to later times, the lecturer said that while smiling at the clothing of columns, we little thought that the column itself was but the clothing of a post, hull over hull, such is Semper's definition of the progression of art. The fact that Classic architecture needs the help of upholstery Semper reckons as a great point in its favour, as a means of heightening the effect of a building on great occasions. Reference was next made to the art of Chaldea, and the clothing principle as expressed in the alabaster

dados which decorate the walls of the interior chambers of Nineveh. The Assyrians appeared to have used metal, either hollow or as casing, on wood framing, thus forming a strong contrast to the Egyptian metal-work, which was solid, and made in thin bars. The metal plating and hollow work appeared under three forms: firstly, on square framing; secondly, a circular section of kernel with corrugated plating; and thirdly, a plating of thin metal pressed out on a lathe like tinware, and used only for vertical supports. A very much later example of the evolution of metal-work out of the casing of woodwork could be seen in the case of two bronze doors at Rome,—the one, from the temple of Remus, followed exactly the original wood panel construction; the other, from the Pantheon, presented outwardly the appearance of panel work, but was really made of one piece of hollow metal. In an upper room of St. Sophia there is an example of metal casing such as was probably used by the Assyrians. The clothing principle had evidently been applied to the construction of the terraced walls of Assyria. Semper concluded that the bricks were laid together on the floor after being sundried, and the whole surface was then painted over with enamel colours. When the colours were dry, the bricks were built up in their proper position on the wall, according to the numbers marked on their backs, and the colour was burned in by making a large fire within the chamber, so that the invention of burning clay to harden it into brick may be due to the experience obtained in fixing the colours thereon by fire. What the colour of the alabaster reliefs might have been it was impossible to say, but Semper felt assured that they were left neither naked nor coloured, like the Assyrian Court of the Crystal Palace. He was inclined to believe they were gilt, and decorated with encaustic wax colours. Reference was made to the description of Ecbatana by Herodotus, in which we find there were seven concentric walls, rising one above another, each painted with a different colour, viz. white, black, purple, blue, orange, silver, and gold. Mr. Harvey referred to the stonework of the Temple at Jerusalem, which Josephus affirms had a casing of wood and gold. The clothing principle was an essential characteristic of the Pyramid. The lecturer also touched upon the history of Roman architecture, which, like that of the Roman Empire, was split into two portions. The Christian architecture of Byzantium was the old Roman architecture invested with the spirit of an Oriental court. In the West the church was not only free, but mistress. The sensual decorations of pagan art were abandoned, and as the structure could be bared of its clothing, the construction and the material rose into artistic importance.

In the course of the discussion which followed,—

Mr. Geo. Wallis (South Kensington Museum) said he had the pleasure of being associated with Semper during the time of his connexion with the Science and Art Department. Semper's views were comparatively new in England. The fact was that from 1836, the period at which the Parliamentary Committee was formed to inquire into the relation of art and manufactures, there had been a considerable agitation as to the necessity for schools of design and museums. Therefore when Semper came to England he found a small body of men who could sympathise with him in his efforts. The centre of this body was the late Prince Consort, who, he believed, was the means of bringing Semper to England. Semper's views were considered novel by those who, like him (the speaker), had been studying the question not so much in relation to architecture, as in its bearings on the textile manufactures. At that time there were many points in Semper's theories which he could not quite see his way to accept, but the Professor's earnestness and zeal made him feel that it was rather for him to inquire than to dispute. Semper's position was practically experimental in this country, and men like Sir Digby Wyatt and Owen Jones associated with him, while not accepting his theories. His was a voice really crying in the wilderness, and in the end he accepted the offer of a professorship at Zurich. Some of his theories in relation to the origin of design were rather far-fetched, but there were others again which seemed to be perfectly true, and worthy of every consideration and study. An English

translation of the book would be of immense value at the present time to those arts in which they were all more or less interested.

Mr. Slater remarked that some of Semper's conclusions appeared to him very startling. He had only had the opportunity of glancing through the book, but it seemed there were two or three points to which it led. The great thing was the importance of textile manufactures. In any inquiry into the life of early nations, all students had come to the conclusion that a great deal would be gained by an examination of the savages who at the present time are in a condition somewhat analogous to the early inhabitants of the earth. All savage tribes have a passion for personal adornment, so that Semper was doubtless right in saying that the adornment of the person was the starting-point of ornamentation generally. Semper said that clothing was the starting-point for ornament, but as civilisation had spread from warm climates where clothing was not a necessity, to colder ones where it was, it seemed a striking instance of a man letting his theory run away with him. It seemed to be an inversion of the whole thing to say that the discovery of tattoo marks on some savages of the present day, similar to certain figures on antique metal-work, showed that the tattooing was the descendant of the more cultivated forms. With regard to the evolution of columnar architecture from wooden forms clothed with metal, Semper seemed to argue from the statue to the column. At the time of Pericles, Phidias, in his two great works, used not stone, but metal, ivory, and various other things to represent the figures. They did not know the reason for this, but there must have been one for the sculptors of Greece at the height of its art and prosperity choosing to do this. Twenty-five years, however, before the time of Phidias, temples were existing with stone columns, and nothing to show that their forms had been covered with bronze. He agreed with Semper that clothing was the origin of everything as far as colour posing a vote of thanks to Mr. Harvey.

Mr. Stannus thought it possible that Carlyle's "Sartor Resartus," which appeared shortly after Semper's book, might have been intended as a satire upon it. The book would be exceedingly valuable if it gave more *technique*. The world would not stand still to learn archaeology or to read books on evolution. At the same time Mr. Harvey would be doing a good work if he translated Semper's book.

Mr. William White, F.S.A., seconded the vote of thanks, which was carried by acclamation.

Mr. Harvey, in replying, said that about fifteen years ago he had a great many doubts as to Semper's theories, but the more he investigated them the more he got sucked into the theories, so that now he was a believer in them. This was the best answer he could make, for if they studied Semper's book they would go further on his road than they had anticipated.

#### DOORWAY OF "LA MADELEINE," VÉZELAY, YONNE.

THE French Government instituted, about four years ago, in the left wing of the Palace of the Trocadéro, at Paris, a museum of casts chosen from amongst the finest specimens of ancient sculpture (from the eleventh to the sixteenth century). This museum, in which things are methodically classed according to the system employed by the late Viollet-le-Duc, is called "Musée de Sculpture comparée," or "Musée Viollet-le-Duc."

The visitor, on entering the first hall, in which the casts from sculptures of the eleventh and twelfth centuries are exposed, has before him a magnificent double doorway, which occupies all the further end of the hall, and through which the neighbouring hall opens. This doorway is the reproduction of that of the abbatical church of the Madeleine, at Vézelay, in the department of the Yonne. The doorway has been so cleverly executed that one would really believe that it had been brought stone by stone from Vézelay, and re-erected in the Palace of the Trocadéro. The colour of the stone, the weather-beaten tinge, the very mouldiness caused by the damp, all has been reproduced with marvellous exactitude.

The casting of the whole doorway occupied

the artists and their workmen about four months. I was at Vézelay at the time, and followed the whole operation with the utmost interest.

The sculptures that decorate the tympanum are very curious indeed, and of great decorative effect. They are, moreover, very much more interesting when seen close by than when taken as a whole from some distance. Each fragment as it was cast disclosed many interesting details that were altogether lost when seen from afar. New discoveries were of daily occurrence,—curious details in the costumes, the shoes, instruments, jewelry, &c. Amongst other things, we may remark a reaper with a scythe, similar to those still in use, a flail of quite modern aspect, and shoes which seem to have been copied from those of the neighbouring shoe-shop.

The artist engaged in this most interesting work having kindly put at my disposal each fragment as it was cast, I was able to copy them, and I published in the journal *L'Art*, of Dec. 15, Dec. 24, 1882, and Jan. 14, 1883, a series of thirty-six drawings, with a notice by M. Havard, which highly interested the artistic world.

"La Madeleine" was the church of the abbey of Vézelay. The abbey was founded and erected primitively at St. Père-sans-Vézelay by Gerard of Roussillon, who, as M. Havard maliciously relates, "was taken, at the close of a somewhat troubled life, with one of those fits of devout fear that have so often proved profitable to the Church, and also to the faithful servants thereof."

Pillaged and destroyed in the ninth century by the Normans, who, after having ascended the Seine and the Yonne, ravaged also the valley of the Cure, the abbey was definitively erected on the hill-top, so as to be more easily guarded and defended.

The liberality of the pious and candid pilgrims that from all quarters assembled to pay their devotions to St. Mary Magdalene, and never failed to leave a peace-offering, soon gave riches and renown to the abbey. It was visited by King Charles VII., by St. Louis, Philippe-Augustus, Richard Cœur-de-Lion, King of England; Thomas à Becket, archbishop of Canterbury; and other personages of mark. Many of the high barons, on their way to the Holy Land, passed through Vézelay in order to visit the celebrated shrine, and also to procure money from the numerous bankers and money-changers that resided in the town.

The doorway of the Madeleine, of which we are speaking, dates from about the middle of the eleventh century. It gives entrance from the narthex or church of the catechumens into the principal church, by a double opening. The two halves of the doorway are separated by a pillar of most exquisite style, which supports a statue of St. John the Baptist, holding in his hands a mutilated disk. This disk was originally a broad nimbus which surrounded a Paschal Lamb, fragments of which are still to be seen.

Above the pillar and jambs there are two lintels, on which are sculptured a goodly number of personages, which have puzzled archaeologists for many a day, and of which even M. Prosper Mérimée was obliged to declare himself unable to furnish a plausible explanation. What could the artist have meant to represent by these long-eared folks, or this other personage with a shell on his head, or again, by this stunted dwarf, who must needs use a ladder to mount upon horseback? (See *Illustration*.)

In the centre of the tympanum Christ is represented in considerable dimensions, surrounded by the twelve Apostles, each having a nimbus. This statue is clad in the ancient *peplum*; the Apostles are robed in Oriental garments.

Above this magnificent tympanum there are three archivolts. The first is divided into eight "Passions," in which are represented different scenes and figures, more incomprehensible still than those on the lintels; scribes are to be seen leaning their "scriptural" or writing-table on their knees; human bodies with animals' heads, others with almost human faces, only adorned with pig-like snouts; one personage is arrayed in Persian attire, another looks like a Russian monk, others have ancient Roman garments, and others still, standing upon high clogs, are dressed somewhat like modern Turks, and bear great resemblance to the natives of the countries that lie around the Black Sea.

SCULPTURE FROM DOOR OF NARTHEX, LA MADELEINE, VÉZELAY.

DRAWN BY M. ADOLPHE GUILLOIN.

The diversity of these figures led M. Viollet-le-Duc to the belief that this tympanum meant to represent all the different peoples of the earth called together by the Apostles in order to hear the teachings of the Divine Master.

The second "archivol" is composed of twenty-nine "medallions," in which are represented alternately the signs of the zodiac and agricultural scenes, particularly the culture of the vine and of corn. In the first of these medallions we see a man about to cut a slice of bread with a long knife, and in the last a personage clad in fur holding a cup of wine. This latter one is surrounded by a Latin inscription: "Omnibus in membris designat imago decembris."

The third *vonnsoir* is composed of a rather heavy ornament of great decorative effect.

The church of Vézelay is one of the rare specimens of Romanesque architecture bequeathed to us by the great school of Cluny. The sculptures of the doorway, very remarkably executed, partake somewhat of the style of Byzantine art, but they are certainly not the work, as some are inclined to suppose, of Greek artists, brought to this country by the noble crusaders when returning from the first crusade. The tendency is Byzantine, but the execution Burgundian. The clever and naïve sculptors were undoubtedly our fellow countrymen; they took inspirations from paintings, enamels, and such like brought from Eastern countries, but they interpreted them, as it were, in their own manner, with their own "temperament," and this it is that gives to this work its great originality.

In short, the doorway of the Madeleine of Vézelay is one of the finest architectural pieces of the museum of the Trocadéro, which museum is destined to expose to public admiration specimens of our ancient national sculpture, our old French school of architecture, so fertile, so bold, and to which we owe so many precious monuments that hold an important rank in our artistic and national riches.

Paris. ADOLPHÉ GUILLON.

#### BEDSTONE COURT, SHROPSHIRE.

This mansion, built for the late Sir Henry W. Ripley, bart., stands about midway between the Hopton Heath and Bucknell Stations on the Swansea line of railway, on a knoll overlooking the valleys of the Clune and Terne, and forms a picturesque feature in the landscape viewed from the railway. It is approached by a new road through a deer park that has recently been formed, which road is entered from the main road, through ornamental gates of wrought-iron, flanked by a lodge in character with the mansion.

The house occupies three sides of a square, the entrance facing the east, the reception-rooms the south, the offices lying to the north.

The building is designed in the Early English half-timbered style, but to which has been imparted a Jacobean feeling. The brickwork is executed in red bricks from the Lilleshall Company, with quoins and dressings of Grims-hill stone, and the roofs are covered with tiles, supplied by the Coalbrookdale Company.

Internally the treatment is Jacobean, and the reception-rooms are appropriately fitted up and elaborately decorated, whilst to all the apartments a special character has been given by a judicious introduction of such features as wooden chimney-pieces, moulded dados, panelled ceilings, and stained glass, the subjects chosen for the windows being suggested by the use of the respective rooms.

A reference to the plan (which will appear in our next issue) will sufficiently explain the arrangement and accommodation of the mansion.

The building was erected by Messrs. Cubitt & Co., of Gray's Inn-road, from the designs and under the superintendence of Mr. Thomas Harris, architect, of Gray's Inn-chambers, High Holborn, Mr. R. Old being his clerk of works. The internal fittings and much of the furniture was executed from the architect's designs by Messrs. Marsh, Jones, & Crilch, of Leeds, and the decoration and stained glass by Messrs. Campbell, Smith, & Campbell.

We will give another view, as well as the plan of the house, in our next.

#### SANITARY HOSPITAL, BOURNEMOUTH.

This sheet of drawings shows the general plan and arrangement of the Hospital, which was designed for the Bournemouth Commissioners by Mr. G. R. Andrews. The external walls are

built hollow, with a space of 3 in., bonded with hoop iron to internal 4 in. walls, which latter are built in cement. Boyle's air-pump ventilators are affixed to each ward on the centre of roofs for extraction, and Ellison's radiator ventilators in the external walls for inlet. Nothing is said as to warming the fresh air on admission.

#### REEREDS, MEAVY CHURCH, DEVON.

MR. J. D. SEDDING, ARCHITECT.

This reeredos was erected in the Church of St. Peter and St. Paul in August last. The moulded framework is of a light greenish marble from the Yealton quarry. The panels are of alabaster, and the sculptured figures of white statuary. The work was executed by Mr. Seale, of Cold Harbour-lane, Brixton, from Mr. Sedding's designs.

ILLUSTRATIONS of a Villa at Wargrave-on-Thames, and of Old Houses at Boppard and Cochen, are unavoidably postponed.

#### BRITISH MUSEUM LECTURES.

MR. BOSCAWEN delivered, on Wednesday, the 10th, the second lecture of the present series in the British Museum. With a view to the accommodation of the especially large audience, the authorities had arranged one of the large rooms in the new wing of the building as a lecture-room. Mr. Boscawen commenced his lecture by pointing out that, as the decipherment of the inscriptions had shown that all the great linguistic languages were represented by tongues using the cuneiform writing as a means of expressing their thoughts, so the researches of explorers had shown that in the population of the land were found representatives of all the great ethnic families of the human race. The reason of this mixture of the population was to be sought in the position with regard to surrounding lands, and its attractive character to nomad wanderers. To the Akkadian coming from his pine-clad and snow-crowned mountains, as to the Semitic from the arid deserts of Arabia, it was like a garden; and, indeed, as its own records call it, a land "flowing with milk and honey," whose streams are "the waters of fertility." The lecturer then proceeded to set forth the evidence which the monuments afforded as to the non-Semitic origin of the groundwork of Mesopotamian culture. The cities of Nimrod, he said, were but a few years ago mere names wafted hither and thither over the whole of Western Asia; but now the spade of the explorer had brought to light from beneath the grave-mounds of the Chaldean plains, the very bricks which formed the walls of the temples and palaces of the cities of Nimrod. Of the cities forming the tetrapolis, Mr. Boscawen said, Babylon was the only one whose site had never been lost, and Hebrew tradition and modern Arabia still located the site in the mounds of Babel. The explorations carried out by Mr. Rassam at Aboo Habba had restored the ruins of the city of Akkad, and Mr. Loftus had partly explored the ruins of Erech, the Uruk of the inscriptions which lay buried beneath the mounds of Warka. The last of the cities to be identified was Calneh, and this had resulted from the explorations carried out by Mr. De Sarzec at Til-Lo on the Slat-el-Hie, a small stream joining the Tigris and Euphrates. There the explorer had found bricks and stones bearing inscriptions which revealed the city to have three names, Lugas, Sergmia, and Kulum; the last of these was the origin of the Kalneh of Genesis. In concluding the account of the primitive city Mr. Boscawen proceeded to point out the important position of the temple. It was the germ, as it were, of the city from which and round which it grew up. In Chaldea, as in Egypt, the foundation of a city was the building of a temple of some king or great man. It was the residence of the patron city-protecting deity, and became, as it were, an embodiment of the city itself. It was the chief court of justice, the school, and civic record office and treasury. Some idea of the immense amount of secular business connected with temples in Babylonia was shown by the mass of inscriptions in the British Museum. From Warka, the ancient Erech, the capital of Isdubar or Nimrod, Mr. Loftus had brought a series of legal, commercial, and social documents, dating as remote as the twenty-second century before the Christian era, and Mr. Rassam has found in the record chambers of the great temple of the Sun-

god at Sippara the Sepharvaim of the Bible, over 30,000 inscribed fragments relating to almost every kind of commercial, legal, and fiscal transaction during the late Babylonian (B.C. 606-538), Persian, and Parthian empires. Mr. Boscawen next proceeded to treat of the arts and sciences of those ancient people. The discovery of a neatly-drawn plan of a temple upon a tablet, dating certainly as early as B.C. 2500, had afforded a clue to the early origin of Babylonia mensuration. It was shown by a cubic rule, discovered with this plan, that the drawing was made to scale, and the proportional divisions of this scale had been accurately estimated by Mr. Flinders Petrie, the able Egyptian explorer and mathematician, and he found that they gave a cubit of 20½ in. The divisions of this scale indicated that the ancient Chaldeans had made considerable progress in the knowledge of the theory and properties of numbers. Additional proof of this was afforded by the discovery of Mr. Loftus at Senker, the ancient Larsa, the Ellassar of Genesis xiv., of tablets inscribed with tables of square and cube roots from 1 to 60. The adoption of the sexagesimal scale was another evidence of the Non-Semitic origin of the inventors, and brought them in relationship with the Chinese. It was the use of the scale which enabled them to divide the great circles of heaven into 360°, and the year into 360 days. Mr. Boscawen then proceeded to describe the progress which these people had made in the arts, and his remarks were especially illustrated by the exhibition of some large drawings of the sculptures discovered by M. de Sarzec at Tel-lo. These statues, he said, were not moulded in plastic material or hewn out of soft stone, but were cut out of blocks of green diorite and porphyry, so hard as to turn the edge of the best-tempered chisel. The solution of the problem was not yet clear as to how the work was accomplished, but, judging by the analogy of Egypt, the work was carried out by the slow process of honeycombing with the diamond drill, and cutting away the perforated portion. The use of the diamond as a cutting-stone was proved by a bilingual list, and by such a slow process these great works had been carried out, and years, perhaps life-times, had been spent in their carving. Mr. Boscawen concluded his lecture by drawing a comparison between the two great civilisations of Egypt and Chaldea, and remarked that where, as in the former, priestly conservatism had exercised a fettering influence on literature and art, and stereotyped, as it were, the products of the father's mind, in the latter the nation had gone from step to step advancing along the path of progress until the influence of so rich a heaven was apparent far and wide.

The third lecture was delivered on Wednesday, the 17th, the subject being the "Semitic in Babylonia." The lecturer observed that the high position attained by the Chaldean civilisation and its far-spread influence was due to the progressive element of the Semitic people in the population, who brought highly receptive, adaptive, and propagating faculties to bear upon the products of the Akkadian mind, and spread far and wide by the influence of war and trade the wisdom of Chaldea. The cuneiform inscriptions from the cities of Southern Chaldea threw great light upon the origin and position of the Semitic element in the population. In the early contract tablets, dated in the reign of the Chaldean king Khammurabi, were found a series of early names which afforded important evidence. After referring to the connexion between these early inhabitants of Chaldea and the Hebrews and Arabs, the lecturer proceeded to deal with the question of the Abramic migration, its date and cause. In conclusion, he illustrated the social life of the people by translations from two legal tablets dating from the twenty-second century before the Christian era.

Mr. Boscawen's lecture on Wednesday, the 31st inst., will be on the "Sacred Books of Chaldea."

**Omnibus and Tramway Men's Benevolent Society.**—The cabmen here long had a society of this kind; the omnibus employes, who form in London a very large class, are starting a similar prudential institution, to create annuities for aged and totally disabled men, and to form a fund to assist the widows and orphans of men who are deceased members of the said fund. Mr. H. B. Verity is the secretary.

## TAUNTON CASTLE.

The large hall, 58 ft. 6 in. by 24 ft., on the first floor, to the west of the entrance gateway, which contained the geological collection, has just been considerably altered and improved. Formerly its proportion was bad, as it was only about 10 ft. high, and the light was quite insufficient to show the specimens. Immediately above it came the roof, containing a number of attic bedrooms, the whole of the upper portion of this part of the castle (except the stair turret) having been much modernised. The wooden floor of the geological hall is about a foot above the top of the Norman vaulting to the rooms beneath, but restoration of the original level would be too costly at present; this must be deferred till a future time. The attic bedrooms have been swept away, a high-pitched roof with massive trusses having collars and king-posts put, the underside of the common rafters covered with boarding, and dormer windows (made to open) inserted. It is externally covered with tiles. The decayed plastering has been removed from the walls, and a considerable part of them rebuilt or faced with brickwork in cement, well tied in, and the rotten wood linings &c. of the windows removed. By the abolition of a modern fireplace at the north end of the hall, it has been possible to open out two thirteenth-century lancet windows, one of which had been nearly destroyed; these with their deep splayed reveals in the thick walls (5 ft. 6 in.) have an admirable effect. It may be mentioned that the side walls are also of great thickness. By the removal of incongruous useless fittings it has been also practicable to open out some perpendicular windows on the east side of the hall. It is much to be regretted that the ugly sham battlements still remain, as well as the pseudo-Gothic windows in the west wall. Something less out of character with the ancient work is much to be desired, but must wait till the necessary funds are obtained. The works described have been done from the drawings of and under the superintendence of Mr. B. Edmund Ferrey, F.S.A., for the Somersetshire Archaeological and Natural History Society, Mr. Charles Fox, of East Reach, Taunton, being the contractor.

## ARCHITECTURAL SOCIETIES.

*Birmingham Architectural Association.*—The second ordinary meeting of the current session was held at Queen's College on Tuesday evening last, the Vice-President, Mr. W. H. Kendrick, in the chair. The following gentlemen were elected members of the Association:—Mr. F. J. Yates as an honorary member, and Messrs. W. G. Midgeley and G. Payton as ordinary members. Mr. J. King James gave a lecture on "Pediments and Gables," which was illustrated by photographs and by many of the author's own sketches. A discussion ensued, in which the following members took part:—Messrs. W. Doubleday, Franklin Cross, W. H. Kendrick, and Victor Scruton (hon. sec.). After a vote of thanks had been accorded to the lecturer, the meeting terminated.

*Manchester Architectural Association.*—An ordinary meeting of the Association was held at the old Town-hall, King-street, on the evening of Tuesday, December 9th, Mr. J. S. Hodgson in the chair. A paper was read by Mr. R. B. Preston, A.R.I.B.A., on "House Sanitation," in which attention was chiefly directed to the consideration of water and water supply. The various sources and methods by which water is usually obtained for the supply of our towns were enumerated, and its different chemical properties pointed out. The absorption of gases by water was shown to be a very important property in reference to sanitary inquiries, and one which should not be lost sight of in planning drains, as this fact might, under certain conditions, render all traps practically useless against the entry of sewer gas. The opinion of Dr. Frankland was quoted in reference to the contamination of water by organic matter, viz., that the danger resulting from the use of such water did not arise from the decomposition of organic matter, but from the risk lest some of it had escaped decomposition. In the discussion which followed, Mr. F. R. Hawxby mentioned a few of the inconveniences arising from the use of well-water obtained from the red sandstone, which contained a large proportion of lime and magnesia in solution. He proposed a vote of thanks to Mr. Preston for his paper, which was seconded by Mr.

T. Chadwick, A.R.I.B.A. The meeting was also addressed by Messrs. Hodgson, Mould, Woodhouse, and Worthington.

*Leeds and Yorkshire Architectural Society.*—The members of this society and a large number of guests sat down to dinner at the Great Northern Hotel, Leeds, on Monday evening, Mr. E. Birchall presided, and the vice-chairmen were Mr. J. W. Connon and Mr. J. Demaine (York). The Chairman proposed "The Leeds and Yorkshire Architectural Society," which, he said, was in a very flourishing state. Mr. G. B. Bulmer (honorary secretary), in responding, said the society was endeavouring to cultivate and maintain a proper state of feeling between those who practised the same profession. Mr. J. W. Connon proposed "The Royal Institute of British Architects and Kindred Societies." He had the greatest possible faith, he said, in the value of the work which societies of this kind did in promoting good fellowship among their members, in raising the standard of the general morality of architects, and consequently in benefiting the public generally. It was not, and he hoped never would be, the aim of any of their architectural societies to promote simply their own interests. He was sorry to find that the architects of the country showed too great an apathy with regard to the assistance to be obtained from mutual combination, and that as a consequence there was a want of correspondence in architectural work in different parts of the country, a circumstance which brought about very serious disadvantages and very great inconveniences. They looked to Mr. Christian's year of office with hope and expectancy, as one likely to be fruitful in just and beneficial changes. Mr. Ewan Christian, President of the Royal Institute of British Architects, spoke in acknowledgment, and in doing so remarked there were no fewer than eighteen architectural bodies in the United Kingdom, besides others in the United States and elsewhere. When he entered the profession there was only one architectural society in existence. He agreed that these societies were of the greatest possible value in promoting union, not for selfish purposes, but for the study of art and for promoting uniformity of practice. He reminded them, however, that whilst societies were of great importance, each individual architect ought to consider that the honour of the profession at large was entrusted to his hands, because it was only from the action of individuals that the profession would be judged. Mr. J. Holden, President of the Manchester Society of Architects, Mr. W. H. Dunn, President of the Northern Architectural Association, and Mr. W. Jackson, President of the Leicestershire Society of Architects, also spoke in acknowledgment of the toast. The Rev. Dr. Gott proposed "Literature and Art." Mr. H. H. Statham and Mr. C. Pebody replied. Councillor Tweedale proposed "Law and Medicine," and Lieutenant-Colonel Hartley and Mr. A. W. M. Robson responded. Mr. John Hepper proposed "Commerce." Mr. J. Barran, jun., replied. The toast of "The Visitors" was proposed by Mr. Geo. Corson, and acknowledged by Professor Bodington, Principal of the Yorkshire College.

## ROYAL ACADEMY STUDENTS' SOIRÉE.

The students of the Royal Academy held a *conversazione* in the Rooms of the Incorporated Society of British Artists, Suffolk-street, Pall-mall (by the kind permission of the Council and members of that Society), on Friday evening, December 12. The *conversazione* was attended by various members of the Academy,—amongst others, Sir Frederick Leighton, P.R.A.; Mr. J. C. Horsley, R.A., Treasurer; Mr. F. R. Pickersgill, R.A., Keeper; Mr. Yeames, R.A.; Mr. Armstrong, B.A.; Mr. Dobson, R.A.; Mr. Burgess, A.R.A.; Mr. MacWhirter, A.R.A.; Mr. Brock, A.R.A.; Mr. Bamo Thornycroft, A.R.A.; Mr. Frank Dicksee, A.R.A.; and Mr. Henry Le Jenne, A.R.A. The band of the Royal Artillery, with occasional solo and part-songs by the students, enlivened the evening, towards the conclusion of which Mr. Brandon Thomas and Mr. E. F. C. Clarke gave some of those recitations and piano performances often given at the *soirées* of the Hogarth Club, but, probably, for the first time heard by the lady students of the Academy. The *conversazione* was the first of its kind, and took the place of the usual students' supper. Its success was generally

considered to be so satisfactory that it is to be hoped it may be given again in future years, if only to place the lady students on the same footing as their fellow-students of the other sex.

## COMPETITIONS.

*Manchester.*—The Manchester Corporation have awarded the first premium to the design of Mr. Joshua Bury, of Manchester; and the second premium to the design prepared by Messrs. Massie & Mills, of Barnsley, in the competition for the proposed laying out of an open space at Cheetam as a recreation-ground.

*Chelsea Vestry Hall.*—The particulars for the guidance of competitors in designing plans for the additions to the Vestry-hall buildings, as settled by the Vestry on the 25th November, have been issued by the Vestry Clerk. The Vestry offer a premium of 100 guineas for the first, 50 guineas for the second, and 30 guineas for the third of such designs as shall, after taking the advice of a professional assessor, be selected, and all such selected designs shall become the property of the Vestry. Should the author, however, of either of the designs be employed as architect of the building, then the premium will not be given, but he will be paid a commission of 5% per cent. on the cost of the work. If, in the opinion of the assessor, a design cannot be carried out within 10 per cent. of the amount named by the competitor, the latter will be disqualified from receiving any premium. The designs are to be sent in on or before Monday, the 23rd day of February, 1885.

## LINE OF FRONTAGE CASE.

FULHAM DISTRICT BOARD OF WORKS v. COLLS. THIS was an adjourned summons, heard before Mr. Sheil, the magistrate at Hammersmith Police Court, on the 16th inst.

The defendant, who is a builder and contractor, was engaged to erect a house and shop at the corner of King's-road and Parson's Green, Fulham. On the 5th of April, 1884, he gave the plaintiffs notice and deposited a plan of the proposed drainage. In due course he proceeded with the work, and the building was erected; he then called upon the plaintiffs to connect the house-drains with the main sewer: this the plaintiffs refused to do, alleging that the defendant had built in front of the general line of front of the adjoining houses, and until the question was settled, nothing could be done in the matter. The plaintiffs thereupon applied to Mr. Vulliamy (the Superintending Architect of the Metropolitan Board of Works), under the 75th Section of the Metropolitan Management Amendment Act, 1862, to decide the general line of building in Parson's Green. Mr. Vulliamy gave his certificate on the 17th of November, 1884, defining the front wall of the adjoining buildings as the general line, and the defendant's building being 15 ft. in advance of that line. The plaintiffs applied for the magistrate's order to demolish the building so far as it projected in front of the general line as defined by Mr. Vulliamy.

The plaintiffs called several witnesses, but they were unable to speak definitely as to the buildings which existed upon the site before the erection of the structure complained of. On the other hand, the defendant called witnesses, who proved that the site was formerly occupied partially by a building, and partially by a paved yard, which was enclosed by a 14 in. brick wall 10 ft. in height, in which were window-openings enclosed by iron guard-bars.

Mr. Sheil decided that the owner had not relinquished his right to rebuild on the site occupied by the former building and yard, as decided in the cases of the Westminster District Board of Works v. Lord Auckland, and the Kensington Vestry v. Barlow, and dismissed the summons, with costs against the Fulham Board of Works.

Mr. Besley (instructed by Messrs. Watson, Sons, & Room) appeared for the plaintiffs, and Mr. Glen (instructed by Messrs. Marsland, Hewitt, & Everett) for the defendant.

*Welford-on-Avon Church.*—Archæologists have sustained a great loss in the destruction by fire on Saturday morning last, the 13th inst., of Welford-on-Avon Parish Church and tower. The bells had been rung on Friday night, and it is supposed that one of the ringers' candles set fire to the matting on the heltry floor, which lay monldering through the night, and burst out into flame in the early morning. The tower is burned completely out, leaving only its massive walls standing, and five of the six bells are broken by falling on the floor below. The church is now a complete wreck. The seats and stalls, communion-table and pulpit, and other furniture, were saved.

**BY-LAWS UNDER THE METROPOLITAN BUILDING ACT.**

BUILDING ON DISUSED BURIAL-GROUNDS.  
BLASHILL V. CHAMBERS.

This was an appeal (by way of special case) from the decision of Mr. Hannay, the magistrate sitting at the Worship-street Police-court on the 17th day of June last, on the complaint of Mr. Thomas Blashill, District Surveyor for Bethnal-green, complaining that the defendant, on the 30th day of March last, at Peel-grove, in the parish of Bethnal-green, did unlawfully commit breaches of the By-laws made by the Metropolitan Board of Works, under the provisions of 41 & 42 Vic., c. 32, s. 14, by commencing to build on a site and foundations at the south-western corner of the Peel-grove Burial-ground, which had been filled up with materials impregnated with animal matter, to wit, some number unknown of dead human bodies without the said animal matter having first been properly removed. The second offence was for not pulling down the buildings erected by him on the said burial-ground, contrary to 41 & 42 Vic., c. 32, s. 17.

The facts of the case are as follow:—The defendant is a builder, and had commenced to build on the above ground, which had been closed by an Order in Council in the year 1855, when it was estimated that there were 20,000 people had been interred therein. The depth of the graves was in some cases 20 ft., and in other cases 25 ft., and the coffins were piled up to within 2 ft. or 3 ft. from the surface. After the closing of the ground rubbish was deposited thereon, forming a bed varying from 1 ft. to 4 ft. in thickness.

The defendant, having commenced to put in concrete foundations, the complaints were laid, and upon the hearing, Mr. Hannay dismissed the complaints, on the ground that the meaning of the words "site and foundation" in the By-law could not be extended beyond that given by the Act 41 & 42 Vic., c. 32, s. 14, and that the ground on which a site had been prepared, and that the By-law was not applicable to the present case.

The District Surveyor appealed against this decision, and the case was heard in the Court of Appeal last week, before Mr. Justice Grove and Mr. Justice Hawkins.

Sir H. Clifford, Q.C., and Mr. Besley, instructed by Mr. Thomas Burton, appeared for Mr. Blashill; and Mr. Gainsford Bruce, Q.C., and Mr. Graham for the builder.

After hearing the arguments of counsel, the Court decided to dismiss the appeal with costs, on the ground that the Act and By-law could not be applied to the case of a burial-ground.

**WIDE TENDERING.**

Sir,—Ten years since the Cottage Hospital was erected here. Shortly after the completion of the building, the walls began to settle and crack. This has gone on increasing, and it was deemed desirable to examine the foundations, which were found lamentably defective, concrete being almost entirely absent where it ought to have been present, and, where it exists, of very inferior quality. It has been decided, under advice, to underpin the walls, and insert damp-proof course beneath the inner walls. I beg to send you the prices given by the four persons who tendered for the work, asking if you can reconcile the great discrepancy therein.

A MEMBER OF THE COMMITTEE.

**Beebles.**

\* \* \* The following is the list of tenders enclosed, but "recomendment" of such discrepancies is as much beyond our insight as it is fortunately out of our province:—

"For underpinning the outer walls of the Beebles Cottage Hospital, and inserting damp-proof course beneath the inner walls:—

Everal, Malvern .....	£225 0 0
Hopson, Beebles .....	168 10 0
Bennett, Norwich .....	97 15 0
Calver, Ringfield (accepted) ...	52 0 0

**SCULPTURE, BLACKFRIARS BRIDGE.**

Sir,—I wonder your correspondent, Mr. Frith [p. 808, ante], should not know why none of the pre-mentioned competitors in the first abortive competition were not asked to compete further. These minutes refer to whose decision the Corporation remitted the matter, duly adjudicated the 1,000l. in premiums according to comparative merit, but they also reported as follows:—"That they were not prepared, in view of the great importance of the work and the high gifts required for its adequate performance, and in view also of the calamitous results of failure, to recommend the execution of any of the designs submitted to them, or the employment of the competing artists in the preparation of other designs with a view to their execution." The report itself may be seen at the Guildhall.

The Corporation gave away the 1,000l. without obtaining any benefit, and they followed the advice of those to whose judgment they referred, namely, Sir F. Leighton, Mr. Calder Marshall, and Mr. G. F. Watts. They are to be commended for so acting.

That the competition was abortive is no reflection on the general body of sculptors. But that is now an old story; and I am sorry to add that the matter is not yet put on a footing which, in my opinion, can lead to a satisfactory result.

With regard to Mr. Caye Thomas's suggestion that an association of sculptors should be inaugurated, I heartily concur. I doubt a little whether these artists as yet see the importance of this, and are prepared to set aside jealousies and pull together for the general good; but though not a sculptor, I would gladly assist if I could, to see this done. In an instance like the present the want of some representative to speak with authority becomes painfully evident.

JAMES EDMESTON.

**NEW ROUTES.**

Sir,—By the *Builder* of Dec. 13 [p. 789], it seems at last settled to have a new road made from Gray's Inn-road to St. John's-street-road to improve the route to the north; but there is also a route, I believe, more directly north, i.e., by Gray's Inn-road and Caledonian-road, if it were not for a very awkward block of buildings which intercepts the junction of Gray's Inn-road with Caledonian-road, and which block induces drivers of vehicles wanting to get into the one from the other of the roads to take a tortuous journey down bye-roads. It seems to me that for a very moderate sum the booking-offices at King's-cross might be readily removed, and a bridge thrown across the railway line, making a proper junction of the two roads. Possibly a little discussion in the *Builder* might lead to the much-required alteration being carried out.

H. E. BALL.

P.S.—I believe it would save omnibuses, &c., travelling from Holloway to Holborn, or vice versa, fifteen to twenty minutes' time.

**FIRE-BARS.**

Sir,—We have an ordinary kitchen, in which the top fire-bar every two or three weeks completely doubles up (formerly they used to last three months), and constantly has to be replaced by a new one. Will you, or any of your numerous correspondents, be kind enough to tell me if there are any means of averting the above?

AN OLD SUBSCRIBER.

**WATER STORAGE.**

Sir,—I have read with interest the articles that have appeared lately in the *Builder* advocating water storage. In your issue for the 30th of August last [p. 281], you advise a slate tank or some other material. I think the following plan would be far cheaper (and cost is often a great consideration) and trustworthy. Where the soil is suitable, excavate a circular well, the diameter and depth according to circumstances; coat the surface with two of sand to one of cement; the next coat half and half, and the last coat finished in neat cement; turn an arch over, and leave a manhole, and then you would have a tank that would hold thousands of gallons, as sound as a china basin, and much cheaper than any other method. It is as well to get water into it as soon as possible after it is finished.

E. P.

**PROVINCIAL NEWS.**

**Haverhill (Suffolk).**—We learn that a scheme, prepared by Messrs. Smith & Austin, C.E., for disposing of the sewage of the town of Haverhill, and removing the difficulties at present obtaining with certain riparian owners, has been adopted by the Local Board.

**Liverpool.**—A temporary home for lost and starving dogs has been erected within the grounds of the Liverpool Zoological Gardens Company. The kennels,—eight in number,—form a semi-circle. They are built of red sandstone, and roofed with red tiles. Each kennel, which will comfortably hold from a dozen to sixteen dogs, has a spacious area in front of it, with a concrete flooring. The internal arrangements of the kennels are well suited to the purpose for which they are designed. The floors, like those of the yards, are formed of concrete, and the beds are raised a few inches above them. These beds are composed of soft thin shavings, which are considered the best material both from a health and warmth point of view. A sliding board keeps the beds from being scattered about the floor, and can be readily lifted up and the whole of the shavings removed when it is needful to renew them with a fresh supply. In the wall of each of these "dormitories" is an iron ventilator which can be opened or closed at will, and which gives the needful supply of fresh air when it is necessary to keep the doors closed. There is an aperture, which can also be closed when required, in each of the doors, which enables the canine inmates to frisk in and out without having the

larger door open. Messrs. Sugden, of Leek were the architects.

**Exeter.**—On the 4th inst. the additions to Mr. Harry Hems's business premises in Longbrook-street, Exeter, were opened. They have been erected from plans by Mr. R. Modley-Fulford.

**The Student's Column.**

**A SECOND PERSPECTIVE LESSON.**

IN a previous article (p. 443, ante) the first principles of drawing in perspective were illustrated by the appearance of a small object, a match-box, as seen through and drawn upon a sheet of glass employed as a picture plane.

The chief use, however, of perspective to an architect is to ascertain what his buildings will look like while, as yet, they only exist on paper.

These buildings are, of course, drawn much smaller than their actual size (fig. 1), and so far, they differ from the match-box, which was itself supposed to be laid down on the sheet of paper and its appearance drawn on the glass.

The only corresponding difference to be observed is that the spectator must suppose himself to be reduced to the same scale as his design, and that his Lilliputian eye is,—let us say,—3 in. above the sheet of paper representing the ground level, supposing his design to be drawn to  $\frac{1}{2}$  in. scale.

He will now take the kindness to place his reduced self at the station point (S. P.) (fig. 2), and, looking straight before him, to mark on the sheet of paper from his feet two lines, embracing an angle of 30° (15° on each side, which will give him the extreme visual rays of the perspective.

He will then use his judgment, in accordance with the principles laid down in the former article, as to the size that he prefers for his perspective view, by fixing the relative positions to his eye (S. P.), the picture plane and the object.

He will, moreover, turn his plan about until he is satisfied that the various features, such as the gables and chimneys, form the best possible grouping, avoiding, of course, any impossible view of his intended building.

Should his building be intended for a narrow street, he will embrace a slightly wider angle of vision than 30°, otherwise he will find that his view only takes in a portion of his building.

He will also find in the result that buildings have to be specially designed to look well in narrow streets, and that the pleasing outline of a distant homestead is "nowhere" in a town; while a slice out of a Chester row would be equally unhappy-looking if perched on a hill-side in the country.

Moreover, an elevated or depressed position must be equally calculated for, and this question, of course, determines the level of the eye and of the horizontal line.

In some cases it is desirable for the designer to "wish he were a bird," so as to obtain an idea of a large group of buildings as seen in a bird's-eye view. This may seem a complicated proceeding, but the writer has hit upon a very simple method of treating it, which may be illustrated, if asked for, in a future article.

Having now settled the relative positions of eye, picture plane, and object, he has simply to proceed as before described, with this difference,—that, instead of handling a match-box, he will handle a pair of dividers, and will measure with them the various heights from the elevations that he has prepared, and transfer these to their respective lines of height.

It is often desirable to make the picture plane touch one angle of the plan of the building, and thus save the trouble of bringing lines forward merely to carry them back again.

On the other hand, it is false economy of trouble to work too much off one line of heights by carrying lines around the building.

On the diagram (fig. 2), the left-hand side of the plan, A B, has been brought forward to the picture plane at L H. It has then been carried back to that angle, and thence returned across the face of the gable from the left-hand vanishing point. A separate line of heights, found from this vanishing point, has been used for the side wall of the right-hand gable, C D.

In finding this left-hand vanishing point, according to the rules laid down, it will be found to be a long way off,—measuring always

Fig. 1.

Fig. 2.

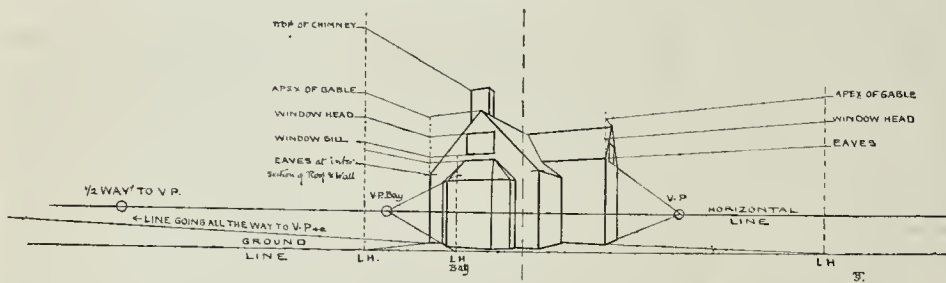

Fig. 3.

from the central visual ray. It might be a process involving severe gymnastic exercises on the part of the draughtsman, and is simplified by dividing the distance between the station point and the picture plane into any convenient number,—on the diagram it is divided into two.

Any one conversant with Euclid will see that a point will be found at half the required distance along the picture plane, which half distance has simply to be doubled on the horizontal line in order to find the real vanishing point.

The great thing in perspective drawing is accuracy, and the avoidance of confusion.

Plans of the building at various heights have to be laid down, and corresponding visual rays drawn from them. On the diagram, the roof plan is distinguished by thin lines, and the visual rays therefrom are dotted.

In practice, it is better to use different colours for the various planes and their rays, and, instead of crowding the picture plane with rays (many of which will overlap each other), to use separate slips of paper pinned down against the picture plane, taking care to mark on each the central visual ray first of all.

Before committing himself too far, the draughtsman should get the general block of the building into perspective to make sure of its grouping well.

Finally, if it be asked whether the view will be the same as would be seen by a man of ordinary stature, without the necessity of shrivelling himself down to one-eighth scale, or one-ninety-sixth of his actual size, the answer is, Yes; and that he has only to follow out the directions given in the previous article in order

to prove this. That is to say, if the house were actually built, and he wished to make a sketch of it to the size here described, he would have to retire from it so as to increase the distance between the object (the house) and the picture plane (his sketch-book), until the latter, held at arm's length, contains the appearance of the house to the required size.

All the other processes then fall into their places, but, instead of being set out to one sixteenth-inch scale, they are found at their actual distances on the picture plane, and present no special difficulties as regards the vanishing points. The lines of heights would, of course, be impracticable, as they imply a sheet of paper as high as the house, but, with a little ingenuity, even this part of the rules could be applied to the process.

CHURCH BUILDING NEWS.

**Holloway.**—On Saturday last, the 13th inst., the new Church of Emanuel, Hornsey-road, Holloway, was consecrated by the Bishop of London. The church is seated partly with benches and partly with chairs, and holds nearly 1,000 persons. On plan the building consists of nave and chancel, north and south aisles, baptistery, and vestries for clergy and choir. The style of architecture adopted is First Pointed, carried out almost entirely in red brick, no stone being used externally, except for the ornamental niche on the entrance elevation, which is executed in red Cornehill stone. Internally, Bath stone is employed for shafts, caps, bases, corbels, and the chancel arch; the remaining arches, labels, and string courses being entirely of moulded red bricks, made to the architects' full-size details by Mr. James Brown. The works have been carried out by the builders, Messrs. Taylor & Crist, of Aylesham, from the designs of the joint-architects, Mr. Frederic R. Farrow and Mr. E. Swifton Innes, F.R.I.B.A., of 32, Craven-street, Strand, W.C. The whole of the footways of the church are laid with mosaic by Messrs. Diespeker & Co. Especial care has been bestowed by the architects upon the design of the wrought-iron hinges, finials, railings, and gas-fittings, which have been executed by Mr. W. R. Shrivell and Mr. W. Downing. The heating is effected by high-pressure hot-water pipes supplied by Mr. R. Renton Cihbs, and a system of ventilation has been devised by the architects based upon the natural means of temperature-difference, and assisted by one of Boyle's extractors. We are informed that the acoustic arrangements of the church are based upon some recent investigations in a new direction by Mr. F. B. Farrow, and they are stated to be very successful.

**Esher.**—The monument erected in Esher Church to the memory of the late Duke of Albany is of choice selected alabaster, richly and delicately carved. It was designed by Mr. Blomfield, and has been executed by Messrs. Earp, Son, & Hobbs, the marble bust being the work of Mr. Williamson of Esher.

**Bromley (Kent).**—Bromley Church has just been enlarged by the addition of a new chancel, south chancel aisle, and a vestry with an organ chamber above it on the north side, from the designs of Mr. T. G. Jackson, architect, at an expense of nearly 4,000*l.* Of the mediæval church at Bromley there are but few remains. During the last two centuries there appear to have been at least three tolerably complete remodellings of the building. In the last century it seems to have been either rebuilt in red brick, or so remodelled in that material as to have retained but few features of the mediæval building. About fifty-two years ago the body of the church seems to have been again practically rebuilt, and about ten years ago it was re-seated, the galleries were new fronted if not reconstructed, and other alterations took place. Fortunately, the fine old fifteenth-century tower has survived these three successive attacks, which have proved fatal to the body of the church. Of the mediæval building nothing else now remains but the Parbeck howl of the font (which, from the analogy of that at Merstham in Surrey, appears to be a work of the end of the twelfth century), a fragment of a fourteenth-century oak door, and a very interesting but incomplete arched recess, which, after being removed from the north wall of the old chancel to the south side of the vestry, was fixed in the east wall of the church, and has now been placed in the north side of the new chancel, where it serves as a credence. This dates from the latter part of the thirteenth century. The west wall of the fifteenth-century nave also remains, with the ruins of a late three-light flat arched window, and it is possible that the fabric of the south wall of the church may be old, though all the windows and doors are quite modern. With these exceptions, and that of some monuments, the church contained absolutely nothing of the slightest architectural or antiquarian interest. The fabric of 1829, so far as concerns the arcade and galleries, is so slight as to convey the impression of insecurity, the slender columns themselves being still further reduced in substance by having the back member cut away to leave room for the introduction of an iron prop to the gallery, which forms in appearance part of the clustered shaft. Nothing can well be worse, either in

construction or in design, and there can be little doubt that before many years the parish will find itself called upon to replace the interior work of the nave by a more substantial structure. The new work is of brick, faced with flints and dressings of Douling stone externally, and all the internal architectural features are in white chalk. All the old monuments have been carefully preserved and refixed chiefly in the new building, to which they add an historic interest and a picturesqueness often absent from new churches. The builder was Mr. Balding, of Bromley, and the clerk of works Mr. Bentley. The heating is by Messrs. Haden & Sons, and the carving by Messrs. Farmer & Brindley. **St. Leonard-on-Sea.**—Christ Church, built in 1875 from the designs of Mr. A. W. Blomfield, has now been consecrated, a special interest attaching to the occasion being the erection of the new pulpit of elaborate design by Mr. Blomfield. The lower portion is hexagonal, supported by marble columns, and the upper parts circular, divided into five arches, each containing the sculptures respectively of Noah preaching (the Ark building in the background), the preaching of John the Baptist, the Sermon on the Mount, St. Peter preaching at Mars Hill, and St. Paul preaching at Athens. These are executed in white alabaster, the arches and crocketed buttresses dividing them, as also the pulpit, generally being of yellow Mansfield limestone. The work has been done by Messrs. Earp, Son, & Hobbs, of London and Manchester, who also executed the carving throughout the church at the time of its erection.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

3,036, Improved Chimney Pot. T. Anwyll.

For the cure of smoky chimneys a chimney-pot, with louvres, is here devised. The top of the chimney-pot is closed, and inside the louvre portion vertical partitions are placed at right angles, so that whichever way the wind is blowing there is always free egress for the smoke. Any direct currents of air which may strike against the pot will first strike on the louvres, and if they enter the pot will be forced to take an upward direction, and will strike against the partitions, and be deflected back through the louvres. The closed top assists this outward course of any currents of air which enter the pot, and prevents the wind blowing directly down the chimney. When the wind blows on one side of the partitions, the chambers or flues on the opposite side will be free for the egress of smoke, which to a certain extent will be drawn or sucked out by the laterally deflected currents of air.

2,817, Improved Imitation Marble. A. Gaattari.

Gypsum articles or carved or sculptured objects are immersed for some length of time in a hot preparation of bitumen. During this operation the dehydration of the material is accomplished, and the bitumen not only penetrates the mass, but fills all the pores and spaces left by the water which was contained in the material treated. A hard and compact mass, which takes a brilliant black polish, is formed. Gypsum is also treated in the rough mass, and pulverised gypsum or marmorite may be similarly impregnated with bitumen.

2,404, Improved Cows. C. F. Harrington.

This improved arrangement of cows for ventilating purposes is an extension of an idea patented by the same applicant, where cows are used in the ventilation of sewers. In the adaptation, self-revolving cows, trapped, with upcast shafts, on which they revolve, are used, and the shafts are made with wickerwork, lined inside, and coated outside with cement or brick tiles. The shafts are arranged to ventilate and convey fresh air to the sewers. A similar arrangement is by this patent adapted for other places requiring ventilation. The cows are formed swan necked in shape, to combine the acting and re-acting force of the wind. The cows are trapped at their connexion with the shafts by means of oil in a suit-ble receptacle. The shafts are easily affixed to ceilings, and, from the greater size of which this form of construction allows, much greater volume of fresh air is allowed to enter the hall, apartment, or cabin to be ventilated.

2,578, Ventilating Ridge Tiles. S. Turner.

A ridge tile is made with passages for ventilation under the eave or ridge of the tile.

3,274, Water-closets. S. A. Adams.

Refers to flushing out the trap of a water-closet. To effect this a branch pipe is connected from the supply to the basin, so that the trap is flushed out every time water is admitted to the basin.

3,739, Oil-cans. J. Lucas.

In the description of oil-cans where oil is ejected by collapsible sides, the shape of the sides is pre-

served by inserting in the body of the can a spiral spring.

APPLICATIONS FOR LETTERS PATENT.

Dec. 5.—15,978, R. Cotterell, Decorative Surfaces.—15,984, J. Jenkies, Fire-grates, &c.—15,993, A. Grady and L. Matzak, Apparatus for Preventing the Slamming of Doors.—16,000, H. J. Alison, Manufacture of Artificial Stone.—16,023, T. Durran, Traps for Sinks, Basins, &c.

Dec. 6.—16,041, J. Gowans, Improvements in Cisterns.—16,057, J. Rhodes, Cupboard Door Turns.—16,066, C. Clarke and A. E. Parsons, Improvements in Sash Fasteners.—16,068, B. Purnor, Door Springs.—16,076, J. B. Petter, Improvements in Chimney Pops.

Dec. 8.—16,097, J. W. Saunders, D. T. Davies, and J. A. Macdonald, Improvements in Sash Fasteners.—16,114, E. Wretzer, Improvements in Brick Presses.—16,134, G. E. Eachus and P. A. Maigne, Ventilating Sewers, &c.—16,145, E. W. Astle, Heating Buildings.—16,154, J. Ball, J. H. Rawson, and F. R. Rawson, Manufacture of Chisels, Gouges, and Augers.—16,163, J. H. R. Dinsmore, Band-saw Machines.—16,164, J. Brown and T. A. Porter, Apparatus for Climbing Chimneys.—16,167, A. C. Killings, and A. D. Middleton, Water-closet Fixings.—16,177, F. Mankly, Ornamental Woodwork and Process of Producing same.—16,187, G. F. Williams and W. C. Horne, Luminous Letters and Signs.

Dec. 10.—16,209, C. L. Baker, Elastic Driving Band.—16,214, T. G. Dooning, Open Fireplaces for Heating and Ventilating Apartments.—16,222, F. McIlvenna, Standards for Shop Windows.—16,223, C. C. A. Krigg, Fixing Iron Rain-water and Soil Pipes.—16,229, J. Rothins, Manufacture of Cements or Compositions.—16,251, E. Brady, Substitute for Wood, Iron, or Stone.—16,255, A. H. Cowles, Machinery for Excavating Earth.—16,258, H. Wainwright, Supplying Water to Water-closets, &c.—Dec. 13.—16,278, R. H. Griffin, Securing Wood against Bench Stop while being Worked or Planed.—16,283, E. Verity, J. M. Verity, and B. Banks, Apparatus for Opening, Closing, Slaying, or Securing Windows, Skylights, Ventilators, &c.—16,290, T. Jones, Supporting the Roofs of Buildings.—16,311, E. E. Searle, Decorating Glass.

PROVISIONAL SPECIFICATIONS ACCEPTED.

5,396, T. Thornton, Flooring Cramps.—8,124, G. J. C. Marie, Cleansing the Outside of Buildings, &c.—13,713, E. Preston, Improvements in Plates, Spoke-baves, &c.—13,824, E. Grisch, Manufacture of Mosaic Ornamental Designs or Patterns.—14,310, F. Candy, Manufacture of Bricks, Architectural Blocks, and Enamelled Ornaments used in Building Construction.—14,319, E. G. Baum, Ventilating Apparatus.—14,614, W. Cortese, Opening and Closing Windows.—14,806, T. R. Water, Flushing Apparatus for Water-closets.—15,255, A. K. F. Grinch and H. M. C. Linger, Kitcheneers.—15,503, J. M. Bryden, Automatic Sash Fastener and Lifter.—1,588, J. Hummerston, Locking Catch for Bolts, Window Fasteners, &c.—14,977, K. A. Stoffert, Improvements in Girders.—15,464, J. G. Lorrain, Ventilation.—15,665, J. J. C. Davis, Wood Pavements.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.  
942, R. Wadsworth and S. Wadsworth, Tipping Wagons and Carts.—3,693, G. R. Crow, W. H. Crow, Planning, Shaping, and Slitting Machine.—3,694, F. W. Lingen, Waste and Soil Pipes.—3,461, W. A. Carlyle, Metal Rollers for Wall-paper Printing.—4,866, A. G. Garrod, Ventilating Sash Fastener.—14,482, J. Pease, Wood-planing Machine.—1,520, B. Haigh, Water-waste Preventers.—2,777, W. Monbony, Improvements in Wall Dies.—3,994, G. Dillway and E. Newman, Furnaces for Bakers' Ovens.—3,927, W. Hayhurst, Holdfasts for Carpenters, Joiners, Cabinet-makers, Wheelwrights, &c.—3,945, E. Robinson, Ventilating Rooms, Passages, and Buildings.—4,047, C. Lawr-uce, Smoke Extractors or Ventilators.—10,221, R. Mason, Window Frames and Sashes.—10,301, G. Skindler, Supplying Disinfectants to Water-closets, Drains, &c.—10,434, G. H. Brown and A. Brown, Domestic Fireplaces.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.	
DECEMBER 11.	
By HARDS, VAUGHAN, & JENKINSON.	
Rotherhithe—38, Derrick-street, Freehold .....	£235
Lewisham—9, St. Stephen's-road, 78 years, ground-rent 4 <i>l.</i> .....	260
New-cross—19 and 21, Vance-street, 83 years, ground-rent 6 <i>l.</i> 6 <i>s.</i> .....	320
DECEMBER 12.	
By FRANK LEWIS & CO.	
Stoke Newington—3, Shackwell-lane, 88 years, ground-rent 6 <i>l.</i> 10 <i>s.</i> .....	410
Tottenham—22, Lockship-lane, Freehold .....	610
The reversion to one-sixth share of railway stocks valued at 8,000 <i>l.</i> , life aged 54 .....	450

DECEMBER 15.	
By EDWARD MULLARD.	
Holloway—George's-road, ground-rent of 13 <i>l.</i> , reversion in 88 years .....	280
Wellington-square—Ground-rents of 32 <i>l.</i> 10 <i>s.</i> , part freehold and part leasehold .....	700
Grace-street—Ground-rents of 32 <i>l.</i> 10 <i>s.</i> , ditto .....	700
Surrey, Kent, and Herts—Rent charges of 6 <i>l.</i> a year .....	102

By COLLIER & BOWDITCH.

Greenwich—Bridge-street, the Beehive Public-house and house adjoining, freehold ..... £1,550

Croydon—23, Union-street, freehold ..... 80

Canterbury—Dane John Farm and 5a. 1r. 2lp. freehold ..... 1,620

By HORACE DOVE.

Enfield—1 and 2, Glasstone-villas, freehold ..... 945

By WAGSTAFF & WARMAN.

Barnsbury—14, Edward-street, freehold ..... 275

Kingsland—18-32, even, Ormsby-street, 7 years, ground-rent 25l. 12s. .... 470

By CRISPEY, MOORE, & HOLLEROSKE.

Gower-street, W.C.—No. 59, freehold ..... 2,100

By F. J. BISHOP.

Walworth—37, Dean's-buildings, 80 years, ground-rent 8l. 10s. .... 420

Rotherhithe—3, Princes-street, freehold ..... 315

63 and 65, Hawkstone-road, 66 years, ground-rent 2l. .... 450

DECEMBER 16.

By A. BOOTH.

Nos. 138 and 142, term 56 years, ground-rent 34l. .... 1,710

By G. A. WILKINSON.

625 "A" Seven per cent. Shares of 20l. each in the Brighton and Hove General Gas Company ..... 16,576

MEETINGS.

MONDAY, DECEMBER 22.  
Inventors' Institute.—8 p.m.

TUESDAY, DECEMBER 23.  
Institution of Civil Engineers.—Annual meeting. 8 p.m.

THURSDAY, DECEMBER 27.  
Royal Institution.—Professor Lyndall on "The Sources of Electricity."

Miscellaneous.

**Hand Guide to Southwell Cathedral.**—A penny guide book to the grand church which now ranks as a cathedral has been brought out by Miss Glaister, of Southwell, whose name is favourably known in connection both with decorative art (as the authoress of the book on "Art Needlework," in Macmillan's series), and with literature in the wider sense. The "Hand Guide to Southwell Cathedral" makes no attempt at literary form, however, but simply gives, in the briefest manner, information which appears to be correct upon the date and history, and various portions of the building. A word more of explanation for the uninitiated visitor might have been as well here and there. For instance, Miss Glaister angles uses "quadripartite" into "four-part" vaulting, but the shorter term probably conveys no more information to a casual visitor. For the same reason it would have been as well, in mentioning the panelling of the north door "carved out of the solid," to remark how very unusual a proceeding this is. These points may be attended to in a second edition, perhaps.

**A Memorial of Dr. Johnson.**—Some years ago a good old house was pulled down in the Old-square, Birmingham, in forming the new street called Corporation-street. In that house the great doctor lived for some time, when a young man, with his old school-fellow, Edmund Hector, who practised there as a surgeon for many years. The house had been already marked by a memorial tablet, put up with the owner's leave, by the members of "Our Shakespeare Club of Birmingham," in 1865. When the house was pulled down, in order to preserve the commemoration of Dr. Johnson, the wainscoting and appointments of one particular room were removed and presented by the Improvement Committee to the Archaeological Section of the Midland Institute. These have been conveyed to Aston Hall, and one room on the ground-floor has been fitted up with them under the direction of Mr. J. A. Cossins, architect, in which have been placed the memorial-stone taken from the front of the old house, and one portrait of Johnson and another of Hector. Saturday last being the centenary of Johnson's death, the ceremony was gone through of presenting these memorials to the Mayor of Birmingham, who received them on behalf of the town.

**Proposed Public Improvement in Lambeth.**—At a recent meeting of the Lambeth Vestry Mr. George Hill called attention to the bad state of the enclosed piece of ground in Palace-road, belonging to St. Thomas's Hospital, and moved that a deputation should be appointed to wait upon the Treasurer of the Hospital with the object of having the nuisance abated or abolished, and also to ascertain upon what terms the Governors would be prepared to surrender the land to the parish to be preserved as an open space. He said that the space at present only seemed to afford a hoarding for advertisements. The space was 3,000 superficial feet in extent, and, in proportion to the whole of their site, had cost the hospital authorities 5,000l. There had been applications to build on the land, but the parties had not been able to come to terms. It would be a great improvement if the land could be secured and maintained as an open space. The motion was seconded by Mr. Schmidt, and a deputation of six members, including the rector, was appointed to wait upon the hospital authorities.

**Stanhope Patent Water Purifier.**—This is an automatic purifier, the main value of which, if it carries out its professions, will probably be in preparing hard water for more effective use in washing processes, and for use in boilers without incrustation. The patentees go further, and state that by its means refuse water from factories, &c., can be purified before passing into streams. That is a much larger matter, and we must know something about the principle and method of action before expressing any opinion on its possible usefulness in that manner. The circular sent to us gives not the slightest information on this head.

**The Ventnor Local Board,** at a meeting held on the 15th inst., resolved to give their surveyor (Mr. R. S. Scott, C.E.) an honorarium of 100l., in recognition of the special services rendered by him while acting as engineer for a Bill which passed through Parliament last session, empowering the Local Board to construct a new promenade pier, roads, and other town improvements.

**A Miniature Memorandum Book.**—Messrs. Crosby Lockwood & Co. send us a memorandum-book of practical details, tables, and calculated results for mechanics, engineers, architects, builders, and surveyors, which contains a great deal of information compressed into a book which will literally go in the waistcoat pocket.

**Architectural Partnership.**—Mr. T. Chatfield Clarke, F.R.I.B.A., whose name has been so long known in the profession, will take into partnership, from the 1st of January next, his son, Mr. Howard Chatfield Clarke, and the style and title of the office from that date will be T. Chatfield Clarke & Son.

**Birmingham.**—It is announced that it is present a new clock and bell to be fixed in the clock-tower of the new art-gallery in Birmingham, at a cost of about 1,000l. The new clock will have four dials, each some 12 ft. diameter.

**The Municipal Records of Bath,** from Richard I. to Elizabeth, are being prepared for publication under the editorship of Mr. Austin J. King and Benjamin V. Watts. The work will be published shortly by Mr. Elliot Stock.

**Manchester Association of Employers and Foremen.**—The annual general meeting of the members of the above Association was held on Saturday at the Mechanics' Institute, Manchester, Mr. Thomas Ashbury, C.E., the President, in the chair. There was a good attendance, and eight new members were elected. The retiring president, in reviewing the period during which he had occupied the chair stated that the Association had made remarkable progress during the past two years, the number of members having increased forty-two per cent. The members admitted during the past two or three years were connected with firms employing no fewer than 50,000 skilled workmen, and the Association had now in hand accumulated savings amounting to 2,600l. Mr. Ashbury further added that Mr. William Mather had proposed to bring before the members the subject of technical education with the view of having this question thoroughly discussed by the members. On the motion of Mr. John Horsley, the retiring vice-president, seconded by Mr. Rawlinson, Mr. Alderman W. H. Bailey (W. H. Bailey & Co., Salford) was unanimously elected President for the ensuing year. Mr. Bailey, in thanking the members, said the society was composed of the most important firms in the engineering trades of Lancashire, and there was probably no similar association in the kingdom whose members employed more energy in connexion with steam engines. It was also one of the most important technical societies in the kingdom, and its papers had for years been conferring on the members what might be considered high-class technical education.

**Thames Valley Drainage.**—The Local Government Board inquiry before Mr. J. Thornhill Harrison, C.E., as to the proposed dissolution of the Lower Thames Valley Main Sewerage Board, or the separating from it of some of the constituent authorities, was continued at Kingston-on-Thames on Saturday. It was now stated on behalf of the Richmond Rural Sanitary Authority that that body did not desire the dissolution of the Joint Board or separation from it; and, further, that they were opposed to the proposed union of the urban and rural authorities in the matter of an independent scheme of sewage disposal for the five parishes comprised within the Richmond Poor Law Union. Mr. Michael, Q.C., the representative of the Ecclesiastical Commissioners, then addressed the Inspector in opposition to the various applications of authorities seeking separation from the Joint Board, whose action he defended. He severely criticised the decision of the Select Committee of the House of Commons upon the occasion of the Board's recent application for a provisional order to carry out the Mortlake scheme of Messrs. Mansergh and Melliss. He opposed the scheme of Messrs. Gots & Beesley for bringing the sewage of Richmond district to Barnes upon land belonging to the Ecclesiastical Commissioners, and called evidence in condemnation of the proposal. A number of witnesses were examined in opposition to the Richmond case.

**The Royal Exchange Assurance Company's Offices in Pall Mall.**—Adjoining the Junior Carlton Club, in Pall Mall, the Royal Exchange Assurance Company are erecting new offices. The buildings have two frontages, one in Pall Mall and the other in St. James's-square. The Pall Mall frontage is 70 ft. in height, the elevation being faced with Mansfield stone, richly carved. The ground story, which will contain the principal business offices of the company, is upwards of 20 ft. in height. This portion of the elevation contains several full-length sculptured figures, the models for which were furnished by Mr. Boehm. There are three main upper floors, having two-light millioned windows, between which are elaborately-carved columns and shafts with similar columns at each side of the frontage. The St. James's-square elevation, in its general character, resembles that in Pall Mall. Mr. G. Aitchison, of Harley-street, is the architect, and Mr. Woodward, of Wilson-street, Finsbury, is the contractor.

**The Timber Supplies of Great Britain.**—Mr. P. L. Simmonds read a paper on "Present and Prospective Sources of the Timber Supplies of Great Britain" at the meeting of the Society of Arts on Wednesday evening. We may return to the subject.

**Moulded Bricks.**—Messrs. Barber send us their illustrated catalogue of brick sections for mouldings, made by them at Mead Lodge Brick Works.

The Tooting Springs and the Southwark and Vauxhall Water Company.—A few weeks ago we referred to the deep well which the Southwark and Vauxhall Water Company are sinking at Streatham, which it was alleged was causing serious injury to the inhabitants of Tooting by draining upwards of one hundred private springs and wells, from which the residents in Tooting are largely supplied. At a public meeting of the inhabitants a committee was appointed to take the matter into consideration, and this committee presented its report at an adjourned meeting held in the vestry-hall, at Tooting, on Monday night, when it transpired that the opinion of the Solicitor-General had been taken on the question, and that it was adverse to the inhabitants. The Solicitor-General observes:—

"The case is undoubtedly a very hard one, but I am unable to see my way to suggest any legal remedy as open to the inhabitants of Tooting or the owners of the wells. At common law there is no right as to percolating water, and any person may pump on his own land, and collect and carry away the percolating water, even though by so doing he should dry his neighbour's wells. I think the Act of water companies which empowers them on their lands to sink wells and erect pumps certainly does not diminish their common law right, or entitle those who may be injured by the exercise of them to compensation. If the attention of the Legislature had been called to the matter they might, not improbably, have inserted some provision for the protection of the adjoining well-owners, as the water companies are, of course, likely to do far more than individuals would be to the prejudice of neighbouring well-owners. I fear that all that is open to the inhabitants is either an appeal to the Legislature, or by sinking deeper wells, and adding pumping apparatus, to compete with the water for their course. I am fully conscious how little either of these courses is likely to do for them, and I regret that I can suggest nothing better."

In answer to a further question, the Solicitor-General says he thinks that if the water company may legally pump the water they may legally sell it.

Large Sale of Building Land at Lewisham.—On Monday evening, Mr. Richard J. Collier, of Finsbury-pavement, conducted an extensive sale of building sites at Lewisham. The property consisted of the first portion of the Priory Estate, containing about 18 acres, with frontages to the Lewisham High-road and several new roads which have been laid out on the estate. The sale was held at the Plough Hotel, where there was a very large attendance of capitalists and others connected with the building trade. The number of lots advertised was fifty-one, the whole of them being sold, and, in consequence of a request by the company present that a further portion of the estate should be offered, the auctioneer consented to submit thirty-two additional lots, all of which were sold. One lot, having a frontage to Lewisham High-road of 23 ft., with a depth of 130 ft., was sold for 2571. The smaller lots, having frontages of 20 ft. and a depth of 100 ft., realised prices averaging from 651. to 701. each. One of the stipulations is that the minimum value of the houses to be erected on the estate is 3000, whilst those having frontages to the high road are not to be of less value than 4000. Since the sale we understand that twenty-four more lots have been sold by private treaty bringing the total proceeds of the sale up to 6,500.

Royal Meteorological Society.—At the usual monthly meeting of this Society, held on Wednesday evening last at the Institution of Civil Engineers, Mr. R. H. Scott, F.R.S., president, in the chair, Mr. Charles Harding read a paper on "The Diversity of Scales for Registering the Force of Wind." The object of this paper was to call attention to the confusion that exists in the systems in use by various countries for registering wind force, whether instrumentally or otherwise, and to show the need of action for improvement.

Middlesex Hospital.—In the account of the new works here which appeared in our last number (p. 807), it should have been mentioned that Messrs. Strode & Co., of Osnauburg-street, did the whole of the gasfitting. In the same building the engineering work in connexion with the fire hydrants and system of fire extinguishing has been done by Messrs. Merryweather & Sons.

Fire-Resisting Doors.—The Council of the Society of Arts have awarded to Messrs. Chubb & Son the Gold Medal offered by the Society, under the Pothergill Trust, for the best exhibit in Class 27 of the International Health Exhibition. The exhibit referred to consisted of Chubb's patent fire-resisting doors.

The New-street Station Extension, Birmingham.—The works here are fast approaching completion, and in celebration of the event a dinner was held on Saturday evening, the 6th inst., at the Old Ring of Bells Tavern, Yardley, at which the various officials and sub-contractors were present, representing Messrs. Nelson & Co. The London and North-Western Railway Company, Messrs. Horton & Son (ironwork contractors), Messrs. Lander & Co. (timber work), Messrs. Braithwaite & Co. (glazing), and representative of various other trades.

Mr. R. J. Crocker, builder, of Bristol, died after an attack of paralysis at his residence, Southville, Bedminster, on the 12th inst. The deceased was a member of the Town Council for the East Ward, Bedminster, and was also a member of the Sanitary Committee of Bristol, and vice-chairman of the Bedminster Board of Guardians. The funeral took place on Tuesday, at Arno's Vale Cemetery, in the presence of a numerous company of prominent citizens. The estate in which Mr. Crocker was held by his workman was shown by their attendance at the funeral in large numbers.

COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS. Epitome of Advertisements in this Number.

COMPETITIONS.

Table with 5 columns: Nature of Work, By whom required, Premium, Designs to be delivered, Page. Includes entries for Vestry Hall Buildings and Street Improvements.

CONTRACTS.

Table with 5 columns: Nature of Work, or Materials, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, Page. Includes various construction and engineering contracts.

PUBLIC APPOINTMENTS.

Table with 5 columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in, Page. Lists public appointments such as Chief Accountant and Civil Engineer.

TENDERS.

Table listing tenders for Metropolitan Free Hospital, Kingsland-road, including quantities and prices for various materials and labor.

Table listing tenders for York-buildings Board School, for the Southampton School Board, including names and amounts.

Table listing tenders for lodge, coach-house, and stabling, at Highfield, Forthbridge, for the Executors of the late Mr. J. R. Neave, Mr. Fred Bath, architect.

Table listing tenders for draining, making walls, building boundary walls, and fixing piazas, iron fencing, and gates, for the Wimbury Burial Board, Middlesex.

Table listing tenders for the erection of the Museum and Schools of Science and Art, Chester, Mr. Thomas M. Lockwood, architect.

Table listing tenders for pulling down and rebuilding the Sir Sydney Smith, Chester-street, Kennington-road, for Mr. Calvey, Mr. Geo. Treacher, architect, 23, Carter-lane, City.

Table listing tenders for the construction of new street and the drainage of building land, Copse-street, Coventry. Mr. Horbert W. Chatsway, surveyor, Trinity Churchyard, Coventry.

For making two new roads, laying sewers and drains, constructing flushing tank, concrete retaining walls, &c., on the Grove House Estate, Windsor, for Messrs. Bolton & Co. Temple. Mr. T. P. H. Davison, engineer:—

SPECIAL NOTICE.—Lists of Tenders for insertion in our issue must reach us not later than 4 p.m. on TUESDAY NEXT, Dec. 23.

TO CORRESPONDENTS.

M. & L. (we will publish it in the course of two or three weeks)—Priority (711,7874)—H. & R.—A. H.—H. A. (you are altogether at sea in your bibliography; there is no such word as "crucia"; the plural is "crucis"—J. H. (next week).

All statements of facts lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications.

Letters or communications beyond mere notices which have been duplicated for other journals, are NOT DESIRED.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

Christmas Week.—The BUILDER for the week ending December 27th will be published on Wednesday, 24th inst., at the usual hour.

Advertisements for insertion in that issue must, therefore, reach the Office before Three o'clock P.M. on Tuesday, 23rd inst.

ALTERATIONS IN STANDING ADVERTISEMENTS, or ORDERS TO DISCONTINUE SAME, cannot be attended to if received after 12 (noon), on Monday, 22nd.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.

Each additional line (about ten words) ..... 0s. 6d.

Terms for Series of Frees advertisements also for Special Advertisements on front page, Columns, &c., by Auction, &c., may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.

Each additional line (about ten words) ..... 0s. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY.

\* \* \* \* \* Stamps need not be sent, but all small sums should be sent by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURKINER, Publisher, Addressed to No. 46, Catherine-street, W.O.

Advertisements for the current week a issue must reach the Office before THREE o'clock P.M. ON THE MONDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c., left at the Office reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

PERSONS Advertising in "The Builder," may have Replies addressed free of charge, 46, Catherine-street, Covent-garden, W.C. Envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied gratis from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum. Remittance payable to DOUGLAS FOURKINER, Publisher No. 46, Catherine-street, W.C.

Best Bath Stone.

WESTWOOD GROUND, Box Ground, Combe Down, Corsham Down, And Farleigh Down.

BANDELL, SAUNDERS, & CO., Limited, Corsham, Wilts. [Advr.]

Dry Corsham Stone. 150,000 FEET CUBE.

PICTOR & SONS, BOX, WILTS. [Advr.]

Doubling Freestone.

The stone from these quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England.

Is of the same crystalline nature as the "helych Stone, but finer in texture, and more suitable for the moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these quarries, and the stone can be applied in large quantities at short notice.

Prices, and every information given, on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, near Ilminster, Somerset. London Agent—Mr. E. WILLIAMS, 10, Craven-street, Strand, W.C. [Advr.]

Doubling Free Stone For prices, &c., address S. & J. STABLE, HAM HILL STONE, Quarry Owners, Stone and Lime Merchants, Stoke - under - Ham, Ilminster. [Advr.]

Asphalte.—The Seyesel and Metallic Lavs Asphalt Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse-floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tin-rooms, and terraces. [Advr.]

Asphalte. Seyssel, Patent Metallic Lava, and White Asphaltes. M. STODART & CO. Office: No. 90, Cannon-street, E.C. [Advr.]

J. L. BACON & CO., MANUFACTURERS OF IMPROVED STEAM AND HOT-WATER APPARATUS, FOR WARMING AND VENTILATING Private Houses, Churches, Schools, Hospitals, Manufactories, Greenhouses, &c. OFFICES AND SHOW-ROOMS:—No. 34, UPPER GLOUCESTER PLACE, DORSET SQUARE, LONDON, N.W. And at DUBLIN, BELFAST, GLASGOW, and NEWCASTLE. Illustrated Pamphlet on "Heating" post free.

# BANNER VENTILATORS.

The Strongest Exhaust Ventilators for all Buildings, Public Halls, Churches, Billiard-Rooms, &c.

## HIGHEST PRIZES at all the most important Exhibitions.

### The Building Movement of the Country.

HE building movement of the country is a subject of no small interest to the architect, as well as to all that great host of industrious persons who are connected with the building trades. We are not so much referring to the numeric increase which is actually taking place in the number of inhabited houses (which is at the rate of upwards of 180 per day, counting only six days in the week), as to the distribution of this activity over the country. As to this, the action of three principal laws results from very extended research as found to be in operation at the present time.

In the first place, the activity of the builder is remarkably concentrated. The growth of towns seems to be, to some extent, a function of their size. Those of less than 10,000 inhabitants (at all events, as far as boroughs are concerned) have hardly grown at all within the last decade. Many of them have actually declined in the number of the inhabited houses that they contain. And all of them, taken together, have not grown on an average as much as one per cent. in ten years.

At the other extremity of the scale (with one or two significant exceptions) the largest towns are also the most rapid in their growth. The urban population is not only double the rural population, but, decade after decade, it more and more preponderates. In London the increase is, at a first glance, somewhat anomalous. In the central area there has been a steady decrease of 5.8 per cent. from 1861 to 1871, and of 7.8 per cent. from 1871 to 1881, taking population as the standard. But, while the ten registration districts which form the central area of London have thus lost 13.4 per cent. of their inhabitants in twenty years, the loss may be, to a great extent, accounted for by the fact that sleeping accommodation has been sacrificed to office accommodation, so that, while the real day and night dwellers have declined, the merely day population has, in a countervailing manner, increased; for, in the outer ring as defined by the Registrar-General, the population has increased by 126.8 per cent. in twenty years. In the area intermediate between these two districts the increase has been at about half that rate, so that the total increase of "Greater London" has been 22.6 per cent. in the last ten years, and 47.8 per cent. in the last twenty, taking, of course, the census years for comparison.

This rapid rate of increase has not been rivalled in either of the six great English towns which, containing upwards of 200,000 inhabitants each, are in all equal to about two-fifths of the population of Greater London. Sheffield, Liverpool, and Bristol, have increased respectively by 18.4, 17.8, and 17.8 per cent. in the decade; Leeds by 16.4, Birmingham by 14.1, and Manchester by only 6.0 per cent. Below these, the sixteen towns containing between 100,000 and 200,000 inhabitants each, show the more rapid average growth of 21.5 per cent. in a decade, treading more closely on the heels of London than do the six first-class provincial cities; and Bradford, the largest of the sixteen, has increased by 25.3 per cent.

The towns containing between 50,000 and 100,000 inhabitants are increasing at the average rate of 17 per cent. Here, however, an element of growth becomes apparent, which is due to the second law, namely, that the increase of the ports and seaboard towns is much more considerable than that of the inland towns.

Thus Great Grimsby has increased by no less than 62.9 per cent. in ten years, Gateshead by 42.9 per cent., Hartlepool by 34.7 per cent., Hull by 29.6 per cent., Swansea by 28.5 per cent., Sunderland by 27.5 per cent., Cardiff by 45 per cent. Nor is the movement confined to great trading ports. Hastings has grown by 43.7 per cent. in ten years, Brighton by 25.1 per cent., Bournemouth by 185 per cent.; and if we took the increase for the decade 1874-1884, the last-named place would probably be found to have more than trebled its population. Thus on the one hand the calls of business, and on the other the attractions of sea air, are steadily diverting an increasing proportion of the population of England to the seaboard towns.

The third law is one to which we have previously called attention. Its operation may, to a certain extent, prove to counteract the aggregative tendency before shown to exist. It is that of direct relation between rateable value and density of population. We have previously shown (vol. xlvii, p. 922) how close this relation is, and attention must be given to the fact that the range of rateable value is very considerable. Thus, while for the whole of London we have a mean rateable value of 52.2*l.* per house, in the Mile End Old Town Union this value is as low as 23.9*l.* per house; while in the City of London proper it rises to 541*l.* per house. It is thus conceivable that rents and rates may rise with the concentration of population, and its increase on a given area, to a point at which the cost of living becomes so excessive as to arrest further growth, if not to cause decline to set in. There are not a few figures in the Blue Books which form the

voluntinous and wholly undigested literature of this subject, which point in this direction, showing decline of population in certain very important centres, as well as in minor towns.

An admirable paper, which was contributed by Mr. Alfred Hickman, President of the Wolverhampton Chamber of Commerce, to the Social Science Congress in Birmingham in September last, and which has been printed in pamphlet form,\* gives some very significant facts as to a movement which threatens so much danger in the distribution of the building activity throughout England. We may observe that Wolverhampton, although the eighth English town (exclusive of the metropolis) in population, has only increased by 3.5 per cent. in the number of its inhabited houses in ten years; while the ports of London, Liverpool, Hull, and Gloucester, with which it has canal communication (unfortunately far from perfect), have respectively increased by 22.6, 17.8, 29.6, and 21.2 per cent. in that time. It is thus easy to understand why the manufacturers of Wolverhampton should be among the first to insist on the direction of public attention to that artificial restriction of their facilities for cheap carriage from which the return of inhabited houses shows that they are suffering. Mr. Hickman says:—"Within the last year, Messrs. Griffin & Morris, of Wolverhampton, artificial manure makers, have set up works at Newport, South Wales" (Newport, we may remark, has grown by 30.4 per cent. in the ten years). "Mr. J. C. Major, manufacturing chemist, has started works near Hull" (increase of Hull, 29.6 per cent. in ten years). "The Chillington Iron Company, have set up galvanising works at Liverpool, and quite lately, the large firms of Morewood & Co., Eliza Tinsley & Co., and the Junction Nail Company, have decided to remove their extensive patent wrought-nail works altogether to near Newport, South Wales. In other cases, instead of the natural expansion of trade taking place here, the new works have been established near the sea, and so trade has either declined or has not increased in its natural ratio. The wire trade, once a great Birmingham manufacture, has left for Warrington and other more favoured places, and the iron-tube trade has been enormously developed on the Continent and Scotland, whilst here it has been nearly stationary."

The object of Mr. Hickman's paper was to point out the suicidal policy of the railway companies serving, or rather not serving, the Wolverhampton district. Into that we are not about now to enter, although we fully share the views expressed in the pamphlet. Our object at present is rather to point out what is actually occurring, and to trace its

\* Barford & Hewitt, Wolverhampton.

cause, than to suggest the remedy. What is now taking place, as far as accessible statistics show, over the greater part of industrial England, is this: Continental manufacturers, benefiting, no doubt, first, by English enterprise and invention, and secondly, by English tools and machinery, which they have purchased to the value of 92,000,000*l.* within the last ten years, are now running our manufacturers very hard in the foreign market. And not only so, but, incredible as it may seem, the railway companies are doing their best to help the foreigner to introduce his goods into the home English market, there to compete with English productions. Thus, at the present time, bright iron wire is carried *via* London from Antwerp to Birmingham for 17*s.* 4*d.* per ton; while, for carrying home-made wire of the same description, from Birmingham to London, 1*l.* 8*s.* 4*d.* per ton is charged by the railway companies. Nails are carried from Antwerp to Wolverhampton, *via* Harwich, for 16*s.* 4*d.* per ton, while from Birmingham to Harwich the railway companies charge 1*l.* 1*s.* 4*d.* per ton. So with sheet-iron, with iron girders, with plate glass; for all which, as well as for the difference in freights on English and on foreign railways, we refer the reader to Mr. Hickman's pamphlet.

We think it more than questionable whether these differential rates are legal. As to the ruinous character of this policy, first as affecting the inland manufacturing towns, and secondly, and in consequence, as sapping the very springs of railway traffic, there can be no doubt whatever. In the great displacement of the building activity which is now taking place in favour of the seaport and river-side towns, it is thus hardly to be questioned that the unfortunate policy of the English railway companies is a very potent factor.

This, then, is the outcome of the inquiry. The urban population of England and Wales is increasing at almost exactly double the rate of the rural population; the ratios for the ten years 1871-81 being respectively 17.5 and 8.3 per cent. The large towns are increasing at a much more rapid rate than the smaller ones, those containing fewer than 10,000 inhabitants hardly increasing at all. The seaport towns, and the seaside watering-places, are increasing at the expense of the inland towns, and in some cases with almost Transatlantic rapidity. And the railways, whose true interest it is to minister to an inland population, spread as much as possible over the country, are adopting modes of charge which tend to the paralysis of inland industry, and to the removal of manufactures from their inland seats to the seaboard; and, indeed, from the British Isles to the Continent of Europe. The tendency of the movement, which is going on at an accelerating rate, is to surround the island with a fringe of ports, towns, and villages, which would be exposed to destruction in the event of war, and to withdraw population, manufacture, and cultivation from the inland area of the island. The movement does not appear to us to be advantageous to the welfare of the country. But of its existence there is no doubt; and it is of no little importance, as well to the constructors as to the purchasers of houses, to have an accurate idea of what is really taking place.

The phenomena above indicated would be even more marked if, instead of inhabited houses, the comparison had been made of inhabitants. Thus Manchester, while increasing, as before shown, by six per cent. in ten years in the number of houses, actually declined, during that period, in the number of inhabitants, though Salford showed a very large increase.

**A New Route from Sutton Coldfield to Lichfield.**—The London and North-Western Line from Birmingham has hitherto stopped at Sutton, but on the 15th inst., an extension was opened from Sutton to Lichfield. The distance is 84 miles only, and the new route will provide the public with a short direct route, instead of the old roundabout way through Walsall. Mr. Evans, of Birmingham, is the contractor.

#### FRESH SUGGESTIONS ON THE GENESIS OF THE DORIC STYLE.

**I**N a recent essay under the title "Der antike Ziegelbau und sein Einfluss auf den dorischen Stil,"\* Dr. Dörpfeld throws out some new suggestions, partly derived from the excavations at Olympia, on the part which brick building may be supposed to have had in laying the foundations from which the Doric style grew up.

As regards Egypt and Assyria, no one doubts the use of brick for building. It is enough to recall the Children of Israel and the Tower of Babel; but as regards Greece there has been a widespread idea that only walls which consist of solid masonry are properly Hellenic. When excavators have in the course of their work lighted on irregular masses of small stones or sun-burned bricks they have set them aside too often contemptuously as "comparatively late work." But recent excavations have tended to overcome this prejudice. At Hissarlik it has been shown that the Pergamos of Ilium was brick-built; at Mycene we have a brick wall of very ancient date; at Tyrins, at Olympia, at Tegea are still remains of brick walls whose size is considerable, and whose age indubitable. Naturally from these remains, few and scattered though they are, we conclude that had brick been a less perishable material we should have had evidence that the practice of brick building was widespread. Further evidence of the pre-existence of brick walls Dr. Dörpfeld gleans from the construction of the later stone walls. The normal stone temple wall had a basis of large slabs as a sort of foundation to the upper courses of the wall. For a brick wall this was of special service. Sun-burned brick, if in contact with the moisture of the earth, would soon rot away; it was necessary, therefore, to place a foundation course of stone, and the tradition was kept up by the large slabs long after the necessity had ceased. The very name "plinth" (*πλατφόρα*) is a testimony to the original brick.

Again, the frames of the doors in Doric temples of quite late times (e.g. Parthenon) have been, it can be clearly shown, of wood overlaid for the most part with bronze. This, where the walls of the entrance were stone, seems unnecessary and inexplicable, but walls of brick would obviously need door-posts of some more solid material to resist the weight and swing of the door on its hinges. Finally, we have the evidence of modern times. Even in Athens, where stone abounds, the inferior kind of houses are still, for the most part, built of sundried bricks.

Dr. Dörpfeld next proceeds to reconstruct in the thought an ancient Doric temple of mixed wood and brick architecture. The walls of the naos are of brick, on stone foundations. The pronaos extending on one side is of the "templum in antis" form; it ends on either side with two short brick walls furnished with wooden ante. Between these ante are two wooden pillars, each standing on a stone basis. The two ante and the two pillars support an architrave of wood. From side to side across the naos are placed beams of wood, the ends of which form the triglyphs. The roof superimposed on this was probably covered with clay and originally horizontal; later the invention of tiles made the sloping roof possible, and with the sloping roof came in, of course, the pedimental spaces. At Troy and Tyrins the roofs were of the horizontal scheme. If the naos were surrounded by a peripteros the pillars would be of wood on a stone basis, and the architrave also would be completely of wood. Such a compound structure would lead, we can readily see, to more substantial proportions than any mere building of wood only.

If buildings such as these were frequent, we must possess at least the stone foundations of something of the kind. Such a building was, in fact, laid bare by the excavations at Olympia, a temple consisting of naos and peripteros, with foundations of stone, with ante and peripteral columns of wood, and with

cella walls of brick,—the ancient Heraion, within the sacred Altis. Full details of this temple are not as yet available, but we know that it consisted of cella, with pronaos and opisthodomos, and peripteral columns; *in situ* are still preserved the stylobate of the peripteral columns, and a few scattered remains of many of the columns themselves, the wall of the cella of the pronaos and opisthodomos to about the height of one metre, one drum of each of the two columns of the pronaos, and the stylobate of the interior columns. It is important to note what are the *missing parts*, viz., the whole of the outer architrave, the pillars of the cella, and the opisthodomos, and the upper part of the cella wall, and the whole roof. What is the obvious conclusion? In all the other purely stone buildings of Olympia traces at least of the existence of these architectural parts have been found. Only for the Heraion there are none. Why? The answer is simple; they were of wood and of clay, both perishable when exposed to the weather,—the pillar and architrave of wood, the top of the cella wall and the roof of clay. There is another curious point about the peripteral columns, some of whose drums remain. These were, of course, of stone; but, oddly enough, no two are exactly alike, their diameter, even the material of which they are made, and the style of their execution, vary in each case. One by one they have been substituted for the old wooden pillars as these fell into disrepair. In the time of Pausanias, just one of these old pillars was remaining; he saw it in the opisthodomos. There is still more circumstantial evidence as to the use of bricks. Within the precincts of the temple the excavators came upon a stratum of clay about 1 metre deep, having no geological *raison d'être*. It can scarcely be other than the clay which once formed the upper part of the cella walls. As soon as the wooden roof perished, and the rain beat upon the rough sun-dried bricks, they melted, and the walls fell to pieces. Had we stood in the Heraion with Pausanias, and seen the last wooden pillar, we should have caught the old temple in the very act, as it were, of translating itself from wood into stone; as it is, we have in the foundations of the temple which remain interesting data for settling the proportions of a temple that was originally a compound structure of wood and brick.

It is impossible to forget that it is this heap of ruined brickwork, melted by time back into soft clay, that has so tenderly preserved for us the rarest of the treasures of Olympia, the Hermes of Praxiteles.

#### NOTES.

**I**HE attention of unfortunate rate-payers at this season of the year is imperatively called to the enormous increase in the urban sanitary rates, which seems to have developed a fresh vigour since the completion of the Local Government Board Report for 1883-84. But even for that year the pressure of this particular item of expenditure, on a limited portion of the community, is far heavier than would appear from the general account of local impositions. The urban population of England and Wales in 1881 was 17,285,026; and if we deduct that of Greater London (4,764,312) it was 12,520,724. The rate of increase of the last decade, if continued, would raise this population to about 13,050,000 by the beginning of 1894. The urban sanitary rate for 1881-82 amounted to 9,084,721*l.* for extra metropolitan districts alone. Since that time we have known instances of the increase of this rate by 55 per cent., and we apprehend that such cases are far from unique. On the urban population of 1881, the actual rate for that year shows a pressure of serious magnitude, while the rural sanitary rates only amounted to 242,486*l.*, charged upon 8,683,260 persons. If this rate of expenditure for professed sanitary purposes is to continue, and not only so, but also to increase, it can hardly fail to awaken a serious reaction against an amateur system which costs the country so notable a sum, while at the same time it has almost absolutely failed to secure the purity of

\* From the "Historische und Philologische Aufsätze," Ernst Curtius Gewidmet.

our rivers. As to the Thames, we need say nothing but that the Board of Works rate and the Local Management rate of the metropolis amount together to 2,390,749l.

**T**HE case of *Kempson v. The Great Western Railway Company*, recently argued before the Railway Commissioners, is remarkable for the conflicting evidence brought forward. The applicants,—better known as T. & L. Jenkins, under which name they carry on business in Birmingham,—complained of being charged an excessive rate for the carriage of undamageable wire rods from Oakengates to Birmingham. The rate complained of was 5s. 10d. per ton, the applicants further stating that they were being charged an additional 2s. per ton for cartage in Birmingham, and that they also considered this charge exorbitant. As regards the latter point, the Company proved that they were charging the same as the waterway carriers, and further, that it cost them 3s. per ton to deliver ordinary traffic conveyed at rates including delivery. But on points involved in the main question the Commissioners have to decide upon widely-differing testimony. The Great Western Company's statement of the manner in which the rate was made up included 6d. per ton for loading into the trucks at Oakengates, and a similar amount for unloading at Birmingham; and they called the chief officials of several lines to prove that the actual cost was 3½d., and that in many cases 7d. was charged, and considered reasonable. On the other hand, the applicants' witnesses stated that it could be done for from 2d. to 2½d., and the Commissioners not unnaturally took time to consider the matter, and reserved their judgment. In view of the now well-known fact that the companies intend to apply for new Parliamentary powers in regard to rates next session, it is certainly a hold thing in Messrs. Jenkins to open up this question, and the result will be eagerly looked for both by the railway companies and the trading public.

**A**T the meeting of the School Board for London last week, Professor Gladstone brought forward a report from a special committee on technical education. The committee was appointed two years ago to consider how far the Board could facilitate technical education. Among other recommendations the committee submitted the following:—"That the instruction in drawing commence with Standard I., and be carried out according to a graduated scheme laid down for each standard; and that increased attention be paid to freehand-drawing from models in all schools, and that mechanical drawing and modelling in clay be introduced into certain schools; and that, as an experiment, arrangements be made for the establishment of a class for the elementary instruction of boys in the use of tools as applied to working in wood, the attendance being voluntary and out of school hours." The two first-named were carried, we are glad to observe, by a very large majority. In thus bringing in drawing and modelling as an integral part of primary education, the Board have taken a step which may have larger results in the future than they are even able to anticipate at present, and they have probably done more to render the teaching of their schools a true "education" in bringing out faculties at once of mind and body, than by any enactment they have made for a long time past, besides investing the school teaching, to many children we may hope, with a new feature of interest and attractiveness.

**A**T the close of this year Mr. Robson will cease to occupy his position as Architect and Surveyor to the School Board. The post will now be divided; Mr. J. T. Bailey being appointed "Architect" at a salary of 600l. rising by annual steps to 900l., and Mr. Andrew Young has been appointed "Surveyor" at a salary of 500l. Both have been working for many years in the department under Mr. Robson, and the Board have done wisely in appointing those who are conversant with the work and who will carry it on, we may presume, in the same spirit. Mr. Robson may claim to have placed school planning on a scientific basis, besides having come very near to evolving

a School Board style of architecture. Of course on this latter point (*de gustibus*) opinions may be divided, but the result has been generally satisfactory.

**A** POINT which appears to have been overlooked with regard to the recent sale of Staple Inn, Holborn, is that the precinct of the Inn is extra-parochial, and is in consequence exempt from local taxation. The Temple, Gray's Inn, Furnival's Inn, Clement's Inn, Dane's Inn, and Barnard's Inn, are also similarly exempt. It is difficult, at the present time, to recognise the justice of exempting these places from all contribution to the local rates, but the exemption has been accepted by the local authorities, and maintained by the Legislature up to to-day. There has been a fiction that the societies to whom these Inns belong performed some services with regard to legal education, and on this ground their property has been hitherto considered to be entitled to be excused from payment of parochial imposts. It will be a matter for consideration whether, on a society being dissolved, and their property alienated, the ground which was formerly the property of the society still remains extra-parochial, and if it should be held that it still remains unparochial, whether steps should not be taken to subject the property to the control of the municipal authorities, and to compel the owners to contribute their proper quota to local taxation. Staple Inn is included within the metropolis by the 250th section of the Metropolis Local Management Act, 18 & 19 Vict., c. 120, but is expressly exempted from the operation of the Amendment Act of 1878, 41 & 42 Vict., c. 32. The reason for this exemption on the part of the Legislature is not clear.

**I**T is to be hoped that the attention which has recently been drawn to the subject of noises in London may not only produce some practical results in regard to railway whistles, but also with reference to street bands and church bells. There is no question that any householder or lodger should have a power of ordering a band entirely out of his hearing, and not merely the power of removing it further from the house. As to church bells it may also be hoped that well-meaning people will no longer waste money by placing bells in churches in town, to the great annoyance of dwellers in the neighbourhood, and without any useful result. Every one knows that the original object of church bells was to summon those from a distance to prayer who had no other means of knowing the time, and even now in country districts such bells are not without their use. But in towns not only are they of no use, but they are a positive evil to the inhabitants of a district. At certain hours, for example, the houses close to St. Mary Abbot's, Kensington, are almost uninhabitable, and yet a large sum was spent in putting up this peal of bells and a clock with a chime and without a face. In the leading case of *Soltan v. De Held* it was decided that bells close to a house were an actionable nuisance, and there is no doubt that Kensington Church bells are only allowed by the good nature of the Kensingtonians.

**W**E have before us the Journal of "The National Society for Preserving the Memorials of the Dead in the Churches and Churchyards of Great Britain."—a society which has so excellent an aim that, in spite of the length of its title, we wish it all success. The neglect and wanton destruction of old monuments is not, indeed, a vice peculiar to the present day. Weever, writing in 1613, lamented that his contemporaries regarded them with as little interest "as the pyrgines of their nayles," and the evil must have grown to a great height when it called forth a Royal proclamation in the second year of Queen Elizabeth's reign. Penalties were therein imposed upon any future offenders, and recent despoilers were commanded either to make good the damage done, or, if unable, "to do open penance two or three tymes in the church, as to the qualitie of the cryme and partie be-

longeth, under payne of excommunication." How the spirit of mischief had been evoked is plain from the terms of the same proclamation, viz., from the licence given (or taken) in past times "to deface monuments of idolatry, and false fayned images in churches and abbeys." But the spirit once raised has never since been laid, and the Society's record shows that it is now as active as ever. One correspondent, writing from Northamptonshire, tells of a fine old font broken up, not long ago, to mend the roads. Another relates how, in the rebuilding of Cheam Church, old brasses were recklessly torn from their slabs, and one, the finest of the set, was subsequently found in a shed in the rector's yard. Croyland Abbey was for many years treated as a local quarry, and the beautiful Brazebridge effigies in Kingsbury Church are gradually, like those whom they commemorated, becoming dust. It may be well to note that by the statute 24 & 25 Vict., cap. 97, sec. 39, it is enacted that any person who shall "unlawfully and maliciously destroy or damage any monument or memorial of the dead," either in church, chapel, meeting-house, or burial-ground, shall be guilty of a misdemeanour and liable to six months' imprisonment.

**T**HE Lower Thames Valley Main Sewerage Board met on Saturday last at Kingston to consider two schemes reported on by the Works and Parliamentary Committee with reference to the drainage of the united district, those of Mr. Shields and Sir Joseph Bazalgette. The former proposed the collection of the sewage on land in the parishes of Twickenham and Isleworth, its defecation by the scheme of Messrs. Mansergh & Mellis, and the running of the effluent into the Thames about three-quarters of a mile below Richmond Bridge: estimated cost, 329,550l. The latter proposed the total diversion of all the sewage of the district to land at Crossness, which the proprietors have to sell to the Board, with two pumping stations, one at Mortlake to lift the sewage from the low-lying land at Barnes; another at Sutton to send the sewage by gravitation on to the land at Crossness: estimated cost, 563,717l. The committee rightly put the question of economy on one side; whether they did rightly in accepting the Crossness scheme is another question. They characterise it as more expensive at the outset, but "final." The transport of the London sewage to Barking was thought to be "final" also.

**I**N the recently-published "Croker Papers" there is a rather curious discussion between Sir Robert Peel and the ex-Secretary to the Admiralty upon the appropriateness of battlements in a Renaissance mansion. Sir Robert was (in 1832) building Drayton Manor, and Mr. Croker urged him to cap his walls with battlements. Peel, however, found time in the midst of Reform agitation to look carefully into the matter, and to come to the confident conclusion that neither battlements nor labelled windows would be in character with the style of his house. "The parapet or ornamented balustrade," he writes, "was in use in the time of Elizabeth and James, and not the battlement. The battlement was of an earlier date." He then mentions the best extant examples of the period, and adds "there is scarcely a window in one of the houses named with a label. There is not one where the course is so near the top of the window, as it is in mine." Croker still contested the points, and though he preferred "to rest the battlements on beauty" rather than authorities, maintained that he had the support of the latter for the use of labels above all the windows not protected by string-courses. Sir Robert Peel was not a man likely to give way upon a question of taste, and at a later period spoke out pretty plainly upon the selection of Matthew Wyatt,—"a had architect and worse sculptor,"—for the Duke of Wellington's unfortunate equestrian statue. He denounced it as a job and an evil precedent,—"a retro-active precedent, if such a thing can be, justifying the selection of Wilkins for the National Gallery, of Soane for this folly, and Nash for that, and every job which immortalises its own disgrace from its durable materials in which it is recorded."

ALTHOUGH as an illuminating power the electric light at the Law Courts seems satisfactory enough, yet it is anything but satisfactory to find that the noise of the engines beneath the central hall is perfectly perceptible, and that their vibration extends even to some of the courts. This in itself is not only disagreeable, but is trying to the nervous systems of men who spend so much time in courts, and often at considerable mental and physical tension. The cracks in the tessellated pavement of the Central Hall are sad to behold, and the effect of the vibration of the engines beneath is likely to have a still further harmful effect.

THE collection of works by Mr. J. D. Linton, now open at the Fine Art Society's Gallery, is of special interest as giving to the public for the first time the opportunity of seeing his fine large paintings of the "Life of a Soldier in the Sixteenth Century" simultaneously and hung in their proper order. We have commented on all of them as they successively appeared at the Royal Academy and elsewhere, and are glad to meet them again in a collective form, though they are not all of quite equal interest or success; the one representing the reception of the keys of the conquered city is decidedly weak in comparison with the others. "The Benediction" is the finest and most serious in feeling, the "Declaration of War" the most characteristic and spirited. Mr. Linton, however, is greater in water-colour than in oil. His finest work, in colour and general execution, is, perhaps, "Admonition," where a group of amorous revellers are rebuked by the authority of the Church in all its array of ecclesiastical properties. The manner in which detail has been studied in this work is exemplified in the sit of the robes upon the figure of the bishop; they are so stiff with gold and embroidery that they stand out from his figure instead of falling over it. One of the finest pieces of character is "Gil Blas" at the Tavern, which is an absolute realisation of the scene. In regard to rich and harmonious colour the exhibition is a kind of feast to the eye such as no other living English artist, perhaps, could give us.

WE greatly regret to hear that the present proprietors of the remarkable and picturesque building at Aberystwith, which Mr. Seddon long ago designed as a hotel, and which, in its incomplete state, ultimately became a college, are about to entrust its completion to another hand than that of the original architect. Such a proceeding on the part of educated men seems quite incomprehensible. The building, as designed, was a very fine and original architectural conception, and that its designer should have waited all these years only to see its completion taken from his hands and given to another, is an injustice on which we cannot but express our feeling very strongly.

MESSRS. DOWDESWELL have formed a small exhibition of beauties of Sussex scenery, by Mr. Sutton Palmer, which, without touching the highest mark, contains some very charming hits of landscape.

A NEW paper, entitled *The Plumbing and Decorating Chronicle*, of which the first number has been sent to us, appears to promise to be a useful, practical paper, so far as the plumbing portion is concerned. The atrocious coloured plate, which is given as a specimen of "sign-writing," seems to emphasise the fact that "plumbing and decorating," so long associated as trades, have no connexion whatever in the nature of things, and had better dissolve partnership as soon as possible, both in journalism and in practice.

WE have received an announcement of a proposal which, if carried out in accordance with the terms of the prospectus, ought to be of some importance to architects, builders, and patentees of building appliances. It is no less than to collect under one roof "a registry of everything worth knowing and seeing in architectural appliances, to be accompanied by an exhibit of the article where possible, or by

an illustration or model." Of course something in this way has been done for some years back in the Museum of Building Appliances in Conduit-street, the range of which, however, has been rather limited. Mr. Phillips, decorative artist, of Baker-street, who is projecting the scheme, is erecting a building for the purpose. He will require a large one.

IN the matter of Westminster Hall, *beo locutus est*, that is to say, Sir Edmund Beckett has written to the *Times*. After that, of course, no more need be said; we are under infallible guidance. Seriously, Sir Edmund Beckett's letter is in matter (we say nothing of manner) a very sensible and practical one; but every suggestion and criticism in it has already been made in our columns, except that of setting up temporary models of the various schemes, to see how they look,—a procedure which is really only necessary to convince dunces, and probably will fail of that aim. The epistle includes an advertisement of "My 'Book on Building,'" and the usual insults, coupled with a pat on the back for Mr. Ayrton as "the cleverest Commissioner of Works there has ever been." It is natural that Sir E. Beckett should have a kind of fellow-feeling for the only man who has rilled him in gratuitous and absurd insolence to the whole architectural profession.

#### A CORNER OF WILTSHIRE.\*

SOME two miles away from Bradford, towards the south-west, lies Westwood, where there is a church that will well repay investigation. Mr. E. A. Freeman has called its tower "wildish,"—a curious epithet, throwing more light, perhaps, on the character of him who uses it than on that of the tower itself. It is, in fact, a square tower with an octagonal stair-turret projecting from the south-east angle. The two lower stages are perfectly plain (except for door and window), while the heltry stage is enriched with simple panelling, which makes the complete circuit of the tower and turret. Above this is a panelled parapet, with enriched pinnacles at the three corners not occupied by the stair-turret. The whole design is extremely simple and bold, and compares favourably with the intricacy of many of the Somersetshire towers. The body of the church is Perpendicular, of a vigorous and pleasing type, particularly in the north aisle or chapel, but in the internal arcade (of two bays) this vigour degenerates into coarseness. It is really a relief to come across something that one can justly condemn in old work. So much trouble has been taken to impress upon our youthful minds that all old work is good, and that everything previous to, say 1530, is worth sketching; that it is a positive pleasure to find something to carp at, something to prove that the old artists, like ourselves, were men and fallible, and that they did not always tread the icy heights of perfection. Not less gratifying is it to find work of a date subsequent to the magic year of 1530 which one may honestly admire, and of which the excellencies can be proved by appeals to accepted canons of art. This classifying of the merit of work according to date, this criticism by periods, is very apt to run us into absurdities. It was no less ridiculous for our grandfathers to dismiss the consideration of many ancient buildings with the contemptuous summary that they were "barbarous Gothic," than it is for us to put a vast array of beautiful structures out of court by designating them as "heavily Classic things." The excellence of a work lies in its own intrinsic merits, and not in the style in which it is wrought. No doubt a greater number of excellent things are found in some phases of style than in others; but it is absurd to deny all beauty to a work because it happens to belong to a particular period of art.

Westwood Church offers work of two periods principally, pre-Reformation and post-Reformation. The former period saw most of the work completed. To the latter belong the pulpit, the chancel-screen, and a curious oriel at the side of the tower arch (see fig. 5 in illustrations given last week, p. 819). It clearly represents the arch-fiend himself, into whose mouth, with hardy humour, the artist has transferred the Apostolic declaration that if he

is resisted he will flee. "Resist me, and I will flee," is written in seventeenth-century characters beneath his effigy. He is represented as an abnormal variety of the genus *vespertilio*, though why bats should be considered as peculiarly like devils it is difficult to determine, unless it may be that they loiter about at dusk, and attend church in a very irregular manner. In addition to the features already noticed, there is a handsome panelled roof over part of the north aisle, while a few old pews, with Flamboyant tracery, are left in the chancel. But some of the most interesting work is the stained glass in the chancel windows. This is very vivid in colour, so much so as to give the impression of being modern, but examination shows it to be ancient. It has been rearranged, and in one light includes a piece of seventeenth-century glass, probably brought from the ruins of the neighbouring castle of Farleigh. The whole glass has to do with the Passion. In the central light of the east window is the Crucifixion; in all the others are angels bearing shields charged with instruments of the Passion. The seventeenth-century glass already alluded to is an oval, containing a charming miniature of the Crucifixion. The whole series is of unusual interest, and will bear a lengthened examination.

Continuing the walk from Westwood the traveller will presently find himself descending a steep hill towards a little brook and the village of Farleigh. The brook marks the boundary between Wiltshire and Somerset. On the further bank,—stands the Castle of Farleigh-Hungerford. It stands,—or rather it stood there,—for there is but little of it left. It belonged to the powerful family of Hungerford, the same whom we have already seen establishing Long Thomas at Wrasall. The Hungerfords were one of those extensive and powerful families whose chiefs held the happiness of thousands in their hands, but who are now extinct; like the Coverts, of Sussex, whose possessions are said to have extended from London to the sea, and who built one of the finest mansions bequeathed to us by John Thorpe, but of which only a few fragments remain at this day. The Hungerfords held much land in Somerset, and not a little in almost every parish of Wilts. Their stronghold was here at Farleigh. From the frowning gateway, guarded by a drawbridge, but without portcullis, their army of retainers clanked up the hill on their way to Agincourt. In later times the grey walls, sparkling with Renaissance ornament, looked down on the messenger who brought Cromwell's letter to "my honoured friend Mr. Hungerford, the elder, at his house," the father of the last Hungerford whom the castle knew as its master.

The changes of the centuries are all recorded in the little Chapel of St. Leonard, still standing within the ruined walls. They are written in stern and vigorous characters, in chain-mail, and plate-armor, in sword and spear of every beautiful and deadly shape; in the pithy incised slab of the fifteenth century, and the wordy epitaphs of the seventeenth. They speak to us in broken accents from coloured windows, and in the clearer, more embellished language of the Jacobean reredos and pulpit. Not the least eloquent of these mute voices are those of the holy-water stoup, and the candles and crucifix left on the mouldering altar, as though forgotten there when the Romish priest howed his last low, and the breath of the monotonous chant for the last time stirred the pennons yet hanging from the roof, huzoned with arms of Hungerford and his allies.

Of all the beautiful things, broken or whole, which this once sacred building preserves, the most fascinating are the weapons of war (fig. 6). It is curious to see how much beauty was bestowed on things that were meant to do nothing but harm to all but the possessor. The lovely curves of the spear-heads, the delicate tracery of the sword-hilts, remind one of the horrible beauty of a snake. One can well understand Claudio going ten miles on foot to see a good armour, and Benedick's regret at his afterwards preferring to carve the fashion of a new doublet. But it would never do for young artists now-a-days to settle their differences with such swords, for they would be so wrapped in admiration of each other's weapons as to forget their cause of quarrel. Important, however, as is the part which the sword and spear played in the history of the Hungerfords, they by no means ignored the pruning-hook, or

\* See p. 819, ante.

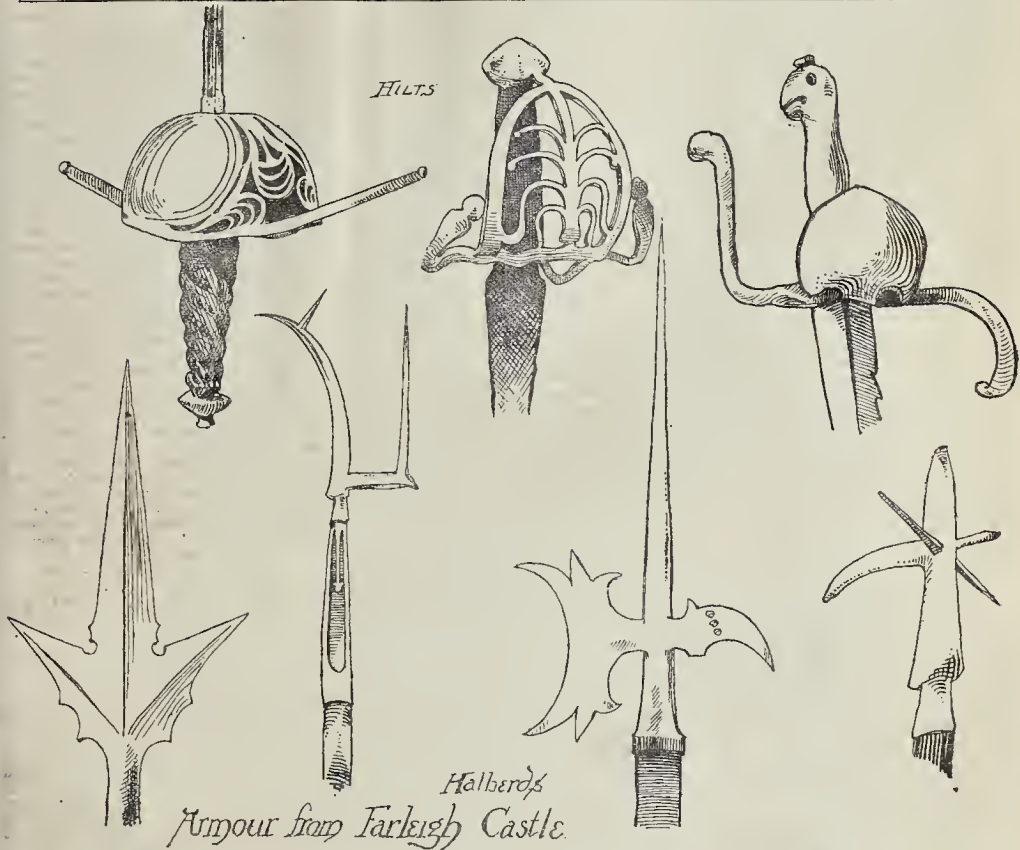

Fig. 6.

rather reaping-hook, for it was their crest. Either alone or in conjunction with the garb, or sheaf of corn, it appears at every opportunity,—in glass, on tombs and pennons, and very ingeniously in a lock plate, where the garb forms the key-hole, and is supported on each side by a sickle (fig. 7).

Fig. 7.

This chapel of St. Leonard is the focus of the interest at Farleigh. The remains of the castle walls contain no detail of any account, and, though perhaps fascinating to the day-dreamer, give little return to the student of architecture. The day-dreamer can picture to himself the long array of knights and ladies who have lived and laughed and loved here, and some of whom still lie in their leaden coffins in the chapel vault. He may fancy he can deprecate old Sir Walter, who was long unjustly credited with having captured the Duke of Orleans at Agincourt; or perhaps he will hear the wails of the unhappy lady, third wife to another Walter, who lay immured in one of the towers for three or four years, kept there by her cruel husband, and subjected to the poisonous wiles of his chaplain; receiving her food from the hands of my lord's fool, and sometimes snrreptitiously relieved at midnight by the pitying peasants. Poor lady! her lot was a hard one, till her wicked husband lost his head on Tower Hill; but then she returned again to life and to love, and, marrying Sir Robert Throckmorton, of

Coughton, in Warwickshire, became the mother of the mother of that Francis Tresham who was to perish miserably in the Tower with his fair fame shattered by his complicity in the Gunpowder Plot. Alas, for the old days, when to hlow up the Houses of Parliament was such a monstrous affair as to give birth to a national festival in honour of the providential escape! Nowadays we have a potential Fifth of November almost every month.

One year after the head of the wicked Bluebeard, Lord Hungerford, fell upon Tower-hill, the same sad place saw the death of another native of Farleigh Castle, Margaret, Countess of Salisbury, and mother of Cardinal Pole. She was born here in 1473, while the castle belonged to her father, the Duke of Clarence, brother of Richard III., who confiscated the place and gave it to the Duke. The unfortunate Countess had not even the satisfaction of lying in her own beautiful chapel at Christchurch, in Hampshire, which she had built expressly to receive her mortal remains; and that charming little structure, on whose carved strings the Renaissance has laid a firm hold, has remained tenantless and silent down to the present day.

Yet one more romantic figure will cross the day-dreamer's misty vision. Napoleon, afterwards the third of that name, once went to Farleigh and sketched the ruins of one of the towers. Whether he wielded the pencil to as little purpose as the sceptre and the sword cannot be said. But none of the rusty weapons hanging in St. Leonard's Chapel could tell so sad, so humiliating a tale, as could that which was delivered up by the imperial sketched on the field of Sedan.

**Alexandra Palace.**—A communication has been received from the Board of Trade certifying that the Exhibition to be held next year at the Alexandra Palace is an International Exhibition.

A SEASONABLE REMINISCENCE.  
BY A LONDON ARCHITECT.

In good Bishop Butler's discourse upon Personal Identity, there is a passage which has always been a stumbling-block to the present writer. It runs thus: "Upon comparing the consciousness of one's self or one's own existence in any two moments there as immediately rises to the mind the idea of personal identity. Or, in other words, by reflecting upon that which is myself now and that which was myself twenty years ago, I discern that they are not two, but one and the same self." Where, to, my lord, we most respectfully demur, discerning nothing of the kind. I look back through a long series of Christmas-tides and try to fix the image of myself at each successive stage in life's journey, and as the pictures present themselves before me, I am not at all sensible of that affinity between them and my present self which the good bishop thought so convincingly clear. I look into myself, I can only look at the mental pictures of the other personages who at one time bore my name. Portraits of friends arise in my imagination equally well defined, and hear as close a relation to what I now am as those other portraits which are supposed to be indeed my very self. What, for instance, is there now in common between me and that youth who in the year eighteen hundred and what-ye-please came friendless to this great city with a light purse and a heavy heart. His story is known to me, it is true, but so are many similar stories of others. He had left the office of a North-country architect of declining practice, with the accumulated arrears of a small salary paid partly in cash and partly in promises, the latter never redeemed, and the former, the actual and tangible portion, by far the smaller of the two. A great war had paralysed the peaceful commerce of the country, and building was almost at a standstill. Not

a cheering outlook for this unfriended young man! An incident in his career may be worth, at this time of year, the page it takes to relate. In those days there stood in St. Peter's-court, — a little, crooked, unfrequented thoroughfare which joined St. Peter's-lane with Duke-street, — a lonely coffee-house of a faded exterior and retiring habits; so retiring, indeed, that it shrank into the furthest point of the re-entering angle of the court, as though in hiding from the race of men instead of advancing any claims upon their custom and patronage. A tablet, framed and glazed, hung in the window and bore the simple legend, "Good Beds." This appeared to the wanderer to be a congenial resting-place. Here he could call only for what he could afford, calculating the expenditure by the printed tariff, and regulating his outlay with the nicest exactitude. The charge for the bed was 1s. per night, and it justified the simple announcement in the window; it was good and clean. This modest little hostelry soon furnished matter for speculation. The proprietor of the establishment was a political refugee who had married a haxom Englishwoman of business habits, and had by her aid got together not only a comfortable home for himself, but an asylum for his less fortunate compatriots. The *habités* of the place were mostly Polish gentlemen, of the military caste, — tall, swarthy, somewhat Pistol-like, with fierce moustachios, brigand-looking hats and cloaks, and Hessian boots. Some of them had little bits of ribbon, — "orders," — on their breasts, and all of them appeared to possess a good deal of what would now be described as "side." They gathered into little knots, and, as they sipped their chocolate and munched their crisp French rolls, discussed in earnest undertones schemes for the regeneration of their country, mingled with curacs (not loud, but deep) for the hated Austrian. They were, — politics and war apart, — tame, gentlemanly creatures, and no orgies disturbed the slumbers of the tired youth who had all day long plodded the cheerless streets in search of that employment which he began to think would never come. His fare, though scanty, and much less varied and nourishing than that supplied to the dwellers in her majesty's prisons, was found sufficient. But with even the strictest economy the little stock of ready-money slowly but surely dribbled away, carrying hope along with it. To ask for credit would have been to precipitate his expulsion from the only place where he could lay his head. And yet something must be done. Now the shops in St. Peter's-court are peculiar. There is an umbrella-maker's at one corner with a red umbrella hanging out, as if to dry, over the door; and in the window facing the court there is a collection of walking-canes of amazing lustre and magnificence. There is a boot-maker's, a tobacconist's, a French landress's, — the prettiest establishment of all, — where you can see the tidy French girls in their muslin aprons and crimped caps laughing and joking as they iron all day long the snow-white linen; there are a picture-frame maker's and a public-house, and there are whole rows of second-hand book-shops, curiosity shops, and shops to loiter over generally. Loitering can be done in the seclusion of St. Peter's-court, and it cannot be done in the throng of St. Peter's-lane from which it leads. But, better than all, there stands, or stood, at the corner opposite to the display of gorgeous walking-canes, a diamond merchant's, — for so he is described on the frieze over his brilliant shop-window, — who was so good as to lend the youth at this crisis in his career the sum of two pounds, kindly taking care at the same time of his case of instruments, which might, you see, have been stolen if left about at his lodgings.

With this sudden addition to his capital, he felt almost independent, and began, with renewed energy, his search for work. As the last golden piece melted slowly away, and with the prospect of employment as far off as ever, the jolly Christmas-tide came on. It was the first he had spent in London, and the glitter and bustle of the streets dazzled him, and in the general excitement he almost forgot his own troubles. It seemed impossible that want could be at hand with plenty all around. The Christmas was cold and wet, and he kept indoors. It was not a time to expect an engagement, and he had learned already to shun the "walk that costs a meal." The coffee-house was not licensed for the sale of intoxicating drinks, and the season brought no new customers, who

found more suitable entertainment elsewhere; and the increased bustle and traffic in the court outside made the quiet and isolation of the dingy room more depressing. Letters to his previous employer brought at first more promises, and after a time were returned through the Dead Letter Office, and hopes from that quarter were at an end. And so, with the last crown-piece in his pocket, he went early to bed on an ever memorable Christmas Eve. The waiter, — with an eye perhaps to the traditional "box," — waylaid him on the stairs in the morning, and wished him a Merry Christmas, — no doubt in perfect good faith. The picture of that Christmas Day, in the coffee-room in St. Peter's-court, could only be painted by a Rubens or a Van Dyck. Everything partook of the same dull brown. The mabogany boxes, sticky with the steam of countless chops, were brown; the walls were papered with that monstrous imitation of blocks of Siena marble, which was once, and is even still, in some quarters thought an appropriate form of decoration, and the varnish had turned a sort of bilious brown. The ceiling was brown with smoke; the floor had a brown oilcloth over it; and a brown fog filled every corner of the apartment. The whole was in perfect harmony, but not in a cheerful key. The shutters were not taken down, and only a few sickly rays of daylight straggled in through the glazed sash over the door. The door itself was unbolted, and on by one, or in groups of two or three, the conspirators entered, and, assuming their wonted places, recommenced their endless labours in freedom's cause. The gas was lighted at the further end of the room and was burning dim and yellow through the foggy air, casting strange shadows from the fantastic figures upon which its sickly rays fell. The fireplace had been obliterated to make room for an extra box or stall, and the only source of heat was a little stove which stood in the centre of the gangway. The visitors were too considerate to crowd round this and monopolise its warmth, and so sat elocated and hatted through the long, long, dismal day. They did not change their fare on account of the season, although the English instincts of the landlady pressed them with appropriate delicacies, and bestowed gratis upon the solitary stranger within her gates a slice of the traditional plum pudding. Silently and by small detachments as they had entered, these strange men departed early, while the hells were still ringing the evening worshippers to St. Peter's Church close by. The gas was partly turned on as being a wasteful excess of illumination for a single customer. The inextinguishable solace of the pipe was not then so much popularised as now. He tried to read some of the greasy and torn novels upon the shelves, the remnant of some old-world circulating library, but his mind was absent, and he followed the lines without catching their meaning; and so he sought once more forgetfulness in that sweet sleep which waits benignly upon the young.

We know that in the mimic world of the stage it is only when the innocent prisoner has actually mounted the scaffold, and has obligingly adjusted his toilet for the executioner, who stands ready, axe in hand, that the borseman dashes up, breathless and incoherent, with the despair of reprieve; and that in polite fiction it is not until the hero's finances are, so to speak, at the last gasp, that the Will is found, or the aunt, relenting, dies, and, regardless of all customary formalities, cash is instantly abundant; or the rich old uncle, with his rug and hat-box, appears unannounced in the drawing-room, in the very nick of time, fresh from the wealth-giving India; and we in our innocence suppose that it is only in the realms of fiction that things turn out thus *à propos*. Not at all. The Universe is under governance.

Within a week a letter from a stranger, now a prosperous gentleman, — a F.R.I.B.A. even, — directed the youth to present himself to an architect (who is now the surveyor-general of a distant colony), where work awaited him. He did so, and instantly became rich with the wealth of 30s. a week. Both these Samaritans, if they should read this, will recall the circumstances.

And now, as I sit in my cosy study-chair, my feet slowly toasting on the fender, writing lazily on the pad upon my knee, the lamp hurrying brightly and the curtains drawn, Mrs. P. busy with her knitting, and the voices of happy children heard from the "hall," which they are decking with bolly, I ask myself, incredulously, am I indeed one and the self-same as the

youth who spent that gruesome Christmas Day in St. Peter's-court? The Bishop says so, and memory confirms the statement, — but memory has often played me false! There are, however, links in the chain of evidence which seem to point that way. The coffee-house is there still, unaltered, and thither come, as of yore, the scanty remnant of that little band of expatriated warriors, — gannt now and pale, with bleared eyes and whitened locks, — moaning garrulously over vanished hopes and unfulfilled desires. The diamond merchant is still there, pursuing his charitable mission, and relieving, in a double sense, necessitous youth. And, lastly, there is the case of instruments which has never called any one owner but myself, and would appear to be a substantial witness to my identity with the youth who once at least found them so very useful. I cannot tell, nor does it matter. The story is a true one, and that is enough. It has been written at this Holy Christmas-tide to bring hope to those from whom hope has well-nigh fled, — that "some forlorn and shipwrecked brother, seeing, may take heart again." The curtain never falls upon the tragedy of human life. The streets are still paced by weary feet seeking rest and finding none, and in many a lonely London lodging care still sits eating the life from out young hearts. Let them not despair. For the least hopeful there is room for hope. If it sound like mockery to wish such as these a Merry Christmas, one may, at least, offer them the sympathy of a fellow-sufferer, and pray that the new year may bring them also a happy issue out of all their afflictions. J. P.

#### THE ANTECHAMBER, TO-DAY AND YESTERDAY, IN FRENCH AND ENGLISH PLANS.\*

I BELIEVE it to be generally admitted by editors, publishers, and booksellers that a great many more papers would be written, published, and offered for sale than actually happens to be the case were the supply of subjects for dissertation more plentiful than it is. I am told that there are even gentlemen living, — members of our profession, — who have early in a session undertaken to read nameless papers before societies like ours in the hope that a subject to write about may, as a matter of necessity, occur to them before the day of execution arrives. But in my case, I determined upon a subject, and invented a title, before ascertaining whether there was much or indeed anything to write thereon. That title runs smoothly enough: "The Antechamber, to-day and yesterday, in French and English Plans," and if you hold me to it, without meroy, my task will be soon accomplished, for an antechamber is merely the *amphithalamos* of Vitruvius's Grecian house, and in both the French and English distribution of a dwelling-house is that piece which is *ante* to a bed-chamber. Permit me therefore to play upon my title with just that licence accorded to those earnest expounders of inspired sentences who admonish us twice on Sundays. Let me divide the text into three parts, and put my subject, Cerberus-like, under three heads, in which the ante-room shall be treated literally, colloquially, and then broadly and generally in the architectural sense of *vestibulum* and *atrium*. But before plunging into space, I want a beginning, — a something to connect the subject with current topics, — and I am reminded that the country is at present in the full enjoyment of a centenary; that this day, one hundred years ago, less a few hours, a great English lexiconographer was buried in Westminster Abbey amidst the respect and gratitude of the nation; and so, as in writing a paper or a poem, there is "nothing so difficult as a beginning, unless perhaps the end," I will begin at once, and with another quotation.

"Seven years, my lord, have now passed since I waited in your outward rooms, or was repulsed from your door." Surely not the very youngest member of this excellent Association ignores the incident which served to put those words into a letter addressed by Dr. Johnson to the fourth Earl of Chesterfield. The scene has been depicted by artists, has been mentally portrayed by thousands of James Boswell's readers, without, perhaps, a thought of the house in which the event happened. Indeed, it was only a few weeks ago that I

\* A paper by Mr. William H. White (Secretary of the Royal Institute of British Architects), read before the Architectural Association on the 19th inst.

asked myself whether the house at the end of Stanhope street, Mayfair, was really that in which Dr. Johnson "did antechamber," or that I doubted whether the outward rooms of a peer in the days of George II. could be other than stately pieces. Have we not all seen pictures of a vast antechamber or vestibule crowded with aspirants more or less modest, with the gloomy Doctor seated uneasily, leaning on a clumsy stick, and frowning at Lord Chesterfield's back, after he had passed with a troop of friends, and paid no heed to clients anxiously searching for a patron. But, gentlemen, on the wall is a plan of Chesterfield House, taken from the "Vitruvian Britannicus" (ed. 1767, vol. iv., plates 67, 68, 69), and there at the door you will see very little room for an assemblage such as I have described. A hall chair and table, two or three dunkeys, and my lord's gracious presence, would have effectually blocked that entrance passage, which merely forms part of the principal staircase to the house itself. There is nothing in that Mayfair residence of an English nobleman which fulfils the idea of an antechamber such as Charles II. brought to Whitehall from France, such as, 200 years ago, Italian and French architects made an important feature in their distribution of rooms, in a house or a palace, or such as, 130 years ago, J. F. Blondel discoursed of in Paris to the students of his school of arts, a short time before he became a professor of the Royal Academy of Architecture.

The antechamber is famous in history, and, perhaps, more than any other part of a house, its existence has helped to make history. Mackintosh and Macaulay repeatedly use the term, which to Fielding and Addison was familiar, and Dr. Johnson has warned us that it should be spelt with an *e*,—not an *a*, as the Dictionary of the French Academy still has it. Gibbon has much to tell of the Roman antechambers, and Cicero of the clients who waited in them. The ancient fashion of waiting in the early morning at a great man's door to attend his levee, or, in the vernacular, his getting-up, has survived even to the present day in Paris. In the age of Louis XIV. it formed a part of the stately manner, as it is possible to picture it from the stately phraseology, of the time. If Pliny left home before sunrise to pay his respects to Vespasian, there were historians in the antechamber of Louis hours before the eyes of his most Christian Majesty were opened; and, during the Second Empire, a well-known minister of Napoléon III. received people of business at half past seven in the morning in his dressing-room, which served as an antechamber. Indeed, the custom of early visiting on matters of business is very general among Parisians, the mass of whom are at work an hour after daybreak. If you had business with Viollet-le-Duc it was necessary to call on him before nine a.m., and I have found his library full of different kinds of visitors at eight o'clock. In this country the levee,\* which, as a formal homage to the Sovereign, is identical with classical precedents, takes place in the afternoon, and, therefore, as far as the meaning of the word goes, is a misnomer. In the time of the Louis there was the great and the petty "getting-up in the morning," and the pictures of such events extant are curiously interesting; for the bedchamber of the last century and of the one previous to it, rather resembled a modern drawing-room than a bedroom as we understand it now, and the antechamber which led into it was usually a luxuriously furnished apartment, preceded often by a smaller room, called the first antechamber, in which the servants waited.

There is nothing supremely elevating in the subject of an antechamber, or of the conversation likely to have taken place there, but those who read French well enough to enjoy the splendid literature with which the architects of the Bourbon dynasty have endowed the noble profession to which it is your privilege, and mine, to belong, will agree with me in admiring the rounded sentences of François Blondel, when he submitted himself to Louis the Great, and those of Desgodetz, when he approached Colbert. Be sure that these men, whom you no doubt regard as old classic fogies,—extinct like the

dodo,—did antechamber in the grand fashion, of which we in England have little idea. In this country the spirit of the Renaissance was never imbibed as it was by the French of the sixteenth century, and this was probably due to the disturbed condition of home politics at the time, though the national character may have contributed to render obsequious less facile to Englishmen than it was in France. Indeed, Horace was often less fulsome in his prostrations to Cæsar and Mæcenæ than were some of the French philosophers and poets of the great age to princes and nobles. To do antechamber then was the province of persons who aspired to live by literature or art, and it was only towards the close of the last century that emancipation from such unworthy thralldom was effected. It is pleasant to remember that, years before his death, Voltaire held the position of a patron rather than a client, and in England Prior was an ambassador, Addison a Secretary of State, while the most conspicuous figure in English politics, in the reign of our dead but ever gracious idol, Queen Anne,—I mean Lord Bolingbroke,—was friend and jolly good fellow with the three Yahoos of Twickenham,—Swift, Pope, and Gay.

It is pleasant, moreover, to read J. F. Blondel, and the architect, Patte, his editor, when they discourse on the antechamber, especially because both had a great deal to do with the development of home comforts in so far as they depend upon the arrangement of a dwelling-house. In their time the proper position of an antechamber was more important than the direction or turn of a corridor is in ours. J. F. Blondel, in his "Cours," complains of "our young architects," *our confrères*, gentlemen, who competed for the prize of Rome, and took the first place among architects in most of the European capitals and great cities,—those young architects who constantly forgot that a first antechamber was required in good houses to precede the antechamber, which was often used as a dining-room,—and thus got found out for being what it always was: a mere passage-way from one part of the building to another. The fact is that most *châteaux*, at the beginning of the Renaissance, were merely long narrow blocks of building divided crossways into rooms, one of which, selected here and there, was an antechamber. You had to pass, in going over such a building, from or through one room to another; and the antechamber, like the hall of ancient times, was an apartment common to every one, in which most of the servants spent the day, and some the night. The doors of several rooms were opened into it, and thus it was like the saloon of a ship,—which is used as a breakfast, dining, and tea, room,—surrounded by rows of private cabins.

Herein was the defect that Patte and Blondel stigmatised, visible in all the plans of the last century, and not completely remedied even at the beginning of this. If you want to judge of this defect in its most exaggerated form,—of the sort of confusion engendered by such planning,—you have only to stay a night or so at an inn, say, in the Pyrenees, or some part of the country distant from any of the great centres of French life. In such places you may, by chance, get a bed allotted to you in a spacious though irregular room, which you may find full of doors. Englishman-like, you will try and lock those doors; but it is a dangerous practice, for often every one of them leads into another apartment, and in your haste to be secure from intrusion you may lock up a priest or a haggan,—even a widow or a maid,—to your own regret, and, possibly, their indignation.

The careful manner in which we now-day plan houses, both for town and country, so as to allow communication between every part of the building without necessarily passing through any of the various rooms is an advance upon the earlier practice; and, further, the very improvements which Voltaire commended, as having been made since the reign of Henry IV.,—which Patte signalled as having been perfected in his own time,—would be regarded now as fatal blots in an ordinary residence. The stride of this century in that, quite as much as in other more remarkable things, has been gigantic, and it would be affectation in any one who appreciates what he reads, and who does not lose his head in the contemplation of the picturesque, to doubt or deny our manifest progress in the arrangement of dwelling-houses. But in our successful efforts to improve, we have improved the antechamber from off the face of our world

altogether. In place of it we get a narrow corridor, with here and there a lobby, and, content with such improvement which has economy in its favour, the uses and advantages of an antechamber have become obsolete,—at least, in England. Yet it served a great purpose in the old *châteaux* of Europe, and may still be seen in many that have not undergone alteration. To quote from a paper of my own, written a few years ago, an enormous antechamber often formed the solo entrance to a set of private apartments; it was a lofty room with a fireplace and large windows. The door to your lord's rooms was on one side, the door to those of my lady was on another. The bedrooms were used as living rooms on ordinary occasions; only on extraordinary occasions were the great reception-rooms and the great dining rooms used. In the descriptions extant of Versailles and Whitehall it is the antechamber in which courtiers met, and of which I cannot refrain from mentioning those who are planning the new fashionable houses-in-flats to study some of these old French buildings, for there is a great deal in them which may be advantageously applied to the horizontal principle of house distribution, both as regards practical requirement and as regards artistic effect.

Take, for instance, a famous plan of a private house, designed and erected by J. F. Blondel, and published in his "Cours" for the purpose of showing students how to plan profitably upon a narrow and irregular site. Here is to be seen the antechamber as it was understood at the beginning of the last century, and the care with which he has managed to give an architectural shape to the room, in spite of more than one acute angle, is worthy of notice. Here, again, is a cheap block of flats built some years ago in Paris as a speculation, intended to pay its proprietor a good annual income. The block contains shops at the street level, and five residences on each story, reached by three staircases; they are arranged for very ordinary people belonging to the middle class, and who are content to live, so to speak, on the Surrey side of the river, at a considerable distance from the Place de la Concorde. Every attention has been given to make the private entrance to each flat useful and agreeable. An entrance like that shown on the plan bears the name of "antichambre," and I venture to think that such a well-considered arrangement as the plan before you, the work of M. Bonenfant, for a mere middle-class block of residences of comparatively low rentals, forms a pleasing contrast to the higgledy-piggledy jumble of shapeless rooms which is now known to Londoners, and joyfully accepted by them, as an orthodox flat. I need not stop to reflect upon the kind of bonfire many of these London blocks would make were it kindled in the basement; for that is rather an affair for statesmen and speculators to treat of, after a catastrophe; my purloiner is to point to the uncomfortable and inartistic character of these new-fashioned residences, no portion of which is uglier or more carelessly treated than the hall or antechamber. I live in a flat myself, and appeal to our young architects, with some degree of personal feeling, against the kind of thing to which I have to submit. My door, opening inwards, is 3 ft. wide. Observe that the person opening the door from the inside must take refuge behind it, while the visitor entering from the outside strikes his nose against the wall in front of him. Flats with entrances like this, and containing, seven, nine, and even eleven rooms, are letting easily for 120l., 140l., and 160l. per annum, in neighbourhoods distant half an hour's walk from Piccadilly circus.

Perhaps I may be allowed to refer to the fact of my having, in 1875, described to this Association "How the Parisians build a House-in-Flats." The paper was a fancy picture sketched at different times and from several examples. I made a further communication in 1878 to the Institute on "Middle-class Houses in Paris and London," and had I dared to say then that houses such as I portrayed,—not altho' their similar to those erected twenty years ago in Victoria-street,—were almost immediately to cover whole streets in London and New York, the statement would have been regarded as the dream of an enthusiast. But the thing has happened, and I have a sequel to add which may be called a further dream. I want to see many of these erected for central London, three antechambers in each. If you will look

\* Macaulay, writing of the "State of England in 1684," says:—"Hardly any gentleman had any difficulty in making his way to the royal presence. The levee was exactly what the word imports. Some men of quality came every morning to stand round their master, to chat with him while his wig was combed, and his cravat tied, and to accompany him in his early walk through the park."

in the *Builder*, of the 29th of June, 1878, you will see an article entitled "Shops and Houses for Central London," with an illustration at page 672. The article contains twenty-four rules for planning and erecting such buildings. In the eighteenth rule it is laid down that "Each residence be subdivided into three parts: one for day habitation, one for night habitation, and the third for the service." Mr. Godwin was good enough to approve of those rules which I had formulated, and contributed to his journal, and I would now go further, and add that "each subdivision have an antechamber proper to it." Thus, the antechamber to the day division would be the entrance-hall, and perhaps during the dinner-hour the serving-room; the antechamber to the bedroom division might contain a linen-press, a female servant might sit there at work, and it would be common to the woman-kind of the household; the antechamber to the service division might be the servants' hall, and form a salubrious break between kitchen, scullery, &c., and the other portions of the residence. Of course, I am not thinking of blocks of building like the French example I have shown, for so elaborate a scheme of distribution as that combining three antechambers; but I am convinced that if young architects who are working out the plans of flat residences will banish from their minds the modern idea of a passage, and try to realise the idea of two centuries ago,—namely, that of the ante-chamber,—they will attain to a principle of distribution more in harmony with the character of the problem to be solved than has yet been adopted by even experts in our art. By such a subdivision as that I have advocated, families may be properly accommodated in horizontal houses; but if the present mode of arranging these monuments of successful speculation be permitted to develop, the fashionable house-in-flats may become as fruitful a hotbed of disease, consequent upon overcrowding and want of air, as the worst slums of Marylebone or Soho.

Now, having treated the subject of the antechamber in a literal and in a colloquial sense, I will proceed, with your permission, to take an extended view of it, for we are now in the third and last phase of illumination as regards the text of this discourse.

Come back, then, for an instant to a state of primitive existence, and I feel sure that my friend Mr. Lawrence Harvey will afterwards assist me in unravelling the by-no-means tangled web of evolution. Horace sang of a simple enclosure containing a hearth or fire, around which lay the inmates,—men, women, children, and slaves,—while the smoke ascended through an issue in a roof of turf. That was the atrium, indeed the dwelling-house of Romans in the good old times, and it had a door but no windows. The client who waited upon his patron waited outside the door, and probably squatted there as natives of India do now in the verandah or the compound (*campagna*). But, as the community developed, the atrium increased in size and character; the open area or vestibulum outside the atrium door got a roof put to it, and horse, cart, and chariot were protected from the weather. The hole in the roof of the old atrium developed also, and, as the *cavum atrium* took architectural shape, a receptacle was provided for the falling rain, which no longer served to damp the open hearth, but fell only to replenish a piece of water cunningly contrived in the midst of an antechamber common to all the members of a household, to the stranger within its gates, and to the slaves, though rarely entered by the Roman matron and her spinners, who occupied a reserved part of the improved dwelling-house. All this becomes easy to realise when you have once visited a Pompeian house; and, depend upon it, the great mass of Grecian and Roman houses of the Augustan period were not very different from those that still exist, thanks to Vesuvius, on the Neapolitan shore.

In similar progression the Mediæval hall ultimately took the shape discovered by archaeologists. The hall of the twelfth century was a covered enclosure, strewn with rushes; dogs and horses, as well as men, women, and children, were sheltered within it. A fire was kindled in the centre for cooking purposes, rather than for warmth; and if there be no absolute evidence of a hole having existed in the roof of such a hall, you may be sure that the latter part of a later period was only a logical refinement of it. Further, as manners improved, a part of the hall was reserved for the master and his

family. Hence the dais or raised platform of wood, which afterwards got boarded in, and developed into the private chamber, the retreat of the lady of the household, the thalamos of Mediæval purity. Just as the vestibulum and peristylum developed in front and back of the primitive atrium, so chamber and antechamber grew naturally within the Mediæval aula or hall, and, to realise the process you have only to live on ship-board for a short time. When you have watched, say in the Red Sea, a sailcloth rigged up across a portion of a vessel's deck, to shelter a group of ladies or some sick passenger, you can at once comprehend the slow method of development that culminated before the sixteenth century in the *châteaux*, palaces, and houses with which our young architects of to-day are fatally familiar.

But to the people that read Dr. Perrault's translation of Vitruvius, to the great noblemen and great scholars who contributed to the magnificence of Louis XIV., the domestic works of the ancients were so many enchanted palaces, about which any extravagance would be believed possible, and to which any scale might be fearlessly applied. Perrault, with the mangled text of Vitruvius before him, designed a Roman dwelling-house of colossal dimensions, with *area*, *vestibula*, *atria*, *cavædia*, forming the, so to speak, public part of the house, with *peristylia*, and a host of rooms of every description forming the private portion. The Grecian house, devised in the same fashion, measures 350 ft. in depth by 275 ft. in frontage, that being, as you probably know, about 150 ft. longer and 175 ft. wider than the Parthenon measured at its topmost step. In the "Travels of the young Anarcharis," written by the Abbé Barthelemi, more than a hundred years afterwards, the plan of a Grecian house shows a thalamos measuring 32 ft. by 25 ft., and an amphithalamos of similar shape and size, and the whole conception of the building is much more extensive than that of Perrault. Nearer our own time, Dézobry, who wrote a novel called "Rome in the Age of Augustus," and Mazois, who wrote another novel in which he described the Palace of Scaurus, imagined colossal edifices covering vast spaces sufficient to contain a Paris *place* or a London square. No wonder, then, that if scholars and experts lost their heads and continued losing them until nearly the middle of the present century, the princes and seigneurs of the Great Age took an exalted view of the images which the spirit of the time had set up, and accepted every estimate of Classical magnificence provided only that it was big enough. Hence the Château de Richelieu rose like a small town, and all over France the great landowners reared: quadrangles of constructions, with outer and inner courtyards and annexes; erected chapels, sometimes theatres, and combined within their own walls all the refinements, and, indeed, all the civilisation, of their time. This went on in France all through the seventeenth century, but the fashion was not general in England until the eighteenth century. On the wall is a rough plan of Blenheim Palace, which was designed by Sir John Vanbrugh, and erected at the beginning of the eighteenth century; but the drawing shows only the principal buildings. Half a mile off on every side the country was mapped out to lead up to the palace. Avenues of trees, lakes and waterfalls, parterres, terraces one above another, perrons and flights of steps, astonished and confounded the spectator from any one of the hundred windows of the palace fronts. To misinterpret Pope, it was the architect's ambition of that day,—

"Jones and Palladio to themselves restore,  
And be whate'er Vitruvius was before."

Of all the marvels produced either in France or England in the last century perhaps the most beautiful, as far as plan goes, was the Château de Marly, which was pulled down by order of the first French Republic. On the table is a monograph of this great and almost last work of J. H. Mansard, in which you will find many beautiful points to observe, but also very much to avoid. The sole excuse for these extravagances lay in the assumption that the glories of Athens and Rome were being successfully emulated in the architectural monuments of the day. Pope, however, saw the absurd aspect of this kind of bombastic revival, and satirised it in his epistle to the Earl of Burlington, wherein Canons, the estate of Lord Chandos, is alluded to as Timon's villa:—

"Greatness with Timon dwells in such a draught  
As brings all Brobdingnag before your thought."

Who but must laugh, the master when he sees,  
A puny insect, shivering at a breeze!

My lord advances with majestic mien,  
Smile with the mighty pleasure to be seen;  
But soft,—by regular approach,—not yet,—  
First through the length of your hot terrace sweat;  
And when up ten steep slopes you've dragg'd your  
thighs,  
Just at his study-door he'll bless your eyes."

Before this was written Swift had caricatured with equal force the fashion of the day in literature. As terraces, vestibules, and ante-chambers had to be traversed before reaching my lord's presence, so books had their dedications, introductions, and prefaces. In "The Tale of a Tub," Swift begins with the author's apology, followed by a postscript; then comes a dedication to the Lord Somers, with a word from the bookseller to the reader; after which a dedication to Prince Posterity precedes the preface, while the matter of the book itself is almost lost in an introduction and conclusion of considerable length. The satire was deserved, and the commencement of the end of the grand epoch was thus announced. How the minds of men were affected by the "grand" and the "stately" in an age of courtesy and compliment, how they were guided in their appreciation of the works which served as its models, and ignored the Mediæval architecture of Western Europe, may be seen in Addison's description of the different effect produced by the contemplation of an ancient and a Mediæval building. "Let any one reflect," he wrote in the *Spectator* (No. 415), "on the disposition of mind he finds in himself at his first entrance into the Pantheon at Rome, and how his imagination is filled with something great and amazing, and at the same time consider how little, in proportion, he is affected with the inside of a Gothic cathedral, though it be five times larger than the other, which can arise from nothing else but the greatness of the manner in the one and the meanness in the other."

But we have changed all that, and more than one British student of architecture has asked himself, when outside the Pantheon, whether the precious time of a tourist in search of the picturesque might be profitably wasted by stepping inside. This same tourist, in his passage through French and Italian cities, may yet regard the great *portes cochères* of ordinary houses, the spacious courtyards of private residences, as so much space to be built upon, which his own more acute compatriots would long ago have converted into a solid mass of offices or dwellings. He may yet wonder why palaces of justice, Government and municipal offices, possess vast halls or *salles des pas perdus*, always open to the public, and often full of people, seeing that in his own more favoured country, the birthplace of popular liberty and common sense, the home of practical men, there are none of such things; and year after year it becomes more and more patent that such things can be dispensed with, and, indeed, are the mere vagaries of an exploded theory or the outcome of affectation, which is profitable solely to the architect, as the one person interested in making what we call a fine building. But neither in France nor Belgium, neither in Germany nor in Italy, do Governments think or act thus. There, no portions of a public work are more carefully considered, or more spacious, than the portions open to the people, and devoted to their use. How such works are understood in France, what the character of ideas which guide the architects who devise them, may be seen in some of the selected designs for the Prize of Rome, photographs of which are hanging on the wall. There is actually a place of justice among them, the architect of which has conceived not only the desirability of a magnificent vestibule, but also a public hall giving access, on each of its three sides, to a court of law. Nor are these designs the chimeras of irresponsible youth. Many of them, matured and, perhaps, reduced in dimensions, are afterwards worked into practical shape; they form parts of monumental buildings, paid for by the nation, and worthy of it,—the very antithesis of that British notion of compactness which may yet culminate in placing the hall-porter of our proposed new Government offices in a box on the street pavement, when it shall be seen, too late, that the spirit of false economy and speculative adventure which inspires the action of modern Ministers has added a fresh architectural calamity to the list of their irretrievable disasters.

Now, what have we got in the place of the

"grand" method of our fathers? In lieu of a courtyard we have a low doorway opening upon the public street; in lieu of a vestibule, of an ante-chamber, we get a vaulted corridor, which, in more than one instance I can name, has an entrance-door at one extremity and a darkened window at the other. Let us, then, inquire how this change has come about?—how men's minds have been led to accept the present haphazard fashion of planning new buildings, and the utter absence of any wish or attempt to compose them?

That the course of revival during the present century has been largely affected by literature of the romantic sort, it is unnecessary to do more than note. That it entered upon a new phase after the attacks of Pope, and the wits that he inspired, has been explained over and over again. The Gothic cathedral, the fortress converted into a signorial residence, the bishop's palace, the manse, the grange, or what not of Mediaeval origin and descent, when they first attracted the archaeologist, were made up of the work of different and successive epochs. A hall erected in one century had its window openings doubled in size in the next; fifty years afterwards a clearstory may have been added. The low porch, or the low arches of a cloister erected in the thirteenth century, may have been partly pulled down and rebuilt in the fourteenth century with more sharply-pointed arches, and filled in with tracery. What met men's eyes when they first began to see the beauty, and perhaps the grandeur, in Gothic work to which Addison was blind, was a something eminently picturesque,—a something that retained its beauty under grey skies, could do without sunshine, enjoyed a monopoly of gloom which served for shadow, and possessed, in its dilapidated, ivy-clad condition, all the charming properties of a sketch and few of the prosaic, necessary fittings or fixtures of the finished building. All over the country were to be found works of this kind; in many notable instances they were the heritage of noble families, of squires, and county people, whose reigning head might have pleaded, though he rarely did so, that the dilapidations of his ancestral home were typical of long descent and early connexion with the soil. Then inquiry bred inquiry, archaeologists mustered, architects learned to reproduce such houses. Rich men who were not proud of their ancestors, and even had reasons for not alluding to them, jumped to find that money could purchase and architects could provide country seats as varied in age and as old in appearance as any ancestral hall or as old the principal entrance was low and a little out of the centre, if it led to the back instead of the front part of the house, the illusion was all the more agreeable and complete. Architecture thus conferred gentility, and no complication of hall or passage was too irregular, no grouping of parts too illogical to subdue the owner's proud reflection that his new house was of the very oldest and most historical in style. So, after all, the immediate outcome of archaeological science, whether it revive the ancient works of Athens and Rome or the Mediaeval creations of Western Europe, is affectation, and not very dissimilar to-day from that of the great epoch of Louis XIV. and his successor. The Timon of Pope was pleased to create, often on a barren soil, something entirely new; the Timon of to-day aspires equally to create, but in fertile glades, something supremely old; and, as we are now considerate enough to deprecate with a smile the affectation of a Bathurst or a Boyle, so may posterity review kindly our present triumphs of architectural skill, which will, I fear, haffle, ere the next century be finished, all the wit of Birmingham, all the learning of Leeds.

Frankly, I feel that too much of the old grand manner,—not to be confounded with the "grand old" manner,—of the stately method of composition in architectural planning has been discarded, and that a too great regard for the picturesque at any price now tends to deprive a public building erected in this country of the oneness and harmonious disposition of parts which belong to the monumental erections of Paris, Vienna, and Berlin. I am not so Quixotic as to suppose that every building can be made to tell its proper tale, but I do most certainly think that our present method of grouping a congeries of buildings, with innumerable entrances, small and confined vestibules, all to do duty as parts of a public office, a town-hall, or a palace of justice, is fatal to popular convenience

and destructive of private comfort. In all such buildings there should be not only an entrance, well and conspicuously marked, but a central hall in which the stranger or the visitor may obtain an information to guide him in his search for a particular office or a particular court. The architect can only by such an arrangement afford the means of making his building intelligible and facile to those who use it. But whether by the fault of others who pretend to instruct him, or from his own desire to be quaint and picturesque, many of the newest public buildings in this country fall in just those points,—in the arrangement of those parts of a great building which should be common to the public,—upon which the architects of the two last centuries lavished their skill, displaying therein a by-no-means contemptible acquaintance with ancient learning, which they used to the profit of the arts and manners of their time.

For some notes of the discussion which ensued, see p. 873.

#### THE COURTENAY MANTEPIECE IN THE BISHOP'S PALACE, EXETER.

WHATEVER may be the case in other climes, the centre of attraction in an English living-room during nine months of the year is unquestionably the fire-place. It is right, therefore, that the object upon which the eye rests most frequently,—and, may we not say, most fondly?—should be one designed not merely to fulfil its special purpose, but to give artistic pleasure. This principle was kept in view by Mediaeval architects, and some grand examples of mantelpieces in marble, stone, and wood may occasionally be found in old English mansions and manor-houses. One of more than ordinary beauty is to be seen in the episcopal palace at Exeter, where it occupies the position in the hall assigned to it by Bishop Phillipotts in 1845. Previously it had stood in the dining-room, and, when there, borrowed tone and colour from the light which fell upon it through the richly-blazoned windows. This consideration may, perhaps, account for the absence of any traces of gilding or colouring even upon the armorial bearings and heraldic devices which are the chief features of the mantelpiece.

The mantelpiece forms the subject of a dainty volume, printed, unfortunately, for private circulation only, at Torquay,\* and rendered attractive by the skillful pencil of Mr. Roscoe Gibbs, and the no less skillful pen of Mrs. Maria Halliday. The history of the mantelpiece is told by itself in the language of heraldry. The centre finial, which rises to a height of 12 ft., consists of the arms of France and England within the garter, surmounted by the arched diadem of Henry VII., and supported by the greyhounds of his consort, Elizabeth of York. Beneath the royal escutcheon occurs the port-cullis,—the cognizance of the Beauforts, which is repeated in the decorated soffit below, and serves for a capital to the dexter column flanking the mantelpiece, as the double rose does to the sinister one. In this arrangement there is an obvious allusion made to the union of the houses of York and Lancaster in the person of Henry VII. Below the royal arms is a beautifully-carved mitre, to which are attached two pendants richly fringed. The position of the mitre may, perhaps, indicate that in Tudor times the supremacy of the Crown was recognised even by

\* Sir Edward Courtenay and the haughty prelate,  
Bishop of Exeter, his elder brother,  
"Richard III.," act iv., sc. 1.)

whom Henry of Richmond was largely indebted for his throne. But the great glory of the mantelpiece is the entablature, which is divided into three equal compartments, each occupied by heraldic shields and other devices. Scrolls bearing appropriate mottoes are introduced with great skill, and the disposition of the dolphins round the centre escutcheon (the arms of the see of Exeter impaling those of the Courtenay) is singularly felicitous. In the mouldings, horizontal and perpendicular, the bishop's initials and family badges give distinctive character to the work, even in its smallest details. It should be mentioned that all the carving is executed in low relief, and in its present position is seen to much less advantage than in that for which it was originally

designed. On the other hand, it is in exceptionally perfect preservation, and is one of the best specimens we have of genuine heraldry applied with taste and meaning to internal decoration.

Mr. Gibbs has added much to the value of his monograph by his researches into the heraldic bearings of the sees of Exeter and Winchester; and his definition of their differences, as seen in Exeter Cathedral, is exceedingly curious. He also draws attention to the remarkable figure carved on the east end of Bishop Stapledon's monument at Exeter, which, from its position, escapes general observation. It is evidently that of King Edward II., whose cruel murder at Berkeley Castle preceded that of the bishop by a few weeks only. The expression of the face is rendered with great power, and five centuries have not sufficed to destroy the original colouring of the figure.

#### HATCHETT'S HOTEL AND "WHITE HORSE CELLARS," PICCADILLY.

We have had an opportunity of going over these premises, now just completed and on the eve of opening. They occupy the site of the old hindings bearing the same designations,—so well known in the past and at the present day in connexion with coaching business and four-in-hand clubs,—and the result is a notable addition to the architecture of Piccadilly. The style adopted by the architects, Messrs. W. S. Weatherly and E. E. Jones, of 20, Cockspur-street, is English Renaissance of about the period of John Thorpe's Kirby Hall, the first stone of which was laid in 1570. The materials used externally are red bricks (supplied by Mr. Thomas Lawrence, of Bracknell) and Ancaster stone. The building is lofty and picturesque, and by means of bays and oriels a great variety of prospect has been obtained, the situation at the corner of Dover-street being very advantageous in this respect. The "White Horse Cellars" are perpetuated in the form of a new and lofty chamber in the basement, vaulted in Dennett's fireproof construction, and having a high dado of panelled deal. Although the floor of this apartment (which is paved with Lowe's wood-block flooring) is 17 ft. 6 in. below the pavement level, there will generally be abundance of light, daylight being supplemented when necessary by incandescent electric lights, which Messrs. B. Verity & Sons, of King-street, Covent-garden, have provided an installation, worked by one of Otto's 12-h.p. gas-engines setting in motion one of Edison's T dynamos. The engine and dynamo are provided in duplicate, in order to provide against breakdowns, repairs, or other contingencies. So far the electric light is only provided in the basement and on the ground-floors, and to the principal staircase. The distribution and mode of treatment of the fittings for the incandescent lights have been specially arranged by the architects, and exhibit a welcome departure from the tentative expedient of utilising the forms of gasfittings. In the "Cellars," the incandescent lights are inclosed in small lanterns suspended from corons; in some of the apartments on the ground-floor the lanterns inclosing the lights are suspended near the ceiling by silk cords; and in one case they are very happily combined with the pendants which form part of the design of the ceiling. The effect in each case is very satisfactory, and the fittings are well carried out by Messrs. B. Verity & Sons. The large and lofty vaulted chamber already referred to as forming part of the basement is to be used as a luncheon-room, it being approached by a broad marble-lined staircase from Piccadilly. In this apartment there will be a grill for chops and steaks. The ground-floor will be appropriated to a buffet and luncheon rooms, and on this floor also there will be the Coaching Coffee-room. The public and private dining-rooms are on the first floor. The woodwork of some of these rooms is of ammoniated wainscot, that of the large dining-room and of other rooms being of American walnut. The external doors are of teak. The fireproof construction is by Messrs. Dennett & Ingle. All the ornamental ceilings have been made from the architects' designs, by Messrs. George Jackson & Sons, in their fibrous plaster. The furniture and decoration is by Messrs. Shoobrod & Co. "Tyne-castle Tapestry," very richly decorated, is used in some of the principal rooms and on the staircase, as a wall covering, while in the bedroom

\* At the office of the "Torquay Directory," 1884.

flowered silk damask is employed for the same purpose. The ceilings of all the principal apartments are richly decorated, gold being plentifully though not too lavishly employed, the effect being rich without any approach to garishness. The fittings, including the chimney-pieces, have been specially designed by the architects. The kitchen is at the top of the building, but completely cut off from the main staircase. The kitchen fittings are by Messrs. J. & F. May, of Holborn, and are very complete. The vestibule of the hotel proper (to which the entrance is in Dover-street), is provided with a telephone lobby, and with another lobby containing electric-bell indicators and communicators. The wrought-iron balustrade, richly gilt, to principal staircase, is by Mr. J. Stone. The locks and the fanlight apparatus (patented for this building) are by Charles Smith & Co., of Birmingham, who also executed the external wrought-iron railing and gates. The stoves in bed and sitting rooms are by Longden, of Sheffield, the dog-grates in the larger rooms being supplied by Messrs. Shoolbred. The whole of the marble-work, including chimney-pieces, has been executed by Messrs. Farmer & Brindley, and is noteworthy for excellence of workmanship as well as for beauty of material. The hall and staircase have white marble steps and strings, the walls up to handrail level being a "Brescia," and above that height "Pavonazzo." The columns and pilasters in the large dining-room are of "Brescia Africano," the chimney-pieces in the same apartment being of "Gialleza statuary," the coupled columns of the same being beautiful specimens of "Isola." The counter-top in the buffet is of "Giallo Antico," from the ancient quarries near Carthage. Other marbles used are "Orange Verona," "Yellow Verona," "Polcevera," "Pavonazzo," and a choice Spanish marble from Catalonia. The bed and sitting rooms, while combining a general unity of style with great cosiness, are pleasingly varied as to size and shape, decoration and furniture, and the service arrangements are excellent. The sanitary arrangements are mainly by Messrs. Jennings. The lavatories are by Messrs. Bolding. The fire hydrants, &c., are by Messrs. Merryweather. The electric bells were supplied by Mr. Dale; and the lightning-conductor is by Messrs. Gray & Co. The contractor for the erection of the building was Mr. John Grover, of New North-road.

**A New Floating Fire Engine.**—On the 19th instant a trial took place with a new self-propelling floating steam fire-engine, constructed by Shand, Mason, & Co., to the order of the Bristol Corporation, for the protection of the docks and water-side property in that city. The hull and propelling engines have been constructed to the specification and under the superintendence of Mr. J. W. Girdlestone, engineer to the Bristol and Avonmouth Docks, while the fire-engine is similar to one supplied in the early part of this year to the Metropolitan Fire Brigade, which, we are informed, has proved so successful at several water-side fires that two others are now in course of construction by the same makers. The experiments were conducted in the presence of Captain Shaw, C.B., Chief of the Metropolitan Fire Brigade, and Mr. Wingfield, superintendent of the Bristol Fire Brigade, and were carried out in a satisfactory manner. At a previous trial a few days since at the measured mile a mean speed of 8.9 knots per hour was obtained, which, considering the size and special construction of the boat, proved very satisfactory. The boat is of steel, 53 ft. long and 13 ft. 6 in. beam, built in four watertight compartments, the screw propeller being driven by a pair of high-pressure engines. The fire-engine is Shand, Mason, & Co.'s equilibrium, discharging 1,100 gallons per minute through a 2 in. jet, reaching, under favourable circumstances, a height of 200 ft. There was no opportunity of testing the height on this occasion, but a water-pressure of 140 lb. per square inch was obtained, the steam-pressure being 110 lb. The boiler is of Shand, Mason, & Co.'s patent inclined water-tube construction, which has been successfully in use for fire-engine and other purposes for fifteen years. The boat will be taken through the canal to Bristol in a few days and finally tested there in the presence of Mr. Girdlestone and the Bristol authorities.

### DESIGN FOR WAR AND ADMIRALTY OFFICES.

BY MR. E. R. ROBSON.

WE gave Mr. Robson's design for the War and Admiralty Offices in the form in which it was submitted for the first competition (see *Builder* for August 16 last), but we think that the fine qualities of the design render it well worth being shown to more advantage than in the small scale-line elevations of the first competition series. Mr. Robson has had two points in the design, at our suggestion, worked out in detail in perspective views; viz., part of the Whitehall Front and an angle of the Park Front. The method in which the old Admiralty screen is worked on the Whitehall Front, with the main building carried round in a semi-circular sweep behind it, is very effective. The Park Front shows some happy adaptation of Classic detail with considerable originality and refinement.

Few of the designs exhibited seem to us to have so well combined the idea of a War Office, in the stern solidity of style and simplicity of grouping which characterise the building, with the merit at once of originality and coherence in architectural treatment.

### DESIGN FOR INFECTIOUS DISEASES HOSPITAL, NEWCASTLE-ON-TYNE.

THE design which we illustrate was prepared in conformity with the instructions issued. The administrative block is in a central position, and near the road. The medical officers' rooms are *en suite* on the ground-floor. The matron's sitting-room and store-rooms, nurses' dining-room, kitchen, and offices, are on this floor. The dispensary adjoins the nurses' room. On the first floor are bedrooms for the matron and nurses, and on the second floor bedrooms for the servants.

All the ward blocks are placed almost due north and south. Each block accommodates fourteen patients: ten in general ward, two in small ward, and one each in two single bed wards. For each patient in the general ward there are allowed 11 lineal feet of wall space, 143 superficial feet of floor space, and over 2,000 cubic feet of airspace. Excessive window area has been avoided. At the south end is a "sun-room," with open fireplace for convalescents. The windows are so arranged that they can be folded back, and an open verandah formed for use when the weather permits. An alternative arrangement shows terrace, as the "sun-room" was not mentioned in the instructions. Disconnected from the ward block by the main corridor are dressing and bath rooms, with entrance-lobby, where patients are entered or being discharged. The connecting corridor is 10 ft. wide. The upper parts of the windows are filled with glass louvres, the lower parts hung so as to fold against the wall, and form into an open corridor.

**Ventilation.**—Inlets for fresh air behind each fireplace, under each bed, and in corners, warmed when required. Top part of windows swing inwardly; lower part, double-hung sashes, with bottom head the depth of the rail, so as to admit air at meeting-rail without draught. Above the ceiling is formed a ventilating chamber, in which are hot-water coils, with louvres at the ends, and two large air-pump ventilators on the ridge. In the ceiling of the general ward, to each pair of beds, is an opening for outlet, fitted with exhaust and draught-preventer box, in which a gas jet, on the Bunsen burner principle, would be continuously burning. Each chimney has an exhaust ventilating-flue, and each gaslight has its separate vent.

### ST. OSWALD'S COLLEGE, ELLESMERE.

THIS Lower Middle-class School is to be for 500 boys, to be boarded and educated at 18s. 18s. a year as at Ardingly, and is for the sons of the lower middle classes and upper artisan class. This amount is proved at Ardingly to give a profit, and, therefore, there is power at Ellesmere to reduce the annual fees when practicable. At present there is accommodation for 200 boys, and the numbers will be gradually increased as the buildings are completed.

The general form of the plan is that of the letter H, giving two open quadrangles facing west and east, with extensions to the south and north. At present there are erected the cross building of three stories, the ante-hall and hall, a two-storied building running east and west, and the offices on the north. Both hall and offices are for the complete number of boys. The dormitories face west on both the upper floors of the cross building, with a cloister 8 ft. wide on their east side, arched with brickwork. There are masters' rooms on these floors, and on the ground-floor, together with Provosts and other rooms, and staircases at each end, one of which is private, for the servants only. The principal entrance is in the centre of this quadrangle. The western quadrangle opens on a magnificent view over the Welsh mountains, from the Llangollen Valley to the Breidden hills, near Welshpool.

The eastern quadrangle is reached by a new road from the Ellesmere-road. Ellesmere is about a mile away. The new road winds round a curious artificial bill called "Spy-bank," supposed to have been a look-out place in British times.

The hall occupies the north side of the western quadrangle, and is 120 ft. long and 36 ft. wide. The lower story has flat-headed mullioned windows; it is now used as the chapel, but will be converted into a gymnasium when the permanent chapel is erected. The hall is reached by a flight of steps from the ante-hall. The ceiling is of flat timber construction and carried on two central stone columns; the angles of the plan are filled with oriel mullioned windows.

The cloisters of the wing enter on the south, and the archway is formed on the east for the chapel. On the north the offices open out. The offices have large kitchen, bakery, and laundry arrangements, and large dormitories and bedrooms for servants and servitors, and also bath-rooms, &c., for the boys' use.

Foundations are put in for the dormitories and master's rooms and great school-room on the south side of the eastern quadrangle.

The corner-stone was laid by the Earl and Countess Brownlow, on August 5th, 1879, and since then the buildings have been steadily carried out. Mr. Bowdler, of Shrewsbury, executed the foundations, and Mr. Collins, of Tewkesbury, the superstructure. The fittings and fittings have been done by tradesmen employed by the committee, under Mr. Garland, the clerk of works. The heating is by Messrs. Haden, and the laundry fittings by Messrs. Bradford. About 27,000*l.* has been at present expended.

The architects are Mr. R. Herbert Carpenter & Mr. B. Ingelow, of London, the college architects. The style of the buildings is a simple variety of Late Gothic, the ball windows alone having tracery, others having square Cefn stone beads and mullions. The facing and walls are of red Ruabon brick, as are the strings, plinths, window and arch jambs, &c. The roofs are covered with Portmadoc slates; paving bricks from Ruabon are used extensively for the cloisters and offices, stair landings, &c. The ultimate cost will be about 50,000*l.*

### BEDSTONE COURT, SHROPSHIRE.

WE gave the description of this house in our last. We add this week the plan and another view of the house.

**Trade Calendars.**—A calendar for 1885, which will be very useful to plumbers, painters, and glaziers, has been issued by Messrs. Farmiloe & Sons, of 34, St. John-street, West Smithfield. It contains tables giving weights of lead pipe; weights, gauges, and sizes of sheet zinc; glass measurement table, giving superficies from 24 in. by 40 in. to 60 in. by 40 in.; a calculator for the oil-trade, for reducing the cost per ton to the cost per gallon; and much other handy information for the trades mentioned. It is mounted on stiff cardboard so as to hang on the wall of office or workshop, and may be had for sixpence. Another handy trade calendar for the wall has been issued by Mr. A. J. Hall, of Barrington-road, Bristol. This includes a table showing the number of feet of different scantlings (from 2 in. by 4 in. to 4 in. by 12 in.) in a Petersburg standard; a table showing price per standard at so much per foot run; and other useful information.

## ARCHITECTURAL ASSOCIATION.

The fifth ordinary meeting was held on Friday, the 19th inst., Mr. Cole A. Adams, President, in the chair.

The Chairman drew attention to the report of Mr. George Aitchison, A.R.A., on the work submitted in competition for the Prize in the Class of Colour Decoration, 1884. In this report Mr. Aitchison gave Mr. Hennings the first place, Mr. Lewis being put second.

Mr. W. H. White then read a paper entitled, "The Ante-chamber, To-day and Yesterday, in French and English Plans," which we print in another part of this number.

The Chairman, in opening the discussion, remarked that looking at the question simply as treating of the ante-room, it would appear, at first sight, that little could be said. Those, however, who had followed Mr. White's paper might deduce from it that the tendency of the Gothic revival had been, perhaps, too much in the direction of studying picturesque effect, and neglecting that balance of parts which distinguished the Classic era of architecture. In modern houses the hall had become an important feature, and in many cases in his own experience great stress had been laid upon its being a sort of ante-room, with staircase leading out from it, and the other rooms grouping around it. No doubt the ante-room had disappeared in many houses simply from questions of cost. In the Albert Hall Mansions, planned by Mr. Norman Shaw, the visitor, after ascending the great staircase and knocking at the door, is at once shown into a square chamber, from which the rooms lead out; and a very pleasant arrangement it is.

Mr. Lawrence Harvey said that Duban termed architecture, *decoration construite*, and the architect of Blenheim had apparently the idea of immense decorations acting as a frame for the proprietor. The idea of decoration should not be allowed to run counter to that of practicality; but Vanbrugh's idea was that a quarry of stones should be used to produce effect. Although not a Gothic architect himself, he considered that the Gothic people took a much more correct view of architecture than the Classics did in works of this kind.

Mr. J. A. Gotch proposed a vote of thanks to Mr. White, and expressed his admiration for the ingenuity displayed in making the subject of the ante-chamber so amusing and instructive. As a matter of fact, huge wandering plans were in existence before the last century, one notable instance being Audley End in Cambridgeshire. This house, although now too large for the occupier, only covers one-fourth of the space it originally did. The house consisted of a block and two large courtyards, one being simply a series of little rooms or lodgings, which in the course of time were found to be useless, and were taken away. So that about the time when Blenheim was being erected, with its superfluous and unmeaning grandeur, Audley End was being denuded of what had been weighed in the balance and found wanting. Lord Bacon, in his description of what a palace should be mentioned the "Ante-camera" as a necessity for a noble suite of rooms. The idea of making the hall into a sort of sitting-room seemed to be a very admirable one where it could be done, because at present a great deal of space in the shape of passages and corridors was thrown away.

Mr. G. H. Blagrove remarked that it was only in the case of large mansions that they had the opportunity of planning the hall. Mr. White might have said whether he preferred having a staircase separate from the hall, or having it worked in and made an important feature of the one hall. Sometimes a very fine effect was produced in old mansions, such as that at Gatton, near Reigate, by the hall being carried up two or three stories. Some excuse might be pleaded for the defects pointed out in Blenheim, as it was distinctly a monumental building. It was allowed to be a great work of genius.

Mr. W. J. Nash said that Vanbrugh had the virtue of using good materials, whereas in Italy Palladio's palaces were frequently built of stucco and plaster. The ante-chamber might be very well utilised in modern plans. The wretched passages called halls were a disgrace to any country.

Mr. F. R. Farrow (holder of the Godwin Bursary), referred to the houses in Vienna, which were built in flats with plenty of ante-chambers. One great drawback, from a London point of view, to the plan of the Continental

house, was the great expense of having ante-rooms. It would have the effect of raising the rents of the flats, which were already too high. In Vienna a man had to pay away one-third of his income in the rent of his suite of rooms, and this was accounted for by the fact of their being planned on a grand style and having so many rooms which were not strictly necessary.

The vote of thanks having been cordially received,

Mr. White, in replying, said that Mr. Gotch was correct in saying that grand planning came over from France in the latter part of the seventeenth century. As to the excessive cost which would arise in the case of houses with three ante-chambers, the present speculative owners of houses were making 7 or 8 per cent. but, if they would be content with less, the occupiers might have their ante-chambers, and he believed this would be the case ere long.

## COMPRESSED AIR

AS A TRANSMITTER OF POWER AND AS A SANITARY AID.

A PUBLIC meeting of manufacturers and others was held in the Old Lecture Theatre of the Midland Institute, Birmingham, on the 17th inst., to receive explanations of the scheme of the Birmingham Compressed-Air Power Company, who propose to supply to power-users from a common centre compressed air for the driving of machinery, &c., upon terms and conditions which, it is claimed, will compare advantageously with the cost and practical requirements of steam. Having obtained Parliamentary powers and the consent of the Corporation, the company propose to erect works and lay down mains for the supply, in the first instance, of the central wards of St. Bartholomew, Deritend, and St. Martin, whence it can be extended, as the demand arises, to other parts of the town, where manufacturers or customers are found in sufficient numbers to make the undertaking remunerative. Under this system air-power will be laid on in the same way as gas or water, and may be turned on or off at will at any period of the day; and as users will only pay for what they consume, which will be measured by meter, there will be none of the waste inseparable from the use of steam.

Some interesting and important considerations in favour of the project (assuming the possibility of its practical success) were laid before the meeting.

The Chairman (Mr. Arthur Chamberlain) pointed out that the carrying out of the scheme would save a large outlay on capital account to each manufacturer, inasmuch as steam boilers and chimney-shafts would not be needed. Moreover, users of compressed air as a motor would be able to "average" their consumption of power. At all times some manufacturers were busy and some were not, but whether busy or slack, if they used steam power they had to keep at the works the same plant for the production of the full amount of power that they might at any time require. By the adoption of compressed air as a motor they could use much or little, as their requirements varied. Moreover, no change of plant was involved, for engines which were now driven by steam could be driven by compressed air, and the abolition of steam boilers in workshops would take from employers a great deal of anxiety.

Professor Henry Robinson, of King's College, said that a meter had been devised which would not only register the volume of air which passed through, but its pressure, the Company being required by their Act to supply air at a certain pressure. There need be no appreciable loss of power through leakage and friction.

Mr. Wilfrid Airy made some interesting observations with regard to possible off-shoots of the main scheme, firstly, the driving of clocks and keeping them going in true time by means of compressed air. There were in Paris something like 8,000 clocks so worked, and the system was rapidly being extended there. Mr. Airy exhibited one of the clocks, and explained how, by means of a puff of air inflating a small bellows once every minute, the minute-hand was moved forward, the supply of air being admitted and cut-off by mechanism connected with a central clock, which was regulated by time-signals from an observatory. He also showed how a striking apparatus when required was attached to the clock, and kept wound up by means of the com-

pressed air. The mechanism of clocks consisted simply of the tiny bellows and two or three spur-wheels, and scarcely ever got out of order. In Paris the clock was supplied, driven, and kept in order for a small yearly tariff,—a very much smaller sum than most people paid nowadays for keeping their clocks going. The modern clock was an abominable instrument. It cost a good deal of money in the first place, a great deal to repair and keep it clean, and in many establishments there was an annual sum paid to keep the clocks wound up. All these expenses would be included in the small tariff charged for the compressed-air clock. The company in Paris also supplied a large number of clocks to the municipality. These were placed at crossings of streets, in squares, and in other public places. The contract stipulated that the company should pay a certain fine for every minute that the clocks were not going, but up to the present time not a single fine had been incurred. The system was in use over an area about one mile and a half long by three-quarters of a mile wide, and twenty or thirty miles of pipes were used. The air-pipes in Paris, like all the other pipes in the city, were laid in the sewers, but they might just as well be laid in the streets. Another possible offshoot of the main scheme was an improved gas-light, an incandescent gas-light. This also was already in operation in Paris,\* and had given very great satisfaction, for it was a very beautiful light. Coal gas and air were introduced simultaneously, but by separate pipes, into the interior of a burner consisting of a globe of stearite surrounded by a thin thimble of platinum. The stearite and platinum were pierced with a large number of small holes, through which the mingled gas and air issued and were burned. The stearite and the platinum became incandescent, and gave a light as good as the electric light for selecting fabrics in shops, and purposes of that kind. The light was also an extremely good one for street lamps, because, being an incandescent light, it was perfectly steady.

Mr. Arnold Lupton, speaking as one who had had considerable experience with compressed air, said he had no doubt that by its means power could be transmitted to every part of the district of two square miles and a half proposed to be served by the company, with the loss of, comparatively, a very few inches of water pressure. He certainly had heard of such a thing as a burst pipe, but it simply meant that there was a pipe gone, and no other harm resulted from it, the compressed air being a most harmless thing. Moreover, compressed air could be used as a means for ventilating rooms. He thought the only scientific mode of ventilating a room was to produce a *plenum* of pressure in the room, air being introduced through the proper openings in such quantities as to cause all the draught to be outward instead of inward, and therefore such as would not do any harm. Compressed air, too, had been applied to locomotives in mines with great success, and was equally suitable for tramways in streets, all that would be required being appliances resembling hydrants, at distances of a mile or half a mile, through which the engines could be supplied with fresh stores of air from the mains. The operation of re-charging the engine occupied about twenty-five seconds. The great advantage of compressed air was that there was no condensation in the pipes. They got their power at the other end, however long the supply-pipe might be.

Colonel Jones explained how compressed air had been used with great success at Eastbourne to force the sewage of the town out into the sea. He also suggested that it would be very useful in Birmingham for pumping chemicals, where metal pumps could not be used. In fact, an endless number of applications would be found for this power if they once got the mains laid in the streets.

Mr. Lawson Tait thought that the scheme was well worthy of attention from a sanitary point of view. The great difficulty of the Health Committee in dealing with the smoke nuisance was in connexion with the small manufacturers, who could not keep a man solely as a stoker, and whom to fine continually would be to ruin them.

On the motion of Mr. Jaffray, seconded by Alderman White, it was unanimously resolved, "That, having heard the explanation offered, this meeting is of opinion that the Birmingham

\* It has been exhibited in London.

Compressed Air Company's scheme is likely to prove a great advantage to power users in Birmingham, by offering them facilities which they do not now possess, and is worthy of public support.

#### RESPONSIBILITY IN SANITARY MATTERS.

DR. SIEVEKING presided on Wednesday evening, December 17th, at the last of the lectures which the Sanitary Assurance Association have arranged this year at the Parkes Museum of Hygiene. The lecturer was Mr. Mark H. Judge, A.R.L.B.A., who delivered an address on "Public and Private Responsibility in Sanitary Matters." Mr. Judge began his remarks by asking his audience to consider whether there was any real cause for serious attention to the conditions under which we live, whether sanitary reformers, from Moses and Mahomed to Edmund Parkes and Florence Nightingale, had been right in the importance they had attached to man's environment. The answer to this must come from the physician, from whom the architect must be content to learn what conditions are essential to health, that he might be able to design dwellings so as to secure such conditions. The authority of Professor De Charmont and Mr. Eric Erichsen was given to show that good sanitary conditions were not only essential to the maintenance of health, but often to the existence of life itself. Reference was made to the defects common to houses in all parts of the country. Speaking of main sewers, Mr. Judge said that they were specially within the province of the engineer, and that the best-constructed and ventilated main sewer was a piece of engineering with which the sanitary architect desired to have no direct connexion. Across the outfall drain he constructs a sanitary moat with iron draw-bridge for easy access in case of invasion from without or mutiny from within. Mr. Judge criticised the powers conferred on Local Boards and their surveyors, and said that they did not possess the qualifications which would warrant the Legislature in handing over to them the right to regulate the internal sanitary arrangements of our houses. He would strengthen the law by minimising its demands to essentials, and by insisting on its absolute enforcement. The responsibility of the individual owner or occupier should be increased, but in so far as the public authority pretended to interfere, he would make it a real interference, and in every case where the law was not complied with there should be some punishment meted out to those responsible for the breaches. Mr. Judge concluded by suggesting eight points, which, if embodied in the law, would define the duties of the public authority, and of the householders, in such a way as to improve the health of the public, and preserve the liberty of the individual. Of these suggestions the one to which most importance was attached was the second, viz., "Every house-drain to have between the house and the public sewer or common drain an air-chamber and disconnecting syphon trap, or an air-inlet disconnecting syphon trap, in a position where it can be readily inspected by the officer of the sanitary authority."

**House Areas.**—Some of the small areas upon which inhabited rooms in town dwellings are dependent for light and air are often productive of conditions prejudicial to health, and the limit, prescribed by legislation, of 100 ft. superficial, is subject to no restriction as to proportion, which is certainly to be regretted, since 10 ft. by 10 ft. is a very different thing from 20 ft. by 5 ft. Besides this, such areas are often carried to heights which render the access of a proper amount of light and air impossible. There is always a tendency, in these areas, for the air to become stagnant, especially in its lower strata. To remedy this, a device has been employed which we commend to the notice of all who are desirous of securing sufficient ventilation in confined areas. It is exceedingly simple and inexpensive, and it frequently omitted in the construction of town dwellings. It consists in connecting one open area under the floors of a pipe or channel passing under the floors of the basement rooms. If it pass under a kitchen so much the better, for the heat of the fire will increase the draught, and promote a free circulation of air.—*Sanitary Record.*

#### THE ARCHITECT'S DEPARTMENT OF THE LONDON SCHOOL BOARD.

At the meeting of the School Board for London on the 18th inst., the Works Committee presented a report, from which we make the following extracts:—

"On the 20th of November the Board referred to the committee a letter from Mr. E. R. Robson, resigning his appointment as Architect of the Board. The committee have since carefully considered the question as to the appointment of Mr. Robson's successor. They are of opinion that the large experience which Mr. Bailey, the Assistant Architect, has had in connexion with the work of the Board since its commencement, renders him specially qualified to succeed Mr. Robson, and they have no hesitation in recommending that he be appointed as Architect to the Board. Mr. Robson, however, is prepared to complete the schools which have been planned by him, and the committee think it would be an advantage to retain his services for this purpose only, for which they recommend that he be paid as remuneration at the rate of 500l. per annum, for a period not exceeding two years. They propose that the salary of Mr. Bailey (which is at present 432l. per annum, and would have been 450l. on the 1st of January) should, on his appointment as Architect, commence at 600l. per annum, rising by increments of 100l. per annum, to a maximum of 800l.; and that he should be required to give the whole of his time to the Board. The committee do not propose to fill up the appointment of Assistant Architect, vacated by the promotion of Mr. Bailey, but they recommend that one of the existing officers in the Architect's department be promoted to the position of chief draughtsman, with a commencing salary of 250l., rising by 12l. 10s. per annum to 300l. per annum. As Mr. Robson had the appointment of Surveyor as well as Architect to the Board, the committee propose that Mr. Young, the Assistant Surveyor, be now appointed Surveyor to the Board, and that his present salary of 432l. be increased to his maximum salary under the scale, viz., 500l. per annum. It is understood Mr. Young retains his private practice, which the Board, by their resolution of the 14th of November, 1883, permitted him to carry on. They accordingly recommended that the resignation of Mr. E. R. Robson, the Architect of the Board, take effect on the 1st of January, 1885.

That Mr. T. J. Bailey be appointed Architect of the Board, from the 1st of January, 1885, at a salary of 600l. per annum, rising by increments of 100l. per annum, to a maximum of 800l. per annum; and that he be required to give the whole of his time to the Board.

That Mr. E. R. Robson be employed to finish the schools which he has planned, a list of which has been submitted; and that he be paid as remuneration at the rate of 500l. per annum, for a period not exceeding two years from the 1st of January, 1885.

That one of the officers in the Architect's department be promoted to the position of chief draughtsman, with a salary commencing at 250l. per annum and rising by 12l. 10s. per annum to 300l. per annum.

That Mr. A. Young be appointed Surveyor to the Board, from the 1st of January, 1885, at his maximum salary of 500l. per annum.

In the course of the discussion which followed, Mr. Urth moved, and Miss Hastings seconded, an amendment to the effect that the annual increments of 100l. in Mr. Bailey's salary should be reduced to 50l. This was supported by Miss Helen Taylor, who said she was in favour of introducing entirely new blood into the Architect's department, and new ideas and practices into the building of the schools. The construction of many of the schools was radically deficient and faulty. Mr. Spicer, on the other hand, said there had been some very substantial improvements introduced into the schools of late years; and Mr. Heller said he could bear his testimony to the fact that the method of building the schools was in no way a crystallised system. The progressive character of the work of the Architect's department was a striking fact in connexion with the Board's history. That department had been engaged in gradually absorbing into their system ideas from all kinds of practical sources, and had striven to render the schools the best possible places for the masters and mistresses to work in. Mr. Bruce and the Rev. T. W. Wehber expressed their opinion that the salary proposed to be paid to Mr. Bailey was too low, Mr. Wehber saying that he was sure there was no other public body which employed an architect, demanded his whole time, and gave him such great responsibilities and so small a salary as did the Board in this case. Mr. Ross did not think the Board needed a specially-appointed architect. A gentleman could be called in whenever his services were required. The amendment was rejected by 21 to 16. Another amendment that the increments should be 60l. instead of 100l. was lost by 21 to 13, and the second resolution was agreed to, subject to an amendment (accepted by the Chairman of the Committee) hindring Mr. Bailey not to undertake any other professional work. On the proposal of the Committee that Mr. Robson should be employed for two years at 500l. per annum to finish the uncompleted schools he has planned (sixty-two in number), an amendment to reduce the salary to 400l. per annum was negatived by 23 to 6, and the recommendation of the Committee was adopted, as was the remainder of the report.

#### SLATE DÉBRIS AND ITS UTILISATION. CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

An ordinary meeting of this Society was held on Wednesday evening, the 17th of December, the President, Mr. Thomas Cole, A.M.C.E., in the chair, when a paper, illustrated with experiments, was delivered by Dr. G. Selkirk Jones, F.C.S., upon "Slate Débris and its Utilisation." The author, after describing the composition and geological formation of clay slate, called attention to the various substances which in the laboratory he had obtained from waste slate (or *débris*), such as crystallised alum, so much in demand as a mordant in calico-printing and other processes; secondly, a new filtering agent for sugar refining and water purification, this substance containing a large percentage of carbon; thirdly, a substance which he named "Argilline" to be used in conjunction with lime for the chemical precipitation of lime. The author then showed an aluminate of peculiar composition, possessing good detergent properties, and which, he said, had already found much favour among wool and silk scorers, its efficacy as a detergent being due, firstly, to its powers as a remover of grease, &c.; and, secondly, on account of its harmless action upon those delicate fabrics, the curl of the wool being uninjured, and the silk freed from the so-called gum without damaging the fibre. The slate *débris* was next shown in its prepared condition for the manufacture of French chalk, pigments, fillers' earth, earthenware, cement, and concrete. Another feature of slate *débris* utilisation was also pointed out, viz., the manufacture of good and substantial bricks, sanitary and other tubes, tiles, &c. The author showed by experiment the cleansing of dirty wool, selecting the worst specimen he could obtain. He also precipitated the solid matter from a gallon of very offensive sewage-water, leaving the effluent bright and comparatively pure. In speaking upon the question of sewage purification, and of our possible visitor, the cholera, the author remarked that this was not a question so much of cost as of national importance. From a sanitary and hygienic point of view, what, he argued, was 5,000l. or even 10,000l. a year outlay compared with the incalculable advantages of pure drinking-water and the prevention of zymotic diseases among the community?

The exclusive rights in respect to the foregoing have been secured at home and abroad.

#### AN ART GALLERY, MUSEUM, AND SCHOOL OF SCIENCE FOR ABERDEEN.

THE new Art Gallery has been erected on a site in the Schoolhill, from plans prepared by Messrs. Matthews & Mackenzie, architects, Aberdeen, whose plans were selected in competition. It is in the style of the Italian Renaissance, and has a frontage of 130 ft., with a depth of 90 ft., while its height towards the lower part of the wall, to the height of 9 ft., being of rough stone, of a pink colour, from Correnie; the general wall-face is of light-grey granite, from Kenmy; while the more ornamental features of the design are worked out in dressed pink stone, which has a lighter colour than the same material in its unheun state. The prominent feature of the front elevation is a portico, with two Corinthian columns, fluted at the lower end, and having the capitals carved out of the solid granite. The outer pilasters, two in number, have massive base-pieces and capitals. The doorway is arched, and has for keystones a head of Minerva, from a model presented by Sir John Steell, R.S.A., to his native city, and which has been reproduced in granite by Mr. G. L. Jamieson, of the Crown Granite Works. Over the doorway, in the centre of the portico, is an oblong recess, in which it is intended to place a figure group representing the fine arts. This piece of sculpture, which is the gift of Mr. Macdonald, of Kepplestone, is from a design by Mr. Lawson, London, and will also be in granite. On each side of the porch is a range of four square-headed windows, placed high in the wall, so as to secure for the interior a top light. These are finished with moulded architraves and cornices, and are each surmounted by a circular medallion, which may afterwards be sculptured. The main cornice, of dignified proportions, is carried over the entrance porch in the form of a large enriched pediment. The work has, for the most part, been done by local tradesmen.

The new School of Science and Art is to be presented to the city by Mr. Robert Gray, of the firm of Mackinnon & Co., engineers, a member of the Town Council, and a director of the Mechanics' Institute, in which vigorous science and art classes have been conducted in the evenings for many years. The building is at present in course of erection on the east side of the entrance to Robert Gordon's College. It has been designed by the same architect, and in its general features is almost a duplicate of the Art Gallery and Museum. Its frontage to the School hill is shorter, being 92 ft., as compared with 160 ft., and its porch, which projects farther, and is more ornate, has four Corinthian columns, instead of two in the Art Gallery. The entrance-hall of the school is 27 ft. by 22 ft., and from it a similar staircase as in the Art Gallery leads to the second floor. The retiring and attendants' rooms are extended on the left of the entrance-hall, while to the back is the model-drawing and elementary room, 66 ft. long, 28 ft. wide, and 18 ft. high, well lighted from the north by a range of high-set windows. On the west end of this large hall is a modelling studio, 20 ft. square, and on the right of the entrance-hall a lecture-room, 29 ft. by 21 ft. On the upper floor is a ladies' studio, 29 ft. by 21 ft.; the antique room, 40 ft. by 28 ft.; a painting studio, 28 ft. by 17 ft.; a room for the life class, 28 ft. by 20 ft.; an apartment for the master, and suitable cloak-rooms and lavatories. All the rooms of the upper floor have top lights. It is intended to unite the art gallery and the museum with the School of Science and Art by means of a handsome gateway thrown across the entrance to Robert Gordon's College, which, as those who are acquainted with Aberdeen know, is set far back from the street in the middle of extensive grounds. The design shows a triple archway, 50 ft. in length, the central archway 21 ft. across, and 19 ft. high, the flanking archways being about half that width. Above the archway a corridor, 9 ft. wide, is introduced, with a small apartment in the centre, in which pictures might be hung. This archway would cost about 1,000*l.*, of which (according to the *Scotsman*) the Art Gallery Committee have offered to pay one-half.

these it was provided that the appointment of any officer of the Board might be made by a minute of the Board signed by the chairman and countersigned by the clerk of the Board, and that any appointment so made should be as valid as if it were made under the seal of the Board. The plaintiff had been so appointed architect to the Board, and the subsequent orders for the execution of the plans were given by the minutes of the Board, properly signed, and his lordship was of opinion the plaintiff's appointment was within the meaning of that section,—that of an officer of the Board.—*Times*.

MARCH'S PATENT STREET-SWEEPER AND ELEVATOR.

On Friday, the 19th inst., a trial was made in Grosvenor-place and in some adjacent roadways of this ingenious machine, which is the outcome of much patient thought and experiment on the part of its inventor. The machine, as its name implies, not only sweeps the road, but lifts the mud or slop into the cart or wagon to which it may be attached. The machine is made in two forms, known as Nos. 1 and 2. The machine known as No. 1

upon a pivot running through the horizontal lever. The brush-pan being hinged to the elevator case is free to rise and fall. Also the rear shaft of brushes connected thereto. The elevator is driven by another spur ring. A long upright lever is centred at the lower end upon the lower shaft of the elevator. Upon this shaft is keyed a small spur-wheel which gears in an upper spur-wheel keyed to a short shaft which revolves in a boss of the lever itself. The two small spur-wheels are, therefore, always in gear, and the upper one is moved in or out of gear with the spur-ring by the long upright lever. At the top of this lever there is a pin which slides in a slot at the end of the shoot lever, whereby the shoot is raised or lowered simultaneously with the movement of the gearing below.

The trials made on Friday morning were, on the whole, very successful, and we trust that Mr. March's perseverance may be rewarded, and the comfort and health of the public promoted, by the wide adoption of his machine in London and other large towns. Of course, an extra horse is required to draw the wagon and No. 2 machine, but the spare horse should be abreast of the shaft horse, the shafts being made purposely to slide instantly from the middle to the "off" side, and *vice versa*, for that

is shown in fig. 1. This is the form in which the machine is placed in front of the cart, and permanently combined with it, the elevator in this case coming between the driver's "steering" and the cart. Machine No. 2 is shown in fig. 2.

Fig. 2.

This is made to couple on to the back of a cart or wagon, and is instantly attached or detached. Machine No. 1 would have advantages in some circumstances, as, e.g., in keeping clean the streets of crowded cities where the traffic might be slightly interfered with by having to connect and disconnect the machine as often as the cart or wagon became full, as would be necessary with Machine No. 2; but this advantage would be dearly bought if the "tip" or depth for the contents of the carts were at any great distance, seeing that to empty the cart the machine would have to be dragged with it. In both machines the working parts are essentially the same. A chain of revolving brushes sweeps the mud, dust, or slop up an inclined pan into the elevator case, the buckets of which, mounted on endless chains, discharge their contents on to the shoot projecting over the cart. On lowering the hand lever, the small spur wheel which is keyed on to the front shaft of the chain of brushes is withdrawn from the spur ring attached to the off-road-wheel. Further depression of this lever raises the brush-pan and brushes. In starting to work, the lever is raised, and the different parts resume their former position in the reverse order. A pair of right-and-left threaded screws, with elongated nut, connects the bind shaft of brushes to the pan, and enables the brushes to be brought down to their work as they wear away. The front shaft of brushes is also lowered by a screw which passes through the angle frame of the machine, and supports the small end of a horizontal lever, centred on the collar of the axle. The small upright lever which holds the front shaft of brushes works

purpose, the spare horse being attached by a leading-rope or whipple-tree to a hook on the fore-carriage. It is also required with this machine to work the lever for throwing the machinery into or out of gear. It is claimed for the machine that, going at the rate of three miles an hour, it will sweep thoroughly 1,200 square feet a minute of any road; that any worn or broken part can be replaced in a few minutes, duplicates being kept; that macadam roads swept by the machine will last longer than those swept by hand or by the one-revolving-brush machine; that varying brush pressure can be applied, according to the nature and quality of the road, or of the material to be swept; and that the machine sweeps and elevates other refuse, besides mud and dust, such as cabbage leaves, straw, &c.—a qualification which should commend the machine to the Duke of Bedford for use at Covent Garden. Obviously the employment of the machine would dispense with those offensive heaps of mud which, in many parts of London, sometimes wait a day or two at the roadside for the leisurely collecting cart or wagon to come round, becoming more or less dispersed over the roadway and pavement, or on the clothing of wayfarers, in the meantime.

The inventor has not yet had an opportunity of testing his machine as a means for clearing the streets of snow, but he says that if the snow were dealt with, as it is in Berlin and other large Continental cities, directly it begins to fall, his machine would pick it up. The patent provides for scrapers in lieu of brushes, if needed, to deal with deep or partially hardened snow, and though a few experiments may be necessary before the machine is brought to deal with snow efficiently, we understand that its adaptation to such a purpose has throughout formed a prominent feature of the machine in the mind of its inventor.

**A Builder's Mausoleum.**—A costly mausoleum is at present in course of erection in the cemetery at Wimbledon, by the family of Mr. B. Cooke, builder and contractor, of Battersea, who died a short time ago. The mausoleum, which measures 9 ft. by 7 ft. externally, is faced with Portland stone and red and grey polished granite. Above a base in Portland stone the frontages are faced with columns and panels in red granite, up to a height of about 8 ft. above the ground-level. These are surmounted by a cornice in stone. Above the panels there are double arched windows. The structure is surmounted by a dome. The entrance is on the north side, leading by a flight of steps down into the vault beneath, 10 ft. in depth. The mausoleum was designed by Mr. J. T. Armstrong, architect.

APPOINTMENTS NOT UNDER SEAL.

SCOTT V. THE GREAT AND LITTLE CLIFTON SCHOOL BOARD.

THE plaintiff in this case (upon which judgment was pronounced by Mr. Justice Mathew, sitting in the Queen's Bench Division of the High Court of Justice on the 20th inst.) was an architect, who sought to recover from the defendants, the School Board of the Great and Little Clifton District, a sum of about 90*l.* for services rendered in preparing plans for and superintending the erection of a school for the defendants.

The case was tried before Mr. Justice Mathew, without a jury, at the July Assizes at Carlisle, when it was conceded by the defendants that the plaintiff had, in fact, executed the work, or that for which had been given him by the Board, and had been agreed to by a resolution of the Board duly entered on their minutes. The defendants, however, refused to pay the plaintiff, on the sole ground that his appointment was not under the seal of the Board, and, inasmuch as it related to work of above the value of 50*l.*, was not binding upon the Board.

The case came on upon further consideration on the 22nd of November, and was argued at some length, the defendants' counsel resting their case mainly upon the cases on the subjects of contracts by Corporations from "Clark v. The Guardians of Cockfield Union," reported in *21 Law Journal*, Queen's Bench, p. 349, down to "Young v. The Corporation of Leamington," reported in "Law Reports," 8, Appeal Cases, p. 518, in which it had been decided that Corporations could avail themselves of a defence similar to that set up in the present case.

His lordship now gave judgment in favour of the plaintiff, and said that although it was true that by sec. 30 of 33 & 34 Vic., c. 73, a School Board was made a body corporate, with perpetual successors and a common seal, yet the same statute contained further provisions with reference to its proceedings, and these would seem to render the cases relied on by the defendants inapplicable; and his lordship said that if it were necessary for the decision in this case he should hesitate to look upon those cases as a safe guide in cases like the present, where the contract was for a purpose incidental to the performance of the duties of the corporate body, such necessity being evidenced by proof that the corporation had, with full knowledge of its terms and of all the facts, acted upon it, and taken the benefit of the performance. His lordship, however, held that the plaintiff was entitled to recover upon another ground, namely, that afforded by sub-sec. 6 of sec. 30 and rule seven in the third schedule. By

## PAINT ON FRONT DOOR.

SIR,—I have a front door that after being made and hung ten years still exudes resin, or whatever the thick liquid is that warms frequently brings out of red deal and similar woods. The door when new was treated in the usual way,—knotted and painted four coats, and five or six years afterwards was re-painted, the parts exuding this moisture being scraped bare and again knotted; but this did no good. Two or three years afterwards, all the paint was burned off the door, and the door again re-painted, and still the same oozing takes place. Now how to remedy this I really cannot tell. It is not caused by knots in the wood, but comes from the grain. Would any of those paints do that are made to stand tropical heat? If they would, are they made fine enough for a front door, or only fit for rougher purposes? It takes but little heat to draw out this moisture. Soon after it was painted the last time (in the month of April), a little afternoon sun in that month was able to bring up blisters and show the moisture behind them. If any of your experienced readers could and would give their advice on this, I should feel obliged. H. G.

## THE OMNIBUS AND TRAMWAY MEN'S BENEVOLENT SOCIETY.

SIR,—With reference to your notice of this Society in your last issue of the *Builder* [p. 839], will you allow me to state that, as the Society is yet in course of formation, we shall be glad to welcome the co-operation and aid of any gentlemen who are willing to give their support to so worthy a project, as I feel sure your readers will at once recognise this to be?

Communications should be addressed to the hon. secretary, from whom all information can be obtained.

HERON B. VERITY, Hon. Sec. pro tem.  
182, Strand.

## A QUESTION.

SIR,—I want a small atmospheric engine for churning. Will any one tell me the best maker?  
A. P.

## PROVINCIAL NEWS.

**Leeds.**—An important extension of the building known as the St. James's Hall Coffee Palace, Leeds, has lately been completed, the building now being one of the largest of its kind in the kingdom. Although Mr. W. J. Armitage, of the Farnley Ironworks, had expended upwards of 13,000*l.* on the hall as it stood up till recently, such success has attended the work carried on here that he has found it advisable to carry out considerable extensions, the cost of which, including land, will be about 19,000*l.* more, making the cost of the whole block about 23,000*l.* The new wing comprises the following accommodation, namely, on the basement, large provision stores; on the ground-floor, new first-class dining-room, 34 ft. by 20 ft., with an additional bay or alcove, 13 ft. by 7 ft. 6 in. This room is fitted up in a superior manner for better-class customers. The walls have a dado of ornamental glazed faience, and the ceiling is handsomely panelled with moulded ribs, with ornamental cornice and deep frieze. Adjoining this hall is a new entrance from York-street, from which a handsome stone staircase ascends to the top of the building. A further entrance is provided from the cross street between York-street and the Market, with stone stairs giving access to the basement and the upper regions of the edifice. The present dining-room in the existing building having been found too small, it has been materially enlarged by the addition of the two small rooms adjoining. Ascending from York-street, on the first floor, is a ladies' coffee-room, 17 ft. by 15 ft. 6 in. On the second and third floors bedroom accommodation is provided, whilst the topmost floor is used as a kitchen. The principal rooms of the building are warmed by hot-water pipes. In carrying out the new wing it has been the aim of the architect to let it harmonise with the existing structure so far as the leading lines are concerned; but he has chosen a later phase of Gothic, tinged with some Flemish characteristics. The building has been erected from the designs and under the superintendence of Mr. William H. Thorp, of Leeds. The original contract, amounting to a little over 5,000*l.*, was let to Messrs. Franks & Evans, of Skinner-lane, Leeds, but some additions have been made.

**Exeter.**—A bookcase and cabinet combined made in oak and walnut from the designs of Mr. Octavian Ralling, architect, together with a gold watch and illuminated address, has been

presented to Mr. Casley, of this city, as a token of appreciation by many friends, of his work in the cause of temperance and thrift among the working classes. Mr. J. R. Gibbard, builder, was the maker.

**West Bromwich.**—The new infirmary and laundry which have been erected in connexion with the West Bromwich Union were formally opened on the 18th inst. The buildings have been erected on land which was purchased in 1880 at a cost of 1,542*l.* Eight sets of designs were received for the buildings and reported upon by Mr. Thomason, of Birmingham. The plans accepted were those of Mr. William Henman, of Birmingham, and these plans were sanctioned by the Local Government Board after various minor alterations, and they are those which have been carried out. Twenty-two tenders were received for the infirmary work, and the lowest, that of Messrs. Stockton & Son, of Oldbury, for 10,500*l.*, was accepted. The contract for the boundary walling, railing, and gates was let to Mr. W. Bennett, of Sedgley, at 958*l.*; and that for the erection of the laundry was let to Mr. William Robinson, of Birmingham, at 3,570*l.* The actual cost of the infirmary, certified by the architect, is 12,447*l.* 3s. 2d. Accommodation is provided for 224 patients of three classes, viz., 170 ordinary, 44 contagious, and 10 infectious. The arrangement of the wards is upon the "pavilion" system, and they are placed north and south, so that the sun's rays may fall on each side during some portion of the day. The East Pavilion is for women, the West for men. Each contains, in addition to four large and two small wards, two nurses' rooms or ward sculleries, and two large day-rooms; also, baths and other conveniences. In the centre of the main block are the administrative offices, providing sitting and bed rooms for the nurses, the dispensary, the house-surgeon's rooms, the kitchen, and store-rooms. The contagious and infectious wards are separate from the buildings, and so arranged that each ward may be entirely isolated. None of the buildings exceed two stories in height, the staircases are all of stone, and numerous hydrants have been placed in convenient positions around the premises.

## CHURCH-BUILDING NEWS.

**Westminster.**—St. John's Church, Smith-square, Westminster, is about to undergo a series of important alterations, the present rector, the Rev. Canon Furze, having obtained the consent of the Vestry to certain changes, which will have the effect of bringing the interior of the church more in accordance with modern ideas. The old-fashioned high-backed pews are to be removed, and replaced with open sittings, while the arrangement of the seats is to be considerably modified. The result will be a slight loss in accommodation so far as numbers are concerned, but a great gain in comfort. The old method of heating by means of pipes beneath the pews is to be superseded, and the floor of the seats will be level with the floor of the church, instead of being, as now, raised some inches above it. The pulpit, which now stands immediately in front of the altar, will be removed to one side of the church, and the reading-desk will occupy a position immediately opposite. A faculty has been applied for, and when it is obtained the church will be closed for some three months. The cost of the work is estimated at 800*l.*, and the plans have been prepared by Mr. Butterfield, who will superintend the carrying out of the alterations.

**Govan.**—The foundation-stone of the new Govan Parish Church was laid on the 6th inst. The new building, which has been designed by Mr. R. Rowand Anderson, LL.D., of Edinburgh, stands in the northern end of the churchyard, and on the site of the former parish church, which has been pulled down and re-erected on another site in Govan. The new church is a much larger building than the one it replaces. It consists of a vestibule, over which is a gallery; then a nave with narrow side aisles, used only as passages; a transept on one side; a choir with side aisles, one of which is for the organ; a hall or chapel capable of holding 250 people; and a tower and spire or the north side, isolated from the church, but connected with it by a corridor. Advantage is taken of a fall in the ground to provide vestries, session-house, and hable's apartments under the choir. The bulk of the congregation will be seated in the nave, the remainder in the transept and choir aisle. The nave is 98 ft. long and 41 ft. broad, and the

aisles are 5 ft. wide. The choir is 30 ft. long and 22 ft. broad. The hall is 40 ft. long and 20 ft. broad. The total height of the tower and spire is 258 ft., and the width at the base is 35 ft. The architecture is of an early type, such as is seen at Pluciscarden Abbey. The cost of the new church will be 17,000*l.*, but this does not include the tower and spire, for the erection of which there are at present no funds. The contractors are:—Mason and joiner work, Messrs. J. & D. Meikle, Ayr; slater's work, Mr. A. D. McKay, Glasgow; plumber's work, Mr. John McFeat, Govan; plaster-work, Mr. R. A. McGilvray, Glasgow; gas-fitting, Messrs. R. M. Eastdale & Co., Glasgow; measurer, Mr. W. H. Dinamore, Bath-street, Glasgow; and clerk of the works, Mr. George Kernack, Glasgow.

**Wilton.**—Some improvements have lately been made in Wilton Church. The vestry, which was built some fifty years ago, has been pulled down, and an ancient window of the north aisle, which was partially blocked by the vestry, and two hutresses, have been restored. A new and more commodious vestry has been erected to the north of the chancel, with four stone doorways and windows and an open-timbered roof. Underneath it has been formed a chamber for a warming apparatus, the church having been recently fitted by Messrs. John King & Co. with their patent small tubes at a cost of about 80*l.* The three windows at the east end of the nave, over the chancel arch, have been filled with painted glass by Messrs. Clayton & Bell, the late Mrs. Acton (*née* Kinglake) having made a donation for this purpose. The central subject is the Sermon on the Mount, with the Virgin and Child and St. Mary Magdalene in the two side windows. The vestry has been built by Mr. John Pearse, of Minehead, builder, from the plans and under the superintendence of Mr. Houghton Spencer, architect.

**Tytherington.**—Several alterations have recently been made in the picturesque-situated parish church of St. James, Tytherington. The church, both inside and out, has been in a dilapidated condition for some years past. About twelve months ago the project of arranging for the restoration of the church was seriously entertained, and the task of preparing the plans for the alterations and seeing them carried into effect was entrusted to Messrs. Pope & Paul, architects, of Bristol, while the building contract was given to Messrs. Roach & Son, of Charfield. The work was commenced some six months ago, and the work is now completed. Previously to the alteration, the nave was covered in with a flat ceiling, but this has been removed, and the original oak rafters of the church left exposed, which not only gives a more lofty appearance, but is more in keeping with the general character of things. Considerable alterations, including a new arch, have been made in the chancel. The old-fashioned heavy-looking pews have been removed, and their places supplied with light open seats of pitch-pine. The chancel roof is entirely new. In the chancel new clergy seats and choir stalls have been fixed. These are of massive English oak, and are the work of Mr. Harry Hems, of Exeter. Mr. Hems has also executed the carving on the chancel roof, and has carved a rosettes in Caen stone, which occupies the entire width of the eastern end of the chancel. The tower screen, the lectern, the font cover, and altar-rails are also new, and of oak. The church has been heated throughout by hot-water apparatus, supplied by Mr. Weech, Mandin-street, Bristol. The entire cost of the alterations is estimated at about 1,500*l.*

## ROMAN CATHOLIC CHURCH-BUILDING NEWS.

**Nottingham.**—During the past twelve years a school and chancel have been added to St. Norbert's Church, which has now been further embellished and decorated by M. Modeste Van Aerschedt, a Belgian artist, and lately a pupil at the Academy of Painting at Antwerp.

**Deftford.**—The Church of the Assumption, built some years ago, has just had the high altar enlarged and completed, from the design of Mr. Fredk. A. Walters. An elaborate terracotta diaper, let into panelled stonework, extends upwards to a height of 6 ft., above which are a series of seven niches, with richly crocketed canopies surmounted by a carved and embattled cornice. Each niche is filled with an angel bearing the emblems of the Passion, the Blessed Virgin occupying the centre. The

eredos is flanked at each end with traceried and canopied buttresses, finished with the "Pelican" and "Agnus Dei" respectively. The work has been executed by Messrs. Earp, Son, & Hobbs, of London and Manchester.

#### STAINED GLASS.

**West Kensington.**—Four Munich windows have just been inserted in the Church of St. Mary, West Kensington, three in the chancel and one in the transept. The chancel windows represent Christ and the Syro-Phœnician woman, the Marriage Feast of Cana, and Christ healing the Sick; while in the transept the subject of our Lord blessing little children is introduced. The windows are by Messrs. Mayer & Co.

**Endon.**—A four-light stained-glass window, depicting Scriptural scenes, and including tracery, has, during the last few weeks, been erected in St. Luke's Church, Endon, by Messrs. Jones & Willis, of Birmingham and London.

**Wimslow.**—A three-light Munich window has been lately inserted in the Parish Church of Wimslow. It represents Martha calling Mary to the Master, John xi. 28, and is carried out in accordance with the architecture of the church, thirteenth century style. The architects are Messrs. Mayer & Co.

**Hunslet.**—Stained glass has now been inserted in one of the large north transept windows of Hunslet parish church, Leeds, by way of memorial to the late Richard and Ann Dobson, of Middleton Grange, Messrs. Powell Bros., of Leeds, were the artists entrusted with the work.

**Zanzibar.**—In connexion with the Universities Mission to Central Africa, a three-light stained-glass window, to be erected in Zanzibar Cathedral, in memory of the late Mr. Keith Johnston, by his mother and sisters, has been executed in Inat's varied antique glass, by Messrs. S. Belham & Co., 155, Buckingham Palace-road.

**Shadwell.**—A small Munich window, by Messrs. Mayer & Co., representing St. John the Evangelist, has just been placed in St. Peter's Church, London Docks, in memory of the late Mr. H. Rome Barton, eight years churchwarden of the parish.

### The Student's Column.

THIS is a week in which most of us are not bent on very serious study, and as our next subject for the Student's Column constitutes, like most of the previous ones, a series of articles on a special branch of study, we do not care to break it by commencing in the last number of the year. Instead of that, we will take the opportunity of saying a word as to this corner of the paper, and what we hope to do with it, — a word for ourselves and for our student friends at the same time.

It has never been intended that the *Builder* should be in its main scope, or in regard to the bulk of its matter, a paper for students or draughtsmen. It is rather intended to be addressed to the most educated section of the profession, and also to those persons (a large number) outside the profession of architecture who take an intelligent interest in architectural subjects. But we have wished to set apart a portion of our space in which to address those who are entering on the study of architecture as learners, and who may find it useful to have practical and artistic subjects treated of from their commencement, in plain language, and without assuming any knowledge on the part of the reader beyond just that general knowledge of what architecture is and what a building is, and what are the things to be chiefly thought of in carrying it out, of which every youth who has been for a few weeks, even, in an architect's office has some general notion. Having undertaken this, we have accepted it, however, as a serious responsibility, claiming, perhaps, in some respects more serious care than most other portions of the paper. It has been our effort and intention that everything set down here, in however plain and simple a manner, should be absolutely trustworthy, and that student readers may feel assured that in studying this column they are getting the best and soundest available information in regard to the subject treated of.

We commenced with some articles giving the outline of architectural history, as the background of the whole matter; and our proposal

then was to take up in turn various practical subjects in connexion with building; for it is in these practical subjects that plain and trustworthy information is most difficult to get, and it is in practical knowledge that the young architect of this generation is most frequently found wanting. We are becoming too much of draughtsmen, too little of builders. We do not by any means intend to imply that the artistic side is not to be treated in this column, so far as it can be made a matter for instruction; but we hold that it is the practical and scientific side of the profession which it will be most useful for us to deal with at present. We have already given some articles on practical subjects, which, we believe, have been found valuable. These will be followed next by others of a similar class on very important subjects, in one or two cases on portions of architectural education which are mostly overlooked in England, and in regard to which the work of an architect affords in this country no instruction whatever. As time proceeds other subjects will come forward for treatment; those which have already been treated of in a general way will afford room for further consideration in a more detailed manner. There can be no limit to the subjects for we are always learning in architecture, or always ought to be, and new processes and materials are constantly springing up, and new wants crying out for attention, and too often not receiving it.

Let us point out also to our student readers that we are desirous to make this part of our paper a medium for giving direct answers to questions asking for definite information on points in regard to architectural history, or design, or construction. We do not wish to turn it into a correspondence column, which would take away, we believe to be its best use, but we wish our younger readers to understand that whoever wishes for special information is encouraged to ask for it here, and that no pains will be spared to give him a reply, not in a mere perfunctory way, but to give the best information that can be had on the subject, whatever it may be, provided that it be within the proper and recognised province of an architectural journal.

Let us add that we are very glad also to receive any suggestions from our younger readers as to subjects which they would think it specially useful to them to see treated in this column. It may not always be possible to comply at once with such suggestions, but they will always be duly considered and acted on where possible. There is one proposition, however, which has been made to us more than once, and to which we will take the opportunity of here replying, viz., that these students' articles should be printed entirely on one page, or on a separate slip, for the purpose of being cut out and bound up by the possessor at the end of the year. There are some practical reasons against both suggestions, having reference to the convenience of printing and making-up a paper; but we may be allowed to add that the *Builder* is not published with the view of having one part cut out and the rest thrown away, and that we are afraid we cannot see our way to enter into special arrangements to facilitate that process.

That, we hope, however, will be regarded by our student friends as a minor grievance, which they will not think it worth while to quarrel with us about. We are doing the best we can for them according to our lights, and, expressing our hope to be able to be useful to them and to succeeding generations of architectural students, we take our leave of them for this year with the best wishes for their prosperity in the future before them, as well as the more immediate and seasonable wish of "A Happy Christmas to all."

#### Books.

*Men of Invention and Industry.* By SAMUEL SMILES. London: Murray. 1884.

NEW work from the pen of Dr. Smiles is sure to attract the attention of a large circle of readers. Those who may wish to hear from him something more of the biographies of men of invention and industry will not be disappointed by the perusal of his new volume. In the biography of Thomas Pett, who became assistant master shipwright at Chatham in 1601, we are told of the beginnings of English shipbuilding. In that of Francis Pettit Smith, who was raised to the honour of

knighthood in 1871, and who died three years later, we have an account of the practical introduction of the screw propeller, now the chief appliance of steam navigation. And we have a glance at the later development of iron and steel shipbuilding in a very interesting autobiographical sketch of K. J. Harland, to whose energy is chiefly due the prosperity of the shipbuilding industry of Belfast. No human industry has shown such an evolution as that of the shipbuilder. Henry VIII., Dr. Smiles remarks, was the first to establish royal dockyards, first at Woolwich, then at Portsmouth, and finally at Deptford. *The Great Harry*, launched for this monarch in 1515, was a vessel "the like of which had never before been seen in England." She was rated at 1,000 tons. In 1815 the first steamboat was launched on the Thames, by Maudslay. In 1846 the steam navy of Great Britain consisted of 360 vessels, with a total capacity of 74,000 tons. In 1883 the number of steam vessels registered as belonging to the United Kingdom was 6,260, with a tonnage of 3,728,268 tons; the sailing vessels at the same time being 18,415, with a tonnage of 3,513,948 tons. The men employed, exclusive of masters, in this year, were 200,727, or one to every 35 tons of shipping. In 1872 they were 203,720, or one to every 28 tons of shipping. Such has been the economy of human labour effected by the steam-engine, in this department of industry, in eleven years.

The life of John Harrison gives occasion for an account of the invention of the marine chronometer, one of the greatest gifts ever bestowed on the navigator. In the life of John Lombe we have an account of the introduction into England of the silk industry, or, rather, of that fundamental portion of the manufacture which consists in the production, from the cocoon, of the organdie or thrown silk. Machinery for this purpose existed in Savoy, where its construction was regarded as a state secret, to be kept on penalty of death. John Lombe obtained employment in a silk-mill in Piedmont, and means to see the engine, fled the country at the risk of his life, and took out a patent in London for the organizing of raw silk in 1718. With the aid of his brother Thomas, who was afterwards knighted, and received a grant from Parliament of 14,000*l.* as "a reward for his eminent services done to the nation in discovering, with the greatest hazard and difficulty, the capital Italian engine, and introducing and bringing the same into operation in this Kingdom," he erected silk-mills at Derby about 1720. Nearly 64,000 persons are returned in the census of 1881 as engaged in the silk industry. Dr. Smiles, however, says that "in 1850 the number employed in the silk manufacture exceeded a million persons." He does not give his authority for the statement. There has been a decline in the number of persons employed in the decade 1871-81, from 82,053 to the number before given, but the whole number of "persons working and dealing in textile fabrics" in 1881 is only given on the census returns at 1,053,648.

William Murdoch was born in 1754, in Ayrshire, where his father was a millwright. In 1777 he obtained employment at Soho Works, under Boulton and Watt, and became the right-hand man of the great inventor of the steam engine. He was the practical inventor of gas-lighting; and his biography is one of no little interest.

The invention and introduction of steam printing occupies three of Dr. Smiles's chapters; the inventors chiefly mentioned by him being Frederic Koenig, "the Walters of the *Times*," and William Clowes. There is an interesting chapter on that almost if not wholly unique incident in the last century of the history of Ireland, the establishment of the admirable system of cross-country cars, by the Italian, Charles Bianconi. The above, with a final chapter on some less known astronomers and students in humble life, make up the contents of this very readable book.

*Sketches in Spain, from Nature, Art, and Life.* By JOHN LOMAS. Edinburgh: Adam & Chas. Black. 1884.

THE writer of this book has divided his matter conveniently into routes, which are, moreover, clearly shown on a very good map affixed to the book: with this exception the work is sadly wanting in method. Scraps of history, of archeology, criticisms of art, and descriptions of nature are thrown together pell-mell, not

arranged as a mosaic, but tumbled promiscuously into a sort of loose incoherent conglomerate. He has, moreover, the unfortunate habit of wandering from subject to subject and back again, visiting and revisiting the same spot and mixing up his remarks in a manner which is most perplexing to the attentive reader. It is often difficult to understand what particular church, cathedral, or other subject he is referring to, and sometimes almost impossible to make out what his real feelings are respecting them.

As an instance we may cite his remarks upon the cathedral at Burgos. The subject is taken up on p. 32, but, after a few lines, the writer passes to San Sebastian, and follows with ten or a dozen discursive pages about many things. On p. 41 he returns to the cathedral, picking up the forsaken thread of his description. Collecting his remarks thereon we learn that at first sight the cathedral is disappointing—even vexing; that one's artistic sensibilities are outraged by the poor west front, the damning Coro, the mixture of architectural styles, and the all-pervading over-decoration of the interior; that, nevertheless, its beauty is glorious, its defects comparatively small; and that it is, after all, "one of the noblest specimens of Gothic work upon the face of the earth!"

The west front is only poor in its lower or modernised part, where the Palladian doorways are thrust under the old pointed arches; above it is singularly elaborate. Nor is it "at first sight" that this and so many other Spanish buildings are "disappointing and vexing." Their ensemble is almost always captivating. Disappointment comes with scrutiny and the discovery how little thought has gone to the production of such an efflorescence of mechanical ornamentation.

The really interesting facts about Burgos Cathedral the writer has left out of sight,—that its late external architecture conceals an early church of great simplicity and beauty; that it is a reproduction of a French type; and that its founder, Bishop Manrica (1213-1238), was almost certainly an Englishman. It is quite certain that he travelled on important embassies in France, and it is credible that he brought thence, as tradition affirms, a French architect, who designed the cathedral, which the good bishop commended to build within a few years of his consecration.

The writer succeeds best in dealing with natural scenery, having a keen sympathy with nature, and considerable facility in expressing effects of colour; but even here it is difficult to account for his selection of subjects. The Bay of Algiers,—certainly one of the loveliest in the world, if not quite the most lovely,—is dismissed with a single epithet; and the writer "drops" provokingly into some commonplace reflections on the "strategic value" of the Rock of Gibraltar, and the inexpediency of surrendering it to Spain,—made, as it is, for the "arbitrage" of the Mediterranean,—a vile phrase; "arbitrage" is a vile phrase.

Every one who cares for the architecture of Spain will find something to interest him in this book. And every one who perceives it will feel with us, in some way or other, a sense of disappointment. It is perhaps too much to expect an adequate treatment of the subject without the aid of pictorial illustrations; but something more could have been accomplished than the author has given us. His sketches fall in the first requisite of a sketch, for they leave no definite impression upon the mind. He cautions the tourist against endeavouring to cover too much ground, and so run the risk of seeing nothing as it should be seen. The caution is a wise one. But a similar danger besets the author, and he would willingly exchange the book he has given us for a smaller number of really careful sketches by the same hand.

#### RECENT PATENTS.

##### ABSTRACTS OF SPECIFICATIONS.

2,528, Ventilators and Cows. J. M. Lamb. This improvement consists in fitting a taper or cone-shaped piece, with an open top on to the shaft. A hood and cover surmount the cone, and an outer large inverted cone surrounds the inner one. Divisions are fixed so as to divide the cylindrical shaft into four separate parts, and deflect the currents of air. For chimney-cows, some modifications are effected by leaving out or re-arranging the cones and divisions. This arrangement whereby deflecting currents of air are induced so as to exhaust the air from the shaft, is the novelty in the patent.

2,686, Preventing the Rattling of Window-sashes. A. B. Johnson.

Two small levers are secured to the heads on each side of the sash, in such a manner that the short end of the lever acts as an eccentric, and when the long end of the lever is moved away from the sash, the short end presses the sash against the parting bead, and, pressing the sashes together, also prevents rattling. It also prevents tampering with from the outside, and gives an additional security.

350, New Method of Inlaying Wood, Henry Forrester.

A composition for wood or ivory is substituted on the material to be inlaid. The pattern is engraved, sawn, or etched in the usual way, and any composition is poured and rammed into the design, which composition will afterwards harden and resemble ivory or wood inlaid.

1,029, Parquet Floors, F. F. Brown.

The tiles for these floors are constructed of a number of squares of end wood arranged that no two adjacent ones shall have their grain in the same direction. The squares are united by glue, and are held in some convenient frame when setting.

2,365, Cupola Furnace, W. Glaze.

In cupola for smelting iron and steel the tuyeres are placed nearer the bottom than usual. It is also made widened out at bottom.

4,635, Concrete Building, W. J. E. and E. J. E. Henley.

In the apparatus for building, uprights are fixed at intervals, and between these are arranged boards fixed at the ends to which, in turn, are bolted to the uprights by two sets of bolts,—an upper and lower. The two sides of the boards are identical, so that when a layer of concrete has been laid and set, by loosening the lower bolts the boards can be swung round the upper ones as centres, and so be in place for another layer. There are distance pieces to regulate the thickness of the wall. The cores or fins are of metal, capable of a slight collapse, so that they may be withdrawn when the work is finished.

#### Miscellaneous.

##### The Sanitary Condition of Whitechapel.

Reporting upon certain charges lately made by the members of the Sanitary Committee of the Jewish Board of Guardians, recently referred to in the *Builder*, the Whitechapel District Board of Works have just issued a long and elaborate statement embodying the investigations of a special sanitary committee. With reference to the more important complaint, that a large number of houses are unfit for human habitation, the committee state that the whole (87 in all) have been specially visited, and the charges made are not warranted by the facts. That many of the houses in the district have been subjected to very hard wear and to much ill-usage is perfectly true. There is hardly a house in the occupation of the poorer inhabitants which is not tenanted by more than one family, and the consequence is that every house so held has to be continually watched by the sanitary officers. As to the remedy suggested by the Jewish Guardians,—that whole areas might, little by little, be improved, and the buildings thereon removed without the costly processes involved by the Artisans' Dwellings Act,—the local authorities state that acres upon acres of houses have just been demolished there under the Artisans' and Laborers' Dwellings Acts and for railway purposes; many thousands of the residents have been turned out of their dwellings; acres more of houses are about to be pulled down, under the scheme known as Bell-lane scheme, by the Metropolitan Board of Works; and in the Pearl-street scheme it is proposed that a further area shall be cleared. It is self-evident that under the schemes promoted by the Metropolitan Board of Works for the improvement of the district and by the absorption of property by railway companies, a great number of houses have been destroyed, and it is estimated that about 12,000 people have been displaced, while accommodation has at present been provided for only about one-fourth part of the number of those disturbed. In addition to the destruction of the houses of the poor above referred to, the Whitechapel Board recall the fact that they have expended 35,000*l.* in improving Baker's-row and 38,000*l.* in widening Royal Mint-street, by which many dwellings of the poorer classes were destroyed. The Whitechapel Board therefore submit that great overcrowding of the houses which remain must of necessity take place.

##### New Insurance Buildings in Fleet-street.

A very extensive block of new buildings is at present in course of erection in Fleet-street for the Law and General Assurance Company. The new premises will replace the old buildings of the company, which have just been taken down, but they will be on a greatly enlarged scale, the adjoining premises on the west side, near the site of Temple Bar, having been demolished for the purpose of enlarging the site. The premises now in progress will have a frontage to Fleet-street about 50 ft. in length, and will be carried to a depth of 200 ft., extending to the north side of Harecourt, in the Temple. They will thus cover a ground area of something like 10,000 sq. ft. Mr. R. W. Edis, of Fitzroy-square, is the architect; and Messrs. Holland & Hannen are the contractors.

**New Dwellings for Artisans in Petticoat-square.**—The large blocks of dwellings for the working classes which have been erected by the Commissioners of Sewers in Petticoat-square are so far completed that they are expected to be opened about the commencement of the new year, or within about twelve months from the time when the foundation-stone was laid. The main face of the several elevations is in yellow brick, but the south-west frontage, and also that on the north-east side, facing Petticoat-lane, are of a more artistic character. The lower portions of these frontages are in red moulded brick, pilasters of similar material being carried up to a height of upwards of 40 ft. Each block is surmounted by a pediment, with panels on each side, the pediments having in the centre the arms of the Corporation. This portion of the work, together with the whole of the surrounding enrichments, is in red terra-cotta. All the blocks are surmounted by open arches and parapets, with flat roofs enclosed and protected by ornamental railings. The buildings, which are upwards of 70 ft. in height, contain five floors, the ground-floor of the blocks at the south-east and north-east ends respectively consisting of shops about fifty in number. The buildings contain about 300 suites of apartments, varying from one to three rooms each. They are estimated to contain a population of about 1,200 persons. Mr. Mark Finlay, of Stratford, is the contractor for the buildings, the cost of which has been about £5,000.

**New Bank Buildings at Beckenham.**—The London and County Banking Company have just opened spacious new banking premises at Beckenham, which have been erected from the designs of Mr. W. G. Bartlett, architect, of New Broad-street. The bank occupies a position in Church Hill, nearly opposite the old Parish Church (which is about to be rebuilt from designs also furnished by Mr. Bartlett). The building is in the Italian style, and faced with red brick and moulded brick dressings and cornices, the entablature and panels to the arched ground-floor windows being in Bath stone. The building has a frontage of 30 ft. to Church Hill, with a return frontage in Church Hill-road about 90 ft. in length. In the basement, the roof of which consists of iron and concrete, is the strong-room, lined with white glazed brick, also the book-room, the doors and fittings of these apartments having been furnished by Messrs. Chubb & Sons. The banking-room on the ground-floor is 36 ft. square. Immediately adjoining is the manager's room. At the rear of this floor, with a private entrance from Church Hill-road, is the dining-room, kitchens, and other domestic offices in connexion with the manager's residence. The two upper floors contain the drawing-room, bath-room, and several bedrooms. The contractor is Mr. Cox, of Beckenham, the cost of the buildings being 3,300l.

**Strong Rooms in Chancery-lane.**—A large block of chambers and offices, having a frontage of upwards of 240 ft., with a depth of over 100 ft., are now on the point of completion on the east side of Chancery-lane. They are designated New Stone Buildings, and are in continuation of Victoria and New Court Chambers, buildings of the same class recently erected. The several floors contain altogether upwards of 300 offices. The basement of the building is about to be appropriated to safe deposit purposes by the Chancery-lane Safe Deposit Company, and the works in connexion with this portion of the building are now in progress. The strong rooms and safes are being constructed by Milner's Safe Manufacturing Company, of Finsbury-pavement and Liverpool. There will be three strong rooms, composed of iron and steel, fire-proof and thief-proof. One of these strong-rooms will, it is stated, be the largest in the world, and will contain 5,000 safes. The other two rooms are being specially constructed for the safe keeping of cash-boxes, jewel-cases, and plate.

**Society for the Encouragement of the Fine Arts.**—The programme of this Society, which holds its annual *conversations* on Jan. 15 of next year, includes several lectures of interest; among them are one by Mr. G. Aitchison, on "Architecture in the Nineteenth Century" (April 16); Mr. Cave Thomas, on "The New Aesthetics" (April 30); Dr. Campbell, on "Physiology in Art" (March 12); and Mr. G. C. Haité, on "Wall-papers and their Manufacture" (Feb. 12).

**New Public Hall, Forres.**—The new public hall at Forres, N.B., has been opened for use. The hall is built attached to the buildings of the Mechanics' Institute, to which the old hall of the Institute forms a spacious approach and ante-room. There is accommodation provided for seating an audience of 800 people comfortably. A gallery is continued round three sides of the hall, and the platform is at the north end. Above the platform an organ-loft is provided. The committee appointed as their architect Mr. John Rhind, Inverness, and he has designed the new hall in the Greek style, in harmony with the Classic character of the old building. The tradesmen employed were Jas. Macdonald, mason, Kingussie; Alex. Laing, carpenter; Alexander Forbes, slater; Adam Ross, plasterer; John Taylor, plumber; and Archibald Macdonald, painter and glazier,—all of Forres. Messrs. Falconer Brothers, Inverness, supplied the cast-iron work; and Messrs. King & Son, Glasgow, the ornamental castings.

**Test of Glue.**—The following is an excellent method of testing glue. Carefully weigh a piece and suspend it in water during twenty-four hours at a temperature not exceeding 50° Fahr. The colouring matter is thus precipitated, and the glue swells in consequence of the absorption of the water. On its removal, the increase in weight will be found to be in proportion to the quality. The weight of the colouring matter can also be ascertained by weighing the glue a second time after it has been thoroughly dried.

**Royal Institute of Painters in Water-Colours, Piccadilly.**—Of the total number of works exhibited at the late Exhibition of the Royal Institute of Painters in Water-Colours, Piccadilly, amounting to 1,083, 305 pictures found purchasers within the galleries, realising the sum of 12,357l. 8s. The prices of the pictures sold ranged from 5 guineas to 400 guineas.

**Ventilation.**—The Acolus Waterway and General Ventilating Company, of Dalston, have received instruction from the Office of Works to apply their system of inlet and outlet ventilation, at warm or cold fresh purified air, to Room of the G.P.O. (New Bu. Martin's-le-Grand.

**Smethwick.**—New Higher Grade Schools for the Harborne and Smethwick School Board, from designs by Messrs. J. P. Sharp & Co., architects to the Board, are now being built in Crocketts-road, Smethwick, by Mr. G. H. Marshall, builder, Smethwick.

**Improvement in Cables Railways.**—It is stated that Mr. A. H. Mathesius, the engineer who superintended the construction and erection of the traction machinery of the Brooklyn Bridge, and who has had extended experience in cable propulsion, has worked out a new arrangement for this purpose, for use on surface roads, which he believes will reduce the first cost of construction from 60,000 dollars to not more than 10,000 dollars per mile. At present the trough in which the cable runs is from 30 in. to 48 in. in depth, the gripping apparatus being worked in this trough, which is constantly exposed to being filled with dirt and snow. To get this trough in position requires a general opening up of the road, and the usual obstructions of water, gas, and sewer pipes are met with. Mr. Mathesius proposes to use a 6-in. covered pipe, running along the top of the front cross ties, which is put in place by simply removing the roadway at the centre between the tracks. The gripping apparatus works outside the tube. As the car moves along, it uncovers the tube at the front end of the car and covers it at the rear, leaving only the part of the tube that may be under the car uncovered. Curves of a radius of 45 ft. may be made by this arrangement.—*Iron.*

**Sanger's Amphitheatre.**—The Metropolitan Board of Works have resolved,—“That a letter be addressed to the Lord Chamberlain to the effect that the gangways of the pit of Sanger's Amphitheatre are allowed to be obstructed, contrary to the clear intention of the Board in requiring the formation of such gangways, and suggesting that his Lordship do take such steps as he may think right with a view to preventing such obstructions; and that Mr. G. Sanger, the owner of the theatre, be informed, in reply to his letters complaining of the danger and annoyance caused by the existence of the central gangway in the pit, that, inasmuch as he had disregarded the intimation already given to him by the Board on the subject, they have felt it their duty to communicate with the Lord Chamberlain thereon.”

**Diaries.**—Messrs. Hudson & Kearns send us their very well-arranged series of diaries for architects' men, including also one entitled "the Architect's Diary," though we do not discern the precise applicability of this diary to architects. It certainly cannot lie in the brief table of characteristics of leading styles, which in a book for architects are too absurd, and should be omitted in future. The "date-indicating blotting-pad," with strips of paper at the side for immediate memoranda, we have found very useful.

COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS:

Epitome of Advertisements in this Number.

COMPETITIONS.

Nature of Work.	By whom required.	Premium.	Designs to be delivered.	Page.
Manufacturing Premises .....	Not stated .....	{ 100 guineas, first 30 " second 20 " third }	Jan. 7th	i.

Instructing Assistant-Warder of Smith's Work, for Prison Service .....	Home Office .....	100l. ....	Not stated	xvi.

**Bridging the Susquehanna.**—The magnitude of the undertaking of the Baltimore and Ohio Railroad Company in building a railway to Philadelphia cannot (says *Iron*) be appreciated without a clear understanding of the gigantic work at the Susquehanna. The bridge over that river will be one mile and a quarter in length, including the trestle-work over Garrett Island. This island is about midway in the river. Across the channel to the west of it there will be one span of 520 ft. in length, at an elevation of 30 ft. above mean high tide, and four deck spans of 430 ft. each. Over the east channel there will be a through span of 380 ft., a deck span of the same length, and another deck span of 520 ft. A clear conception of what will be the distance across the bridge may be had by bearing in mind that it will be 6,300 ft. long, and that the bridge of the Philadelphia, Wilmington, and Baltimore Railroad is only 3,300 ft. The approaches and the crossing over the island are of iron trestle-work. The spans constitute the superstructure of the bridge, and will rest upon eleven large piers and two massive abutments of granite masonry. The piers are built upon caissons sunk by the pneumatic process to rock bottom. An engineering feat never attempted before was successfully accomplished at one of the piers. The caisson had sunk to within 2 in. of the bed-rock at one point, when it was discovered that at other points within the area the rock was 12 ft. lower. The whole structure, which weighed 6,000 tons, was held in suspension for two weeks, while the bed-rock was laid bare at every point, and a concrete foundation built up from the rock to the working chamber in the caisson. The highest points of the bed-rock were blasted off inside the caisson so skilfully that not the slightest damage was done. Work is carried on at the bridge night and day, the whole force employed including 700 men.

**Stable, &c., Fittings.**—The Carron Company send us their catalogue of stable and cattle-house fittings. The practical ironwork appears very well designed. There are some well-intended attempts to give ornamental treatment to some of the cast-iron work. Such attempts in trade catalogues are seldom successful, but one or two in the present instance are better than ordinary.

**TENDERS.**

For the erection and completion of the Leadenhall Market extension for the Corporation of the City of London. Mr. Horace Jones, architect. Quantities by Messrs. William Reddall & Son:—

Nixon	£16,917 0 0
Corder	16,465 0 0
Hall & Bellhall	16,430 0 0
Greenwood	16,273 0 0
Hart	16,216 0 0
Ashby Bros.	16,034 0 0
Perry & Co.	15,738 0 0
Holland & Hammen	15,647 0 0

Gentry	14,375 0 0
Mowlem & Co.	13,490 0 0

For new shop-front and fittings at 147, Shoreditch, for Mr. Eaton Buck:—  
W. Shurmer (accepted).....£225 0 0  
[No competition.]

For repairs, &c., at Aston Grange, Preston Brook, Cheshire. Messrs. Linaker & Davies, architects, Frodsham:—

**General Repairs.**

Stelfox & Carter, Northwich	£164 10 1
T. Davies, Frodsham	425 0 0
Executors of the late John Glouie	326 18 6
Frodsham (accepted)	.....
F. Spencer, Frodsham (accepted)	59 15 0

For the erection of a pair of cottages, East Donyland, Colchester, for Miss M. E. Shave. Mr. J. W. Stant, architect, Colchester:—

A. Gladwell, Colchester (accepted)	£23 0 0
[No competition.]	.....

For bottling stores, &c., for Messrs. J. A. Alabaster, Kingsland-road. Mr. F. J. Smith, architect. Quantities by Mr. Walter Barnett:—

Chesnut	£1,642 0 0
S. Hayward	1,374 0 0
Allard	1,300 0 0
R. Forest	1,287 0 0
Simpson & Co.	1,249 0 0
T. Boyce	1,245 0 0
W. Shurmer (accepted)	1,179 0 0

For alterations, &c., to premises, St. Andrew's-street, Holborn. Mr. F. J. Smith, architect. Quantities by Mr. Walter Barnett:—

R. & G. Russell	£4,558 0 0
R. Hindle	4,473 0 0
W. & D. McGregor	4,400 0 0
G. Colls & Son	4,400 0 0
Simpson & Co.	4,299 0 0
Harsh & Co.	4,289 0 0
Schaban & Williams	4,250 0 0
Miller & Brown	4,128 0 0
T. Boyce	4,092 0 0
J. O. Richardson	4,017 0 0
W. Shurmer	3,978 0 0

For alterations at the Bell public-house, Middlesex-street, for Mr. W. Rose. Messrs. Wilson, Son, & Aldinckle, architects:—  
W. Shurmer (accepted).  
[No competitor.]

**SPECIAL NOTICE.**—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our Office, 49, Catherine-street, W.C., not later than Four p.m. on THURSDAYS.

**PUBLISHER'S NOTICES.**

**CHARGES FOR ADVERTISEMENTS.**  
SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRAVEL, AND GENERAL ADVERTISEMENTS.  
Six lines (of about fifty words) or under..... 4s. 6d.  
Additional lines (about ten words)..... 6d. 6d.  
For Notices of Trade Advertisements, also for Special Advertisements, see separate notices.  
For any particulars, apply to the Publisher, at any of the following addresses:—

**SITUATIONS WANTED.**  
Four lines (about thirty words) or under..... 2s. 6d.  
Each additional line (about ten words)..... 6d. 6d.  
PREPARATION IS ABSOLUTELY NECESSARY.  
\* \* Resumes need not be sent, but all small sums should be remitted by Cash, in Registered Letter, or by Money Order, payable at the Post-Office, Covent-garden, W.C., to DOUGLAS FOURDRINIER, Publisher, Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.  
The Publisher cannot be responsible for DRAWINGS, TESTS, MONALS, &c. sent at the Office in reply to advertisements, and strongly recommends that of the latter OFFICE ONLY should be sent.

**SPECIAL.**—ALTERATIONS IN STANDING ADVERTISEMENTS, or ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY mornings.

PERSONS Advertising in "The Builder," may have Replies addressed to the office, 46, Catherine-street, Covent-garden, W.C. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient postage to cover the postage.

**TERMS OF SUBSCRIPTION.**  
"THE BUILDER" is supplied gratis from the Office to residents in any part of the United Kingdom at the rate of 1s. per annum, FREE OF CHARGE. To countries within the Postal Union, 2s. per annum. Remittances payable to DOUGLAS FOURDRINIER, Publisher, No. 46, Catherine-street, W.C.

**TO CORRESPONDENTS.**

F. (your inquiry was evoked last week; we are obliged to decline recommending books—see permission notice to that effect below.—H. G. (next week).—W. C. J.—E. I. H. (next week).—H. H. C. (shall be glad to assist).—F. H. (next week).—A. B. (it is a purely legal question, on which we cannot advise. Correspondents should enclose name and address).

All statements of facts lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.

Next.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the author. We cannot undertake to return rejected communications.

Letters or communications (except news-items) which have been duplicated for other journals, are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

**Best Bath Stone.**  
WESTWOOD GROUND,  
Box Ground, Combe Upton,  
Corsham Upton,  
And Farleigh Upton.  
BANUELL, SAUNDERS, & CO., Limited,  
Corsham, Wilts. [ADVT.]
