

AN

✦ ILLUSTRATED ✦ WEEKLY ✦ MAGAZINE ✦

FOR THE

ARCHITECT, ENGINEER, ARCHÆOLOGIST, CONSTRUCTOR,  
SANITARY REFORMER, AND ART-LOVER.

CONDUCTED BY

H. H. STATHAM,

FELLOW OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

"Every man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kinde of private princedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON.

"Our English word TO BUILD is the Anglo-Saxon Bylban, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"Always be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE.

VOLUME LIII.—JULY TO DECEMBER, 1887.

OFFICE: No. 46, CATHERINE STREET, COVENT GARDEN, LONDON, W.C.

# INDEX TO VOLUME LIII.

JULY TO DECEMBER, 1887.

*The Imperial Institute Competition.*

HE six designs submitted in the limited competition for the Imperial Institute have been on view to the public this week in the Vestibule of the late Indian and Colonial Exhibition. The building, as our

readers are probably aware, is to stand on a site within what were the Horticultural Gardens, on a line axial with the centre of the Albert Hall, the principal front facing southwards towards the back of the Natural History Museum. It seems, to begin with, a mistake to face the front of one great building towards the back of another,—at least, it is unfortunate, but perhaps could not well be avoided on this site.

We have always maintained that the site was a mistake for the purposes and meaning of the building, and that, failing sufficient subscriptions, public money should have been voted for doing the thing in a grand manner on a site near the great Palace of the Imperial Legislature; and that on such an occasion cost ought to be no element in the matter, or at least no obstacle. The exhibition of the designs does not tend to modify our conviction. Nearly all the competitors are obviously hampered by the attempt to do something big without enough money to do it. Two of the finest designs are too costly for the circumstances; the only one which is a typically monumental design is obviously impossible for the money. The selected design is a good one as far as plan is concerned, and the design is picturesque and rich in effect, but it is not a design rising to the occasion of a building of such great significance and importance.

The principal requirements appear to have been a grand reception-hall, a library, a

conference-room, various rooms for secretaries and committees, permanent museum galleries, and capability of future extension. It is obvious in such a case that the reception-hall and the State entrance form necessarily the centre of the whole, the nucleus around which the other departments should be grouped.

The design submitted by Mr. Colcutt, a perspective of which we give in the present number, has the merit of providing a sufficient and complete building on plan for the present, with a very convenient and easily managed provision for large extension. How this is generally arranged will be seen by the small block-plan appended, the blocks marked as future per-

*Block Plan of Imperial Institute.*

manent galleries extending along the north front, with returns on the east and west sides to join the system of permanent galleries proposed to be first built. The large spaces marked K on the block plan, which will then become enclosed quadrangles or gardens, will be available for temporary exhibitions, but this

whole space, as well as that occupied by the future extension of the galleries, is at present left entirely out of the building scheme; and it is no doubt this well-managed economy of building for the present which has done a good deal towards recommending the selection of this plan, the funds available so far being obviously insufficient for the production of a monumental building of a high class to cover the whole site. Generally speaking, the plan (which we are unable to give in detail this week) is simple, practical, and effective in arrangement. The principal entrance leads up a broad and lofty flight of steps, first through a square vestibule chamber forming the base of the tower, thence to the cortile of the principal staircase, then through a large octagonal ante-room top-lighted, and thence to the grand reception-room, with an apse at the upper end. The front vestibule, under the tower, opens right and left on to what may be called the administration blocks (marked B on block plan), with long corridors giving access to the secretary's rooms, committee-room, &c. (facing towards the quadrangles F); and leading on the west to the door of the general conference-room and on the east to that of the library. There is thus a capability of a very fine vista straight from the principal entrance to the apse of the reception-room, and another east and west, across the first vestibule, along the whole of the administration blocks. A similar east and west vista is obtainable along the permanent galleries and through the openings in the inner octagon vestibule. The general entrances for the public to the galleries are in the basement of the conference-room and library at each end, through the arcades shown in the perspective.

The design is, as will be seen from the lithograph, an exceedingly graceful and rich composition, in the style of modified Renaissance which Mr. Colcutt's architectural muse (architects may surely have their Muses as well as poets) has in general inspired him with.

As far as the main body of the building goes, it is a very pleasing piece of architecture. The tower we hardly think is so happy; it is rather too hazy to assort well with the richness of the rest of the design, and seems, at any rate, to demand a more richly-treated upper story and lantern to be worthy of its position. Our conclusion as to the design generally, however, is that, charming as it is in itself, it is not of the stately and monumental character which we should associate with a national building second only in importance to the Houses of Parliament, if second to that. This can, perhaps, hardly be charged, entirely at least, against the architect. The funds for a building such as the occasion demanded have not been promised. Mr. Collcutt has evidently been influenced by considerations of economy; and we cannot say how far he might have risen to the occasion had he not had this stumbling-block of economy before his eyes.

We have described the design in the title to the plate, as accepted "subject to modification," in accordance with the decisive official expressions which have been communicated to us, that the Committee of the Imperial Institute do not bind themselves to erect that design, and that it may be subject to considerable modification. It was decided, however, to accept it as, at all events, the basis of the building to be erected; a decision, by the way, which its architect first learned from a letter from the editor of this journal, some days before it was made public, though, as the information came to us informally and in conversation, we did not feel at liberty to make public use of it.

Having described first the accepted design, we will take the others in the order of hanging. That by Dr. Rowand Anderson certainly does not serve to explain the reputation which its author enjoys in the northern portion of this kingdom, and Scotland may be said, in fact, to be out of the running altogether. The plan is scattered and wanting in arrangement and concentration, and the design is simply a piece of commonplace, not meriting higher praise than that of being "neat and appropriate"; the author has failed to realise the importance of the occasion, and has produced a design which only suggests the idea of a large training college.

Mr. Blomfield's plan consists of two great quadrangles divided by a large central block running north and south; the central portion of this contains the reception-hall; the State entrance is, as in all the plans, in the middle of the south side, and gives access to a large octagonal entrance-hall 70 ft. diameter, leading through a small vestibule to the reception-hall beyond. The octagon hall is square externally, and the angle spaces internally are occupied by deep arches, niches, or recesses, with columns and galleries crossing the openings in a rather artificial manner; but the effect of this octagon hall with its deep recesses, lighted from a dome and lantern above, would undoubtedly be very fine internally, and be a worthy entrance on State occasions. Externally the octagon dome with a solid basement, a large triple arcaded opening on each face, and a rich cornice and gallery below the base of the dome, is a very fine feature; but the effect of this central feature of the south front is sadly marred by the arrangement of the roofs of the adjoining blocks of building north and south so as to stop short of the base of the dome, and leave a gap on each side of it. Had the lower portion of the central feature, comprising the grand entrance porch, been enlarged in scale and carried higher, this defect would have been avoided, which goes far to spoil an otherwise fine design. The main blocks of building are in two nearly equal stories, with a low rusticated basement under them, and a rather too lofty roof over them, which seems to depress the whole structure more or less. In the plan the more public entrance to the galleries is on the north side, where there is a staircase and large coloured vestibule behind it, which seems of very little use either for architectural effect or practical convenience, access being had to it only by narrow doors and side corridors; it is cut off architecturally from everything, and is a most singular piece of

planning; and the front blocks on the south side are curiously irregular in planning for a building of this type; as we heard it remarked, it is "house-planning," not public-building planning. The galleries for exhibition are on the north, east, and west sides, and the spaces enclosed utilised for occasional exhibitions. This part of the plan is suitable enough practically, but there is no internal effect or vista anywhere except in the entrance-hall and reception-hall. The author can claim credit for considering, however, one point, which several other competitors have entirely neglected, the desirability of doing something with the north front, towards the Albert Hall, instead of leaving it a mere back elevation. It is adequately treated in a Romanesque style with dark and light bands, the main features crowned by *frontons* (a convenient word which we will take the liberty of adopting from the French), with open arches, in which statues are placed standing free; a pretty architectural effect, though not the best way to show a statue, certainly. The pencil detail elevations of part of the south front show very graceful and pleasing work. The main perspective view, also in pencil, is ineffective and flat in execution, and seems to have been hurried.

The design by Mr. Aston Webb and Mr. Ingress Bell shows a most elaborate set of drawings, and is certainly in every respect one of the most notable of the designs. The general style of the design is evidently intended to assimilate to that of the Natural History Museum, so as to produce a certain architectural unity on the site. The buildings are disposed in two great parallel lines running east and west, with crossing blocks at either end, projecting north and south beyond the line of the main blocks, so as to give force and projection to the angle and structure. On the south elevation these side blocks project about 80 ft. in front of the main line of building, and rise into angle pavilions, while the centre shows another projecting block considerably higher. In front of this centre pavilion is left an open space up to the boundary of the site (the other portion of the ground in front being enclosed as ornamental gardens), and in the centre of this space stands a monumental tower, entirely free, having a highly-decorated lower story, with a niche on each face, that on the south face being occupied by a statue of the Queen. This separate tower is a fine idea, and the tower is very well treated architecturally, but it may be questioned whether it is large enough in scale for the occasion; it looks so in the perspective view where it is placed in the foreground, but in the section it hardly seems sufficient to assert itself and dominate the building. In the plan, as in Mr. Collcutt's plan, the north and parts of the east and west galleries are planned for future addition. The style adopted is a Romanesque Gothic much on the same type as that of the Natural History Museum. The principal entrance is through a deeply-recessed arcade into an arcaded and vaulted vestibule, across which is reached the reception-hall, placed in the centre block running north and south. The great galleries run right and left from the vestibule, and the authors appear to have boldly left the whole open to the vestibule so that the whole of this part of the building can be seen through from end to end; there is an arcaded court running up through two stories on either side of the vestibule, then the long gallery, then another arcaded court; the whole would make a beautiful interior effect. The library is at the back of the reception-hall, on the north front, and reached by corridors on either side of the reception-hall. A large detail drawing of part of the centre pavilion (south side) shows exceedingly rich and effective work, apparently intended for terracotta execution: a frieze of figures runs along the top in the central part, and is stopped by the projections at the ends of this pavilion. It may be a question whether the decorative details of windows and arches are not a trifle large in scale as compared with the scale of the human figure. The whole effect, however, would have been very rich and grandiose; also rather costly, which has perhaps militated against the design. Sufficient attention has

been paid to the north front. The tower is treated in a very original manner, the buttresses at an angle of 45 deg. in the lower portion, rising first from the square ground-line with no very great projection, but developed inwards in the upper stage by the setting back of the wall face, and finally resulting in a kind of arched angle buttress connecting the octagon lantern with the substructure; the development of octagon out of square is thus managed in a manner at once playful and solid-looking. The square pavilions terminating the wings have a very solid appearance also, though they are perhaps a little squat in proportion, and the towers and octagonal turrets at the re-entering angles are exceedingly well placed. The whole design is very well considered, and has the unity of conception so essential in the architectural treatment of a large public building.

Honour to Ireland: for the design by Mr. T. N. Deane, who represents the sister kingdom in the competition, is the most distinctly monumental and imposing of the whole set, both in regard to plan and design. It is a very costly design, so much so as probably to put it out of court on that ground alone; but it is a very fine conception. It is Classic in style; the plan shows a grand flight of steps up to a columned portico, which gives access through a small vestibule into a large central hall, worked into an octagon with niches at the angles; the library is beyond, and corridors opening east and west lead to an assembly-hall westward and a conference-hall eastward; the wings curve onward, southward, in semicircular porticos, leaving open areas between the back of the corridors and conference-hall and assembly-hall, and leading to further corridors giving access to minor rooms. Unfortunately this part of the plan, however symmetrical and striking it may look on paper, is very inconvenient and unpractical in arrangement, and would prove a very inconvenient working building; and the colonnaded aisles at each side of the assembly-hall with doors at each end would, unless the doors are kept locked, become practically passages. The assembly-hall, to seat 1,000 persons, is, we suppose, practically intended to be the reception-hall, for there is no apartment marked as reception-hall; but if so, this is a mistake, as the reception-hall ought to be, in its position and approaches, the grand central feature of the building, whereas the approach to it in this case is a side one, balanced by the approach to the less important apartment assigned to the conference-room. Behind the main building is the most distinctive feature of the plan, in which it differs from every other one, viz., an immense amphitheatre (so-called), a vast longitudinal apartment with each angle curved into a semicircle, with special external entrances on the axis of the semicircle, and also internal entrances (not sufficiently large) from the corridors of the main block. All this, however, is shown in outline only on the plan, and, therefore, we presume, is only intended as a future extension. The design contains no special novelty of detail; it is a Palladian type of architecture, with a rusticated basement story and a large order of unfluted Corinthian columns running through the stories above. But the grouping as seen in the perspective view, with the long horizontal lines of surbase and cornice, the curve of the arcaded corridors, the smaller angle pavilions with their eight octagonal cupolas and the large dome in the centre, forms an exceedingly grandiose composition on what are certainly very old-fashioned lines of architectural design; a composition which might no doubt be improved and diversified in detail, but which could not fail to command admiration as a whole. The principal floor, we may observe, is lifted to the level of the lofty surbase, up to which the great flight of entrance steps leads: the steps are flanked by an immense podium on each side, supporting a colossal statue. The conference-hall and assembly-halls rise as square masses behind, and assist in telling the story of the internal plan. The dome is constructed on the same principle as that of St. Paul's (unfortunately, for, with all reverence for Wren, it is a false

principle); there is an inner masonry dome and an outer timber one, but the place of the cone is taken by a high curved dome, a small segment of a large circle, which carries the lantern. The latter might be improved in design; it is heavy and ungraceful, and in the interior the author has repeated the mistake of Wren in hanging inwards the pilaster order in the drum of the dome. He has also indulged liberally in the use of the conventional vase (of portentous size in this case) for balustrade finials. In short, the design includes many of the long-recognised weaknesses and mistakes of Classic design of the type adopted; but while its faults are those of the type of architecture employed, its merits are those of the present designer, who might have done a still finer thing had he given a little loose to his fancy and invention in detail, instead of following recognised, but by no means faultless, precedents. The plan would require remodelling in many of its points, for practical reasons; but as a design, and independently of the question of cost, it is certainly the grandest and most stately and monumental in general conception.

Mr. Jackson's design is shown in a most beautiful set of drawings, and contains, as every one would expect, a great deal of architectural beauty and refinement. The plan, however, is certainly a mistake for a building of this class. The entrance, from a *portico* into a vestibule under the central tower, is in itself a narrow and rather poor one, and is further completely marred, as a matter of interior architectural effect, by its total want of centralisation and climax; the inner door of the vestibule leads up to a blank wall on the other side of a passage; the visitor has to turn to the left and then to the right again to enter a hall or crush-room of by no means imposing proportions; the whole design of the front block is "house-planning" again, and not very good house-planning; a crowd of rooms with very small areas for light burrowed into them. This may be called a picturesque arrangement of plan, but ever since great buildings for state purposes have existed the world has thought that spaciousness and symmetrical arrangement are necessary conditions of dignity and monumental character; and the world is likely to go on thinking so. The museum galleries in the plan are placed as narrower blocks along the east, west, and north sides of the site, enclosing a quadrangle, and an extension wing is indicated on the east and west sides. The design is, in the main, a very pleasing one. It is Elizabethan in general character; the ground-story has an arcade of semicircular arches with windows under them; above are long mullioned windows running through two stories, with decorative panels across the centre dividing the stories; and the elevation finishes with dormers of the Caius College gateway type. The building is of brick with stone dressings. The tower, nearly 300 ft. high, is a fine and picturesque one in general outline, lessening rapidly as it rises through its successive stages, and developing into open arcades in the upper portion; the general outline and composition reminding one of a North-German *Hôtel de Ville* type of tower, though the details are very different, and some of them very objectionable. The large double curls of stone stuck on the top of some of the turrets and connecting them with the tower are (whatever precedent may be quoted for them) pieces of huge gimcrack, in the worst taste, and it is quite a pity that a design in general marked by good taste and refinement should have been disfigured by them.

The exhibition of the designs seems to have excited very little interest among the general public, as far as we noticed; the majority of the few people visiting them were apparently architects, who, of course, had a special interest in them. Of other visitors there were very few, as far as we had any opportunity of observing. The public will fight for seats to see the ceremony of laying the foundation-stone, as they will for any other chance of assisting at a ceremony in which royalty is concerned; but what is to be erected over it is a matter they are apparently quite indifferent about,

## THE PROPYLEA AT ATHENS.

BY W. WATKISS LLOYD.

THE progress of the excavation of the surface of the Acropolis at Athens, which has brought to light such a store of examples of the Archaic style of Attic sculpture, has not been without results of peculiar interest to architects: it has laid bare, quite unexpectedly, the complete ground-plan of what appears to have been originally the principal temple of the tutelary goddess of the city. The site of this is so close to the Erechtheum as to be encroached upon by the Caryatid portico; it appears to have been the temple which was destroyed by the Persians. It was with great judgment that a new position,—that of the present Parthenon,—was adopted for the restored chief temple on somewhat higher ground, at a greater distance from the entrance to the Acropolis, and of more favourable presentation and conspicuousness.

At the present time, when so much is planned and in progress around us for opening out and widening the approaches to our national buildings of ancient date, and others that are in contemplation, it may be worth while to draw attention to some principles of grouping and relative proportion which commended themselves to the genius of the architects of the city "of the violet crown."

In designing the Propylæa of the Athenian Acropolis the architect was, above all things, governed by loyal regard to its becoming relation and subordination to the Parthenon.

It was required by the proprieties of the case, and by the proximity of the two structures both in the same style of architecture, that this important entrance to the Acropolis should support and not have the air of competing with the Parthenon, and be so arranged as to favour the best aspect of the Temple, both from special distance and presentation.

This last condition was accommodated by the distance of their respective east and west porticoes, being exactly equal to the length of the Parthenon on flank; and then by the parallel axis of the Propylæa being placed so far to the north that the produced diagonal of the plan of the Parthenon from S.E. to N.W. strikes exactly the centre of its east portico.

In consequence the Parthenon was presented to one entering the Acropolis at the favourable angular aspect, a front and flank coming into view together and in agreeable perspective, the flank colonnade not excessively foreshortened.

The approach not only up to but through the Propylæa was an ascent, and the Parthenon is again upon a higher level. That the platform below its lowest step is exactly on a level with the cornice of the Propylæa cannot be a mere coincidence, but proves that the adjustment of relative level was also determined after consideration and on a principle.

That the porticoes of the Propylæa are hexastyle was sufficient so far to subordinate them to the octastyle temple; but it was also of importance in promotion of the same object that greater lightness should be given by more open spacing, and then by an inferior scale for the columns.

The determination of this scale was all-important; only by a certain dignified approach to the massiveness of the Parthenon columns could those of the secondary structure harmonise with them; the problem for the architect was, therefore, to decide on a relative proportion which should avoid competition on the one hand and meanness or meagreness on the other.

The lower diameter of the Parthenon column is 6'245 ft., and that of the large Doric order of the Propylæa 5'11 ft.

Compared directly these are as 9 : 11 (11 : 9 :: 6'245 : 5'109).—Cf. measured 5'110). The areas of circles are to each other as the squares of diameters; and these columns consequently are proportioned to each other by area of plan, as 2 : 3 (81 : 121);  $9^2$  (= 81) :  $11^2$  (= 121). Such is the simple relation of the masses, whether or not so determined.

The foregone determination of an appropriate diameter for the column relatively to

that of the Parthenon gives at once a general limit for the height of the column, and even for its spacing. It is in accordance with the adopted principle of greater openness of spacing that the column is loftier relatively to the horizontal complement; that is to the joint heights of the entablature and steps; and that the metope is broader relatively to the triglyph than in the Parthenon; there is, in fact, a general widening out of intervals,—of voids relatively to solids.

It would probably be a mistake to attempt to discover which of these adjustments was decided first and determined others; the ultimate design may be assumed to have been the result of many trials of modes of conciliating advantageous relations, and chosen at last, it may be, as the best out of several, each with considerable pretensions.

There is more to be hoped from tracing the harmony which the artist did achieve and rested in than in presuming to set forth how he first arrived at it, or how he must have been guided to it, though even of this we may have an occasional glimpse.

A conspicuous peculiarity of the composition is the central ditriglyphal spacing of the two porticoes, which was adopted to admit of the equivalent of a carriage-way.

The triglyphs are proportioned in breadth to the metopes as 9 : 14; to compare with 9 : 12 (= 3 : 4) in Parthenon.

Thus the central columniation or extent from axis to axis of the two central columns would embrace on the entablature three metopes and three triglyphs,—two whole and two halves,— $9 \times 3$  (= 27) +  $14 \times 3$  (42) = 69.

The adjacent columniation would answer to two metopes and two triglyphs,—

$$9 \times 2 = 18 + 14 \times 2 (28) = 46;$$

$$\text{and } 46 : 69 :: 2 : 3.$$

The central columniation, in the terms of this comparison, is to the adjacent as 3 : 2. The completion of the architrave at either end comprises two metopes and two and a half triglyphs, = together  $14 \times 4 = 56 + 5 \times 9$  (= 45) =  $101 \div 2 = 50\frac{1}{2}$ , apart from possible modifications of the triglyphs and metopes by the angles.

We find therefore that, in effect, the stylobate is divided into three equal parts, of which the central part is assigned to two columns, and the single broad intercolumn, and each of the others to two columns and two ordinary intercolumns, except that the one by the angle is contracted by the angle column being moved inwards towards the centre and from the central line of the triglyph above, to accommodate the normal termination of the entablature. This is the ordinary well-known Doric adjustment, due to the circumstance that, had the axis of the angle column been allowed, as in the case of the other columns, to plumb with the centre of the triglyph above, it must have weakened the composition by projecting idly beyond the end of the architrave.

The distribution so far is compatible with any variety of heights and spacings of the column.

The height given to the column of the eastern portico equals  $5\frac{1}{2}$  diameters. (In the Parthenon this height comes out curiously near to 1.6th of the mean diameter of the angle column. Here it compares, however, with  $5\frac{1}{2}$  the ordinary diameter,  $34 \times 347$  as  $34 \times 253$ ,—thus with a reduction of 0.094.

This gives to each triplet group of columns exactly the same height as its breadth on plan; it brings them, in fact, into a square. They are so spaced that the intercolumn on the right and left of the centre is proportioned to the diameter of the column, as 4 : 3.

The central intercolumn is to the diameter of column as 7 : 2.

The abacus of the column is exactly 1.13th of 70 attic feet, a dimension of which we shall presently recognise the importance here in relation to a leading dimension on plan.

$$70 : 938 \div 13 = 5.456 \text{ (measured } 5.466).$$

The abacus of the Parthenon west front, with which it comes most directly into comparison, averages, according to Penrose, 6.578; this compares with the above very closely as 6 : 5.

$$6.578 \div 6 = 1.096 \times 5 = 5.480.$$

The eastern portico has only one step, which thus represents a mere stylobate; its height is included in the rectangular proportion of the front, that is, the proportion of height to breadth, but not in the rectilinear or proportionate division of heights, which appears in most cases to be the most important comparison.

In the Parthenon, the height of the architrave is rather less than the upper diameter of the column; here it agrees very closely; it is exceeded by the frieze, as usual, by a fraction.

The horizontal cornice, which in the Parthenon is proportioned to the frieze as 4 : 9, is here as 3 : 8.

With this addition of the cornice, the height of the entablature comes out proportioned to the central wide columniation as 1 : 2.

The addition of the pediment with its cornice completes the facade, and a total height, which compared with the breadth of the stylobate gives a rectangular proportion of 11 : 16. This is one of the series having a difference between the terms of 5, which is employed in regulating all the proportions of the Parthenon.

The joint height of the pediment and entablature,—that is, the horizontal complement less the stylobate,—compares with the height of the column in the simple superparticular ratio, 2 : 3.

The western elevation repeats the eastern with the differences first that the column is made loftier to the extent of the thickness of the abacus,—or what is nearly the same, that of the eastern stylobate; and then that the stylobate is augmented and consists of four steps.

The additional height thus conferred brings out a ratio of full height to breadth of front as 3 : 4,—the ratio which is so much in favour for hexastyle compositions; it also accommodates a proportion between the joint height of column and entablature, and the breadth of front, as 6 : 11, another ratio of the Parthenon series.

A like comparison holds good in the Parthenon, where the proportion is with marvellous exactness 4 : 9.

9 : 4 : : 101.341 measured breadth : 45.0426, differing from measured height 45.046 by 0.0034,—Penrose's dimensions.

The eastern symmetry between the height of the column and the spacing on plan is of course lost by the change of the former.

The comparison of height of column with the full complement,—that is, joint height of pediment, entablature, and steps,—brings out here, not as usual in many examples of fine Greek architecture, a simple super-particular ratio, but 7 : 9 very exactly.

To obtain a super-particular ratio, we must arbitrarily leave out of account one step, as on the east front; the satisfactory ratio will then emerge of 3 : 4 (4 : 3 : : 28.960 : 21.72).

It may be noted that, whether by unregarded or regarded coincidences, the same proportion 4 : 9 exists between stylobate and entablature, and entablature + stylobate and the height of the column. This is probably one of the coincidences which are certain to occur when combinations of very simple terms are dealt with.

The caution cannot be too strongly insisted on that no numerical relations are to be taken account of unless the parts they apply to come into comparison significantly and naturally.

The architect seems to have worked in the small Doric order of the wings by the general proportion of the larger order of 7 : 10, though the lower diameters of the columns as given compare somewhat more and indeed very exactly as 11 : 16.

Supposing the ratio 7 : 10 to be applied to these diameters, the sectional areas would then approximate to the simple ratio 1 : 2 ( $7^2 : 10^2 :: 49 : 100$ ).

This proportion would require for the smaller column diameter 3.577 as against 3.516 measured.

The full height assigned to the western front only exceeds that of the line of cornice of the Parthenon above the pavement by (51.592 - 51.104 =) 0.488.

We now proceed to consideration of the plan, which, there can be no doubt, was not

settled independently, but taken into consideration concurrently with the considerations of propriety which applied to the elevation.

The general structure may be described as consisting of a central hall, divided by a cross-wall and portals from a hexastyle portico on the east, and entered from the west through another stately Doric portico, beyond which two smaller porticos as advanced wings are at right angles to, and so embrace, a number of steps which lead up to the entrance. Both steps and porticos and hall are traversed by a broad road, which leads through the structure by the ditriglyphal inter-columniation to the interior of the Acropolis.

The axis of the building, taken from the edge of the step of the eastern portico to the line connecting the ante of the small advanced western porticos is obtainable from the engravings of Mr. Penrose's book, as 101.248. The fact is not observed there, but we cannot doubt that the basis of this measurement was the same hecatempdon, or 100 Attic feet (101.341), which measures the breadth of the Parthenon.

One half of this dimension is given to the central hall and west portico; the other half is equally divided between the eastern portico, and the steps advanced westward and flanked by the subordinate porticos. The two central Ionic columns of the hall lie in consequence on the central transverse axis of the general composition on plan.

Upon this scheme 50.670 would be assignable to the central hall.

The measured dimension from the edge of the western stylobate to the cross wall is as near to this as 49.977.

This leaves 27.322 for the cross wall with the five portals and the eastern portico, which is in excess.

These joint dimensions (27.322 + 49.977 = 77.299) exceed the theoretical 3-4ths of the hecatempdon by 1.300, at the expense of the 1-4th assignable to the western extension, which, in fact, is given as (20.815 + 3.134 =) 23.949.

It will be seen that this anomaly is not to be escaped by any distribution of the width of the cross wall between the eastern portico plan and that of the central hall. I do not doubt that it was deliberately admitted for the advantage of some proportions of the interior of the building.

The hall and the eastern portico are on different levels, and this would render precise exactness of proportion less necessary, to say nothing of the uncertain distribution between the two of the thickness of the cross wall.

The breadth of the platform to which the steps of the advanced flanks immediately descend is given as 70.603. This is so near to 70 Attic feet (70.939) that I do not doubt that this dimension was so regulated to have the proportion of 7 : 10 to the main axis of the structure.

The width of the carriage-road is limited by the wide central intercolumn; it occupies very nearly 1-5th of the width of the central hall, and this is proportioned to the side avenues, as 1 : 2.

The proper area of the central hall may be considered as limited by the line of the cross wall eastward, and westward by the plumb of the abacus of the west portico. This would give 49.977 - 5.466 = 44.511 to compare with the measured breadth, and bringing out very accurately the simple proportion 3 : 4.

4 : 3 : : 59.527 : 44.643 to compare with 44.511 as deduced.

The height of this hall was necessarily determined, apart from subordinate accommodations in treatment of the marble ceiling, by that of the order of the west portico, and this height would, of necessity, control the magnitude and proportions of the Ionic columns.

This height is 36.786, or very slightly exceeding the height to the summit of the external frieze, as taken to the under side of the marble beams that carry the lacunaria.

This dimension would require to be increased by as much as 0.114 (= 37.20 to accommodate moderately simple proportions to the length and breadth of the hall.

Height.	Breadth.	Length.	
37.20	44.641	59.527	5 : 6 : 8
3 : 4			3 : 4
5 : 6			5 : 8
5 : 8			

It does not appear, however, how such an increment of height can be justified.

The height at command for the Ionic columns, after allowance for the architrave, is 33.989; from which is derived their lower diameter of 1-10th,—3.387.

The design was for three Ionic columns on either side of the carriage-way, upon the space from the western portico columns to the cross wall, viz., 44.685.

Deduct from this the sum of three diameters :—

44.685 - (3.387 × 3 =) 10.161 = 34.524

This remainder is divisible among the four intercolumns :—

34.524 ÷ 4 = 8.567, which agrees with the measured to a fraction. Columniation :— 11.954 ; diameter, 3.387 = 8.567.

This apportionment accommodates a proportion of diameter of column to intercolumn nearly as 2 : 5.

5 : 2 : : 8.567 : 3.427 (Cf. 3.387 measured, err. 0.04).

The intercolumn also compares with the transverse intercolumn very closely as 3 : 5.

The space given to the Pinacotheca and its portico north and south compares with the full breadth of the interval between the flank porticos now very nearly as 2 : 3.

78.627 ÷ 3 = 26.225 × 2 = 52.450. Cf. 51.771 measured.

#### THE LAW OF LIGHT AND AIR IN INDIA.

**L**HOSE who advocate the abolition in this country of the easement of light and who urge that a man should be allowed to build without regard to interference with his neighbour's light, will not find their task more easy when it is understood that the principles of the English law have been found acceptable in British India. It would have been possible there to do away with this particular easement altogether, or to modify the principles of English law. But, on the contrary, those who have been responsible for the promulgation of the law in India have practically accepted all the principles of the English Prescription Act, as well as most of the judicial decisions which in England have gradually raised up a substantial mass of judgment law upon the basis of it in connexion with the statutory enactments. In 1877 the Indian Limitation Act (No. XV. of 1877) was passed, which extended to the whole of British India, and the easement of light and air was dealt with in section 26. It is of sufficient interest to be quoted at length, and it runs (so far as it concerns light and air) thus, "When the access and use of light or air to or for any building have been peaceably enjoyed therewith as an easement, and as of right, without interruption, and for twenty years. . . .

The right to such access and use of light or air . . . shall be absolute and indefeasible.

Each of the said periods of twenty years shall be taken to be a period ending within two years next before the institution of the suit wherein the clause to which such period relates is contested.

*Explanation.*—Nothing is an interruption within the meaning of this section, unless where there is an actual discontinuance of the possession or enjoyment by reason of an obstruction by the act of some person other than the claimant, and unless such obstruction is submitted to or acquiesced in for one year after the claimant has notice thereof, and of the person making or authorising the same to be made."

This Act was followed by "The Indian Easement Act, 1882," which, however, only applies to the territory of Madras and to the Central Provinces and Coorg, the rest of British India being still governed by the Act of 1877. The easements of light and air are governed by

Section 15, which is the same as Section 26 of the Act of 1877 except that the words in that section which we have printed in italics are absent from the later Act.

The first and most important particular in which the law of British India in regard to the easement of light differs from that of England is in the value which is given to the word "air." In the English Prescription Act it does not appear at all, and, as has been more than once pointed out from the Bench, the common sequence in this country "the easement of light and air" is erroneous because English law really does not regard the easement of air at all. But in India it is different, and the easement of air is regarded as of equal value with the easement of light. In the recent case of *Nandkishor Balgouva v. Bhagubhai Pringalabhdas* (8 Indian Law Reports, Bombay Series, p. 95), Mr. Justice West said,—"The access of air is in this country of hardly less importance than that of light. It must be taken as a matter of common knowledge that a material interference with it is injurious, not only to the comfort but to the health of the inmates of the house thus affected." Upon this principle an obstruction of the air to an aperture gives ground for a successful application to a Court of Law, whereas in this country the mere obstruction of the access of air is not an actionable wrong. But, in British India the familiar phrase obstruction of light and air is quite accurate, and thus the law in so far as it hinders building is more severe in India than it is in England.

On the other hand, in this country, as is well known, there may be a break in the prescriptive period, so that an enjoyment of fifteen years, with a break for five, and then a further enjoyment of the easement for five years more makes up the prescriptive period of twenty years. But in India the law is different, and "the interruption of the unity is not merely to suspend the process of acquisition while it lasts, but to destroy altogether the effect of the previous user by breaking the continuity of the enjoyment as an easement and as of right" (Mitra's "Law of Limitation and Prescription," p. 418). On this point, therefore, the law of British India is more favourable to the owner of the servient than of the dominant tenement, and would seem also to be more in accordance with sound legal principle and with practical reason.

Again, in both the Act of 1877 and the Act of 1882 are inserted the word "peaceably," the enjoyment of the easement must be peaceable. Here, again, the law of British India is more favourable to the owner of the servient than of the dominant tenement, and has, in fact, placed him in a far better position than he is in this country. For, says Mr. Mitra in a passage which expresses the law with great clearness and accuracy, "enjoyment by force or violence, enjoyment during strife or contention of any kind, enjoyment continually disputed and interrupted (even when such interruption is not acquiesced in for one year) is not of right or peaceable. Repeated interruptions, in fact, though too short to operate as 'an interruption' within the meaning of the Acts, are good evidences to show that the user all through was 'contentious.'" It is, therefore, obvious that in India the owner of the servient tenement has two remedies open to him to prevent the acquisition of this easement; he can, if possible, obstruct the light for a year, and if submitted to this will defeat the acquisition, or he can interrupt the user from time to time, and do such acts as prevent the enjoyment of the light or air from being peaceable.

Again, in the Act of 1877, though not in that of 1882, the words "as of right" appear. These words are hardly suitable in regard to such an easement as that of light and air, because the whole basis of a prescriptive right is the fact of unobstructed user. For this reason these words were not inserted in the later Act, and in the former their effect is slight, for if the open enjoyment of the easement is not actually obstructed, "and it is not had in such wise as to involve the admission of an obstructive right in the owner of the adjacent heritage, the easement is en-

joyed as of right within the meaning of Act XV. of 1877." In other words, the phrase "as of right" is little more than mere surplusage. To turn to another point, in the English Prescription Act the prescriptive period must be one "next before some action or suit" wherein the right to the easement is brought in question. But in India the prescriptive period must be attached, so to say, to the particular suit or action in which the matter is being discussed.

A more interesting and less technical point is, however, the explanation of the meaning of the term "substantial damage," which is always in this country a matter of so much uncertainty. Explanation II. to section 33 of the Act of 1882, is as follows:—"When the easement disturbed is a right to the free passage of light passing to the openings in a house, no damage is substantial within the meaning of this section, unless it falls within the first explanation (i.e., materially diminishes the value of the easement), or interferes materially with the physical comfort of the plaintiff, or prevent him from carrying on his accustomed business in the dominant heritage as beneficially as he had done previously to instituting the suit." Explanation III., which refers to the right to air, is silent as to the prevention of carrying on business, and after the clause as to the physical comfort of the plaintiff, the following words are added: "though it is not injurious to his health." These explanations of "substantial damage" seem to make Indian law on this subject clearer and more understandable than the law of England. This is not surprising. Those who drafted the Easement Act of 1882 had the advantage of the various English decisions, and were thus enabled to make the law clearer than it can be when it is elucidated in a piecemeal fashion by judicial decisions as it is in this country. Having regard to the great importance of the law of light in England, the form and the substance of the same law in British India may enable those desirous of improving this law here to do so, if not in a drastic, yet in a sensible, manner. If a legislative term for substantial damage were to be created in England, there can be very little doubt that it would tend to decrease litigation, and put the law of this easement on a sounder footing. Indeed, the whole of the Indian Easement Act affords valuable lessons, and shows the possibility of placing the law of easements in this country in the form of a code. We cannot but think that the Institute of Architects would do good service to the whole community if they could create and carry through Parliament a code of the law of light. As is well known, it is to the Bankers' Institute that the country is indebted for the code of the law of hills of exchange, which is based on that originally published as a private work by Judge Chalmers, who subsequently drafted the Bill for the Bankers' Institute. With their multifarious and pressing political duties it is impossible to expect that any Government will take active steps to codify branches of the law. In India codification is at once a tradition and a duty of the legal member of the Governor-General's Council. In this country it must be done by public and influential bodies, and one of the advantages of the two Acts to which we have referred is that, in addition to making the law in India clear on some points and improving it on others, they are to some extent a precedent for a code of the law of light and air and other easements in this country.

#### NOTES.

**T**HE Westminster (Parliament-street, &c.) Improvement Bill has passed the second reading in the House of Commons. This Bill is of an important character, and might, we think, have received a little more attentive consideration by the House. It provides for the widening of Parliament-street on the west side, between Charles-street and Parliament-square, the widening of Charles-street between Parliament-street and Delahay-street, and the widening of Delahay-street. A new street is pro-

posed to be formed between Charles-street and Great George-street opposite the northern end of Little George-street, and another new street on the site of Little George-street between Great George-street and Broad Sanctuary. King-street, Gardiner's-lane, Boar's Head-yard, and the roads on the north and west sides of Westminster Sessions House will be absorbed, and portions of these roads utilised as building sites. A portion of the enclosure in the rear of Canning's statue, on the west side of Parliament-square, is included within the limit of land to be acquired upon the deposited plans. It is much to be regretted that an undertaking of this kind should be allowed to be carried out by private enterprise. The improvement is one of a metropolitan character, and should be undertaken only by a public body armed with power to carry it to a successful termination. It was stated in the House of Commons that the work would not be left in the hands of a joint-stock company, but would be carried out by the same persons who had effected the improvements on the Cadogan-square estate. This appears to be a distinction without a difference, the point being that the work will not be carried out by a responsible public body. The evil results of handing over a public improvement to a private company were exemplified in the case of Victoria-street, Westminster, which was for many years a miserable failure, and is not wholly completed to this day.

**A**NOTHER important public improvement, the continuation of the Mall into Charing-cross, appears to have been resolved upon in the hole-and-corner manner in which all our important public works are usually determined. Mr. Plunket announced on Tuesday last that the Mall would be prolonged, and would be made of the width of 75 ft. in connexion with the New Admiralty and War Office site, but he declined to give any pledge with regard to the open spaces about the buildings. The Mall must be at least 130 ft. wide, and to call a street 75 ft. wide an extension of the Mall is ridiculous.

**W**E have already commented on the unsatisfactory and inartistic character of the new coinage, on which point there seem to be no two opinions among those who have any right to an opinion. The answer of the Chancellor of the Exchequer to a question on the subject last week was amusing. He replied, with an air of injured virtue, that if the reverses of the coins had been confirmed it was probably in ignorance of the fact that they were reproductions of the best of our old designs. The right hon. gentleman was so satisfied with this reply that he repeated it twice, not appearing to see that it was simply a begging of the whole question. He is correct in saying that the Gothic details on the old florin are not very good: they are not, but the coin has the merit of being designed with an eye for decorative effect, which the new florin is not, and to repeat that it is an old design reproduced is no kind of defence for the design; it is had and ineffective, whether old or new.

**O**N Tuesday the second reading of the "Metropolitan Open Spaces Acts Extension Bill" was passed in the House of Lords. This is a measure to promote and facilitate, in urban and rural sanitary districts, the acquisition of land for permanent open spaces, as has been done in regard to many disused churchyards and other spaces in London. The Bill will enable Corporations to appropriate their land for open spaces, to sell or give land to urban authorities to be used for the enjoyment of the public, &c. It is gratifying to find that a salutary movement of such comparatively recent growth is thus making its way, and its advantages becoming generally recognised.

**F**OR nearly ten years past the stones of Temple Bar have lain in sorry neglect in an enclosure next northwards of Farringdon Market. The lead from the roof was melted into medals, and the windows are destroyed.

On Thursday, June 23rd, the Court of Common Council carried, by a majority of forty-two, a report of their City Lands Committee recommending that the stones be presented to Sir Henry Bruce Meux, Bart. Sir Henry undertakes to defray all charges of their transport, and of re-erecting the materials at the entrance to his seat, Theobald's Park, near to Cheshunt, in Hertfordshire. The latter cost is estimated to amount to 1,700*l.* So that the rumour to which we alluded in last week's issue (p. 931), that Temple Bar was about to be re-erected in a gentleman's park not fifty miles from the City, is confirmed, notwithstanding that the *City Press* denounced it as a *canard*. An amendment was moved that the matter should be referred back; but this did not meet with much favour, and the report of the Committee was adopted by a majority of 80 to 38. One member observed that it would be impossible to re-erect the gate, as the majority of the stones had been carted away, and had been macadamised in London and elsewhere, and another member remarked that it was absurd to class Temple Bar with Westminster Abbey,—the Abbey being a thoroughly ancient structure, while the Bar was only 200 years old. Whatever is done with the stones, it may safely be predicted that the gate, when re-erected, will retain very little interest as a building or an antiquarian relic.

MR. PLUNKET'S explanation in the House of Commons in reply to a question by Mr. Howorth as to the treatment of the ancient Coronation Chair at Westminster during the Jubilee celebration on Friday week was eminently lame and unsatisfactory. The allegation, which was first made by Mr. Frederic Harrison at the annual meeting of the Society for the Protection of Ancient Buildings on June 9th, was that "the historic chair of five centuries and a half, the fetish of the English monarchy, the chair famous in Shakespeare and in our literature, has been delivered over to the tormentors, and is being gilded and furnished by the court upholsters." The *Athenæum* of last Saturday remarks, "We shall scarcely be believed when we say that the Coronation Chair, perhaps to most Englishmen the most precious of all the relics in the Abbey, was handed over to some barbarian to be smantened up, and he has daubed it the orthodox Wardour-street brown and varnished it!" Mr. Plunket's explanation is that it was found necessary to fit in temporarily some few pieces of tracery which were missing, and to stain them so as to match the colour of the old work. That is to say, that the chair has been "restored." We should like to know by whom it was "found necessary" to undertake this purely gratuitous and mischievous piece of work. The chair has been used for the Coronation of every English sovereign since Edward II., and on these occasions the chair has been covered with gold tissue, or similar costly stuff, and one is at a loss to imagine why such a course should not have been adopted on the occasion of the Jubilee, if the chair were found to be too shabby for its tinsel surroundings. Dean Stanley says of the chair ("Historical Memorials of Westminster," p. 66):—"It is the one primeval monument which binds together the whole Empire. The iron rings, the battered surface, the crack which has all but rent its solid mass asunder, bear witness to its long migrations. It is thus embedded in the heart of the English monarchy,—an element of poetic, patriarchal heathen times, which carries back our thoughts to races and customs now almost extinct;—a link which unites the throne of England to the traditions of Tara and Iona, and connects the charm of our complex civilisation with the forces of our mother earth,—the stocks and stones of savage nature." This "primeval monument" has been wantonly falsified,—the poetic element in it eliminated, and, as the *Athenæum* says, "the throne of six-and-twenty monarchs has been vulgarised into the semblance of the hall chair of a Cockney Gothic villa."

A COMPANY has, we learn, been formed for erecting a new concert-hall, to be named the Victoria, at the quite northern end of Regent-street. The site lies, in fact, in Langham-place, being by the corner of Riding-house-street, over against the Langham Hotel and Nash's church of All Souls. Its total area of about 20,000 ft. superficial is at present occupied by Nos. 3 and 4, Langham-place; by St. George's Hall, whither the "German Reed" company migrated from the quondam Gallery of Illustration which Nash had originally built for his own residence; and by the dismal pile of Portland Hall Bazaar, Nos. 20 to 22, better known, perhaps, some thirty years ago, as the "German Fair." St. George's Hall and the two adjoining houses are let for thirteen or fourteen years hence at an aggregate rental of 880*l.* a year, so that an area of about one half acre only is, as yet, available for building purposes. All the property is held for certain terms direct from the Crown. It has been valued by Messrs. Drivers & Co. at 49,000*l.*, and at this price will be acquired by the Company. The new premises will comprise a great hall, nearly square in plan, with a capacity for 3,500 seats on the ground and in the balconies, and an orchestra of 700 performers, together with a subsidiary hall to accommodate from 900 to 1,000 persons. Messrs. T. E. Knightley and C. J. Phipps, F.S.A., are appointed as joint architects to this undertaking.

BY their scheme for readjusting parochial charities of St. Bride's, London, the Charity Commissioners propose to establish a "People's Palace" in the Ward of Farringdon-without, and open to all, somewhat like that which has just been opened by her Majesty in connexion with the Beaumont Trust at Mile End. The site chosen is now occupied by the vegetable market in Farringdon-street, lying between Stonecutter-street and Messrs. Pontifex & Wood's foundry (*olim* Oldhour Hall). The market covers the ground,—some one acre and a half in area,—whereon formerly stood Shoe-lane workhouse and its burial-ground, the latter containing Chatterton's grave. It was built in 1828-9 from the designs of William Montague, City Architect, and at an outlay of nearly a quarter of a million sterling, to replace Fleet Market. That market, again, had been opened on September 30th, 1737, as a successor to the Stocks Market,—site of the Mansion House,—and extended, over the Fleet, all the distance between the Holborn and Fleet Bridges. Its green market was at the southern end, by the prison; in the centre stood the market-house, having a high tower and vane. The present vegetable market will be transferred to the building specially designed for the purpose by the late Sir Horace Jones, but latterly used for the Central Fish Market, for which new premises are to be erected facing Snow-hill.

IF we may credit a statement made by the Reverend Prebendary Billing as spokesman of a deputation from the Whitechapel District Board on the 24th ult., the condition of what is known as the Bell-lane area, Spitalfields, must be eminently unsatisfactory, and seems to call for redress. Taking the whole area of the metropolis, the average population is 54 persons to an acre, in Whitechapel it is 107 to an acre, in Spitalfields 286 to an acre, while in the area in question the number of persons to an acre is stated to reach the enormous total of 900 persons to an acre. As we have frequently had occasion to point out, density of population is an important factor in the consideration of sanitary questions. In a scattered community the death-rate is invariably lower than in closely-packed neighbourhoods, the other conditions being similar. Bell-lane was condemned by the medical officer of health for Whitechapel in 1884, and frequent representations have been made to the Metropolitan Board on the subject. It is difficult to understand why these representations have been hitherto disregarded, but there may be some influences at work of which the public have no knowledge.

THE most ancient Latin inscription so far known is to be found on a gold fibula recently discovered at Palestrina. The inscription is engraved from left to right, and runs as follows:—"*Manios med Fhe Phaked Numasios*," i.e., in ordinary Latin "*Manius me fecit Numasios*," Manius made me for Numasios. The form *Fhe*, for *F*, and the interesting reduplication now lost in the word *fecit*, make the inscription of the first importance for epigraphists. The fibula is in excellent preservation. The inscription is published in the *Mittheilungen des Arch. Instituts Römische, Abtheilung II.*, No. 1, with full commentary by Dr. Dümmler. In the same number Dr. Hellhig publishes in two prototype plates a fine marble head now in Paris, which he believes to be a portrait of Livia. The coiffure of the head is very elaborate, and of course, if it be Livia, false, as she was bald. The features are fine and well marked, notably the nose, which is thoroughly "Roman." The whole cast of countenance answers well to the character given by Tacitus to the Empress.

THE demolition of masonry built in the Middle Ages has often, in Rome and elsewhere, brought to light remains of Classical sculpture. Interesting discoveries of this kind are just now being made in the Via Labicana. The road runs through ground which was once the site of the gardens of Maecenas, and is therefore, *a priori*, likely to be rich in ancient treasure. The find is so far a miscellaneous one. Fragments of shattered limbs abound, which, it may be hoped, will some time in part be put together. Twenty heads have been found, of which the greater number are Isis types of late date. Some others belong to portrait busts. So far the finest specimen that has come to light is the head of an athlete, reported to be very like the Doryphoros. An account is given by Sig. Gatti & Visconti in the *Bullettino della Commissione Archeologica di Roma*.

ON July 20th next, two well-known properties at Richmond will be put up for sale by auction at the Mart in the City. One is the Castle Hotel and its stabling, in Mill-street, together with the adjoining Spread Eagle public-house; the premises and cellars tenanted by Mr. George Ellis, wine merchant; and those occupied in part by the London and Provincial Bank. These have a frontage extending down to the Thames, and include some boat-houses and cottages beneath the riverside terrace. Immediate possession of the hotel and its appurtenances can be obtained; the leases of the other tenancies have from ten to fifteen years more to run. The other property is the "Lass of Richmond Hill" tavern, with a cottage next thereto, by the end of Queen's-road, and close to the top of Richmond Hill. With this tavern will be sold two neighbouring residences on the Terrace, known as Lion House and Moreshead House, finely situated on the summit of the hill, and very near to the gates, bearing the date 1798, which "Capability" Brown set up for King George III. at the entrance into Richmond (New) Park. Sir Joshua Reynolds and Sheridan lived on the hill. The first-named painted the world-famed view from Wick House, by the Star and Carter. The New Park, originally made by Charles I., was given by Parliament to the Corporation of London, who returned it, with a present of 12,000*l.*, to Charles II. at his Restoration. Here, on the occasion of his Saturday visit with Lady Yarmouth and others to the White Lodge, King George II. used to add to gallantry the pleasures of the chase by driving his flock of fat turkeys into the trees and there shooting them on their perches. In our columns of June 12th and October 16th, 1886, and in "Notes," June 4 last, we adverted to the purchase, recently effected by the local authorities, of the Duke of Buccleuch's estate on Richmond Hill, now known as "The Terrace Gardens."

THE late Mr. George Barnes Williams, whose death on the 23rd ultimo is announced, although a Fellow of the Institute, having been elected an Associate as early as 1845, was more a surveyor than an architect, although he

erected a number of buildings in the City of London and the suburbs. He entered the office of the late Mr. George Smith, surveyor to the Mercers' Company and the architect of St. Paul's School, at an early age, and afterwards joined Mr. Smith in partnership and carried on business at No. 43, Frederick's-place, Old Jewry. On the death of Mr. Smith he succeeded him as Surveyor to the Mercers' Company, and was also Surveyor to the Vintners' Company, for which latter Company he carried out extensive alterations to their premises in Lower Thames-street and rebuilt the hall. The extensive block of buildings on the north side of Cheapside between Ironmonger-lane and Old Jewry, in which the old entrance gateway to Mercers' Hall is reproduced, was from his design. Mr. Williams was District Surveyor for Plumstead and Eltham, and was largely employed in compensation cases, his experience in dealing with City property being extensive.

IN our columns of May 28th last we announced a projected sale of the Marquis of Huntly's Dee-side estates. Their net rental value is calculated at 12,260*l.*, with timber valued at 80,000*l.* At the Mart, on June 22nd, the estates,—as a whole,—were withdrawn at an offer of 150,000*l.* A bid of 70,000*l.* was then refused for the four properties lying on the northern side of the Dee, including Aboyne Castle with its park, &c., extending over 6,700 acres,—net rental nearly 4,000*l.* No offering made for Glentanar and Birse Forest, south of the Dee,—net rental 3,000*l.*—the property was submitted in six lots, all of which were eventually withdrawn. Some of these were reserved at the following prices:—Birse Forest, 11,000 acres, mostly grouse moor,—40,000*l.*; Glentanar, with residence, 29,000 acres, mostly deer forest, 140,000*l.*; Muir of Dess, 2,400 acres, 30,000*l.*; Cullblen, Kinnord, and Cambus o'May, 9,350 acres, 4,500*l.*

ON July 12 will be offered for sale, at the Auction Mart, No. 8, Carlton House-terrace, next adjoining to the German Ambassadors'. For the thirty-nine years' lease, at a ground-rent of 170*l.* per annum, the upset price is 15,000*l.* On the 19th idem will also be sold the house, Nos. 14-15, in the same terrace, by order of the trustees of the will of William, late Earl of Lonsdale. Of the Crown lease for the mansion and stabling, forty years are unexpired. The remaining sixty-five years' Crown lease of the premises next to Marlborough House gates in Pall-mall, recently tenanted by the Beaconsfield Club, has been sold to Mr. Ashton Lever, founder of the Club. The premises were built fifteen years ago, and the property is bought for 30,700*l.*, subject to a ground-rent of 550*l.* per annum.

IT appears that, the nightly-illuminated garden fêtes at South Kensington having now ceased, the same kind of entertainment is to be provided in an "Arcadia" to be formed at the Agricultural Hall from July 7th to near the close of September; flowers, lamps, promenade concerts, and a specially-arranged waterfall 50 ft. in height. There is, no doubt, that the "Feast of Lamps" of South Kensington supplied a new and most popular evening recreation, and an attempt to carry on something of the same kind will probably be a success, though it will not in this case be in the open air, nor in so attractive a neighbourhood.

MR. HOLLINGSHEAD has practically disposed of the site for a theatre in Shaftesbury-avenue, with which his name has been prominently associated. We hear that, *en revanche*, he is establishing two other theatres in the vicinity, and is about to exhibit M. Phillippoteau's cycloramic painting of Niagara. The building for this picture, which is 50 ft. high and 390 ft. in circuit, will comprise a museum, together with an American café and restaurant after the style and model of "Delmonico's" in New York.

ONE of the results of the recent talk about architectural education has been the establishment in London of an *atelier* for architectural students, on the French system, under the direction of Mr. F. T. Baggsallay (Royal Academy Gold Medalist) and Mr. Walter Millard (Royal Academy Travelling Student and Pugin Student). Both are well known as among the ablest of the artistic designers among the younger generation of architects, and their experiment is one which will, no doubt, be watched with interest and good wishes. The terms proposed are very moderate; and it should be observed that the *atelier* is intended to afford facilities not only to those preparing to enter an architect's office, but to those already engaged as pupils or assistants who desire to supplement the knowledge acquired in business hours.\* The question is whether an *atelier*, where the directors only make a visit in the course of the day, is a system likely to promote diligence and regularity of working among the students. We are sure Mr. Baggsallay and Mr. Millard will use every effort to make it profitable to those who attend. But we confess that our idea of an architectural *atelier* would be one where the instructor was carrying on his own architectural work on the same premises and exercising constant supervision and authority over the pupils. We may add our conviction that in any *atelier* for architectural instruction a prominent place should be given to the study of the scientific side of architecture. At present there is certainly too little of that and too much of drawing; the latter is the popular element, no doubt; but for that very reason it should be kept in its right place in an *atelier* of architectural instruction.

THE rumour that we have previously referred to, that the provision of a new building for the Admiralty and War Offices was to be quashed altogether, has turned out to be correct, judging from the Report of the Committee's proceedings as given in last Saturday's *Times*. The following are the concluding words of the Report:—

"We are satisfied that by making additions to the present Admiralty, all the requirements of that department may be suitably provided for; that this work, including some repairs and improvements to the existing building, can be done at a moderate cost, and may be completed within two or at most three years; that a very large reduction of expense for buildings would thus be secured, and to this must be added, as against the cost of erecting a new War Office, the value, estimated at 298,000*l.*, of the portions of the Spring-gardens site which would be preserved after providing for the suggested additions to the Admiralty and for the opening of the Mall into Charing-cross. We therefore recommend that the entire official staff of the Admiralty and War Office respectively should each, as soon as possible, be placed under one roof, and that the two buildings should be situated at no great distance from each other; but we are of opinion that these recommendations can be carried out, and that a great saving of money and time can be secured by adopting other plans instead of those which have been referred to us for consideration; and we find that the main buildings of the Admiralty may with advantage be retained."

Thus, it will be seen that after all the fuss that has been made about this affair, and the sham parade of a large architectural competition, the whole thing is to be cut down into a cheese-paring muddle of bits of old buildings, to suit the miserable spirit of economy of the present day. It is true that the design which had been selected was architecturally a very poor one, which would have done little credit to Victorian architecture; but it is obviously not on that ground that the building has been thrown over: for one of the most prominent members of the recent Committee was also one of the most prominent members of the Committee for organising the competition and selecting the designs. It is only another example of the modern Governmental spirit, and the way in which modern England "stupidly travels her round," as a great poet has said, and subordinates all questions of art to the miserable consideration, "how much money can we save on it?"

\* Further information as to the *atelier* may be obtained on application to either of the directors, 5, Bloomsbury-square.

LETTER FROM PARIS.

THE painful feeling aroused by the disaster at the Opéra Comique is still far from being allayed, and the regulations now insisted on by the Prefecture of Police have necessitated the temporary closing of some theatres. The Municipal Council of Paris is naturally much occupied with the subject, and in the course of a discussion on it the Colonel of the Sapeurs-Pompiers declared that he never took his family to one!—a remark which, coming from such a quarter, was certainly not calculated to reassure the public. Unfortunately, whenever stirred up by unhappy events of this kind, the Government masks its habitual indifference by an excessive zeal, which lasts only a very little while. Committee after committee is appointed, and a crowd of directions issued, the very multiplicity of which prevents their realisation, and then all this ardour suddenly goes out like fire in straw. The reports of the Comites go into the Ministerial portfolios, to repose with other perfunctory papers; the directors of the theatres occupy themselves busily in doing nothing; the Administration complacently closes its eyes, and all goes on as before till the day when another similar catastrophe comes to reveal that nothing has been done to provide for the safety of so many lives.

In the recent fine weather the works of the Exhibition have been actively pursued. The getting up of the supports of the "Palais des Galeries diverses" has been effected with great rapidity; and, thanks to modern constructive science, the weight of the construction has been much diminished from what would once have been thought necessary; and this portion of the work ought to have the framework completed by August. The contract for the Palais des Machines is to be let to the Maison Cail and to the Compagnie des Fives, Lille, in two divisions each, including about 6,400,000 kilogrammes weight of material. The work for the Palais de Beaux Arts is somewhat more extensive than either of these two contracts. The four bases for the Eiffel Tower are now complete, and the ironwork has been commenced in the shape of sixteen wrought-iron shoes of great weight placed at the angles of each pier for forming the footings of the angle-pieces. The work from this point will have, at all events, much of technical interest. M. Eiffel expects to complete it by the opening day of January, 1889. Generally, the state of the work leads one to think that before 1887 has passed the greater part of the works will be well in hand, and that everything may be completed on the Champ de Mars by the middle of 1888.

M. Sauvestre, the conductor of M. Eiffel, it may be mentioned, has been named architect for the French Colonial Section. This part of the Exhibition, which will be one of the most interesting to the public, will have as its centre a palace including about 1,800 square metres of area, surrounded with pagodas, Indian and Cambodian, and villages inhabited by negroes from the Congo. A Cochinchina pavilion, a Creole habitation, and Senegalian huts will be grouped picturesquey around a small lake on which will float various specimens of African boating craft.

The line of railway to serve the Exhibition is also under consideration. The scheme drawn out by M. Georges Berger includes three distinct lines; one from the Quai d'Orsay; near the angle of the Ministry of Foreign Affairs Office, and following the line of the quays till it comes to the old Champ de Mars Station; the second from the entrance of the Exhibition near the Seine, and leading to the machinery galleries; the third a high-level line uniting the Esplanade des Invalides to the entrance of the Avenue Lamoignon. The construction of these lines will be the object of a competition, which will leave a large margin to the competitors in regard to the size of the roads and the method of traction (whether steam, electricity, or compressed air).

The State and the City are meanwhile occupying themselves with their usual acquisitions in the Palais d'Industrie. In recent years a committee, presided over by the venerable M. Bailly, and including such painters as Puvis de Chavannes and Laurens, such sculptors as Dalou and Falguière, architects such as Vaudremer and Lisch, made choice of the works of art worthy to be purchased by the municipality. But this year the new Municipal Council, which piques itself on its enlightened taste, and

recognises no other authority, not even that of talent, has chosen to buy for itself, without any guidance from artists. The result is a mélange of purchases more than questionable. We may mention among them, however, the "Douleur d'Orphée" of M. Verlet, and "La Seine," the pretty bas-relief which M. Puech has sent from the Villa Medici.

This proposition of the Parisian municipality to artistic infallibility is odd enough; and if the same idea goes on, we shall some day see it making itself the plans and elevations for the monuments to be constructed, and discarding the technical knowledge of architects as superfluous. In regard to the purchases of the State, always too numerous, we may cite the graceful "Tête de Créole," by M. Heuner, the "Guerre" of M. Roll, the "Curée" of M. Rochegone, the "Défaite des Casselets," by M. Tattégrain, and three good landscapes,—"Soirée de Septembre," by M. Japy, "Soleil couchant," by M. Mesdag, and "Le Matin," by M. Rapin. All these are well chosen and do credit to the Committee of Selection.

M. Verlet, whom we have mentioned as having obtained the "prix du Salon" after three votings, is a young sculptor of high promise, pupil of M. Cavalier and M. Barrias. He had as rivals M. Scherrer and M. Brouillet, both painters. As usual, the Council of the Beaux Arts has awarded a certain number of travelling bursaries. In the section of architecture, this recompense has been obtained by M. Albert Duret, who had exhibited in the Salon a design for a country-house, exceedingly well studied.

This year the Académie des Beaux Arts is occupied about its great biennial prize of 20,000 francs, which is given in turn to each one of the sections of the Institute. The Committee has placed M. Mercié in the first rank for his tomb of Louis Philippe, of which an illustration appeared in the *Builder* for June 19, 1886. M. T. P. Laurens was classed second for his frescoes in the Pantheon. Lastly, after some discussion, M. Detaille was placed in the third rank for his historical illustrations of the costumes of the French army. The first choice will be approved by all who know and appreciate the splendid talent of M. Mercié. The final voting will take place on the 2nd of July, and the decision of the Sectional Committee will, as a matter of form, be submitted to the five classes of the Institute in solemn convocation on the 6th of July.

At the École des Beaux Arts the decision has been given on the annual architectural competition between students of the higher class. The subject was "Une Porte de Ville"; the first medals were awarded to MM. Conill and Seade, pupils of M. Guadet; the second to M. Risler, pupil of M. André, and to M. Guenet, pupil of M. Vandremere and M. Kadlin; and to M. Louvet, pupil of MM. Louvet and Gimain.

We are approaching the National Fête, which is not likely to differ from other celebrations of it, except in the extraordinary fact that there is no inauguration of a statue; that of Gambetta, which was counted on, will not be finished till the end of September. Nevertheless, in order to allow the sculptor and the architect, M. Aubé and M. Boileau, to give account of the progress of their work, the hoardings which masked the half-finished monument have been removed. Gambetta appears standing in the midst of combatants, and exhorting his country to resistance. There is a great deal of spirit in the arrangement of the groups, but all the talents of M. Aubé have not enabled him to give to the tribune of the people the expression of dignity, in which he was, in fact, totally wanting. Gambetta was of a vulgar and coarse personality, and the modern costume does not offer any help in carrying off this defect of physical expression. The principal figure, moreover, carved out of the same stone as the monument, does not stand itself sufficiently from the pyramid. A grey granite or a darker coloured marble. On the opposite face, looking towards the Square du Carrrouel, a cock, with wings outstretched, disports himself on a heap of crowns, flags, and other attributes. Various allegorical statues, which M. Barbedienne has been commissioned to cast in bronze, will complete the decoration (somewhat surcharged) of this monument, the effect of which in execution hardly carries out the promise of the model.

Possibly the monument to Admiral Courbet may prove to have been similarly deceptive;

but the design of MM. Falguière and Mercié, as now accepted by the committee, has undoubtedly all the appearance of a great work. It is in an elongated form, and the base will represent the prow or forepart of a ship. On the prow a nude female figure, symbolising colonial France, is seated, protecting another female figure, recumbent, which is supposed to represent Chinese India ("Indo-Chine"). Behind this group a figure, standing on a higher level, represents Admiral Courbet in the costume of a naval officer and in an attitude of command. At his feet is a winged Victory, holding to him a laurel crown. At the rear of the monument are disposed Chinese arms and armour, and at the sides will be represented the cannon formerly given to China by Louis XV., and which have been collected at Abbeville, where the monument is to be erected, each figure in which will be about 3 metres high. The committee have not yet decided if the monument is to be in bronze or in marble; it will depend partly on the funds available. It is hoped, at all events, that this great work will be completed in a year from now.

We have already spoken of the monument which it is proposed to erect to Bastien-Lepage in his native town. M. Roden has been commissioned to execute the statue of the painter. The model for it, which we have seen, is a very remarkable one. It will be submitted shortly to a committee of artists presided over by M. Bailly.

A whole series of important works will shortly be undertaken at Paris. Without speaking of those which are intended in completion of the National Library, of which the new entrance from the Rue Richelieu is in progress at present, we may mention, in the first place, the reconstruction, so often announced, of the Collège de France. The new building will have a façade towards the Rue des Écoles, and the square in which M. Aubé's statue of Dante is erected will form a kind of *cour d'honneur* to it. It will require probably six years to complete the buildings, which will include eight laboratories and ten large lecture-rooms, at an estimated cost of 12,000,000 francs.

There is talk also of a new hospital, the erection of which has been long deferred, in the populous quarters of the XIXth Arrondissement, between La Villette and Belleville, behind the Parc de Buttes Chaumont. There is a probability also of the opening of a great competition among painters for the decoration of the new Salle des Fêtes of the Mairie of the XIVth Arrondissement, the sum of 40,000 francs is to be spent on the decorations of this *salle*, which is being built from the designs of M. Gimain. We may note, also, that M. Hermand's remarkable building, the Maison de Repression at Nanterre, of which we have spoken before, has been completed and handed over to the Prefecture of Police.

The archaeological world has been much excited during the last few weeks about the excavations recently made at St. Maur les Fossés, a small place a few miles from Paris, by an architect, M. Macé, who, in staking out a road, discovered a number of skeletons, swords, lances, bucklers, bracelets, and other ornaments, of very artistic execution. The discovery is a very interesting one, if, as is supposed, we are here in presence of a cemetery of the ancient Gauls. It is even suggested that the remains are those of the "Bagaudes," peasants of Gaul who revolted under Diocletian, and who, driven from the Arverne district by the Roman army, took refuge in the peninsula of St. Manr, where they were destroyed. Whatever may be the origin of these remains, they are a real historic curiosity, and all the objects discovered have been carefully placed in the Musée St. Germain.

Two sculptors of great merit, though of a very different kind, have recently died; Carrier Belleuse and Lequesne. Albert Ernest Carrier Belleuse, who died at the National Stèves Manufactory, of which he was art-director for many years past, has occupied an important place in recent artistic history. He was one of those who were most inspired with the fine traditions of the eighteenth century, and who has mostly largely contributed to the development of French industrial art. He was born at Anizy-le-Château in 1824, and studied in the atelier of David d'Angers. He obtained a medal of the third class in 1861, a medal of honour and chevalier's cross in 1867, and an officer's cross in 1885. Among his works were

a splendid group, "L'Amour et l'Amitié," exhibited in 1857; a "Bacchante," a "Jupiter and Hebe," an "Urdne," the monument to Massena, a statue of Camille Desmoulins, besides a great number of busts, among which were those of Renan, Napoleon III., Fechter, Thiers, and Théophile Gautier. He exhibited in the last Salon a bust of General Bonlanger, and also a pretty marble statuette of "Diana Victorieuse."

Louis Eugène Lequesne, who has died at the age of seventy-two, was a distinguished pupil of Pradier. He carried off the prix de Rome in 1844, and on returning from the Villa Medici he exhibited the model of the dancing faun, which has since become famous, and the bronze of which adorns the parterre Medici at the Luxembourg. He obtained medals of the first class in 1851 and 1855. He was engaged, on the death of Pradier, to complete the twelve Victories which adorn the tomb of Napoleon I. at the Invalides. We may mention also among his principal works a statue of Marshal St. Arnaud, a "Baigneuse," a "Soldat mourant," "Lesbié," a "Prêtresse de Bacchus," and various statues which decorate the Church of St. Augustine.

The death is also announced of the sculptor Chas. Matahon, pupil of Duret and Caillotte, who made a speciality of busts and medallions. He exhibited a good many years ago a bust of Shakespeare, which excited much notice, and some years after one of Félicien David, commissioned by the Ministry of Fine Arts.

Two other artists of talent, a painter and an engraver, have also died during the month. The former, M. Vincent Vidal, had studied in the atelier of Paul Delarocche. He was a portrait-painter who had his hour of celebrity under the reign of Louis Philippe, and whose pastels were much sought after. He died at the age of seventy-two, having obtained several medals at different times, and the Cross of the Legion of Honour in 1852. The engraver, M. Eugène Bldry, who had reached his eightieth year, had obtained numerous recompenses, including that of the Legion of Honour in 1846. He was an artist of great merit, and great rapidity of working, and was Professor of Drawing at the "École Spéciale des Beaux-Arts."

#### PROPOSED RECREATION-GROUND FOR LEWISHAM.

THE Lewisham Vestry, after having had for some time past under consideration two alternative sites for a recreation-ground for the parish, have just decided to purchase for the purpose the property known as the Ravenshonre Estate, and some on adjoining land, containing altogether an area of upwards of 50 acres. The land stretches from Cafford at one end to Ladywell at the other end. A portion of the land, 42 acres in extent, belongs to several owners, and can, it is said, be purchased for 20,000*l.*, being at the rate of about 500*l.* an acre. At the Lewisham end the land agreed to be purchased consists of 9 acres belonging to the Earl of Dartmouth, for which 800*l.* per acre is the sum named, the entire amount for the purchase of the whole of the land required being about 28,000*l.* At the meeting sanctioning the purchase, Mr. Williams, the representative of the Vestry at the Metropolitan Board of Works, stated that he had no doubt the Metropolitan Board would advance 14,000*l.* towards the purchase, and that Alderman Whitehead, one of the owners of land in the locality, had intimated his readiness to contribute 1,000*l.* towards the cost of the purchase, and that Mr. Jerrard, another owner, would contribute 500*l.* He added that he had reason to know that the City companies, and others interested in the neighbourhood, would contribute about 4,000*l.* He said that it was proposed to keep the land as much as possible in its present condition, except as to one or two points, and that if the scheme were carried out they would have one of the finest recreation-grounds to be found anywhere in the metropolis. It had natural beauties connected with it which would make it a very pleasant recreation-ground. On one portion of the ground a lake of about three acres in extent could be formed, and a smaller lake on another portion. From one end of the ground to the other there was a running stream, which could be bridged over with rustic bridges. The proposal to purchase the land was all but unanimous, there being only four dissentients.

**Illustrations.**

**DECORATIVE PAINTING FOR THE NEW SORBONNE, PARIS.**

**H**IS great piece of decorative painting, about 80 ft. in length, which is the most prominent work in the Salon Exhibition, is designed by M. Puvis de Chavannes, the remarkably individual artist who has almost made a school of his own, and occupies a somewhat similar position in French art to that occupied by Mr. Burne Jones in English art. The work was fully described in our article on "the Paris Salon of 1887" in the *Builder* of May 21st, page 760. We are glad to be able to supplement the description by an illustration of a work which, whatever its mannerisms of style, is a fine example of ideal or imaginative painting, a type of art which, in spite of the realistic tendencies of much modern French painting, still finds more votaries in France than on any other soil.

**DESIGN FOR THE IMPERIAL INSTITUTE.**

We give a perspective view of the design by Mr. Colcott, which has been selected, subject to probable future modification. We have commented on it, along with the others, in another column.

**BRONZE GATES.**

This plate represents the gates of the elegant little loggia at the foot of the campanile of St. Mark at Venice, on the side facing the Porta della Carta. They were designed and executed by one Antonio Gai, described as a Venetian sculptor and metal founder, who lived between the years 1684 and 1769; they belong, therefore, to the early part of the eighteenth century.

The loggia was erected from a design of Sansovino's about the year 1540. According to a passage quoted by Cicognara from an older writer, its original object was to provide a place whither the robes might resort for the purpose of entertaining themselves with learned discourse; it was, however, within a very few years, put to other purposes.

The main façade consists of a composite order, with three wide and four narrow intercolumniations; in the wider ones are open arches, and in the narrow niches containing bronze statues of Pallas, Apollo, Mercury, and Peace. Above the order is a high attic, panelled out with subjects in bas relief. The whole is raised on a little platform several steps above the level of the piazza. It is chiefly constructed of pure white Carrara marble, but the dies of the pedestals, the main architrave and cornice, and the cornice of the attic, are of Venetian "gentil rosso," and the shafts of the columns are of breccia.

**WEST DOORWAY, ORVIETO CATHEDRAL.**

The Cathedral of Orvieto has been recently re-opened, after being closed for some time for restoration and repairs. The central western doorway, of which an illustration is given this week, is a fine example of that rich and almost jewelled type of work characteristic of the Gothic of North Italy, of which the Florence Campanile is the most famous example. The richness of the door-jamb, with its alternating orders of spiral shafts, carving and inlay, is remarkable. On the other hand, the weaker qualities of Italian Gothic come out in such details as the thin secondary impost moulding above the genuine impost, and through which the archivolt mouldings appear to run; a detail the origin or significance of which it is difficult to understand, and which weakens the whole composition architecturally. But it is, nevertheless, a sumptuous piece of decorative work carried out without stint as to cost or labour. The illustration shows a portion of the remarkable wall diaper of small figures interwoven with foliage, which is one of the special points in the detail of Orvieto. The mosaic pictures on each side of the gablet are modern.

**SCULPTURE AT CHARTRES AND AMIENS.**

**THE NORTH PORCH, CHARTRES CATHEDRAL.**

One of our plates this week shows a portion of the north porch of Notre Dame de Chartres, and the statue of Christ from the west door of Amiens Cathedral. Both were executed

early in the thirteenth century. An interesting account of both examples of this beautiful period of French sculpture is to be found in M. Viollet-le-Duc's Dictionary (articles, "Sculpture" and "Christ").

M. Le Duc particularly speaks of the once-coloured decoration of this statuary. He says:—"La statue et l'ornementation des portails de Notre Dame de Paris, des Cathédrales de Senlis, d'Amiens, de Reims, des porches latéraux de Notre Dame de Chartres étaient peintes et dorées, et de même que la sculpture la coloration peignait vers le naturalisme." He goes on to say how, not merely were flat tints used, but that in the folds of the drapery, and in portions shaded from the light, dark glazes were put over the colour, which had the effect of accentuating those portions in full light. He would appear to show the sympathy existing between artists at that time, when he says:—"Les artistes qui ont fait les admirables vitraux des XII<sup>e</sup> et XIII<sup>e</sup> siècles avaient une connaissance trop parfaite de l'harmonie des couleurs pour ne pas appliquer cette connaissance à la coloration de la sculpture."

Beautiful drawings of the sculpture of Chartres are to be found in "La Monographie de la Cathédrale de Chartres," published in Paris.

**STATUE OF CHRIST, WEST DOOR, AMIENS**

Speaking of the statue at Amiens (the local name for it is "Le Beau Dieu d'Amiens"), M. Le Duc says, "Amongst the statues of Christ remaining in France the most beautiful is that of the 'Christ man' (as opposed to other types, such as 'Christ triumphant') at Amiens, where the type is Byzantine, without any hardness and undue severity of character." He calls the attention of sculptors to the beautiful profile of the statue. He says, "This sculpture is treated like the heads carved by the Greeks of Ægina." The same simplicity of model, the same purity of outline, the same execution, at once broad and refined, the expression grave, without sadness. This head is the more remarkable, because in those of the apostles right and left, and which were carved at the same time, this divine character is not perceived. They are portraits of men, of the Picardy type; whereas that of the Christ is of a "type consacré."

A most interesting feature in this sculpture is the beautiful expression of Christ being the "son of David." David is not found in the ranks of the prophets on either hand, but forming the pedestal of Christ. As king he holds the sceptre, and the scroll as prophet. On the north side of the pedestal is sculptured a lily; on the south a rose, with a tendril of vine above. "I am the Rose of Sharon and the Lily of the Valleys." "I am the true Vine."

Represented above are the basilisk and the adder, typical of the most active evil principles of the earth; the basilisk half dragon, half cock; the deaf adder, laying one ear against the ground, and stopping the other with her tail.

Under the feet of Christ himself are the lion and the dragon, the images of sin.

A most interesting description of this and the other sculptures of Amiens is to be found in the "Bible of Amiens," by John Ruskin.

G. HORSLEY.

\*\* Mr. Horsley writes to say that he was not "Alwinckle Student," as engraved on the plates of last week (and on some already engraved for this week's issue before his correction arrived), but "Owen Jones Student" for 1887.

**New Works in Paris.**—The *Journal des Céramistes et des Chanfourniers* states that the loan of 1,500,000, lately raised by the City of Paris will be principally devoted to the following purposes:—

1. New works connected with water supply.....	228,000
2. New canal works .....	20,000
3. New sanitary works .....	92,000
4. Proportion borne by the Municipality in the suppression of level crossings on the Ceinture Railway .....	40,000
5. Highway works of all kinds .....	700,000
6. New school works .....	72,000
7. Subvention to new hospital works.....	32,000
8. Proportion towards the Sorbonne works borne by the Municipality .....	28,000
9. Proportion borne by the Municipality towards the Lycées on the right and left banks.....	66,000
10. New architectural works and improvements.....	145,000

A first annual contribution of 80,000, will be made to the Universal Exhibition of 1889. The expense of raising the loan was 36,000.

**SUGGESTION FOR THE SITE OF THE NEW WAR OFFICE AND ADMIRALTY BUILDINGS.**

SIR,—I wish to offer the following suggestion for combining the erection of the new War Office and Admiralty with the eventual rearrangement on a symmetrical plan of the old and irregular buildings forming the south and east sides of the parade-ground and of the front towards Whitehall.

The plan [see next page] is so divided into sections (as marked by the lettering) that it may be executed in successive stages, in part only deferred, postponed indefinitely, or abandoned altogether at any stage, without the appearance of incompleteness in the parts already executed necessitating or suggesting the execution of the whole.

In adopting, therefore, a scheme of this kind, the Government would not be committed to anything beyond the actual necessities of the case at any period.

A glance at the parade-ground itself will show that with its breadth of 600 ft. and depth of 250 ft., approached from an open space like the park, it is one of the finest sites, if not the very finest, in Europe, and should be dealt with on some principle of symmetry, if it be possible. This plan simply suggests that it is possible.

This magnificent site, when the New War Office is built on the north side (a lofty mass nearly 90 ft. high) will be occupied on the other two sides by low, mean, and irregular buildings, which, in the nature of things, must be reconstructed at no very distant date.

This scheme is to provide for such reconstruction on a symmetrical plan, in the first place towards the parade-ground, and, secondly, on the Whitehall front.

At the present moment, no doubt, some feeling exists for the preservation of the Horse Guards building; it is not proposed to deal with this till the necessity for so doing arrives. Standing as it does now, and constituting the central and loftiest mass of a number of low irregular buildings, the effect is pleasing; but if a building like the proposed New War Office be erected in closest juxtaposition, and the buildings on the south side re-constructed, as they assuredly will be, on a more liberal scale, the conditions will be reversed. It will then be a low mean-looking building of very vulgar design, jammed in between loftier buildings possibly more than double its height, and yet it will be the central point of this magnificent site.

The scheme suggested, moreover, is not that of any specific design, but simply of applying the principles of symmetry to the arrangement of the buildings surrounding this magnificent site on a principle of economy.

It is not a question of elaborate decoration, since a plan spread over so wide a space suggests plain and simple treatment.

It is not a question of acquiring expensive property for the whole of the area affected is already in the hands of the Government; indeed, a great economy, perhaps 100,000, may be accomplished, as hereafter shown, in the matter of the site alone. Neither is it a question of removing solid and substantial buildings, since those now occupying the site are mean and irregular, and cannot be suffered to remain very long.

Lastly, by shifting the site southwards instead of northwards, not only will the further purchase of expensive property to enlarge the site of the proposed new buildings be avoided, but the block of houses marked X<sup>1</sup> and X<sup>2</sup> on the block plan, already purchased, may be preserved, and perhaps something like 100,000, economised in this way only.

Note.—All the buildings are in the hands of Government, and must soon be reconstructed.

H. B. GARLING.

**The Lighting of Staircases.**—A legal decision has been given in Germany as to the obligation of householders to light passages and staircases in such a manner that no one can be injured for want of sufficient light. A postman in Stettin having fallen and hurt himself under these circumstances, the courts have inflicted a penalty upon the proprietor of the house. It has always been understood that factory staircases have to be lighted, and this supposition is now, it is remarked, confirmed by the above decision.

DESIGN FOR THE IMPERIAL INSTITUTE BUILDING. (ACCEPTED, SUBJECT TO MODIFICATION.)

MR. T. E. COLCOTT, F.R.I.B.A., ARCHITECT

SKETCHES BY MR. GERALD HORSLEY, ALDWINGKLE STUDENT, 1887.

BRONZE GATES OF

E LOGGIA, VENICE.

FIGURES FROM THE N. PORCH, CHARTRES CATHEDRAL.

SKETCHES BY MR. GERALD HORSLEY, ALDWINCKLE STUDENT, 1887.

THE "BON DIEU d'AMIENS."

INK PHOTO SPRAGUE & CO. 27, MARKING LANE, LONDON E.C.

Ancient Palace of the Archbishops of Canterbury at Maidstone. (See "Note" in BUILDER of June 4 of this year.)

#### THE NEW TOWNHALL AT PORTSMOUTH.

DURING the visit of the Association of Municipal and Sanitary Engineers to Portsmouth on the 4th ult., as mentioned by us at the time (see *Builder* for June 11, p. 882), the members inspected the works now in progress for the erection of the new Townhall, with reference to which Mr. Boulnois, the Borough Engineer, read the following notes:—

The new Townhall at Portsmouth, now in course of erection from the designs of Mr. William Hill, F.R.I.B.A., architect, of Leeds, and under the superintendence of Messrs. W. Hill & Sons, of Leeds and Portsmouth, stands upon a site containing  $3\frac{1}{2}$  acres acquired by the Corporation (partly by purchase and part in exchange for other land) from H.M.'s War Department.

When the existing boundary wall and old buildings are removed, the east or principal front of the building will be seen at a distance of 160 ft. from the centre of Commercial-road, the chief thoroughfare in the borough, and near the central railway station. The south front of the structure faces a wide road called Park-road, and is 90 ft. from the Gas Company's offices, the nearest building on that side. The west front is open to a portion of Victoria Park, and the north front is also open to this park, but unfortunately separated from it by the railway embankment, which cuts off the whole of the basement of the building, and about 8 ft. or 9 ft., or one-fourth, of the order of pilasters, from the spectator's view in these ornamental grounds.

The following are the leading dimensions of the building on plan, viz., the east and west fronts from north to south on the plinth line 185 ft., and through the centre in the same direction 206 ft.; and from east to west 164 ft. and 194 ft. 6 in. respectively; the total area covered being 35,380 sq. super, the cubic contents of the structure being approximately 2,500,000 ft.

The under-mentioned figures give very closely the areas allotted to the several departments falling under the head of municipal offices. On the east or principal front, immediately north of the portico on the basement or ground-floor, are the rate offices, four in number, covering an area of 1,650 ft. super. On the north front, beyond the north-east stairs, is the sanitary department, the Inspector's with 925 ft., and the medical office with 700 ft., the north main entrance to the principal floor bisecting these offices; 380 ft. is then taken for lavatories, &c., and ball-keepers' and porters' rooms (together 560 ft.) fill up the north-west angle. Next to these on the west front come two stair-

cases,—a separate one to the Borough Courts and another to the principal floor; beyond this the police cells, eleven in number, with corridor and stairs to the court, occupy an area of 2,500 ft. Contiguous to these the police department, with two entrances and numbering eight rooms, take up 1,790 ft. of space, exclusive of stairs to floor above and corridor to cells. Passing the south main entrance to the next floor we find the whole of the south-east angle of the building from the last-named staircase to the portico devoted to the public library and reading-room, together occupying 5,260 ft., and an additional space under the great hall of 1,100 ft. for store-room purposes; the rest of the space under the hall being distributed as follows, viz., 800 ft. to the heating and ventilating apparatus room, 2,300 ft. to the police parade, and 1,500 to the store and testing-rooms; a further area of 3,790 ft. is taken by the corridors and stairs before named.

Following the same order, we find, on the principal floor, east front, the part north of the centre allotted to bookkeepers, cashier, clerks, &c., with a similar amount of room as in the rate-offices below, and connected with these and the Town Clerk's offices above by a private staircase, by which the strong-room in the tower can also be reached. On the north front are clerk and retiring rooms on each side of the north entrance, embracing an area of 1,600 ft. super. Beyond these are the harristers' and solicitors' rooms, filling, with the stairs, the north-west angle. The west front on this floor is given up to the Borough Court, magistrates', and witnesses' rooms, &c. The Court, running up through both floors, measures some 50 ft. by 40 ft., in which is also a separate gallery for the public. An apartment on the south front is set aside for a coroner's court, containing 560 ft. From the centre of this front to nearly the centre of the east front are located the Borough Engineer's offices (over the library). Of this space the drawing offices take some 800 ft., Borough and Deputy Engineer's 740 ft., while the public office, Road Surveyor, and Improvement Surveyor share 1,260 ft. between them, making a total of 2,800 ft. super. allotted to this department. The height of this floor is 17 ft. 6 in. from the floor below, the basement floor being 16 ft. from floor to floor.

The above-named offices are all reached from a corridor 10 ft. wide, surrounding the great hall, which is 108 ft. in length by 70 ft. 8 in. in width, exclusive of the semicircular apsidal projection at the south end to receive the organ.

On the first floor, the 10 ft. wide corridor, in communication with three staircases, is carried round three sides of the great hall, and connected with the balcony by eight doors on the

inside, and with the various rooms here described. On the outside, on the first floor, viz., opposite the portico, we get the mayor's reception-room in the tower; north of this comes the mayor's parlour, with 400 ft. area; adjoining are the town clerk's offices, three in number, containing 800 ft. super.; facing the north we get the council-chamber, a fine apartment with about 2,000 ft. of floor space; committee, robing, and other rooms occupy the rest of this front. The upper part of the Borough Court, grand jury and other rooms also fill up the west front on this floor.

On the south of the main hall, beyond the apsidal end forming the organ gallery, the remaining space of 1,400 ft. is set apart for a museum, over which the kitchen and culinary department will find a home. Returning to the east front we reach the banquetting-room, a fine apartment 72 ft. by 25 ft. 4 in., with the mayor's reception-room and parlour *en suite*, and opening into the upper corridor.

Should the fittings of the Borough Court not interfere with the view, a very unique effect will be obtained by opening all the doors on the principal floor from the entrance-hall across the minor axis of the building in the centre and through the centre window of the court; the view will extend over the railway to a distance of some 400 yards westward till lost among the trees in the distance.

The great hall will be 60 ft. high to the panels in the deeply-coffered ceiling, round which will run a deep cove, pierced by the numerous semi-circular windows that light the hall above the adjoining roofs. Beneath this cove an enriched entablature runs round the hall, carried by a series of pilasters. There are two orders of these, divided by the balcony before described.

The ventilating and warming arrangements are in the hands of Messrs. Baden, of Manchester. The numerous flues for the supply of warm and fresh air to every room in the building, together with the extraction shafts for vitiated air, are in the course of construction from the designs of those gentlemen.

The stylo of the building is Classic, of a Roman type, and entirely carried out in Portland stone, from the bed known as the Whit or brown bed. A rusticated basement, with a bold plinth, above which are the ground-floor windows, 9 ft. 6 in. high, reaching to the subbase, 17 ft. from the ground-level, runs all round the building. From the top of this subbase starts the order of columns and pilasters, also surrounding the building. These are 3 ft. 4 in. in diameter, and ten diameters (33 ft. 4 in.) in height, and run through two floors, with a string course marking their division, the subbase marking the level of the principal floor.

The columns and pilasters carry an entablature

ture 8 ft. 6 in. in height, surmounted by a balustrade 5 ft. 3 in. high. In the centre of the east front, and standing 21 ft. in advance, is a hexastyle portico 57 ft. wide, reached by a pyramidal range of steps on each side of the portico, and on the same level is a loggia 57 ft. long and 6 ft. 6 in. deep, with four columns in each, and double pilasters at the angles. On the south, the centre advances 10 ft. 6 in. carrying four three-quarter columns and coupled pilasters; the north and west fronts are treated similarly, but with pilasters only. In the centre of the east front, immediately behind the portico, rises the clock-tower, the lower stage rising boldly toward a break for 29 ft., including frieze and cornice, making a fine base for the hefty stage, which is enriched with pilasters, carved capitals, and panelled semi-circular openings on each face, filled with ornamental iron grilles; above the cushion frieze and cornice of this portion comes the still more highly-enriched clock stage, with dials 9 ft. in diameter, surmounted by pediments and angle terminals; above this starts a copper-covered octagonal cupola or domical roof, over this again rises an open turret with cupola, all in stone, the whole reaching to a height of 205 ft. from the ground.

Taken altogether, the strong lights and deep shadows of the finely-grouped and well-balanced masses, the carefully-studied detail, the charming variety in size and outline of the turrets and cupolas, emphasising the salient angles of the structure, and leading up to the crowning central feature, unquestionably stamp the design as a grand, effective, and harmonious composition. The foundations rest on a firm, compact stratum of gravel throughout; the walls in all cases stand on a depth of 2 ft. 6 in. of cement concrete, except the tower, which has a depth of 5 ft. 6 in. under two courses of roach Portland stone covering the whole area.

The quantity of stone required for the whole building will be upwards of 200,000 cubic feet. The contractors for the whole of the work are Messrs. Armitage & Hodgson, of Leeds. The stone sawing and working machinery introduced by this firm is quite a novelty in this part of the kingdom, as well as a most important factor in facilitating the work.

I am indebted for the whole of the foregoing particulars to Mr. Lawrence, the able clerk of works, who was appointed by the Town Council to superintend the erection of this important building.

We may add that the new Townhall is to a great extent a replica, though on a somewhat larger scale, of the new Townhall at Bolton, by the same architect. How this comes to be the case was explained by the Mayor of Portsmouth in the following words:—“We wanted a new Townhall, but how to get one to suit our requirements we did not know. We thought of initiating a competition, but we came to the conclusion that the result would be doubtful, so we determined to appoint a Committee to visit some of the most important buildings of the kind which have been erected of late years, particularly in the North of England, with the view of finding a building which came up to the ideal of our requirements. The Committee, after visiting numerous Townhalls, were so struck with the internal arrangements as well as with the external architecture of the Bolton Townhall that they recommended the Corporation to employ its architect to build a somewhat similar structure in Portsmouth, and their recommendation was adopted.”

**Economy in Telegraphy.**—Messrs. R. Cull & Son, of Palmerston-buildings, E.C., having a shipping inquiry for glazed stoneware kitchen sinks beyond the quantity of their London stock wired their Works people as follows:—“Bricks, Halifax, wire stock sinks, Teyere.” The reply was—

112	24	by	18,	50
24	by	16,	6	30
hy	18,	73	30	by
20,	20	36	by	18,
25	36	hy	20,	stock.”

The commas are ours, but the message was perfectly distinct to the recipients without them, the number of each sized sink and their measurements in inches being quite accurately given.

#### ARCHÆOLOGICAL SOCIETIES.

*Bradford Historical and Antiquarian Society.* The second excursion for the present season of this society took place to Wrostell Castle and Selby Abbey. At Wrostell the members were met by the Rev. R. Kennedy, the Vicar of the parish, who read a paper on the history of the castle from its foundation by Thomas Percy, Earl of Worcester, in the time of Richard I., about 1188, to its dismantlement by order of Parliament in the time of the Commonwealth, and ultimate destruction of the interior by fire in 1796. At Selby Abbey the antiquaries were met by the Rev. Canon Harper, Vicar.

*Newcastle Society of Antiquaries.*—A meeting of this society was held on Saturday last at Hexham, and, under the guidance of Mr. J. P. Gibson and Mr. C. C. Hodges, the members visited the Abbey Church. Mr. C. C. Hodges read a paper on Hexham, in which he expressed the opinion that Hexham was not the site of a Roman station, and that the Roman stones found at Hexham had been brought from the neighbouring Roman station of Corsetopium (Corbridge), which onshore in splendour any other Roman city in Northumberland. Referring to the Roman altar taken from the bed of the river Tyne a few days ago, Mr. Hodges said he had a theory as to how it came there, and his theory was confirmed by the fact that there were two other Roman stones lying in the river beside it. His theory was that the cartors, in carrying Roman stones from Corbridge, to be used in the building of the church at Hexham, had had the cart upset in the river, and had not been at the trouble to get the stones out of the water again, but had returned for another load.

*Society of Antiquaries of Scotland.*—At the concluding meeting of this Society for the present session, the first paper read was entitled “Notices of St. Margaret’s Chapel in Edinburgh Castle,” by Daniel Wilson, LL.D., Toronto. This chapel, according to the *Scotsman*, was discovered by Dr. Wilson in 1845, with a wooden floor dividing it into two storeys, and the apse converted into a powder magazine. But its structural features had, fortunately, escaped the destruction of time and siege, and the little oratory that crowns the castle rock still presents much the same aspect as in the early days of the reign of David I., to which the features of the chancel arch most probably assigns its construction, though the other masonry is of diverse periods. After tracing the history of the two chapels,—St. Mary (which was demolished in the present century) and St. Margaret, and noticing the relics of St. Margaret which were kept in the Castle, Dr. Wilson concluded by alluding to the work of restoration now being carried on in the Castle by the liberality of Mr. William Nelson, which, it was remarked, would add greatly to the attractive interest of the grand old fortress. St. Margaret’s chapel was also included in the original scheme of operations, but every stone of the venerable little oratory is historical, and it was to be regarded as fortunate that it has escaped the renovating process. In the second paper, Mr. A. Hutcheson, architect, Broughty Ferry, gave an account of the excavation of a burial-place of the Bronze Age at Barnhill in that neighbourhood, exhibiting the urns and other objects that had been found. In the third paper Mr. J. Russell Walker, architect, F.S.A. Scot., gave some additional notices of baptismal fonts in Scotland, in continuation of a paper on the same subject read to the Society last session. The number of Scottish fonts which he has collected and figured, with measurements, now amounts to fifty-two. In the fourth paper Mr. J. W. Curstler, F.S.A. Scot., Kirkcaldy, gave an account of several weapons of bronze recently obtained in Orkney and Shetland. The last paper was a notice by Mr. George P. Black, assistant in the Museum, of a sculptured slab recently discovered in the Isle of Man, on which are sculptured representations of the legend of Sigurd Fafnis Bane, as found in the Elder Edda. The stone was found by Mr. Kermode in the churchyard of Kirk Andross. It is sculptured on both sides with subjects from the Norse mythology.

*Surrey Archaeological Society.*—The annual meeting (for it can hardly be called excursion) of the members of this Society will take place this year on Tuesday, July 5th, when the Church of St. Saviour, Southwark, Lambeth Palace, and St. Mary’s Church, Lambeth, will be visited. Viscount Midleton is the President of the meeting. At St. Saviour’s, Southwark,

Mr. F. T. Dollman is announced to read a paper on its history and architecture. At Lambeth Palace the Library and Picture Gallery will be described by Mr. S. W. Kershaw, F.S.A., and Mr. John P. Seddon will offer some remarks on the architecture of the chapel. This Society has not visited Lambeth Palace since October 31st, 1856, when it was described by the late Rev. Charles Boutwell. A full account of the meeting on that occasion, with illustrations, will be found in the *Builder* of November 1st and November 8th, 1856. St. Saviour’s, Southwark, has not been visited by this Society since May 12th, 1858, when an “Architectural notice of the Nave of St. Saviour’s Church, made during its demolition, accompanied by numerous drawings from actual measurement,” was read, written by the late Mr. W. Pettit Griffith, F.S.A.

#### COMMISSION ON QUANTITIES.

M’INERY E. PAWSON AND OTHERS.

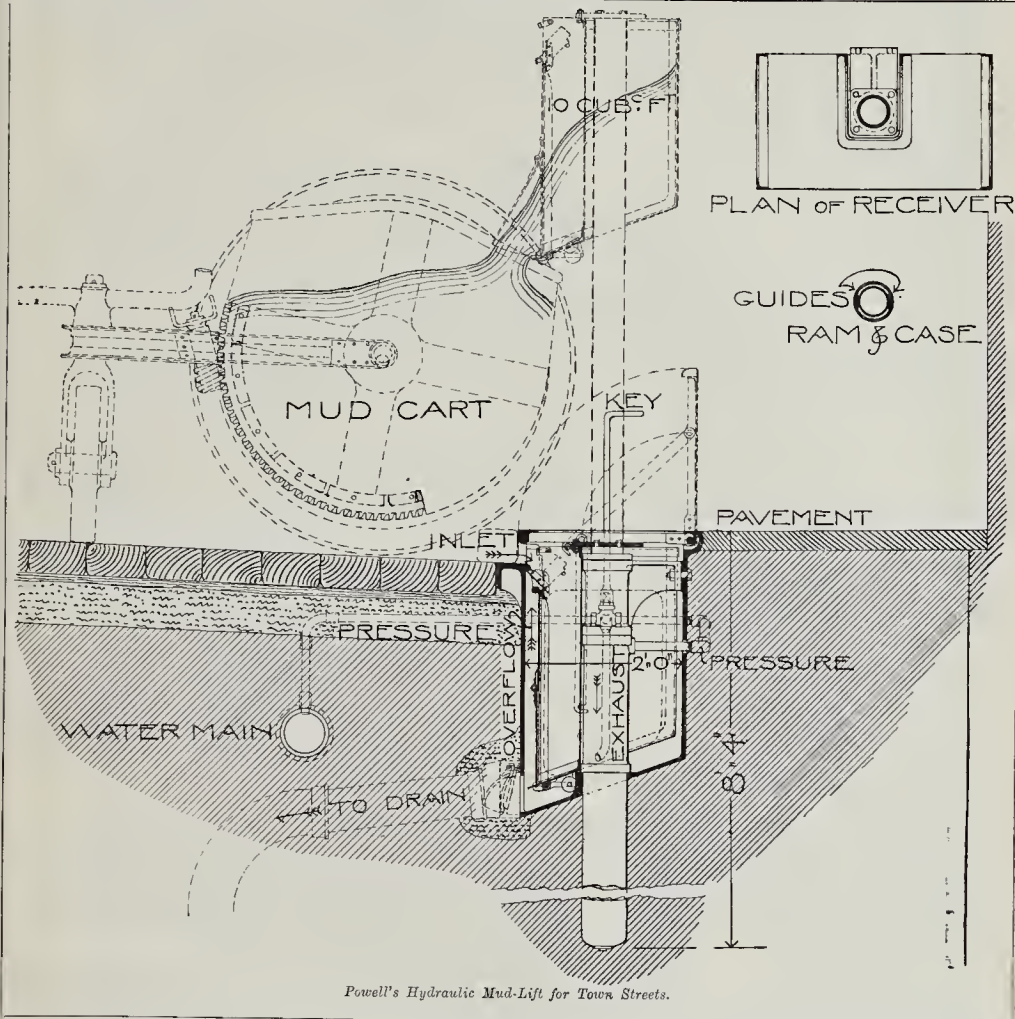

THIS was an action tried in the Sheffield County Court a few days since, before Judge Ellison. Mr. John M’Inery, quantity surveyor, High-street, was the plaintiff, and Mr. Henry Pawson, the elder, Mr. Henry Pawson, jun., and Mr. John Armitage Brailsford, printers and stationers, High-street, were the defendants. The action was brought to recover commission for quantities. The plaintiff claimed three sums amounting altogether to 1094. 1s. He had, however, abandoned one item, leaving in dispute one sum of 222. 5s. and another of 754. 8s., together 977. 13s. The defendants had paid into court 531. 2s. and 31. 3s. costs, and that, they said, was all they were liable for. The real point at issue, however, was whether the defendants were liable to the plaintiff or Messrs. Longden, the contractors. The case was entered for hearing in a superior court, but the defendants had paid the 531. 2s. in order to bring the action within the jurisdiction of the County Court, and not to admit their liability for any part of the sum claimed.

From the statement of counsel for the defendants, who, by arrangement, opened the case, it appeared that in 1883 Messrs. Pawson & Brailsford, who were three partners, proposed to build for themselves some large premises in Sheffield. For that purpose they employed an eminent firm of architects, Messrs. Hadfield & Son, who prepared plans, which amounted on their estimate to something between 14,000l. and 15,000l. Messrs. Pawson & Brailsford thought that some of the materials which the architect intended to employ might be reduced, as a question of cost. They were regarded as over-good, too expensive for the premises they proposed to erect. They suggested that in this way the architects’ estimates might be reduced to 11,765l. Messrs. Hadfield & Co. introduced Mr. M’Inery to Messrs. Pawson & Brailsford as a quantity surveyor, and he bargained absolutely that he should be paid a commission of 2 per cent. on the contract when done. That sum the defendants were perfectly willing to pay the plaintiff, and they believed that they had paid him. Afterwards there were interviews between him and Messrs. Pawson & Brailsford as to the question of variation in the original contract, and the amount he ought to receive for that variation. The plaintiff agreed that if the value of the original contract was diminished by variation he should receive 1 per cent. on the omissions instead of 2 per cent.; if there were additions to the original contract then that he should receive 2 per cent. for the additions. The real question was, had the contractor paid the quantity surveyor the whole sum that was due to him, or ought he now to pay the sum? The defendants had paid Longden the whole amount of their contract, which included the charge of the quantity surveyor, and therefore they had discharged all their liability to the quantity surveyor.

Mr. James Longden was then called. He said that he and his father were the contractors for the new premises of the defendants. In answer to questions, he said his firm had paid the two per cent. for the quantities on which the contract was taken, but had not paid a claim from the plaintiff for 1094. dated 5th January, 1886, because when the work was measured the proprietors always paid the commission on additions and omissions, unless the amount was added to the builder’s account. The builder did not pay on measuring up unless he received it from the proprietors. They did not receive it from the proprietors.

Mr. Charles Hadfield, architect, was next called, and in reply to questions put by the defendants’ counsel, Mr. West, said his firm were the architects of the new premises of the defendants in High-street. It was not his practice to give certificates of the amount due to the quantity surveyor. His certificates were given for the amount due *pro rata* according to the contract, and including what was due to the quantity surveyor, but the amount was not specified. He dealt with the commission on the omissions and additions in a final certificate to the contractors. It was then specifically arranged that the sum of 1094l. the commission due to the plaintiff on those items, should be paid by the defendants,

Powell's Hydraulic Mud-Lift for Town Streets.

given by the defendant had been in support of the plaintiff's case. Therefore they were bound to find a verdict for 44l., in addition to the sum paid into court.

The jury now complied, and returned a verdict for the plaintiff as directed.—(Abridged from the *Sheffield Evening Star*.)

POWELL'S HYDRAULIC MUD-LIFT FOR TOWN STREETS.

This invention is one the adoption of which, wherever possible, would, it appears to us, conduce greatly to the cleanliness and tidiness of town streets. The patentee is Mr. W. B. Powell, of Tintern-street, Ferndale-road, Brixton, and the main idea of the invention is that the mud, dust, and other refuse matter should be swept into sunk receivers placed at intervals at the edge of the kerb and underneath the footpath, the receivers being raised by hydraulic pressure (obtained from the water-mains) for the purpose of discharging their contents, an operation very quickly performed. The invention is so clearly shown by the accompanying diagram that it is not necessary to say much about it except that it has been materially improved and perfected since it was exhibited in the Inventions Exhibition two years ago. The diagram shows it in its latest form.

If these mud-receivers were placed, say, about fifty yards apart in some of our crowded town streets, the scavengers would be spared the temptation of sweeping mud down the gullies, — a practice far too frequent in London, to the detriment of the sewers, — and

and he withheld his final certificate until that arrangement had been accepted by the solicitors on each side.

The Judge: You never called upon Messrs. Longden to pay it?

The Witness: No, your Honour.

Mr. West called in question the accuracy of Mr. Hadfield's statement, whereupon Mr. Barker (counsel for the plaintiff) read letters from Mr. Hadfield to the defendants in confirmation of his statement. The most important of the letters was dated December 11th, 1885, and it was not, Mr. Hadfield said, until the following March that he was given to understand that the defendants objected to the item of commission. At the same time the defendants objected to his charges.

Mr. West: I believe you had some legal proceedings about your charges?—Mr. Hadfield: Yes.

Which were compromised and arranged by a mutual friend?—Yes; honourable to both sides.

Mr. Barker: Compromised by payment in full and apologising.

In reply to further questions, Mr. Hadfield said he declined to give information as to what Longdens had paid the plaintiff, because he did not know. It was stipulated in the bills of quantities what the plaintiff should receive from contractors, and he had no more to do with it.

The Judge intimated to Mr. West that he did not see how he could go on with his case. Mr. Hadfield had told them that in this case it was expressly provided that the amount claimed should be paid by the defendants.

Mr. West admitted that as he could not go into the general account to calculate what commission the plaintiff had received on the whole, that the evidence was against him on the specific items. He had no evidence of the payment of the specific sums mentioned in the pleadings. He could not prove it.

The Judge: It has been the opinion for some time that you could not carry the case on.

Mr. Barker (to the witness): You had to bring an action against the defendants for your commission as the architect, and they counter-claimed against you?—The witness: Yes.

And charged you with fraud for having given these very certificates?—Yes; they did.

Then they paid the amount of the claim and apologised for the imputations?—Yes; paid and withdrew all their offensive imputations.

Mr. West: Who employed the plaintiff, you or the defendants?—The witness: I did, with the concurrence of the defendants.

Mr. J. A. Brailsford, one of the defendants, was called, and said that the arrangements as to the new buildings were left very much in his hands. He was under the impression that the whole of the commission due to the quantity surveyor was included in the builder's contract. He was quite willing to pay what was due, but they were unable to ascertain from any one what it was.

Mr. West said that was his case.

Mr. Barker asked if there was any case to answer?

His Honour said he thought all the case was in favour of the plaintiff, and, addressing the jury, said the evidence that had been called was in favour of the plaintiff's claim, although called on behalf of the defendants. It had entirely failed to support the defendants' case, and, therefore, it was not necessary to go into the case on the other side. He therefore directed the jury to find a verdict for the amount claimed, with the sum paid into court.

The jury laid their heads together, and then expressed a desire to retire to talk the case over.

His Honour reminded them that they were sworn to find a verdict according to the evidence. It was his duty to tell them what the state of the evidence was, and he had told them that all the evidence

"the public would be spared the spectacle, too commonly to be witnessed, of seeing heaps of mud swept up to the edge of the kerb, to remain there for hours, and sometimes days,—save and except so much of it as gets scattered and splashed by horses' hoofs over pavement, passers-by, or shop-windows, or gradually distributed over the surface of the road again by countless wheels,—just as printing-ink is "distrubuted" by rollers on a printing machine. Even where things are so well ordered under the present system (if such it can be called) that the mud-cart follows the scavengers' broom very closely, the adoption of Mr. Powell's invention would abolish the tedious operation of shovelling-up,—an operation fraught with danger to the hats and clothes of wayfarers. The contents of one of Mr. Powell's mud-receivers could be elevated and discharged into a cart brought alongside, and the receiver lowered into its place ready for future sweepings, in two or three minutes. The momentary occupation of a small portion of the pavement, and that near the edge, would be an inconvenience more than compensated for by the other advantages we have named; and the adoption of these lifts in certain town streets which are always more or less crowded with traffic might conceivably be worth consideration merely with a view to preventing obstruction to traffic by avoiding prolonged stays of the scavengers' carts. Water being the motive power, the exhaust water would go to flush the sewers. The inventor by preference would employ mud-carts of the type shown in the sketch ("Gleehill's patent"), which are lower in height than the ordinary carts or wagons, and are readily "tipped" by the worm-wheel and toothed quadrant shown in the diagram. No doubt the first cost of fitting a street with these mud-lifts would be considerable, but against this disadvantage would have to be set the advantages of greater cleanliness and economy of time. At any rate, it appears desirable that the invention should be tried in the next new important street that is made. It is obvious that with certain modifications of detail the invention is applicable to the speedy removal of dust and refuse from large establishments, public institutions, &c., wherever there is access for carts.

The receiver, of 10 cubic feet capacity, is shown by the dotted lines in its raised position on the top of the ram-head of the lift, and in the act of discharging its contents through a flap-door. The inlet for the mud, below the edge of the kerb, is shown on the diagram, as is the overflow for water in times of heavy rainfall. From four to six gallons of water would be used each time the lift is raised.

#### HEAVITREE, DEVON.

##### JUBILEE CELEBRATION EXTRAORDINARY.

SIR,—As a "Jubilee Memorial" it is proposed to pull down the old (fifteenth-century) tower and to build a new one.

A more wanton destruction of the sole surviving part of the church in which Hooker worshipped can hardly be imagined.

In order to justify its destruction the tower is stated to be unstable, but no authority is given for the statement, no external cracks are apparent, and the bells are rung on all occasions.

Several years ago, when the building of any thing new was held to justify the destruction of anything old, a fund was started in the parish for a new tower to "correspond" with the church,—an example of Gothic architecture as rendered by a country architect forty years ago, would-be "Perpendicular," with small chancel and abundant galleries, a big, odd-looking building inside and out.

Since this fund was started, the old tower has had no care save in the removal of battlements and mullions, which required repair, and are now stacked in a corner of the churchyard. Of course, so far as neglect can bring it about, the tower is in a disgraceful condition; yet it had a look of dignity on Tuesday when a pit was dug near its foundations, to foreshadow its approaching destruction, and to receive the first scaffold-pole for the erection of its successor.

There is a strong feeling in the parish that building a new chancel would be a far wiser application of the funds collected, but much was given years ago, and some of the givers are dead, and others do not like to admit that

they have subscribed to a wrong object; and so it comes about that the poor old tower is doomed, unless a word of exhortation from you may induce the architects who are competing for the new building to protest against the task that has been set them to do.

#### CONSERVATIVE.

#### "LIFTS."

SIR,—In your issue of the 18th June we find the letter of Messrs. Smith & Stevens. This letter contains a "catechism" which we think will be regarded by most of your readers as designed to bring out what Messrs. Smith & Stevens regard as a fault in the Standard (or Otis) hydraulic elevator, and the superior merits of the patent balance ram lift as made by Messrs. Smith & Stevens.

The closing paragraph refers to our repeatedly-expressed desire for investigation, and assumes that we "would not wish to confine such inquiry to those who have everything to learn in connection with the subject." Our invitation is extended to all who have anything to learn. We must therefore admit the inquiry of Messrs. Smith & Stevens.

We take the questions in their "catechism" by their numbers. In order to save space we will not quote them in full.

1. There is, in the Standard Hydraulic Elevator, as we now make it, a "positive entrapment of the charge of driving water," so that as "in all the best English lifts, the charge of pressure water, after lifting the cage, is trapped in a closed chamber, from which there is no escape except through a passage completely dominated by the starting-valve. The cage cannot move till the valve is opened. In case of overloading, the effect is only a greater pressing action on the entrapped water, but no movement can occur until something positively breaks."

We have used exactly the language of Messrs. Smith & Stevens, and thus show that in regard to the point which they raise, we are precisely on a level with the Patent Balance Ram Lift to which they refer. It is proper to say, however, that this is a comparatively recent improvement, and that in our elevators, as they used to be constructed, there was theoretically a possibility that the charge of driving water might, by excessive overloading, be driven back upon its source. We say this was so theoretically: practically the point was not important, for the governor is always certain to prevent a descent at an unsafe speed. We have now built and fixed more than 4,600 of these elevators in all parts of the world, and in no single instance has there been such a degree of overloading as to force the charge of driving water back. The elevators have repeatedly been loaded to the utmost capacity; that is to say, passenger-lifts have been loaded until not another person could be crowded in, and nothing of the kind has happened. Our rule is to make the power of the elevator strong enough to lift the utmost load that can be put in. It would be possible, in the case of a passenger lift, to fill it with pig iron, for instance, until the effect described by Messrs. Smith & Stevens would be produced, to which case the car would descend until stopped by the governor, but it is not usual to fill passenger cars with pig iron.

Instances of our present method may be seen, for example, in the National Liberal Club (new building) the Hotel Victoria, the Great Northern Hotel, King's Cross, &c. In all these cases it is impossible "for the charge of driving water to be driven back," as answered in the answer to No. 1. There is no "free escape for such water back to the supply," nor can "the driving water be forced back and the cage descend."

4. It has already been shown that no motion can take place except when the valve is open for the purpose. The governor, however, is, as all our friends know, always ready to perform its duty, and always does perform its duty whenever a pre-determined rate of speed is exceeded.

5. This question,—as, indeed, all the questions in the "catechism,"—is based upon the one point brought out in the opening part of Messrs. Smith & Stevens's letter, and the answer to one question virtually answers them all. Many years ago the point came up as to how to give the attendant in the car the ability to stop the cage at any moment. If any inquirer will call at this office he will see, in the models which have been here during all the time of my administration, the means shown by which the attendant has perfect control of the elevator under all circumstances. Other means will be pointed out. Long ago we have ceased to use these means for the reason that they were regarded as redundant and unnecessary. They can be supplied in a moment at any time to any person. Perhaps your readers will be willing to call upon us for the details of this. As to all our other questions could hardly expect us to give them all these details.

6. There is ample provision.

7. The speed of the governor is that which we fix in accordance with the request of the owner.

8. All our details and appliances for every purpose are carefully explained in all our catalogues. To recapitulate them all, and to describe them here, would take altogether too much of your space.

We conclude by simply repeating emphatically our wish for the investigation and inquiry referred to in the closing paragraph of Messrs. Smith & Stevens's letter.

WM. AUGUS. GIBSON,  
President American Elevator Co.

#### THE LATE FATAL FIRE IN NEWMAN-STREET.

SIR,—This sad affair exposes a great danger existing in the midst of us. Here were three families living on the top floor of a large three-story house, all the water supply being in the basement. A fire broke out in the night on the second floor. There are no hand grenades near, no easy way up to the roof, and a burning staircase is between the poor creatures and the water-taps at the bottom of the house,—a real death-trap. This, all will say, is dreadful, but it is a fact, and it may occur again any day. I consider that, in the interests of the community generally, it should be enacted that water be laid on to the top floor of all high houses let out in apartments, and also, if possible, that there should be a fireproof flat roof with easy access to it, and which will not cost more than any other good roof.

I hear that the Surveyor to the Berners Estate had, some time back, sent in a requisition for some extensive repairs to be done to this house, but the lessee, unfortunately, objected to do them, as she had already, a few years ago, spent nearly 1,000*l.* for work required to be done by the estate surveyor.

#### PORTLAND CEMENT.

\* \* \* The Surveyor of the Berners Estate (Mr. E. C. Robins), informs us that the tenant has spent 1,000*l.*, as stated, but underlaid the block premises fronting the news to a firm who rebuilt them at their own expense. The lease of the house had since fallen out, and was agreed to be renewed to the old tenant upon certain improvements being made to the house itself, which included the suggestions contained in this letter. The tenant had hitherto objected to do them, and has now suffered the consequence of the neglect, coupled with the loss of the renewal which was dependent upon the said works being done. The Surveyor justly observes that "it is only upon the falling-in of long leases that the freeholder gets the opportunity of bringing up the property to the more enlightened requirements of the day"; and he adds that "the practice of the Berners Estate is to require the houses to be brought into coincidence with the Building and Sanitary Acts of Parliament upon any renewal."

#### LIGHENS UPON STONE.

SIR,—I would like to endorse the views of your correspondent, Mr. F. J. Barnes, in last week's *Builder* (p. 852), as to vegetation on the surface being a safe test of the "weathering" qualities of stone. His brief exposition of facts, so far as somewhat extensive observation of mine shows, will apply to all kinds of building stone; and also to bricks and tiles on roofs.

The growth of the mossy covering is doubtless primarily set up by local atmospheric conditions and aspect, and certain kinds of stone or burnt earth with rough granular surfaces appear to give readiest food to vegetation. It is not, however, unusual to find ancient masonry of smoother and finer texture, as magnesian limestones in Yorkshire and the North, covered with minute,—almost microscopic,—vegetation, equally attesting its endurance.

That this growth is not inimical to the material upon which it fastens must, I think, be conceded. Wherever in the country ancient tile roofs are good and sound, the northern slopes are almost invariably covered with lichens and moss; and I am disposed to think there is a preservative element in the vegetation,—or, at least, a counteraction to balance the warmth and dryness of portions exposed to the summer aspects.

On removing the tiles from an ancient roof of a church I am now restoring in the Eastern Counties, the moss-grown tiles from the northern roofs are found to be equally sound, and, in fact, less weather-worn than the tiles on the warmer and drier slopes.

The proverb that "A rolling stone gathers no moss" is usually quoted as to the disadvantage of the restless *lapis*. Like many other ancient saws, it has, I believe, an origin in nature's providential laws.

SAMUEL KNIGHT.

#### WOOD-BLOCK STREET PAVING.

SIR,—While it is admitted on all hands that wood paving is the best for our city streets, yet, in face of the fact that the common deal blocks now in use soon wear away, become irregular, and require constant renewal at great cost, and inconvenience to traffic, may I be permitted to suggest that blocks of eucalyptus wood (gum tree) be used instead, as in cities of Australasia? This wood is, of course, known to be as hard as the heart of oak, a great deal more durable, is not at all affected by water, and would wear six times as long as deal. It is used now for special value and saving of cost to all great cities, besides opening up a new trade with Australasia.

All who have visited these countries, especially Tasmania, will agree that it is a lamentable sight to see whole forests of this useful wood (trees 100 ft. to 150 ft. high) being "ring" and burned simply to clear the ground (a "caution" to immigrants). Let there be a demand for eucalyptus blocks for paving, and this wood will be well worth bringing to the coast in blocks ready for use and exportation.  
 PRO BONO PUBLICO.

**THE JUBILEE HOLIDAY.**

SIR,—As an employé of Messrs. Thomas Crapper & Co., manufacturing sanitary engineers, Marlborough Works, Chelsea, I am glad to be able to inform you that the pleasures of the jubilee of Her Majesty the Queen were enhanced when on Saturday last the cashier of the firm paid a full day's pay for Tuesday last to each employé, both piece-worke and hourly man. This is one kindly act of many which the firm have shown to their workpeople during the time I have been with them.

W. A. COLLINS.

**Sale of the London Land Company's Estates.**—A large and important sale of building sites took place at the Auction Mart on Thursday week, the liquidation of the London Land Company having placed upon the market 320 plots of freehold building land situated at New Southgate, Willoden, and Chingford. The largest portion of the property submitted was that situated at New Southgate, comprising 215 plots on the New Southgate Park Estate. The property at Chingford comprised the Chingford Station Estate, adjoining the station, and close to one of the most picturesque parts of Epping Forest. The number of plots submitted was thirty-eight. The Willoden property comprised the West Stonebridge Park Estate, and contained sixty-seven plots. The largest sale-room at the Mart was much crowded. Mr. H. J. E. Brake, of New Bridge-street, conducted the sale, which commenced punctually at two o'clock, but was not finished till close upon half-past seven, being, no doubt, one of the longest sales that have taken place at the Mart. The amounts realised for each estate were as follow:—Southgate, 7,811; Chingford, 1,027; Willoden, 5,117; making a total of 13,953.

**The Student's Column.**

**LAND SURVEYING AND LEVELLING.**  
*Field Work.*

**MAVING** in our last volume given an account of the construction of some of the principal instruments employed in land surveying and levelling, together with an explanation of their setting up and adjustment, we will now deal with the actual execution of work in the field, and show to what purposes those instruments are applied. We shall also describe the office work which is undertaken in connexion with the field work.

**1.—RANGING OUT A LINE.**

In making a survey the first thing to be done is to determine the best positions for running the straight lines upon which the survey is to be based, and the next is to range out the base lines before measuring them from one station to the other. Ranging rods, of lengths varying from 5 ft. to 7 ft., are usually made circular in section, and painted in lengths of one link (7.92 in.), 9 in., or 1 ft., white, red, and black alternately. When one colour at a distance cannot be clearly seen against a background, one of the other coloured portions can generally be distinctly observed.

The surveyor must agree with his assistant as to the signs he intends to adopt for directing him in the field when setting a pole or ranging rod in a required line; and the pole must not only be fixed in the ground upon this line, but be left vertically in position. The latter precaution can generally be accomplished by eye, but where great accuracy is required the aid of a plumb-bob, as shown in fig. 2, must be introduced, the string from which the plumb-bob is suspended being turned over the first and second fingers of the hand, so that when the string hangs vertically the pole may be set parallel to it. The detail of the plumb-bob in fig. 5 shows the top unscrewed for the purpose of attaching the suspending cord by means of a knot. Whip-cord is the best to employ, as it wears better than string. A good form of plumb-bob for carrying in the pocket is shown in fig. 3, with a reversible point which screws

up inside the hollow case forming the body-piece of the plumb-bob. Sometimes a square-distance plate equal in width to the diameter of the cylindrical case is added, which is useful when checking the perpendicularity of walls.

A straight line may be set out by successively placing poles in line with one another at convenient distances apart, in the order marked 1, 2, 3, 4, 5, in fig. 1, when one station B is fixed, the line being found to pass through A. If both the stations A and B are fixed and the intermediate points upon the line have to be determined, the best order to place the poles in position, is to commence near the distant station and allow the assistant to work towards the surveyor along the line, as by this means each pole that is being fixed is distinctly seen by the surveyor, and is not in any way hidden behind the other poles. If pole marked 5 in fig. 1 is fixed first, the remaining poles might appear in line when a complete diameter out as indicated upon the diagram, because daylight could not be seen between them in the direction A B and the base line A B, would if continued beyond B or if the pole B does not stand perpendicular, take the direction of the dotted line. Although this would not affect the actual length of the line measured between the points A and B, it would affect the length of lines measured off A B upon either side of it.

Figs. 6 and 7 illustrate the ranging out of a base line between two fixed stations C and F when a bill intervenes. The poles C and F are fixed perpendicularly in the ground, and the surveyor with one of the intermediate poles D or E and his assistant with the other intermediate pole, each proceed to a distance as far apart from one another as will enable the top half of the pole at C to be viewed from E and the top half of the pole at F to be viewed from D. Then, by the process illustrated in plan in fig. 7 the lines C, D, E and D, E, F are eventually brought into one straight line.

When the position of a station point upon or at the termination of a base line is marked by a wooden peg driven into the ground, it is advisable to observe the precaution illustrated in fig. 8 in order that the pole may appear in the direction of the line viewed. In rough open moorland iron pegs fixed in concrete, as shown in figs. 9 and 10, may be advantageously employed for

the main stations. The hollow portion serves to hold a ranging rod which can be easily wedged up vertically in setting up, and the top of the peg serves as a reliable bench mark when taking the levels.

#### CHURCH-BUILDING NEWS.

**Asbridge.**—The parish church at Asbridge was reopened for services on Midsummer Day, after restoration. The church, dedicated to St. John the Baptist, is one of the finest and most perfect of the fifteenth-century period in the county of Somerset. The restoration of the church has been carried out in sections, and is now complete. The *Bristol Times* says that "the renovation has considerably enhanced the archaeological interest of this queen of churches." What will the Society for the Protection of Ancient Buildings say to that? The first part of the building taken in hand was the nave and aisles, which were completely restored and re-seated in 1879, at a cost of about 3,200l. In 1880 the chancel was restored by the then rector, the Rev. A. G. Dowell. On removing a thick coat of plaster which encased the walls, the existence of a triple sedilia and piscina was discovered on the south side, and on the north a small squint and doorway, which once opened into a now non-existent priest's chamber. The roof of this structure may, however, be plainly traced on the wall outside. The east window, formerly walled up, was also reopened and glazed. The work now carried to a successful completion was commenced in January of the present year. The large six-light window of the south transept, which was in an almost dangerous condition, has been rebuilt, every fragment of the old tracery which had escaped decay being again utilised. In the other windows the smaller parts of the tracery and individual heads had been cut away by unsympathetic workmen of a more recent age, apparently to make easy work for a clumsy glazier. These have been replaced and the windows filled with tinted cathedral glass. The oak roofs of the aisles have, in places where decayed, been renewed with faithful reproductions of the actual mouldings removed. The south chancel aisle, together with the south transept, will now be used as a morning chapel. A stained-glass window, the gift of Mr. Sidney Hill, of Langford, has been executed for the east end of the church by Messrs. Bell & Sons, of Bristol. The four lights represent respectively the Nativity, Crucifixion, Resurrection, and Feed my Lambs, the divisions of the tracery being occupied by figures of the four Evangelists, with their symbols, and Moses and Elijah, a central division containing the "Agnus Dei" emblem of St. John-the-Baptist and arms of the town. The temporary seats for the choir are replaced by oak stalls, and the church appears only to require oak screens to make it one of the most perfect in the diocese. The restoration, including the choir stalls, has been carried out at a total cost of 5,000l. by Messrs. Charles Trask & Sons, of Norton, near Ilminster, from designs by Mr. J. D. Sedding, the diocesan architect, and under the direction of Mr. W. J. Jane, of Congresbury, as clerk of the works.

**Lofthouse (near Wakefield).**—Mr. William Watson has been appointed the architect for the proposed new church at this place. The church is intended to accommodate 500 persons, is to cost about 3,000l., and will be built entirely of stone.

**Runcorn.**—A new reredos has been erected in Runcorn Parish Church to the memory of the late Canon Barclay. The design is in alabaster, relieved with coloured marbles and jewels. The work is from the studio of Messrs. Norbury & Paterson, Myrtle-street, Liverpool, and the total cost is about 300l.

**Sandridge (Herts).**—A few days since was reopened, after complete repair and extension of the aisles westwards, the ancient Church of St. Leonard's, Sandridge, near St. Alban's. The church contains several features of remarkable interest. The arcades are of the Late Norman period, and the north doorway. There is a remnant of a round-headed chancel arch, which was constructed in the Early Norman period of old Roman bricks, similar to those with which the tower and some other portions of St. Alban's Abbey were built. This arch was almost destroyed in the fourteenth century by the insertion of a fenestrated stone screen, extending right across the gable,

and cutting away the jambs and lower portion of the arch. The screen had become mangled and crippled by the weight of the loose walling of the gable above, and in order to render it secure, this walling has been removed, and the space filled in with open framework of oak timber. The whole has been re-roofed. A clearstory has been added in place of one which was removed early in this century, when also a flimsy western tower was built in place of an early one which had fallen forty years before. This has been replaced by a massive tower, built in local concrete, finished outside with flint and inside with brick, and roofed with a low timber spire covered with oak shingles. New oak fittings have been provided upon floors of wood blocks. A considerable number of old encaustic paving tiles have been discovered and relaid in the chancel. The work has been carried out by Messrs. Thomas Gregory & Co., under the supervision of Mr. William White, F.S.A.

**Weymouth.**—Holy Trinity Church, Weymouth, has lately been re-opened, after restoration and enlargement, at a cost of about 7,000l. The work has been carried out by Mr. A. Clarke, builder, Weymouth, under the superintendence of Messrs. Crickmay & Son, architects. The whole of the sculpture and stone carving has been executed by Mr. Hems, of Exeter; Mr. Tett, of Weymouth, carried out the arrangements for heating the church, and Messrs. Jones & Willis supplied the altar-rails and standards. The altar-piece, the "Crucifixion," said to be by Vandycck, has been "cleaned, renovated, and reframed," but we are informed by a local paper (the *Southern Times*), that "owing to the reflection of the cathedral stained glass, it is not seen to the best advantage."

#### DISSENTING CHURCH-BUILDING NEWS.

**Galston (Ayrshire).**—A new Free Church is in course of erection here. It is designed in the Early English style, with a tower rising square to a height of 65 ft., above which will be a spire rising to a total height of about 100 ft. above the ground line. The total number of sittings provided for is 500, of which 340 are in the area and 220 in the galleries. The accessory accommodation is very ample, including a hall to seat about 100 persons, large session house, which can also be opened into the hall, vestry, ladies' room, &c., with retiring rooms. The estimated cost is 2,300l. The contractors are Messrs. J. & R. Anderson, masons; J. Glog, joiner; Robert Mason, Glasgow, plumber; A. Falconer, plasterer; Joseph Miller, Glasgow, glazier; Thos. Black, gasfitter. The architect is Mr. J. B. Wilson, A.R.I.B.A., Glasgow.

**St. Helens.**—A new Baptist church is in course of erection in Boundary-road, St. Helens, Lancashire. Mr. Gandy is the architect, and Mr. Robert Davis is the contractor. The building is to seat about 400 persons, and its estimated cost is 1,200l.

**Wakefield.**—The memorial-stone of a Primitive Methodist Chapel, at Bellevue, near Wakefield, was laid on Saturday week. The new building is entirely of stone, 47 ft. 6 in. by 34 ft., will seat 300, including the Sunday scholars. The roof is open, timbers wrought inside, and ceiling divided into panels. The fittings are entirely of pitch pine. The cost is 860l. 6s. 8d., exclusive of some of the stone, which is given to the committee. The architect is William Watson, of Wakefield.

#### RECENT PATENTS.

##### ABSTRACTS OF SPECIFICATIONS.

8,643, Fireplaces. E. Heim.

By this invention an elaborate system of pipes and "annular conduits" is arranged above, below, and around the grate. The admission of heated air to these is controlled by dampers, and a large heating surface is obtained. A fuel magazine in the form of an inclined tube of rectangular section, and arrangements for drawing off the water of condensation, are also essential parts of this invention.

8,607, Disinfecting. S. A. Johnson.

According to this invention a mechanical arrangement is so provided that on flushing the closet-pan, oil, or some greasy substance mixed with a suitable disinfectant is thrown in and disposed so as to entirely cover the entire surface of the water so as to prevent any upward rise of gases.

13,205, Terra-cotta Building Blocks. J. D. Denny.

The idea of this invention is to press or mould by improved machinery blocks of terra-cotta for use in building. Pateras or other ornaments are impressed at the time of manufacture, and a method of facing the blocks with various colours is claimed as an important part of the invention.

2,843, Sanitary Improvements. T. Kemp.

By this invention a water-closet pan and trap are combined in one, and the front part of the trap is fitted with an india-rubber washer, by which the drain is perfectly sealed and easily inspected. The top edge of the pan is also fitted with an india-rubber draught excluder. A delivery of the flushing water to the pan, sprayed for the purpose of giving a better cleansing, is also a notable feature.

4,937, Drain-traps. A. J. Bonté.

According to this invention, a drain tile pipe is so formed that any soil or sediment is carried out of the trap and prevented from returning. A hand-hole is placed in such a position that both the trap and the portion of the tile leading to the sewer can be readily and simultaneously examined. In all other forms of traps, the bottom of the outlet pipe leading to the sewer is substantially level with the top of the seal; consequently, solid matter is frequently carried by the backwash back into the trap. Owing to the formation of this trap, however, anything which has once passed through the trap cannot re-enter as the top of the seal in the trap is above the level of the outlet.

5,331, Saw-Setting Apparatus. C. C. Harris.

This invention relates to a small and handy apparatus by which it is claimed that saws may be set without breaking the teeth. This freedom from chance of injury is attained by a peculiar construction of the hammers and anvils. The machine is operated by striking lightly a plunger or hammer, and different widths of saws are admitted and adjusted by gauge.

5,423, Bricks, Tiles, and Earthenware. F. Wallbrecht.

It is claimed that by mixing the raw materials with the sulphuric carbonic and nitric salts of the alkalies (soda, potash, &c.), the goods are enabled to be burned in a wet condition without in any way prejudicing the manufacture. Bricks, formed in hand moulds, are burned in a remarkably short time in an easier way, and the forms retained much better than with the customary process. A mixture of moist clay and coarse grain salt can be tried with like effect.

Glasgow Architectural Association.—Mr. Alex. McGibbon on "Italian Renaissance—The Order."

WEDNESDAY, JULY 6.  
Builders' Foremen and Clerks of Works' Institution.—Ordinary Meeting. 8.30 p.m.

Miscellaneous.

**An Altar**, dedicated to "Our Lady," has been erected in the north transept of the Convent Chapel at Sidmouth, Devon. It is carved in wood and decorated in white and gold. It has been made by Messrs. Luscombe & Son, of Exeter. The rose window over the altar has been filled with stained glass, and has been executed by Mr. Drake, of Exeter.

**Wood-block Flooring.**—The business with which Mr. A. E. Geary (of the late firm of Geary & Walker) has long been connected, has been formed into a Limited Liability Company entitled the Wood-block Flooring Company, with Mr. Geary as manager. The offices of the Company are at No. 24, Charing Cross, S.W. Further particulars of the Company's work appear in our advertisement columns.

**Dr. Hunter's House.**—Mr. Hollingshead having lately described, in the *Daily News*, a house in Great Windmill-street, Haymarket, as "the deceased Café de l'Étoile," Mr. Charles Hawkins writes to that journal giving the history of this house, which, to the medical world especially, is an interesting one. He writes,—"In 1746 Dr. William Hunter, the elder brother of John Hunter, had commenced teaching anatomy in Covent Garden to a society of navy surgeons in the evening, but Garrick, at that time appearing at another theatre, was a rival that Hunter could not compete with, and he was obliged to lecture in the afternoon. In this school he taught with great success, and attained a great reputation as a surgeon as well as a physician, and having possessed himself of a considerable fortune, in 1765 he applied to the Government to have granted to him a piece of ground that he might, at his own expense, erect a building fit for a school of anatomy, and supplied a plan 'for a museum in London for the improvement of anatomy, surgery, and physic.' Upon this offer being declined, he commenced building the 'Hunterian School' in Great Windmill-street, comprising a mansion (the deceased Café de l'Étoile), a museum, and anatomical department. He took possession of these buildings in 1768, and he lived in the mansion until his death in 1783. The buildings contained the magnificent collection, said to have cost upwards of 100,000*l.*, which he bequeathed to the University of Glasgow. Besides the scientific department there were pictures, prints, manuscripts, coins, &c. Upon his death his nephew, Dr. Matthew Baillie, the celebrated physician, went to reside in the house, which he did until 1799. The house was afterwards inhabited by Mr. James Wilson, the celebrated anatomist, who subsequently sold the property, reserving the 'school' buildings, which were at the rear of the house, and were demolished a few months ago."

**Fibrous Steel.**—Steel is scoring another point in its contest with iron. Ironmasters who, as sheet and plate and angle makers, have been suffering acutely from the distinct advance which steel has made as a metal possessing bending and shaping qualities, have hitherto assumed that, however malleable the opposing metal may become, it is unlikely to attain to a fibrous quality. The grand fibre which distinguishes the best qualities of Yorkshire and Staffordshire iron had been held to be a fortress impregnable to all the assaults of the most accomplished of the steelmasters. The security of the Staffordshire firms has just been rudely disturbed by the exhibition in several of the localities in the Black Country of a section of a 3/4-in. round bar of steel characterised by undiaped fibre. It is explained that it has been made by the granulating and balling-up of Siemens-Martin steel under a process which has been patented by Messrs. Dorman, Long, & Co., and Mr. R. Howson, of Middlesbrough-on-Tees. If by-and-by this "fibrous steel" should be shown by experience to be equal to the service of cable and rivet making, the best iron firms will be run very hard, since it will be impossible for them to compete with the steelmasters in the matter of price. The makers hold that the new metal is well adapted also for armour-plates,—in the manufacture of which the pile has to return to the fire so often,—since the silicious coating of each fibre protects it, it is claimed, from the action of the fire, where pure iron would perish. For the same reason it might be used, it is inferred, for the hilges of ships, as to which recent experience has shown that homogeneous steel is subjected to rapid oxidation.—*Iron.*

**The Clerks of Works' Association of Great Britain** have removed their quarters from 31, Spring-gardens (the office of Mr. John Oldrid Scott), where they have been located for the past five years, to Carpenters' Hall, London-wall, the Worshipful Company of Carpenters having granted them the use of a room for the purpose of holding their meetings, &c.

**New Liberal Club Buildings** have just been commenced for the Liberal Association, Sudbury, Suffolk. The premises consist of large assembly or reading-room, recreation-room, committee-room, and card room. The contractors for the works are Messrs. George Grimwood & Sons, of Sudbury and Ipswich.

**The Third Annual International Amateur Photographic Exhibition**, under the auspices of the London Stereoscopic Company, is announced to be opened on October 25th next.

**Society of Arts.**—The annual general meeting of the Society of Arts was held on Wednesday, the 29th ult., concluding the 133rd session of the Society. The report on the proceedings of the Society during the year was read and adopted. There were eighteen papers at the ordinary meetings, seven in the Indian Section, six in the Foreign and Colonial Section, and six in the Section of Applied Art. Five courses of Cantor Lectures were given, and the usual course of Juvenile Lectures at Christmas. Prizes to the amount of 368*l.* have been offered for competition to art workmen, for articles to be sent in next December. Prizes have also been offered for motors for electric lighting. Entries for these prizes are to be made by the end of the year. Amongst other matters mentioned in the report were the reports on the Colonial Exhibition prepared by the Society, the presentation of the Albert Medal to her Majesty in recognition of the progress made in arts, manufactures, and commerce during her reign, and the erection of a Memorial Tablet on the house of the late Mr. W. M. Thackeray. The income of the Society during the past year amounted to 12,573*l.*

**The Jhelum Bridge on the Sindagar State Railway.**—The bridge over the River Jhelum at Chuk Nizam, which is a little more than half a mile long, being seventeen spans of 160 ft. from centre to centre of piers, was opened by the Lieutenant-Governor of the Punjab on the morning of the 16th of May. The foundations are single wells of brickwork, 25 ft. external diameter, erected on wrought-iron curbs, 20 ft. 9 in. in diameter, sunk 82 ft. below lowest water level. The brick setting is 5 ft. 3 in. thick. All the wells are heaved with a 10 ft. plug of Portland cement concrete, above which is ordinary semi-hydraulic lime concrete. These wells, from low-water level, are carried up to girder-level in solid brickwork as circular piers 25 ft. in diameter, finished off with plain massive cap projections. The well-sinking was begun in September, 1885, and was finished in December, 1886. The girders are 10 ft. above flood-level, and are of steel, 150 ft. span, of the ordinary triangulated type in use on State Railways with the railway on the bottom booms. The cross girders have been lengthened on both sides to carry two footways, 4 ft. 6 in. wide, outside the main girders. Some-what extensive protection works have been carried out up-stream to steady the river through the bridge.—*Indian Engineer.*

**Artesian Water-Supply in the City.**—The scheme of the Corporation of the City of London to obtain independent water-supplies in the City, which has been discussed for a considerable period, and was referred to in detail in our last volume (p. 161) has at length taken practical form. Some weeks since the Commissioners of Sewers invited tenders for sinking an artesian well into the chalk at the artisans' dwellings close to Bishopsgate-street, E.C. At a subsequent meeting of the Commissioners the Streets Committee (who had the matter on hand) reported that the tender of Messrs. Z. Hills & Co., of Abbey Works, 130, Old-street, London, should be accepted. The report was carried, and referred back for execution. The necessary formalities having been completed, the works will forthwith be commenced. It was stated that Lieut.-Col. Haywood, the City Engineer, had taken great trouble in the matter, and hope was expressed that this well would be the means of relieving the ratepayers of a grievous impost.

**Jubilee Memorial Fountain, Reading.**—A public Memorial Fountain was opened here last week by the Mayoress. The following inscription in relief letters runs round the frieze—"Erected to commemorate the fiftieth year of Her Majesty's reign, 1837." Bands of carving contain representations of the rose, shamrock, thistle, and British oak, and there are lions bearing shields, with the Royal arms and Borough arms, the whole being surmounted by a crown and coronet. The work has been carried out from the designs of Mr. G. W. Webb, A.R.I.B.A., Friar-street, Reading (whose design was selected in competition), the contractors being Messrs. Wheeler Bros., of Reading.

**Mr. Beresford Hope.**—The *Banner* says:—"We wish that we could confirm the sanguine utterance of *Truth* in reference to Mr. Beresford Hope's recovery; but we regret to learn that, although his convalescence is reassuring, there is but little probability of his return to public life."

**The New Archaeological Museum of Rome.**—The construction of a special Archaeological Museum at Rome is reported to be secured, the negotiations between the Italian Ministry of Public Instruction and the municipality of the city having come to a satisfactory termination. As the plans are already prepared, it is expected that a portion at least of the proposed buildings will be shortly completed, with a view of concentrating the abundant and valuable material which is now distributed in the various collections in Rome. The total cost of the buildings is estimated at 2,204,989 lire (\$8,000,000), of which the Government will contribute two-thirds, the municipality at most one-third. The site selected for the new museum lies between the Colian and the Esquiline. The museum, when finished in its entirety, is to receive all art treasures and antiquities already found; and all future discoveries in the city and province of Rome; but the collections contained in the Capitoline Museums are to be retained there intact.

Collin, Warrington (accepted). 3,950 0 0

Alterations at No. 82, Strand.—In regard to this work (as to which we inserted last week, at the request of Mr. Frederick A. Dovey, a statement that he, and not Mr. Banister Fletcher, is the architect), Mr. Banister Fletcher has sent us documentary evidence to show that he is the architect, and that Mr. F. A. Dovey is one of the firm of contractors. The meaning of such a gratuitous statement on the part of Mr. Dovey (which we naturally accepted in good faith) we entirely fail to comprehend.

\* SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 48, Catherine-street, W.C., not later than 12 Noon on THURSDAYS.

### A West Midland Waterway.

**B**IRMINGHAM, as the centre of a large district in the Midland counties, desires to have a waterway capable of carrying to and from the nearest seaports,—those of the Bristol Channel,

—loads of 200 tons, or about as much as an ordinary goods train on a railway. The promotion of the Birmingham and Bristol Channel Improved Navigation, as the scheme is called, is in the hands of a committee formed from the Gloucester and Birmingham Navigation Company, the Corporation of Gloucester, and the Corporation of Birmingham, and appears to be fast approaching a practical issue. Situated centrally in England, the district round Birmingham is on or near the Warwickshire and South Staffordshire coal-fields, and hence arises its industry of the manufacture of iron and other metal goods. Iron and coal being usually found together or near each other in the earth, those manufactures in which iron is used as the chief material are set up where coal and iron are found, and, in this district, to the manufacture of articles in iron have been added brass work and a multitude of industries of cognate character. The town of Birmingham itself is, perhaps, generally thought to be a poor place, but it is as worthy of the name and position of a city as Liverpool or Manchester, or other town of rapid growth in modern times; it is not so smoky as Sheffield, and is nowhere so squalid as parts of Liverpool, or so unlovely as some parts of Manchester and Salford. Perhaps most of the manufacturers of Birmingham are little masters, whose trade individually is on a scale which may be called small by comparison with some of the great firms, but which, in the whole, makes up a very large amount when brought together and distributed by the merchants; and there are also in the district some individual works of great magnitude; and the transit of all these goods is dependent chiefly on railways, and, like other centres of industry, this one has felt the hard grip which railway companies lay upon the public when there are no other means of conveyance of goods than those which have been created by the railway system and its peculiar management. When that system has once been established anywhere, the previous means of transit are rendered nugatory and become disused. But inasmuch as the system does not,—whatever it was supposed it would do,—satisfy the requirements of the public at the

present day, other means of transit are being sought for, and these are found in the re-establishment of canals in an improved form. Already on the eastern side of the country, Leeds, Wakefield, and other Yorkshire towns have been put into communication with the sea by the Aire and Calder Navigation, which terminates at Goole, but the transit of goods is continued down the Humber to the ports of Hull and Grimsby. Time was when this Navigation could not compete with the railways, before it was deepened and widened and the locks enlarged, but it is now a very prosperous undertaking, notwithstanding that the cost of haulage is less than it is anywhere else, not excepting the waterways of France or Belgium. But it has become prosperous only by the expenditure of a large amount of money, and this will probably be found to be a necessity in any similar case. Regular boat trains for general goods are run at fixed times between Leeds, Hull, Goole, and Wakefield, and goods are delivered as quickly as by railway. The Aire and Calder Navigation affords a striking example of a dock and canal company, prompted by a spirit of enterprise, recovering lost ground by improving the water communications, and with great and satisfactory results. Its circumstances are, in many respects, similar to the Gloucester and Birmingham Navigation. Goole has docks high up in the estuary of the Humber, as Gloucester has, at Sharpness, in that of the Severn. The Leeds and Bradford district may be compared to the Birmingham and Staffordshire district, and Goole and Goole Docks to Gloucester and Sharpness Docks. Moreover, Hull and Grimsby may be compared to Bristol and the Channel ports. There is at present a canal from Birmingham to Worcester, on the Severn, a distance of thirty miles, but it is only four or five feet deep and 33 ft. wide, and it ought to be twice as deep and twice as wide to meet the requirements of the present time; because, if any improvement is to be made, steam haulage must be adopted: moreover, the present locks are only 7 ft. wide. But arriving at Worcester is not arriving at a seaport, and the key to the position of the whole scheme is the navigable condition of the river Severn for thirty miles below Worcester, that is, down to Gloucester. The whole route may be said to consist of four portions. First, thirty miles of canal from Birmingham to Worcester; secondly, thirty miles of river navigation from Worcester to Gloucester; thirdly, seventeen miles of canal (the Gloucester and Berkeley Ship Canal) to Sharpness Docks; and, fourthly, thence to the seaports of the Bristol Channel for certain portions of the goods to be carried.

The second portion, the river between Gloucester and Worcester, is, or can easily be

made, nine feet deep, but perhaps not more than that easily, and, if so, that is the depth to be adopted in the upper portion of the navigation, from Worcester to Birmingham. Arriving at Gloucester, the boat leaves the river and enters the old Gloucester and Berkeley ship canal, avoiding the long detour of twenty-eight miles of river, and arriving at Sharpness, on the estuary of the Severn, in seventeen miles only; and here the boat may either ship its cargo into an ocean-going vessel or may enter the tideway and proceed to one of the ports of the Bristol Channel, Avonmouth or Portishead on the eastern side, or Newport, Cardiff, or Swansea, on the western side. A boat which could safely navigate the Bristol Channel, as well as the river and the improved Navigation, of a carrying capacity of a hundred and fifty or two hundred tons, must be specially designed to economise space and headway, and would be approximately 100 ft. long, 18 ft. wide, and 6 ft. draught of water, and would be provided with means of safety in the windy weather which would be met with in the Channel. Such a vessel would require locks in the improved canal between Worcester and Birmingham 110 ft. long, 20 ft. wide, and 8 ft. deep, but if steam-tugs were employed the locks should be 210 ft. long, so as to hold the tug and one vessel, or two vessels, at the same time.

These are the dimensions recommended by Mr. G. W. Keeling, C.E., the appointed engineer, who further recommends that the new locks be built alongside the old ones, and that they should have a lift of not less than 14 ft. The present locks, of which there are fifty-eight between Birmingham and Worcester, are mostly of 7 ft. lift, but it would economise time in passing the locks to make the lift greater. Commencing at Birmingham the present canal is level for fourteen miles to Tardebigg, and then falls 217 ft. by a flight of locks, thirty in number, in a distance of two miles; it then falls 42 ft., by six locks, in the next mile; then a level length of one mile, and a descent of 42 ft. by six locks in the next mile. Here commences a level length of five or six miles, and at the distance of about the first mile the Droitwich branch takes off to the right, and passing that town, joins the Severn at Hawford, three miles above Worcester, and just above the Bevere lock on the river. Proceeding, however, with the canal direct to Worcester, at the end of the five or six-mile level there is again a fall of 42 ft. by six locks in the length of little more than half a mile, and then, in the next five miles, to the river, there is a further fall of 82 ft. in a succession of short levels and locks, through Worcester to Diglis Weir, just below the city. So many locks would be a hindrance to the passage of boats on the

improved canal, although, if there were water enough for the enlarged locks, boats would pass up through the locks as easily as downwards; there would be no mechanical effort, but the time occupied in opening and shutting the sluices would be against the economy of working. The flight of thirty locks at Tardebigg would, perhaps, be done away with altogether by substituting an incline, which is thus described by the engineer:—The boat passes into a carriage caisson or trough filled with water, and closed at both ends by gates or lifting sluices. The caisson is carried on a large track, the framework of which is deeper behind than in front, so as to carry the caisson in a horizontal position, and the truck rests on wheels running on a railway. There are two caissons, one descending the incline whilst the other is ascending. The motive power is a steam engine fixed at the top of the incline, the gradient of which is 1 in 10, and when drawing up the ascending caisson it is assisted by the one descending. The road bridges over the canal, and culverts and archways under it, of which there appear to be sixty, would require widening. There are three short tunnels, of about a quarter of a mile each, and one of a mile and a half, and these would have to be enlarged, except that a considerable portion may be cut open. The canal ends in Birmingham at the Worcester Wharf, in the very centre of the town, and for the accommodation of the traffic of the town this wharf would be retained, but for the traffic to be transferred from the boats navigating the numerous canals in the manufacturing districts round Birmingham, and converging there, increased space for quays would be required near the town.

There are, as we have said, two points of communication with the river Severn, one at Diglis Weir, below Worcester, the other at the Bevere Weir, above the city, at the end of the canal from Droitwich, and either of these may be enlarged. The Droitwich route is the shorter, but by entering the Severn above Bevere Weir the lock there would have to be lengthened. This, however, would perhaps be no great difficulty; a greater one would be that Worcester Bridge would not allow sufficient headway for the navigation when the river is flooded. Mr. Keeling's proposal is that the roadway should be raised a little. It would certainly bear raising, without detriment to the roadway, as a matter of gradient, and if the footway and parapets could be re-arranged so as to coincide with the alteration, the general façade of the bridge would be improved. Perhaps a feasible plan might be found, which might also be satisfactory to the City Council, if the whole question were left to the decision of an architect, or to the engineer of the Severn Navigation; but if the question becomes one for general discussion in the Council, its settlement may be long delayed: so long, indeed, that the new navigation authority may regret that the question was ever raised; and, all things considered, perhaps the better plan would be to enter the river at Diglis, and enlarge the branch from the junction with the main canal as far as Droitwich, a distance of two miles only: and in consideration of Worcester Bridge being left untouched, the City Council might render some facility for the enlargement of that portion of the canal which borders on city property. In any case, it is not expected that the city of Worcester would desire to stop the scheme altogether.

We have said there are some very large works in the district of which Birmingham is the centre. Proprietors of large concerns might prefer to remove their works to the seaboard rather than submit to the terms of railway companies, but such a move, if at all general, would require careful consideration. If works be removed, men will go too; if men go, houses will be unoccupied; and if houses have no tenants the owners will receive no rents, and no rates can be collected by the Local Authority. Shop-keepers will lose customers; business generally will decline; and a sorry state of things altogether will be the result. It will hardly do to say that what one place loses another will gain; there is

absolutely no compensation for waste; and the destruction of property is waste of material, and of the labour which has been employed in putting it together. Then, although large works may be removed, small ones cannot, and if the one class of works be enabled to avoid the heavy charges for transit of goods, by shortening the distance, the other class, left behind, will be still less able than before to work profitably.

On every hand may be discerned the necessity of enlarging the waterways we have mentioned, and we consider the scheme to be whole and complete as described; but in addition it is proposed to extend the ship canal, which now has its entrance into the Severn at Sharpness, to Sheperdine, five miles lower down the estuary of the river, where there is deeper water. It appears that some of the largest of the ocean-going ships can hardly enter the Sharpness docks by the present entrance at neap tides.

The approximate estimate of the cost of the undertaking is as follows:—

Purchase of the property of the Sharpness New Docks and Gloucester and Birmingham Navigation Company...	£850,000
Enlargement of the Worcester and Birmingham canal .....	600,000
Making new entrance to the Gloucester and Berkeley canal at Sheperdine, with the extension of the ship canal widening, deepening, and improving the canal between Sharpness and Gloucester.....	300,000
	40,000
	£1,890,000

This amount includes ten per cent. upon the estimated cost of the works, as a margin, but allowing for Parliamentary and other expenses, and a wider margin for works, the sum of 110,000l., the total outlay on the undertaking comes out at 2,000,000l.

#### ARCHITECTURAL PHOTOGRAPHY.

BY J. EATON FEARN.

HOTOGRAPHY has proved a useful handmaid in even the stern, prosaic business of everyday life, and the whole of the professions stand greatly indebted to this interesting art-science. Nor is there now any excuse for neglecting it, since cameras are so inexpensive and dry-plate photography so easy to manipulate. The modern operations, too, are so clean that even ladies are numbered by thousands amongst the ever-increasing band of amateurs.

The aim, therefore, of this paper is to give practical elementary instruction in the art, enabling any one who carefully carries out these directions to take within an hour a fairly successful picture.

To enable the reader to do so, he will require a camera, a lens, a tripod, some dry-plates, a few chemicals, some sensitised paper, a printing frame, and a few shallow dishes.

As the camera and lens are of the greatest importance, we will deal with them first.

How large do you wish to take pictures? Of course, the larger your picture, the heavier and more cumbersome your apparatus. Bear in mind, when deciding the point, that it is always possible to have small pictures enlarged when required. The size most strongly to be recommended is that known as the half-plate size, enabling you to take a photograph 6½ in. by 4½ in. The quarter-plate (4½ in. by 3½ in.) is too much of a toy to be of practical service, and should pictures of this size answer every purpose required, they can be taken with the half-plate camera as well as with the quarter-plate.

Now the all-important question arises, "Which camera in the market is the best?" If money be no object, why certainly buy a "McKellen" or a "Shew," but if you wish to spend the minimum of money for the maximum of value you had better turn your attention to the cameras of Messrs. Lancaster & Sons, of Birmingham. One of their numerous cameras will be sure to correspond with your purse, and very creditable work can be executed with even their cheapest "set," but the most useful camera of theirs, to my mind, is the "International." It has every modern improvement.

The lens supplied, however, with this camera is unsuitable for architectural work, since it somewhat distorts straight lines, although it is admirable for portraiture or landscape. For a slight extra cost, however, it can be exchanged for one of their excellent "Rectigraph" lenses.

Do not forget, the lens you must purchase for architectural subjects must be a rapid, symmetrical doublet, equally good for all-round work, and any of the following may be strongly recommended:—The "Rectigraph" (Lancaster & Sons); the "Optimus" (Perken, Son, & Rayment); the "Orthopannetic" (Newton & Co.); or a lens by John Browning, the well-known optician of the Strand.

Any of the above lenses are exceedingly cheap, considering the quality of work they produce, and are equally adapted for buildings, portraits, landscapes, or groups.

As this is principally written for architects it is not deemed necessary to go into "shutter" or "instantaneous" work. Buildings will at all events stand still to be photographed.

The next matter in importance is the "dark room." In developing your negative it is imperatively necessary to exclude all white light. Every chink must be carefully stopped up, as even a streak of white light coming through the key-hole is fatal to your picture.

If you possess a small room in your house which you can conveniently spare, purchase a few yards of ruby calico and tack it double thickness over your window. The ruby light filtered through the calico will afford a good safe light to work by in the daytime, and for night work a photographer's red lamp must be resorted to.

Having provided the above you are now in a position to set about taking your first picture.

Of course you have provided yourself with a dozen or two dry plates. For first experiments the ½-plate size will be the best, and the "Hford" brand are equal to anything in the market. Open the packet in your dark room. Take one out and examine it. One side of the plate you will quickly perceive to be coated with a thin layer of pink-looking gelatine. This is the sensitive or film side of the plate. Now get your double dark back and place two plates in the grooves, one film-side upwards and the bottom one film downwards. Fasten securely, and, to make thoroughly safe, wrap up with dark cloth. Now for the exposure. An opposite house will do very well for your first experiment. Rear your tripod and fasten the camera securely to the same. Then focus by pulling out the bellows till the image is sharp and distinct on the ground glass. In order to see this properly, cover your head and camera with the black focussing cloth. Possibly when the centre of the picture is beautifully sharp the edges will be a little out of focus. If such be the case, insert in the slit in your lens one of the stops till the picture is perfectly "sharp" all over. The smaller the stop the sharper the definition, but the longer the exposure required.

Now cap lens, slide your dark back into its proper groove, cover with dark cloth, then draw out very carefully the slide of your double back. Now comes the critical moment. The point is, what is the correct exposure? Well, experience alone can guide you in this. Give this plate say two seconds, then reverse your double back, and give the second one four seconds. One of the two is almost sure to give a good printing negative if properly developed.

There are numerous ways of developing, but the one here recommended gives pleasing black negatives. The following is the formula:—

Pyrogallic acid .....	½ ounce.
Sodic sulphite .....	1 ounce.
Ammonium bromide, .....	150 grains.
Citric acid .....	60 grains.
Nitric acid .....	5 drops.
Water up to 3 fluid ounces.	

The above will keep any length of time, and any ordinary chemist will make it up for you, if you wish to be spared the trouble.

Should you prefer "dispensing" yourself, dissolve first the sodic sulphite in two fluid ounces of hot water. Next add the citric acid. Now pour this solution over the pyrogallic acid and ammonium bromide; when these are dissolved, make up to three fluid

ounces with cold water, and finally add the citric acid.

Now procure a small bottle, which you had better label A (accelerator) for distinction. Into this put 1 ounce of 0.880 ammonia, diluted with half an ounce of water.

Now, you are ready to develop your negatives. Take the exposed plates out of their slide in your dark room and, for safety's sake, do not go too near the artificial red light. Lay the plate film upwards in your developing dish, having previously soaked it in a pail of clean water for a few minutes. Measure out a dram of the developing solution into a cup, then add two ounces of water (if distilled so much the better). Flood this over the plate. Now drop four minims (every drop being practically a minim) of solution A into the cup. Pour the developer back into the cup and thoroughly mix. Then pour over the plate again. If properly exposed the image should show signs of appearing. The high lights will appear first, then the other lights according to their gradations. If the picture does not come in a minute or two add a couple more drops of A. If this does not fetch it add a few more. If it shows no signs of coming in five minutes the plate was under-exposed. A little practical experience will soon teach you the correct exposure. When all the detail is plainly visible take the plate out of the developing solution and wash well.

After this has been done place for a few minutes in a saturated solution of alum. Then wash again. Finally, it is placed in the fixing solution.

Hyposulphite of soda ... 5 ounces.  
Water ..... 1 pint.

The object of this bath is to disperse the white appearance which is to be seen at the back of the plate. When this has all disappeared the plate is fixed. White light now has no effect on it, so you may leave the dark room and perform the final washing under the tap. The negative should now be left to dry of its own accord.

The printing from the negative is an easier matter.

The negative is placed, when dry, in the printing-frame, film upwards. A piece of sensitised paper (which can be bought very cheap from any photographic dealer) is placed in contact with it, the prepared side of the paper downwards. It is then exposed to good diffused light till printed. Print a little deeper than you would like the picture, as in the after-operations it will fade considerably. When you take the prints out of the frames, be sure to keep the pictures from light. When you have printed as many as you require, wash them well in several changes of water. To change their disagreeable colour it will be necessary to tone them. The following is a good toning formula, and may be used immediately after mixing:—

Gold chloride..... 1 grain.  
Borax ..... 60 grains.  
Water ..... 12 ounces.

Pour this solution over your prints, which should be face downwards. The red-brick colour will soon be changed to pleasing purple. When this has taken place the prints are toned.

At this stage put them in a clean dish and wash well under the tap.

When this is done place them for ten minutes or a quarter of an hour in a solution of:—

Hyposulphite of soda ... 2 ounces.  
Water ..... 12 ounces.

Both the toning and fixing dishes should be kept in constant motion, or unevenness of tone will be the result.

The prints when taken out of the fixing bath must be thoroughly washed. After washing leave them in soak all night, and give them a thorough rinse under the tap next morning. If not properly washed the photographs in the course of time will fade.

Next dry between blotting-paper and mount.

**The National Liberal Club.**—Messrs. G. A. Williams & Son, of Queen's-road, Baywater, are fixing spring roller blinds throughout this new Club-house, recently described by us.

SOME SCULPTURE OF THE YEAR.

**T**HE Royal Academy sculpture of the year, as we have before observed, is not up to the best mark of some former years. The three works in it which are of the highest interest we have already illustrated and commented on,—Mr. Thornycroft's model for a monument to Gordon, and Mr. Arnstead's "Ladas" (*Builder*, May 7) and his Bishop Ollivant memorial (*Builder*, June 25). In regard to the Gordon monument, we may remark on the excellent and original design of the pedestal; and well-designed pedestals are perhaps even less common than good statues.

Mr. Boehm's large marble group of the "Bull and Herdsman," which is conspicuous in the octagon, does not seem to us to have been quite worth execution in marble on that scale. The bull is a grand animal, and very finely modelled, in the hind quarters especially, and the herdsman's smockfrock is, no doubt, very sculpturally treated,—quite Attic, indeed: it shows what can be done with a simple garment like this, but there is not much of character or interest in the man, and, on the whole, the feeling of most persons will be that a great deal of material has been used without a commensurate result.

Mr. Williamson's "Sister Dora," a cast of a statue more than life-size erected at Walsall, is interesting as a spirited and expressive portrait of a noble woman; and of the nursing dress nothing can well be made in sculpture. Mr. Mark Rogers exhibits another of his caryatid figures for a chimney-pipe supporter, a finely-modelled and powerful male figure; it would have been better if some attempt had been made to model the superincumbent entablature so as to look more fitted to be upheld by the figure without pain and discomfort; there is something new to be done in this way in caryatides generally; in the present case the sharp edge of the entablature on the neck of the figure, whose head is twisted aside to avoid it, is almost painful to look at. The two portraits of ladies by M. Jean Antonin-Carlès (1788, 1789) are curious examples of a kind of would-be aristocratic mannerism: upright pose, long neck, very small head carried with a great air of pride; it is fine in its way, but so completely a mannerism that the busts give at once the idea of representing sisters, though apparently the ladies are not related; at least the catalogue gives us no reason to suppose so. Mr. G. A. Lawson sends a bronze of his fine figure of a boy reclining on his back, the plaster of which was in a former Academy, and was illustrated in our pages (*Builder*, May 29, 1886). Miss Emmeline Halse's "Jerusalem in Captivity" (oddly described as a "statuette," as it is a large life-size work) is expressive in pose, and shows fine broad treatment of drapery.

In the Lecture-Room, the principal work, besides those we have already mentioned as the finest works of the year, is Mr. Onslow Ford's "Peace," of which also we have given an illustration (*Builder*, May 7, 1887). There is a little ambiguity about the precise meaning of this work. If the intention is to represent "Peace" as a personification, the figure is quite wanting in dignity and appropriate expression for that; but if it is meant as a young girl sent out as a messenger or announcer of peace, it is very pretty and spirited, though the face seems rather wanting in vivacity. The action, on the contrary, is full of life, perhaps a little too realistic if anything, but at all events it is, as a study of a nude figure, decidedly original in character and movement. The feet seem a little large. Mr. Bates's small triptych bas-relief of "Psyche," "Psyche borne away by Zephyrus," and "Cupid," is a charming little work in low relief; Psyche, on the left, a breezy figure seated on a rock, and in the centre compartment a recumbent figure borne away on the back, or rather on the mantle of Zephyrus, a group reminding us of some of Flaxman's Homer illustrations. Miss Halse's "The Pleiades" is a pretty and fanciful piece of high relief, but of a much more ordinary type. "Dawn," by Miss E. Gwyn Jeffreys, is a

graceful conception, a female figure holding up some drapery which makes an inverted festoon over her head, as if carried upwards by the breeze; it would be better without the rather vague assortment of Cupids and other accessories which form a rather shapeless pedestal to it. Sir F. Leighton's has-relief for the reverse of the Jubilee Medallion, about which much has been said, is a most graceful and refined work of the kind, in very low relief, very delicately modelled. Mr. A. Gilbert exhibits a circular decorative panel in alto-relief on the old subject (not often treated in sculpture, however), "Post equitem sedet atra cura," in which an armed knight seems in chase of a floating figure before him, and the sinister figure of "black Care," heavily cloaked and hooded, clings to him behind; there is a strong and stern Gothic feeling in this fragment. Mr. Mullins's two boys, kneeling over some game apparently, are called "Conquerors," but the significance of the title we do not appreciate. Mr. Maclean's statue of Tragedy, a finely-modelled, heavily-draped figure, with a dagger in her hand, is not equal to its companion, Comedy; the face is wanting in tragic expression. Among small things that are worth noting are Mr. Conrad Dressler's "Dust of Mr. Stanley," Miss Louisa Jacob's head of a monk, with the title "Fiat voluntas tua"; Mr. Arthur G. Walker's "Love," a kind of Paolo and Francesca group; M. Emile Chatrousse's "La Lecture"; Miss Hallé's bronze medallion of Herr Joachim, with a reverse showing Orpheus taming the beasts; and Mr. W. R. Stephens's wax statue of a girl with birds perching about her, under the title "Pigeons."

Of the larger collection at the Paris Salon, whose short season has now closed, we can only speak briefly. As in our Academy, the collection has been below the average in general excellence, though it included some very remarkable works. The statue of "Fou Monseigneur Dupanloup," by M. Cbapu, to be executed in marble for Orleans Cathedral, is a very fine specimen of pure monumental design. The prelate, in his vestments, is shown reposing on a couch supported by an antique sarcophagus, on which is a tablet supported by two genii, with dates "1802: 1849: 1878"; those of his birth, consecration as bishop, and death. To right and left of the niche in which the monument will be placed, will stand two figures representing "Faith" and "Courage." The latter, a very noble figure, forms the subject of one of the illustrations in our present number. Another episcopal tomb by M. Louis-Noël was exhibited, that of Mr. Lequette, kneeling on a cushion, with mitre and cross in his hands; the long draperies are finely treated. The monument is intended for the church of Notre Dame des Ardents at Arras.

M. Mercié, whose talent shines in all forms of sculpture, exhibited a charming design for a tomb to the painter Cot; a child mounted on a stele, holding in its hands, with an expression of grief, a palette and brushes. Nothing can be more simple,—there is no crowd of accessories; but the effect is complete.

Most of the French sculptors of the new school, unfortunately, have a tendency to the employment of contorted and unnatural attitudes, exaggerating natural defects, as in M. Cordonnier's "Protection," under pretext of seeking "vigour." The fine group by M. Boisseau, of which we give an illustration this week, "Defense du Foyer," is free from these defects, and is a fine representation of the ancient Gaul on whom the minds of the French artists are so much set at present, the people who,

"Agriculteurs, guerriers,  
Savaient, jusqu'à la mort, défendre leur foyers."

The group by M. Boucher, "Vaincre ou Mourir," shows the same influence of political pre-occupation which has pushed the painters this year towards military subjects. It shows a woman, symbolising France, supporting a young warrior, who is dying, while his child tries to take the sword, to fight in his stead. Behind the principal group a kneeling man is forging a new sword. M. Boucher, at least, puts a remarkable exuberance of life into these

violent and sensational subjects. "On Veille," by M. Desca, was another group representing the ancient Gaul looking out for his enemy, which, of course, a well-understood intimation that the modern Gaul is similarly employed.

The bas-relief by M. Lecoq, "Après dîner chez Madame Geoffrin," is a realistic work, totally wanting in decorative effect, and giving portraits of some of the eminent encyclopedists, Diderot, Marmonet, Grimm, d'Holbach, and others. The portraits are supposed to be good likenesses, but the effect of the whole is heavy and uninteresting, and shows the mistake of attempting to bring the characteristics of a *genre* picture into bas-relief.

The enormous group by M. Hébert, with the equally enormous title, "Le génie de la libre pensée glorifiant la mémoire du Chevalier de la Barre, supplicié pour n'avoir pas salué une procession," is as confused and undigested as is its subject, but curiously typical of some of the tendencies of modern French art, which, unlike our own, often allies itself so enthusiastically with the political and moral ideas of the day. This often leads to artistic mistakes, yet it argues more active intellectual life than the worn-out and meaningless subjects which too commonly content English sculptors and painters. An abstract work of a different character was M. Marqueste's "Art," intended for the Hôtel de Ville, and as a pendant to the "Science" of M. Blanchard. Of the "Rousseau" statue by M. Berthet we have given an illustration (*Builder*, April 23); and we may record among the monumental works a fine statue of Handel, commissioned from M. Salmonson for the Grand Opera.

The tendency of the new French sculpture towards the illustration of modern life we have several times noticed. M. Falguière's "A la porte de l'Ecole" is a good example; a little girl with a satchel of books on her arm rising on tip-toe to kiss her little brother in her mother's arms; the figures and the feeling are very simple and natural. Of the same school is the "premier album" of the late M. Mathias Schiöf, a young artist who died just as he was making a reputation. M. Escoula's young rustic girl, "Pastorale," is also of the modern note, and the "jeune mère" of M. Lenoir, a mother washing her infant; a work which by its grace and naturalness escapes what might be the commonplace nursery character of the subject.

Among the number of mythological personages, we counted this year three Dianas, of which by far the best is that of M. Falguière, a splendidly-modelled figure, but with a rather feeble and commonplace head. The pretty "Circé" by M. Delaplanche should be recorded among the list of the Classicities.

Among other sculpture works of the *Salon* of 1887 may be named the "Galathée," by M. Roland,—Pygmalion's marble lady,—a finely-treated figure; the "St. Cécile" of M. Gautherin; the "Belles Vendanges" of M. Vital Cornu; and the "Espérance" of M. Ludovic Durand; but of all these allegories, the one most worthy of attention, after the Diana of Falguière, was the beautiful bas-relief, representing "The Seine," a nude figure in low relief profiled on a background representing distant Paris. This was the work of a young Villa Medici student, M. Puech. Among the animal sculptors, M. Frémiet obtained a "succès de curiosité," as one may express it, with his "Gorille enlevant une jeune Femme," a wonderful study from nature, but very disagreeable in outline and in subject; a sort of work which would find its proper place in a natural history museum. The marble bust of the late M. Eallu, commissioned by the Municipality for the Hôtel de Ville, is a remarkable work by M. Barras, to be placed on a pedestal designed by M. Albert Ballu, and adorned with a *génie* in bronze by M. Coutan. A more life-like resemblance could not be given to marble. Two bronze busts exhibited by M. Dalou were interesting as showing the excellent results to be obtained from the process of casting *à cire perdue*, which we venture to think will soon be the only process accepted for bronze work of the highest class.

## NOTES.

HERE appears to be a difference of opinion as to the desirability of bringing on the Railway and Canal Traffic Bill in the House of Commons for the second reading at once. It was proposed in the House by Mr. Heeneage that this should be done, in order that the Bill might be sent to a Select Committee with a view to its becoming law during the present Session, and the Government seem to be willing to adopt this course. Mr. Mundella,—who naturally takes a great interest in the subject,—is in favour of deferring the second reading of the Bill so as to ensure a full discussion of its provisions at that stage. The weight of opinion on both sides of the House appears to be in favour of proceeding with the measure as soon as there is an opportunity; but, in any case, it is very necessary that no effort should be spared to render the law clear and intelligible, and not, as at present, open to various interpretations. A case was heard before the Railway Commissioners only last week which illustrates the uncertainty of the law relating to preferential rates. In giving judgment, each of the Commissioners expressed different views. Sir Frederick Peel held that the applicants had not given proof of such an undue preference as to entitle them to a decision in their favour. Mr. Price considered that the rate charged could not be justified, and was, therefore, undue; while Mr. Miller, though also looking upon the rate in question as unjustifiable, did not consider that the applicants had proved that they were prejudiced, and judgment was given against them, no order being made for costs.

ON Friday last week the Metropolitan Board of Works put up to public auction the lettings (Mr. Robert Reid being the auctioneer) of the whole of the surplus lands in Charing-cross-road and Shaftesbury-avenue, with the exception of a few that were not ready. Forty-eight sites were so put up before a large assemblage, and forty-five were let in the room at rentals varying from 5s. to about 9d. per superficial foot. It is a new and important departure on the part of the Board, it being very unusual to let lands by auction, the ordinary practice hitherto having been to let by tender. We think there is much to be said in favour of the new system, as unsatisfactory results have often followed blindfold tendering for land. It seems to us that in this particular case fair and satisfactory results have been obtained. In connexion with this subject it is of importance to note that within the next year or eighteen months, 150,000l., or upwards, will be spent on these sites, which are in the centre of the metropolis. Much of this outlay will, of course, go in wages in one or another form, and extensive outlay on neighbouring properties may be expected, so that business in the building trade ought to be sensibly improved by the development of this new thoroughfare as the centre of a business neighbourhood.

THE Rector of St. Martin's-in-the-Fields has written to us calling attention to a model at the Vestry-hall of a proposed alteration of the steps of his church, asked for by the Metropolitan Board of Works, in order to widen the roadway at that point. The Rector and his Churchwardens have to decide what answer shall be given to the application, and Dr. Kitto very rightly, in a matter which concerns the architectural appearance of the church, wishes to elicit some expression of opinion from those who feel interested in the matter. We have looked at the model: the proposed alteration is cleverly contrived, and will be less of a blemish to the church than we should have expected. The colonnade of the portico stands at present on an unbroken range of steps, seven steps in height at the north side, increasing southwardly as the ground falls. It is proposed to form five steps in each intercolumniation, abutting against the pedestals formed beneath the columns, and thus throwing the whole of the steps inward

by the width of five steps. It will certainly deteriorate the effect of the portico; there is no doubt about that; it will lower the continuous base-line of the columns, show pedestals where none were intended, and contract the floor area of the porch. It is not what can be called a flagrant disfigurement; that is all that can be said; and it has evidently been planned with a desire to make the best of the alteration. On the whole, however, we should recommend the Rector to defer his consent until it can be fully considered whether the impediment to traffic just there is really a serious enough evil to warrant even partially spoiling a rather celebrated building. If the alteration is made it will never be un-made.

THE *Times* of Tuesday, in an effusively laudatory and evidently "inspired" notice of the new staircase at the National Gallery, referred to the double staircase which has been removed to make way for the new staircase, as if it formed part of the original design. This is not the case. The double staircase was put up by the late Sir James Pennethorne, at the instance of some cheese-paring First Commissioner of Works (who was no doubt at that time very proud of his achievement), in order to obtain some little additional room; and to effect this alteration a noble staircase, by Wilkins, of very original design, and with a dignity and mystery in its aspect which are rare in our public buildings, was destroyed without any protest from any quarter. Those who are old enough to remember this staircase cannot fail to recall the impression created by it on entering the building,—a sense of spaciousness and an indefiniteness which, perhaps, no other building of its size possesses. This has now wholly disappeared.

WE observe that although Mr. John Taylor is named, in connexion with the Office of Works, as having had something to do with the new work at the National Gallery, some notices in the daily papers attribute the design to Mr. G. Shaw-Lefevre. It is not difficult to guess how this comes about, and many of the papers know so little of these matters that they will believe anything that is told them on official authority. Perhaps we shall be told in the course of a few years that it was Mr. Ayrton who designed the Law Courts. It was known that he had something to do with the design, but the part he took was generally supposed to have been confined to jamming a large and complex building upon an inadequate site and cutting out as many of the architectural features as possible. We know that Mr. Lefevre, in conjunction with Mr. Mifford, cut (after a fashion) the Gordian knot of the improvement at Hyde Park Corner, and we may, perhaps, find that he was the architect for the restoration of Westminster Hall, and that Mr. Pearson merely acted under his direction. It is commonly reported that Sir Antonio Panizzi designed the Reading-room at the British Museum, and his bust is placed at the entrance in a conspicuous position, as if he were the tutelary genius of the place; but those who have any knowledge of the subject are aware that all Panizzi did was to suggest the circular arrangement of the readers' tables, and the placing of the room in a position that no architect in his senses could by any possibility have proposed. In like manner, Sir Joseph Paxton was credited with the design of the First Exhibition building in Hyde Park on the strength of a few scrawls on a sheet of blotting-paper, which were afterwards rendered intelligible by Sir Charles Barry.

WE may call attention to the fact that the value of the Godwin Bursary, founded by Mr. G. Godwin, in connexion with the Institute of Architects, for the promotion of the study of works of modern architecture abroad, has been increased from 40l. to 50l. for the year 1888. Candidates for it must apply to the Institute before the 1st of January next. It may be useful to give further publicity to the following brief statement in regard to it from the last number of the

“Journal of Proceedings” of the Institute :—  
 “The selection of a holder of the Bursary is made by the Council after comparison of the candidates’ applications, testimonials, and general acquirements; and the successful candidate has to make a visit, of not less than five weeks, to some place or places outside Great Britain and Ireland, specially to study and report on a specimen or specimens of modern planning or construction, drainage, water-supply, ventilation, or other sanitary arrangements to be found there.” Perhaps we must not expatiate too much on the value of this particular prize of the Institute, founded by the former Conductor of this Journal,—

“This comes too near to praising of ourselves,” but we may point out that, with the exception of the Grissell Medal, it is the only scholarship of the Institute founded to encourage and promote practical knowledge in architecture, and it certainly, to say the least, filled a gap that wanted filling.

FROM a manufacturer’s point of view it is possible to insist upon too high a test of the breaking strength of Portland cement, because, as Mr. Collins says,\* it leads to the increase of lime in the manufacture to the highest possible point, which does not make a safe cement, although it may ensure a high tensile strength at short dates, and the danger of doing this cannot always be counteracted by heavy burning. He has seen briquettes made from a cement weighing 123 lb. to the bushel break at 1,200 to 1,300 lb. on the 1½ in. × 1½ in. section in seven days, which a few months later broke at less than 800 lb., and this he considers entirely due to the excess of lime which it was necessary to use in the original mixture. He suggests for a section of 1½ in. × 1½ in., a test of 700 lb. under ordinary conditions, or, if the time test of one minute be insisted upon, 600 lb.; and this he believes will give safer and ultimately better work than any higher requirement. For engineering work he recommends a weight of 112 lb. per bushel, a tensile strain per square inch of 350 lb. at seven days and 450 lb. at twenty-eight days, and that the fineness of grinding should be such as to leave a residue of less than 10 per cent. when passed through a 2,500 mesh sieve. For special work he would have the same strain with a weight of 110 lb. per bushel, and a residue of less than 10 per cent. through a 3,400 mesh sieve. Weight per bushel, Mr. Collins says, is only of much importance when taken in conjunction with fineness of grinding, but to get accurate results the cement should be fed through a standard hopper into a bushel measure in the manner specified in Sir John Cooke’s work, of which he gives an illustration with dimensions. The cement formed by the mechanical mixture of the slag of iron with slacked lime must not be confounded with Portland cement, which is a chemical combination. If it be mixed with Portland its presence may be ascertained by dropping the mixture into dilute sulphuric acid, and then, whilst stirring, allowing Condy’s fluid to fall in drop by drop until the red colour remains permanent. If there is no admixture of the slag cement with the Portland twenty drops will be sufficient, while a cement made from slag only will probably require 200 drops. Mr. Collins gives some useful advice also on the general treatment of Portland cement, such as air slacking, exactness of quantity of water used in gauging, and several other requirements necessary to its successful use.

ON July 14, Thurgarton Priory, in the County of Nottingham, will be put up for sale. This property, lying on the Trent, between Nottingham and Southwell, is situated in Thurgarton, Epperstone, and Southwell parishes, near to Sberwood Forest and “the Dukeries.” It includes a modern house of brick, on the site of an old convent, with a park of 120 acres, and six farms of about 1,750 acres in all. The Early English tower and three bays of the (St. Peter’s) parish church form part of the

priory church belonging to some Austin Canons, who were established here, in 1130, by Ralph de Ayncourt. At the suppression their income was computed to be 259l. 9s. 4d. In 1853, the priory church was renovated by Mr. Hine, of Nottingham, architect, who added a chancel and north aisle. The living of Thurgarton and Hoveringham is in the gift of Trinity College, Cambridge, who own most of the land.

MR. EDWARD FELLOWES, who sat as M.P. for Huntingdonshire from 1837 to 1880, will take his newly-created title as Baron De Ramsey for his country seat of Ramsey Abbey in that county. That alhhey of the learned and wealthy Benedictines was founded in the year 969 A.D. by Ailwin, Eorlderma of East Anglia, on Ram’s Island, a remote and desert tract amid the great Eastern Fens. Bishop Oswald, nephew to Odo of Fleury by the Loire, sent twelve monks from his priory of Westbury in Gloucestershire; Ailwin gave lands, and 30l. for organ pipes of copper; King Edgar gave much money and a bell for each of the church’s two great towers. Successive benefactions were increased by varied arts of acquisition which are naively set forth in the chronicle of Ramsey,—a beautifully-executed MS. of the early fourteenth century, by an unknown monk,—which was exhibited in the Record Office at the recent Domesday Commemoration. At the Dissolution its annual revenues were assessed to the amount of 1,937l. 15s. 3d. In 1540 the demesne was granted to Sir Richard Cromwell, in whose family it continued for a long time. Tradition has it that a piece of cloth which had been ordered from London for the making of a coat for Colonel William, cousin to Oliver, Cromwell, carried the Plague into the town. His death, and burial on the next day, February 23, 1665-6, and the visitation of the pestilence, are chronicled in the register of St. Thomas a Becket parish church. From the Cromwells the property passed to Colonel Tins Salt, whose eldest daughter devised it to two of her servants. These sold it, circa 1736, to Mr. W. Coulson Fellowes, ancestor of the now possessor. Nothing of the abbey exists beyond a ruined gateway and some arches which stand in the walls of the manor-house that has been built on the former site. An earlier MS. relating to the abbey’s history is preserved in the Bodleian. A fourteenth-century catalogue shows how rich was the monastic library. It contained as many as 600 written volumes; seventeen or eighteen of them being transcribed in the Hebrew tongue. The Jews are known to have settled themselves in the Eastern counties from a very early period. Those MSS. were doubtless acquired for the abbey at the general confiscation of the Jews’ possessions (temp. Edward I., when the contents of the synagogues at Stamford and Huntingdon, and elsewhere, were sold by auction.

OWING to the death of Sir Henry Charles Paulet, Bart., certain good sporting properties in Hampsire will be sold at the Mart in course of July current. These comprise the freehold manorial estate and house of Little Testwood, a tithing of Eling parish, at the western head of Southampton Water, and overlooking the pretty Test valley. For the convenience of purchasers the whole estate of 350 acres can be divided into five lots: one consisting of Little Testwood House with its well-timbered grounds of sixty-six acres; the others of various plantations, and the Brookeswood, Broadmoor, and Paulet’s farms. Besides salmon and trout fishing in the neighbouring rivers, a licence to shoot over New Forest, 65,000 acres, could be obtained by the purchasers on easy terms. At the same time will be offered for sale the Canterton Estate, which formed portion of the settled estates of Sir Henry and the late Lord Henry Paulet. Canterton lies in Eramshaw and Minstead parishes, in the New Forest; its southern limits being barely 300 yards distant from Stoney Cross, where is preserved the Rufus’s stone. The Manor House has been long noted for its rhododendron plantations.

The property, mostly woodland and copse, covers in all about 600 acres, which could be divided amongst several lots. To the Manor of Canterton appertain certain sporting rights over the Wastes, containing altogether 320 acres.

THE ancient and once royal manor of Chylesmore, in Coventry, will give his new title to Mr. W. H. Eaton, M.P., of that city, silk manufacturer. Mr. Eaton purchased this property some twelve years ago from the Hertford family, to whom the Crown had sold the manor, which had been an inheritance of our Princes of Wales since King Edward III.’s reign. Wishing to join the third Crusade, Roger de Monthault sold his lordship of all Coventry, except this manor, together with its fortified house, to the famous monastery that Leofric, Earl of Mercia, husband to Godiva, had founded in honour of SS. Osburgh and Peter. Amongst its possessions, by the way, was included Eaton manor in Cheshire. Robert de Monthault, his descendant, entailed Chylesmore upon Queen Isabella of France, with remainder to her second son John (of Eltham). But at John’s death in 1336 this manor passed to his elder brother, Edward III., who settled it upon his eldest son Edward, the Black Prince. Up to these events Coventry was unwall’d; but in 1346 the king incorporated the city, and during the latter years of his reign its walls were built. By the sovereign’s command, the manor-house and its Little Park were enclosed within the lines. Four years before Richard II.’s accession the tower and spire of St. Michael’s Church were erected by Adam and William Botoner, who ranked amongst the earliest masons of Coventry. Though the turbulent citizens once laid waste the grounds of Chylesmore temp. Henry V., they did not alienate themselves from out of sovereign favour. Henry VI. made the city into a separate county; in 1458 he held here what the Yorkist party stigmatised as his “Diabolical Parliament”; Edward IV. celebrated a Christmas here with his queen (1467), and kept a feast of St. George at his son’s manor of Chylesmore. In course of time the Park was built upon, and merged into the inhabited city. And so, to pass on to later days, we find that many martyrs were burned within its limits, and that from Chylesmore Hill Charles I., just before the raising of his standard at Nottingham, bombarded the city on its refusal to admit the royal forces. The citizens were relieved by Hampden’s and Hollis’s levies of foot; soon after the Restoration the city walls were overthrown. Some vestiges of the manor-house are said to exist to this day, whilst the manor’s old association with our Princes of Wales is commemorated by the three plumes wherewith the civic shield is charged. Our own generation may take pleasure in being reminded that in her thirteenth year George Elliot,—who was born at Griff House, by a bend of the road between Coventry and Nuneaton,—went to Miss Franklin’s school in Coventry. In 1841 Robert Evans removed to Foleshill with his daughter, who, in the words of her biographer, Mr. J. W. Cross, “transfigured these Warwickshire scenes, dear to Midland souls, into many an idyllic picture, known to those who know her books.”

STUTTON HALL, Suffolk, erected by Sir E. Jerny, Kt., and remarkable for its ornamental chimneys and brickwork gateway, is to be put up for auction, on July 12th, at the Great White Horse Hotel, Ipswich. This old Elizabethan house stands on the banks of the Stour, about seven miles from Harwich harbour; the property extends over 470 acres,—for the larger part rich pasture.

OF building of theatres in London there appears to be no end. As we mentioned some few months ago, another theatre is about to be built in Oxford-street, on a large plot of vacant ground formerly occupied by the Star Brewery, in the rear of the Oxford Music-hall, for Mr. Alexander Melville, of the Grand Theatre, Birmingham. The new theatre will accommodate about 2,500 persons. Messrs. Essex & Nicol, of Birmingham and Chancery-

\* A few words on Portland Cement, by a Manufacturer. D. L. Collins (Gibbs & Co.) London: E. & F. N. Spon, 1887.

lane, are the architects of the building. The *Daily News* announces also that a site has been secured by Mr. John Clayton for a new theatre in Chelsea, near the Court Theatre, which is about to be removed for an improvement on the Cadogan Estate, but the site is not further indicated.

ON Thursday, June 30th last, was laid the memorial-stone of the new London and South-Western Bank in Fenchurch-street. The premises have a frontage of nearly 50 ft. to that thoroughfare, by 110 ft. in depth, with an entrance out of Gracechurch-street. Mr. James S. Edmeston is the architect, the contractor being Mr. Wm. Shepherd. The site thus covered is said to have been that occupied by certain premises, which, having been rebuilt without delay after the Great Fire, were long known by the signs of the Cross Keys, the Three Kings, and the Black Lion. Their neighbour, the Rose Inn, formed part of Mr. Birch's presentment of Old London, made for the Health Exhibition, 1884.

UPON the invitation of the East India Art Manufacturing Company we have visited their premises, 13, King-street, St. James's, to see some carvings from the Palace of the late King of Burmah. The carvings consist of two compositions of pyramidal form, beautifully carved in teak in high relief, and very much under-cut. There is no information as to what part of the palace or what features they have belonged to, but their form and size suggest that, if architectural at all, they may be the upper members of architraves to doors or openings. The carving represents conventional foliage and rocks with groups of figures engaged in various occupations, ordinary and otherwise, from driving a goat to protecting, with a sacred umbrella, a figure on horseback rising from the ocean. In one opening in the foliage is to be seen a group of monkeys. In the centre of each composition a branch rises and expands into a flower, on which is seated a large male figure of a god or monarch, who is trying to look indifferent to the homage of six female figures of like size, kneeling in an attitude of adoration on similar flowers, three on each side. The execution is as free as if teak were as soft as cheese, and there is a touch of colour on the lips of some of the figures.

THE female scarlet fever wards of the London Fever Hospital, Islington, have just received a notable and very valuable addition in the shape of some decorative wall paintings. These paintings consist of groups of flowers painted on the varnished surface of the walls, and have been executed by Miss Emily Wall whilst a patient in the hospital. As works of art they are of a very high order of merit, and the brightness and beauty they add to the ward it is hardly possible to overrate.

AT his premises in Charlotte-street, Bedford-square, Mr. J. Aldam Heaton has on view an altar-table with a decorated front and ends, designed to "obviate the constant trouble and expense involved in the use of embroidered altar-vestments." There are no architectural features or even mouldings in the work; the front has seven upright panels containing figures of angels with censers and musical instruments, painted by Mr. W. H. Margeson, on a highly-burnished gold background. Above the panels appear the words *Sapientia, Pietas, and Timor Domini*, but they do not appear to be connected with the figures. The framework of the front is ornamented with a freely-drawn pattern in brown and yellow stain on a dead gold ground. The whole work is beautifully executed and harmonious in colour, but rather harsh in outline, and wanting in thought as regards the general scheme.

IN the *Antiquary* for this month Mr. J. F. Hodgkiss commences a series of papers on "The Smith and Wright," intended to give a brief outline of the work performed by the two classes of artisans thus designated; regarding

the "smith" as a worker in metal, the "wright" as a worker in any other materials. The first paper promises well for the series; it is eloquently and picturesquely written, and shows both learning and enthusiasm. The same number of this useful periodical contains an interesting account of the old house called "The Oak House," at Bromwich, accompanied by a sketch.

ANOTHER case of the vested right in a chantry chapel has just been decided by Lord Coleridge in favour of the descendants of the original owners and against the churchwardens. This was in the case of a chapel attached to the parish church of Louth. This had been erected as the chantry chapel of a guild established under a charter of Henry VI., in 1450. After the suppression of the chantries at the Reformation, the disused chapel was assigned to the then lord of the manor, Sir John Bolles, of Thorpe Hall, and to his heirs the possessors of Thorpe Hall "for ever," in consideration of Sir John having assigned the tithes to the prebend of Louth, who was rector. A recent owner, Mr. Fyfeche, had consented to the chapel being seated for general use, but without giving up his right to it; and he having sold Thorpe Hall to Mr. Bennett, the plaintiff in the case, the churchwardens, rather disingenuously, endeavoured to dispute his right to ownership of the chapel. Mr. Fowler, of Louth, under whom the church was restored, gave evidence in support of the plaintiff. The church, he said, was originally built in the thirteenth century, but rebuilt in 1450, and the seats in the chapel were coeval with the church as thus reconstructed. It was, he said, what was called a parclose; it was evidently *in situ*, and as originally erected, and the pew or row of seats supposed to be substituted for it was in a peculiar position, not corresponding with others of the seats in the church. Lord Coleridge said the evidence in favour of the user of the chapel by the Fyfeche family was unanswerable, and confirmed the right of the present possessor of it by purchase. So Mr. Bennett, like the gentleman in the "Pirates of Penzance," "has bought the chapel and its contents," including ancestors. The *Times*, by the way, devotes a short leader to this case, and, apparently inspired by a sudden idea of "justice to architects," remarks specially that both this and the Fitzalan Chapel case were decided mainly by the evidence of architects. But the *Times* cannot avoid lumbering about architects and architecture even when its intentions are friendly, and the name of Mr. Butterfield, one of the most eminent and popularly known architects of the day, who gave evidence in the Fitzalan Chapel case, appears in capitals as "MR. BUTTERWORTH"!

#### THE NEW WORK AT THE NATIONAL GALLERY.

THE new staircase and rooms at the National Gallery constitute a piece of work well carried out, and creditable to Mr. John Taylor, of the Office of Works, who, we believe, is the actual architectural designer of the work. We do not know that more than that can be said for the staircase and entrance, which does not show any stroke of architectural genius, and really depends for its effect more on the materials employed and on the decorative work done by Messrs. Crace & Son than on anything remarkable in the design architecturally considered, in spite of the poems which have been sung over it in the daily press. This is, of course, only what is to be expected as long as public architectural work of this kind is turned out by an official staff, however practically competent, instead of being entrusted to an independent architect of genius. The additions comprise a grand staircase in two main flights with a broad landing between, lighted by a glass dome above; a large vestibule at the top of the staircase, leading to a large gallery running north and south, with two small rooms opening from the centre of the east and west sides of it, and numbered II. and III. on the plan attached to the new edition of the official catalogue; the main room being numbered I. From the north end of this latter room we reach another small room of the same size as the vestibule and numbered V., and through this we pass into another large gallery

running east and west, like the cross at the top of a T, and which forms Gallery VI. From the intermediate landing of the new staircase two subsidiary flights of stairs rise eastward and westward, each landing in a good-sized vestibule, which is available for picture-hanging, the floors of these vestibules being returned round the stairs to the edges of the main flight. From these east and west vestibules access is obtained to the old range of galleries extending along the Trafalgar-square front. The old staircases, approached from the outer lobby on either side, are still retained, and these and the new subsidiary stairs result, therefore, in the rather incongruous arrangement of two parallel flights of stairs, both leading to the same ranges of galleries. Architecturally the effect of this is certainly odd and confused, but we understand it is thought convenient, on occasions when the Galleries are crowded (as on public holidays), to have the old stairs to be utilised as exit stairs, the new stairs forming the entrance stairs. This may no doubt, be a practical advantage if the public will take it that way; there is nothing at present to compel them to do so. But the whole as it at present stands looks like a very odd effort in planning. Further communication between the new and old galleries is obtained from the east side of Gallery III., which opens on the back of the former *cul-de-sac* gallery, westward of the octagon hall, where the Crivellis and other examples of early Italian painting used to have place; and from the east end of Gallery VI., which opens into the end of Mr. Barry's long gallery (VII.), formerly devoted to the Italian pictures by the masters of the great period of Italian painting. Another curious result of this more grandiose entrance now made in the centre of the building is that Barry's octagon hall, the loftiest and most sumptuous apartment in the interior, which a visitor would expect to find on the axis of the principal entrance, becomes merely a side feature in reference to the entrance. This could not be avoided, but the result is to add to the effect of architectural confusion and want of purpose in the planning of the interior. If the back portion of the building is ever extended westward, this octagon hall will no doubt be balanced by another in a similar position on the west of the main axis of the building; and there would then be something of uniformity and principle in the whole plan. We cannot but regret that a great plan for the rebuilding of the National Gallery was not resolved upon and carried out in a manner worthy of the nation, instead of these piecemeal additions to a building the main façade of which is quite unworthy of its position, and the ultimate rebuilding of which is rendered, by each of these additions, more improbable and more difficult.

The approach to the new staircase is somewhat hindered and crowded by the necessity of retaining the piers and arcade which carry the north wall of Wilkin's cupola; the approach is between these piers, and then between a new arcade, similarly spaced, at the foot of the staircase; the new piers being, however, of marble, — these two arcades, close to each other, combining again to increase the effect of confusion in the planning. The new stairs ascend between flanking walls faced with a very transparent yellowish-toned Giallo-antico marble, with a capping of fine and broadly-veined Pavonazetto marble. The main architectural decoration consists of columns and pilasters of red Numidian marble, with base mouldings in Pavonazetto, and Corinthian capitals of Derbyshire alabaster for the columns, and of white Carrara marble for the pilasters. The following list of the various marbles employed was furnished to us some time since by Mr. Taylor, and may be of interest:—

*Rouge Etrusque Numidian* (quarried near the coast in Algeria, between Algiers and Oran).—Used in columns and pilasters of staircase and doorways of exhibition rooms.

*Pavonazetto* (obtained from the old quarries in the Apennines, Italy, Province of Modena).—Used in bases of columns and moulded curbs of top landing of staircase and the pilasters of screen in vestibule.

*Verde di Prato* (obtained from the old quarries in the mountains near Prato, from which the Florence and Prato cathedrals were built).—Used in moulded pilasters of exhibition-rooms and staircase.

*Giallo Antico* (obtained from the ancient Roman quarries in Tuscany; it used to be shipped to Rome at Tabarca).—Used in sills and spandrels of staircase up to level of exhibition-room floor.

*New Zealand* (obtained from New Zealand).—Used in sub-bases of columns and pilasters in staircase.  
*Alabaster* (obtained from Derbyshire).—Used in capitals of columns and pilasters in staircase.  
*White Statuary of Carrara* (obtained from Carrara).—Used in capitals of screen, pilasters, &c.

According to the account furnished to the *Times*, it is stated that the idea of working the old North African marbles was that of Mr. Shaw-Lefevre; and this statement has probably given rise to the notion of some of the daily papers (referred to in another column) that Mr. Shaw-Lefevre "designed" the staircase; that would be quite sufficient hint for the architectural reporter of a London "daily." The *Times* contributor, it is amusing to notice, mentions it as a special value of the red marble that it harmonises so admirably with the red background against which the pictures have been hung; his notion of decoration apparently being that if you have a red wall you want a red setting to it—"harmonise." Messrs. Crace & Son, it will be seen below, give the red colour of the marble pilaster as the gracie reason why they could not use the red background in the staircase portion of the work. Their description of the scheme of decoration they employed, and the reasons which governed it, we subjoin in their own words:—

"The additions to the National Gallery consist of two large rooms, three small rooms, and the grand entrance staircase, with its vestibules on the level of the rooms.

The two large rooms, alike in most of their details, differ mainly in their length, and in the fact that the longer room has two large tie-beams below the lantern level. Both are lighted by lantern lights and skylight, and both have a wide cove, subdivided vertically into numerous plain panels above the frieze and cornice of the walls. None of the surfaces are enriched, the relief enrichments being confined to the mouldings of cornices and to the trusses and rosettes of the upper structure. For ornamentation, therefore, the new rooms (unlike those by the late Ed. Barry, adjoining) depend entirely on the coloured decoration.

The walls are hung with double flock paper of a deep red tone, the result of many experiments, and it will, we hope, be admitted that the paintings already hung, notably the "Benigno Raffaello," show to great advantage on the ground selected. The cornice and architrave are in stone colour, with the enrichments in a golden bronze colour, heightened by gilding; whilst the frieze is of a dark low tone of warm green, with a key fret pattern in stone colour thereon, its repetition being broken at long intervals by a block of other colour at the points from which the main ribs of the upper structure spring. These ribs, and the soffits to which they lead, are ornamented with a gullioche in dull white on a deep yellow ground, whilst the long array of panels in the cove are left in two tones of dull white, the mouldings in orange colour and gold, defined only by a firm red line, which a little helps to carry up some repetition of the walls. A series of long narrow panels under the lantern again recall the stronger colouring on the walls. All the remaining upper-structure may be said to be in a warm tone of subdued white, relieved with the same pale brown and gold as below.

The smaller rooms, which have neither cove nor lantern, have their walls and entablature precisely like those of the larger rooms, whilst the small strip of ceiling which divides these from the skylight is subdivided in a simple manner by coloured lines.

The skirtings throughout are of a cool, very dark green marble.

The staircase is an exception to the absence of relief ornamentation, which here is carried into some of the constructive lines; all these enrichments are treated with the same 'old gold' tone which prevails throughout the cornices.

The fine display of real marbles in columns, pilasters, and other constructive features, have here governed the colouring. It was impossible to continue the red walls where the rich rods of the 'Numidian' columns would come into direct contact with them. A warm dull green has therefore been adopted for these walls as the next best ground for the pictures which will hang here. And in the friezes and the margins of the upper panels, the deep maroon red tone of the columns is again recalled. The large, plain panels of the upper coves are decorated with a white paint in the dull gold colour, neutral grey, and dull red. In the screen which separates the staircase from the first large gallery, the tympana within the three arches of the doorways contain alti-relievi portraits of great painters. These are treated as dark houses, the better to emphasise the arading, the doors themselves being square-headed.

Mr. Crace has personally directed the decoration throughout.

Messrs. Crace are justified in claiming for the result that it is harmonious and suitable to the position. We do not care, we confess, for the decorative filling of the cove panels on the staircase ceiling. It is neat, elegant, what you

will of that kind, but it is not the highest type of decorative detail. We may observe also that the white finish of the arcade at the foot of the staircase, on the staircase side, butts harshly and inharmoniously against the red pilasters; it should not have been left so white. The band of ornament in relief over the entrance-doors to Gallery I. is a very good little bit of decoration, well treated in colour. On the outside of these doors are medallion heads of Leonardo in the centre, Raphael on the left, and Correggio on the right; and over the inner side of some doors Titian occupies the centre, with Rubens and Rembrandt on each side; but where is Buonarroti?

The new rooms are very well lighted, and the classification of the pictures, far more systematic than was possible before, is a great improvement in the effect and the significance of our great collection. The Ansiede Madonna, in its sumptuous architectural frame, appropriately closes the vista on the north wall of Gallery VI., facing the axis of the entrance; this room being devoted to the Umbrian School. Barry's long gallery (VII.) is now devoted to the Venetian and Brescian schools, and shows how rich we are in Venetian work. We could have wished that the glorious Titian, the "Bacchus and Ariadne," which to our thinking is the richest jewel of the collection, had been given a central place at the end of a vista; size, of course, is some consideration, but it is well worth a place of the highest honour that could be conferred. As it is it is hung as a pendant to the "Venus and Adonis," in a side position. It is much better seen, however, than it was, and its details and background come out in quite a new fashion. Into the general scheme of hanging we do not go at present, our remarks being now referring rather to the new work in the building; but in general it seems exceedingly satisfactory, and has evidently been the result of much care and thought.

THE "GERMAN GERMAN" \* ON FERGUSSON.

AN architectural critic who could well defend himself has gone from among us; it is left for those who valued his character and reputation as a critic to vindicate them. It is very true that "the Englishman, James Fergusson, the author of a 'History of Architecture in all Countries,' in his account of the Cathedral of Cologne, does take general exceptions to its proportions,—externally the proportions are as mistaken, if not more so than those of the interior;—that he notes of the nave that it is too short, and that it would have had a better effect had the transepts been curtailed; that a true architect would have reduced the height of the towers by a third, and that the west façade is rather the noble conception of a mason than of an artist in the highest sense of the word." That he should have said all this might fairly give occasion to Professor Adolf Güller, as "Architekt, Professor am K. Polytechnicum zu Stuttgart" to express and to do his best to justify a difference of opinion. That this is not the particular course which he has taken in adverting to the criticism is to be lamented in so appropriate an opportunity as a publication "Zur Ästhetik der Architektur," a striking inconsistency in Fergusson's criticism might have been fairly noticed; this is an alternation of enthusiastic expressions with stringent objections. There was the same variation of tone in his conversations on this building; he would speak of it as he wrote of it, as "certainly one of the noblest temples ever erected by man in honour of his creator," p. 613,—as "one pre-eminent example, possessed by Germany alone, in which all the beauties of the Pointed style are united";—of one of its principal beauties being the uniformity of style that reigns throughout,—and as "a glorious temple." But these were eunuchs of a conflicting,—not of incompatible expressions. A critic of architecture is constantly in the same difficulty as an estimator of personal character. Perfection is as little the rule in one case as the other. Substantial truth can be asserted and maintained for each of two representations, which may leave quite different impressions, unless fairly balanced one with

\* See Heine's description of the way he was called to order at a Teutonic gathering:—"At this German meeting must the German German speak." † Stuttgart: K. Wittwer. 1887.

the other. Moroseness or ill-nature may give credit for virtues only as relieving lights upon a general ground of vicious qualities; charity or favouritism, on the other hand, with equal conscientiousness and truth, sums up the very same items with the intimation that failings, of which the seriousness cannot be denied, are only drawbacks upon an essentially noble character; such is the difference between,—a character or a building as "very admirable, but—," or a character or a building "has abundance of faults, but still—." Truly there seems no help for it when there is an honest desire to dissimulate neither genuine admiration nor concurrent conscientious objections, but to take, like Fergusson at Cologne, first one attitude and then the other, and now indicate faults as drawbacks, and now excellencies as redeeming from denunciation; so Fergusson did in this case of Cologne, and it may confidently be said many others will be inclined, and are inclined, to do so after him. For, indeed, are not all the indicated objections fully sustainable? Let each speak for himself; but there are those who, uninfluenced by our lamented critic, have found Cologne Cathedral in the interior tame, mechanical, monotonous,—have experienced that the first effect is the sole effect,—and that its interest is as speedily, as entirely exhausted; that the limits have not been felt by the architect, within which simplicity becomes baldness, and beyond which loftiness offends as exaggeration. Years have gone by, and yet at the moment of present writing, the remembrance comes back ungratefully of the unrelieved level from end to end and from side to side, of the oppressively abundant repetition of identical forms, and absence of that suggestion of exuberant inventive resource which is the charm of Gothic,—of a yearning for such a prolongation of the perspective as would admit of taking in consciousness of the enormous height without a strain. James Fergusson had ever the courage of his opinions,—frequently very courageous opinions indeed,—and they who knew him best and often disagreed with him, always appreciated his honesty and sincerity, as well as his knowledge. We turn to his Historical Notice of German Architecture (i., p. 558), and find as little trace there as in his criticism of particular buildings to justify reflections on narrowness of view or imputations of spite or unfairness;—we do find much truth very tersely expressed as was his wont without fear or favour, and assuredly the glory of Germany not extenuated wherein it is worthy. As undeserved by him as surely is worthy of a writer who claims to take the attitude relatively to a common study, of a philosopher as well as an historian are such sentences as the following:—

"The case is clear; he is accustomed to the lengthy plans of the English cathedrals with the low towers of the west fronts like those of Ely, for example; in consequence, the decidedly different concentrated proportions of Cologne do not suit him, and in blind self-sufficiency he rejects these other proportions as tasteless contrivances (*gefälllos erfunden*). In similar fashion, he passes judgment on all other German architecture, not always simply after his peculiar English standard, but frequently also with venom and gall (*mit Gift und Galle*). Is there any other answer to all this than to formulate the psychological principle according to which every tonförmig is charmed with his cap and bells" (p. 86). It is poor reward for some hours spent in toiling "through the long, heavy, painful pages" of Herr Güller's aesthetic treatise to be brought up by such an unhappy specimen of international amenities as this. It admits of a ready retort, but it would be encouraging what we denounce to bandy his own words.

**The British School at Athens.**—The first annual meeting of the subscribers to this school was held on Wednesday afternoon. We defer a notice of the meeting until next week, but may say that Mr. Penrose, the Director of the School, was present, and gave an account of the working of the school.

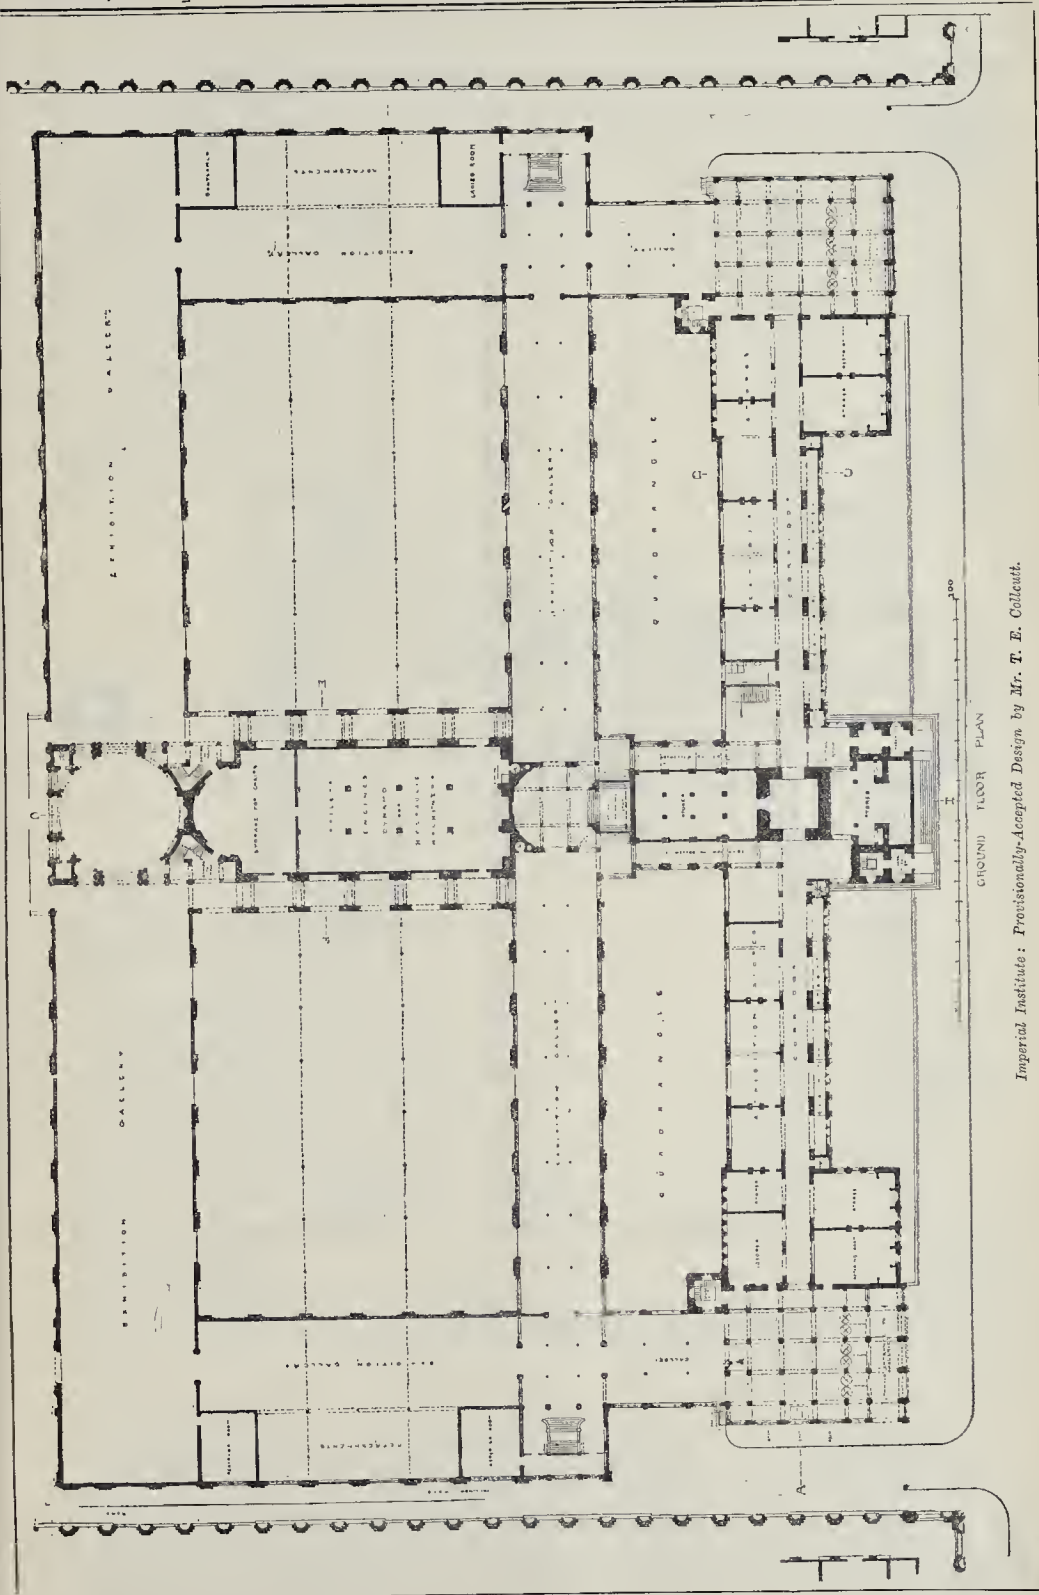

**District Surveyorship of Plumstead and Eltham.**—The Metropolitan Board of Works have appointed Mr. Alfred Conder, F.R.I.B.A., District Surveyor for Woolwich, to act as temporary Surveyor in the above-named District, which is vacant by the decease of the late Mr. G. Barnes Williams.

#### DESIGN FOR THE IMPERIAL INSTITUTE.

**WE** give this week the detail of Mr. Colcutt's design and two of his plans; and the perspective view, detail, and principal plan of the design by Messrs. Aston Webb and E. Ingress Bell.

The designs had to be photographed *in situ* during the time of their exhibition, and the necessary employment of dry plates, which do not require a dark room, has produced an unsatisfactory result in the case of the perspective of Messrs. Webb and Bell's design, which we regret. The dry plates will only bear a short exposure, and do not succeed in defining the lines sufficiently. Owing to the circumstances, it was, however, a choice between that and indefinite delay.

We commented on both the designs in our notice of the competition last week.

#### SCULPTURE AT THE PARIS SALON.

THE two works here illustrated, "La Défense du Foyer" by M. Boisseau, and "Le Courage," by M. Chapu, were among the sculpture exhibits in this year's Salon. Some remarks on them will be found in the article on "Some Sculpture of the Year," in another column.

**A SEWERAGE SCHEME FOR LEICESTER.**

MR. J. GORDON, R.E., one of the Engineering Inspectors of the Local Government Board, recently held an inquiry at Leicester with regard to an application by the Corporation for sanction to borrow 142,600*l.* for works of sewerage and sewage disposal, viz., 14,800*l.* for main trunk sewers from the borough boundary to the proposed new pumping-station, 80,000*l.* for the pumping-station and works for distributing the sewage over the Beaumont Leys Estate, and 47,800*l.* for two storm-water-outfall culverts down to Thurmaston.

Mr. J. Gordon, the Borough Surveyor, said that he had submitted several reports on this question to the Town Council, and the result was that in the long run the Beaumont Leys scheme was selected. He subsequently reported to the Council on the question of the main trunk sewers of the town, having in his first report, impressed upon the Council the necessity of dealing with the sewers at the same time. A scheme of new trunk sewers had since been adopted, and so far as the proposed works lay in the borough it had been approved by the Local Government Board, at an estimated cost of 75,000*l.* There was a little to be done outside the borough, at an estimated cost of 14,800*l.*, and to that there was no opposition. That would complete the trunk sewerage scheme up to the pumping-station. Mr. Gordon then described the works in connexion with the Beaumont Leys scheme, including the position of the pumping-station, the rising mains, and the expenditure in preparing the estate for the reception and treatment of the sewage. The cost of the pumping-station, including buildings, boilers, engines, &c., would be 41,645*l.*, exclusive of the usual ten per cent. for contingencies. The sewage, after passing over the land, would be taken up by the main effluent water culvert, and would ultimately pass from a considerable portion of the estate into the Ansty brook; whilst another portion of it, from about 400 acres, would come back to Leicester, and deliver into the Belgrave pond. The rising mains were estimated to cost 14,047*l.* 10*s.*; there were settling-tanks on the top of the hill put at 1,500*l.*, 10,400*l.* for distributing the sewage over the land, 3,400*l.* for land for the pumping station, making altogether, with the contingencies provided for, a sum of 80,000*l.*, which represented the total expenditure to be incurred up to the point of delivering the sewage on the farm. (The Town Clerk here interposed the remark that for the preparation of the estate there would probably be needed an expenditure of 10,000*l.* or 12,000*l.*) Mr. Gordon then went on to describe the course he intended to pursue in the treatment of the effluent. He believed now that the Corporation had adopted the plan for re-sewering the town that they would reduce the bulk and quantity of the sewage. He did not think that after the whole work was completed they would have to deal with more than five million gallons a day. In fact, he thought it would be within the mark to say that four million gallons only would be passed off through the effluent culverts. Taking 70 per cent. of that as going into the Ansty brook, it would be something less than three million gallons going in that direction. The large area of land taken was with the view of treating the sewage on the principle of broad irrigation, as distinguished from intermittent filtration, on account of the character of the soil. Unless a very large quantity of land was taken it would not purify the effluent to the degree that it ought to be purified. But the Town Council had not only gone as far as he wished them, but much further. He asked for 1,200 acres, and they had secured 1,375, so that they could now pass the sewage over the surface of the land, properly drain it, and finally bring it into the Ansty brook in a condition that he thought would compare well with that of any sewage farm in the country. The sewage could be effectually dealt with on this 1,400 acres of land, without being a nuisance to the adjoining owners. Passing on to the storm outfall sewers, Mr. Gordon explained that their principal object was to relieve cellar flooding in the town. He explained how this would be done, and said these outfalls would act as a complete safety-valve for the whole of the sewers in the town, and without them, in his opinion, the expenditure of 85,000*l.* for the sewers would be very incomplete, inasmuch as the chief object would be in a great measure, if

not entirely, lost. Having minutely described the course of the culverts, he said they were put down as costing 47,800*l.* It was no doubt, a large expenditure, but it would be fully justified by the advantages to be gained from them. He looked upon them as a positive necessity in connexion with the trunk sewers of the town.

Considerable evidence was given on the part of adjoining owners in opposition to the scheme.

**WORKMEN'S JUBILEE FÊTE AT PETERBOROUGH.**

Just as we go to press this week we have received a copy of the *Peterborough Express* of the 29th ult., which gives a detailed account of a very pleasant day spent by the workmen of Mr. (Alderman) John Thompson, the well-known builder, at Peterborough. Mr. Thompson, with characteristic amiability, felt that he should like his workpeople to appropriately celebrate the Jubilee by a fete to themselves: so he invited them all to spend the day in the meadows attached to his residence, the Lindens, on the Lincoln Road. The grounds were thrown open at ten o'clock, when recreation was provided in the shape of a cricket match, nine-pin alleys, shying for cocoa nuts, juggling matches, &c. At one o'clock a substantial dinner was served in a large marquee, after which the sports were resumed. The Rushden Temperance Prize Band was in attendance and played numerous selections during the day. Between three and four o'clock the wives and sweethearts of the *employés* were admitted, when a number of ladies and gentlemen, specially invited by Mr. Thompson, began to arrive and manifested great interest in the proceedings. About six o'clock, the whole assemblage, numbering about 500, sat down to a sumptuous knife-and-fork tea. The speeches made on the occasion show that the best of relations subsist and have always subsisted between Mr. Thompson and his workmen. Mr. Thompson, in the course of the proceedings, said:—

"During the past fifty years in which I have been more or less working in connexion with building, and in a great part of that time occupied in restoring or building beautiful houses for the worship of the King of kings, it has been my joy and my pleasure to have around me workmen whose hearts have gone with me and whose labours have seconded my every desire and occupation. (Hear, hear.) When I say that in this assembly at the present moment one man has been upon the firm between 50 and 60 years—I don't think he has worked a day for any other person—and when I say that his number here many others who have been with us over 40 and 50 years, and very many others from 21 to 30 years, and not many of much fewer years, it speaks for itself that the expressions which have just been uttered come from a willing and hearty class of workmen. (Cheers.) One thing I must say on behalf of my workmen. Only a short time since—a few weeks—my heart was touched, and it is touched now at the thought of what occurred. One morning, I received from these workmen unexpectedly, a letter sympathizing with me because they thought I was then employing them, and that business was not so good as it had been for the last several months. And who do you think my workmen did? I must say it before them—they offered voluntarily to aid me in any efforts I might use to obtain contracts at a reduced cost, and offered to sacrifice voluntarily that which was their due. (Cheers.) This little gathering to-day, Mr. Mayor, is but a small expression of my gratitude to them."

Simultaneously with this gathering, another party of Mr. Thompson's workmen, to the number of about one hundred, were celebrating the Jubilee in a similar fashion at Coventry.

Mr. Thompson is evidently as much to be congratulated upon his workmen as they are to be congratulated upon having such an employer.

**PRIZES FOR ART-WORKMEN.**

THE Council of the Society of Arts, John-street, Adelphi, have determined, on the recommendation of the Committee of the Applied Art Section, to offer prizes to art workmen under the following conditions:—

1. Prizes are offered to art workmen in certain classes of art workmanship enumerated below. These prizes will be awarded to workmen only, and the work must have been executed in the United Kingdom or its dependencies.
2. The objects submitted for competition may be the work of one man, or of several workmen working in combination. They need not necessarily be the property of the workman or workmen sending them in. Manufacturers or employers may exhibit articles on behalf of their workmen. In this case, besides the name of the manufacturer, the names must be given of all the workmen who have executed portions of the work, with a statement of the portion executed by each. If any prizes are awarded they will be given to the workmen, and a certificate, enumerating the award or awards, will be given to the manufacturer.
3. The objects in each class may be—(i.) Copies of existing works. (ii.) Modifications of existing works. (iii.) Original works.
4. In awarding the prizes, the judges will take into

account the following points:—1. Originality or beauty of design. 2. Fitness of treatment. 3. Excellence of workmanship.

5. Before the award of prizes is finally made the candidates must be prepared, if called upon, to satisfy the council of their competency.

6. The works will remain the property of the competitor, or of the person from whom he has borrowed them for the competition.

7. Although great care will be taken of articles sent for exhibition, the Council will not be responsible for accident or damage of any kind.

8. Prizes may be attached to articles sent in and sales made, and no charge will be made in respect of any such sales.

9. All the prizes are open to male and female competitors on equal terms.

10. When two or more workmen combine in the production of any article sent in for competition, the names of, and the respective parts taken by, each must be specified when the article is sent in, and the proportions must be stated in which they may have agreed, if successful, to divide any prize which may be awarded.

11. All articles for competition must be sent in to the Society's House on or before Saturday, December 3, 1887, and must be delivered free of all charges. Each work sent in competition for a prize must be marked with the workman's name, or that of the manufacturer, or, if preferred, with a cypher, accompanied with a sealed envelope giving the name and address of the workman or manufacturer. With the articles a description for insertion in the catalogue should be sent. The works will be exhibited at the Society's House, or, if the necessary arrangements can be made, at the South Kensington Museum.

12. The Council reserve the right of withholding any of the specified prizes, or of substituting smaller prizes, or varying in any way their respective amounts. Silver and bronze medals may also be given at the discretion of the judges."

Prizes are offered in the following eight classes for the present year, as follows:—1. Painted Glass, 25*l.*, 15*l.*, 10*l.*; 2. Glass Blowing in the Venetian style, 10*l.*, 5*l.*, 3*l.*; 3. Enamelled Jewellers' Work, 25*l.*, 15*l.*, 10*l.*; 4. Inlays in Wood, with Ivory, Metal, or other Material, with or without engraving, 25*l.*, 15*l.*, 10*l.*; 5. Lacquer, applied to the Decoration of Furniture or Small Objects, 25*l.*, 15*l.*, 10*l.*; 6. Decorative Painting on Wood, Copper, or other material applied to Furniture and Internal Decorations, 25*l.*, 15*l.*, 10*l.*; 7. Hand-tooled Bookbinding, 25*l.*, 15*l.*, 10*l.*; 8. Repoussé and Gashed Work in any metal, 25*l.*, 15*l.*, 10*l.*

**ARCHITECTURAL STUDENTS' PRIZES AT UNIVERSITY COLLEGE.**

THE following prizes have been awarded in the classes of Professor T. Roger Smith, F.R.I.B.A.:—

**FINE ART.**—Donaldson Silver Medals, *equal*. E. Hollicar of Bromley, H. S. Wood of Hereford. *Third Prize*. H. R. Appelhoe of London. Certificates, 4<sup>th</sup>. H. Hutchinson of London. 5<sup>th</sup>. E. H. Dawson of Lancaster. 6<sup>th</sup>. Horace Hildson of London. 7<sup>th</sup>. J. Borrowman of Godalming. *Second Class*. W. D. Claridge of London, G. P. G. Hills of London, H. C. Lander of London, T. H. Winny of London. *Third Class*. C. E. Bateman of Birmingham, T. H. Hitchin of Nottingham, A. B. Jackson of Hunsley, E. H. Sim of London, B. E. M. Towns of London, F. J. Waller of Greenhithe, W. W. Wilson of Leytonstone.

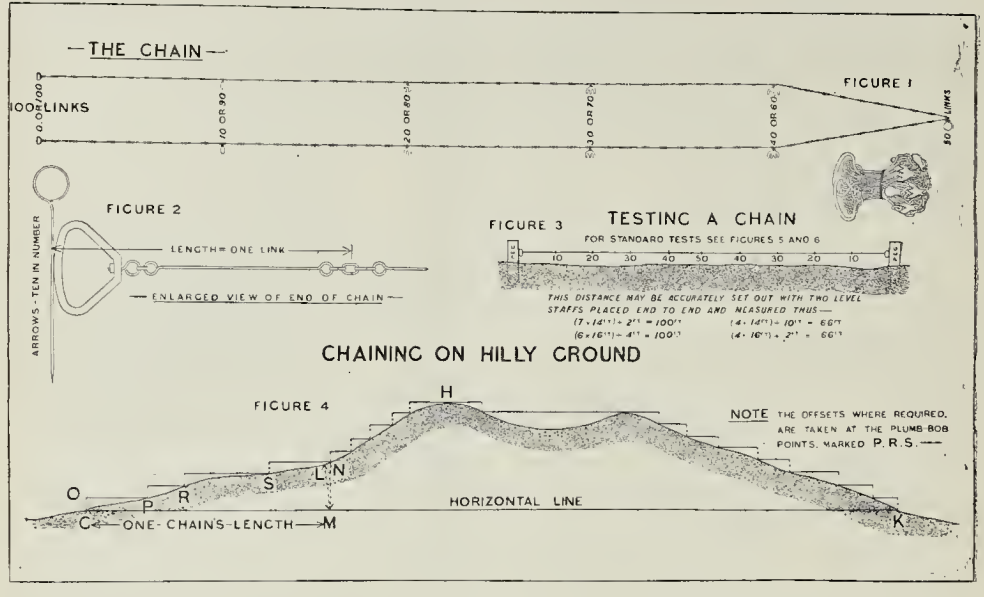

**SCIENCE.**—Donaldson Silver Medal. L. Martineau of London. *Second Prize*. E. Hollicar of Bromley. Certificates, 3<sup>rd</sup>. H. Hutchinson of London. 4<sup>th</sup>. E. A. Rüntz of London. 5<sup>th</sup>. G. P. G. Hills of London. *Second Class*. W. S. Douthwaite of Sydenham, H. J. Durlay of London, W. C. Kerr of Blackheath. *Third Class*. G. Baker of Oakham, C. E. Bateman of Birmingham, E. H. Dawson of Lancaster, R. C. T. Gordon of London, A. Griffin of London, R. S. Maynard of London, G. Roberts of Portmadoc, F. C. Stainton of London, T. H. Winny of London, A. B. Yeates of London. **MODERN PRACTICE.**—Prizes, *equal*. R. C. Gordon of London, Alfred Griffin of London. Certificates, 3<sup>rd</sup>. E. A. Rüntz of London. *Second Class*. E. J. Slow of London, T. N. Turner of London. *Third Class*. A. B. Clement of London, L. R. Ford of London.

We are requested to state that students can obtain their worked papers of answers on application to the Professor, at No. 10, Lancaster-place, Strand, within the present month (July).

**Projected Works at Bournemouth.**—The Local Government Board have granted their sanction to the loans for the following works, viz.:—9,000*l.* for works connected with a scheme for watering the roads and flushing the sewers with sea-water; 5,500*l.* for the construction of a storm outfall; 1,750*l.* for private street improvement; 320*l.* for additions to stabling; 2,500*l.* for public conveniences. The whole of the works will be carried on under the direction of Mr. G. R. Andrews, the Surveyor to the Bournemouth Commissioners.

\* Obtained the number of marks qualifying for a Prize.

COMPETITIONS.

**New Schools, Higher Blackley, Manchester.**—In an open competition for designs for new schools at Higher Blackley, Manchester, for the Methodist New Connexion, the drawings submitted by Mr. J. H. Burton, architect, of Ashton-under-Lyne, accepted.

**Proposed High School for Hartlepool.**—An adjourned meeting of the Governors of Henry Smith's Charity, Hartlepool, was held on the 27th ult., the Mayor in the chair, to further consider the correspondence with the Charity Commissioners with respect to the plans for the new schools. The plans conditionally accepted and sent in under the motto "Rover" having failed to fulfil the conditions enjoined by the Charity Commissioners, the Mayor said he thought that the proper course would be to call in the services of a first-class architect and tell him exactly what they wanted and ask for an estimate of the cost. Mr. Wood supported this view. Mr. Henry Belk moved, "That seeing the plans marked 'Rover' had failed to receive the consent of the commissioners, they be not accepted by the Board." Mr. Nielsen seconded, and this was carried. As none of the plans sent in appear to have met the requirements of the case, it was ultimately decided to invite Mr. G. G. Hoskins, of Darlington, to meet a consultative committee relative to plans and specifications for the proposed High School.

**New Park at Bilston.**—Mr. William Hall, of Bilston, has generously presented the town with twenty-two acres of ground within ten minutes' walk of the Bilston Town-hall, as a jubilee gift for a public park. It was decided to offer two prizes of twenty and ten guineas for the best design for laying out the same, which, owing to the nature of the ground, was a task of unusual difficulty. The first prize has been awarded to Messrs. W. Barron & Son, of Elvaston Nurseries, Borrowash, Derby, and the second to Mr. W. Milne, Crystal Palace School of Landscape Gardening, Sydenham.

CONCRETE AND IRON BAR.

SIR,—Referring to your issue of the 25th ult., and your notice [p. 494] of the weighted concrete bar at our stand at the Newcastle Exhibition, we beg to inform you the first 3-in. square bar tested had an iron rod  $\frac{1}{2}$  in. square placed in the centre of a concrete bar made with 3 of crushed brick and scorie and 1 of cement. This carried  $\frac{7}{8}$  cwt. safely on bearings 3 ft. apart.

A rod of the same dimensions bent with 25 lb., and a similar concrete bar broke when the weight exceeded 3 cwt.

We agree with you that it would have added to the value of the exhibit had the iron rod been shown in section. W. B. WILKINSON & Co.

WINDOW FITTINGS.

SIR,—May I ask through your widely-circulated columns the best way of fitting windows so as to keep out noise? I have much work to do. I am a new arrival, and find the noise interfere greatly with my work.

The nuisance must be felt by so many, surely there are some fittings adapted successfully to cope with this evil. D. BENNETT.

\*\* A new sash-fastener, of which an illustration will appear in our columns next week, may do something towards answering our correspondent's question, by way of keeping sashes tighter. But the only effective manner of lessening the transmission of noise from outside is double glazing, with a space between the two sheets of glass, or double sash-frames. It is through the glass that the noise comes; glass of ordinary thickness allows a great deal of sound to pass.

THE NUISANCE FROM SEWER VENTILATORS.

SIR,—Another instance of the utter uselessness of stack-pipes as a means of ventilation to sewers came under my notice yesterday, which may interest your readers.

At Tottenham, many of the sewer ventilators being a nuisance, the Board, instead of putting up shafts, decided to make other alterations to abate the evil, and on taking up an offensive grating opposite Green-lanes Station, Wood-green, found that a brick ventilating pipe was already attached, running under the road some 50 ft., and carried up the house adjoining, the outlet being half-way up the chimney. According to theory, a current of air should be going up this pipe to relieve the sewer, but, in fact, the air was nearly stagnant,—if anything there was a downward current, but giving the appearance of a pipe choked. On testing, this pipe was found clear, but the portion running under the ground was filled with a sewer gas, heavier and of a lower temperature than that of the grating or atmosphere of the street. This acted like a plug or choke damp, preventing any ventilation taking place in the sewer, except through the grating. After rarefying the sewer gas in the inlet pipe, the smoke ascended the pipe similar to that of any ordinary chimney. Is it not natural that sewer ventilators should prove a nuisance during hot weather, when, by the action of sewer gas passing through these cold pipes, an effectual stoppage of ventilation takes place, and that at a time when good ventilation is most needed? In cold weather, when the air in pipes underground is warmer than that of the street, an uncertain current is set up, but in summer it is quite the reverse.

R. H. REEVES.

Putney, June 30th.

**Hamilton's Brush Manufactory**, 9 and 10, Greek-street, and 8, Rose-street, Soho-square, has just been removed to new premises, specially built for the purpose, at 96, Clerkenwell-road, E.C.

The Student's Column.

LAND SURVEYING AND LEVELLING. II.—THE CHAIN AND CHAINING.

A SURVEYOR has to select one of two kinds of chain which are commonly employed in the measurement of land, each divided into 100 links. The total length of the short chain is 66 ft., and of the long chain 100 ft. The former is called Gunter's chain from its inventor, the Rev. Edmund Gunter (1620 A.D.), and consists of 4 poles, or 22 yards (the usual length of a cricket-pitch), decimally divided into links. Each link, being one-hundredth part of 66 ft., will be equal in length to 7.92 in., but this fact is more interesting than useful, as any portion of a chain is invariably expressed in links. In Edward I.'s reign the statute acre was fixed at 160 square poles or perches. Hence, with the use of Gunter's chain, ten square chains equal one acre. When the 100-ft. chain is employed, the number of square chains has to be divided by  $\frac{10000}{66^2}$ , or multiplied by its reciprocal .2295 to arrive at the acreage. Hence it will be seen that when acreage is required a considerable portion of the arithmetical work is saved with the use of Gunter's measurements. Having arrived at the area in square links, cut off five figures to the right-hand, and the figures to the left-hand will then express acres. To obtain rods and perches of the decimal portion of an acre indicated by the figures upon the right-hand of the decimal point, multiply first by 4 and then by 40.

At every tenth link from each end of a chain a piece of brass with notches or points is fixed to denote the number of the tens, that at ten links having one notch or point, at 20, two; at 30, three; and at 40, four points. At 50, the centre of the chain, is a round plain piece of brass. The chain being thus marked as shown in figure 1, the links may be easily counted from either end, the tellers at 90, 80, &c., being respectively the same as that at 10, 20, &c., so that it is immaterial which end of the chain is placed at the zero point. Some chains have also a small brass ring midway between each tenth index, to show the fifth link, and thus to facilitate the reading of the unit measurements. Part of the first link at each end is made into a large ring or handle for holding the chain in the hand. This is shown in detail in fig. 2. The best chains have the links connected by three elliptical rings, by which means the chain is rendered very flexible, and the links are not so liable to twist or coil when the chain is folded up.

In folding up a chain the most expeditious plan is to roughly lay it out as in fig. 1; then take the

links nearest the 50 mark in one hand and fold the chain double, until the handles are reached, taking care so to cross the links which come next to one another in folding, that the body of the chain when folded, may be smaller in the middle than at the ends, as shown in the figure representing the chain folded up. A strap is first passed round the middle to bind the links together and is then passed through the handles together with the heads of the arrows and fastened by a buckle. When you wish to unfold the chain, having unstrapped the arrows, take both handles in one hand, and having freed the first two or three links, take the remainder of the chain in the other hand and throw it out from you taking care to keep hold of the handles. When thus thrown out upon the ground you must then straighten and adjust the links where necessary and close any of the connecting rings that may be open at the joints before proceeding to measure the base line.

Every chain is accompanied by ten arrows, each about 1 ft. in length, made of stout iron or steel wire, and pointed at the bottom. These are usually bent in a circular form at the top for convenience of handling, and a piece of red cloth is often attached to the ring of each, in order that they may be easily observed when fixed in the ground. When in use they may be best carried by attaching the buckle end of the strap, which is taken off the chain to the ring, or top of one arrow, and passing the strap through the rings of the remaining nine arrows from which they can be easily removed, one at a time, as required. The use of the arrow with the strap upon it will then indicate that the whole ten arrows have been employed in the measurement of any given base line.

**Books.**

*A History of Berkshire.* By LIUT. COL. COOPER KING, F.G.S. London: Elliot Stock. 1887.

HIS is by no means the least excellent of an excellent series of "Popular County Histories"; dealing competently and pleasantly with the multitude of subjects which demand a place in a work of this kind, and avoiding in a marked degree the errors and questionable statements which are almost certain to be found where so vast a range of subjects are treated by a single hand. We must, however, repeat our grumble at the absence of a map, which would, at a slight additional expense, have made the reading of the work at once easier and more profitable.

A curious statement *appropos* of Ponghley Abbey, is made at p. 186, to wit, that some fragments of the abbey stained glass now at Pries Court depict figures in the costume of the fourteenth century, as sitting in an ale-house, "smoking." The abbey was dissolved by Wolsey, and either the glass in question was not brought thence, or Sir Walter Raleigh's importation of "the fragrant weed," had been anticipated. It is a point worth looking further into.

The working-man of to-day may, amidst his assumed hardships at the hands of capital, take comfort from the fact that his position is better than was that of his Medieval predecessor, who (p. 227), in the building of Eton College Chapel, was fined 2d. (5s.) for "chiding," for "telling tales," for "playing," and even for "looking about!" Under such laws how much of the modern artificer's wage would be left at the week's end?

Amongst the notables native to the Royal County, and they are many,—the most notable is King Alfred, who was born at Wantage, and dying, left to his widow, *inter alia*, the Manor of Yattendon, where now another Alfred,—a king, too, in his way,—is lord.

This agreeable and well-written history is presented to the public with the artistic completeness and care which distinguish the work of the publisher, and we can say with a clear conscience that "no (Berkshire) gentleman's library is complete without it."

*The History of Streatham.* By FREDERICK ARNOLD, JUNIOR, F.R. Hist. Soc., F.S. Soc., Lond., &c. London: Elliot Stock. 1886. The author claims this to be "the first history of Streatham that has ever been published," although there are certain "historical sketches" of an inferior kind before the public. He has no doubt been diligent in making excerpts from county histories, parish registers, &c., and has

thrown them together into one thin volume. But as a book, in the proper sense of the word, it is "without form and void." What a state must that historian's mind be in who could write thus!—"The usual plan was to put up a rude representation of the deity in stone on some neighbouring hill, or on an artificial mound, which was called Teut's Hill, &c., and therefore my belief is that the mystic rites in connexion with this god Teutates, Tniato, Thor, Tot, Teut, were probably carried on on some raised mound in our near neighbourhood, or the slight eminence overlooking Tooting, and that the name of Tooting was derived from this. But although this theory is very plausible, I think we must dismiss it as untenable. . . ."

It is said that history repeats itself: this History of Streatham certainly does; for the later chapters constantly serve up again,—sometimes in the same words,—the facts and fictions of the earlier ones. We protest against the familiarity which alludes to Dr. Johnson as "the great immortal Sam," and are not satisfied with such security as "an old writer," and "an old author," for "historical" statements. The illustrations, which are bad enough, are the best part of the book, which few but reviewers ("dreadful trade!") will, we imagine, have the patience to get through.

*Handbook of House Property and Fine Art.* By E. L. TARBUCK. Fourth edition enlarged. London: Crosby Lockwood & Co. 1887.

THE body of this work is too well known to professional readers to require description or recommendation. The new section on fine art,—added by particular request,—is of very questionable value, the views and opinions expressed being those of "a day that is gone." We find ourselves in almost total disagreement with it, and are far from admitting that the "present state of architectural art is extraordinarily retrogressive,"—that "the most skillful modern architects simply commit to memory the details of archaic styles," and repeat them, that they "fear to depart from precedents," rarely "dare to think for themselves," or that their art is reduced to "a mechanical routine." As to which we record our opinion that all this may once have been true, but that it is not true now. The artist was, we believe, never more free in the exercise of his skill than at present, and in the art of architecture we at least see plenty of signs of a vigorous vitality. This new section is a quite useless addition to an otherwise useful work, which was complete and various enough before, and dealt with subjects which could be taught by books. Skill in art cannot be so imparted.

The really competent artist can never say "how it is done," and those who write books to explain the secret fail because they themselves do not possess it.

*Drainage of Lands, Towns, and Buildings.* By G. D. DEMPSEY, C.E. Revised by D. KINSEAR CLARK, M. Inst. C.E. London: Crosby Lockwood & Co. 1887.

MR. CLARK has made some additions to two little volumes originally published by Weale in 1849, one on the drainage of land, the other on that of towns and buildings. These have been combined, and new matter has been contributed by Mr. Clark, amounting to one-half of the present volume. Some of the old sections have been omitted; the new ones embrace the subjects of Under-drainage, as exemplified in the experiments on the Hinxworth Estate; Rainfall and percolation; Reclamation of Hainalt Forest; drainage of peat bogs in Ireland; Drainage in the Valley of the Po; Drainage of desert land in the South of France; Fen drainage; the St. Germain's sluic, &c. Also the general principles of the disposal of sewage, the main drainage of London, Brighton, Torquay, Paris, and the valley of the river Wandle; the drainage of Newport, Dnudez, Hamburg, Abingdon, and Adelaide, with notices of sewage irrigation at Abingdon, the Wandle Valley, Abergavenny, and Adelaide. These are mostly taken from the Minutes of Proceedings of the Institution of Civil Engineers. It would seem to be somewhat difficult to graft new matter concerning the drainage of towns upon an old stock. With land drainage the case is different, but in towns the practice is not quite the same now as it was when Mr. Dempsey wrote upon it, and hence arise, in the present volume, inconsistencies such as that "a town on a hill top is the most readily and cheaply drained" (p. 182); whereas, p. 247, "so far from its being easy

to sewer such a town, if proper means are not taken to provide for ventilation, the engineer may leave the town worse than he found it." People know very little about town drainage, whether on a hill or elsewhere, when the first of these remarks was made; the other one became necessary at a later time. With respect to house-drains, by the instruction of pp. 231 to 238 they are to have sufficient declivity and to be perfectly trapped at their upper ends, but nothing is said about their ventilation. There are some curious references to wells or receptacles for sewage to be placed in various parts of a town,—pp. 191, 207, 208,—apparently about half a mile apart, but more or less according to circumstances. What wells are these? The remarks seem to have no bearing on the subject. We suppose they refer to a plan which was proposed by Mr. Dempsey for the drainage of London, and perhaps of other towns, whereby the sewage would be collected at numerous stations or wells, and raised thence to higher levels; a plan which is similar in principle to Mr. Isaac Shone's, whereby the sewage is raised to higher levels by compressed air. Whether Mr. Dempsey's plan was ever seriously considered by the authorities who had to decide upon a plan for the drainage of London we do not know, but in the book now under notice the key to these remarks about wells, &c., has been withdrawn by omitting all mention of the plan itself, while the allusions to it have been left standing. The extraordinary calculations of the original author contained in pages 203 and 206 are founded upon very exceptional circumstances, and although it may have been of some use to state them forty years ago, it cannot be of any practical use to do so now. The case is very different with the new parts contributed by Mr. Clark, for these consist of descriptions of works designed since, as, for instance, those of London, Brighton, and Torquay by Sir Joseph Bazalgette; of Newport, in Monmouthshire, by Mr. A. Williams; of Dundee, by Mr. J. Filton; of Hamburg, by Mr. W. Lindley; of the Wandle valley, by Mr. Baldwin Latham; of Abingdon, by Mr. J. Bailey Denton; of Abergavenny, by Messrs. Dudley and De Salis; and of Adelaide, by Mr. Oswald Brown. An extract from the Model By-laws issued by the Local Government Board is given as an appendix, being section IV. on "New Streets and Buildings."

**CHURCH-BUILDING NEWS.**

*Birmingham.*—The foundation-stone of a new church for All Saints parish was lately laid by the High Sheriff of Warwickshire. The site is at the junction of Dover-street, Musgrave-street, and Park-road, Solo, and it is planned to accommodate a total of 565 persons. The building will consist of a nave and side aisle, chancel, and sanctuary. In connexion with the chancel on the south side will be the clergy and choir vestries, with a side approach out of Dover-street, and on the north side of the chancel an organ-chamber. The eastern bays of the aisle will be enlarged and projected to form transepts, and the west end of the south aisle will have an octagonal projection for a baptistery. A portion of the west end of the nave is to be screened off to serve as a lobby to the main entrance from Musgrave-street. On the north side, near the western extremity of the aisle, will be a porch giving access from Park-road; the walls of this porch will be planned for continuation upwards as a tower, though the erection of a tower is not, for lack of funds, included in the present undertaking. The building will be erected chiefly of brick, with stone dressings to sills, tracery, copings, columns, corbels, and where else necessary; the external stonework being chiefly from the Codsall quarries, and the stone used internally from Corsham Down, near Bath, Grinton, near Shrewsbury, and Bromsgrove. The internal walling will be faced with pressed buff-coloured bricks, with moulded brick arches and strings. The nave is of six bays, and will be open-timbered, with framed and ribbed principals of Baltic fir, plastered and coloured between the rafters (except to the chancel, which will be boarded), and covered with Bangor Countess slates. The building will be of an early Gothic type of design, and funds being limited, the architect has, for effect, relied more upon good lines and dignified proportions than upon elaboration of details. The following are engaged upon it:—

Contractor, Mr. Fell, Leamington, the contract amount being 4,707l.; contractor's foreman, Mr. Jenkins; clerk of works, Mr. Amos Jones. The architect from whose drawings and under whose general directions the building is being carried out, is Mr. John Cotton.

**Cwm-dare.**—A few days since the Bishop of Llandaff attended at Cwm-dare for the purpose of opening St. Luke's Church, recently erected there on a site given by Mr. J. P. Gwynne-Holford, Buckland. The church, which was designed by Mr. Bruce Vaughan, architect, Cardiff, is in the Early English style, and is built of white bricks, with Bath stone dressings. The whole of the work has been carried out by Mr. Edward Lumley, of Merthyr Tydfil.

**Pembroke.**—The parish church of St. Michael, Pembroke, was re-opened on the 14th ult., after a complete re-erecting of the body of the church, which was rebuilt some eighty or ninety years ago and was about 40 ft. wide and covered with a tie-beam roof and flat plastered ceiling. Opportunity has been taken of the walls being down to create two nave of equal width, the north being a restoration of the fourteenth century one, the foundations of which were discovered in forming those of the arcade piers. A new chancel has been formed of its eastern portion. Two new porches have been built and other improvements effected, the total cost being 1,800l., the contractor being Mr. H. Edwards, of Milford, and the architect Mr. E. H. Lingin Barker, of Hereford.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

9,362, Window-sashes. W. S. Simpson.  
In order to allow of the top sash being lowered for ventilation, a rack handle is, by this invention, fitted so as to engage either with the top stile of the lower sash, or with projections formed for it. Provision is made for the employment of Young's "Hold-fast fastener" when the top sash is raised or lowered by means of cords.

9,608, Pneumatic Door Checks. G. F. Newman.  
The novelty of this invention consists in making one end of the back end of a door-check turn upon a side joint or an arm or rod working within the side bearing of a bracket lying out of the axial line of the barrel of the appliance.

9,750, Raising and Lowering Windows. J. C. Tait and T. W. Carlton.  
This invention has reference to sliding sash or windows, and the window rests upon a sliding bar or support, which depends upon two spring barrels or drums which are partly enclosed within the garnish rail of the door or window. An inwardly projecting piece or strip serves to exclude the draught and dust from the room or space closed by the window.

10,960, Material for Removing Old Paint. M. Benedictus (Brussels).  
The material which is the subject of this invention is laid on to woodwork by a brush or spatula. It is claimed that it has, in the course of an hour or so, such action that the paint can be readily sponged off with water, leaving the surface clean. It is a pasty substance in which caustic soda and caustic potash plays the principal part, and it is claimed that this composition will entirely supersede mechanical scraping or burning off paint.

11,087, Fireplaces and Boilers. W. Smith.  
The object of this invention is to construct a fireplace so as to receive a boiler which can readily be removed for repairs without inconveniently interfering with the use of the fireplace. The fireplace back is made of chair-like shape. When the boiler is placed in position, it is enclosed within the space made to receive it by a top front plate, and the circulating pipes are connected to the boiler in the usual way. When repairs are required, or in very frosty weather, the plates are removed, and the boiler uncoupled from the circulating pipes and taken out. The fireplace can then be used without the boiler, while it is being repaired or is out of its place.

3,803, Encaustic Tiles. F. J. Freugel.  
For the better production of artistic patterns, improvements in the successive processes of manufacture are introduced by this invention, which consists in making encaustic tiles in relief by first making a diaphanous intaglio of the design, producing a positive matrix therefrom, pressing the same in the face of the tile so as to produce a relief thereon, coating the tile with a layer of enamel or glaze; and lastly, burning or drying the said tile.

5,723, Building Materials from Glass. G. Falconier (Nyon, Switzerland).  
The idea of this invention is to use blocks of blown glass, built up as bricks, for facing walls of bath-rooms and other parts of dwellings. The bricks are

made like ordinary bottles, of different shapes and colours. It is claimed that they are light and cheap, and that the layer of air which they contain is a good preservative against either cold or heat.

NEW APPLICATIONS FOR PATENTS.

June 24.—8,981, C. Wilson, Unextractible Saws.—9,002, A. Bellchambers, Construction of Chandeliers.

 Architectural Association.—Visits to Sutton Place, near Guildford, and Loseley Park. (See advertisement on p. 1.)  
 Association of Municipal and Sanitary Engineers and Surveyors.—Annual Meeting at Leicester. (Third day.) Visits.

**Miscellaneous.**

**Surveyorship Appointment.**—On the 14th of last month Mr. Albert D. Grestorox was elected to the appointment of Assistant District Surveyor for the Northern Division of Manchester. Mr. Grestorox was assistant with Mr. John Price, Assoc. M. Inst. C.E., Engineer and Surveyor to the Toxteth Park Local Board, and with whom he served his pupillage. There were forty candidates.

**Association of Municipal and Sanitary Engineers and Surveyors.**

—The annual meeting of this Association is to be held in Leicester, on Thursday, Friday, and Saturday next, July 14th, 15th, and 16th. The business will begin with a council meeting in the committee-room, Town-hall, Leicester, followed by the annual meeting of members and reception by the Mayor. The President will deliver an address, and this will be followed by papers and discussions. The papers will include "Concrete Cement and Asphaltic Footways," by Mr. G. R. Strachan, A. Inst. C.E.; and "Refuse Destructors and their Results up to the present time," by Mr. C. Jones, A. Inst. C.E. In the afternoon members will visit various places of interest and works in the town, and the annual dinner will take place at the Masonic Hall, Halford-street, at 6.30 p.m. On Friday the members will again meet in the council-chamber for reading and discussion of the following papers:—"An Examination of the Experiments of Mr. W. F. Dohin, F.C.S., F.I.C., for the Metropolitan Board of Works on Sewage Treatment." By Mr. R. W. Peregrine Birch, M.I.C.E., F.G.S., &c.; "On Crematories," by Mr. W. Eassie, C.E.; "Description of Jennings' and Brewer's Automatic Sewage and Water Gauge," by Mr. W. Jennings. In the afternoon the members will visit various works recently executed and in progress in the borough, such as:—1. New Weir and Flood Basin, Freeman's Meadow, Ayleston-road; 2. New Gas Tanks now in progress, and Chemical Works recently completed, Ayleston-road Gas Works, under Mr. Colson, Gas Engineer and Manager. 3. New Building Estate, Spinney Hill. 4. Spinney Hill Park; 5. New Sewerage Works, Belgrave-road; 6. Abbey Park; 7. Open-air Swimming Bath at St. Margaret's Pasture; 8. Flood Works from North Lock to Branstone Gate. In the evening there will be a garden fête at Ashleigh, Knighton, the residence of His Worship the Mayor, Ald. Hart, J.P. The last day of the meeting, Saturday, July 16th, will be wholly occupied by visits to, among other places, the Victoria Stone Company's Works at Groby, where Mr. Griffiths, the lessee, will receive them; the Bradgate Reservoir and Pumping Station, by way of Bradgate Park and Ruins (by kind permission of Lady Stamford); the Mount Sorrel Granite Quarries; and the Barrow Hydraulic Lime Works of Messrs. John Ellis & Sons.

**Sales of Building Sites at Wanstead, Oxted, and Stevenage.**

—On Monday evening Messrs. Protheroe & Morris offered for sale at the Cuckfield Arms, High-street, Wanstead, 64 plots of building land, situate respectively in the main High road, Nightingale-lane, Cambridge Park-road, and Addison and Dangan roads. There was a very large number of buyers present, and there was a spirited competition for all the lots offered. Eight of the sites in the main road are intended for shops. They have frontages of 18 ft. by a depth of 100 ft., and were all sold at prices varying from £200 to £205 each, being rather more than £11 per ft. frontage. The plots in Nightingale-lane, intended for private houses, and having frontages of 19 ft. and depths of from 100 ft. to 109 ft., were also sold at from £65 to £70 per plot. The frontages of the plots in Cambridge-park-road, Addison-road, and Dangan-road, varied from 35 ft. to 16 ft., and depths of from 100 ft. to 160 ft., and, with a few exceptions, were all sold at from £48 to £60 each.—On Tuesday, Messrs. Baker & Sons submitted for sale at the Hoskins Arms Hotel, Oxted, 62 plots, being the second portion of the Barrow Green Estate at Oxted. Most of the plots offered have frontages of 18 ft. and 20 ft., and depths of about 120 ft., some larger plots having frontages of 40 and 50 ft., and depths of from 140 to 170 ft. They were all offered for unreserved sale, the smaller plots being sold at from £10 to £15 each, and the larger ones at from £20 to £28 each.—Last week Messrs. Baker also offered for sale 91 plots at Stevenage, near Hitchin, being the second portion of the Stevenage Station Estate. The sale took place in a marquee on the ground, when every plot was rapidly sold at from £9 to £16 each, the frontages varying from 14 ft. to 16 ft. each.

**Technical College, Finsbury.**—The third "Students' Conversations" will take place on Friday evening next, when, in addition to concerts, exhibitions, &c., Prof. Ayrton, F.R.S., and Prof. Meldola, F.R.S., will give popular lectures.

**Last Week's Disaster at Walworth.**

—Mr. Wyatt, the deputy coroner for East Surrey, held an inquiry at Walworth on the bodies of Charles Draper, aged 24, of 97, Orb-street, Walworth, and William Stimpson, of 14, Wood-street, Lambeth Walk, who were killed by the falling of a wall on Thursday morning in last week, at the premises of Mr. Richard Wood, iron and steel merchant, Brandon-street, Walworth. Mr. Wood spoke to hearing on the morning in question a rumbling of iron, and looking up he saw a stack falling, and the other stacks followed. The deceased man, Draper, who was an assistant employed by the firm, the deceased man Stimpson, who was a customer, and an employe named Shewell, were in the "walk." Building operations were going on at a hall adjoining his premises, but he had had no notice of them. He estimated the total weight of the iron that fell at 200 tons. Mr. George Lansdowne, District Surveyor, gave it as his opinion that the wall was knocked down by the iron falling. He did not think that the excavation for the collar in the adjoining premises had anything to do with the fall of the wall. The jury returned a verdict of "accidental death" in both cases.

**Lectern, Burton-on-Trent.**

—A brass eagle lectern has just been placed in Holy Trinity Church as a Jubilee gift from the maltsters of Burton. It consists of a very massive base and stem, the lower part of which is richly ornamented with tracery and supported by massive lion feet; the eagle is chased, and has been modelled from nature. The base bears the following inscription:—"For the Honour of the Word of God: presented by the Maltsters of Burton of Trent: in the Fiftieth year of the Reign of our Sovereign Lady Queen Victoria." It is from the design of Mr. J. O. Scott, and manufactured by T. Potter & Sons, who made a similar one a few years ago for Frant Church, Sussex.

**Approaching Sales.**

—A number of freehold properties, lying in a justly-favourite part of Surrey, will be sold at the Mart on the 13th of July current. The several lots are situated in the parishes of St. Mary and Holy Trinity, Guildford; in Godalming, Hascombe, Cranley, Ewhurst, Shalford, and Bramley, comprising an aggregate of more than 1,000 acres. These are divided into certain farms and homesteads, together with plantations and woodlands, in the valleys and along the hills in the neighbourhood of Godalming and Guildford. Some parcels of ground at Shalford, near to the common, will also be sold as building and accommodation lands.

**Wodnesbury.**

—Brunswick Park, which has just been completed at a cost of 6,000l. from the designs of Messrs. William Barron & Son, Elvaston Nurseries, Borrowash, Derby, has just been formally opened by the Mayor of Wodnesbury (Alderman Williams). Messrs. Barron were assisted in their design for the lodge by Mr. W. H. Radford, architect, of Nottingham. The park is about twenty-five acres in extent, and is finely undulated. A commanding mound 50 ft. in height, which was formerly a most unsightly pit-hill, has been very effectively treated. Two lakes have been constructed, and a cricket-ground, tennis-lawns, bowling-greens, bandstands, shelters, &c., provided.

**Sanitary Institute of Great Britain.**

—The anniversary meeting of this Institute will be held on Thursday next, July 14th, at three p.m., when the chair will be taken by Sir Douglas Galton, K.C.B., D.C.L., F.R.S., who will present the medals and certificates awarded to the exhibitors at the Exhibition held at York. An address will be delivered by Dr. G. V. Poore, entitled "The shortcomings of some modern methods of Sanitation." The annual dinner will be held the same evening at the Holborn Restaurant.

**Regenerative Gas Lamps.**

—Last week, Mr. Justice Kekewich was occupied for three days in trying an action which the Wenham Lamp Company, Limited, had brought against Messrs. May & Co., the manufacturers of the "Kegent regenerative lamp" for an infringement of their patent. Several scientific witnesses were called, and, in the result, his lordship granted the injunction applied for, with damages and costs against the defendants.

**Wanstead Flats.**

—Mainly by the exertions of Major Mackenzie, a notable alteration is effected in the area known as Wanstead Flats. A large gang of men have been employed in trenching and draining the ground, and in planting a vast number of trees.

**Obituary.**—Mr. Arthur Hayball, of Sheffield, died suddenly on the 27th of June. He was one of the early pupils of the Sheffield School of Design, since known as the "School of Art." Born in 1823, the son of a local builder, at a very early age he showed considerable aptitude in modelling and carving. In 1844 he became a pupil at the School of Design, and in 1851 he exhibited a carved cabinet, Italian in style, in the Great Exhibition in Hyde Park. This cabinet, which gained for the exhibitor a medal, was figured in the *Art Journal's* Illustrated Catalogue of the Exhibition. His works are very numerous, his altars, retables, stalls, pulpits, screens, &c., being scattered in churches all over England, Ireland, and Scotland. Mr. Harry Hems, of Exeter, was his first apprentice.

"**Wood Block Flooring.**"—Referring to the paragraph under the above heading, on p. 49 of our last issue, we are asked to say that the "Wood Block Flooring Co.," of which Mr. A. E. Geary is manager, is not a limited liability company, as inadvertently stated.

### Tanagra Terra Cottas.

#### THE SABOUROFF COLLECTION.\*

HE monumental work by Dr. Furtwängler on the great Sabouroff collection is at last complete. We say "at last," not with any idea of the slightest reflection on the energy and zeal of either editor or publisher,

whose labours have indeed been untiring, but because to eager subscribers the four years which have necessarily elapsed have seemed long. The Sabouroff collection has, as every one knows, ceased to exist. Before proceeding to consider in detail Dr. Furtwängler's book, it may be well to retrace briefly the history of this, perhaps the finest amateur collection of antiques that has ever been made. M. Sabouroff was for ten years Russian minister at Athens. He had every qualification for the work of a collector; keen love of art, highly-educated taste, ample means, and, last, but not least, unusual luck as to the time of his residence in Greece. The Tanagra excavations were just yielding their first and finest fruits, and it is in Tanagra terra cottas that the collection is richest; but, as we shall later see, M. Sabouroff was not carried away by the somewhat commonplace beauty of these too popular monuments; he diligently collected from every department and every period of ancient art, and his collection is unique in this, among other most important characteristics, that every single object contained in it has been found on actual Greek soil.

In 1880 M. Sabouroff came as ambassador to Berlin. It was a happy day for the Royal Museum there when he did. His collection was placed on view in the sculpture galleries and Antiquarium. In no museum of Europe could it have met with keener professional appreciation. It was, further, a happy day for M. Sabouroff, a day that secured the immortality of his name among archæologists, when he decided to have his collection published in a splendid illustrated work and to ask Dr. Furtwängler to write the text to accompany the plates. The work was at once put in hand. Dr. Furtwängler took down detailed descriptions of each monument, descriptions which form the basis of the present publication. The Photographic Society of Berlin undertook to photograph all the sculptures and a portion of

the terra cottas. These photographs were sent to Paris to be reproduced by the heliographic process of M. Dujardin. For the reproduction of all the vases and such of the terra cottas as did not come out satisfactorily by photography, recourse was had to the coloured facsimiles of M. Eichler, whose drawings, by their wonderful fidelity, have gained him such a great reputation with the German Archæological Institute. Dr. Furtwängler frankly owns in his preface that the process of lithography by which these plates have been reproduced has, in some cases, impaired their beauty.

The plates were already complete, and a portion of the text had appeared, when M. Sabouroff had to leave Berlin, and decided to sell his collection. The result of the sale we noted at the time. It was highly characteristic. To St. Petersburg went what may be called the show portion of the collection,—the unrivalled terra cottas, with their delicate shapes, brilliant colouring, and world-wide prestige. At Berlin remained the more sober, but to the archæological mind far more precious, portion of the collection, *i.e.*, the early grave reliefs, votive slabs, vases, fragments of sculpture, bronzes, &c. At the Hermitage last autumn we saw the terra cottas set out with all the pomp and circumstance of imperial plate-glass and velvet, and we are bound to say with excellent artistic effect, but with no catalogue by which the unlearned might get further than the delight of the eye. At Berlin, three weeks before, we saw the marbles, bronzes, vases, &c., each standing orderly in its own place, each already entered in the catalogue of the section to which it belongs, and in which it is fully described and approximately dated. Of the collection itself, as a collection, Dr. Furtwängler's book is now the sole surviving testimony. Never, perhaps, had a collection such good fortune: fortunate in the circumstance of its formation, it has not suffered dispersion into private hands, but has found shelter in two of the finest museums of Europe, while its unity is still preserved in a book which takes rank at once as a standard treatise. The plan of this book we must briefly summarise.

It consists of two volumes. The first volume contains the Berlin portion of the collection, *i.e.*, the sculptures and vases, and numbers seventy-five plates, each with accompanying text. The second is the St. Petersburg portion (with one exception, plate seventy-six), *i.e.*, the terra cottas. Now, it is obvious that if the book consisted of simply plates and commentary it would be difficult, if not impossible, satisfactorily to review it in detail; we could but note for agreement or controversy a scattered opinion here and there; but a book conceived after such a plan, excellent though

it might be, would not give expression to the peculiar bent of Dr. Furtwängler's genius: he is by nature quite incapable of remaining in the catalogue commentary stage; he must take a general view, and summarise the results. Accordingly, he has taken the bold step of prefacing each section with an introductory essay, in which he boldly expounds his own view on some of the most hotly-controverted points in all the domain of archæology. How bold, how almost premature, this proceeding is he is the first to own. He says (we quote from the French book,—"*Dans les introductions je me suis efforcé de traiter dans leur ensemble quelques questions particulièrement importantes qui se rattachent aux monuments de la Grèce en général. J'ai le sentiment d'avoir fait là un travail dont le moment n'était pas très heureusement choisi. La grande publication des étèles funéraires antiques, actuellement en préparation, permettra, je l'espère, sous peu de se prononcer, avec beaucoup plus de précision et de justesse sur plus d'un des points que j'ai touchés. De même après l'achèvement de la collection des terres cuites commencée par l'Institut Archéologique il sera possible plus tard de répondre plus complètement et mieux que je n'ai pu le faire aux questions que j'ai examinées. Je n'ai cependant pas cru devoir renoncer à publier ces études: en effet j'ai la conviction qu'il vaut mieux que chacun travaille dans la mesure où il peut s'en rendre maître, plutôt que d'attendre le moment où tous les matériaux seront soigneusement réunis su grand complet. Car puisque nous sommes encore à l'heureux âge des découvertes, il faut croire qu'à ce moment-là nous ne serons plus de ce monde. D'ailleurs tout travail fait sur les matériaux bruts qui s'accumulent facilite pour l'avenir la tâche des chercheurs. Le sort de tout essai est d'être remplacé par un autre essai: et plus les travaux se remplacent, rapidement, mieux cela vaut, quand même nous devrions ne jamais atteindre à la perfection, car tout travail scientifique n'est jamais qu'un essai." Dr. Furtwängler is clearly not the sort of scholar to be stifled under the accumulations of his own learning. It is easy to see that the toil of detailed individual description of each particular slab and terra cotta has been lightened by the gradual dawn of new light, fresh generalisation of the whole. With these growing convictions we must not, he says, demand that every portion of a work extending over four years should be rigidly consistent, "Il m'était d'ailleurs impossible de demeurer parfaitement identique à moi pendant ces quatre années." Dr. Furtwängler is not of the order of preachers who can with comfort, and even pride, preach the sermons of twenty years ago. It is, therefore, not to the description of any individual monument*

\* La Collection Sabouroff Monuments de l'Art Grec publiés par Adolphe Furtwängler. Deux volumes. Berlin Librairie: A. Asher & Cie. 1883-1887.

that we shall turn, but to the general conspectus of each section, and the new theories set forth.

We take the terra cottas first, as having the strongest hold on popular interest, though in the book they occupy the second volume.

The terra cottas come, as we have noted before, mainly from Tanagra. A few scattered instances were gleaned from Corinth, Hermione, Thisbe, Megara; fewer still,—just sufficient to point the contrast of certain differences of style,—from Asia Minor. Before we come to the interesting and much-disputed point as to the purpose of these Tanagra terra cottas, we must note that Dr. Furtwängler agrees with the majority of commentators in thinking that the bulk of the specimens are post-Alexandrian. A few there are of distinctly archaic work, a few also of the fifth and early fourth century, but the vast majority bear all the notes of the so-called Hellenistic style. This style is specially shown by its *restless* method of treating figures at rest. Even Praxiteles kept enough of the ancient manner about him to make his figures really stand still, *i.e.*, support the weight of the body on one leg and let the other fall behind, additional support being often imparted by the trunk of a tree or some such object. But about the time of Alexander the standing figures all begin to walk, and it is largely this that makes us feel, with so many of the Tanagra terra cottas, that they lack repose and dignity. Of course, many of them are lolling about in every lax variation of attitude, but those that are simply upright are all more or less on the march. Another Hellenistic note is the arrangement of the drapery. Everybody has noticed the unpleasantly tapered effect of many of the Tanagra figures,—the folds are thin and scant about the breast, girt very high, with no overhanging folds, and becoming ample and abundant as they flow downwards; in fact, the figures tend to the extinguisher shape, like a modern lady with a small old-fashioned crinoline. It is this also that pleases the modern eye, which, from long usage, prefers a woman to have the shape of a cone with a curve in the middle. It is this also which makes the eye, trained to the idealised reality of the Pheidian drapery, shrink from the tricks of modern mechanism. We ought to say that Dr. Furtwängler, with characteristic reserve, notes the Alexandrian manner, without commenting on its vulgarity. A third note of time is the shape of the fan held by so many of the Tanagra ladies. It is leaf-shaped, and quite other than the fan which appears on vases, even of the early fourth century B.C., whereas it is precisely identical with that which appears on Pompeian paintings; further, the pointed hat, so fashionable with the maidens of Tanagra, never appears on vases. Lastly, as regards style, the manner in which Eros is conceived is thorough post-Praxitelean; he is throughout the series the mischievous hoy of Alexandria.

Coming to external evidence, we have the important fact that painted vases are never found with this class of terra cottas: we may, therefore, safely conclude that the fashion of making these vases had ceased before this peculiar kind of terra cottas had set in. Finally, we have the evidence of the recently-discovered Myrina terra cottas. These are known to date from the third to the first century B.C. Among them are several types obviously copied from Tanagra fashions; we may, therefore, presume that the Tanagra terra cottas preceded those of Myrina, but by no very long interval. Next, the question arises, whence did the Tanagra figure-makers (*κορπύλασται*) draw their inspiration? Are we to look to their works for echoes of the great creations of sculpture or of painting? Not of sculpture, Dr. Furtwängler says emphatically. The *κορπύλασται* of Asia Minor loved to reproduce statues in miniature, and we have only to look at the Myrina specimens now on view in the Campana Gallery of the Louvre to see instances enough; but at Tanagra it was otherwise. We have no single instance of the reproduction of the motive of any known statue. The reason does not seem far to seek: the

age of Alexander was conspicuously an age of painters rather than of sculptors, it was by painting rather than sculpture that the minor arts of Beotia were naturally influenced. This theory is borne out by the fact that in the paintings of Pompeii, which are echoes of the Alexandrian manner, we recognise abundant analogies to the pose, drapery, gestures of the terra cottas. With the terra cottas of Asia Minor it is just as naturally quite the reverse. After Alexander had come the great renaissance of sculpture in the Pergamene and Rhodian schools, when painting was comparatively in abeyance. This theory of Dr. Furtwängler's at all events tends to assist us to a juster appreciation of Tanagra excellences, an appreciation which to some of us, whatever their wide popularity, is uphill work. Their brilliancy, their restlessness, their vivacity, all unpardonable from the plastic point of view, become at least explicable when they are regarded as the outcome of strong pictorial influence. It has been usual to point to these terra cottas as helping us to realise the painted sculpture of the time of Praxiteles. Dr. Furtwängler thinks, as we do, that this is a grave error: the colouring is laid on in a way essentially pictorial, and gives no idea of its plastic purport. Finally, he points out, and we think here all will agree with him, the marked contrasts between the Tanagra figures and the later specimens of Asia Minor, contrasts which well bear out his theory of the different influences to which they were subjected. Tanagra bears the palm in finish of form, in delicacy of facial expression, in brilliancy of colouring. In these respects Asia Minor terra cottas look by their side coarse and unfinished, but when it comes to variety of subject, to sculpturesque largeness of manner, to diversity and directness of movement, Asia Minor is easily first. Students can readily make the comparison for themselves if they consult side by side Dr. Furtwängler's present book and the work on the Myrina terra cottas which we recently reviewed.

We come to the vexed question of the purpose of these terra cottas, and we have now to pass beyond the limits of æsthetic criticism to the large field of human faith and sentiment, as expressed in funeral customs. And we may say at the outset that we think Dr. Furtwängler has spoken a "clear disposing word" on a most tangled and intricate subject,—a word the more satisfying because it takes up and embodies so much of past theories, is so constructed out of well-worn material, that its novelty is rather in disposition than invention. It would be hard to lay one's finger on a single sentence and say this is absolutely novel, and yet the whole weary mass of tedious opinion, scattered conjecture, has shaped itself into a live conviction never felt before,—a conviction stamped with the impress of a cogent personality.

The question of the precise signification of Tanagra and other terra cottas would have been less difficult of solution had we possessed full and exact information into the circumstances of their discovery. Such information is unhappily in many cases lacking just where it is most essential, for terra cottas far more than vases bear the impress of local workmanship and local cults. Happily, of this much we are sure; independent terra-cotta statuettes,—*i.e.*, as opposed to those which were merely plastic ornaments of vases,—are found exclusively in either tombs or sanctuaries. At Pompeii, they are, indeed, placed merely as ornaments in niches in private houses, but this was when they had become *articles de luxe*, and we have no evidence whatever that this was at any time a Greek custom. The only purpose served by terra cottas in daily domestic life was that of *toys for children*. The industry of doll-making was, we know, of considerable importance among the Greeks; from it all statuette-makers took their name of *κορπύλασται*; these *κορπύλασται* had their regular shops in the Agora, and there they themselves disposed to children of the dolls they had made. Later, when the little girls married, they offered their dolls as *anathemata* in the shrines of goddesses, notably of

Artemis and the nymphs. Dolls were also very naturally placed in the graves of children, for their use in the world below. So far all is clear and simple, but terra-cotta statuettes are found also in the graves of adults, and in these cases we must seek another explanation. Some archaeologists have thought that as the child had her dolls, so the grown-up person had her statuettes, in which he took æsthetic delight, and which as *objets d'art* were buried for his delectation in his tomb. This is a plausible view, and one likely to find acceptance with those who have a superficial acquaintance with the Greek mind, and a general notion that they were a people of artists sunk in æsthetic contemplation. No custom could be really more unlike them, more wholly un-Greek, more opposed to the wholly practical,—we might almost say utilitarian,—nature of their funeral customs. They hurried in their tombs whatever could be of use to the dead man: his arms, his clothes, his toilette utensils, his jewellery, it is true, but only because he could wear it; never, so far as we know, a single thing that could serve only for his contemplation. If objects of mere art had been wanted, why not stone statuettes, bronzes, pictures? Yet none of these appear.

It is otherwise as regards the gods. A large and less utilitarian view was taken of their needs and desires: an object of art, as such, could be offered to a god, though it was withheld from the tomb of a mortal; hence we must distinguish between the signification of terra cottas placed in sanctuaries and those in graves. In order to get at the meaning of these last, *i.e.*, of statuettes in the graves of adults which cannot be regarded as dolls, we must go back to the earliest instances, and trace the custom in its historical sequence. The secret of their purpose is sure to be found, if anywhere, in the earlier instances before the meaning became obscured by long tradition. Passing by Mycenæ, where the instances are so rare as to forbid generalisation, we turn to the tombs of Cyprus; there in large numbers are found rough figures curiously worked almost like small hoards representing a nude female goddess, no doubt the protectress of the dead. These tombs are probably anterior to Greek influence. In archaic Greek tombs we find also a female divinity, but heavily draped, and with sometimes a child either in the arms or on the shoulder. Sometimes she holds a flower or fruit in the hand, sometimes wears a high head-dress. She is the mother goddess in the simplest form, the emblem of fertility of life, and, by antithesis, of death,—a conception common to many mythologies. She was a sort of general conception of the goddess feminine, whom by giving her various attitudes it was easy to transform later into a Demeter, a Cybele, an Athene. Another category of statuettes coming from archaic Greek tombs are representations of human figures occupied in doing some work pleasing or useful to the dead man,—a man baking or grinding corn, obviously for the dead man's sustenance. One Tanagra figure represents the operation of hair-cutting; others are of slightly less utilitarian cast,—a woman with the crotala of tympanon, a woman lamenting; a hydrophoros, *i.e.*, a woman carrying the funeral water-jar; figures of maidens carrying funeral offerings of cakes and fruit, youths carrying coaks,—in fact, personifications either of offerings to the dead, or, of what is scarcely distinguishable, the cult of the infernal deities. Figures of horsemen and chariots represent the funeral procession; the figure of a man reposing, holding the cup and the lyre, is the image of the dead man who receives the offerings. Lastly comes a class of objects, curious to our notions, the burlesques and grotesques. Their purpose is obvious: the dead man must not only eat and drink, he must laugh. The sorrowing Demeter, angry and averse, was made propitious by the fooling of a servant; in like manner it was wise to keep the dead man, now a potent hero, in good humour,—hence the figures of comic monkeys and Sileni.

In the next period, that of transitional and early fine art, we find a tendency to specialisa-

tion. The mother goddess becomes individualised in various ways: with veil and talathus she becomes obviously Demeter, with agis Athene; a group of two goddesses who clasp each other's shoulders represents the divine mother and daughter, Demeter and Proserpine; but still many of the old traditional types maintain themselves side by side with the new. In the next period, that of late fine art, a marked difference is observable; the mother goddess with the attribute child is no longer a mere emblem of fertility, she is an actual mother with an actual child. Demeter and Proserpine have become two friendly maidens with scarcely a trace of the divine; the goddess with the pomegranate is a girl holding a flower, the youth bringing offerings to the tomb is a mere chancephobos from the palastra. In a word, the artist is busy with artistic motive, with pose and gesture, not with sacred meaning; by chance he adheres sometimes, indeed often, to the traditional type, but he is already forgetting what prompted these types. Such figures of everyday life are the large majority of the Tanagra terra cottas; and it seems at one time as though all trace of sacred intent must disappear, and the motives of terra-cottas degenerate into mere genre; but just at the critical moment, a reaction sets in. We find in the post-Alexandrian terra cottas a marked return to mythology; maidens begin to turn into Muses and nymphs and Bacchantes, youths into Eroses, Aphrodite begins to reign supreme, Eros and Psyche appear. The fact of this reaction, Dr. Furtwängler has noted and most ingeniously explained. It is a revival of the old cult of the dead, but with a difference. The dead man not haunting his tomb and requiring food and drink and an occasional coarse joke, but of the dead man in Elysium,—the dead man who chants in the chorus of the initiated, the beatified soul of a later faith to whom the Muses and Dionysos and the Love-gods must minister,—of such a faith we have abundant literary evidence, from Pindar and Aristophanes onwards. Thus from beginning to end we have a continuous tradition. Terra cottas buried in graves to satisfy the dead man's material need, and to consecrate his resting-place; later the same custom continued, but the artist, half forgetting his purpose in the human beauty of his work,—*"Il n'y a nullement rupture complète avec l'ancienne tradition; celle-ci perce, au contraire, encore sur beaucoup de points, elle est seulement transformée en ce sens que partout ont triomphé les exigences purement artistiques qui ne réclament que la beauté et plus encore l'élégance"*; and lastly, a return to the unreal, to the old presentation of the unseen, to the presentation of the life and function of the beatified.

Whatever added interest of detailed interpretation future investigation may add, we feel sure that Dr. Furtwängler has given us the right clue, and with this in our hand, we can wander among the motley throng of gods and goddesses, Sileni and Satyrs, Maenads and Muses, high-hatted fan-bearing maidens and matrons, feasting heroes, and hair-tearing Sirens, no longer, as before, puzzled and confused, but marvelling only at the genius of those who could people their tombs with a crowd of fancies so diverse and so gracious.

NOTES.

**T**HE question of St. Martin's Church has drawn three letters in the *Times*, from Mr. Butterfield, Mr. Beresford Hope, and the Rev. E. C. Hawkins, the Rector of St. Bride's, Fleet-street. Mr. Butterfield totally condemns the proposal shown in the Board of Works' model, referred to last week, for inserting flights of steps between the columns, and leaving them each on a separate pedestal; but he proposes instead, as what he fears is inevitable, the removal of the front rank of columns from the portico, thus throwing it and the steps back by one intercolumniation, and saving 12 ft. of road. In the opinion that the Board of Works' expedient will spoil the building we quite concur, as already observed; but that it should

be regarded as a lesser injury to the design to remove a whole colonnade and deprive the portico of half its depth and shadow, seems to us one of the oddest of paradoxes to come from an architect. Mr. Beresford Hope's letter is simply a warm protest, without any consideration of the logic of the case. Mr. Hawkins, who protests, adds, however, a reason,—to wit, that from his own frequent and special observation there is no block at the bottom of St. Martin's-lane, that the roadway is wide enough for the traffic, and the grievance is an imaginary one. Our observation coincides with that of Mr. Hawkins. We cannot remember to have observed any block or delay of the traffic there. What there may be some day is another question, of course. But for the present the Board of Works' desire to tamper with the façade of St. Martin's seems to us to have no better justification than that blind and superstitious reverence for a straight road by which official minds have been of late years so carried captive, that they would probably be ready to pull down St. Paul's if they could thereby shorten any street route by five minutes.

**MR. MUNDELLA'S** views as to the course it is desirable to adopt in the House of Commons with regard to the Railway and Canal Traffic Bill appear to be quite in accord with those of the Railway and Canal Traders' Association. The following resolution was unanimously adopted by the Council of the Association on the 6th inst.:—"That the Council strongly object to the proposed reference of the Railway and Canal Traffic Bill to a Select Committee, and they trust that the Government, by reasonable concessions to the views expressed on behalf of traders and agriculturists on the subjects of undue preference to foreign produce and the proposed allowance of station terminals, will provide for a discussion of the Bill in Committee of the whole House." When reviewing the prospects of the session last week, Mr. Smith said that it was impossible that the Government could give time for protracted debate on the second reading of this Bill, but that opportunity might be found towards the close of the session for discussing it in Committee. Mr. Mundella again took the opportunity of protesting against the Bill being sent to a Select Committee, and expressed a hope that the Government would give speedy facilities for its consideration in Committee of the whole House; whereupon Mr. Smith stated that this was one of the measures they desired to pass if there should be time for the adequate discussion of the different points arising in connexion with the subject. Several members have given notice of amendments bearing on the points alluded to in the resolution just quoted, and every effort will be made to render the measure practical and beneficial.

**MR. JOHN FIELD** has sent us the eighteenth annual number of his Analysis of Metropolitan, Suburban, and Provincial Gas Accounts,\* being that for the year 1886. Like its predecessors, this number is a model of clearness of arrangement and beauty of printing; the bird's-eye view which it gives of the working of thirty-four distinct gas enterprises is both instructive and satisfactory. The consumer gets his gas cheaper and cheaper, while the dividends on capital are not impaired, the growth of the business affording its proper increment of profit. The receipts for the sale of residuals continue to fall off, but, on the other hand, the price of coals is generally lower than in 1885. One of the comparisons that catch the eye in Mr. Field's tables shows how much more brilliantly the metropolis is lighted than are the great country towns. The three metropolitan gas companies have 2,766 miles of main, while nine great corporations have an aggregate of 2,633 miles. But, while the former undertakings have 104 consumers to the mile against 136 per mile for the latter, the former sell eight million cubic feet per mile, the latter little more than half that quantity.

\* London: Eden Fisher & Co., 59, Lombard-street.

Despite the greater brilliancy of the shops, the streets of the metropolis have twenty-five public lamps per mile of gas main, those of the provincial capitals only twenty.

**T**HE French papers announce that the Directors of the Panama Canal have resolved on inviting a fresh loan, which is put at 500,000 obligations at 440, or 56 per cent. discount. The successive liabilities already incurred by the Company are as follow:—

1881 Estimated cost of Canal complete	£24,000,000
1881 March. Company organised with constituted capital	12,000,000
1882 Loan at 5 per cent.	5,000,000
1883 Loan at 3 per cent.	12,000,000
1884 Loan at 4 per cent.	7,747,749
1886 Loan at 3 per cent.	18,352,089

Total responsibility..... £55,099,820  
The produce of the above securities, less 5½ per cent. commission, has been:—

Stock	£12,000,000
First loan	4,375,000
Second loan	6,840,000
Third loan	5,160,000
Fourth loan	8,059,499

Cash received... £36,434,499, showing a rebate of 43·4 per cent. on the loans. By the close of the present month we may expect to learn what proportion of the work of the canal has been executed for the money spent.

**F**ROM time to time rumours have been prevalent as to laxity of administration, not to say the existence of jobbery, in some departments at the head-quarters of the Metropolitan Board of Works in Spring-gardens. One of these rumours had reference to the circumstances under which the land upon which now stands the London Pavilion Music Hall was let. The matter, it seems, has been under the consideration of the Board for some time past, and at the meeting to be held this Friday, the 15th inst., the Works and General Purposes Committee of the Board will present a report,—

"Submitting, in pursuance of the resolution of the Board of the 3rd of December, 1886, a statement of the facts connected with the letting of the land at Piccadilly-circus:

Reporting the result of an investigation which the Committee has made into matters arising out of the above reference:

And stating that, in the opinion of the Committee, Mr. Robertson, of the Architect's Department, has been injudicious in allowing relatives to become tenants of the Board without informing the Board; but that the Committee does not find that there has been anything worthy of more severe censure."

We quote these sentences from the Board's agenda, but we trust the full report of the Committee will be published, and that the whole subject will be fully sifted at the meeting of the Board. The public interests, no less than the interests connected with building, demand that the proceedings of the Board and its officers should be beyond suspicion. We notice that some members of the Board are not inclined to take so lenient a view of Mr. Robertson's conduct as the Committee is disposed to do. Mr. Mossop has given notice that on the motion to agree with the report of the Committee he will move, as an amendment:—

"That, in view of the circumstances disclosed in the statement submitted by the Committee, the Board regrets to be unable to come to any other conclusion than that it is inexpedient that Mr. T. J. Robertson should remain in the Board's service; and that he be dismissed accordingly."

Mr. Price has also given notice of the following amendment:—

"That, in the opinion of the Board, the conduct of Mr. Robertson, as detailed in the report of the Works and General Purposes Committee, has been such as to render it undesirable that he should remain in the service of the Board."

**MR. FREDERIC HARRISON'S** paper on "The Sacredness of Ancient Buildings," read at the annual meeting of the Society for the Protection of Ancient Buildings, and now published in the current number of the *Contemporary Review*, is an eloquent and ably-written appeal on the conservative and reverential side of the question, as Mr. Harrison knows so well how to write. As

a statement of one side of the question nothing could be better, and Mr. Harrison even shows some glimmering of perception that there is another side, in his reference to the fact that the clergy regard a church as the place where their official work is done, and may, therefore, naturally be expected to wish to keep it in repair and even to make additions to it when necessary. Mr. Harrison, it is true, stigmatises this feeling as false and dangerous, "a dreadful temptation"; it is something, however, that a lecturer at the "Anti-Scrape Society" can even recognise the fact that it is a not unnatural feeling. It is odd, however, that a student of history like Mr. Harrison should appear quite blind to the fact that this worship of ancient buildings is entirely a recent development of feeling; that when architecture was a living interest, people would not scruple to remove any old building to put up one that suited them better; and that the blind worship of ancient buildings is really an indication of a country having lost confidence in its future, and clinging despairingly to the records of its past. We have read many passages in the article, however, with pleasure and sympathy; among others the following:—

"Statues and paintings are the creations of single Masters. Buildings are the collective growth of Ages. But for this very reason, what buildings lose in personal interest they gain in human interest, in social significance, in historical value. The multiplicity of parts in a great edifice, the vast range of its power over an infinite series of human souls, the sacrifices, the endurance, the concentration of efforts by which it was built up, and the countless generations of men who have contributed to its beauty or have been touched by its majesty, give it a collective human glory, which no statue or picture ever had,—a glory which is exceeded only by the great poems of the world. . . . A great national building is the product of a nation, and is the school of a nation. And for this reason it should stand next in reverence and love to the great poems of a nation. Next to the 'Iliad' and the 'Eriology' comes the Parthenon. Next to the 'Divine Comedy' the Duomo of Florence and its adjuncts. Next to Shakspeare and Milton, the Abbey."

IT is a pity that "A Sanitary Engineer" who wrote a letter to the *Times* on Saturday last on "the effects of continued drought on water supplies," should have thought it necessary to wind up an otherwise very useful and sensible letter by a sneer at a what he termed the "waste of water in foolish fountains." He referred especially to the fountains in Trafalgar-square, and there is no doubt they are poor concerns enough; but it was obvious that the "Sanitary Engineer's" complaint against them was not that they were poor fountains, but that they were fountains at all, and that in such an object as a fountain the sanitary engineering mind sees nothing but a waste of water. This is only one instance out of many of the manner in which, doubtless for some wise purpose, sanitary authorities and professors seem created usually without any sense of the beautiful. If the use of water in a fountain is foolish waste, the use of any material to produce mere beauty is foolish waste also. The fact is that a finely-designed and liberally-supplied fountain is one of the most beautiful additions that can be made to a public square or place; not only a beautiful object, but with the additional beauty of change and movement; as Browning has so finely described it in his allusion to the fountains before St. Peter's:—

"How these fountains play  
Growing up eternally,  
Each to a musical water-tree."

We should be very glad to see the fountains in Trafalgar-square removed to give place to better ones; but for any one to talk of fountains as a foolish waste of water is only a proof of his own insensibility to beautiful things. There is no more refreshing and cheering object in a crowded and heated city than the sight and sound of a fountain, and we only wish there were more and better ones in London than there are.

A NEW patent, taken out by Mr. T. C. T. Walrod, Associate Inst. C.E., for facilitating the connexion of house-drains with

sewers, deserves notice. The object is to simplify the making of connexions between house-drains and street-sewers by the use of a special junction-pipe or block, the mouth of which points upwards. When the sewer is being made pipes are carried up vertically in the sewer trench without any extra excavation from the junctions to within a foot or two of the surface of the road. All deep digging when the house connexions are laid in is thus avoided. The junctions may be made to act as junctions and traps in one. Of course, in some situations the difficulty of practically rendering this contrivance available would be that it would not always be possible to foresee where future junctions would be required. But in the case of a street or a building estate already laid out in lots, the points where connexion will be required can be pretty well localised, and under such circumstances the improvement seems calculated to be a very practical and useful one.

IN a pathetic article entitled the Disembowelling of Venice, headed with the text from Isaiah, "Who hath taken this counsel against Tyre, the crowning city, whose merchants are princes, whose traffickers are the honourable of the earth?" (xxiii. 8), Signor Giacomo Boni laments the vulgarisation of his native city at the hands of the municipality and bric-à-brac hunters. The palaces on the Grand Canal, he says, have been reduced to skeletons; the balconies, the window-openings, are lined with hotel signs or the placards of furnished apartments, or of dealers in antiquities, who, "after stripping our sumptuous palaces of their ceilings and cornices, and even the architraves of the doors, are replacing them with modern imitations. The South Kensington Museum has already some two or three hundred pieces of marvellous Venetian sculpture, among the rest the marble tops of our wells. Byzantine, Gothic, and Renaissance, adorned with ornaments and symbols, representing the art of eight centuries; the emblematical bas-reliefs which once adorned our ancient houses and the homes of Mediaeval art guilds; balconies, and complete windows with their dressings. In a short time the very skeletons of these palaces will have been carried off piecemeal and rebuilt in some English park, or perhaps between a coal-yard and a tannery in Chicago; the Grand Canal will be filled up and the palaces replaced by five-storied houses with iron roofs, cement cornices, cast-iron balconies, pale yellow plaster, and red railings. The apse of the church of the Frari will be rebuilt, and an inscription upon it will record that the bricks were made on purpose, and are of the same size as those used in the fourteenth century." This forecast is, perhaps, not in all respects so improbable as it at first appears, and the Venetians will do well to consider that in divesting their beautiful city of all that makes it interesting they are in truth killing the goose with the golden eggs.

DURING this summer the old seat of the Fane family at Fulbeck, Lincolnshire, will be sold at auction. The land lies in Loveden Wapentake, ten miles distant from Grantham and Lincoln, and includes a portion of the well-known Heath sheep range. The manor, together with its six farms of arable and grazing land, extends over 1,500 acres. The Fanes settled here in the early years of the seventeenth century. The parish stands on Cliff-row, an acclivity close to the ancient Ermine Way. Also to be sold is Wrotham Hill Park, an estate of, say, 800 acres, on the high chalk hills between Sevenoaks and Maidstone, near to Weobley Station. Wrotham is of considerable antiquity, many remains having been dug up here which point to British and Roman settlements. Some ruins of the archbishop's palace may be found adjacent to St. George's parish church. Built in the Early English and later styles, the church was founded by William of Wrotham, a governor of Dover Castle temp. Henry II. His supposed tomb and coffin were discovered at the restoration of the fabric thirty years ago.

THE final service at the French Protestant Church, St. Martin's-le-Grand, was held on Sunday, May 29th last. Pending the building of another place of worship, the congregation will meet for a while in the Athenæum Hall, Tottenham Court-road. The demolition of the church, and of some of the neighbouring property, is now in progress, by way of clearing a site for the enlargement of the General Post Office. The Great Northern Railway Depot is removed from the Bull and Mouth to new premises in Bread-street, Cheapside; and Bull and Mouth-street will be eventually built over. The cost of the new departmental building is calculated at 125,000*l.*, exclusive of the ground and compensation awards. In the Parliamentary estimates now before the House of Commons an aggregate of 388,000*l.* is scheduled in respect of various post-office buildings throughout the country.

THE long-continued sunshine of this summer has naturally called the attention of householders to outside or sun blinds. Those who are well off can afford to go to the expense of putting them up, but even in well-appointed houses they are confined to a few rooms. In small houses ineffectual attempts are made to shut out the heat by drawing down Venetian or other inside blinds. But they have next to none of the effect of an outside covering. In fact, Venetian blinds inside a window are some of the foolish things of the modern builder; if they are placed outside they are in their proper place. The most effectual of all shields against the sun and heat are outside wooden shutters, which ought to be affixed to every country-house, as they keep out the cold in winter and the heat in summer. Those, however, whether being in town or country, who cannot afford regular outside blinds, can do much to keep out the sun and heat by hanging a piece of canvas or sacking over the windows from the outside. It can be hung to a couple of nails above the window, and kept in its place by a bit of cord tied to a nail below it.

THE large Agricultural Hall at Islington, not to be outdone by its larger rival at Kensington with its "Olympia," has been opened under the title of "Arcadia," but though an abundance of flags and streamers, plenty of flowers and shrubs, with Chinese lanterns and coloured gas-lamps by the thousand, have done much to brighten the interior aspect of the hall, it is the Agricultural Hall still. In various parts of the Hall are erected certain wooden platforms, approached by devious inclines as well as by steps. These platforms are in some instances faced or backed by some scene-painter's architecture, à la "Old London." As a matter concerning the public safety, we should like to know whether the erection of the platforms and steps referred to has been supervised by any responsible architect or surveyor? The handrails when we visited the hall on Monday last were (some of them) very shaky, while the steps (particularly those at the back of the arches at the Islington Green end of the hall) struck us as being very slight in construction, and quite inadequate to bear the "live loads" that may come upon them on crowded days. It will be well, we think, to look to this before next Bank Holiday, August 1, when no doubt there will be a very large number of visitors to "Arcadia." We cannot say much for the entertainment. What we saw of it was of the ordinary music-hall "variety" type, with a great deal of dangerous gymnastics and profligate contortion of the human body. A feature of the place is the large water-fall at the Liverpool-road end of the hall, immediately under the clock. This has been built by Mr. Dick Radclyffe at a cost, it is stated, of 600*l.* The water for the "fall" is pumped into two large tanks, one on the gallery floor and one above it just below the level of the clock. The effect is very good.

THE Summer Exhibition of water-colours and sketches at the Dudley Gallery is not very much to speak of, but contains some pretty

things. Mr. Arthur Severn has one of his brilliant experiments in colour, "Misty Morning at Sea" (49), with a red sunrise and golden reflections on the waves, represented with a brilliancy which is startling at first sight, but which improves on acquaintance. Architectural subjects are rather numerous. Mr. Harry Goodwin contributes a good study of Boston Tower and Lichfield, and Mr. Medlycott takes Rouen Cathedral and Westminster; in the latter, however (147), the proportions of the Victoria Tower are too broad and stunted. Mr. Newton Bennett's Thames scenes (64, 71), are very delicate and refined, if a little wanting in force, and Mr. R. A. K. Marshall, whose name we do not remember, has shown some charming work, minute in detail without losing atmospheric effect, in "Cottages near Chirk" (184) and "The Valley of the Test" (205). Mr. Waterford's "Our Lord among the Doctors in the Temple" (28) would he well suited for a decorative work in mosaic or fresco, for which it is, perhaps, intended. Among other drawings worth picking out are a still-life subject, a study of old hooks (22), by Mr. Block; "The Edge of the Common" (37), by Mr. P. Ghent, a landscape of much beauty; Mr. Howard Gaye's "Stokesay Castle" (113), a good architectural subject; "The Last Glean of Sunlight" (137), by Mr. Hiscox,—rather staid, but powerful; "The Sand-pit" (220), by Mr. Claude Hayes, an unusual drawing in tone and treatment, certainly fine, but looking rather like an attempt to imitate an old water-colour of the pre-chromatic period; Mr. Danford's "A Field Pool" (246), a study of twilight effect; Mr. Franz's "Twilight on the Tiber" (200); Mr. Arthur Severn's "Fir Island, Coniston" (194); and Mr. Dixey's "An East Coast Village" (77), seen dark against the sky from flat marshy land behind it. Mr. J. Knight's large drawing, "The Rock above Lake Idwal" (177), is a grandly-drawn subject, but wholly unreal in colour; the artist's own inventions in colour have run away with him.

PASSING through the Inner Temple the other day, we were moved to turn aside for a few yards to look upon Goldsmith's tomb, which, as many of our readers know, is just to the north of the eastern end of the Temple Church, but outside the churchyard railings, in the midst of a somewhat neglected space or court at present partly used as a stone-yard. The tomb consists of a simple coped slab, inscribed on one side with the words "Here lies Oliver Goldsmith," and on the other with the dates of his birth and death. The coped slab is quite unprotected, and the inscriptions are fast becoming obliterated,—partly by the action of the weather, but partly also (judging from certain scratches on the stone) by the feet of light-hearted juveniles, who perhaps find the tomb a convenient coign of vantage for playing at "I'm the King of the Castle." We wonder that something has not long since been done to protect and keep in decent order the grave of the author of "The Vicar of Wakefield."

AT Messrs. Bellman & Ivey's Gallery in Piccadilly is a small but interesting collection of sculpture, including a bronze reduction of the very fine statue of "Diana," by M. Falguère, which was in this year's Salon,—one of the most spirited ideals of the goddess of the chase that has been seen. A full-size bronze of the bust is also there; the head is of very original type. Among other interesting works are M. La Vingre's terra-cotta statuette, "At the Fountain," and some spirited little clay sketches by Mr. Alfred Drury.

THE Times has not yet, after the lapse of a week, discovered its blunder about "Mr. Butterworth," in spite of having had a letter with the right name in its own columns in the interim. On Wednesday it printed a letter from Mr. Butterfield, signed with his name, but on Thursday the reporter of the case of the Louth Chapel, in replying to a letter of Mr. Freeman's, thinks better of it, and goes back to "Mr. Butterworth" again. Mr. Freeman, in writing on the subject, said, "he could

not find Mr. Butterworth's evidence" in the records of the Fitzalan Chantry case. No wonder.

A VISIT TO THE FORTH BRIDGE.

IN the *Builder* for January 2, 1886, we gave a good many constructional details of the Forth Bridge, as well as a small view of it as it would appear when complete, and an account of the works up to that date. More recently we have published (*Builder*, April 23, 1887) the very full and technical account of the work on the foundations, furnished by Mr. Middleton, the contractor's engineer during that period of the works, to the Civil and Mechanical Engineers' Society. At a future stage of the work we shall probably be able to give further technical details. But these, though of the most value to practical men, do little to give an idea of the real scale of the work which is being carried on at the Forth, and of the bold nature of the undertaking. Mr. Baker's lecture at the Royal Institution a few weeks back, to which we referred, did something, aided by the lantern, to convey an idea of the scale of the bridge to those who have not seen it; but only a visit to the work itself can enable any one to realise the actual bigness of it. Mr. Baker's photographs, however,

work, after being first drawn to scale on paper, being set out on this floor full-size, and very complicated work some of this detailing must be, considering the number of steel plates of which each portion is built and the accurate fitting required at junctions. The moulding-loft contained, at the time of our visit, an "architectural" model also, of the arch which is to crown the last stone pier before the steel portion of the bridge commences, and through which the railway is to run. This arch, which has to come on the top of the last stone pier shown in our first sketch, is a little larger than the Marble Arch; not, it must be admitted, equal to that in design, but more suitable to the situation. The other sheds are filled with machines for dealing with mild steel in various ways; planing and trimming machines, crawling slowly backwards and forwards along the edge of a plate; circular saws, moving with what seems very slow revolution, but which has been found to be the most effectual in shearing through soft steel; hydraulic presses for giving the requisite curve to the plates, which are placed on a concave bed of the required curve, a convex "squeezer" of the same curve coming down on the plate and settling the job in a moment. Everything is slung and moved by hydraulic cranes; there is no lifting of heavy weights by manual labour. Outside the sheds a travelling drilling machine

Fig. 1.—Approach to the Bridge from the Queensferry Side.

stimulated the imagination so far as to lead us to the conclusion that life was not worth living without seeing the Forth Bridge, and accordingly we found ourselves not very long afterwards disembarking at the mean-looking little roadside station of Dalmeny, about fifty minutes' walk from Edinburgh and twenty minutes' walk from the head of the bridge works. A few notes of impressions on the spot may assist others who have not been there to understand the real nature of the work, which is unquestionably the boldest engineering undertaking of which we have any record.

Walking from the station, we come first to the workshop for preparing the various portions of the structure; for everything is set out and made on shore, the plates being afterwards numbered, taken to pieces, to be put together again *in situ*. These work-yards extend for a considerable distance along the southern bank of the Forth, near to, but not close on, the shore, except at the point where the bridge head is reached. At the entrance to the work-yard is the house for the resident staff, and for the accommodation of the chief engineers on their frequent visits. The illusion in regard to scale which meets one throughout the work, and is only gradually dissipated, begins in the work-yards, for the extent of these is so great and the constructions dealt with generally are so large, that it is difficult to realise at first that the portion of one of the large angle tubes for the main piers, which is lying along after being built up, is really 12 ft. in diameter. The upper story of one of the sheds is laid out as an immense drawing loft, all the details of the iron

is working on the plate of a portion of one of the tubes, holes being drilled by hard steel drills working under a jet of water directed on the point; these cut out the mild steel in long thin spiral ribands which strew the ground beneath. In other places the operation of riveting up by a hydraulic riveter was going on; "pretty," as Pepys would have said, to see the red-hot nut of the bolt, at one stroke of the riveter, crushed, cooled, and polished into a smooth semicircular boss, giving a remarkably neat finish to the portion of the riveting which has been thus worked. Hydraulic riveting, however, cannot be applied in all situations.

Going down on to the road skirting the shore, we proceed towards the first, or Queensferry pier, along the temporary bridge and road which have been formed by the side of the stone piers carrying the shore ends of the viaduct. The appearance of things from this point of view is indicated in the first of the sketches appended. On the left are the lofty granite piers carrying the viaduct, and which in themselves constitute what would once have been thought a great engineering work, but which is completely dwarfed by the magnitude of the cantilever portion of the bridge. This dwarfing, however, is not apparent from this point of view. The steel pier does not show its real size any more in the reality than in our sketch; there is nothing to give scale to it, and in perspective it appears close to the last of the stone piers. It is difficult to realise from this point that the structure beyond, now wanting only the top member or crosshead, is 350 ft. high, and that each of the tubes shown is 12 ft.

diameter. (The tubes are a little too thick in proportion in the sketch.) The cylindrical excrescences clinging round the top of each tube are the cages invented by Mr. Arrol, the contractor, for the safety of the men. They are built with vertical bars, with the spaces between filled in with wire netting. The men work inside this, building up the plates, and as the tubular structure progresses, the cage is pushed up in advance of it; so that the tube forms to a great extent its own scaffolding.

Proceeding till we got under the pier, we at last realise the size of the thing we have come to look at. The space included within the four angle piers is quite a large area, crammed, of course, with all the debris of builders' operations, while here and there a red flag warns people off places which are dangerous, owing to the chance of falling bodies from work going on above. The angle tubes go up like leaning towers into the air. Above there is a complicated mass of wind-braces, scaffolding, and tackle, which obstructs the view to the top, and

this sketch are seen two of Mr. Arrol's "cages" clinging round the tubes. Arrived at the top, we find ourselves on a broad scaffolding covering nearly all the space included between the members of the pier; from this there is a glorious view over the Firth and the adjoining country; and, which is more to the purpose, from this point we can realise better than anywhere else the nature of the undertaking. Let the visitor bear in mind that he is here 350 ft. above sea level, on the top of a construction of immense proportions and enormous weight; let him look out at the next pier, the Inchgarvie pier, a third of a mile off; and let him reflect that from the erection he stands on, a construction equally massive and heavy in its parts, and nearly twice as long, is to be built out horizontally into mid-air over the sea, without any possibility of scaffolding, by men working in squirrel cages stuck on to the end of the tubes, and pushed on as the tubes are built, and he will probably agree with us that this is an engineering project calling not only

complete and stable in itself, and the next section can be proceeded with in the same manner. The temporary supports for the lower members are in themselves of a tolerably permanent kind, and at the time of our visit temporary "temporary" slings were being adjusted for this purpose, which, it may be mentioned, were formed from some of the links of Old Hammersmith Bridge, which have come in very usefully, and seem to be in very good condition.

We asked one question at headquarters which we thought a crucial one, and the answer to which we promised to keep a secret, if desired, viz., how long do the engineers, in their inner conscience, believe that an enormous iron structure like that, with such an outer and inner area of plate surface, will last? Mr. Baker, however, has every faith in it from that point of view; he is of opinion that, properly looked after, there is no reason why it should not stand for 500 years. Provision has been made for getting at every part of it; there are

Fig. 2.—Half-way up the Queensferry Pier, showing Main Angle Tube and Cross Braces.

Fig. 3.—Near the Top of the Queensferry Pier, looking down on Masonry Pier and Viaduct.

prevents one taking in the whole. We can go up very expeditiously, however, in one of the two travelling-cages which work with guides on a couple of steel ropes stretched till they are rigid; the cage being drawn up a rope wound by a steam-engine below, and fitted with a patent clip warranted to hold on the guide-ropes if the suspender breaks. The ascent between these vast bones, so to speak, of the structure, is curious and picturesque in effect. In sketches 2 and 3 we give reminiscences of the effect of the structure as seen from two points on the temporary ladders fixed on the wind bracing. They are both looking towards the Queensferry side of the Firth, and will perhaps give some idea of the look of things up here, and the appearance of these great tubular girders soaring up into the air. No. 2 is taken just at the half-way point, where the great cross-braces at the side intersect; No. 3 is about 60 ft. or 70 ft. perhaps from the top, and in this is shown the masonry pier before mentioned, far below, and reduced to very secondary position. At the upper part of

for scientific knowledge and experience, but for no little courage, on the part both of engineer and artisans. A vivid idea is given of the nature of this part of the work by the appearance of the portions of lower members of the cantilevers already finished, as shown in sketch 4, taken from the top of one of the four circular granite piers which form the base of the steel pier. Here the portion of the cantilever tube which is completed is shown projecting out into mid-air like the bowsprit of a large ship, with the workmen's cage at the end of it; and in that way and by that means it is to be carried on. (At the time of the sketch being taken the cage was not being used, and the netting had been removed, leaving only the frame-work.) The cantilevers at opposite sides of the main pier are, of course, carried on simultaneously, in order to balance each other, and the plan is to commence with the lower member of the cantilever; then to sling it up temporarily and execute an equal length of the top member and the cross braces which connect the two; this section of the cantilever will then be

manholes in every tube and in the diaphragms throughout them, and steel ladders formed in the interior of the tubes. It is to be hoped air inlets have been provided also; it would be rather a stupid kind of death to be stifled at the top or bottom of a long tube.

The cantilevers are only just commenced, and there is no doubt this is the most difficult and anxious part of the work; but we anticipate its successful accomplishment.

It will, no doubt, be objected by some that the bridge is a very ugly erection; that was our own impression the first time we saw a sketch of the design. But the fact is that you do not feel this after seeing the work itself. It is so immense that it fascinates by its very size, and so difficult an undertaking that one feels that decorative considerations would be out of place; the problem is to do it at all. Every architect who is in the way of doing so should see this extraordinary work. He may not think it beautiful, but he will probably come away with the conviction that Gothic vaults were not such very big things after all.

Fig. 4.—The lower member of the Cantilever starting on its journey; Inchgarvie Pier in the distance.

NOTES FROM DURHAM AND AUCKLAND CASTLE.

BISHOP HATFIELD'S magnificent hall at Durham Castle, now the Dining-hall of the University, has recently received the much-needed addition of an oak screen and gallery at the lower end, from the designs of Mr. C. Hodgson Fowler. The rich Renaissance screen erected by Bishop Cosin, during his magnificent tenure of the See (1669-1674), was ruthlessly swept away in 1849, under the iconoclastic rule of Dean Waddington and Archdeacon Thorp, together with the sumptuous mantelpiece and panelling which hid the bareness of the walls. The whole was a gorgeous specimen of its style, with Ionic terms, broken pediments, arabesque escutcheons, and swags of foliage, on every account deserving preservation. Mr. Fowler has, very wisely, not attempted to reproduce Cosin's work, but has formed his design in accordance with the best examples of medieval hall-screens, the traditional arrangements of which he has carefully followed. The centre is solid, with a sideboard below, and a square projection rising from a curved soffit in the gallery above, and a wide two-leaved door on either side. The front of the gallery and the centre and flanks of the screen are covered with well-designed Perpendicular panelling, in which a little greater depth of moulding and vigour of outline would have given more effectiveness to an excellent work.

The picturesque Ionic porch with which Cosin masked Bishop Hatfield's fourteenth-century arched doorway, from the friable nature of the stone, has gradually fallen into a state of almost dangerous decay. All the four columns are much weather-worn, and one is reduced to such exceeding tenuity that it reminds one of a stick of barley-sugar which a child has vigorously sucked. It is to be hoped that when the needed restoration takes place the old mischievous principle of restoring away Renaissance work, because it is not Gothic, which has swept away so many beautiful and interesting features in the Castle as well as in the Cathedral, will not be revived, but that though Cosin's wood-work is gone,—probably burnt,—Cosin's porch will be allowed still to bear witness to the princely liberality of that great "prince palatine," and that the repair may be done by some sympathetic hand.

The windows of Bishop Tunstall's late but

charming little chapel in the Castle cry out loudly for stained glass. The modern panelled desk-fronts assort but poorly, either in colour or design, with the gorgeously rich bench-ends with heavy poppy-heads in black oak bearing Bishop Rutiland's arms (1509-1523), brought from Auckland Castle, or with Cosin's screen and gallery. The walls of the sanctuary are lined with some good examples of "intarsiatara" panelling representing Apostles and Evangelists brought from the cathedral, or some other sacred building.

The original three-aisled Norman chapel of Bishop Walcher (1081-1096), with its tall cylindrical pillars bearing up its vaulted roof, its herring-bone pavement, and raised platform for the three altars, one at the end of each aisle, still serves as the thoroughfare to Salvin's Kerp. It is to be wished that so interesting a building were better cared for, and treated with greater reverence.

The newly-erected Lecture-rooms and Examination-halls on the Palace green, both without and within, powerfully recall a second-rate Board school. A more bald uninteresting work we have seldom seen. With such excellent architectural skill at their doors the University authorities have little excuse for giving an illustration of the old saying, "Go further and fare worse." The cold blue slates are so offensive to the eye, and render the lecture-rooms so intolerably hot, that it has been resolved to exchange them for grey Stonesfield slates.

The Chapel of Auckland Castle is receiving a costly process of adornment, at the expense of the present Bishop, whose munificence is as remarkable as his learning, under the general superintendence of Mr. Hodgson Fowler. The total cost will not be much under 4,000. The truth of the tale that this chapel was originally the hall of the Episcopal palace, and was converted to its present use by Bishop Cosin, the former chapels,—there were originally two, one over the other,—having been pulled down by Sir Arthur Haselrigge to erect his mansion, which in its turn was demolished by Cosin, indignant at the sacrilege, which had been doubted by some, on the ground of the ecclesiastical character of the building, and its proper orientation, has been fully substantiated during the progress of the repairs. On lowering the ground at the east end the three archways opening respectively to the buttery, kitchen,

and pantry, which are so certain a mark of a Mediaeval hall, were discovered built up in the wall, as well as the putlog-holes of the gallery floor, traces of the outside staircase to which, and the door leading to it, are to be seen in the south wall. Though Cosin is accredited with having built the chapel, he did no more than restore a half-ruined building, putting in new windows, and erecting a lofty clearstory and panelled ceiling. The stalls and other furniture, of great richness, are also his work. The arcade of four bays, the arches supported by the "divers pillars of black marble," described by Leland, in "the great hall" (the same Frosterley marble which gives its character to the chapel of Nine Altars in Durham Cathedral) is of Early English date, but not all of one period, the westernmost pier having the square abacus of the Transitional style. The wall-shafts of the original roof at a lower level, rendered purposeless by the erection of Cosin's lofty clearstory, have had meaning given to them by being made to support angels, with expanded wings, carved in oak.

The chief new feature in the chapel is the lofty panelled oak reredos, in three compartments and two tiers, designed by Mr. Fowler, containing very well executed groups and figures in alto-relievo, the work of Belgian artists. The principal subject is the Crucifixion, occupying the central panel in the upper tier. The other panels contain statues of apostles, martyrs, and local Northumbrian saints,—St. Oswald, St. Hilda, St. Cuthbert, &c. The whole finishes with a projecting concave cornice. Below the reredos, the retable of the altar is formed by a long panel of polished brass, set in Frosterley marble, exhibiting in ten arched compartments the various instruments of the Passion in coloured enamel. The wings of the altar are of hangings of rich stuffs of subdued hues. The three eastern windows contain excellent glass of very pleasing, calm tones, the work of Messrs. Burlison & Grylls, who are also responsible for some other parts of the decoration. The whole of the work of the chapel displays an exquisite feeling for colour, which we have so often to feel the want of in more gorgeous and pretensions works. At each angle of the sacrum stands a tall brass candlestick on a circular Frosterley marble base. A portion of a black marble altar-slab, retaining two of its five crosses, rescued from base uses in the kitchen, has been appropriately converted into a credence-table. In addition to the ordinary choir-stalls, Cosin erected a range of clubbed stalls along the aisle wall on either side, below the windows, quite up to the east end. The bare space above these has been relieved by a dull-green dado, bearing the arms of the bishops in their proper tinctures. The aisle windows, three on each side, which are now disfigured by a travestie of Cosin's "fret" in cold blue or white glass (the tinctures being really "or on azure"), are to be filled with new glass illustrative of the history of the see of Durham by the same artists who have so successfully executed the east windows. A new canopied stall for the Bishop in the return at the west end shows how fully Mr. Fowler has entered into the feeling of Cosin's Renaissance work. Nothing has as yet been done to the ceiling, which is flat and of panelled wood. It would be improved by being relieved with some gilding and a little colour. The good taste which has ruled the whole work is a guarantee against any of the gaudiness which so often offends us in modern attempts at polychrome.

At Durham Cathedral nothing has been done calling for remark since the restoration of the choir by the late Sir Gilbert Scott, beyond the addition of some stained-glass windows, reflecting great credit on Messrs. Clayton & Bell, by whom the whole series has been executed. Few cathedrals, if any, have been equally fortunate in having all their principal windows filled with glass by the same artists, and on one plan. All the windows are good, but the "Te Deum" window on the south transept and the "Joseph" window in the Chapel of Nine Altars deserve special commendation.

It is to be regretted that the niches of the unique tabernacled Neville-screen behind the altar still remain vacant. Some little while since there was a proposition to restore the statue which augured well, but though energetically advocated in influential quarters, the decided opposition of some and the lukewarm support of others have, though we hope only for a brief period, suspended the work.

The altar itself has received an appropriate ornament in the shape of a gilt metal altar-cross, designed by Mr. J. B. Clayton, of the firm of Clayton & Bell, and executed by Messrs. Barkentin & Krall. It is the offering of Mrs. Lake, the wife of the present dean, and nine other ladies of the diocese. It is a costly and elaborate work of art, on which the designer has evidently spent thought and pains. But owing to the effect of a full-sized model not having been previously tried, it fails to fill its place adequately. Nothing, we may say, is more deceptive than the dimensions of a large building, and it is impossible for the most accurate eye to carry away its proportions as to be sure that any new piece of furniture will be in harmony with its surroundings unless an actual experiment is first made. As it is, the Durban cross looks dwarfish,—though not so painfully diminutive as the still more costly altar-cross at Ely,—and for want of being an inch or two higher, the horizontal bar falls in the same line with a string-course of the reredos, and loses distinctness. Common sense so plainly dictates that the effect of such a design should be proved before it is executed that we are surprised that this preliminary step is not more often taken. A bit of planking, or even a piece of mill-board, cut to shape, would be enough to prevent an irremediable error. Mr. Clayton, in his design, has evidently desired to avoid the commonplace, and to make a new departure in altar-crosses. His wish is commendable, but the way he has carried it out is hardly happy. Instead of the usual circular or polygonal base of equal sides, his cross rises on an elongated octagonal podium supporting a little bit of brass panel work pierced with four traceried windows, and terminating in as many pinnacles. The ordinary treatment is to us more pleasing. The lower part of the stem is formed of a cluster of shafts supporting a bold projecting cornice, from which the cross proper rises, connected with the cornice by bold spiral sprays of foliage. The arms, which are not equal, the lower being the longer, end in square medallions set round with "hobs" of rock crystal, which might be well spared, and containing the evangelistic symbols on white metal. The centre is formed by a large rock crystal surrounded with red carnelians. The stem is crocketed, giving it an nnhappy resemblance to a fish's backbone, or a sword-fish's snout. The cross would have been more effective if the design had been simpler and its proportions more harmonious. The execution is good. Bishop Cosin's stately Renaissance silver candlesticks are to be brought into keeping with the cross by gilding. The ends of the retable now showing bear hints of deal require concealing by an extension of the hangings.

### Illustrations.

#### COMPETITIVE DESIGNS FOR THE IMPERIAL INSTITUTE.

**S**INCE last week we have obtained, after a great deal more delay and difficulty than there ought to have been about so simple a matter, the loan of the principal drawings from among the Imperial Institute designs, in order to have them photographed under more favourable conditions. We therefore give the perspective of the fine design by Messrs. Aston Webb and Ingress Bell over again, to a larger size and as an extra illustration, in order to do better justice to it. We also here subjoin the following remarks by the authors on their design, which were sent by them too late for publication in our last:—

"In preparing this design it was considered of first importance to impart as far as possible a monumental character to the building, and by displaying the museum galleries, with a central block for the Institute offices, some expression would be given to the various uses of the building; and in order to prominently connect it with the Queen's reign the main tower was detached and devoted entirely as a personal memorial of the sovereign, in the same way as the Albert Memorial is in Hyde Park.

A round-arch style was selected as giving increased dignity to the buildings, and delicacy and preciousness of enrichment were aimed at by the engraving on it of Renaissance detail. The building was set back 100 ft. from the road, with a central square for the detached tower, and sunk gardens on either side required by the levels of the ground; the whole being

laid out with architectural surroundings and sculpture.

The central entrance leads to a hall with a group of offices on either side for the societies and others, with a staircase to each block; beyond were the public entrance to the museums and the grand staircase, and also the entrance to the great reception-hall; towards the gardens in the quiet were placed the libraries and reading-rooms, centrally situated for both the museum blocks.

Access to the museums for the delivery and removal of exhibits was obtained at either side on the basement level."

We give also a perspective view and plan of the graceful design submitted by Mr. T. G. Jackson. The following extract from his report explains his views in regard to the design:—

"In its general arrangement, the plan falls naturally into two parts,—1st, the Institute proper, and 2nd, the Museum, with its galleries. These two parts, it seems to me, should be distinct, though placed in direct communication with one another; for, while the officials of the Institute would require ready access to the Museum, the Museum and Exhibition galleries would be resorted to by the general public, who would have no business inside the Institute. In my plan, the Institute forms a compact quadrangular block facing the new road, with the Museum behind it, and communicating with it at two points on each floor. To insure ready communication between the various departments of the Institute, I have grouped them in four wings round a central space. Beyond the entrance-hall is a spacious crush-room, with two large staircases, each 10 ft. wide, leading to the great hall.

The great hall and great conference-room are placed together in continuation of one another, and form a magnificent suite of rooms stretching along the whole north side of the interior quadrangle. These rooms would be handsomely finished with ceilings of ornamental plaster and oak panelling part of the way up the walls, and the vestibule would be decorated with marble columns and door-cases, mosaic floor, and moulded plaster ceilings. The library occupies the first floor in the right-hand part of the front, and the various reading-rooms are placed in contiguity with it.

The rooms for the Royal Colonial Institute and Royal Asiatic Society look to the front, and occupy the first and second floors in the left-hand wing.

The sample rooms occupy the ground-floor under the great hall, and are lighted by large windows with a north aspect.

The museum and exhibition galleries are arranged round a series of courts on the northern side of the site behind the institute proper. In the centre is a great quadrangle, of which the hank of the institute forms one side, and in the buildings forming the other three sides I should propose to place the museum of permanent exhibits.

*Architectural Design.*—It has been somewhat difficult to decide how to design a building standing about half-way between objects so diverse as the huge mass of the Albert Hall on one hand, and the group of Mr. Waterhouse's lofty towers on the other. The main building cannot conveniently be very lofty, and certainly cannot be made to bear comparison with the huge hulk of the Albert Hall. I therefore thought it best to interpose my great quadrangle and museums, which, though they might not entirely hide the Albert Hall, would have the effect of dividing the two buildings distinctly from one another.

The best way, in my opinion, of giving proper dignity to the Institute is to crown it with a lofty tower, which is of itself a monumental and appropriate feature. I have therefore made the central feature of my design a great tower, 43 ft. square at the base, which rises to the height of 300 ft. The upper part would contain a clock, and might be furnished with a carillon of bells.

The building is designed to be of red brick with dressings of Portland stone. The style is that of the Early Renaissance of the beginning of the seventeenth century.

Estimating the main building at 1s. per cubic foot, the tower at 1s. 6d., and the museum surrounding the great quadrangle at 9d., the Institute, exclusive of the additional exhibitions, would cost under 250,000*l.*, the sum to which the competing architects were limited."

We give also this week the perspective view, section, and plan of the design by Messrs. Deane & Son, of which we have already spoken as in its main idea the most suitable and monumental of all. Messrs. Deane & Son write:—

"In preparing our design we have had principally before our minds the greatness of the occasion, and we consider that cost in reason should be no hindrance to the carrying out of such a work, which is to be for ever a monument of the greatness of England and her Colonies, and a worthy memorial also of the Jubilee of Queen Victoria; and we were encouraged in the belief (that the cost would not be a hindrance), by the instructions given by the committee, which stated that at present the cost

should not exceed 250,000*l.*, but that architects were to show how much of the design they submitted could be done for that amount.

In consequence, we made our design (which included far more accommodation than we were asked for), hoping that we should have an opportunity of giving an explanation, and pointing out where we could modify our design,—or rather what portions, for the present, we should propose to omit if it was found to exceed 250,000*l.*

We have had an estimate given to us by Messrs. J. & W. Beckett, of Dublin, who are the contractors for our Science and Art Museum and National Library, a copy of which we enclose.

This gives a total estimated cost of 347,127*l.*, equal to 9d. per foot cube all round, including steps, landings, and portico, and it will be seen that although it exceeds the amount, yet it would be perfectly easy to bring it within the cost, without permanently mutilating the design or reducing the accommodation below the present requirements.

We think, however, as we did from the first, that our design falls short of what is due to the occasion, and we should like to have seen it a work of such a character as the Romans would have done under the circumstances, with open courts for stately and fountains, and with detached buildings, each with a distinct object; but it was utterly impossible to do this, and we were too much tied down by the instructions (sketchy as they were), and the site, but in a small way we thought we had conceived something of the right sort in our amphitheatre.

Nobody, however, seems to have understood it or our feeling about it or the necessity of such a place. It would have been perfectly splendid surrounded with marble statues, and from a utilitarian point of view easily convertible into a huge hall for exhibitions such as periodically occur. We appear to have been the only architects in the competition who completed the whole scheme, showing sections and back elevations of future extension (part of which was the amphitheatre), and we fear we were supposed, therefore, to have included all the work we showed in our estimate, whereas we left all future work in outline as directed."

#### SELECTED DESIGN FOR EDINBURGH PUBLIC LIBRARY.

THE site upon which this building is about to be erected is a peculiar one, in respect that the two streets which form its east and south boundaries are at different levels, and, as its name implies, George IV. Bridge crosses the Cowgate, at a height of 45 feet above the level of that street. The adjoining buildings to the north are of great height, and the difficulty had to be overcome of covering up the rough natural gable, and at the same time leaving an area for access and light next the bridge. This has been done by projecting the principal staircase forward to the building line of the adjoining tenement, while keeping the main part of the building 10 feet back from the parapet of the bridge.

The motif of the design of the building is to secure abundance of light equally on all four sides of the three large rooms—the general reading room, the lending library, and the reference library. This has been attained by the adoption of the cruciform plan. The arms are short in length, and the whole end of each arm is occupied with large windows, so that ample light in every direction is obtained. The four angles which fill up the space between the cross form and the square outline of the site are occupied respectively with the public staircase from the Cowgate to the libraries, service stair, and rooms for staff, book stores, and grand staircase to reference library.

The principal entrance is on the level of George IV. Bridge, giving access to a colonnaded vestibule, at one end of which is the stair up to the reference room, and at the other the stair down to the general reading room. In the centre of the vestibule and directly opposite the main entrance are the doors to the lending library, which is disposed in much the same way as the telling room of a bank, the work to be performed being much the same in both cases. The centre area formed by the intersection of the arms of the cross is given up to the public, and is surrounded by the service counter, over which the books will pass between the public and the attendants. The book-shelves will be principally at right angles to the windows, for good lighting, and are so arranged that every book can be reached without the aid of steps or ladders, and are within a pace or two of the attendants' place at the counter. To the right and left of the doorway

\* This was quite obvious in the drawings.—Ed.

Plan of Design by Messrs. T. N. Deane & Son.

are the catalogues, while indicators placed at each section will inform readers whether the books they wish are in or not. The shelving in this room and the adjacent book store will accommodate 53,450 volumes, calculated at 10 volumes to each square foot of vertical shelf elevation.

The reference library upon the first floor above George IV. Bridge will have shelving to contain within itself 72,651 volumes, and the adjoining book store—which will be constructed upon the well system, with glass roof and sparted iron floors at 8 feet heights—will contain 35,253 volumes, giving a total for the

reference department of 107,904 volumes, calculated at 8 vols. to each square foot of vertical shelf elevation. It will be capable of accommodating 160 male readers, and 36 female readers in the wing or arm of the cross, set apart and screened off for the use of ladies.

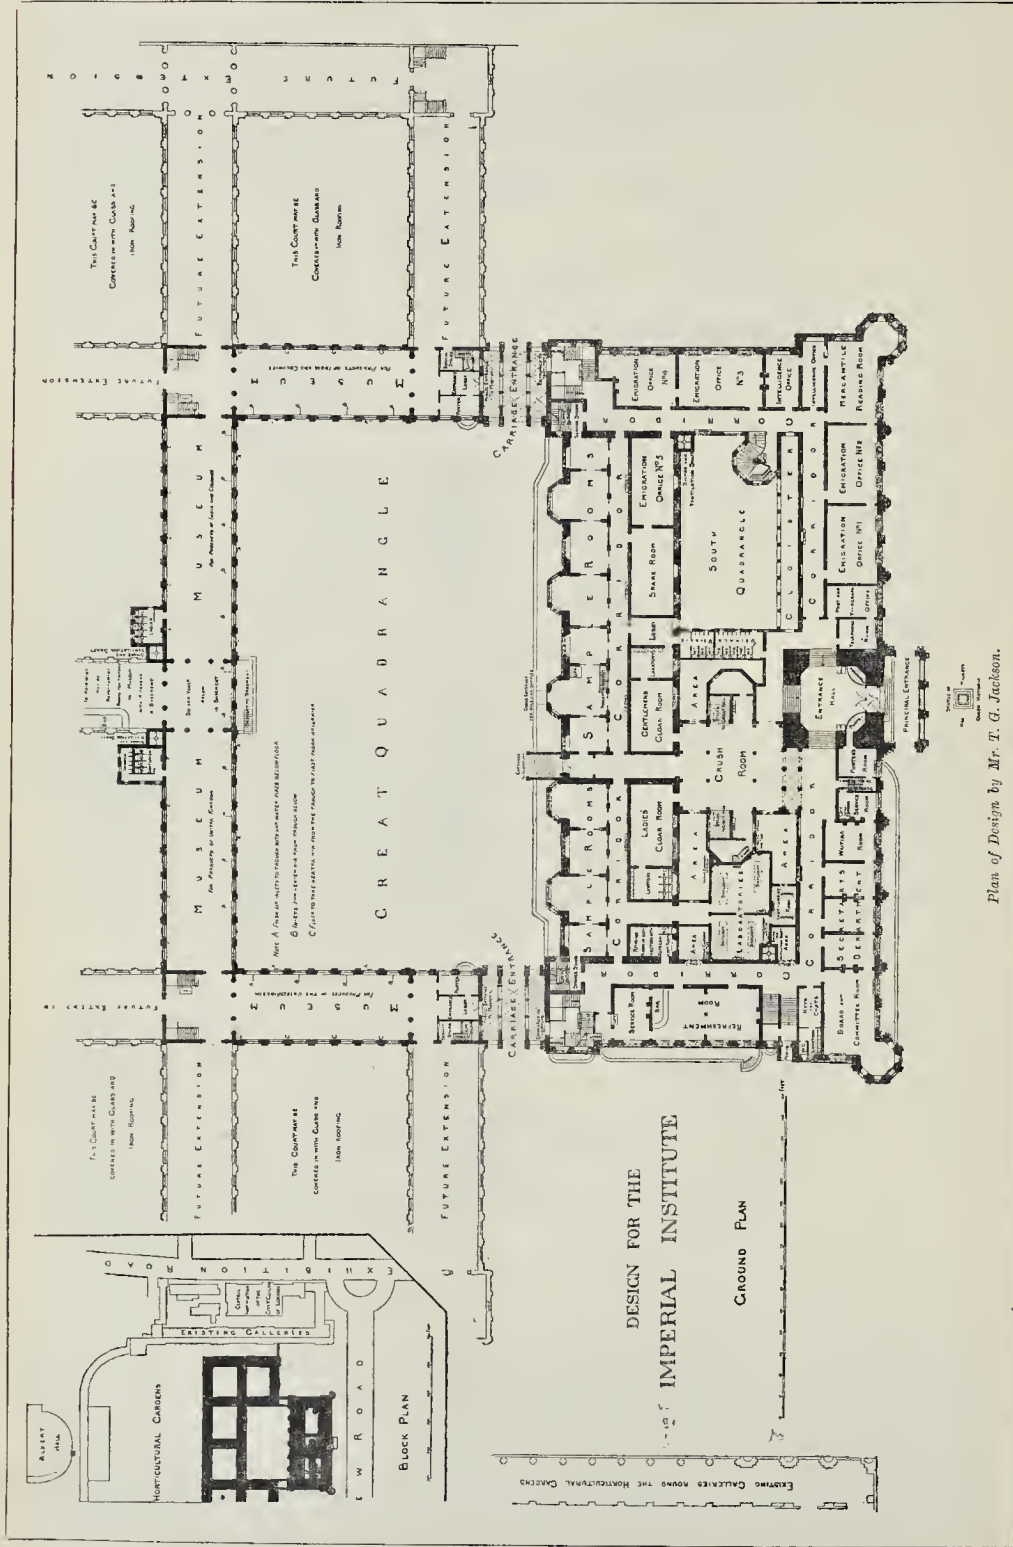

The newspaper and general reading room occupies the first floor below George IV. Bridge, and is reached both from that street and from the Cowgate by straight flights of steps 6 feet broad. This room is of the same size and shape as the reference room, and has in connexion with it a separate room for juveniles, and one for the higher-class magazines. The walls upon

this floor will be tiled to a height of 12 feet above the floor.

The work-rooms for the staff are placed on the floor below, and the machinery for heating, ventilating, and electric lighting upon the ground floor or Cowgate level.

The building will be of fire-proof construction; the external face of the walls to George IV. Bridge, and the Cowgate will be of Stirlingshire or Northumberland stone, finely scabbled on face, the steps of stairs of cement concrete, and the walls lined with well-glazed tiles. The estimated cost is 30,000l.

The architect is Mr. G. Washington Browne.

THE BRITISH SCHOOL AT ATHENS.

As we briefly mentioned in our last (p. 57), the first annual meeting of the subscribers to the British School at Athens was held on the 6th inst. The Earl of Carnarvon was in the chair, and there were present, among other ladies and gentlemen, Sir C. T. Newton, Professor Jebb, the Earl of Morley, the Rev. Charles Evans, Sir F. Pollock, Mr. E. A. Bond, Mr. G. Godwin, Mr. Watkins Lloyd, Professor Percy Gardner, Mr. Walter Leaf, and the secretary, Mr. George A. Macmillan. Letters of apology for non-attendance were read from M. Genadius, the Greek Minister, the Bishop of Durham, Sir Frederic Leighton, P.R.A., the Provost and the Head Master of Eton, and the Dean of St. Paul's.

The Secretary, Mr. George A. Macmillan, read the report, of which the following are the most important passages:—

At the last meeting, on October 19, 1886, it was announced that the school building\* was complete, and that a very competent Director had been found for the first year. In the person of Mr. F. C. Penrose. It was further stated that an income of 400*l.* a year had been provisionally secured for three years. Mr. Penrose went out to Athens early in November, and about the middle of December Mr. Ernest Gardner, Fellow of Gonville and Caius College, Cambridge, and now Craven University student, was admitted as the first student of the school. Two months later the Oxford Craven Fellow, Mr. David G. Hogarth, of Magdalen College, was admitted. Later in the session two more students, Mr. O. J. Jansonides, of Athens, and Mr. Rupert Clarke, of Exeter College, Oxford, were added to the number. In accordance with the rules drawn up by the committee, Mr. Penrose, besides directing the work of the students, has delivered three public lectures at the Parthenon, the Erechtheum, and the Temple of Olympian Zeus (see *Athenian*, May 7, 1887), and will deliver three more in the course of October before he lays down his office. He has, moreover, at the expense of the Dilettanti Society, conducted excavations on the site of the Temple of Olympian Zeus at Athens, which have established the important fact that the temple was octastyle, not decastyle, as has hitherto been generally supposed. Before closing this brief record of the first year's work of the School, mention must be made of the very cordial welcome given to the Director and students of the British School both by the native Greek archaeologists and by the members of other foreign institutes. Special mention is due of the extreme friendliness of the relations between the British and American Schools. The American Director and students did their utmost to smooth the way for their English colleagues, generously throwing open their excellent library. Representatives of the British School were present at the laying of the corner-stone of the American School building, which is now in the course of erection on the adjoining site. The two projects have been surrounded by a single fence at the joint cost of the schools, and will, it is hoped, to a certain extent enjoyed in common. It is obvious that for the work of a school at Athens one indispensable requirement is a good library of archaeological and classical books. The committee are happy to be able to state that a very good beginning has been made in this direction during the first year. In the first place, valuable gifts of books have been received from the delegates of the Oxford University Press, from the Syndics of the Cambridge Press, and from many private publishers, including Messrs. R. Bentley & Son, Messrs. George Bell & Son, Messrs. Macmillan & Co., Mr. John Murray, Messrs. Kegan Paul, Trench, & Co., and Messrs. Calvary, of Berlin. Mr. F. F. Tuckett, Mr. Barclay Head, and other private individuals have also made valuable gifts to the library, and it is hoped that their example may be widely followed. In the next place, the committee have expended a sum not far short of 250*l.* upon the purchase of the books which it was considered most important for the School to possess. Turning to the financial position of the School, the managing committee regret to say that the appeals for aid made for last year after the meeting of subscribers in October did not produce very much result. The new donations amounted to no more than 115*l.*; new annual subscriptions were promised to the amount of 70*l.* 15*s.* a year. Donations towards the establishment of a capital fund or annual subscriptions will be gladly received by the hon. treasurer, Mr. Walter Gardner, and the Finance-part of the committee feel that there is every cause for satisfaction in the progress made by the School in this, the first year of its existence; and the outlook for the future is no less promising. As Mr. Penrose's successor the committee have been fortunate in securing, for two years, at any rate, the services of Mr. Ernest Gardner, who is a thoroughly trained archaeologist, and has had the great advantage of working under Mr. Penrose as a student during the past season, so that he will take up the work with

full knowledge of what is required. It is proposed next session to provide board and lodgings at a moderate rate in the school building for a limited number of students. Information upon this point may be obtained from the hon. secretary, Mr. George Macmillan, 29, Bedford-street, Covent Garden, W.C., to whom all applications for admission to the school should be addressed.

The Chairman, in moving the adoption of the report, said:—Ladies and Gentlemen,—Every one will have heard with great interest the report which has just been read. There was not a word which could be spared. But I think if I summed up the general purport of it, I might say, in a few words, that although much has been done, a great deal more remains to do. Like many other reports, it is of a mixed character,—there is good, there is evil in it. Still I think this annual meeting may congratulate themselves upon the large stride which has been taken in the cause in which we are all interested. It was launched under every good augury, and those of us who a few years ago were present at the meeting in Marlborough House under the presidency of the Prince of Wales will feel that the work has in a great measure responded to the anticipations of that time. At that meeting were eminent in literature, in art, in science, in politics, in classical learning, and in society. Since that meeting the Greek Government gave us very generously a piece of land; a temporary endowment for the brief space of three years was provided; our house has been built, our library, as the report tells us, has been founded, and amid the help of our American friends and the generous rivalry of French and German students our work has been commenced. Lectures have been inaugurated, students have been admitted, and the teaching and training of Mr. Penrose, to whom we owe so deep a debt of gratitude, the undertaking has been fairly and fully launched. One thing, and one thing only, seems to be wanted,—money comes but slowly in. But I must say when I look to the nature of the work and to its probable results I marvel that there should not be found men throughout the length and breadth of this country who possess great personal and private means who are willing to identify themselves with this most remarkable movement, and to be associated for all time with the British School at Athens. I sigh to think that we cannot find some Mæcenas or Hierodes Atticus who might gain glory by connecting his name and reputation with such a work. I assume, of course, that we all agree on the value of such a school as this. I do not appeal to the dull ears of those who have no sympathy with the teaching of Greek in the curriculum of the highest English education. I assume that we all agree that the life and literature of the ancient,—and particularly of the Greek,—world, lie at the root of our highest education in England, and if that be the case then I think there is ample reason and advantage in such a school as that which we have recently founded at Athens. And for these two good reasons: first of all, that Greek and Latin archaeology, but especially Greek, has been admitted within the circle of our Classical teaching. It was not always so, but the more we accept the doctrine, which is the true doctrine, that history is not entirely comprised of battles and sieges, and the biographical events of individual lives, but comprehends the whole existence and movement and progress of nations, the more we must recognise Archaeology as a very essential element in History. She is, if not in fact History, the handmaid of History. In the second place, there can be no better place in which to study the Greek archaeology than Athens. There is a *genius loci*, as it has been called for want of a better word, that sort of subtle atmosphere which arises on the spot, the presence and influence which gives interpretation, so to say, to passages which would otherwise be obscure and reality to facts which it would otherwise be hard to realise. All this we get by actual study on the spot. And he must be very cold and hard, very dull of apprehension, who can stand on that ground and not feel keenly at the sight of places where Pericles spoke, where *Æschylus* sang, where Aristophanes joked, and where St. Paul preached. As I take it, from the slopes of Illymettus, where our house stands, you may see all, or nearly all, these objects and places to which I have alluded, and it requires a very slight effort of vision to see the spot from which the great orator's voice rang,

the theatre where the great masterpieces of the drama were enacted, and the *Areopagus*, famous both in the earliest dawn of Greek history, and in the commencement of Christianity. And if Athens be the best place in which to study Greek archaeology, it is rapidly becoming, I fancy, the only place, and for this reason, that the discoveries which have been recently made in Greece are of so large and interesting and fascinating kind that the work will soon be carried on here alone with advantage. The soil of Greece is giving up treasures which have been buried for centuries. Athens alone has produced a rich harvest. Discoveries are being made in the mystical soil of Eleusis; Sicyon, which overlooks the Corinthian Gulf, has afforded much; ancient Thyms, with its Cyclopean walls, has disclosed marvels of the Old World. In Mycenæ the work of excavation is going on. Delos, which, as the poets feign, is bound by adamant chains to the depths of the sea, and only twice, I think, underwent an earthquake,—once before the Persian invasion and once during the Peloponnesian war, the meeting-place of the great Ionian races,—is now being explored, I think, by our French rivals; and, lastly, Olympia, the solemn meeting-place of the games, has given up treasures of the highest worth. And in Delphi, where the oracle spoke to a wondering and awe-struck world, we are not without great and valuable records of the past. I might go on for a long time in the mere enumeration of what has been done. But the important part of these discoveries is this,—that the Greek Government has, with infinite care and loving attention and skill, brought together in the Museum at Athens the principal works of art and interest which have been discovered. All this is ample justification for the School, and all that we now want are the necessary funds, without which no institution in the world can exist. Our great French and German rivals in this field of classical labour are so convinced of its value that their Government's have made large and handsome grants in aid. In America the Government gives no assistance, but private munificence has stepped in, and endowments and subscriptions before which our utmost private efforts pale have been made by high-minded and liberal American citizens. In England, I am sorry to say, we have a more uphill task. Our Chancellors of the Exchequer are by nature and tradition very obturate. During the life of my dear friend Sir S. Northcote I might have had great hopes. He was one who *nil Græcum, nil Latinum a se alienum putavit*. I have some hopes of Mr. Goschen, who was a contemporary of mine at Oxford, and who had there a distinguished classical career. Therefore I would suggest to our secretary that he should press these reminiscences on Mr. Goschen on the first favourable opportunity, and use every influence he can bring to bear to induce him to assist us. But our best hope is in private liberality; and although I know well that every class and interest in this country feels the depression of trade and of finance, still there is a great deal of money left in the country, and I think also a great deal of the old spirit still exists, and we shall not make our appeal in vain. I beg to move the adoption of the report.

The Earl of Morley seconded the motion, which was agreed to.

After the transaction of some formal business,

Mr. Penrose gave an account of his work during the past year. He had been able to visit and collect objects of art from Palermo, Oropus, Sicyon, and other places, and in his labours the American and German archaeologists had afforded him much valuable help. He had, unfortunately, contracted a fever, but had been able to give lectures on the Parthenon, the Erechtheum, and other subjects, and had been honoured by the presence of Sir Horace and Lady Rumbold, and Mr. Watts, the artist. Mr. Hogarth, Mr. Clarke, and other students had been doing good work, and had achieved valuable results.

Lord Carnarvon moved a vote of thanks, which was heartily given, to Mr. Penrose for the great services which he had rendered the School.

Professor Jebb moved a vote of thanks to Lord Carnarvon, who had been connected with the project from its inception, and had throughout shown an active interest in its work. It was just twenty years ago when a resolution

\* We gave plans, view, and description of the building, of which Mr. Penrose was the architect, in the *Builder* for Nov. 20, 1886.

was passed in that room, in pursuance of which Lord Stanhope pressed the claims of such work as they had been engaged in on the attention of that distinguished scholar, Lord Sherbrooke, then Mr. Lowe and Chancellor of the Exchequer. But the only recommendation they got was to look for some Mæcenas. There were plenty of Mæcenas and Herodæ Attici in the country, but it was difficult rightly to guide their efforts. Their chairman was known as a translator of the *Odyssey*. Their school had not, like the heroine of that poem, many suitors as yet; but their chairman was amply endowed with the qualities of the hero Ulysses, resource and patience.

Sir C. Newton, late Keeper of the Greek and Roman Antiquities in the British Museum, seconded the motion. As a veteran he was not disappointed at the number of students, as the qualities of a real student were difficult to find in combination, and the gentlemen who were now students of the School had shown themselves to be possessed of those qualities. Great results were to be expected from their labours, such as those which the French archaeologists had already obtained in Delos. He desired specially to refer to the Greek journal, *Ἐφημερίς Ἀρχαιολογική*, which was a model of what a paper devoted to such subjects should be, and ought to excite the emulation of English scholars.

The vote of thanks was heartily accorded, and the meeting separated.

[The *Times* report, from which we quote the foregoing, says that the meeting was held in the rooms of "The Society of Athens." For "Athens" read "Antiquaries."]

#### THE NEW TAY BRIDGE.

By the completion of the new Tay Bridge another gigantic engineering undertaking has been brought to what, judging from the tests applied and the strict precautions adopted, appears to be a satisfactory conclusion, and an important link in the chain of railway communication between the north and south of Scotland will be re-established. To the North British Railway Company the completion of the bridge begins a new chapter in its history which promises within the next few years to be pregnant with great results,—seeing, as it is hoped it will do, the completion of the Forth Bridge, the construction of the new Glen Farg Railway, and the opening of a direct route between South and North. There is no need, at this time, to recall the history of the former ill-fated Tay Bridge, which, after a brief existence of little over two years, fell with such tragic accompaniment on December 29, 1879. We quote the following particulars as to the new bridge from the *Scotsman* :—

In considering the question of the reconstruction of the bridge, the idea at first mooted was to utilise the old piers as far as they might serve, and a Bill on these lines was promoted in Parliament in 1880, which, however, failed to pass. Later in the same year the complete abandonment of the old viaduct was agreed to, and it was resolved that a new bridge should be erected twenty yards further up the river, having a double line of rails instead of a single line, as in the case of the old bridge. The fallen bridge had cost 350,000*l.*, and on the new structure it was proposed to expend 670,000*l.* As a matter of fact, however, the bridge has cost nearer a million sterling, which has been solely defrayed out of the funds of the North British Railway Company. Parliamentary sanction having been obtained, designs were submitted for the bridge by Messrs. W. & H. Barlow & Sons, engineers, London, and in November, 1881, an offer for its construction by Messrs. Arrol & Son, contractors, Glasgow, was accepted. It was not, however, until June, 1882, that a start was made with the bridge; and though a good deal interrupted, especially in the winter, by the storms which are frequent in the Tay valley, the work has gone on continuously since. Of its kind the bridge is a very handsome structure, though in its general aspect it has nothing but its great size to distinguish it from any modern viaduct. There are no novel principles of engineering introduced into its construction, as at the Forth Bridge, the chief parts consisting of lattice girders carried on piers, erected in sets of two, across the river. Its total length is 10,780*ft.*, or just a little over two miles. The number of its piers is eighty-six, with spans varying from

68*ft.* to 245*ft.* There are eleven spans of the largest size, two of 227*ft.*, and the rest are for the most part either 145*ft.*, 120*ft.*, or 71*ft.* in width. The large spans are in the middle of the river, where the bridge, at its highest point, has a clear headway of 77*ft.* above high-water level, or 11*ft.* lower than the headway of the old bridge. From the Dundee side the bridge leaves the esplanade with a fine sweeping curve on a rising gradient of 1 in 14, which takes it out to the deep water. In the centre its straight line is broken by raising the height of the thirteen central piers, so as to admit of the rails being laid on the lower members of the large girders. North and south of this portion the rails are on the upper "booms." From the centre the gradient falls away to the south, and the bridge is joined on to the high rocky shore at Wormit by a series of four massive brick arches, which terminate in a great land abutment of immense strength and solidity.

In the founding of most of the piers which stand in the water, malleable iron cylinders of different diameters have been used. For those in the deep water of the centre of the river and carrying the large girders the basal diameter is 23*ft.*, with a taper upwards to 17*ft.* 6 in. On each side of these the basal diameter of the cylinders is 17*ft.*, with a proportionate taper, and in the shallow water on the north side 15*ft.* The founding of the piers took about three years and a half to accomplish,—the last of the deep-water cylinders having been put into its place on the 10th of June, 1886. In the process of founding, which took place from ingeniously-constructed pontoons, a large steel mechanical digger was used; and in addition to excavating the sand, gravel, and boulder clay of the river bed, the labour was enormously added to by the removal of hundreds of tons of large stones, which had been put into the river with the view to their gathering round the foot of the piers of the old bridge to prevent "scouring." The average depth to which the cylinders have been sunk is 30*ft.* below the bed of the river, but many of them are founded much deeper down than that,—several going down as much as 84*ft.* below low-water mark. Each cylinder on being founded had its interior filled with brickwork and concrete, so that a shaft of great solidity and strength was thereby formed.

The testing of the piers under the Board of Trade supervision was a work which entailed an enormous amount of labour, each pier having had heaped upon it blocks of pig-iron varying in weight from 1,248 tons for the smaller columns to 2,500 tons for the larger. This enormous strain,—which is inconceivably greater than anything that can ever be put upon the piers by the superstructure of the bridge and the traffic upon it, was, it is understood, in all cases successfully withstood. This strain is popularly described as being 33 per cent. more than would be put on the piers supposing the bridge were loaded with locomotives standing close to each other on both lines of rails.

From low-water up to 28 in. above high-water level the cylindrical shafts are continued in solid brickwork, the facing being of blue vitrified Staffordshire brick, which is quite impervious to the action of water. At 18 in. above high-water, binding girders are carried between the two members of each pier, and upon this a course of granite surmounted by 7*ft.* of blue brickwork is erected. This forms a solid base for the superstructure of wrought-iron which rises to the level of the bed-plates of the railway girders. This superstructure consists of a frame-work of wrought-iron plates  $\frac{1}{2}$  in. thick, firmly braced in the interior with angle and T-bars, and tied down to the piers by bolts passing 22*ft.* down into the brickwork.

The girders employed are of two types. Those for the smaller spans are lattice girders, of uniform depth, strengthened by vertical half braces, alternating with cross braces at each second lattice. For the thirteen large spans in the middle of the river, hog-backed girders curving from 20*ft.* at the ends to 28*ft.* at the centre, are employed. The whole of the girders for the deep water spans are newly constructed. North and south of this some of the girders of the old viaduct were, after being thoroughly tested, lifted over to the new bridge, and form the outermost members of the various sets of four which stretch from pier to pier. Wind pressure has been provided against by lateral bracing, and, to serve at once as a wind screen and parapet, there is on each side of the bridge a continuous side lattice-work, 5*ft.* 6 in. in

height, surmounted by an oak coping. The immense girders were floated out from the jetties on either side upon pontoons, were placed on the piers at high water, and were raised to the requisite height by hydraulic jacks. It is estimated that 18,000 tons of iron were used in the construction of the large girders, and ten millions of bricks in the arches and lining of the cylinders, &c. The permanent way is laid on the top of a strong ridge-and-furrow flooring, and on the outer side of the ordinary rail there is a check rail to prevent the possibility of the train leaving the metals. The whole of the bridge has been painted a dull red colour. One very gratifying feature about the construction of this gigantic undertaking has been the fewness of the serious accidents attending it,—a fact due to the first-rate staging which was employed, and to the care with which all details were supervised by the resident engineers. Messrs. Barlow, the engineers, were represented by Mr. Kelsey, C.E., and the contractors by Mr. W. Inglis, C.E. The work has also had the benefit of the constant personal supervision of the head of the contracting firm, Mr. William Arrol, who, in the course of its progress, devised not a few ingenious and useful appliances for saving labour and perfecting the methods by which the bridge was built.

The Newport branch line leading to the bridge, and which had to some extent to be diverted by being thrown back so as to improve the junction,—necessitating the construction of a tunnel 140 yards in length,—has also been finished by Messrs. Arrol & Son. A glance at the bridge by those who had seen its predecessor is sufficient to convey an idea of the marked improvement that has been effected in its stability. There is, even to the non-scientific eye, a substantiality and a solidity that impresses one with a sense of security, and this is especially brought home to the spectator's mind when he sees still standing alongside the massive piers that support the new bridge the remains of some of the spindle-like columns that for a time served to uphold the former bridge. During the five years over which the construction of the bridge has extended, a large number of hands, who in the prevailing commercial depression would otherwise have been idle, have found employment. Upwards of one thousand have been at work at one time.

On the occasion of the recent inspection of the bridge by the Directors of the North British Railway Company, the Chairman, the Marquis of Tweeddale, in proposing the toast of prosperity to the North British Railway Company, said that in regard to the Tay Bridge, Mr. Barlow, the engineer, was well known as one of the most distinguished members of his profession in the country, and he was sure they would all congratulate him on the success which had attended the proceedings at the bridge that day. It was one of the finest works that had ever been constructed. It was the longest railway bridge in the world, and he thought he might add with perfect assurance that it was one of the safest. They might congratulate Mr. Barlow on having crowned a long and successful career with the successful completion of this very important work. As to Mr. Arrol, the contractor, he was sure that all recognised him to be one of the most remarkable men of his time. In respect of inventive genius, Mr. Arrol was second to no man in the world; and the manner in which he had carried out the contract of the Tay Bridge, as well as that for the Forth Bridge, stamped him as one of the most prominent practical engineers of whom they could boast in this country.

Mr. W. H. Barlow, in replying, said the carrying out of this bridge had been a hobby of his, and with the manner in which it had been accomplished he was glad to hear so hearty satisfaction expressed. He could not sufficiently thank the contractor for his part of the work. Mr. Arrol had been most correctly described by the chairman, and but for the ability of the contractor the bridge could not have been seen that day in the state in which they found it. To his excellent staff of assistants he also felt that he had been greatly indebted.

Mr. Arrol, in a few words, also returned thanks. The bridge, he said, had been a very pleasant job to him, and that it had been so was due to the support he had received from Mr. Barlow, the assistant engineers (Messrs. Kelsey and Inglis), and from the Railway Com-

McCallum's System of Sewer Ventilation.

McCALLUM'S SYSTEM OF SEWER VENTILATION.

In this method of ventilating sewers, the air-current is caused by utilising the natural action of the flow of the sewage, the air coming in contact with the more powerful element being compelled to travel in the same direction as the water. In order to "harness" this power, the sewers are divided into sections by means of a light flap valve (A on sketch), actuated by a float, and so shaped and arranged that the air-current is intercepted and directed upward. At each end of such a section a shaft is carried to the surface, one (C) to act as a fresh-air inlet, and finished with a grating slightly to one side of the road, and the other (D), to act as an outlet and having its grating in the centre of the road. A curved plate (B) is used to direct the incoming air current; this plate is also hinged so that if an accident should happen to the float of the valve A, the sewage would automatically open B, and thus prevent choking of the sewer.

The constant circulation of air caused by the above arrangement prevents the gases becoming stagnant, and, by means of the large quantity of fresh air introduced and mixed with the sewage emanations, the latter are oxidised and rendered innocuous before emerging into the open. The dividing of sewers into sections also makes each district deal with its own sewer gas.

The large arrow on the sketch shows the direction of the flow of sewage, and the small arrows show the direction of the air current.

DRAIN VENTILATION.

The general principle is the same as with the sewers, but the disconnecting trap takes the place of the valve. Special provision is made at the inlet (which is just above the water-closet connexion) to prevent wind interfering with the air current. The outlet is taken to the centre of the street.

WESTMINSTER IMPROVEMENT COMMISSION AND BONDS.

SIR,—In perusing your very sensible remarks, contained in your issue for July 2 (page 5), respecting the intended Westminster Improvements, as contemplated by the Bill now passing through the House of Commons, I am struck by the practical sense of your recommendation that all great metropolitan improvements should be carried out by a responsible public body, and you allude with some despondency to the incomplete condition of Victoria-street, Westminster, even at the present day. I share your despondency, but for far different reasons; for I am an unfortunate holder, as a trustee and otherwise, of Westminster Improvement bonds, to the amount of several thousand pounds, and have never during the whole time I have been so possessed,—some quarter of a century,—received more than at most two half-yearly dividends. At that time the secretary of the Commission disappeared, and many stormy meetings of the unfortunate bondholders have since then been held at the Westminster Palace Hotel. The secretary who was appointed after the flight of the first one, a Mr. Jacques, has recently died. The offices of the Commission in Victoria-street, Westminster, have been abandoned. The bonds I represent are

entirely renewed within the last six years with stained glass and fresco paintings, some of which are placed in memory of the late Mrs. Tait and her son, and some to commemorate the visit of the American highships to Lambeth.

PODMORE'S "PATENT SASH-FASTENER."

We give illustrations of this, which appears to us to be one of the best and most effective sash-fasteners that has been brought out. The self-acting fastener is a bolt fixed in a sheath, on the meeting rail of the top sash, with a spring behind it, which is kept back by a catch when required or when the window is open, but is released by the action of shutting down the lower sash, and springs forward over the head-plate on the meeting-rail. This forms in itself an effectual fastening, so far as preventing the opening of the window, but a further recommendation is in the action of the screw and nut carried in the bolt, and which can be screwed down so as to hold both sashes perfectly tight, and thus form a defence against draughts and against rattling sashes.

SHUT

SHUT

OPEN

Podmore's Patent Sash-Fastener.

A spring is no doubt always a weak point in a thing of this kind, in so far as it is always liable to weaken with use; but this objection, of course, applies equally to many locks and latches which are in constant use. In other respects the fastener is a very good one, as it both closes and tightens up the window, and is simple in its construction and working. Messrs. Jas. Boyce & Son are the makers and agents.

THE ROYAL ACADEMY.

ADMISSIONS TO ARCHITECTURAL SCHOOL.

The following students have been admitted to the Architectural School of the Royal Academy (Mr. R. Phené Spiers, F.S.A., Master) :—

Upper School.

ARCHAEOLOGICAL SOCIETIES.

British Archaeological Association.—This year's annual meeting of the British Archaeological Association will begin on August 15, Liverpool being the head-quarter.

Royal Archaeological Institute.—The Royal Archaeological Institute will hold its annual meeting this year at Salisbury, commencing on Tuesday, August 2.

Surrey Archaeological Society.—On the 5th inst. this society held its annual meeting, and visited the Church of St. Saviour, Southwark, and Lambeth Palace, under the presidency of Viscount Middleton. The former building, one of the most interesting of London churches, is the subject of a complete architectural work by Mr. F. T. Dolman, who conducted the party and described this church. Many of our readers will remember the beautiful Lady Chapel and the fine reredos. In St. Saviour's Church are many noted monuments, and one of surpassing interest to the poet Gower, seen on entering the edifice. The members and visitors, with ladies, reached Lambeth Palace at three p.m., which, by permission of the Archbishop of Canterbury, was thrown open to the society. The fine library, better known as "Juxon's Hall," the picture-gallery, and the chapel, were all seen by the visitors. Mr. S. Wayland Kershaw, F.S.A., described the chief features of the hall, and traced the foundation of the library from Archbishop Sancroft in 1611 to the present day. He also commented on the former library in the "cloisters," which were removed in 1830, and wherein the books were placed previously to their present position in the hall. A paper "On the Manor-houses of the Archbishops in Kent and Surrey" by Mr. Kershaw, formed the next part of the programme, and then the company viewed the series of portraits of the archbishops hung in the state dining-hall. From the "Long Gallery" the private chapel was reached, and Mr. J. P. Seddon, F.R.I.B.A., pointed out its architectural features. The chapel has been

pronounced on the Stock Exchange to be altogether without value, and whether a Westminster Improvement Commission actually exists at the present moment I have tried in vain to ascertain. A glimmering light beams once more upon me on reading your remarks, and if you can afford me, and the countless sufferers, also bondholders with me, any clue to the present *locus in quo* of the present Westminster Improvement Commission, I shall feel truly grateful,  
KENSINGTONIAN.  
July 7, 1887.

#### "THE NATIONAL GALLERY."

SIR,—There is one point in your criticism of my decoration of the new staircase which you may not object to my remarking upon. You describe as "too white" the arches and string course over the entrance. The criticism is, no doubt, correct as the work now stands; because, since the long panel over this arcade has been hung with the green flock paper (as a temporary measure), this white has been "forced" by the contrast. But I never intended that this panel should be so treated, even temporarily.

From the first I painted this out to the Trustees as a fitting space for a mural picture; and I so indicated it in my design. As a temporary finish, I had painted this space in light tones; and I still consider that to bias this elevation by the dark colour was a mistake.

It has the additional disadvantage of making the Carrara marble capitals (and the arcade, which is *toned to match them*) appear somewhat "too white."  
J. D. CRACK.  
Wigmore-street.

#### GOVERNMENT OFFICES.

SIR,—Even my good friend, H. B. Garling,\* has submitted to the seduction of saving a few thousands, which being spent in the centre of London on a national undertaking is no real economy.

Why should he mar a noble scheme by leaving the bottle-neck of Whitehall but 70 ft. wide, and omitting the broad way or continuation of the Mall into Charing-cross? The first scheme was spoiled by retaining the Horse Guards. This proposal is ruined by keeping the Admiralty. -  
EDWD. C. ROBINS.

#### THE NUISANCES FROM SEWER VENTILATORS.

SIR,—So far as can be judged from his letter on p. 78, it seems to me that Mr. R. H. Reeves draws important conclusions from rather curious premises. He refers to an "offensive" street sewer grating, which had "a brick ventilating pipe" under it, running below the road some 30 ft., and thence up a house wall to half-way up the chimney.

Now if this street grating had no water-trap below it, how could it be expected that stink in the sewer should not blow out at it, even although there was a so-called ventilating pipe put up as stated? If it were trapped, there must have been something faulty, or how else could the bad smell get out?

Then, was the "brick" ventilating pipe carried up the wall, or was the vertical pipe iron, and not brick? If iron, what size? and is it not nearly choked at the foot by falling rust; if not painted or coated inside?

Further, if it was desired that this sewer ventilating pipe should act efficiently as a ventilator for the sewer, why was its outlet not carried up to above the chimney eaves several feet, and surmounted by a good fixed exhaust ventilator, instead of the outlet stopping at halfway up the chimney?

So far as I can judge at present from Mr. Reeves's letter, he has no sufficient reason, under the circumstances, to write about the "utter uselessness of stack pipes as a means of ventilation to sewers." In my opinion, the said stack pipes,—but properly connected and put up,—will be much more used in the future than they are as yet.

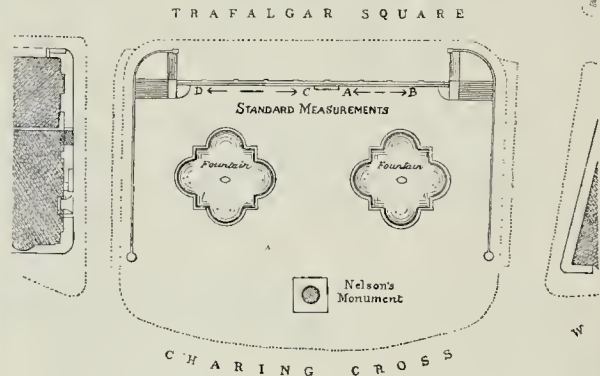

W. P. BUCHAN.

#### SCULPTURE AT ORVIETO CATHEDRAL.

SIR,—In respect of the central figure over the western doorway of Orviëto, a drawing of which appeared in your issue of July 2, I should be glad to be informed whether it is a representation of the Christ or of the Virgin. The character of the face and arrangement of the tunic about the head and shoulders point, I imagine, to the latter; while the use of the stole crossed in front, seem to indicate the former. I should be much obliged, also, to any

\* See pp. 9, 10, ante.

+ In spite of the vesica, it appears to represent the coronation of the Virgin; but this, if we mistake not, is a modern mosaic.—ED.

of your readers who would furnish me with notes of representations of the Saviour, with reference more especially to the vestments worn and position of the figures, which occur in existing remains of Medieval art, in glazing, mural paintings, MS. illuminations, and in statuary, both in England and on the Continent.

The most notable representation which has hitherto come under my notice occurs in a mural painting in the Chapel of St. Gabriel, in Canterbury Cathedral. The figure is vested in an alb-like tunic, with rich collar and hand-shaped girdle; over this is worn the stole (not crossed), the ends of which appear from under an apron attached to the girdle. Above all is a loose tunic, covering one shoulder and knee, and appearing upon the opposite arm. As I write from memory, I cannot give the colours of these vestments.

The most common method of vesting the sacred form shows the two garments ordinarily used by the Jews: the *cethoneth*, or closely-fitting garment, with or without a girdle,—a person wearing this only is described as *naked* in the Bible,—and a tunic worn loosely over the shoulders and around the body.

Sometimes the latter garment only appears, as in a memorial brass at Sibstone, in Leicestershire, of which Bishop Mitchison has kindly supplied me with a rubbing.  
G. M. LITTLE.

Holy Trinity, Twickenham.

#### NUMIDIAN MARBLE.

SIR,—Having executed the whole of the marble work of the National Gallery extension and the grand staircase of the new Liberal Club, we beg to state that none of the materials used are from the quarries of the so-called "Numidian Marble Company Limited," whose revised prospectus is now before the public, and in which they infer that these marbles are the produce of their quarries, when in reality they are shipped at ports 200 and 600 miles off respectively, in North Africa, as concerns the National Gallery; the Liberal Club marbles being the products of Italy.  
July 13. FARMER & BRINDLEY.

#### A QUERY AS TO TILES.

SIR,—We shall be glad if any of your readers can kindly give us the name and address of the maker of blue and red floor tiles, branded with a crown and W. G.  
GEO. BENSON & SON.  
York.

**New Street.**—On Wednesday, the 6th, was opened a new approach, by way of a continuation of Arthur-street East, from Monument-yard to Lower Thames-street—over against Billingsgate Market. For the making of this street by the Commissioners of Sewers, nearly four years ago, a beginning was made by pulling down part of Monument-yard. In its course through Padding-lane, Botolph-lane, and Love-lane, forty-nine houses had to be removed. Of the 108 claims for compensation only four, we are told, were referred to settlement by jury. The cost of the construction is large, amounting to 490,966*l.*, inclusive of the subway. The subway is 12 ft. in diameter by 7 ft. 6 in. in height. It has a central footway, and rails are laid along its length for the transit of a trolley.

#### The Student's Column.

##### LAND SURVEYING AND LEVELLING.

##### III.—THE CHAIN AND CHAINING (continued).

**C**HAINS when new ought always to be examined to see if they are of correct length. They also stretch with frequent use, and need to be afterwards occasionally tested. Special standards for the use of surveyors in London have been fixed by the Government at Trafalgar-square (see fig. 5), and also in the Guildhall. Their lengths are derived from the British standard yard, which is the distance at the temperature of 62 Fahrenheit between two marks upon a certain bar, which is preserved in the office of her Majesty's Exchequer, official copies being kept at the Royal Mint, the Royal Observatory at Greenwich, and in the rooms of the Royal Society. The length of the standard yard was finally fixed and legislated by the 5th Geo. IV., c. 74, which declares that "the pendulum vibrating seconds of mean time in the latitude of London in a vacuum at the level of the sea is 39-1393 inches of the standard, and that the yard shall be in the proportion of 36 to 39-1393."

The standards above alluded to for testing chain measurements in London are marked upon pieces of brass let in flush with the masonry into which they are fixed, as indicated in fig. 7. Permanent standards have likewise been fixed by various municipal authorities in prominent positions over different parts of the country. For the purpose of testing the chain employed in an extensive survey during the progress of any work, it is well to fix two pegs upon a level piece of ground near a fence, and at a distance apart just sufficient to enable the outside of the handles of a correct chain when drawn tightly to touch the inner sides of the pegs, as shown in fig. 3 (*Builder*, July 9th, p. 78). This arrangement is better than making the chain's length measure from centre to centre of the pegs. The test distance may be set out very accurately with a level staff, or, better still, with two level staves placed end to end in measuring the line, provided each level staff has been previously tested upon the Government standards. It is sometimes well to keep a properly-tested spare chain in reserve, to be used only for purposes of testing, when a level staff is not near to hand, and the distance should be proved, prior to each testing of a chain, as pegs have been known to be purposely moved by parties interested in opposition.

Figure 8 illustrates the measurement of a base line, and the method of taking offsets from one side of it to a fence line. The station or point upon a line from which the measurement is to commence being first determined, the leader carrying all the arrows draws the chain in the direction of the line to be measured, and is guided by signs from the follower who sights the line of poles or other marks, which determine the direction of the base line. The ten arrows are used as tallies, thus:—When the leader reaches the full stretch of the chain, the other end being

IMPERIAL STANDARD CHAIN OF 66 FEET

FIG 6

IMPERIAL STANDARD CHAIN OF 100 FEET

MEASURING TAPES

FIG 7

FIG 8 - DIAGRAM ILLUSTRATING THE MEASUREMENT OF OFFSETS WITH A TAPE

held fast by the follower, the leader holds an arrow vertically, as shown in fig. 2, against the outer edge of the end ring or brass handle of the chain, and after striking and pulling the chain to ensure a straight line, the leader thrusts No. 1 arrow into the ground. He then leaves it there, and advances with the chain, until the follower who has hold of the other end of the chain reaches No. 1 arrow, and calls upon him to stop. The leader places another arrow against the brass handle or terminal ring of his chain, which is again stretched and directed as before. He then fixes No. 2 arrow into the ground and leaves it there to show the follower what point upon the base line he has next to measure from. The follower now picks up No. 1 arrow, and both the leader and the follower advance as before, until the required length of line is measured, or until all the ten arrows have changed hands, when a pole can be placed in line to mark the position of the tenth arrow, or length of one thousand links, while the follower hands all the ten arrows to the leader. If the ground is too hard to press the arrow at the end of any chain's length into its place, the leader marks the ground with the point of an arrow, thus,  $\nabla$ , and lays the arrow down. The intersection of the lines in this mark shows the follower to which point the end of the chain has to be held in continuing the measurement of the line.

In taking offsets, the surveyor reads the tape at the chain, and the ring of the tape being held at a point to which the offset is required, the surveyor twists the tape round in a horizontal plane, as shown in fig. 8, in order to read the shortest measurements, and also to ascertain the link upon the chain at which the offset would form a perpendicular to the base line. When a ditch intervenes, the centre of a bedge may be reached by placing the spiked end of a ranging rod in the ring of the tape C, as indicated in fig. 7, and proceeding as in fig. 8.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

10,150, Preventing Down-draught in Chimneys. J. De Baere.

According to this invention, a box or casing is made double the width of the chimney opening, and an opening is made near the back of the case corresponding with the opening or flue of the chimney. A stop-plate projects half way across the width of the case, and being so placed allows a passage for the smoke to pass around it and so up the chimney. The stop-plate is also hinged, so that when the chimney is to be swept it can be turned back.

10,219, Ventilation of Drains. P. R. Smyth.

By this invention ventilating-boxes are fitted, preferably at the surface, for drains and traps leading to the common sewers. Each of these boxes consists of a light cast-iron circular case about twice the diameter of the pipe to which it is to be fitted, and having in the centre a smaller pipe of near the diameter of the trap or pipe. This is fitted with an open spigot end, and the sides of the short central pipe are perforated with holes, as a rose.

10,682, Improvements in Lavatories. P. Everitt.

This invention consists in an application of the automatic principle, whereby the appliances may be used by the introduction of a coin. A lock is so fixed that only on the introduction of a coin or token can any part of the apparatus be raised or lowered for use.

13,313, Disinfecting and Ventilating Drains or Sewers. R. H. Reeves.

The chemicals used by the inventor for disinfecting are mixed in separate chambers before being passed into the basin or receptacle. By the admixture of suitable chemicals, with drip-taps and other appliances to regulate the issues, a vapour is formed which, it is claimed, greatly increases the power of the disinfectant. Different forms of the appliance are used for separate situations.

14,386, Manufacture and fixing Metal Tiles. F. H. Rees.

The chief improvement to which this invention refers consists of making the flange-pieces, which are used to fasten the tiles in position, of a non-corroding metal. Instead, also, of being made out of the same piece of metal as that of which the tile is formed, they are in smaller detachable pieces. These two simple points are, it is claimed, of some importance, as it is found that the tiles are liable to be destroyed by rust when fixed to damp walls.

16,694, Window Fastenings. J. L. Seymour.

This invention relates to a lever-catch, which, when the window is fixed in position, falls by gravity and prevents the ash being lifted.

6,494, Metallic Roofing. L. L. Sagendorph.

By this invention special ridges and corrugations are made with the view of forming a joint which is perfectly impervious to water, and which is easily connected, and allows the tiles to be readily secured in place. The form slightly varies for special purposes, but is not unlike the general make of metallic tiles.

STAINED GLASS.

Chester.—A Manchester paper says that the Duke of Westminster is about to fill with stained glass the great west window of the Church of St. John, Chester. The subjects to be depicted will be taken from episodes in the history of St. John. Mr. Frampton, of London, has, it is understood, been commissioned to prepare the designs for the window.

Ilkley.—A window has been placed in Ilkley Parish Church by the change-ringers of England, in memory of Mr. Jasper Whitfield Snowdon, late president of the Yorkshire Association of Change-Ringers. The window, a three-light one of rich coloring, is placed at the north-side of the church, near the tower, and introduces Gothic details of stonework, with swinging bells visible through the openings. A group of angels, portrayed as offering praise on strings and pipe, forms the leading feature of the window; and three views are given in the base showing the bells "at rest," and when "set" at "band-and-back stroke." In the upper part of the middle light the heavens are shown opening, and permitting the sacrifice of praise to ascend; and across the three lights are scrolls bearing portions of Psalm cl. The entire work has been designed and executed by Messrs. Powell Brothers, of Leeds.

Holborn Theatre.—The Holborn Theatre, High Holborn, which has been for a long time vacant, is about to be converted into a public hall, which is proposed to be called West Central Hall. The hall will be about 160 ft. long and 85 ft. wide for the greater part of its length, and 54 ft. high, to the apex of the roof. The hall will have two tiers of galleries, and will have exits into French Horn-yard and Eagle-street. The architect is Mr. E. Clark, of West Strand.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

JULY 1.

By B. REID.  
Cherting Cross-road and Shaftesbury-avenue—The letting of 62 plots of building land, for a term of 80 years, averaged from 8d. to 4s. 9d. per foot .....

JULY 4.

By F. J. DABY.  
Bermondsey—1, 3, and 5, Franciscus-street, freehold .....

Rotherhithe—41 and 50, Swan-street, freehold .....

By J. & R. KEMP & Co.  
Barnes—Ground-rents of 194, reversion in 80 years .....

By EBARD & SON.  
Paddington—33, Hercules-street, 59 years, ground-rent 5s. ....

JULY 5.

By BEAL, SON, & CHARTERS.  
Shoreditch—77, 79, and 81, Curtain-road, freehold .....

By DALE & SON.  
Ratcliff—115, Brook-street, 33 years, ground-rent 10s. ....

By C. & H. WHITE.  
Clapham-road—28, Aldebert-terrace, 78 years, ground-rent 7s. 10s. ....

By PATCHING & JOHNS.  
Worthing.—The freehold house "Grayingham," and Angusta Home-street, freehold .....

By E. & H. LUMLEY.  
Portman-square—4, Granville-place, 68 years, ground-rent 5s. ....

By DEERHAM, TAYSON, & Co.  
City of London—Ground-rent of 42s., reversion in 10 years .....

Poplar, Burcham-street—Ground-rents of 16s., reversion in 67 years .....

St. Leonard's-avenue—Ground-rent of 8s., reversion in 84 years .....

Canning Town—Ground-rent of 33s. 10s., reversion in 80 years .....

MEETINGS.

SATURDAY, JULY 16.

**Architectural Association.**—Visits to Sutton Place, near Guildford, and Loseley Park. (See advertisement on p. 1, July 9.) Trains from Waterloo at 9.45 a.m., and 2.45 p.m.  
**Association of Municipal and Sanitary Engineers and Surveyors.**—Annual Meeting at Leicester. (Third Day.)  
 Visits to Victoria Stone Company's Works, Bradgate Reservoir, Mount Sorrel Granite Quarries, and the Barrow Lime-works.  
**St. Paul's Ecclesiastical Society.**—Visit to Salisbury.  
 Train from Waterloo at 9.45 a.m.  
**Liverpool Engineering Society.**—Excursion to view the Park Extension of the Mersey Railway, the Wirral Railway, and the Bidston Observatory.

TUESDAY, JULY 19.

**Victoria Institute.**—Annual meeting: Address by Professor Stokes. 8 p.m.

WEDNESDAY, JULY 20.

**Builders' Foremen and Clerks of Works' Institution.**—Half-yearly meeting. 8.30 p.m.

Miscellaneous.

**The Will of the late Sir Horace Jones.**—The will of Sir Horace Jones, the City Architect, late of 30, Devonshire-place, and 4, Coddington-place, Brighton, and also of the Guildhall, who died, on May 21st last, was proved on the 2nd inst. by Dame Ann Elizabeth Jones, the widow, and Mr. Octavian Hansard, 2, of the executors, the value of the personal estate exceeding 20,000. The testator gives all his household furniture, plate, glass, linen, pictures, carriages, horses, wines, consumable stores, and jewelry, and 1,000l. to his wife; 20l. to his executor, Mr. Hansard; the use, rent free, of his house, White Lodge, Sunbury, to his three sisters, Mary Shopherd Jones, Sarah Gardiner Jones, and Lydia Lynch Jones, for their lives, and numerous legacies to relatives and friends. His property at Rotherhithe, together with his houses, 22, Ulster-place, and 62 and 54, Cannon-street, he leaves upon trust for his wife for life or widowhood, and then to his said daughter absolutely; but by a codicil the testator (in the event of his having other children besides his said daughter) leaves the residue of his property between them in equal shares.—City Press.

Great Indian Peninsular Railway

**Terminus, Bombay.**—The central keystone of the large masonry dome of the above buildings was fixed on Jubilee day, the 20th of June, thus bringing this large work to another stage nearer completion. The event was signalled by the contractors, Messrs. Burjoojee Rastoojee, Maistry, & Co., having a ceremony and presenting their sub-contractors, head maistries (foremen), and moneys, the usual native method of appreciating services rendered when any great work has been practically completed. The dome, which is 45 ft. clear span, is entirely of cut-stone masonry, and has been constructed without any centering or supports whatever. The whole of the interior masonry construction of the dome is exposed to view, and covers the grand staircase and ball. Now that the keystone has been fixed there only remain the embellishments of the interior and exterior, such as the mouldings, carvings, and statuary. The dome will be terminated by a colossal figure of "Progress" in Bath stone. The buildings will in all probability be completed by the beginning of next year. The statue of H.M. the Queen-Empress, representing the State, the railway being guaranteed by Government, will be placed under the canopy in the central gable of the building. The cost of the terminal buildings when completed will be 27 lacs of rupees, or 250,000l. They were designed by Mr. F. W. Stevens, late of the Public Works Department, and are being carried out by that officer with the assistance of Mr. Siteram Khanderin, assistant engineer. The sculpture for the buildings has been executed by Messrs. Earp & Son, of Lambeth.

**Another Inter-oceanic Railway.**—The contract for the construction of another important inter-oceanic highway has just been concluded. It is proposed to construct a railway in Guatemala, to extend from Santa Tomas, on the Atlantic seaboard, to the Pacific Ocean, a distance of 275 miles. The new railway is to be in operation in eighteen months. The scheme was postponed in consequence of the death of President Barrios, but negotiations between representatives of Guatemala and two American contractors, Mr. Charles Mackin and Mr. J. H. McCreery, have been concluded in New York, and the necessary funds provided. Guatemala is the richest coffee country in the world, and an inter-oceanic railway, such as is projected, means a curtailing of the route to California by over 2,000 miles. In renewing negotiations for the railway, the Government has made some very valuable concessions. By the terms of the present contract the contractors are to receive 50,000 dol. per mile in gold-bearing government bonds, 5,000 dol. in gold per mile, and a grant of 250,000 acres of land along the line of the road, the route of which the contractors can select themselves. Of the bond issue, 6,000,000 dol. worth are stated to have already been assured of sale in Paris,—enough to ensure the completion of the line. Of the land conceded, General Guacalata, who will be in charge of the construction, states that no less than 30,000 acres of it are in rubber trees, and the remainder is rich in mahogany, rosewood, and other valuable woods. Last year Guatemala exported 80,000,000 pounds of coffee, and the trade is susceptible of rapid expansion.—Iron.

**Chubb's Push and Pull Locke.**—On the 8th instant an interlocutory application was made on behalf of the plaintiff in the case of Kaye v. Chubb to the Master of the Rolls (Lord Esher) and Lords Justices Lindley and Lopes, for a stay of proceedings in the action pending an appeal to the House of Lords. When the action was tried, Mr. Justice Mathew decided in favour of the plaintiff; but in the Court of Appeal their lordships gave judgment with costs in favour of the defendants, Messrs. Chubb, lock and safe manufacturers. The plaintiff having entered a further appeal to the House of Lords, now applied for a stay of execution pending the result of such appeal. After hearing the arguments, however, their lordships refused the application with costs.

**Numidian Marble.**—Our columns have of late contained several references to Numidian marbles, which, owing to their richness and beauty, are beginning to be used in modern buildings in this country. In our advertisement columns will be found the prospectus of a company which has been formed to work the Numidian quarries, which are stated to be practically inexhaustible.

A New Public Hall at Mitcham.

—A new Vestry-hall, which is also intended to serve the purposes of a public hall for meetings and general entertainments, has just been erected and opened at Mitcham. The land upon which it has been erected is on an open and central situation overlooking Mitcham Green, and the principal frontage of the building to the high road from Mitcham to Sutton. The building is in the "Queen Anne" style, the materials used being red brick, with patent red-brick window heads and bands, and Shawk stone dressings, entrances, and cornice. The principal frontage, facing Mitcham Green, is 80 ft. in length, the height of the cornice being 40 ft., and to the ridge of the high-pitched roof 60 ft. At the north-east corner a clock tower, in which there is an illuminated clock and a peal of bells, rises to a height of 80 ft., and in a central position, above the summit of the roof, there is a ventilating flèche rising to the same height as the tower. The building is isolated, the north and south return frontages being 35 ft. in length, and the west frontage of the same length as the principal elevation to the east. The ground-floor contains a committee-room and three offices, one of which forms the general office for the business of the parish of Mitcham, the other two offices being let to the Croydon Sanitary Authority. The upper floor contains a public-hall, 58 ft. in length and 31 ft. in width, and is 32 ft. in height to the apex of an open timber roof, in which there are three central outlets connected with the ventilating flèche. In the walls are also inserted Benham's ventilating inlets. The hall will seat an audience of about 400 persons. At the south end there is a moveable platform or stage. In connexion with the hall there are retiring and cloak rooms: The architect of the building, which has cost about 3,500l., is Mr. R. M. Chart, and the contractor was Mr. E. J. Burnand, of Wallington. It may be added that the building has been erected on the site of the old stocks and "cage," which were removed for the purpose.

Sale of a Building Estate in Kent.

—On Thursday last week the first portion of a building estate, situated on Swanley Hills, in Kent, was offered for sale by Messrs. Baker & Sons. It is known as the Rowell Estate, comprising about 15 acres, and has been laid out for the erection of upwards of 250 houses and shops, five new roads, each 50 ft. in width, having been formed on the estate. It is about a mile and a half distant from the Swanley Junction of the London, Chatham, and Dover Railway, and nearly two miles from the Crawford Station of the South-Eastern line. It stands upon high ground, commanding extensive views of the county of Kent for several miles around. The number of plots offered was 166, being nearly two-thirds of the entire number of plots on the estate, twelve being shop plots, and one a hotel plot. Before inviting offers, Mr. Baker, the auctioneer, reminded the company present that the whole of the plots to be submitted would be sold without the slightest reserve for whatever they might fetch, it being the object of the vendor to offer every encouragement for the immediate commencement of building on the property. He added that the purchasers of the several lots would have conveyances made to them free of expense except the stamp duty. On the sale commencing, the whole of the plots were rapidly sold, several purchasers taking as many as six and twelve plots each. The plots for the erection of private houses, having frontages of 16 ft., and depths of about 70 ft., were sold at from 31. to 41. each, whilst the shop plots, having frontages of 18 ft., and depths of about 80 ft., realised from 61. to 81. each. The hotel plot, having a frontage of 54 ft. to Claremont-road (the main road to London), and a return frontage of 80 ft., was sold for 451.

**Andover.**—The Mansion of Enham-place, near Andover, belonging to the late Colonel Earle, which was destroyed by fire four years ago, is about to be re-built by his brother, Mr. Thomas Hughes Earle, Clerk of the Peace for Hants. Except by the incorporation of the old cellars, the house will be erected from entirely new plans, by Mr. Samuel Knight. The style adopted is Italian, Classic in its detail, but with high-pitched tile roofs, tall chimneys, and other Jacobean features. The elevations in red brick and Ham-bill stone. The general contract has been entered into with Messrs. Stephens, Bastow, & Co., of Bristol.

**Carved Statuary Marble Mantelpieces for Melbourne.**—We have had an opportunity of inspecting, at the show-rooms of Messrs. George Wright & Co., 155, Queen Victoria-street, one of a pair of large and handsome mantelpieces executed by that firm for the drawing-room of a new mansion at Melbourne for Sir William Clarke, Bart. The mantelpieces are Renaissance in style. The fireplace or opening is 4 feet wide, with deep splayed lined with large and very good hand-painted tiles. The cast-iron dog-grate has nickel bars, and the "dogs" are of hollow cast brasswork, pierced and burnished, the supports for the fire-irons being of the same material, similarly treated. The piers of the mantelpiece are 18 in. wide. The height to the top of the shelf (which is 21 in. wide) is 5 ft. 7 in. The shelf, which is richly moulded, is supported by carved consoles, in their turn supported by diminishing pilasters. The frieze is broadly treated, and has in the centre a shield supported by two cherubs—rather too sedate of feature, perhaps. On each side of these is a "swag" of roses and leaves, and smaller "swags" are looped round the consoles which support the mantelshelf. The workmanship is very creditable. The show-rooms of this firm, we may add, are well worth visiting, for, among other specialties, they contain a new tile-canopied dog-grate which, while excellent in appearance, seems to be well calculated to prevent the smoky chimneys too often resulting where dog-grates are used.

**Handy Reference Books for the Office.**—"May's British and Irish Press Guide for 1887" (London: F. L. May & Co., 159, Piccadilly) is a compact and well-arranged handy-book, and that its merits are appreciated evidence is afforded by the fact that this is its fourteenth year. It is what it claims to be, "a classified, concise, and comprehensive index to the Press of the United Kingdom," and it also includes a list of the principal Colonial and foreign journals. We can cordially recommend it. It is published at 1s.—Another work of a reference of a kind character, but with some special features superadded, is "Sells' Dictionary of the World's Press for 1887" (London: H. Sell, 107, Fleet-street). Of this work we are able to say, after careful examination, that, on the whole, it is perhaps the most complete reference-book of its kind—as, indeed, it ought to be, taking its bulkiness into consideration. With one or two exceptions which we have noticed, it appears to be very accurate and quite up to date. It gives lists of foreign journals, as well as those of Great Britain and Ireland, and a large mass of matter interesting to all who buy, read, or advertise in papers,—in other words, to everybody. It claims to be the largest 2s. book ever published.

**A Memorial Pulpit** has been erected in Sparkwell Church, Plympton, South Devon, of which the Rev. Pender H. Cudlip is the vicar. It was designed by the Rev. E. Geldart, of Little Braxted, Witham, Essex. The base is of freestone, and the superstructure in English oak, with traciced and carved panels and cornices; the central panel contains a sculptured figure of St. John the Baptist, in high relief, standing on a carved corbel, and a riband over the figure bearing the words "Bring forth fruits of penance" carved thereon. A "brass" inserted in one of the panels bears the following inscription in Old English text—"In loving memory of Vice-Admiral George Woolcombe, of Hemerdon, died 3rd July, MDCCCLXXV, aged 70, and of Mary Elizabeth Woolcombe, his wife, died 26th Jan'y, MDCCCLXXXIII, aged 81. Erected by Major and Mrs. Robert Woolcombe." The whole of the work has been executed by Messrs. Linscombe & Son, of Exeter.

**St. George's-in-the-East Workhouse.**—The Report of the Local Government Board Inspector (Dr. Brydges) upon the recent additions to this establishment has been laid before the Guardians. It states that the new workhouse block (Messrs. Wilson, Son, & Aldwinckle, architects) is all that could be desired as regards drainage, warmth, and ventilation, which is on the Boyle system. On the occasion of Dr. Brydges' visit, the Workhouse was full of people, but we are informed that the air was remarkably pure. The report was referred to the House Committee for consideration.

**National Gallery Alterations.**—We are asked to mention that the material of the steps in the new work is from the Craigleith quarries.

**The Banner Sanitation Company** has recently issued a very concise and instructive catalogue, entitled "The Sanitarians' Companion." It is not confined to the Company's own well-known specialties, but includes specialties of other makers, so that, in short, it forms a complete conspectus of the best modern practice in sanitation and sanitary fittings. It is not overlaid with a multiplicity of detail, but shows at a glance typical specimens of the best kind of fittings and apparatus for varying requirements. The Company a year ago opened excellent show-rooms at Wessex House, Northumberland-avenue (opposite the Hotel Métropole), where may be seen in action a great many of the appliances figured and described in the catalogue. We would specially call attention to Banner's patent "drain grenade" or "drain ferret," a small tube of this glass charged with pungent and volatile chemicals. When one of these "grenades" or "ferrets" is dropped down any pipe, it breaks, and the odour of its contents can, with necessary precautions, be confined within any particular section of a house-drainage system which may be suspected of allowing the escape of sewer-gas. The advantages of enclosing the chemicals in glass are obvious. Among valve-closets figured in the catalogue is the "Nestor," the special feature of which is that the trap of the overflow is formed by the water in the basin itself, and therefore cannot be unsprung, nor is it likely to get choked, for the water in the overflow-pipe is necessarily changed each time the closet is used. The catalogue also includes particulars of a very efficient and cheap "wash-out" closet.

**Upper Helmsley.**—A consistory court was recently held at York Minster, before a surrogate to Lord Grimthorpe, when a faculty was decreed to the Rev. G. J. Horner, rector of Upper Helmsley, and Colonel G. E. Herbert, churchwarden, for the carrying out of what are described as improvements at the parish church. It is proposed to re-roof the edifice, and to build new chancel, porch, vestry, and heating-chamber. Internal alterations are also to be made, the church being reseated and refitted, and other desirable improvements effected. The plans are being prepared by Messrs. William Lewis & Son, architects, York.

**Paper Doors.**—Paper doors are coming into use in America, and it is not difficult to foresee that, should they answer requirements, they will soon be introduced in Europe. It is said that they compare favourably with those of wood, as they neither shrink, swell, crack, nor warp. The doors are formed of two thick paper boards, stamped and moulded into panels, and joined together with glue and putty, and finally rolled through heavy rollers. After being covered with a waterproof coating, and with another which is fireproof, the doors are painted, varnished, and hung in the usual way.

**George Neal & Co. (Limited).**—Our advertisement columns this week contain the abridged prospectus of a company which has been formed to acquire, as a going concern, and to further develop, the business,—well known throughout the whole of the Metropolis—of Mr. George Neal, of Wandsworth and Battersea, lime, cement, and brick merchant, wharfinger, hallast, tar-paving, and general contractor and carman, started by the late Mr. Robert Neal as far back as 1826.

**Arbitration in re the Sheffield Sewerage Works.**—The Sewerage and Rivers Committee of the Sheffield Town Council have recommended that the corporate common law be asked to the appointment of Mr. C. J. Innocent, architect and surveyor, as single arbitrator to settle the amount of compensation to be paid to Mr. David Ward, "for the loss and damage alleged to have been sustained by him in respect of his property at Walkley Bank, by reason of the construction of certain works of sewerage."

**Preservation of Stone.**—In reference to our recent articles on this subject, a correspondent writes:—"About twenty years ago two houses were built in Ashley-place, the exterior being formed of brick and Bath stone dressings; the stonework was, on completion, covered with Ransome's silicate, which has preserved the stone from any decay whatever."

**Upton (Essex).**—The new church for the Franciscans, at Upton (Essex), is now being built from the designs of Messrs. Pugin & Pugin. The contractor is Mr. James Morter, of Stratford.

**Parish of St. Mary Magdalen.**—The Commissioners appointed ad hoc recommend in their report that the contemplated union of the parishes of St. Mary Magdalen, Old Fish-street, and St. Gregory-by-St. Paul with that of St. Martin-by-Ludgate, should be carried out forthwith. An income of 570l. per annum will be paid to the rector of the new benefice, and the proceeds of the sale of the site of St. Mary Magdalen, in Knight-riding-street (the church having been lately destroyed by fire), will be devoted towards the building of a new church in London.

**Architectural Lectures.**—The lectures on Style and Styles in Building, to be delivered by Mr. Harvey at the Guilds' Institute, will begin on the 19th inst. The fee for the whole course is 5s. Applications for tickets and syllabus to be addressed to the Secretary of the City and Guilds of London Institute, Exhibition-road.

**Linthgow.**—The new Catholic church at Linthgow, designed by Messrs. Pugin & Pugin, has just been commenced. It is being built in memory of Mary, Queen of Scots.

### Pottery at the Burlington Fine Arts Club.

THE examples of Hispano-Moresque and of Majolica ware, now collected at the Burlington Fine Arts Club, form one of the most attractive of the loan exhibitions which have been

seen there; though the interest of the first-named portion of the collection, the Hispano-Moresque ware, has been somewhat exaggerated. It is a type of work which, as representing a special development of pottery design under special influences, was no doubt worth collective illustration, but its merit in regard to design and execution is not, for the most part, of the highest order; a good deal of the work is roughly delineated and executed, and the designs based on a few rather commonplace motives, though some of them are certainly valuable as suggestions which might be further worked out. The majolica portion of the collection consists of a class of work with which most visitors will be tolerably familiar; but it is not often that there is an opportunity of studying and comparing so fine a collection of examples in one room.

The work defined as Hispano-Moresque has been supposed to be the production of Moorish potters working in Spain under Christian rule, though there seems no special reason for this conclusion beyond the negative one that it is difficult to account for its character under any other supposition as to its origin. Moresque it is in character, but later than the period of Moorish power, and its designs are mingled with Christian emblems. There is thus a vagueness and uncertainty in regard to it which gives it interest as a historical curiosity; and amid some rather coarse work of very varying degree of excellence, are some fine designs of rather unusual character.

The majority of the examples of this work in the collection, which are attributed to the fifteenth and sixteenth centuries, consist of rather large circular dishes, with broad rims, and in many cases with raised bosses in the centre. The general decoration is in most cases in conventional floral diaper of metallic lustre, and in some cases the design is raised or embossed in parts, the embossed portions being most generally the flower forms which are the salient points in the ornamental design, though in some cases mere repetition forms, mechanically repeated, are thus emphasised by partial relief. A feature recurring in a good many examples is the employment of broad lines or divisions spring-

ing tangentially from a centre boss or medalion, so as to impart a spiral character to the design. This rather obvious and well-worn device is repeated so often as to appear as a kind of recognised fashion among the producers, whoever they were, of this ware.

Among the examples possessing special characteristics are two dishes, forming a pair (2 and 3 in the catalogue), which are covered with a small diapering in gold lustre, but have large figures of a lion and a hull respectively, coarsely incised in outline on the surface, the figure occupying the entire surface of the dish as a ground, entirely irrespective of the division into sides and centre. The animals, the bull especially, are rude and clumsy in drawing, but the incident is so peculiar as to be worth attention on that ground. One of the examples that is of value, on far different grounds, is No. 5, a dish of a make of which there are only a few examples in the collection, with a deep centre and vertical sides or walls between centre and rim. The surface is entirely covered, except for a shield in the centre, with concentric circles of vine leaves and tendrils, the leaves being alternately gold lustre and blue; the general arrangement is nearly symmetrical, with variety in the details. There is no decorative sense, it is true, in making the same leaves of alternating colours; in every design where colour comes in as an element, there should be some obvious reason for distinction of colour, the one colour should be a leaf, the other a flower, or the leaves of contrasted colours should be of different outline. But, apart from this little aesthetic lapse, the effect of this dish, with its sparkling circlets of leaves, is charming, and it suggests a *motif* which might be further carried out and developed with greater elaboration. That is one use of such exhibitions as this; quite beyond the mere "collector's" interest in it is the artistic interest of noting what has been attempted in the way of decorative idea which may furnish new suggestions, and be susceptible of new and perhaps better treatment.

This concentric arrangement, which is shown with good effect in the last-named example, is found in a good many other instances carried out in a more mechanical manner and with little artistic effect; it is more like pattern-making than designing. Another peculiar form among these exhibits, not beautiful, but worth noting from its peculiarity, is that exhibited in No. 20, and in some other examples, where the prominent decorative feature consists of raised lines in relief, radiating from the central boss at equal distances, like the spokes of a wheel. It is a poor and mechanical effect, but seems to have been a fashion at

one time, and is tried in two or three different ways. The "spokes" usually cross to the outside of the rim without any reference to the structural division of the dish. The reference of the decorative design to the structural form is entirely neglected in many of these Hispano-Moresque designs; in some, and those among the best otherwise, it is carefully kept in view. Thus in No. 91, a very fine example, the centre boss, the surface of the bowl, and the rim, are kept quite distinct in treatment, the surface of the bowl being ornamented with a zone of conventional floral design, leaving a space on each side of it; the rim having a gadrooned ornamental form embossed on it. This gadroon ornament is a characteristic of the school, and recurs frequently. In some cases it is made out in relief, without any special decorative outlining; in others, as in No. 80, it is treated with considerable elaboration, the gadroons being varied in detail, either singly or in groups. In No. 117 is found a design entirely differing from any other in the collection, though the plateau on which it is found obviously belongs to the same class of manufacture as the rest; this is a Japanese-like eccentricity, where the circle is divided into four quarters by strong blue lines crossing each other at right angles, and two of the opposite divisions are filled up with similar lines, all running parallel to one of the central ones, the other two divisions being filled with foliated ornament. This is so completely different from any other design in the collection, that it looks like an experiment on the part of a single free-thinking designer.

Some other special examples may be noticed. No. 22 shows a surface covered with very delicate and flowing floral ornaments in gold lustre, while over all this is painted a great *fleur-de-lis*, in dark blue, the whole width of the dish. This looks rather rampant, but it is certainly bold and effective. Nos. 31 and 34 are worth attention as fine hold designs; the latter shows a main design of two Maltese crosses interlacing, the one in a mass of gold lustre, the other in geometrical diapering in gold lustre. The description adds, "At the back, concentric circles of lines of zigzags, with an arrow-head in the centre." From the catalogue it appears that a majority of the examples have this kind of subordinate decoration at the back; and as this decoration of the back of the plate is a special feature of some interest, it is a pity that some of them were not arranged so as to show back and front, or, where the designs are in pairs, as in some cases, to show the front of one and the back of another. Nos. 44 and 47 are two other fine examples of bold work, designed more or less with reference to construction; while

No. 49 is a warning as to a radical mistake in designing conventional foliage, as the hits of foliage on the rim show growth from opposite ends of the same stem, a feature most uncomfortable to the sense of logic in design. It would have shocked Owen Jones to find any artist of his beloved Moresque School committing such a deadly sin as this. The plateau, No. 53, with little bunches of leaves in relief on the outer rim, is another unrighteous piece of work, for these little blobs of leaves have no principle of arrangement and no growth from anything else in the design, and are clumsily designed in themselves. No. 59, with some very finely-drawn conventional leafage in gold lustre, with dark blue flowers interspersed, is well worth attention. Nos. 74 and 75, hung as pendants, and evidently by the same hand, are interesting as showing a special character differing from any other examples; the surface covered with floral dispersing in gold lustre and dark blue, radiating from the centre, but in thin interlacing sprays; pretty in effect, but a little weak. Nearly all the floral decoration employed is of the type so largely pervading Moresque design; that which looks as if it arose from the influence of Greek ornament on Moorish feeling and taste, and which consists of cleanly-drawn flowing stems, with small conventional leaflets growing from them at intervals. This is a beautiful form of decorative foliage when well carried out; but in a great many of the examples here it is carelessly and clumsily drawn, and, in fact, produces an impression of being the imitation of good work by inferior draughtsmen.

The majority, in fact, of these Hispano-Moresque plates seen, in comparison with the majolica collection, like the decorative efforts of children as compared with those of practised artists and draughtsmen. This latter part of the collection is of the greatest interest in more senses than one; for splendour of colour and often of draughtsmanship, and for the atmosphere of the world of Renaissance Italy, its tastes and feelings, which seems to pervade the whole. A large number of the examples, of course, contain painted figure-subjects; and though the drawing of the figure, as is the case in the majority of these majolica plate pictures, is not up to the great standard of the Renaissance, and shows especially far too strongly marked curvatures in the outlines of the limbs, still the spirit and earnestness of action, and the direct way in which the story is told, render these ware-pictures of considerable interest, even from the pictorial point of view. The best of them date during the first half of the sixteenth century. The writer of the short introduction to the catalogue, remarking that a great number of majolica examples are named and dated, says, "It thus appears that the most interesting works were produced about 1480-1525, and the most artistic about 1525-1570, and that they were chiefly produced in and around the Duchy of Urbino." He does not define, however, what he means by "interesting," nor in what sense the admittedly less artistic work is to be ranked as "more interesting" than the more artistic. This, we presume, is a piece of collector's logic; from our point of view, we confess that we find the most artistic examples the most "interesting." Among the finest designs in this portion of the collection are two remarkable works in blue and white, grisaille shaded; one (140) lent by the Queen, the other (174) lent by Mr. Drury Fortnum. The first of these is a large circular dish, with grotesques, monsters, and birds left in white on a ground of dark blue, and shaded and modelled in grisaille. The design extends all over the dish, without taking account of its shape, and the figures and scrolls are designed with that combination of boldness and refinement which is characteristic of the finest decorative work of the Renaissance. The other, No. 174, is less bold, but even finer and more finished in execution. In this case the blue, a much lighter one, is painted on, and forms the design, on a grey ground, the design being heightened with touches of white. The centre shows a figure of a mermaid with a mirror in her hand, the

figure drawn with more delicacy and finish than is to be found in any other example in the collection. She is floating on water, with buildings seen on the shore in the distance. On the rim is a beautifully-designed symmetrical ornament of interlacing sprays of flowers, &c., representing the perfection of Renaissance ornament of this class. Both these two are Venetian, and 174 is said to be the earliest dated piece of Venetian ware (1540); but why on earth the catalogue should therefore jump to the conclusion that they are "perhaps by the same hand" it is impossible to understand; this is another piece of "collector's logic"; to any artist it must be manifest at a glance that they could not be by the same hand; the whole touch and style of the two is as different as possible,—as well as the colour and the method of execution; but they are both splendid pieces of work, and the former especially (140) seems full of the exuberant life of the Renaissance.

Of course, however, fine as are these blue and white examples, we generally connect the idea of rich colour, creamy yellows and deep blues, with the idea of majolica, or maiolica, ware (the catalogue adopts the latter spelling); and of the ware of this type there is a splendid collection. It is impossible to do more here than give a general idea of what is to be seen, and note a few of the most striking examples. The top and one side of the room, and the cases in the centre, are entirely occupied by examples of majolica of the richest decorative type, and many containing figure subjects of more or less spirit and interest. Among the most interesting of the pictorial ones, and also a very well designed piece in a decorative sense, is No. 167, one of a series of which several pieces are, we are told, in the Correr Museum at Venice. It has a deep centre, in which is the figure of a bull within a circle, and the wide rim is occupied by a scene from the history of Midas, who is enthroned on the right, a Cupid, hound, kneels before him, and on the left three women, two draped and one nude, come from a house, the architectural details of which, including a projecting balcony on heavy corbels, are shown with some minuteness. This is dated 1482, and is therefore one of the "more interesting," according to the catalogue preface, and here we concur; it is one of the most interesting in the room in its intensely Renaissance feeling, and also in the disposition of the figures and architecture, and one of the best executed in regard to the figures, in spite of its early date. Architectural accessories occur in a good many of the pictured scenes, but they are not of much interest in general to the architect, except as illustrating the rather odd manner in which Classic detail is modified to suit the purpose of the decorative designer, or perhaps rather to save him the trouble of drawing it correctly. Two large dishes, or rather a dish and a tazza, which both illustrate the Rape of Helen (233 and 260), are interesting, as showing a repetition of nearly the same action and position of the principal figures in the foreground (notice in both the hoataan seated on the edge of the boat, with his back to the spectator, and turning to observe the contest with those on the bank); in both a palace is shown on the right, though with considerable difference of treatment. These are not among the most decorative in effect; they are interesting rather as figure-compositions. The first is by Nicola da Urbino, and the second is put down as "probably" by him, but that, we imagine, is merely a conclusion from the fact that the arrangement of the groups is similar. That is, however, eluding the very question which the comparison of the two suggests, viz., whether there was any generally accepted treatment of the subject which was adopted in its main lines by various artists, as there have been in regard to other subjects, both in Classical, Mediæval, and Renaissance periods.

Among the other objects in this fine collection which we specially noted for their decorative effectiveness are No. 189, a plate with a portrait in the centre and a fine border of dolphins and acanthus leaves, very bold in design; No. 194, a small tazza, the centre representing an open music-book, with

grotesques filling up the rest of the space, a beautiful decorative effect with a special suggestion in it; No. 199, tazza, with grotesques moulded in relief and coloured grey against a dark blue background; 200, remarkable for the boldness of its border of grotesque figures; 201, the Death of Tarpeia, with architectural details of considerable interest, figure very spirited in action, and the landscape fine as far as a landscape in such a medium can be fine,—the whole with a very Titianesque glow about it; 207, plate with a sunk centre and a medallion portrait with a very fine border; 209, of somewhat similar type; 213, a medallion with coat of arms and cupids and tritons in white on a dark blue background,—this is a most brilliantly effective thing; 214, a cupid riding a dolphin in the centre, with a magnificent border of torsos and masks; 234 and 235, plateau and tazza; pilgrim bottles (239 and 241) on one of the centre cases; two large drug-pots (245 and 348), companion pieces, each with saints in medallions, and the rest of the surface covered with foliage; 256, dish with a man in Mediæval dress playing the violin, and a border of grotesques, &c., in white on a deep blue ground; 247, part of the rim decorated with a dance of cupids, a charming bit of design; 293, tazza, Aurora rising from the Sea, a bright mass of light behind her, and her horses led by the Hours; this is a curious and very spirited composition, rather reminding one of the feeling of Blake.

These are only a few to be noted as exhibiting special effects of colour and design. The whole collection deserves study on the part of those who are concerned in designing in this class of work. The periodical display of porcelain painting at Messrs. Howell & James's would improve very much in artistic value if its contributors could catch some of the decorative spirit, the feeling for rich colour and broadly-treated conventional design, which characterises so much of the majolica ware of the sixteenth century, as illustrated at the Burlington Club.

## NOTES.

**M** DE LESSEPS has issued his proposals for the second series of *Obligations nouvelles* for the Panama Canal. The terms are almost identical with those of the issue of last year, except that the *Obligations*, which are re-imbursable at 1,000 francs each in forty-eight years, are issued at 440 francs, instead of 450 francs. The subscription will be opened, at Paris and at New York, on July 26th, and closed on the same day. The notice is accompanied by a letter from M. de Lesseps, in which he states that more than half the sum realised by the emission of 1886 is in the coffers of the company, and that, "if the 100 millions of francs which we have *en caisse* are a great source of quiet and of force to us, this quiet and this force will be simply tripled by a balance raised to 300 millions." "What is necessary," he adds, "is that with the 600 millions realised, all measures should be taken that the ships may pass from one ocean to the other." Desirable as this object is, it is not quite evident how the proposed issue will tend to effect it. If 8,000,000 are received by the company, on the terms proposed, this whole sum will be required for paying interest and sinking fund (in the form of repaying 6,000 *Obligations* per year) for between ten and eleven years, without laying out a single centime on the works of the canal, and the net result of the operation will be to leave the company burdened with a debt of 16,000,000, in respect of the loan, after that amount of interest and of sinking fund has been paid. The figures come out very simply and clearly on paper. The puzzle is,—what is the object of borrowing money on such terms?

**A**T the Kensington Petty Sessions, on Wednesday last, the 20th inst., a case of some importance as regards railway companies was decided. The Vestry of Hammersmith applied for an order on the London and North-Western

Railway Company to demolish a building erected on the north side of North Pole-road, Wood-lane, Hammersmith, adjoining the Wormwood Scrubs Railway Station, used as a booking-office, which building was alleged by the Vestry to be in advance of the general line of buildings on the north side of North Pole-road, and had been certified to be so by the Superintending Architect to the Metropolitan Board of Works. Mr. Besley appeared for the Vestry, and the railway company was represented by the assistant solicitor to the company. The facts of the case were not disputed, but the company relied upon a decision of Vice-Chancellor Wood in the case of the London and Blackwall Railway Company v. the Board of Works for the Limehouse District (Law Journal's Reports, vol. 26, p. 164, 1856-7), in which a bill was filed to restrain the defendants from demolishing certain buildings for the purpose of a new station and railway over Commercial-road, Limehouse. In the course of his judgment, the Vice-Chancellor remarked:—"I think it quite plain, upon the construction of an Act of Parliament of this special character, that, whenever the Legislature has enacted that certain powers of a special character shall be vested in a corporate body or any body of commissioners for the express purpose of carrying out a special object which the Legislature has in view, no subsequent Act, giving in merely general terms powers which, by their generality, apply to the powers of the special character given by the first Act, will override the special powers so delegated to the particular body of commissioners or corporation." The Bench considered that they were bound by the decision of Vice-Chancellor Wood, and decided the case in favour of the railway company. It has already been decided that a railway company is exempt from the Metropolitan Building Act with regard to the construction of all buildings erected by them even in the heart of the City, and at a distance from their railway, if such buildings can be colourably shown to be for the use of their undertaking; and the effect of recent decisions seems to be that it is competent for a railway company to erect a wooden building in Pall-mall or Cheapside, and to place it in front of the adjoining buildings, without anybody being able to object.

WE regret to see that Mr. Butterfield repeats in the *Times* his extraordinary proposition to remove the front row of columns of the portico of St. Martin's Church, to provide against a more imaginary than genuine obstruction of traffic. Mr. Butterfield states that the parish possesses a model of the church with a portico of only one range of columns, which he concludes "must have been made" under the direction of Gibbs. This, however, is only a possibility, or at best a probability; and supposing the model was made under Gibbs's direction, that would only prove that he was dissatisfied with the shallow porch and improved upon it afterwards. Seeing what a number of blockheads there are who are always ready to pull about a fine building for the sake of "practical" advantage, we cannot but regret that Mr. Butterfield should have been led to give his support as an eminent architect to such a proposition, which we should not scruple to characterise as a wanton act of destruction. Mr. Ralph Nevill's letter on the same subject is much more to the point. He says:—

"The only pinch is at the corner of the National Gallery. All that is required is to take down the flight of steps leading to the disused door of the former residence of the keeper of the Gallery, and to carry the pavement over the useless area adjoining. The railings to the front area would start from the corner of the building. By this means a 40-ft. road would be obtained at very small expense, and without damage to any architectural feature of either building."

This is a common-sense proposition, the more so as it is probable that the front of the National Gallery will be rebuilt sooner or later in a manner more worthy of its position and contents; and therefore even some slight disfigurement to it could only be a temporary

evil, instead of a permanent spoliation, as in the case of St. Martin's. We must protest most strongly against what we must call Mr. Butterfield's extraordinary and most ill-advised proposition.

PROPOSALS are before the shareholders for amalgamating the East and West India (London and Tilbury) and St. Katharine's Docks Companies. The East India Docks, at Blackwall, having a water area of thirty acres, were opened on August 4th, 1808, for the Honourable East India Company. They have since passed to the West India Dock Company, whose basins were opened on August 27th, 1802, the first stone having been laid by William Pitt on July 12th, 1800. William Jessop was the engineer; his plans cover nearly 300 acres, including the canal across the Isle of Dogs. Hardwick constructed the St. Katharine's Docks, next eastwards of the Tower, from the designs of Telford, at a cost of 1,700,000. As many as 2,500 navvies were employed for a period of fifteen months, 1827-8, in digging out the ground. Most of the excavated earth was carried up the river to Millbank, and thence utilised for filling in the Chelsea Water Works reservoirs, near to the new Victoria Railway Station, in pursuance of Cubitt's building operations at Pimlico. The space taken by the Dock Company included a densely-crowded area of twenty-four acres south of Upper East Smithfield, lying between Little Tower-hill (*olim* Fosse-side) and Burr-street, King's Distillery, and Nightingale-lane. Within these limits were situated a vast number of streets, courts, and alleys, together with Hangman's, or Hanson's, Gains; the Flemish Church and its graveyard; a Whitehall, St. Katharine's-square, and the original dock; together with the church, cloisters, Sisters' Close, the master's house and orchard, the Brethren's and Sisters' almshouses and the burying-ground of the hospital, which had been founded by Queen Maud, 1148, and reconstituted by Queen Eleanor. The hospital church, with its appurtenant buildings, stood where are now the inner lock gates and the entrance basin. Western Dock covers the site of the Flemish church and churchyard, whilst Hangman's or Hamsden's Gains lay where are some of the Company's buildings that have lately been demolished for an approach to the new Tower Bridge. In 1824 the hospital site was disposed of to the Dock Company for a sum assessed by Lord Eldon at 125,000*l.*, in addition to which grants were allowed of 36,000*l.* for new premises, 2,000*l.* for new site, and so on. The old church, as is recorded in a letter to the editor of "The Every Day Book," vol. i., col. 1405, was finally closed on October 30, 1825; and by 1828 Ambrose Poynter's new hospital was erected in the Regent's Park. Hither were removed, at an expense of 1,000*l.* the tomb of John Holland, Duke of Exeter; and the carved wooden pulpit given by Sir Julius Caesar whom Queen Elizabeth, *pleno jure*, appointed Master in 1596. From the earliest times nearly all the nominations to a share in this charity, about 6,000*l.* a year, are in the absolute gift of the queen consort or dowager, and, failing them, of the sovereign. This privilege saved from spoliation at the Dissolution one of the most ancient ecclesiastical endowments in England. Hollar made some drawings of the earlier buildings, and in the Soane Museum may be seen a plan of the property as it existed in 1781.

MESSRS. DOULTON have just made, and are exhibiting, a terra-cotta and Doulton-ware reredos, font, and pulpit, for the Prince and Princess of Wales. The furniture is destined for the English Church of St. Alban, at Copenhagen, and was designed by Mr. A. W. Blomfield, M.A., the architect of the church. The reredos consists of a large and two small panels within trefoil-headed arches, supported on small Doulton-ware columns, and surmounted by gablet-formed hoods; the whole is enclosed between small buttresses, and stands above a super-altar, in the back of which are three oblong panels, filled with Doulton-ware. The large panels, representing the Ascension,

and, at the sides, the Betrayal and the Unbelief of Thomas, are from the band of Mr. Tinworth, and are none the worse for having a little more repose and less of the robust naturalism than some of the works of that original and vigorous artist. The font is octagonal, and stands on an octagonal centre shaft and eight columns of plain blue Doulton ware. The angles of the basin are marked by little Doulton-ware shafts, and the side panels are alternately figure-subjects by Mr. Tinworth, and ornamental devices. The pulpit is ordinary in character, with open traceried sides, and stands on Doulton-ware columns. That the design and detail of these works are refined and scholarly, and the execution nearly perfect, is what one expects, seeing who have been concerned in the matter; and we are not disappointed; but, as critics must have their growl, we may ask, perhaps, whether the forms of mouldings and conventional foliage that suggested themselves to a thirteenth-century carver of obdurate stone are likely to be the most appropriate for the use of a nineteenth-century modeller in a plastic material?

THE escape of St. Bride's Church from the thunderstorm of Friday afternoon last week reminds us that on two previous occasions its spire has been struck by lightning. As originally built by Wren,—1701-3,—it rose to a height of 234 ft. The spire, unprovided with a conductor, had been so greatly damaged by a stroke of lightning on June 18, 1764, that it was found to be necessary to take down 85 ft. of the fabric. Franklin's experiments had been made ten or twelve years before. In repairing the injury, Sir William Staines lowered the spire by 8 ft.; the portion removed was for a long while preserved in a mason's yard in Old-street-road, St. Luke's. The cost of making good the damage done in that year amounted to 3,000*l.* In 1803 this beautiful steeple was again struck by lightning, but with injury less serious than on the previous occasion. Last week the lightning passed down the conductor into the ground, though not without causing considerable alarm by the violence of its current, manifest in the wreck and *débris* at the steeple's base.

VISITORS to Edinburgh who from the Dean Bridge have looked down upon the gorge through which flows the Water of Leith may have noticed upon a ledge of rock by the side of the stream a circular Grecian temple. There are comparatively few, however, who descend to inspect the structure, which covers a mineral spring, and is known as St. Bernard's Well. For some years past this structure and its surroundings have not met with proper attention, and been allowed to fall into a dilapidated state. Through the munificence of Mr. William Nelson, publisher, this state of matters has been remedied, the temple has been restored, and the domed chamber decorated in mosaic and ultramarine and gold. A new statue of Hygeia is to be placed under the open canopy. A handsome new entrance and flight of steps has been placed at the Stockbridge end of the ground, and an elegant parapet erected along the margin of the stream. There are few more picturesque spots than this to be found in or about Edinburgh.

FURTHER up the Water of Leith another improvement has been effected at Belbridge, on the old Queensferry road. The bridge which crossed the stream at this point having shown symptoms of decay, and having been found too narrow for the increasing traffic caused by the extension of the city, a new bridge, with improved access, was resolved upon. The new bridge, designed by Messrs. Blyth & Cunningham, civil engineers, now completed, is on a higher level than its predecessor, the approaches from the east and west having been raised to a corresponding degree; and an entirely new access has been formed from the north end of Palmerston-place, thus forming a direct outlet from this quarter to the north-west. The situation is one which suggests picturesque

treatment, and it is to be regretted that the aid of an architect was not called in to impart somewhat of an artistic feeling to the structure; for anything more unmeaning and commonplace than the hatletemple coping, albeit composed of granite, it would be difficult to find, and the treatment of the approaches is such as one may see at railway bridges in the country, but hardly expects within a city.

A CORRESPONDENT of the *Field*, "H. E. L." under the heading, "Horses in London Streets," objects strongly, in the interest of the horses, to the use of wood and asphalt pavings on slopes: they ought only to be used, he urges, on level streets, and where there is light traffic, not where heavy two-horsed vehicles, such as omnibuses and carts, are the rule. From the point of view of the horses we have no doubt he is right. The noise from London traffic, increasing almost year by year, has, however, been such a serious evil to the human beings who have been compelled to carry on their avocations in the midst of it, that some change from paving and macadam seemed inevitable. We have no doubt the constant uproar of the City streets in old days tended to shorten life; only the toughest nerves could remain unaffected by it. Now the horses suffer instead, unbappily. The ideal pavement, which should equally suit the comfort of man and horse, has not yet been found; who will find it?

THE memorial to Rossetti, of which we gave an illustration some time ago, was unveiled on the Chelsea Embankment on Thursday, last week, by Mr. Holman Hunt, before a small concourse of persons, chiefly relatives and friends of the late artist. As our readers may remember, the monument consists of a drinking-fountain, designed by Mr. Seddon, with a quarter-length figure of the poet, modelled by Mr. Madox Brown. This should have been a head and bust merely, with a conventionally-designed pedestal; the head and upper portion of the body, cut short off for no apparent reason except that there is no room for more of it in the space allotted, has an exceedingly bad effect. It is neither one thing nor the other, neither a bust nor a figure, and produces a somewhat ludicrous impression. Mr. Holman Hunt delivered an address in regard to the genius of Rossetti, in which he formed an estimate of him which we do not think future generations will ratify, and to single out Rossetti's mannered piece of archaic prettiness, "The Annunciation," in the National Gallery, as remarkable for "vitality of expression" and as superior to the Ansidei Madonna in "artistic discrimination of form," was, at all events, a proof that Mr. Hunt has the courage of his opinions.

IN the summer of 1885 the Council of the Royal Scottish Academy supplemented their annual winter exhibition by one devoted to works in water colours by living artists. The financial results were not satisfactory, and the existence last year of the International Exhibition was a sufficient reason why the experiment should not be repeated that summer. Under the same auspices a similar exhibition was opened on the 13th instant, but it is not, as in the previous instance, confined to the works of living artists, but contains examples of lately deceased painters. The works exhibited are 852 in number, and besides water colours embrace examples of black and white, and of the product of the sculptor. Amongst the names of deceased artists who are represented on the walls are those of Turner, David Cox, Landseer, G. P. Chalmers, and George Mason.

IT appears that the Leeds Architectural Society sent a memorial to the Leeds School Board some time since asking that the designing of schools might be taken out of the hands of any special architect, and left open to the profession generally. The Board eventually gave a qualified consent, in the form of an inquiry from members of the architectural profession as to the terms on which they would undertake such work, and it

appears that certain architects who are named offered to carry out the work at 3½ per cent., 3½ per cent., and 4 per cent. respectively, and that some of these "cheap" architects have accordingly been commissioned to erect schools for the Board. One of these is an architect of considerable repute and large practice. The work to be done includes, it should be observed, more than an architect is usually expected to do for the ordinary fee of five per cent.; it embraces the survey of sites, the taking of levels, the furnishing of sketch-plans, and the preparation of quantities. Architecture, of course, is not bound up with the sacred ritual of five per cent.; but we do not think the architects who have thus responded to an inquiry, the literal meaning of which was "who will do the work cheapest?" have acted in a way calculated to raise either their own dignity or that of the profession to which they belong.

#### SUTTON PLACE AND LOSELEY HOUSE.

ON Saturday last the Architectural Association visited two of the most interesting houses in Surrey,—Sutton Place and Loseley House, near Guildford. They have neither of them changed hands since they were built, but have been handed down either by direct descent or by will to their present owners. In Sutton Place mass has been said without a break for 350 years. They have both always been occupied, and have undergone a certain amount of alteration and curtailment, but not enough to destroy the very important evidence they afford with regard to the domestic architecture of the sixteenth century; that is, of the Early Renaissance. Sutton Place was built first, and was the first to be visited on Saturday, under the guidance of Mr. C. Forster Hayward, F.S.A., who has made careful measured drawings of the whole house, which, it may be hoped, will some day be published. Mr. Hayward's researches, together with those of Mr. Frederic Harrison, whose mother now occupies the house, ought to suffice to clear up its history, and to throw a considerable amount of light on a very interesting period of house-building. Mr. Harrison has already collected a good deal of information, which was published in the "Collections of the Surrey Archaeological Society" (vol. ix, part 1, 1885).

Sutton Place was built by a Sir Richard Weston about the year 1525, and is remarkable for three special reasons; firstly, that it was one of the earliest fortified houses in England; secondly, that all its ornamentation is in moulded terra-cotta; and thirdly, that here may very distinctly be seen the commencement of the change from Gothic to Classic, exhibited in a manner almost unique, and depending largely for its significance upon the material employed. First, as to plan. The house was originally built round a quadrangle, 80 ft. square or thereabouts, which was entered beneath a large tower, opposite to which, on the other side of the Court, was the Hall. There was also a second court attached to one of the wings, but this was quite subordinate and devoid of fine architectural treatment. The large courtyard was the centre of interest, and was arranged with a symmetry almost rigid, and to which convenience of planning had to bend. This arrangement was of very frequent occurrence in houses of the period, though, as Mr. Harrison claims, Sutton Place is probably the earliest example of it. When the tide of house building had fully set in during the last half of the century, numerous examples of a perfectly symmetrical court with the hall on the side opposite to the entrance may be found; but about Sutton Place is this curious feature, that apparently the door to the hall opened direct into that apartment instead of into the "screens," which invariably divided the hall from the buttery and kitchen. The rooms arranged round this quadrangle numbered nearly forty, and are all mentioned by name in an inventory of the furniture and effects of the builder, Sir Richard Weston. Mr. Harrison remarks that the house "was planned with all the apartments required by modern habits," but it must not be forgotten that these apartments were arranged for the most part in a highly inconvenient manner, and though the material required by modern habits is here, its disposition by no means accords with modern ideas. In those days the larger number of

rooms were thoroughfare rooms, and many of the bedrooms or "lodgings" opened direct into the court, across which open space was the only means of access to them.

The present house consists of three sides of the original quadrangle, the fourth, or entrance front, in which was the large tower, having been taken down in 1782. The return of this front on the two remaining sides may still be seen, and Mr. Hayward exhibited on Saturday a conjectural restoration, for all the features of which he had found some authority.

The plan, therefore, of Sutton Place is its first point of interest: it shows the absence of fortification; the introduction of many rooms with modern designations, but ill arranged, except as producing an imposing symmetry; and the subsequent destruction of one whole side as being, in fact, superfluous and an unnecessary expense to maintain.

But, perhaps, more interesting than the plan are the general appearance and details of the structure. The general appearance, as may be seen from Nash's Mansions (plate 43), is that of a Tudor or Late Perpendicular house, with windows having cusped heads, with flat-pointed doors, and with a panelled parapet; but a closer inspection reveals the fact that all the mouldings of jambs, mullions, transoms, and strings are adorned with raised ornaments of Italian character, and that all the dressings are of terra-cotta. Probably, in this use of terra-cotta is to be found the key to the singularly early introduction of the essentially Italian ornamentation, which is not confined to the strings and mullions, but appears over the front door and elsewhere in the shape of amorini in panels divided by half-balusters and a raised floral pattern. The impression conveyed by the meagre and ineffective treatment of these panels over the front door, by the unworkmanlike way in which the string cuts into the middle of a moulded panel on the canted sides of the bays, and by the patched appearance of the parapet, is that here were English workmen using a material to which they were unused, which had to be designed and moulded and made before it came to its place in the work, and which could not be moulded to meet an emergency in design as stone could. No worker in stone would have let his string butt right up against the middle of a carved panel. But with this terra-cotta what could you do? No special mould was supplied for such an emergency, and so a bungle it was, and a bungle it had to remain. It may be that difficulties of this kind prevented the use of terra-cotta from spreading, for we find it hardly anywhere else in any quantity except at Layer Marney, in Essex, which was finished before Sutton Place was begun. These two buildings, indeed, are abnormal. Though so early in date they have much Italian detail, and all in terra-cotta. Most of the contemporary buildings were of stone and still quite Gothic in treatment. May it not be inferred from this that the moulds from which the terra-cotta details were made were supplied from foreign sources? That, the English workmen not taking kindly to the new material, it fell into disuse? and that only after the lapse of some decades and by a gradual process, did Classic detail become the general language of the English workman? The reason of the employment of so much Classic detail here may be found in the fact of Sir Richard Weston having spent much of his time abroad in the service of Henry VIII, to whom he was closely attached.

But the ornamentation at Sutton Place is not all of foreign inspiration. The "tin" which so frequently appears as half a reborn on Weston, has its counterpart in many English buildings of the preceding fifty years, while the grapes that adorn the small end of the quoins may equally have been derived from English sources; but undoubtedly most of the designs, especially the amorini and those in the window mouldings, must have come direct from abroad. It is interesting to note how the various mouldings have been used, how by combination they were made to produce different designs, and how frequently they have been reused, and yet how, in spite of his ingenuity, the builder was hampered by his material, and unable to do all he would have done had he been working in stone.

These, then, seem to us the lessons to be drawn from an inspection of the workmanship. That we have here the result of the owner's travels abroad; that he procured the coveted Renaissance detail from foreign sources and

by using moulds made possibly abroad, but utilised at home by English workmen, because he knew that no Englishman working in stone could have given him what he wanted; and that the difficulties inseparable from the use of ready-made detail prevented the material in which it was made from being brought into general use. Had the application of terracotta been more successful no doubt the English Renaissance would have been hurried on, but as the Italian forms had to win their way in stone, the process was longer, and not fully accomplished for fifty years or more, and by that time doors, windows, and mouldings, as well as carved ornament, partook of the Classic spirit. But, however that may be, Sutton Place must always be remarkable as a building Gothic in all its detail, except what would be (were it of stone) its carved ornament.

Not less interesting than Sutton Place is Loseley House, where the members of the excursion were hospitably entertained, and were conducted over the house by the owner, Mr. Molyneux, who knows and loves every stone of the building, and who explained all the points of interest. There is not much detail outside; and the inside has been considerably pulled about at various times, so that few of the features are in their original places, but this matters little with Mr. Molyneux as a guide. Perhaps the most important thing in regard to Loseley is that a plan of it is to be found in John Thorpe's book (fol. 39-40), with the title, "Sir Geo. Moore's house." (It is a remarkable thing how little distance one can go in the study of the English Renaissance without coming across John Thorpe.) The date of the commencement of the building is fixed by the original building accounts which are preserved among the numerous and highly interesting Loseley MSS., from which it appears that the original house was begun by Sir William More in 1561, and finished in 1569, and cost 1,600*l.* 1*9s.* 7*d.* Every item of expenditure is set forth at large, and at the end is written:—"Sm<sup>o</sup> totalis of all mye huldryngs from 1561 untill Mychylmas, 1569. Mv*l*.ix.ii. xix. s. vii. d." There must have been an earlier house than this one, built by Sir William; for at Christmas, 1558, one Edward Tyle writes to him from Windsor:—"I ham very glad to here of yo<sup>r</sup> romyshe wyne, I praye yo<sup>r</sup> kepe yt well, for I trust my p<sup>r</sup>te [part] ys therein"; but of this earlier house which held the excellent Rhinias, no traces remain. In the new house which Sir William built, the family lived till the beginning of the seventeenth century, in the first year of which he died. His son, Sir George, succeeded him, and desiring to be in the fashion, and to be as magnificently housed as his friends, he called in the assistance of John Thorpe to enlarge the building. It is Thorpe's plan for the enlargement that is given in his book under the title "Sir Geo. Moore's house." The plan shows the original house,—which can to this day be identified, window for window, and room for room, though the internal arrangements are slightly different,—and the new wing on the west side. It also shows, partly in pencil, a suggested wing on the east side, and a screen-wall from wing to wing, with a gateway tower in the middle, thus completing a quadrangle about 200 ft. wide by 130 ft. long. Had these suggestions ever been carried out, the house would have been one of the most imposing in the country; even as it was, the old house and the new wing made a large place, so large, indeed, that some sixty years ago the new wing was pulled down as being too great a burden to maintain. In Manning & Bray's "History of Surrey" a view of Loseley is given, which corresponds in all but a few unimportant particulars with Thorpe's plan, showing that the new wing was carried out as shown thereon. The house, therefore, has reverted to its original size, save for an eighteenth-century projection on the south side, containing a staircase and study, and for a small new wing built by the present owner; and it still deserves Camden's description as the "delicate seat of the knightly family of the Mores." Thorpe has, rather curiously, omitted to show the small porch at the south end of the "screens," which must have been part of the original structure, as it bears the date 1568, the only date to be found.

The chief apartment, of course, is the hall, but the drawing-room, called by Thorpe the parlour, has more original work left, and the ceiling, cornice, and chimney-piece are fine examples of the period. They are figured in Nash's "Mansions." In the cornice occurs the rebus of the Mores,—a mulberry tree with an

inscription on either side, *Morus tarde moriens; Morum cito moriturus*,\* as who should say, the tree itself lives long, but the fruit dies quickly. There were formerly many of these inscriptions, only one of which is now left, and that over the front door: it is a Latin hexameter:—

"Invadit claudor patet sed semper amice."

The sentiment is the same as in the pithy saying over the door of Montacute, "And yours, my friends." The others are given in the "History of Surrey," and were curious for their aptness to the rooms to which they were assigned. Over the kitchen door was, "For hunger, not glutinous"; over the hutery, "For thirst, not drunkenness"; and over the parlour, "For the upright, not the wicked." But these are gone, and no remains are left. There are, however, in various panels of the hall and in a small bedroom upstairs, some very beautifully painted panels, which from their character and design and from the date of the panelling which surrounds them, justify the belief that they came from the palace of Nonesuch, which was destroyed early in the eighteenth century, when they probably were brought to Loseley and worked into the panelling then being put up. These painted panels are of singular delicacy, and are conceived entirely in the spirit of the Italian Renaissance, much more so even than the work at Sutton Place which we have been discussing.

The "delicate seat" of Loseley is a difficult place to leave; there is so much to explore, the views are so fine both back and front; the old garden with its long high terrace and quaint garden-houses at the corners, is so fascinating that it is hard to leave it for the prosaic work-a-day world. But the return must be made, and it is at least a satisfaction to feel as we go away how wide a glimpse into history the two houses of Sutton and Loseley have given.

CONGRESS OF MUNICIPAL AND SANITARY ENGINEERS AT LEICESTER.

LEICESTER is a growing and rapidly-improving town, and very important and in some respects unique public works are now in progress there, from the plans and under the superintendence of Mr. Joseph Gordon, the Borough Surveyor, who, before he came to Leicester, several years ago, had become favourably known as the engineer of several important sanitary works on the Continent, Frankfurt and other large towns in Germany having been completely sewered and drained by him. The Association of Municipal and Sanitary Engineers and Surveyors have this year elected Mr. Gordon their President, and the fourteenth annual meeting of the Association was held in the Council Chamber of the Town-hall, Leicester, last week. The Association, we may here say, was established in 1873 (its founder being Mr. Lewis Angell, now Borough Engineer of West Ham), and it has been steadily growing ever since its commencement. At the time of writing it has 11 honorary members (including the chief municipal engineers of London, Paris, Brussels, and Amsterdam), 304 ordinary members, and 9 graduates, making a total of 324. Of the importance of such a society, and of the value to the public of the free interchange of opinions and experiences between gentlemen holding the important positions of engineers and surveyors to municipalities, local boards, and other public authorities, there can be no question, and we are therefore very pleased to notice the growth and increased usefulness of the Association.

Mr. R. Vawser, M. Inst. C.E., of Manchester, presided temporarily at the opening meeting on Thursday morning, and amongst the members present were:—Mr. Thomas Hewson (Leeds), Mr. H. U. McKie (Carlisle), Mr. A. M. Fowler (Manchester), Mr. H. P. Boulnois (Portsmouth), Mr. J. Gammage (Dudley), Mr. E. G. Maybey (York), Mr. T. W. Stainthorpe (Eston), Mr. J. Howcroft (Redcar), Mr. J. Haigh (Abergavenny), Mr. C. G. Lawson (Southgate), Mr. G. Eedes Eachus (Edmonton), Mr. John Price (Toxteth Park), Mr. G. B. Lafan (Bridgewater), Mr. T. Farrell (Sherborne), Mr. R. Pickering (Whitehaven), Mr. P. Newman (Rye, I.W.), Mr. W. H. White (Oxford), Mr. C. Jones (Ealing), Mr. Jos. Lohley (Hanley), Mr. S. S. Platt (Rochdale), Mr. F. Ashmead (Bristol), Mr. John Parker (Hereford), Mr.

\* The Mulberry (tree) is slow to die. The Mulberry (fruit) shut quickly die.

J. Cartwright (Bury), Mr. A. W. Parry (Reading), Mr. T. do Courcy Meade (Hornsey), Mr. John T. Eayrs (West Bromwich), Mr. J. W. Cockrill (Great Yarmouth), Mr. Sidney G. Gamble (Grantham), Mr. Thos. Coulhaust (Derby), Mr. Alfred T. Davis (Stratford-on-Avon), Mr. J. W. Washaw (Peterborough), Mr. Robert Godfrey (King's Norton), Mr. H. J. Clarson (Tamworth), Mr. E. R. Window (Bishop's Stortford), Mr. Geo. R. Strachan (Chelsea), Mr. F. J. C. May (Maidstone), Mr. G. R. Andrews (Bournemouth), Mr. W. H. Savage (East Ham), Mr. W. H. Lecte. (Luton), Mr. G. E. Shore (Crewes), Mr. Geo. Hoodson (Loughborough), Mr. T. Gledhill (Heekmondwike), Mr. Jas. Lemon (Southampton), Mr. W. Dent (Nelson), Mr. W. Banks (Rochester), Mr. E. B. Ellice Clarke (London), Mr. J. Buehan (Grimby), Mr. A. Creer (Lancaster), Mr. J. W. Wardle (Longton), Lieut.-Col. Jones, V.C. (Wrexham), Mr. S. Dyer (Bridlington), Mr. W. Stewart (Rugby), Mr. A. Couher (Kidderminster), Mr. S. F. Rolley (Tipton), Mr. C. J. Dawson (Barking), Mr. J. D. Watson (Arthroath), Mr. C. H. Lows (Hamstead), Mr. W. G. Laws (Newcastle-on-Tyne); and Mr. Thomas Cole, Secretary.

The visitors included Sir Robert Rawlinson, K.C.B.; Major Tulloch, one of the Local Government Board Inspectors; Alderman Hart, Mayor of Leicester; Alderman Chambers, J.P.; Alderman Kempson, J.P.; Councillor Goddard, Chairman of the Highways Committee; Dr. H. Tomkins, Medical Officer of Health for the Borough; Mr. William Eassie (London), Mr. R. W. Peregrine Birch (London), Mr. Walter Jennings (London), Mr. J. S. Hodgson (Rotherham), and other gentlemen.

Mr. Vawser having explained that he presided temporarily, owing to the retiring President, Mr. Lohley, being detained on his journey from Hanley,

The Mayor, on behalf of the Corporation, gave the Association a very cordial welcome to Leicester.

Mr. Vawser, on behalf of the meeting, thanked the Mayor, and then resigned the Presidential chair to Mr. Lohley, of Hanley, who had now arrived: he had been unexpectedly delayed at Uttoxeter. The minutes of the last annual meeting were passed, and

The Secretary then read the fourteenth annual report, which expressed the pleasure with which the Council were able to record that all the statistics in the account of the proceedings of the past year showed a larger increase of numbers than in any previous year, as well as a satisfactory advance in the financial position of the Association, while there was evidence that the examinations which it had instituted were being received with confidence by the public. Since the last annual meeting, held at Hanley on July 8, 1886, and two following days, district meetings had been held at Rochester, Walthamstow, West Hartlepool, Warrington, Portsmouth, Kidderminster, and Bolton. During the past year 44 new members, consisting of 39 ordinary members and 5 Graduates, had joined the Association. Death, resignation, and other causes had removed 14 members. The Council recorded with regret the deaths of Mr. William Whittington, Borough Surveyor of Neath (Glamorganshire), and of Mr. John Green Hall, City Surveyor, Canterbury. The extension of the rules made at the last general meeting, so as to admit the metropolitan surveyors to membership, was being appreciated, inasmuch as up to the present time more than a quarter of their number had been enrolled as members. A similarly satisfactory result had also to be recorded with regard to another new rule made at the last general meeting, by which certificated candidates were admitted as Graduates of the Association. Up to the present time, thirty per cent. of the candidates who had successfully passed the Association's examinations had joined as Graduates. The audited balance-sheet showed a balance in hand on the 30th of April of 298*l.* 6*s.* Two examinations had been held during the year.\* The Sanitary Institute of Great Britain, jointly with the Parkes Museum, having petitioned Her Majesty for the grant of a Royal Charter of Incorporation, under the name of "The Sanitary Institute," the Council, on behalf of the Association, petitioned against the granting of such Charter, or, at all events, against including in such Charter the power of granting certificates to local surveyors. Up

\* The results of these will be found recorded in the Builder for Oct. 23, 1886, and May 14, 1887.

to the present time no decision had been arrived at by the Privy Council. The Parliamentary Committee of the Council of the Association had held many sittings during the year, and had given careful attention to "The Sanitary Registration of Buildings Bill" and "The Sanitation of Houses (Metropolis) Bill." The draft of the first-named measure had been considerably modified, and the second measure was withdrawn at an early stage of its existence. In conclusion, the report dealt with proposed alterations of the rules, &c. The ballot lists having been duly issued, the scrutineers reported the following gentlemen elected for the Council:—

*President.*—Mr. J. Gordon.

*Vice-Presidents.*—Messrs. H. P. Bonhous, C. Dunscombe, and E. B. Ellice Clarke.

*Ordinary Members of Council.*—Messrs. A. Brown, J. Cartwright, T. Coulthurst, J. H. Cox, J. T. Eayrs, A. M. Fowler, T. Hewson, H. U. McKie, T. de C. Meade, A. W. Parry, R. Read, and T. Walker.

*Honorary Treasurer.*—Mr. Lewis Angell.

*Honorary Secretary.*—Mr. C. Jones.

The report was adopted, on the motion of the President, seconded by Mr. Vawser, and the following telegram was despatched to Her Majesty the Queen:—

"The Association of Municipal and Sanitary Engineers, assembled at their annual meeting now being held at Leicester, desire to offer their congratulations to your Most Gracious Majesty on the completion of the fiftieth year of your reign, and they pray that your Majesty may long be spared to continue your happy reign over your loyal and contented subjects.—J. GORDON, President."

In the course of the sitting the following reply was received:—

"The Queen has received with much pleasure the congratulations of the members of your Association.—FORSBY."

A proposal to alter the title of the Association to that of "The Association of Municipal Engineers," introduced by Mr. T. De Courcy Meade (Hornsey), was first considered. He urged that the old title was cumbersome, and he thought that the suggested abbreviated title would express all that was necessary, and be much more convenient.

Mr. Godfrey (King's Norton) seconded the proposition.

Mr. C. Jones (Ealing) moved, as an amendment, that the title should be, "The Association of Municipal Engineers and Surveyors." He held that the title should express as nearly as possible the character of the Association, and he thought the one he proposed would do this better than the title Mr. Meade suggested.

Mr. W. H. White (Oxford) seconded the amendment, chiefly on the ground that the term "Surveyor" was that by which they were designated in the Act of Parliament.

Mr. Hewson (Leeds) said he thought that the argument employed by Mr. White was inconclusive. What did not the term "Surveyor" embrace? The title was used by all sorts of unqualified persons.

Mr. Fowler (Manchester) said that there was equal ambiguity as to what was embraced in the term "Engineer."

Sir Robert Rawlinson said he happened to know that the Government were going to take action with regard to setting out new districts, which would alter the constitution of the local government of the country very materially. He suggested that the question of the alteration of the title of the Association should stand over until it was seen what effect the Government Bill would have on the local government of the country.

Mr. Meade (Hornsey) withdrew his motion, conditionally that Mr. Jones withdraw his amendment. Mr. Jones acceded to this, and the question of alteration in the name of the Association accordingly stands over until next year.

The District Secretaries were reappointed until the next meetings of the various districts, as follows, viz.:—Home Counties, Mr. O. C. Robson, Willesden; Midlands, Mr. A. T. Davis, Stratford-on-Avon; Yorkshire, Mr. J. W. Horsfield, Batley; Lancashire and Cheshire, Mr. S. Platt, Rochdale; Western, Mr. Jos. Hall, Torquay; Northern, Mr. P. V. Thomson, Wiltington Quay; Eastern, Mr. E. Buckham, Ipswich; and Wales, Mr. J. W. M. Smith, Wrexham.

Mr. Lowe (Hampstead), Mr. Price (Toxteth Park), Mr. Eayrs (West Bromwich), and Mr. De Courcy Meade (Hornsey), were appointed scrutineers to conduct the ballot for the election of the next Council; and Mr. Godfrey (King's

Norton), and Mr. Strachan (Chelsea), were chosen as auditors.

On the motion of Mr. C. Jones (Ealing), seconded by Mr. White (Oxford), a cordial vote of thanks was passed to the retiring President, Mr. Lobley, for the exemplary manner in which he had discharged his duties, and for the services he had rendered to the Association.

Mr. Lobley expressed his thanks, and observed that his interest in the Association would be rather augmented than lessened by his having passed the chair.

#### The President's Address.

Mr. Joseph Gordon, M.Inst.C.E., the Borough Engineer of Leicester, as President elect, then took the chair, and delivered his inaugural address. After thanking the members for his election to the chair of the Association, he said that the original object for which the Association was established had been fully maintained in the present aim and usefulness of its operations. The diffusion of knowledge on the subjects coming within the range of municipal engineering in all its varied phases, differing, as they must necessarily do, in different parts of the kingdom, amongst the members by the papers read and discussed at the various district meetings during the year, coupled with the advantage of an opportunity for an inspection of the works to which the papers referred, in the various towns, was a distinct and very material advancement upon the very limited opportunities which the municipal engineer had, prior to the establishment of this Association, for gaining a knowledge of what was being done elsewhere than in his own town, in the solution of those problems which municipalities and Local Boards had to deal with to meet the growing wants of their districts, and for the improvement of the sanitary condition of their respective localities. It was to the distinct advantage of the corporations and Local Boards that their Surveyors and Engineers should belong to the Association, and take as active a part in its work as possible, for he thought he might venture to say on behalf of every member who was in the habit of attending the District Meetings, no matter how experienced he might be, that he had in every instance learned something of advantage, whether it had been some better way of carrying out some particular class of work or some minor detail, or something had been brought under his notice which it was desirable to avoid in any similar works. Very few of the members were able to attend all the meetings held in different parts of the country during the year, and it must not be forgotten that it was at considerable expense on the part of those members who did so, and that consequently the full advantages of the Association would not be realised until the municipal authorities and Local Boards became impressed with the benefits which would accrue to the towns represented, by knowing that their surveyors attended all such meetings, so as to keep himself abreast of the times in his knowledge of the actual works of the country of a municipal character. That, he was afraid, would never be practicable unless the local authorities themselves came to the rescue, as they heard at their Oxford Meeting in 1883 several boroughs and Local Boards had already done (as regarded the annual meeting, at any rate), by paying the expenses of the members attending those meetings. The good effects and results of the Association by bringing its members into contact with each other at the various meetings were, he was quite sure, being felt in all those towns and districts whose surveyors were members of it. After alluding to the annual volume of "Proceedings of the Association," the President said:—

A step in the right direction was taken by our Society two years ago in the establishment of Examinations for the office of local Surveyors. The success attending the inauguration of that step has been most satisfactory indeed, and deservedly so, I think, when it is considered that in addition to the many other duties the Members of the Council have to perform, they are also chosen as an Examining Board, and that a section of them devote two days of their time twice a year to these examinations without any remuneration. It had long been felt that there was an examining body for certificates of competency for local surveyors which fully met the requirements of the case. The Royal Institute of British Architects have for some years held

examinations and granted certificates of competency for District Surveyors practising in London, and the Metropolitan Board make it a condition that all candidates for such offices should hold such a certificate. This is, no doubt, as it should be in principle, but the question arises whether the Institute of British Architects is the most fitting body to hold examinations for provincial Surveyors, whose duties are scarcely identical with those of metropolitan Surveyors working under different Acts of Parliament.

The Sanitary Institute of Great Britain instituted also, some years ago, examinations for local Surveyors and Inspectors of Nuisances, conducted by a Board of Examiners composed of gentlemen eminent in sanitary science. It has been felt, however, that a certificate emanating from a body composed of gentlemen filling the most important surveyorships in the kingdom, daily and hourly occupied in the practical work which all surveyors to local authorities have to encounter, would be of great practical value, and recommend itself to local authorities.

There is one other body whose certificate would have all the force and weight of authority, not only in this kingdom but throughout the British Dominions, if that institution would undertake the task,—I mean the Institution of Civil Engineers,—because that body includes within its ranks not only the greatest living authorities on all engineering subjects, but also the chief City and Borough Engineers and Surveyors to Local Boards of the United Kingdom.

It might be urged that as many of the duties of the local Surveyor are of an architectural character, that element would not receive sufficient attention by a body of engineering examiners. On the other hand, while many local surveyors are drawn from the architectural profession, and have been entrusted with important architectural works, yet it will be conceded that the great bulk of their duties are of an engineering character, and that therefore the engineering element is paramount. An engineering body of examiners would appear to be, therefore, a more fitting body to examine and certify as to the competency of candidates for local Surveyors than a Board selected from a purely architectural institution, although perhaps both elements should be present on such a Board.

If the Institution of Civil Engineers were to undertake the task, I think it is fair to presume that with so practical a body of men they would largely select their examiners from that very class of men who have the most complete knowledge of the subject.

What, then, so natural as that this Association should undertake the task until a Board of Examiners has been established, either by the Institution of Civil Engineers, or by the joint action of all the institutions affected and interested, in which all could have confidence? That the Association was right is shown by the fact that the number of candidates who have presented themselves at the three examinations which have been held is much larger at each examination than has appeared before the Examining Boards of other institutions to which I have referred, and I think the Association is to be congratulated on the inauguration of this new step, and that we owe a deep debt of gratitude to those members who took such an active interest in its establishment, and also to those active members of the Board of Examiners who have, at great sacrifice of their time, presided so efficiently over the examinations which have already been held.

A perseverance in this work cannot but be productive of good to the community at large, and I am even sanguine that Local Authorities may eventually follow in the footsteps of the Metropolitan Board of Works, and admit only candidates possessing the certificate of competency of this Association.

The President next proceeded to review the sanitary progress which has been made during the reign of Queen Victoria. In the course of his remarks under this head, he said:—

The average mortality for England and Wales was 22.4 in 1838, and in 1836 19.3, which shows a saving on last year's population of England and Wales of 86,400 lives annually, and a saving in suffering from an estimated number of about 1,728,000 cases of sickness.

To accomplish all this vast sum of money have been expended, probably not always wisely, inasmuch as there have been mistakes made in this direction, as in all new developments of science when applied in practice, and evils have

arisen which, if foreseen at all at the outset, were underrated.

The great object of the Public Health Act, 1848, was to enable Local Authorities, by its adoption, to properly sewer, drain, and cleanse their towns, and to provide efficient supplies of water, free from contamination and impurities dangerous to health. The raising of money by loans repayable in a series of years, which the Act empowered, enabled all these objects to be accomplished, and whilst the first duty of Local Authorities was undoubtedly the provision of a good supply of water and proper sewerage for the removal of liquid filth from the immediate vicinity of inhabited dwellings, the carrying out of proper works for the latter object has been of much slower growth than the former. Private companies led the way, in fact, in providing supplies of water, inasmuch as there was a prospect of the works becoming remunerative to shareholders investing their money in them, and in nearly every instance where Local Authorities have eventually found it to be in the interest of the inhabitants of their districts to purchase the works, they have had to pay high prices for the undertaking. This has generally led to a great deal of dissatisfaction with companies holding such works, but it must not be forgotten that the companies would, in most instances, never have had any existence if the Local Authorities had taken the initiative, and that but for the companies this great boon of a pure supply of water would most probably have been long delayed to many large as well as small communities.

The evils which have arisen from the sewerage and draining of towns, have been of a twofold character. Firstly, in the increased pollution of rivers and streams into which the sewage, in the earlier stages of these works, was poured without any previous treatment; and, secondly, in the production of sewer gas, which, up to the present moment, seems so difficult to deal with. These concomitant evils and difficulties attending the execution of sanitary works are in no way to be underrated, but it still remains the first duty of town authorities to remove, as quickly as possible, all liquid and other refuse from the midst and immediate vicinity of large populations, before putrefaction has had time to take place. There are some minds whose course of reasoning seems to lead them to the conclusion that the evils attending the introduction of modern systems of sewerage are greater than those of the old methods of dealing with town sewage and refuse, but the facts are against them to such an extent that it would be difficult to point to a responsible medical officer in the kingdom who would be courageous enough to advocate a return to the old régime of cesspools, privy ashpits, open ditches, and flat-bottomed culverts. The introduction of earth-closets as one of the safeguards against sewer-gas has made no headway for large populations, and is beset with practical difficulties. In the Midland and Lancashire towns the system known as the pail or tub system has been much more largely introduced as a substitute for the water-closet, and it has, from a landlord's point of view, many attractions. In the first place, the first cost, as compared with that of a water-closet, is very small, and the landlord is relieved for ever afterwards, I believe, in most towns, of all future costs and maintenance; whereas, in the case of water-closets there is undoubtedly great difficulty, in cottage property, in keeping them in good working order, especially during the frosts of winter. There are, however, many objections to the pail-system, which it is not proposed to touch upon in this address beyond this, that it appears to be a costly appendage to the water-carriage system, without the expected corresponding advantage of relieving the municipal authorities of any of the difficulties of river pollution, inasmuch as the remaining liquid refuse of the town has still to be dealt with by the modern systems of precipitation or irrigation, at practically the same cost as would have been the case, if the water-carriage system had been adopted in its entirety.

The Rivers Pollution Act gave an impetus to works for the treatment of sewage, although much had been done prior to that, and Leicester was one of those towns which led the way so early as 1854, in precipitating the solids of the sewage before allowing it to enter the river. The innumerable methods which have since then been tried, and, after large expenditures of money, have proved to be failures, show the

difficulties of the question. On the whole, however, sewage-farms, or a combination of the chemical system with irrigation or intermittent filtration, have been the most successful, so that the first evil to which the cleansing of towns, viz., the increased pollution of rivers, gave rise, may now be said to be capable of satisfactory solution, notwithstanding that the old hassle of the systems of precipitation *versus* application of sewage to land still wages whenever opportunity occurs.

The second evil to which I have made reference, viz., that of sewer ventilation, seems still unsolved, and I would earnestly entreat members, all of whom have, more or less, opportunities of experimenting and making observations of the behavior of sewer gas under certain conditions, to direct their attention to this subject. It is admitted on all hands that the sewers must be ventilated,—that is, that there must be a means of escape for the polluted air of the sewers, for it is well known that the conditions prevailing within the sewers during the twenty-four hours of the day are very varying, and on this subject the early observations of the late Medical Officer for the City of London (Dr. Lotheby), and the present Engineer for the City of London (Lieut.-Colonel Haywood), and the still more recent investigations of Professor Pettenkofer, of Munich, Professor Soyka, of Prague, and our own members, Mr. McKie, of Carlisle, Mr. Read, of Gloucester, and others, are well worthy of attention. It does not, however, seem to be so readily or universally conceded that a plentiful supply of fresh air is of equal importance, and that the great aim and object of sewer ventilation should be the introduction of atmospheric air for the purpose of diluting and oxidising the air of the sewers, and the creation of a current to some exit, which shall, if possible, either be above the roofs of the houses, or still better, to some point where the sewer gas can be cremated. The most recent contribution to this subject, in direct opposition to these views, is to be found in the address of Professor Atfield to the Hertfordshire Natural History Society and Field Club, in which it is laid down that all that is necessary is a vent at an elevation above the ground, and that, therefore, the surface ventilators or other openings for the introduction of fresh air are not only not necessary, but are, on the contrary, injurious, even when acting as down-cast shafts.

These aims and objects are beset with difficulties, and the most scientific minds of the country have failed so far to devise a method of ventilation, which shall at the same time be within the range of practical application as regards cost, and universally satisfactory.

The report of last year of a Committee of the Metropolitan Board of Works is worth attention, as showing the opinion of the metropolitan Surveyors. Out of the forty districts the opinions of whose surveyors were taken, thirty-five were in favour of open ventilation, two were doubtful, two against, and one had no experience in this matter. The average distances of the ventilators were from 30 to 200 yards, and the Committee came to the conclusion "that pipe ventilators of large section can be used with great advantage in addition to, and not in substitution for, surface ventilators."

To supplement the street openings as much as possible with vertical cast iron or other shafts up the house sides would seem to be the first thing to do, for there can be no doubt that the more this is done the more perfect will be the ventilation of the sewers. It must also not be forgotten that the anxiety of late years of English sanitarians to protect each house from the possible dangers of sewer gas from the street sewer has led to a system of so-called disconnection of the house drains by a water seal or syphon trap, and that consequently the soil-pipes of the houses, which, when carried through the roofs acted as ventilators to the public sewers, have been lost for this purpose, and thus the difficulty of sewer ventilation has been greatly increased.

In Leicester we have been fortunate enough to secure the co-operation of factory owners, who have allowed us to connect no fewer than fifty-two chimneys, whilst we have already carried out, at a cost of about 1,250*l.*, 146 special shafts up the house sides, with a locked opening upon a large number of them, by means of which we can test the velocity of the current as well as the temperature of the outflowing air. The connexions with the high factory chimneys are all of too small a calibre to be of great use,

being generally only 6 in., with a few exceptionally of 9 in. diameter.

The radius of effect of specially-erected chimneys, as shown by the experiments of Sir Joseph Bazalgette, and as experienced with the special ventilating towers erected at Frankfort, is disappointing and discouraging when the cost is taken into consideration. It cannot be expected, however, that manufacturers will admit larger connexions to be made with their chimneys, otherwise, of course, much more satisfactory results would be obtained. To fall back upon special shafts up the house sides means, in my opinion, that there should be probably as many in number as are represented by the soil-pipes of the houses, for in this we have a tested example at Frankfort, which, so far as I know, has up to the present moment proved eminently satisfactory. The distance apart of such shafts would largely depend on the size of them, but as a rule it will be found that house owners object to large pipes, in which case the number must be increased, and if we take a distance of about 30 yards, we should require about 5,000 such shafts in Leicester.

Whether some artificial means of inducing currents in sewers by drawing down fresh air from shafts above the eaves of the houses, and sending forth the diluted sewer gas to still higher levels, or burning it in an outcast shaft, will take the place of natural ventilation, and prove to be less costly and more certain in its action, remains to be seen; but it is quite certain that notwithstanding the patents which have already been taken out and failed, and those now before the public, there is still a wide field of research before this question is satisfactorily solved, so that no cause whatever shall remain of complaint on the part of the most fastidious.\*

One other important question common to all towns is that of the collection and disposal of the ashes and refuse of the households. It is one which is becoming daily more difficult to deal with, especially in those large communities where the old privy and asphalt system has not been entirely abolished. The removal of such ashes is at all times a source of nuisance, and if they cannot be disposed of to the agriculturists of the district they become a source of difficulty. In purely water-closeted towns the so-called dry ashpits cannot be kept in such a condition as to be entirely free from nuisance, especially in the summer months, inasmuch as the refuse of vegetable and animal matter finds its way into them, and they are, in close and inhabited districts, necessarily too close to the living apartments of the dwellings; the tendency therefore now is rather to discourage the establishment of ashpits by the substitution of ashbins, to be collected daily or weekly as the case may be, and I think there can be no doubt that, from a sanitary point of view, this is by far the best system, harmonising as it does with the general principle applicable to town sanitation of removing all refuse likely by decomposition to become dangerous to health, as quickly as possible from the precincts of human habitations. The difficulty of disposing of the ashes, mixed as they must necessarily be with animal and vegetable matter, is one that is forcing itself upon the attention of all town authorities, and the days of the rich dust contractors of the Metropolis are practically numbered.

Destruction by fire seems to be the ultimate end to be aimed at, and in this respect several towns have led the way, but as this is a subject which will be fully dealt with by a paper to be read during the meeting, I will not anticipate the information which will be brought before you, further than to say that the great end to be aimed at in this method of disposing of the ashes and refuse of towns is greater economy in cost of construction of destructors, as well as in the cost of working them.

The progress in sanitation on the Continent, America, and the Colonies has not been coincident with the progress in England, but these countries have largely benefited by the experience of the United Kingdom, and in some respects their specialists take more extreme views than those of this country in matters of

\* On this subject, we may mention that in the course of the proceedings at Leicester, Sir Robert Rawlinson intimated his intention to place at the disposal of the Council of the Association the sum of 10*l.* 10*s.*, to enable them to appoint a person in whom they had confidence to work out all the present information on "Sewer Ventilation." It was intimated on behalf of the Council that this generous offer would be further supplemented by them.

detail. This is, perhaps, more particularly the case with the Americans, who have devised all sorts of exceptional details in connexion with private drainage, in order to protect the interior of the houses from sewer gas, and to perfect its ventilation.

In plumbing matters they seem also to be very advanced, and to have established examinations for plumbers, and far-reaching regulations for house drainage. Time will not permit me to examine into the works of a sanitary character which have been undertaken in the several countries after the example of England, but they have been attended with similar beneficial results and saving in life and sickness as in this country, although the Continental towns which have led the way with such works cannot as yet point to the low rates of mortality for large towns which have attained in England, with the exception of the German towns of Karlsruhe, Frankfurt, Wiesbaden, and Stuttgart, which show death-rates of 20.55, 20.64, 22.00, and 21.40 respectively. The greatest reduction of the mortality by the execution of proper sewerage and water works took place in Danzig on the Baltic, and on the Danube, where, after the execution of the works, the mortality was reduced by 7.85 and 10.17 per thousand respectively, and in the case of Danzig this reduction is almost exclusively in zymotic diseases.

Berlin is also a remarkable example of the enterprise of German sanitarians, for there they are demonstrating to the world the practicability of dealing with the sewage from a population of over 14 millions upon 16,000 acres of land, of which about 10,000 acres are already under irrigation.

In conclusion the President alluded to the important public works now in progress and in contemplation at Leicester, including flood prevention and sewerage works of a very difficult and costly character. A notice of these is necessarily deferred till next week.

Sir Robert Rawlinson, in proposing a vote of thanks to the President for his address, said he had known Mr. Gordon ever since he was nineteen years of age, and had been proud to continue his acquaintance ever since. He had the highest opinion of him as an engineer, and hoped he would live long enough to have his eminent abilities recognised by the country.

Mr. Jones (Ealing) seconded the proposition, which was carried by acclamation, and the President briefly acknowledged the compliment, and said he hoped that at the termination of his period of office he should still retain their esteem.

Subsequently a paper was read by Mr. G. R. Streehan (Chelsea), on "Concrete, Cement, and Asphalt Footways,"\* and after some discussion the meeting adjourned, and the members visited the old Townhall, the Roman pavement, the public baths, and two or three of the local manufactories.

In the evening the annual dinner took place at the Masonic Hall, Halford-street.

**The Memorial to Alexander III. of Scotland.**—The memorial erected at Kinghorn, in memory of Alexander III. of Scotland, was unveiled by the Earl of Elgin on the 19th inst. The memorial, which has been erected at a cost of some 300l., takes the form of a shaft over 11 ft. in height, slightly tapered, square on plan, each face being about 21 in. broad. Upon each angle is a roll moulding, with capitals and bases. On the front of the pedestal is a slightly-recessed panel, on which is the following inscription:—"To the illustrious Alexander III., the last of Scotland's Celtic Kings, who was accidentally killed near this spot, March 19, 1286. Erected on the sixtieth anniversary of his death." The front panel shows a *bas-relief* in bronze by Mr. John Rhind, sculptor, representing King Alexander surrounded by his courtiers, hearing the pleadings of some of the peasantry during one of the Circuit Court assemblies, which are said to have been a special feature of Alexander's reign. A cross terminates the whole at an altitude of 28 ft. above the rock base upon which the memorial is founded. The entire structure is of Peterhead granite, from designs by Mr. Hippolyte J. Blanc, architect, Edinburgh.

\* Of this and of the other papers read before the Congress we will give some report in our next, together with an account of the visits to the important flood-prevention works now in progress in Leicester, to the Groby and Mount Somer granite quarries, the Victoria Stone Works at Groby, the Leicester Waterworks at Bradgate, the Leicester Gasworks, &c., &c.

### COMPETITION DESIGNS FOR THE IMPERIAL INSTITUTE.

WE give this week the principal elevation, section, and plan of Mr. Blomfield's design for the Imperial Institute. The following extracts from the report sent in with the design will serve to explain the objects kept in view in working out this design:—

"In the instructions issued to the competing architects, the only part of the specified building, or group of buildings, which appears capable of having a monumental character imparted to it, without in some measure detracting from its convenience or utility, is the entrance-hall. In the accompanying design this hall has, therefore, been treated, both externally and internally, as the central dominating feature of the whole composition. In order to give it as much prominence as possible, it has been kept to a certain extent detached from the main building on each side, and rises straight from the ground, with nothing in front of it but an open porch.

"It plan an octagon of 50 ft. clear internal diameter, surmounted by a dome, the top of which, all neighbouring buildings, it would in itself form a monument not unworthy recording the occasion of its erection.

"The main building faces south. The entrance-hall is in the centre, and communicates directly with every department; it is approached under a spacious *porte-cochère* by a carriage drive, from the far end, and has doorways of ample width, so contrived that the whole may slide back on special occasions, leaving a clear opening of 20 ft. in width. On entering the hall, the first and most prominent object that meets the eye is an embossed statue of the Queen and Empress, and right and left are statues of the Prince Consort and the Prince of Wales. Passing straight on, the reception-hall is approached by a lofty corridor which carries on the architecture of the entrance, and is lighted from above.

"A great reception-hall, except on State occasions, is commonly a useless and somewhat dreary place; an attempt has been made to avoid anything of the kind in the case of the present hall. As will be seen, it is brought into close communication with the Exhibition Courts by means of corridors on each flank, these corridors having on one side numerous doors leading into the reception-hall, and on the other arched openings commanding the Exhibition Galleries 9 ft. below. These galleries would be approached by staircases at intervals.

"The hall might thus, when not required for meetings, be used for temporary exhibitions, or merely as a 'Salle des pas perdus.' Ample storage is provided in the basement below for seats or any other movable fittings.

"Returning to the entrance, the Secretary's offices will be found close at hand in the right wing, and beyond these the various conference-halls and committee-rooms, refreshment-rooms, &c.

"At the extreme west end are the Emigration Offices, communicating with the main building, but having a separate entrance. The upper part of this wing is occupied by the smaller committee-rooms, refreshment and smoking rooms, and by the kitchen and domestic offices, which are completely shut off, and are provided with a separate service staircase and ample lift accommodation. Rooms for stores and collars are placed in the basement of this wing, in immediate connexion with the lift and service stairs, and with the serving-rooms attached to the refreshment-rooms.

"On the left of the entrance-hall will be found, first, the post and telegraph offices and telephone room, and then the Mercantile Reading-room and Intelligence Offices close to the postal department on one side and the library on the other. On entering the library from this end, the Sub-Librarian's room is found close to the door on the right, and opposite to it the Librarian's room.

"At the other end of the wing are placed the general reading-room and students' reading-room, with a separate entrance.

"The whole of the upper part of this wing is devoted to the storage of books or to work connected with the library. In the basement, beside book-rooms, a large receiving and unpacking rooms, and heating-chamber, provision is made for porters' rooms, police-room, and a fireman's room.

"This comprises the main building, which may be termed the administrative part of the Institute. The remainder is entirely distinct, and is divided into two exactly equal and symmetrical sections, each of which consists of suites of galleries for permanent exhibitions or museums so arranged as to enclose a quadrangle of 220 ft. square, entirely occupied at a lower level by galleries principally of iron and glass for temporary exhibitions.

"Although no requirement of this kind is hinted at in the instructions, it is quite clear that, if large exhibitions are to be held in these courts from time to time, a considerable number of comfortable and roomy offices will be required in immediate connexion with them, and entirely distinct from those of the administrative department of the Institute itself; such offices have therefore been provided in

a convenient, easily accessible, and central position at the north end of the great reception-hall.

"The question of style appears to be almost settled by the character of the immediately surrounding buildings, and even by the *genius loci*, with which any style other than some phase of the Renaissance would be palpably incongruous. Great freedom of treatment should nevertheless be permitted and even encouraged in a building of this kind, and in such a position. A period at which the picturesque character of northern Medieval architecture had not yet entirely disappeared under the chilling influence of rigid Classical rules and formula seems, therefore, to be indicated as the best source of inspiration.

"The principal materials proposed to be used are red brick and stone. Terra-cotta, attractive as it is for some reasons, has inherent defects which make it unsuitable for a building of this character, in which stone of some kind is much to be preferred. Portland stone would naturally be selected as best able to resist London smoke and atmospheric changes; but the contrast with red brick is too marked. Corsehill (a red sandstone from Dumfries), which is easily worked, weathers well, and can be used at about the same price as Portland, is strongly recommended. Green polished granite, which would be used in such positions as would give it its full value in the general effect of the building. External statues and groups would be of bronze.

"The dome, surmounted by a gilded figure of Britannia, would be covered with copper scales and relieved with gilding. The whole of the construction of the outer dome and cupola would be of iron.

"The roofs generally would be covered with green slates. The principal and most elaborate portion of the internal decoration would be confined to the entrance and to the reception-hall, where British granite, marble, and mosaics would be freely used, both in the form of columns, dados, and plain ashlar, and in mosaic decoration of various kinds.

"It appears that there are few, if any, Colonial stones or marbles which would be available for extensive use in the building; but in the internal fittings there would be ample opportunity for the employment of many of the beautiful woods of which such fine examples were seen in the Colonial and Indian Exhibition."

"We give also the perspective view and principal plan of the design sent in by Dr. Rowland Anderson. The following explanatory remarks are taken from his report:—

"As the level of the site is below that of New-road, I propose to keep the basement entirely above ground, and to set back the building about 80 ft. from the line of this road, and enter by an elliptical ramping approach, somewhat similar to that of the Natural History Museum. The floor of this basement is kept a little above the surface, so as to form tunnels below the corridors, and at some other parts for drains, water, steam, and all other piping, &c., and large enough for workmen to get at any part of everything that is in them.

"Off the entrance-hall is the porter's and inquiry office on one side, and on the other the post-office, telegraph-office, and telephone-room.

"Branching right and left are the corridors for access to all the business parts of the building, which are kept entirely separate from those parts of the Institute that would be frequented by the general public and sight-seers; beyond this a fore-hall, and then the great reception-hall. The public access to the museums is right and left from this fore-hall, those on one side being equal and similar to those on the other, and thus equally divided between the United Kingdom, India, and the Colonies.

"The public lavatories are provided in such a position as makes them easily accessible, and where they can be ventilated to the open air, and at a distance from all room windows.

"I propose to locate all the boilers, engines, dynamos, &c., in a central position in the basement, between the entrance and the great hall.

"I would suggest the use of oil as a fuel, because it is cleaner, and economises labour to a large extent in attendance, stoking, and the removal of ashes, and renders a large chimney unnecessary.

"The engines and dynamos for the electric lighting will be placed in the courts, and so prevent any noise penetrating into the building.

"The building would be heated by low-pressure steam, returning all the water of condensation automatically to the boilers.

"The great reception-hall, general conference-room, library, entrance-hall, staircases, and corridors would be fitted with steam radiators, and the museums warmed from steam piping arranged in compartments below the floor, provision being made for the introduction of fresh air wherever required. Ordinary fireplaces would be used in all the business rooms.

"The ventilation of the building would be chiefly effected by the four great upcast shafts,—the draught being produced by the use of compressed air. Over each corridor is a ventilated-air chamber, having connections with all the apartments, and the museums, and these upcast shafts.

"The great hall is provided with its own upcast shafts.

In dealing with the architectural treatment of

Plan of Design for Imperial Institute by Dr. Rowand Anderson.

this building, considering its purposes, and their exclusive associations with the United Kingdom and the Colonies, and also the place where it is to be erected, I have endeavoured to make this building look like our own country, and to give it the character of the old buildings about London. I have, with these views, adopted that phase of Classical art which prevailed in the United Kingdom about the middle of the last century, and which at that time assumed a character distinct from Classical art in other countries of Europe.

The building is designed for erection in brick and stone of a cream colour tint. The roofs to be covered (for the sake of colour and durability) with lead, but the use of this covering must be determined by the cost; if too expensive green slates should be used.

This combination of materials is founded on good precedents, and it produces a fine artistic effect, which time improves.

The small scale to which the plans are made, and the somewhat limited time allowed for their preparation, has prevented me showing more fully the decorative treatment of the various parts of the building; but there is throughout a large field for the exercise of the Arts of Painting and Sculpture, the stone and wood carver, the glass-painter, and worker in metal.

In the great hall, large spaces are available for wall-paintings, and the entire surface of the vaulted ceiling for decorative painting. Raised on a dais in the circular recess at the north end, I suggest a seated statue of her Majesty, and on the wall behind it a hemicycle of the great men of her time. In the entrance-halls, the large conference-room, the

museums, and refreshment-rooms, &c., there is ample space for paintings, sculpture, and decorative work of every class; and in the reading-rooms and Emigration Offices there are large wall-spaces for maps, &c. Outside and in front I suggest places for two equestrian statues, such as Lord Clive and General Wolfe, who are so intimately associated with the founding of our Empire in India and Canada. In the tympanum of the portico, sculpture represents the Arts of Peace, and above this a seated figure of Britannia.

ORVIETO CATHEDRAL.

We give a general view of the façade of the famous building which its architect, Lorenzo Maiani, under whom it was commenced in 1290, had the good fortune to see completed during his own lifetime, a circumstance which probably operated in favour of the unity of design and character in the building itself.

The illustration of the north-west door on a larger scale shows the general effect of the remarkable sculptured panels, once erroneously attributed to Niccolo Pisano, who, in fact, died before the commencement of the building, and subsequently to Giovanni Pisano, and to others of Niccolo's pupils. It seems impossible now, however, to settle the part taken by various artists in a church which was so great a centre of interest at the time that no less than forty artists of various types came and settled at Orvieto to take part in the work.

Of the two panels shown, consisting of small subjects in relief divided by vine branches, the left-hand one represents scenes from the Creation and the earliest Biblical history. The second one commences with Abraham, and gives the genealogy and descent of the Virgin. The figures in these sculptures, those on the left side of the door especially, though somewhat childlike in modelling, in their large heads and naive action, are full of expression and feeling. Over the four panels are the emblems of the Evangelists, those of Matthew and Mark being seen in our illustration.

**The Metropolitan Board of Works and the Sale of Surplus Lands.**—The Metropolitan Board of Works, at its meeting on Friday last, after a long discussion, passed the following resolution by 24 to 20, viz.:

"That this Board is of opinion that none of its officers should be interested in the financial success of any dealings with the Board's properties, and considers that Mr. Robertson's admitted financial connexion with his brothers, under the assumed name of Grey, in such dealings, and especially the unauthorised substitution of one of his brothers for Mr. Foster, a tenant appointed by the Board, as most improper and deserving of censure."

The transaction mentioned in the resolution was referred to in our "Notes" last week (p. 87), and the Board, at its meeting this Friday, the 22nd, will consider the course to be taken in giving effect to the resolution.

SECTION.

SANITARY INSTITUTE OF GREAT BRITAIN.

The anniversary meeting of the Sanitary Institute was held on Thursday, the 14th inst., at 74, Margaret-street. The chair was occupied by Sir Douglas Galton, F.R.S., who presented the supplementary report of the judges on the exhibits at last year's Exhibition at York, deferred for further practical trial. The judges recommend that medals should be awarded to the undermentioned exhibitors:—

- Doulton & Co., Lambeth, for Self-adjusting Joint for Stoneware Pipes.
- White, W. P., & Co., London, for Nicholls' Soot and Salt Closet.
- Wragg, T., & Son, Burton-on-Trent, for Hassall's Joint for Stoneware Pipes.

They also recommend that certificates of merit should be awarded to the undermentioned exhibitors:—

- Burn & Baillie, London, for Combination Bath Fittings.
- Calvert, F. C., & Co., Manchester, for Boro-Phenol.
- The Stanhope Co. (Limited), London, for Electro-Magnetic Telephones.
- Woolley, James, & Co., Manchester, for Sanitary Rose Powder.
- Broad & Co., Paddington, for Rock Buff Facing Bricks.

The judges have not yet had sufficient opportunity of testing several other exhibits, which are therefore of necessity deferred for a future report. They regret that they are unable to recommend the award of the Richardson Medal. Their report is signed, "W. H. Corfield, Chairman; A. Wynter Blyth, W. Essie, Rogers Field, Henry Law, J. Wallace Peggs, H. Saxon Snell, Ernest Turner."

Dr. G. V. Poore next gave an address "On the Shortcomings of some Modern Sanitary Methods." It was an attack on the practice of mixing putrescible matter with water, or, in other words, on the method of dealing with excrement by means of water-carriage. The following is an abstract of the paper:—Recent investigations have shown that the decomposition of organic matter depends upon the growth of microbes. When organic matter is buried not so deeply in the soil the microbes are of a kind which cause oxidation and nitrification, and prepare the organic matters for absorption by the roots of plants. When mixed with water the microbes produced are different, and those offensive changes are caused which are known as putrefactive, and ammonia and carburetted hydrogen are formed, and oxidation is prevented. The mixing with water prevents and delays the only natural use of organic refuse, viz., that of forming food for plants. This practice, therefore, may be regarded as one which is antagonistic to nature, and it is evident that such an antagonism is worse than hopeless. The mixing of organic refuse with water in cesspools and sewers causes putrefaction of it, and these putrefactive changes are not only most repellant to our senses, but are a great and universally acknowledged cause of diseases of various kinds. Further, many diseases of the zymotic class have of late years been shown to depend upon living organic particles, which possibly multiply in putrefying liquids, and most certainly are disseminated in the most perfect manner possible when organic matter containing them is mixed with water and allowed to flow to rivers or wells. In connexion with this aspect of the case, it must be remembered that no method of "sewage treatment" can be considered as reliable for the removing or rendering innocuous of zymotic organisms. This practice of mixing with water involves a neglect of the great principle of "resisting the beginnings," and as an illustration of this the lecturer alluded to the cholera epidemic of 1863, when the excrement from the house finding its way into the River Lea, presumably caused the death of 4,000 persons, and he pointed out that if this matter had been buried or burned, instead of being mixed with water, many or all of these lives would have been saved. The "Water System" inevitably produces a fouling of our rivers. Of this fact the Thames, the chief source of our water supply, is a glaring example. With increase of water-carried sewage pure water is getting daily more difficult to obtain. This is of importance, not only to us, but to our animals, and it must be remembered that the health of animals and of human beings has been shown in many instances to be very intimately connected. The financial and economical results of the water-carriage system have been disastrous.

\* This was exhibited at Leicester, but the testing was not completed in time for the last report.

Sewers which cost millions cost thousands to keep in repair, and the "treatment" of the sewage must be a permanent charge and never a source of profit, because the mixing with water arrests nitrification. The ratepayer is being crippled and the land exhausted. The farmers are crying out for "protection," and they most certainly ought to be protected from the impoverishing effects of sewers. The lecturer contended that we have no right to borrow money for sewers, because they must be a source of expense and never a source of profit to those who come after us. The results of co-operation were most disastrous when persons co-operated to commit a blunder, and each generation ought to be at the sole charge of its own sanitary experiments. It was pointed out that water carriage, by enabling houses to be built without any curtilage whatsoever, was a great cause of overcrowding,—the greatest of all sanitary evils. It was to be remembered that this system of "water carriage" was not limited to towns, but was common in country districts where there was no possible excuse for it. The lecturer said he was a strong advocate for the dissemination of sanitary knowledge, but he was no advocate for legislation, by means of which blunders were often stereotyped. He advocated the encouragement of independence by householders, and he contended that those who did not use the sewers should not be compelled to pay for them. Our present method of levying rates was a distinct premium on jerry-building and overcrowding, and must produce mischief. If an equitable adjustment of sanitary rates were instituted, and the Pollution of Rivers Act were enforced against individuals, and if water were supplied by meter, sewage schemes in such places as the Thames Valley would very quickly become unnecessary, and people would resort to rational methods of treating organic refuse, i.e., they would subject it to immediate burial. The outcry for allotments was good, and if the allotments were near the houses so much the better. Sewage farmers advocated an acre to every 100 persons, but it was clearly better to let the 100 persons live on the acre of ground, and thus save the expense of sewers, and reap the benefit of the produce. If every cottage (for the average five persons) had 1-20th of an acre of ground, the sewage difficulty would disappear, and there would be an increase of health and contentment. A "Workmen's City" built on this plan would accommodate 64,000 persons to the square mile, or, making allowance for roads, 50,000 to the square mile. With an equitable adjustment of sanitary rates, the lecturer felt sure that this plan would be very generally adopted. The change would be very gradual, but he considered that the great failing of the present day was the constant attempts which we make to hurry when hurry is not possible.

In the discussion which followed, The Chairman (Sir Douglas Galton) said he had been extremely delighted in listening to Dr. Poore's charming paper, which contained so many points of interest, and gave rise to many thoughts as to the various problems of sanitation. One of those problems was that of the overcrowded state of the metropolis, which was a matter of the most serious moment, every vacant space being huilt over without the slightest remorse. It would be in the recollection of some who were present that after the Health Exhibition a proposal was made to build a sanitary house, and that the Duke of Westminster offered a site for it. The ground, of course, had to be paid, and there was also the interest on the cost of the building; but the scheme fell through because it was found to be impossible to build a sanitary house on the site allotted to it, so as to meet those charges. That was the case with London houses, and until the public insisted on having a sufficient area upon which to build, they would not get really healthy houses in the metropolis.

Mr. Baldwin Latham, M. Inst. C.E., proposed a vote of thanks to Dr. Poore, and added that although he agreed in the main with the tone of the paper, there were many matters in it which might be subject to dispute. He had constructed many drains and sewers in his time, but he was afraid that if Dr. Poore was right in his contentions, he had made a great mistake. At the same time, if a comparison were made between the death-rates of former generations and those of the present time,

things came out much more strongly in favour of modern sanitation. No one could have listened to Dr. Poore without having his mind awakened to the many points which required further elucidation, and there was no doubt that a vast amount of good might be done by following the advice that had been given. A great amount of evil occurred through the want of proper scavenging, and the leaving of organic putrefying matter in the immediate vicinity of houses. From the fluctuations that took place under ordinary climatic conditions, there was much to be done in future, and as long as they could not maintain a general good average death-rate, not subject to violent fluctuations, they had not succeeded in doing their duty as sanitarians.

Mr. E. C. Rohius seconded the vote of thanks. Dr. Poore, he said, had taken them to the state of things which existed before sanitation was understood, and he did not seem to say that sanitation had failed, or that the death-rate had become greater, but rather that there were conditions of things under which the old systems were more suitable than the modern ones. If, therefore, they were anxious to have everything done on the selfsame lines they would soon find themselves in an evil case. The resolution was then put and carried by acclamation.

Dr. Poore, in replying, remarked that he had commenced his paper by saying it contained a good deal of debatable matter. It had been his great desire to find the best principle of dealing with the question, and having found the scientific principle along which they should move, they must see whether it was practicable to put it into force. He believed the principle he advocated was the true and proper one, and he was exceedingly obliged to Mr. Baldwin Latham for the gentle way in which he had been handled. To Mr. Latham, and sanitarians like him, a great debt was due for the manner in which they had carried out a principle of sanitation which, however imperfect it might be, was unavoidable in a great overgrown city like London.

On the motion of Mr. Symons, seconded by Mr. Kingdon, a cordial vote of thanks was passed to the Chairman, and the proceedings terminated.

ANNUAL DINNER.

The anniversary dinner of the Institute was held on the evening of the same day, at the Holborn Restaurant. The chair was occupied by Professor W. H. Corfield, who was supported by, among others, Sir Douglas Galton, Dr. Mackellar, Mr. H. C. Cunningham, Mr. Baldwin Latham, Prof. T. Hayter Lewis, Major Flower, Mr. E. C. Rohius, Mr. H. H. Collins, Mr. H. Saxon Snell, Mr. James Doulton, and Mr. E. White Wallis (Secretary).

The Chairman proposed the usual loyal and patriotic toasts.

Sir Douglas Galton, in proposing the toast of the evening, "Success to the Sanitary Institute," said that with her Majesty's reign began the systematic registration of births and deaths, and, as far as they had them at present, the causes of death; and that sanitary legislation which culminated in the Acts of Parliament of 1875, and those which now prevailed. It was felt, some ten or fifteen years ago, that sanitary science would never be thoroughly appreciated in this country unless the public were educated in it, and unless there was a means by which it could be generally diffused over the whole land. For that purpose the Sanitary Institute was formed, and that had been its mission.

The Chairman, in responding, said it was necessary to show good reason for the existence of the Institute in order to encourage others to assist in the work they had in hand. The Institute had been in existence for ten years, during which time nine Congresses had been held in different parts of the country, and by this means a great many people had learnt something about sanitary work. Besides this, the Institute issued a volume of Transactions containing the papers read at the Congresses, with abstracts of the discussions and various other matters connected with the work of the Institute. Those volumes would be found to contain a mass of valuable and interesting matter bearing upon practical sanitary work. The Institute had also issued two volumes, one consisting of a most important epitome of the works of Dr. William Farr and another of the works of Sir John Simon, whom they congratulated with Sir Douglas Galton on the honour

FIGURE I

PLAN SHOWING BASE LINES

ing taken to place the two poles accurately line and vertical, chaining forward from to P, taking the distance between the poles on the hedge, and then adding the measurement to E P, and placing the proper k to G to indicate the amount so determined fore continuing the measurement to H. The magnetic bearing of one of the base lines which the relative position of the north of the survey is arrived at, may be taken with a compass which contains a compass, or with a solar compass. If the prismatic compass is used in the line A B reads 34°, as shown upon a plan, the bearing can be plotted with a protractor, as shown in fig. 8, allowance being made for the deviation of the true north from a magnetic north (see Builder, Feb. 5th, 1887). If the prismatic compass be held on the line C A, and viewed in the direction from C to A it would read 242°. We refer our readers to the Builder, dated January 1st, p. 203, for explanation of the prismatic compass, and to the Builder, dated March 1st, p. 370, for explanation of the construction a theodolite.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

10,384, Improved Door Lock. G. Nobes. The subject of this patent is a slam lock for single swing doors. The end of the bolt which is nearest the door-frame is made cylindrical in shape, while the nozzle is of a semi-globular or rounded form. The part of the bolt inside the lock-case is rectangular in form, and it is controlled by springs. This invention is chiefly designed as a mortise lock, and a guide pin is therefore fitted to a detachable key screwed to the back end of the case.

10,683, Checking Workmen's Time. P. Perret. This invention relates to an apparatus combined with a clock or other suitable mechanism and printing or stamping mechanism so arranged that the workman on entering his employment, by pushing a drawer or slide, obtains a card or ticket which the date is stamped, or the time or particulars of his work.

10,453, Improvements in Flushing Cisterns. B. Evered. This invention refers to the long leg which extends below the bottom of the tank; the short leg is enlarged at its extremity, and has a plunger working in it. The plunger is pivoted on the tank. When the tank is full of water, and the plunger is near the bottom end of the short leg of the syphon, the latter is also nearly full of water, and the upward movement of the plunger lifts the water lying above the same, and causes it to flow over the bend of the syphon, whereby the latter is emptied. The flow continues until the water reaches a level of the short leg of the syphon, the valve of the plunger permitting the free passage of the water.

10,752, Improvements in Saws. S. Taylor. The object of this invention is to construct an improved saw, which can be used in positions where it is inconvenient to get in the hand of the user, or close to a skirting, or in the case of a plug saw in the wall, and which requires to be cut off close with the wall, or in similar positions where the access for the hand is limited. The handle of the saw is made with a hinged joint, which can be fixed in any position, and fixed there by a bolt. Sometimes the blade of the saw is hinged for a similar purpose.

6,283, Bricks, &c. A. Murray. With the object of giving to bricks, mouldings, &c., a sharply-defined edge, a thin shaving of clay proposed by this invention to be taken off after the goods are dried. It is also claimed that the process improves the colour of the bricks.

NEW APPLICATIONS FOR PATENTS.

July 8.—9,618, S. Washington, Compound for painting or Varnishing Ironwork.—9,622, J. Jones, Concrete Pavements, Floors, &c.—9,627, F. Pitking, Fireproofing Columns, Stanchions, Girders, Pillars, Walls, Floors, &c.—9,635, J. Lindley, Improved Door Latches.

July 9.—9,666, W. and N. Haigh, Flooring Comp.

July 11.—9,694, F. Stokes, Manufacture and setting of Cement.—9,695, W. Wise, Windows.—16, J. Hirschfeld, Fastenings for Doors.

July 12.—9,757, J. Turner, Explosive Alarm for Protection of Doors, Windows, &c.—9,759, W. Watson, Water-tap.—9,783, A. Bayer and C. Mott, Comp. for Flooring and other Woodwork.—9,800, J. Bout, Window-fasteners.—9,817, O. Murray, Material for Covering Walls, &c.

July 13.—9,846, F. Bishop, Fastening Windows.

July 14.—9,888, J. Savage, Fastening Windows, Doors, Casements, and Doors.—9,908, H. Henry, Improved Chimney-cap.

PROVISIONAL SPECIFICATIONS ACCEPTED.

7,571, J. Tuckett and G. Foster, Mortise Lock.—8,503, W. Bradley and Others, Floor Cramp, Lifting Jack, &c.—8,756, E. Emanuel, Flushing and Trapping Overflows to Water-closets.—9,039, F. Naumann, Faced Bricks.—9,140, S. Hazelaed, Wood Planing Machines.—8,266, W. Cliff and R. Peto, Brick or Building Block.—9,034, R. Whiston, Combined Sash Lift and Automatic Sash Fastener.—9,036, W. Dennison, Water Waste Preventing Cisterns.—9,452, W. Goulton, Sliding Window Sashes.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to Opposition for Two Months.

11,289, T. Easley, Attaching Door Knobs to Spindles.—11,602, G. and S. Jennings, Water-closets.—11,809, W. Wright, Regulating Water Waste Preventer.—14,837, H. Bromhead, Skylight or Fanlight Opener.—479, J. Shaw, Gullies and Sinks.—8,023, C. Webb, Automatic Dry Closet.—8,383, B. Keull, Plates or Panels for Decorative Purposes.—11,424, B. Luther, Decoration of Wood, &c.—12,009, E. Gillis, Ventilator for Rooms fitted with Sash Windows.—3,445, G. Goodhue, Timber Structures for Mines.—7,251, H. Lake, Fastener for Window Sashes, Casements, &c.—8,559, H. Lake, Opening and Closing Windows.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

JULY 11.

By WALKER & RUNTZ (by Tender). Old Kent-road—Peckham Birkbeck Schools, area 64,900 ft. freehold £4,500

By J. WILCOX. Notting-hill—6 to 8, Bolton-groves, 66 years, ground-rent 184. 450

By NORMAN & SOX. Easton-road—12, Madison-place, 15 years, ground-rent 254. 60

By CHINNOCK, GALSWORTHY, & Co. Putney-hill—The Grange, 78 years, ground-rent 374. 2,750

North Kensington—12, Wornington-road, 88 years, ground-rent 71. 10s. 275

138 to 142, Wornington-road, 89 years, ground-rent 124. 563

Notting-hill—52 and 64, Branley-road, and 29 to 31 odd, Blechynden-road, 77 years, ground-rent 404. 630

Tottenham, Northumberland Park—The Limes, freehold. 740

By E. RICHARDS & Co. Wandsworth-common, St. James's-road—Hampton Villa, freehold. 1,030

By DEBENHAM, TAYSON, & Co. Bethnal-green—Freehold ground-rent of 904. a year, reversion in 8 years. 5,000

Chester-square—104, Emery street and stabling, 35 years, ground-rent 121. 2,550

By H. BUTLEY. Hampstead-road—12, Rutland-street, 39 years, ground-rent 51. 5s. 670

Regent's Park—3, Albert-street, 28 years, ground-rent 41. 10s. 525

Sudbury, Llanover-road—Montague Cottage, freehold. 385

Six plots of freehold land. 170

JULY 13.

By R. A. NOLLEY. Mile End—73 and 75, Harford-street, 21 years, ground-rent 54. 280

By M. MITCHELL. Holborn—The Red Lion and Ball public-house, freehold. 3,170

By W. R. SMITH. Drury-lane—23, Macklin-street, freehold. 4,670

By HOBSON, RICHARDS, & Co. Dalston—171, Queen's-road, 33 years, ground-rent 41. 10s. 305

Hackney—Improved ground-rent of 221. term 5 years. 66

Brixton-hill—An improved ground-rent of 1761. 1s., term 4 years. 401

JULY 14.

By F. SCOBELL. Lewisham—29, Wisteria-road, 85 years, ground-rent 41. 220

By BRADLEY & Co. Enfield—The residence, Fir Tree House, and 2s. 3r. 32p., freehold. 2,800

Silver-street—A plot of freehold land. 370

Churchbury-lane—A block of freehold land, 2s. 2r. 26p., detached freehold residence. 1,600

Silver-street—Detached freehold residence. 1,900

By DEBENHAM, TAYSON, & Co. Hoxton—The Unicorn public-house, and 1 to 6, Land of Promiss, freehold. 2,630

By C. C. & T. MOORE. Mile End—18, Hawkins-street, 13 years, ground-rent 21. 8s. 115

Poplar—4 and 6, Pennyfields, and 61 and 63, West India Dock-road, 5 years, ground-rent 311. 10s. 123

61 and 63, Pennyfields, copyhold. 258

Woodford Wells, Mornington-road—A plot of copyhold land. 221

By FAREBROTHER, ELLIS, & Co. Stanmore, Middlesex—The mansion, all of Canons, the residences, North Lodge and South Lodge, in all 461a. 1r. 4p. 40,000

A plot of freehold land, 0s. 2r. 14p. 165

Stone Grove House, Stone Grove Lodge, and Stone Grove Cottage, freehold. £2,540

Ground-rent of 71, reversion in 35 years. 670

Strand—No. 285, Carr's Tavern, freehold. 3,800

Paddington—57, Cambridge-street, 39 years, ground-rent 121. 12s., with short reversion. 930

Strand—No. 285, Angel and Sun public-house, 3 years, ground-rent 161. 6s. 6d. 200

New Cross-road—Nos. 189 and 191, Edward-street West, 70 years, ground-rent 184; and a ground-rent of 61. 1s., same term. 420

Lewisham—10, 11, and 15, Jerrard-street, 75 years ground-rent 71. 10s. 750

Peckham—1, 2, and 3, Alfred-place, freehold. 810

Canterwell—141, Grove-lane, 36 years, ground-rent 184. 10s. 110

By ELIAS & SOX. Ilington—20, Theberton-street, 31 years, ground-rent 81. 405

By D. WATNEY & SONS. Wandsworth—33, West-hill, freehold. 1,060

4, 5, and 8, Putney Bridge-road, 20 years, ground-rent 51. 285

1 and 2, Adelaide-cottages, 60 years, ground-rent 200

Crawley, Sussex—The residence called Dearwood, and 32a. 2r. 27p., freehold. 3,650

Freehold cottage, and 5a. 2r. 28p. 600

An enclosure of freehold land, 5a. 3r. 34p. 205

By DYER, SOX, & HILTON (on the Premises). Blackheath—62, Vanbrugh Park, 74 years, ground-rent 81. 3s. 600

JULY 15.

By MURRAY & SCOBELL. Gray's Inn-road—Nos. 69 and 71, and 6 and 7, North Mews, freehold. 3,540

Homerton—No. 2, St. John's Church-road, freehold. 445

21, College-avenue, freehold. 345

By B. BIRD. Oxford-street, 51, Castle-street, 33 years, ground-rent 501. 500

Regent's Park—31, Upper Baker-street, 15 years, ground-rent 81. 6s. 560

An improved ground-rent of 251. 4s., term 14 years. 220

By C. R. COOKE. Uxbridge-road—1 to 5, Bloomfield-pavement, 99 years, ground-rent 701. 3,845

Shepherd's Bush-road—No. 8, freehold. 670

By BAKER & SONS. Kenish Town—Six freehold houses called Bellina Villa. 3,900

Kensington, Edwarde-terrace—Profit rentals of 3631. 6s., term 23 years. 4,160

Ealing—The freehold residence Castletor Court, and 4a. 1r. 3 p. 2,210

By W. & F. HOGGARTH. Stoke Newington—100, Farleigh-road, 77 years, ground-rent 81. 545

Walthamstow, Cranville-road—Yew Villa, freehold. 210

The Copeland Arms beerhouse, freehold. 970

Grove-road—Two plots of freehold land. 180

Lorton—1 to 3, Capworth-villas, freehold. 1,600

Beaman-road—Two freehold houses and plot of land. 310

7, High-street, freehold. 300

Manor Park—1, 4, and 5, Carlyle-terrace, freehold. 750

MEETINGS.

TUESDAY, JULY 26.

Glasgow Architectural Association.—Visit to the Commercial Bank, Buchanan-street. 515 p.m.

THURSDAY, JULY 30.

Architectural Association.—Visit to Streatham Churches. (See Advt. on p. xiv.)

Liverpool Engineering Society.—Visit to the Forth Bridge Works, at Queensferry. Train from Lime-street Station, Liverpool, at 9 p.m.

Miscellaneous.

Liverpool Engineering Society.—On Saturday last the members of this Society visited the Park Extension of the Mersey Railway, the Wirral Railway Works, and the Bidston Observatory. Arriving at Birkenhead at about 2.15 p.m., the party were met by Mr. E. S. Wilcox, the resident engineer of the Mersey Railway, who conducted them by way of Market-street and Beckwith-street to the site of the New Park Station, pointing out on the way the damage sustained by subsidence to the buildings along the route of the tunnel. From the Park Station the party proceeded to inspect the work underground, after which, under the guidance of Mr. R. Froehirne, the Wirral Railway Works were examined, much interest being taken in the working of the "steam navy" in the cutting. The members having visited the railway works then proceeded to the Observatory at Bidston, when Mr. Hartnup gave an interesting description of the various instruments for obtaining the daily records of the atmospheric changes, and also exhibited diagrams showing the wind pressures and barometric changes experienced during some of the more severe storms that had visited the district.

Lifts.—We have received a letter from Messrs. Archibald Smith & Stevens in reply to Mr. Gibson's last letter, but cannot spare space to continue the discussion.

**Opening of New Public Baths at Balham.**—The extensive building operations and consequent increase of population at Balham during the last three or four years has led to the erection of new public baths, which were formally opened on Thursday. The site of the baths is on the east side of the Balham main high road, not far from the London and Brighton railway station. The building has a frontage 43 ft. in length, with a depth of 240 ft., the structure thus covering a ground area of about 10,400 ft. The elevation is 50 ft. in height, and contains four floors, having an arched central entrance 10 ft. in width, leading to the private and swimming baths in the rear. Those portions of the ground-floor on each side of the central entrance are intended to be let off as shops. The frontage is faced with red Suffolk brick, the windows of the several floors having red gauged brick arches. Immediately over the central entrance to the baths there is an ornamental oriel window at the first floor. The walls of the entrance are faced with enamelled brick in varied colours, and the floor is laid with encaustic tiles. About midway along the entrance corridor, on each side, are the men's and women's private baths and dressing-rooms, and beyond these is the public swimming-bath, 100 ft. in length, and 30 ft. in width, with platforms on each side, and upwards of forty dressing-boxes. The walls of the bath, which is 6 ft. in depth at one end, and 3 ft. 6 in. at the opposite end, are faced with white enamelled brick. At the extreme rear is a boiler-house and laundry, in connexion with the baths. The roof of the swimming bath, which has a lantern light, rests on ornamental iron girders. During the winter months the swimming bath is intended to be utilised as a public hall, for meetings, lectures, and entertainments of a miscellaneous character. Mr. J. Dickson, of Battersea, is the architect, and the building has been erected by the owner's workmen, under the superintendence of Mr. Alfred Wallis, as foreman.

**Composition of Antiquus Metals.**—The well-known Paris chemist, M. Berthelot, has recently made some discoveries on the above subject, which are considered to have both scientific and historical importance. M. Place discovered in 1854, under the ruins of the palace of King Sargon, a stone coffer containing several metal plates covered with cuneiform inscriptions, recording the erection of the building (B.C. 700); the fact being likewise recorded that three of the tablets were respectively of gold, silver, and copper, while the fourth was composed of various substances. M. Berthelot's researches (described in the *Illustrirte Zeitung für Blech Industrie*) confirm the correctness of the inscriptions as to the first two plates, but the third he found to be bronze instead of copper, containing 85 parts of copper to 10 of tin. The fourth plate was found to consist of crystallised magnesian limestone (carbonate of magnesium), a very rare mineral, unknown to scientific men at the commencement of the present century. Some fragments from Tello were likewise analysed by M. Berthelot, with the result that a vase was found to be composed of pure antimony, which metal has always been regarded as unknown to the ancients and as having been discovered only in the fifteenth century. Tello has been deserted since the time of the Parthians, so that the remains of the oldest Chaldean culture are found there. Virchow has also recorded the discovery of antimony ornaments in a Trans-Caucasian necropolis. A statuette was found by M. Berthelot to be of pure copper.

**Sale of Property.**—The sale of Canons, in Middlesex, described in our columns of June 25 last, was effected at the Mart on Thursday last. Sir J. W. Ellis was auctioneer. The house and grounds of about 460 acres were bought for 40,000. Other lots of 65 acres and 38 acres were sold for 7,000, and 5,400, respectively. The whole nine lots, comprising all the estate, realised 55,330.

**The Tay and Forth Bridges.**—Referring to the account given in our last (p. 116) of the Tay Bridge, Mr. Joseph Hamlet, of West Bromwich, writes to say that the blue bricks mentioned were supplied by him, and also that he is now supplying all that are being used in the construction of the Forth Bridge.

**Total Destruction by Fire of a Swedish Town.**—The town of Inlck, in the North of Sweden, was recently entirely destroyed by fire. The church, the Town-hall, as well as other public buildings, were burnt down.

### Historic Towns: Oxford.\*

THE history of Oxford is an extensive subject, and Mr. Boase must have found the 217 pages of his book none too many to render even moderate notice of many a weighty event, which—in fairness to its importance de-

demanded longer reference. Each of the pages before us is well filled, and the author does not take for granted that the reader is already conversant with the subject, which has been, to some extent, the case with the previous publications in this series. On the contrary, every point not likely to be known or understood by general readers is explained as we go along, even where the explanation may be of value only to one in fifty.

The history of Oxford is different from that of any of the other towns which have been already dealt with in this series, and it has been selected on account of its difference. While London stands as of right foremost as the capital of the country, and with a history in like manner different from that of other towns; while Exeter is remarkable for maintaining its existence unbroken in the midst of an agricultural country; and Bristol, on the other hand, shows what trade and enterprise have done for it; Oxford history indicates a state of things unlike any of them. The University of Oxford is the cause of this difference, and it is curious to trace in the book before us how completely the University has transformed the ordinary market town.

"The University of Oxford," says Mr. J. R. Green, "is so far from being older than the city that Oxford had already seen five centuries of horough life before a student appeared in its streets. The University found it a busy, prosperous borough, and reduced it to a cluster of lodging-houses. It found it among the first of English municipalities, and it so utterly crushed its freedom that the recovery of some of the commonest rights of self-government has only been brought about by recent Legislation." Not the least interesting portion of the book is the narration of the gradual encroachments of the power of the Universities upon that of the municipality, and we shall have occasion again to refer to the subject; but it is satisfactory to think that the principal victory over the latter was at a comparatively late period.

Mr. Boase does not treat of the architectural history of Oxford. Indeed, considering the importance of the buildings and of their artistic value, it is not a little remarkable that he has made so readable a book with such meagre reference to the chief glories of the city. There is ample compensation in the pages before us, but architectural readers will not find much. The archaeology of the city, in like manner, is only dwelt upon cursorily, as it arises in the narration of its history. No reference at all is made to the recent discoveries made during the erection of the new Examination Schools, which clearly indicate the existence of a pre-historic settlement at Oxford. The site was found to be covered with the remains of a hut village, the pits of the houses being excavated in the stiff bed of gravel which overlies the clay. They were so close together that the gravel was only left in some places as walls between hovel and hovel. There were beaten floors, with traces of fire.

These discoveries, so important in respect to the early history of the city, do not appear to have been followed up, or to have been investigated as minutely as they deserved. Still, they are amply sufficient to indicate that in pre-historic times the site of Oxford was known and occupied. The prosecution of further researches in this direction must be left to future times, and they will be materially helped from the circumstance that investigators will know what to look for, and where. The adjoining sites to the erected portion of the Examination Schools are as likely to be covered with traces of the settlement as the comparatively limited area which was examined.

The legends about Alfred "have been analysed so thoroughly by Mr. Parker that the work will not need doing again." In consequence, the history in the book before us opens with the year 912, when King Eadward took to himself Lundenbyrg and Oxnaford, on the death of Æthelred, ealdorman of the Mercians, who had held the valley of the Thames, on the banks of which Oxford had risen. The importance of the place at this, apparently, the earliest authentic date recorded in history, is shown by its being "coupled with London as necessary to secure the obedience of Mercia, or Middle England"; and it is conjectured, with probability, that it was one of the places fortified by the "English" about this time, to guard the rivers which acted so well as the main arteries of communication from point to point, and by which the Danes penetrated into the heart of the country.

The streams of the Thames upland converge near Oxford, and in their windings their channels often pass through marshy and reedy clays, affording no sure bottom. Fords had to be sought for not merely at a place where there

was shallow water, but where there was either hard gravel or rock to afford a secure road. Such a state of things exists at Oxford, "not only at Folly Bridge, but also near Mincksey and Binsey." The derivation of the name of Oxford, which exists to this day, is obtained easily from the passage of oxen across the river. There are many similar derivations in England of Saxon origin, and Heortford,—the ford of harts,—is cited as a cognate instance, and these are accepted as matters of course. They are, however, open to the inquiry as to why there should only be harts in one place and oxen in another; and we are inclined to receive this class of ready definition with a certain amount of doubt. Still, some accidental circumstance or use of the site for the passage of oxen may have started the name; and does not the city shield display an ox in full field passing over a stream wavy, to this day, and what more ought there to be to gain-say the sceptic?

We may well assent to the suggestions made as to the condition of things at Oxford at the date which affords so good a starting-point. Its situation in relation to the stream made it almost a natural stronghold, "since it only needed to dig out a ditch on the northern side, somewhere near the line afterwards occupied by the northern wall," "to make the gravel ridge between the Thames and Cherwell into an island, protected by the many streams into which the rivers divide." "The earth thrown up from the ditch would provide material for the mound." The formation of the castle mound in Saxon times is thus, we think, correctly, suggested, and the plan of the town shows how completely its early site provided for the castle to be the head of the surrounding fortifications. Still, the low-lying position of the site of Oxford is peculiar to itself, and it is different in this respect to that of the three other towns of this series of volumes, although they are all of prehistoric origin.

As at Exeter, so here at Oxford, the evidence of numismatics plays an important part in the early history of the town, and thence we learn that there was a mint here, and that it issued coins of Alfred, Athelstan, Edmund, Cnut, Harold, and others. A glimpse of still earlier times is afforded by the dedications of the churches, evidences which always demand attention, which have been much neglected, but which, in the future, must be taken into consideration. The names are almost all early ones; and two of them are those of Celtic saints,—St. Aldate and St. Eudoc; "but we have no further help towards inferring any previous Celtic influence on the place." The relation of the Mercian kings with the Celts, or Romano-Britains as we prefer to call them, and the conversion of

\* Historic Towns. Edited by Ed. A. Freeman, D.O.L., and Rev. Wm. Hunt, M.A. Oxford: by C. W. Boase, Fellow of Exeter College. London: Longmans, 1887.

Mercia by Celtic missionaries, is plainly stated. It follows as an easy consequence that the earliest of the churches would be called after Celtic saints of repute, as readily as does the name of an old church,—Danesbourne,—point to a later Danish, and St. Frideswide and St. Mildred to a Saxon, element. At Oxford, as in the other towns which we have already passed in review, we find evidences of the existence in early times of a numerous group of churches. Of these, Domesday Book mentions four, incidentally as usual, when they are connected with the ownership of property. They are St. Mary, St. Michael, St. Ebbe, and St. Peter. From the cathedrals of Abingdon and other adjacent religious houses we obtain four more, St. Martin, St. George, St. Mary Magdalen, and St. Frideswide. This is not even a complete list, since a charter, ascribed to Henry I. in mentioning all the churches in which St. Frideswide held rights, names All Saints, St. Mildred, St. Peter-in-the-Castle, St. Michael, St. Aldate, St. Michael-at-South Gate, St. Edward, the Chapel of the Holy Trinity over East Gate, and St. Clement. These are seventeen in number, and they are shown to have been in existence very soon after the Conquest.

We are presented with interesting details, from Domesday Book, of the number of houses in the town, for the use of whose inhabitants this large number of churches was devoted, and we find that there were, before the Conquest, 721 houses. At the time of the survey there were, however, only 243 houses inside and out the wall that paid geld, and 478 unoccupied and ruined.

With so many empty houses, it is hardly likely that very many new churches would be founded during the early days of Norman rule, and we may therefore safely conclude that, at any rate, almost the whole of the seventeen churches named as existing *temp.* Henry I. were of Saxon or earlier foundation. We have arrived at similar conclusions, but on other local circumstances, with respect to the foundations of the remarkable groups of early churches of London, Exeter, and Bristol. The positions of some of these churches in relation to the four gates of the town are as curious as at London or Bristol. Thus, the two St. Michael's were by the north and south gates, the two St. Peter's by the east and west. St. Clement's, like St. Ewan's, in London, and others elsewhere, stood in the middle of the road, and St. George's was within the castle. One of the few architectural notices in the book relates to the tower of St. Michael's, and this, from its relation to the gate, is stated, as has been stated before, to be part of the town wall, and a tower for its defence serving as well for the church. We can but differ from these views. The tower is Saxon and not Norman, and it bears relation to the church in a way so like an ordinary tower to its church that its position with regard to the line of the wall may be taken as but an accidental circumstance; and beyond saying that the tower might serve for defence on an emergency, we see no reason for the belief that it was ever a portion of any other structure. In addition, we have no evidence that the early walls of Oxford were of stone. Had they been so, and even in early Norman times, it is reasonable to inquire why they should require such complete renewal as has been the case wherever they remain for us to examine them.

The town is laid out with its two principal roads meeting at right angles at a Carfax, where one of the churches is placed. The others about either upon the High-street at fairly equal distances, or are arranged more evenly than is the case in other towns in line to the left and to the right of the central High-street. Be the foundation of the churches of Saxon date or not, we find no evidence in the pages before us of the foundation of any other parish churches during the whole of the Medieval period. On the contrary, they become reduced in number instead of being increased. Religious houses, abbeys, and friaries were founded, but not parish churches.

Some of the most curious references of the first chapter are those to the presence of Jews in the town, which are ahly summed up as

follows:—"But the Jews did more for Oxford than lend money or build stone houses, for with the Jewish settlement began the cultivation of physical science. Some students could learn Hebrew, and the Hebrew books which he found among the Rabbis were the means by which Roger Bacon penetrated to the older world of research." "A medical school which we find established in the twelfth century can hardly have been other than Jewish, and in the operation for the stone, which one of the stories in the 'Miracles of St. Frideswide' preserves for us, we trace the traditional surgery still common in the East." "At last, in 1290, Edward I. banished all Jews from the kingdom, and the expulsion was carried out with peculiar atrocity. Their return after nearly 400 years was due to the tolerance of Cromwell."

The keeping of lions, leopards, strange spotted beasts, and such like animals, within the park of Woodstock by Henry I. is pleasantly told, and the prosaic but doubtless true opinion is hazarded, that the leprosy of the Middle Ages, dire scourge as it was, was owing merely to the unclean mode of living, to men eating salt meat half the year, and having next to no vegetables. The Fellows of Oriel used to go to St. Bartholomew's Hospital on Ascension Day, hear a service, and then walk to a well,—Hickwell,—and sing hymns. Wax candles were offered at St. Edmund's Well until the practice was stopped by the Bishop of Lincoln in 1304. These are curious survivals of well-worship, and their notice is followed by reference to some aids to faith formerly at the hospital,—to wit, Edward the Confessor's comb, the bones of St. Stephen, and one of the ribs of St. Andrew. There are interesting references to the rise and progress of the corporate power,—as yet there were no colleges,—and to the existence of many guilds, particularly to that of their guild merchant in the charter of Henry II. given before 1161, and a distinction is made between *thrif* guilds and those for trade, the former being considered the earlier. "Later on, class privileges became themselves oppressive, and a hindrance to the progress of society; but there is a time for everything." The charter distinctly lays down the principle that the merchant guild had the exclusive right of regulating trade, except in specified cases, which is conclusive as to what was the governing body within the town, so to speak, originally.

We find the Barbers' Company being incorporated in 1348, but not by either mayor or external authority, but by order of the Vice-Chancellor, and there is a curious case cited 1530-31 in a dispute between city and university,—one of many,—as to the alleged unlawful incorporation of the Taylors, which is of no little interest in the history of guilds.

The Cooks were incorporated in 1480, by the Chancellor, but at this date the power of the universities had greatly encroached on that of the mayor and corporation. By the charter of Richard, the Mayor of Oxford had the curious privilege of being butler at the coronation feast of the Kings of England, which means that he should "assist the Lord Mayor of London, who assisted the chief butler."

Some curious local references to the old names of the streets are of interest, and Kapeharm's Twychen is explained, as everything is explained, as meaning *twy cina*—in old English, a meeting of two ways, "twitten and twichel" are still used in some places to mean a narrow alley." Our readers will be interested to know that the inhabitants copied those of London in more ways than in their municipal privileges; as, for instance, after the burning of 1190, the artisans "now began to follow the example of London in using stone, at least for the party-walls between the wooden houses," whereas they had been of wood and straw, they began to build with stone and slate, being afterwards described as stone or tiled halls, while glazed hall was used to distinguish houses with glass windows. The wall of Oxford, as in so many other cities, had a continuous street all round the town, just within the wall, by which direct communication could be obtained, and to the four gates, which latter were not removed until

1771. Medieval Oxford is summed up as follows, and again we must say prosaic but truthful:—"If any enthusiastic person could wish himself back in Medieval Oxford, he would probably not find it very inviting. The artisan stepped out of his mud hotel into a muddy street." "The unpaved lanes had a gutter running down the centre, into which much was thrown from the windows." "There was an absence of all due means of cleanliness and health." "In the houses, the charcoal fire escaped through an opening in the roof." "Candles were dear, nearly twopence a pound; that is, two shillings of our money at least." "People rose at five; the dinner-hour was at ten; late in the afternoon they supped, and went to bed early." The statutes of Magdalen ordered all students to leave the hall, where they lingered because of the fire, at curfew time, except on saints' days. "The dining-halls were strewn with rushes, into which all sorts of nastiness were thrown, and after about a fortnight they became unendurable."

It is not a little singular that, while the power of the university has been so great and the value of the colleges so considerable, their beginnings are so obscure. The university grew up gradually, but it was not incorporated till kings and bishops thought good to recognise acknowledged facts. "*Universitas* means corporation." Paris University has no documents to show its existence earlier than 1250, and Oxford is even more deficient.

The chapter on "The University and the City" will be read by all with much interest, for it lucidly and briefly renders in a pleasant, chatty style, a very comprehensive account of the rise and progress of the colleges, and of their growth in power, until the town, or city, as it became, sank to a very secondary position. In Durham Hall was the first public library of Oxford. Bury, Bishop of Durham (1333-45), had found precious volumes in the noblest monasteries, "defiled and injured by mice and worrus, and abandoned to moths," and these appear to have been here collected, although it is not said so. The staircases on the left, as you go through Worcester College, are the entrances to old Benedictine hostels, where the half-defaced arms of convents may still be traced, the custom having been for the various monasteries to send up about one in twenty of their numbers to study. At the time treated of, there were only separate schools at Oxford, and many of these appear to have been only of small size, lodgings for the students being found in private houses, and in inns or hostels,—the English and French words respectively for lodging-houses." Another name for them was "entries." A hostel was a private house hired by a group of students for economy, and the senior among them, who was responsible for the rent and to the University for good conduct, "gradually came to be called Principal." Chaucer's "Poor Scholar," we are reminded, lodged with a carpenter who worked for the Abbot of Osney. The collegiate system had, however, begun as early as the reign of Henry III., for it was in 1274, that William de Merton transferred the scholars of Malden, Surrey, to a freehold at Oxford. His plan excluded the monastic influence altogether, for no friar or monk was to be admitted to the foundation. This was followed by other colleges, the first seven being styled the first group, and they were essentially *civil*, not *ecclesiastical*, the pupils or boarders being commoners at Oxford; pensioners, that is, payers, at Cambridge.

The chapter on the Renaissance and the Reformation treats of the founding of what is called the second group of colleges, in which reaction against the tenets of Wycliffe is shown. The Reformation times brought about the suppression of the monasteries, and several of these soon reappeared as new colleges. Indeed, this transformation had begun before the general dissolution; for, not to speak of Walsey's foundation out of some of the minor priories, we are reminded that Chichele had founded All Souls mainly out of the alien priories. The end of the long reign of Elizabeth is noteworthy in the history of Oxford for the

foundation of what must always remain one of its noblest institutions among so many,—the Bodleian Library.

There are not in this book many references to the information as to the aspect of old Oxford which are to be derived from old views and maps. Still there is notice of Ralph Agas's map, *temp.* Elizabeth, and there is a neat little reproduction of Hollar's charming and scarce map-view of the city, drawn in 1643, in his very best manner. In this pretty print we can see at a glance what Oxford was like when Charles I. made his head-quarters there, and when his standard was raised only to be blown down again,—an ill omen so often noted. The view shows the castle in its entirety, and its relation to the fortifications of the city is conspicuous. The momentous events relating to the king's stay, the erection of the fortifications, &c., are all told briefly, but sufficiently, and notice is taken of the stealing of the books of the college libraries by the Cavaliers. Antony Wood preserves record of many curious references to passing events in Oxford, of which our author has not been slow to avail himself, and thus we hear of the opening of the coffee-house by Jacob, a Jew, in 1650; of Christopher Wren; and of newspapers and written news-letters; and many others of equal interest.

A charming chapter on Modern Oxford concludes the book, and the chapter itself concludes with a walk through the city of to-day, in which reader is led by author. "And when he comes back in the evening, just after nine, the visitor will hear Great Tom ring out 101 times in honour of the old number of students. And should he wander through the city for a last look, he may be willing to allow that, far or near, he has seldom seen a fairer sight than that

'Sweet city, with her dreaming spires.'

NOTES.

**T**HE Government Bill on the subject of technical instruction has just been issued, but we can scarcely expect it to become law this session. It is very doubtful if its provisions will be of much value when they find their way into the Statute-Book. By Section 2 "any local authority may pass a resolution" that it is expedient that the elementary should be supplemented by technical instruction,—that is to say, whether a particular district is to be supplied with technical education is to depend on local option; therefore, there is no general scheme introduced by this Bill, but it is left to each locality to do as it sees fit. Technical instruction may be considered the necessary complement of elementary education, and it would be as reasonable to leave the elementary instruction to the caprice of a locality as the technical teaching. It has also to be borne in mind that by Section 4 the expenses "shall be defrayed out of the local rate," so that certainly there will be arrayed against the application of the Act all the diverse forces which make in favour of economy in local finance. In Section 8 it is laid down that the expression "technical instruction" means instruction in the branches of science and art with respect to which grants are, for the time being, made by the Department of Science and Art, or any other subject sanctioned by that Department. Thus this Bill gives no real definition of technical education. It may be a genuine or a nominal education. This is not the way in which a great country should endeavour to remedy its shortcomings. By such feeble efforts we are not likely to place the artisan of England on a level with those of Germany, or effectually help him in the keen industrial race. This attempt to introduce a system of technical instruction is indeed disappointing and feeble.

**T**HE fact that, as appears from the current report of the Controller-General of the Patent Office, the publications of that office are either, in whole or in part, presented to many institutions, seems to show that the plan might well be carried further. The possession of these papers by working men's clubs and insti-

tutes and similar bodies cannot fail oftentimes to be of great use to those who belong to these societies. In the same way, any papers or *Ilue* Books which bear on technical matters, or on such points as are likely to be useful or instructive to artisans and others, should be presented to any club or institution which may apply to be placed on a free list. That the publications of the Patent Office are peculiarly interesting to nearly every one having to do with technical matters goes without saying. Over 12,000 persons applied for patents from England and Wales in 1886, and over 17,000 patents were applied for in that year. The study of the drawings and specifications which are now available, through the spread of the Patent Office publications, must therefore enormously tend to stimulate technical ingenuity, and keep up the standard of knowledge of many ingenious artisans.

**L**ORD STRATHEDEN and CAMPBELL'S proposed "Smoke Nuisance Abatement (Metropolis) Bill," even "as amended by the Select Committee," is a foolish affair, unscientifically worded, as may be seen from Clause 6, "The Metropolitan Board of Works may from time to time make, and when made alter and repeal by-laws for requiring any fire-place or furnace intended to be used in any building to be constructed after the passing of this Act to be so constructed as to consume or burn, as far as possible, all smoke arising therefrom." The saving clause, "as far as possible," has more point than Lord Stratheden and the Committee seem to be aware of. The object to be aimed at is not the "consuming" of smoke, which is practically a very difficult matter when smoke is once given off; it is the prevention of the formation of smoke by ensuring perfect combustion, which is by no means a very difficult problem. Every one who knows anything about the matter knows this; and yet here is an Act which has been solemnly sat over by a Special Committee, none of whom have apparently known how to state correctly and scientifically the object of their Bill. As to the practical effect of the Bill, we should be very glad to get rid of smoke; but it is necessary to enter a caution against what may prove another and equally serious public nuisance, viz., the licensed official interference with that sacred institution, the fireside. Any attempt to legislate against the community at large in the matter of smoke production can only be reasonably made in the interests of the community, and it is a question to be asked whether many of the community would not compound with a certain amount of smoke rather than be exposed to the annoyance and expense of having their household fires officially interfered with. There ought to be some definite attempt made to ascertain what is the public feeling on this point. There are, no doubt, a certain number who would support legislation on the subject, but many of these are mere *doctrinaires*,—people who are blockheads enough to think that putting an end to London smoke would put an end to London fog. Let them try. They will soon find their mistake, practically and definitively. It would, however, be very desirable to diminish London smoke if we could do so without a vexatious interference with private houses and their occupiers, but it is absurd to propose to put dwelling-houses on the same footing in this matter as factories. The two cases, in their relation to public rights and public duties, are perfectly distinct.

**I**N considering canals and other waterways as competitors of the railways, it is generally assumed that, on account of the slow rate of speed on the former, the competition would be restricted to heavy traffic, such as stone, iron, and other raw material for manufacture, and export traffic of no particular urgency. Some time ago, however, as a protest against the high rates of carriage on fruit, a consignment was sent to London from the Kent district by water instead of by rail, a saving of 35 per cent. in freight being thus effected. It would appear that, notwithstanding the perishable nature of the traffic, and

the necessity for speedy transit, the result of the experiment was considered satisfactory, for it has been repeated this week, and it is asserted that the fruit arrived at its destination in better condition than when sent by rail. This fact, together with the energetic movements which have recently been made with a view to improving the canal system of the country, goes to show that the canals may prove far more formidable rivals to the railway companies than the latter have anticipated. Timely concessions on their part to the needs of depressed industries may perhaps avert the danger; though we believe the Kent fruit rates had been reduced,—those for hops from that district certainly were,—some months ago.

**T**HE discussion at the Council Meeting at the Guildhall on Thursday last week, as to whether the office of "City Architect" should or should not be continued on its old lines, is rather amusing reading. Mr. Sly, the Chairman of the Officers and Clerks' Committee, moved that the appointment should, in future, be designated "City Surveyor and Clerk of the City Works," with a salary of 800*l.* attached to it. It appeared, however, that this recommendation had only been adopted by the Committee in question by a casting-vote at a small meeting. Then ensued a curious discussion of the respective advantages of having an official architect, or of employing outside members of the profession. Major Joseph moved an amendment that the office of City Architect should be retained on its old lines, and went into figures to show that the retention of the office of Architect at the salary of 1,500*l.* would really be a saving. Major Joseph, however, spoke as if the only alternative would be putting up architectural works to competition, which is certainly not a necessary result. He went into some of those kind of comparisons which are proverbially said to be "odious," between the buildings which were the result of competitions, and those which had been erected under the superintendence of the late City Architect, in which he was thoroughly unjust to the architects of the City of London School, which is a very good building, while he much over-rated the late City Architect's markets. Mr. Beck supported the amendment in the same strain, apparently also thinking it necessary to vilipend all other architects who had done anything for the Corporation, in order to emphasise the superior ability of the late City Architect. Mr. Edmeston, who followed on the same side, knew better than to draw comparisons of this kind, but he said, with truth, that the Council were proposing to degrade one of the chief offices of the Corporation, and with no adequate reason. After a great deal more desultory talk the voting, curiously enough, was again a tie (61 to 61), and the Lord Mayor cast against the amendment, so as to allow of another being moved, and eventually an amendment was carried to refer the matter back to the Committee for further consideration and further returns and information. The truth about the subject seems to us to be that the Corporation will much better consult its own credit and dignity in continuing the office of City Architect on its former basis, and making it worth acceptance by an architect of high standing and cultivation, and that such a result will be best for the public and best for architecture, as an able man in that position may have an important influence on the architectural treatment of London sites and buildings; and on the whole it is for the interest of the architectural profession to see the office continued, for though the fact of the existence of a City Architect may prevent some works being thrown open to the profession generally, it is nevertheless for the credit and honour of the profession generally that it should be well represented on the Corporation staff.

**T**HE meeting of the shareholders of the Panama Canal Company, which took place on the 21st of July, appears to have been chiefly memorable for the presence of the Emperor of Brazil, in the character of a shareholder; a fact which has no material import-

ance as to any question of engineering or of finance. We defer remarks on the subject until the receipt of the *Bulletin du Canal Interocéanique* of the 1st of August, as the book-keeping of the company is not easy to understand from telegraphic summaries. Thus in the balance-sheet rendered on the 30th of June, 1886, in the "passif" or debtor side of the account, the liability for the three loans contracted in 1882, 1883, and 1884 is set down at 393,379,920 francs; whereas the obligations in respect of which that sum is acknowledged as received bind the company to repay the sum of 595,646,000,—which, therefore, is the real liability. Whatever may be the view entertained by the directors or shareholders as to the true method and audit of accounts, the outside public can hardly fail to be misled by such a statement. It is thus safer to wait for the sixth balance-sheet of the company, in order to compare it with the five preceding statements, than to reproduce the partial details sent by the telegraph. The next number of the *Bulletin* will, no doubt, contain the annual report as well as the accounts,—the latter, however, only down to the 30th of June, 1886.

THE papers read at the recent Conference of Architects on the subject of architectural education have been published in a neat pamphlet form,\* under the editorship of Mr. Arthur Cates, and form an interesting and valuable collection of opinions and information on the subject. A supplement is added, giving the programme of architectural studies at various Institutions in the United States, and at the Royal Academy of Arts, the *École des Beaux Arts*, and the "École Spéciale d'Architecture" in Paris.

WE have received a copy of the first annual address by the Chairman of Council of the Association of Public Sanitary Inspectors for the North-Western District of England, recently delivered at Liverpool by the Chairman, Mr. Albert Taylor. The general tenour of the address indicates that the new body of sanitary inspectors intend to adopt a high standard, and to take a serious view of the importance and responsibility of their office. In the course of his address Mr. Taylor urged that more and fuller power should be delegated to the sanitary inspector to enable him to carry on the duties imposed upon him in a speedy and simple manner, and that his position ought to be rendered more secure than it is,—that he should only be discharged or called upon to resign, "which are one and the same thing," in the event of misconduct or proved incompetency. This remark evidently points at the evil, of which we cannot ignore the existence, of the sanitary inspector being hampered in the execution of his duty by the necessity (if he would retain his post and its usefulness) of more or less considering the personal interests of those whom he serves, where those interests clash with his broader duty to the public. It is easy to say that the sanitary inspector ought to have no interests but those concerning his duty to the public; but it is placing a man in a very cruel and almost impracticable position if he is liable to be discharged or otherwise injured by making true and unbiassed reports on property in which his official employers may be interested; and we know very well that this dilemma is no imaginary one.

WE some time ago adverted† to a scheme of restoration, which had then been just commenced, of St. John's Church, Clerkenwell. We may here supplement our earlier accounts of the crypt, October 7, 1854, and July 1, 1876, by stating that during last week it was opened for inspection by visitors. The portions which have not been bricked up are the central aisle of five bays; one bay (east) of the northern aisle and two bays (east) of the southern aisle. These bays of the side aisles and three of the five central bays have pointed main arches; the remaining three bays, west of the central aisle, have round arches with massive square

archivolts or soffits. All the ribs spring from rounded columns, having square capitals, rising from a level of 32 in. above the earthen floor. The easternmost portion of the crypt lies beneath the vestry; and on the right of the entrance steps are two little chambers that are probably part of the original undercroft. This crypt, indeed, extended further westwards, the present church representing no more than the choir of the original fabric; but it is to be observed that its western wall, underneath the church steps, is very thick. A passage communicates from the furthest bay, which is vaulted in brickwork, of the middle aisle to the closed-in portion of the northern aisle. In these vaults are deposited various human remains, including those of "Scratching Fanny," whose ghost is said to have haunted the house in Cock-lane. Her coffin and its contents were once an object of vulgar show; they are described by J. W. Archer. The clock above the church's main doorway is a relic from the old church of St. James's, Clerkenwell.

THE rebuilding, now in progress, of the upper floor of No. 16, James-street, Haymarket, for Messrs. Hebbert & Co., army contractors, will considerably change the pristine aspect of their premises. The building formed one of the last of the remaining tennis-courts in the town, having been used as such until about twenty years ago. There is extant a view of the interior, with Randall and Turner sparring in the Fives-court,—engraved by T. Blake, 1825. This is, in all likelihood, the same court with that wherein Pepsy saw King Charles II. at play, with a degree of dexterity which evoked his courtiers' willingly-bestowed applause. It is, perhaps, a survival of the Gaming-house, or "Shavers' Hall" which, erected temp. Charles I. by the gentleman barber to the Earl of Pembroke and Montgomery, Lord Chamberlain, is so often confused with its neighbour Piccadilly Hall. The latter stood on the northern side of Coventry-street, at the angle with Great Windmill-street. The upper floor, with its deep top-cornice, is to be replaced with two stories. The ground range of windows is quite modern. Over one of these windows, facing the southern end of Oxendon-street, but removed from its original position, is a finely ornamented plaque, which is inscribed "James Street, 1673." This tablet had been (as late as 1850) on the house between the Tennis-court and the "Barn," the still standing wooden premises then known as Busher's Coach Factory. A view of all three was published in 1886, by the now defunct Society for Photographing Relics of Old London, *curis* Mr. Alfred Marks.

THE fourth fascicule of Dumont and Chaplain's "Les Céramiques de la Grèce Propre" has just appeared. As we have noticed the other issues from time to time we need only briefly to call attention to this volume, which contains both the faults and the merits of its predecessors. The two most valuable chapters are those on Corinthian vases and on the vases of the Greek colonies in Africa. A treatise that comes from France should be strong on Corinthian pottery, for the Louvre contains a unique series of inscribed vases of that type. To study these adequately has been hitherto no easy task. The Campana collection, which contains them, has no catalogue except the old original Italian one, a book possessed by a few private individuals, and rarely to be found in libraries. M. Pulitzer is at work on a new catalogue, but he holds out no hopes of its appearance under two years. Meantime, in the present issue of the *Céramiques*, most of the important Louvre Corinthian vases are given with their inscriptions, and are thus made fairly accessible, if not to the general student, at least to the specialist. The chapter on the pottery of Africa deals, of course, with the new discoveries at Naukratis, and the editors acknowledge their obligations to Mr. Cecil Smith's monograph published by the Egypt Exploration Fund. The plates of the new volume include several Attic white *kyklos*, and also the curious and unique

*Locrian lekythos*, usually, though we believe wrongly, interpreted as the punishment of the Tyrrhenian pirates.

THE relief known as "the Apotheosis of Homer," in the Græco-Roman Gallery of the British Museum, is a monument almost too well known; we mean that the public is familiar with it in countless inexact reproductions, and that uncertainties in its interpretation have by long currency become canonical. Dr. Salomon Reinach (*"Gazette Archéologique,"* 1887, 5-6) does double service. He gives in plate 18 a beautiful and strictly faithful reproduction of the monument in a Dujardin Heliograph, and he suggests a new and we think very interesting interpretation of three of the figures. The paper should be read in detail. We have only space to note the chief points. From the inscriptions,—the form of which is now for the first time accurately published,—Dr. Reinach concludes:—1. That the letters were cut in Asia, probably in the neighbourhood of Smyrna; 2nd, that they date between 120-180 B.C. It is satisfactory to know that this coincides with Mr. Newton's opinion. Others have been inclined to date the monument as late as the time of Tiberius. As regards the interpretation, the tall commanding figure next to Zeus has always been called Melpomene. Dr. Reinach shows, we think, convincingly that she is Mnemosyne, goddess of memory, mother of all the Muses,—hence her superior height. The figure dancing down the slope, who seems to bear the message of the Apotheosis, he calls Calliope. If this be true she is a speaking monumental commentary on the "Descende coelo Calliope" of Horace. In the second rank of the relief there is a figure of smaller size standing within the cave with Apollo: she,—on the strength of a seeming patera held in the right-hand,—has been called the Pythian priestess. Dr. Reinach and Mr. Cecil Smith agree that the patera is no patera at all, but a roll, the common symbol of any and every Muse: hence she becomes a Muse, probably the now missing Melpomene. Dr. Reinach points out her analogy to a terra cotta recently found at Myrina, and now in the Louvre.

DR. A. MILCHHOEFFER thinks that he has discovered the site of the Sanctuary of Dionysos, in Icaria, and he writes to the *Berliner Philologische Wochenschrift* (No. 25), earnestly pleading that the subject may be taken up, and thorough excavation of the site be promptly made. From the inscriptions and fragments he had already, by the most superficial search, discovered, it seems likely that such an excavation would be richly rewarded. If his supposition be right, a double gain is registered. He has discovered an important early centre of the worship of Dionysos; second, he localises the deme of Icaria. Tradition says that King Icarus first received the wine god into Attica, and this scene of the reception of Dionysos is depicted in a number of marble reliefs, one of which is in the Græco-Roman Gallery of the British Museum. The story of the death of Icarus and of his ill-fated daughter Erigone are well known. Statius (*Theb.* xi., 641) says Icarus was slain "Marathonide sylvâ," and this agrees well with the site Professor Milchhoeffer has fixed on. Leake had already noted the same site as a likely one for the deme Icaria, and he was aware of the ruins of a church built to a large extent out of the ancient marble blocks which had previously served some other purpose. He also copied an inscription which had obviously belonged to some choragic monument. But what clinches Prof. Milchhoeffer's argument is his discovery of another inscription on a slab hilt into a doorway. It runs as follows:—

"Κηφισίος Τιμάρ(ου) Ἱκαριεῖς  
εὐχάμενος ἀνέθηκε τῷ Διονύσῳ."

"Kephisos, of the deme of Icaria, dedicated this votive offering to Dionysos." If Kephisos was an Icarian where should he dedicate his offering but in the local shrine?

AMONG the various new methods of lighting which are being brought forward at the

\* Wyman & Sons. "Reprinted from the *Builder* of Mar 7, 1887."  
† *Builder*, November 28, 1885.

present time, under the stimulus given to the subject by the development of electric lighting, the Ross Patent Lighting Company propose a system of oil lamps continuously fed from a main supply, instead of separate lamps which have to be charged afresh each time they are used. The system is, in fact, the gas-burner system with oil substituted, but under special and improved conditions. A cheap rock oil (5d. per gallon) is used, which in itself gives but a poor and smoky light, which is developed into a bright flame by a current of air mechanically poured into the flame through the burner. The supply of oil is by gravitation, from a tank fixed in any convenient situation outside (if possible) of the building, —at least outside of the living-rooms in which the light is burned, otherwise a certain degree of smell may cause annoyance: the oil is not an explosive or highly inflammable one, so that, with anything like ordinary care, there is no danger in its storage; and there is an efficient automatic check against over-supply to the burners. The air-current is supplied either by a small fan worked by a clock-weight, or, where water power can be easily applied, by a small organ-bellows worked by water. The latter, which was in use at the company's offices at the time of our visit, is quite noiseless, and the clock-work fan would probably be practically so; it could easily be placed where no noise could be heard from it. The system claims to give the same light as gas at half the lowest cost of gas for small installations, and a much greater proportionate reduction on large ones. To test this, it would be necessary to have comparative burners of the two lights supplying light at the same cost; that is the only practical way to make a comparison. In itself the light does not appear to us to be a very bright one in proportion to the extent of the flame, but it is unquestionably a very cheap one, and the principle of supplying a current of air to the flame is, of course, a perfectly scientific one, the efficacy of which has been long recognised in procuring complete combustion in furnaces. A piece of paper held as close over the flame as can be without setting it alight remains quite clean, showing a very perfect combustion, which gives it one great advantage over gas as a stationary system of lighting for dwellings. The flame is, as may be supposed from the way in which it is produced, perfectly steady. One advantage claimed in the prospectus, that the light is more sanitary than gas, because the air current is conducted to it from outside the building, and it "does not consume the air in the apartment," is a piece of claptrap to catch the ignorant, and had better be omitted. It is not the fact of the gas living on the air in the room that does harm: it is the discharge of the products of its combustion into the room, instead of carrying them away outside, that does the mischief. With this attended to, and proper means for the influx of fresh air, any flame burning in a room only acts in assisting and quickening ventilation; much more so, in fact, than when a special supply of air is led to the flame from outside.

IT is to be hoped that the two strong letters in the *Times* from Mr. Poynter and Mr. Horsley on the artistic demerits of the new coinage will at least have convinced the Chancellor of the Exchequer that some people know a little more about the design and modelling of coins than he does, and that the general dissatisfaction expressed with the coinage is not, as he seemed to suppose, a mere grumble without reasonable motives. Mr. Horsley supports Mr. Poynter's proposition in favour of a competition for the best designs; and if the competitors were judiciously selected and not too numerous, such a competition would probably bring out some good work and be of much interest. It would be necessary also, however, when a fine design was secured, to be sure that there were the means of having it properly carried out. In this respect, however, we are rather inclined to think that Mr. Poynter's observations on the execution are a little more severe than is called for. We have examined the crown-piece carefully in comparison with his remarks,

but it does not appear to us that the planes of the modelling are so entirely out as Mr. Poynter suggests: the head is not sunk below the plane of the cheek, nor is the crown standing out in advance of the cap rim,—as far as we can judge. The clumsy modelling of the nose, which, as Mr. Poynter says, ought to be the lowest part in relief (as furthest from the eye in a profile head), is indeed very obvious, and also the mistake in the cap, "which is sunk into the head instead of projecting from it." Altogether, the more one looks at the new coinage the poorer and more unworthy of the occasion it seems; and there is no need to exaggerate its defects.

#### THE KENT ARCHEOLOGICAL SOCIETY.

The annual meeting of the Kent Archeological Society took place on Tuesday, the 19th, and Wednesday, the 20th, the old market town of Tonbridge having been selected as the place of assembly.

The weather on Tuesday was very fine and brilliant, and the programme being a fairly attractive one, there was a large attendance.

The meeting commenced for despatch of business at eleven o'clock. New members having been elected, and a goodly balance having been stated to be in hand, a move was made to Tonbridge Castle, which, with its beautiful grounds, was thrown open to the inspection of the party by its present owner, Mr. C. J. M. Wanton. The remains of the ancient building, now attached to a modern house, are very curious and interesting. They have, however, been difficult to make out, not only from their at present incomplete condition, but from their overgrown state. Fortunately, a well-prepared paper was published by the Society on the architectural arrangements, by Mr. J. F. Wadmore, and this was published in the sixteenth volume of "Archeologia Cantina."

The castle has consisted of a lofty conical mound raised on a low-lying site, on which was erected in late Norman times a shell keep with large projecting buttresses, of which only a fragment or two remains. Walls of irregular oval plan, with deep ditches, enclosed the inner ballium, while an outer ballium was defined in like manner beyond it, the whole being connected with the town wall and ditch. The River Medway forms one of the boundaries of the site. Subsequently to the erection of the keep a large entrance tower was erected, and in this the best rooms were placed, there being a curious curtain wall carrying a passage of communication from it to the keep. Mr. Wadmore pointed out this unusual feature of the arrangements, and the Rev. Canon Scott-Robertson, the secretary, pointed out many of the most remarkable features of the ruin, one of which was the existence of some apertures in the sill of the window, once the outer arch of entrance. This window is in one of the best rooms, but the apertures were evidently for the descent of missiles on to the heads of an entering foe. An early date was claimed for the formation of the mound, for since Roman coins have been found upon it, it is stated to be as old as that people, if not of even earlier date. Tonbridge Church is a plain building, with a good early fourteenth-century western tower.

After the visitors left the Castle, a long line of carriages was formed, and the party proceeded to the fine old mansion, Penshurst Place, which, by the courtesy of Lord De l'Isle, was thrown open to the party. This charming house was reached after a drive through a very beautiful part of Kent, the grounds of Hall Place, Leigh, having been opened for the passage of the party by Mrs. Morley, while Mr. Hills, in like manner, permitted the party to pass through those of Redleaf. The brilliancy of the sunshine enabled Penshurst to be inspected with great advantage, and the party, having alighted, proceeded into the great hall, which remains almost exactly as it was originally built by Sir John de Pulteney in 1341. The Rev. Canon Scott-Robertson briefly described the history of the building, and the curious arms and armor on the walls; also the long old oak tables, which are probably as old as the hall. The party then ascended into the old withdrawing-room, built by Sir John, now used as a State dining-room. The walls are hung with interesting pictures. The room has been

restored of late years, in fact, to its original aspect, except that it is impossible to reopen the ancient windows. Beyond this is "Queen Elizabeth's Room," and then the picture-gallery. Afterwards many of the party descended to inspect the vaulted cellar, while others saw the exterior of the building, rich in its many colours of warm stonework and red brick mellow with lichens. The church was also inspected, as well as the curious fifteenth-century church-house and lych-gate. The carriages were then reassembled, and on the return to Tonbridge, after dinner, an evening meeting was held, and the temporary museum in the New Science Buildings of Tonbridge School inspected. The museum contained a remarkable collection of old coins and ancient Greek pottery, lent for the occasion by Mr. J. W. Trist, F.S.A., and of sketches of old buildings in Kent by Mr. Wadmore.

Wednesday's proceedings were of no small interest, since a journey into the midst of the Weald of Kent was arranged for, the scenery being the most picturesque of its kind in the county, and the day being one of great beauty. The district is still so well wooded as to afford a good idea of the density of the forest which must have covered it in early times. Houses and cottages are few and far between, and the cultivated portions being to a great part covered with hops of more or less luxuriant growth, the appearance of the foliage of to-day is singularly fitting the old name. A long drive from Tonbridge brought the party to the quaint old town of Brenchley, which may be regarded as the capital of the Weald district. It is a town of ancient timber houses, of irregular size, with an open space in its midst, around which are grouped the few shops of the place, while the grey old church, which is partly behind the houses, presents its sturdy tower to make up as pretty a picture of English rural life as can well be found. Progress was made through the village to a remarkable old house called the Old Rectory, but in reality the mansion-house of the Fane family. It has a beautiful room, the walls of which are covered with quaint old panelling of Elizabethan date, in perfect condition, the work having survived the passage of time uninjured. The house is approached by a quaint stone archway, of simple but very good detail. The old Workhouse, so called,—almost everything is old at Brenchley,—is a fine timber-framed mansion, the last house in the town, having a brick chimney of enormous size. The church is cruciform, with a massive western tower, all being of plain and simple work, extremely so when the large size of the building is taken into consideration. Its effect is in perfect harmony with its surroundings, and the building is a capital study of what may be done by simple forms when in good proportion. The church has a clearstory, as has the adjoining church of Horsmonden, although such a feature is less common in Kent than in some other counties. The whole has been restored under the direction of Mr. Jos. Clarke, F.S.A. There remains in the interior the base of what has been a very beautiful rood-screen of later date than the fall of Cardinal Wolsey, in whose time the church was given to his college, Christ Church, Oxford. There is also a monument to the memory of the lady who built the old rectory, who died in 1596, although the date is given as 1566 by a singular error of the engraver. She was a woman of many virtues; but then, if we may judge by the epitaphs of this period, there could have been no lack of very good people. The party quitted this most interesting village with no little regret, and not a few remarks were made that our landscape-painters and lovers of pictures of English rural life have too much neglected this charming district. Progress was then made for the church at Horsmonden, which stands in the midst of a village thoroughly Kentish in character. A merry peal of bells welcomed the party, and after a welcome from the Rev. H. F. Smith Marriott, the history of the building was briefly told by the Rev. Canon Scott-Robertson.

Horsmonden church has a sturdy tower at the west end, having a staircase turret at one angle, a common feature in the county. It has here the addition of an obtuse pinnacle, which is not common, and more quaint than beautiful. A remarkable feature within the building is the existence of what appears to be two rood-loft staircases, one in the wall of the south aisle, by which access would be obtained to the rood by a gallery over the parclose screen of the south aisle. The second

staircase is westward of this, one bay intervening. It is an all but exact counterpart of the other, there being to each an external octagonal projection and buttress. The explanation rendered was that while the most eastern were the roof-loft stairs, those to the west were for entrance to the *parvatorium*, as in several cathedral churches. There have been several altars along the south wall, as is evidenced by the existence of the piscinas. An external north porch of timber is remarkable for being of fourteenth-century date. The south parclose screen is of great beauty.

A long drive brought the party to Scotney Castle, the village of Gondhurst perched on a high hill having been in view for many miles. Tempting as was its appearance, it was not visited. At Scotney the party was welcomed at the modern house by its owner, Mr. E. Hussey, and entrance afforded to the charming grounds of the mansion, the boundary of Kent and Sussex running through the estate. At the lowest level stand the ruins of Scotney Castle. This ancient fabric is little known, partly from its singularly sheltered and hidden position, surrounded by high hills on nearly all sides, and from its being within the grounds of a private mansion. It is surrounded by a wide moat of running water, which this forms it into a little island, approached by a stone bridge, once defended by a barbican, now in ruins. The outer court, through which access is obtained, is itself almost surrounded by water. The castle, so far as the more ancient stonework is concerned, is of Edwardian date, one of the towers of circular plan being fairly perfect, and having massive corbels and arches forming a projecting parapet.

To the tower is attached a small Elizabethan house, in perfect condition, in which a recently-discovered secret chamber, covered by a sliding panel in the floor, attracted much attention. Beside this are the ruins of a seventeenth-century building, attributed, on slender grounds so far as appearance is concerned, to Inigo Jones. The plan and position are not unlike those of Leeds Castle. The modern mansion stands on high ground, and here refreshment was partaken of. The contrast of position between the house of to-day and that of former ages in a low-lying position, for the sake of water and shelter, was very remarkable. The grounds are of great beauty, and the adaptation of the quarry, from which stone for the house was dug, into an ornamental garden, has contributed not a little to the beauty of the effect. After thanks to Mr. Hussey, the carriages were resumed, and a hasty visit was made to the ruins of Bayham Abbey, which, although in the adjacent county of Sussex, had to be passed on the way to Frant Station, where the party separated. The ever-present and genial hon. secretary, the Rev. Canon Scott-Robertson, rapidly, as befitted the occasion, led the party over the ruins of the fine old abbey, pointing out all the principal features of interest. The proceedings were very enjoyable to the large party of members and their friends, and the arrangements for the carriages, which have been admirably carried out under the direction of Mr. Geo. Payne, F.S.A., contributed not a little to the success of the meeting.

#### MEETING OF THE ARCHITECTURAL AND ARCHAEOLOGICAL SOCIETY OF THE COUNTIES OF LINCOLN AND NOTTINGHAM, AT NOTTINGHAM.

The Lincolnshire and Nottinghamshire Architectural and Archaeological Society held its annual meeting at Nottingham on Tuesday and Wednesday in last week, July 19th and 20th, under the presidency of the Bishop of Nottingham. The first day was devoted to Nottingham and its immediate neighbourhood. On the second day it had been proposed that Newstead should have been visited, but the request of the authorities of the Society for permission to do so met with so cold a reception that it was felt to be necessary to make other arrangements, and ultimately Bakewell and Haddon Hall were fixed upon. Happily such discourtesy is rarely met with, and the treatment of the Society by the owner of Newstead is an exception to the general behaviour of the proprietors or occupiers of historic houses.

The Society assembled in good numbers on Tuesday morning at St. Mary's Church. Choral matins were said at 10.30, immediately after

which an historical and architectural description of the church was given by the Bishop of Nottingham. St. Mary's is well known as one of the grandest and most characteristic examples of the class of building which had its origin here, and is to be found nowhere but in England, the large Perpendicular parish church. The whole building is approximately of one date, the chancel being somewhat later than the nave and transepts. Thus there is no admixture of earlier styles, the entire fabric being of one design, and the major part of it executed "d'un seul jet." On this account the building is all the more worthy of careful examination, and we think that the designers of our modern town churches, intended for large congregations, may do well to pay more attention than they have commonly done to the fifteenth and early sixteenth century parish churches, so peculiarly the growth of our own soil. As a rule, they are better suited for modern requirements, and harmonise better with urban surroundings, than the more powerful buildings of thirteenth or fourteenth century design. The continuous clearstory, which is so peculiarly a feature of these later churches, has a manifest fitness for town sites, which are apt to be cramped, and where the aisle windows are liable to be darkened by adjacent buildings. St. Mary's, Nottingham, is cruciform in plan, with a very broad and bulky central tower, and a long chancel. The aisles are very wide, having two windows instead of the usual single window at the western end. The piers of the crossing deserve notice for the slowness of their projection, causing unusually little obstruction to the eye and ear, while their sufficiency for their work is shown by the solidity of the tower, which, though of immense weight, shows no symptom of failure. The uniformity of this church, as well as the multitude of its windows, and the great size of the principal of them, together with its general air of spaciousness, will strike every visitor, as it struck old Leland nearly four centuries back. In fact, there is hardly any solid wall, the whole building being pierced in every direction with an elaborate system of fenestration, not leaving a corner where another window could be introduced. There is not much to commend in the design of these windows. Of the largest of them it may, indeed, be said, design there is none; they are very little more than vast stone frameworks, under low, almost triangular, arched heads of very ungraceful outline. The great end windows of the nave and transepts are each of twelve lights, divided horizontally by three transoms, comprising as many as forty-eight separate compartments, besides the openings of the tracery. The coloured glass, which alone can make such large openings tolerable, has been gradually replaced, to the great improvement of the effect of the interior. The best glass is that in the west window, by Messrs. Hardman, which is very silvery in tint. The same firm is not to be congratulated on the east window, which is heavy and inharmonious. The great south transept window is still more offensive. We could not learn who the artists were. A very good beginning has been made in the centre of the north transept window, by Messrs. Clayton & Bell. We hope the rest will soon follow. The window proposed as a memorial of the late vicar, Canon Morse, will, we hope, be worthy of a man to whom the Church of St. Mary, in common with the whole town of Nottingham, owes so much. Many of the smaller windows are filled with glass of various degrees of merit, or demerit; but here, as is too commonly the case, the want of a definite scheme for the subjects of the windows, making them one continuous whole, is to be deplored. During Mr. Morse's incumbency, the work of restoration, which had been already begun, was carried on with judgment and vigour. All the galleries and pews with which the fabric was encumbered in every part were removed; the glazed screens which partitioned off the area to form a convenient preaching-house were thrown down, and the whole area laid open. The oaken stalls and benches of the chancel, which had been sold by a previous vicar to a neighbouring church, and replaced by decent deal pews, were re-erected; a lofty light pierced screen, of exquisite design, surmounted by a gilt and coloured cross, was set up in the chancel arch; and the altar furnished with a highly decorated reredos, which, together with the screen, is from the designs of Messrs. Bodley & Garner. The reredos is panelled in two tiers, each tier

of five compartments, containing sacred paintings. The chief subject, which fills the central upper panel, is the Crucifixion, under a rich canopy, rising up in a tall tabernacle in front of the east window, and—it is no loss,—hiding some of its glass. The side panels contain figures of saints. The position of the organ is a problem which greatly exercises the minds of architects, and which has not yet received a satisfactory solution. In St. Mary's the organ, enclosed in a lofty carved oak case of elaborate richness, fills one bay of the chancel wall on the north side. The chancel is wide enough to bear it, but it is an obstruction which would be better away. We are convinced that in cathedrals and other large churches there ought to be two organs,—a small one in the choir for the ordinary services, and a large organ at the west end of the nave, as in Continental churches, for the grander functions. To hide an organ in a triforium, as at Canterbury, or stow it away in a side chapel, as at Lichfield, is at once a confession of not knowing what to do with it. The position of St. Mary's is a noble one, on an eminence sloping down rapidly to the east. The west front, which had then given way, was rebuilt in 1726, in a strange pseudo-Classical style, with flaming urns and obelisks, but was restored again after the original design by Sir Gilbert Scott. It cannot be called beautiful, being filled with one vast ill-designed window.

From St. Mary's the party moved across the town to the Castle, of which Mr. T. C. Hine, F.S.A., who told the members that he filled the ancient office of constable or custodian of the castle, gave a clear and interesting account to the members assembled in the Long Gallery. The position of the castle on the edge of a lofty escarpment of sandstone rock is a noble one, and worthy of a more suitable fabric than that which has replaced the picturesque Medieval fortress. The Conqueror's Norman keep, or "Cesars' Tower"; the castle hall with its double row of columns, like those still existing at Oakham and Winchester and originally at Westminster, the additions of Henry III. and subsequent sovereigns, especially Edward IV., who erected the stately and magnificent semi-octagonal tower at the north-west angle of the outer ward, called by Leland "the most beautiful and gallant building for lodging"; the adjacent range of apartments with projecting oriels due to the same monarch; indeed, the whole fabric of the castle has entirely vanished, leaving no trace of its existence but one or two bastions and lines of wall, and the fourteenth-century gatehouse to the lower ward, which, with the addition of a ridiculous pepper-box at the side, still forms the entrance into the castle precincts. The existing building, in the heaviest style of the revived Classical architecture of the end of the seventeenth century, long and low, was erected by the old royalist general, William Cavendish, the first Duke of Newcastle, who, it appears, from Mr. Hine's investigations, was his own architect. The building forms three sides of a quadrangle, the chief front being decorated with attached Corinthian pillars supporting a bold cornice, and is not devoid of a certain ponderous stateliness, but its prevailing horizontal lines are quite out of harmony with the soaring altitude of its site. As is well known, the modern castle was reduced to a roofless shell, split and blackened during the riots excited by the throwing out of the Reform Bill by the House of Lords in 1831, in which the Duke of Newcastle had taken a leading part, when the mob, unchecked by the authorities, attacked the castle and set it on fire. After having lain a ruin for nearly half a century, various schemes for utilising the shell having, we may now say, happily proved abortive, it has in the last few years been successfully converted by the constructive skill of Mr. Hine into an Art Museum for the town and county of Nottingham. The task before Mr. Hine of adapting the mansion to so entirely different a purpose from that for which it was built, and turning a three-storied building into one of two stories with the loftiest apartments at top where the lowest had been, and supplying them with adequate light for the exhibition of pictures, was by no means an easy one, and he is to be congratulated on the ingenious way in which he has carried it out. Few of the great English towns have art galleries so well lighted, so well arranged, and so spacious. We cannot leave the castle without echoing the astonishment which Mr. Hine told us was expressed by the Prince of Wales on his visit,

that the equestrian statue of the Duke of Newcastle, which occupies the centre of the principal façade, and was smashed by the rioters, should be suffered to disgrace the building by its mutilated condition. If the town is too poor to do it, a word to the present noble owner of the castle would probably secure its restoration.

In the afternoon an excursion was made to Wollaton Hall, which (in marked contrast to the rudeness experienced at Newstead) was thrown open in every part by Lord and Lady Middleton, who themselves returned to Wollaton that they might do the honours of their beautiful house. On the way to Wollaton the party halted at Lenton Church,—not for the sake of the church itself, which is a modern edifice in the meagre Early English of fifty years ago,—but to inspect the very remarkable Norman font, which, having originally stood in Lenton Priory Church, and having afterwards done duty as a garden ornament for many years, has been happily rescued and restored to its sacred purpose. The font is of a cubical form with an attached nook-shaft at each angle. The basin, instead of being circular, is of a quatrefoil shape. Each face of the cube is ornamented with subjects carved in low relief. The south side is entirely occupied with a large foliated cross. That opposite to it, on the north, exhibits the Crucifixion,—Our Lord hanging on the Cross, the Soldier piercing His side with the spear, and the Two Thieves each breathing his last on his cross, their souls being represented as small naked figures issuing from their mouths, one taking its flight upwards, the other sinking downwards to the jaws of a hideous monster, emblematical of hell. The eastern side has two rows of subjects: the upper represents the raising of Lazarus, the lower has not yet been certainly identified. To the left are three nimbed figures; to the right is an open domed building supported on pillars. Some have considered it the Adoration of the Magi, but the occurrence of the nimbus is fatal to that supposition. The western side is also in two tiers, of twelve arched panels. The Descent from the Cross, it is said, but doubtfully, occupies the chief panel of the lower tier, winged angels standing on the other panels. This very curious font deserves more attention than it seems to have hitherto received. We commend it to the practised eye and wide knowledge of the Rev. G. F. Browne, our chief living authority on all early carved stones.

Of Wollaton Hall it is unnecessary to say much, as it is well known as one of the most admirable examples of Renaissance architecture in its best phase in this country, combining dignity of form, picturesqueness of outline, purity of detail, and opulence of ornamentation, animated by a joyousness of spirit which, though, in Ferguson's appreciative words, "running occasionally into excesses bordering on the grotesque, presents probably the happiest conception of its age in this country." The heavy mass of the great hall rising as a huge tower from the centre of the building, occupying what in earlier designs would have been an open courtyard, with its coarse and heavy windows, and clumsy angular gables, certainly so overpowers the beautiful façades, with which it is out of scale, that we could almost wish it away. But it is really too queer and quaint to be readily spared. As a whole, Wollaton Hall is one of the most picturesquely beautiful things in the world. When seen from a little distance, rising above the trees of the richly wooded, deer-hunted park, it looks almost like a palace of enchantment, which one can scarcely believe to be real. It is remarkable that the whole area of the hall, 62 ft. by 30 ft., is occupied by an immense chamber above it (making this central tower mass more intrusive than it would otherwise have been), approached by a spiral staircase in one corner. The old name of this apartment, now called the "Prospect Room," was "Bedlam," not with any reflection on the sanity of its projector, but, probably, as we gather from other examples at the old Palace of Richmond and at Hurstmonceux Castle, with reference to its purpose as a large general sleeping-chamber for the accommodation of the less honoured guests of the mansion. The interior of the house, with the exception of the timber-roofed central hall, is disappointing. The whole passed under the hands of "Wyatt, the Destructive," who, while he impressed upon it an air of modern comfort and refinement, effectually wiped out all traces of antiquity. To Wyatt Wollaton owes its

extensive conservatories, which cost 10,000*l.* in building and stocking with plants, the price of the camellias alone amounting to 1,400*l.* The house itself, built between 1580 and 1588, cost 30,000*l.*, and was eight years in building. One Smithson has been occasionally accredited with its design, but the researches of the present Lady Middleton, who takes the interest of a true archaeologist in all connected with Wollaton, proves that he was only the surveyor employed, and that the architect was, as has generally been believed, John of Padua.

From Wollaton Hall the party drove through the picturesque park to Wollaton Church, close to which stood the earlier Hall, of which an ivy-clad fragment is still to be seen. Wollaton Church is a small building of no great architectural interest. Its north aisle is Jacobean, and the arcade on this side seems like a clumsy rebuilding of Decorated piers and arches at the same time. The south aisle has been recently added from the designs of Mr. Hodgson Fowler, who has also rebuilt the Willoughby Chapel, which had been destroyed. The tower, which is crowned by a spire, stands on open arches, like those of Brading in the Isle of Wight, and Coningsly in Lincolnshire. The interest of the building centres in the Willoughby altar tombs, with effigies, on either side of the chancel,—that of Sir Richard Willoughby, 1471, the builder of the chancel, and his wife, to the north, and that of Sir Henry Willoughby, 1528, and his four wives, whose diminutive effigies lie around that of their husband, to the south. Both tombs have "cadavers" below. The day closed with an evening meeting, at which papers were read, viz.:—"An Account of the Discovery by Sir John Savile Lamley, of the Temple of Diana Nemorensis, and a Description of the Collection of Classical Antiquities from the Site of the Temple, presented by him to the Nottingham Art Museum," by Mr. G. H. Wallis, F.S.A., Curator of the Museum; "The early History of Nottingham," by Mr. W. H. Stevenson, editor of the Records of the Borough of Nottingham; and "The Rock Habitations of Nottingham," by Mr. J. T. Godfrey, F.R.A.S.

The next day, Thursday, was employed in an excursion by rail to Bakewell Church and Haddon Hall, both of which are too well known to warrant our troubling our readers with any account of them, even if our space permitted.

The meeting concluded with a *soirée* given by the Mayor and Mayoress in the Art Museum to the members of the Society and their friends.

#### THE CITY AND SOUTHWARK SUBWAY.

Little attention has hitherto been paid to an undertaking which, when completed, will confer great benefits upon persons who have to pass from one side of the river to another in the neighbourhood of London Bridge, a spot where we meet with perhaps the most concentrated traffic in the world. The undertaking in question is the City of London and Southwark Subway, and consists of two tunnels, reaching, when completed, from the Monument in King William-street to the Swan at Stockwell, a distance of over three miles. The two tunnels pass down Arthur-street West, side by side, but, before reaching Swan-lane, one tunnel is superposed above the other on account of the narrowness of that thoroughfare. Shortly after entering the bed of the Thames, one tunnel diverges a little to the right, and the two then run alongside each other for the remainder of the route, the distance between them being about 5 ft. The depth at which the tunnels have been placed varies between 40 ft. and 60 ft. below the roadway, and they follow Borough High-street, Newington Causeway, Kennington Park-road, and Clapham-road, there being four intervening stations, viz., at the junction of Great Dover-street and High-street, the Elephant and Castle, New-street (Kennington Park), and the Oval. As the tunnels are carried at a great depth through virgin clay, all intervening obstacles are eluded, and there will be no interference whatever with private property, excepting for purposes of access. The mode of construction, devised by Mr. J. H. Greathead, the engineer-in-chief of the undertaking, is as novel as it is expeditious. Unlike the underground railways, there will be no disturbance of the surface excepting at the stations, and the only sign at present of operations of some kind being carried on at all is the

staging erected behind Old Swan Pier, London Bridge, where we find a crane, a small tramway, a small engine driving a fan and an air compressor, and a wooden office. From this stage a shaft 13 ft. in diameter has been sunk to the crown of the upper tunnel, up and down which the skips, bringing up clay and taking down material for construction, pass all day long. The two tunnels have been completed under the river, west of London Bridge, and for some distance on the south side. The mode of construction is exceedingly simple; but it is only through a personal inspection that we learn how simple tunnelling in clay has become by the method employed by Mr. Greathead. A steel shield, overlapping (like the cap of a telescope) the forward end of the iron tunnel constituting the subway, is driven forward by hydraulic power as the material is excavated before it through an opening in the shield. The tunnel, 10 ft. in internal diameter, is built up of flanged segments, 14 in. thick, which are bolted up under cover of the shield, and form rings, 1 ft. 7 in. wide. Six of these rings can be erected daily, which represents a rate of progress of about 10 ft. at each face. As the shield is moved forward, the annular space outside the iron tunnel, left by the advance of the overlapping steel plate of the shield, is filled up by hydraulic cement, ejected by air pressure from a vessel inside the tunnel. The iron tunnel is thus protected on the outside by an impervious coating, whilst the circumferential joints are filled up by tarred rope and cement, and the longitudinal joints by pine strips. When the subway is completed, the "up" traffic will be worked in one tunnel and the "down" traffic in the other. The use of locomotives is dispensed with, rope traction as applied in American cities for tramways, and now also being introduced in Edinburgh and Birmingham, being employed. Owing to the exclusion of engines, and also to the traffic being worked always in one direction in each tunnel, the air will be pure and free from noxious gases, and a continuous circulation will be kept up. The carriages are promised to be commodious and well lighted, and a frequent train service is to be established, small trains carrying a hundred passengers running at first every two minutes. The fares are to be 1*d.* and 2*d.*, according to distance. A further boon will be conferred upon the public by the erection of hydraulic lifts at each station, such as are now being successfully worked on the Mersey Railway, which will take passengers from the street level down to the respective platforms, or *vice versa*. The hydraulic power for working the lifts, as well as the power for working the cables, will be derived from a central station, placed at the Elephant and Castle. The average speed is to be about that on the underground railways, so that a resident in Clapham will be able to reach the heart of the City in twenty minutes, without having to undergo the annoyance of travelling in smoke-begrimed carriages and in an injurious atmosphere. The carrying capacity of the line is estimated at over 100,000 passengers per day. The contract for the subway and stations is being carried out by Mr. Gahutt, of Liverpool, and the cost of the undertaking is put at 550,000*l.*

#### CONGRESS OF MUNICIPAL AND SANITARY ENGINEERS AT LEICESTER.\* Asphalt and Concrete Foot Pavements.

Mr. G. B. STRACHAN (Chelsea) read a paper "On Asphalt and Concrete Foot Pavements." He said that the object of the paper was to invite the criticism of the members of the Association upon the experiments and experience of the writer and others on asphalt and concrete as materials for foot pavements, and to induce other surveyors to make experiments with the view to perfecting pavements of those descriptions. He desired to place in the forefront of the paper the fact that the credit of the Hornsey experiments, referred to in the paper, was due to Mr. T. de Courcy Meade, who placed them at his disposal. Having referred to the nature and origin of asphalt, he described the works of the French Asphalt Company,† which obtains its supplies for England

\*Continued from p. 132.

† Mr. Strachan said he described the works of this Company because they had executed all the asphalt works in Chelsea, but he wished to say that the Val de Travers Company, Claridge's Asphalt Company, and others, did equally good work.

from its mines at St. Ambroix, in the South of France. He next described the manufacture of and methods of laying compressed and mastic asphalt, and gave numerous analyses of good asphalt. He then went on to give various practical details of work which has been carried out. We make the following extracts from the paper:—

In Chelsea there are 16½ miles of footways paved with mastic asphalt, having an area of 68,200 square yards. On the Queen's Park Estate there are 41,500 square yards, which have been laid five years, and which are now in good condition, not having cost one penny for repairs. In King's-road, at Walpole-street, a length has been laid for seven years. The foot traffic over it is 7,500 persons in eighteen hours. At the end of the first five years it was cut open, and the wear was found to be such as had reduced the thickness to a spare ¼ of an inch, the original thickness being 1 in. full. On the east side of New Bond-street a length of mastic asphalt was laid thirteen years ago between Oxford-street and Conduit-street, the thickness being ¾ of an inch. The asphalt is now wearing through on to the concrete in the line of traffic at the forecourt line. The cost for repairs has been so trifling that it may be neglected. In this case the concrete foundation is as sound as before, and all that is necessary to restore the footway is to relay the asphalt at about two-thirds of the original cost, when the pavement will be good for another thirteen years. As the traffic here is very severe and the footway narrow, it is reliable evidence of the durability of asphalt.

The foundation for the asphalt footway is made with 3 in. of Portland cement concrete (6 to 1) of a very good quality. The surface is smoothed with the shovel, and four days are allowed for drying. The concrete has been laid hitherto without any joints. The mastic asphalt is floated over this surface, and the path is then completed. Mastic asphalt does not show any cracks on the surface. The concrete foundation, when the asphalt is removed, shows the irregular, tree-like cracks all along its length, branching from the kerb to the back line, but the elasticity of the mastic asphalt is sufficient to resist the tearing action of the concrete as it contracts.

A study of the asphalt question resolves itself principally into a study of the movements of concrete when laid in long lengths, narrow widths, and small thicknesses. The writer inclines to the opinion that concrete has in itself a small power of contraction, apart from any considerations of temperature. The experiments of Dyckerhoff which show that neat cement (slow setting) had an average expansive power over twelve months of .0734 per cent., and quick-setting cements of .2019 per cent., and that concrete (3 to 1, sand) had an expansive power of .0264 per cent. (slow setting) and .0320 per cent. (quick setting), seem to show the contrary to be the case. The writer laid down a length of concrete (6 to 1, ballast) 52 ft. long, 12 in. wide, and 3 in. thick, under a shed which had an open front, but so that the sun did not touch the concrete. The strip was laid on sand so as to give it freedom of movement. Another strip 26 ft. long, of the same width and thickness (3 to 1, pebbles), and a third of the same dimensions (3 to 1, sand) were also laid under the same conditions. The only movement discernible, at the end of one month, was a slight contraction in length in all the samples. The uniform experience of concretes under asphalt is that cracks occur, which would tend to show that contraction and not expansion is the rule. At the same time, the writer has experience that concretes do expand, but this he attributes to the action of temperature. It is no uncommon thing to see the surface of an asphalt path raised crosswise in an irregular line, as though a small tree root was under it. In every case where the asphalt has been uncovered at these points by the writer, he has found the concrete crushed and the concrete on the falling level thrusting itself under the concrete on the rising level. This effect is most marked on hot days. In January last the writer laid some thousands of feet of asphalt path in St. Luke's Gardens, Chelsea. The sun is on it all day, and during the hot weather at the beginning of June, the number and size of these raised lines was astonishing. Shortly after midday they were most pronounced, and towards night they were less prominent. As a further evidence of the expansion

of concrete under the sun's rays the streets in the City can be named. The footway and carriageway are in asphalt on concrete. The expansion of the concrete in the carriageway presses the kerb at the bottom; the expansion of the concrete in the footway presses the kerb at the top on the opposite side, and the two have tilted up the kerb in a marked manner. The writer has on a hot day taken up asphalt on a footway and has found the heat much greater under the asphalt than on the surface. In order to avoid the expansion showing itself in footways the concrete should be laid in sections, and the joints between them filled with some compressible substance.

Compressed asphalt has about one-third longer life than mastic asphalt under the same conditions. The cost is the same, but the use of compressed asphalt for this purpose has not been universally followed by reason of the cracks that appear on its surface. The cracks do not tend to spread under traffic, nor does the asphalt wear more at these parts than at others. They are unsightly, however. It is found that these cracks are exactly of the shape and in the position of the cracks in the concrete foundation. Compressed asphalt has no elasticity in itself, and when subjected to the contracting force of the concrete it is torn through. It is an admirable tell-tale of the movements of the concrete. Much ingenuity has been displayed in endeavours to avoid the cracks. The first step was to localise them. This was done by laying the concrete in 12 ft. bays and in alternate bays, and filling up the screed space with fine concrete. The contraction then showed its effects at these places, with a result that a series of regular straight cracks appeared instead of the irregular tree-like cracks when the concrete was laid in one piece. These effects can be seen at many places in London without specifying any particular place. Having localised the cracks, an experiment was made at Hornsey to avoid them. A strip of bituminous felt 6 in. in width and ¾ in. thick was placed on the concrete over the whole length of the screed mark. This felt has much elasticity, and the object of the experiment was to ascertain whether it would take up the contracting movement of the concrete and absorb it. The length is laid at Crouch Hall-road, between Coochurst-road and Clifton-road. The result has been that, instead of one crack at each screed mark, there are two, one on each side of the narrow strip of felt. It is evident that the concrete in contracting compresses the asphalt longitudinally, and that the cracks appear at the points where the opposing motions meet; and as the strip of felt represented a narrow area which was free from these forces, a crack appeared on each side where the forces took effect. In Archway-road, Hornsey, another experiment was made by covering the screed mark with a strip of mastic asphalt 9 in. in width and ¼ in. thick, just as in the last case with felt. For three months no cracks appeared; then a few slowly and at irregular intervals showed themselves; but during the severe winter of 1886-7 every screed mark showed its crack. These cracks were irregular in line, but they are confined in each case to the area covered by the mastic asphalt. These footways are laid on a 3-in. foundation of concrete. In Marlborough-road, Chelsea, an experiment was made on different lines. A foundation of concrete 6 in. thick was laid, and the compressed asphalt laid on it. For four months no cracks appeared, but after that time they occurred at frequent intervals, though they are fewer than usually appear on a 3-inch foundation. When the asphalt and concrete were removed at the cracks it was found that the crack extended through the whole thickness of the concrete. This experiment was based on the observation that cracks do not appear in compressed asphalt carriageways, and as the principal difference between the foundations in the footways and carriageways is the thickness of the concrete, it was assumed that it was the cause. The observation is, however, an incomplete one. In streets of light traffic the cracks do appear in the asphalt, as in Little Blenheim-street, Chelsea, and elsewhere. In streets of heavy traffic the cracks in the concrete tear the asphalt as they slowly form, but the traffic welds the asphalt together again before they show on the surface. In footways of heavy traffic there are fewer cracks than in streets of light traffic for a similar reason. At Muswell Hill, Hornsey, the experiment of covering the whole of the area of the footway

between Onslow Rise and Grosvenor Gardens with bituminous felt was tried. The felt was in 3-ft. widths, and was laid longitudinally with butt joints. At the circular kerb the pieces were necessarily somewhat patched. The result has been that cracks have appeared at every joint of the felt with marvellous fidelity, owing to the movement of the concrete. In Whitehead's grove, Chelsea, between Marlborough-road and Keppel-street on the north side, a length was laid in 1855 on a 3-in. concrete foundation, which was covered with mastic asphalt ¾ in. in thickness. On this ¾ in. of compressed asphalt is laid. The mastic asphalt was laid to absorb by its elasticity the movement of the concrete without transmitting it to the compressed asphalt. It has survived two winters of great severity, and has lived twenty-one months without any cracks appearing. From this it would appear that the principle of a material between the concrete and the compressed asphalt which will absorb the effects of the movements of the concrete is a correct one, and the writer invites the members of the Association to experiment on cheapening the method. The present result is an increase of life of 33 per cent. at an increase of cost of 12 per cent.

As evidence of the durability of compressed asphalt in footways, those in Cheapside may be named. They were laid in 1876 at a thickness of 1 in., and are now wearing through. On the south side of the Strand, east of Wellington-street, 1 in. of compressed asphalt was laid in 1881, and has had only the most trifling repairs. The streets in the City, which have the heaviest foot traffic in the world, are paved with compressed asphalt on the footways.

The advantages of asphalt foot-pavements are durability, a smooth surface unbroken with joints, a good foothold, even and regular wear, their impervious character, and the readiness and neatness with which they are repaired. They have a sombre appearance, and show water on their surface longer than stone pavements. They wear to the last thickness without breaking up, and give a useful wear for the whole of their thickness. When a stone or other pavement has worn 1 in. it may not be half worn through, but its useful life is over. Where there are cellars under footways, asphalt as a material for footways is unrivalled. In ordinary traffics, such as those named in King's-road (7,000 to 8,000 persons per day), an asphalt pavement can be laid 1 in. thick with the certainty that for at least ten years it will need no repairs whatever. This pavement has also the advantage that the foundation is always preserved and good for use again when the wearing surface of asphalt has to be renewed.

The following abstract of the present contract schedule in Chelsea will give the prices for these pavements:—

	Per sq. yd.
Compressed or mastic asphalt 1 in. in thick.	a. d.
ness on 3 in. of concrete	6 3
Bitte, ditto, ¾ in. thick	6 0
Compressed asphalt ¾ in. thick on 3 in. mastic asphalt, laid on 3 in. of concrete.	7 0
Compressed on mastic asphalt 1 in. thick	3 8
on concrete foundation (relay)	3 0
Ditto, ditto, ¾ in. thick	3 0

These prices carry a guarantee of free maintenance for ten years. The Vestry prepares the foundation for the concrete in new work at a cost of 2d. per square yard. The specification provides that the asphalt will be cut open at distances not exceeding 50 ft. apart, and the thickness measured. Five out of every six of these measurements must be at least the specified thickness, and the average of every six must be at least the specified thickness. The specification is strictly adhered to. The cost of the foot-pavement in New Bond-street, already referred to, over twenty-six years, would be as follows at per square yard:—

Preparing foundation	a. d.
Laying concrete foundation and ¾ in. mastic asphalt	0 2
At end of 18 years relaying mastic asphalt (life 13 years)	5 6
Repairs	3 0
	0 0
Total	8 9

or a cost per year, not including interest, of 4d. per square yard. It should be mentioned that the small cost of renewing asphalt footways is due to the fact that the asphalt taken up is good as new asphalt after it has been cleaned and prepared, and is re-used for footways.

In dealing with the question of concrete as a material for foot-pavements, the writer

cannot claim such an experience of it as he has had with asphalt. In 1880, however, the Vestry of Chelsea had laid by the respective makers a series of pavements in King's-road against the Royal Military Asylum wall, and in 1885 a report was made on them by the writer.

Mr. Strachan went on to give a synopsis of this report, which is now out of print. In it he described the manufacture of the "Imperial Stone" pavements, of which a specimen piece was laid down in competition with other pavements in King's-road, Chelsea. As to these trials of pavements, Mr. Strachan continued—

In the King's-road experimental pavements the makers laid their pavements with the knowledge that they were competing with their rivals. They were laid in 1880. Asphalt, York stone, Ferrumite stone, Victoria stone, and Imperial stone were laid side by side and subjected to the same traffic. The writer includes the York stone results, though not strictly coming within the subject of the paper.

In June, 1884, the Ferrumite stone was removed, as its slipperiness had become a source of danger. Its area was taken by Wilkinson's granite concrete pavement and by Shap-stone pavement. After five years' wear of the original stones, the following results were obtained:—

The York stone occupied an area of 87 square yards; the original thickness was 3 in.; the number of stones 123, of which, after five years' wear, 10 had broken edges, 16 had broken corners, 21 had their surfaces peeling off, and six were worn so as to be dangerous. The wear was not measurable by reason of the uneven thickness of the stones, but it was unmistakable. The foothold was good in all weathers. The actual cost was 8s. 7d. per square yard laid.

The Victoria stone occupied an area of 81 square yards; the original thickness was 2 in.; the number of stones 168, of which thirty-five had broken edges and corners, two had their surfaces peeling off, and three were visibly cracked across. The wear was not quite  $\frac{1}{2}$  in. at the greatest traffic line. The joints of the stone were pleasing, and the colour cheerful. The foothold is not so sure as that of York stone in dry weather, and in a drizzling rain it approaches slipperiness. The cost was 6s. 4d. per square yard laid.

The Imperial stone occupied an area of 90 square yards. The original thickness was a full 2 $\frac{1}{2}$  in.; the number of stones, 187, of which eighteen had their corners and edges broken, and one had its surface partly peeled off. The wear was not quite  $\frac{1}{2}$  in. at the greatest traffic line. The regularity of the joints is pleasing to the eye, and the colour is light and cheerful. The foothold is more sure than that of the Victoria stone sample, but it becomes somewhat slippery in drizzling rain. The cost was 6s. per square yard laid.

The experience gained with the Shap stone laid in 1884 is more limited, but the stone does not appear to be better than the concrete stones described. The length laid *in situ* by Messrs. Wilkinson is subject to the same remark, but the aggregate is already wearing up. It is laid in 8-ft. bays. A repair made in it is a great disfigurement to it. The effect of the traffic in wear is visible.

Mr. Walker, of Leeds, has laid down (1886) in King's-road, a short length, in bays of about 4 ft. square. It has a very smooth surface, and appears to be a very good pavement. He lays a foundation of hallast concrete, 2 $\frac{1}{2}$  in. thick, to within  $\frac{1}{2}$  in. of the finished surface, and cuts roughly through it so as to form the bays. He then floats the surface with fine rich concrete, made of one part of cement to one or one and a quarter part of crushed granite or slag which pass through a  $\frac{1}{2}$  sieve. This is then cut through with a knife into bays of small areas. The foothold is fairly secure, and the wear very satisfactory. No cracks appear when the bays are made less than 10 ft. square. At 322, Oxford-street, a piece has been down three years, and no wear is visible. He claims that his fine rich concrete on the surface attains more nearly to the texture of York stone than any other pavement. The joints, however, have a tendency to spread.

Concrete pavements laid in slabs have two serious disadvantages. The writer's experience refers to Victoria stone, but there is no reason to suppose that slabs of other make are free from them. The first is the annoyance caused by the hard metallic sound of the foothold on

them, which is especially noticeable at night. The other is their brittle nature, and the presence of hidden cracks after wear. When taken up to relay, it is often found that a stone which was apparently sound breaks before it can be relaid.

Concrete pavements *in situ* have the serious disadvantage that they cannot readily and cheaply be repaired. A patch in them shows for the whole life of the pavement, unless a whole bay is removed.

The writer is of opinion that concrete pavements *in situ* are preferable to concrete pavements laid as slabs. There is, however, no reason why this pavement should not be laid by surveyors themselves, without the aid of a contractor. Much has to be learned before concrete as a material for foot-pavements is perfected, but that can most readily be learned by each engineer doing his own work, and exchanging experiences. The prices paid for concrete pavements are very great. One stone is advertised for 7d. per square foot, which equals 4l. 14s. 6d. a cubic yard. This is an extravagant price to pay for concrete, even if it be of the very best kind, and silicated too. Concrete for foot pavements has its own field, and within well-marked limits its use is advisable, but until its capabilities are more largely tried, and its usefulness increased, the full advantage will not be obtained from it. The price stated is large enough to cover the cost of experimenting, and the writer trusts that the members will carry out such a series of tests and trials as will complete the knowledge of concrete as a material for foot pavements.

Mr. Vawser (Manchester) opened the discussion by mentioning the advantage which was experienced at Macclesfield by laying concrete footpaths in about 4 ft. squares, and putting between each a piece of plank. It was found that the elasticity of the planking was sufficient to prevent any cracking.

Mr. Fowler (Manchester) agreed as to the great value of concrete paving, which, seven years ago, he used for the Newcastle Cattle Market. There he placed a lath round the boundary of each section, and there was not a single crack.

Mr. Ellice Clarke (London) said his experience of an asphalt footpath  $\frac{1}{2}$  in. thick was that at the end of three years it required very considerable repairs. The unsightliness of cracks in asphalt was their principal objection; they did not detract at all from its wearing well. The practice mentioned by Mr. Vawser had been discontinued by all who had had much experience of asphalt. Now it was usual to lay two slabs of concrete on alternate days, or two or three days.

Mr. Cockrill (Great Yarmouth) spoke of the satisfactory wear of thirty miles of asphalt footpath in that town.

Mr. Parry (Reading) said that paving that was the hardest, in his experience, was the first to be discarded, and that wore best which approximated nearest to York flagging.

Mr. Boulnois (Portsmouth) said that some of the earlier samples of ferrumite stone had too much iron in them, and being thus too hard, had a very slippery surface. The secret of the wear of asphalt lay in a nutshell. Unless it got sufficient traffic upon it it would never consolidate properly.

Mr. Lemen (Southampton) said that twenty years ago he was very enthusiastic about asphalt, and his Corporation laid a great deal of it down. He had come to the conclusion now that there must be a very large traffic over it, or at least sufficient to keep it together, otherwise it was bound to fail. Some laid down  $\frac{3}{4}$  in. thick soon wore out, but some laid 2 in. thick in a roadway where there was great traffic had been down for fifteen years, and had never cost sixpence for repairs. With respect to concrete, he thought concrete made and laid *in situ* was the foothold of the future.

Mr. Jones (Ealing) said that from the clinker from their destructor they were making a very good pavement at a cost of about 3s. per yard superficial.

The President (Mr. J. Gordon, Leicester), in closing the discussion, said that the difficulty of laying concrete foundations was one that he did not think had yet been solved. He mentioned several examples of cement pavement in Leicester, and to which he directed the attention of members.

Mr. Strachan was thanked for his paper, and in acknowledging the compliment, he observed

that the way in which it had been received and criticised was an encouragement to young members to come forward and give their experiences.

In other columns we give some particulars of the granite quarries, &c., visited by the members of the Congress, but we are compelled by want of space to hold over some other portions of our report of the Congress until next week.

#### SANITARY REGISTRATION OF BUILDINGS BILL, 1887.

THE Council of the Civil and Mechanical Engineers' Society having appointed a committee to consider the provisions of the Sanitary Registration of Buildings Bill, 1887, now before Parliament, the committee, after very careful consideration of the Bill as a whole, and also of its several clauses, arrived at the conclusion that in its present form it would not be of benefit to the public; and they further proceeded to draft a Bill to replace it, the provisions of which they thought would be acceptable, and the Council of the Society resolved that it would be in the interest of the public to strongly urge the substitution of the Bill drafted by the committee for that now before Parliament.

The main points of difference between the proposed and the original Bills may be, with a few additional words, summed up in the report presented by the committee:—

1. They consider that as the Bill is one of registration only of the decisions as to quality and description of work,—over which the registering body is not intended to have any power,—it would not be compatible with the dignity of the Local Government Board (in itself the highest sanitary authority in the country) to be in the position of a registering machine, especially when such registering machinery already exists, as in the case of the registrars for births, deaths, and marriages, and for vaccination, and they suggest that this duty should fall on the Registrar-General and his subordinates.

2. It is considered that if the buildings mentioned in the Bill are to be registered compulsorily, it is just as necessary that boarding-houses, restaurants, and all places where food is produced, stored, or distributed, should come under its provisions as the places mentioned in the original Bill, namely, schools, colleges, hospitals, asylums, and lodging-houses and hotels; and that the action of the Bill should be universal instead of being limited to districts having a population of 2,000 and upwards.

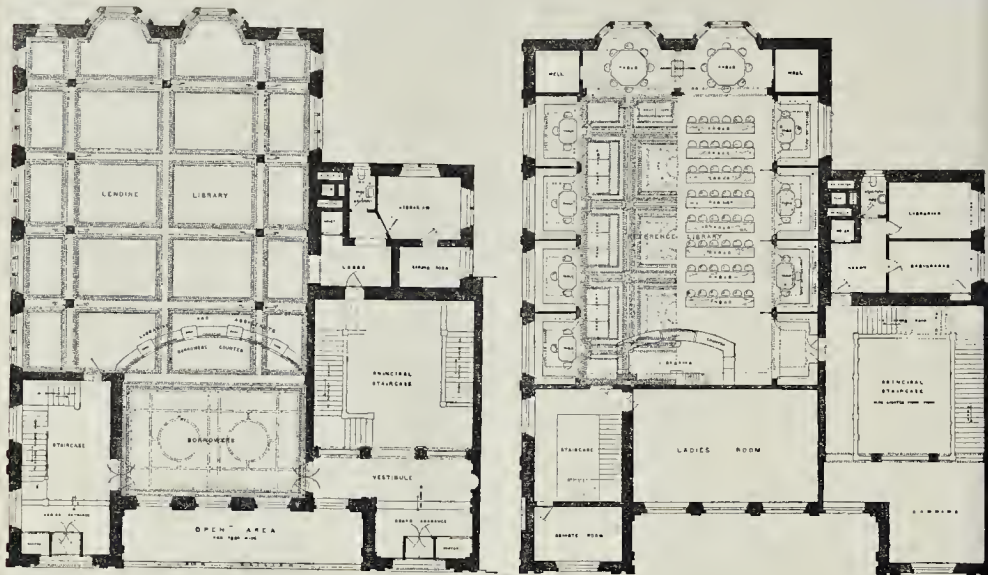

3. It is thought necessary that some definition should be made as to who is to bear the expense required by the Bill, and the Committee arrived at the conclusion that the owner ought properly to bear this burden, and they have provided accordingly.

4. In the Bill it is provided that corporations shall receive licences in sanitary practice. This, it is contended, is contrary to common sense and to the interests of the public,—as, although severe penal clauses are introduced in the Bill, these would be practically nugatory so far as corporations are concerned, for they could neither be examined as bodies nor could they be adequately punished as corporations; and there would be no security that their qualification to act rested on any sure basis; therefore the word "corporations" has been entirely expunged from the Bill.

5. It is considered that the provisions for examining candidates by the several bodies or corporations to which they might belong, while no adequate provision was made for the examination of those who were not members of any body or corporation, were faulty and clumsy; and a clause has therefore been introduced for examinations to be made by one or more specified bodies authorised for the purpose by the Registrar-General.

6. It is found that the question of the eligibility of any persons or class of persons to be registered as Licentiates in Sanitary Practice without examination, offers many difficulties; but after much consideration, it was decided that it was impossible to require that all should be examined before being registered, but that the number of those who might be considered to be eligible was strictly limited to men who should from their professional training be expected to understand, and be able to deal with, not only the theoretical but the practical part of sanitary science; and this body has

LENDING LIBRARY FLOOR PLAN

REFERENCE LIBRARY FLOOR PLAN No 1

Edinburgh Public Library Competition.—Plans of Second Premiated Design, by Mr. Jas. B. Dunn.

therefore been limited to architects and engineers of a certain standing.

7. Clause No. 10, which specifies the minimum requirements before a license can be granted, has been considerably amplified, as it is felt that if all sanitarians are agreed that this minimum of requirements is necessary, then this clause only emphasises this fact; if, on the other hand, they are not agreed as to the necessity for this minimum, it is all the more necessary that it should be clearly, amply, and distinctly specified.

8. Although it is specified in the Bill that if any alterations be made in the structure of any building which affects the sanitary arrangements the building shall be considered as unincertified, no provision is made for the publication of such alterations, which might be easily made, and the same certificate remain in force, although the whole plan of the drainage had been altered, and its efficiency destroyed. A clause has therefore been introduced throwing the onus of publication on whomsoever it may be who makes the alterations.

9. In order to effect a further safeguard, a clause, No. 15, has been introduced intended to prevent Licentiates in Sanitary Practice from granting certificates for houses in which they are peculiarly interested; and as it is considered contrary to professional etiquette to advertise, provision is made in the same clause for the prevention of any such practice either directly or indirectly.

10. The Authority which shall decide as to what buildings come under the provisions of the Act, has been somewhat varied so as to provide that decisions shall not be given except by magistrates sitting in court and otherwise.

11. The forms attached to the Bill have been varied and amplified to meet the alterations in the body of the Bill, and a list of fees to be charged by Licentiates in Sanitary Practice has been added.

**Obituary.**—The death is announced of Miss Margaret Gillies, one of the pioneers amongst English lady artists. The *Daily News* says that she studied oil painting for a short time in Paris under the brothers Henry and Ary Scheffer, and painted a few works in oil. But water-colour was the medium in which she was destined to acquire most fame. She joined the Royal Society of Painters in Water-Colours in 1852 or 1853, and since that time has been a frequent contributor to the Society's exhibitions.

## Illustrations.

### COMPETITIVE DESIGNS FOR THE IMPERIAL INSTITUTE.

WE give this week the detail elevations of the designs for the Imperial Institute by Mr. Blomfield and Mr. T. G. Jackson. The detail elevation of the last-named design was one of the most refined pieces of design and drawing in the collection, though we do not think the author has succeeded in harmonising the details of the dormers with those of the substructure; the dormer looks rather as if transplanted from somewhere else.

### EDINBURGH PUBLIC LIBRARY COMPETITION.

#### SECOND PREMIATED DESIGN.

WE give this week the exterior perspective, the interior of the Reference Library, and two plans, of the second premiated design in this competition, by Mr. Jas. B. Dunn. We fully commented on and described the design in our general article on the subject in the *Builder* for June 18th of this year (p. 833). Mr. Dunn only asks us to add that the Lending Library was designed to store 48,320 volumes (nine to the superficial foot), and the Reference Library, Plan No. 1 (the one we give), for 68,420 volumes, and plan No. 2 for 96,210 volumes. The interior perspective is drawn in accordance with No. 2 Plan, which contains five alcoves in its length, instead of four. The panelling above the bookcases in the return portions, shown in the view of Reference Library, was intended to occupy the space for the present until more bookshelves were required; the panelling would then have been removed, and the shelves carried to the top of the alcoves.

### CHURCH OF THE SACRED HEART, WIMBLEDON.

THIS church is being built upon the rising ground between Wimbledon and Raynes Park, and is to take the place of a temporary iron church a short distance away, which has for some years past supplied the needs of the Roman Catholics of the district. It comprises on plan nave, aisles, chancel, with side chapels and sacristy, while a large organ-chamber and singing-school will be placed above one of the side chapels and sacristy, opening by a large

arch into the chancel. The total length of the church when completed will be 168 ft., the width 64 ft., and the height from floor to ridge 68 ft. The style is Late Decorated, the materials used being, externally, flint with dressings of Ancaster stone, and Broseley tile for roof. Internally, nearly the whole is in Beer stone. At present the nave of eight bays is all that is carried out. Its chief characteristics are its loftiness and general richness of detail and carving. Elaborate niches occur in the spandrels of the arches of each alternate bay, while the arched and moulded principals of the roof spring from corbelled-out wall-shafts with richly-carved caps. The ceiling is arched and panelled with carved wooden bosses, decorated in gold and colour at the intersection of the ribs. Mr. Frederick A. Walters, F.S.A., is the architect, and the contractors are Messrs. Goddard & Sons, of Farnham. The carving has been carried out by Mr. McCulloch, of Kennington, who is also preparing a large elaborate roof and beam to be fixed in the chancel arch. The heating is by Grundy's hot air system.

**Festivity at Wilton Park.**—During the last few months extensive alterations have been in progress at the mansion at Wilton Park, Bucks, to fit it for the occupation of Mr. Pascoe Grenfell. The alterations, &c., which will cost considerably over 10,000*l.*, have been carried out by Messrs. G. and H. Bywaters, of London from the plans and under the direction of Mr. Arthur Vernon, architect. The approaching completion of the work was celebrated a few days since by a dinner to the workmen employed, together with the staff engaged on the estate, and the tenants, all of whom were invited by Mr. Arthur R. Grenfell, the trustee of the estate, to join in the festivities. A party of some 250 gathered in a large marquee placed near the mansion. Both Mr. Grenfell and the architect, Mr. Vernon, spoke in very high terms of Messrs. Bywaters and their men, and a very pleasant day was spent by all concerned.

**Institution of Mechanical Engineers.**—The summer meeting of this Institution will be held in Edinburgh on Tuesday morning, the 2nd of August, and Wednesday morning, the 3rd of August, in the University. The chair will be taken at half-past nine o'clock by the President, Mr. Edward H. Carbutt, in the Natural History Lecture Theatre. The list of papers will be found in another column under the heading "Meetings."

**THE LEICESTERSHIRE INDUSTRIES**  
 VISITED BY THE ASSOCIATION OF  
 MUNICIPAL ENGINEERS.

by Granite Quarry and Victoria Stone Works.

On the occasion of the recent annual meeting of the Association of Municipal and Sanitary Engineers at Leicester, a visit was paid to the Groby quarry and to the works of the Victoria Stone Company in connexion therewith. The visitors were met by the representatives of the Victoria Stone Company, and conducted over the Leicestershire branch works. Matthews's patent machinery for crushing granite was first examined. It consists of inclined metal troughs, 24 ft. long, in each of which a number of shovels are set to an angle with the bottom of the trough work forward and backward, carrying granite up the incline, continually turning it in the trough, while a copious stream of water runs in the opposite direction down the incline, first meeting the cleanest granite and then passing through the series of shovel-blades as granite is moved upwards by them, and the particles of dust and deleterious matter is washed out of the granite. The granite is then washed in trucks to the mixing-rooms, where Portland cement is also taken, and having been spread on cooling floors in cement-stores for at least three weeks, and sifted again immediately before being used, to exclude the numerous small lumps which frequently are found in cement used out from the manufactory. The washed granite and cement are carefully gauged and placed in metal-lined moulds, and are allowed to remain for ten days. The granite is then taken out of the moulds and placed in cans containing a solution of silica for a further ten days, and it is afterwards stacked for at least six months before being sent away. Although the company manufactures a large quantity of landings, staircases, window sills, copings, and other constructional articles, the Groby branch is kept busy making set paving, of which there is a very large quantity used. The company makes 30,000 tons per week, and keeps a stock of these sets alone of upwards of 500,000 ft. These sets were specially built for the manufacture of Victoria stone, and have been planned with a due regard to cleanliness and efficiency. The proprietors are continually seeking to improve their stone, and are now laying down new machinery at these works similar to that erected at their Stratford works last year, which we hear that excellent results have obtained. The materials are turned over in two minutes and a quarter, with the result, as we are informed, that the tonnage of the material is increased 25 per cent., without appreciable extra cost. The settes made by this process have withstood a very high strain of 1,125 lb. per square inch, and did not permit of more than a cursory examination at many interesting features in connexion with the works and the manufacture of this stone. Leaving the works the President in a few chosen words expressed the thanks of the members to the proprietors for the way in which they had thrown open their works and invited the visitors. One of the numerous companies belonging to the Groby Granite Company, adjoining the Victoria stone works, was viewed, and great interest was taken in the blasting of the granite, the setting-making and the granite machinery, which were pointed out by the company's manager.

*The Mountsorrel Granite Quarry.*

A visit to this famous quarry was a very interesting one. As was stated by us in an article on the subject last year,\* the stone here is of an arenaceous granite, and is of two colours, — black and a greyish white, due to the difference in the tint of the felspar, this mineral occurring in small crystals. Though there are varieties in colour, there is no difference in the hardness of the material. The difference in colour is hardly apparent unless the stone is not cleaned or polished. The output is from 100 to 130,000 tons per annum of all sorts, the quantity brought down by each blast varying from a few tons to many thousand tons, according to the situation. From 27,000 to

30,000 lb. of powder are burnt annually, and each 100 lb. of powder will get and break, upon the average, 450 tons of rock. The stone polishes well, but it is very hard, and takes a long time to produce a face. The main face of the quarry, it may be mentioned, has a maximum height over all of about 200 ft., with two steps or platforms. Roughly speaking, it describes an arc about 1,440 ft. long and 1,200 ft. across the chord. As the work carried on at these quarries is comparatively little known except to those more directly concerned, we give some additional particulars relating to it, taken from an interesting pamphlet issued by the company. The rocks which constitute the table-land of Leicestershire terminate in a line of bold cliffs at Mountsorrel, which is situated between the Sibley and Barrow Stations of the Midland Railway, and here the operations of the company are carried on, providing employment for between 500 and 600 men and boys. The granite is first dislodged by blasting, and after the masses of rock have been detached from the face of the working they are rolled down to the floor of the quarry. Here the large stones are reduced to a workable size by "shooting" them down, that is, splitting them by small charges of powder from two to three ounces in weight. The rough blocks are then wheeled across to the sheds of the squarers. These sheds or huts are arranged in rows, with their open sides towards the rocks to facilitate the supply of stone. In each compartment are several boys working, under the guidance of a man. Often a father and his children work together, and, by a proper division of labour, can work more economically than the same number of adults. By these the granite is formed into sets or squared stones for paving or pitching roadways and pavement crossings, as it is in these sets and broken stone, or macadam for roadmaking, that the chief trade of Mountsorrel consists. The stone, after it has been shaped, is paid for and sold by weight. Most of the work done at these quarries is piecework. As the sets are completed, they are loaded in small trucks, under the supervision of a foreman, and, when weighed, to ascertain the amount earned by the workmen, are removed to the company's stock ground, where the different sizes of sets are piled up in distinct heaps. The hammers used by the men engaged in squaring or shaping the granite are of various sizes, the largest and heaviest weighing about 25 lb., and the smallest 2 lb. The block of stone, after having been roughly chipped into shape, is dressed over with a light hammer, weighing about 2½ lb. In parts of this quarry there are still to be seen a few of the old-fashioned "ring-breakers," or men making macadam by hand. These breakers use a small short-handled hammer, and hold an iron ring in their left hand. With this ring they rake down the lumps of stone on to the block upon which they are broken, and also hold the pieces together to prevent their flying about. The real work of making macadam is, however, now performed by machinery. The mills consist of two Blake's breakers, employed at Mountsorrel merely to break down the larger lumps of stone (and not to finish the material), and below them a large pair of rolls, 3 ft. long by 2 ft. 6 in. in diameter, which in reality manufacture the macadam. Through these rolls there can be passed from 500 to 550 tons of material in a working day, and the stone is afterwards screened in a circular riddle, 25 ft. in length by 5 ft. 6 in. in diameter, and is thus divided into five different sizes of stone, from the finest sand to the largest sort of macadam used for roads. From this riddle the stone falls into boxes, and thus direct into the railway wagons; and so is not handled from the time that it is automatically poured into the mills until it is hauled away by the locomotive. The larger sizes of broken stone are used for macadam, and the smaller sizes for garden paths, and also for the manufacture of concrete stone in conjunction with Portland cement. A line about a mile in length constructed by the company, runs from the works to the Midland Railway, and there is also canal carriage by the Soar to all parts of the kingdom. It should be mentioned here that, while inspecting the working of the machinery in the mills, one of the visitors narrowly escaped being crushed to death by a truck-load of granite. Thanks, however, to the prompt action, attended by some personal risk, of the quarry-manager, Mr. G. Baker, a fatality was averted.

*The Barrow Lime and Cement Works.*

One of the most interesting of the visits was that paid to the Barrow lime and cement works. On arriving at the Mountsorrel Junction of the main line of the Midland Railway, the party were conducted by Messrs. Ellis to one of their lias limestone quarries. Here they walked through one of the workings, and were shown a section of the lias formation, as well as the mode adopted by Messrs. Ellis in working. The Barrow-on-Soar beds of lias are peculiar to the neighbourhood, and from them is made the well-known Barrow hydraulic lime, which has been in high repute, we had almost said from time immemorial, and has been used in some of the most important works in the country. It was stated that similar beds of lias are to be seen only at Lyme Regis. The party inspected with interest a rough collection of fossils found in the strata, consisting of remains of ichthyosauri, flat-fish, ammonites, &c. Time did not allow of a visit to the kilns, loading docks, and grinding-mills, and after a cursory inspection of Messrs. Ellis's new and very complete Portland cement works, including laboratory and testing-room, the party left again by train for Mountsorrel, not without cordially thanking Messrs. Ellis for their courtesy. One point which struck the visitors to the limestone workings was the large amount of excavation through shaly and other material which had to be done before the thin bed of limestone was reached.

**BUILDERS' BENEVOLENT INSTITUTION.**

The fortieth annual meeting of this Institution was held on the 21st inst., at Willis's Rooms, St. James's. Mr. Basil E. Peto, President, occupied the chair, and was supported by Messrs. George Plucknett, J.P., T. Patrick, C. Bussell, R. Richardson, T. W. Duffield, T. Stirling, C. Ansell, W. Scrivener, and other gentlemen.

Major Bruton, the Secretary, read the annual report, which stated that during the past year ten deaths had occurred among the pensioners, and nine candidates who had been waiting for the benefits of the charity had been elected. The total number of pensioners was 32 men and 33 women, necessitating a large annual expenditure, and causing deep concern in the minds of the Committee to obtain new subscribers, the more so as many, who had for years past given regularly and liberally to the Institution, had been removed by death. The Committee greatly regretted that the income of the Institution for the past year had not been sufficient to meet the expenditure, and that it had been necessary to withdraw the balance of the Reserved Fund. There was also an increase every year in the number of applicants seeking election. The Committee were under great obligations to Mr. Basil E. Peto for his valuable aid during the past year, and they also remembered with gratitude the support his father (Sir S. Morton Peto) had given to the Institution. The Committee were pleased to announce that Mr. H. H. Bartlett would be the President for the ensuing year, and that with the consent of the Court of the Carpenters' Company, the annual dinner would take place in Carpenters' Hall on the 3rd of November next.

The report and accounts were adopted, on the motion of Mr. C. Bussell, seconded by Mr. Thomas Patrick.

Votes of thanks were passed to the President for the past year (Mr. Basil E. Peto), to the Vice-Presidents, to the Trustees (Mr. George Plucknett, J.P., Sir James C. Lawrence, Bart., Sir S. Morton Peto, Bart., and Mr. C. T. Lucas), and to the Treasurer (Mr. George Plucknett, who was again re-elected).

Votes of thanks were also accorded to the Committee, the retiring members of which were re-elected, and Messrs. Basil E. Peto and A. Moore added to their number. A similar compliment was paid to the auditors (Messrs. Ward, Bolding, and Duffield).

Mr. George Plucknett proposed as President for the ensuing year Mr. H. H. Bartlett, who, he believed, would shyly fill the chair.

Mr. Thomas Stirling seconded the motion, which was unanimously agreed to.

A vote of thanks to the chairman closed the proceedings.

**The Rossetti Memorial.**—We are asked to mention that the granite used for this memorial, mentioned in our last, was from the Gannislake Quarries, Tavistock.

 For further information concerning these quarries see *Builder* for Nov. 12 and Dec. 10 and 17.

### BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

A GENERAL MEETING of the subscribers and donors to this Institution was held at the Offices, 21, New Bridge-street, E.C., on Tuesday evening last, at which the President, Mr. W. R. Freeman (Messrs. John Mowlem & Co.), took the chair. There were also present Mr. E. Brooks (Treasurer), Messrs. C. K. Turpin, F. Robson, H. W. Parker, W. D. Gilbert, J. Burchell, E. C. Roe, and other gentlemen.

At the conclusion of the formal business, three candidates for the Widows' Pension of 20*l.* per annum were elected by show of hands. There were in the first instance but two vacancies, but a third was specially announced in honour of the Queen's Jubilee, thus enabling the meeting to elect the three cases, without subjecting the candidates to the harass and expense of a canvass. The new pensioners are Louisa Hadrill, Maria Bowtle, and Eliza Holding.

At the close of the election the following additions to the Rules of the Institution were submitted to the meeting and adopted:—

Rule II, Sec. 3, add:—“For the purposes of this Section it shall be lawful for the Trustees to purchase presentations for periods of twenty-one years, in such Institutions as a General Meeting may from time to time sanction, in the names of the Trustees of the Builders' Clerks' Benevolent Institution.”

Rule XIX., add new Section:—“That the holders of each presentation purchased in pursuance of Rule II, Sec. 3, shall bind themselves to use such presentation only in favour of such candidate as shall be elected by this Institution, and to conform in all points to the Rules thereof, and to the Rules of the Institution into which the child is to be presented.”

At the close of the business a cordial vote of thanks was accorded to the President for his services, not only on that occasion, but for his active personal interest in all that pertained to the welfare of the Institution.

### THE “NORTH LONDON COLOSSEUM.”

BICKMORE v. BAKER AND GINNETT.

THIS case was tried in the Queen's Bench Division recently, before Mr. Justice Grantham and a common jury.

The plaintiff was Mr. William Bickmore, of Shepherd's Bush, huilder and contractor, who sued the defendants, Mr. Henry Minter Baker, of Dover (a member of the firm of Barwell & Baker, Government contractors), and Mr. George Ginnett (the well-known circus proprietor), for the recovery of 452*l.*, balance due to the plaintiff for work done, materials supplied, and money advanced for the use of the defendants in connexion with the erection of a building in Roseberry-place, Dalston, known as the “North London Colosseum”; for the brick, timber, and iron work, for which the plaintiff was the contractor; and also for damages for breach of contract to complete the work, the plaintiff having been stopped by defendants when about one-fourth of the work had been done, and afterwards prevented from proceeding further with the same, which was completed by another firm of builders (Messrs. Wilkes & Co.), who used all the plaintiff's plant and materials left on the ground by him for the purpose of carrying on the building. The defendants employed a Mr. Alfred Brandreth as their agent and architect in the concern, and with whom the plaintiff principally dealt as such agent; but since the stoppage of the work and during the course of the action, the defendants denied such agency and repudiated the plaintiff's claim and their dealings with him and connexion with the building in question.

The plaintiff was represented by Mr. E. U. Buller and Mr. Stamp W. Lambert, instructed by Messrs. Turner, Son, & Norton; and the defendants by Mr. Cock, Q.C., and Mr. Glyn, instructed by Messrs. Thos. Baker & Sons.

The first witness called for the plaintiff was Mr. Griffith Williams, of 20, Spring-street, Sussex-gardens, W., tailor, who deposed to having cashed cheques and post-office orders from Brandreth, which he (Brandreth) had received from the defendants, and to conversations which had taken place in his presence between Brandreth and the defendants, in which they appeared to treat Brandreth as their servant.

Mr. William Bickmore, the plaintiff, was called, and examined by Mr. Lambert. He said he first met the defendant Baker on the site of the intended building in the latter end of August, 1855, when Brandreth introduced Baker to him as one of the proprietors of the concern. Baker asked him how long the job would last, and what money he should require, and the plaintiff stipulated for weekly payments, which sums Baker said he should be prepared to pay on the certificate of Mr. Brandreth, his architect. He was afterwards introduced to the defendant Ginnett in the same way by Brandreth, and went into the matter with him. Plaintiff first met Brandreth in the matter some time before he met the defendants, when Brandreth produced to him a rude drawing of a circus, which

he had built in Manchester or Liverpool, from which he was asked to give an idea of the price of brick-work. Mr. Brandreth said he should want him to assist in working out the drawings, as he (Brandreth) was not used to the Metropolitan Board's requirements. He was to submit his estimate, others having been sent in at too high a figure. The plaintiff then detailed at length the circumstances connected with the taking of the land from the freeholder, the preparation of the building agreement by Messrs. Beard & Sons, and the commencement of the works, Brandreth having in the meantime written letters to the plaintiff in which he represented himself as being merely the architect of the concern, and alluding to his principals. Plaintiff duly prepared and forwarded the specification and contract to Mr. Brandreth, expecting him to sign a duplicate, and return; which, however, he did not do, but wrote to the plaintiff as follows:—

“2, Spring-street, W. Thursday Evening, August 29, 1855.  
Dear Sir,—Sorry was not at home when you called. Hope to begin work on Monday, or at least sign your contract. You may get scaffolding on ground when you like. I will try to have the new work within a week. Mr. Baker, and the fact of your having your scaffolding on the ground, or getting it on when we get there, may greatly hurry up the money. Do you understand?—Yours truly,  
ALFRED BRANDRETH.”

He took this letter to be in answer to the contract and specification which he had left, and he accordingly attended Christmas, in January, Mr. Ginnett and Mr. Baker, this being the interview with Baker before alluded to. He then went on with the work till he had notice to stop. It appeared that the cheques given in payment were sent to Mr. Brandreth, who cashed them, and handed the plaintiff what he thought fit. On the 21st the plaintiff received the following letter from Brandreth:—

“Railway Hotel, Leicester, 14th December, 1855.  
Dear Sir,—Mr. Ginnett, Mr. Baker, and their solicitors will be on the ground at one o'clock sharp, on Thursday morning next. I have told them the wall was up all round the building about 5 ft. Mind you keep the men hard at it. I have also said the new work was in hand, as you told me you had settled with Lyagh.—Yours truly, in haste,  
ALFRED BRANDRETH.”

At this meeting matters were gone into, and some discussion ensued as to the advisability of discharging some of the workmen, which caused some discontent among them, and they were accordingly retained until just before Christmas. In January, Mr. Ginnett and Mr. Baker visited the ground, and as the time was approaching for the completion of the building by the time required, the plaintiff said he should want 50*l.* or 60*l.* a week to get it done. Mr. Ginnett and Mr. Baker, he understood, arranged that he should receive that amount. Soon after the work was somewhat stopped by the frosty weather. The defendant Ginnett left ten sovereigns for him on the desk in the office. During the time the work was in progress, the plaintiff had drawn three bills of exchange, for 25*l.*, 50*l.*, and 65*l.* respectively, which were drawn on condition that the defendants should know it, and that they should be duly met. On the 25th January, a formal notice was served by the Metropolitan Board of Works on the plaintiff, by a letter from Mr. Brandreth to him, of the 30th, as follows:—

“National Hippodrome Company,  
23, Spring-street, Sussex Gardens, Hyde Park, W.  
30th Jan. 1856.

Sir,—I hereby give you notice that pending certain investigations and surveys in connexion with the building operations in Roseberry-place, Dalston-lane, the work will be stopped on and from Monday next, the 2nd of February, and further orders, and that your services will not be required on the ground until the Metropolitan Board of Works' Surveyors and the ground landlord's surveyors have inspected ground and deliberated on the matter with me as to the course to be adopted. I need not remind you that should you attempt to ignore this notice you will expose yourself to very unpleasant proceedings. I have a consultation with my solicitors this afternoon, and I may as well add that I shall require the builder to enter into a building agreement, containing usual clauses, and providing satisfactory securities for their fulfilment before the work is resumed, or any further moneys advanced.—I am, sir, yours,  
ALFRED BRANDRETH.”

The last payment on account of the work was on the 29th January, 1856, when Brandreth handed plaintiff 40*l.*; on the 12th February plaintiff saw defendant Ginnett on the ground, when they conversed on the matter, and Ginnett did not understand the work being stopped. Plaintiff wrote to Brandreth, with his account, and on the 3rd February he received a reply from him disputing the accuracy of the same. Ultimately the work was taken up by Messrs. Wilkes & Co., who used the plant left on the ground by the plaintiff. Plaintiff also wrote to defendants, but received no reply to his letters.

In cross-examination by Mr. Glyn, the plaintiff did not say whether or no he did any work on the ground prior to the 30th September, the date of the building agreement. He maintained that Brandreth represented Baker, in that gentleman's presence, as his principal in connexion with the works, and his evidence-in-chief was not shaken on any material points.

Edward Carter, a labourer, of Starch Green, said he had been in the employ of the plaintiff off and on for 24 or 25 years, and was employed by him on

the occasion in question in looking after the job, cutting up the ground and concreting. Baker and Brandreth came on the ground, and the former asked him whom he was sent to by the latter. He replied, for “Mr. Bickmore,” the scaffolding arriving on the ground in their presence, and he saw Baker there many times afterwards. He also saw Ginnett there. He, witness, deposed to different conversations he had with Baker, and to messages having been left for plaintiff by Baker, and to the fact of plant and materials being left on the ground by the plaintiff and being used by Messrs. Wilkes & Co.

James Tilbury gave similar evidence. Mr. George Sparrow, an architect and surveyor, formerly in the employ of Mr. Legg, District Surveyor of West Hackney, proved service of the formal notice on the plaintiff in January, 1856. He assisted Mr. Brandreth in amending the plans as required by the Metropolitan Board of Works. In 1856 Mr. Ginnett was introduced to him in Mr. Legg's office as one of the proprietors of the Hippodrome, by Mr. Brandreth. At that time he believed Messrs. Wilkes had not taken up the building. He never saw Mr. Baker.

Mr. George Hamilton was called to prove discharging the labourers drawn by the plaintiff, and that the bill for 50*l.* was taken up by a cheque of defendant Baker.

Mr. Charles Steel, proprietor of the Crown and Castle, Kingsland Gate, close to the building, said he saw Mr. Ginnett during the erection of the Colosseum with Brandreth and Bickmore. Mr. Brandreth introduced Mr. Ginnett to him as one of the proprietors. In conversation with Ginnett, the latter said that Wilkes claimed some 3,000*l.*, 4,000*l.* as owing to them, and remarked, “We spent 700*l.* or 800*l.* on the place before Wilkes took on.” This closed the plaintiff's case.

Mr. Cock then opened the case for the defendants and contended there was not the slightest foundation for trying to make the plaintiff liable to the plaintiff.

Mr. Thos. Beard, of the firm of Beard & Sons, of 10, Basinghall-street, solicitors, was then called to prove his instructions for and the preparation of the building agreement of 30th September, 1855, and that he was not instructed by the defendants.

Mr. Alfred Brandreth said he was an architect and surveyor, of 17, Devonshire-square. He had been for some time previously to the 30th September, 1855, endeavouring to form a company to develop an idea which had since been developed, viz., a hippodrome which had taken the name of “Olympia,” and succeeded very well. He worked hard to develop it, but failed in doing so for want of the necessary capital. In the course of his investigations in London he found two sites which he considered would be the best for the purpose. One was where the American Exhibition is now, and another at Dalston. He saw the owner of the land in the latter case, and ultimately a building agreement was entered into. The witness then detailed at length the history of the transaction, and said he remembered employing the plaintiff to do some work. He positively denied ever having represented to plaintiff that defendants were the proprietors of the concern, but stated he was sole proprietor, the money necessary to enable him to carry on the work having been lent him by Mr. Ginnett. Witness was then submitted to a long cross-examination by Mr. Bullen, with a view to show that his financial condition was not such as to enable him to carry on the work. Mr. George Ginnett, examined by Mr. Glyn, said he was a circus-proprietor and one of the defendants, and had known the last witness for some years. I proposed to witness building a theatre or circus in London to be used for all sorts of purposes, and asked witness to finance him, which he agreed to do for the first season for a circus, and he accordingly advanced him money from time to time. He never instructed Brandreth as his agent to employ builders. I never dared say in his (witness's) presence that (witness) was his principal, and he should have to answer him differently if he had; nor had Baker any share or interest in the matter more than witness had.

In cross-examination by Mr. Bullen the witness could not say how many circuses he had had in time, but he had a fresh building every winter. Perhaps four of these had been built for witness Brandreth, and in the case of a circus in Birmingham the relations between them were similar to those present. It was not a building of this kind, and it had been taken down. He had never and one of the kind before Mr. Baker had sent witness money, and one transaction held a bill of sale on his property for about 155*l.*

Mr. Henry Minter Baker, the other defendant, was then examined by Mr. Glyn, and said he was Government contractor residing at Dover. He had no interest whatever either in the building that was the building agreement, or in the Hippodrome Company was formed, he subscribed for five shares in the 1st of May, for which he paid 500*l.* in May and June; that was his only interest. Ginnett asked him for money to lend to Brandreth. Brandreth never, to witness's knowledge, introduced witness as one of his principals, or he should have contracted it directly. He never heard of Flint or Allen until this case came on.

Cross-examined by Mr. Bullen.—Do you mean say, Mr. Baker, that you never heard of Flint or Allen?—I never heard of Flint or Allen.

his statement which appears in this letter of 14th of November, 1885, written by Brandreth, to whom?

—The witness?—It has been read over and over again. "What about this week's cash? That's what I have written to inquire this evening. They not let me take money from Beard or Flint so there was a precaution to pay and they not saving it as they were not short of 1,000." At true?—No; perfectly untrue. Brandreth mentioned Flint's name to me.

Justice Grantham.—Nor Beard's?  
Witness.—Nor Beard's. I did not know him 3 months after.  
examination continued.—I believe it to be the invention of Brandreth's. I have seen more two or three times on the ground, and on to him. I knew nothing of him in connexion with the work at Dalton. I know that Brandreth, Bickmors and Bickmors doing work by the wish of Brandreth. I was not certain of it. The account of conversation given by Bickmors at the "Crown Castle" is quite false. I never asked why they did not go on faster. I never told Bickmors I had plenty of money, or had any connexion with him.

is closed and the defendant's case, and Mr. Glynn addressed the Court, and Mr. Bullen having read on the whole case, the learned Judge stood up. He said he thought the jury would have very little difficulty in coming to a conclusion as to the truth of the case. Did they think a builder the plaintiff was likely to undertake work of kind without seeing how he was going to get his money? But that was the defendant's case, and it was for the jury to say whether they believed it or not. In regard to the relations between Baker and Brandreth, did they think one would lend another money in that way without any return? As to the relations between Ginnett and Brandreth, it was for the jury to say whether the relations of principal and agent existed, which it was admitted existed between them formerly had ceased to exist on the present occasion.

The jury at once found a verdict for the plaintiff, and costs, on all the issues, and his Lordship gave judgment accordingly, and directed that the amount due for work done, materials, &c., and expenses should be found by a reference to one of the official referees.

PROVINCIAL NEWS.

**Newcastle-under-Lyme.**—With regard to the proposed municipal buildings here, the following communication received by the Mayor, read at a recent meeting of the Town Council—

"Treasury-chambers, July 4, 1887.

"The Lords Commissioners of Her Majesty's Treasury have laid before them the memorial from the Corporation of Newcastle-under-Lyme, dated the 5th of August, for leave to purchase land and borrow money for the erection of a council-house, assembly-hall, free library, &c., together with a counter memorial from the ratepayers, and the correspondence that ensued, as well as the report of the Local Government Inspector upon the whole scheme. The conclusion which my Lords have arrived at is as follows:—The objects of the scheme are no doubt desirable, but in view of the opposition it has excited on the part of a large number of the ratepayers, arrangements should be made to prevent the execution of it from entailing any additional net indebtedness of the borough. Moreover, the expediency should be taken to include in the scheme the erection of the requisite municipal offices, whilst making economical alterations in the general design of the buildings as will prevent the addition of these offices from raising the total cost. The Corporation owns a site in the street which was bought in 1879 for 10,000*l.* for municipal offices, the funds being raised by loan with the sanction of the Local Government Board. This site is a large one, and my Lords propose that the Corporation should, with the concurrence of the Local Government Board, sell this site, or so much of it as is not required for the extension, and apply the proceeds to the reduction of the debt in accordance with section 176 of the Public Health Act, 1875. Their lordships have reason to know that the Local Government Board will assent to this proposal, and if the Town Council will pass a resolution giving themselves to adopt it, my Lords will consent to borrowing a sum of 1,000*l.* for the purchase of the Stratton House site required for the scheme now in contemplation. The loan of 1,000*l.* will have to be repaid in more than thirty years. As regards the further loan for the erection of buildings, my Lords cannot decide on the amount until the plans have been modified so as to include municipal offices as already suggested, nor until I know what amount of debt has been cancelled by the sale of the High-street site.

I am, Sir, your obedient servant,  
R. E. WEBBY."

The Mayor said he thought the Council were in a position to discuss this communication on such short notice, and moved that the question be referred to the General Purposes Committee. This was agreed to.

**Oldham.**—Alterations and additions have been made to the Convent here, the new portion having opened a few days since. A large extension has been built, while the existing parts have been considerably enlarged. The ground floor of the extension consists of dormitories, corridors, and bath room, while the upper floor, which is of lofty proportions, is on the second floor, being entered from the portion

previously erected. It has an open-timbered, hammer-beam roof. The walls, to a height lineable with the window bottoms, are covered with oak panelling, the head of each panel being filled in with tracery, the panels alternating in design. On each side of the chapel are ten stalls, the seats being made to lift up, showing the carvings beneath, the whole of which vary in design and detail. At the end of the chapel, adjoining the entrance, is a screen, consisting of eight compartments, the upper portion of each filled in with tracery. At the other end of the chapel is the altar, of Decorated Gothic design. The side niches are filled in with statues. The altar-table, which is executed in stone, stands upon black marble columns, with foliated caps. The windows are filled in with stained glass, two of the windows containing representations of Our Lady, St. Joseph, St. Angela, and St. Stanislas. The brickwork has been executed by Mr. Haines, the masonry by Mr. Staley, the joiner's work and slating by Messrs. S. Ashton & Sons, plumbing, glazing, and painting by Mr. Iearn, all of Oldham. The whole of the fittings, including altar and screen, have been executed by Mr. Oor, sculptor, Roermond, Holland, who makes a speciality of this class of work. The stained glass has been supplied by Mr. S. Bourne, of Birmingham, and the gas-fittings and brass work to the altar by Messrs. Thomasson & Co. The plans of the building, and details of the altar-screen, and other fittings, have been prepared by Mr. A. Banks, of Oldham, who has superintended the erection of the work.

**Rodcar (Yorkshire).**—The trustees of the Kirkleath Estate have offered sixteen acres of valuable land to the Local Board for pleasure gardens. Mr. J. Howcroft, their surveyor, has received instructions to prepare plans for laying out the same. The Board have also decided to extend the sewer outfalls through the rocks to low water, as recommended by their surveyor.

**Sunderland.**—A new hospital for infectious diseases is now in course of erection in the Hylton-road. The ground upon which the buildings are being erected is twelve acres in extent, and was purchased from Col. Scourfield in February, 1885, for the sum of 5,000*l.* It is situated a little more than two miles from the centre of the town. The boundary walls upon three sides of the site were erected by Mr. T. P. Shafto, the contractor for these buildings, in 1885, at a cost of 780*l.* The buildings now being erected include the administrative block, the washing, laundry, and disinfecting establishment; boiler house, stable, and ambulance house; post-mortem room and mortuary, two fever pavilions, entrance lodge, and the northern boundary-wall, gates, &c. The administrative block will be erected in the form of the letter T, with kitchen department in the centre and rear, so that in the future it may be extended if necessary in the form of a quadrangle. The west frontage will be 100 ft. in length, and the main building will be three stories in height, whilst the wings will be two stories, and the kitchen offices one story high only. The fever pavilions will each contain two large wards, for male and female patients, 48 ft. long and 26 ft. wide, by 13 ft. high. Each ward will accommodate eight patients. At the extreme end of each ward will be situated the annex containing the conveniences, &c., and in the centre of the building will be the nurses' duty-room, overlooking each ward, together with bath-room, pantry, and coal store. An isolation pavilion is to be erected for the purpose of accommodating cases in which it is not always possible in the early stages to be positively certain of the precise nature of the disease. This building, like the fever pavilions, will be one story in height only; it will contain four smaller wards for the reception of ten patients, and will also have the requisite duty-rooms for nurses, and the usual conveniences. The floors of all wards will be laid with narrow pitch-pine boards, screwed down and waxed, and the walls will be plastered with Parian cement. The block of one-story buildings on the south-side of and adjacent to the administrative block will comprise disinfecting rooms, washhouse, laundry, stable, hay and straw store, ambulance house, boiler house, post-mortem room and mortuary. The buildings have been designed by the Borough Engineer, Mr. S. Rounthwaite, and the quantities were taken out by Mr. G. D. Irwin. The contract for the whole of the work has been entrusted to Mr. T. P. Shafto, of Sunderland, the amount

of his tender being 13,796*l.* 1*s.* 8*d.* Mr. J. Binks is acting in the capacity of clerk of works.

**Ventnor (I.W.).**—The new pier at Ventnor, and the enlargement of the Ventnor Hospital for Consumption, are two works noticed in the *Hampshire Independent*. With regard to the pier, it is stated that the Ventnor Local Board in 1884 obtained an Act of Parliament which enabled them to purchase the old pier at a cost (including the charge in connexion with procuring the Act) of 3,500*l.* They bought the old pier, and have since carried out the present fine promenade and landing-place, which has cost nearly 12,000*l.* Mr. Henry E. Wallace was the engineer selected by the Board in competition, and he appointed Mr. Theodore Saunders, Ventnor, as resident engineer. The contract was obtained by Messrs. Trehearne & Co., of Batorsea, and Mr. Grace, of Southampton, has acted as foreman of the works. The work was making rapid progress when, in October last, a considerable portion of the staging was washed away, and a delay of three months ensued. The head of the pier may be described as shoeshaped, measuring 100 ft. by 80 ft. A glazed wind screen is fitted at the head, and a bandstand of cast-iron is erected within this screen. There is a landing-stage entirely disconnected from the pier. This stage consists of two levels, one for high water and the other for low, and is constructed upon green-heart piles 14 in. square, and braced in wrought-iron. The head is raised 18 in. above the trunk of the pier, and is reached by three steps. The width of the body of the pier, measuring between the backs of the seats, is 25 ft. It is built throughout on cast-iron piles, braced with wrought-iron. There are wrought-iron gates at the entrance by Messrs. Macfarlane & Co., Glasgow. The whole structure measures from end to end about 650 ft.

—With regard to the Consumption Hospital, a new block has been added to it with money bequeathed by the late Mr. John Jones, of Piceadilly. The new block is larger than any of its predecessors. Immediately opposite to the entrance are doors which open on a small landing overlooking a spacious dining-hall, where the whole of the patients under treatment at the hospital, and more, can be accommodated. At each end of the hall are sitting-rooms. On the left of the entrance-hall are apartments for the head-nurse and the dispenser, and on the right are consulting and waiting rooms. Upstairs there are bedrooms for twenty patients, each to have a separate apartment, and all facing the south. A verandah runs outside the bedrooms, from which the patients will have a splendid view over the sea and the landscape below and on each side of them. All the rooms are fitted with the means of ventilation, and the warming apparatus is most complete. The sitting-rooms and bedrooms have each a box of steam pipes. In the coldest weather the air passes through these pipes into the room at a temperature of 62 degrees. By means of a rapidly-revolving fan the vitiated air in each of the rooms is drawn through a grating near the ceiling, and by this means an atmosphere as pure as possible is maintained. The architect of the new block is Mr. Hillier, of Ryde, and the builders are Messrs. Ingram & Son, Ventnor. The ventilation is carried out by Messrs. Bacon & Co., London; the furnishing by Messrs. Lawes & Son, City-road, London; and the cooking arrangements by Messrs. Edwards & Son, Great Marlborough-street, London. The sewerage arrangements for the entire set of buildings are very complete, and distinct from other systems in the neighbourhood. The drainage discharges into one channel carried under the rocks 200 yards right out to sea. The new block is to be opened by the Princess Beatrice early in August.

**Technical Examination for Carpenters and Joiners.**—In order to promote efficiency on the part of carpenters, joiners, builders' foremen, and clerks of works, the Worshipful Company of Carpenters propose to hold examinations in their Hall and at their Technical Institute in Stratford, and to grant to candidates certificates of their theoretical and practical acquaintance with their craft. The first examination will take place in June, 1888, and full particulars, with specimen of examination papers, can be obtained at Carpenters' Hall.

PART PLAN OF A TOWN SHOWING SURVEY LINES

NOTE.—THE DETAIL OF THE ENCLOSURES, CAN AFTERWARDS BE SURVEYED IN, FROM LINES TIED ON TO THE FRONTAGE LINES, TO COMPLETE THE PLAN, AS SHOWN ABOVE.

PLAN OF ROADS, SURVEYED FROM BASE LINES SHOWN THIS — THE RELATIVE POSITION OF WHICH, IS FIXED, BY TAKING THE ANGLES AT THEIR POINTS OF INTERSECTION, WITH THE THEODOLITE, AND PLOTTING THEM WITH THE PROTRACTOR.

The Student's Column.

LAND SURVEYING AND LEVELING.

V.—BASE LINES (continued).

**W**HERE a system of chain triangulation cannot be adopted, the angles between the base-lines are taken with a theodolite in the following manner.—The instrument is set up level with its vertical axis exactly over the intersection of two base-lines. This is indicated by the plumb-bob hanging exactly over the centre of the station peg. Upon a well-paved road, the best way to mark the station points is to run the base-lines so that they terminate, where possible, in the joints of the kerbstone into which a 4-inch nail can be easily driven, and can be readily found when required for future reference, by noting its

distance along the kerb from the nearest lamp-post, or other fixed point. The accompanying diagram illustrates a part plan of a town where this method was adopted. The roads were first surveyed from the base-lines as shown. The angles at the points of intersection are taken, and the lengths of the base-lines accurately chained. The detail of the enclosures can then be afterwards surveyed from base-lines fixed in position by being tied on to the frontage-lines to complete the plan. The accuracy of the horizontal angles which are measured is proved by a process of repetition, which consists of respectively doubling and trebling the amount first read, and in order to avoid error of direction in plotting, it is advisable to adopt a uniformity of method, by always recording the amount of arc traversed by the telescope when moved, in the direction of the hands of

a watch. Hence, when the base-line to which you are approaching deviates to the right-hand of the surveyor as he walks over the previous base-line, the angle hooked exceeds 180°, and when it deviates to his left-hand it reads less than 180°. It will be observed that as the primary scale of divisions is marked in a continuous circle upon the outer edge of the lower plate, a horizontal angle may be repeatedly and definitely round the limb of the instrument, and thus a number of repetitions added mechanically will serve to secure accuracy in the resulting mean. Referring to our diagram of last week (p. 154), let us suppose we require the angle between the base-lines A B and B C, fig. 1. The instrument when removed from the box is in an unclamped condition, and is set up over the peg at B, before in a

amping the plates. The vernier of the horizontal plate is then set to zero at F, and clamped. The upper plate being clamped to the lower plate, the reading at G is finally adjusted by the tangent screw and to the horizontal plate. Both plates are revolved upon the vertical by turning the telescope with the hand it comes as nearly as possible in the line of the line BA, and the line of collimation in the telescope is set to intersect the line of a ranging-rod or peg, which has been placed exactly upon the line BA. The instrument is then clamped, and the milled-headed tangent screw connected to the collar clamp is slowly turned by the hand until the distant point of observation on the base-line is accurately bisected. When done this, leave the lower-plate clamped, clamp the vernier plate. By this means will be given to the stage carrying the telescope to traverse the required angle, and the angle is measured by the arc as described, after the telescope is set in the direction of the line B C, and the line of collimation bisects the distant point observed. In proceeding from station A to station C in fig. 1 (Builder, July 23, p. 154), the angle between the line A B and B C is set at 275° 11', whereas if we were proceeding in the opposite direction from station C to station A, the angle at B would be at 81° 49'. For convenience of reading the zero point is placed at the side of the stage carrying the telescope, so that the angle required to be taken is situated within fig. 4, the actual angle traversed by the verniers is shown in fig. 3.

points in this invention. A full description of elaborate methods of fixing is given in the specification.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

7, Construction, Bedding, and Laying of Pipes. J. Potts.  
 object of this invention is to provide a solid joint for the pipes so that they may be permanently maintained at their proper level or position without fracture. A cradle is therefore laid on the ends of each pipe, so that a sufficient length of each of the bearing surface is obtained. The cradle is either formed in one piece on the pipe laterally, and when separate it is connected to the pipe by cement or mortar; or concrete may also be used for the cradles.

11, Ventilators for Down-draught. H. T. T. T.  
 basis of the invention to which this patent relates, is the employment of grooved rings instead of the ventilator which act as draw-down and prevent down-draught. The rings are of metal or of clay. The bases of cylindrical but the cover may be of any of the common ordinary shapes.

14, Wood Pavement. E. Bull.

object of this invention is to lay wood-pavement in such a manner that a better grip is afforded to the feet. There is a space all round each block which is filled in with cement, concrete, or in slabs of wood. The blocks are attached to the surface of wood by nails, these are attached to slabs at right angles. These double slabs may be transported from place to place, and can be laid down without blocking up the streets for long periods. A kind of grate is used under the blocks in position when building up the pavement.

17, Sash-Fasteners. J. Dedden.  
 invention relates to a window-fastening device to prevent the use of a knife to force back the sash spring is fixed so that unless it is pressed with a thumb cannot be pulled back. It is simple, and cheaply made.

19, Electrical Burglar Alarms. R. Hadden.  
 alarm which is the subject of this invention is controlled by the action of curtains or textile articles which are stretched over a frame-work used to the window-curtain, which also forms the alarm.

20, Chimneys. C. J. Henderson.  
 construction of chimneys according to this invention, circular bricks are used, and these tubes, instead of the continuous openings, while smaller use fresh air to ascend, the heated fresh air is used for warming apartments, while the smoke is carried to the outer air.

21, Window Frames and Sashes. S. S. S.  
 device for sliding the sash without weights, for the same against the sides, are the main

## Miscellaneous.

**The State of the Thames.**—At a recent meeting of the Common Council the present disgraceful and dangerous state of the Thames was once more discussed. Mr. E. G. Wood spoke of a large portion of the river as a huge sewer, and Deputy Saunders, who represents the Corporation on the Metropolitan Board of Works, admitted the evil, and even went so far as to confess his fear that it would never be effectually remedied "until the main drainage outfalls had been removed to a far greater distance down the river." The Board is spending enormous sums for chemicals, and is preparing for a still more enormous expense for permanent works of precipitation at the present outfall. But, as we have often pointed out, no true solution of the difficulty is as yet contemplated. The pertinacity of the Board in resisting the mass of evidence before it, and clinging to the present outfalls, is amazing. All the money that is spent on them will be thrown away, for common sense must inevitably prevail in the end, and a simple and practical remedy has repeatedly been suggested. There is, indeed, but one real remedy that is possible. The strongly expressed advice of the Metropolitan Sewage Discharge Commissioners must, sooner or later, be adopted. The sewage must go down to Convey Island, or some other suitable spot in Sea Reach, and there be defecated, filtered through the land, and only thrown into the river as a clear and innocuous effluent.—*Lancet.*

**Electricity and Health.**—Electricity in the house has some important bearings on hygiene. One of these M. Samuh has recently called attention to (*Revue d'Hygiène*), in the liberation of hydrogen, where strong batteries are used in which zinc is dissolved by sulphuric acid. Besides the danger of shattering the vessels, the hydrogen spreading in the air may form an explosive mixture; and it may have a cooling effect through its great conductivity for heat. It also deadens the voice and alters its timbre. Further, if, as may be, the hydrogen is charged with sulphur, arsenic, phosphorus, carbon, or silicon, there are other and greater dangers. A chemist is known to have died from breathing a little arseniated hydrogen. These facts are not cited against the use of electric light, but to induce proper care in those who use it.—*Nature.*

**The Primitive Methodist Chapel and Schools.** Lees-road, Oldham, have recently been re-opened, after extensive alterations and additions. The chapel has been supplied with new pitch-pine pews and rostrum, and the upper floor of the school has been divided so as to form a number of class-rooms. Other improvements have been effected, and a new staircase has been erected. The work has been carried out by Mr. Lees, builder, Oldham, from designs by and under the superintendence of Mr. A. Banks, architect, Oldham.

**Wesleyan Schools, Hyde.**—The foundation stones of the Victoria Jubilee Wesleyan Schools, Hyde, have been laid by the Mayor of Hyde, and other influential gentlemen connected with the town. The schools will have a frontage to Water-street (in which is the main entrance), of 69 ft., whilst the frontage to Milk-street and Port-street is about the same, the sideentrances being in these streets. On the ground-floor are infants' school, 48 ft. by 31 ft. 6 in., with classroom adjoining,—the latter 25 ft. by 15 ft. 6 in., and containing galleries; lecture-room, 22 ft. by 16 ft.; class-room, 25 ft. by 15 ft. 6 in.; tea-preparing room, 16 ft. by 8 ft. 6 in.; and boys' and girls' lavatories and latrines. On the first floor will be an assembly-hall, 65 ft. by 31 ft. 6 in., with an open timbered roof of pitch-pine, and on one side will be large class-rooms for the young men and women, each measuring 25 ft. by 15 ft. 6 in., the principal staircase being between these two class-rooms. On the other side of the large hall will be classroom and lavatories, also the back staircases, over these being cloak-rooms. The schools, which are designed in the Gothic style, will be faced with local bricks, relieved with sandstone dressings, and Ruabon terra cotta, and slated with blue slates, capped with red ridge tile. The ground-floor will be paved with wood blocks, upon concrete, whilst to prevent any noise reverbering from one floor to another the joists to the first floor will be covered over with patent silicate slag cotton wool. The whole of the staircases will be of easy ascent, and are to be built of Whitworth stone. The contract for the work has been let to Mr. S. Robinson, Hyde, the designs having been prepared by Mr. A. Banks, Oldham, who was the successful architect in a limited competition.

**New Bank Buildings, Canterbury.**—The new banking premises for Messrs. Hammond & Co. are making good progress. Designed by the late Mr. John Green Hall, the City Surveyor of Canterbury, the carrying out of the work has been entrusted to the care of Mr. W. J. Jennings, architect (and formerly assistant to Mr. Hall), Mr. H. B. Wilson being the builder. The style of the design is Early Tudor. The building has two elevations. The materials of each façade consists of red Suffolk brick, Ancaster and Stoke ground stone. The construction of the massive vaults and cellars has lately been proceeded with. The basement strong-room is 20 ft. by 12 ft. The ground floor will contain a fine bank-room, 41 ft. by 31 ft., which will be entered by the main doorway, through a small lobby. There will be ample accommodation for a business within, the bank counters having a total length of over 50 ft. Behind this large room will be a manager's room and bank parlour, and at the back of the counter a hallion-room, built over the strong room of the basement. The upper part of the premises will be the residence of the chief clerk, the entrance of which will be in St. Margaret's-street.

**Railway Work in India.**—The Indian Midland Railway is remarkable for the length of new lines under construction, which exceeds 500 miles, part of which is completed, while a large portion is rapidly approaching completion. The Kalpi Bridge over the Jumna (ten spans of 250 ft.) is well advanced, the masonry being finished and the bulk of the ironwork fixed. There are several large bridges in progress on this railway, the next in magnitude to the Kalpi Bridge being that over the Betwa on the Jhansi-Manikpur Branch, which has thirteen spans of 150 ft. and one of 60 ft., whilst its piers are 90 ft. above low water. A large cutting, 60 ft. deep, in the Antri Pass on the Jhansi-Gwalior Branch, is a prominent feature of the extensive earthworks under construction. A length of forty-two miles, between Cawnpore and Chaurah, has been opened for traffic during the year, and is being worked by the East Indian Railway Company.—*Indian Engineer.*

**Plastilina.**—Dr. F. Wilhelm, of Leipzig (according to the *Spektrum*), has for several years prepared a modelling composition under the above name, which has been much appreciated by artists and modellers. It is a close mixture of finely-pulverized clay and various fatty substances, usually glycerine. Its plasticity is excellent, and, as it does not dry up, it can always be used again without difficulty.

**Raffety, Thornton, & Co. (Limited).**—The directors of Raffety, Thornton, & Co. (Limited) have declared an interim dividend at the rate of seven per cent. per annum (free of income tax).

**Greenlaw Church, Paisley.**—The competitive plans for Greenlaw Established Church, proposed to be built by the Abhey congregation were on exhibition in Lawn-street School last week. The committee received nine sets of plans from Glasgow and Paisley architects Mr. Sellars, of Messrs. Campbell, Douglas, Sellars, Glasgow, adjudicated on the merits of the plans, and his award placed the plan of Mr. T. Graham Abercrombie,—with who associated Mr. R. S. Symington, who has been head draughtsman for the last four years in the office of Messrs. John Burnet & Sons, Glasgow,—first; that of Mr. Caldwell, second; and that by Mr. Donald, third. The committee unanimously agreed to Mr. Sellars's report.

**The Norwegian Wood Pulp Industry.** During last year the export of wood pulp from Norway,—an article now used for various ornamental purposes in 'decorating buildings,—was larger than in any previous year, but prices were very low, falling from 3l. 2s. 6d. to 2l. 10s. per ton free on rail at Hull for mechanical pulp containing 50 per cent. of water. The total export was 120,000 tons against 107,000 tons in 1885, and 42,000 tons five years ago. The value of the total production (including about 15,000 tons used in Norway) was estimated at about 400,000l. There are also at present two factories at work in Norway for the production of nitrate and sulphite wood cellulose, whilst nine more are in course of erection. The total output from the same is estimated at 10,000 tons dry.

**The High School for Girls, Mansel-road, Wimbledon.** of which Mr. J. Osborn Smith, A.R.I.B.A., is the architect (Messrs. Howell & Son, of London and Bristol, being the builders, and Mr. R. Old, of Wimbledon, the clerk of works), was opened on the 21st inst. It will accommodate 250 pupils, and has been erected by the Girls' Public Day School Company (Limited), to meet the increasing demand for secondary education in this locality. The accommodation consists of ten class-rooms, a laboratory, a studio, a large central hall, rooms for head and assistant mistresses, classrooms, dining-room, covered playground, host-keeper's apartments, lavatories, &c.

**Clock Tower, Basingstoke.**—The ceremony of unveiling the new clock tower presented to the town as a Jubilee Memorial by the Mayor (Mr. May), was performed last week by the Duchess of Devonshire. The ancient clock, now a century and a half old, has been thoroughly restored by Mr. Benson, the dial enlarged 3 1/4 ft. diameter to 5 ft. 9 in., and five new train wheels and two bells added to chime the 12 quarters.

**Brighton.**—The Catholic-Apostolic Church, Brighton, is to be re-roofed, restored, and an system of ventilation introduced under the advice and recommendation of Mr. Art Loader, architect to the trustees. Boy large upcast ventilators is one of the methods recommended. The work is to be begun once, and Mr. G. R. Lockyer, of Brighton, is the builder to whom it has been entrusted.

**New Abattoirs for Sheffield.**—Hadfield has prepared plans for the abattoirs which the Duke of Norfolk counts plates erecting in Cricket-road. The *Sheffield Evening Star* states that preliminary plans have been laid before the Health Committee Town Council, and met with the general approval of the committee.

**Blinds in the Board Schools.**—We learn that Messrs. Jones & Son, window-blind manufacturers, of Aldersgate-street and Piccadilly, have been successful in competition in obtaining the contract for taking down, mounting, fitting with new material, and refitting blinds for the London School Board Schools.

**A Methodist Free Church** has been opened at New Wandsworth. The building, which has seating accommodation for 500 people, has been designed by Mr. Edw. Speed, A.R.I.B.A., and is Gothic in character. It has been erected at a cost of nearly 31 by Mr. James Holloway, builder, Lavender Lane, Wandsworth.

**St. Swithin's Mission Church, Leamington.**—The east window of this church recently been filled with stained glass illustrating the Ascension of Our Lord. The work was designed and executed by Messrs. Warriss & Co., of Fitzroy-square.

**The New Municipal Buildings, Middlesbrough** were inspected by the members of the Northern Architectural Association on Saturday last, the 23rd inst., under the guidance of the architect, Mr. G. G. Howland, President of the Association.

of Building Sites on the Cliff at Birchington.—On Monday last Richard J. Collier conducted a sale of g sites, forming a portion of the Cliff at Birchington. The estate stands on 40 ft. above the level of the sea, which immediately overlooks, commanding extended as well as marine views. Several side roads have been constructed on the all of which are formed in boulevard, and planted on each side with ornamental trees. Gas and water mains are laid the whole of these roads, the water being obtained by pumping from deep in the chalk which abounds in the neighborhood. The sites offered were 74 in number, being extensive frontages to the several and suitable for the erection of marine houses and bungalows. The sites offered in the second portion of the estate, the portion having been sold last summer, also took place at the West Cliff Hotel, when there was a very good attendance. The sale commenced on the eastern portion of the estate, consisting of forty-five lots, being offered. Several sites have frontages of 22 ft. and 25 ft., depths of 120 ft., whilst other larger plots frontages of 40 ft. and 50 ft., and depths of 1 ft. Most of the lots were sold, the sites realising from 40l. to 53l. each, including about 2l. per foot frontage. The larger lots disposed of were two plots, having frontages of 54 and 57 ft., these were sold for 150l. and 160l. respectively. The lots on the western portion of the estate, twenty-nine in number, were next offered, and were all sold, those having frontages of 25 ft., realising from 55l. to 60l. Two lots, having frontages of 50 ft., and depths of 170 ft., running through to the sea, to which also they have frontages of 150 ft. each. The total profit of the sale amounted to upwards of 1000l. As evidence of the increasing value of property, it may be stated that at the first portion of the estate last year, sites having 22 ft. and 25 ft. frontages, sold at from 35l. to 40l. each, whereas of similar dimensions realised from 40l. each at last Monday's sale.

West Window of St. John's Church, Paddington, has just been re-designed by Mr. A. W. Blomfield, and filled with rich glass. There are six large lights, each containing three tiers of subjects, illustrating the life of Joseph, and placed under natural canopies in the fifteenth-century style. The members of the congregation subscribed the sum of 800l. for the glass. Messrs. J. A. Butler, & Bayne, of Garrick-street, who executed the work, also carried out the east window, which was restored about two years ago.

Useful Trade Book is the "General Catalogue" recently issued by Messrs. George & Sons, of St. John's-street, Westfield. Handy in form, concise in arrangement, and well-printed, it is an admirable volume of sanitary fittings, pumps, pipes and cast, plumbers' brass work, tools, &c. It is illustrated with representations of typical pieces of apparatus and fittings, and under every will be found a very useful reference office or workshop.

Pulpit at St. Barnabas's Church, Oxford.—A new pulpit, designed by Mr. A. W. Blomfield, for St. Barnabas's Church, Oxford, has just been completed. The material used is walnut, and the design is in a simple, richly decorated. The framework is supported on six pedestals, and is spaced out in nine bays, each containing a panel with a figure of an angel, and figures of St. Clement, St. Andrew, St. Polycarp, St. Chrysostom, St. Gregory the Great, and St. Augustine of Hippo. The staircase and balustrading is decorated, and on the sides of the pulpit are the doves representing the gifts of the Holy Spirit. The whole is mounted by a very massive sounding-board, enriched with carving. On the underside is a painting of the Policar. The designs and decorations were executed by Messrs. Heaton, Butler, & Bayne, of Garrick-street, London, who have had this costly and intricate work in hand for some considerable time, it is to be fixed in the church during the week in August, and will be preached on Sunday, the 7th prox.

LONDON.—For improvements at the Conna tavern, Gifford-street, Caledonian-road. Mr. R. A. Lewcock, architect, 83, Bishopsgate-street Within:—

Table listing names and amounts for improvements, including Goodall, Spencer & Co., Walker, Jackson & Todd, Ivory, Steel Bros.

LONDON.—For alterations, &c., to the Warrior public-house, Deptford Lower-road, Rotherhithe, for Mr. W. Dean. Mr. H. E. Mountford, 28, Pigott-street, Limehouse, surveyor:—

Table listing names and amounts for alterations, including W. W. Tyler, Bermondsey, G. Lusk, Mile-end, J. Walker, Limehouse, J. P. Chappell, Fimlico, S. Salt, Limehouse (accepted).

LONDON.—For the erection of shop and dwelling-house, No. 15, Collier-street, N., for Mr. Jasper Williams. Mr. L. P. Crace, architect, Nottingham-place:—

Table listing names and amounts for shop and dwelling-house, including Lidstone, Alford, Riley Bros., Pentonville (accepted).

NOTTINGHAM.—For the erection of the Nottingham Borough Asylum Extension. Messrs. Thos. C. Hine & Son, architects. Quantities by Messrs. Berridge & Barnes:—

Table listing names and amounts for Nottingham Asylum Extension, including Perry & Co., J. Hodson & Son, E. Gabbant, H. Lovatt, Kirk & Randall, Kirt, Knight, H. W. Keeler, Rudd & Son, H. Willcock, W. Hind, Nottigham, R. Proctor, H. J. Bell & Co., W. Dudely, G. Foxley, Bell & Son.

PADDINGTON.—For painting, and other works, at the Infirmary, Harrow-road, for the Guardians of Paddington. Messrs. A. & C. Harston, architects, 15, Leadenhall-street. Quantities not supplied:—

Table listing names and amounts for painting and other works, including Croxford & Gowen, Atchison, W. H. Handover, Woolford & Son, W. Nash, R. Proctor, C. Conway, W. Dudely, G. Foxley, Bell & Son.

PADDINGTON.—For repairs to 27, Newton-road, Westhorne-grove, for Mr. D. Oliver. Mr. J. H. Taylor, architect:—

Table listing names and amounts for repairs, including Barnett, Marks, Clifton, Devoor, Pritchard & Sons, Burgeon.

PECKHAM.—For painting and decorating the Peckham public hall, the small halls, committee-rooms, corridors, &c., for the proprietor, Mr. W. L. Dowton:—

Marchant, Lady Somerset-road. £144 0 0 Accepted.

SWINDON.—For making alterations and additions to the Lamb and Flag Inn, New Swindon, Wilts. Mr. William Drew, architect, 22, Vickers-street, Swindon:—

G. Wiltshire, Swindon (accepted) £194 0 0

SWINDON.—For the erection of a dwelling-house at Baydon, Swindon, R. S. Co., Wilts. Mr. William Drew, architect, Swindon:—

G. Wiltshire, Swindon £405 0 0, H. Looker, Stratton 385 10 0, W. Moulding, Aldbourne 391 15 7

TILEHURST (near Reading).—For restoring Tilehurst Rectory-house, burnt down. Mr. E. G. Bruton, F.R.S.A., architect:—

S. Elliot, Newbury £2,957 0 0, J. Bottrill & Son, Reading 2,887 0 0, Symm & Co., Oxford (accepted) 3,350 0 0

### The Panama Canal Report.

CONTRARY to the usual custom, the Committee of Management of the Panama Canal have issued an extra number of the *Bulletin*, containing the report presented to the annual meeting of the shareholders on the 1st July. We are thus in possession of the accounts a few days earlier than we anticipated. They come down, however, only to 30th June, 1886.

At that date it is stated that the total expenditure of the company amounted to 40 millions of francs, or 25,600,000*l.*, and is *actif disponible*, or available funds, to 32½ millions of francs. But these two items, which alone M. de Lesseps takes notice, are very far from representing the liability incurred by the company to that date. To their aggregate has to be added the rebate, or discount, at which the loans of 1882, '83, and '84 have been sued, which raises the debit of the company, on 30th June, 1886, to 39½ millions sterling. To this has to be added the figures of the loan of 1886, involving a debt of 18 millions sterling, and of a loan to an equal amount announced for issue in July, 1887. If this loan is placed, the published liabilities of the company will amount to 75½ millions sterling.

As to what has been done for that portion of this immense sum which is brought to book in the present report, there is a great silence. For a considerable period the *Bulletin du Canal Interocéanique* published monthly telegrams stating the amount of excavation done in the preceding month. That good habit has been abandoned; and it takes a considerable amount of research to arrive at the fact that the total quantity of earthwork returned as excavated from the commencement of the undertaking to the 30th of June, 1885, was 14,260,000 cubic metres, of which rather more than half had been done in the year then closing. The total sum expended in that year on management and work in the Isthmus was 88 millions of francs, showing a cost of 11½ francs per cubic metre excavated in the year. In 1885-6 only 78 million of francs are carried to account under the same heading, so that it is not probable that more than seven or eight millions of cubic metres of excavation were done during that year, instead of the 24 millions of the programme. As to the work of 1886-7, we are still more in the dark.

The total quantity of excavation required for the canal was stated by M. de Lesseps in

1879 at 46,150,000, in 1880 at 75,000,000, and in 1883 at 120,000,000 cubic metres. There are, however, some grounds for questioning whether even the last-named figures are at all a reliable maximum. Herr Beyeler, in October 1886, on data furnished by the officers of the canal, gives a quantity of 150,000,000 cubic metres. In this case the total volume is divided into the contents of the twelve sections comprised in the line, and 20,000,000 is allowed for river diversions. But even here it must be remarked that the deepest cutting, that at Culebra, is set down as containing 25,000,000 cubic metres within a length of two kilometres. The axis of the canal here crosses the water-shed which separates the valley of the Ohispo from that of the Rio Grande, at the lowest point, which is 100 metres above the level of the sea. But the summits rise on either side to 120 and 190 metres respectively, and allowing only 1 to 1 slopes (which for clay and sand exposed to a rainfall of 170 in., is a very questionable allowance), the deepest part of this cutting attains a depth, on the eastern slope, of 557 ft. 9 in., and one of 425 ft. 9 in. on the western slope. As a mere calculation on paper, 33 millions come nearer the mark than 25 millions for the contents of this cutting. And what it would ultimately prove that it would be necessary to remove, in order to open and maintain a sea-level trench through this treacherous hill, he must be a bold man who would even presume to guess.

In the same way it is easy to see that the estimate cited by Herr Beyeler of 20 millions of cubic metres for river diversions is wholly inadequate. The river Chagres crosses the axis of the canal at the 45th kilometre from Colon, the bed of the river at the point being 74 ft. above that proposed for the canal. In heavy floods,—as, for instance, in 1879,—the Chagres is known to rise 40 ft. above its ordinary level. Its volume at such a time is estimated by M. Dangler, one of the ablest and best-trusted servants of the Canal Company, at 1,600 cubic metres of water per second, or rather more than four times that of the Thames in flood. To allow such a cataract to pour into the canal, when dug, is of course impossible, as it would wreck and choke the whole channel from Matabachin, the point of intersection, to the sea. The Chagres intersects the axis of the canal no fewer than twenty-nine times, finally leaving its course at about 8 kilometres from Colon, and falling into the sea to the west, while it debouches from the east of the canal line. On the first crossing it unites with the Ohispo, the volume of which we have not found stated in the publications of the company; and lower down it receives the Rio Trinidad, with a volume of 400 cubic metres per second, from the west, and

the Gatuncillo, of an equal volume, from the east, besides smaller affluents.

It is obvious that in order to maintain, under such circumstances, not only the navigation, but the bare existence of a sea-level canal, it is indispensable that two lateral canals should be constructed,—one on the west, to carry to the sea the waters of the Ohispo, the Trinidad, and three other large affluents; and one on the east to receive the flow and the floods of the Chagres, the Gatuncillo, and eight other affluents, and to carry them into the sea to the east of the peninsula of Colon, without crossing the canal. The latter channel, however, must be so enormous that it has been proposed to regularise and delay the floods of the Chagres by forming a large dam where this river issues from the mountains. It was first proposed to erect this of masonry, but the foundation proving unreliable, the plan selected, up to the present time, has been to construct an earthen mole, 1,000 metres long, 960 metres wide at bottom, 240 metres wide at top, and 40 metres high, behind which the flood would expand into a large lake containing a thousand millions of cubic metres of water. Sluices and culverts were to be constructed in connexion with this dam in order to draw off the water gradually at the rate of 400 cubic metres per second. Even that flow, through a channel of the cross-section of the proposed maritime canal, would cause a current of the velocity of 6 ft. per second, independent of the waters of the affluents from the east. Thus, while making every allowance for the utilisation of such portions of the existing river channels as would fall in with the general plan, it is impossible to calculate the excavation necessary for the deviations of the Chagres and the Ohispo, even after the construction of the regulating works at Gamboa, at less than from two to three times that of the volume required for the excavation of the maritime canal itself. From Colon to kilometre 45 this excavation is estimated by the officers of the company at 42 millions of cubic metres. The addition to be made to this mass for the river deviations, if no dam is made, must be much underestimated at 100 millions more, while only 20 millions are allowed not only for the deviations of the Chagres and of the Ohispo, but also for that of the Rio Grande, on the Pacific slope of the Cordilleras.

In these two items alone, of the cutting at Culebra and of the river diversions on the Atlantic slope, the plans and contours published in volume v. of the *Bulletin du Canal Interocéanique* (pp. 996, 1000), give a sufficient amount of definite information as to levels and contours to lead to the conclusion that the estimated contents of 67 millions of cubic metres of cutting for this 47 kilometres of canal

specified would be more likely to be trebled than not before the work was complete and safe. As to the Pacific slope, much the same course of argument is applicable; and the remainder of the central mass of the hill, the sections of Obispo, Emperador, and Paraiso, are liable to the same class of comment as to the inadequacy of slopes set out at  $\frac{1}{4}$  to 1 for rock and 1 to 1 for soft material.

This question of the adequacy of the estimate of 150 millions cubic metres of excavation for the completion of a sea-level canal, receives an unexpected support from the report made by M. de Lesseps on the 21st of July in the present year. "It is certain," he says, "that no human power can guarantee us against the unforeseen, which resides in the geological mysteries of the central mass." And he proceeds to order "the substitution of a simple bank, directing the waters of the Chagres towards the deviations, for the construction of one immense dam," as "one of the principal simplifications effected in the programme." Such a substitution, the reader will see, would involve increasing the excavation necessary for the Chagres deviation to at least a four-fold amount, so as to take away 1,600 cubic metres per second, instead of 400.

The second "simplification" mentioned in the report is the abandonment of the tidal lock at Panama. The central siding of 5 kilometres long on the canal is also to be abandoned, and the ports of Colon and of Panama are to be reduced to what is strictly necessary. It seems further that the dredging at the Colon end of the line, which at present has gone no lower in a vertical direction than the surface of the rock, where this makes its appearance under water, is to be taken as sufficient for the opening of the canal.

As to the lock, a reference is made to the statement, previously cited in the columns of the *Builder*, of the "conclusions of M. Bouquet de la Grye" as to the difference of level which may exist between the two oceans. As to that the evidence is contradictory. But it matters very little whether the mean tide level be or be not the same at the two ends of a canal forty-six miles long. What does matter is the range of the tide. There is no controverting the statement that at Panama this range varies from 20 ft. to 27 ft. Nor can there be any doubt that such a tidal movement would be destructive to any canal into which it was allowed free admission. To abandon the tidal lock at Panama is only in other words to abandon the idea of navigating the canal.

We have been anxious in the foregoing remarks to avoid two things,—one is the expression, and, indeed, as far as possible the entertainment, of any private opinion on the subject; the other is any tendency to prophecy. We have based each statement on the definite information furnished by the *Bulletin du Canal Interoceanique*, and by the statements signed by M. Ferdinand de Lesseps. In the absence of any statement, in this sixth annual report, of the work done and to be done, according to the estimates of the company, we have grave reasons, which every engineer can appreciate, for the conclusion that the last estimate so given of the latter, although three times as much as the first, leaves out of account important and, indeed, controlling features of the case. We have shown what was the last annual amount of excavation of which the company have afforded the data, viz., 7,600,000 cubic metres in the year ending with June, 1885. We have shown that as to the sum for which the company are now responsible, if their obligations are reckoned at the price at which they have contracted to repay them, the present liability amounts to 57½ millions sterling, which the issue of the loan now offered will raise to 75½ millions sterling. How near that expenditure will bring us to the opening of a sea-level canal we leave to our readers to estimate.

**New Welsh Chapel, London.**—The Committee of Crosby-row Chapel have appointed Mr. Charles Evans to be architect for the new chapel about to be erected. The site selected is in Falmouth-road, end of New Kent-road.

## HARMONIC PROPORTIONS IN ARCHITECTURE.\*

BY W. WATKISS LLOYD.

ON OCCASION has occurred in the article on the Propylæa† to observe how the greatest Greek architects were careful to subordinate a secondary structure to a superior which was in obvious relation to it,—the Propylæa of the Athenian Acropolis to the Parthenon,—and also the secondary to the superior members of the same structure,—the wings of the Propylæa to the central portico. These differences, we can see by the result, were designed with consummate art. The impression of the magnitude and dignity of the chief subject is enhanced very wonderfully, and yet those which are subsidiary still vindicate their appropriate importance. The smaller columns of the Pronaos and Posticum of the Parthenon come into view perspective with those of the porticos in front of them, and tell with the same effect upon the sense of gradation.

We have an example always before us how resources are worse than wasted when this principle is neglected. The elevation of the British Museum would only gain in dignity if the architecture of the wings, by reduction of the scale of the columns, supported rather than detracted from the majesty of the central design. At present the elevation is provocative,—provocative even in an irritating sense,—of suggestions of relief. How would it do, one says, to advance the walls of the building and keep down these obtrusive lateral columns by engaging them? Would the façade be improved by taking them away altogether? What of a scheme to re-arrange them as interior supports of a grand hypostyle hall upon the now vacant area, and fronted nearer to the street by the portico re-erected and released from the competition of the bullying blocking course of the flanks? Subordination,—happy subordination,—is the principle of the very best effects of Gothic architecture no less than Greek, and the Greek may have learned his lesson by observation of some of the great Egyptian temples. But what the Greek is to be credited with as original and exclusive seems to be his appreciation of the value of accurate and numerically simple proportions in adjusting sequences of magnitudes of architectural members and distributions. Even so the adoption of this principle required to be supplemented by fine taste in correction of solid judgment, to decide both the stages of such gradations and between what several structural and ornamental terms they were to be fitly applied.

Dr. A. Zeising, as long ago as 1854, published at Leipsic an elaborate treatise on Proportion, and enunciated a theory which might not be worth advertising to except as a specimen of laborious error, and that it continues to be adverted to from time to time by German writers as worthy of the subject. He set forth that all excellent proportion, both in nature and art,—in the human frame and that of animals generally, in the leaves and growth of plants, in music and in architecture,—depends upon the division of quantities by the so-called golden section. In a line so divided by a simple geometrical problem, the smaller part bears to the larger the same proportion that the larger bears to the entire line; the larger part is then to be divided again on the same principle, and so at last a series of divisions are obtainable which give a good chance of hitting leading points of a composition more or less exactly.

But the proportions of such divisions to each other are not to be expressed in simple terms, and the applications of the system have no such significance and preciseness as to make it reasonable or plausible that the vast variety of simple numerical proportions should be renounced in its favour,—in favour of one inflexible rule.

No theory of proportion in art can be of value which does not admit of infinite variations of schemes and systems of proportion,

\* We are not, of course, responsible for the opinions expressed by Mr. Lloyd in this article.—Ed.  
† See *Builder*, p. 3, ante.

—and which does not repudiate all pretensions to supply beauty automatically,—by the mere mechanical operation of a law. It is certain that the Greek architect had a definite theory; it is equally certain that he employed it as a musician may employ an instrument which he has perfectly in tune, with full confidence that it must depend upon his own judgment, taste, and manipulative skill whether he evokes from it harmony or discord. There is much appearance that the musical genius of the Greeks was far in advance of their musical science; that like many executants at the present and at all times, they could produce melodies which they could not write down,—and even that they explained some of their best successes not only imperfectly, but erroneously. It may have been much the same in architecture; the judge is proverbial who was always admirably correct in his decisions, and always grossly absurd in his account of how he arrived at and justified them. So it might be that the scheme of proportion employed by Ictinus in the Parthenon and by Mnesicles in the Propylæa had really nothing to do with their production of such admirable works; in this case, which is at least conceivable, the discovery of their system would have an historical interest, but not an artistic; it might be left to the students of pure archaeology as a matter more of curiosity than of scientific value. Enough, however, has been recovered concerning it to prove that this is not the case; the system is so coherent in itself, is found to come into application so universally, and at the same time so consistently with rational proprieties, that it is impossible to refuse to it the credit of being a true and valuable instrument in the hands of those who evolved and who were capable of using it.

A further question may be reserved,—whether it is as available in the practice of design in other styles than the Greek? Or, at least, what are the extensions or restrictions, the limitations or the developments, which are required by the complication of modern circumstances in order to make it so? This is a very considerable inquiry indeed; but the field of inquiry as to proportion in art is essentially considerable,—it is one that had better be left aside altogether unless a becoming consciousness is entertained of its scope and comprehensiveness. Proportional laws control the solar system itself, and in their search for them astronomers have had their noblest successes and most disappointing defeats. We may leave them to do the best they can to find a substitute for Bode's discredited law, and turn off in a direction of our own from what was their, and has been in all ages, a common starting-point.

It is certified beyond question that the study of music first brought home to the philosophical sense of the Greeks the conviction that precise numerical proportions were not more closely related to the problems of geometry than to the reactions of physical nature on the one hand, and on the other to the excitement of æsthetic sympathetic emotion. To the same Pythagoras were ascribed,—whether rightly or not,—the discoveries of the numerical relations of the sides of right-angled triangles, the very charter of trigonometry, and of the dependence of musical concord,—the basis of sentimental expression,—on the specific quantities of weight, tension, and lengths of vibrating matter. As regards music, they held for the most part to the true philosophical course of grasping the principle of definite proportions between concordant strings, but of relying on accurate observation and experiment to decide its particular operation. Thus it was that the school of so-called Pythagoreans settled the musical scale, which is that of civilised nations, upon a truly scientific basis. Plato might be shocked at such concession to concrete matter of fact. He has nothing but sneers for the men who thought to elicit truth by "putting musical strings to the torture as if they were slaves under examination," and laid down their ears to catch minute differences of interval; to him it was below the dignity of philosophy to search for the secrets of musical harmony otherwise than by study of the nature of numbers in themselves. It was by this

false track that the wits of many,—and among them many so-called Pythagoreans,—went wool-gathering. It is quite possible that spurious theories of architectural proportion may have so originated, and even have gained so much vogue as in some instances to have governed practice. Xenophon, in the "Memorabilia," represents Socrates asking a young man who affected to despise instruction,—“If you proposed to be an architect should you not think it reasonable to provide yourself with a store of books on the subject?” There was, therefore, no lack of writers on architecture; and, we may assume without argument, no lack of conflicting theories, some of them, no doubt, wild or pretentious enough. Good and bad,—sane or supercilious merely,—all have alike perished. The only salvage from the wreck that can be hoped for is to be obtained from the study of the best remains, with the view to discover upon what theory their authors proceeded, and then with the resolution to put even these results to the best test of reasonableness that we can. We are bound to ask boldly, did the architects of such works as the Parthenon and Propylæa really find any true assistance in the proportionate theory which they are proved to have observed, or was it really indifferent to their success?

One of their applications of combined proportions has such remarkable analogy to the theory of musical chords that it is difficult to believe that we have in it only a case of casual coincidence. A musical triad consists of three notes, each of which is at a consonant interval from each of the others,—that is, any two notes of which taken together form a consonance. It will be seen at once that the case is directly analogous to a combination in architecture of three dimensions,—whether these are taken rectilinearly, that is, between three divisions of a straight line, or, more importantly, in the direction of the three dimensions of space,—the width, length, and height of an apartment, or of the exterior of a structure, which are presented quite as naturally in relation as the notes of the musical combination.

A protest is not unlikely to be heard here,—“the Greeks had no recognition of harmony,—they only regarded the consonance of notes in sequence,—not as sounded together.” To such a protest the reply is open that a different opinion may be sustained on very substantial grounds. True it is that in what Greek treatises remain “De Re Musica,” it would not be easy to find a definition of a chord,—but there are abundant classical passages which establish the fact (*vide* Chappell's History),—and this simple fact is enough, that those who tuned their instruments by sounding different strings together could not have been unaware of the value of the consonance of concurrent as well as of consecutive musical notes.

A consonance of three notes is that all-important constituent of harmony, the chord; and the principle of such consonance is the same both for the major and the minor scale.

The major scale supplies three perfect chords,—C, E, G; F, A, c; G, B, d, called respectively those of the tonic or key-note, the sub-dominant, and the dominant.

The agreeable effect which distinguishes such combinations is proved by experiment to depend on the number of vibrations which produce one note occupying precisely the same time as the different numbers of vibrations which produce the others. As matter of fact, six of the vibrations which produce the note G take place in the same time as five of the note E and four of C.

The same rule, but with different numbers, applies to the perfect chords of the minor scale,—A, C, E; D, F, a; E, G, b. In all these cases ten vibrations of the first note occupy the same time as twelve of the second and fifteen of the third.

Now it will be observed that both these systems agree in one respect, the index numbers of the concordant notes differ in the very simplest degree,—that is by unity.

Major concords.....  $\frac{4 : 5 : 6}{2 : 3}$

Minor concords .....  $\frac{10 : 12 : 15}{5 : 6 : 4 : 5}$   
 $\frac{2 : 3}{3 : 5}$

The superior value of simplicity appears in the lower numbers which effectuate the major concords, and it is still more apparent in comparison of those of chords of inversion, on which it is not necessary here to enter.

It is enough to instance those of the first inversion of the tonic-major :—

$\frac{12 : 15 : 20}{4 : 5 : 3 : 4}$   
 $\frac{3 : 5}{3 : 5}$

In this combination one ratio varies by a difference (3 : 5) between its terms in excess of unity.

This, however, was a system of proportions which had some remarkable applications in early Greek architecture. I have shown, in the appendix to Mr. Cockerell's work on “Bassæ and Ægina,” that the upper and lower diameters and breadth of abacus of the columns of both the temples at Ægina and of the very archaic temple at Corinth were so regulated by the terms 3, 4, 5.

Upper diameter : Lower do. : : 3 : 4  
Lower do. : Abacus : : 4 : 5  
Upper do. : do. : : 3 : 5

It is probable that this early predilection for the terms 3, 4, 5, was due to a supposition of some especial value derived from the celebrated theorem of Pythagoras, these numbers being the simplest expression of the relation of the square of the hypothenuse of a right-angled triangle to the squares of the other two sides.

Later Greek architects decided that the diminution of the shaft thus obtained was

2 : 7 Full height to length of top step.....	65-185	228-147	Measured. Error.
4 : 9 Breadth of top step : length of top step.....	101-341	228-017	(228-141) 0-006
9 : 14 ” ” : full height front.....	”	”	(65-185) 0-038

far too quick, and adopted very different proportions; there is much appearance that they were guided in some important instances by proportions, not of diameters, but of the sectional areas of their columns above and below. In this connexion it is of interest to observe how early the notion of the squares of low numbers was brought into association with the designing of this important architectural member.

The Athenian example of the small temple on the Ilyssus furnishes us with what may be called a precise architectural chord; the upper diameter, 6 : lower diameter, 7 : breadth of abacus, 8.

$\frac{6 : 7 : 8}{3 : 4}$

The interior of the naos of this temple appears to have been an exact cube.

The largest dimensions which are brought into comparison are, of course, those of the height, length, and breadth of the temples on the exterior. Whether it was worth the while of the architects to bestow pains on effecting such precise adjustments is a matter with respect to which differences of opinion may possibly be entertained, and in any case it is worthy of discussion; but that such pains were bestowed can be fully established.

The small Doric temple of Artemis Propylæa at Eleusis had the proportions—full height of front, 4 : length of top step, 6 : breadth of ditto, 3 : giving the simple architectural chord :—

$\frac{3 : 4 : 6}{3 : 4 : 2 : 3}$   
 $\frac{1 : 2}{2 : 3}$

The constructive conditions enable us to recover the height of the naos interior, with fair probability, and we obtain,—

$\frac{8 : 9 : 12}{8 : 9 : 3 : 4}$   
 $\frac{2 : 3}{2 : 3}$

The temple of the Nike Apteros, as plausibly restored with pediment, gives the two following chords :—

Exterior  $\frac{6 : 8 : 9}{3 : 4 : 8 : 9}$   
 $\frac{2 : 3}{2 : 3}$   
Interior  $\frac{72 : 80 : 90}{9 : 10 : 8 : 9}$   
 $\frac{4 : 5}{4 : 5}$

It will be observed that these comparisons are taken exclusively from structures of moderate dimensions; when we examine fine examples of larger scale we find that the architects, true to the suggestions and exigencies of their own art, break away from the simple rule of unitary differences which would be imposed by the law of the perfect musical chord. They do so in two directions : first in that which is indicated by the chords of inversion, which do not repudiate one ratio of the triad with a difference of terms greater than unity; and then by combining with uniform difference between terms, and so far with analogy to the perfect chord, an admission of difference in excess of unity, and higher numbers.

It must suffice to adduce the case of the Parthenon,—the grandest of all examples of proportional architecture,—and, considering the novelty of the exposition, it is fair to give verification of good faith by juxtaposition of the theoretical and executed dimensions,—the latter taken from Mr. Penrose's work on Athenian architecture.

$\frac{65-147 : 101-341 : 228-147}{9 : 14 : 4 : 9}$   
 $\frac{2 : 7}{2 : 7}$

Measured. Error.
(228-141) 0-006
(65-185) 0-038

These three ratios, like those of the perfect chord in music, have a uniform difference between their terms, but a difference of five instead of only unity. They pertain to a scale or series, regulated by this common difference,—a scale which is exclusively resorted to throughout the design.

NOTES.

**T**HE Channel Tunnel hobby was ridden again by Sir E. Watkin on Wednesday night, and defeated by 153 to 107; not so large a majority as we should have liked to have seen. There was the usual tall talk about patriotism and public spirit; qualities which have been so remarkably displayed in the whole course of Sir E. Watkin's public career, and his assumption of which in regard to this scheme will, no doubt, be estimated generally at its true value. As to the military dangers of the tunnel we have, of course, no right to speak, but we may say that we are hardly so convinced of their formidable character as some critics appear to be, and we should be disposed to agree with Sir Wilfrid Lawson that this class of objection to it has been exaggerated, and that for your enemy to get into a hole 20 ft. square was not the most favourable position for him to act against you. The real objections are the doubtful character of the strata, the probability of faults, the exceeding practical difficulty, not to say impossibility, of adequate ventilation, and the still greater improbability of the enterprise paying even if accomplished. There is another question which we and others have asked, and which Sir E. Watkin appears to carefully avoid : will the slight difference between the French and English gauge ( $\frac{1}{4}$  in. in the North of France and  $\frac{1}{2}$  in. in the South) materially interfere with the rolling-stock of one country running on the metals of the other? If that is so, the whole tunnel would be practically useless for economic conditions of traffic. It is all very well for the Chairman of Committees to

talk of "bogeysism" and "fogeyism," but Mr. Courtney is not an engineer, and political aspirations will not alter engineering facts.

THE defeat of Lord Stratheden and Campbell's Smoke Nuisance Abatement (Metropolis) Bill was a foregone conclusion, though we hardly expected so large a majority against it as 30 to 12, by which majority the Peers voted Earl Weyns's amendment, that "before the law for the prohibition of smoke is extended to private dwellings, it is desirable that the purpose and intention of the existing Acts be more fully carried into effect, either by their amendment or by their better administration." On the subject of London fogs and smoke, the Earl of Crawford and Balcarres brought a little common sense to bear, observing that during the last Whitsuntide recess an excessively black fog had hung over London for twenty-four hours; that fog he traced back to Holland, whence it got to Dover, and eight hours later to London; it could not therefore be occasioned by London smoke. Other people might see as much if they would open their eyes and understandings to take in facts and their meaning. It would, no doubt, be better to have no smoke at all; but the passing of such a Bill as was proposed would simply result in a kind of tyranny over the domestic hearth worthy of the days of the curfew.

DR. KITTO, the Rector of St. Martin's-in-the-Fields, has forwarded to us a printed statement of his views in regard to the proposed alterations of the church, which we see, also appeared in a slightly different form as a letter in the *Times* of Thursday. Dr. Kitto goes into all the suggestions which have been made in a most clear, sensible, and impartial manner, and comes to the following conclusions:—

"1. That no such necessity [for widening the roadway] can be shown to exist on the ground of public convenience, so far, at least, as the present is concerned.

2. That if anything is needed to be done, the improvement can afford to wait until that time comes when the National Gallery is dealt with.

3. If, however, it is thought that something ought to be done at once, I suggest that by carrying down the steps in one continuous flight on the east, or St. Martin's, side, and by the sacrifice of the unused steps on the National Gallery side, as much space will be gained as by the alteration which the Board proposes.

4. Only in the very last resort, when public convenience is seriously interfered with, and when every other remedy has been tried and proved to be insufficient, should any alteration be allowed in the front of St. Martin's Church."

In regard to the question of the interruption of traffic, Dr. Kitto points out that the omnibuses select this as a stopping-place, which they could not desire or be allowed to do if the traffic were thereby impeded; and that it has never been found necessary to place a policeman here to regulate the traffic; in fact, any one can see with his own eyes that there is no block,—there is only the possibility that there may be some day. If ever there should be, Dr. Kitto suggests, as we have done, that the end of the National Gallery, and not the fine portico of St. Martin's, would be the proper building to be modified and altered. We may quote also Dr. Kitto's dismissal of Mr. Butterfield's singular proposal to mutilate the portico:—

"Mr. Butterfield proposes to cut down the portico to half its depth, and he justifies this proposal on the ground that it is so shown in a model of the church in the possession of the parish. This is perfectly true, but what does it prove? Mr. Butterfield clearly does not appreciate the value of the evidence of his own witness. The model, obviously, was not made after the church was built, or it would have been made to correspond with it, and would accurately reproduce the portico. No doubt it is a model which was prepared beforehand from the plans of Gibbs, in order to show how the design would look when completed. And when it had been so prepared and considered, it was evidently regarded as unsatisfactory, and it was decided to enlarge the original plan of the portico to its present dimensions in order to improve the general effect. The evidence goes to prove that Mr. Butterfield's proposal was considered and rejected before the church was built."

We hope here be truths.

THE fears that have been expressed that the Government would abandon the Railway and Canal Traffic Bill have been realised, the measure having been withdrawn on Monday. The regret expressed by the Leader of the House of Commons, in announcing that the Government found themselves obliged to take this course, will be echoed by all who are desirous of seeing the railway rates controversy settled, as it was admitted that the Bill went a long way towards putting at rest some of the questions involved. Although it is a severe disappointment, to the agricultural interest in particular, to find the preferential-rate question still in abeyance, there are other points of great interest to both the trading community and the railways also again shelved indefinitely, which is equally disappointing and greatly to be deplored. With regard to the results achieved by the present attempt to legislate upon this subject, the various clauses have been fully considered and commented upon by different bodies interested; and although the anticipated debate in the House of Commons has not taken place, the views of those chiefly concerned have been prominently before the country, and amendments were forthcoming had the second reading been moved, which would, if accepted, have effected some of the reforms admittedly necessary. This will not have been altogether labour in vain, as, of course, the matter cannot now be lost sight of. Outside circumstances have prevented successive Governments from bringing the question to an issue, although it is clearly ripe for settlement; and, while refraining from comment upon the cause of these failures, we sincerely hope that the next attempt may be more successful.

A PAPER, in the June number of *Harper's Magazine*, by Mme. Jane Dieulafoy gives the fullest popular account yet attainable of the excavations carried on at Susa by that remarkable lady and her husband. It may not be so generally known that in the *Gazette Archéologique* an article by M. Auguste Choisy deals with the subject from a somewhat more technical point of view, without being at all unreadable to the general public. This article is accompanied by a beautiful chromograph plate, giving in *fac-simile* a portion of the enamelled frieze from the palace of Artaxerxes-Memnon. The ground is pale blue, delicately interspersed with dull green, yellow, and white. The architectural remains discovered have no-wise disappointed the sanguine prophecies of M. Viollet-le-Duc, at whose instigation, in great part, the expedition was undertaken. No less than 302 engraved cylinders have been brought back. M. and Mme. Dieulafoy are still hard at work classifying and setting up their *trouvaille*. They told us they hoped the whole would be on view in the Louvre early next year.

A VERY interesting archaic bronze statue is published for the first time in the *Mittheilungen* of the German Archaeological Institute ("Romische," Abtheilung II, 2, 2). The statue has been, so to speak, rediscovered; it was dug up long ago in Bartoli's days, and passed into the Barberini Palace. Archaeologists paid it little or no attention till it was brought to light in the Exhibition of Bronzes held last year in Rome,—another instance, if one were needed, of the usefulness of these special exhibitions. It belongs now to the Prince Sciarra, who, with the utmost liberality, has allowed it to be examined and published. It was important that this should be done, as the Sciarra palace (in the Corso) is not open to the public. Dr. Studniska accompanies the plate with a detailed commentary. The statue is, in his opinion, of the first importance in the history of Greek sculptures. It represents a victorious athlete, a boy probably of Peloponnesian birth, for the statue is Sicyonian in style. It dates about the time of the Persian war. The *pose* is very like the well-known Stephanos statue of the Villa Albani.

IT is certainly very much to be regretted that the Government did not sanction the publication of full reports of the Colonial Conference during its sittings instead of publishing verbatim

reports in two enormous Blue Books, issued late in the month of July. Indeed, Sir H. Holland's report of the proceedings is only dated July 23rd. The subjects discussed are of the highest importance to business men as well as to politicians, being, among others, postal and telegraphic communications, merchandise marks and Imperial customs tariffs and uniformity of patent marks. To publish the doings of the Conference and the papers read, in two volumes, one costing 6s. and the other 3s. 6d., when the attention of the public has passed away, is one of the most absurd and short-sighted performances which even a Government department could accomplish. At any rate, it is not yet too late to make amends for this stupid management by republishing the most salient points and papers in a cheap form.

SIGNOR GIACOMO BONI, in a recent contribution to the *Riforma*, enters another energetic protest, this time against the disfigurement of the noblest buildings in Venice by sign-boards and advertisements,—a practice which has now reached a painful pitch, and calls loudly for repression. He reminds the Venetians that among the sumptuary laws of the Venetian Republic there was one forbidding the occupation of the palaces bordering the Grand Canal to those who made a traffic of their beauty, and it is noteworthy that this law was made at a time that Paul Veronese was immortalising these very persons on canvas, and Peter Aretino was chronicling their lightest actions. Nowadays, the palaces on the Grand Canal are being converted into hotels and *bric-à-brac* shops, or stores for the products of every conceivable branch of industry. "The Venetian Republic," says our enthusiastic Venetian, "excluded from the palaces on the Grand Canal those who bartered their persons for gain, and this was done, not in opposition to personal liberty, but from respect for the locality and its memories. The sale of oneself is less vile than speculating on the beauty of others, and the most infamous of trades is that which tends to destroy the honour of our common mother of that strip of land upon which we were born, whose sons have made it honoured and renowned by deeds which are attested by the fair and stately monuments which have been handed down to us for their preservation, and not that we should pull them down, scrape, or whitewash them, or plaster them over with advertisements or signboards. . . . Let it be absolutely forbidden to conceal or disfigure the architecture of our palaces (ours as Venetians, although they may be private property) by announcements that within these palaces are for sale the spoils of our one great and redoubtable and still lovely and venerable city."

THE case of *in re* the Oxford Benefit Building and Investment Society, which is published in the current number of the *Law Reports*, is profitable reading for directors in any company as well as for shareholders in building societies. One of the articles of association of the company has that "no dividend shall be payable except out of the realised profits arising from the business of the company." As a matter of fact, however, the directors paid dividends out of profits which were estimated by the secretary to be available. That is to say, the dividends came partly out of floating capital in the hands of the directors, and upon the assumption that the mortgage securities they had taken were sufficient to repay the loans they had taken with interest and costs. In many cases this was not the case, for by their own operation the company depreciated their own securities. Said the Judge, "It might easily have been anticipated that a company like this, having the command of large sums of money, which they were eager to lend for the purpose of encouraging building in the city of Oxford, would stimulate that branch of industry to such an extent as greatly to depreciate building property, and this was what actually occurred." The result was that the directors

were ordered to repay out of their own pockets the sums improperly paid as dividends, also the remuneration they had received, and interest at the rate of four per cent., the amount in which they were mulcted being 21,000*l.* This case, therefore, will serve as a necessary warning to directors to be careful how they pay dividends and estimate profits, and it also makes clear the danger which building societies run of depreciating their securities by unduly encouraging building enterprises.

THE Municipal Council of Paris, before separating for the year, has decided upon creating a new professional school for training apprentices in all the industries connected with book-producing, from paper-making and type-founding to binding and gilding, without neglecting the various methods of producing illustrations. This school will be housed, with the least possible delay, in a building to be erected upon a public site in the Boulevard d'Italie and the Rue de Gentilly, which will accommodate 300 students. The Municipal Council, with the approval of the Administration, has given the commission for the building to M. Charles Lucas.

ONE of the most striking and beautiful of the vases in the British Museum has just received a new and very interesting interpretation. The vase represents a Sphinx, painted in creamy white and finely modelled, carrying on her back a rhyton decorated with a very delicately-drawn red figured design. This design consists of six figures, which fall into groups of two each. The centre and most important group has the figure of a bearded man ending in a coiled tail. This figure has always been called a Triton, and hence the true interpretation has for fifteen years (the vase was found in 1872, and acquired by the Museum in 1873) been missed. Mr. Murray, now Keeper of Antiquities, is the new interpreter. From the simple observation that the tail is that of a serpent, not a fish, he saw that the bearded man was no Triton, but a far more important personage, old Cecrops, the serpent king, founder of Athens. The scene represented is, in fact, the birth of Erichthonios, a myth not uncommon on vases, but special interest attaches to the rhyton, because the manner of presentation is quite unique, as will readily be seen by those who are conversant with mythology. Mr. Murray publishes his views in the last number of the *Hellenic Journal*, and his article is accompanied by two coloured plates of the vase.

WE may note that the same number of the *Journal* is distinguished, not only by several articles of somewhat exceptional interest, but also by the addition of two new features, which we have long thought very desirable, and for the addition of which the *Builder* has more than once pleaded. We refer to the archaeological news and the reviews of books. The archaeological news of the present number consists of a Report by Mr. Penrose (Director of the British School at Athens), on "Excavations in Greece," most of the news in which we have already from time to time noted, but which is invaluable as a *résumé*; and a valuable paper by Mr. E. A. Gardner (the Director-elect of the School for the coming year), on recent discoveries in Sculpture and Epigraphy. The addition of such papers of general interest should widely increase the circle of readers of the *Journal*.

"MAKING a pie" is sometimes mentioned when the system of competition tendering is discussed, but it is always with breath a little hated, and the hope that all inconvenient things may be avoided. Contractors generally follow suit, and content themselves with judicious smiles,—capable of various interpretations. The Leyton Local Board, as we learn from the *East London Observer*, held an inquiry recently as to their contracts; and obtained some "startling revelations,"—submitted in writing in admirable detail, and with consummate candour. One contractor for roadmaking stated that he took money from "the man who

wanted the job," as a reward for sending in bogus tenders, and the successful competitor's version was very like that of his critic. Once, when good faith was kept, the enterprising contractor, Mr. Jackson, paid 25*l.* to each of the contractors who had obtained the quantities, and as a reward obtained 3,000*l.* for work priced at 1,750*l.* Last June perfidy came to the rescue of the ratepayers, as Mr. Jackson found, to his great surprise, "that the old traitor had received the money, and not acted according to his promises." Mr. Carter had received 15*l.* as his honorarium,—5*l.* more than his fellow pie-makers,—but he actually filled in his tender at 556*l.*, instead of 731*l.* 19s. 6d. (1), as requested,—and got the job. The Board happened to hear of a want of amity between the two contractors, and asked them to attend an inquiry and explain. They failed to attend, but they wrote very full explanations indeed. Of course, plenty of contractors play the game fairly,—win a contract at a fair price when they want it, or ask a high price when they are quite hazy enough. No one wants a contractor who has more work than his personal energy, people, plant, and capital are fitted for. Apathy, blunders, jaded workpeople, delays, ill-will, and frequently litigation, are the results in such cases. The system of competition-tendering intelligently pursued might go on without any of them. Contractors of honour and character decline to tender when they have their hands quite full,—now and for a fair time ahead,—and then others can have a chance also. Contractors without honour and character will, of course, always do the best they can for themselves alone, and could just as well be dispensed with altogether. The Leyton Board have decided "to exclude both contractors from tendering in future, and to extend the area of their advertising." They had previously put their advertisements in one or two papers circulating in their immediate vicinity. Certainly one way of preventing any one "taking a hit to stand out" is to make the stress of competition genuine. Something might also be done by feeling and showing a steady preference for honest men.

IN reference to a Note in our last issue (page 162) about the address of the Chairman of Council of the Association of Sanitary Inspectors for the north-west of England, Mr. Albert Taylor writes to explain that he is the secretary, not the chairman, of the Association, and that the address was delivered, not by him, but by Mr. T. Styles Ainge, the chairman. We regret the mistake, but secretaries who wish their Societies to be correctly represented in the Press should be clearer in their own communications. We received the address in a MS. copy, a great part of which was barely legible, accompanied by a letter scarcely more legible, and with no indication on the MS. itself of either the author of it or the place where it was read. We have no doubt Mr. Taylor is an "energetic secretary,"—all secretaries are,—but one of the primary duties of a secretary is to furnish information in a clear and unmistakable manner.

LETTER FROM PARIS.

THE recent burning of the Théâtre Lafayette, at Rouen,—which happily occasioned no loss of life,—has again brought up the subject of the Opéra Comique disaster, which had already begun to pass out of mind. One cannot affirm that the innumerable restrictions imposed by the Prefecture of Police are everywhere observed; but as far as concerns the State and Municipal theatres the necessary alterations are proceeding steadily, and electric lighting especially is being everywhere installed.

The pickaxe has demolished all that remained of the Opéra Comique, but it will be long enough before it will rise from its ashes, and it is not known yet where the theatre will transport its Penates; there is talk of the Eden Theatre, others name the Vaudeville or the Châtelet, others the Galté. The two last-named belong to the City, which seems little disposed to let either of them to the Government,—though it would be an excellent speculation in a financial sense. In regard to acoustic properties, the Châtelet is the best,

and if it were only more central in position, would answer the new purpose admirably. The question must of necessity be quickly settled, and probabilities seem in favour of the Galté, which stands opposite the Squaro des Arts et Métiers, and only a step from the principal Boulevards. This building dates from 1862, and was designed by M. Cusin, and decorated externally with statues by MM. Doublemard and Vital Dubray. The interior is adorned with paintings by M. Jobbé Duval. The house will seat about 2,000.

We spoke doubtfully some months ago as to the success of the Jubilee Railway Exhibition, in which the large railway companies refused to take part. The event has confirmed our opinion, and this unfortunate enterprise has been the occasion of all kinds of scandals. The Municipal Council, which gave away much too lightly to the Exhibition a great part of the Bois de Vincennes, is perturbed about the matter; serious accusations have been made against several of its members, and the law has been invoked to throw light on a speculation which has made many dupes, and for which the questions of railway construction and progress were nothing but an open pretext. One consequence to the Municipality will be the spending of about 200,000 francs to put the Bois de Vincennes in order again.

The financial success of this year's Salon has been brilliant. Deducting 38,000 francs for pensions and for the victims of the Opéra Comique disaster, the Société des Artistes Français has cleared 323,000 francs; more by about 12,000 francs than last year. The Palais d'Industrie is now taken possession of by the Union Centrale des Arts Décoratifs. The mention of decorative art reminds us of a new experiment, owing in the first instance, to the late Minister of Agriculture, M. Devolle. Thanks to him, we can now see in the sumptuous hotel in the Rue Varcennes, which the architect Brune left unfinished, a collection of designs in silversmiths' work by the most eminent artists of the day, and some of them not unworthy of the best days of the Renaissance. It is from among these that the Government will select the prize which, for ten years from 1888, is to be given for agricultural success. Twenty-three competitors have taken part in the competition, among whose works we may specially mention those of MM. Delaplanche, Falguière, Coutan, and Longepied. The first has symbolised the "Fermo-Ecole," under the guise of a pretty peasant girl reading a book; the second has shown a group of little girls dancing round a cup. MM. Longepied and Coutan, besides a series of beautiful miniature figures, personifying rural occupations, have exhibited two bas-reliefs commissioned by the house of Christoffe, "Reaping," and "Vintage." Various artists have also exhibited animals, or groups of animals, treated in a modern spirit. M. Jacquemard's "Attelage des Bœufs" is especially remarkable, and M. Valton's "Porcher" is a statnette full of originality. By the side of these groups, in which the influence of Millet is so obvious, the Classic school is represented in this competition by the pretty group of M. Deloye, "Triplolème apprenant Cérès l'Art de cultiver la Terre."

The national fête, as usual, has served as the pretext for conferring some artistic *récompenses*. M. Th. Ribot, and M. Busson, the landscape-painter, have received the cross of an officer of the Legion of Honour. The cross of Chevalier has been conferred on MM. Jean Béraud, Ingalbert, Longepied, and Champigneulle. The only remark we need make on these distinctions is in regard to the parsimony of the Government towards architects, who have also some little claim to official honours of this kind.

Turning from these rewards to artists arrived at maturity, we may note that the younger aspirants have just received judgment in the competition of the Ecole des Beaux Arts. The first prize to be settled was that for medal engraving, the subject being "Jason carrying away the Golden Fleece," and the "Frix de Rome" was awarded to M. Charles F. Vernon, pupil of MM. Cavalier, Aimé Millet, and Tasset. In sculpture, the subject was "Ismene and Antigone, daughters of Oedipus, brought to their father by Theseus." After a long examination, the prize was awarded to M. E. H. Boutry, pupil of M. Cavalier; the second prize to M. Charles Desvergues, pupil of MM. Chapu and Thomas; and an extra prize to M. Felix Soules, pupil of MM. Jouffroy and Falguière. The ten bas-reliefs sent in showed very genuine

and serious artistic work. For painting, the subject given was the death of Themistocles, a subject which does not appear to have interested the competitors, judging from the cold and formal character of the work. The "Grand Prix" was gained by M. H. C. Danger, pupil of MM. Gérôme and Aimé Millet, and the second by M. J. A. Marieton, pupil of MM. Mailland and Gérôme, and an extra prize was given to M. L. G. A. Charpentier, pupil of MM. Bouguereau and Tony Robert-Fleury. The architectural competition was not adjudged till Monday last, when the "Grand Prix" was awarded to M. Georges Chedanne, pupil of M. Guadet; and the second prize to M. Henri Eustache, pupil of M. Ginain.

As we anticipated, the Institut has ratified the judgment of the Académie des Beaux Arts in giving the biennial prize of 20,000 francs to M. Mercier, who thus obtains, while in the full success of his career, the greatest artistic reward which is to be had in France. The Institut has awarded to M. Sni-Abadie, author of a very graceful "Idylle" exhibited this year, the Deprez Prize, founded to be awarded to a sculptor of ability of less than thirty-four years of age.

Work has been going on diligently in the Champ de Mars, especially about the foundation work of the Palais des Machines, the difficulty of which has been increased by the nature of the ground, which does not afford a solid foundation at a less depth than 8 metres. In a few days the metal portion of the construction will be commenced, the contract for which has been taken at 1,100,000 francs. The metallic portion of the Eiffel tower, over which 400 men are employed, is already begun, and one can see, from the opposite bank of the Seine, the four large tubes, rising to the height of 6 metres, which are to receive the lower arches of the tower. The committee of management is considering the question of the power required to put in motion the machinery which is to do its work before the public as part of the show. It is calculated that 2,500 horse power will be required, at a cost of 1,180,000 francs. For the Exhibition of 1878 the requirement was 1,900 horse-power, at a cost of 980,000 francs. Whether the Exhibition is to be opened in the evenings and to be lighted with electric light is another question to be considered. This question has been adjourned, however, for the present.

Unfortunately, there is a black spot in regard to the exhibition, the rejection of the Metropolitan Railway Bill by 298 votes to 221,—a decision which has given rise to very acrimonious discussions in the Paris journals, which have bitterly reproached the deputies from the provinces with having shown once more their jealousy of improvements in the capital. This, however, is hardly fair; for the fact is that the Governmental project had not been sufficiently developed. The Chamber having refused the project as a matter of general interest, the Municipal Council will probably take it up as one of local interest; but there is not time to get it completed by 1889.

The Government has been strangely inert about the matter of the Hôtel des Postes to which we have before referred; this great building having been completed for two years, and its practical occupation for working purposes appearing as distant as ever, owing apparently to differences of opinion about the furniture and fittings and mechanical appliances. The "Direction des Bâtimens Civils" is, however, to be congratulated on the measures it has taken in regard to the Palace at Versailles, the state of dilapidation of which had caused much anxiety to all those who are interested in our architectural monuments. The Government has asked the Chamber for a vote of 440,000 francs for the works required, among which the repair of the façade of the Louis XIII. wing will cost more than 100,000. The Minister in his report observes that the Republic owes it to itself not to let the works of the great artists of the seventeenth century go to ruin, and it is satisfactory to find that the high officials of the Republican Government, or some of them at least, are awake to the perception that architecture and art are not matters of political partisanship, and that fine architecture, even when produced under a monarchy, is worth preserving. Certainly, unless something is done without delay, the foreign visitors to the Exhibition who go to see Versailles will see only ruins.

The Ministry may also be congratulated on

having taken steps to have a proper catalogue made of the admirable tapestries of the Garde Meuble; when this has been done, it will be possible to distribute these almost priceless and little known treasures on loan among the national museums and public edifices.

There seems hope of the Pantheon decoration being really completed at last, which is matter for congratulation; and we may also mention with satisfaction the appointment of M. Deck, probably the first ceramic artist in France, to the post of director of the Sévres manufactory. M. Deck has created by his talent and energy a "fabrique de faïences" which has a European reputation; moreover, he has invented a turquoise blue which bears his name. No one could be better qualified to restore to the Sévres manufactory its ancient reputation.

At the Louvre the new Salle de la Colonnade has been prepared to receive the Dieulafoy collection, and three new rooms on the first floor are set apart for the enlargement of the marine museum.

The municipal administration is very busy about the decoration of the Hotel de Ville, a committee having been formed of painters, politicians, architects, and critics, to decide on the surfaces to be decorated, and their appropriation either to special artists of reputation or to public competition. The work is directed by the President of the Municipal Council, assisted by M. Bailly, and the secretaries are M. Armand Renaud, Inspector en Chef des Beaux Arts, and M. R. Brown, Chef du Bureau des Beaux Arts.

The decoration of the abattoirs of La Villette is one of the principal works in course of execution. The principal entrance is to have two groups of animals, with figures in bronze, designed by MM. Albert Lefevre and Deslongchamps. A new abattoir is to be constructed in the 15th Arrondissement. M. Moreau, architect of the abattoirs of La Villette, has been charged also with the designs of the new building, which will cost not far from four million francs. We may note also the construction at Fontenay-sous-Bois of a new infirmary for aged men, and the completion of the Avenues Niel and MacMahon, abutting on the Arc de l'Étoile.

The City Service des Beaux Arts is busy with the completion of the topographical and archaeological plan of Old Paris, commenced in 1849 by the late architect, Berty, and which hitherto only included the region of the Louvre, the Tuileries, the city, and part of the University. M. Albert Lenoir has undertaken the mapping out of the other quarters and faubourgs down to the fifteenth century. The plan will give the line of the enceinte, and that of the old streets and public buildings. No one can be better prepared for the work than M. Lenoir, who knows the topographical history of Paris intimately, and is competent to enter into all further researches which may be requisite.

Paris has got some new statues. At the commencement of the month, the statue of the chemist Nicolas Le Blanc was erected in the Court of the Conservatoire des Arts et Métiers, opposite that of Denis Papin. A few days later the statue of Père Captier, one of the Dominicans shot in 1871 by the Commune, was erected at the École Albert le Grand, at Arcueil; this statue, in white marble, is the work of the sculptor Bonnaissieux. On Saturday last the statue of Paul Broca, by M. Chopin, was unveiled on the Boulevard St. Germain.

Art-criticism has lost two able representatives during the past month; M. René Ménard and M. Charles Clément. The first had been a painter, studying under Drolling, Couture, and Troyon, and subsequently became a writer on art. He is author of a much appreciated "Histoire des Beaux Arts," of "Art en Alsace-Lorraine," and of "Mythologie dans l'Art Ancien et Moderne," and was Secretary to the École des Arts Décoratifs. He died at the age of 60.

M. Charles Clément, who died at the age of 66, was a writer of great ability, who for more than twenty years filled the place of art critic to the *Journal des Débats*. Among his principal works were studies on the genius and works of Michelangelo, Leonardo, Raffaella, Géricault, and Decamps, also a remarkable book on "Artistes Anciens et Modernes."

The death is also announced, at the age of fifty-four, of the painter Auguste Perrodin, pupil of Hippolyte Flaudrin, whose principal work was the decoration of Notre Dame, under the direction of Viollet-le-Duc. His death is a great loss to decorative art.

We also record with great regret the death of M. Ronchard, Director of the National Museums, at the age of seventy-one. He belonged to an old and noble family of Franche-Comté, though he did not adopt the title to which he had a right. He was a man of letters, and a distinguished archaeologist and lecturer on archaeology. One of his great pleasures recently was in seeing the complete success of the Dieulafoy mission in Persia, which he had been largely instrumental in promoting; for it was at his instance that the Government voted the necessary funds for the expedition, as well as the ribbon of the Legion of Honour for Madame Dieulafoy, which M. Ronchard had asked for on her behalf.

#### A LOCH LOMOND WATER SUPPLY.

LOCH KATRINE is famed as a magnificent reservoir, whence the citizens of Glasgow are perennially furnished with an abundant supply of almost pure water; but it is not generally known that Loch Lomond, the greater neighbour of Loch Katrine, and the largest freshwater expanse of which the island can boast, has also been effectively tapped for purposes of municipal water supply. This is the case, however, and for the past three years, fully, the water of Loch Lomond has served the needs of one water district at least, and served these needs faithfully and well, to the not unwelcome disappointment of a few local critics who early made up their minds that the money expended on the Loch Lomond water-works would be money thrown away. Unlike the case of Loch Katrine, the outlet of whose conduit lies thirty miles away, the customers of Loch Lomond live in the immediate vicinity, though not exactly on the margin of the sheet itself. The loch, with a total area of twenty-eight square miles, is 23 ft. above the level of the sea. From its natural outlet at Balloch, by the River Leven, to the waters of the Clyde at Dumbarton, the distance is four miles on a very easy descent through the Vale of Leven. Originally but sparsely inhabited, the vale has of late years added greatly to its wealth and population, owing to a strong growth on the part of the dyeing industry which the purity of the overflowing loch-water two centuries ago enticed within its bounds. Exclusive of the ancient royal burgh of Dumbarton at the junction of the Leven with the Clyde, the valley has a string of rising townships dotting nearly the whole of its length, these comprising Renton, Alexandria, Bonhill, Jamestown, and Balloch, with a population of over 20,000, where not so long ago the whole ran barely to as many hundreds. Isolated family wells at first supplied the necessary watering; afterwards the springs of the hillside began to be methodically utilised, and less than ten years ago a comprehensive scheme to that end was formulated and carried through by the members and officers of the Local Authority concerned. This strained the capacity of the hillside sources to their utmost stretch, and when it was found that the combined water district of the upper half of the valley still continued growing beyond its equipment, it became manifest that some more liberal and elastic source of supply had to be discovered and organised. Loch Lomond was almost at the doors of the searchers, but the loch did not, till quite late in the quest, suggest itself as a possible solution of the difficulty. Many borings were made over adjacent uplands, and some samples of water, fair to look upon and sweet to the palate, were got, but these the Glasgow analyst, without knowing whence taken, practically condemned one after another. A sample of water from the great loch was also sent,—more, apparently, as a passing curiosity than out of any really serious design, for the loch has a large passenger traffic on its surface now, and many of its conditions would seem to preclude the possibility of a sufficiently high degree of purity. The analyst could tell that this was a pure lake or river water, and on detailed examination he pronounced the sample to be the only unobjectionable one submitted to him, being little, if at all, inferior to Glasgow's Loch Katrine water. A serious objection to the Lomond water still remained in the circumstance that, as many of the streets of the district occupied the flanking ascent of the valley on either side, the loch level was altogether relatively too low for an efficient supply on the gravitation principle. The Water Committee of the Local Authority, with Mr. J. E. Jones, of Dalmonach, at its head, determined, after carefully counting the cost,

to tap the loch by means of pumping. Proprietors on the banks were, for the most part, acquiescent; but some slight objection had, nevertheless, to be met and overcome so as to avoid the expense and delay of a Bill in Parliament. This partial opposition was founded on an apprehension lest continued pumping would drain the water away and appreciably affect the existing levels, to the detriment of all properties fronting the shore. It was shown, however, on the basis of a calculation by the engineer of the scheme, that even on the utterly wild supposition that no water at all came into the loch from the numerous tributaries within its six miles of watershed, or from the heavens above, it would take one thousand days of pumping to reduce the loch level by just one inch, calculating a daily withdrawal by the pumps of four hundred thousand gallons. This was sufficient for the objectors, and the Loch Lomond water scheme at once took material shape, with the result that by the summer of 1883 the water of the loch was fully at the service of all the dwellers within the water area indicated.

The works of the Loch Lomond water-supply commence about 100 yards west of Balloch Pier, at the extreme foot of the lake and contiguous to its outfall by the Leven. About 10 ft. below the surface, so as to get it fresh and cool in the summer, and sufficiently to safeguard against damage from the Loch steamers and other craft at all times, the water is admitted into a 12-in. suction-pipe protected against the ingress of fish, or other undesirable intrusion, by a rose termination of copper, resting on a staging of timber. It flows by gravitation about 100 yards along this pipe to a straining well, 6 ft. 6 in. deep by 5 ft. 2½ in. diameter, sunk into the ground on a concrete foundation at the loch edge, where, after passing through a straining-frame of wove copper wire, it is operated upon by the pumping gear. The pumping-station, however, is situated not on the loch edge, but 700 yards distant from it, on the line of the public road which leads from Balloch down the vale on the western side of the Leven. From the straining well, over this distance of 700 yards, the water is drawn through a 12-in. suction main to the pumping-station, and is thence forced along a supply main, which for a mile and a half follows the public road spoken of, to where it reaches the first house of Alexandria. At this point, the pipe mounts the hill to the artificial reservoir, situated at a satisfactory altitude, and capable of supplying by gravitation the entire district. The distance from the loch to the reservoir by the pipe line is a little over two miles. It is the function of the pumping-engines, by an average of about ten hours of work daily, to keep this reservoir filled with water freshly taken from Loch Lomond, full storage with partial assistance from the old hill-side spring being sufficient for a twenty days' supply in the event of accident to the waterworks of the loch. The reservoir is supplemented by filters for a further cleansing of the stream before final distribution from the attendant pure-water tank, but on an emergency the water may be sent direct from the loch to the houses without filtration. Half of the district is situated on the opposite or left bank of the Leven, service being performed upon it by a main pipe crossing on the bed of the stream at Bonhill Bridge. The whole was executed from the plans, and under the direction, of Mr. Wilson, C.E., Greenock.

The Vale of Loven supply (exclusive of Renton, which relies on a small hillside loch or tarn of its own) thus constituted on the Loch Lomond basis has continued to give almost full satisfaction to consumers, whether domestic or industrial; and neither prime cost nor current expenditure has exceeded the limits of moderation. The original outlay fell short of 10,000*l.*, and the current annual charges, exclusive of repairs to pipes and plant, are confined to the maintenance of a small but efficient staff of inspectors and works' caretakers. Engineers' reports were lately issued on the capacity of the loch-works supply, in view of a possible extension of the water district boundaries, and from these it appears that with a slight augmentation of strength, and improvement in the pumping machinery, the wants of fully 25,000 of the population might readily be served. At present, about two million gallons of water are taken from the loch weekly, and it is hardly necessary to add that not the slightest discernible impression has been made

Link-holder, Siena: Fourteenth Century.

on the level of the loch itself, or upon the volume of surplus water carried away from it by the Leven.

**ELECTION OF A DISTRICT SURVEYOR.**

At the meeting of the Metropolitan Board of Works on the 29th ult., thirty-five candidates applied for the appointment of District Surveyor for the District of Plumstead and Eltham. In accordance with the order of the Board of the 1st of April, 1887, the members of the Board proceeded to reduce the number of candidates to six, by one ballot, each member being entitled to vote for any six candidates. The result of this first ballot was ascertained by two members of the Board acting as scrutineers, together with a representative of the Clerk of the Board. When the scrutineers delivered their report, the names of seven candidates were returned, in consequence of a "tie" in the voting. The names and numbers of votes so returned were: Batterbury (T.), 35; Bridgman (H.), 13; Hardcastle (W. J.), 11; Pelly (H. A.), 11; Saunders (M. L.), 20; Spiers (W. L.), 18; and Stock (H. W.), 22. A ballot was next taken to decide the tie between Messrs. Hardcastle and Pelly;

the result was the retention of Mr. Hardcastle's name. The Board then proceeded to ballot on the remaining six names, with the following results, viz., Batterbury, 23; Bridgman, 0; Hardcastle, 3; Saunders, 7; Spiers, 5; Stock, 3. Mr. Batterbury having thus a clear majority of all votes cast was at once declared to be duly elected, and having thanked the Board for his election, he promised to faithfully discharge the duties of the office.

**LINK-HOLDER, SIENA.**

This is a good example of spirited design and execution in wrought iron, the best point about it being the ready manner in which a grotesque quasi-animal form is worked out of little more than a mere bar of metal, with forcible expression, though without any attempt at realism.

**The Buxton Reservoir.**—The Buxton Local Board have accepted the tender of the Arlesley Lime and Portland Cement Company for the supply of 1,000 tons of their "Eddystone Portland Cement" for the construction of the Hogshaw Reservoir.

THE SALISBURY MEETING OF THE  
ROYAL ARCHEOLOGICAL INSTITUTE.

This year the Royal Archeological Institute holds its annual meeting in Salisbury for the second time, but after an interval of nearly forty years; for it was in 1849 that the Institute held its first meeting in that city. Since then great changes in its *personnel* have taken place. In 1849 Professor Willis took an active part in the proceedings, and gave a most lucid description of the cathedral. This year his place in that particular respect was taken, not unworthily, by Precentor Venables, as we shall have occasion to mention further on.

The opening meeting was held at noon in the Council Chamber, where the members of the Institute were formally received by the Mayor and Corporation on behalf of the citizens. The Mayor read an address of welcome in which he congratulated the members on meeting in Salisbury under happier circumstances than in 1849. In that year, when the lamented scholar and statesman, Sidney Herbert, presided over the meeting, "the country, and Salisbury in particular, was suffering from a fearful visitation of epidemic cholera." Proceeding with his address, the Mayor quoted and endorsed the oft-repeated statement that few if any counties in England can vie with Wiltshire in the variety and interest of its ancient remains, "evinced the successive ages of Celtic, Roman, Saxon, and Norman occupations." Reference was of course made in the address to Old Sarum and to the cathedral, and in conclusion the Mayor expressed the hope that the visit of the Archeological Institute to Salisbury might be as pleasant and instructive as its members could wish.

On behalf of the Wiltshire Archeological Society, its President, the Bishop of Salisbury, read a second address of welcome. He said he welcomed the Institute to Salisbury in a double capacity—not only as President of the local Society, but as sixty-eighth Bishop of Salisbury and as sixty-second Bishop of New Sarum. Having remarked that he was glad that the visit of the Institute had come at a time when he had been long enough in residence to appreciate, to some extent, the wealth of interest in the land and the city over which it was his lot to preside, his lordship went on to say that it was impossible for a Bishop of Salisbury, whether he looked down upon the cathedral and city from the heights of Old Sarum, or looked up to the spire from the house in which his predecessors had lived in almost uninterrupted succession since the year 1220, or perceived the still needle-point of that same spire from the plain on which reposed the isolated sanctuary of Stonehenge, or drove along the green wooded valleys in which the little villages, with ancient churches and monasteries clustering along the sparkling streams like jewels upon a silver thread,—it was impossible for him, whether at rest or on a journey, to forget the debt that he owed to the past and to those who, like the members of the Institute, had linked the present and past together and made them a living whole. Passing on, his lordship said that as President of the Wiltshire Archeological and Natural History Society, he had a yet more decided and special reason for welcoming the members of the Institute to Salisbury; for on the occasion of the last meeting of the Institute in the city, in 1849, the veteran John Britton, then about 78 years old, editor and in great part writer of the "Beauties of England and Wales," and of the "Architectural and Cathedral Antiquities of Great Britain," put forth a circular of some importance showing cause why the then Wiltshire Topographical Society should be transformed into a larger and more popular society. The proposal was not taken up at once, but in 1853 the Wiltshire Archeological Society was inaugurated, and the foundation of its library and museum was laid by the purchase of Mr. Britton's collection of books, drawings, &c., which were deposited at Devizes. The Bishop concluded his address by saying that local antiquaries had perhaps, since the first visit of the Institute to Salisbury, learned something more than they then knew as to the true meaning and scope of antiquarian pursuits. They were now less, perhaps, of speculators and less also of Mediaevalists. They went further behind into the roots of things. They examined with as much care (in the person of General Pitt-Rivers) the isolated civilisation of little Romano-British villages as they would a great

and magnificent monument. They were as careful (under the guidance of Mr. Nightingale) to register and to treasure the pieces of plate presented to local churches in the Georgian era as they were in regard to rare pieces of pre-Reformation times. They had therefore gained something in method.

Earl Percy, as President of the Institute, expressed the thanks of the members to the Mayor and Corporation, and to the local society, for their addresses of welcome. He spoke of the antiquities of Wiltshire as unique, and told an amusing story (which he said he hoped was apocryphal) of a party of tourists visiting an ancient monument when the owner of it happened to be there; the tourists (not knowing him) politely requested him "to be good enough, if possible, to give them the loan of a hammer!" While the Institute and the Wiltshire Archeological Society had no doubt done much to foster a loving care of local antiquities, he felt certain that Wiltshire must stand in a very exceptional for the exertions of all antiquaries, local and general, in inclining the inhabitants to respect and protect the memorials of the past that existed in their midst. Having once more expressed the thanks of the members of the Institute for the addresses of welcome which had been presented, Earl Percy vacated the chair in favour of the "President of the Meeting," Lieut.-Gen. A. H. Lane-Fox Pitt-Rivers, F.R.S., F.S.A.

General Pitt-Rivers then proceeded to deliver the Presidential address, which was mainly devoted to that branch of archaeology to which his own attention had been principally directed, viz., the exploration of burrows and tumuli. The following is the concluding portion of the address:—No one now requires to be reminded of the great advance of knowledge that has been brought about by the study of the drift gravels, which, at the lowest computation, has quadrupled the time during which we are allowed to investigate the works of man. No longer confined to the last 3,000 or 4,000 years, the archaeologist has been carried back far into geological time and has been brought in view of the earliest struggles of our ape-like ancestors to become men. No individual amongst those who assembled here in 1849 had the least idea that beneath his very feet were to be found the relics of man's workmanship at a time when he was contemporaneous with the elephant, and other extinct animals. But the discoveries of M. Boucher de Perthes, in the valley of the Somme, were going on at that time, although they were not recognised by men of science until ten years later, when our countrymen, Mr. Evans and Mr. Prestwich, confirmed the opinions of the French savant. The valley of the Avon, near Salisbury, was one of the first places examined by Mr. Prestwich, after his return from France in 1859, but although the gravels had been well looked over by him, and their fauna duly recorded, no palaeolithic implements were discovered until later by Dr. Blackmore\* and Mr. Stevens in the drift beds at Fisherton and elsewhere, where they were found in beds that had been deposited before the valley had worked its way down to the level on which Salisbury now stands. Since then, through the munificence of Mr. W. Blackmore, the Museum which bears his name has made Salisbury a place of reference for information on the antiquities of this period. Similar discoveries were soon made in the valley of the Thames, in which I had the privilege of taking part. Although not the first discoverer of palaeolithic implements in the Thames valley, as they had previously been found by Mr. Leech, Mr. Prestwich and Mr. Evans on the seashore near Reculver,† I believe I may claim priority for the part of the river near London. Having carefully watched for the space of a year or more excavations in the drift gravel at Acton. I was able in 1872 to show by means of plans and sections, published in the quarterly journal of the Geological Society, the exact analogy of the palaeolithic site there with that of the valley of the Somme, near Amiens and Abbeville. Other similar discoveries have since been made in the valley of the Exe and elsewhere in this country. The nature of the implements found in these gravels was such as to fully bear out the doctrine of evolution, being characterised by extreme simplicity as

compared with the stone implements of a later date, and they introduced us to a condition of the arts of man, in which a simple flake or a flint held in the hand at one end and trimmed to a point at the other, appears to have afforded the most advanced idea of a general tool for all the purposes of life, so that the palaeolithic or earliest form of implements can be everywhere distinguished by their simplicity from the neolithic or stone implements of a later date, and they are more or less the same in all the localities in which they have been found. As regards the time necessary for the erosion of the valleys and the deposition of the beds belonging to this period, it is generally admitted that it cannot be computed in years. At first, geologists were inclined to demand an enormous time for it, but recently, in consequence of observations on the erosion of glaciers, less time has been thought necessary, and Mr. Prestwich, in a paper read lately before the Geological Society, has given his reasons for believing that the time estimated since the termination of the last glacial epoch may be greatly curtailed. But, although the sequence of palaeolithic, neolithic, and bronze implements had been firmly established in the North and West of Europe, it had not been proved that the same sequence took place in Egypt, Assyria, and those countries in which civilisation dates back to a very much earlier time, for it seemed certain that the stone age of the North and West of Europe was contemporaneous with a very much more advanced civilisation in the south and east. The attention of archaeologists had therefore been turned for some time to the question of a stone age in Egypt. The valley of the Nile, it was found, was covered with flint implements which correspond in form to those of the palaeolithic type of Europe, but this coincidence of form alone, though highly suggestive for the reasons I have given, was not in itself sufficient to determine sequence, because they had been found only on the surface, and in order to prove them anterior to Egyptian civilisation it would be necessary to adduce the same kind of evidence of their antiquity that had been shown in Europe, by finding them in the gravels in the sides of the valley and in places which could be proved to have been undisturbed since Egyptian civilisation commenced, and this was the more necessary because it was known that flints were used for embalming purposes in Egyptian times. Here I may be permitted again to refer to a discovery of my own, although in introducing it into so brief and condensed an account of the history of the subject, I must again claim your indulgence as a lecturer. Being in Egypt in 1881, and having devoted particular attention to this point, I was fortunate enough to find flint flakes and an implement in parts of the gravel of the Nile near Thebes, into which gravel, after it had become nearly as hard as rock by exposure, the Egyptians had cut the square-topped chambers of their tombs, and I chiselled several of these implements out of the gravel beneath stratified seams of sand and loam in the sides of the Egyptian tombs themselves. These flints, I believe, afforded the first absolute evidence of the priority of the use of flint implements to the time of the building of Thebes, and to a time before the valley of the tombs of the kings had been completely eroded. At any rate, it was the first discovery of the kind which had been recorded. I have not been able to go to Egypt since, but I believe that by further search upon that site it may be possible to determine when flint implements were first introduced there, for I could not, after careful search, find them deeper in the gravel than a certain level. If this should prove to be the case, it will be an important additional item of evidence. As regards the osteology of the human skeletons discovered in the drift, our knowledge of them appears to develop slowly. If, as I have said, the skeletons of the Ancient Britons are rare, still less frequent must be those of quaternary man, our knowledge of which must depend on the accidental washing of them into drift deposits or the discovery of them in the floors of caves belonging to that period. For some time it was contended that no approach towards lower forms of life could be recognised in the skeletons of this period, and that the one or two abnormal skulls that had been brought to light were either those of idiots or were the result of disease. But in the presence of additional discoveries of similar skulls and skeletons that have since been made in different parts of the

\* Quarterly Journal of the Geological Society, vol. xx, 1864, p. 189.

† Quarterly Journal of the Geological Society, vol. xvii, 1861, p. 362.

world, and more particularly in Belgium, this position can no longer be maintained. Within the last year two additional skeletons have been discovered in the quaternary deposits of a cave at Spy, in the province of Namur, and have been reported upon by M. Fraipont in the *Bulletin de l'Académie Royale des Sciences* in Belgium. The following are reported by M. Fraipont to be the peculiarities in which these skeletons depart from the human form and approach that of the anthropoid apes. The superciliary ridges are more developed and the forehead more shelving than those of any existing race of men, in which respect they resemble the orang, gorilla, and chimpanzee. The chin is more receding than those of any existing race of men. The forward curve of the femur is also greater than any existing race of men, and the angle and size of the articular surface of this bone and the tibia is such as to show that the individuals must have walked with their legs slightly bent. In other respects the skeletons are pronounced strictly human. These appear to be the latest facts revealed to us by the earliest specimens of our race. If they militate against some cherished dogmas we have, nevertheless, no alternative but to accept them if they are established on sufficient evidence. I cannot myself see how human conduct is likely to be affected disadvantageously by recognising the humble origin of mankind. If it teaches us to take less pride in our ancestry, and to place more reliance on ourselves, this cannot fail to serve as an additional incentive to industry and respectability. Nor are our relations with the Supreme Power presented to us in an unfavourable light by this discovery; for if man was created originally in the image of God, it is obvious that the very best of us have greatly degenerated. But if, on the other hand, we recognise that we have sprung from inferior beings, then there is no cause for anxiety on account of the occasional backsliding observable amongst men, and we are encouraged to hope that with the help of Providence, notwithstanding frequent relapses towards the primitive condition of our remote forefathers, we may continue to improve in the long run as we have done hitherto.

On the motion of Earl Percy, the thanks of the meeting were accorded by acclamation to the President for his address.

After an interval for luncheon, the members assembled at the west end of the cathedral, and proceeded to inspect the building, under the guidance of the Rev. Precentor Venables. Passing through the cloisters, they made their way to the chapter-house, where

Precentor Venables gave an interesting lecture on the history and architecture of the cathedral. He said that on the former occasion when the Institute visited Salisbury the members had the advantage of being conducted over the building by that master of architectural exposition, especially in connexion with history, Professor Willis, by the kindness of whose nephew and literary executor, Mr. John Willis Clark, of Cambridge, he (the Precentor) was enabled to have the use of the notes and illustrations used in 1849. With their aid, then, he would proceed to sketch the architectural history of that magnificent cathedral,—“magnificent” was not the proper word, perhaps, as it implied a degree of richness and opulence which we did not find in Salisbury. He would rather speak of it as an exquisitely simple and charming building, for it was exceedingly graceful, and perfectly harmonious and symmetrical. Its spire, though not the tallest, was perhaps in point of design the most perfect in the world. As an architectural composition, he regarded Salisbury Cathedral,—more especially as seen from the outside,—as the first of the cathedrals of England. He knew that it was often said, and said with some degree of truth, that Salisbury was one of the least interesting of our cathedrals, but in so far as that was true it was only so because the cathedral (with the exception of the tower and spire) was the continuous development of one design from east to west, carried to completion within a comparatively small number of years. This circumstance was no doubt due to the fact that the foundation of the cathedral on its present site only dated from 1220, the first cathedral of the diocese having been at Old Sarum. Precentor Venables then went on to narrate the story of the transference of the cathedral from the one site to the other, and described the building of the present cathedral, the subsequent addition of the Decorated tower and spire, and the

special expedients which had been found necessary to ensure the stability of this part of the cathedral. He of course spoke of the havoc wrought by Wyatt, but pleaded, in extenuation of harsh judgment on his deeds, that in Wyatt's time the idea of the historic value of an old building or an old monument had not dawned; hence the ruin that was effected by well-intentioned custodians of buildings who regarded themselves as perfectly free to make such changes as seemed called for by the necessities, or fancied necessities, of the hour. Having spoken with regret of the pulling down, at the end of the last century, of the detached campanile which stood to the north-west of the cathedral, Precentor Venables devoted a few words to the chapter-house and cloisters. The chapter-house he regarded as in some respects more beautiful than the one at Westminster. The sculptures running all round the building above the arcading were very curious, and would well repay careful study. The present appearance of the chapter-house was in marked contrast to that which it bore when the Institute visited Salisbury in 1849. It was then in a dreadfully dilapidated and neglected condition, and the only thing to regret in connexion with its restoration was that the decorative wall-painting was executed before the walls were perfectly dry; hence much of it had peeled off. Under the conduct of the lecturer the visitors next proceeded to inspect the cathedral, beginning with the Lady-chapel, where the slender Purbeck marble columns supporting the vaulting were commented upon as being part of a somewhat daring constructive feat. The way in which tombs, arcades, and other features had been removed, altered, and placed in different positions by Wyatt, as if they had been so many pieces of furniture in a drawing-room, was also pointed out. Much of this work of alteration was very unintelligently done, several monumental effigies being at the present time placed on substructures which certainly never belonged to them. The Precentor also referred to the wanton destruction of much of the thirteenth-century grisaille glass which formerly filled the numerous windows of the cathedral. On this subject we may quote from a little pamphlet,\* written by Mr. J. E. Nightingale, who says:—“Considerable and important pieces of this interesting grisaille glass, which originally decorated the windows of the cathedral (with the exception, probably, of the eastern and more important windows, where the richer medallions were used), has been for many years placed in the three lower windows of the south-east transept. Quite lately all the remaining fragments have been brought together by the care of the present Dean and Chapter, and now form the glazing of the remaining windows in this transept. These windows now contain a mine of wealth of ancient examples of thirteenth-century plain glazing, the loss of which is so painfully felt in the present state of the cathedral, and the reproduction of which has not hitherto been successfully attained. The following letter, which was found during the researches of the Historical MS. Commissioners, will show to what extent this reckless destruction of ancient work was carried on during the ‘restorations’ at the end of the last century. It was written in June, 1788, by John Berry, glazier, of Salisbury, to Mr. Lloyd, of Conduit-street, London:—

“Sir,—This day I have sent you a Box full of old Stained and Painted Glass as you desired me to doe which I hope will suite your Purpose in the best that I can get at Present. But I expect to Receive a great Deal more very soon as it is his of now use to we and we Due it for the lead if you want any more of the same sorts you may have what these his, if it will pay for taking out, as it is Dead of Trouble to what Bearing it to Pecosis his you will send me a line as sune as Possibl for we are goin to move ore glazing shop to a Notter Place and thin we hope to save a great Deal more of the like sort which I ham your most Ombie Servant John Berry.”

Subsequently a visit was paid to the hospital of St. Nicholas, which shows some considerable remains of Early English work, which were remarked upon by the Rev. Mr. Moberley, the Master. They next proceeded to Harnham Bridge, adjoining, with its chapel, now converted into a dwelling-house. Finally, they visited the Bishop's Palace, under the guidance of the Bishop. Here remarks on the architectural character of the buildings were made by Mr. J. T. Micklethwaite, F.S.A., and Mr. Ponting. To quote from Mr. Nightingale, “The Bishop's Palace has some very ancient portions, but it has been so frequently altered by

\* General Notes upon the Places visited during the Meeting. Salisbury: Bennett Bros., Journal Office.

successive prelates that it is not easy to distinguish which they are. In the cellars were some early arches, in a great measure hidden; these have lately been opened up by the care of the present bishop, and a fine chamber or undercroft of thirteenth-century work has been developed. During the Civil Wars this building was much injured, and the great hall destroyed. It was extensively repaired by Bishop Seth Ward soon after 1608, and it is to this prelate, probably, that a good deal of the existing work must be attributed. Other additions and alterations were made by Bishop Barrington at the end of the last century.”

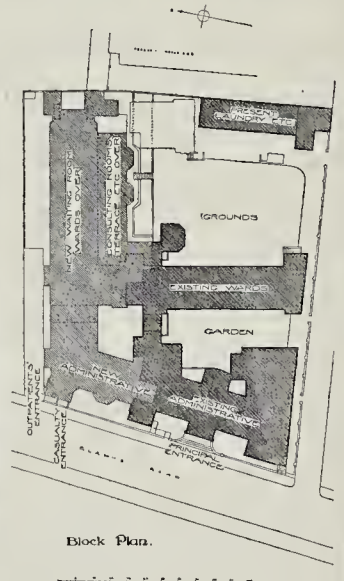

The Antiquarian Section held its opening meeting in the Council Chamber in the evening, when the President of the Section, the Bishop of Salisbury (Dr. Wordsworth), delivered an interesting address on “The Seals of the Bishops of Salisbury.” He said that when first he began to have a practical interest in the matter of bishops' seals, some two years ago, he made inquiries whether anything had been written on the subject, and he learnt, somewhat to his surprise, that it was one which was almost wholly untouched. He was shown, indeed, an excellent book on Scottish Seals, in two vols. 4to, by the late Henry Laing, of Edinburgh (published in 1850 and 1868), which contained a catalogue of as many as 223 seals of Scotch bishops; but he could not learn that there was a similar book for England, even of that general character. One or two articles in encyclopedias, and a few scattered papers in learned periodicals, seemed to exhaust the literature of the subject. He was, therefore, led to examine such seals as were accessible in the British Museum and in the Bodleian Library, and formed certain general conclusions which were not difficult to gather, even from such a hurried and partial survey as he then had time to make. He was now glad to find that his friend Mr. W. H. St. John Hope, Secretary of the Society of Antiquaries, had collected a much larger store of information, and drawn much more precise and practical conclusions from the fine series of seals in the possession of the Society last-mentioned, formed, his lordship believed, by the late highly-esteemed Mr. Albert Way. Mr. Hope's paper was read in two divisions on February 3rd and 10th of the present year, and had been recently printed in the “Proceedings” of the Society. To that paper all succeeding inquirers would naturally refer, and it had been of the greatest possible service in the preparation of the present memoir. His lordship said he did not think that Mr. Hope made any comparisons between English seals and the corresponding Scottish series, but otherwise his work seemed to be very complete. The interest of the subject was considerable. As works of art, illustrating the improvement, the decay, and the caprices of public and private taste, they yielded to few of the smaller monuments of the class to which they belonged, and they had the great merit of being subject to strict classification in the order of time, and of forming an almost continuous series, if a sufficient number of examples were examined. Mr. Hope appeared to have had before him 168 examples of pre-Reformation seals. He (the Bishop) had before him thirty-six seals (large and small), belonging to twenty-one individuals out of the thirty-four pre-Reformation bishops of Salisbury; and thirty-three seals belonging to twenty-seven out of the thirty-four post-Reformation bishops,—making a total of sixty-nine seals,—a very considerable number, having regard to all the mischances which were apt to befall such objects, though he did not despair of being able to render the series much more complete. To the theologian the study of seals was of some interest, as showing the types of devotion which were popular in the centuries immediately preceding the Reformation, and the changes of feeling which succeeded it. To the Ritualist (using the term in its proper sense), seals offered certain useful indications of ecclesiastical dress, ornament, and custom, but not, perhaps, as much as might be hoped, owing to the small size of the representations. To the local historian and herald they were naturally of very high value, especially as the arms figured by no means always agreed with those given in the books which dealt with the subject,—e.g., Rev. W. R. Riland Bedford's very useful “Blazon of Episcopacy;”—and in that field they raised many interesting and difficult questions. To the epigraphist the continuous series and development of the lettering ought to be very

TERRACE AND BALCONY.

East London Hospital for Children.

Block Plan.

helpful in determining the epoch of other undated inscriptions. Such being the different studies to which these objects ministered, he had no need to apologise to his audience for the subject that he had chosen for his address. He trusted that before the paper was printed in *extenso*, the interest of antiquities would stimulate friends far and near to assist himself and other bishops to complete their sets of seals. He might mention that the Archbishop of Canterbury and the Bishop of Durham had, like himself, called in the aid of the veteran Mr. Robert Ready, of the British Museum, to lay a foundation, and they would be grateful for any help that could be rendered them in filling up gaps in that collection and in the Way collection of the Society of Antiquaries. His lordship then proceeded to deal in detail with the classification of seals of different kinds and periods, and described *seriatim* those belonging to the See of Salisbury. The paper, which was illustrated by impressions of nearly all the seals mentioned, was listened to with great interest, and after a few remarks from the President of the meeting, General Pitt-Rivers, thanks were tendered to the author.

Mr. H. J. Moule, of Dorchester, next read an interesting and learned paper entitled "Description of the Vetus Registrum Sarisberienense, with a Short Notice of some of the other MSS. at Salisbury." In concluding the paper, Mr. Moule

paid an eloquent tribute to the writers of these and kindred Mediaeval MSS., many of which, he lamented, had been in later times burned or wantonly destroyed.

After a few remarks from Mr. J. T. Micklithwaite, F.S.A., the meeting broke up, and thus terminated the first day's proceedings.

We will continue our report of the Congress in our next.

#### EAST LONDON HOSPITAL FOR CHILDREN, SHADWELL.

This hospital was built in 1875, since which time its usefulness has been so appreciated that it is now necessary to nearly double the size of the original building. The new wing, which is to be erected as a Jubilee memorial, includes a new out-patients' department, and two wards for twenty-four beds each. The former is the more immediately needed, and will be commenced as soon as the funds allow. It consists of a waiting-room, 129 ft. by 24 ft. 6 in., with dressing and consulting rooms on the south side. Over these will be constructed a terrace and balcony, with access from the ward windows, as shown in the view we publish. A new dispensary is also provided to serve the whole hospital.

The addition to the front block towards the street comprises two isolation rooms and a new casualty room, with a separate entrance from

the street. The basement contains boilers for heating the whole of the buildings, engineer's rooms, a new kitchen with the usual offices, dining-hall, store-rooms, &c.

The architects are Messrs. Walter Millard and Wm. G. B. Lewis.

#### COMPETITIONS.

*New Church Tower, Heavitree.*—The successful competitor for the Heavitree church tower competition is Mr. E. H. Harbottle, of Exeter. The two next competitors whose designs were considered as of about equal merit, were Messrs. W. & W. B. Barrett-Smith, of London, and Messrs. Packham Croote & Stuart, of Exeter. The committee were advised by Mr. Ewan Christian, late P.R.I.B.A.

*The Victoria Hospital for Sick Children, Hull.*—The design submitted by Mr. Samuel Musgrave, Hull, has been selected; premiums of 15l. and 10l. respectively being awarded to Messrs. Botterill, Son, & Bilson, and Messrs. Smith & Brodrick, of the same town.

*Sheffield.*—On Monday last the Mayoress of Sheffield (Lady Stephenson) laid the foundation-stone of new Sunday schools, &c., at Garbrook, of which Mr. C. J. Innocent, of Sheffield, is the architect.

THE BUILDER, AUGUST 6, 1887.

BASE OF FLAG MAST IN THE PIAZZA DI SAN MARCO, VENICE.

**Illustrations.**

**BASE OF FLAG-MAST IN THE PIAZZA, VENICE.**

**T**HIS is one of the beautiful bronze pedestals in which are stepped the three scarlet masts from which there used proudly to float the gonfalons of silk and gold emblematical of the three dominions of the Venetian Republic, Candia, Cyprus, and the Morca. The pedestals were erected in 1501 and 1505, by Paolo Rabbo, a procurator of St. Mark, and the Doge Loredano, whose portrait it probably is that adorns the medallion on the upper part of the pedestal we illustrate. The elaborately-finished reliefs of sea-nymphs and tritons are the work of Alessandro Leopardi.

**MURAL BRASS MEMORIAL TABLET.**

The mural brass, of which we give an illustration, is one of the largest that has lately been engraved in England. It has just been erected in Bristol Cathedral to the memory of the late Rev. Jordan Roquette Palmer-Palmer, and is on the south pier of the tower. The work is incised, the background being sunk and then darkened so as to give effect to the bright foreground. The figures of the Evangelists and the Angels are added on the upper part, to give further effect and support to the principal figure of the priest in vestments. The brass was designed by Mr. E. R. Singer, of the firm of Messrs. J. W. Singer & Sons, by whom the work was executed.

**EDINBURGH PUBLIC LIBRARY COMPETITION.**

THIS week we illustrate one of the designs selected for special consideration, by Mr. Thomas P. Marwick, A.R.I.B.A. In our issue

of June 18 we said "this was one of the best designs exhibited, the plans good, and the architecture characterised by great taste and refinement."

The designer writes that his aim was to secure a library-like building. He has brought the front forward to the line of the bridge, so as to enable the building to be seen from some distance going north or south.

The rooms below the loggia were to be devoted to inferior purposes.

**MASONS' MARKS ON WESTMINSTER HALL.**

We are indebted to Mr. T. Shelmerdine for the annexed sheet of mason's marks on the walls of Westminster Hall, as observed and drawn by him. Mr. Shelmerdine says:—

"Nearly all the accompanying marks are on the three first bays at the north-west end of the hall. The marks occur in different positions on the wall, some on the lower course, and similar marks on different courses higher up. If these marks are the work of separate masons, there must have been a great number at work, for this could only represent a small portion employed at the time. Some of the marks seem to represent monograms, others the cross, axe, level, arrows, &c.

I noticed the other day, on some of the remains of Roman London at the Guildhall Museum, similar marks, but cut much deeper, but not on the face of the stone."

**Iron Building at Morden.**—Messrs. North & Son, of London-road, Southwark, having back a large iron building which had been lent on hire to the National Agricultural Hall Company, Kensington, have erected it on ten acres of freehold land fronting on the Epsom-road, Morden, and recently inaugurated it by placing it at the disposal of the workmen and wives of Messrs. Field & Sons, estate agents, Borough, for their annual outing.

**THE TESTING OF HYDRAULIC MORTARS.**

ATTENTION has been directed in Germany to the above subject by conferences held in 1884 and 1886 at Munich and Dresden. In compliance with a resolution adopted at the latter assembly, a series of definitions and propositions has, according to the *Thonindustrie Zeitung*, been elaborated in anticipation of the Conference to be held at Berlin during the autumn of 1888, embracing the following leading points:—

**A.—GENERAL REMARKS.**

Tests should be made in such a manner as shall closely represent the purposes for which the articles will be used. The strength of extension and resistance to pressure of cement mortar, as now usually defined, are not the sole indications of the durability of buildings; resistance to the weather, brittleness, resistance to water, strength of adhesion and constancy of volume being other points of importance.

As the degrees of strength now obtained in mortar are not altogether utilised, it is not required to arrive at higher results. The question whether the mixing of mortar materials shall in future be according to volume instead of weight, is referred to the new permanent Commission.

**B.—DESIGNATIONS.**

1. *Hydraulic Limes* are products obtained by burning limes containing more or less clay (or silicic acid), which on being moistened with water are slaked wholly or partially into powder. According to local circumstances, they are sold in piece form or hydrated in powder.

2. *Roman Cements* are products obtained from lime marls rich in clay by burning below the limit of slagging. These are not slaked with water, but have to be pulverised by mechanical processes.

3. *Portland Cements* are products obtained

from natural lime marls or artificial mixtures of substances containing clay and lime by burning up to the limit of sintering, and by subsequent pulverisation. For the regulation of properties of technical importance, an addition of foreign substances up to 2 per cent. of the weight is permitted without the name being changed.

4. *Hydraulic Fluxes* are natural or artificial substances which do not harden, as a rule, independently, but in combination with caustic lime; such as Puzzolan earth, Santorin earth, trass of suitable volcanic origin, blast-furnace slag, burnt clay, &c.

5. *Puzzolan Cements* are obtained by the intimate mixing of lime hydrates in powdered form, with hydraulic fluxes reduced to the fineness of dust.

6. *Mixed Cements* are products obtained by the intimate mixing of prepared cements with suitable fluxes. Such binding substances are to be distinctly called mixed cements, according to the fundamental substance and the flux.

#### C.—TESTING.

1. *Weight*.—In obtaining the specific weight (that of the grains) a cylindrical litre vessel (0.22 gallon) of 4 in. height is used, into which the substance is sifted or shaken.

2. *Fineness of Grinding*.—The fineness of grinding is defined by sieves of 900 and 4,900 meshes per square centimetre (0.155 square inch) for Portland cement, and 900 and 2,500 meshes for other hydraulic binding substances. For each trial the quantity used should be 100 grammes (3.527 oz.). The thickness of the wires of the sieves should be:—

Per square centimetre (0.155 sq. inch).		
Meshes	4,900	2,500
in.	in.	in.
0.0197	0.02759	0.03934

It is recommended to have the sieves all of the same make.

3. *Conditions of Setting* are to be tested at a temperature of 59° to 65° Fahr., except for Puzzolan (trass), by the normal needle and the apparatus for defining consistency. To carry out this test, 14 oz. of the hydraulic binding substance are worked up with water to a stiff paste; the time occupied being three minutes for slow-binding qualities and one minute for quick-binding descriptions. The cylindrical box of the apparatus, 1.59 in. high and 3.12 in. wide (of an impervious substance not conducting heat), is filled with the mixture. A normal consistency allows the testing appliance to stop at a height of 2.34 in. from the bottom of the box. The normal needle used for testing the setting weighs 10.58 oz., and has a circular sectional surface of .0015 square inch, the box employed being the same as before. The commencement of hardening has taken place when the needle no longer penetrates the entire substance, and the mixture has set as soon as the needle makes no impression. A similar test can be made with a cake on a glass plate. It is suggested that tests with higher proportions of water than in the normal consistency would be of value. Puzzolan is dried at 212° to 230° Fahr., is subjected to a trial for its loss from heat (defining the proportion of water it contains), and is tested for its initial hardening under water at 59° Fahr. The mixture consists of two parts by weight of Puzzolana (trass), one part of powdered hydrate of lime, and one part of water. The mortar (in the box as previously explained) is placed under water and tested after two, three, four, and five days to find the weight necessary to make the needle penetrate it deeply.

4. *Constancy of Volume*.—Portland cement is tested by being mixed with water to a normal consistency, and made on a thin glass plate into cakes of 3 in. to 4 in. diameter and  $\frac{1}{2}$  in. thick. Two of these cakes are, after twenty-four hours, put on a metal plate and subjected to a temperature of 230° to 245° Fahr. for at least an hour, until no more aqueous vapours escape. If the cakes show no curvatures or cracked edges, the binding substance may be considered as being constant in volume. Should the contrary be the case, the result of the test on glass plates is decisive. If more than 3 per cent. anhydrous sulphate of lime be present (or a corresponding quantity of unburnt gypsum), this test is not conclusive. The most reliable test consists in stirring 3.52 oz. of cement with water into a normal consistency, a cake of 0.78 in. thickness being formed of the mixture on a glass plate. Two of these cakes (protected from drying so

as to avoid cracks) are placed under water after twenty-four hours, or after setting has taken place. The binding substance of which they are composed is regarded as being of constant volume if the cakes after twenty-eight days, exhibit no curvatures or cracks at the edges. Hydraulic limes and Roman cements are tested in the same manner. Puzzolana (trass) mortar is tested with a mixture of two parts by weight of Puzzolana (trass) and one part by weight of water, by means of the box and normal needle, as already explained. After the ring which serves to close it has been loosened, the box is placed in a vessel with level bottom, into which water is carefully poured up to at least 0.78 in. above the upper edge of the box. The hardening mortar should not in any way separate the two parts of the box, nor should it protrude at the top. The investigation of abbreviated methods for defining the constancy of volume in air of cement and other hydraulic binding substances is referred to the new permanent Commission, the test by boiling being also left for examination by that body.

5. *Tests of Strength*.—For all hydraulic binding substances, with the exception of Puzzolana, tests are to be made with three parts by weight of sand and one part of the binding substance. It is suggested that additional tests should be made with a higher proportion of sand. The sand used is the so-called normal description consisting of quartz sand as pure a condition as possible; the size of the grains being such that with three sieves of 64, 144, and 225 meshes to 0.155 square inch, half of the weight passes the first and remains on the second, while the other half passes the second and lies on the third. The thickness of wire in the three sieves should respectively be .0156, .0117, and .0078 in. The question is referred to the new permanent commission whether wire sieves should be replaced by those made of perforated metal, as well as the defining of the diameter of the perforations which would correspond with the above thicknesses of wire. The reliable test for strength is that of pressure which is carried out with blocks of 7.75 square inches sectional surface. The usual test of quality is that of extension, effected by the normal apparatus upon trial blocks of the normal shape with 0.77 square inch surface of fracture. The Commission will, it is suggested, define the normal consistency of mortar and seek an effective method of making the trial blocks by machinery with a view to uniformity. Meanwhile they are to be made by hand. For ascertaining the strength of extension and the resistance to pressure, six trial blocks are required of each stage of hardening; the average of the four highest results obtained in each case giving the official result. The blocks have to be kept during the first twenty-four hours in air in a room saturated with steam, and for the remainder of the time until the tests under water, at a temperature of 59° to 64° Fahr. The results after twenty-eight days are regarded as decisive. Portland cement mixed in the proportion of 1 to 3 can even be tried after seven days. The testing of strength of Portland cement of normal consistency, made on a non-absorbent foundation, and that of normal sand after three days, are left for the new Commission to deal with. The general question of the testing of hydraulic binding substances in a shorter time than is now customary will also be discussed by that body. The testing of Puzzolana (trass) mortar is effected with a mixture of two parts by weight of Puzzolana, one of powdered hydrate of lime, three of normal sand, and one of water. The test is carried out as previously explained, but in some cases the blocks are placed under water immediately on being made, it being recommended in such cases to add one-tenth more of water in preparing the mortar. The due observance of the prescribed temperature is of importance in these tests, as well as the purity of the lime used; the strength of the composition being greatly dependent upon the last-named ingredient.

6. *Strength of Adhesion*.—It is suggested for the consideration of the new commission that the strength of adhesion of hydraulic binding substances shall be tested by the normal apparatus for testing strength of extension. The testing surface is 1.97 in. x 1.97 in. = 3.88 square inches. The samples to be tested must be kept in a room saturated with moisture, in the same manner as explained regarding the extension tests. In order to arrive at a right comparison

of the strength of adhesion all subsidiary effects of the binding substances on the objects to be united must be excluded. Thus, with all calcareous binding substances bricks must not be used which would produce the formation of a Puzzolana cement through combination with lime. It is also recommended that the appliances used in testing should resist the action of lyes and acids, opaque ground glass and biscuit porcelain being spoken of as particularly suitable. The former, being relatively cheap, is specially approved. All the glass plates used should be ground or roughened to the same extent.

7. *Yield of various hydraulic binding Substances in the Preparation of Mortar*.—This is ascertained either by the usual volume-measuring appliance or by Stahl's method.

#### MR. DIBDIN'S EXPERIMENTS IN TREATING METROPOLITAN SEWAGE.

MR. R. W. PEREGRINE BIRCH, M. Inst. C.E., read a paper at the Leicester meeting of the Association of Municipal and Sanitary Engineers and Surveyors, entitled "An Examination of some Recent Experiments on Sewage Treatment made by W. J. Dibdin, Esq., F.C.S., F.I.C., for the Metropolitan Board of Works." In the course of it he said,—Many members present are responsible for the treatment of sewage by chemical precipitation, and there are probably few who have not tried numerous chemical reagents, or who have not been invited to do so by various patentees, or persons interested in pushing the sale of some particular material. It will be remembered that at the Institution of Civil Engineers at the beginning of the year, an admirable paper was read by Mr. Dibdin, Chemist to the Metropolitan Board of Works, upon sewage sludge and its disposal, in which he sets forth the process about to be put into operation by that Board, for the treatment of the sewage of London. The metropolitan sewage is to be treated with 37 grains of lime and 1 grain of sulphate of iron per gallon, and Mr. Dibdin produced the results of a large number of experiments to show that although greater purification might have been effected by a greater expenditure of chemicals the improvement would not have been worth its cost. Great difference of opinion was expressed in the discussion as to the capability of such homeopathic treatment, and it is not proposed here to say anything about the relative merits of different precipitants; but the 575 analyses made by Mr. Dibdin, besides showing the relative merits of different agents, also show the relative susceptibilities of the samples tested, and it is in order to call attention to the importance of this difference that the author has ventured on this occasion to address the Association of Municipal Engineers and Surveyors. It must be clearly understood that in this communication there is nothing but what could be extracted from Mr. Dibdin's paper; but the object in the two cases not being the same, it has been thought worth while to utilise the large mass of well-authenticated facts obtained by the Metropolitan Board of Works to teach a lesson which on the former occasion was not emphasised as the present author considers it might have been with great advantage. Mr. Dibdin took twenty-three samples of sewage from the Metropolitan Outfall at Crossness, and having extracted from them the matter in suspension, treated each sample in twenty-five different ways. He used lime alone in quantities varying from 3.7 to 15 grains per gallon, sometimes in solution, sometimes as milk of lime. He used lime in conjunction with sulphate of iron in various proportions, lime together with sulphate of alumina, lime supplemented by both sulphates, and also lime, sulphate of iron and animal charcoal together. The chemicals necessary for these treatments were estimated to cost from 81 of a penny per head per annum to 48s. per head per annum, and it is obvious from Mr. Dibdin's figures that the use of the larger quantity of chemicals would, independently of the expense of dealing with the increased quantity of sludge, have cost a great deal more than their worth. It is to be learned from Mr. Dibdin's figures that whether he added 4.77 grains of chemicals or 108 grains to the gallon at costs respectively of 14d. per head and 4s. per head, it did not make more than 20 per cent. difference in the amount of organic matter removed. This is very strong, if not conclusive, evidence in support of the opinion

arrived at by the Board of Works, namely, that it was best to limit the amount of chemicals used as proposed by Mr. Dibdin. But although the difference between the effect of one precipitant and another precipitant upon any one of the samples tested is small compared with the cost, the difference in the extent to which the samples have been found to yield the dissolved organic matter contained in them is very striking, and this brings the author to the point he wishes to impress upon the members of this Association having the management of sewage precipitation works, viz., that more is to be expected from experiment and research into the question of what are the influences affecting the susceptibility of sewage to chemical precipitation than from any number of trials of different chemical agents.

Mr. Birch exhibited a diagram showing the results of one treatment upon twenty-three different samples of sewage, as well as the results obtained from treating one sample in twenty-five different ways.

From the diagram it was apparent that there is a much greater uniformity in the latter set of results than in the former ones, showing that the results arrived at depended more upon some quality or condition of the sewage at the moment of treatment than upon the character or quantity of the precipitant used. The diagram also showed that certain samples have yielded up their impurities far more generously to all of the treatments than other samples have to any, and that certain samples yielded more dissolved organic matter to 15 grains of lime than they did even to a greater quantity of lime together with a considerable addition of sulphate of iron and alumina.

It is obvious, said the author in conclusion, that when certain samples of sewage yield generously to twenty out of twenty-five different treatments, but in the other cases resist reagents which have been effective with other samples of the same sewage, the strength of sewage is not the only factor to be considered, and that the variety of result must be due to some varying physical condition, possibly age or temperature, or degree of decomposition of the sewage when treated, or may be to the temperature of the atmosphere or the barometric or photological conditions prevailing at the time. The author knows that Mr. Dibdin has not at present satisfied himself as to the meaning of the facts collated on the diagram further than was necessary for the question he had in hand at the time he made the experiments; but the author believes that if the science of sewage precipitation is to be advanced it must be through investigations, by gentlemen in this Association, of the nature and extent of the outside influences which affect the action of precipitating agents upon sewage.

In the course of the discussion which followed Mr. Strachan (Chelsea) said that the results of Mr. Dibdin's experiments would only be more strongly incline engineers to cease to put their trust in chemists for the solution of the sewage problem, and Sir Robert Rawlinson strongly condemned the costly expedients which the Metropolitan Board of Works is adopting in order to palliate the evils arising from the discharge of the London sewage into the Thames, expedients which, he predicted, were doomed to fail. Mr. Eacchins, Mr. A. M. Fowler, Mr. McKie, Colonel Jones, and the President, continued a very interesting and practical discussion.

WOOD-DRYING EXPERIMENTS.

The Chicago, Burlington, and Quincy Railroad Company has had carried on at its shops at Aurora some interesting experiments to determine the fluctuations of moisture in various woods during seasoning. The chief object of the experiments was to discover the laws of seasoning, if such laws existed, and thus to ascertain in what months the greatest amount of seasoning takes place, and whether wood thus seasoned re-absorbed moisture during the wet months of the autumn and winter. The work, according to the *Railway Review*, from which the particulars given are taken, was undertaken in a systematic manner, the following mode of procedure being adopted. The experiments were commenced on December 21, 1885, and ended on February 28, 1887. Three pieces of rough dressed oak, ash, and Norway pine,

thoroughly green, were piled loosely, with cleats between, with a board overtopping them, in a situation where they were protected against drip and direct rain, but where they were open to rain, snow, and the sun on their sides. The conditions were, as nearly as possible, those to which timber piled for out-door seasoning is usually subject. The dimensions of these pieces at the commencement of the experiments were as follows:—Oak,—cross dimensions, 8½ in. by 5½ in.; length, 9 ft. 6 in. Ash,—cross dimensions, 8½ in. by 4½ in.; length, 7 ft. 6 in. Pine,—cross dimensions, 9½ in. by 5½ in.; length, 14 ft. 2 in. In each alternate week, pieces of wood were sawn from these timbers off the same end every time, and borings taken from the centre of the sawn-off blocks. From the oak, 5 in. were sawn off each time for the first eleven tests, and 3 in. for the remaining fourteen tests. From the ash, 4 in. were sawn off for the first eleven tests, and 3 in. for the remaining thirteen tests. From the pine, 5½ in. were sawn off every time. The borings taken from these pieces were carefully weighed, then thoroughly dried, and again weighed, which process gave the percentage of moisture in each piece. The results of each fortnightly test were tabulated, and show the fluctuations of moisture during the whole period of one year, two months, and one week. The exact percentages of moisture thus obtained are given in the following table:—

Date.	Percentage of Moisture.		
	Oak.	Ash.	Pine.
December 21, 1885.....	40.93	27.56	24.25
January 4, 1886.....	40.78	27.36	23.35
January 15, 1886.....	41.01	28.27	23.63
February 1, 1886.....	42.36	28.31	23.94
February 15, 1886.....	42.03	28.98	23.88
March 1, 1886.....	42.14	28.87	23.25
March 15, 1886.....	42.83	28.25	23.12
March 29, 1886.....	42.03	27.25	22.62
April 12, 1886.....	42.25	26.96	22.44
April 26, 1886.....	41.23	24.98	21.63
May 10, 1886.....	39.45	23.98	20.83
May 24, 1886.....	37.29	22.79	19.40
June 7, 1886.....	37.05	20.78	17.81
June 21, 1886.....	36.79	20.58	18.14
July 6, 1886.....	36.70	17.78	16.14
July 19, 1886.....	36.77	15.84	15.74
August 2, 1886.....	34.99	12.74	12.85
August 16, 1886.....	35.91	13.54	14.92
August 30, 1886.....	35.03	14.66	14.04
September 13, 1886.....	34.65	13.28	13.33
September 27, 1886.....	34.66	13.00	15.36
October 11, 1886.....	33.54	12.02	13.48
October 25, 1886.....	33.50	13.77	14.28
November 8, 1886.....	33.33	14.02	14.41
November 22, 1886.....	Stolen.	13.78	14.98
December 6, 1886.....	.....	.....	14.55
December 20, 1886.....	.....	.....	14.92
January 3, 1887.....	.....	.....	14.49
January 17, 1887.....	.....	.....	14.10
January 31, 1887.....	.....	.....	14.01
February 14, 1887.....	.....	.....	14.35
February 28, 1887.....	.....	.....	14.61

The above figures indicate that there was a slight increase in all three kinds of wood between January 4 and February 15, 1886. The seasoning,—that is to say, loss of moisture,—began practically February 15, with all three woods, and ended August 2, 1886, with the ash and pine, but in the case of the oak October 11 appears to be the closing time. The results with the oak were not altogether satisfactory to the experimenters. The proposed second series of trials will, it is hoped, throw more light upon this kind of wood. From February 15, 1886, to August 2, 1887, the percentage of moisture in the ash dropped from 29 to 12½ per cent., a loss of 16½ per cent. From August 2 to December 20 the fluctuations in the moisture were between 12 and 14 per cent., the exact average being 13.27 per cent. The moisture in the pine from February 15 to August 2 dropped from 24 to 12½ per cent., a loss of 11½ per cent. From August 2, 1886, to February 28, 1887, its fluctuations were between 12½ and 15½ per cent. From October 25 to February 28 the exact extremes of moisture were 1.41 and 1.92 per cent., a difference of only 0.82 per cent. The extreme fortnightly fluctuation was 0.61 per cent. The average fluctuation was 0.3 per cent. The average moisture for that period was exactly 1.45 per cent. These experiments, although they do not at present supply infallible data, in a general way lead to the conclusion that, as regards oak, ash, and pine woods in a green condition, seasoning begins in very early spring (depending, of course, largely upon the kind of weather), and ends in midsummer. The provisional limits of this drying season may be fixed at March 1 and August 1,—in other words, including the months from March to July. It has also been shown that, as regards ash and pine, after seasoning is effected, the wood will not take back water,—that is, not beyond slight amounts during the wet and cold seasons. These con-

clusions are true, however, only for the interior parts of the woods in question, and of the size, experimented on. Variation in the character of the wood, condition at the time of cutting down the tree, treatment between that time and the first time of testing, sizes of pieces, and other influences, may alter the conclusions; but it is not likely that they would do this to a material degree.

THE HARWICH AND DOVERCOURT WATER SUPPLY.

ACCORDING to the *East Anglian Daily Times*, the most important feature in the Jubilee celebration at Harwich was the formal opening of a supply of pure water, the want of which has so long pressed upon the inhabitants of the neighbourhood. Down to the early part of this century the inhabitants of the town and the shipping frequenting the harbour had to depend upon such precarious and at best dubious supplies as could be obtained from the storage of rain-water from house-tops, spring water brought down in wherries or barges from Ipswich or Mistley, and the yield of a few local shallow wells. In 1819 an Act was obtained for the appointment of Commissioners for paving, lighting, and watering the town, with general provisions for such purposes. Boring into the chalk in search of water was resorted to in 1820-2, and in 1826, and again about the year 1810, but in neither case did it appear that water was obtained in any useful quantity that was not absolutely salt. In 1854 Mr. P. Bruff, the engineer for the works under the Commissioners' "Improvement Quays and Pier Act, 1851," as well as for the railway to Harwich, deeming it probable that the difficulty might be overcome by more care and outlay than had previously been resorted to, entered into an agreement (May 16th, 1854), with the Corporation, which was duly confirmed by the Commissioners under the Act of 1819. In consideration of the obligations and conditions thus undertaken, the Corporation granted him the exclusive concession of the water supply for seventy-five years. After various unsuccessful efforts to accomplish what was required and an extension of the limit of time in such agreement, the chalk and underlying strata were pierced to the depth of 1,098 ft., when a hard alaty rock was encountered, and proceedings were then suspended, without obtaining any water whatever. In 1862, the agreement having been revised and extended, Mr. Bruff obtained a supply of water at Dovercourt by means of a well and artesian boring, and commenced supplying the town and borough in 1865-6, and has since continued to do so. Although limited in quantity, and not all that could be desired in quality, having a considerable excess of chlorine in its composition, it proved to be the best obtainable within or anywhere near to the borough, and was thankfully accepted by a large number of the inhabitants as a great improvement upon the former state of things. In 1881, in order to meet the requirements of the Public Health Act, 1875, application was made to the Board of Trade, and a provisional order was conditionally granted, under which efforts were made to effect an improved supply, but were unsuccessful, notwithstanding further large outlay. The order was rescinded, and the agreement between Mr. Bruff and the Corporation reverted to, subject to the conditions imposed by an award made in an arbitration held in accordance with its provisions. Finding that in every case where attempts have been made within the limits of the borough only failure had resulted, it was resolved to carry out a scheme of bringing water of approved quality and in sufficient quantity from the nearest spot where it might be obtainable, and in 1884 and 1886 applications were made to Parliament to authorise works to be established at Bradfield and Mistley, and Acts of Incorporation were obtained by the Tendring Hundred Water Works Company, after considerable opposition, a previous application in 1883 having failed. A site having been acquired at Mistley, a spacious well and boring into the chalk were made, from which the present supply of water is obtained. Buildings have been erected at Mistley, and duplicate engines and pumps fixed, and a main is laid to Harwich, a distance of about twelve miles, and in addition the company have acquired the existing works at Harwich, Dovercourt, and Walton-on-the-

Naze, as well as sites for enlargement of Works and establishment of reservoirs at Bradfield and Dovercourt, and by arrangement with the Great Eastern Railway Company they expect to have a site placed at their disposal for a similar facility at Parkestown, for the use of that locality. On subscription of the further necessary capital it is intended to proceed with the extension of the conduits from the nearest points of junction at Wix Cross to the town and district of Walton-on-the-Naze. After many arduous efforts and large expenditure, extending over a period of more than thirty years, and until recently carried on single-handed by the pioneer of the undertaking (Mr. Bruff), with little encouragement from success of any kind, and sometimes against active opposition, the community of the borough and district are placed in possession of a good and abundant water supply. The wells, borings, and pipe-laying have been carefully and expeditiously carried out by Messrs. Thomas Tilley & Sons, Artesian Well and Hydraulic Engineers, of Walkbrook, London, under the direction of Mr. Peter Bruff, Mem. Inst. C.E. The erection of the buildings at the pumping station at Mistley, including a chimney-shaft 82 ft. in height, was entrusted to Mr. F. B. Capon, of Manningtree; and the engines, boilers, and pumping machinery have been fixed by Mr. A. G. Mumford, of Colchester.

#### BUILDERS' ACCIDENT INSURANCE (LIMITED).

The sixth ordinary general meeting of the above company was held at the Registered Offices on Friday, the 29th ult., Mr. Stanley G. Bird in the chair. The minutes of the meeting of the 7th of July, 1886, being taken as read, the Secretary, Mr. E. S. Henshaw read the report and balance-sheet for the year ending May 31st, 1887. We subjoin a portion of the report:—

"The Directors, in presenting their sixth annual report, have the pleasure of stating that, notwithstanding the increasing competition, the general slackness of trade, and the efforts made by other insurance companies, whose policies are (as the Directors consider) far less favourable to the insured, to draw away members, there has been during the past year a marked increase in the premium income of the Company.

During the past year notice was given to the Company by policy-holders of four hundred and nine accidents, and among these two were of a serious nature, involving injuries in the one case to five, and in the other to eleven men, but although this number greatly exceeded the number of which notice was given during the previous year, the amount paid in claims is somewhat less, and the financial condition of the Company, as will be seen from the accompanying accounts, is very satisfactory.

The Select Committee upon the Employers' Liability Bills appointed last session made the following amongst other recommendations:—

1. That the employer shall be liable to subcontractors' men in respect of injuries resulting from defects in ways, works, &c., of the employer, if such defect had not been remedied owing to negligence of the employer or his foreman.
2. That in Section 8 of the Act the words "person whose sole or principal duty is that of superintending and who is not ordinarily engaged in manual labour" should be repealed.
3. That the Court may allow an action to proceed, though no notice should have been given, if the Court is of opinion that there was reasonable excuse for the want of notice.
4. Extension of the term "workmen" to tramway servants, &c.

The Government have stated that it is their intention to introduce a Bill during the present session of Parliament presumably to give effect to the recommendations of the Select Committee, and your Directors will carefully watch any such Bill, and take such steps as they may be advised as necessary in the interests of the policy-holders.

Two Bills to extend the provisions of the Employers' Liability Act have already been introduced by independent members during the present session, but your Directors have reason to believe that neither of such Bills will pass into law.

In view of the additional liabilities which may be thrown upon employers of labour, the directors have thought it the more advisable to add to the fund held in reserve rather than to recommend a larger bonus, and believe that in so doing they will have the cordial approval of the policy-holders.

The question of issuing policies under which a workman would be entitled to compensation for injuries received in any accident, although he might have no right to compensation at law for such injuries, was carefully considered by the directors in conjunction with the actuary and solicitors, but after mature consideration the directors did not see

their way to adopt any system which would be alike feasible and attractive."

In the course of some remarks on the report, the Chairman said that the Act was every year becoming more known and appreciated by workmen and lawyers, and there was no doubt it had become a very fruitful source of income to the latter. He considered that they settled many cases for which they were not legally liable, he should say that at least fifty per cent. of their cases were settled in this way, cases which they would contest if they could only be sure of their being tried and settled on their merits, but the sympathy of juries generally went with the workmen. He thought, however, that as a rule they settled their cases in a way which not only gave satisfaction to the insurers but impressed the men with the fact that they were not harshly dealt with.

The report and balance-sheet as audited and presented to the meeting were adopted.

Mr. J. Franks and Mr. George Burt, J.P., having retired from the directorate, it was resolved "That the maximum number of directors be reduced from twenty to eighteen, and that Article 50 of the Articles of Association be and is hereby altered accordingly."

The following retiring directors, Messrs. H. H. Bartlett, S. G. Bird, J. Bradney, W. Brown, W. H. Cowin, and T. F. Rider, were re-elected.

#### CHURCH-BUILDING NEWS.

**Ditchingham (Norfolk).**—A new organ has been placed in the parish church. It is divided, and one half is placed against each side of the chancel. Handsomely moulded standards separate each lower case into two bays, the priests' door opening through one of the bays on the south side, and the keyboard occupying one of the bays on the north side. Above the standards, and corbelled beyond them, are the upper cases containing the bellows and pipes. These project only 26 in. from the wall; they are arched in three bays, carved and crocketed. The design was made to avoid hindling an organ-chamber.

The only sort of chamber for which funds were forthcoming (and which the architect declined to sanction) was a plain lean-to recess. Such recesses are a disfigurement to the exterior of our country churches, whilst two cases inside are better for the tone of the organ, and furnish and enrich the chancel, and the cost of dividing the organ is but little more than that of a recess. Mr. R. Morris, of Ditchingham, executed the cases in English oak; Mr. Godhold, of Harlestone, the carving; the whole being the design of Mr. Augustus Frere, architect. Dr. Bennett, of Norwich, undertook to arrange the specification and supervise the mechanical construction of the organ, and the work was entrusted to Messrs. Norman, Bros., of Norwich.

**London.**—The last of the Bishop of Rochester's ten churches, St. Bartholomew's Church, Camberwell, has lately been consecrated by the Bishop. The church is built in brick, lined with red brick externally, and internally with red brick in the lower portions, and yellow intermixed with a few red hands in the upper portion. The nave piers and other columns are in Dumfries stone. The nave is 40 ft. from floor to wall-plate, and is covered with a lofty roof in pitch-pine, and open to the apex. The chancel roof is carved and divided into panels, which are decorated. The tower, which contains the two vestries (one above the other) is at the east end of the north aisle, and the morning chapel is at the east end of the south aisle. Marble mosaic has been used for the chancel floor and passages, and wood blocks to floors under the seats. The chancel stalls and pulpit are in oak, and the nave and aisle seats are of pitch-pine, and fitted with "Butterfield kneelers." The accommodation is for 700 people, and the cost (exclusive of the upper portion of the tower, not yet built) about 7,500l. The whole has been carried out from the designs of Mr. W. Taprell Allen, architect, and executed by Messrs. Stephens, Bastow, & Co., builders, of Bristol and London.

**Manchester.**—St. Barnabas Church, Pendleton, was consecrated last week by Dr. Moorhouse, Bishop of Manchester. In the construction brick and terra-cotta have been used with stone only where absolutely necessary. The church is of simple detail, but substantial throughout. The contract has been carried out by Messrs. W. Southern & Sons from the designs and under the superintendence of Mr. W. H. Booth, of

Manchester. The cost has been under 3,500l., and the accommodation provides 516 sittings.

**Monkton-Wyld (Dorset).**—The Church of St. Andrew, Monkton-Wyld, has been enlarged, at the cost of the Rector, the Rev. J. B. M. Camm, by the addition of a sacristy on the north side of the old choir vestry. It has a stone altar, after the example of old English sacristies, and will also have a lavatorium carved in stone, and chests carved in oak to contain the numerous and highly valuable collection of altar frontals, dossals, &c., richly embroidered in silk and beset with jewels. The whole of the structure is in the Early Decorated style, harmonising with the church. The sacristy has been presented to the parish "to commemorate the Jubilee of Queen Victoria, 1887." A new pulpit has just been placed in the church. The base, hexagonal in plan, is of red Mansfield stone, with polished Devonshire marble columns at the angles, from which spring the groined and sculptured Mansfield stone canopy, which supports the superstructure. The pulpit, from the floor over the stone canopy to the top, is in oak, carved and enriched with buttresses, columns, pinnacles, and niches, with boldly projecting crocketed canopies. In the niches stand the figures of four saints sculptured in sycomore wood. The Saints are St. Andrew, the patron of the church; St. Cecilia, crowned with roses bearing the organ and listening in rapture to the songs of the angelic hosts; St. Mary Magdalene, bearing her costly gift of spikenard; and St. Elizabeth of Hungary, with a nun's veil and a crown on her head. A fold of her dress holds a cluster of roses, and a beggar-boy kneels at her feet, to whom St. Elizabeth is in the act of giving bread. The steps to the pulpit are in red Mansfield stone and the balustrading and bandrail in polished brass. The pulpit bears an inscription showing that it was erected in memory of Elizabeth Hodson, foundress of the church, at the joint cost of the Rev. Canon Hutchings, M.A., first vicar of this church, and the present Rector. The whole of these works has been executed by Messrs. Linscombe & Son, of Exeter, from the designs of Messrs. Hayward & Son.

**Ringland (Norfolk).**—The church here, dedicated to St. Peter, was lately re-opened, after considerable restoration works. The whole fabric was in a deplorable state, and the exquisite nave roof was in such danger of falling that it was almost beyond repair. However, with great care every unsound piece of timber has been removed, and the roof is now in a thoroughly efficient state. It is an interesting example of a hammer-beam roof, concealed by gilded ribs springing from sixteen columns supported on carved heads, and was erected in the fifteenth century, based upon the design of, and probably built by the same architect as, the roof of St. Peter Mancroft, at Norwich. The north and south aisle and porch roofs have also been renewed in oak, and the whole lead roofing has been relaid. Much repair in the masonry was needed, as trees grew out of the weathering of the buttresses, and the tower was covered with ivy, which seriously weakened it. These were all cut down, the growths removed from under the flint work, and all walls re-pointed. The stonework of nearly all the windows was renewed. In the north clearstory the original glass, representing the varicose donors, the angel Gabriel, St. John the Baptist, the Virgin Mary, and many devices and monograms, has been replaced. This part of the work had suffered much from wind and weather and the patching of village glaziers. Messrs. J. & J. King, glaziers, of Norwich, have taken great trouble to carefully refix all this glass. The seats in the nave are renewed in oak, and all the floors are laid in pitch-pine blocks, with tile borders, the monumental slabs being left in their original positions. The entire cost of the works, including pulpit, reading-desk, and chancel seats, will be 2,000l., and they have been executed by Mr. Wegg, of Norwich, from designs by Mr. E. Preston Willis, diocesan architect, Norwich.

**Scholes Church, near Cleckheaton.**—In connexion with the Jubilee celebrations a reredos was erected in Scholes Church, near Cleckheaton. The structure is of oak, consisting of three panels, filled in with emblems painted on zinc on a gold ground. A brass lectern was also placed in the church at the same time. Both these works were executed by Messrs. Jones & Willis.

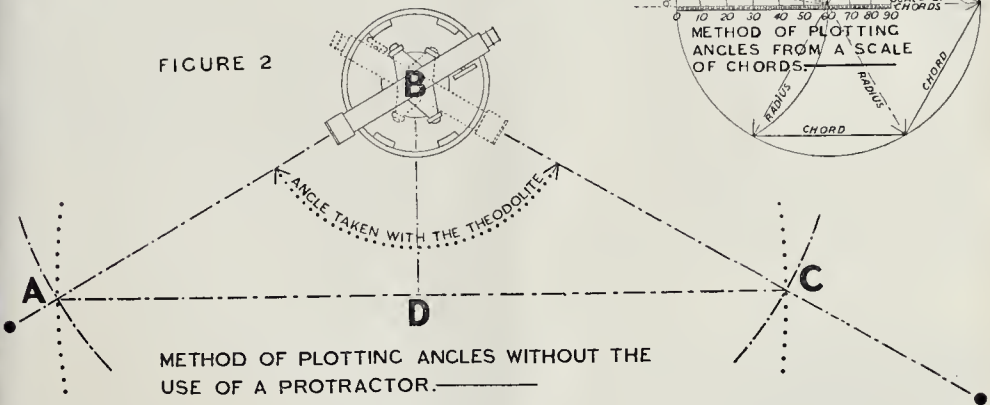

FIGURE 1

is furnished by the number of the subdivisions which appears to coincide with a division upon the primary scale. Thus when the zero point indicated by the arrow upon the vernier has travelled towards B, a distance of one-sixth of a main division from A, the coincidence appears at the first division from the arrow. For a reading of two-sixths the coincidence appears at the second division from the arrow; and for three-sixths or one-half of a main division the arrow itself coincides with the subdivision upon the primary scale. For a reading of four-sixths the coincidence is similar to one-sixth, but as the arrow in travelling from A towards B has passed the first half subdivision from zero, the one-sixth must be added to the one-half, which gives four-sixths; and, in the same way, two-sixths added to one-half gives a total of five-sixths. For further detail explanation of the vernier, we must refer our readers to p. 102, *Builder*, Jan. 8, 1887.

It will be thus seen that the same result is obtained by means of the vernier scale as would be furnished by the plotting of a diagonal scale upon paper, as shown in the diagram.

FIGURE 2

$$\frac{AD}{AB} = \sin ABD$$

$$AD = AB \times \sin \frac{1}{2} ABC$$

$$AC = 2AB \times \sin \frac{1}{2} ABC$$

**The Student's Column.**

LAND SURVEYING AND LEVELLING.

VI.—BASE LINES (continued).

ON the repetition of the angles taken at the intersection of the base lines as indicated in our previous article (*Builder*, July 30th, p. 188), it will in practice be found that both the second and third operations give a result slightly varying from the first angle read. The amount of difference when divided by the number of repetitions should, however, never exceed the value of one sub-division upon the vernier plate, if the first angle has been correctly recorded. The mean of the different results will furnish the true angle to be plotted. The advantage of recording the first reading is that it serves as a check upon the number of degrees and minutes in the final result.

The subdivisions are read by means of a

vernier, the general principle of which is illustrated in fig. 1. If the line A B represents the length of two divisions upon a continuous circle, or upon a straight line of any required length, and if, for example, each of these main divisions be subdivided into two equal portions, as shown, a sliding scale of the length of these two subdivisions containing equal divisions amounting to one more in number than the number of subdivisions upon the primary scale, will enable us to read to amounts equal to one-sixth of a main division upon the primary scale. To render the application of this clear, each main division upon the line A B is shown subdivided into six equal parts, and the sliding scale is represented in seven different positions along the line A B. The vernier or sliding scale is read in each case at the coincidence of one of its subdivisions, with a division upon the primary scale, and the number of the sixths to be taken

The most accurate way of plotting angles is by the intersection of arcs, having calculated, as shown in figure 2, the length of an hypotenuse to a triangle the sides of which are taken of equal length. For rough purposes the scale of chords found upon the short plain scale which accompanies nearly every box of instruments is sufficient. The application of this scale, as shown in fig. 3, depends upon the fact that the chord which subtends an angle of 60° at the centre of the circle is equal to the radius, so that by describing a circle with a radius equal to the chord of 60° other angles can be set out by intersecting this circle with a chord equal in length to that given upon the scale for the required angle; and drawing the angle at the centre of the circle which subtends that chord. But for important surveys a circular protractor having a primary scale of divisions and verniers similarly divided to the theodolite is usually adopted.

## A HYGIENIC BAKERY.

IN James-street, Westminster, Messrs. W. Hill & Son have just opened a new bakery, in which hygienic conditions in bread-making appear to be fully observed. The bread is made by machinery, as at their bakery in Alexander-street, Westbourne Park, which we noticed three years ago. The building at Westminster has been designed by Mr. Thomas Verity, architect, and is Renaissance in character. The builders were Messrs. Green & Lee, contractors, of Anton-street Works, Amhurst-road, Hackney. The façade is adorned with four plaques, modelled by Mr. Harry Bates, whose "Socrates teaching in the Agora," exhibited in the Academy in 1884, gained him the Gold Medal, the Travelling Studentship, and the personal congratulations of Sir Frederick Leighton, P.R.A. Mr. Bates has modelled four life-size figures in high relief, emblematical of "Ploughing," "Sowing," "Reaping," and "Milling," with subsidiary figures in each plaque that are full of life and spirit. Entering, the visitor is conducted in a hydraulic lift to the third floor; here is storage for at least a thousand sacks of flour. The different flours required for daily use are shot into a large bin, and conveyed by means of an endless screw into a hopper; when this contains 250 lb. (a sack), by a self-acting process the screw ceases to work, the bottom of the hopper opens, and the flour runs through a sieve at the rate of a sack a minute into the dough-kneaders on either the first or second floor, as may be desired. By running exactly a sack at a time through the hopper, a check is kept on the flour used, and therefore on the bread made. Upon the third floor are two large reservoirs, each holding some 1,200 gallons. The water used in bread-making runs from one of these cisterns into a Johnson Press Filter, passes through a series of carbonised discs, and is discharged into the tempering cistern. This cistern, fitted with a thermometer, has a measured glass gauge running its whole length. By this means 10, 40, or 200 quarts can be drawn at a time, whilst with the aid of steam from boiler, and ice pockets, the temperature can be easily regulated. Upon the second floor is a German oven, built for Messrs. W. Hill & Son by Mr. Albert Wirtz, of Bochum-on-the-Rhine. It has a very low interior and a sharply-sloping floor. It is this sharply-sloping floor and low interior forcing the steam evolved in baking on to the goods that gives German bread the delicate glazed appearance it presents. The drainage,—carried out by Messrs. Dent & Helyer,—has been carefully studied. The engines and different machinery have been supplied by Messrs. Werner & Pfleiderer, of Upper Ground-street, Blackfriars.

## TECHNICAL EDUCATION.

SIR,—You truly say that the attempt to introduce a system of technical education as shadowed forth in the Government Bill is disappointing and feeble, but in your remarks as to placing the artisan of England on a level with those of Germany, you are at issue with the Report of the Royal Commission on Technical Instruction, which states that the resources of Continental countries for the technical education of workmen outside of the workshop are much more limited than has been supposed to be the case, and the facilities offered for evening instruction in science and technology are inferior to what our own workmen possess. The advantages of the German workman consist in the general diffusion of elementary education, and in his being compelled to attend during his apprenticeship, for a certain number of hours per week, a continuation school, where the studies of the ordinary elementary school are continued. In many industrial centres there are societies for promoting the technical instruction of the workman in the evening. Then there are the excellent building schools, supported by the State, at nominal fees, but these are held in the day, and can only be attended by those workmen who are able to sacrifice their employment for the purpose,—a sacrifice which many make.

## TECHNICAL.

**Kensington Gardens.**—We are glad to learn, from Mr. Plunket's answer to a question asked on Tuesday, that Her Majesty has conceded to the Commissioner of Works a portion of Kensington Palace grounds adjoining the Baywater-road, in order to make a better and more ornamental approach to Kensington-gardens from that point. The brick wall adjoining the road will be removed.

## Books.

*Land and Engineering Surveying.* A rudimentary treatise by T. BAKER, revised and corrected by J. R. YOUNG, of Belfast. London: Crosby Lockwood & Co.

NEW edition, the fourteenth in number, of this well-known book has lately been issued, revised, and corrected by the late Professor Young, whose ability as a mathematician fully entitles the work as a compendium of mensuration to our best respect. Previous editions have been revised by civil engineers, and the original text came from the pen of that distinguished civil engineer, Mr. T. Baker. The book forms No. 60 in Weale's series, and, chiefly on account of its reasonable cost (it is sold for 2s.), it is one of the first books that a student who aspires to become a surveyor resolves to purchase. It contains many useful introductory hints, but leaves the student in the position of realising that he knows just enough to need some actual practice in the field before he could undertake any work with confidence, and then he discovers that, while the information acquired from the perusal of the book has done him no harm, there are many methods of work not included in the book which he must learn from the field, and which are absolutely essential qualifications for a land and engineering surveyor to possess. At the time Mr. Baker's book first appeared in print, it supplied a much-needed want for young students. Several similar works, some more elaborate, and nearly all more expensive than this little book, have likewise been issued from the press. We are, however, bound to admit that the general impression left upon a student's mind after reading these books, until he seeks practice in the field, is that lines are measured with the chain, solely to arrive at the measurement of areas; whereas in practice survey lines are run to measure offsets from, to defined points and boundaries, these lines being connected together in the most expeditious manner for the purposes of plotting; and the areas required are usually subsequently calculated from a very accurate plan. The notes upon plane geometry, and the office instruments used in plotting are practically expressed. The hints given upon the measurement of gaps and obstructions in chain lines are good. The descriptions given of the prismatic compass and of the box sextant are well written, but under the pages which illustrate the theodolite we should like to have seen the transit form as well as the plain form of instrument given. The levelling instruments described in this book have been considerably improved by such makers as Messrs. Elliott and Messrs. Troughton & Simms during recent years. There are, however, many useful remarks upon the principle of levelling, although we cannot commend the method of keeping a level book, which enters a foresight in the same line as the previous backsight taken upon the same point. Thus, upon p. 145, the system would be clearer to the student if all the figures in the backsight column were raised one line, so that the backsight reading 13.71 would come upon the same line as the reduced level, 100.00, to which it refers. The backsight reading 9.40, and the foresight reading 7.88, are both taken at 619 links from the commencement of the section, and therefore would be better booked upon the same line as this distance is booked. We also should have preferred to see a column for intermediate sights to avoid the addition of the readings taken without shifting the instrument when checking the reduction of the levels in the usual way. Thus the reading, 10.96 at the centre of the road, half-way down the page, would here have been entered as an intermediate sight. In taking sections over very rough country, considerable labour in the final reduction of the level book is saved by the introduction of a column for intermediate sights.

The excellent chapters at the end of the book, upon the laying out of railway curves, turn-outs, crossings, the setting out the surface widths of railways, tunnelling, and the methods adopted for running contours, are clear and precise, and contain most valuable information for the railway engineer. A comprehensive index is, we are glad to observe, added at the conclusion of the work.

*Cottage Building.* By C. BRUCE ALLEN, Architect. Tenth edition, revised and enlarged; with a chapter on Economic Cottages for Allotments, by EDWARD ELLIS ALLEN, C.E. London: Crosby Lockwood & Co.

A book dealing with a subject upon which many books have been written may surely claim exemption from detailed criticism on reaching a tenth edition. The date of the first appearance of the work is not stated; but many of the recommendations so eloquently urged have been carried into effect, both as regards the education of the poor and the improvement of their dwellings, and much of the author's pleading is now happily unnecessary. A great deal, however, remains to be done, and such works as this falling into the hands of landowners and others cannot fail to have a beneficial effect. There are portions of the book which require careful revision, such as the section on drainage, which appears to rely upon *double trapping* wastes from sinks, &c. (p. 27), instead of the modern and more effectual plan of disconnection. The proposal to flush the drains and cisterns by cistern wastes is, if we read it aright, not one to be commended; and we cannot approve of a cottage plan which gives no fireplace to any room but the one used as a kitchen. Every bedroom *should* have a fireplace as a security for some sort of ventilation, and as a possible necessity in case of serious illness. The designs for cottages are the least satisfactory portion of the book. Some are far from what they should be, and, indeed, might well be made better with the same expenditure; and others we should be sorry to see newly erected in any case. An additional chapter on economic cottage building promises a five-room cottage, to be erected in sections or panels of iron standards with corrugated iron filling and wood lining, at 125*l.*, furnishing a return of 6 per cent. upon the outlay, although it is not clear that the proposal has been put to a practical test. One of the recommendations given is that such a cottage could be taken to pieces and rebuilt in a new situation. We doubt the comfort of a cheap cottage so constructed. But every attempt towards so desirable an object as the healthy housing of the poorer classes should have a hearing, and if possible an experimental trial. In conclusion, we can only say that the book is extremely well written, and shows in every page that the author is in entire sympathy with the class whose claims he so warmly advocates.

*Shoring and its Application: a Handbook for the Use of Students.* By GEORGE H. BLACKOVY.

London: Crosby Lockwood & Co. 1887. There is no portion of an architect's duty which makes a greater demand upon his scientific knowledge and readiness of resource than the design and employment of the various forms of shoring, often required at short notice to meet dangerous emergencies, and hampered in its application by troublesome conditions.

This addition to Mr. Weale's well-known series of handbooks gives clear information on the principles of shoring, which the student will find not only useful but necessary, and descriptions of accomplished works of special importance and difficulty which he cannot but find interesting. The little book might have been advantageously extended and more copiously illustrated, but, so far as it goes, it may be safely recommended to those for whose use it is more particularly designed.

*Civil and Mechanical Engineering Popularly and Socially Considered.* By J. W. C. HADLAND, C.E. and M.B. London and New York: E. P. & N. Spon. 1887.

This is an attempt to write a popular book of engineering gossip somewhat lighter than even its title would imply. It is written in a lively manner, and contains some good stories, also some rather poor ones, and gives a certain amount of popular information as to what goes on in an engineering and ship-building yard (the book deals principally with marine engineering) in a very desultory kind of manner. A popular sketch of engineering work is a quite possible kind of thing to be done, but it is not so easy to do it well, and requires rather more literary grasp and power than the author seems to possess; the book hardly gives information enough for one class of readers nor amusement enough for another class; the volume is a collection of gossip rather than a book; and, like one of

an engineering inventor he describes, the author goes in for too much of the "slap-bang!" style. Those who are thinking of sending any youth into the engine-building profession may, however, pick up some hints from the book as to the nature of the life and the work he has to look out for, and a good deal of padding. Among the good stories (we do not affirm that it is new) is that of an old yachting pilot who was taking yachting through a dangerous channel, and being asked by the owner whether he was sure he would find the place well, replied "I ken every rock in this const, from Capo Wrath to the Mull of alloway,—there's one of them," he added, as the ship struck on a sunken reef.

ourist's Guide to the Wye and its Neighbourhood. By G. PHILLIPS BEVAN, F.S.S. With maps and plan. London: E. Stanford. 1887. This is a conveniently small-sized guide-book, containing good maps, indications as to routes, and a great deal of information in a small space as to objects of architectural and technological interest, better done than is usual in guide-books. A plan of Hereford Cathedral, which is of course the central object of this portion of the work, is appended.

RECENT PATENTS.

ABSTRACTS OF PATENTS.

8,310, Spray Ventilators. J. Jauka. This invention consists essentially in a U-shaped pipe, one leg of the tube being in communication with the room, the other opening to the outer air. Two sprays are employed, one to introduce fresh air into the room, the other to suck air out of the room to be ventilated. Regulation is effected by means of an appliance for widening or spreading the spray. The force of water and the draught produced is therefore at times under control; it can be regulated, or entirely shut off, by the button attached.

10,730, Ornamental Fillets. E. A. Brinkmann. The object of this invention is to cheaply imitate decorative fillets heretofore engraved by hand. Soft wood is covered with a paste of chalk and glue, and, before the paste hardens, patterns are impressed upon it, and the whole is gilt, painted, or otherwise decorated.

10,917, Glazing, &c. D. Brown. By this invention two bars are combined, each having a single curl, which supports the glass, and also forms a drip-water channel. Sometimes a covering of lead is placed over the whole astragal; this then further fixes the glass, and obviates the use of putty.

10,920, Bolts for Double Doors. F. Henson. An arrangement of spiral spring and screw allows a bolt at the top of the double doors to be easily actuated and unfastened.

11,086, Portable Buildings. J. C. Gaebauer. According to this invention, buildings designed for transport are formed of sheets and thin boards bolted together so that horses or other draught animals are not required. If for cold climates, the boards are doubled or covered outside with tiles or hurdle work filled in with clay.

14,312, Cement Briquettes. T. Arnold. By this invention the briquettes are moulded in a dry state under heavy pressure. Water is then added and absorbed by the briquette, the object of this being to avoid the formation of air bubbles and consequent weakness of the briquette.

NEW APPLICATIONS FOR PATENTS.

July 22.—10,244, J. Ripley, Cement.—10,250, C. Rogers, Wood.—10,251, G. Backus, Combined Stoves and Chimney-pieces.

July 23.—10,284, J. Wilson, Walls, Buildings, Flooring, &c.—10,292, J. Rhodes, Door-bolts.—10,324, W. Matthews, Portland Cement.

July 25.—J. Phillips, Ventilation of Sewers. July 26.—10,377, W. Youton, Fireproof Floor Construction.—10,380, T. Duncan and D. Mills, Brackets, Ranges, &c.

July 27.—10,426, T. Moore, Lifters and Fasteners for Skylights, Window-sashes, &c.—10,446, C. Howe, Plaster of Paris.—10,449, P. Beatie, Boring Bits.—10,461, T. Bray, Syphon Water-waste Preventer Cistern for Water-closets.

July 28.—10,493, H. Howse and H. Howse, Jun., Combined Door Spring and Buffer.—10,511, W. Swettenham, Flushing Apparatus for Water-closets.

PROVISIONAL SPECIFICATIONS ACCEPTED.

3,586, H. Johnson and T. Wilson, Ventilators.—3,660, E. Vorty and Others, Attaching Combined Springs and Air Checks to Doors, &c.—9,099, F. Weston, Wood Screw.—10,434, J. Eber, Automaton Apparatus for Dry-closets and Water-closets.—9,489, W. Lee, Circular Saw Spindles.—9,622, J.

Jones, Concrete Pavements, Floors, &c.—4,300, A. McKeehan and G. Wicks, Plumbers' Traps.—3,678, A. Caldwell, and J. Burnett, Warming and Ventilating Buildings, &c.—8,849, S. Bastow, Door Cramp.—9,448, H. Allen, Service Cistern for Water-closets.—9,783, A. Bayer and C. Mott, Cramp for Flooring and Woodwork.—9,813, A. Douglas Hamilton, Cows or Wind-guards.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to Opposition for Two Months.

9,808, W. Thompson, Plumber's Portable Furnace.—12,189, J. Watkins, Tapes for Measuring round Timber.—2,291, E. Young and G. Bainbridge, Ventilator.—7,755, F. Bronner, Water-supply in Houses.—2,918, R. Little and J. Hall, Timber Roofs.—3,757, W. Pidditch, Hanging Doors and Casements.—7,884, W. Duckler, Sheathing for Buildings or Structures.—9,172, L. Sagenodorph, Machines for Making Metallic Roofing.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

JULY 25.

By E. ROBIN & HINE. Brixton—Ground-rent of 1,000*l.* a year, reversion in 98 years..... 42,500

By G. A. WILKINSON.

Englefield Green, St. Jude's-road—An enclosure of freehold land, 4*ac.* or 36*ac.* 1,680  
Woolwich—A plot of land, with a garden, 5,100  
5 to 9 and 14, Hardeon's-lane, and a plot of land, freehold 680  
A plot of freehold land, with croft and croft-tenement, area 37,000 ft. 3,500  
Glass-yard—A coal store and stabling, 55 years, ground-rent 6*l.* 145

By FULKER, MOORE, & FULKER.

Mitcham—A plot of 4 acres, freehold 1,220  
A plot of market garden land, 1*ac.* 1*ro.* 10*p.* 203

By ROBINSON & RUBIN.

Beckenham—13, Ravenscroft-villas, freehold..... 290  
Bow—30, 38, Pall's-road, 72 years, ground-rent 5*l.* 910  
Eltham—50, High-street, and 2 and 3, Court-yard, freehold 310  
The residence, Whitworth House, and two shops, freehold 1,235  
1*ac.* and 1/2, and 3, Elizabeth-terrace, freehold 715  
7, 8, and 17 to 24, Elizabeth-terrace, freehold..... 1,623  
Eleven freehold cottages in Sunyard 325  
Ground-rent of 3*l.* 10*s.* in perpetuity 70  
4 to 7, Weston Park, freehold 1,319  
11, Weston Park, 40 years, ground-rent 12*l.* 10*s.* 200  
Ground-rent of 12*l.* 10*s.*, reversion in 49 years 250  
Ground-rent of 3*l.* 15*s.*, reversion in 87 years 75  
Ground-rent of 4*l.* 5*s.*, reversion in 44 years..... 110  
Ground-rent in perpetuity..... 450

By FURTER, SOX, & BYRNE.

Westminster—19 and 29, Newport-street, 74 years, ground-rent 10*l.* 430

JULY 26.

By BROAD & WILTSHER.

New Cross-road—No. 283, term 54 years, ground-rent 10*l.* 15*s.* 550  
Caledonian-road—No. 306, term 57 years, ground-rent 5*l.* 730

By T. TURNER.

Lisson-grove—94, Earl-street, 23 years, ground-rent 6*l.* 6*s.* 300  
Paddington—73, Hill-place, 51 years, ground-rent 7*l.* 7*s.* 420  
Kennington—4, Whitlam-street, 62 years, ground-rent 5*l.* 320

By H. RUTLEY.

Tottenham-court-road—The lease of 87 and 89, Whitfield-street, term 41 years 705  
Gable-square—37, Charlotte-street, 38 years, ground-rent 5*l.* 5*s.* 505

By A. & A. FIELD.

Bethnal-green—68 and 70, Royston-street, 35 years, ground-rent 6*l.* 340  
Stegney-green—18, Copley-street, 58 years, ground-rent 4*l.* 320

By A. RICHARDS.

Fulham, Peterborough-lane—Vine Cottage and Holly House, freehold 703  
Tottenham, Northumberland Park—Windor Lodge, 8*ac.* years, ground-rent 10*l.* 180  
Enfield Highway—4, Hope-cottages, freehold 350  
Enfield—12 and 13, Gost-road, freehold 300

By DEBENHAM, TWISS, & CO.

Esex, near Haverhill—Great and Little Walton's Farm, 30*ac.* or 17*ac.*, freehold 5,000  
Broad Green Farm, and 127*ac.* 1*ro.* 25*p.*, freehold..... 1,700  
Great Norton's Farm, 12*ac.* or 30*ac.*, freehold and part copyhold 950  
The Lion Hotel, and 2*ac.* or 30*ac.*, freehold 1,025  
Enclosures of land, 11*ac.* 2*ro.* 25*p.* 615  
Two cottage residences 700  
Freehold allotment gardens, 7*ac.* 1*ro.* 15*p.* 395  
Stoke Newington—Ground-rents of 28*l.*, reversion in 98 years 700

By B. BROWNE.

Limehouse, Crawford-street—A freehold site, area 6,300 ft. 800

By ROGERS, CHAPMAN, & THOMAS.

South Kensington—40, Elm Park-gardens, 87 years, ground-rent 2*l.* 1,620

By THURGOOD & MARTIN.

Belgravia—23 to 29 odd, Belgrave-road, 40 years, ground-rent 20*l.* 6,320  
51, Belgrave-road, 40 years, ground-rent 5*l.* 1,300  
19, 19, and 21, Eaton-square, 37 years, ground-rent 17*l.* 11*s.* 16,000

By DYER, SOX, & HILTON (at Deptford).

Peckham—259 and 261, Queen's-road, 54 years, ground-rent 8*l.* 826  
130 to 230 even, Queen's-road, 62 years, ground-rent 24*l.* 1,950

JULY 27.

By J. A. SMITH.

Kennington—17, Camden-grove, 56 years, ground-rent 7*l.* 4780  
Bayswater—14, Garway-road, 33 years, ground-rent 6*l.* 15*s.* 480

By W. A. BLAKEMORE.

Upton Park—Carlos Cottage, and two plots of land, freehold 1,180  
Bayswater—Upton House, freehold 165  
Sydenham—47, Kent House-road, 76 years, ground-rent 8*l.* 175

By HOBSON, RICHARDS, & CO.

Edmonton—1 to 24, Tramway-avenue, 92 years, ground-rent 67*l.* 1,080

By PHILLIPS, LMA, & DAVIES.

Northend—2, Barforth-road, 73 years, ground-rent 6*l.* 330  
City—8, Ludgate-hill, 23 years, ground-rent 6*l.* 4,210  
Southend—13, Prittlewell-square, 71 years, ground-rent 5*l.* 910

By FEENEY, PRICE, & FEENEY.

Bermodesey, Upper Grange-road—Ground-rent of 28*l.* 16*s.*, reversion in 14 years 1,430  
Ground-rents of 6*l.* 5*s.*, reversion in 23 years..... 175  
Ground-rent of 27*l.*, reversion in 24 years 1,038  
123 to 132 even, Long-lane, freehold 1,595  
King's-cross, Copenhagen-street—Ground-rent of 14*l.*, reversion in 18 years 730  
Copenhagen-street—Ground-rent of 10*l.*, reversion in 19 years 1,000  
Buckingham-street—Ground-rent of 30*l.*, reversion in 27 years..... 835  
Buckingham-street—Ground-rent of 4*l.*, reversion in 30 years 1,180  
Buckingham-street—Ground-rent of 4*l.* 10*s.*, reversion in 15 years 165  
3, 12, and 14, Buckingham-street, freehold 1,115  
43, Brewery-road, 60 years, ground-rent 6*l.* 550

JULY 28.

By D. WATNEY & SONS.

Tunbridge Wells—The freehold residence called Broomhill Park, and 12*ac.* 3*ro.* 25*p.* 15,000  
Brighton—9 and 10, Secondary-avenue, freehold 6,800

By C. C. & T. MOORE.

Romford-road—The freehold residence, St. Helen's Bethnal-green—70 and 72, Arbery-road, 64 years, ground-rent 11*l.* 555

By FURBER & SON.

Islington—32, 35, 38, and 42, Essex-street, freehold 2,890  
Barnes—1, Castleman-gardens West, 42 years, ground-rent 6*l.* 380  
Bloomsbury—13 and 14, Lascelles-place, 12 years, ground-rent 40*l.* 130

By H. C. WOOD.

Southwark Park-road—Nos. 331 and 333, 30 years, ground-rent 7*l.* 4*s.* 300

By PARKES & CHESAR.

Southwark—9, Maze-road, freehold 405

By C. D. FRENZ & SONS.

Borough—37, High-street, freehold 2,940

By FOXMAN & CO.

Kilburn—10, Goldsmith-place, 57 years, ground-rent 6*l.* 480

By H. J. BLISS & SONS.

Bethnal-green—2 and 3, Albert-road, 67 years, ground-rent 5*l.* 630  
5 and 6, Albert-road, 68 years, ground-rent 47*l.* 575  
Hackney—7 to 14, Cross-street, 69 years, ground-rent 28*l.* 1,130

By E. SIMMONS.

Lambeth—89, 101, and 103, Vauxhall-walk, 55 years, ground-rent 10*l.* 650  
Gid' Charlton—16, 17, and 18, Victoria-road, 64 years, ground-rent 22*l.* 6*s.* 1,240  
Kennington-road—124 and 126, Prince's-road, 21 years, ground-rent 13*l.* 280  
Denmark-chill—20, Danville-road, 75 years, ground-rent 5*l.* 10*s.* 380  
16, Belborne-road, 75 years, ground-rent 5*l.* 10*s.* 305

By NEWBOW & HADFIELD.

Hackney—42, Gore-road, 63 years, ground-rent 7*l.* 340  
Upper Holloway—28 to 40 even, Brunswick-road, freehold 1,370  
Prospero-road—Freehold land, 2*ac.* 3*ro.* 1*p.* 3,300

By W. EDYMAN & SON.

Acton—2 to 8 even, Grove-place, freehold 870  
82, 84, and 90, Park-road North, freehold 1,745  
101, 103, and 105, Park-road North, freehold 860  
34, 36, and 38, Gohorne-road, freehold 1,600  
74 and 76, Bello Bridge-road, 330  
The Gladstone public-house, freehold 3,100  
Saville-road—Two plots of freehold land..... 130

JULY 29.

By ST. QUENTIN & SONS.

Mitcham—A plot of copyhold land, 1*ac.* 2*ro.* 16*p.* 150

By F. C. KATTEL.

Epping, Station-road—The freehold residence, Laurel Bank 1,550

By DEBENHAM, TWISS, & CO.

Worcester Park, Avenue-road—The Bungalow, with stabling, and 2*ac.* 2*ro.* 25*p.* 1,500  
3, Redcross-road, freehold 360  
Hyde Park—33, Southwick-street, 43 years, ground-rent 11*l.* 800  
6, Porchester-place, 45 years, ground-rent 10*l.* 10*s.* 1,100  
Clapham—9, The Pavement, 19 years, ground-rent 67*l.* 800  
Shepherd's-lane—57, The Lawn, 4 years, ground-rent 6*l.* 6*s.* 100

By PRICKEETT, VANALBES, & CO.

Ponder's End, South-street—Freehold residence 1,030  
Highgate—15, Cromwell-place, 94 years, ground-rent 10*l.* 10*s.* 800

By BECKLAND & CO.

South Kensington—10, Prince's-gardens, 57 years, ground-rent 70*l.* 10,000

By REYNOLDS & EASON.

Hexley Heath, North-street—A plot of freehold land 60  
1 and 2, Leamington-villas, freehold 350  
1 and 2, Warwick-villas, freehold 315

## MEETINGS.

**SATURDAY, AUGUST 6.**  
*Royal Archaeological Institute (Salisbury Meeting).—*Excursion to Wardour Castle, Tisbury Church, Wilton House and Church. Sectional Meetings in the evening.

**MONDAY, AUGUST 9.**  
*Royal Archaeological Institute (Salisbury Meeting).—*Excursion to Boyton Church and Manor House, Scratchbury Camp, Heytesbury Church, Knoke Church, and Heytesbury House. Sectional Meetings in the evening.  
*Clerks of Works Association (Carpenters' Hall, London Wall).—*Mr. Linn Dillon on "Technical Education and its bearing on Clerks of Works." 8 p.m.

**TUESDAY, AUGUST 9.**  
*Royal Archaeological Institute (Salisbury Meeting).—*Excursion to Farnham Museum, Woodcuts (Romano-British) Village to Rushmore, returning by way of Rotherly Wood (Romano-British) Village, Winklesbury Camp, and Ferne. (Concluding day).

**SATURDAY, AUGUST 13.**  
*Architectural Association.*—Visit to the Seat of Mr. E. W. Currie, near Farnborough, Hants. (See advertisement on p. 214.)

## Miscellaneous.

**The Sanitary Condition of Margate.**—Margate and its sanitary condition continues to engage public attention, and the Town Council have published a report by Professor Corfield on the mortality returned of the borough during the six months ended June 30th of the present year. The report shows "that the borough has been during the past half-year remarkably free from zymotic disease of any kind"; but no one is content with this fact if Margate retains conditions which are liable at any moment to be a source of danger to the inhabitants and visitors. Families visiting the seaside for the benefit of their health do not desire to inhale the exhalations from hundreds of cesspools, however much these may be diluted by the sea breezes. Last year showed Margate to be the seat of a considerable prevalence of typhoid fever, and the town still has about it all the conditions to foster this disease. It would be a misfortune if the public mind were quieted before the Town Council have recognised the necessity of performing the most elementary duties of a sanitary authority, viz., the provision of a safe water supply and of a proper system of excrement disposal. As a mere matter of pecuniary investment, the necessary outlay would have an ample return in the security it would give to the health of the many persons who annually frequent this locality. Until the Town Council have fully complied with the recommendations contained in Dr. Page's report to the Local Government Board, and are able to assert that the conditions which are therein properly condemned no longer exist, it is impossible for intending visitors to think of Margate as a town in which proper precautions are taken to secure them from disease.—*Lancet.*

**The Health of Ramsgate.**—The Medical Officer of Health for Ramsgate, in his half-yearly report to the Sanitary Authority, stated that the birth-rate of the borough was 25.6, the death-rate 14.3, and the death-rate from zymotic diseases .3 per 1,000 for the past six months. He reported that the general sanitary condition of the town was good, and that there was a marked absence of those diseases which are attributed to defective drainage. He considered that the satisfactory state of the district was due to the completion of the extensive new drainage works, and to the alteration of the sewer outfall, which together cost the town upwards of 20,000*l.* and which must still further enhance its salubrity, although it has long been one of the healthiest towns in the kingdom.

**Iron, Hardware, and Metal Trades' Fension Society.**—At the semi-annual general meeting of this Society, held at the offices in London last week, the following pensioners were elected, viz.:—Men (four): George Brown, Rotherham, 660 votes; Richard Farmer, London, 650; John Bettridge, London, 538; and John Finch, London, 450. Women (two): Charlotte McKenzie, Birmingham, 2,504; and Mary Aldous, London, 2,070. Mary Holley, Sheffield, being the highest unsuccessful candidate, received the Falkirk Iron Company's gratuity of 5*l.* 5*s.* John Bettridge was awarded a pension of 20 guineas; the remaining five received pensions of 25 guineas, they or their late husbands having been subscribers to the Institution.

**Ferry & Co., Limited.**—The directors of this company have resolved to pay on the 1st September, out of profits, an interim dividend on the ordinary shares for the first six months of this year at the rate of 6 per cent. per annum, free of income tax, being at the same rate as for the corresponding period last year.

**The Belgian Girder Competition.**—The Belgian girder competition question has just taken an important turn which should be to the advantage of English makers. Excitement exists among buyers at the circumstance that the prices of Belgian, French, and German rolled joists delivered into this country have just been advanced about 10*s.* per ton, the result of the increased number of orders being received at the works. London importing merchants are also advised that a further advance of 8*s.* per ton is contemplated, since Continental makers are determined to make the most of the present enlarged demand. The fact that the Continental girder-makers have been getting scarcely any profits during the last year or two had led to the expectation by English merchants that a rise would be declared at the first opportunity. Scarcely any of the Continental companies paid a dividend last year, and the highest that was paid by any one concern was 14 per cent. The advanced prices of Belgian rolled joists delivered into the Midlands, if delivered promptly from stock in London, and allowing a small middleman's commission, are:—12 in. by 5 in., lengths to 30 *ft.*, 6*l.* 12*s.* 6*d.* per ton, and 10 in. by 5 in., 6*l.* 10*s.* If consumers are prepared to wait for orders so as to allow of the iron being got direct from the works, the prices are very much lower, namely, 5*l.* 12*s.* 6*d.* for 12 in. by 5 in., and 5*l.* 11*s.* 10 in. by 5 in. Small sizes, such as 6 in. by 3 in., are about 5*l.* 14*s.* 6*d.* brought from stock and delivered into the Midlands. The fact that English ironmasters have given up the manufacture of rolled iron joists in competition with the imported goods, and that they are now confining their attention to rolled steel joists, makes it much easier for the foreigners to command the advances just declared than would have otherwise been the case. English architects are, however, becoming acquainted with the circumstance that native makers are now giving their attention to steel, and are specifying steel joists in building erections. Messrs. Dorman, Long, & Co., Middlesbrough, who have taken the lead as makers, report that they have lately found the demand for steel joists increasing. Prices of English joists of this description delivered into the Midlands are now 6*l.* 15*s.* per ton up to 8 in. deep, 7*l.* per ton up to 10 in., 7*l.* 5*s.* up to 12 in., and 7*l.* 15*s.* up to 16 in., which is the maximum size at present manufactured.—*Iron.*

**Local Government Board Inquiry at Birmingham.**—An inquiry was held at the Council House, Birmingham, on the 27th ult., by Mr. J. D. Harrison, to consider an application by the Corporation to borrow 6,000*l.* for sewage purposes. The Town Clerk, in supporting the application, said the money was required to construct a sewer which was necessary to prevent a great difficulty that had been experienced with regard to the flooding of a portion of the borough. The proposed sewer would commence at the River Lea, and the storm-water would pass into it, near Montague-street Wharf, and from this point would be continued through the Corporation Wharf, along Glover-street, Bond-street, Bordesley, along the Midland Railway Embankment, and terminating in Lawden-road, at which point it would be connected with the brook course. It would not, however, have any influence with the brook's course, except during heavy flooding. The Borough Surveyor (Mr. Till), in exhibiting the plans, said he had seen water lying to a depth of 2 *ft.* 6 in. above the roadway. The full length of the proposed sewer would be 1,667 yards, and of these 1,035 yards would have a diameter of 4 *ft.* and 632 yards a diameter of 3 *ft.* 6 in. Mr. Till said that a provisional arrangement had been made with the Midland Railway Company, and the Warwick Canal Company would have no cause for complaint, as the proposed sewer would benefit their property. In answer to Mr. Pollock, of London, who acted on behalf of Lord Norton, Mr. Till said it was not intended to connect the new sewer with any other sewer. The Inspector said he quite understood that the new sewer would be perfectly distinct from the ordinary sewage system, and would only carry storm water. In answer to another question, Mr. Till said he did not intend to have storm outlets in the course of the sewer. The Borough Treasurer, in answer to the Inspector, stated that the population had increased by 25,000 since 1881, and that the loans borrowed under the Sanitary Act amounted to 969,853*l.*, of

which sum 144,799*l.* had been paid off. The Inspector thought the work proposed to be done was very necessary, and after a vote of thanks to him the proceedings terminated.

**The High School for Girls, Stroud Green,** which has been erected here for Miss Emily Mills, was opened on Tuesday afternoon, the 26th of July. The design is an adaptation of the "Queen Anne" style. The walls are of yellow bricks, with red dressings and arches, relieved with a light brown stone from the New Biggen quarries; and the gables are finished in rough cast ornamental plaster, upon which is worked the date of the foundation and the title of the school. Over the side porch for pupils is carved the motto of the school, "Doe ye nexte thyngs." The school contains accommodation for 300 scholars, in four large apartments known as the lecture-hall and third-form room on the first floor, and gymnasium and kindergarten-room on the ground-floor, in addition to which there are three music or class-rooms and a dressmaking-room, also housekeeper's rooms, cellars, and other domestic offices, principal's room, dressing-room, and lavatory for professors on each floor, and a bath-room, each fitted with hot and cold water. The total cost of the building and fittings has been 2,400*l.*, or 8*l.* per scholar. The building was designed by Mr. W. S. Wilson, in conjunction with Mr. J. W. Stevens. The work has been carried out by Messrs. Lansdowne & Co., of Richmond, Surrey. Mr. Rogers, of Hornsey-road, has executed the internal school fittings.

**The Home of Mercy, Lostwithiel.**—The Home of Mercy stands upon rising ground over and above this pretty Cornish town, and commands a superb view. It was built some twenty years ago from the designs of the late George Edmund Street, R.A., and attached to it is a chapel dedicated to St. Faith. Some few years ago a special gift was made to this chapel in the shape of a fineeredons in polished alabaster and marbles, designed by Mr. R. Medley Fulford, F.R.I.B.A., architect, of Exeter, and made by Mr. Harry Hems, of the same city. Additions to this oratorios have just been made at either side. Niches have been placed in the east wall, within which stand life-sized statues of SS. Peter and Paul respectively. They are set upon corbels held up by angels. The canopies are delicately groined, and terminate with lofty crocketed spires. The new work, like the surroundings, is of early character, designed by Mr. Fulford and carried out in its entirety by Mr. Harry Hems.

**A Working Men's Flower Show.**—We hear that the Co-operative movement will be well represented at South Kensington on August 23rd, on the occasion of the National Co-operative Flower Show, held under the auspices of the Royal Horticultural Society, which will be an exhibition of the products of *bona-fide* working men's gardens, grown from seeds sold in penny packets, through the medium of the twelve hundred co-operative stores which now exist. The show cannot help being interesting and instructive, as it will so thoroughly represent the gardening capabilities of small cottages throughout the length and breadth of the land. Cheap excursions are being organised from all parts of the kingdom, and the Conference, which is to be held in the afternoon on the "Possibilities of Co-operative Allotments and Associated Gardens," will doubtless be well attended, and give rise to an interesting discussion.

**Road Surveyors' Association for Scotland.**—A meeting of this Association was held within the pavilion of the Highland and Agricultural Society at Perth, on the 25th ult., at which there was a large attendance. Mr. Mitchell, Dundee, President, occupied the chair. The office-bearers elected for the ensuing year were, Mr. Rankin, Carronbridge, President; Mr. McLennan, Dunfermline, and Mr. Laidlaw, Linlithgow, Vice-Presidents; Mr. Stevenson, Ayr, Secretary and Treasurer. After the ordinary business had been completed, papers on "Bridges and Culverts," by Mr. Aikén Cmpar, and "Amendments suggested on the Road Act," by Mr. Laidlaw, were read and discussed.

**Romano-British Remains.**—The new volume of the "Gentleman's Magazine Library," to be issued by Mr. Elliot Stock immediately, will contain the completion of the section on "Romano-British Remains." In it we are promised a record of the discoveries of Roman remains in all parts of the country, classified into counties.

**LONDON.**—For alterations and additions to the office of the English and Scottish Law Life Assurance Association, 12, Waterloo-place, S.W. Mr. Mark H. Judge, architect, 5, Park-place Villas, W. —

### Irish River Conservancy.

**L**reland, outlets for the water issuing from drained land began to be made in 1843, but not much was done until 1846 and 1847, the time of the potato disease.

Between that time and the year 1863 more than two and a quarter millions of money were spent in the construction of public works in that country, of which nearly two millions were spent on these outlets for land drainage, or arterial drainage as it has been called. Practically, it is a lowering of the water-level of the outlets of land drainage, to enable the land drains to be laid with a sufficient fall for a sufficient distance from the arterial drains. The area so provided for during those years,—and mostly during the ten or twelve years from 1846 to 1857,—was 266,391 acres, statute measure. The average cost per acre was 6*l.* 17*s.*, and there was, of course, the cost of the land drains besides. This land drainage is called, in Ireland, "thorough" drainage, and is distinct from the subject of arterial drainage, of which we now desire to say something, the basis of which is the Appendix to the First Report of the Royal Commission on Irish Public Works, which contains the evidence given before the Commissioners who sat on forty-three days between October, 1886, and April, 1887. The Appendix is accompanied by a map on the scale of ten miles to the inch. There have been three systems or orders of procedure under which the arterial drainage of Ireland has hitherto been undertaken. Under the first, constituted by an Act of Parliament in 1831, landed proprietors were enabled to form themselves into joint-stock companies, and to proceed with the execution of drainage works without the intervention of other Acts of Parliament, and by private agency and with private funds to execute the works. Little practical result, however, followed this measure, and Parliament endeavoured to find some more effectual means for the attainment of the object by an Act passed in 1842, which provided that the works might be carried out by the Government on the application of owners of land in any district of the country. It was not necessary that all the owners, in a district desired to be drained, should make the application, or should agree to the work being done, but Government took action on the application of the owners of two-thirds in value of the lands proposed to be provided with proper outlets for the drainage, whereupon the works were carried out by the Commissioners

of Public Works in Ireland, or the Irish Board of Works, as they are more commonly called, under the superintendence of engineers appointed by that Board. It was intended by this Act that private funds should still bear the chief part of the expense of the works, but it did not exclude the Government from being one of the subscribers, on the security of the improved value of the land. On the undertaking being completed in any district so drained the expense was apportioned on the lands benefited, according to the benefit conferred; but during the next three years drainage works progressed slowly, and it was not until the famine years, to which we have made reference, that serious attention was given to the subject. There then ensued a demand that means should be found for the employment of labour to alleviate the wide distress. If such means were to be supplied by the Government, it was thought desirable that it should be by way of employment on reproductive works, and the choice fell on arterial drainage. With a view of meeting the urgency of the case the Government obtained fresh Parliamentary powers in 1846, which enabled the Irish Board of Works to proceed with works of this kind on its own responsibility, with the consent of the proprietors of but one-half in value in any district proposed to be drained. These works were then largely proceeded with, the Government lending the money; but, when the famine was over, the Government became alarmed at the outlay, and directed every exertion to be made to close the works, and return to the ordinary procedure under the Act of 1842. Complaints were made by the landed proprietors that, in order to find work for labourers, schemes had been forced upon them. By an Act passed in 1853, special Commissioners were appointed to inquire into these complaints, who recommended extensive remissions to be made, and in 1859 the amount so remitted, out of the total outlay of 1,827,068*l.*, was 906,786*l.*, or nearly one half. Whether that was satisfactory to the Irish landowners we do not know, but it seems to have had the effect of stopping further supplies from the Imperial Exchequer on that system of carrying out the work; for, after 1857, nothing seems to have been done until 1863, when an Act of Parliament was passed which relieved the Government of the responsibility of executing any works through the instrumentality of the Irish Board of Works, and by the engineers appointed by that Board. The aim of this Act was to leave the initiation of arterial drainage entirely to proprietors, and to enable them to carry out works with less interference, but offering them the advice and experience of the Board of Works and its

engineers, and the assistance of loans of money. Before we say anything of this new arrangement, however, we may say that the amount (1,827,068*l.*) was expended on 119 districts, the average area of which is 2,239 acres, the average cost per acre,—the acre being in all cases herein referred to the statute measure,—was 6*l.* 17*s.*, but in three of these districts, comprising 41,000 acres of drained land, the drains were made navigable, and in these cases the average cost per acre was 7*l.* 15*s.*, or less than 1*l.* above the average cost of drains not navigable. It must be said, however, that these were not new cuts; they were, for the most part, navigable waterways already, and what was done in them was of the nature of improvement only. In the case of a new cut, the difference between the cost of what would be necessary for drainage only, and that which would be necessary if navigation were provided also, would probably be greater than it appears from these figures, in the first instance; but in the long run it would, nevertheless, be found probably the more economical of the two. The average expenditure on each of these districts was 15,35*l.*, but on each of four of them it exceeded 100,000*l.*, and the average cost per acre of these four was 8*l.* 8*s.* The total area of the four districts is 57,166 acres, and the total expenditure upon them 481,911*l.*

Going from this largest class of drainage districts to those upon which more than 20,000*l.*, but less than 70,000*l.* was expended upon each, there were, of these, twenty-one, comprising an area of 108,211 acres, and upon which 808,385*l.* were expended, the cost per acre being 7*l.* 9*s.* Then there are thirty-one districts upon which less than 20,000*l.*, but more than 5,000*l.*, were expended on each, the total area of which is 65,653 acres, and the expenditure 331,431*l.*, the average being 5*l.* 1*s.* per acre. The smallest class of districts, those upon which less than 5,000*l.* were expended on any one district, are sixty-three in number, comprising 31,377 acres of drained land, at a cost of 122,564*l.*, or an average of 3*l.* 1*s.* per acre.

These were the works and this was the cost of draining the 119 districts under the conditions of the Acts of 1842 and 1846, and of which the landowners complained, although the annual improved value of the 266,391 acres of drained land was 74,502*l.*, and the average return per annum of the 1,827,068*l.* expended was over 4 per cent., and, if the remission which was made by the Government of 906,786*l.* be allowed for, the average return per annum must have been over 8 per cent. However, works were practically suspended after the famine time, but the importance of providing further means for arterial drainage forced itself on the attention of Government,

the outlines are the same, but the stern expression is lost in the outline sketch. The castle, or the portion shown, is dated 1562, a date which accords with the details of interior doors given on the same plate, but not (to the "Southron" mind) with the exterior of the building itself, which stands as an outward or visible sign of the longer duration in Scotland of the fiercer type of feudalism which had at this time pretty nearly died out in England. There is, perhaps, not in all Great Britain a more characteristic bit of building than Rowallan. Compare that with the (in its way) equally characteristic manor house of Ockwells, Berks, very fully illustrated in a series of measured drawings (plates 10 to 12); this is a century earlier than Rowallan; but what a contrast between the stern northern castle and the quiet-looking domestic southern English dwelling-house. The two are eloquent of the respective social states of the two countries at the time.

One of the most interesting portions of the collection is the series of very careful measured drawings (plates 48 to 57), devoted to the illustration of New Abbey or Sweetheart, a few miles from Dumfries, the latter *alias* arising from a legend as to an embalmed heart preserved there. This ruined abbey was well worth such careful illustration, both on account of its powerful and grand style of work and its many interesting peculiarities of detail. Newark Castle is carefully illustrated, with plans and geometrical drawings. Various pencil sketches of Scotch work,—old houses in Paisley and elsewhere; the west end of Paisley Abbey, with a fine and rather unusual arrangement of tracery windows; views of Glamis Castle, Midmar Castle, and others; details from Jedburgh Abbey; these and many others are of great interest, and charming to look at.

In the larger pen-drawn geometrical drawings, Mr. Browne gives us clear, strong-lined, and what may be called business-like, drawing, but the strongly-ruled joints across the masonry, and the thick lines generally, give a somewhat mechanical appearance to this portion of the drawings; and the throwing back of the portions on a more distant plane, as in the elevation from Dryburgh Abbey (plate 15), by vertically-ruled shading lines, is still more mechanical, and a device in architectural draughtsmanship that is, to say the least, not worth the trouble it gives; besides, it crowds up the surface of the paper and interferes with the clearness of the actual construction lines (especially curvilinear arch lines) which have to cut through all this ruling. For pencil-drawing the author's touch and style is charming. Occasionally we find a certain now fashionable trick of effect with draughtsmen carried a little too far,—that of stopping or interrupting lines and leaving the eye to carry them on in imagination. This is to a certain extent a legitimate source of effect, and it is in accordance with the actual effect of moulding lines, on old buildings especially, under varying gradations of light; but when we see the cornice of the circular tower at Falkland Palace (plate 24) completely omitted in the middle portion, as if it had dropped out (which we do not imagine is what is intended to be conveyed), one is tempted to ask whether it is not rather a too easy mode of sketching to draw only the beginning and end of a set of curves, and leave the rest to imagination. There seems also to be a disposition among the modern school of draughtsmen to be less particular about perpendicularity than formerly. In the sketch of Ponds Priory Gate (plate 5) the arcade above the gateway is falling backwards; in that of Dunblane (plate 19) the clearstory windows are tumbling in. The comparison of the two leads to the conclusion that this is a licence of sketching, not a representation of fact. We used to think it was a special characteristic of ladies' architectural sketching that their buildings are not upright. Architects should be more careful.

**The Suggested Board of Forestry.**

The report of the Select Committee on Forestry has been issued. The Committee recommends the establishment of a Board of Forestry, presided over by a responsible Government official.

**NOTES.**

**T**HE Midland Railway strike does not seem to be turning out so serious a matter for the company and for the public as it was at first feared that it would. We must confess that we regarded with considerable apprehension the statement that fresh hands were being taken on from other railways to act as drivers, seeing that to learn the signal system of a great line is no easy matter, and that it is generally understood that all drivers go through a probation of learning the road, in the capacity of stokers or otherwise, before they are allowed to drive on it; and we "attended ourselves," as the French put it, to a serious accident from some mistake of a driver unfamiliar with the road. It says much for the pains and care exercised by the officials in charge and their new helpers that nothing of the sort has occurred. With regard to the matter in dispute between the Company and the men, it appears to us that the Company are in the right. We are told by those who ought to know that the men, even under the new system proposed, would be paid better than those of any other railway in the world. The kind of complaint which the men make is represented in what was said to us by a passenger driver on the Midland (not a striker), that if he went from Liverpool to London and back with a "special" he would be so situated that he would not be able to take his turn next day, according to the rules, but must make only five days that week. This, however, is surely a matter that could be easily arranged by a scale of pay for distance run. Knowing what is the average proportion of willing workers and unwilling workers among mankind, and remembering that even engine-drivers are but human, we should expect that a system ensuring a week's pay, whether the usual amount of running was done or not, would infallibly be taken advantage of by the less worthy and diligent men whenever a chance occurred, and that to the detriment of the hard-working and willing men; and it must be remembered that the work of a great line cannot be carried on well without a strict disciplinary system, and what is now proposed by the Company is only the system in existence on most of the other great lines in England. We fear the men are in the wrong in the general demand, and there is no question that those who thought proper to pull up their trains at a given time and desert them are flagrantly to blame, and that the Company are quite right in their positive refusal to re-engage any men who had neglected his obvious duty, not only to his employers but to the public, in such a manner. It is the case of a sentinel deserting his post.

**O**N Monday last was issued a supplementary estimate for 363,799*l.* in connexion with the Civil Service and Revenue Department. Amongst the payments is one of 256,000*l.* to the Local Government Board for certain distrikted and main roads in England and Wales; and one of 8,000*l.* to Messrs. Leeming & Leeming, architects, "in full satisfaction of their claims upon her Majesty's Government in connexion with the preparation of plans for the erection of new offices for the Admiralty and War Departments." The taxpayer is hereby reminded that the scheme for fresh buildings over the Spring gardens and Whitehall sites is for a while in abeyance. A grant in aid of 2,000*l.* to the Victoria University is also included in this estimate. There are also grants of 4,000*l.* in aid of cost of site of the new hall for Edinburgh University; and of 2,230*l.* for buildings at the Royal University, Ireland. A fair pecuniary justice seems to have been done to Messrs. Leeming & Leeming, provided they had not made working drawings for the new building; and we presume matters had not gone so far as that. Most of those who are interested in architecture will be glad to hear that their commonplace design is shelved; and it is to be hoped that public opinion may still be stirred up to protest against the miserable

economy which recommends a piece of cheap patchwork for the War and Admiralty Offices, instead of a building worthy of the nation.

**T**HE fire at Whiteley's has once more frightened people about the safety of London in the admittedly improbable event of two great fires taking place on the same night. Practically, the whole available fire engine force was concentrated on one conflagration, and though London is not now the combustible town which it was when the Great Fire occurred, there might be an unpleasantly near chance of something like a great fire establishing itself some night if two "Whiteley's" took to burning simultaneously. The question is partly one of rates, of course, and those who grumble just after a great fire because there are not enough fire-engines, would probably grumble equally at being double-rated for a fire service of double efficiency. There is, perhaps, another practical difficulty apart from this, in the fact that, however great may be the demands occasionally made on the fire-brigade, they are few and far between; and there is a not unnatural feeling as to the waste of *matériel* and *personnel* which would be incurred in keeping up a much larger force of men, engines, and horses, which would be for far the great majority of their time standing idle. If any system could be developed by which extra men could be trained and engaged, to be called out only when urgently needed, and to be at liberty to work at their own occupations in the meantime, on the understanding that they should be within a certain radius of the station, and so as to be easily summoned (which, if we mistake not, is the actual system now pursued in the lifeboat service), there would seem to be the best chance by such a system of squaring efficiency with economy, and not keeping men about as idlers: this latter necessity being in itself objectionable on other grounds than those of economy.

**A**S usual, a large fire brings out the stereotyped queries, "Why is not everything fireproof?" and Earl Wenyns writes to the *Times* to ask why Whiteley's and all other buildings are not built with Brannon's fireproof covering to the timbers, which by this system are encased in a fibrous, non-combustible concrete. These things are not so easy and obvious as Earl Wenyns supposes. The question of increased cost would be very considerable, which Earl Wenyns would probably recognise if he had to erect a large building at his own cost; but there is the further question, which does not occur to amateur correspondents on these matters, What is the wood doing all the while under this concrete shroud? Wood is a material the behaviour of which requires looking after, and the man who puts his faith in coating the structural timbers of a roof with concrete might be disagreeably surprised some day to find that a rotten tie-beam or strut let the roof down over his head.

**I**N a letter to the *Times* of Tuesday, Mr. W. H. Gregory makes a protest in regard to the condition of the National Portrait Gallery and the South Kensington Museum. The erection of an adequate and worthy building for the National Portrait Gallery is the main object of his letter, but the completion of the South Kensington Museum building, which Mr. Gregory only treats as an accessory matter, seems to us by far the most important matter of the two, and the one of most public and artistic interest. The fact is the National Portrait Gallery has never been an object of high interest to the cultivated portion of the public, on account of the very fact which Mr. Gregory emphasises, that it is not an art collection, and the pictures composing it are not thought from artistic considerations; and the dull and uninteresting aspect of a collection of mostly second-rate and third-rate paintings cannot be much atoned for by the consideration that the subjects of all the paintings are of more or less historical interest. Few visitors were ever found in the National Portrait Gallery when it was in the dangerous but more accessible "sheds" in the Exhibition-

road; we understand there are fewer still at Bethnal Green; and we cannot wonder at it. The collection is not likely to prove attractive to "the masses." Bethnal Green is the wrong place for it, and it was only sent there temporarily, and there ought to be a gallery built or found for it in a more central situation. But the state in which the principal front of the South Kensington Museum has for many years been left is, to our thinking, a much greater artistic scandal, and one which has existed so long that, as Mr. Gregory observes, the London world has become quite accustomed to it and makes no complaint; and we are apt to forget that these bare and unsightly brick walls, behind which our art treasures are placed, do not represent the kind of architectural covering which was ever intended for them as a permanency. It is really contemptible that, while spending money freely on the acquisition of artistic objects not always of equal worth, we should leave the building containing them in the forlorn state which seems now to be tacitly regarded as permanent. Even if Londoners are accustomed and reconciled to it, how does it look to foreigners? The South Kensington Museum has a world-wide reputation; how does it strike artistic students from the Continent, who come to see the exhibition as one of the art-springs of Europe, to find its outward aspect that of a barn? The fact can scarcely raise the credit of England in their eyes.

FROM a reply of Mr. Egerton's to Mr. Künher, on Monday evening in the House, it appears that, a portion of the cornice of St. Mary-le-Strand having fallen, the church has been declared by the Board to be a "dangerous structure." This may be all very well so far, but we become somewhat alarmed when the representative of the Board goes on to say that "The Board had before them suggestions for widening the Strand at that point, either by the removal of the south side of Holywell-street or by the removal of the church, but they were not in a position to act upon either suggestion." From the tone of the Board's representative, it seems pretty evident that the Board would be perfectly ready to pull the church down if they were "in a position" to act upon the suggestion. When suggestions like this are mentioned in the House, and get into people's mouths, there are always some idiots desirous to act on them sooner or later. We published some time ago an illustration showing how the Strand could be widened by forming a roadway on either side of the two churches, in the shape of a fine design made by Mr. Brewer for a certain "Strand Improvement Association" (see *Builder* for Dec. 26, 1885). This scheme would not only not sacrifice the churches, but would realise a new and very fine effect, while giving ample roadway. But it would be easier, and cost less, to pull down a fine building, and that is the only thing that a body like the Metropolitan Board of Works thinks of.

IN June last we published the names of the authors of the fifteen selected designs for the completion for the new front of Milan Cathedral. The name "Teodoro Ciaghin," of St. Petersburg, was No. 9 in the list. We have lately received from a correspondent the news of the sudden death of Theodore Tchagine, at the early age of twenty-seven. He was a member of the Imperial Academy of Russia, and Professor of Architecture at the University, and is said to have been a man of exceptional ability.

LONG'S Hotel, New Bond-street, is about to be demolished and rebuilt. In connexion with its earlier annals the following note by Sir Walter Scott (*vide Moore's Life of Byron*) is worthy of remembrance:—"I saw Byron for the last time in 1815. He dined or lunched with me at Long's in Bond-street. I never saw him so full of gaiety and good humour, to which the presence of Mr. Mathews, the comedian, added not a little. Poor Terry was also present." This part of Bond-street stands on what had been the grounds of Clarendon, vulgarly styled Holland, or Dunkirk, House,

as bought in 1675 by Christopher Monk, second Duke of Albemarle, of the Earl of Clarendon, son to the Lord Chancellor Hyde of that title. Evelyn tells us that the price paid was 25,000*l.* Monk sold most of his purchase (*circa* 1685) to Thomas Bond, of Peckham, comptroller of Queen Henrietta Maria's household, whom Charles II. had made a baronet. Bond pulled down the house and erected Bond, Albemarle, and Stafford Streets over the property. Clarendon House stood north of Piccadilly, over against the end of St. James's street.

WE have received from Mr. B. G. Jenkins, F.R.S., his London weather chart for the rest of this year, based on his paper on "Forecasting the Weather," published in the Transactions of the Royal Academy of Belgium. The first experience is hardly happy. We received the chart last Monday, and find barometer and thermometer alike marked at a low level for those two sweltering and almost tropical days, Sunday and Monday last, with the general remark:—"Barometer rather low first half of the month, bringing rain and decrease of temperature." We can only wish, at the moment we are writing, that Mr. Jenkins had been a true prophet. He adds: "Violent gale probably about the 4th (!)" However, we will keep an eye on Mr. Jenkins's prognostics for the rest of the year, and see if the results come any nearer to the predictions.

#### THE SALISBURY MEETING OF THE ROYAL ARCHÆOLOGICAL INSTITUTE.

This year's meeting of the Royal Archæological Institute was brought to a conclusion on Tuesday last, though some twenty-five members have arranged for a supplementary tour in Brittany. We this week continue our report\* of the meeting, and hope to conclude it next week. The congress has been a very interesting and successful one, its success being, of course, greatly helped by the unintercepted fine weather which prevailed during the whole eight days of the meeting.

On the second day of the meeting, Wednesday, August 3rd, carriages conveyed a party of about a hundred members and visitors to Old Sarum, where General Pitt-Rivers took the party under his direction, and read a paper on the site of the city. From this paper we quote the following passages:—

The fact of the place having originally been a British earthwork is proved by the six Roman roads leading up to it, traces of which may still be seen, and, as the work from its shape is certainly not Roman, it must necessarily be pre-Roman and British. The three roads which led to the eastern entrance were from Winchester, Silchester, and Badbury. A fourth is believed to have run north to the Roman station of Cimetic, near Marlborough, a fifth went to Bath, and a sixth to Ilchester. It was probably originally the stronghold and place of refuge of an independent tribe of Britons, to which the inhabitants of the surrounding district retired when attacked by a neighbouring tribe. It occupies a knoll of the chalk hill, and, like most British earthworks, its outline conforms to the line of the hill. The reason it is nearly round is because the hill was round. It has two principal lines of defence,—an outer line with a deep ditch and rampart on the inside, and a smaller rampart on the outside of it, and which has two entrances, one on the east and one on the west. The inner line, consisting of a ditch with one rampart on the inside, has only one entrance on the east. It is believed that the outer line of defence only was British, and that the inner line or keep was added in the eighth or ninth century to make a fortified residence for the lord of the place. This, however, has not been proved, as it might be, by excavations in the ramparts. Besides this, there are radiating lines of entrenchment between the central keep and the outer defence made for the purpose of protecting part of the outer ward should the enemy break in through the outer line. This appears to me to be a Norman method of defence, as a similar arrangement is seen in the so-called Caesar's

camp at Folkestone, which I excavated and proved to be of Norman construction. The Normans found the mounds of earth here and built on them a line of wall on the inner rampart, the remains of which are seen at the entrance, and another on the rampart of the outer line of defence, a fragment of which, 25 ft. long, 12 ft. high, and 10 ft. thick, may be seen on the north-west side, but Mr. Roach Smith is of opinion that this fragment is Roman. The Normans also added earthen barbicans to cover the eastern and western entrances to the outer line, each having a separate ditch of its own detached from the main ditch of the place. The marks of a large well can be seen in the keep, and Leland says there are other wells, which I think would be worth finding and examining. There was a suburb outside the fortification on the south side. Few relics of any period have been found in Old Sarum, and the place has been very much neglected by archaeologists. In studying ancient fortifications, it is always desirable to keep in view the distinctly different purposes which an earthen rampart served in ancient and modern times. In modern times the rampart is intended to give cover to the defender from the cannon of the enemy, and to be able to do that it must be of a certain thickness, that the shot may not pass through it, and, in consequence of this thickness of the rampart, the defenders standing behind it are unable to see down into the ditch in front of them. The line of the rampart has, therefore, to be arranged so that the ditch in front of each part may be seen into by some other part, and it is this flanking defence, as it is called, that has given rise to the different system of modern fortification. But in ancient fortifications the wall, or stockade of wood, not being required to be of very great thickness, the defenders, standing behind it and looking over it, or through loop-holes in it, were able to see down into the ditch in front of them. Flanking defence was, therefore, not necessary to the same extent: parts which, in a modern fortification, are called dead ground, or ground in which an enemy could lie concealed, would not be dead ground in an ancient fortification, and a simple straight line of ditch and rampart was all that was required. The use of an earthen rampart in ancient fortification was to give command to the defenders, to increase the force of their missiles by gravitation, and to place the stockade, or wall that was built on the top of it, beyond the reach of the enemy's hattering-rams. The object of a modern rampart is to give cover, not command; the object of an ancient rampart was to give command, not cover. If this is kept constantly in view, the lines of ancient British entrenchments will be better understood. It will be found that almost invariably the height of the rampart in each part of a work was greater where the ground outside was flatter, and where command had to be obtained by artificial mounds. Where the ground sloped down from the rampart, it was not so high; and in places where the natural slope of the ground afforded sufficient command without an earthen rampart, it was dispensed with altogether, especially in the less important works. But at Old Sarum these principles of fortification, which are so usually observed in all British works, as at Whichurch, for example, on the other side of Salisbury, do not apply. Although the ground is much weaker on the east than on the west side, the ditch and rampart are of the same size all round, and this leads me to think that the fortification may have been modernised in more recent times. Alfred, in 871, ordered Leofric of Wiltonshire to make another ditch at Old Sarum, to be defended by palisades, and this alteration may have consisted in deepening the old ditch. It is even possible that the present ditch may have been altered at the time when the barbicans were added, to cover the openings in Norman times. The father of Cnut is said to have burned the place in 1036; the bishopric of Sarum was established here in 1075; William the Conqueror was here in 1086, and held a review of 60,000 men who swore allegiance to him. The Cathedral of Old Sarum was consecrated in 1092. William Rufus was here in 1096. There was a mint in Old Sarum, as proved by the coins struck in the place. On the coins of Ethelred II. the name of the place was written Searbe; on those of Cnut Sæler,

\* See last week's *Builder*, p. 200.

Ser, or Sere; on those of William I. and II., Sere, Sebar, or Serri, which were evidently corruptions of the Saxon name Seabyrig, which latter was the Saxon version of the Roman Sorbiodunum, and this, in its turn, a corruption of the Celtic name ending in *dun* or *annun*, "a fortified hill." On a coin of Stephen, however, it first appears in the modern form of Salis, and on the coins of Henry II. Sal or Saler. In the course of time, the soldiers and the clergy, living together in some a place, fell out. The clergy annoyed the soldiers by constantly singing psalms, and the soldiers, no doubt, annoyed the clergy by their bad language, so that in 1256 the clergy departed, and established the new cathedral in modern Salisbury. During the long drought of 1834, the outline of the old cathedral, which had been destroyed, was discovered beneath the grass which had turned brown over the spot in the north-west quarter, and it was excavated by Mr. Hatcher and Mr. Fisher. It was found to be a plain cross, 270 ft. long by 150 ft. broad. There were double aisles to the nave, choir, and transept. The cloisters were also discovered to the north of the choir.

On leaving Old Sarum, the party proceeded to Great Durnford, where the church was visited, under the guidance of Mr. George H. Gordon, A.R.I.B.A., who read a short paper on it. Subsequently Amesbury Church, Stonehenge, and Lake House were visited. Of these we will say something in our next. In the evening the Historical Section was opened by an address by the President, the Dean of Salisbury.

A paper by Dr. Wake Smart, entitled "A Brief Account of some Celtic and Roman Antiquities within the North-eastern part of the County of Dorset, between Bockley Dyke and the River Stour from Blandford to Wimborne," was read before the Antiquarian Section. The author said that Bockley or Bokerley Dyke, the northern boundary of the area included within the scope of the paper, was also a boundary between the counties of Wilts and Dorset. It was an earthwork of high antiquity. The best general view of it was to be had from the top of Blagden Hill, over which it passed. Its whole length was from four to five miles. The western turnpike road traversed the Dyke about three-quarters of a mile from Woodyates, and at the same place the Via Iceniana, Aekling Dyke, or Roman road from Old Sarum to Dorchester, crosses it. These two roads, ancient and modern, make some confusion in their united passage through it; but the Roman road may be soon traced from its emergence into arable land, and runs nearly parallel with and near the turnpike road to Woodyates Inn, which stands on its line. As to the origin of the earthwork the author said he was utterly opposed to the Belgic theory of its construction, which he believed was generally accepted, though it was not the opinion of Mr. Warne. That theory seemed to be founded on a misconception of historical statement, for which the learned Dr. Stukeley was primarily responsible. There was no basis of proof that the Belgæ ever peopled Dorset. For the first three-quarters of a mile after it leaves Woodyates Inn the Roman road has to be taken on trust, for it is hidden from sight by the turnpike road, which has been carried along the *dorsum*; but at the eleventh milestone, where the open Down succeeds the enclosures, the Roman road parts company with its companion, and, at a sharp angle, runs in an independent direction and straight course to Badbury Rings, at the distance of about ten miles south. The widening space formed by the ancient road and the turnpike encloses a large tract of the Down, which is studded with Celtic tumuli in great variety; and overlooking all from Handley Hill is a very fine specimen of the oblong (perhaps chambered) barrow, of unknown antiquity. With the exception of this one, all the rest, which are of the Bronze Age, were opened by that indefatigable explorer, Sir R. C. Hoare, or his companion and friend, Mr. Cunningham, and most of their discoveries are now deposited in the Devises Museum. These barrows were remarkable in producing more artistic relics, as ornaments of amber and glass, and trinkets with jet and gold, also bronze daggers, in a larger proportionate number than fall to the lot of barrow diggers in the southern parts of Dorset. In this respect those tumuli assimilate more to the Wiltshire barrows about Stonehenge. The Via Iceniana, or Aekling Dyke, in its course across the Down, presents, for the most part, a fine example of Roman

road-making. It is a raised causeway, with rounded back and sloping sides, to throw off the rain and melted snow. The substratum is chalk, with a thick covering of broken flints; and in a certain section he had noticed a superficial layer of yellow gravel, such as may be dug on Pentridge Hill. The road must have been a work of much time and labour,—enforced labour, no doubt, with very little regard paid to "the groans of the Britons." It is much to be regretted that modern road-making has done a good deal of mischief in places by pillaging the store of flints; but there are still remaining portions that have not suffered yet from the human despoiler or from the wear and tear of time. Proceeding with his paper, Dr. Wake Smart pointed out the mistakes which had been made by some previous writers as to the continuation of this road, and enumerated several Roman remains which had been found in proximity to it or its branches.

On Thursday morning the Architectural Section was opened by an address from its President, the Rev. Precentor Venables. Of this we print the greater part on another page, under the title "Architecture and Architectural Topics in Wiltshire." Subsequently there was an inspection of some interesting old buildings in the town, including St. Thomas's Church, which was described by Mr. A. Wood, in a paper from which we extract the following passages:—

"The Church of St. Thomas is the most important of the three remaining parish churches of Salisbury. It was erected as a sort of chapel-of-ease to the cathedral by Bishop Bingham, who occupied the see of Salisbury from 1228 to 1246. Bishop Bingham is a figure of considerable importance in the history of Salisbury. Two years previous to his death, availing himself of the Royal Charter granted to Bishop Poore, he brought the Icknield-street, or "Wilt Way," to New Sarum, and built the bridge over the Avon between Harnham and the city. This proved no little injury to Wilton, and was altogether fatal to Old Sarum. Bishop Bingham built the small chapel of St. John the Baptist, now converted into a dwelling-house, upon an islet between the main stream of the Avon and an artificial channel connected with it. Here two chaplains were to say mass, and to receive the alms of passengers to defray the expenses of the bridge. We shall find that there was a chapel of St. John the Baptist in the church of St. Thomas, and it may be inferred, with some probability, that Bishop Bingham, who built the bridge-chapel of St. John on the islet was also the founder of the original chapel of St. John in the church of St. Thomas. As to this, however, there is no certainty, as the latter was the chapel of the Merchant Tailors, whose patron was St. John the Baptist. It may have been that they found an existing chapel of St. John the Baptist, and proceeded to rebuild and enlarge it. The date assigned to this church is the year 1240. No part, however, of the present structure can be assigned to the thirteenth century. It is of the same general date as the other three remaining parish churches of the city as they at present stand. It is a large and fairly handsome building of the Third Pointed style, measuring 130 ft. in interior length, and 70 ft. in width. Its component parts are a nave with two aisles, or, as the Italians, with better reason, term this arrangement, three naves (*tre navate*), a chancel with aisles or subsidiary chapels, and a double vestry or sacristy. To the south, flanking the third bay of the aisle, is a square tower of moderate elevation, not with the pyramidal capping which I am wont to hear termed a Sussex head, but an octagon in plan, although of no higher elevation than one is accustomed to see in Sussex. The detached position of this tower, and the fact that the buttresses die into it below the belfry stage, give it more of the character of a campanile than is common in England. But the practical genius of our countrymen is shown by the employment of the lowest of the four stages as the south porch of the church. Its worst feature is the awkward compromise between a staircase turret and a buttress at the north-east angle. The best is the panelled parapet that surmounts it, and next to that the elegant belfry windows, divided into two lights each, filled with the quatrefoiled tracery so common in Somersetshire. This tower contains a peal of eight bells, brought hither from the detached belfry of the cathedral at its demolition by Wyatt, the icono-

clast. On the east side of the tower are two figures to strike the bells of the clock. In the second stage, on the south side of the tower, are two large niches with figures, now very much mutilated, one representing St. Thomas à Becket, the patron of the church, and the other the Virgin and Child, the arms of the see of Salisbury. It may be observed that the three parish churches of Salisbury exhibit great variety of treatment in the position of their towers. The tower of St. Thomas is attached to the third bay of the south aisle; that of St. Edmund's is what is termed disengaged at the western end of the nave; that of St. Martin's projects from the south aisle, and is flanked by a porch and chapel, now used as a vestry-room, extending across the nave and north aisle. The only other projection, with the exception of the unusually large vestry, from the general plan of the church of St. Thomas, is that of a turret staircase on the north side which formerly conducted to a room above the north porch, which, with the porch itself, has been removed. The third window from the west occupies the site of this porch. The upper part of the turret is partly supported by a corbel carved with the head of St. Thomas à Becket. The date assigned to the nave and its aisles is 1404. The chancel is some forty years later. The history is evidently this, that when the nave was built, Bishop Bingham's old chancel was left standing, but this arrangement proving unsatisfactory to the munificent church-builders of those days, the rebuilding of the chancel was shortly afterwards undertaken, and the whole church brought to its present uniform appearance. The site was not made a mere *tabula rasa*, and then built upon with the temerity of our modern builders; the rebuilding was a thing of time and circumstance, and travelled from west eastwards, instead of from east westwards, as would have been the case with a wholly new fabric. The great west window occupies nearly the whole of the upper portion of the west front. It is of seven lights. It is subarcuated by an elliptical arch running through all the compartments. It is also transomed. The spandrels are hollowed out, but not pierced. To the south of the west door was formerly the monument, carved in oak, of Humphrey Beekham, now removed for protection to the porch beneath the tower. Humphrey Beekham, other specimens of whose carving are still extant in Salisbury, died in 1671, at the age of eighty-eight. He informs us upon his monument that it was his own work. His claim to these rudely-fashioned *alto-relievi* would hardly be contested by any considerable artist. The subjects are the Sacrifice of Isaac by Abraham, the Dream of Jacob, the bargain of that Patriarch concerning the striped and ringed cattle. Such subjects,—treated on about the same artistic level,—are common on the old iron fire-backs in Sussex farm-houses. The lower windows of the nave of the church are large, divided into four lights each by mullions, with abatement lights in the heads, save in the outer compartments, where a *vesica piscis*, placed obliquely, gives something of a Flamboyant character, and relieves so far the ribbed rectilinear regularity of the Third Pointed style. The clearstory windows have elliptical arches, a form not very frequently met with, but here evidently a favourite with the architect, as he has introduced it, as we have seen, into the west window. There is a good example in Middle Pointed at Over, in Cambridgeshire; there are examples in the Church Transitional to Third Pointed at Etchingham, in Sussex; and there are examples also at St. Andrew's, Halstead, Essex, which, like St. Thomas's, Salisbury, is well within the Third Pointed period. The clearstory is surmounted by a battlement without pinnacles. The interior of the Church of St. Thomas is large and dignified. The arches of the nave are each 16 ft. in width. These arches rest on square piers fluted at the angles, set with four shafts on the cardinal faces, surmounted by octagonal capitals. These are enriched with vine leaves, and in some with clusters of grapes. The mullions of the clearstory windows are carried down below the sills so as to form blank panelling, and rest upon the outer surface of the arches. The "Doom" over the chancel arch is worthy of particular observation. It was first discovered in 1819. It is supposed to have been concealed during two centuries. It was re-touched, or, as would appear, really repainted; then again covered over, and only

fully shown of late years. The Heavenly Jerusalem, at the top of the picture, appears above or is partially concealed by the figures. Above it, on the left, is seen the sun in its splendour, and on the right the star in the East. In the centre is Our Lord seated on a rainbow, with his feet resting on another of less size. At His feet are the Twelve Apostles seated in judgment. Our Lord shows the five sacred wounds. To His right is an Angel bearing the cross, which is of the tau-shaped form, whilst on his left is another angel holding in one hand the spear and sponge, and in the other the column of the flagellation. From the cross hangs the Crown of Thorns. At the right extremity of the rainbow upon which our Lord is seated appears the Blessed Virgin in a kneeling posture. At the left extremity of the rainbow is a male figure, also kneeling, with a nimbus round his head and having a long mantle. It seems not unlikely that he is one of the patriarchs of the Old Covenant, or St. John the Baptist, the last and greatest prophet of that dispensation come to judge to condemnation the unbelieving and undeserving of the new dispensation. On either side angels summon with trumpets the dead to judgment. The female figures are represented as rising in shrouds from their graves, whilst on the right angels are receiving the Blessed into the Heavenly City. An angel on the left is turning from the reprobate, and apparently casting a glance of pity behind. On the left is a representation of Hell, beneath which is the inscription: "Nulla est redemptio." Here are depicted several demons and a group of figures chained together and being drawn towards Hell's mouth, represented by a dragon. With the freedom of that age,—of which there are many other examples,—one of this group is distinguished by a mitre. There is also a representation of a bishop among the Blessed. The bishop on the left hand is accompanied by two kings. This painting is apparently of the close of the fifteenth century. The figures below are described as King Henry II. with cockle-shell and pilgrim's staff and St. Thomas of Canterbury. As Henry II. made his pilgrimage, not to Compostella but to Canterbury, I fail to discover the appropriateness of the cockleshell. The chancel of St. Thomas was restored by Mr. G. E. Street. There are three frescoes on the wall of the south chancel aisle: they represent the Annunciation, the Visitation, and the offering of the Magi; the last is much mutilated. On the beams of the roof are these inscriptions alternately,—'Orate pro animâ Wilhelmi Swayne, et Christiani Uxor[is]jeus,' and 'Orate pro animâ Jacobi, patris Wilhelmi Swayne.' On the shields in the ceiling are first, the Swayne arms: azure, a chevron between three fleams; (2) the well-known emblem of the Holy Trinity; (3) a representation of the five sacred wounds; (4) a merchant's mark of the type which is supposed to represent the flag which accompanies the lamb of St. John the Baptist. This chapel was the chantry of William Swayne. There is a crucifix in stone on the fifth buttress from the east of the south chancel aisle. The altar tomb of William Ludlow, of Hill Deverel, who seated and painted the north aisle, hntler to Henry IV., Henry V., and Henry VI., was formerly on the north side of the chancel; but it was taken down and broken to pieces at the same time that the rood-screen was destroyed. In the north chancel aisle are to be seen the remains of the staircase to the rood-loft. In the windows of this aisle are fragments of glass, one of which is called the Head of Moses. The large organ in this aisle is that which was given by George III. to the cathedral, in the character of a 'Berksire gentleman,' Windsor being situated in that county. It is that which must have been in the mind of the novelist as being played upon by Tom Pinch on his visit to Salisbury. It was built by Green, of Isewerth. On the ancient monument, inscribed in the last century with the name of Chattyn Markes, &c., merchant marks may again be seen. In the same aisle is the parish chest bound with iron bands. There is a similar one in Bridport Church near the city. In the vestry is a Medieval frontal, or it may be the upper part of a cope, in a frame. The subject inwoven is the Salvation, with numerous spread eagles, or two-headed eagles displayed, and fleur-de-lis. There is also a portion of a vestment in a frame. There is also a small modern figure of St. Thomas à Becket. In the inner vestry there are stained-glass

representations of St. Thomas à Becket, St. Christopher, and a third figure, greatly obliterated, but which is described as our Lord in the act of benediction. In conclusion, I may remark that, now that St. Nicholas' Church exists as a more fragment, the cathedral of Salisbury and the parish churches stand not in a competition that would be fruitlessly maintained on the part of the latter, but in sharp contrast. The destructive hand of Wyatt has contributed to this result by sweeping away some minor portions of the cathedral. We have now the Early Pointed in its perfection, and the Late Pointed in sufficiently adequate representation side by side in the cathedral and parish churches of this interesting city, and the eye is educated by the contrast between them, and if it learns to prize yet more highly the beauty of the former, yet neither does it despise those later sacred houses, of which St. Thomas's is the chief."

In the afternoon there was a carriage excursion to Britford and Downton, taking Longford Castle *en route*, and returning via Trafalgar. At Britford and Downton the churches were visited, and at Downton the "Moot" was inspected, under the guidance of Mr. E. P. Squirey. We will say more of this and of the subsequent days' proceedings in our next.

On Friday there was an excursion to Bradford-on-Avon, where the Tithe Barn and the Old Bridge were visited, the party afterwards proceeding to Kingston House and the Saxon Church. In the afternoon South Wraxall Manor House, and the Manor House and Church of Great Chalfield were visited. In the evening there were Sectional meetings. In the Architectural Section, papers were read by Mr. C. E. Pouting on Edington Church, and by Mr. E. Green (on behalf of its author, Mr. J. A. Gotch) on "Longford Castle and Longleaf." This paper we are enabled to print on another page.

Saturday was devoted to a visit to Wardour Castle, Tisbury Church, Wilton Church, and Wilton House.

In the evening, before the Historical Section, Mr. J. S. Udal read an interesting paper "On Dorset Seventeenth Century Tokens." Incidentally referring to the national collection of coins and tokens at the British Museum, he said,—While I am upon the subject of our national collection of tokens, I hope I may be pardoned when I say that I think it is a great pity that wider powers should not be given to those having the care and superintendence of our coin departments in dealing with private collectors and others wishing to exchange or purchase duplicates from them. I understand that it is the practice for them to be allowed to accumulate, and then to be sold wholesale to the dealers. The authorities are not allowed to exchange or sell privately as occasion offers. I could more than once have offered a very liberal exchange of duplicates to the public authorities, but have been met by the above-named rule. It needs very little discrimination to infer that considerable advantage would result to our public collections were this rule a little relaxed and a little more latitude in this respect allowed to the heads of those departments. I understand that as far as the Bodleian collection is concerned, an attempt has been recently made to pass a new statute to that effect, though as yet without success. It is to be hoped that those having authority over the disposition of our public collections will be led to deal more liberally with the coin-collecting section of the public; it will assuredly be as much to the ultimate advantage of the national depositories themselves as it will be a decided boon to private collectors.

On Monday, Boyton Church and Manor House, Scratchbury Camp, Heytesbury Church, Knook Church, and Heytesbury House were visited; and on Tuesday carriages left with a party of about sixty for a long ride across the Wiltshire Downs to Farnham Museum, passing *en route* Bockley Dyke and Ackling Ditch. They then proceeded to Rushmore, where they were entertained by the President of the meeting, General Pitt-Rivers. After inspecting some recent excavations, near Rotherley Wood, of a Romano-British village, they visited Ferne, and subsequently returned to Salisbury from Tisbury Station.

We will next week conclude our report by giving amplified notes on some of the buildings and antiquities which we have only had space to name in the foregoing lines.

## ARCHITECTURE AND ARCHITECTURAL TOPICS IN WILTSHIRE.\*

PREHISTORIC architecture, illustrated so magnificently in the county of Wiltshire by the mysterious circles of Avebury and Stonehenge, and the standing stones, cromlechs, and dolmens which stand its dowms, as well as in the British camps and villages which so abundantly crown the hill crests, belongs to the section of Antiquities, and does not enter into our present purpose. Architecture, properly so-called, begins for us with the so-called Anglo-Saxon era,—a convenient and intelligible if not strictly correct term. Of this era in ecclesiastical architecture, the county of Wiltshire has several examples to show, one of which is certainly unsurpassed in value by any building of its age in England. I mean, of course, the old church at Bradford-on-Avon, rescued from desecration and restored to its sacred purpose by one whose premature death has inflicted an irreparable loss upon the archeology of Wiltshire generally, and of Salisbury in particular, never more acutely felt than at our present gathering, the late Canon Rich-Jones. In this little building,—which, in the words of one who, though happily he is still alive and likely to live for many years, and is not so very far from us, is, unfortunately, not with us, Professor Freeman, is "probably the most ancient unaltered church in England,"—we may safely recognise the church erected by St. Aldhelm at the beginning of the eighth century, and mentioned by William of Malmesbury as standing in his day, as it still stands in our day, at the Broad Ford over the Avon,—*"est ad hunc diem in eodem ecclesie locum quam ad nomen heattissimi Laurentii (Aldhelmi) fecisse predictatur."* All qualified judges who see it will agree that there is only one period at which a building so remarkable both in its outline and in its detail could have been erected in England, and that the period named by Malmesbury. There are other examples of the same rude pre-Norman style in the remarkable Church of Britford and at North Burcombe, and though less certainly at Manningford Broose, where the east end is semicircular instead of square, as is usual in English churches anterior to the Norman Conquest, and at Avebury, where Mr. Pouting has discovered and replaced a remarkable series of small circular clearstory windows, unique in character. As far as I know, no instance of the characteristic Anglo-Saxon tower, such as those at Earls Barton, Barton-on-Humber, Barnack, and in the city of Lincoln, occurs in Wiltshire.

We hardly need to be reminded how intimate is the connexion between the character of our Mediaeval churches and the geological formation of the district to which they belong. The nature of the local building-material rules the architecture. There is an exception to the law where, as in parts of Lincolnshire and the adjacent low-lying district, water carriage was easy and inexpensive. Here we find an abundance of noble churches, excellent in their stonework and unobscured in the richness of their design, in a country which does not produce building stone of any description, the whole being brought on rafts or in barges from the quarries of Barnack and Kettleton. But where there was no such facility of transport the builders were entirely dependent on local material, and the character of the churches, both in form and detail, varied accordingly. The reason why we find round towers so common in Suffolk and parts of Norfolk is that they could be constructed of flint alone, which was abundant, and had no angles to be strengthened with quoins of stone, which was rare. The same causes led to the invention of the elaborate patterns of black flint set in tracery of white stones, which are so beautiful a feature in the East Anglian churches. The variety of light and shade produced elsewhere by deeply-cut mouldings and recessed panels, here, where stone was scarce and thin and had to be used economically, was ingeniously given by the contrast of colour on the same plane. The thatched roofs speak of a swampy district, where slates were not and tiles were dear, while sedge and reeds might be had for the cutting. Want of stone and abundance of pebbles has also given us the boulder-built churches of the Sussex seaboard, while the wooden hull-turrets and shingled spires of the same county may be

\* From the Address given by the Rev. Prentor Venables, F.S.A., as President of the Architectural Section of the Salisbury meeting of the Royal Archaeological Institute, elsewhere referred to.

traced to the wide-spreading forests which, until the iron works which once had their seat there had consumed them all, and thus, fuel ceasing, put themselves out, covered its surface. The unmanageable texture of the Cornish granite is answerable for the coarseness of the ecclesiastical architecture of that county, while the fatal softness of the red sandstone of Cheshire and Staffordshire has led to an indulgence in an excess of ornamentation which has proved only too transient.

If now we turn to Wiltshire, we find the same law dictating the character of the churches. Wherever good stone is abundant, and as the masonry of Salisbury Cathedral testifies, no county in England supplies better, as in the northern part and in some districts of the south west, the churches are usually large, lofty, and carefully designed, much pains being taken,—as is noticeable in the noble chancel of Amesbury,—in the ashlar of the walls, and in the exterior generally, on which a good deal of ornament is often bestowed. Where, on the contrary, as in the southern and eastern districts, the only building material is chalk, clunch, and flints, with a small amount of green sandstone that will serve for windows and doors and dressings, the churches are diminutive and homely, with wooden belfries or low square steeples. These materials are often arranged in chequers of stone and flint, producing a very pleasing effect. This mode of walling is very common in Wiltshire. Many of these smaller churches possess features of considerable interest, more especially those which have escaped the hand of the restorer,—which has, alas! been very busy in Wiltshire,—or those on which that hand has been laid lightly, and has been guided by the first principle of all restorations, to preserve and maintain and never to destroy. Norman doorways and chancel arches are by no means infrequent, and are sometimes richly ornamented, while a considerable amount of good Early English work is to be found, often plain and simple, but always pleasing. These smaller and humbler churches often get passed over by the tourist, but they will almost always reward a visit. Even when their architectural features are of the plainest, there is an undefinable something in their shape, and colouring, and position, and the way in which they group with the cottages which are scattered about them, and the trees out of which their little belfries peer, on which the memory dwells with more satisfaction than on many a more stately edifice.

It is observable that, while in some large parts of England the cruciform plan is hardly found at all, churches of this form are of somewhat frequent occurrence in Wiltshire. Some of these are on rather a large scale and of considerable dignity, such as Edington, Westbury, Amesbury, Tisbury, Heytesbury, Downton, Bishopston, All Cannings, Bishop's Canning, Great Bedwyn, and several more, while others are small and unpretending. The nave at least is commonly provided with aisles, but the noble Early English church of Potterne, one of the finest in the county, has none, and the churches of Winterbourne-Stoke, and the early church of Britford, are also aisleless. A singular line of cruciform churches is found in the Vale of Chalk, where Bishopston, Broad Chalk, Bower Chalk, Alvediston, and Berwick St. John in succession exhibit the same plan. A central tower is essential to the completeness of the outline of a cruciform church. This is seldom wanting in the Wiltshire churches; and in some, as at Chilmark and Bishop's Cannings, where it is crowned with a stone spire, at Potterne, Westbury, St. Sampson's Cricklade, and others, it is of considerable dignity. Corsham Church had till recently a central tower, but when it was restored by the late Mr. Street he pulled it down and built a new tower and spire in a different position. No doubt he felt that there were good reasons for his action, though we cannot but regret it. While speaking of towers it should be mentioned that two churches near the N.E. border, Purton and Wanborough, present the unusual feature of two steeples, one at the west end of the nave and the other in the centre. This arrangement, it will be remembered, is also found at Wimborne Minster. There is a reason for this arrangement there, the western tower being at the belfry of the parochial nave, that at the intersection belonging to the Collegiate Church. I am not aware that any satisfactory explanation can be given of its occurrence at Purton and Wanborough.

Stone spires, though not numerous, are not very uncommon. Passing over that of Salisbury Cathedral, confessedly without a rival in England, and for the union of simple majesty and exquisite grace almost without a rival in the world, these spires do not, generally, take the first rank for height or beauty. There are, however, good examples at Chilmark, Bishop's Cannings, Trowbridge, and Lacock. Pack-saddle roofs—an unusual form in England—are found at North and South Wroxall and at Winsley. A bell-turret, crowned with a spirelet of much elegance, is rather frequent in the north-west corner of the county, as at Acton Turvill, Sutton Benger, Corsley, Corston, Biddeford, and Great Chalfield. The small wooden bell-turrets of the south-east have been already referred to. They are often very picturesque.

Stone groined roofs, though far from being common, are less uncommon in Wiltshire than in some other parts of England. The Norman chancels of St. John's and St. Mary's, at the Deveses, have good vaults of that date. Early English and Decorated vaulting is found at the beautiful churches of Bishop's Cannings, Urchfont, Steeple Ashton, Bishopston, and Marlborough, St. Peter's. The nave of Steeple Ashton is groined in wood, the ribs springing from stone shafts. At Edington there are curious plaster ceilings, of late date, which deserve notice.

Taking a general survey of the county, we find Norman work very abundant, though not usually of a very high order. The humble village churches frequently contain a door or a window, or a chancel arch of that period. Great Durnford is a typical example, and the fabrics of a large number, though with but slight architectural traces of their date, evidently belong to this epoch. We have examples within a short distance of Salisbury. Berwick St. James preserves its Norman doorway, while we have doorways and other remains of Norman work in the churches of Winterbourne Stoke, Stapleford, South Newton, and Little Langford, all very near together.

The most conspicuous Norman building in Wiltshire is the fragment of the Abbey Church of Malmesbury. Much of it, however, is late in the style, and belongs rather to the Transition period. The doorways are well known. The outer south door, with its interlaced bands and series of Scriptural medallions, is unsurpassed for richness of decoration by any door in England. We have fine examples of Late Norman in the groined chancels of the two churches at Deveses, the work of the warlike Bishop Roger, the greatest builder of his day. The churches at Corsham, Preshute, and several others, preserve their Norman arcades; and at Mellsbam, amid many undesirable alterations, we have enough left to make out the original cruciform Norman church.

Passing to Early English, in the unrivalled cathedral under the shadow of which we are meeting we have the most perfect example of the style on its grandest scale to be found in England. As is natural, its influence spread, and we find village churches displaying the same purity of design, harmony of proportions, and dignified simplicity of outline, of which the mother church set the example. Potterne, which may very probably be ascribed to Bishop Poore, the founder of the Cathedral, may not improperly be called Salisbury Cathedral in miniature. Bishop's Cannings, though with later alterations which mar its unity, is also a beautiful example of the style, which we find also in great excellence in the chancel of Great Bedwyn, at Collingbourne, Kingston, Boyton, Purton, Downton, Amesbury, and many other places.

The fourteenth century seems to have been less prolific in church building in Wiltshire than elsewhere. There is, it is true, no want of Decorated architecture in windows, doors, and in portions of churches, but there are fewer entire churches in this style than in the midland counties. The chancel of Downton is a good example of Early Decorated. We have rich Flamboyant work in the transepts of Great Bedwyn, and in those of Lacock; we must mention also the chancel and transepts of the very interesting church of Bishopston, especially the south transept, with its curious external cloister. At Boyton the Decorated work is earlier in date, and very good.

The transition from Decorated to Perpendicular is exemplified in the very remarkable church of Edington, now under careful restoration by Mr. Penting, one of the most important

buildings we possess for the history of English architecture, in which we trace the beginnings of the new style,—the special growth of English soil,—and watch the flowing curves of the tracery stiffening into rectilinear uniformity. Perpendicular not improbably had its rise in the Abbey of Gloucester. We find the earliest-dated instance of its employment in the south transept of the cathedral, soon after which it appears in the remodelling of Winchester Cathedral, commenced by Bishop Edington, 1345-1366, by whom it was adopted in the noble collegiate church founded by him in his native village as a thank-offering, which is deservedly one of the chief glories of Wiltshire. The first stone of this church was laid in 1352, and it was dedicated in 1361,—dates of some importance in the origin of the Perpendicular style.

It would occupy too much of your time to dwell on the Perpendicular work in this county, as everywhere there is hardly a church which does not exhibit some trace of the great wave of rebuilding and alteration which passed over the country as the Gothic style was losing its life and freedom and gradually giving way to the newly-introduced Classical revival. The stately church of Mere, with its noble west tower, may be mentioned as one of the best in South Wilt. Westbury deserves notice as an example of a church originally Norman recast in Perpendicular, much in the way Wykham treated Winchester Cathedral. The nave is very stately, and the aisles show a not very usual feature in the transverse stone arches, with interpenetrating mouldings, which cross them from north to south. The masonry throughout is of great excellence. While at Westbury we have an adapted building, and at Mere a mixed building, at Trowbridge we have an example of a Perpendicular church raised from the ground as one design without any admixture of earlier styles, by the munificence of the inhabitants, in 1475. It is a typical church of its date, with a western tower groined within and lofty stone spire and north and south porches, and a very beautiful open-timber roof, the whole deserving Leland's description as "lightsome and fair." The font is lofty, carved with the emblems of the Crucifixion. Steeple Ashton, built between 1480 and 1500 by the clothiers, is also a very noble Perpendicular church, exhibiting well-finished masonry of the highest order of excellence. The clearstory is lofty, the arcades lofty and imposing, the windows large and good. Both the chancel and the nave are groined, the former in stone, the latter in wood. St. Thomas's, Salisbury, though late and rather coarse, is a very good example of a rich Perpendicular town church. With its light arcades, very wide aisles, and low timber ceilings, it supplies a model the designers of our town churches might do well to follow. I would except the clearstoried chancel, which is of somewhat excessive length for modern requirements. Perpendicular work of peculiar richness is to be found in the north-east angle of the county, sometimes in the fabrics of the churches, sometimes in appended chapels and chantries. The nave of Lacock is a sumptuous building, and the Lady-chapel deserves notice for its fan-traceried roof and general richness of character. The Baynton Chapel, at Bromham, is also a very gorgeous example of Late Gothic with a richly-pannelled ceiling. In the same district a rich canopied niche crowning the apex of a gable is by no means infrequent; we have good examples at Lacock and St. John's, Deveses. The chancel and tower of Calne, rebuilt after the fall of the older tower in 1645, is a very interesting specimen of the survival of the Gothic style, of which we have such interesting examples at Oxford and Cambridge.

The monastic remains of Wiltshire are scanty. The great religious foundations of Wilton, Amesbury, and others have been entirely passed away, leaving but small fragments of their once extensive buildings. At Malmesbury, a large portion of the nave is still standing, and a vaulted crypt, under what may have been the abbot's house, and some other relics, are built up in an Elizabethan house. At Bradenstoke, the refectory, a beautiful example of Early Decorated work, is preserved, with its vaulted undercroft, prior's house, and domestic offices. The remains of Monkton Farleigh are of Early English date, but are very insignificant. The most important and best preserved monastic building in the county is the nunnery at Lacock, founded by Ela of Salisbury, in memory of her

husband William Longsword. It is too little known, for it exhibits one of the best existing examples of conventional arrangement, substantially unchanged. The cloister, with its three beautifully vaulted alleys of good Perpendicular design, is surrounded with the usual monastic buildings, on a small scale but of excellent character. The church on the south side has entirely passed away. Opening out of the east walk we have in succession the sacristy, the chapter-house, the slype, and the calefactory or day-room, all of Early English work, with the Perpendicular dormitory above. The refectory occupies the north side, standing on a vaulted undercroft, with the kitchen at the west end. The whole building is of the greatest interest, and it is to be regretted that it lies too far away for us to visit it on this occasion.

If the remains of monastic architecture in Wilts are but scanty, the remains of military architecture are scantier still. The great castles of the county which played so important a part in English history, have completely vanished, leaving only their huge mounds and earthworks, with some fragments of walls and vaults to testify to their former existence. I may mention Old Sarum, Devizes, Marlborough, Castle Combe, and Ludgershall. The only castle of which the walls still stand is Wardour, hexagonal in plan, a good example of Early Perpendicular, when the military castle was passing into the nobleman's residence.

In domestic architecture few counties are so rich as Wiltshire. In the northern part of the county nearly every parish can show specimens of the smaller manor-houses of the fifteenth and sixteenth century, with long gabled front, two-storied porch, hall and solar, lighted by stone mullioned windows. There are also several examples of the larger and more stately mansions, especially those of South Wraxall, with some later adaptation; Great Chalfield, and the Duke's House at Bradford, all of which we are to inspect,—Norrington, Charlton, Corsham, Littlecot, and many more. The still larger and more magnificent houses of Wilton, Longleat, Longford, and others, have few rivals in any part of England. The town houses of Salisbury, the Audley Mansion, and the Church House, the Hall of John Halle, and others more or less mutilated, afford an excellent illustration of the domestic life of our civic forefathers.

Naturally the examples of later architecture are more abundant, but earlier examples are not wanting. The fourteenth-century houses at Stanton, St. Quentin Place House, Tisbury; Woodlands, Mere; and the Barton Farm, at Bradford, with its noble fourteenth-century barn, deserve the most careful examination.

I pass now to notice the chief architectural events connected with archaeology during the past year. These have been comparatively few. Commercial and agricultural depression, by drying up the springs, have retarded the work of restoration, and there are few extensive works of that nature to record. The most important work is that still in progress, and likely to be in progress for many years to come, at the Abbey,—now the Cathedral Church,—of St. Albans. While desiring to do the fullest justice to the constructional skill, wide knowledge, and, above all, to the munificent liberality of Lord Grimthorpe, it is necessary in the cause of true archaeology and of architectural history to record a firm protest against the mode in which his lordship is dealing with that venerable fabric (applause). It is true that he has, at great cost, ungrudgingly rendered, secured the stability of a decayed and tottering fabric, and that by his generosity one of our grandest architectural monuments will be preserved from ruin and a cathedral given to the new diocese equal in structural excellence to that of any other diocese in England. For this Lord Grimthorpe cannot be too highly commended. But every one to whom the historical character and structural continuity of our churches are dear must deplore the rashness with which his lordship is wiping out the original features of the edifice and replacing them with architecture of his own design, which, whatever its merits,—a topic on which I do not wish now to enter,—has no real affinity with the fabric, it being entirely unlike anything which ever did or ever could have stood there. The west front has been finished for a year or two, and does not come within our limits, but during the past year the south transept gable has been entirely

demolished and a new one erected. The old gable end,—a portion of the veritable old St. Alban's,—was Norman, with a round turret of interesting character at the west corner, and a large Perpendicular window, inserted by Abbot Whet-hampstead. At the base were the very curious, elaborately-ornamented arches of the Norman style. All these are now of the past. What the English eye has been familiar with for centuries is gone, and we have in its place an entirely modern building, designed, it is true, after the best models of ancient art, but falsifying the history of the building. The gable now presents a series of five gigantic lancets, as big or bigger than the celebrated "Five Sisters of York," flanked by turrets, square instead of round, finished with conical caps, the arches of the slype being nailed up as it were, like hawks or wassels on a barn door, on the wall below, appendages to not integral parts of it. A correspondent writes:—"The whole south front of this transept will probably be new, the effect good, the introduction of the slype arches clever, the effect of the high roof satisfactory, but . . . I fear the north transept will soon be similarly transmogrified." Once again, in the name of the Institute, I may be permitted to raise a serious protest against such a treatment of an ancient building (applause). It is endeavoured to be justified by reference to the similar mode in which the earlier builders treated the work of their predecessors, which they pulled down and altered unscrupulously to replace it by work of the reigning fashion. But at that time architecture was a living, growing art. The new work belonged to its own age and was its natural growth, now all we can do is to copy and adapt; with what success I leave it to those who visit St. Albans to say.\* We have a new, well-built, carefully-designed, and attractive design,—a new lamp, bright and furnished, in place of an old lamp, battered, broken, and dingy. Some may prefer the new lamp; I prefer the old one.

Another work is proceeding in the same Cathedral in a far different and more reverential spirit,—the restoration of the stannary of the long-impooverished reredos, by the munificence of Mr. Henry Hicks Gibbs. Everything has been done here, with due respect to ancient lines and historical precedent by a true architect, Mr. Arthur Blomfield.

There is not much other cathedral work to record. At Peterborough the central tower has been carefully rebuilt in its old form, by Mr. Pearson,—happily preserving the east and west pointed lantern arches. The want at present of corner turrets,—those taken down, it will be remembered, were late additions by Dean Kipling,—gives the tower a bald, stunted look. We wait with anxiety to see how it will be completed. It is well known that Mr. Pearson desires to add another story to the very low tower. Until the point is finally decided, the turrets are necessarily suspended. No steps have yet been taken for the restoration of the choir.

At Winchester, the investigations of the energetic Dean have been rewarded by the discovery of the foundations of what is probably the earlier church, beyond the present north walls. The Norman crypt has also been opened out, and several ancient interments brought to light. The statues are being replaced in the reredos. We are beginning to perceive that tenantless niches are as unmeaning a decoration as vacant picture-frames.

At Lincoln, excavations in the retro-choir have revealed the foundations of the semi-hexagonal apse, with radiating chapels, which was the original termination of St. Hugh's Minster, removed for the erection of the Angel Choir,—the saints' building being destroyed to recover the saint's shrine. The external effect of this east end, though rather crowded, must have been of great singularity and beauty.†

The cathedral of Manchester,—a mere stately parish church of the latest style of architecture, without any pretensions to the minster type,—has undergone much rebuilding of its walls, which were considerably decayed, and other much-needed improvements. But a real cathedral at Manchester is still wanted.

\* We must entirely differ from the line taken by Precursor Venables here, and regret that he should have taken up a position so open to attack. The real objection to what is being done by Lord Grimthorpe at St. Alban's, as we have said over and over again, is not that it is new design, but that it is bad and clumsy design, carried out by incompetent hands.—Ed.

† For an article, with plans, fully describing these discoveries, see the *Builder* for May 21 last, pp. 755-58.

Decided steps have been taken to supply this want at the sister city of Liverpool during the past year by the cathedral competition. Out of the large number of designs submitted, three were selected by the committee, those of Mr. Brooks, Messrs. Bodley & Garner, and Mr. Emerson, and submitted to Mr. Christian for adjudication. Of these, Mr. Christian, while highly commending the other two, selected that of Mr. Emerson as better fitted, in its plan and arrangements, for the requirements of a modern cathedral than the others, in which the old cathedral idea was more strictly followed. I do not think that Mr. Christian's verdict has met with general acceptance (hear, hear). Mr. Emerson's plan is certainly one of great merit. The value of a spacious domical area for the reception of large congregations is proved by the cathedral of St. Paul, nor can any one question the beauty of a cupola, uniting dignity and grace, as the central figure of a great church. But the idea is far superior to its carrying out. The style chosen,—I may rather say invented,—by Mr. Emerson is far from attractive, and the ornamentation is in some cases almost grotesque. I could only consider it a national misfortune if the design were carried out in its present form (hear, hear). To render it at all worthy as a monument of the nineteenth century the whole must be redesigned; the skeleton re clothed in more comely attire. As architectural studies, the severe Early English of Mr. Brooks, and the rich, luxuriant Decorated of Messrs. Bodley & Garner, produce far more satisfactory results. Mr. Brooks's design is specially admirable (hear, hear).

While Liverpool Cathedral still remains, as one may say, in the clouds, that of Truro, due to the exquisite genius of Mr. Pearson, is all but completed,—at least the eastern half of it,—and will be consecrated before the close of the year. Our generation may be congratulated on possessing an architect capable of producing so beautiful a work, instinct in every part with artistic life, not unworthy to take rank,—especially when completed,—with the best of the smaller cathedrals of our country. *O si sic omnes!*

The same great architect has been intrusted with the re-erection of the destroyed cloister at Exeter, with a library over the southern wall. Sufficient indications of the original work remain to guide Mr. Pearson in his design.

Mr. Pearson has also restored the Abbey gateway at Bristol Cathedral. He has created a very beautiful structure, and we cannot doubt that so conscientious an architect has found satisfactory evidence for all that he has done. But the result has been that the old building has put on a new face, which looks strange to those who knew it in former years. It is earnestly to be hoped that Mr. Pearson will absolutely forbid the re-chiselling of the elaborate Norman moldings of the well-known archways, which those who have the conduct of the work are contemplating. Such an operation would entirely destroy the historic value of these very remarkable archways, and transform them, for all practical purposes, into nineteenth-century work.

One of the most important works of restoration carried out during the past year has been that in the Priory Church of St. Bartholomew's, Smithfield, under the able and conservative hands of Mr. Aston Webb. Through the energy of the late (alas! that I should have to say the late!) incumbent, the Rev. W. Panckridge, who scarcely lived to see the completion of the great work on which he expended his vital strength, and the munificence of the patron and others, the Lady Chapel has been purchased and rescued from desecration, the Norman apse restored, and the whole church re-roofed and refitted. Happily, the interior walls of the church have not been touched, save with a broom, and still retain the rich colouring which time has imparted to them. The church still looks old; a sadly rare case in a restored church. This is, however, only the commencement of a work of restoration the successive steps of which we shall hope to be able to record in future years.

Time forbids me to speak of other minor works. I can barely refer to the new buildings rising on the west side of Westminster Hall. One must not call them "restorations," as there was nothing to indicate more than the general plan and arrangement of what preceded them. On these much difference of opinion has been expressed. Let us hope the result will

justify the soundness of Mr. Pearson's judgment. Waltham Cross is, for the second time in my own memory, under the restorer's hand. We cannot hope that, after such repeated demolitions and re-constructions, much more of the old structure will be left than was left of the traditional Irishman's knife.

I may conclude with an expression of thankfulness that after a somewhat hard fight the Stone Bow at Lincoln, crossing the High-street much as Temple Bar used to cross Fleet-street, with the Guildhall over it, has been rescued from impending destruction, and has been admirably restored by Mr. Pearson. The changed policy of the municipality and citizens of Lincoln with regard to the architectural remains of their town, which we rejoice to trace also in every part of England, is one among many satisfactory evidences of the excellent work done by the Institute, and other kindred societies, in spreading archaeological knowledge, and awakening a feeling of reverence for and interest in the monuments of the past, which in our own memories was so lamentably deficient. We may congratulate ourselves that we have not lived in vain.

**LONGFORD CASTLE AND LONGLEAT.\***

LONGFORD CASTLE is interesting in many ways. Its curious plan,—that of a triangle, with a tower at each angle,—the various circumstances connected with its origin, and its fine collection of pictures, make it interesting to those wholly unacquainted with architecture; while to those who practise that art, and to all who (like the company present to-day) are given to the study of archaeology, the fact that we have the original drawings of the castle preserved in the Soane Museum is of the highest interest.

Let us first recount the building of the place according to popular tradition. The Manor of Longford belonged in the middle of the sixteenth century,—that is, in the time of Philip and Mary,—to a family named Cervington, the last of whom was a man of extravagant and dissipated habits, so much so that in course of time he was obliged to mortgage his estate to one John Webb, of Salisbury. John Webb, being unable to get the interest of his money, foreclosed in the year 1573, and the last of the Cervingtons found himself ejected from the home of his ancestors, and wandered about the country in a condition of great misery. John Webb, who had turned him out, shortly afterwards sold the estate to Sir Thomas Gorges, a son of Sir Edward Gorges, of Wraxall, co. Somerset, and it is said that the unfortunate Cervington, who still larked about the place, used to make his way into the house, to the annoyance and terror of the servants. On one occasion the wild and miserable man was taken before Sir Thomas himself, and, on being questioned as to who he was, told his name, and added that a Cervington was at least as good as a Gorges. Sir Thomas, moved by his sad plight, gave orders that thenceforth he was to be treated with attention and respect; but the unfortunate man shortly afterwards died miserably under an elm tree in the Coney-garth, a victim to his own improvidence.

The house thus invaded by the wreck of its former master could not have been that which we now see, for Cervington was ejected in 1573 and the foundations of the present building were not begun till thirteen years later, in 1586, and it is incredible that the poor man's misery could have been prolonged through all those years. Sir Thomas Gorges had married Helena, the widow of William Parr, Marquis of Northampton and brother of Katherine Parr, who was so fortunate as to survive Henry VIII. Lady Gorges was a Swede by birth, being the daughter of George Wolfgangus Snaechenburg, and she had come over to England in the train of Princess Cecilia, daughter of Eric, King of Sweden, all of which history may be deciphered by the carvings on her tomb in Salisbury Cathedral. When her second husband, Sir Thomas, thought of building himself a new house, she persuaded him, it is said, to build it after the model of a castle near her own country,—the Danish castle of Uranienburg in the Sound, which had been designed by Tycho Brahe. Sir Thomas complied with her wishes, but the site chosen for the building swallowed up the greater part of his fortune in

foundations, and the work threatened to be abandoned, when by a fortunate chance one of the galleons in the Spanish Armada was wrecked near Hurst Castle, of which Sir Thomas was Governor. His lady successfully begged the hull of the queen, and this was found to contain enough treasure to complete the whole structure in the year 1591, the total cost being about 18,000*l.*

Such is the popular version of the building of Longford. How far it is authenticated, and how far it is mere tradition, I am unable to say. Let us now turn to the information we have in black and white, namely, the drawings preserved in the Soane Museum.

The drawings are by an architect named John Thorpe, who was concerned in a very great number of houses at this period, among them being Burleigh House, by Stamford Town, Kirby, Holdenby, all in Northamptonshire, Burley-on-the-Hill, in Rutland; Audley-End, in Essex; Amptill, in Bedfordshire; Holland House; Slougham-place and Buckhurst House, in Sussex; Losely House, in Surrey; Somerhill, in Kent; besides many others. All his drawings, bound into a book and numbering over 250, are preserved at the Soane Museum, in London. The drawings relating to Longford are on folios 155, 156, 158, and consist of a ground-plan, front elevation, and an elevation of the garden side. The ground-plan shows a triangular building with a triangular court in the centre, a round tower at each external angle, and a circular staircase at each angle of the courtyard. These features may be found to-day, but the courtyard has been roofed over and made into a fine saloon. The interior generally has been modernised, and there has been a good deal added to the house, so that it is a very different place from what it was when first built. It is certain, however, that Thorpe's ground-plan was not carried out as drawn, and we may fairly regard it as a preliminary sketch. It is otherwise with the elevation. This does not agree with his plan, but it agrees in all but a very few particulars with a view of Longford, drawn by Robert Thacker, showing the castle "repaired and beautified by Henry Hare, Baron of Coleraine, in the year 1650." It agrees so minutely that there is no doubt that this elevation of Thorpe's represents the house as it was originally to have been built, although a few modifications were introduced as the work went on.

The front that is to be seen at the present day has evidently been rebuilt, for it differs in essential particulars of arrangement from Thorpe's elevation and Thacker's view; but apparently nearly all the old features have been used again, including the balustrades, arches, pilasters, cornices, and strings. This opinion, arrived at by comparing these old views with the present structure, is borne out by information derived from the clerk of the works, who says that the stone and mortar of the arcaded part differ from that of the tower, and that the floor of the arcaded part does not rest on the lower wall, but is supported by posts and iron bands.

The conclusions, therefore, that we may come to are these:—The tower to the right of the entrance is the original work, so is also the other tower on the garden side. The entrance-front itself has been rebuilt, with the original features, arranged in a somewhat different manner. The garden side between the two towers has been almost entirely rebuilt. The interior has been re-arranged and modernised, while a large part on the north-eastern side is altogether new.

Assuming, as we may fairly do, that John Thorpe was the architect of Longford, where did he get his idea of the curious triangular plan? Did he copy the castle of Uranienburg, as stated, or did he design it himself? His drawing certainly looks like a preliminary sketch plan; it is partly in ink and partly with pencil notes. On the front side it says "Court here," on the garden side it says "Garden here," and on the third side "Orchard here," all of which imply that the site was already fixed. The fact that it is a quaint and fanciful plan is in favour of its being Thorpe's own design, for his MS. book abounds in fanciful plans, and on fol. 161, that is, in close proximity to this plan of Longford, occurs another plan on the triangular system, but more matured, and a further development of the Longford idea. There is, however, no name to it, and no evidence of its ever having been

carried out. If, on the one hand, an examination of Thorpe's designs leads us to the conclusion that he might very well be the author of Longford, on the other, there must be some foundation for the statement that the design was brought from Denmark; and if evidence could be given of this, it would throw a very interesting light on the source of some of Thorpe's ideas. But, whatever conclusion we adopt, we must not imagine that this is a solitary specimen of fanciful design imported from abroad. The air of the latter part of the sixteenth century was full of quaint conceits, some of which got embodied in stone, and among them was Longford. Its date is 1591. In 1593-5 Sir Thomas Tresham was building at Rushton, in Northamptonshire, his Triangular Lodge, a very much smaller building, but one containing many more quaint conceits. It is an embodiment in stone of the idea of the Trinity,—three in one. Curiously enough, on Thorpe's plan of Longford, within the triangular courtyard, is a device emblematic of the Trinity. But the Triangular Lodge was not the only emblematic building erected by Sir Thomas Tresham. About five years later, that is, in 1600, he was building Lyveden New Building, which is a cross on plan, and in all its parts symbolises the Passion. Plans of Lyveden are also among Thorpe's drawings, so that a very close relationship is established between all these quaint and curious buildings.

Longford Castle, therefore, may be taken as an example of one type of planning prevalent in Elizabeth's reign, when the object of those concerned seemed to be not so much to promote the comfort or convenience of the house as to embody some sentiment, or to work out some quaint idea to which all notions of convenience had to bend. The appearance of the plan on paper was all that was cared for. At Longleat we shall find another type of building, much less quaint but more reasonable, in which symmetrical magnificence was aimed at, but almost equally at the cost of convenience. You will, no doubt, have noticed that in the middle gable over the front entrance is carved a ship in full sail. Has this any reference to the legend of the Spanish galleon? And, if so, was it placed there in commemoration of that circumstance, or was the circumstance invented in consequence of the ship being there? On Thorpe's elevation the arched recess is shown, but not the ship; it appears, however, on Thacker's view in 1650. With regard to the rest of the detail, it is of the period: but a close examination will show that the sections of the strings and cornices are by no means orthodox, though they are very similar to those on other buildings attributable to Thorpe.

Longford Castle, therefore, in spite of the alterations it has undergone, throws no little light upon a phase of architecture of great interest, and one which was the result of the most active period of house building which the country had ever seen previous to the Victorian era.

*Longleat.*

Longleat is an excellent text upon which to found a discourse on the Domestic Architecture of the Renaissance, but before doing this let us see what we know with regard to its history. Canon Jackson has already busied himself with this subject, and is in a far better position to speak on it than any one else, and it is therefore with great diffidence that I approach it.

The house was begun by Sir John Thynne,—who was the founder of the family and the purchaser of the estate,—in 1567, as shown by a book of building accounts which begins on the 21st of January, 1567, and continues till the 29th of March, 1578, during which time 8,016*l.* 13*s.* 8*d.* was spent. Losely House, near Guildford, was building about the same time, viz., from 1561 to Michaelmas, 1569, during which time only a little over 1,000*l.* was spent; but Losely House is not so large as Longleat. The 8,000*l.* sufficed to cover the cost of the outside of the house, except the west front and part of the inside court, but the exact extent it is difficult now to determine. Sir John Thynne died in 1580, leaving his son, the second Sir John, to carry on the work. Under his directions the balustrade that crowns the walls, many of the chimneys, and some of the towers, were built, and the screen in the hall and much of the panelling were also finished. The work was taken up by Sir John's successors, one of whom employed Sir Christopher Wren, and was continued for a great

\* A paper by Mr. J. Alfred Gatch, F.R.I.B.A., read at the Salisbury meeting of the Royal Archaeological Institute, so-cisewhere mentioned.

number of years. Finally, Jeffrey Wyatt came upon the scene early in the present century and blotted out all history from the inside, and from the outside too, except from the south and east fronts. It is, therefore, from them that we must learn all that Longleat has to teach us. But, before proceeding to this lesson, let us see what we know about the actual designing of the building.

Longleat has been attributed to John of Padua; to John Thorpe, who is erroneously supposed by some to be the same man under an English name; and to Robert Smythson, who has been said to have designed Wollaton House, near Nottingham. Here are several suppositions which open up rather a wide field of controversy. Without lingering in that field for any length of time, it may perhaps be as well to give one or two facts which will dispose of some of the points in doubt. First of all, John Thorpe cannot be John of Padua, since John of Padua is recorded to have received his first grant, "Pro servitio in architectura et ympanicis," in 1541. One of Thorpe's plans is dated 1620, i.e., seventy-six years later, and it is hard to believe that an architect can have been in active practice for seventy-six years. Secondly, I am not aware that any evidence exists that John of Padua had anything to do with Longleat. Thirdly, it is certain that no evidence exists that John Thorpe was ever concerned there. Canon Jackson is my authority for this statement, which I can supplement by saying that there is no drawing in Thorpe's collection which can be meant for Longleat. We are, therefore, left to deal with Robert Smythson's connexion with the house, and with Wollaton. It is stated that the previously-mentioned building accounts show that on the 11th of March, 1568-9, Robert Smythson succeeded John More as head freemason. I have not been able to examine these accounts in detail, but, from a short inspection made with Canon Jackson some time ago, it appeared that they mention a Richard Smythson as freemason at 16d. a day, but do not mention Robert Smythson at all. It would seem, however, that a Robert Smythson was sent about 1567 to succeed More, the mason, but how to reconcile the difference in the names I do not know. If Richard really were the name of the Smythson employed here, he could not be the same man who is connected with Wollaton, for his name was Robert, as his epitaph in Wollaton Church states. The epitaph is as follows:—

"Here lyeth ye body of Mr.  
Robert Smythson Gent.  
Architector and Surveyor  
or unto the most worthy  
House of Wollaton with  
Diverse others of great  
account, he lived in ye faryth  
of Christ 28 years, and then  
departed this life ye XVth of  
October Anno Dni 1614.

Into the rival claims of Robert Smythson and John Thorpe to have designed Wollaton, I will not enter; but this much may be said:—that a plan and elevation of Wollaton are found in Thorpe's collection, just as a plan and elevation of Longford are found, and I myself regard Thorpe as responsible for "the most worthy house of Wollaton." It is interesting to note that Wollaton was begun in 1580, the year of Sir John Thynne's death, so that it would have been quite possible for the same man to have been engaged on both buildings consecutively. But the evidence relied on by some writers,—an exact similarity of detail between the two places pointing, indeed, to a use of the same templates or moulds,—this evidence cannot be established. I have compared the sections of the mouldings side by side, and find that, though in general disposition they resemble each other, yet in particular features they are quite different; those at Wollaton could not even have been worked from an ill-proportioned sketch of those at Longleat, except in one or two cases. The mouldings at Wollaton are hardly as well proportioned, as those at Longleat. But, in spite of particular differences, there is a certain general similarity in idea between the two places, which would be accounted for by supposing the same foreman to have been engaged at both.\*

With regard, therefore, to the immediate source of inspiration at Longleat we can form no certain opinion; but the ultimate source was,

\* We have recently stated (p. 165 ante) that the researches of the present owner of Wollaton may be considered to have put an end to the claims of Smythson in connexion with it, and established those of John of Padua.  
—Ed.

of course, Italy. Italian ideas permeated every every branch of art and literature at this period, but Longleat is rather a curious example of their influence, inasmuch as no other building of so early a date is so thoroughly Classic. Kirby, for instance, which was begun three years later, in 1570, is very much more English in feeling, less formal, and consequently more interesting. But Longleat, in its very formality, in its exact balance, in the rigidity of its horizontal lines, in its somewhat tame sky line, from which none of those beautiful gables spring which are characteristic of Anglicised Classic,—in all these points Longleat very aptly illustrates the effect upon English architecture of travelling in Italy. The same influence is observable in the projecting windows, which are not bay windows in the strict sense of the term, not at all like the large semicircular bays at Kirby, or Burton Agnes, or (to name earlier examples) those at the dais end of many halls in Oxford and Cambridge. Then, again, observe the circular recesses filled with busts. The busts all represent some classic personages, gods and goddesses, the Nine Worthies (as at Montacute), or Virgil, Aristotle, and Plato, as at Wollaton. Here none are named, but they are of the same family with those that are, and very sorely they must have puzzled the British workman who put them in their places.

The present plan of Longleat can tell us only one fact of historical interest, and that is that the original arrangement of the rooms became unsuitable to modern ideas, and that, consequently, it has been swept away wholesale. It is often said that the era of house-building that began in Elizabeth's reign introduced all the apartments required for modern use. To a large extent this is so. We might even go further, and add that it introduced a great many for which no modern use can be found. But we must not forget that, though there was a great multiplication of apartments, they were very unsuitably arranged. Nothing is more obvious, in visiting Elizabethan houses which are still inhabited, than the straits to which the occupants have been put to obtain a reasonably comfortable home without destroying the venerable appearance of the house. At Burleigh a corridor has been contrived round the courtyard; at Apherhope you have to make the circuit of the building to get from your bed to your breakfast; at Loseley the family sleep at one end and the guests at the other, with the great hall between them; at Wollaton the window-sills are so high that to sit down is almost like being in a well. Indeed, there is no concealing the fact that John Thorpe and the other designers of that time went to work on wrong lines. They produced houses into which the inhabitants had to fit themselves. They did not first ascertain the requirements of the inhabitants and then build the house to suit their comfort and convenience. Their way was the easiest. They said: "Here is my architecture, suit yourself to it." Our way is the best; we say: "Such are your habits, our architecture shall be founded on them." In the result what we lose in stateliness we gain in comfort, and those who do not have to live in such houses can freely afford to admire them, and to be thankful to those who, in spite of inconveniences, jealously preserve these magnificent memorials of the past.

## Illustrations.

### CATHEDRAL, TOLEDO.

WE give four views, reproduced from photographs by Laurent, of Madrid, of portions of this Cathedral, of which a long description is given in Street's "Gothic Architecture in Spain," and which is, in many ways, a very remarkable Medieval monument.

The Cathedral is believed to stand on the site of an older one, which had been converted into a mosque during the Moorish occupation of the city, but of which nothing remains. The first stone of the present Cathedral was laid in 1227, by King Don Fernando III, and Street was of opinion that French architects were concerned in the design of it. The French character of the older part of the work is evident enough from the interior view, in the eastern ambulatory of the choir.

The church, of which Street gives a plan, is five-aisled, and on a great scale, 178 ft. wide and 395 ft. long, and 50 ft. 6 in. from centre to centre of the nave columns. The plan is

remarkably grand and simple, the transepts hardly projecting on the ground line, and the outer aisles being carried in a splendid semi-circular sweep round the apsidal eastern termination. The columns are all circular, surrounded by engaged shafts; a portion of one of them is seen above the view of the side of the high altar-screen. The words "Side of the high altar" on the plate, are the literal translation of the Madrid photographer's title, which should, however, rather be "choir-screen adjoining the high altar." This gorgeous piece of fourteenth-century work only exists in this state on one side of the choir, the remainder having been continued in "Berruguetesque." Street expresses great admiration for the elaboration and delicacy of the work here.

The so-called "Gate of Lions," only named so, as will be seen, from the Renaissance addition of the lion-crowned columns supporting the grille, is the doorway of the south transept. The principal western doorway, shown in another illustration, is work of the early part of the fifteenth century, when the west front was commenced; but all the upper portion of this front (as will be gathered from the story immediately over the gable in the illustration) was altered and modernised in later times.

### COMPETITION DESIGN FOR EDINBURGH MUNICIPAL BUILDINGS.

WE give this week another of the designs submitted in this large competition, that by Messrs. Foster & La Trobe, of Bristol. The authors have duly appreciated the importance of the aspect of the building towards Cockburn-street, as shown in their sketch perspective of it from this point of view.

### HOUSE IN SUNDRIDGE PARK, BROMLEY, KENT.

This house, which is in the course of erection, is situated on rising ground, there being an extensive view from the south windows.

Mr. G. H. Lay, of Bromley, is the builder, the estimated cost being rather more than 2,000.

The external walls are faced with red bricks from Dumton Green, Kent, and the roof is to be covered with Yorkshire tiles.

Mr. Evelyn Hollier, of Bromley, Kent, is the architect.

### WIMBLEDON BRANCH OF THE LONDON AND SOUTH-WESTERN BANK, AND BUILDINGS ADJOINING.

THESE buildings have been erected from the designs of Mr. J. S. Edmeston, Mr. H. Johnson being the builder. The amount of the contract was 11,500. The walls externally are of Farnham brick, with all mouldings and enrichments of red terra-cotta supplied by Mr. J. C. Edwards, of Raubon. The other buildings consist of shops, with a private residence at the corner.

The bank contains, on the ground-floor, banking hall, with waiting and manager's rooms, and in basement, fireproof strong-rooms, lavatories, &c. The upper part of house arranged as manager's residence.

The mosaic pavements are by Messrs. Rust & Co. The bank fittings, partitions, and joinery, all in polished teak, are by Messrs. Bright & Co. Mr. Wm. Tooke is clerk of works.

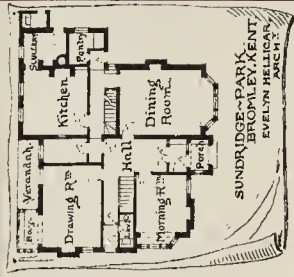

### Association of Municipal and Sanitary Engineers and Surveyors.—A Northern Counties District meeting of this Association is to be held at Newcastle, this Saturday, Aug. 13.

The members will assemble in the Council Chamber at the Town-hall at 11.30 a.m., by kind permission of the Mayor. The first business will be the election of a District Secretary. The following paper will be read and discussed, "The Floating Hospital of the Tyne Port Sanitary Authority," by Mr. W. G. Laws, City Engineer, Newcastle. The members will afterwards adjourn to the Exhibition, where, in the North Court, a model will be seen of the Floating Hospital. As there are many objects of interest to municipal engineers in the Exhibition, it is proposed to spend the rest of the day there.

CREMATION.\*

The disposal of the human body after death is always occupied the earnest attention of the living in all countries, and it may be that the method of simple exposure as against burial was a outcome of much cogitation and dispute long the ancient peoples who practised it. He can prove that the Phrygians and others who hung their dead upon the limbs of trees; the North American Indians, who to this day expose their rudely handaged dead relatives tall platforms in the prairie; the Syrcenians, to left their dead in the near forests to the wild dogs to devour; the Paraces, who from an immemorial have laid their dead upon mounds on the summit of high "towers of stone" for the vultures, did not adopt these various systems of disposal of the dead after the most profound consideration, apart from any religious or superstitious bias? It was only easier for these ancient peoples to inter their dead, than the "far-off descended race" apparently taught the very earliest races to protect themselves from the dead and to confer the earth to be the very property of the living. The practice of the exposure of bodies to the attack of carnivorous birds, beasts of prey, wild dogs, crocodiles, and the like must have been instituted, not from the want of land for interment or labour to dig graves, but from the human consciousness that the earth was required for far nobler purposes than as a storehouse for the putrefying dead . . . .

It may almost be said that when mere exposure of the dead ceased to satisfy, and when re-burial became obsolete, inhumation or earth burial by contact was introduced, with all its herent drawbacks. Burial in the earth has, I think, existed from the very dawn of our race's life; certainly no one can absolutely prove this. But it is a very ancient practice, and was the easiest means of hiding the dead to sight. It matters not how contrivancists may decide this point, and it is sufficient to admit that burial in the earth is of remote antiquity. I do not think that it was resorted to for reasons of health, but for reasons of expediency, and economy.

Terrible outbreaks of death-dealing disease have followed indiscriminate and injudicious burial. It would nanseate you to quote a thousandth part of the number of cases which have been recorded where the depurating power of the earth has been almost nil. Earthworms continually, from their very nature, upheave germ-laden soil from below, with the usual consequences. I need only note some instances here misguded burial has been followed by re-sequences. I will not mention the reappearance of the plague at Modena, where 600 years before the victims of a plague were inured, and how similar disturbances of the same sites caused immediate outbreaks of disease, or enhanced the virulence of epidemics such as cholera and the like. This happened in London in 1854, although the pits had been dug and filled up for almost 200 years. In 1843, when a parish church near Stroud, in Gloucestershire, was in process of rebuilding, the superfluous soil of the burial-ground was sposed of for manure to the villagers, and the soil was nearly a declination of the place. An outbreak of the plague in Egypt in 1823 was traced to the opening up of a disused burial-ground about fourteen miles from Cairo, and outside perished in consequence.

M. Pastour states that he has obtained, from dug-up earth, germs of splenic fever as virulent when the animals died twelve years previously. A recent investigation was made in the cemetery of Rio do Janeiro, scarcely four years ago, upon earth taken about spade deep from graves where victims of yellow fever had been buried some twelve months previously, and this soil was found to contain "myriads of microbes," self-same with those present in persons stricken with the same at the time of the excavation. A healthy inea-pig was incarcerated in a space over which earth taken from a grave was sprinkled, and in five days the animal was dead, its blood being found to be "literally crammed" with germs of the disease in various stages of elution. It will, therefore, be conceded that argument requires to be sprung in favour of cremation for the relics of humanity when the

same thing occurs in respect of the remains of the lower animals.

It is a fortunate thing for us that the majority of the animals which now perish from disease in our crowded towns are no longer buried in the earth, but are scientifically destroyed, and even some valuable products recovered. But this was not so in the olden times, when the corpses were merely thrown into a hole in the neighbourhood of the cattle-markets. It is almost impossible to excavate any distance in Shoppers' Market, now Mayfair, London, without coming across numberless relics of animals slaughtered from motives of health for their own race, but interred to the detriment of their owners.

I do not think cremation will ever become universal, and I am equally satisfied that burial in the earth never was a universal practice. Since the abandonment by gradually civilised and growing nations of disposal of the dead by exposure, desiccation, embalming, and the like, burial in the earth followed, and as the ancient world was opened up to the new, the practice of cremation in the former was brought to the knowledge of newer races, and eventually enthusiastically taken up by the Greeks and Romans. And both burial and cremation were practised at the option of the relatives, and this accommodation of parties must always, I think, continue to rule. Socrates was made to say that he had no care whether he was buried or burnt, but this apathy was rarely exhibited, and soon the rite of cremation was exalted to such an extent that certain of the citizens were forbidden it. All suicides, all persons killed by lightning, and all the still-born, were excluded from the pyre.

When the star of Christianity climbed the horizon, it became necessary for its teachers to adopt some distinction between Christians and Pagans, and very evidently the Christian leaders decided upon discarding cremation, and insisting upon the practice of inhumation. A wide-spread scism followed, and the rite became perfect when the system of burial in and around the churches began to obtain with the community. This practice of crowding the churches and churchyards with the dead was carried to such an extent, that about 1843 the burials in London around the churches averaged in some cases 1,204 per acre; in others, 1,278 per acre; in several, 1,560 per acre; in one case, 2,323 per acre. This was surely burial around the churches with a vengeance!

In ten years following 1852, when Orders in Council were issued to stay this monstrous evil, some 4,000 old burial-grounds were closed, and the good work of regulating interments is still carried on. Within the same space of time some 400 local Burial Boards were constituted, and this number has been far enhanced. Then necessarily followed the institution of cemeteries, and the metropolis alone has now one acre of burial ground for every 1,000 inhabitants, although, of course, this is partly taken up by roads and shrubberies. At present London has twenty-two cemeteries, with an aggregate of 2,210 acres.

A cemetery should have a close and yet dry, porous soil, such as would allow the rain, and the air which accompanies it, to pass down to the level of the lowest interment. With a soil like this, the depth for burial might be extended to a dozen feet, and everything save the larger bones would disappear in a dozen years. When a cemetery soil is very dense and clayey, it is impervious to moisture, and therefore objectionable. Its drawbacks can be partially remedied by deep cross drains with gravelled bottoms, and by pipe drains being laid between the bottom of each grave-space. The spaces nearest the deep drains should be first need gravelled at the bottom, and each subsequent grave, after being gravelled at the foot, should be connected with the other graves, and all drain into the cross drains, the outfall of which should be carefully chosen. Graves in clay formations are sometimes improved by the admixture of gravel and sand when refilling the graves. The cost of these proceedings is, however, very great, and it cannot be said that any commensurate success ever attended it. I have been informed that the cemetery instituted by the Corporation of this city [Leicester] is formed of a stiff and almost impervious clay, and that a tenth of a million of dead have been laid in it. I hope that matters are not so unencouraging as this, however.

Just as wheat may be said to be the ulti-

matum of all grasses, I think that cremation will be final and the chiefly chosen improvement upon burial. Where the earth is suitable for due resolution of the body, nothing can perhaps be preferable, but most unfortunately this consummation cannot be always achieved, and even where a suitable soil can be obtained there are dangers of air pollution and fouling of water, which have always to be strenuously guarded against, as many a community knows.

Since the resuscitation of the practice of cremation, brought about in our country by the telling works of Sir Henry Thompson, several ideas have been introduced to public notice with a view of minimising the dangers known to be attendant upon any promiscuous system of interment. I will only notice one, and that is what has been called "earth-to-earth" interment, and the use of wicker baskets in lieu of coffins. I can see no improvement here upon what was prevalent with our forefathers, when no coffin was used at all. Winding-sheets alone were in use until the sixteenth century, and in the Vestry Minutes of St. Helen's, Bishopsgate, London, there occurs, under the date of March 5th, 1564, an order that no one shall be hurried within the church unless the corpse be confined in wood. Up to the present time, many old families in Ireland inter their dead with shrouds only. At the conclusion of a paper which I read at York in September last,\* the Dean of York mentioned incidentally that at Easingwold, close by, there was a parish coffin, which had been in existence for several hundred years, whereby bodies were conveyed to the grave, and there consigned without enclosure to the earth.

It is sickening to read, as I have done in the Records of the Patent Office, the various improvements which have been laid before the public from 1781 to even last year,—I mean sickening to any one who has formed a high estimate of his fellow-man. Fancy plans for all kinds of coffins in stone, marble, granite, slate, cement, porcelain, earthenware, bitumen, asphalt, paper-maché, peat, indiarubber, iron, and glass being foisted upon us! An enclosure in lead was the parent of all these strivings after a long preservation of the dead, and this is now becoming altogether condemned, seeing that it robs the earth of its very own. The wicker-basket enclosure is no innovation, and should have a fair field, but its application must be very limited; and it is impossible to see how a body which has perished from, for instance, bad confluent small-pox could be laid in the earth without detriment. I opine that all who have perished from contagious disease, and all the unclaimed dead, should be compulsorily reduced to ashes at the nearest crematory. And, in order that such conveniences should exist, I would feel inclined to recommend that for the future, at all events, every new or enlarged cemetery should be compelled to erect a crematory of some economical kind on its grounds, to carry out such cremations, as also to afford optional cremation to those desiring it,—those who desire when dead to leave their mother earth not worse than they found her.

Cremation is variously practised now, but in former times the funeral pyre was most resorted to. The hurning ghants of India give an example of this at the present day. At the present moment the reform wave of cremation has reached even the Mauritius, and, falling a proper crematory, the people preferring cremation are having recourse to the common pyre. In some parts of Japan the body is scated, and after the body has been surrounded by the wood the orifice is closed, and the body is reduced to ashes. In January of this year an exactly similar cremation took place in Russia, when the remains of the Lama, or Grand Priest of the Calmucks, was consumed.

To describe even a fifth part of the various methods of cremation which I have in my possession would weary you.

The systems of cremation now in use may be said to consist of the Gorini, the Venini, and the Siemens methods. There are others, but it would serve no purpose for me to explain them to you. I have seen the various systems in use at various places abroad, and chose for use by the Cremation Society of England, which is a learned and not a trading society, the Gorini system, and I was instructed to erect one at their grounds, St. John's, Woking, Surrey, which I did. As yet no temple or chapel

\* "The Economy of Cremation," See *Builder*, Oct. 2, 1886.

From a paper by Mr. W. Essin, C.E., F.L.S., F.G.S., read at the Leicester meeting of the Association of Municipal and Sanitary Engineers and Surveyors.

surrounds the crematory, but that can only be a question of time.

The procedure in the Gorini system may be shortly stated to be as follows:—A fire is first lighted in the chimney close to its base, and through this all smoke and evolved gases are destroyed, thus precluding the escape of any deleterious products which may have escaped from the first combustion in the crematory chamber. A fire is then lighted in the furnace portion of the crematory, and this is chiefly composed of wood fagots, with a sprinkling of anthracite coal, and the heat from this passes through flues under and above the crematory chamber, where the body is placed. When the reception chamber has been sufficiently heated, the body is introduced, and is consumed in little over an hour, the residuum being pure white ashes. The tray is withdrawn after the chamber has somewhat cooled down, and the ashes reverently deposited in a suitable receptacle. On the Siemens system, which is also represented, the requisite amount of destructive heat is first of all generated by combusted fuel, the flame from which imparts most of its heat to the fire-brick or regenerator chamber, and, when the apparatus has been in operation sufficiently long, this fire-brick and crematory chamber become of the usual white heat. The tray containing the body is then slid along the rollers, shown on the right of the plan, into the crematory chamber, atmospheric air is laid on, and when the ashes have fallen into the receptacle below they are inurned.

The progress of cremation within the last few years has been very rapid, and there now exist scientifically-constructed crematories at Woking, England; at Gotha, Germany; at Milan, Lodi, Cremona, Varese, Udine, Padua, Brescia, and Rome in Italy; at Geneva, Switzerland; and at New York, Buffalo, and other places in America. France is also completing an extensive establishment in Paris; and other countries, such as Holland, Belgium, and Sweden, only await a recognition of the right to perform cremation when it is sought for.

The licence will come in good time to those who work and wait, as we did in England, until it was manifest that there was no legal bar to the reformed practice. About twenty-five cremations have taken place in England, the last of them being that of a retainer of Maharaj Sir Pertab Singh, of Jndhpore, India, who himself, with a suite, attended to witness the ceremony, and who removed the ashes afterwards for immersion in water, as he explained to me, according to Hindoo custom.

The cost of cremation varies, according to the number cremated with one heating of the crematory. But it varies from 6l. to 2l., the former sum ruling in England, where succeeding cremations have not as yet occurred. As to the custody of the ashes, they have chiefly hitherto in England been removed by the relatives, and interred in churchyards or vaults. But the desirable practice would be to collect them for a given time in a columbarium attached to the crematory, and after twenty years, if not claimed then, disposed of upon the ground. There seems to be a consensus of opinion in favour of this, because no good could accrue from the preservation of ashes when none of the family care to pay a fee for further conservation. Many persons simply specify that the ashes shall be thrown upon the earth.

Very much nonsense has been spoken and written upon the possible effects resulting from the destruction of bodies by fire, and the asserted loss of ammonia resulting therefrom was but one of the many bogus objections. With an audience such as this I would not venture upon the religious objections made, because they do not merit a moment's attention, and are puerile to a degree. There is also a series of sentimental exceptions taken to cremation, but they none of them rise even to the level of merest platitudes.

The Cremation Society of England, of which I have been both Hon. Secretary and Hon. Engineer from its commencement, was formed to promote the objects set forth in the following declaration:—

"We disapprove the present custom of burying the dead, and desire to substitute some mode which shall rapidly resolve the body into its component elements by a process which cannot offend the living, and shall render the remains absolutely innocuous. Until some better method is devised, we desire to adopt that usually known as cremation."

The conditions of membership are:—

"I. Admission by signature to the above declaration.  
II. The payment of an annual subscription of one guinea, or a single payment of ten guineas."

III. The payment of ten guineas, with an obligation from the Society insuring cremation after death."

Much has been said concerning the possibility of cremation becoming an inducement to commit crime by means of poison; but, with the safeguards now taken by the committees where cremation is carried out, no concealment is possible. People seem to forget that for one body presented for cremation in possibly 5,000 there could be no possible mistake as to the cause of death.

The securities demanded by the English Society are as follows:—

"(a) An application in writing must be made by the friends or executors of the deceased,—unless it has been made by the deceased person himself during life,—stating that it was the wish of the deceased to be cremated after death.

(b) Two certificates from duly-qualified medical men are required relative to the cause of death, one, at least, of whom must have attended the deceased."

These must satisfy the Council of the Society or their representative, and in some rare or doubtful case an autopsy might be desirable. Several autopsies have already been made by orders of the friends of the deceased themselves previous to cremation.

A branch of the Cremation Society of England has been formed in Leicester by some very influential citizens, and will be certain to prosper.

In the discussion which followed, there was a unanimous consensus of opinion that cremation was the most sanitary means of disposing of the dead, especially in large towns and thickly-peopled countries.

#### THE NEW TEDDINGTON FOOT BRIDGE.

MR. GEORGE POOLEY, C.E., has been appointed engineer for the foot bridge which is about to be constructed across the Thames at Teddington. The structure will consist of two distinct bridges, one over the Thames, adjoining the Angler's Rest Hotel, and the other over the lock cut. The bridge over the river will be a suspension bridge of one whole span of 160 ft. adjoining the Teddington side and one half span of 80 ft. next the island. The bridge will have a clear minimum headway above the mean water level of 12 ft. The suspension part of the structure will be carried upon four steel wire cables, each 7½ in. in circumference, guaranteed to sustain an ultimate strain of 200 tons each. The footway is 8 ft. wide in the clear, and the bridge is stiffened on either side with wrought-iron lattice girders. The bridge over the lock cut will consist of wrought-iron lattice girders of a clear span of 99 ft., the abutments being of Portland cement concrete, furnished with flights of steps to enable the requirements as to headway laid down by the Thames Conservators, namely, 12 ft. clear headway at the towing-path and 18 ft. clear headway above water level of lock cut, being complied with. The sanction of the Thames Conservancy has been obtained to the erection of the bridge, and the plans have been approved by the Local Government Board. It is much to be wished that some effort may be made to produce a bridge of picturesque appearance and such as will not be a disfigurement to the river; but we fear there is little hope of this except so far as this, that a suspension bridge must always present a graceful curve in its main line, the forces of Nature themselves providing for this. The iron girder bridge we regret to hear of; all the iron structures put over the Thames have been more or less detestable in appearance. In the old wooden bridges at various points on the upper Thames there is an obvious effort and intention to do something not only durable but picturesque; and the new granite bridge at Putney is really a fine one, though it makes no attempt at being architectural; it is built in a manner and with a material which must look impressive if left to itself. But when an engineer gets hold of an iron girder bridge there is an end of the picturesque; and we fear it will be the same here as in other parts of the river.

**Eton College.**—The governing body have definitely decided on the plans for a new block of buildings which will stand on the site of the old mathematical school, facing the laboratory. The buildings will form a square, and will contain, beside several class-rooms, a lower chapel, a lecture-room, and a museum. The work will be begun at once, and can hardly be finished under two years.

#### THE WORK AT THE FORTH BRIDGE WORKSHOPS.

WE take the following from Mr. Malcolm Wood's paper on the "Forth Bridge," read at the recent meeting of the Institution of Mechanical Engineers:—

"The procedure in the shops may be described as follows. The flat plates and bars are first straightened. The plates to be curved are heated to a uniform red heat in a gas furnace, and while red hot are moulded in dies under hydraulic pressure to the required form, stacked and coated with ashes, and allowed to cool slowly and equally; any misalignment warping is taken out by placing them again in the press when cold, and giving them a final squeeze into the correct shape. The hits of the bars are cold sawn, and the edges and butts of the flat plates are planed in the usual manner. The ends of the curved plates are planed in a novel form of machine, in which the tool travels in a circular path readily adjusted to the radius of the curved plate. On completion of the planing, the plates are taken to the tube yard, and are built up round the longitudinal ribs and internal stiffening frames, which have previously been fitted together in moulds to the exact diameter required, so that the plating of the framing at once gives the tube its proper form. The plates are in 16 ft. lengths, and break joint alternately over the stiffeners at 8 ft. intervals. Means are adopted to keep the tubes in line while the rivet holes are pierced by a travelling annular drilling frame, which is mounted on wheels and carries a hoiler and engine driving ten drills by cotton ropes. A pair of drills are attached to each head; and as the beds can traverse the circumference of the tubes, while the drills can traverse the length of the beds, the whole outside of the tube is commanded, and the holes are completed with accuracy to ensure their precise coincidence when the parts are rebuilt at the site. As fast as each section of 8 ft. length is finished, the machines are propelled along the rails to take up a new position; they thus travel gradually in successive stages over the whole length laid down. The tee and trough shaped parts are built together in the shops, and the holes are drilled by adjustable vertical and horizontal drills, fitted to a travelling carriage; the power is transmitted to the machines by ropes from the shop shafting. Numerous radial machines are also in use for the secondary parts. For dealing with special parts, many ingenious and somewhat novel workshop appliances have from time to time been brought into use, beyond those here mentioned. All the parts of the junctions are carefully fitted together in the yard in the exact positions they will relatively occupy in the bridge. After each member has been prepared, the pieces are painted, marked, and stored until required for erection."

#### MASONS' MARKS AT WESTMINSTER HALL.

SIR,—These masons' marks were monograms representing the name of the mason who worked the stone. The mark was cut on the stone to distinguish it as having been worked by a particular man, and was entered in the measurer's book, the measurement and price being placed against it. For moulded work the mark would be cut on the bed of the stone, not on the face. It must be noted that the marks for the most part are straight lines, such as could be cut by a plain chisel, and the majority form angles. These forms could be nicked in at once, without extra trouble, such as must be used in cutting curves; I, in fact, doubt such curved forms as being true masons' marks. Some stupid egotist, to be singular, may, however, have used them.

At the Custom House, Liverpool, 1832-3, I worked as a youth, and the ashlar stone hurled in the foundation were marked as at Westminster Hall, at Heidelberg, and at our monasteries. At the Custom House the masons claimed the stones for working in due rotation, each man's mark being entered in a book kept for the purpose. When the stone was worked the mark was cut upon it, and it was measured, entered up, and was paid for to the mason by his own name, which the mark represented. A triangle might be John Smith, a double triangle John Jones, the arrow James Stout five points Thomas Williams, and so on.

In Freemasonry some of these marks may have mystic meaning. I, however, am ignorant as to this. The incised cut with a plain chisel was the easiest form to make, and admitted of a large variety of compound forms, as shown on the page of the *Builder*. But the whole of this explanation is only a repetition of a very old story.

ROBERT RAWLINSON.

Sir.—It will be interesting to Freemasons to note that, of the masons' marks shown on p. 215 of last week's *Builder*, only about one-third have an odd number of points, while the other two-thirds have an even number. Some imagine the latter are not proper masonic marks, or at least indicate an inferior status. I doubt such an idea is a mistake. In Scotland, masons used to pay for getting or choosing their marks, and having the same recorded in the lodge-books. Entered apprentices had their marks, which were "hooked," as well as those of the fellows of craft and masters.

W. P. BUCHAN.

ASPHALTE AND CONCRETE FOOT PAVEMENTS.

Sir.—The author of the paper on "Asphalte and Concrete Foot Pavements," recently read before the Association of Municipal and Sanitary Engineers, *Builder*, 165, *ante*, describes with more or less minuteness the great care required in manufacturing asphalt. The necessity for guarding against the use of spurious materials, the immense difficulty of preventing unrightly cracks, the marked manner in which kerbs are filled by it, the effects of the sun upon its surface in raising it in irregular lines, its unfortunate power of conducting heat, to the great detriment of the concrete, and the length of time water remains on its surface; and these particulars constitute a grave indictment against asphalt, while many of the charges apply with equal force to *in situ* pavements. The condemnation of both, however, would have been more complete if the facts had been added, that the cost of relaying trenches is from four to eight times as great in these materials as in slab pavements, and that neither asphalt nor *in situ* pavements can be repaired, but when worn down in the lines of greatest traffic, they must be renewed. Even more interesting data would have been obtained if the author's inquiries had been extended to materials which the best asphalt have sometimes lasted only six, eight, and ten years, and that in streets of comparatively light traffic. In a recent report by Mr. Lovegrove, M. Inst. C.E., several such instances are related, and doubtless the experience of other surveyors could have been had for the asking. Important information as to the failure of many *in situ* paths which were laid on the most approved principles could also have been obtained in a similar way.

Practical members of the Association will probably be of opinion that the space in the paper occupied by ancient history and chemical analysis might with advantage have been left blank, and that the elaborate geological quotations could have been spared for a treatise on the subject, the actualities sustained by the various kinds of pavements in a number of streets, and the effect of traffic upon them, together with a few simple calculations as to the approximate cost of each material per million or hundred millions persons passing over them.

The writer of the paper has been careful to inform us of the doubtful statement that when stone has worn 1 in. its useful life is over, but he has omitted unintentionally, no doubt) to say what value is left in asphalt or *in situ* pavement when worn only ½ in. Again, he has noted with exactness tests of tensile strains which he did not witness, and with a marvellous ear detected discord in, and been annoyed by, the "sound of the footfall" on slabs, while he has been studiously silent as to the sloppiness of asphalt and *in situ* pavements in wet weather, when worn down below the kerb-level.

In making these few remarks, I have avoided obtruding my opinion as to which is the best material for footways, for the reason that it appears to me we have had more than enough opinions, and that in future reference to this subject, it will be better to simply give the data necessary for forming opinions, and so avoid giving any of the companies which supply these materials cheap advertisements, and prevent the suspicion being aroused that our papers emanated from an asphalt office or a stone yard.

A. M. HISCOCKS, C.E.

HOUSES FOR EARTHQUAKE DISTRICTS.

Sir.—Can any of your readers who happen to have any experience in the building in districts affected by earthquakes, make any suggestions as to the safest method of construction? My own idea would be a very low building, timber-framed, and filled in.

R. KNILL FREEMAN.

Bolton-le-Moors.

PROVINCIAL NEWS.

**Birkenhead.**—A lecture hall in connexion with and contiguous to the Hamilton Presbyterian Church, Laird-street, Birkenhead, was opened at the end of July last. The size of the hall is 40 ft. by 2½ ft., with wagon-headed ceiling, finished in pitch pine, and it has sitting accommodation for nearly 200. Mr. W. H. Forde was the contractor, and the cost about 450l. Mr. James N. Crofts, of Liverpool, who also designed and carried out the church a few years ago, was the architect.

**Oldham.**—New buildings for the use of the Salvation Army in Oldham have just been inaugurated. They are situate in Union-street, and the accommodation comprises a large main hall to seat 3,000 persons, a smaller one, intended for week-night services, capable of accommodating 900 persons, a shop, several retiring-rooms, hoiler-house, heating-chamber, and the usual necessary appurtenances. The front is of red brick, with stone dressings, with a tower running up each side of the main hall, finished with battlements. Tudor Gothic has been adopted for the architectural treatment. The contractor was Mr. Councillor Holt, of Cheetham, Manchester. The brick and stone work was carried out by Mr. Thomas Whitehead, of Fallsforth, Manchester. Mr. J. Williams Dunford acted as assistant architect. Mr. E. J. Sherwood, of Queen Victoria-street, London, E.C., was the architect. The entire block covers an area of 12,250 square feet, and the cost has been about 5,70l.

CHURCH-BUILDING NEWS.

**Braiding (Isle of Wight).**—The peal of bells belonging to this church has been re-adjusted. No. 5, bearing date 1694, is cast anew, with the addition of 1 cwt. of metal, and four smaller bells are added. The tenor is dated 1594. The flooring, framework, and beams in the hells have also been repaired, the whole work being carried out by Messrs. Mears & Stainbank, of London, at a cost of about 350l.

**London.**—The foundation-stone of St. Philip's Church, Buckingham Palace-road, was laid on Wednesday last, by Lady Grosvenor, as proxy for her Grace the Duchess of Westminster, who was absent through illness. The parish is to be formed out of St. Michael's, Chester-square. The Duke of Westminster has given the site and 3,000l., and it is expected that the Ecclesiastical Commissioners will augment the endowment. The church will consist of nave and chancel, north and south aisles, transepts, and morning chapel, and will accommodate 750 persons. Clergy and choir vestries, to be used also together as a parish room, with organ-chamber over, are arranged on the north side of the chancel. The materials used are Gainsborough bricks for outside facing, with Lawrence's brick strings, &c., and Doulting stones for sills. The core of the walls is of concrete inside, Corsham stone is used for dressings, and the walls are plastered. The roofs are of pitch pine, with hoarded ceilings, and covered with Broseley tiles, and there is a flèche, 100 ft. high, above the nave floor, covered with copper at the crossing. The cost of the fabric, exclusive of fittings, is about 6,000l. Messrs. Demaine & Brierley, of York, are the architects; Messrs. Macey & Sons, Strand, the contractors; and Mr. T. W. Creed is clerk of works.

**Portsmouth.**—On Tuesday, the 9th inst., the Crown Princess of Germany and her three daughters visited Portsmouth to lay the foundation or memorial stone of a new parish church for Portsmouth. An anonymous donation of 15,000l. is given towards the cost of the new structure. This will be on the site of the present parish church of St. Mary, in the titling of Kingston, where the tower of the original fabric is still standing. The register dates from 1653. In the churchyard is the monument to Admiral Kompeufelt and his "twice four hundred men" who were drowned at Spithead by the capsizing of the *Royal George* on the 29th of August, 1782. Charles Dickens, who was born (1812) in Landport, was christened in this church. The estimated cost of the new church is 40,000l., of which three-fourths are already subscribed. It is designed to receive 1,600 persons, and will be built in the Perpendicular style, having a general external facing of flint, with freestone dressings. The architect is Mr. A. W. Blomfield.

Books.

*Labour, Leisure, and Luxury; or, Contributions to Present Practical Political Economy.* By ALEX. WYLIE. London: Longmans, Green, & Co. 1887.

IT is a good sign of the times that an audience of working people can be got together to listen to dissertations on social politics, as in the case of the Renton Literary Association, near Glasgow, and still more so, when we find that the lecturer is no less than one of the masters of the establishment, which numbers over 2,000 hands. All the same, a series of lectures is not always the better for being raked together into a hook, for it is apt to lose its coherence, and read rather disjointedly. Mr. Wylie deals with the alliterative subjects of Labour, Leisure, Luxury (which latter, though very interesting as a chapter, is scarcely suitable for a working-class audience), Progress, and the Acquisition of Property by the Working Classes. One of the best chapters in Mr. Wylie's little hook is that on the acquisition of property, in which, after dealing with economy, temperance, thrift, and so on, the keynote is co-operation, and especially as regards building societies. These societies have increased wonderfully of late years. In 1861 there were but 66; while in 1881 there were 1,118 with 6,850,000l. capital, so that co-operation has evidently been a great success, and this is more particularly the case with distributive co-operation, the increase in which is marvellous. Mr. Wylie's little work forms a capital hook of reference, as it is well studded with statistics from Giffen, Leone Levi, Mullah, the late Mr. Hoyle, and others, and we can recommend it as one which should be added to every one's library.

*Social Arrows.* By LORD BRABAZON. London: Longmans, Green, & Co. 1887.

LORD BRABAZON (who has, since the publication of this book, succeeded his father as Earl of Meath) is so well known for his philanthropic views, and, if one may say so, his particular line of philanthropy, that his volume of "Social Arrows" needs but little explanation or apology. On the contrary, it is most interesting, suffering only from the fact that the papers of which it is composed have already appeared in various magazines, and are consequently rather repetitive in their nature. Throughout he deals with the ills to which suffering humanity is heir, especially in our large overgrown towns and cities, and tells us in vivid language to what dangers society is gravitating by carelessness and in allowing such dangers to exist. Lord Brabazon's individual efforts (and successful ones) to provide for the use of the poor, gardens, playgrounds, and open spaces where crowded places only were before, shows what can be done, for he has pioneered one of the most valuable philanthropic movements that the metropolis has ever known. State-directed Colonisation is another "Arrow," the importance of which cannot be over-rated, and from first to last the hook is advocating useful works. The last chapter is a strong appeal to men of wealth and leisure to hestir themselves for the common good, and well it deserves to be read and acted upon.

*The Blackley National Provident Insurance Scheme; a Protest and an Appeal.* By THE REV. J. FROME WILKINSON, M.A. London: Swan Sonnenschein, Lowrey & Co. 1887.

This little volume is a jeremiad from beginning to end, and a dissertation upon the shortcomings of the Rev. Canon Blackley, who, as all the world knows, is the framer and (pertinacious) proposer of the Compulsory Insurance Scheme. He has, however, apparently met his match in the Rev. Mr. Wilkinson, who, with what success remains to be seen, has taken a great deal of trouble to dissect the Canon's plans, and show how very unreliable they are. In any case, the Canon has a Herculean task before him, for the innate difficulties in themselves are quite sufficient to take up all his attention, even were the attack less uncompromising than it is. But, whoever is right or whoever is wrong, it is a good sign when we see such a grave matter a subject of controversy, for, at all events, recognises that a great evil exists in our social system which requires rectification; but we must be careful that in creating a remedy we do not fall into a worse

condition. We agree with Mr. Wilkinson that it is as impossible to make a people thrifty by Act of Parliament as it is to make them religious; but we ought to be well satisfied with what voluntary effort has already done. One can scarcely imagine it possible to stop 10l. out of any wage-earner after 18, whether he likes it or not, especially where the measure is so strongly objected to by the numbers already belonging to friendly societies, but the difficulty will be enhanced a hundredfold when the measure begins to be really worked, and it must infallibly break down by its own weight. At any rate, Mr. Wilkinson's hook may be read with a great deal of interest as giving enlightenment on a scheme which, right or wrong, takes high rank in the schemes of the day.

*The Pilgrim at Home.* By EDWARD WALFORD, M.A., editor of the *Antiquarian Magazine*. London: Society for Promoting Christian Knowledge.

At this season, when pilgrimages of all sorts are being undertaken (ostensibly in pursuit of health, but practically for recreation's sake), Mr. Walford's little hook will be found useful. It may serve to shape the course of a holiday tour, as well as to increase its enjoyment; for we hold, with the author, that a visit to any spot which past events have made famous distinctly helps one to realise with more vividness the events themselves. A recent writer has, indeed, contended that the faculty of association interferes with the simple enjoyment of a work of art, but in most cases it enhances it. The contemplation of a Botticelli may be spoiled by the gaudy frame and surroundings which environ it, or by a recollection of the exorbitant price paid for it; but there is scarcely room for any such disturbing elements when we are looking at the ruins of Kenilworth or standing within the walls of "old Iona's holy fane."

Mr. Walford writes to please all tastes, and shows experience in making his start on very level ground. The scenery of Olney, the little town in Buckinghamshire, where John Newton and William Cowper composed the hymns that bear his name, is about as tame as the bars that fringed around the poet. Who shall say that it had no influence on his verse? "The Task," which Cowper wrote at Weston Underwood, hard by, is full of local allusions, and the features of this place have undergone so little change that at every turn some lines are suggested wherewith to describe the scene.

Glastonbury Ahhey takes the tourist much further afield, and into comparatively unknown regions, though the valley of Avalon has at length been invaded by the railway, and the pilgrimage thither can be made without difficulty. It is one which will well repay the student of architecture. Professor Freeman, as a native of Somerset, is anxious that the fullest justice should be done to such an historic site. "It is certain," he says, "that Glastonbury was the one church of first rank in England which stood as a memorial of the British days,—the only one which had lived unscathed through the storm of English conquest, and which received equal reverence from the conquerors and the conquered." But, of course, the church of wicker and timber has long since passed away. It survived the English, Danish, and Norman conquest, but it yielded to the grander conceptions which the Norman architects introduced. For awhile it was permitted to stand beside the stone minster which was erected in the tenth century, but both the one and the other gave place to the noble abbey which dates from the twelfth century. St. Joseph's Chapel—the fairest fragment that now remains,—was consecrated in 1186, and, with the connecting "Galilee," gave to the great church a length of no less than 580 ft. Nor are these ruins the only objects of interest at Glastonbury. To say nothing of the miraculous thorn, there are two parish churches of considerable beauty, numerous fragments of antiquity around which an old world air still lingers, and such a prospect from the top of Weary All Hill as delights the eye and brings back to the student of Tennyson a thousand recollections. These, indeed, will be still further stimulated if he accompanies Mr. Walford to a more distant and sequestered spot,—Caerleon-on-Usk (Castrum Legionis)—the "Isca Silurum" of the Romans, and the city where King Arthur was crowned, and which shared his love with Tintagel, his birthplace, and Glastonbury, where he lies buried. The practical tourist may like to know that Caerleon lies about three miles

north of Newport (Monmouthshire), and that, with the exception of the Roman antiquities in the local museum (a most interesting collection), the relics of its past history are unimportant. There are vestiges of the old walls with undoubted Roman masonry; there are indications of an amphitheatre and a few fragments of an early castle, but scarcely anything to remind one that Caerleon was once the capital of Britannia Secunda, and at a later period,—but that as remote as A.D. 182,—the seat of an archbishop. Fairford, Sedgemoor, Lindisfarne, and Abbotstford, are some among the places to which Mr. Walford conducts the reader. All are fraught with memories, while to those of Upton,—the home of Pope's *Belinda*,—a special interest has been given by the memory of Bishop Fraser, its sometime rector.

## RECENT PATENTS.

### ABSTRACTS OF SPECIFICATIONS.

9,922, Ventilating Window Blinds. Wm. Harte.

This invention is intended to provide for the ventilation of rooms when the window-blinds are drawn down. The blind is hung on the top of the sash, where the roller rests upon brackets. When the sash is lowered, the blind roller goes with it until it reaches the required limit from the top for ventilation. It there unships itself, when it is caught up by and supported upon two other bearings fixed to the window-casing, instead of the sash. The sash may then be lowered to the bottom if required. When the sash is raised again, it lifts the roller in passing off the lower bearings on to the sash brackets, and carries it up with it. The blind is rolled and unrolled in the ordinary way.

10,208, Shoes for Piles and Posts. S. L. Bromhead.

The special feature in this invention is the manufacture in cast metal of hollow pile shoes, with projecting straps for fastening the shoe on to the wood.

10,408, Ventilation of Rooms. J. P. Wilson.

According to this patent, lifting sashes are hung so that one balances the other. A regulator is fixed at one end of each cord to rectify any stretching of the cords. The ordinary sash-weights are dispensed with.

10,625, Tiles for Enclosing Girders, &c. J. D. Denny.

The specification describes method of machinery for manufacture of "Girdler Tiles," which are made of moist clay, terra cotta, &c.

10,919, Improvements in Chimney-tops, Cowl, or Ventilators. T. D. Bayliff.

According to the inventor, the wind is guided across the somewhat contracted orifice of the chimney. The cowl is arranged to face the wind, and is detachable for cleaning.

11,266, Hanging Sash Windows. J. H. Jones.

According to this patent, the sash-weight is formed in links or sections to avoid so large a pocket-hole as at present in use. The cord is passed through the frame and knotted, being covered by a small brass plate, which, it is claimed, is an easier and more effective method of securing the cord and the sash.

11,360, Sashes, &c. G. J. Soper, jun.

This invention is intended to be applied to the altering of existing sashes and frames, and in the manufacture of new ones, to allow of the sashes being turned back into the room for cleaning or painting. The sashes are fitted with a screw-pin passing through plates screwed to sash stiles, to the sash-ends of cords are fixed metal eyelets, which are placed on the pins between guard-plates, allowing sashes to reverse freely. The sash stiles are grooved throughout part of face of stile next groove, cut away to depth of groove and rounded to allow line to pass out and in and turn on pin suspended on the cords, thus enabling them to be replaced in frames in a reverse position.

11,435, Temporary Buildings. R. Bucknall.

Roofs, walls and all parts are hollow, and made in sections for convenience in transport, and for warmth or utilising hollow space as cupboard or storage room.

### NEW APPLICATIONS FOR PATENTS.

July 29.—10,530, J. James and F. Ransome, Furnaces for Burning Hydraulic Lime, Cement, &c.—10,548, W. Burt and C. Pryn, Sliding Window-sashes, Panels, &c.—10,553, W. Kent, Water Meters, &c.—10,556, T. Buck, jun., Brick and Tile Making Machines.

July 30.—10,552, W. Sargent, Flushing and Cleansing Closet Basins, &c.  
Aug. 2.—10,608, F. Hemming, Wood Veneers.—10,610, T. Nesbit and T. Forster, White Lead, &c.—10,642, G. Redfern, Preventing the Leakage of

Water around Chimney or other Pipes passing through the Roofs of Buildings.

Aug. 3.—10,675, J. Rickerby, Mechanic's Combination Compass and Tool.—10,704, C. Alger, Door Fastener and Indicator.

Aug. 4.—10,726, A. Boulé, Privies and Privy Seats.—10,731, A. Boulé, Sharpening Attachment for Tools.

### PROVISIONAL SPECIFICATIONS ACCEPTED.

8,497, C. Hax, Sharpening Saws.—8,917, T. Truss, Cows for Chimneys and Ventilating Shafts.—8,936, H. Johnson and T. Wilson, Exhaust Ventilating Cows.—8,938, J. Jobson, Domestic Fire Crates.—9,435, J. Fox, Latches.—9,593, H. Hansom, Fire-places.—10,034, R. Smith, Chimney-pots.

### COMPLETE SPECIFICATIONS ACCEPTED.

#### Open to Opposition for Two Months.

10,298, F. Lyte, Manufacture of White Pigment.—12,397, H. Whiteley, Regulating the Opening and Closing of Fanlights, Casements, &c.—12,401, E. Taylor, Opening, Closing, or Fastening Casements, Fanlights, &c.—2,290, E. Young and G. Moss, Fireplaces.—9,246, W. Thompson, Ventilation and Air Moistening.—12,526, R. Baird, Step Ladders.—16,294, H. Bassett, Window Sash Fasteners.—11,454, R. Hunter and J. Turnbull, Kitchen Ranges.

## The Student's Column.

### LAND SURVEYING AND LEVELLING.

#### VII.—CIRCULAR PROTRACTOR.

PROTRACTORS are made into various shapes and sizes; the circular forms are the most accurate. The plain circular protractor has its outer circumference bevelled off to a thin edge, and is marked with radial lines indicating degrees and subdivisions of a degree, which are marked off upon paper with a needle point when required for purposes of plotting. The centre of the circle at which the angle is situated is marked upon the centre of the edge of a fixed bar, which crosses the hollow inner space in the instrument, and which is so constructed that the bevelled edge of this bar gives a true line through the centre of the protractor joining the zero point upon the outside edge with the division indicating 180°. In some instruments a revolving arm is fixed so as to project beyond the circumference. One edge of this arm forms a radial line from the centre of the circle, and, when a vernier scale is attached, the arrow or zero point upon the vernier comes upon this radial line. In the best instruments folding arms are attached as shown in fig. 1, and also to a reduced scale in fig. 2. These folding arms can be fixed in any required position by means of the clamp screw marked D. The complete circle is here graduated into degrees and half-degrees, and the verniers read to minutes. The folding arms and apparatus connected with them, to which the verniers are attached, are fixed upon a frame, the whole of which can be made to move when the clamp D is slackened, round the centre of the instrument. The detail of the attachment of the folded arms is shown in the section A A. It will be observed that, instead of the projecting arm lying flat upon the paper, as in the plain form of instruments, a sharp point, marked H, is fixed to the end of each arm, which, by light pressure with the hand, will leave a small hole upon the paper, and the line joining the points so marked by each arm will pass through the centre of the circle, and will correspond in a line with the reading of the instrument. The spring shown in the section A A at the joint of the folding arm with the vernier frame enables the point H to become automatically removed from the drawing-paper directly the required position has been marked and the pressure of the hand above it is taken off. The short marks K upon the inner circumference of the circle are engraved upon bevelled edges, as shown in fig. 1 and the section B B. These are placed so that lines joining them cross one another at right angles through the centre of the instrument. The centre of the instrument is sometimes made of glass with fine lines across it in the direction of the lines K K, and the centre is sometimes engraved upon the bevelled edge of a semicircular piece as indicated at B. In order that the line drawn through the points H H passing through the centre of the instrument may cross the two opposite marks K K at zero and 180°, and be at right angles to the line joining the marks K K at 90° and 270°, when the verniers read zero and 180° respectively, the zero points upon the vernier scales are placed in the centre of each scale.

FIGURE 2

FIGURE 3

NOTE—HERE THE VERNIER READS 145° 33''.

To set the verniers to any required angle, say, 145° 33', for the purpose of plotting the angle A B C: having determined the exact position of the station B by scaling its length from the station A, in the given direction A B, the line A B is temporarily extended in length by ruling a pencil line towards the 150° mark, and another pencil line at right angles to it of sufficient length that the marks K may be each set upon these lines when the centre of the instrument is placed over B and the mark K at zero comes on the base-line A B. The projecting arms are then opened and travelled round with the hand, by moving the frame at or near D, until the arrow upon the vernier coincides with the nearest division upon the primary scale to the reading required. In the present case this would be 145½°, as shown in fig. 4. The clamp D is then fixed, and the vernier is set to 145° 33' by means of the tangent screw (see fig. 1). The actual position required is indicated in fig. 3. It should be remembered that the tangent screw is only intended to be applied for adjusting the subdivisions upon the vernier scales to any addition required, which cannot be accurately set by eye upon the primary scale marked upon the continuous circle of divisions.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

JULY 26.

By Messrs. COBE (at Rochester).	£270
Snodland, Kent—Two plots of freehold land	850
The Cottage, and 4s. 0r. 6p. freehold	560
Rochester—4s. and 20s. High-street, freehold	1,770

Miscellaneous.

**Sales of Building Land at Addlestone and Brighton.**—Last week Messrs. Baker & Sons conducted a sale of building land at Addlestone, Surrey, situated between Weybridge and Chertsey and Virginia Water. The property offered consisted of 154 plots, including two corner hotel sites, several shop plots, and other plots adapted for the erection of medium-sized houses. Most of the plots submitted have frontages of 15 ft., and depths varying from 70 ft. to 90 ft., and nearly the whole of these were sold at prices ranging from 9s. to 11s. each. It should be stated that before the sale commenced the auctioneer announced that twelve of the plots had just been sold by private contract for an aggregate sum of 180s. Three corner plots, having frontages of 17 ft. and depths of 108 ft., were sold for 17s. each. One of the hotel plots, having a frontage of 34 ft. to Liberty Hall-road, and a return frontage of 108 ft. to Conquest-road, was sold for 36l. 10s., and the other hotel plot, having a frontage of 30 ft. to the same road, and a depth of 87 ft. to Peartree-road, realised 25s. For upwards of 30 of the plots, the highest offer was 8s. 15s. each, on which they were withdrawn, the auctioneer stating that his reserve was 9s. 10s. per plot. The prices realised for the lots sold averaged from 400s. to 500s. an acre, and the total proceeds of the sale amounted to about 1,500l. On Monday last Messrs. Baker & Sons submitted for sale at Portslade, Brighton, 107 plots of building land, forming the Brighton View Estate. The estate is situated at Portslade, about three miles west of Brighton. It stands on high ground, commanding extensive views of Brighton and the neighbourhood, also fine views of the sea. The plots offered included a large hotel site, having a frontage of 40 ft. to South Sea View, and a return frontage of about 60 ft. to Brighton View, together with grounds attached, the whole covering an area of between 9,000 and 10,000 ft. Also several house and shop plots having frontages to the high road, Brighton View, Ocean View, Fair Sea View, and South Sea View. The whole of the plots offered were rapidly disposed of. With a few exceptions, they have all frontages of 15 ft. and depths of 60 ft., the prices realised being from 7s. to 8s. per plot; a few other plots, having frontages of 16 and 17 ft. realising from 10s. to 12s. each. There was a very close and severe competition for the hotel plot. The biddings commenced at 40s., and the plot was ultimately sold for 92l. 10s. The prices at which the several lots were sold represented an average of about 350s. an acre.

**London and County Banking Company (Limited).**—The balance-sheet of this company for the half-year ending June 30th last is published in our advertisement columns. The directors report that, after paying interest to customers and all charges, also 23,660l. 13s. 9d. bonus to officers (under resolution of Meeting of 3rd of February last), making provision for bad and doubtful debts, and for 24,435s. 3s. 3d. relate on hills not due, the net profits amount to 185,689l. 7s. 7d. This sum, added to 33,598s. 19s. 10d., the balance brought forward from last account, produces a total of 219,288l. 7s. 5d. The directors have declared an interim dividend for the half-year of 10 per cent, which will amount 200,000l., leaving the sum of 19,288l. 7s. 5d. to be carried forward.

**"A Hygienic Bakery."**—Referring to the notice in our last of Messrs. Hill & Sons' new bakery, Mr. C. H. Mabey writes to ask us to mention that he executed the whole of the full-size models for the enriched parts of the building, with the exception of the four panels above the name-plate.

**Crystal Palace Engineering School.**—The summer term closed on Saturday, when the certificates awarded to the students were presented in the singularly-elevated and not easily accessible lecture theatre of the school, near the top of the south tower of the Palace. Mr. William Shelford, F.G.S., F.S.S., C.E., presided. The examiners of the work of the students during the term were, for the Mechanical Engineering Section and the Colonial Department, Mr. W. N. Colam, C.E., M.E.; and, for the Civil Engineering Section, Mr. Henry Law, C.E. After a short address from the chairman Mr. Shelford read the examiner's report. The lectures for the term were on "Railways, their Construction and Appliances." Thirty-three students attended the lectures, to fourteen of whom, a smaller proportion than usual, certificates were awarded. The highest number of marks attainable is 268. B. G. Lloyd was first, with 224 marks. One of the students refused to accept the order of merit awarded to him by the examiners for lecture questions and for work in the drawing office. The other firsts in the various departments were as follows:—Drawing Office, A. W. Pearson; Pattern Shop, E. A. Glover; Fitting Shop, H. P. Miles. Second year's course Civil Engineering, General Surveying, and Preparation of Plans for Parliament, E. J. Bowman; Calculations, Plans, and Estimates for a Railway and Dock, W. E. Underwood; Design and Construction of Existing and other Engineering Works, W. J. Bowman and E. J. Chew. Equal firsts, Mining Engineering, J. H. Chute. Eight certificates were also awarded in the Colonial Section. Mr. J. Bosman, a Hong Kong Queen's Scholar, and *primus* student at the Crystal Palace School for this term, was presented with the Bronze Medal awarded to students who have taken nine certificates, all third, or higher, in order of merit. He was greeted with prolonged and hearty applause by his fellow-students. Mr. Law, examiner, and Mr. Walmisley, a former examiner, also addressed the students. Mr. J. W. Wilson, Principal of the School, referred, in an interesting address, to the kindness they met with at the hands of engineering authorities. Mr. Kirtley, Locomotive Superintendent of the Chatham Railway, had afforded 400 of their students opportunities of learning something of locomotive driving by riding upon the engine. In their annual visit to Dundee Mr. Barlow kindly told off a steam tug for their use in examining the works of the Tay Bridge; a like courtesy had been shown them when they visited the Forth Bridge on the following day; and the Admiralty authorities had done the like to facilitate their inspection of the fort at Spithead. Mr. Wilson gave an interesting account of a former student, Mr. Thomas Birch Freeman, who is now in a responsible office at Cape Coast, on the east and allowances. The usual votes of thanks closed the proceedings.

**Shah Jehan Mosque.**—The first mosque ever erected in this country is about to be built at the Oriental University, Woking, from designs of Mr. W. I. Chambers. The style selected is Saracenic, and the drawing shows a large central dome, surrounded by minarets, and comprises the usual court-yards, sacred tanks, &c., and will be complete in every respect. The site adjoins the Salar Jung Indian Memorial House, which is of a refined type of Northern Indian architecture, and is now in course of construction from the designs of the same architect. We hope to illustrate both buildings in an early number.

**The Court Theatre, Lower George-street, Chelsea,** being about to be pulled down to make way for some extensive improvements on Lord Cadogan's estate, a new theatre is about to be built to replace that which is to be pulled down, by Mr. John Clayton, on a site adjoining the Sloane-square station of the Metropolitan District Railway. The theatre will accommodate about 500 persons, and will be almost wholly constructed of fire-resisting materials. Mr. Walter Emden and Mr. W. R. Crewe are the joint architects of the building, which is proposed to be opened at Christmas.

**Carpenters' Hall.**—The Worshipful Company of Carpenters will hold a second exhibition of works in wood at their Hall, London-wall, London, in the early part of next year. Full particulars as to time and conditions will be advertised as early as possible in October.

### Dalmatian and Istrian Architecture.

THE large and admirably illustrated work on the architectural remains of the eastern coast of the Adriatic, which has been brought out by Mr. T. G. Jackson,\* is the first attempt at anything like a complete description and illustration of a group of architectural remains about which there has been a kind of spasmodic interest excited from time to time, and at long intervals, but about which, with the exception of Diocletian's palace at Spalato, no one in England has till lately known or heard much in a collected manner. Fergusson devotes a considerable space to Spalato, or Spalatro as it was then called; but the names of Ragusa, and Zara, and Traù, and Sebenico are known in his comprehensive survey of the architectural remains of the world. More recently Professor Freeman has broken ground on the subject in his collection of essays on the "Subject and Neighbouring Lands of Venice," in which the architectural remains of some of the principal papal towns of the locality are described with a zeal and enthusiasm which is not always according to knowledge, and the effect of which the author did his best to nullify by the juxtaposition of the accurate and ill-executed sketches which adorned such a ludicrous comment on the glowing descriptions of the buildings which they were supposed to represent. The book was not one to recommend itself to architects, but the few who did read it probably came to the conclusion that there might be a new and fruitful field there for the architectural sketcher, at all events, if not for the architectural student. In the mean time a competent observer and an artistic draughtsman was laying the foundation for an illustration of the district more worthy of its real architectural interest, which will be rendered fully obvious for the first time, to those who have not visited the neighbourhood itself, by Mr. Jackson's elaborate descriptions and numerous drawings. For all real purposes of architectural illustration Mr. Jackson is (except, of course, in regard to Spalato) practically first in the field, and he has made the most of it. In the course of three apparently tolerably lengthy visits he has collected as much information and as many illustrations as could well be comprised in one

book, and though it is likely that Dalmatia and Istria will now be more or less popularised and become a new hunting-ground for the company of architectural sketchers, there is no probability that Mr. Jackson's book will be superseded for a long time to come.

Robert Adam's monograph on "Spalatro" is, of course, a classical work in architectural illustration, though we imagine it had dropped very much out of the minds of architectural students until Fergusson drew attention to the importance of this building in the history of the transition from the column to the arch. Adam went to study and measure it (which he did under great difficulties from official and non-official interference), mainly as the only known example of the plan of a great Roman mansion, of which sufficiently intelligible remains were left. He also, however, seemed struck with the suggestiveness of its style, and of the arched openings with the cornice members carried round them; and, speaking of the elevation of the Porta Aurea, with its circular-headed windows, adorned by projecting shafts carried on brackets, he makes the rather odd remark,—“It appears to have been from something of this kind that Palladio and other architects of his time have adapted the modern Venetian window.” But, passing over this well-known book on an always celebrated monument, it may be a surprise to him to whom Ragusa, and Traù, and Sebenico are almost new names, to find that the architectural remains of these and other places on the east coast of the Adriatic, were visited and described with considerable appreciation by an English traveller as early as 1675. Mr. George Wheler, in company with “Dr. Spon of Lyons,” in that year visited a good many of the places now illustrated by Mr. Jackson, and produced a volume of goodly size recounting his observations in this neighbourhood and in other parts of Eastern Europe. His special object was not architecture, it is true; he had various interests, among others that of botany, and went “a-sampling” when he arrived at Istria; “a curiosity which seldom failed to give me satisfaction when all other divertisements were wanting; and there I found *Scapoides limonis foliis* and *Limonium reticulatum*,” &c. But Mr. Wheler had an eye for things of architectural and archeological interest, and a considerable contempt for those who could not share his enthusiasm. “As to the matter contained in this book,” he observes, “I have no reason to be ashamed of it, although I do not expect it should escape censure. For I know some will say, why does he treat us with insipid descriptions of weeds, and make us huddle with him over broken stones, decayed buildings, and old rubbish? But, these being things their

curiosity does not extend to, I should but trifle in giving them a serious answer.” The illustrations are curious enough, in that kind of half map, half bird's-eye view, which was once so much practised in the illustration of towns and buildings; and, even in this naive form of illustration, Mr. Wheler got into difficulties with his engraver. “In the figure of Zara, the bastions of the walls of the town ought to be round, as I have described them, although I find in the figure, both he that designed it after my sketch [sic] and the engraver after him have made it square.” Possibly Mr. Wheler's original drawings were not much better than Professor Freeman's, and, in spite of the licence taken by the engraver, it may have been as well for him that he had not the chance of getting them reproduced photographically, like the modern amateur sketcher referred to. But he duly chronicles the architectural objects of each place visited; notes the dome (i.e., cathedral—“Duomo”) of “Sebenico” as “much praised by the Venetians, being all of marble and the architecture very good;”—the expression “all of marble” possibly includes a reference to that peculiar roof construction at Sebenico to which we shall refer again; is much pleased with Traù, “the dome well built and ancient”; and suggests that “Spalato, or, as some call it, Spalatro, seemeth to be a corruption of the word *palatium*,” in which he was probably right. The French and English travellers seemed to have differed here, for he adds,—“It hath a square tower at each corner and three gates, and with M. Spon's favour no more, that side to the sea having none, according to the best of my remembrance”; but here, according to Adam's plan, which both Fergusson and Mr. Jackson follow,\* both travellers might think themselves right, for there is a small entry from the crypto-porticus, but only three important entrances, on the three other sides.

It is curious that the decided evidence given by Wheler, though in an amateurish kind of way, in regard to the existence of important and fine architectural work in this part of the world, should have been adequately followed up by no one until quite recently; and that even an accomplished architect and very wide-awake man like Robert Adam should have spent so much time over Spalato without going aside to look after what might be found in any of the neighbouring places. But the region was out of the way and difficult of access; nor is it evidently, very commodious travelling there now. Spalato had a special fame, and Adam, who had generally an eye to business, went there to get what he wanted in as short a time

\* Dalmatia, the Quarnero, and Istria, with Cattigne in Montenegro and the Island of Grado. By T. G. Jackson, M.A., F.R.S.A., Hon. Fellow of Wadham College, Oxford. Clarendon Press: Oxford. 1887.

\* It is odd that Fergusson repeats the common popular error about the architect's name, giving the plan as “from Adams.”

as possible. Nor is it likely that he would have appreciated Traill and Ragusa had he seen them. They would have been in his eyes examples only of a barbarous and corrupt architecture. Stuart devoted some space in his great work on Greek architecture to the Roman remains at Pola in Istria, the Temple of Rome and Augustus, the Arch of the Sergii, and the theatre with its boldly rusticated order; and Allason, whom Mr. Jackson seems to have overlooked, produced in 1819 a fine folio on the same subject, illustrated by some beautifully-executed engravings by George Cooke, and accompanied by a long dissertation on the history of Dalmatia and of Istria, on which Sir Gardner Wilkinson seems to have drawn to some extent in his later work on the neighbourhood in 1848. But Allason, like Stuart, illustrates only the Classic remains; of anything later he takes no note, as far as illustration is concerned. Wilkinson's work on Dalmatia, Montenegro, and Herzegovina does not go much into architectural remains, except in regard to Spalato, on which he dwells at some length, and which he illustrates by some rather tame and mechanical wood engravings,—one of the Porta Area and one of a view of the so-called Temple of Jupiter, and some other parts of the remains; engravings which were adopted rather too easily by Fergusson as adequate representations of the remains. He has a good deal to say about many of the other places illustrated by Mr. Jackson, but his views of them are merely picturesque, and only introduce the architecture as a secondary feature in the view.

Paton's book, "The Highlands and Islands of the Adriatic," which followed Wilkinson's a year later, shows more interest in the Romanesque and Medieval remains than any previous writer had shown since the date of Wheler's book, and he understands their value much better than Wheler did, the interest in architecture of this class having now begun to permeate the minds of archaeologists. Of architectural illustration there is not much to speak of; but of intelligent description there is a good deal, so much so, that it is rather curious that buildings so fully described, and the interest of which is so fully recognised by him, should have yet been remained for nearly forty years without any adequate illustration in this country. Paton's description of the cathedral at Sebenico, with its remarkable roof, to which we have before referred, is worth quoting here. He says of it:—

"The peculiar style of Lombardy predominates. The lower part is overlaid with ornament, and two detestable statues of Adam and Eve, standing on each side of the great entrance, look like caricatures of the Apollo Belvidere and the Venus de Medici\* by G. Crikshank. But the interior is truly grand, not so much in mere dimension as in effect. . . . The roof of the nave is a masterpiece of technical ingenuity, being a semi-cylinder composed of flat flagstones, some of them twelve feet in length, the edges fitting each other with knees and angles, the whole forming an unadorned vault, but so unusual in effect that the spectator, on a superficial view, fears that if one gave way the whole might fall in; but the architect charged with the repairs of the cathedral, having shown me the sections of the edifice, assured me that, aerial as the roof might seem, it had a chance of lasting as long as any part of the cathedral."

This is the building, the exterior of which is shown in one of the plates from Mr. Jackson's book, which, by the kindness of the publishers, we are enabled to reproduce (see lithograph). It is, in fact, a most interesting example of what Fergusson always declared to be the great desideratum in a vaulted roof, viz., an outer covering of homogeneous material with the vault and the walls, instead of the perishable timber roofs with which the Medieval builders protected their vaults. Mr. Jackson, who seems to have been as much struck with it as Paton, also gives a full description of it. The exterior effect is not very picturesque, and might be improved upon in that respect; but it is the practical solution of a problem in the construction of a vaulted roof, which Fergusson would have made a good point of in his history, had he

\* The selection of these two statues as typical of classic sculpture is amusingly characteristic of the aesthetic creed of forty years ago.

been aware of it. Paton found metal details to interest him, too. At Curzola he came across an old gentleman who rejoiced in having on his door a superb bronze knocker, representing a Hercules swinging two lions by their tails.

"With a smile of enjoyment he lifted the head of one of the lions, letting it whack against the door so as to make the court ring again. He resumed, 'I have been offered its weight in silver, but we have no fear of thieves in Curzola; if I lock it up in my cabinet, I cease to enjoy the use of it.'"

Signor Boni, who mourns so over the selling of art-treasures at Venice, would have loved that old gentleman.

There must have been a certain amount of interest excited of late years in England about the architecture of Dalmatia and Istria, since the Viennese architect Eitelberger, as quoted by Mr. Jackson, stated that the first edition of his work illustrating some of the buildings had been almost entirely bought up in England. It is gratifying to know that our own country was more forward than any other in appreciating the value of the illustrations of this architectural province; and possibly Eitelberger, whose work was impeded by ill-health and cut short by death, might otherwise have come pretty near to forestalling Mr. Jackson's laurels. Eitelberger's earlier volume, in which he described the Romanesque and Gothic architecture at Arhe, Zara, Traill, Spalato, and Ragusa, we have not seen; in the second one he describes and illustrates the Basilica at Parenzo very fully; giving a chromo-lithograph of some of the mosaic decoration which is found in profusion there, and a considerable number of the details, as well as general views, in very clear and precise, but rather mechanical-looking, illustrations. There is a very considerable resemblance in general arrangement between Parenzo and Torcello, which is a century later (542 is given by Fergusson as the date of Parenzo); and this is, perhaps, one of the instances which might be used in favour of the view apparently held by Mr. Arthur Evans, that the inspiration of the Venetian architects came originally from the other side of the Adriatic; though we certainly cannot accept this as the correct view of the architectural relations of the two sea coasts at the time of the greatness of Venice. The inspiration seems to have been all the other way then; and Mr. Evans and Professor Freeman seem to have mutually led each other astray on this point. But modern archaeology, like modern history, takes a special enjoyment in turning old and long-received creeds the other way about.

Turning now to the new work on the subject, the predecessors of which we have been glancing at, we find a great portion of the first of Mr. Jackson's three well-filled volumes taken up with a pretty long *résumé* of the history of Dalmatia, gathered, the author tells us, from a variety of sources, some of which are not easily accessible, and possessing, therefore, he hopes, a certain value; and, even were it only a *résumé* of known history from accessible sources, the importance of such a historical sketch, as an assistance to the right understanding of the architectural characteristics, is especially obvious in the case of a district which has been for a great part of its history a kind of no-man's land, or every-man's land, a perpetual battle-ground, and where the architectural style is the result of a mingling of elements from south, north, east, and west. Into the details of the history and its influence on the architecture space will not permit us to go here. It is sufficient to note that the architectural history of Istria and Dalmatia commences, as Pola and Spalato give such splendid evidence, under the then omnipresent Roman empire, and that the prominent and important factor in their history as influencing their architecture lies in the struggle between the two elements of Latin civilisation and Slav incursion. By the middle of the seventh century Dalmatia was almost entirely occupied by Croats and Servians:—

"The old Latin or Roman population, however sadly it was crushed and weakened by this irruption, did not disappear, nor did it lose its identity and become merged in the ranks of the conquerors. When the first shock was over, the Romans either returned to their old towns or founded new ones,

where they managed to live in a state between independence and vassalage till they became strong enough in time to take care of themselves. Zara soon arose again from its ruins, the fugitives from Epidaurus settled on an isolated rock not far from their ancient home and founded the city of Ragusa, and the unhappy Salonitans, not daring to return as yet to the ruins of their old capital, crept back to the mainland in reduced numbers, and found a refuge within the impregnable walls of the deserted villa of Diocletian, which has grown into the modern Spalato. The fate of Traill on the mainland, and of the island towns of Arhe, Veglia, and Ossero in the Quarnero, during this general catastrophe, is obscure; but we find them in the tenth century still peopled by Roman citizens, and living under their old Roman institutions."

The author speaks further on of the "dual element" in Dalmatia, without recognition of which the history of the country cannot be understood; but it is not quite clear from the context (page 19) which are his "dual elements," and "dual" is understating the case, which is complicated by many elements. Roughly stated, it may, perhaps, be said that the more important and characteristic monuments of Dalmatian architecture are the result of a combination of Roman tradition and inherited tastes; Byzantine influence brought by a roundabout road through Ravenna, and obvious enough at Parenzo, with its mosaics and Byzantine-shaped capitals; Slavonic influence from the north, especially from the invasions of Hungary, between which and Venice the Dalmatian cities were at one time a bone of contention; and direct Venetian influence when Venice became the paramount power in the waters of the Adriatic.

In speaking of Spalato, which still remains the centre of interest in Dalmatian architecture, Mr. Jackson has a new suggestion to make, namely, that certain parts of the work in the octagon temple (we object to calling it "Temple of Jupiter," as heging what is in fact a question), are made up from the spoils of earlier buildings. He says "one column in the temple is too large for the capital that rests on it; and the columns of the upper order of the interior, stumpy in proportion, only seven diameters high and set without any bases on the cornice of the lower order, look suspiciously like clumsy adaptations of ready-made materials. On no other hypothesis can I account for the difference between the capitals of this upper order and those of the rest of the work; it is not only that they are composite or quasi-composite while the rest are Corinthian, but that, while every other piece of foliage is ruffled in the Greek manner, these are ruffled in the Roman manner and executed in an entirely different way and by a different school of carvers, and to all appearance they once belonged to a different building."

The inference, of course, is that the bulk of the building was executed by Greek artists; a supposition exceedingly probable in itself. The probable influence of the plan of this temple on Dalmatian architecture is referred to elsewhere, in regard to the singular plans of the ancient basilicity at Zara and of the churches of S. Trinità at Spalato and S. Orsola at Zara, circular central spaces surrounded by six apses opening from them. It is rather startling to find, in regard to Spalato, that the interior of the octagon temple, now the Duomo, has been for some time under a process of "severe restoration." In 1882 the whole of the columns were removed and the church blocked with scaffolding, and the interior found the interior cleared of scaffolding and ready for use, the antique character much gone; but it is satisfactory to learn that the old stones which were considered in sufficiently good preservation to remain, have not been scraped to match the new work. But the anti-Quarian interest of the interior must have suffered severely indeed.

"The lower entablature has, with the exception of a few stones, been entirely renewed, together with the eight Corinthian capitals. Of the upper entablature, the whole of the cornice has been renewed in Curzola stone, and part of the frieze and architrave. As the dome springs from this cornice, it was necessary, in order to insert the new stones, to cut out the brickwork of the dome all round the building, and to reset it afterwards,—a process not likely to increase its stability, and most damaging to its appearance of antiquity. The old reliefs that

run round below the entablature have been retained, and for so much we may be thankful, but the capitals of the upper order, which are in very good preservation, have been assigned to the limbo of the museum, and are represented by copies. The capitals of the lower order had certainly become decayed to an extent that perhaps justified their renewal, but by the removal of these eight upper capitals a most unnecessary injury has been done to the antiquity of the building."

It should seem from this that it is not much worth while to go to Spalato now. But, melancholy as the account is, we have always maintained that, if an ancient building is lawfully in use for modern purposes, those who have the right to use it have the right to keep it in repair for their own purposes, and are not to be expected to regard it only as an ancient relic for other people's enjoyment. In the present day, if such a relic as the temple at Spalato were discovered, it would be thought worth while to preserve it *in statu quo*, without putting it to any practical use; but the Christian got into the temple of Spalato at a time when a Pagan building in pretty good repair was considered as providentially left for his benefit. And now it is too late to turn him out, and the mischief is done.

The church of Sebenico, to which we have already referred on account of its remarkable roof, offers a curious example of change of architect and change of style in the same work, and without any further lapse of time than was involved in dismissing the first architect and summoning his successor. Both were Venetians. Antonio, son of Pietro Paolo, commenced the church about 1430, in pronounced Italian Gothic style, and the exterior the author considers to be his up to the cornice of intersecting arches shown in the illustration. He appears to have been then dismissed and Messer Giorgio summoned from Venice to take his place, and from that point the building takes a decidedly Classic turn, half Renaissance, half Romanesque. Messer Giorgio, who probably invented the roofing arrangement, if he did not carry it out himself, seems to have been a man of genius, and his name crops up, as we shall see just now, in connexion with a remarkable building at Ragusa. But, without any recorded change of architect, the free-and-easy manner in which round and pointed arches are mingled in the architecture of Dalmatia is one of its most curious peculiarities. We have given on the lithograph part of another of Mr. Jackson's illustrations, showing the double-story arcade surrounding the courtyard of the Dogana or Sponza, the Custom House at Ragusa. The two stories, from examination of their details, Mr. Jackson concludes to have differed very little in their date (probably 1300, or thereabouts). If it were 150 years older one would recognise the natural transition of round changing to pointed as the work ascends, allowing a little time between the completion of one story and the undertaking of the next. But in the interior of the Duomo at Curzola, which is probably about the same date from the appearance of the arcade, the said main arcade has pointed arches, and the wall arcade of the triforium is round arched. But, indeed, Messer Giorgio, in spite of his Classic tendencies, himself left at Sebenico as curious a record as could be of the divided tendencies of the period, for he could not quite forget Gothic tracery, but kept the balance of taste by inserting a fluted column in the midst of it (fig. 1); and really the effect is not so *outré* as might have been expected. There is a "new departure" for the modern architect sighing after originality.

The other view in the lithograph, also one of the illustrations from Mr. Jackson's drawings, the court of the Dominican Convent at Ragusa, we have given partly as a picture in which elements which seem architecturally heterogeneous combine somehow into a remarkably pleasing whole. But the cloister shown in this view is an interesting feature in itself. It is of the date of about the middle of the fourteenth century, as near as can be inferred, and represents, as Mr. Jackson observes, the Dalmatian working out Gothic in his own way; semi-Classic capitals and mouldings with Gothic tracery-forms. The Venetian influence here is, of course, apparent in the general

effect. The Classic well in the courtyard bears the date 1623.

One of the most curious problems in the mixture of styles is that presented by the Rector's Palace at Ragusa. Here we have, as existing, a two-storied building with an upper story of pointed Italian Gothic windows, similar pointed windows but without tracery on the ground floor at each end of the building, and the centre portion of the ground floor

of the arch order and one of the capitals shows that the arch is quite Renaissance in some at least of its decorative detail, *i.e.*, a foliage moulding tied up with a spiral ribbon. The capitals are by two hands, three of them distinctly Renaissance, with festoons and *amorini* according to rule, but all of them have a large massive kind of extra abacus on the top, very thick and decorated with four series of enriched mouldings. The other four

Sebenico drawn  
Apse Windows - Fig. 1.

Fig. 3.

occupied by a round-arched arcade, looking like other round-arched work of the district, rather like a cross between Renaissance and Romanesque, and with capitals of a curiously mixed description. Mr. Freeman goes into great ecstasies over this building, which he regards as a Romanesque ground story completed by a Gothic upper story. He admits

capitals are very fine pieces of sculpture of Gothic character. Mr. Jackson's theory is that the Gothic capitals are the original ones, and that, so far from the round arches being, as Professor Freeman will have it, of direct Romanesque descent,\* the original arcade was pointed; that the fire and explosion by which the building was known to have

Fig. 2.

that the building dates 1388-1435, but says:—"Never mind the date, here is Romanesque in all its truth and beauty; here, in the land which gave Rome so many of her greatest Caesars, the arcade of Ragusa may worthily end the series which began with the arcades of Spalato," &c., &c. From Mr. Freeman's illustration (!) of course nothing can be made out which could interfere with his rhapsodies; the columns and arches shown there might be anything at all; but Mr. Jackson's detail drawing

suffered rendered necessary the taking down and rebuilding of the loggia and centre part; that the two ends, with their pointed windows, remained *in situ*, but that, when Messer Giorgio (he of Sebenico) was called in to take the work in hand, he replaced the upper windows as before, but rebuilt the important architectural feature, the loggia, with round

\* It must be remembered that all Romanesque is holy with Professor Freeman, and all Renaissance is abomination.

arches, according to his Classic tendencies, put three new Classic capitals in place of the older ones that were the most injured, and added the thick enriched *abaci* aforesaid, to give a higher springing for the round arcade. Mr. Jackson ascertained that the *abaci* are all separate stones from the capitals beneath them, and the one of which he gives a drawing is distinctly Renaissance in its decorative detail. The case is a very curious one, and, perhaps, neither critic has hit on the truth; but Mr. Jackson's view is possible, Mr. Freeman's is not, having regard to the character of the decorative details of the arches. It is amusing to observe that Mr. Freeman is so carried away by his own "Romanesque" theory that he shows the ground-story windows at each end of the

to give us. As an example of the peculiar detail to be found in this church, we subjoin a cut of one of the capitals of the nave piers (fig. 2), which also might very well be taken as a point of departure for some new experiments in capital-designing. The window (fig. 3), with the curious interlaced circle tracery, is from the quasi-Byzantine Church of S. Lorenzo in Pasenatico, a few miles from Parenzo, which Mr. Jackson attributes to the eighth and ninth century. We give it as one of the many examples of architectural curiosities in which Dalmatian and Istrian architecture seem to abound.

The illustration of the stall carving from the Duomo of Zara (fig. 4) represents what the author describes as the finest example of a class of woodwork which abounds in Dalmatia and

rich friezes with running scroll work in the best style of Roman architecture, dedicatory inscriptions, mouldings, and string-courses, all thrown flat on the pavement of the Roman town, some on their sides, some upside down, and some arranged cornerwise or awry, with a rough approximation to the plan of the superstructure. The whole mass of these fragments was filled in with earth and rubbish, and covered over with the pavement of the Christian church, so that till now their existence was not even suspected. The two pairs of columns that were saved and used in front of the apses, were probably spared, not from any admiration or respect, but simply from the difficulty of making new ones in that rude age. The rest seems to have been trodden under foot, with an asscotic scorn for the marvellous splendour of Pagan rites and Pagan temples, and, with a sublime irony, to have been made to carry the simple piers and coarse masonry of the Christian church."

Thus the whirligig of Time brings in his revenges.

Long as this article has become, we have left much of the contents of Mr. Jackson's sumptuous three volumes entirely untouched and unnoticed. But it is a book which no architectural library can afford to be without, and which exhibits a completeness, in regard to historical information, architectural criticism, and architectural illustration, which not many illustrative works on architecture can boast of. We have only one criticism to make,—a literary one. We do not know whether the pages have been insufficiently corrected, or whether Mr. Jackson has theories of his own about punctuation; but there is an absence of the logically necessary commas in many passages which has a very awkward effect. "The Romanesque and Gothic architecture at Arbe-Zara Traù Spalato and Ragusa," for instance; or, "took the Croatian towns of Belgrad Sebenico Nona and Novigrad which had never been Venetian before." This omission of commas makes a very clumsy-looking sentence, and may even lead to obscurity of meaning; it should be corrected in a second edition, which is certain to be called for in due time.

#### NOTES.

**R**UBLIC advertisement has called attention to the fact that an order has been made by the Board of Charity Commissioners for the administration of the trust funds of the "British Institution for promoting the Fine Arts in the United Kingdom." The funds of this now long-established Institution having been intended not merely for the general advancement of art, but, in the words of the Charity Commissioners, "for the benefit and emolument of individual artists," the Trustees of the Institution suggested their employment in the purchase of the works of deceased artists for the National Gallery. There is no doubt such an application of them would be widely approved; but the Commissioners object that "the purchase of pictures generally appears to be a mode of employing the fund now to be dealt with which is peculiarly susceptible to the influences of individual taste, of preference for particular schools of art, and of other collateral considerations which may tend to warp the judgment of those who administer the trust." There is some truth in this, and on the whole, perhaps, the suggestion of the Charity Commissioners for the employment of the funds in question in the foundation of scholarships to encourage and assist artists in the study of art is more to the purpose. The value of such scholarships depends a good deal on the manner in which they are regulated so as to give assistance to the right people, and in the best way, and most of us would be disposed to reserve our judgment until we see a little of the working of the scheme; but the idea is a good one. There are not too many artistic scholarships in existence, and a large proportion of artists and art students are at the outset of their career too restricted in their means to be able to secure all the advantages of study, especially of foreign works, which they would wish and which would be of material assistance to them. We hope architecture will be given a due and proper place in the establishment of such scholarships as are proposed.

Fig. 4.

arcade as round-headed. Mr. Jackson both describes and draws them as pointed, and of the two witnesses he is certainly likely to be the more accurate. The two accounts should be compared together, they throw light on the value of the architectural criticism of the self-confident and dictatorial historian who, like Macaulay, is always "so cock-sure of everything."

No monument illustrated in this work is finer or of more interest in a purely architectural sense than the Duomo of Traù. This is a grand basilican church, which, though erected in the thirteenth century, is really to all intents and purposes Romanesque. The great west doorway, with its deeply-recessed pilasters covered with carving, and great lion figures on projecting brackets on either side, is truly a work of architectural genius, and the finest thing in the way of illustration of Dalmatian architecture which the author has

the neighbourhood, and which, as shown here, conveys the idea of being wonderfully rich and fine work, though we gather from Mr. Jackson's further remarks on it that the execution is but coarse in detail. The churches at Zara seem to be of great interest, none more so to our thinking than the round church of S. Donato, with its enormous blocks of masonry piers marking off the outer aisle from the centre space, and which actually cover more ground than the interspaces between them. But the most extraordinary thing about this church is the discovery which was made in taking up the pavement in 1877, when the rude Christian building was discovered to be wholly founded on the *abris* of Roman work. The foundations

"consist of huge fragments of more than one magnificent Classic building, entablatures with Corinthian enrichments, marble columns cut or broken into lengths and laid simply on their side,

IT is with very great regret that we hear of the death of Mr. Richard Jefferies, who first attained a reputation as the author of the charming book on rural life, called "The Gamekeeper at Home," and whose eye for the picturesque, and powers of vivid description, must have interested many an artistic reader in his work. Some time since we quoted in these columns a brilliant bit of writing of his on the picturesque of the London Docks, and the folly of painters in running after Venetian galleys, &c., as subjects, instead of painting the far finer craft sailing out of the Thames, carrying the commerce of that City of London, whose real greatness and poetic effectiveness, the author said, would perhaps be only fully appreciated five hundred years hence.

THE two so-called Technical Education Bills, that for England and the one for Scotland, passed their second reading under a fire of criticism, and with very half-hearted aid from those who supported them,—"They were better than nothing"; "It would be a step in the right direction,"—all of which may be very true, but this does not justify a great national question being dealt with in the way in which a Vestry would begin to pave a street. The mischief of this inadequate treatment is that the public, instead of being impressed with the importance of the subject, are struck with its apparent triviality. Petty measures of this kind are not likely to rally popular support to the important matter of a thorough and matured system of technical education.

THE technical examination announced by the Worshipful Company of Carpenters to commence on the 2nd June of next year, "provided that a sufficient number of candidates present themselves," seems likely to afford a very full and practical test of the knowledge of the candidate in regard to practical dealing with woodwork. The examination paper includes the subjects of the nature of timber, timber framing, joinery, shoring, temporary structures, centering, scaffold and hoisting tackle, timber-work in excavations, history of carpentry and joinery, and description at sight of various kinds of wood, and of defects, from specimens to be placed before the candidates. The examinations will include not only paper work and *visu voce* work, but practical carpentry to be done at the Company's workshops at Stratford on certain days, such as preparing the foot of a king-post, showing portions of the beam and struts, mortises for the keys of strap, &c.; preparing semicircular and elliptical centering, quarter size; erecting a bay of scaffolding, quarter size, &c. The drawing of details is also to be executed on the spot. The examination will unquestionably be worth working up to, for a good position in them will be a very good record for a rising workman.

THE decision of Mr. Justice Kekewich last week, in the case of the Gas Light and Coke Company v. the South Metropolitan Gas Company, is one of some interest to gas consumers on a large scale, as well as to gas companies. The point of the case is that the defendant company supplied gas to the London and South Western Railway through meters which were situated within the defendant company's district, but the gas supplied through which was consumed in buildings or localities within the plaintiff company's district. After going carefully through the arguments on each side of the case, his lordship ruled that, in accordance with legal precedent, the point where the meter of the gas company is fixed and where the gas leaves the meter and passes to the consumer is the point where the risk of the company ends and the risk of the consumer begins, and, therefore, that so long as the meter, the point at which the gas sold, in fact, is within the district of the company supplying it, the consumer may lead it where he likes after that. We hope this is good law; we are quite sure it is good common sense. At the meter the gas company part with their gas; and, as long as the bill is paid, they can have no right to interfere with the use of it by the consumer in the manner most convenient to himself.

ON Wednesday, August 3rd, were opened in Approach-road, Victoria Park, the new buildings in connexion with the Parmiter's Bequest. These comprise seven class-rooms, two master's rooms, a governors' board-room, a hall, dining-room, laboratory, and an art room, together with two fives courts and a playground. The school is designed to receive, at a small fee, 300 boys, between the ages of 7 and 16, being residents at Bethnal Green. The development of the trust funds from a very small amount is remarkable. By his will the founder bequeathed an income derived from some land in Suffolk to his wife for her life, and then to trustees, for the building of "six almshouses in some convenient place upon the waste of Bethnal Green; and further for the building there one free school, house, or room," for ten poor boys of Bethnal Green. At his widow's death, in 1702, the property fell into Chancery, and for some years the actual income of the trust, originally valued by Thomas Parmiter at 48*l.* a year, did not exceed 18*l.* By 1772 the accumulations, increased by certain gifts, had amounted to 540*l.*, and with this sum the governors began to build the original premises in St. John-street, Brick-lane. About this period the trustees bought a parcel of then waste land, 4½ acres in extent, at Cambridge Heath, for 36 guineas, with a sum of 50*l.*, which was advanced to them, *ad hoc*, by Mr. Edward Mayhew. In the year 1800 that property was let in two leases for a total of 225*l.* a year. Seventy years later the Great Eastern Railway Company paid 27,440*l.* into the Court of Chancery on behalf of the Trustees for their frontage in Cambridge-road. Meantime, the St. John-street Schools had been rebuilt (1838). In 1871 the freehold of the new site was bought for 2,100*l.* out of unexpended capital. In 1885 the Charity Commissioners' scheme was ratified, in terms whereof a new site was taken for the present school, and certain changes have been introduced into the administration of this endowment. The new buildings cost, in all, 8,600*l.*; the furniture and fittings amount to about 3,100*l.* The annual income of the charity in 1886 amounted to 3,569*l.* 6*s.* 8*d.*, to be increased by investment of the capital sum derived from the railway company.

WE understand that during the recess the Carlton Club will be supplied with the apparatus necessary for the purpose of electric lighting. The Athenæum and Junior Carlton are already so lighted, and thus the Reform Club will soon be the only large club in Pall Mall remaining a supporter of gas. We may well ask, "What's in a name," when the Reform is the least reforming of clubs?

ON the afternoon of Friday, the 12th instant, some experiments were made, in the Victoria Docks, with Herr E. Loeb's new respirators, by the Maritime and General Improvement Company, of St. Dunstan's-hill. These respirators, being similar to those now used in the German navy, are designed for operators when by smoke, gases, noxious fumes or the like thereto, respiration is difficult or fatal. The apparatus covering the wearer's mouth, nose, and eyes comprises a respiratory appliance fitted with layers of cotton wool and wet sponge, in front of a basis of charcoal and wool damped with glycerine. Some modifications in the contrivance render it applicable for use in hospitals, laboratories, and mines. The inventor demonstrated the capabilities of his appliance, which seems to be well adapted for the end desired.

HAVING been almost completely gutted by fire early on the morning of Wednesday, 10th August current, Macclesfield House, Soho, is officially "condemned" to speedy demolition. It is Nos. 34-5, Gerrard-street, and extends in the rear to Dansey-yard. Facing the southern end of Macclesfield-street, its elevation forms a striking feature amongst some yet remaining old-fashioned fronts in this quarter of the town. This house was built for the celebrated royalist Charles Gerard, who in consideration of his gallant services before Cardigan Castle, and elsewhere in South Wales, was created Baron Gerard, of Brandon, on

October 8th, 1645. After the Restoration he was created, 21st July, 1679, Viscount Brandon and Earl of Newberry, the latter title being changed to Macclesfield. In the following reign he was, together with the Earl of Stamford and Lord Delamere, committed to the Tower and condemned to death. He was, however, pardoned, and lived until 1693. His house here stands upon part of the site, as purchased by him, of the Artillery Ground, otherwise known as the Military Garden, of Henry Prince of Wales, elder son to King James I. It would seem to have been occupied by his elder son and successor, Charles, for in the St. Anne's, Soho, rate-books we lately saw an entry under date 1700 of "Earle Maxfield" as rated to pay 1*l.* 6*s.* in this street. Hatton mentions "Macclesfield House, alias Gerrard House . . . now [1708] in the possession of the Lord Mohun." Yet his statement is difficult to be reconciled with an entry in the rate-books of this time, wherein Lord Mohun is rated to pay 2*l.* for a house on the opposite side, clearly, of the street. The handsome staircase to which we drew attention in our notice, in the *Builder* of March 22nd, 1884, of the sale of this property, was in No. 35. Though upwards of thirty-one poor persons are rendered homeless by the fire, the flames were fortunately prevented from consuming the adjoining premises, including the house once occupied by Edmund Burke, now part of the Hotel de Versailles.

EXHIBITIONS are becoming a kind of world's monomania. Within the next two years no fewer than nine of them have been arranged. In October of this year a Russian general agricultural exhibition will be opened at Charkoff. In November next an exhibition of lighting will be opened at St. Petersburg; it will last until February, 1888. A German national art industry exhibition will be held at Munich in 1888. The Melbourne international exhibition will be open from August 1 next to January 31, 1889, and will comprise art, education, engineering, mining, general industry, agriculture, and sanitation. Belgium will hold a great international exhibition at Brussels next year. An international exhibition for trade, science, and art will be held at Glasgow in 1888. A northern art and industrial exhibition is to be opened at Copenhagen in May next. The municipality of Barcelona invites to an international exhibition in August next. Finally, Hamburg will hold a trade and industrial exhibition in 1889.

ADVANCE sheets, containing the summary report on the mineral production of the United States in 1886, published by the United States Geological Survey, show the value of building stone quarried last year to have been \$19,000,000, or about the same as in 1885 and 1884. The manufacture of bricks and tiles is valued at \$38,500,000, compared with \$35,000,000 in 1885 and \$30,000,000 in 1884. The production of 1886 is, consequently, about 10 per cent. higher in value than that of the preceding year. The increase in production was rather over 10 per cent.; but the price of bricks and tiles was somewhat lower during part of last year. The production of lime in 1886 is estimated at 42,500,000 barrels, against 40,000,000 barrels in 1885, and 37,000,000 barrels in 1884; the price remaining constant at 50 cents per barrel at the kilns. The manufacture of cement from natural rock was 4,350,000 barrels of 300 lb. each, valued at \$3,697,500, against 4,000,000 barrels in 1885, valued at \$3,200,000. The production of artificial Portland cement was 150,000 barrels of 400 lb. each, valued at \$292,500, as against a similar quantity in the preceding year, of the same value. The total production of cement of all kinds was 4,500,000 barrels, valued at \$3,990,000, against 4,150,000 barrels, valued at \$3,492,500, in 1885, and 4,000,000 barrels, of an estimated value of \$3,720,000, in 1884. The promptness with which these statistics are collected and published in the United States contrasts favourably with the delay experienced in the publication

of similar statistics in the United Kingdom. We are still patiently waiting for the appearance of the latter.

**T**HE Report made to the Local Government by Dr. Thorne and Mr. Gordon Smith, on the sanitary state of Oxford, and the attitude of the local official mind on the subject, is certainly most edifying reading. The Inspectors were much struck with the crowded and over-huilt state of many parts of the town; the gradual building up even of the insufficient open spaces formerly existing, the total want of proper means of ventilation, and of ordinary sanitary precautions in many places. In one place they found back-to-back houses with only 2 ft. 6 in. space in front of them. In an interview with the Local By-laws Committee the Inspectors discovered, by little and little, that not only were the Committee indifferent to this state of things in the present, but that they were averse to any revised legislation such as might work a change for the better in the future. The Inspectors

"Asked the committee if, in order to meet the difficulties they felt, they could describe an area of the city which might be altogether exempted from the operation of new by-laws as to buildings, and remain controlled only by the by-laws at present in force; an improved code, dealing, among other things, with open space about dwellings, being adopted for the remainder of the district. On considering this suggestion, it was contended by one and another that this and that locality should be included in the exempted area, until it became clear that, although a small minority desired that any such exemption should be restricted to a comparatively small area, others practically insisted on including such an extent of the urban district as could only be regarded by us as altogether unreasonable. . . . But the general outcome of our inspection and interview is that a majority of the sanitary authority of Oxford are not at present really desirous of effecting such changes as would be likely to lead to effectual improvement in its sanitary condition in regard to new buildings, unless they could be sure that such improvement would not interfere with the increasingly fictitious value which house property is acquiring owing to its dense aggregation."

This is a charming state of things in a town which is supposed to be a great centre of "culture," and where a picked body, as one may say, of the young men of this country spend two or three years of their lives at the period when they are passing from youth to manhood, and when their future physical as well as intellectual well-being may be considerably influenced by their surroundings. The majority of undergraduates, it is true, lead tolerably active and open-air lives, and get well oxygenised during the Long; nor are they, perhaps, much given to visits in courts with back-to-back houses; but typhoid may corner them some day unawares, for all that, if such apt lairs are provided for it to lie in wait. Can the University exercise no influence in the matter? or are her children to be left to harmonise with the environment?

**THE ARCHITECTURAL ASSOCIATION EXCURSION.\***

THE district visited this year by the Architectural Association presents a complete change from the scene of last year's excursion. Then it was all red brick; now it is grey stone. In Kent the hop fields undulated over long parallel

RUINS - HINTON ABBEY.

ridges. In Wiltshire the hills are more irregular and varied, and constantly present

\* The small sketches inserted in this report, as also those in the report of the Salisbury Meeting of the Archaeological Institute on another page, are made from photographs by Mr. Wilkinson, of Trowbridge.

evidences of occupation by a race to whom architecture was unknown, at any rate architecture suitable for transcription in a sketch-book. The range of interest could hardly be wider than this year. Every phase of work is to be seen, from the Roman baths or the White Horse, cut on the downs above Westbury, to a village of the time of William and Mary, and the still later crescents and terraces of Bath itself, the head-quarters of the excursion.

Hinton Abbey

Church-work and house-work divide the programme about equally. Hinton Abbey, Lacock Abbey, Norton St. Philip, Wellow, Westwood, Steeple Ashton, Edington and Westbury, represent the former; Cheynoy Court, Corsham, South Wraxall, Great Chadfield, and Cold Ashton, the latter. Then there are in addition the quaint town of Bradford-on-Avon, the large

examination with a view to determine the original uses of the ruined apartments, but it may fairly be doubted whether the names given in the guide books are quite correct. The work of what is called the Chapter-house is of that simple, supple character which renders un-restored early work so delightful. The object aimed at is achieved with so little effort, every-

Hinton Abbey.

sleepy village of Marshfield, and the treasures in the chapel at Farleigh Castle. So the programme is varied, and he must be a difficult man to please who does not find something to his taste.

*Bath and the Neighbourhood.*

The first day's excursion took place in most favourable weather, and included places of con-

siderable interest, though, fortunately, they were not so replete with matter to be sketched as to put members to great inconvenience. The first stopping place was Claverton, where only the terraces remain of what was once a large Elizabethan house, possessing a good deal of detail both inside and out. The terraces themselves are stately enough, and indicate the nature and extent of the mansion which was pulled down by a recent proprietor, partly

thing is so spontaneous, difficulties are met in such a naive manner, that it is quite refreshing to return to early work after the pomposities of later days. From Hinton Abbey, by way of the Horse and Church of Hinton Charterhouse, the party went to Farleigh Castle, the ruins of the stronghold of the Hungerforts. In Leland's time (circa 1536) the castle remained intact, "sette

THE GEORGE INN  
NORTON-ST-PHILIP

on a Rokky Hill." It had "praty towerres" an "auncient Chapelle" with a "praty Mansion at the very Est end of it" for two chantry priests, a fair gate-house to the inner court, and a stately hall and three stately chambers within the court. Of the features thus enumerated only "the auncient Chapelle" and the "praty Mansion" at the east end of it remain; the rest has fallen to decay, and the chapel has become the repository for all frag-

mentary remains of the castle, and the chapel has become the repository for all frag-

ents and curiosities which from time to time are found. The following slight sketch of the castle was given by Mr. Alfred Gotch:— At first sight it might appear that Farleigh Castle which we saw last year, but though the whole, or nearly the whole, of the architecture has disappeared, there still remains within the disused chapel of St. Leonard much

the building mania then prevalent, till it fell to decay long after it had passed from the family who built it. The purchaser of Farleigh, Sir Thomas Hungerford, died in 1398, and lies buried in the chapel here. His son Walter, Lord Hungerford, probably erected the monument which bears his effigy and that of his lady. The same Walter built the chapel itself, and at the same time built the church upon the

an inner court round which the dwelling-house was built, its four corners being formed by four towers, parts of which still remain; the rest of the house is completely gone. This was the home, for something like three centuries, of the Hungerford family, and all their pride and all their possessions, and all the memorials of them, almost, have shrunk into the small compass of this chapel. There you will find many of their tombs, much armour of their retainers, some of their chairs, and numerous scraps of stone and metal which once helped to add to their magnificence, — a magnificence which ended in a blazo of extravagance and dissipation at the Court of the Second Charles. But enough remains here and in written records to show how great a man a Hungerford must once have been and how fine his dwelling was. And now that his house is gone, the best purpose the site serves is to be the bourne of picnic parties, and Hungerford himself, as he lies on his beautiful tomb in all the pride that heraldry can lend, what is he? An object that all the world may stare at on payment of 3d., — an object not the least of whose honours now is that the Architectural Association is willing to sketch him.

From Farleigh the party went to what Loland calls the "pratie Market Town" of Norton St. Philip, where the principal attraction was the "George Inn," a place evidently re-named in its old age, for it dates from the fifteenth century. The lower story, the porch, with its pointed arch and cusped side windows, and the main bulk of the walls, are of stone, but the greater part of the front is of timber and plaster, each floor being brought forward something like 2 ft. The whole effect is very picturesque, but the detail is of no great beauty. There are, however, two octagonal chimneys with battlemented heads and pierced sides which deserve attention, and on an adjacent building is a circular chimney-head of a similar nature. At the back of the house an octagonal stair turret, combined with the pointed arch of a passage, makes a highly-picturesque group, while the wide open fireplace of the common room, with its grate and ornamental ironwork, found many admirers. The church here is of some interest, which is chiefly confined to the tower. This is rather unusual in several respects. It has large mullioned windows on every side, one of which (that on the east face) is contained in a gabled projection thrown out, so it is asserted, to accommodate an altar in the bell-ringers' chamber. Between the buttresses on the west face a porch has been inserted with a panelled soffit of good design, said to have been brought from elsewhere, but if so, we can only admire the lucky chance that made it fit so exactly into its present position. The whole effect of the tower, with its projecting parapet, is rather coarser than most work in Somerset, but, nevertheless, Norton St. Philip may boast of having a notable tower.

Somewhat similar, but less elaborate, is the tower of Wellow, the last place visited on this day. The merits of this church are certainly over-rated by Mr. Murray in his Guide-book, when he classes it "among the finest village churches in the country." Nor can the date, 1372, given by him be correct. The nave is certainly not earlier than the end of the fifteenth century, and is correspondingly poor. The most interesting part is the Hungerford Chapel, where some of the original colouring remains on the roof, recently restored in a judicious manner by Mr. Wallace Gill, of Bath. In the chapel, under a shallow arch, is this inscription, —

"For love of Thee and Mary is sake.—Praye for them that this letre make."

What "lete" might mean no one was able to say. In the village is the Manor-house, once the dwelling of a Hungerford. The back porch is dated in the spandrels of the arch, — G. I. H., 1634. The initials, no doubt, are those of George and Joan Hungerford, who lie buried in the church. He died in 1638; she, in 1679. There is not much to be seen in this house, but a little very good woodwork of a date, apparently some thirty years prior to the porch. It consists of an over-mantel and a doorway, both of which are adorned with the delicate foliage and griffins with sprouting tails that mark the work of the Renaissance. The over-mantel contains three panels, surrounding shields which bear the arms of Hungerford, and the poimient over the door bears their device of three sickles interwoven.

Cherney Court, the first place on the programme

ALMSHOUSES, CORSHAM.

not is of interest, and much that will grace a sketch-book. Before, however, examining the beautiful objects gathered together in that building, it will, perhaps, not be altogether beside the mark to learn how they got there. This castle, then, of Farleigh - Hungerford

hill. Up to that time the parish had used the church within the castle walls, but when the castle was completed it was evidently highly inconvenient for them to do so; therefore the great Lord Walter built them a new church outside in the year 1443, and at the same time

LACOCK ABBEY

belonged to the powerful family of the Hungerfords, a family which owned immense estates, and which not only dominated the whole country, but took a prominent part in events which help to make the history of England. The first possessor of Farleigh was Sir Thomas Hunger-

built the Chapel of St. Leonard within the walls for his own use on the site (probably) of the old church. This chapel, the priest's house at the east end of it, the gate-house, and a few fragments of the towers and walls, are all that remain of the once formidable structure.

ford, who purchased it from a Lord Burgheish in the year 1369. There was already some kind of a house here, which Sir Thomas converted to a castle by adding towers and a moat, leaving the work, however, to be completed by his son Walter, first Lord Hungerford. The castle as they left it remains almost unaltered, save for a few changes made towards the end of the sixteenth century under the influence of

Enough is left to enable us to see what kind of place it was, and Canon Jackson has an approximate plan of it in his exhaustive account of the castle. The gatehouse led into an outer court, in which stood the chapel, detached; while against the walls were stables and guard-rooms, extending from the main gatehouse to another gate on the west side. Beyond and to the north of this outer court was

for Tuesday, is a picturesque gabled house, dating from about the middle of the seventeenth century. The detail is coarse throughout, especially in two large chimney-pieces, in which an earlier style is caricatured. Nevertheless, the mullioned windows, the disused hooded doorway, the flight of steps to the present front door, the ivy-clad walls, and the broad terrace path combine to make the general appearance exceedingly pleasant. Corsham Court, the next place visited, is a far more imposing edifice, but only the south front has any interest to the

feature in the shape of a large window at the east end of the nave contrived above the chancel roof. The north chapel is of great interest and beauty. It is extremely late in style, still Gothic, but drooping into Classicism its pendants. In the north wall is a fine wall tomb to Sir William Sherrington: it bears his initials, "W. S.," in the spandrels of the arch, and the date, 1566, in a panel. The workmanship is of the most delicate in design and execution, and it is a fitting memorial of the author of such good work as Sherrington did

architectural student. This dates from 1582, and is a good example of Elizabethan work. The mouldings of the cornices are clean and well proportioned, the square bay-windows are massive and solid, while the gables, crowned with grotesque figures, give a pleasant variety to the skyline. The treatment of the hays, both in general effect and in the section of the mullions, recalls Longleat, some fifteen miles to the south. By the kindness of Lord Methuen the party was enabled to see the collection of pictures, which is one of the finest private collections in the country. Corsham Church has suffered much of many restorers, and possesses little to attract a skilful party beyond two elaborate tombs in the north chapel, one of which is the tomb of the builder of Great Chalfield Manor-house (a sketch of the north front of which, and a sketch of the adjoining church, are given on pp. 208-9), visited on Thursday. Much more attractive are the almshouses, built in 1668 by a Lady Hungerford, and containing many suggestive little bits in the shape of brackets, panelling, bench-ends, and other woodwork. It is true that the stone details are poor and coarse, including the heraldic ornamentation over the porch; but the porch itself is good in outline, and the many gables which adorn the exterior of the whole building render the grouping picturesque from all points of view, while the whole place has a satisfactory air of being judiciously left alone.

By far the most exciting place of the day's programme was Lacock Abbey, where very excellent work of three periods abounds. Much of the old thirteenth-century work remains, so do the fifteenth-century cloisters, while added to them is some refined Renaissance work of the time of Edward VI. The Abbey was founded by Ela, Countess of Salisbury, in 1238, for Augustinian canonesses, and at the Dissolution was sold to Sir William Sherrington in 1541. He converted it into a dwelling-house, and added a large stable yard, but he left much of the old work intact, and there it stands to this day with its beautiful rounded caps and vigorous vaulting and crisp orichels, while in the cloisters the vaulted ceiling is dotted over, at the crossing of the ribs, with curious-coloured bosses. Sherrington's own work is no less good, and much of his carving was done by one John Chapman, whom Sir John Thynne begged in order that he might carve him some beasts for his gables at Longleat (there are no gables there now); but his wish could not be gratified, as Chapman was away at Dindley, where he was putting up some carving for my Lord Northumberland. The time at Lacock was all too short to do the place justice, and only a peep could be given to the church, where there is a very unusual

feature in the shape of a large window at the east end of the nave contrived above the chancel roof. The north chapel is of great interest and beauty. It is extremely late in style, still Gothic, but drooping into Classicism its pendants. In the north wall is a fine wall tomb to Sir William Sherrington: it bears his initials, "W. S.," in the spandrels of the arch, and the date, 1566, in a panel. The workmanship is of the most delicate in design and execution, and it is a fitting memorial of the author of such good work as Sherrington did

at the Abbey. Both it and the chapel itself are coloured. A hurried glance at the village showed it to be full of picturesque bits, and seldom has the pitiless whistle of the quarter-master been heard with greater distress than on this occasion.

We shall continue our account of the excursion in our next.

#### THE SALISBURY MEETING OF THE ROYAL ARCHÆOLOGICAL INSTITUTE.\*

We continue our notes of this congress.

At Great Durnford Church, which was visited after leaving Old Sarum, Mr. George H. Gordon, A.R.I.B.A., read a short paper. The church is one of considerable interest, with two good Norman doorways, the chancel arch and font being also Norman. Mr. Gordon said that the architect of the church pointed to a date somewhere between 1120 and 1160. He thought it was probable that if the church were carefully and conscientiously restored, much that would be interesting and instructive about it might be discovered. The north door is of Early Norman work, and is in good preservation. The workmanship is rude, and the porch is of modern date, with no pretensions to architecture. On the north side of the nave is some old glass of the thirteenth century, representing the Crucifixion. Beyond is a small fourteenth-century door, leading probably from the church to the external steps to the roof-loft. The chancel arch is in good preservation, but is coated with whitewash. The string has been cut, and there are other indications of the existence of a roof-sec. The caps to this arch are quaint, being an owl on the north side, representing Night, and a dove on the south, representing Morning. The colouring of the chancel is modern, but is a reproduction of the ancient design, except as to the colours, which were originally brighter. Some curious frescoes were found when the chancel was restored about twelve years ago. The chancel windows are lancets, and show no indications of Norman work. The seats in the nave are thirteenth century, rude, but in good preservation, and afford a good example of the durability of oak. The font is of late Norman date, probably 1160 or 1180, and is in good preservation. Its design is interesting and remarkable. The south porch has an Early Norman arch. Externally, there are two Norman buttresses, and on the north side is a leper's window, which has been filled up on the inside, but has a hinge and latch on the outside. It is Early Gothic in character, and is remarkably near the floor

of the church. The tower, which at first sight appears to be Perpendicular, is Early English. The arch between the nave and tower needs opening out and restoring. There is some curious Early English corbelling on the buttresses at the west end of the tower.

Briford Church, which was visited on the following day, is a very interesting building. It was restored in 1873 under the late Mr. Street, who appears to have been most careful in preserving the few remaining indications of what the original church had been before the alterations carried out by one of the Earls of Radnor during the last century (circa 1764). It was at that period that the massive tower and west front assumed their present appearance, according to the Rector, the Rev. Mr. Morris, who read a short paper on the church. He said that when the church was restored in 1873 the last-century porch at the west end was removed and the present one built in the south wall of the nave. In doing this an old round-headed arch, evidently of a very early period,—presumably of the same date as the two other round arches in the north and south walls of the nave, which form the special feature of interest in the church, were discovered. The two arches last named were opened out for the first time in 1872, when they were found to be perfect, the only part of them before visible being their exterior surface in the outer wall of the church. From their appearance they were mentioned by Bosman as being Saxon, but since they have been opened out they have been generally held to be Roman,—an opinion endorsed by the late Mr. Street and also by Mr. Roach Smith, who considers them to be "Roman, *in situ*." There has been much discussion as to the date of the carved work on the arch in the north wall, which appears to be unfinished, and also as to the purpose of the projecting stones at the bottom and towards the top of the springing of the arch.

Mr. R. P. Pullan said the church was a most interesting one, but he inclined strongly to the belief that the arches referred to were Saxon, built with Roman bricks. The carving on the jambs of one of them was the finest and richest of its period that he remembered to have seen in any church in the kingdom. It was somewhat later than the construction of the arches themselves.

Mr. J. T. Micklethwaite said that the church afforded a very interesting example of the very earliest form of the cross church. It was perfectly clear to him that the first church here consisted of a nave of exactly the same size as the present nave. There was probably a small sanctuary, not projecting further eastwards than the tower does at present. The interesting archways whose age was in dispute gave access to small side chapels which were, in fact, the earliest development of the transept.

Mr. Arthur Evans spoke of the carvings on one of the arches as being decidedly Byzantine in character, while Mr. Parke Harrison argued that it is Saxon.

At Bradford-on-Avon, which was reached by special train, the interesting and very fine tithe-barn (of which we give a sketch) was first visited, under the guidance of Mr. C. S. Ayle. It has a very fine roof. Some discussion took place as to the date, the conclusion arrived at being that it was erected circa 1330 to 1350. At a meeting of the Architectural Section, however, on the following evening, Mr. Parke Harrison said he was not satisfied that that decision was correct. The buttresses were certainly Early English, but he thought he could adduce good reasons for believing that the walls were Norman. Firstly, the walls were themselves out of the perpendicular, thrown out by the weight of the magnificent roof. But the buttresses, which were admittedly Early English, were not out of the perpendicular, showing that they must have been erected subsequently to the main walls, in order to support them. If the walls themselves were coeval with the buttresses, the latter would have got out of the perpendicular when the walls did. Secondly, having studied masons' marks abroad and at home, he had a good knowledge of the Norman masons' marks, and he had found on the walls of the Bradford tithe-barn certain masons' marks which were found also at Gloucester and in William Rufus's hall at Westminster. Thirdly, the tooling of the stones in the walls of the Bradford barn showed them to be Norman.

\* See pp. 220, 228, ante.

The visitors next proceeded, under the guidance of Mr. Adye, to the old bridge of Bradford-on-Avon. He pointed out that the bridge was originally much narrower (as could be seen by the inspection of the underside of the arches), being only a foot or pack-horse bridge. The bridge was widened circa 1645. The curious little building on one side of it (shown in the accompanying sketch) excited some discussion. Was it ever a chapel? Aubrey

displayed in the architectural features of the surrounding terraces and balustrades, by the rich and imposing details of the interior decorations, and also by the unique similarity of the three in style, in ornament, and in general effect. The first of these is Kirkby, in Northamptonshire, the seat of Lord Winchilsea; the second is the old manor house of Claverton, near Bath, formerly the seat of Wm. Bassett; and the third the Duke's, or Kingston House, in Brad-

during the reigns of Queen Elizabeth and King James," have both written descriptions and published drawings of this house. The last publication relating to it is a volume of illustrations of Claverton and the Duke's House, of Bradford, published by Mr. George Vivian, of the former place, in 1837, and containing some admirable drawings of the buildings and internal decorations. In these works it is described as being of the Transitional style, between the Old Tudor or Perpendicular and the new or Palladian: many of the enrichments are copied from German work in fashion at that time. The front facing the south is divided into two stories, with attics in the gables. The windows are in beautiful proportion, with stone mullions. These are formed by three projections, the central one square, and the two side ones recessed, with semi-circular bows. In the centre is a large sculptured doorway to a porch, and the summits of the window hays are adorned with open parapets. The characteristic feature of this style of architecture is, of course, the window light. As seen from the outside, the windows are extremely handsome; from within, they are in the winter suggestive of cold, and in the summer of heat.

Returning through the narrow lane known as "The Shambles," the visitors next proceeded to the interesting Saxon Church of St. Laurence, under the guidance of Mr. Adye, who has restored the building in a very conservative spirit, only doing what was necessary to put it into repair and to keep it in good preservation. He pointed out that the string-course and arcading, partly shown in the view which forms one of our phototype illustrations are constructional,—i.e., cut out of the wall-stones, and quite irrespective of joints.

Mr. E. Chisholm Batten read an interesting paper on the church. He said that very shortly after Ina's accession Aldhelm communicated to him his intention of going to Rome to obtain a grant from the Pope of the largest privileges of a monastery for the abbey of Malmesbury and its dependent house at Frome, to which proposal not only Ina, but Ethelred, the King of the Mercians, gave full countenance. Aldhelm obtained at Rome a bull or charter of privileges from Pope Sergius exempting the monasteries of Malmesbury and Frome from episcopal jurisdiction and secular services, and conferring on the monks the privilege of electing their abbot. After his return from Rome Aldhelm founded a monastery at Bradford. (It was probably not founded before that time, as Bradford is not named in the charter of privileges of Pope Sergius.) When Ina divided the Bishopric of Winchester into two, in 705, and founded the Bishopric of Sherborne, he insisted on Aldhelm becoming the first bishop of the new diocese. The monastery of Bradford is first named in the episcopal letter of Aldhelm, which he wrote in 705, stating that he had desired, on becoming a bishop, to resign the position of abbot in his monasteries of Malmesbury, Frome, and Bradford; but his monks insisted on his remaining their head, which he consented to do, and King Ina was a witness to the letter. William of Malmesbury, after mentioning this episcopal letter of St. Aldhelm, in which the monastery of Bradford is named, adds the now well-known sentence:—"Et est ad hunc diem eo loci Ecclesiola quam ad nomen beatissimi Laurentii fecerat predicator"; which may be translated: "And there is to this day in that place a little church which he (Aldhelm) is asserted to have made for the name of the most Blessed Lawrence." The question to be submitted to the visitors was: "Does the building now standing only occupy the site of the church built by Aldhelm, or is it the actual church itself?" Mr. Chisholm proceeded to argue that the present building was the building erected by Aldhelm. He said that in a tract published by the Committee of Trustees for the preservation and restoration of the building in 1872, Mr. Freeman expressed his opinion of its date in these words: "From the character of the building I should be inclined to place it early in the last of the three ante-Norman periods which I tried to make out in my 'History of Architecture.' There is certainly in this building nothing that can be described as Norman." The opinion of the late Mr. J. H. Parker was thus expressed:—"The church was built, as it seems to me, in the time of Bishop Ethelwold, between 970 and 975, or possibly then built of wood only and rebuilt of stone about 1025, not

Barn, Bradford Mills

said it was, and this was the opinion of Precentor Venables and the Rev. Dr. Cox. It was long used as a lock-up, but is now, Mr. Adye said, made available as a powder magazine! It was the opinion of most of the visitors who were competent to judge that the dome-like roof was of late date, probably Jacobean. The fish (a gudgeon) which forms part of the final is the emblem of St. Nicholas. The inhabitants of the town were familiarly spoken of as "Brad-

ford gudgeon," purchased and restored by the late Mr. Moulton. Longleat, situated only a few miles from here, is usually referred to as very similar in style and about the same period. The older parts of Kirkby House were built in the latter end of the fifteenth century, while that which so closely resembles Kingston House must have been erected in the seventeenth. The date, 1625, of the old Manor House at Claverton was, with the arms and initials of the

BRADFORD BRIDGE

ford gudgeon," according to Mr. Adye, and those who had been tenants of the lock-up were said to have been "under the fish and over the water."

The visitors proceeded next to Kingston House, a very fine specimen of domestic architecture, and of which a small view is given on our sheet of phototype illustrations. Mr. F. Sham, F.S.A., read an interesting paper on the house. In it he said that Kingston House is one of three country mansions erected at the same period, distinguished by the singular beauty of the buildings, by the exquisite taste

owner, recorded on the building itself, which was unfortunately taken down by the late owner, Mr. Geo. Vivian, and a new mansion built from a design by Sir Jeffery Wyatville. The terraces and balustrades only are preserved intact. Kingston House clearly belongs to this time, possibly a little later, for not only is the building in a better state than Claverton prior to its destruction, but the style of architecture and the details are more developed and elaborately treated. The genial and enthusiastic John Britton, and Richardson, author of "Observations on the Architecture of England

later." The foundation for this opinion of Mr. Parker's was the great similarity between the sculptured angels in the east wall of the chancel (one of which is represented by the annexed sketch), and the figures of angels

found in the Benedictional of St. Ethelwold, who held the see of Winchester from A.D. 983 to 984. In 1874 Mr. Freeman, who had in the meantime most carefully examined the building, wrote, in his paper on "Ina," printed in vol. xx. of the "Transactions of the Somerset Archaeological Society":—"As Abbot of Malmesbury, Aldhelm had been one of the greatest builders of his time. The realm of Ina was adorned with a number of churches, the work of his saintly kinsman. Of these one happily remains to us, the church reared by Aldhelm on the scene of his uncle Cenwesh's victory,—the lately-rescued church of St. Lawrence at Bradford-on-Avon. There it stands, telling its tale that the English of the seventh and eighth centuries were not savages unable to put stone and mortar together." In pursuing his argument, Mr. Chisholm Batten pointed out that Aldhelm certainly built the great church at Malmesbury of stone, and the church he built at Wareham was also of stone. Then why not this church at Bradford? No one, he said, would insist on the church, as it now stood, being exclusively the work of Aldhelm, and certainly the angels in the east wall of the chancel might well have been added after the nuns of Shaftesbury owned the church. Much of the ornamentation externally must have been done after the erection of the walls.

At South Wraxall Manor House,—of which we give a sketch of a gateway and (on our sheet of phototype illustrations) a view in the courtyard, besides views of three of the chimneys,—Mr. C. E. Ponting, architect, Marlborough, read a short paper, in which he said that this charming specimen of English Domestic architecture illustrates in a remarkable manner the development of the dwelling-house from the later middle ages onwards. The oldest parts of the building are the hall, the kitchen, and parlour on the south of it, with the host's chamber over; and the buttery, with guests' chamber over, on the north of the hall. Of the latter only the roof remains of the original features to indicate the date. The whole of this was erected in the early part of the fifteenth century, and probably by Robert Long, M.P. for Wilts in 1433, who died in 1447. Next in date (and very little later) is the block of offices at the north-east angle of the courtyard, which then stood detached. This also has its original roof. The entrance gateway, with the porter's dwelling over, and the buildings connecting it with the parlour, were apparently erected at the beginning of the sixteenth century, after the acquisition of the Manor of Draycot Cerne by Sir Thomas Long, as the badge of the possessor of this manor is cut on the label termination. The original part of the gateway only extended to about 14 ft. from the south face, and the quoins is visible on the west side, as well as a blocked-up doorway forming a foot entrance from the outside. An enlargement, by the erection of what Walker calls the "Dining Room (east of Withdrawing Room)," with the new guests' room over, was made at about this time, this being indicated by the roof, with its collar and wind-braces; and it is doubtless owing to this not being accessible to him that Walker sets this part of the building down as dating from early in the reign of James I. During the latter part of the reign of Elizabeth and the early part of the succeeding one, very extensive alterations appear to have been made in the house to adapt it to the changed habits of the people. A fireplace was added to the hall. The chimney-piece bears date 1598, and was erected during the ownership of the property by Walter Long, who was Sheriff of Wilts in 1601. The greatest change, however, was made in the remarkable remodelling of the part north of the hall. The ancient guests' chamber over the buttery was transformed into a "With-

drawing Room," and its dimensions increased both in length and in width; and in order to effect this without disturbing the original roof, a piece of the north wall was left to support it, in such a position as to come in the centre of the extended length of the room, and the space between this pier and the new north wall was built up. The whole block (of the pier) was then made an ornamental feature by forming five niched seats in it. Lintels were thrown across east and west of the pier, to carry the north plate of the roof. A large bay was then formed on the east side of the pier, and the widened room lengthened 8 ft. westward, the entire available space in the new walls being occupied by mullioned win-

name from *creech* or *crechen*, a hill,—being placed on an isolated eminence fortified with a ditch and having a rampart all round the summit. The word "scratchy" was sometimes applied to land where the rock was only thinly covered with earth, and that had been given as the origin of the name "Scratchbury," but the late Canon Jones derived the name of the camp from the Scandinavian word *scratti*, a demon,\* the idea being common in ancient times that great works like the fortifications at Scratchbury were carried out by the help of evil spirits. The fortified space has three entrances, the south-east entrance being approached by a narrow neck of land called *Barberry*. The camp is ancient British, and the area comprised

dows of three lights in height. The beautiful chimney-piece in this apartment (shown in the left-hand bottom corner of the sheet of phototypes) blocks up the doorway which formerly led into the small chamber over the north-west bay of the hall. The rich coved plaster ceiling was erected under the braces of the original roof, which were cut off at the plate level for the purpose. The oak panelling is apparently coeval in date. The two rooms east of this, which Walker terms the "Dining Room" and "New Guests' Room," appear to have been refitted at this time, as the chimney-pieces indicate. At about the same time a new kitchen was added. The hall itself was enriched about the year 1600 by the erection of the carved screen. About a

within the fosse and vallum exceeds 40 acres. The circuit of the outer rampart is 1 mile and 86 yards. The greatest height of the vallum is 66 ft. Within the circuit are several tumuli, and an inner earthwork of circular form. The material of the ramparts is chalk and earth, obtained from the fosses and firmly hedged together. These ancient fortresses of a primitive and simple people, said Prebendary Scarth, in conclusion, were, as features in the history of the races that had peopled this island, well worth preserving, and he hoped they would always be respected and preserved. In the Architectural Section, the Rev. J. A. Bennett, B.A., read a paper entitled "The Architect of Salisbury Cathedral." He commenced by remarking that it was a

century later a great deal was done in modernising the fittings and surroundings of the house.

Subsequently the visitors proceeded to Great Chalfield, to inspect the church and manor-house, under the guidance of the Rev. E. Kingston and Mr. E. Green. We append a sketch of the north front of the Manor-house. The gable shown to the left hand has nothing behind it, the building being partly a ruin. Closely adjoining this end of the Manor-house is the church, with its picturesque turret perched on the gable end.

Scratchbury Camp was visited on the last day but one of the meeting. Prebendary Scarth said that Scratchbury Camp, which is situate to the north-west of Heytesbury, South Wilts, was supposed to derive its

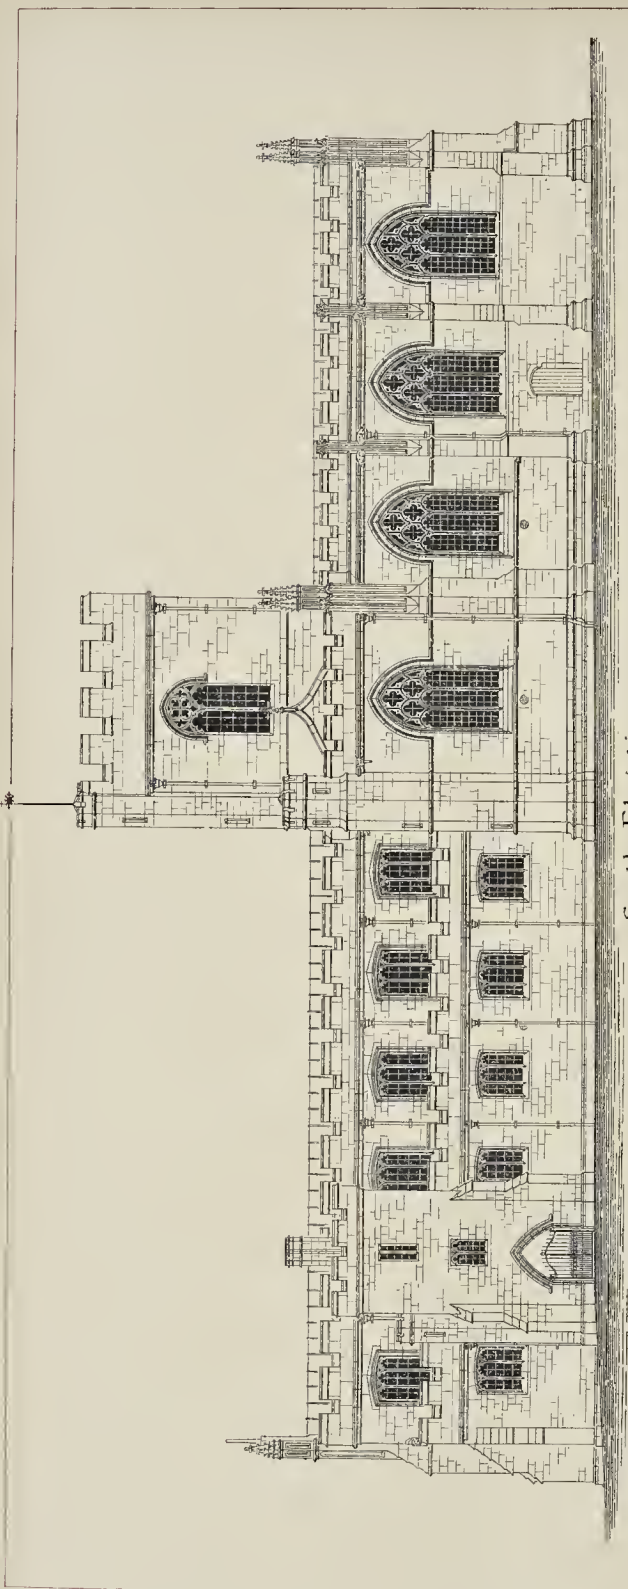

common subject of regret that while we had, in every part of the kingdom, works of art in stone second to none in the world, the names of the men who had created them were lost. It was his aim to show that in one Master Elias de Derham we had the name of one of those great men of old,—one of the masters in the school which created for us our own distinctive Early English style. He was a man of considerable eminence among the personages of the time. The earliest date at which the author had met with the name of Elias de Derham was in a Close Roll of A.D. 1205. In it, he, as one of the executors of the will of Archbishop Hubert Walter, was ordered to pay over

\* As bearing on this question, one of the visitors, Mr. Greville Chester, remarked that in some parts of the country "Old Scratch" was a vulgar name for the Devil.

in moneys which had belonged to the then Bishop of Bath. The author said he had been told on what should be good authority, King John's Palace at Westminster was fired by Elias de Derham in the year 1209, he had not been able to verify that statement. The next mention of his name was found in early will of Hugh de Wells, Bishop of Exeter (a copy of the will is amongst the documents of Wells Cathedral). In it Bishop John appointed Master Elias de Derham to be

and that the architect employed was Elias de Derham, who seemed to have been in close connexion with the King, and, indeed, to have been in much the same relationship to him as William of Wykeham was to King Edward III. and his successors. Mr. Bennett continued his paper by arguing inferentially, from certain resemblances between contemporary work at Salisbury, Winchester, and Wells, that these works must have emanated from one master-mind, viz., that of Elias de Derham.

was, by royal favour, appointed to the See of Winchester, and shortly afterwards made Lord High Chancellor of England. Soon after his consecration to Winchester he appears to have set about improving the state of the church in his native parish of Edington. He first (in 1331) arranged with the Abbess of Romsey for the establishment at Edington of a collegiate body of secular priests under a warden. But a short time after this, at the special request of the Black Prince, he converted his college into a monastery of the Augustinian order of Bonhommes, and built the present church. Leland gives the following extracts from a certain Latin book of Edington monastery:—"3rd July, 1352, was laid the first stone of the monastery of Edindou."

"A.D. 1361. The Conventual Church of Edindon was dedicated by Robert Wyville, Bishop of Sarum, to the honour of St. James the Apostle, S. Katherine, and All Saints." We are thus able to fix the exact date of the commencement and completion of the church, the whole of which was carried out during the bishop's lifetime. The church is especially interesting, Mr. Poynting remarked, as marking the period of change from one of the great divisions of Gothic architecture to another,—from the Decorated (which Parker set down as ending about 1360, and Rickman as 1377) to the Perpendicular (which both authorities considered as commencing about the year 1400). The value of the example is enhanced by the fact that (with the exception, perhaps, of the porch, which appears to have been added to the aisle wall rather than built up with it, and is somewhat later in detail), the building is all of one date, and it remains practically unaltered, so that it presents to us a complete specimen of the monastic church of the fourteenth century. The tower was formerly vaulted in stone at its lower stage, but the corbels, springers, and wall-ribs only remain. The chancel being the church of the monastery, the parish altar was doubtless placed under the tower. The original chancel roof (which must have been of wood and not of stone, as so often stated) has disappeared, and a modern roof and plaster ceiling of about a century old have taken its place. But the corbels which supported the roof trusses remain,—two on each side,—as well as four niches, which probably contained figures of the Evangelists. On the east wall, flanking the window, are two niches of very elaborate design and delicate construction, the slender proportions of their tabernacle work being suggestive of wood rather than stone. In the centre of the south side of the chancel is a doorway which (doubtless from its plain external appearance) has been considered modern, but which is richly moulded on the inside, the label being carried up as an ogee canopy with flanking pinnacles and crockets, and dying into the string course. But the rebate for the doors is on the outside, where the western jamb and arch have a small plain chamfer, whilst the eastern jamb is deeply splayed off. This was evidently not originally an outside entrance to the chancel, as at present, but opened into a long narrow chamber against the two eastern bays. Referring to the south elevation, it will be seen that the outer sills of the windows of these two bays, are on this side, kept higher, the sills being flatter to admit of it. There is a built-up window in the buttress at the west end of the chamber, and an archway for passage through the intervening one, also blocked up. In the chancel wall at this part there are two built-up squints or windows (with a mullion between) which once looked into the sanctuary. The object of this passage-like chamber opens the field for much conjecture. It must have been too narrow for a sacristy. Was it the kind of anchor-hold described by Mr. Mackenzie Walcott, the openings being made to enable the recluse to see the mysteries? Or was it a place for the leper? However that might be, all these features, including the doorway, were certainly coeval with the chancel. The roofs of the nave, aisles, and transepts are Jacobean, the dates on them ranging from 1605 to 1674. There are reasons for believing them to be, in general form, copies of the original. They are of the king-post and tie-beam type. The exterior of the church is remarkable for the regularity of its design. The west front is notable for its unique window and doorway. The doorway appears to have been intended more as an architectural feature than for use, as the splayed wall-plinth of soft stone is carried through as a sill, and

Another paper read in this Section was by Mr. C. E. Poynting, on Edington Church. We give a summary of the paper on another page, and accompany it by some illustrations reproduced from Mr. Poynting's drawings for the restoration of the church. We have a few more brief notes to follow in completion of our report.

**Illustrations.**

**CHURCHES AND OTHER BUILDINGS VISITED BY THE ARCHITECTURAL ASSOCIATION.**

OUR sheet of phototype illustrations shows some of the churches and buildings visited by the Architectural Association during the present week. By a coincidence elsewhere mentioned, some of these buildings were visited a fortnight ago by the Royal Archaeological Institute, in connexion with its meeting in Salisbury, now being reported in our columns.

**EDINGTON CHURCH, WILTSHIRE.**

This fine church, of which we give plan, transverse sections, and south, east, and west elevations (as well as a small view on our sheet of phototype illustrations), has been visited this week by the Architectural Association. As elsewhere mentioned, it formed the subject of an interesting paper read in the Architectural Section of the Salisbury meeting of the Royal Archaeological Institute a fortnight ago by Mr. C. E. Poynting, the architect for the restoration of the church. Mr. Poynting, at the outset of his paper, said the church would be restored in the most conservative sense of the word. He went on to say that the rectory of Edington belonged to the Abbey of Romsey, of which the rector was a resident prebendary, and the parochial duties, with the services in the church (the predecessor of the building under notice) were discharged by a vicar. About the year 1300 William of Edington (whose surname is unknown) was born in the village whose name he adopted. After education at Oxford, and having held two previous livings, he in 1322 became rector of Middleton Cheney, in Oxfordshire. In 1345 he

executor, together with his own brother John, Bishop of Bath. At about the same time he was employed as architect upon a work of great importance,—the Shrine of St. Thomas at Canterbury. The authority for that was the Paris, who added to his account of the shrine of St. Thomas, in A.D. 1220, the statement that the shrine whither the body was moved was the work "of the incomparable masons, Walter de Colchester, Sacrist of St. Dunstons, and Elis de Derham, Canon of Salisbury." Another notice of Elias de Derham about the same date was found in connexion with Salisbury. The Diocesan Registers spoke of him, as a canon of Salisbury, eleven times, and there were positive statements in the "Book of Evidences," among the Bishop's documents, that he was the builder of the "Aula magna," or "Loden-hall." Leland gave an account from an old martyrology of Salisbury which spoke of Elias de Derham as "rector" of the new fabric of the church of Salisbury from its first foundation for twenty-five years. Prebendary Jones, in his history of the diocese, stated that by a sort of dim tradition Elias de Derham was believed by some to have been the designer of the cathedral. Prebendary Jones did not give a decided opinion as to the exact meaning of the word "rector," but there seemed to be every reason for taking the word in its usual sense (meaning the chief person concerned, and not merely as the equivalent of "magister rationum,"—"clerk of the works,"—and for saying that the tradition was founded on fact. It seemed to Mr. Bennett also that the fact that Elias de Derham was employed in architectural capacity during the same time at Salisbury, Canterbury, and Winchester, and that he accompanied Bishop Poore to Exeter in the midst of it all, was quite incongruous with the position of a (mere) clerk of works, the very reason for whose employment it was that he should be in daily superintendence of some particular building. Mr. Bennett, in his paper on the King's Hall at Exeter, which was printed in the Winchester volume of the Institute for 1845, showed, by extracts from the Close Rolls and Liberate Books, that a great deal of work was going on at the hall about the years 1230-1235,

shows little sign of wear. A noticeable fact in the design of the church is that effect is produced by good proportions, solid construction, and rich mouldings, rather than by carving. The capitals throughout are plainly moulded. In concluding his paper, Mr. Ponting adduced from this church reasons for believing that it was its founder, William of Edington (and not William of Wykeham, who has generally been credited with it) who introduced the leading principles of the Perpendicular style.

We may add that Mr. Ponting's report on the condition of the church reveals a sad state of neglect and dilapidation, and it is quite clear that the structural repairs which he recommends ought to be carried out with as little delay as possible if the church is to be preserved intact.

#### DALMATIAN ARCHITECTURE.

The page of illustrations which we give from drawings by Mr. T. J. Jackson, M.A., are referred to in our first article this week.

#### NEW PREMISES, OXFORD-STREET.

We give this week a perspective view of premises in the course of erection in Oxford-street for Mr. Henry Heath. They extend from Oxford-street to Hollen-street, the manufactory being in the rear, and already completed and occupied.

The erection of the front has been delayed till the end of this season, so as not to unnecessarily interfere with the business.

The front is to be faced with terra cotta from the Burmantofts works.

Messrs. Peto Bros. are the contractors; and the work is being carried out from the designs and under the superintendence of Messrs. Christopher & White, architects.

#### THE BRITISH ARCHAEOLOGICAL ASSOCIATION.

The British Archaeological Association is now holding its Forty-fifth Annual Congress at Liverpool, the President, who will also continue in office during the ensuing year, being Sir James Allanson Picton, F.S.A., an old member of the Association and inhabitant of the city. There is an influential reception committee, consisting of seventy or eighty of the principal citizens and others. The Local Hon. Secretaries are Messrs. C. W. Bleasde, Ed. M. Hance, LL.B., and R. D. Radcliffe, M.A.

The proceedings commenced at three o'clock on Monday with an "At Home," given by the Mayor of Liverpool, Sir James Poole, in the Town-hall, where the reception committee assembled to formally welcome the members of the Congress. An adjournment was then made to the Council-chamber, where Mr. John Hughes, acting on behalf of the Mayor, presided.

After rendering the members a hearty welcome, Mr. Hughes called upon Sir J. A. Picton to deliver his inaugural address, and vacated the chair for the purpose. We have the greater part of Sir James Picton's interesting address in type, but it is unfortunately crowded out this week; it shall appear in our next.

The address was listened to with much interest by the audience, which completely filled the Council Chamber. At its close a vote of thanks to the lecturer was proposed by the Rev. H. H. Higgins, who dwelt upon the important services rendered to the city by Sir James Picton, during a long life, particularly with respect to the Free Public Library of Liverpool. The vote was carried by acclamation, and the party adjourned to the upper rooms of the Town-hall, where the maces and silver plate belonging to the Corporation were laid out for inspection. The whole of the charters granted to Liverpool by various kings of England were also exhibited, and these were described by Mr. de Gray Birch, F.S.A., one of the honorary secretaries of the Association. The first in order of date is the so-called charter of King John. It is written on a small slip of parchment a few inches in length. It recites that the burghesses who have taken up their abode at Liverpool are to possess free customs as are enjoyed by other maritime towns. This cannot, therefore, be regarded as a Charter of Incorporation, such as is the next in date, that granted by King Henry III. in 1229, by which Liverpool is constituted a free town with a merchant guild, no one being allowed to make any merchandise except by a member of the

guild, or by its permission. In addition, other rights and privileges are granted. There is no seal to either of these documents. The charter, or rather the confirmation of the former documents, made by King Edward III. at York, was also exhibited. This is an interesting document from the number of signatures of members of the king's court attesting it. Various other charters of later date were also exhibited, among them being those of King Charles I., William III., and the market grant of Queen Anne.

Mr. Birch called attention to the excellent state of preservation of the documents, which indicates careful treatment of a better kind than is frequently found, and the example of the municipal authorities may be followed with much advantage by other corporations.

Refreshments having been partaken of, the party proceeded, under the guidance of the Town Surveyor, to inspect St. George's Hall, which was specially thrown open and lighted up for the inspection of the party, the intention having been not only to show the visitors a monument of which Liverpool is so justly proud, as to indicate its resemblance to some of the works of ancient Rome. The building was seen to great advantage. At the conclusion of its inspection the thanks of the party were rendered to the City Surveyor by Mr. Arthur Cates, F.S.A.

The party then adjourned, to re-assemble at a public dinner, which was partaken of at the Adelphi Hotel, under the presidency of Sir J. A. Picton.

On Tuesday, the 16th, the party proceeded to inspect the remains of the old Priory of Birkenhead, where, on assembling in the ancient Chapter-house, a paper was read by Mr. Charles Aldridge, F.R.I.B.A. The building was founded by Hamon de Massey in 1150 for sixteen Benedictine monks, and the lecturer showed that although the establishment was at first in some way considered as an offshoot from the great Abbey of St. Werburgh, at Chester, yet it was independent of the parent house. A plan was produced showing a curious resemblance between the disposition of the buildings at the two monasteries, both having the domestic portions north of the church. At Birkenhead the remains consist of the Chapter-house and the Scriptorium over it. This building is roofed in and is in fairly good condition. The remains of the abbot's house on the west side of where the cloisters have been, and the refectory on the north side, complete the bulk of the ruins, although portions of the north side of the church may be traced. The entrance to the Chapter-house and its vaulted ceiling are of Norman date, of very plain and early description, which are fully thirty years earlier in date than the period so usually assigned for the foundation. These portions indicate that they had been erected at the earlier period, and only devoted to the use of the community at the date named in the documents, which seem to be well attested. Other portions of the ruins are of early fourteenth-century work, and there are many insertions of later date. The broken walls form a singular group of ivy-clad ruins hemmed in with small modern houses, close to the present church of Birkenhead. Reference was made to the ferry to Liverpool owned by the monks, which is continued with all the appliances of modern times down to our own days; and passing mention was made to the discovery about forty years ago of an oak-framed bridge completely buried beneath the modern level. The lecturer supposed this to have been the work of the monks. Since, however, it was found completely silted up and buried beneath alluvial soil, it points clearly to a period when the level of the land was higher than at present. The subsidence has to be taken in relation to the submerged forest on the Meols shore many miles off, which points to a similar sinking. The discovery, which deserves more attention than was bestowed upon it at the time, has considerable interest in relation to the former condition of the district, and a Roman origin, which was claimed for it at the time, is none too remote a date to assign to its formation.

The party then proceeded by carriage to Bidston Hall, one of the homes of the Stanley family, a moderate-sized stone-built house, having a long, low front with apparently a poor modern roof, the only marks of antiquity being the walls, the mullioned windows, a projecting oriel, and a plain entrance door, the building having a gloomy look from the entrance court,

and also the garden in the rear being enclosed with low walls. Sir Jas. A. Picton described the connexion of the Stanleys with the building, and pointed out the most salient of its features, also the peculiar manner in which the stone floors are decorated with patterns by the present occupiers whenever they are washed. The church, dedicated to St. Oswald, of which only a very elegant but simple tower remains, was described by Mr. E. P. Loftus Brock, F.S.A.

Passing by the Meols shore and its submerged forest, close to the supposed site of a Roman settlement, a halt was made at West Kirby Church, where the Rev. Canon Eaton received the party. The church, dedicated to St. Bridget, is a conspicuous object of no little interest. In its restoration several stones with incised patterns of Saxon date were found.

Progress was then made along the banks of the Dee, whence a beautiful view was obtained of the Irish Channel and the Welsh mountains of Flintshire. At Thurston Hall, Sir David and Lady Radcliffe welcomed the party, and luncheon was partaken of in a large marquee. The ancient hall was then examined, and many curious features of the building pointed out. The old fabric stands beside a beautiful new parish church, recently completed by Mr. Pearson, which was thrown open for the inspection of the party. The huge mass of red sandstone on Thurston Common, was then visited, and here Sir Jas. Picton read a paper, pointing out that the stone was most probably called after Thor.

Rapid progress was then made to Woodchurch, where the well-kept church was inspected, and, by invitation of the Rev. Canon Robin, tea was partaken of. A visit to the quaint old half-timbered hall at Irby had to be abandoned for want of time. This was much regretted, since the building is said to be greatly decayed, and its partial renovation is contemplated.

Tuesday's proceedings were brought to a close by a meeting in the Walker Art Gallery, when the following papers were read:—"The Continuity of Christianity in Wirral from Roman Times," by the Rev. A. E. P. Gray, M.A., F.S.A.; "Relations of Wales and Cornwall in the Fifth, Sixth, and Seventh Centuries," by the Rev. W. S. Lach-Szirma; and "Considerations on the Plan of the Walls of Chester," by Mr. Loftus Brock.

On Wednesday, the 17th, the party proceeded by carriages to inspect various antiquities in the southern and eastern suburbs of Liverpool, the first halt being made at the celebrated prehistoric circle of stones called Calder Stones. Instead of their being found on some open moor or other site which may seem to be fitting to such early remains, they are, in fact, surrounded by a dwarf wall and a circle of iron railings, at the junction of three well-frequented roads, close to modern houses. An inscription indicates that they were enclosed in 1845, and, although their appearance through the iron railings is not good, yet we may be thankful that the enclosure has prevented the stones from being entirely covered over with initials and other marks of popular interest. Entering through an iron gate into the small circular enclosure, the party listened to an able address by the President, who called attention to the curious cup and ring marks which occur on almost every one of the group of stones. These are not yet obliterated. The name Calder he considered to be derived from the Saxon, Calder, meaning witchcraft or magic; and nothing could be more likely than that the little circle of stones would have been regarded with superstitious feelings by the Saxon invaders. Entering upon the wider inquiry as to the age of the stones, he referred to the large extent of the earth over which stones similarly marked have been found, and could only say that he believed their erection to be the work of some Taranian tribe at a very remote period. In the discussion which ensued, Mr. de Gray Birch, F.S.A., suggested that the markings on the stones might probably have been rude maps of some ancient settlement. Prior to the enclosure the stones had been covered by a sand hillock now removed, and the sepulchral nature of the circle was shown by the discovery of several urns filled with burned bones, which were scattered by the workmen.

A short visit was paid to Messrs. Paley & Austin's fine new church at Mossley Hill, some of the principal features of which were pointed out by Mr. Paley. A visit was then paid to the

antiful old timber mansion, Speke Hall, which was thrown entirely open to the inspection of a party by special invitation of Miss Watt, who welcomed the party in the old banqueting hall, and whose refreshment was laid out. Sir James Picton read a brief description of the all, and pointed out the fine panelling brought from Holyrood Palace by Sir William Norris, who was killed in 1547. A moat surrounds the mansion, the only relic of a still more ancient building which once occupied the site. Entrance obtained by a stone bridge, 20 yards long, the work of E. N., as is recorded by the well-known Latin inscription on the entrance. The plan is a parallelogram of half-timber buildings surrounding an inner quadrangle, in which are two ancient yew-trees of large size. The drawing-room has a ceiling of elaborately modelled plaster decoration in panels, while the beams dividing it into squares are covered with foliage decoration laid on; the walls are panelled with dark oak, and here is a quaint old fireplace covered with carving, representing a whole generation of over twenty children of the Norris family. The house is filled with old panelling, carving, old bedsteads, chairs, tapestry, and suchlike. The party lingered around this beautiful mansion, in which there is nothing of modern date, and which is seldom shown to the public, and left it with not a little regret. The position of the building is admirably chosen, and it presents a charming picture with its background of pretty old gardens and trees.

A passing visit was then paid to the "Hutten," by which name the residence of the Ireland family is now known. It consists of an entrance gateway of brick, approached by a stone bridge over a moat. The work is of Elizabethan date, and it has a coved cornice of half-timber work. It led to the ancient Hall, which is now demolished, but the whole site is enclosed by the moat. The entrance door into the ancient Hall remains as a ruin, a good example of fourteenth-century work, while near it are the remains of a chimney-piece of Elizabethan date, and a good window.

Childwall Church was next inspected,—a large building with a tower and spire, but which has been almost entirely modernised in the style of the last century. There remains within it an old arcade on the south side of the nave, of poor work, and two brasses of the Norris family now scrowed to some panelling in the south aisle, the brasses having been removed from the Norris monument on the demolition of the latter, apparently about 1760.

After leaving the church, the party proceeded to Sandy Knowe, Wavertree, the residence of the President, on his invitation, and here an elegant luncheon was partaken of. The weather being very wet, an intended inspection of the site of Edward the Confessor's castle at Croxteth, still called Castle Field, had to be given up.

We will continue our report of the proceedings next week.

**Sheffield Society of Architects and Surveyors.**—A general meeting was held at the Sheffield School of Art, on Tuesday, the 16th inst., to receive the report of the provisional committee appointed at the preliminary meeting in May last. Mr. T. J. Flocton presided, and Mr. J. B. Mitchell-Withers, Mr. F. Fowler, Mr. C. J. Innocent, Mr. G. W. Wilson, Mr. R. Davidson (Borough Surveyor), Mr. W. C. Fenton, Mr. W. E. Hemsell, and a large number of the members of the profession, the meeting being of a thoroughly representative character. The rules, which have been modelled on those of the Manchester and other societies, were carefully discussed and finally adopted, and it was decided that the society should be styled "The Sheffield Society of Architects and Surveyors," and that a special meeting should be called in a fortnight's time for the election of officers, &c.

**Sale of Property.**—On Wednesday last the Lincolnshire estates of the late Rev. Lord Saye and Sele were put up for sale by auction at Spalding. The property, divided into 100 lots, comprises twenty-three farms, of from 40 acres to 200 acres a piece, covering an aggregate of 2,780 acres, all title-free, and yielding an annual rental of nearly 5,200l. In the result only 808 acres were purchased, for 30,273l., being at an average of less than 40s. an acre, including the buildings.

**ST. MARY'S CHURCH, HOLME-NEXT-SEA.**

SIR,—As architect for the restoration of the above church I am desirous of ascertaining through the medium of your paper if any of the posterity of the Stone family are living in England. It may interest them to know that in excavating a few days ago for the foundations of the new seating, a large flag-stone, 6 in. in thickness, was found at the south-east corner of the nave with the following inscription roughly carved thereon:—

"Richard Stone and Clemens his Wife."

In the chancel is a richly-carved monument of alabaster and marble with husband, wife, and thirteen children kneeling, with the following quaint inscription on a tablet beneath:—

"Here under lyeth Richard Stone and Clemens his Wife who lived in Wedlocke joyfully together for 61 years and three months; of them proceeded 7 sones and 6 daughters, and from those and theirs raised 72 children which gave to the sayd Richard Stone and Clemens great comforte. Richard Stone died the 5th of October 1677 aged 87 years and Clemens died 10th day of November aged years."

King's Lynn. Wm. Adams, Architect.

**WOLLATON HALL.**

SIR,—So far as I can judge from the references to Smithson (at pp. 165 and 234, ante), there need be no difficulty in reconciling the statement on his tomb with the ascertained fact that John Padua was the architect of this house.

The title "architect" used in the seventeenth century was not equivalent to the modern title of architect. It denoted a master builder,—one who, by contract or on other terms, would carry out building operations; a constructor, or, as we now say, a "builder." He might be capable of designing and executing an ordinary structure, but his business was building, and not designing. John Abell, a clever and substantial Herefordshire village carpenter, who died probably in 1674, had an epitaph beginning,—

"This craggy stone a covering is for an architect's bed"; but the stone has been recent, and the word changed to "architect's," in disregard of metre, and Abell, like Smithson, is credited with works which he never thought of claiming.

I do not know what evidence Lady Middleton may have collected, but I suggest that it is improbable that Smithson's epitaph,—set up before the eyes of those who would best know the facts,—would state anything but the truth. It means to state that he built Wollaton or some considerable portion of it, perhaps only the masons' work, which was probably the most important part. He might well be "surveyor" over the other work, or standing surveyor of the whole house when it was completed. John of Padua would furnish the original design. The difference which appears to exist between the main façades and the rest of the work rather suggests that the builder had to finish the work without his assistance.

THOS. BLASHILL.

**MASONS' MARKS.**

SIR,—Allow me to add a few words to Sir Robert Rawlinson's letter [p. 252, ante] in further explanation.

In Medieval work you will find these marks out on the face of the stone; in all modern work they are cut on the top bed, and this was no doubt introduced into this country with Classic architecture, requiring a finer finish to the face.

It must be remembered that the art of writing was not generally acquired, and that in early days operative masons, as well as the classes above them, signed their name with a cross.

In order that the foreman should be able to detect the worker of a stone, and to save disputes as to a stone being worked wrong, it was, and is still, the custom for each mason to adopt a particular mark. In early work these can be seen on the face, but now they serve a double purpose: they are the signature of the mason to his work, and an instruction to the setter as to the part of the stone that is upwards in the building.

ROBERT PHILLIPS, Clerk of County Works for Gloucestershire.

**ASPHALTE AND CONCRETE PAVEMENTS.**

SIR,—If the letter which appeared in your last issue [p. 253] emanated from a slab-pavement manufacturer, I would not have troubled to notice it; but as it is signed by a C.E., I would ask you to allow me space for a few remarks on the assertions of this cautious critic.

1. When asphaltic paths become worn they can be most readily repaired, and with less inconvenience

to the public than either stone or slab pavements; an ordinary gang of workmen will lay upwards of 300 super. yards per day, and the path can be thrown open to the public within three hours after the asphalt is laid.

2. All paths will become sloppy "in wet weather, when worn below the kerb level," but asphalt pavements, having no joints for dirt to accumulate in or work through, are undoubtedly the cleanest.

3. A reliable analysis of the asphalt used is most important, as spurious asphalt is, unfortunately, often met with. Within the last fifteen years numerous asphalt was laid in the City of London; of all these, the asphalt of three companies only now survives. Mr. Strachan's paper dealt with facts relating to two of these successful companies, and would, no doubt, have included the third city company,—which also supplies asphalt of excellent quality for paving,—had information from an independent and reliable source been available. In every case Mr. Strachan gives the situation of the particular pavements referred to in his paper, so that the interested or sceptical may satisfy themselves by personal observation.

4. The life of an asphalt footway pavement, composed of 1 in. of best compressed asphalt on 3 in. of Portland cement concrete, may be fairly taken at from twenty to thirty years for the asphaltic surface with ordinary traffic. The Local Government Board sanctioned the borrowing of money by local authorities for such pavement for a period of twenty years. Mr. A. M. Hiscocks suggests that the analyses and geological quotations might have been left out of Mr. Strachan's paper "to make room for statistics of traffic actually sustained by the various kinds of pavements in a number of streets, and the effect of the traffic upon them, together with a few simple calculations as to the approximate cost of each material per million or hundred million of persons passing over them." To obtain such information in a reliable manner is not so easy as Mr. Hiscocks imagines. A few years ago I had traffic returns taken for another purpose. The traffic varies in each street daily and hourly, and is much influenced by converging streets, character of the surrounding state of weather, and numerous other circumstances; and in many streets the traffic on one side is often three or four times that of the opposite side. How, then, are reliable comparisons to be made?

5. With regard to the noise (especially at night) of traffic on concrete slab pavements, I can testify to this nuisance, as I reside in a street so paved; and I have received numerous complaints from residents on the same subject.

T. DE COURCY MEADE, Engineer and Surveyor to the Hornsey Local Board.

**WHAT ARE FIREPROOF MATERIALS?**

SIR,—A fire which occurred in Colchester in 1878 burnt three houses to the ground in High-street. The houses were divided from each other by 9-in. brick walls, which were demolished.

They were divided from the two outer adjoining houses by old oak partitions pugged with thatch and clay, which effectually stopped the fire.

The houses destroyed had fir joists and deal floor boards and joinery.

No material commonly considered fireproof can resist a flame feeding on fir and deal.

Iron will conduct the heat; stone will fly to pieces; and brick crumble to dust.

While the forests of Canada and Scandinavia are becoming exhausted, some districts in England are becoming overgrown with oak and elm for want of a market. The trees are left to rot internally and become harbours for wasps and other vermin.

Elm floors would be far safer than deal, and not more expensive. Try and light a fire with elm, oak, ash, or other English wood when you want an early breakfast to enable you to catch a train!

We have had plenty of foreign competition against home labour. Let us try a little home competition against foreigners.

W. SCARGILL.

**A SURVEYOR'S APPOINTMENT.**

SIR,—While on a visit to Derbyshire a few days since, my notice was called to a recent appointment of a local surveyor. If you could give it publicity, I think you would be serving the interests of qualified men, as your journal has always been willing to do.

The Local Board of a rapidly-growing town near Chesterfield lately required the services of a surveyor and inspector of nuisances, to fulfil the ordinary duties of a surveyor and manage the sewage farm.

There were three applicants selected from among the candidates for the post: one, an architect in practice in the adjoining town; another, a gentleman connected with building and surveying for more than twenty years; and the third a farmer.

The first two had long and varied experience, but were put aside by the Board (the vice-chairman is a C.E.), and the farmer elected!

To test the candidate's knowledge before election, the Board asked him a few questions, among them the following:—

The Board.—"How would you make the joints to an earthenware drain?"

\* Dates gone.

The farmer replied, "He did not know. How would a land joint do?"

When asked, "What fall he would give drains generally?" he replied, "As much as he could."

The appointment was, however, made, and the Local Government Board have confirmed the same. It is to such a person that the architects in the district have now to submit plans whenever they build within his jurisdiction.

F. T. W. GOLDSMITH, A.R.I.B.A.

### The Student's Column.

#### LAND SURVEYING AND LEVELLING.

##### VIII.—FIELD-BOOK.

THE field-book of a survey should contain upon its first page an index to the base-lines, not necessarily drawn to scale, but sketched so as to indicate the relative position of the main base-lines, and the direc-

tion in which they are chained. Thus the index sketch of the base-lines used in plotting from chain measurements only, the plan shown on page 154 (*Builder*, July 23), is represented in the accompanying diagram. The base-lines are numbered, and an arrow upon each line shows the direction in which they were measured. There is no occasion to chain a base-line twice in order to prove its accuracy. The tie-line is the best proof of correct measure-

ent, and is founded upon a proposition of solid (Book I., Prop. 7), that upon the same, and upon the same side of it, there can be two different triangles, having their sides terminating at the same extremity of the base, and to one another. Thus the line marked 7 in the diagram, proceeding from a point in the line A B to the intersection of lines marked 3 and 6, forms a tie to the triangle formed by the lines marked 1, 3 and 6 respectively. The main terminal stations are lettered in the field-book, but not the intermediate stations, herwise in an extensive survey the alphabet could soon be exhausted. A peg is driven into the ground at each station, and the chain is always started from the peg, which denotes the station. Thus, in line 2 from station B to station A the zero of the chain is placed at B when joining the line BC. The position of the line, twenty links back, can be most accurately determined by measuring this distance in the direction of the line BC, but this is done with a tape or with the chain, before measuring line 2. The total length of line 1 at station B is 352 links from station A. This is written in the field-book sideways, as shown, to distinguish it from the other chain measurements. The line is then continued on, to meet the fence at 15 links. In line 2 the measurement is continued on in a similar manner to meet the fence at 176 links.

The Surveyor should endeavour to have as many pegs as possible near each other in the details of a survey, a station on which several lines radiate being more correctly determined than where several angles commence or terminate close to one another in a base-line. The exact distance of an intermediate station from the commencement of the base-line may be best distinguished by enclosing the length entered in the field-book in a oval or oblong, and placing a circle with a dot in the centre upon the side, right or left, in which the branch line is to be chained. This is done in the case of line 7, which is measured on 170, in the line 1, to the right hand of A B. The most usual form of field-book is that dictated in our diagram as pages 1, 2, and 3, with two central lines, generally ruled in blue, on each page. As a rule it is not necessary to page a field-book. The leaves of the book could be regarded as forming a continuous roll, divided into pages, for convenience of binding. The surveyor commences his entries at the bottom of a page, and works upwards as he proceeds along the base-line. Thus the bottom page 3 follows immediately the top of page 2. To render the central column of the field-book intelligible, we will assume that a draughtsman could have no difficulty in getting the irregular fence-line which crosses the line marked M M, if perpendicular measurements are given, as shown, at distances say 1 links apart along the line M M. If this right angle line, M M, be supposed to be widened into a column, N N, sufficiently broad to write in the measurements taken along the line M M, and the offsets varying from 7 links to the right of 60, up to 29 links to the left of 210, be repeated, we have practically in the form N N a field-book, as indicated by page 2 in the diagram. It will be observed that the vertical offsets for the offsets, measured from the line M M, or the column N N, are omitted in the field-book, and the distances only are figured, against the line indicating the fence. As the central column is simply provided for the convenience of easily recording the chain measurements taken along the base-lines, and therefore practically indicates a single line, the fence line at 50, 90, and 290 links respectively, where it crosses the base-line A B, should not be drawn across the column, but should be sketched, as shown, on each side of the column, and the measurement at the intersection upon the chain stated in links by figures within the column.

**Metropolitan Board of Works.**—The Board have adopted a report of their Works Committee to the effect that Ravenscourt Park, ammersmith, has been purchased for 58,000*l.*, bis estate covers 32 acres. By a unanimous vote the solicitor has been instructed to furnish return which shall set forth (1) particulars of all plots of land sold by the board to members of officers of the board during the last ten years; (2) particulars of all land leased to members or officers, with the annual rent and premium, if any, during the like period; and (3) the like information of all land transferred to members or officers by the Board's lessees.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

11,502, Improvements in Closets. G. H., and S. Jennings.  
This invention relates to a further improvement upon closets previously manufactured by the patentees. A valve is specially applied, and the flushing arrangement is managed under better control. Thus, the handle has fixed to it the ends of two rods, one on each side of the valve rods, and their other ends are fixed to a ring sliding outside the tube in which the ring valve-rod works. When the handle is drawn up, the afore-mentioned ring comes against and raises a weighted forked lever, which opens the water supply. When the handle is put down again, the weighted lever is not forced down, but gradually descends by its own weight, so that the water supply is not immediately cut off, but the flow continues sufficiently long to fill the pan.

12,099, Ventilators. E. J. Gillis.  
The ventilator, which is the subject of this patent, consists of perforated zinc and tinted glass, and is fastened to the upper part of the outside lining of the window-frame, and does not interfere with the sashes in any way. Ventilation can be regulated as required or shut off completely. When ventilation is required, the upper sash of the window is to be lowered to within half an inch of bottom of ventilator, thus admitting fresh air in between the sashes, and allowing foul air to escape.

14,837, Skylight or Fanlight Opener. H. K. Bromhead.  
This contrivance consists of an endless cord working over a flanged wheel in such a way as to turn the wheel in either direction. This wheel is fixed upon a rod which forms a screw on one side of the wheel. This screw works in a screwed boss or nut, placed on an arm or stay fixed to the sash. On the other side of the wheel is a swivel or cup-and-ball joint attached to the rod on which the wheel is fixed. The action of the endless cord in rotating the wheel revolves the screw, and thus moves the screw boss backwards or forwards.

479, Improved Sink and Gully. John Shaw.  
The grate, with a hell under it, is hinged, and falls over the trap, which is so formed that it may easily be taken out and cleaned if required.  
797, Roofing Tiles and Slates. M. Hussey and W. Clark.  
According to this invention, each tile is formed square or of other suitable shape in plan, but has two of its four corners cut off, the tiles or slates being formed with flanges or not according to the purpose for which they are required.

6,493, Metallic Roofing. L. L. Sagendorph.  
The object of this invention is the same as mentioned in the previous specification, but applicable to metallic roofing such as is common in America, from whence the patent is communicated. Lips and ridges are arranged for fastening, and the ends of the shingles are cut away to give a more ornamental appearance.

7,644, Paving and Flooring. F. Wicks.  
This invention consists in the manufacture of blocks or slabs by means of a combination of natural or artificial stone, slag, or other building material with a metal or mineral so that the stones may be embedded to a sufficient depth within the bed of metal or mineral which, on cooling, holds the parts rigidly together, and, combined with the embedded materials, form compound blocks of unequal qualities or degrees of hardness in the working or wearing surfaces.

NEW APPLICATIONS FOR PATENTS.

Aug. 5.—10,762, W. Lewis, Construction of Fire Clay, Terra Cotta, or Fire-brick Domestic Fire-places.—10,779, E. de Pass, Imitating by Casting White and Coloured Marble.  
Aug. 6.—10,813, J. Gowland, Chimney Tops, Ventilator, or Cowl.—10,830, J. Docton, Combined Hot and Cold Water Waste and Overflow Lead Fittings for Baths.  
Aug. 8.—10,857, W. Holland, Valve for Discharging the Contents of Water-closets, Cisterns, &c.—10,858, J. Gill, Brick-pressing Machinery, &c.—10,881, B. Warwick, Producing Mosaic and Inlaid Work in Wood.—10,895, J. Anderson, Stays and Fasteners for Hinged Window-sashes, Casements, or Doors.—10,925, A. von Puch-Bürgel, Water-closets, Privies, &c.  
Aug. 10.—10,944, N. Kimberley, Bolts, Latches, and Locks.—10,950, J. Bean and W. Gaines, Closing Doors and Preventing the Slamming of same.—10,960, W. Akerman, Roofing Tiles.  
Aug. 11.—10,996, P. Henson, Bolts for Doors, Casements, &c.—10,998, J. Pullan and Others, Brick-pressing Machinery.

PROVISIONAL SPECIFICATIONS ACCEPTED.

8,786, J. Watson, Wood Graining Apparatus.—9,548, E. Hughes, Chimney and Ventilating Shafts.—9,887, J. Rust, Material for Colouring Paints, Cement, &c.—7,351, J. Dudley and J. Hamilton, Concrete and Artificial Stone Mantel-pieces.—7,517, T. Tyzack, Saws.—10,312, R. and R. Hughes.—Gas and other Hangings.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to Opposition for Two Months.  
12,764, W. H. H. Harris, Trap for Waste-water Outlets.

**\* SPECIAL NOTICE.**—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.O., not later than 12 Noon on THURSDAYS.

**TO CORRESPONDENTS.**

Registered Telegraphic Address, "THE BUILDER, LONDON."

"Aquarius" (our correspondent presumably knows the ordinary formulae for calculating the velocity over a weir's crest. In the case illustrated by him each velocity may be taken as the velocity acquired before the water descends the slope, and be reckoned as velocity of approach. The actual velocity at any given point on the slope will be that due to the perpendicular height of such point below the level of the surface of water on the crest. The depth or thickness of the film passing over that point will be found by dividing the volume over any unit of length by the velocity.—W. A. L. Bros. & Co., "The Paris Market," Jersey market; Derby market-hall; Bradford market; Leeds market; Southfield; the present and proposed Huddersfield market; new market about to be erected at Gashill; these are some of the principal ones of the class you inquire about.—L. V. H. (hardly to be mistaken for N. and N.—R. W. F. (drawings received).—B. & E.—A. J. H.—T. C. W.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications. Letters or communications (especially news-items) which have been duplicated for other journals, are NOT DESIRED.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

### "Walks in Rome."

HE extraordinary popularity of this book,\* which has now reached its twelfth edition, must clearly be due to its supplying a real want, commonly felt by the general mass of English-speaking visitors to Rome, most of whom are neither learned in classical archaeology nor very familiar with the history of Medieval art.

For this purpose the general scheme of the book is a very good one; the grouping of the places described into a series of walks about Rome has many conveniences, and it is always pleasant and sometimes instructive to read the numerous extracts which are so copiously inserted from English, French, and American writers on the very site to which the quoted passage refers. Moreover, Mr. Hare has considerable literary facility and the gift of putting things in a pleasant and readable way, valuable qualities in a book meant for popular use.

Other qualifications are, however, necessary in the author of a work on Ancient and Medieval Rome. Some classical scholarship and some real acquaintance with the science of archaeology are absolutely essential, and in these qualifications Mr. Hare appears to be almost wholly deficient.

The result is that nearly every page is marred by some inaccuracy or blunder, very frequently of the most serious kind, both in the descriptions of the existing remains, and also in the accounts of the accepted theories relating to the attribution and history of the various buildings. It would be a weary and hankless task to make out a complete list of Mr. Hare's mis-statements; a few examples may suffice to show that our accusation is not made without some just ground. At p. 124 of vol. i. we read that the great flight of steps leading up to the Church of Ara Cœli marks "the site of the famous staircase to the temple of Jupiter Capitolinus." Now, putting aside the fact that recent discoveries on the other peak of the Capitoline Hill have made it almost, if not quite, certain that the Church of Ara Cœli stands on the ancient Arx, and not on the site of the great Tuscan temple of Jupiter, we know that till the fourteenth century there was no access whatever to the Capitolium from the side of the Campus

Martius; the steep ascents, both to the temple of Juno Moneta and to that of Capitoline Jupiter, being alike on the side of the Forum Romanum. In ancient times an inaccessible cliff, strengthened by a fortification wall, formed a complete defence on the western side,—that by which the Capitolium is now most easily approached.

In describing the so-called Tabularium, which occupies the Forum side of the Capitoline Hill, Mr. Hare writes,—“This is one of the earliest architectural relics in Rome. It is built in the Etruscan style, of huge blocks of tufa or peperino.” The fact is that both the documentary history of the building and the character of its masonry show that it is not older than the early part of the first century B.C. In what may be called “the Etruscan style” blocks of much greater size, and of very varying dimensions, are used; while in the Tabularium (so-called) the blocks are all accurately worked to the same sizes, 4 ft. by 2 ft. by 2 ft., so that the courses of “headers” and “stretchers” work in with absolute regularity in the fashion of a modern well-built brick wall in “English bond,”—a method of building which certainly was not developed to this extreme pitch of accuracy till the latter years of the Republican period.

The long staircase leading down through the Tabularium to the Forum level, of which Mr. Hare says (i., 130) that “traces exist,” is, on the contrary, the best-preserved portion of the building; all its sixty-four steps are as sharp and perfect as when they were built, mainly owing to the disuse of this approach caused by Domitian, who built the existing Temple of Vespasian close up against the Tabularium in such a way that the cells of the temple completely blocked up the only lower access to the staircase.

The celebrated inscriptions known as the Fasti Consulares were discovered, not near any temple of Minerva Chalcidica (as we are told, i., 147), but near the Temple of Vesta. This is an important point, as Mr. F. M. Nichols has recently shown in an interesting paper (printed in *Archæologia*, vol. 50, part i.) that there are many reasons for believing that these consular lists were engraved on the marble walls of a chamber in the Regia, the official residence of the Pontifex Maximus, remains of which have recently been exposed close by the Temple of Vesta.

With regard to the Forum of Julius Cæsar, (i., 180), Mr. Hare writes:—“The only visible remains of this Forum are some courses of high square blocks of stone (*Lapis Gabinus*) in a dirty court.” A careful examination of the remains will show that much more than this really exists. There is a series of arched openings, behind each of which is a vaulted

chamber, still well preserved, though partly buried below the modern ground level. The construction of these arches is of special interest as an example of the skilful Roman use of different materials. The head of each opening is formed by a very carefully-jointed flat arch, made of brown tufa, not *Lapis Gabinus*, except the springers and key-stones, which are of the harder cream-white travertine. Over each flat arch is a semicircular relieving arch with tufa voussoirs. The vaults of the chambers are of concrete, made of pozzolana, lime, and fragments of tufa. These chambers, which once probably surrounded the whole Forum Julium, appear to have been offices for lawyers' clerks and other officials connected with the business of the place.

There is no authority for the author's statement (i., 186) that distances within the walls of Rome were inscribed upon the *Umbilicus Rome*, which stood close to the Arch of Severus, on what has been conjecturally called the *Græcostasis*. Except a bare mention in the *Regionary catalogues*, little or nothing is known about the *Umbilicus*. Judging from its name and the conical shape of the existing remains, it was probably a sort of copy of the celebrated *Omphalos* at Delphi, which was supposed to mark the centre of the world. The form of the *Omphalos*, which is represented on various Greek vases and coins, especially on the electrum staters of Cyzicus and silver tetradrachms of the Seleucidae, seems to have been very similar to the brick and concrete cone in the Forum Romanum, from which all the once rich marble linings have been stripped off. The account of the adjoining *Rostra*, together with a good deal more of the newly-inserted paragraphs about recent discoveries, is taken, without any acknowledgment whatever, from Middleton's “Ancient Rome in 1885,” but with his usual inaccuracy Mr. Hare has introduced blunders of his own among the borrowed information.

At i., 202, we are told that “the front of the Church of S. Adriano is a fragment of the basilica of *Æmilius Paulus*”; the real site of this basilica was to the east of the church, and its remains, if any exist, are hidden 20 ft. below the present level, under a row of modern houses. The *Comendatore Lanciani* has pointed out, in his able monograph on the history of the Curia or Senate House, that it is this building, as reconstructed in the reign of Diocletian, which still partly exists as the Church of St. Adriano.

At i., 230-31, Mr. Hare appears to think that the upper story of the Colosseum was built by Titus; whereas, the Flavian work really ends with the third tier of open arches; the remainder was very carelessly built in the

\* Walks in Rome. By Augustus J. C. Hare. Twelfth edition, revised. London: Smith, Elder, & Co.

time of Severus Alexander and Gordianus III., after a fire caused by lightning, which burnt the upper galleries, which at that time were of wood. The difference of workmanship between the masonry of the Flavian period, c. 80 A.D., and that of the third century, is very striking, the later part being mostly composed of drums of columns, pieces of entablature, and other fragments taken from older buildings, and very clumsily fitted together.

A more serious blunder is contained in the statement (at i., 206) that the Basilica of Constantine occupies the site of the Temple of Peace.

This magnificent temple, one of the most splendid in Rome, formed the central object in Vespasian's Forum Pacis; part of its precinct wall still exists, built of massive blocks of peperino, with a doorway formed in travertine under a neatly-jointed flat arch. The basilica of Constantine stands quite clear of the Forum of Peace; and, indeed, the Templum Pacis had been rebuilt by Severus after the fire in the reign of Commodus, and was still standing when Maximian and Constantine built the great basilica. The real site of the Temple was near the Church of S. Cosmo e Damiano, on the side away from the basilica.

One passage (i., 308) is so very funny that we must quote the whole of it. It appears not to be intended for a joke. Describing the Flavian Palace on the Palatine, Mr. Hare writes:—"Beyond the triclinium is a disgusting memorial of Roman Imperial life, in the *Vomitorium*, with indications of its basin, whither the feasters retired to tickle their throats with feathers, and come back with renewed appetite to the banquet." This novel meaning applied to the common Latin word *vomitorium* is the more startling, as at i., 231, Mr. Hare uses it in its right meaning as a passage for the exit of a crowd. It need hardly be said that the indications of such a basin exist only in Mr. Hare's imagination, or were perhaps derived from the fertile invention of some *valet de place*. The house buried under the peristyle of the Flavian Palace is not, as Mr. Hare states at i., 306, any part of the Palace of Augustus, which really stood quite clear of Domitian's Palace on the S.E. Any of the more recently published plans of the Palatine will show this.

The author does not often commit himself to a translation of the Latin which he quotes, but it may be noted that *schola* does not mean school in such a connexion as *Schola Xanthi* (see i., 256), or *Schola Græca*, and that the word *pseudo-peripteral* (i., 259) does not mean "one side being enclosed in other buildings."

A better Latin scholar would know that Varro is not an authority with regard to the etymology of Roman names, and would not have seriously quoted the derivation of Esquiline (Hill) from "*æscultus*, because of the ornamental groves which were planted by Servius Tullius." It is really derived from *es-quit-ia*, "the dwellers outside," the root "*quit*" occurring in *in-quit-inus*, "dwellers within." Varro's other derivations, such as *velabrum* from *vehere*, to carry, because people were ferried across its pools, are equally fanciful and groundless, as was nearly all the etymology of two thousand years ago, and yet this is the authority which is usually given throughout the book.

Mr. Hare's knowledge of Mediæval art and archaeology is little if any more complete than his acquaintance with the Classical period. He gives (ii., 218) the year 1370 as the date of the unique "Pointed" Church of S. Maria sopra Minerva; the fact being that it was built in 1280-90 by the same Dominican architect-monks who designed another grand church for their order,—that of S. Maria Novella at Florence. The lovely cloisters of S. Paolo fuori le Mura, designed by one of the Cosmati in about the year 1285, is called by Mr. Hare (ii., 425) a work of the twelfth century, in spite of its obvious connexion both in date and design with the Lateran cloisters, which he rightly refers to the thirteenth century.

Another misstatement at ii., 427 (note), is more excusable, as it has been previously made by many writers on Mediæval art:—

"Among the most interesting of the objects lost in the fire [that which destroyed the nave of S. Paolo fuori le Mura in 1823] were the bronze gates ordered by Hildebrand (afterwards Gregory VII., when legate at Constantinople, for Pantaleone Castelli, in 1070, and adorned with fifty-four Scriptural compositions, wrought in silver thread." These very valuable relics of the eleventh century were happily preserved from the flames, and are now kept in a large wooden case in the sacristy of S. Paolo, where they are very seldom seen by visitors, as a special permission from the ecclesiastical authorities is required in order to get the case unlocked. Mr. Hare's "silver thread" really is a fine variety of niello, with broadly-drawn silver inlay.

One great fault in the sections of this work devoted to Mediæval art is the utter want of selection in describing pictures and sculpture. Long lists of quite worthless paintings are given, and really notable works of art are often passed over without notice. Thus, in the account of S. Maria Maggiore, a good deal of space is devoted to the costly rubbish in the Capella Borghese, and nothing is said about the magnificent reliefs by the great Florentine sculptor, Mino da Fiesole, which are now built in to the walls of the apse, inside the church, under the windows. These reliefs, together with a number of others,—one signed by Mino,—now in the sacristy, once formed part of a magnificent reredos behind the high altar, which in the seventeenth century was broken up and its reliefs dispersed; when perfect it must have been the largest and most elaborate of all this sculptor's works. Another of Mino's finest works is also passed over in silence, namely, the reredos in the N.E. chapel of S. Gregorio on the Coelian. Mr. Hare does casually mention the altar, which belonged to this reredos, and is now moved to the other side of the church, but he says nothing as to its authorship.

The account of another beautiful work of the Florentine is strangely blundered. At i., 38, note 2, we read:—"The beautiful fifteenth-century altar of four virgin saints at S. Cosimato in Trastevere is said to have been brought from this chapel," i.e., that of Card. Cibo, in the Church of S. Maria del Popolo. This so-called "altar" is really the tomb of Cardinal Cibo himself, the altar which now stands under it is quite a modern addition. Several other instances exist in Rome of a fine fifteenth-century tomb having been made into the reredos for a later altar. A notable example is to be seen at the east end of the south aisle of the Church of S. Cecilia.

With regard to the fifteenth-century bronze doors of St. Peter's, Mr. Hare repeats an often-corrected blunder of Vasari. The Simone, who with Filarete modelled and cast this noble piece of bronze-work, was not the brother or any relation whatever to the Florentine Donatello. His real name was Simone di Ghini, and he was also the principal sculptor of the effigy of Pope Martin V., which at ii., 103, is attributed to Filarete.

The truth is that this later part of the work needs as much careful revision and pruning as that which deals with ancient Rome, and the general conclusion that one is led to is that a book which deals with so complex and often difficult a subject requires on the part of its author more knowledge and much more power of patient labour than Mr. Hare possesses.

It is greatly to be regretted that so very successful a work (financially) as this should not possess the solid merit of accuracy; it would obviously be no less pleasant reading, and no less suited to the general public if all its many blunders were carefully sought out and corrected. The so-called "revision" of this last edition appears to have done little or nothing in this direction.

**The Metropolitan Fire Brigade.**—A lecture on "Our Fire Defences" was given before the members of the Balloon Society, on the 19th inst., by Mr. Jenkin Ingram, who, in the course of his address, contended that Captain Shaw's position was too autocratic, and that the brigade should be controlled by a committee with more expert knowledge.

#### BURGES'S "DETAILS OF STONE WORK."

HIS thin folio forms a second volume\* or second series of the illustrations of Burges's architectural designs, of which the companion volume, showing the general designs of buildings, has already been issued under the editorship of Mr. Pullan, and was noticed in the *Builder* for June 23, 1883. Three or four of the same plates, giving general views of buildings, are repeated in this volume, in order to render the meaning of the details more obvious.

Burges's curious and very rough, and even, one may say, ugly drawings, illustrating his studies on the spot of Mediæval masonry and detail, published a good many years ago, will be in the memory of many of our readers, though not many, perhaps, possess a copy, for the edition and its circulation were, if we remember rightly, somewhat limited. The plates, both in their subjects and manner of drawing, were strongly marked by Burges's sturdy and defiant originality, which, indeed, was in this case so defiant that some of his most intimate friends and architectural allies confessed to a difficulty in swallowing the fare put before them. The work now before us,—a much smaller one in page area,—does not partake of the *outré* character of the larger stonework drawings just referred to. It consists, in fact, of general plans and sections of some of Burges's most remarkable designs, executed or unexecuted, accompanied by details of portions, with plans and sections showing the masonry construction. The general sections and elevations are of the most businesslike character, drawn squarely and mechanically in line, with the details merely blocked out in outline for further delineation in larger drawings.

In a short preface the editor, after remarking truly that correct detail no less than good proportion is essential to the perfection of Gothic architecture, claims for Burges that, while extremely accurate in his knowledge of Gothic detail (which no one will question), he had the power of so using his collected materials as to produce originality and correctness without copyism. Among the buildings illustrated in this volume, which include Cork Cathedral and Hartford College, Connecticut (executed), and the School of Art, Bombay, and the Memorial Church for Constantinople (unexecuted), "each was adapted to suit the climate, the site for which it was intended, and the circumstances under which it was designed. In his own house, which was one of his best works, although there are ideas taken from Greek and Assyrian architecture, they are carried out exactly as a thirteenth-century architect would have carried them out had he possessed the enlarged opportunities of observation that we possess in the present day." That is true enough as far as it goes, but there is exactly the rub: Burges did carry out buildings "exactly as a thirteenth-century architect would have carried them out," and Mr. Pullan puts forth this qualification as if it were to satisfy all demands. But why did not Burges endeavour to carry out buildings exactly as a nineteenth-century architect should carry them out? That he had "a great power of assimilation" is quite true; he assimilated the Mediæval spirit more fully, in reality, than either Street or Scott did; and it is also true that he adapted his buildings to their sites and purposes with a considerable amount of variety and originality. But it is the variety and originality of a thirteenth-century architect, not of a nineteenth-century one. And it is for that reason that, as we turn over these pages we seem to be looking back at a chapter of architectural revival of which the page has been already turned. Mr. Pullan notes that there is a great deal of "discordance" in the detail of Gothic architecture as carried out now, an admixture of English, French, German, and Italian details from both ecclesiastical and domestic buildings. If this charge is intended

\* The Architectural Designs of W. Burges, A.R.A. Details of Stonework. Edited by R. P. Pullan, F.S.A., F.R.I.B.A. London: B.T. Batsford, 1887.

against the leading men who have practised the architecture during the revival, we only think it is true; not, at any rate, to the tent which is implied. But it is curious, most pathetic, to read that "this will not be in the future, when increased knowledge and a more extended power of analysis will enable one to distinguish good architecture from inferior"; and so we are offered Burges's simulated Mediæval architecture as an assistance in the right direction. Does not Mr. Pullan perceive any sign that the page is read, and that this particular chapter of architectural revival is pretty nearly closed? We do not question the interest of the publication, however; we only question it having the precise kind of value which the editor attributes to it,—in that it comes too late. Burges's plates are more likely to warn the student of Gothic revival than to spur him in trying it on, for the kind of work they present is so palpably out of touch with the present day. In the first place, the spirit of the architecture is so completely and unconvincingly Mediæval; and the English world is pretty well got over its Mediæval fever. When it is nonsense to say there is not copyism, it is true that in the general scheme of composition and distribution of the materials there is originality. In the design for the Bombay School of Art, for instance, there is a distinct element of Gothic to suit it to a tropical climate. Perforated slabs were, wherever practicable, to be substituted for glass windows. The roofs were to be of low pitch, and raked double, to allow of perfect ventilation, and the eaves were to have great projection, in order in some degree to shade the windows. If this is well, though, after all, it is not more an exercise of ordinary common sense, nor one could have lived in a Gothic building that climate if it had not been modified for its circumstances. But then, we are told, Mr. Burges chose the architecture of the latter part of the twelfth century, which is characterised by broad masses and deep shadows, as that most suitable for an Eastern climate." But why the European style of the twelfth century for an Eastern country? Why, there must be a past style adopted, not take one native to the soil? or, finally, was it not possible, by "power of assimilation," to develop something "characterised by broad masses and deep shadows," without going back to the twelfth century for it? We cannot be surprised that Burges did not attempt to do so, because he lived in the midst of the Gothic movement, and the most original of us can hardly go right against the stream; but we are surprised that Mr. Pullan should not perceive that things have moved since then. However, granting that in this and in the memorial church design there is an adaptation to the site and circumstances which takes each of his designs, as a whole, out of the region of copyism, surely it cannot be denied that the details shown in these pages are full of copyism. They are, for the most part, simply early French Gothic adopted wholesale. And where they are modified, they are not improved. The massive character of this phase of Gothic was, no doubt, peculiarly attractive to Burges's genius, which leaned towards weight and mass in architectural expression; but his desire for these qualities led him to exaggerate his models; and a good deal of the detail shown in these plates, the short, thick, stunted shafts and high capitals and bases, impresses as, though powerful, decidedly wanting in refinement; in some cases even "clumsy" would hardly be too harsh a word to apply to it. The real value of these drawings to the architectural student, old and young, consists, in the first place, in the preference for solidity and massiveness which they show, the absence of anything that is flimsy or at variance with monumental character; but still more in the evidence given, by the detail drawings more especially, of Burges's truly architectural feeling in designing. His way of treating the sections and plans is so distinctly that of a man who was not designing a design, but building a building. Everything in his detail seems thought out with reference to the putting together of the stones, and not as a process of

putting lines on paper. We should not recommend any young student to go to the book to study Gothic detail, or to adopt his style from it, as if that were the same thing as going to original mediæval work, as the editor fondly suggests. But what he is likely to acquire from the study of it is a feeling for massiveness and monumental character in architecture, and a clearer perception of the relation between masonic construction and outward architectural expression. We do not know that all the constructive details are to be recommended as models,—at least, if we take the drawings as intended accurately to show the jointing. The student will learn from them how solid and massive was Burges's manner of putting stones together, and how religiously he carried his string-course stones right through the wall, so as to make them real constructive bond and not mere ornamental facing. The details of Cork Cathedral tower may be studied with particular advantage, and the section through the nave. But we should hope that Burges did not really mean the window-label stones in the drawings for Brisbane Cathedral, for instance (plate 12), to be shaped as shown on the section (see A in figure). If the stone was really intended to be cut that way, it is not only a great waste of labour and material, but it is a form in which, in the event of any settlement, the stone would be almost sure to crack at the angle; and if it is not meant so (and we can hardly think it is), the drawing is misleading for purposes of study.

The drawings were, however, well worth publishing, as the record of a very gifted and original architect's manner of working, and though the editor somewhat exaggerates their value as models, they are well worth study if taken as sources of architectural inspiration and instruction, though not as models of style. Mr. Pullan speaks of possible future volumes containing illustrations of Burges's designs for woodwork and metal-work. These could hardly fail to be of interest; probably of greater interest than the volume we are now noticing, as there would be more scope in them for the exercise of the powerful originality in detail which Burges undoubtedly possessed, but which, in regard to purely architectural detail was, to our thinking, somewhat weakened by his loyalty to Mediæval precedent.

NOTES.

**D**URING the remarkably severe thunderstorm which prevailed in London for nearly three hours on the evening of the 17th inst., several buildings were struck by the electric fluid and more or less damaged. The most serious case which has come to our notice is that of the spire of Christ Church, Endell-street, Long Acre, which has been very badly shattered, especially on its north-eastern side. The spire, which rises to the height of about 120 ft., was built, with the church, more than forty years ago, the architect being Mr. Benjamin Ferrey. (A view and description of the church appeared in the *Builder* for March 8, 1845.) The stone appears to be a variety of Bath, and is in parts very much decayed. An iron finial surmounts the spire, but there was no lightning-conductor. The electric fluid apparently struck the iron finial, by which it seems to have been conducted into the interior of the spire, and, possibly attracted by iron cramps in the stonework, to have hurst its way through to the outside of the spire, carrying away large masses of stone. The side of the spire most affected looks as though it had suffered homhardment, great holes being made in it. These holes, especially one above the uppermost lucarne, have been partly filled up again by blocks of stone, displaced from above, lodging there in their descent, and showing by their projection that they were only just saved from falling to a lower level. Altogether, the spire is in a very precarious condition, as may be seen by viewing it through a glass from the workhouse

yard adjoining. An inspection of the interior still further reveals the ruined condition of the spire, and makes one marvel how it holds together. Services have been discontinued in the church, and a considerable area of the street in front of the spire has been hoarded in, and the carriage traffic diverted for fear of the effects of vibration. The work of restoring the spire has been very promptly placed in the hands of Messrs. R. Avis & Co., of Putney, and we wish them and their workmen well out of their hazardous undertaking. Mr. Coleman, their courteous representative on the works, pointed out to us the curious way in which the electric fluid, on reaching the base of the tower, travelled for some fifteen yards or so along the iron railings on the north side of the church, and was conducted by an iron stay-bar into the easternmost buttress but one, seriously rupturing it. At this point the course of the fluid is lost sight of. The moral of this and of many previous casualties is, of course, that every church and every prominent building ought to be provided with a lightning-conductor, whose efficiency should be periodically tested.

**M**R. DE LISLE, the member who "did not even smile," deserves the best thanks of all who are interested in decorative painting generally, and in the completion of the decoration of our national palace of legislature more particularly, for his sensible letter in the *Times* of Tuesday in regard to the unfinished decoration of the Central Hall of the Houses of Parliament. As Mr. De Lisle says, the existing mosaic of St. George by Mr. Poynter "may not be faultless," but its general effect is "bright and splendid" (we presume Mr. De Lisle uses "splendid" in its literal Latin sense), and its cost, 650l., might be said to be almost absurdly small for a work of high-class design, covering so large an area, and executed in so costly and laborious a method as mosaic. To our thinking, Mr. Poynter's design deserves a good deal more than the faint praise which even those in favour of continuing the series have been content to bestow upon it. His "St. George" is a fine and heroic-looking figure, and the general effect of the design is decorative and well suited to mosaic. But, at all events, it is a commencement of the scheme of decoration, which ought to be continued, and which has long remained incomplete, to our national discredit. Mr. De Lisle is also quite right in his conclusion that mosaic alone can be advantageously or rightly employed for the completion of the series of pictures in the central octagon, and that for one more reason than he seems to be aware of. Not only is it the case that the brilliant scheme of decoration of the Central Hall, with its gilding and stained glass, requires a no less brilliant medium than mosaic for its pictorial decoration; but also, the one area having now been filled with mosaic, the treatment of the other similar spaces with fresco, as one or two of the æsthetic (!) blockheads in the House have proposed, would be a proceeding architecturally out of the question, unless those who propose it are prepared to hack out Mr. Poynter's mosaic, and replace it also with fresco. Mosaic and fresco will not range together; and fresco pictures would be killed in that position by their decorative surroundings. We fear Mr. De Lisle's appeal has little chance of success in an assembly where vulgarity and economic claptrap are so rampant as in the present House of Commons; but he is, at all events, to be thanked for having made one more effort to arouse attention to the discreditable manner in which the central rendezvous of our legislative palace, the architectural keystone of the design, is left year after year in its incomplete state, a derision to visitors, foreign and English alike.

**B**Y an order of the 4th of July last, only just published in the *Journal Officiel* of August 25th, the French Minister of Public Instruction and Fine Arts has created, in connexion with the Museum of Comparative Sculpture, at the Trocadéro, a French Chair or Professorship of Mediæval and Renaissance Architecture; and M. de Baudot, Inspector-General of "Travaux Diocésains," and member of the

Commission des Monuments Historiques, is nominated as the first occupant of the office. This appointment has a certain significance, as it implies a desire on the part of the Government to promote a more definite and regular study of that phase of architecture, which though it is recognised by many in France as more especially "national" than any other, is yet little studied at the Ecole des Beaux Arts. M. de Bandot is the oldest Inspector-General of "travaux diocésains," and one of the most devoted disciples and followers of Viollet-le-Duc.

**T**HE subscriptions to the second series of the New Obligations on the Panama Canal, which was opened on the 26th July, 1887, show a marked abatement in the confidence with which M. de Lesseps's appeals are responded to in France. The three per cent. loan of October 3, 1883, amounting to 12,000,000*l.*, was all taken, at a discount of 43 per cent. Of the first series of the "New Obligations" at 3 per cent., issued at a discount of 55 per cent., 91·7 per cent. were taken last year. Of the offer of the present year, also at 3 per cent., at a discount of 56 per cent., only 51·7 per cent. has been applied for, giving a cash amount of 4,556,000*l.*, for which the Company incurs a liability of 10,355,480*l.* The total loan liabilities of the Company, outside of the original capital of 12,000,000*l.*, now amount to 53,900,880*l.* (less a small reduction for the action of the sinking fund). For this the Company acknowledges the receipt of 29,909,348*l.* in cash, showing a rebate of 23,991,532*l.* The total to the debit of capital account thus stands at 65,900,880*l.*, of which some 8,000,000*l.* is in hand. The annual sum required for interest on the above, together with 1 per cent. for sinking fund, is 2,668,458*l.* The total amount of excavation for the canal and river deviations is now estimated at 150,000,000 cubic metres. This estimate must, however, be considerably under the mark, as the river deviations will be very much increased in volume by the abandonment of the *Barrage* or dam at Gamboa. The deep cuttings, moreover, are only estimated for at slopes of, and under, 1 to 1; at which there can be no rational anticipation that they will stand. From the monthly accounts of excavation published from time to time it appears that 36,000,000 cubic metres have been excavated since 1879, leaving 114,000,000 cubic metres, out of the minimum estimate above quoted, to be excavated on July 1st last. The rate of progress for 1886 was very nearly one million cubic metres per month, and this has been increased by about one-sixth during the first six months of 1887. At this rate of progress it would take eight years to complete the excavation. But the true limit of time (apart from the question of the Chagres floods, and the Rio Grande diversion) is found in the Culebra cutting, which, in less than two kilometres of length, is estimated (at 1 to 1 slopes) to contain 25,000,000 cubic metres of rock, sand, and clay. Of this unprecedented volume only about one-tenth, or 2,550,000 cubic metres, have yet been excavated. The largest return made from this cutting in any month hitherto was 122,000 cubic metres in May last; the volume, however, sinking to 50,000 cubic metres for June. At the most rapid rate yet given it would take fifteen years to execute this cutting, if the work were uninterrupted, and if the slopes stand as designed. In the course of fifteen years 40,000,000*l.* will be required to pay the amount of interest due on the money already raised, to say nothing of that required to carry on the works for the period above indicated. The above figures are all taken from the authorised publications of the company.

**A** VERY conspicuous object from the harbour of Queenstown is now the New Roman Catholic Cathedral, which stands almost in the centre of the lines of houses which run along the margin of the bay and line the steep slopes above. It would have been impossible to have chosen a finer site, and the building is by far the most conspicuous object as vessels draw towards the quays from the sea. Un-

fortunately, however, the building is incomplete, and its further progress is at present delayed for want of funds. Externally it is to all appearances nearly complete, except that the tower has yet been carried no further than the height of the roof. The south side of the building is seen from the bay, as it is built along the side of the hill from west to east. The most prominent feature is the southern transept, with a rose window and small side towers and pinnacles. The east end is in the form of an apse, whilst the unfinished tower stands in front of the west end, that is to say, at the south-west corner of the building. We understand that the building is internally also unfinished. It is most unfortunate when a striking and important building in a conspicuous situation is left in a state which is almost worse than not being in existence at all. It says little for the genuine interest of the Irish Roman Catholics in their religion or their country that they allow this work to remain unfinished.

**W**HEN English watering-places are annually overrun it is difficult not to be struck with the way in which those on this side of the water neglect the attractions of the glorious bay of Queenstown,—the Cove of Cork,—and the delightful shores of the Lee from Cork to Haulbowline. The bay is one of the finest boating waters in the world. There are additional attractions in the vessels of all nations which trade there, and in the splendid mail packets to and from America; there are steamers plying on bay and river, and direct railway communication with Cork and Dublin; yet there are scores of sites for houses unoccupied, and an almost total dearth of tourists.

**T**HE effect of the treatment of sewage described in a paper sent to us by Mr. Richard Weaver, C.E., F.C.S., can only be known by trial; but there are certain leading conditions which must be fulfilled in one or other respect in every place, according to circumstances. These are not the same in all, but in most places nothing should be added to the sewage which would prevent it being used beneficially on land, and the same may be said of the solid residue separated from the sewage in tanks by settlement, and the clarification of the effluent water by chemical ingredients; for we take it that, sooner or later, the sewage of most towns must be applied to land before it is finally got rid of and passes beyond the control of the sanitary authorities. The agricultural chemist may form a pretty accurate notion of the probable effect of the "ferchlor" proposed in this case when its precise nature and composition are stated; and we should advise the inventor to make sure, before he goes any farther, that the new ingredient he proposes to add to the sewage will have no detrimental effect when it comes in contact with the soil, whether it be a light or a stiff soil, and whatever composed of, unless, indeed, the process be intended for exceptional cases only, and we cannot suppose that to be the object of the inventor. If the proposed treatment should turn out satisfactory in this respect, we should say it would prove to be a valuable discovery, for it would probably be effective in deodorising the sewage in its passage through the sewers, if applied at their upper ends; but it would hardly be practicable to apply it, as is suggested in the paper, at the heads of the house-drains. In any case in which these are laid so as not to carry off the sewage cleanly and quickly away from the house, they must perforce continue to give off foul air, until they are taken up and laid properly, for the frequent attention required to deodorise them would be given by but few persons, if any. Corporations and other sanitary authorities, however, can easily deal with the sewers in this way.

**B**Y the fire which broke out at Knole House, Sevenoaks, on Tuesday, the 16th of August, the barn,—one of its oldest features,—and the adjoining stables were destroyed. The barn was a relic of the time of Archbishop Thomas Bourchier (died 1486), who rebuilt most of the house, enclosed the park, and

devised both to his own metropolitan See of Canterbury. His successor, John Morton (died 1500), made some additions. The hall, chapel, chaplain's room, servants' "gale," and the gate-house are of these two prelates' days. The gate-house is very like that by Morton, the building archbishop, at Lambeth House. Crammer, fearful of what the laity should say, exchanged the house for certain lands to the Crown. Thus it passed by favour through various hands, including those of the Protector Somerset; John Dudley, Duke of Northumberland; Cardinal Pole; and the Earl of Leicester. Ultimately Elizabeth bestowed it upon Thomas Sackville, first Earl of Dorset, in whose line it has continued ever since, save for a break during the Usurpation, and an alienation by Richard, third earl, to Alderman Henry Smith, of London, which his nephew redeemed. Lord Dorset, who died suddenly in the council chamber, Whitehall, in 1608, also enlarged the house in the Early Italian or Classic style then in vogue. The water-spouts which he set up throughout the premises bear date 1605. Richard, fifth earl (died 1677) made substantial repairs; his union with the Lady Frances Cranfield, heir to her brother Lionel, the Earl of Middlesex, is recorded by the arms of their two houses upon the garden gates, the dial, and elsewhere. The mansion narrowly escaped from destruction by a fire, which, on the Christmas Day morning, 1817, was discovered in the Venetian chamber, and consumed the state bed that had been originally made for King James II.'s use, together with some valuable pictures and Gobelins tapestry. Its earlier annals begin with Baldwin de Bethune, *temp.* John, and so on to the Marischals, Earls of Pembroke; the Bigods, Earls of Norfolk; and Otho de Grandison, *temp.* Edward I. Viewed from without, the various buildings, in a great diversity of style, cover about five acres, and stand within a magnificently-timbered park extending over some 1,000 acres. Within is a priceless collection of paintings, with some furniture and decorations dating from the sixteenth and seventeenth centuries. Whilst the property itself takes a foremost rank amongst the historic seats of England, the prospect as viewed from River Hill over Western Kent with Penshurst, home of the Sidneys, in the nearer distance between the foreground and the Sussex downs and hills of Hampshire, spreads out unsurpassed in this country.

**W**RITING to the *Standard*, "F. R. A. S." suggests that to the scientific reports in our daily papers be added a notice of the exact error of Westminster Palace clock at any fixed hour of the preceding day. This error, by the way, is ascertained twice daily. On the 10th of August last the clock was advanced four seconds, having remained untouched since the 29th of March last. In telling us to regulate our own clocks and watches by marking the first note of any hour as it is struck upon Big Ben, "F. R. A. S." forgets one important element of the observation: we must also make allowance for the time that the sound has taken to reach our ears: so his recommendation is of but little practical use.

**A** LOCAL committee invite contributions towards the restoration of the Martyrs' Memorial at Dartford, Kent. This stands in the old burial-ground on the site of an ancient chapel that was dedicated to St. Edmund-the-Martyr. It commemorates the burning at the stake, on July 17th, 1555, in Queen Mary's reign, of Christopher Walsley and two of his fellow-townsmen for their adherence to the Protestant faith. A similar movement has been made in respect of the monument to Robert Nelson, author of "Fasts and Festivals of the Church," who was the first person to be interred (1715) in the burial-ground of St. George-the-Martyr, Holborn, next north of the Foundling Hospital, London. The Latin epitaph was composed by Bishop Smaulridge. Mr. Butterfield has examined the monument, and it is estimated that 60*l.* will meet the necessary repairs and provide a suitable railing.

**M**R. HOLMES, honorary secretary to Lord Meath's Public Gardens Association, wrote recently to the *Times* directing

attention to recent encroachments upon Burton's, *olim* Great or College, Court, Chelsea. Lying between Royal Avenue and St. Leonard's-terrace, this once open space was lately leased to the General commanding the Home District for a soldiers' cricket-ground, to the exclusion, for all practical purposes, of the public. A Treasury grant of 800*l.* was made for preparing the ground; two pavilions have been set up; and, unless the matter be vigorously handled, there is much danger that the ground will soon be quite converted into a private enclosure. It is to be observed that the grove of trees and the Royal Avenue bear, north-west, towards Kensington Palace. The story runs that Queen Anno intended to make a road and avenue from the Soldiers' Hospital, across the Court and the fields beyond, to her home at Kensington. The Court extends over about twelve acres, and was bought with the public funds in 1682.

THERE is an amusing paper in the current number of the *Nineteenth Century*, by the Rev. Dr. Jessop, on the "Trials of a Country Parson," in the course of which he describes a visit he lately paid to a church "to which a very hurricane of a man had been recently appointed, and which he had already set himself about to restore"—

"He knew no more about architecture than I do about chemistry. He had a small army of bricklayers and stonemasons about the sacred edifice, tearing down this and digging up that, and smearing (a good word this) over the other. And this worthy had not even consulted the parish clerk! 'Of course, you have a faculty for this?' I suggested. 'Not I! Faculty, indeed! I have made up my mind to have nothing whatever to do with any officials or professionals of any sort or kind; I am my own architect!' Now, if a man chooses to be his own tailor, nobody will be much the worse, and nobody will much care; but when a man sets himself to 'restore' a church by the light of nature, it is a much more serious matter, and it is almost beyond belief what a brisk and bounding young fellow, with the best intentions and an immense fund of ignorance to fall back upon, can do without any one interfering with him. You tell him that he will get into a scrape, that the bishop will be down upon him, that there are such things as law courts. He smiles the benevolent smile of superior wisdom, and dashes on with heroic colour. If he calls himself a Ritualist, he gets rid of the Jacobin pulpit, and the royal arms, or the Ten Commandments, and sets up a construction which he calls a reared, all tinsel, and putty, and paper-mâché, hurls away the old pews before you know where you are, nails the brasses to the walls, sets up a lectern, and intones the service, keeping well within the channel, from which he firmly banishes all young fellows who are not made. As for that gallery at the west end, which he never used to sit for a couple of centuries, and never failed to take their part with conscious pride in their own performances, that is abomination in his eyes,—that must go of course, 'to throw out the helmy arch, you see, and to bring the ringers into closer connexion with the worship of the sanctuary.' 'I love to see the bell-ropes,' said one of these dear well-meaning young clergymen to me. . . . But if an energetic young reformer calls himself an Evangelical he is, if possible, a more dangerous renovator than the other. Then the axes and hammers come in with a vengeance. None of your pagan inscriptions for him, teaching false doctrine and popery. None of your *Oratio pro anima*, none of your crosses and remains of frescoes on his walls; St. Christopher with the Child upon his shoulder wading through the stream, St. Sebastian stuck all over with arrows, or St. Peter with those very objectionable keys. As for the rood-screen, away with it. Are we not kings and priests? If you must have a division between the chancel and the nave, set up the pulpit there, tall, prominent, significant; and if the preacher cannot be heard, then learn the lessons which our grandfathers taught us, and let there be a sounding-board. The serious part of all this passionate meddling with the *status quo ante* is that any young incumbent can come in and play the wildest havoc with our old churches without any one interfering with him. The beneficial clerk is master of the situation, and is frightfully more so now that Church-rates have been abolished than he was before. It is no one's interest to open his mouth: is he not induced to possession of the sacred building, and is he not, therefore, tenant for life of the freehold? As long as he makes himself liable for all the expenses, he has no better to let him have his way. 'I ain't-a-going to interfere,' says one after another; and in six weeks a church which had upon its windows and its doors, upon its every stone and timber, he marks and evidence which constituted a continuous chronicle, picturing,—not telling,—a tale of the faith and hope, and folly and errors, and

devotion and sorrow, and striving after a higher ideal, and painful groping for more light in the gloom,—a tale that goes back a thousand years; a tale of the rude forefathers of the village world, which still regards the house of God as somehow its own,—in six weeks, I say, all this is as effectually obliterated as if a ton of dynamite had been exploded in one of the vaults, and the genius of smugness had claimed the comminuted fragments as her own."

This, it is needless to remark, is only one side of the picture and of the question, and we only quote it as such. To have one side put with picturesqueness and point is, however, worth something,—provided we always recognise clearly that it is only one side.

IT appears that the southern colonies are making a decided move in favour of exploration of that unknown waste, the Antarctic region of this planet. The Antarctic Committee which has been, according to the *Times*, appointed by the Royal Society of Victoria and Royal Geographical Society of Australia, has memorialised the Premier of Victoria in favour of offering honours to stimulate Antarctic research. Bonuses will be given for the conveyance of scientific observers into south latitudes, special honours for oil from fish caught south of 60 degrees S., and further ones for passing 70 degrees S. A flying survey of any coast lines not in the Admiralty charts is desired, and the discovery of new waterways and harbours for wintering. We have no doubt that before long we shall hear, however, of a special expedition for the exclusive object of Antarctic research. Grumblers will say that "no practical advantage" is to be derived from it, and no doubt the lives of adventurous men will be sacrificed to the fascination of South Pole exploration as they have been to that of the North Pole; but it is likely to go on for all that, and we wish it good speed. That restlessness of the human spirit, which can never be content till we know all about our globe that is to be known, is one of the things that makes life worth living; and any who may persist in the attempt to increase our stock of knowledge will at least lie in honoured though perhaps unknown graves.

THE ARCHITECTURAL ASSOCIATION EXCURSION.

REVIVING our account of the Excursion of the Architectural Association, the first place visited on Wednesday, the 17th inst., was South Wraxall (see prototype illustrations in last week's *Builder*). This is a very interesting manor-house of two styles, Perpendicular and Elizabethan. The house is now, and always has been, in the possession of the family of Long, which emerged into history under the patronage of the Hungerfords of Fifeigh, but which has outlived that race, and has achieved distinction on its own account. It

right, there seems little doubt that the son of the founder of the family began the manor-house, which was further enlarged by his great-grandson, Sir Thomas Long, about the year 1500. The means of dating his work are afforded by a heraldic device,—a marshal's lock,—which Sir Thomas was the first of the family to display; he inheriting it, as it were, from his mother. The cognisance once adopted was freely used afterwards, and appears in the work added a hundred years later, when the somewhat straggling Perpendicular in which Sir Thomas worked had given way to the hold Renaissance of his great-grandson, Sir Walter. The chief features due to him are the fine drawing-room and the chimney-pieces of several other rooms. Three of these were illustrated in our last number, and the hold and original nature of the work is evident at a glance. The designers of this and of much other Renaissance work seem to have aimed at effect: their work is strong if not refined. Sometimes it is both; but any way preferable to the tame proprieties of a later date. The drawing-room is a very interesting example of an alteration of existing work. Sir Walter widened the old room by 4 ft. or 5 ft., but retained the old roof and wall plate. In order to do this he left or built a large mass of masonry projecting from one side to carry the plate; this he ornamented with niches and clothed with panelling, thereby converting it into an agreeable feature, and one which lends much interest to the plan of the room. Then, at opposite corners of the apartment, he made great windows of many square-headed lights, he covered the old timbers with a fine plaster ceiling, and, behold, a room such as men love to look upon. Unfortunately, it is a thoroughfare room in two directions, and this mistake in planning, combined with other inconveniences of a similar nature, no doubt led to the demise of the house as a family residence. Its emptiness, however, enabled the excursionists to sketch and measure without let or hindrance. One drawback an empty house brings with it, and that is, that the garden is neglected. At South Wraxall this is the case, but the flagged paths and the great stone piers (see illustration in last week's *Builder*) show what possibilities there are.

In great contrast to South Wraxall is Kingston House at Bradford-on-Avon (see view in last week's *Builder*). Here we have a fine house occupied, and surrounded by beautifully-kept gardens; but Kingston House excited no interest in comparison. The fact is, Kingston House has been restored. According to the best authority, it has been restored to the utmost care; piece by piece the decayed work was taken out and replaced, the new work being an exact reproduction of the old. But with all this care it fails to attract the architectural sketched. His aim is to get at the thoughts and ways of his predecessors at first hand, and not through the medium of facsimiles, however exact. Hence he will desert the fine, clean, scraped work,

is said that one of my Lord Hungerford's suite in the beginning of the fifteenth century was a tall fellow called Long Thomas, or according to another authority, Henri le Prenx. This adjective "long," by dint of constant use, was finally adopted as a surname, and Long Thomas became Thomas Long, or Henry Long, according to the other authority. Whichever may be

beautiful though it may be, and content himself with some dirty, chipped affair, whose very dirt and chippiness attest the hand of Time at each glance the sketched raises towards it. The town of Bradford-on-Avon itself is very picturesque, owing much of its charm to its situation on the side of a steep hill, and some, perhaps, to the fact that in its early days it

became the homes of weavers from the Low Countries. Its most remarkable monument is the celebrated Saxon chapel, which within the last fifteen years has been discovered and rescued from oblivion, and is now carefully attended to and duly appreciated. It is, however, a building which would better grace an account of the doings of an archaeological society than of an excursion of sketchers. As to the church, it may be said of this as of many others, that interest may be extracted from any church dating from Mediaeval times, even though it offers little for the pencil to note. The other principal features in the town are the Tithe Barn and the Bridge, both of which, as well as the Saxon chapel, we illustrated last week.

At Westwood, where the party went next, they found a church with a beautiful panelled tower and a corner stair-turret carried up, and crowned with a crocketed stone cupola. Inside some fragmentary glass attracted attention, as well as a wooden pulpit, dated 1607, and a very florid altar-rail, or low screen, of the time probably of Charles I. The adjacent manor-house, though retaining little internal work, has a picturesque exterior, and, combined with the recessed windows of the excellent north aisle, or chapel, and the panelled tower, forms a group of great architectural interest.

On Thursday, the first resting-place was Great Chalfield Manor-house, of which we gave an illustration last week. In some respects it recalls South Wraxall, from which it is distant about three miles; but the work here is of a slightly better character, although a little later. Nothing beyond the exterior remains, and since it was illustrated by Walker some part has been pulled down; but the front of the house is left, and so are the ranges of farm buildings, as well as traces of the moat, and of the fine stew-ponds. It is a place well worthy of study, if only for the plan of the whole premises, which may be said to include the church, for it serves few people besides those living in the Manor-house.

Soon after leaving Chalfield an accident occurred to one of the two vehicles conveying the party, whereby the day's arrangements were somewhat upset, Keesvil being omitted altogether, and a shorter time allowed for the remaining buildings. Of these, Steeple Ashton was the first. The village takes its name,—not from its church, which has only a tower,—but from the staple, or market, which formerly existed here. The church (of which we gave a small view last week) is, at first sight, an imposing one, but a closer inspection shows the detail to be very coarse and of unpleasing proportions. The church has had a spire twice, but it fell down twice, and, taking this as an intimation of a Divine objection to such a feature in that village, those concerned decided not to attempt to reconstruct it. Leland gives the popular derivation of the name, and mentions the spire. He says (cir. 1536), "It is a praty litle market Towne, and hath a praty Buyldinge. It standithe moche hy clothiars. There is in it a very fayre church, huyldyd in the Mynd of Mea now lvyngye. The spired Steple of Stone is very fayre and highe, and of that it is cawlydy Steple Asscheton. Rohart Longe, clothyar, huyldyd the Sowthe Isle, of theyr proper costes."

But far more interesting is the splendid church of Edington. Splendid, at any rate, it once was, for a long period of neglect has rendered a thorough restoration necessary. Last week we gave some illustrations and a short historical account of the edifice, which, on the occasion of the visit of this Association, was described by Mr. J. D. Sedding, who, in a paper which did justice to the beauties of the place, uttered rank heresies in respect of William of Edington's connexion with the building thereof. Certainly the work ascribed to the same man here and at Winchester is very different in character, and apparently in date, and possibly the heresy of to-day may become the true faith of to-morrow; but the time at disposal was limited, and even archaeological disputes sank into the second place in the presence of such beautiful work as there was on every hand. The original structure presents windows of an excellent type, fair canopied niches, supported by exquisitely-carved figures, whose drapery is rendered with the masterly arrangement and the delicacy of execution which mark the period, and which may well be the despair of modern carvers. It

also contains much later work, equally delicate and refined, although belonging to what some people are pleased to call the Pagan style of the Renaissance. The pulpit, reredos, and font-cover are examples, and are hardly less notable than the great tomb to Sir Edward Lewis, who died in 1630. On an altar tomb lie the beautiful figures of Sir Edward and his wife, while above them hovers a cherub offering the crown of life. The cherub hangs from the panelled soffit of the flat canopy, which is supported by columns. The recess is partly screened by curtains, which are drawn back and tied round the columns. Above the canopy rises a tablet carrying the arms, while below the recumbent figures kneel effigies of five children. The panelled ceilings are also Jacobean in date, and though poor in detail they give a rich effect to the church, and are of great historical interest. It is earnestly to be hoped that in the restoration now proceeding every effort will be made to preserve them. Three other important monuments deserve notice, one is the Cheney Chantry, or what remains of it, in the nave; another is a Late Gothic tomb to an unknown ecclesiastic, in the south transept. It is elaborately and richly coloured, and from the reliefs which adorn it in various places,—a sprig of hay and a tun, or barrel,—it is supposed to commemorate one John Baynton. A curious feature is that the recumbent figure rests its feet not on an animal, as is usual, but on a barrel. The third monument is one by Chautrey, of which we reproduced a photograph last week. It is to the memory of Sir Simon Richard Brissett Taylor, who died in 1815, and it was erected by his sister, Martha Taylor, who died in 1817. As is always the case with a good building, the time allotted to Edington passed all too quickly, and it was with regret that the party moved away towards Westbury. The church here, it

rose the hills of Monmouthshire and the hazy mountains of Wales,—a vast view, recalling in extent and character the panorama from Edge Hill seen on the Banbury excursion. Marshfield was next visited. It is a long, straggling, little town, dating principally from the time of William and Mary. When once there, no doubt something may be found to sketch, either at the church, the almshouse, or in the street, but there is nothing of commanding interest. Very different is Cold Ashton, where the church and manor-house abound in useful scraps. The church was built by one Thomas Koy, whose rebas, a T and a key, occurs frequently. The pulpit, which is recessed in the wall, has a crocketed canopy over it, and is approached by the same steps that used to lead to the rood-loft. It is figured in Dollman's hook. The manor-house dates from early in the seventeenth century; it was probably built by a John Pinwell, who lived there in 1608, and who subsequently sold it to John Canning, Mayor and Alderman of Bristol, who was alive in 1645. He built the elegant stone gateway in the front, and adorned it with his arms,—three culverins or guns. The house is now a farmhouse, and has been altered somewhat to suit its changed purpose, but a great deal of Jacobean wood-work is left, as well as some plaster ceilings, some of which bear exquisite designs in low relief. The view from the front of the house across the valley of St. Catherine's is very charming, and gives Cold Ashton an advantage over most contemporary houses, for they were usually built down in a hole with little prospect beyond their own beautiful gardens. From Cold Ashton,—Ashton Frigida, as it is called in fourteenth-century documents,—the way lay down the hilly road that winds along the wooded side of St. Catherine's valley to the church and court-house of that name. The house is said to have been built by Prior

must be confessed, did not tend to lessen the regret, for though interesting enough historically, it does not contain much of the food for which the excursionists crave, nor was there much time to do anything more than glance round it.

The last day, Friday, began with the house of Hamswell, said to be a corruption of St. Anne's Well, which is in an adjoining field. Its waters are esteemed very efficacious in diseases of the eyes. The house once belonged to the Whitingtons, and two heraldic creatures, said to be cats, grin out from the ivy over a garden door. There is not much architecture visible through the thick leaves of the ivy, but the front porch is clear. It is late in date, and is surmounted by a broken pediment, in which the parts of the pediment are so small as to be what physiologists call rudimentary organs. The garden is charmingly old-fashioned, the ground sloping away from the house in terraces down to a Dutch canal, along the straight sides of which runs a broad grass walk with an arbour at each end. A very short stay was made here, and then the party went on to Marshfield. Their way led them along the ridge of a hill with a wide view on either side; to the south-east lay the winding valley where St. Catherine's Court House lies hidden, to the west stretched a broad plain, right away to the Severn, beyond which

Cantlow in 1499, but it looks later; and the porch no doubt dates, as generally stated, from the early days of Charles I. It is unusually good in design. The angles are canted, and the canted side contains a niche on the ground-floor, and on the upper floor one light of a millioned window that makes the circuit of the whole projection. The doorway is round-headed and flanked by columns, while the sides of the porch itself are pierced with an open arcade of three small arches carried on rounded stone balusters. The whole is crowned with an open balustrade. The house stands on the side of a hill, and is surrounded with well-kept gardens. The approach is by a broad gravel sweep and flights of grey, timeworn steps, through an ivy-covered arch on to the level space in front of the porch. The house faces sideways, and beyond it the garden continues in smooth lawns and long lofty terraces, with stone balustrades, hacked by a high hedge of trimmed yew, through which a small arch gives a glimpse of further walks. When the present owners came here the place was dismantled and in decay, but through their energy and good taste it is now panelled in keeping with its style, and abounds in nice bits of woodwork, which, though not native to the place, are by this time thoroughly naturalised. The church,

which is reached by part of the same path that leads to the house, is a small structure, very carefully kept up. It has remains of some stained glass which has been worked up into the east window in a very clever way, and matched with new glass hardly distinguishable from the old. The east and west walls are lined with tiles of harmonious colours, and the whole effect is as pleasing as well may be.

This was the last place on the programme, and it formed a pleasant termination to a pleasant week. The party returned to Bath with the vision lingering in their minds of the ivy-clad house, the soft sward of the stately terraces, and the lichen-strewn steps, all embosomed in trees and removed.

"Far from the madding crowd's ignoble strife,"

#### THE BRITISH ARCHAEOLOGICAL ASSOCIATION.

CONTINUING our report (see p. 282, *ante*) of the Liverpool Congress of this Association, at the evening meeting on Wednesday, the 17th inst., a paper was read on "Old Liverpool China," by Mr. W. H. Cope, F.S.A., in which the rise and progress of this old local trade were detailed, and reference made to the examples in the Mayer collection, presented to the town in 1867.

A second paper followed on the "Manx and Cornish Languages, considered Historically," by the Rev. W. S. Lach-Szymra.

Thursday morning, the 18th, proved to be very wet, and the party was considerably thinned in consequence. Still, a goodly number proceeded by rail to Runcorn, whence carriages in readiness conveyed them to the ruins of Halton Castle, once a place of considerable strength, on an elevated bill of conical form, but now only a mass of broken walls remains, forming a conspicuous feature for many miles, the view from the castle hill being one of great extent and beauty.

A hasty perambulation of the walls was made through the rain, after which the history of the building was related by Messrs. Ed. M. Hance and M. Morton, while Mr. Loftus Brock described the architectural features, and particularly referred to the existence of some walls, now portion of the inner battlement, built of large blocks of stone without mortar, having an archway cut out of a single stone. These may probably be of Roman date. The site was occupied by the Ancient Britons and by the Romans, for whom it was an important outpost to guard the road to Warrington. It was a place of strength in Norman times, and finally ceased to exist at the conclusion of the civil wars, when it was dismantled.

Fine weather rewarded the visitors during the remainder of the day, and progress being resumed, at Warrington the local museum was inspected. There is here an interesting collection of antiquities, mostly acquired from local discoveries by the late Dr. Kendrick, an old Associate. Here are most of the articles discovered at Vindespoul, most probably the *Condote* of the Romans, including a curious mask of clay, called a tragic mask, although its appearance is very much at variance with its name. Here are also portions of a curious encaustic tile pavement, found long since on the site of the old Friary church, at the junction of Friars' Gate with Friars' Green. A plan of the discoveries then made is also exhibited. The church had a long chancel, 75 ft. long by 24 ft., a very short nave, 27 ft. wide, divided from the former by a narrow space, on which was once, doubtless, one of the slender steeple so common to churches of Friars. There was also a singular transept at the north side, larger than the nave, since it was 64 ft. by 44 ft. wide, divided into a central nave, with two side-aisles. The building has entirely passed away, the ground plan being only preserved by the few relics exhibited and by a series of photographs.

After luncheon Sir J. A. Picton pointed out two remarkable specimens of black and white houses in the Market Place and elsewhere, after which progress was made along the old Roman road, now occupied for the most part by the main highway to Winwick, where a justly celebrated church was thrown open for inspection. The building stands on high ground, and its tall tower and spire are visible for a considerable distance. It is built of yellow stone and is mainly of the fourteenth century, the arcades of the nave being of different designs on each side,

that on the north being the most elaborate. The chancel is of stately proportions, but very much restored. An inscription around the S.W. angle of the exterior records the death of St. Oswald and his connection with the parish. There is a stone covered with interlaced patterns of Saxon date now placed just clear of the east end of the church. It is the two arms of the upper part of an enormous cross. The patterns are of much beauty and interest. There are no portions of the shaft remaining.

A lengthy drive along the Roman road brought the party to Wigan, where, on arriving at the Municipal Buildings, an address of welcome was read by the Mayor, who afterwards invited the inspection of the two maces of the Corporation, one of which is a handsome work of the reign of Charles II. There are also a fine sword of state and other articles of interest, all of which, with the various charters, were laid out for the party.

The beautiful church of Wigan was visited, and a short stay made there, all too short for its examination. It is a fine building of the fifteenth century, with good details, thoroughly and well restored. The tower is on the north side of the north aisle opening out from the building. Short as the visit was, it seriously curtailed the length of the evening meeting at the Walker Art Gallery, where a paper was read on the Calder stones, by Mr. C. Romilly Allen, F.S.A. (Scot.), Rhind Lecturer.

Friday's proceedings were devoted to a survey of some of the works of Liverpool of today, and had more reference to the realisation of what is going on in the busy world of the town than to works of the past. Still, not a little of antiquarian lore was put before the members. The proceedings commenced by a survey of the site of old Liverpool Castle, which is now in a great measure occupied by the present St. George's Church. The happy idea of marking out the extent of the old building had occurred to Mr. E. W. Cox, and he accordingly carried it out by having the outline of the circular bastions of the walls indicated by white markings on the surface of the modern roadway and pavement, crossed and re-crossed as they are by tramways. The outline was seen to great advantage, and inspected not only by the members of the Congress, but by a great number of citizens, until the lines were obliterated by the ceaseless traffic.

St. Nicholas Church, which stands on the site of the old parish church, was inspected, and the tower and spire of open work, erected early in the century before the period of the Gothic revival, received its meed of praise. It was explained by Mr. Hance.

A visit was then paid to the enormous block of buildings, the Waterloo grain warehouses, where the party was met by the engineer, Mr. A. G. Lyster. The buildings have capacity for the storage of 68,000 tons, the floor space comprising eleven acres. The arrangements for the discharge of cargoes and the distribution of the grain were indicated and explained, and one of the enormous 100-ton cranes was put in motion. The hydraulic pumps are of great power and excellence.

A visit was next paid to the White Star steamer the *Britannic*, which had only arrived in the Alexandra Dock from New York on the previous evening. Here they were received by Captain Parsell, the commander, and Captain Hewitt, the marine superintendent. Embarking on the Dock Board's tender, the *Hodgson*, a number of the docks were steamed through, and on being transferred to the *Vigilant* tender a visit was paid to the Cunard steamer, the *Umbria*, which lay in mid-water on the Mersey.

After inspecting this fine vessel, the *Vigilant* took the party to Eastham Ferry, where carriages being in readiness, the party proceeded to Carlett Park, the handsome modern residence of the Rev. W. E. Torr. There is a beautiful little chapel adjoining the mansion, of recent erection, from the design of Mr. Douglas, which was inspected, after which the carriages conveyed the party to Eastham Church. Here Mr. Torr read a paper on the history of the parish, and Mr. Loftus Brock described the architectural features of the building, attention being drawn to the tower and spire, which are of sturdy proportions of fourteenth-century date, and with the peculiarity of having gables at the angles of the spire instead of pinnacles. The old font was also pointed out as being of Saxon date, as is also that of the adjoining church at Bevington. Both have mouldings of early design, and there is no carving on either.

In the evening a *conversazione* was held in the Walker Art Galleries, all of which were thrown open to the visitors, as well as the Picton Reading-room. The party was received by Sir J. A. Picton and Miss Picton, and by members of the Art Committee. A paper was read during the evening on "A Victorian Era in Romano-British History, supported by Coins and Inscriptions," by Mr. Thomas Morgan, F.S.A.

The sun shone brightly on Saturday when the inspection of the Mayer Collection at the Free Public Museum took place. This magnificent gift to the town was made by Mr. Mayer during his lifetime, in 1867, and it fills, with some additions made during recent years, the whole of a large galleried building. There is a good representative collection of ancient Egyptian, Babylonian, Assyrian, and Etruscan antiquities, arranged on the ground floor. The central galleries contain objects of Mediaeval times, and those of later date are placed in the topmost gallery, the attention of the visitor being thus directed upwards from the works of earliest date. Mr. Mayer was for many years an active member of the Association, and the visit was not merely one for the gratification of the inspection, but as some sort of tribute to the memory of an old member. Among the earliest exhibits is a small collection of goldsmiths' work of great beauty, mostly Etruscan. There are also two silver vases from Canino; other notable objects are several diptychs of Roman and Byzantine date, a set of toys from the grave of a Roman child, from Cologne, a series of moulds for the production of Samian ware howls, many examples of Greek and Roman glass, a fine Nola ware black dish, modelled in high relief, and a hand of linen 17 ft. long, woven with an elaborate pattern. It came from a mummy, and was found at Memphis. Here is also the Fansett collection of Anglo-Saxon antiquities which Mr. Mayer fortunately purchased after it had been declined by the British Museum. It is admirably arranged, a separate compartment being provided to contain all the articles found in each grave. Among the articles is the celebrated Kingston Fibula, doubtless the finest Saxon brooch in existence. Its all but perfect condition and brightness render it difficult to realise that it is about 1350 years old. Not to speak of the ethnological portion, it may be sufficient to say that the third gallery contains a fine collection of Old English and German wares, encaustic tiles, a splendid display of old Wedgwood ware, Dresden china, and particularly of Old Liverpool pottery.

The members and visitors left the museum and proceeded, by the 11.45 train, to Burscough to inspect the ruins of the priory, and also the excavations now being made by the Earl of Derby to determine the extent of the church in which so many members of the Earl's ancestors were interred. Only two of the piers of a fourteenth-century tower remain, but the excavations have already revealed sufficient to show that the church consisted of an aisleless nave, chancel, and transepts, and that at some later date than the original building a chapel had been built in the angle of the north transept and nave, opening into both of these portions of the church by arches. The party was met by the Earl's agent, who exhibited an early chalice which had been found during the excavations, and Mr. Loftus Brock pointed out a great number of masons' marks which had been laid open to view by the removal of accumulated earth.

Progress was then made for the fine large church of Ormskirk, which was described by the Rector, Sir J. A. Picton, and Mr. Brock, who referred to the local tradition that the large western tower was erected after the Dissolution to contain bells from Burscough. The tower is evidently built of masonry worked for some other purpose. The church is remarkable for having a tower and spire at the west end of the south aisle, in addition to the tower.

After luncheon at Ormskirk, a visit was paid to the beautiful old church at Halshull, which was described by the Rev. Canon Blundell and Mr. Brock. It has a tower and spire of fourteenth-century date, the latter springing from an octagonal heltry, as at Ormskirk. The most remarkable feature in the church is its very fine chancel, a work of the close of the fourteenth century, the design, at least of the upper part, having fine window tracery almost Perpendicular in style. There are two elegant

turrets north and south of the chancel arch. The church has recently been admirably restored by Messrs. Paley & Anstie.

After inspecting some curious ruins in Canon Bindell's grounds, of fourteenth-century date, a visit was paid to Lydiatle Chapel, passing on the way the curious old half-timbered Hall of Lydiatle and an old stone cross in the grounds of the new R.C. Church. The chapel, which is in ruins, consists of a pinnacled tower, a south porch, and a nave, there being no defined chancel. There are no windows on the north side. The building is of late fifteenth-century date, and in its state of ruin, with its partial covering of ivy, makes a pretty object in the landscape. The day was now drawing to its close, but the celebrated church of Sefton being in the programme a visit was paid to it, although by doing so it was impossible to catch the train back in time to hold the closing evening meeting. The building possesses the finest screen work and carved pews to be found in the country. There is also a curious incised slab dated 1450, and the tower and spire form a portion of an earlier church. The church is dated 1511, but many of the windows are dated 1542 and later years, having been erected by various donors. None of the windows have casings to the tracery.

Monday last, the 22nd, was one of the extra days of the Congress, but it was, in its results, the most important of all, for it was devoted principally to determine the age of the walls of Chester, recently said to be no older than the time of James I. or Charles I. A large party proceeded from Liverpool by an early train to Chester, and on arriving there they paid a visit to the ancient Church of St. John, now sadly shorn of its fair proportions by the fall of its lofty tower, until within the last few years one of the most conspicuous objects in the city. The party were surprised to find that no attempt has been made to rebuild the tower, the ruins of the ground-story of which alone remain. On the contrary a curious gabled structure has been erected at the east end, which is in strange contrast with all the ancient work around it. The Rev. S. Cooper Scott conducted the visitors over the building and related its history. After inspecting the grand interior of the church, the ruins of the choir of the Collegiate Church were inspected, and afterwards the Chapter-house, which, like that of Llandaff Cathedral, is a square building on the south side. It is now devoted to the storage of a great many remarkable fragments taken from the ruins, among which none exceed in interest some sepulchral crosses of Saxon date. Proceeding to the Cathedral the Ven. Archdeacon Barber, in the absence of the Dean, received the party, and conducted them over the whole of the building, the window recently completed in the south transept, formerly St. Oswald's Church, being greatly admired.

A paper was subsequently read by Mr. Roach Smith, F.S.A., in which a recent theory with respect to the late date of the walls of the city was originated, and the reasonableness of the Roman origin was insisted upon. It is known that the walls are built without either mortar or bonding courses of tiles, and analogous instances were pointed out, not only in England but in France. Mr. Loftus Brock followed, and referring to a series of excavations which have been made in various positions, he said that they revealed a uniformity of design wherever the ancient wall had been opened out. The wall consisted of huge blocks of red sandstone, in some cases 5 ft. in length, put together without mortar and presenting tooled patterns on the outer face. A chamfered plinth has been met with. The work is Roman in every position where the excavations have been made. An enormous quantity of carved and moulded stones have been found built into the Roman wall in Roman times. These dispose of two objections that have been made to the early date claimed for the wall,—the first being the absence of mortar. These stones are for some series of earlier buildings, but none of them show any trace of mortar. If there was none in these there was no need for mortar when put to their second use in the city wall. Again, a part of the latter has a moulded cornice, which has recently been stated to be no earlier than the time of James I. Its counterpart, however, of Roman date has been found built up in the centre of the city wall, showing that the former is Roman also. Before proceeding to a survey of the walls under Mr. Brock's guidance, a large

number of the city charters were inspected, Mr. Earwaker pointing out many curious items of information, his comments being supplemented by Mr. de Gray Birch, F.S.A., the importance of publishing the charters and the curious books of proceedings being strongly urged upon the Corporation. Proceeding to the excavation at the Kaleyard, the wall was found to be of massive blocks resting on a bed of puddled clay and stones, and having a chamfered plinth. Another excavation at the extreme end of the Cathedral close reveals similar construction, and this spot was chosen since the wall has only recently been freed from adjoining buildings which have hidden it from soon after the Siege of Chester. Proceeding to the principal excavation, north of the Phoenix Tower, an enormous mass of cornices, &c., were laid out for inspection just as they had been taken out of the wall. The wall itself is of similar construction as already observed. The excavation on the Roodey was then inspected. Instead of a single row of massive stones resting on a quicksand, as has been recently stated, the huge wall was found to go down to a considerable depth. The excavation has been carried down for 13 ft., and no bottom has been found. The excavation had to be suspended owing to the rising of water.

Sir James Picton, at the last point, summed up the evidence which had been laid before them by Mr. Jones, the City Surveyor, and Mr. Brock, and said that it was impossible to consider the remarkable work they had inspected as anything else than of Roman date. In doing so, he appeared to express the opinion of the meeting. A visit was then paid to a plain Roman arch, the jambs of which are embedded in masonry of Norman date, at the angle of the old castle keep. After which the Museum was visited, and its interesting collection of Roman antiquities inspected. The two Roman columns belonging to the large building found in Bridge-street, about fifteen years ago, were then seen. These remain *in situ*, and possess circular bases, shafts, and large carved capitals.

The party then returned to Liverpool, to proceed on Tuesday to Lancaster, and on Wednesday to Furness Abbey.

Thus has ended a pleasant and agreeable meeting, which has done good service if only in bringing additional information to bear upon the question with respect to the age of the walls of Chester.

#### NOTES FROM OXFORD.

The University is, at the present time, increasing to a large extent the number of its academical buildings. With one or two exceptions these are all Renaissance in style, forming a pleasing contrast to the, in many places, unsatisfactory detail of the older work.

First may be mentioned the further additions to the Examination Schools, the present building being placed just east of Mr. Jackson's fine block in the High-street, and although forming a separate design, is joined to the larger building by a low wall. It will be used for the "unattached" students of the University, and contains a fine examination-room on the first floor, approached by a wide staircase, besides the usual rooms and offices. The High-street front has three picturesque gables; but perhaps the best "bit" is the charming oriel corbelled out at the south-east angle and looking into the quadrangle of the schools. When this is finished and has acquired the tone of the larger block, it will form, perhaps, the most striking group of modern work in the city.

At Trinity College the President's house, which, with the Chapel, forms the north side of the new quadrangle facing Broad-street, is being covered in. This, as well as the finished eastern block, is in what may be termed the "Kirby Hall" type of Renaissance, and very happy the result seems to be. The stonework of the east block has, like the schools, toned down in a very satisfactory manner, including the stone slates, which are so much seen on both old and new buildings, the old roofs having been chiefly covered with slates from Stonesfield in the neighbourhood, while in the new buildings slates from the Cotswolds have been used.

Brazenose College is also making further additions, the work now being carried out having a considerable frontage to the High-street just west of St. Mary's Church. This, which will be the Principal's House, will form the south side of a new quadrangle, of which

the west side has already been built. A picturesque Common Room, which reminds one of the "Tribunal" at Glastonbury, is being finished internally. At present the Principal's House is scarcely above ground, and demolitions are still going on to make room for the new work, which will form a fine addition to the High-street.

Hertford is rebuilding its hall on the west side of the quad facing the old schools, and this will be in a style harmonising with the present buildings, which date chiefly from the eighteenth century, with additions by Mr. Garbett in 1820.

So far all the work noticed is being carried out from Mr. Jackson's design.

Mr. Champneys's Nonconformist college, to be called Mansfield College, near the parks, and of which drawings were in this year's Academy, is now just above ground, portions of the chapel plinth being in position, but it will doubtless be some little time before the works are sufficiently advanced for the general effect to be properly realised.

Magdalen tower has two of its pinnacles enveloped in scaffolding, as they were in an unsafe condition and required rebuilding. This tower is probably one of the best bits of masonry in Oxford, and does not seem to have been affected by the weather and blackened, like most of the university buildings. The stone used in these, Headington, seems to have been badly chosen, and requires constant attention.

Of lately finished buildings it is hardly necessary to speak, but a day will be well spent amongst the new buildings of the University generally. The most important are Mr. T. G. Jackson's work at the Schools, Trinity, Corpus Christi (a picturesque block nearly opposite Merton Chapel), Brazenose, Lincoln, and Somerville Hall. In George-street is the High School for Boys, with an imposing entrance and picturesque louvre, and on the Banbury-road just beyond St. Giles's Church, the High School for Girls, in the Queen Anne style, and built of brick, both also by Mr. Jackson.

At the end of Broad-street is Mr. Champneys's Indian Institute, with its boldly-treated angle staircase tower. This is only partially completed, as it is intended to extend to some considerable distance southward facing the Clarendon building.

The north side of St. John the Baptist's Quad, at Magdalen, is being completed by Messrs. Bodley & Garner, who have also designed the new entrance from High-street and the new quadrangle westward.

In Holywell-street will be found some further additions to New College, by Mr. Champneys, in the Perpendicular style, including a Fellows' house and students' rooms. There are some good windows on the south side facing the grounds.

The neighbourhood of Oxford has been extending rapidly, especially the northern districts, and the general design of the villas is more satisfactory than is generally found, an absence of unmeaning ornament being a noticeable feature in the work. On Headington Hill, so well known for its fine general view of the city, two or three large private residences have been and are being built.

On the left-hand side of the Cowley-road is a very simple but charming block of buildings, known as Nazareth House, and built by Mr. Tasker. It is in brick with stone dressings, having a chapel and sacristy standing on a sub-structure, and a block westward containing rooms for children and the "aged and infirm." The chapel and upper rooms being approached by a stair in a semi-octagonal turret, which projects from the middle of the south front.

There is also at Cowley a new church of Sts. Mary and John, the north side of the nave being an effective piece of Early Decorated Gothic.

**Competition for a House of Parliament at Buenos Ayres.**—The Parliament of the Argentine Republic has voted the sum of eight million piastres (1,600,000*l.*) for a Parliament House. Invitations are to be issued shortly to the architects of all countries to compete for designs. The two best designs are to receive premiums of 40,000 piastres (8,000*l.*) and 10,000 piastres (2,000*l.*) respectively. The conditions of the competition are to be forwarded immediately to the representatives of the Argentine Republic abroad. Designs and plans must be deposited with the latter by April 1st next. Omnious date!

SIR J. A. PICTON, F.S.A., ON  
ARCHAEOLOGY AT LIVERPOOL.

We extract the following from the inaugural address given by Sir James Picton last week as President of the Liverpool Congress of the British Archaeological Association:—

When the proposal of an Archaeological Congress at Liverpool was first propounded, it was received in some quarters with a smile of incredulity,—almost of contempt. What, it was asked, could there be in common between a city of mushroom growth,—all whose energies are absorbed in ships and cotton, corn, sugar, timber, and tobacco,—with the stately remains and venerable traditions of ancient and Mediaeval England?

The question is a natural one, but it is not difficult to answer. More than forty generations have passed since our Anglo-Saxon forefathers first planted the sapling which has borne such goodly fruit; and within this long interval there has been no period which has not been distinguished by events having an important bearing, both locally and nationally, on the progress, fusion, and development of the English character and English institutions. A large portion of these events have left visible memorials behind, and many others lie imbedded in our traditions, laws, manners, and customs, which it is the province of the archaeologist to bring out and illustrate.

In applying these remarks to Liverpool and its neighbourhood, I may observe that, although the visible remains of antiquity are not numerous, some of them are of great interest, and carry us back to periods beyond the reach of historical research. Our Congress is that of an association for the study of archaeology, which, I suppose, is distinguished from the study of palaeontology by its limitation to what concerns the human race; but there are cases in which the two departments are continuous, or, rather, overlap each other, and where the events in the one cannot be understood without reference to the changes in the other. This, I think, will be found to be the case in the district with which we have to deal.

The sphere of our inquiries and observations during the present Congress will be found principally, though not exclusively, to lie in the vicinity of the estuary of the Mersey, which has been the vivifying source of the commercial progress and prosperity of the district; and here, at the outset, we are launched upon a field of inquiry which carries us back into the prehistorical ages, where, in the absence of documents, we have to grope our way in the dim twilight of tradition, and to draw our inferences from the visible phenomena presented to our observation. Dogmatism would here be out of place. We have to tread cautiously, and to frame our conclusions with modesty and reserve.

The Mersey has been from the earliest ages the dividing line between two very important districts of England. When the Romans first penetrated into the country, the northern bank was occupied by the Brigantes, and the southern by the Cornavii, two of the most powerful Celtic tribes. Under the Roman dominion, the Mersey separated the two provinces of Maxima Caesariensis to the north, and Flavia Caesariensis to the south. During the Saxon period, the northern merged into the province or sub-kingdom of Deira, whilst the southern side formed part of the province of Mercia. The estuary has ever since maintained its character, as indicated by its Saxon name, *Mere-sea*, "the boundary water."

Now, the first thing which strikes us in reference to the history of the estuary is the fact that all the other rivers along the west coast,—the Conway, the Voryd (or Clwyd), the Dee, the Ribble, the Lune,—have Celtic or Cymric names. The Roman geographers, Ptolemy and Antoninus, give these names in a Latinised form. The Mersey is not mentioned by them at all, and it has no Celtic name. Supposing the estuary had at that time existed in its present shape, such an omission would be unaccountable. We are, therefore, drawn to the conclusion that subsequent to, or during the latter part of, the Roman dominion, a serious change must have taken place in the physical features of the locality. These features themselves bear similar testimony. That there has been a considerable depression of the land along the coast is manifest upon very slight investigation. The submarine forests which extend below high-water mark on both sides of

the estuary, with stamps of trees *in situ*, many bearing marks of the axe; the recorded inroads of the sea upon the land which formerly stretched much further to the westward; the fact that a large portion of the peninsula has to be protected from submergence by a costly embankment; with other circumstances which cannot here be detailed, unite to prove that the level of the land has undergone material alterations.

It has hence been inferred that previous to this change the channel of the Mersey formed a freshwater lake, extending from Ruworn Gap to Seacombe, fed by the waters of the Irwell and the Weaver, the overflow discharging itself through Wallasey Pool and across a wide extent of marshy land into the sea, not far from the present embouchure of the Dee. This seems to be confirmed by the place name, "Walla's-ey," or island, given to the rocky eminence where the church now stands. The depression of the coast, which admitted the sea into the lake, giving a new outlet, such portion of the marshes as were above the sea level would naturally sink up in the course of time, and become dry land.

To what race the earliest inhabitants of the district belonged we have no satisfactory evidence. Such relics as we possess seem to point to the pre-Celtic period, most probably to the neo-lithic age. In the year 1837 an ancient cemetery was discovered at Wavertree, near Olive Mount, in which were found a number of earthenware urns, containing ashes and burned bones. In 1859 a tumulus was opened at Winwick, between Newton and Warrington, from which similar urns were unearthed, containing burned bones and stone implements.

Another relic of the primeval period is the circle of unheun stones, about four miles from Liverpool, called the "Calderstones," which, though not of large dimensions, is of a very interesting character. The circle stands at the intersecting point of the three townships of Wavertree, Woolton, and Allerton. The name *Calder* is evidently a corruption of Anglo-Saxon *Galdor*, sorcery, enchantment. The rough Teutonic warriors, whose superstitions were of a different character, would be awed by the mysterious Druidical rites associated with the stone circle, and would naturally ascribe them to witchcraft. These stones offer a very remarkable example of the cup and ring sculptures which have so much perplexed the antiquaries to account for and explain.\*

In the dawn of history, during the Celtic occupation, the soil was comparatively barren and the population sparse. There are no visible remains of this period, and the evidence of place names is very restricted. We find two cases of *Ince* (*Ynys*), island; *Bryn*, an eminence; *Llandican*; *Knock-torum*; *Dove* (*dhue*). It is probable that the Saxons on their arrival found the district, to a great extent, waste. Several circumstances seem to lead to this conclusion. The counties of Norfolk and Lancaster are nearly equal in area. When they were divided into hundreds and parishes, probably about the end of the ninth century, some proportionate reference must have been made to the number of inhabitants. Norfolk is divided into thirty-three hundreds and 666 parishes. Lancaster has only six hundreds and sixty-six original parishes.

Again, the frequent occurrence in the names of places of the terms *Moss*,—*Moor*,—*Wood*,—*Carr*,—indicate a large extent of waste or uncultivated land.

There is no record of the date of the Saxon or Angle conquest of this district, but it most probably occurred during the latter part of the sixth century, under Ella, King of the Northumbrians, who reigned from A.D. 560 to 588. The settlers gave to the localities the usual Saxon nomenclature. There are the *tons*, the *hams*, the *burys*, the *leys*, the *ings*, the *worhs*, &c. We have not many remains which can be traced to Anglo-Saxon times. Oswald, who reigned in Northumbria from A.D. 634 to 642, had a palace or stronghold at Winwick, near which he was defeated and slain by Penda, King of Mercia. This is commemorated by a Mediaeval inscription on the church of Winwick. King Edward the Confessor possessed a castle at West Derby, about four miles from Liver-

pool, the site of which is still designated the Castle Hill.

The arrival of the Danes, and their settlement in this district on both sides of the estuary, had an important influence on the history of the locality, and forms a very interesting subject of inquiry. Little is said about it in our annals, but, by a careful comparison of the various sources of information, it is possible to put together a connected narrative of the circumstances. The Danes first appeared in English waters A.D. 787, when they harried the Southern coast. After a century of plunder they began to settle in the land, working their way westward and northward from the east coast. In 868, they had partially accomplished the conquest of Mercia, and established their head-quarters at Nottingham. In 877, the Danish fleet went west about, and plundered the coast of Wales. The tide of conquest then set in from the north by sea. The Hebrides, or Western Islands, the Isle of Man, and a considerable portion of the East and North of Ireland were captured by the Northmen. It is probable that the Danish settlements in the estuary of the Mersey date from this period,—about the latter end of the ninth century.

The Saxon Chronicle gives a very graphic narrative of the proceedings of the Danes in this district at that time. Under date A.D. 804, we read that "the Danes in East Anglia made a forced march across the country to reach their hrethron in Cheshire." The record states that, having committed their wives, their ships, and their booty to the East Angles, they marched on the stretch day and night till they arrived at a western city in *Wirheal*, that is called *Chester* (*Lega-ceaster*). "There the army could not overtake them ere they arrived within the work. They beset the work without for two days, took all the cattle that was thereabout, slew the men whom they could overtake without the work, and all the corn they either burned or consumed with their horses every evening. That was about a twelvemonth since they first came hither over sea." There is a singular reminiscence of this expedition in the name of *Knutsford*, or *Cnutsford*, in Cheshire. This is evidently of Danish origin; yet it occurs in the midst of a purely Mercian or Anglian district. It lies, however, in the direct track followed by the Danish forces, and, doubtless, commemorates the fording of a small stream, probably in flood, by the army under the command of *Knut*, a Danish chief,—not, of course, the great King Knut, or Canute. The next year, A.D. 805, the chronicle informs us, "the Danes went from *Wirheal* into North Wales, for they could not remain, because they were stripped both of the cattle and the corn they had acquired by plunder. They then went again out of North Wales with the booty they had acquired there, and marched over Northumberland and East Anglia, so that the king's army could not reach them till they came into Essex eastward."

About this time a very remarkable woman exercised an important influence in this part of the country. This was Ethelreda, the "Lady of Mercia," daughter of King Alfred, the wife, and afterwards widow, of Ethelred, Eorl-merman of Mercia. The peninsula of Wirral, in Cheshire, and the district between Chester and Ruworn, on the Mersey, formed a sort of debatable battle-ground between the Saxons, the Danes, and the Welsh, as the Britons began now to be called. At the end of the ninth century, the Britons had been pretty well driven beyond the Dee. The operations of King Edward the elder were ably assisted by his sister Ethelreda, who restored the city of Chester,—which had remained waste and desolate for three hundred years,—extending its area, and rebuilding the walls.

Ethelreda, to secure her possessions, erected several fortresses: one at Ruworn on the Mersey; another at Thelwall, near Warrington, to defend the passages over the river; and one at Warburton, in the direct track of the Danish invaders.

The land then had peace for seventy years, but in A.D. 980 we read that the coast of Cheshire was plundered by the Danes; and in 997, for the last time, North Wales was ravaged by a piratical attack. During this period the Danish nomenclature and institutions were becoming established in the district, which constituted an isolated Danish colony, separated from the eastern, midland, and northern Danes by intermediate districts purely Saxon. It is

\* The late Professor Sir James Simpson, of Edinburgh, wrote, in 1865, an article on this subject which will be found in the Transactions of the Historical Society of Lancashire and Cheshire, vol. xvii. He carries back the origin of the Calderstones to a very remote antiquity, ascribing them to a Tursanian race, which preceded the advent of the Celts or Cymry.

not difficult to trace their course. They must have arrived by sea and have left their mark in the names given to the salient points along the coast; Orme's Head, Carmarvonshire; Worms Head, Glamorgan; the islands of Bardsey, Ramsey, and Caldey; the Nase; Stackpole; the Skerries Rocks; the Point of Aire; Linney Head; with others. The Isle of Angles-ey and the Isle of Man were both originally called Mona, the modern name having been given to the former by the Danes to distinguish it as the island attached to the Angles. These invaders must have made the estuary of the Mersey their line of disembarkation, and thence have spread from each shore north and south. Evidence of this is manifest from various sources. Had they formed a single column from whatever point they had advanced, they would, like their predecessors the Saxons and Angles, have marked their course by the nomenclature of their settlements. This they have done, but the peculiarity in this case is that the place names are to a great extent duplicated, the same occurring on both sides of the Mersey. The *Thing-wall*,—the bill of counsel, the place of assembly, where the laws were made and promulgated and the armed forces mustered,—has its representatives both in West Derby and Wirral, where the eminences are still to be seen, crowned, one by a windmill the other by a modern mansion. The isolation of this Danish colony will be manifest on a comparison of the place names.

In South Lancashire the Danish names principally occur in the Hundred of West Derby. Going northward, in the Hundred of Leyland they are almost entirely wanting. Amounderness and Lonsdale are Danish; and, as we proceed into Westmoreland and Cumberland, the names of the parishes and villages are to a great extent Danish. Proceeding eastward from Cheshire, we find few or no Danish names in Staffordshire. In East Derbyshire, Nottinghamshire, and Leicestershire, which constituted the main portion of the ancient Danelagh, they are, as might be expected, predominant. The Danish names in Cheshire are principally found in the Wirral peninsula. Within these limits we find the suffix *by*, equivalent to the Saxon *ham*, such as Frankby, Pensby, Helsby, Formby, Withby; the *dals*, Ainsdale, Skelmersdale, Birkdale; the islets, Wallasey, Bewsey, Sankey, Aldersey; the eminences, Childwall, Heswall, &c. Many of these Danish names are common to both sides of the Mersey, as Kirkby, Meols, Ness, Roby or Raly, Crosby or Greasby. The Hundreds of West Derby in Lancashire and Wirral in Cheshire are of Danish origin. Derby (*Dyr-hy*) is the home of the wild game. Wirral (*Wir-hæl*) is from *Wir*, the sea, and *Halla*, a slope, which describes the district sloping on one side to the Dee, and on the other to the Mersey. The term *Hale*, with a similar significance, is found in place names in Lancashire and elsewhere. The Saxon "Hundred" was converted into the Danish "Wapentake," so called from the mode of acknowledging allegiance to the "Thing," or Court, by touching the spear of the chief, fixed erect as a sign of authority. The Wapentake Courts in West Derby and Wirral were continued down to a recent period. The most visibly prominent of the Danish relics hereabouts is the Great Stone of Thor, about eight miles from Birkenhead and two miles from Thingwall, on an eminence overlooking the Dee. The name of the place, "Thor-stane-ton," corrupted into Thurstaston, is indicative of its origin. It is a huge, isolated rock of red sandstone rising in the middle of a natural amphitheatre of four or five acres, scarped into shape by human hands. It corresponds in every respect with the recorded customs of the heathen Danes in the festivities and sacrifices annually made in honour of the God of Thunder. It is probable, however, that it was never completed. The conversion of the Danes to Christianity followed close upon their settlement in the latter part of the ninth century. The peace of Wedmore, between King Alfred and Guthrum, the Danish monarch, by which the Danes undertook to renounce heathenism and enter the Christian Church, was agreed to in 880. Soon afterwards, we find Christian churches rising up, with Danish names attached, in close proximity to Saxon communities. Such are West Kirkby, and Kirkby-in-Walley (now Wallasey), not far distant from Woodchurch; and, in Lancashire, Kirkby and Ormskirk, not remote from the Saxon Church-town. I have perhaps extended to an unreasonable length

these Danish reminiscences; but they are not generally noticed, and they throw considerable light on the early history of the district.

Of the period between the Norman Conquest and the Reformation, there are many remaining relics of interest to the archaeologist. The soil not being fertile, and the inhabitants few in number, this neighbourhood cannot vie in its ancient remains with the eastern and southern counties; and the rapid rise of manufactures and commerce during the last century has led to the destruction of many.

At the parcelling out of the great Norman fiefs, the peninsula of Wirral was included in the grant to Hugh Lupus, and the Hundred of West Derby fell into the hands of Roger de Poitou, a member of the great family of Montgomerie. Domesday Book has no specific record under the head of "Lancaster-Scire." The southern part is included in "Cestrescire," under the heading, "Inter Ripam et Mersham." The northern portion forms part of Yorkshire, but the record is incomplete. We obtain from this source a concise but graphic glimpse of the state of this locality about twenty years after the Conquest. We find that the extensive manor of Derbei (West Derby), with six *berewicks* or outlying hamlets, had belonged to King Edward the Confessor, and rendered in farm a rent of "xxvi ponds and ii shillings." Previous to the survey, the grant of Roger de Poitou had been forfeited to the crown, which retained the fief in its own hands. The Hundred of West Derby was granted in fee to forty-eight thanes, all of whom were under a custom to render two *ores* of twenty-four pennies each for each carucate of land. The thanes all bear Saxon names. They were under an obligation, like the *villains*, to maintain the king's houses, and the *hays* and *stands* in the wood. Whoever came not to these as he ought was fined 2s., and afterwards had to come to the work until it was finished. Each of them sent his mowers one day in August to cut the King's corn. If any free man committed theft, or *forestal*, or *heinfare*, he was fined 2s. According to the Domesday record, a considerable portion of this district was dense forest. In West Derby there was a wood six miles by three. In Latham, Melling, Lydiat, Crosby, and Woolton, there were woods from three to six miles long by one and a half to three miles wide. In Cheshire, such names as Woodchurch, Woodside, Birkenhead, and Holt Hill, indicate the existence of a large extent of timber. According to the old rhyme,—

\* From Birket Wood to Hilbere  
A squirrel might hop from tree to tree.

Owing to the circumstances of the case and the sparse population, there was no necessity for the means of defence adopted in more fertile districts.

We have no Norman feudal castles in this part of the country. Of Lancaster Castle little remains besides the entrance gateway and the flanking towers. The castle of Liverpool was erected by King John in the early part of the thirteenth century. It consisted of a number of towers or bastions connected by curtain walls, surrounded by a deep fosse cut in the rock. It was demolished about 1721, and St. George's Church erected on the site. The outline of the area is marked by the surrounding streets.

Another fortified mansion called the Tower was erected or fortified by Sir John de Stanley, the founder of the Derby family, in Liverpool, on the margin of the estuary. This was removed in 1819, and its place is now occupied by Tower Buildings. A castle was also erected by King John, at Shotwick, on the Dee, to guard the passage into Wales, which has entirely disappeared.

The ecclesiastical remains in the neighbourhood are not remarkable for stateliness, but are interesting from their associations. The principal monastic establishment is the Priory of Birkenhead, founded about the year 1153 by Ilamo de Massie, third Baron of Dunham, for sixteen monks of the Benedictine order. The remains are still standing, and will form an interesting visit during the Congress. Priors also existed in Lancashire at Burscough, Holland, and Wandleshaw, but have disappeared, leaving only fragmentary remains.

The churches are numerous, and many of them worth attention. In Wirral, Bebbington Church is an interesting admixture of Norman and late Gothic. Woodchurch is an admirable specimen of a village church, carefully maintained and lovingly preserved. West Kirkby,

Heswall, and Eastham will probably also be visited. On the Lancashire side there are several Mediaeval churches worthy of inspection. Sefton is a very complete example of late Gothic unaltered, with some good woodwork and a rood screen. Ormskirk is remarkable for its duplicate steeples, a tower and a spire side by side. Wigan has a fine old parish church with a grand tower. Childwall, Halsall, Angbton, Huyton, and Winwick will probably attract your attention. The latter has a good specimen of a chancel screen. At Lydiat will be seen an ecclesiastical structure, commenced just previous to the dissolution, and never completed.

Of nobleman's mansions, Knowsley Hall, the seat of the Stanleys, Earls of Derby, has many points about it worthy of notice. Old Lathom House, the seat of the baron de Jaillon during the Civil Wars by Charlotte de la Tremouille, Countess of Derby, was taken down about 1724, and the present modern structure erected in its place. Croxeth, the mansion of the Molyneuxs, Earls of Sefton, was erected about the beginning of the eighteenth century. Haigh Hall, near Wigan, the seat of the Earl of Crawford and Balcarres, is a modern mansion, which contained a rich and valuable library of rare and curious works, recently dispersed.

There are many manor houses scattered about this part of the country, which will well repay a visit. In Liverpool there formerly existed two: the Old Hall, within the precincts, which gave its name to Oldhall-street; and Bank Hall, outside the town, of which Bank Hall-street is a reminiscence. Both belonged to the family of Moore, anciently De la More. Bank Hall was a Mediaeval moated building, extending round three sides of a court, with a fine hall. It was removed about 1774. Speke Hall, the ancient seat of the Norreys family,—which will, I trust, be visited by the Congress,—is one of the purest specimens of half-timbered moated houses existing. The Mansion of the "Huttee," belonging to the Irelands, in the same neighbourhood, has little left except the entrance gateway and most, with a few other fragments, which show it to have been an extensive and noble building. Hale Hall, the seat of the Blackburnes, is a quaint brick building, and is worthy of a visit on account of the neat picturesque village attached. Lydiat Hall and Rufford Hall are good specimens of the black and white architecture. Poole Hall, in Wirral, is an interesting example of a Mediaeval mansion in stone. Hooton Hall is a modern building occupying the site of a fine old timbered mansion belonging to the elder branch of the Stanley family. The Hall, which has been unoccupied for some years, has many points worthy of inspection.

The City of Liverpool, to the outward eye, has little to interest the antiquary. There is not a building within its precincts two hundred years old. The scale on which it was originally set out was so circumscribed, its streets and ways were so narrow, and its buildings so mean, that, as commerce developed, the destruction of the whole or a large portion of the original structures became absolutely necessary. I have already mentioned the castle and the tower, both long since dismantled. The only other original building was the Parochial Chapel, now the Parish Church of St. Nicholas, erected in the fourteenth century. This was rebuilt in 1774, in the atrocious style of Batty Langley Gothic, leaving standing the tower and spire. In 1810 the spire unfortunately fell on a Sunday morning, burying in its ruins a large part of the congregation just assembled. In 1819, a new tower was erected, crowned with an open lantern, in a very satisfactory style of architecture.\*

The remainder of Sir James Picton's address mainly dealt with the Municipal History of Liverpool, of which we have spoken in reviewing his two interesting volumes of Memorials of Liverpool.

**Proposed Town-hall, Lewisham.**—A Town-hall is proposed to be erected at Lewisham, estimated cost 8,000l. We hear that Mr. Althert L. Guy has been appointed architect. The building will include shops, offices, large hall to seat 1,000, and two small halls, &c.

\* Imitated, however, from the lantern of the large and fine church at Newcastle, dedicated to the same saint.—Ed.

A CHAPELLE DES MORTS, AT AVIOITH, NEAR MONTMÉDY.

**T**HIS exquisite work of the fourteenth century is to be found at Avioth, a small village in the north-west corner of the department of Meurthe-et-Moselle, four miles from Montmédy, and not far from Sedan. It is situated at the angle of the village church, and near the entrance gateway to the cemetery, and is built upon a kind of raised platform, a little over 3 ft. high from the ground, unfortunately not clearly shown in our illustration, but explained by the annexed plan at P.

originally existed to receive the alms that the bystanders might give for the benefit of souls in purgatory.

The *raison d'être* of the raised platform would be clearly seen on the Jour des Morts, when an important mass is celebrated, and the priest, after it is over, descends upon the platform, and there exhorts those assembled to pray for the dead, and finally gives his benediction.

The clearstory was originally glazed in order probably to protect the lamp which undoubtedly hung from the apex of the vault, and was kept burning throughout the night, and probably used also at burial celebrations in the cemetery. Thus, this chapel may be regarded as an elaborate "lanterne des morts," so many

protect the living from the fear of ghosts and evil spirits, and to remind them to pray for the dead.

From this simple column it is not difficult to imagine how the idea became elaborated and developed until it attained the beauty and richness of the example at Avioth.

THE CHURCH OF VAL DE GRACE, PARIS.

WE give a view this week of this fine Renaissance church, which was one of the objects specially visited by the members attending the last Congress of French Architects in June of this year. The church was commenced in 1645, from the designs of François Mansard and Lemercier, and (its construction having been interrupted by political troubles), was completed twenty years under Lemuet, Gabriel Ledru, and Duval. The abbey with which it was connected is now transformed into a military hospital. Some further particulars in regard to it will be found in our report of the Congress. (See *Builder*, June 18 of this year, page 898.)

CHURCH OF ST. MARY STAR OF THE SEA, HASTINGS.

THIS church was founded by Mr. Coventry Patmore, by a donation of 5,000*l.*, and built by the Pious Society of Missions.

The material used in the walls is beach pebbles, with irregular layers of tiles. The dressings are of Bath stone. The church is situated in the upper portion of the High-street of old Hastings, in which the west end stands, and as the ground falls considerably towards the east, there are extensive crypts beneath, a portion of which was used as a temporary church during the erection of the superstructure, and is now converted into classrooms. The cost of the whole church was about 11,000*l.*

Mr. Basil Champneys is the architect, and Messrs. Bell & Sons, of Saffron Walden, were the contractors.

STONELANDS, SUSSEX.

THIS house, now nearly completed, is the property of Mr. F. Frank, and stands upon the side of a hill, about a mile from the village of West Hoathly, Sussex. Sheltered on the north and east by pine trees, it commands beautiful and extensive views to the south and west.

The outer walls are built entirely of sandstone, quarried upon the estate, and have a 2 in. cavity in the centre and an inner lining of brick. The roofs are covered with Broseley tiles, as is also a portion of the upper story.

Chapelle des Morts at Avioth. France

The lower part of the chapel is quite open, and has the altar enclosed in the recess (A), so arranged that, while it shelters the officiating priest from the violence of the wind and rain, it, nevertheless, allows him to be seen by every person assembled. On the left-hand side of the altar is a small corbelled piscina (B), and in the pavement of the centre of the chapel may yet be seen the position (C) occupied by a stone coffer of considerable dimensions, which

examples of which exist in the centre and west of Franco. Originally, they consisted simply of an isolated column, in the centre of which a lamp was raised some height, and was allowed to show its light for miles round by unglazed openings through the column. They were placed at the entrance of abbeys, monasteries, cemeteries, leper hospitals, charnel houses, &c., but almost invariably near some frequented main road; their use being to

The woodwork in the dining-room, shown in the illustration, is entirely of oak, and the other rooms are of corresponding character.

The wrought ironwork has been made by Messrs. Alfred Newman & Co., and the window casements are by Messrs. Wenham & Waters, of Croydon.

The whole of the contract, including entrance lodge, stables, farm buildings, &c., has been carried out by Mr. James Longley, of Crawley, from the designs and under the superintendence of Mr. Ed. W. Monufford, of Buckingham-street, Strand.

The drawings were in this year's exhibition of the Royal Academy.

#### FURTHER NOTES OF THE SALISBURY MEETING OF THE ROYAL ARCHÆOLOGICAL INSTITUTE.

We have already devoted so much space to the proceedings of this meeting\* that we must now bring our report to a close by some brief notes on such of the buildings and places visited as have not been previously referred to in detail.

First, then, with regard to Stonehenge. General Pitt-Rivers, Mr. Arthur Evans, the Rev. F. Duke, the Rev. Dr. Cox, and the Rev. Prebendary Seath all took part in discussing the probable date of the circle, but nothing new was advanced. General Pitt-Rivers and Mr. Duke argued in favour of the high antiquity of the structure, the latter gentleman incidentally broaching a theory of his own as to the origin of the word "sarsen," which he did not believe was a corruption of "Saracen," as commonly supposed. Looking at the fine sandstone of which some of these sarsen stones were formed, he believed that their name was derived from the nonn *sars* (so to be found in old dictionaries, such as Bailey's), which meant a fine sieve, the verb "to sarsen" meaning to sift through a fine sieve. The fineness of the sand of which the stones were composed might have led to the notion, on the part of untravelling natives, that the stones were composed of sand which had been "sarsed." From this it would be an easy transition to "sarsed-up" and ultimately to "sarsen." Mr. Arthur Evans agreed with General Pitt-Rivers that Stonehenge was of pre-Roman date, and spoke of certain resemblances between necklaces and other ornaments found in the barrows round Stonehenge and similar articles discovered at Bologna and other places on the Continent. Dr. Cox favoured the theory that the structure was of post-Roman date, and that it was erected in the fourth century A.D. as a trophy of victory gained by the British tribes in driving away the Romans.

Amesbury [or Ambresbury] Church, visited on the same day, is a very interesting building, which was described by the Rev. Precentor Venables. It is unusually lofty for an aisleless Norman church. The general character of the chancel, transepts, and crossing is Early English, the chancel being much the staliel part of the church, which was monastic. The south-western pier of the crossing affords evidence of having been strengthened in consequence of some structural failure. There is a very fine Norman corbel-table. In the chancel are two fine Decorated windows, with reticulated tracery.

Mr. Micklethwaite, in the course of some remarks on the church, adduced reasons for supposing that there was originally a Saxon church on the site, and he called attention to the absence of the screen, which, he stated, was removed when the church was "restored," some years ago, when some one conceived the idea that the screen ought to be removed. Fortunately, it had been carefully preserved in its entirety by Mr. Edwards, a local gentleman, who had, indeed, built a museum for its preservation. It was in very good condition. Mr. Edwards authorised him to say that whenever the vicar and churchwardens saw fit to re-erect it in the church it was at their service.

Mr. Greville Chester said that it was his idea that, according to the Rubric of the Church of England, it was illegal for a chancel to be without a screen. This view was endorsed by other gentlemen, but as the discussion appeared likely to lead to warm controversy it was not pursued. The church was stated to have been restored by Mr. Butterfield. Mr. William Cove

Kenn, of Amesbury, who was present on the occasion of the visit of the Archæological Institute, has kindly forwarded us an interesting paper read by him, in 1876, at the Salisbury meeting of the Wiltshire Archæological and Natural History Society. To this paper we may refer our readers for a detailed history of the church.

Lake House, visited on the way from Stonehenge, by permission of the owner and resident, the Rev. E. Duke, is a very pleasantly-situated and picturesque residence, of late Elizabethan or early Jacobean date. It is of moderate size, and very suggestive of Shaw House, near Newbury.

Of buildings in Salisbury itself, visited by the Institute, we have already described St. Thomas's Church. We have also to mention in this connexion the interesting Poultry Cross (partially restored some years ago); the "Hall of John Halle," now serving as the principal show-room of a china and glass merchant on the canal, but formerly the hall of a merchant's residence, dating from about 1470. It was very conservatively restored by the elder Pugin, and contains a specimen of his handiwork as a painter. (Referring to Pugin, we may mention that while on one of their carriage excursions near Salisbury the visitors passed a house of very pronounced Gothic character which was said to have been built by Pugin as a residence for himself. It is now called "The Grange"; whether moated or not we could not learn, but some member of the party said that as built by Pugin it was entered by a draw-bridge). Another interesting building in Salisbury which was visited by the party is what was formerly known as Audley House, an interesting old mansion partly dating from the second half of the fifteenth century. Within the last two or three years it has been acquired for the purpose of a "Church House" for the diocese of Salisbury, and has been very conservatively restored by Messrs. Crickmay & Son. It is admirably adapted for its new purpose, several of its fine rooms being well suited for council meetings, committees, &c., while other rooms serve as offices, libraries, secretaries' rooms, &c.

Downton Church, near Salisbury, was inspected under the guidance of Mr. R. P. Pullan and the Rev. W. D. Hill, the vicar. Mr. Hill, in the course of his paper, said that the size and dignity of the church, and especially of the chancel, were not due to connexion with any monastic establishment. The bishops of Winchester were lords of the manor in Saxon times, and to their care and interest we were probably indebted for the building of the church. In 1382 the church was appropriated to "the Bishop's table" for the maintenance of William of Wykeham's scholars, and in 1385 William of Wykeham (with the licence of the Crown and of Pope Urban VI.) appropriated it to his now College of St. Mary-Winton at Winchester, to which it continues to belong. The church presents three distinct periods of building. The oldest is that of the western part of the nave, in which we have three bays with late Norman arcade and pointed arches. The capitals on the north side are original; those on the south side are mainly modern imitations, in cement, of the old work. Two lofty bays of Transitional character form the eastern extension of the nave. The eastern tower arch is a fine specimen of Early English work, with clustered shafts and rich mouldings. The chancel is of the Decorated period.

While at Downton the party visited the very curious earthworks known as the "Moot," which were explained by General Pitt-Rivers and the occupier, Mr. E. P. Square, F.S.I. They are now very thickly planted with trees, but an old sketch or print is extant, dating from about 180 years ago, showing them devoid of any trees whatever. The curiously graded oval enclosure, forming a sort of elongated amphitheatre, was, it is believed, formerly the place of assembly or moot. During this day's drives, Longford Castle (described in a paper by Mr. J. A. Gotch which we printed a fortnight ago) and Trafalgar, the seat of Earl Nelson, were taken en route, for the purpose of external inspection.

Wardour Castle, visited on the 6th inst., by permission of Lord Arundell of Wardour, is a late specimen of castellated architecture, and the keep is unusually lofty. It received some Renaissance embellishments at the hands of Sir

Matthew Arundell, and some of these, especially an internal doorway, are in picturesque contrast with the more massive Gothic work above and around them. The old castle suffered much during the Civil Wars. Subsequently the visitors proceeded to the modern house known as Wardour Castle, which was designed by Pugin about a century ago. Much of the detail, internally is suggestive of the work of the Brothers Adam. Lord Arundell's valuable collection of pictures and *objets d'art* were thrown open to the inspection of the visitors.

Tisbury Church, which was subsequently visited, is a building of some architectural interest. The upper stage of the tower is somewhat curious, and was built about 1201, years ago to replace the spire, which had been destroyed by lightning. Some of the visitors thought it ugly, but Mr. Micklethwaite expressed the hope it would be suffered to remain, as it was a most ingenious piece of construction, of lighty built of stone; it was mainly supported by an ingenious framework of timber to relieve the lower stage of the tower (which had been badly crushed by the fall of the spire) from its weight.

The visitors next proceeded to Wilton House, by kind permission of the Earl of Pembroke. The south front was rebuilt by Inigo Jones, and at the same time (according to Mr. Nightingale) the wings of the east side were brought somewhat into harmony with it. The central portion of the east front is very suggestive of the old Examination Schools at Oxford. The so-called "Holheim's Porch" in the gardens, and the graceful Palladian bridge are among the other architectural attractions of the place. The fine collection of pictures and antique sculpture in the house were inspected with much interest.

Wilton Church, hard by, was visited as a notable specimen of a modern church, built mainly on the lines of the Italian Basilican churches. It was built some thirty years ago at the cost of the first Lord Herbert of Lea, the architects being Messrs. Wyatt & Brandon. It has a lofty campanile, and contains a great deal of old glass and mosaic work brought from Italy. Canon Olivier read a paper fully describing the church.

Heytesbury and Knook Churches, both of which have been restored by Mr. Butterfield, and Heytesbury House, were also visited.

The last day's excursion was to Rushmore, where the visitors inspected General Pitt-Rivers's excavations at Woodcutts, a Romano-British village, where discoveries of considerable interest have been made.

#### FLAMSTEAD CHURCH, HERTS.

The following is the greater portion of a paper on this church, read by Mr. S. Flint, Clarkson, at the recent meeting of the St. Albans Architectural and Archæological Society:—

"Totternhoe stone and flint were used in this original work of the church. Totternhoe, in Beds, is situated under the slopes from the west side of the table-land, on the eastern edge of which Flamstead is placed. Rough-cast basalt was applied with much liberality to the external surfaces of the building, covering up both wrought stone work and flint work. Dampness, decay of surfaces, and odd taste are probably responsible for this in about equal proportions. Ashlared buttresses, stone dressings, to openings, and split flint work remain visible in the vestry building. The chancel basalt wrought stone work to windows and buttresses, and split flint wall surfaces, having been restored about 1860 by the University College, Oxford; the rectory was given to the College by the will of the Rev. Robert Gunshoy, incumbent of the church, who died in 1618. The six arches in each of the nave arcades are all carried on octagonal piers. The scale is unusually small, the distance from centre to centre of pier being only 10 ft., and the height between cap and base 5 ft. 10 in. The tower at the west end is just upon 23 ft. square externally at the top. The chancel is 16 ft. 3 in. wide, and of fair length. A tall perpendicular wood-screen, solid for about 4 ft. of its height, and open above, with nine divisions in its width, runs across on the nave side of the chancel arch—Sedilia, piscina, and an external doorway are found in the south wall. In the north wall at door leads into a vestry. At a little above mid-height in the lofty room the stone corbels remain which once carried a floor. The sight,

\* See pp. 209, 223, 266, ante.

\* Notes on Amesbury Church and Abbey.

† See p. 233, ante.

on explains what looks curious in the arrangement of the windows as seen from outside. A minaret room is found not rarely in a vestry in this way. The history of the tower is not clear at this moment in all respects, but it has been a good deal altered, and rough-hewn brick patches now hide some evidences of date. There are, as far as we know, no contemporary documents, with allusion to the church, on which conclusions or guesses might rest. The profiles of the arches, the cap and of the hood-mould of the arch in the east wall of the tower show that there was a Norman tower, and therefore a church of an early date. Possibly a good deal of the present tower is of the Norman period, with its openings and added buttresses; how far in Norman we cannot see through the masonry, &c. A year cannot be named for the work, as the archway is filled in with masonry. In the centre of this filling-in is a small archway, only 7 ft. 9 in. between the piers, of Geometrical date, say about 1260. Crumbling of the old tower may have begun, and the larger arch may have been filled in as a precaution against further failure. The tower has been helped at various times since by brick buttresses and iron ties. The nave dates must be dated at about 1195; they are beyond the period of Transition. The most worthy feature in the arcades is the foliage of the caps and responds; the ten caps of piers and four responds are all carved. They are in design throughout, some of the good being of much merit. The leaves are ventral, some of the capitals at different angles, being lost some of the stiffness and most of the adherence to the bell which characterise the foliage of the Transition, as far as any rate about the year 1175; but the leaves are still full and somewhat stiff, and are not fully rounded and downward-bending as the leaves in the Lancet. The Lancet window remaining the north-west corner of the chancel would lead us to believe that a Lancet chancel,—it is shorter than the present chancel,—was added in to the Lancet nave. The arch now opening from the nave into the tower has been dated as of Geometrical date (about 1260), the windows, sedilia, and piscina in the chancel have been restored, but they no doubt represent in the main the original work of that date of the building and the chancel arch the original work, that is, Curvilinear work about 1330. The chancel was either added to or remodelled at that time. The chancel roof may well belong to the same old. It is a high-pitched roof in three bays, with purlins, collars, collar braces, and wind-caps, all plain in the extreme. The present sturkey is a later addition. A somewhat gaily-sloped set-off may be seen above the east-story arches. The upper wall is thinner in the earlier work below. The roof of the tower is a plain low-pitched roof, with strong rafters plainly chamfered only. The carving of the corbels under the wall-pieces is not numerous; some have angels bearing shields, and some grotesques. The principals centre in proper way with the columns of the arcade; but in the aisle roofs the principals disregard the arcade in the most determined way; the aisle roofs are also plain, and have plastered ceilings. The wooden screen between the nave and the chancel is well moulded and fairly good. There are remains of the old colouring on the division on the north of the central opening; graining and varnish have not been spread on the rest. There are a few old benches in the easternmost bay of the nave, of a simple kind, showing for injuries, neglect, and reparations, a church is much as it was in the sixteenth century; no important structural changes have been made since then. The communion-rail is heavy oak one, supported on turned balusters twisted, apparently early eighteenth century work. The pulpit was moved to its present position against the north-east respond of the nave, and the (characterless) tall pews were ordered 1 ft. 6 in. about 1859, under the care of the Rev. W. H. Hinde, a benefactor to the parish, who held the living from March, 1858, to June, 1875. The second pier from the east on the north side was roughly dated when the pulpit was placed against it (in the position from which Mr. Hinde moved it), and it has been ingeniously suggested that the signs of rough usage on the opposite pier (that side of nave) may be due to the pulpit being tried there before being put

on the north side. There was a narrow gallery at the west end, which was removed about six years ago; its erection and its removal did little damage, but the erection of the canopy, now removed, over the large pew at the south-east corner of the nave, caused serious damage to the stone respond of the arcade. Making all explanations and allowances, it must still be noted that the building is not in good order; that, in fact, it should be a pleasing example in the eyes of the sentimentalists who delight in unretarded decay and slovenly backing and patching. The bells are six in number. Five of them have the inscription, "Chandler made me, 1664;" the sixth, "John Waylett, London, fecit. 1729." "Chandler made me" seems to be a favourite inscription of these founders. Their foundry was at Drayton Parslow, Bucks, about midway between Leighton Buzzard and Winslow; and from it were supplied a good many bells for this neighbourhood when the rush of business came at the Restoration. The earliest bell from the foundry now in Hertis is dated 1651; this would be by Anthony, the second of the Chandlers, born 1622. The competition of the great London foundries led to this one being given up in 1723. When Edward Hall, who thus gave up the struggle, died in 1735, he was described in the parish registers as "a poor bell founder." Mr. North, in his "Church Bells of Hertfordshire," suggests that the "four bells and a Sanct Bell, in the steeple" in 1552, were probably recast by Chandler in 1664 into the five bells now existing. The font is of Tottenhoe stone, and is said to be the original font, shaped afresh as we see it between thirty and forty years ago. There are two recumbent effigies under the third arch from the chancel on the north side of the nave. A pinnacle runs down on each side, and a cusped crocketed canopy with embattled cornice rises up behind the head of each of the figures; all being nicely designed and well executed. The figures have loose robes, feet supported by dogs, and a scroll runs from dog to dog. I hope the Rev. H. Fowler's careful study of this monument may tend to some identification of the persons commemorated. Its date is evidently about the end of the fourteenth century, when the manor was held by the Beauchamps. The brass on the chancel floor in memory of John Oudeby, some time rector of this church, who died 7th March, 1414, has a good figure under a canopy. The Beauchamps were lords of the manor of Flamstead from 1316 to 1471; and the rectory and right of patronage were till 1487 vested in the lords of the manor. Oudeby was, it is stated on the inscription, Canon in the Collegiate Church of St. Mary in Warwick, in which the Beauchamps took so much interest. The choir of that church is said to have been built by the second Thomas Beauchamp about 1392, and Oudeby, no doubt, did duty in that choir. Of the wonderful Beauchamp chapel he, of course, knew nothing; for the Richard Beauchamp who devised the building of that chapel, and fixed the spot for its founding his lifetime, died at Rouen in April, 1439. The foundation was laid in 1443; it was completed in 1464, and consecrated in 1475. The generous interest in buildings, "well, fair and goodly built," of these great nobles seems, however, to have expended itself without Flamstead gaining any thing akin at their hands. The two small brasses of about 1450 represent a man in civil costume and his wife and children. The inscription and four shields have disappeared. The rhyming inscriptions on the stone piers of the nave arcade are so old that they must be noticed. Their dates are 1596, 1597, and 1598. They can hardly be the crowned works of a fraternity of parochial versifiers. No doubt some one person, with a suitable pocket knife, a love for rhyming, and a pride in both, was responsible. Here is a specimen, on the easternmost of the piers on the south side of the nave:—

"Within thisyle  
Where bricks are laid  
There lieth buried  
A virgin mayde  
Frauncys Cordall  
Was hir name  
She lived and died  
In godlye fame  
Año. 1597 June VII."

This Frauncys Cordall, who died in 1597, was most likely a sister of the George Cordall, born 1569, eighty-four years old in 1653, whose virtues are recorded in another position. Something should be ascertained as to the Cordalls, John Grigge of Cheverill's End, John Pace, Sir Bartholomew Fovke, and I should be glad to

have assistance in ascertaining it. The monument to "Sir Bartholomew Fovke, Knt. [died 1604, aged sixty-nine], who served Kinge Edward, Queene Marye, and was Mr. of the Household to Queene Elizabeth for many yeares, and to King James that now is," is just at this junction of the east and south walls of the chancel. A small figure of a knight in armour is kneeling at a desk. The monument is in alabaster, with little obelisks of red marble, and was erected by "Edward Fovke, gent.," his brother. At the east end of the south aisle is a large monument of black marble, with figures in white,—a bit of solid history, but not a beautiful work. The Thomas Saunders, of Beechwood, commemorated, died in 1693. He was the grandson of the first Saunders who came to the parish. About 1579 Beechwood was in the possession of a Thomas Saunders, son of John Saunders, of Amersham. Anne, the daughter of the Thomas Saunders who died in 1693, is one of the figures in white marble. She is kneeling in the front, away from the figures of the other children who died in her father's lifetime. Anne [born 1670, died 1719] was married to Sir Edward Sebright, of Bedford, co. Worcester, Bart., born 1666, died 1702. The baronetcy dates from 2 Car. I. (1626). The wife of Thomas Saunders and mother of Anne, was Ellen, daughter and heir of Robert Sadlier, of Sopwell, St. Albans. Sopwell came to Thomas Saunders in this way: it was sold by him to Sir Harbottle Grimston (died 1683). It has apparently escaped notice hitherto that, at the foot of the monument in the east portion of the north wall of the chancel, is inscribed, "1382, John Flaxman, fecit." The memorial inscription contains the names of six Sebrights, ranging from Sir Edward Sebright, the third baronet, husband of Anne Saunders, died 1702, to Sir Thomas Saunders, who died in 1764, with mention of Dame Henrietta, who did not die till 1772. The monument was executed during Flaxman's seven years' absence in Italy, and when he was twenty-seven years old. Perhaps it was carried out in England from a model sent from Italy. Several funeral monuments were produced in that way from his models,—notably that of Collins in Chichester Cathedral. Faith reclines on the east side of the urn, which is placed in the centre at the top; and Hope with an anchor reclines on the west side. The figures are less than life size, the extreme distance from toe to toe is only 7 ft. 4 in. The effect is conventional enough to us in these years, but there is an engaging earnestness and simplicity which will always make the work worth looking at. Not, of course, that the powers of the greatest designers of sculpture England has produced are fully shown here, for the monument was designed in the early days of mastership, with figures in the round which were never Flaxman's forte, and was probably executed under adverse circumstances. The large Pickford tomb in the north-east portion of the graveyard has less than no interest as a design, but should be noticed as a memorial of the founder of "Pickford and Co.," who started at Markyate-street, in the parish of Flamstead, what was afterwards developed into a great system for conveying goods by road, a couple of generations or more before railways came to the aid of his successors. Thomas Pickford departed this life on the 21st day of September, 1811. We have at Flamstead a good specimen of a method of finishing a church tower, of which there are several examples in the district. A spire is always in idea a high-pitched pyramidal or conical roof covering the whole, or nearly the whole, area of a tower. But this tower has lead gutters inside the piers, and a lead flat inside the gutters, and in the centre of the lead flat is a spirelet (see sketches) with very steep sides, showing in a general view as a thin finger pointing upwards, contrasting in an agreeable way with the simple square outlines of the good-sized tower. There are no distinctive details by which the date can be settled with certainty. I should be much pleased to receive notes, with reference to accurately dated (or dateable) examples, of flat roofs and central spirelets of this sort. The size of the tower at the top is 22 ft. 9 in. by 23 ft. 2 in. externally, and the spirelet is octagonal on plan, and 5 ft. 9 in. across; the sides of the octagon are thus about 2 ft. 6 in. Four of these sides are parallel to the four sides of the tower. Chaucy in 1700 found "a square tower, wherein is a ring of bells, and a shaft or spire about 20 ft. high, erected upon

the tower covered with lead,"—the total height to the top of the vane is evidently more nearly 30 ft. than 20 ft. The central portion of the tower roof is carried by a beam 12 in. by 13 in., running in the centre from north to south, and by beams 10 in. by 11 in., parallel to this beam, and at a distance of 3 ft. 4 in. from it. Bearers 7 in. deep and 6½ in.

Spirelet, Flamstead Church.

Plan at Base of Spirelet.

Plan looking up

wide, put diagonally from the side beams to the central one, form a square placed anglewise in the centre of the tower; and from these diagonally-disposed bearers 7 in. by 6 in. pieces start in the centres of the north, east, south, and west sides of the spirelet, also 5 in. by 6 in. shaped pieces at its angles, and 4 in. by 5 in. bearers in the centres of the other sides of the octagon. The space between the

inclined timbers is thus less than 12 in. at the bottom, and, of course, is less and less upwards. These 4 x 5 x 4 = 16 pieces, which make out the shape of the spirelet, abut at their upper ends against an upright post 9 in. by 9 in., placed in the exact centre of the tower. This upright post is framed into the 12 in. by 13 in. carrying beam, and runs up to the vane. The tendency to alteration of form by the wind's action is counteracted by raking braces, 5½ in. by 3 in., running parallel to the cardinal side of the octagon, and secured at their ends to the 7 in. by 6 in. bearers which run up the centres of the cardinal sides. As these raking braces pass the central upright, at distances of about 4 ft., something is cut out of each, the braces thus pressing shoulders against the upright. Battens, 5 in. by 1 in., and 2½ in. apart take the lead covering. There are lead rolls at the angles; and lead rolls, making diagonal lines between the pieces of lead for about two-thirds of the height, give an easy variety to the surfaces; above that level the sides of the octagon have become narrow, and single pieces of lead are used. The extreme length of the longest bit of lead in the lower part of the covering is about 2 ft. 10 in. The access to the flat roof of the tower is by a ladder placed in the centre of the bell-chamber, and by a short and narrow door in the north-east side of the spirelet. Additional height would have been convenient, but that would have forced the door into an awkward prominence when seen from the village street, unless the diagonal lines of the rolls had been continued over it. Starting the timbers of the octagon upon a framed curb secured against any change or form, and some additional horizontal bracing at different levels, also a better way of banging the lead, might be suggested; but, although of course nothing unusual, the general construction is simple and effective. Descriptions and old examples being somewhat rare, I have ventured on a rather minute account of this, stating or implying in going along the reason for each detail.

GLASGOW ARCHITECTURAL ASSOCIATION.

A MEMBER sends us the following account of the first sketching excursion made by the members of this Association:—

"During the latter fortnight of July a small party of members of the Glasgow Architectural Association made the first architectural excursion under its auspices, and the results, on the whole, were of such a satisfactory nature that there is little doubt that it will form the first of a series of annual architectural tours. It was ultimately agreed that Cheshire might prove a happy hunting-ground, and to Cheshire it was accordingly decided to go.

To Chester, via Liverpool, and on as far south as Nantwich, from thence by a more easterly route to Manchester, and so back to Glasgow, was finally the programme which found most acceptance. The choice of this route was made chiefly on account of the half-timber work in which this county is so rich, and which forms so important a part of the Domestic architecture of England; even in the northern kingdom it is not without its modern followers. On Thursday, the 14th of July, a start was made, our first stoppage being Liverpool. Here we were much delighted with St. George's Hall, both the exterior and interior occupying our best attention.

The drawings for the Liverpool Cathedral and the paintings in the Walker Art Gallery were also examined. Speke Hall, about seven miles from Liverpool, was next visited, and a considerable amount of sketching done by the members. This was our first introduction to real old half-timber work, and during our tour we did not see a finer example. It is built round a quadrangle and surrounded by a moat, and is comparatively early work, its details being generally of a Gothic character, differing in this respect from most of the remaining half-timber we afterwards saw in Chester, which was of a more Classic or Renaissance nature. Chester was our next place of halt, and we stayed here four days. The thanks of the Association are due to Mr. Lockwood, architect, in Chester, for the kindly interest he took in our procedure and the useful information he gave regarding the places most worthy of our attention; also to his assistant, Mr. Bewick, who went over the ground with us and without whom we should have missed much.

At Chester we measured Stanley House, one of the best examples of timber work, and numerous sketches were made in Bridge-street, Whitefriars, St. John's Church, and the Cathedral. Several of the modern buildings in Chester were also much appreciated. From Chester we went to Nantwich and stayed there for two days. Here there is also some half-timber work, but the parish church is distinctly the most interesting building, and received most of our attention. The octagonal central tower and the stone pulpit and screen are specially admired and, of course, sketched. At Sandbach, which we next visited, there is an interesting half-timber hall, now used as a hotel, a Perpendicular church restored by Sir Gilbert Scott, and two old crosses standing in the Market-place. With Congleton we were disappointed, as there is not much of interest there, but it is a good centre for viewing places of interest in the vicinity.

Astbury Church and Moreton Hall were visited from hence, the latter pleasing us exceedingly. It is now occupied as a farmhouse, and is rapidly falling into disrepair. The hall is approached by a stone bridge leading direct into the courtyard over the moat, which is still filled with clear water supplied by a spring. There are several octagonal hay windows in the courtyard, which rise through two stories, and each side of which is finished with a wooden gablet and bargeboard. Some of the tie-beams of the gables are elaborately carved in a very spirited manner. The principal feature of the house is the ball-room, which occupies the third story, and is about 80 ft. long by 10 ft. broad. Along the entire sides of this ball-room is a row of windows filled in with leaded clear glass, the patterns of which are many and varied. From Congleton we walked to Macclesfield, by way of Garswood. Garswood Church is a most interesting Perpendicular example, and is splendidly situated. The wooden roof of this church and the decorations of the beams are specially good. There is also a good half-timber hall here. From Macclesfield, which is quite uninteresting, we went to Adlington to visit the Hall there, but as the occupant was engaged with company, we could not see the interior. Our regret at this was great, as we understand it is one of the sights of the shire. We next proceeded to Bramhall, now being restored under the directions of Mr. Charles Nevill, the proprietor, in a very thorough manner. Mr. Nevill was kind enough to show us over the hall, explaining to us his restorations and the data on which he was proceeding. This hall is a very extensive one, and has somewhat the same arrangement of gables in the front as Speke Hall. Some of the original decorations of the house have been lately discovered, and are very interesting, the colour being specially well preserved. From Bramhall we came on to Manchester, and visited the Exhibition there. This finished the first Glasgow Architectural Association tour of any duration, but we hope to make it a permanent part of our programme of work, and thereby increase the usefulness of the Association and the enthusiasm of its members.

**Memorial to the late Hon. Thomas Grosvenor.**—In the secluded churchyard of Northwood, on the border of More Park, Rickmansworth, has just been erected, in Sicilian and Cipolino marbles, a memorial of the late Hon. Thomas Grosvenor. It consists of a pierced and elaborately-carved railing surrounding the grave. Each side is formed into three panels; the centre one has a cross surrounded by Cipolino; on each side of this the panels are delicately pierced. The foot of the memorial contains the inscription-panel, surrounded by highly-worked piercing. The head consists of a pierced cross and the letters A.P.C. within a circle, and two carved scrolls of the vine, carved on both sides, and springing from a chalice at the base. The work was designed by Mr. E. J. Poynter, R.A., and has been executed by Mr. Henry Terry, sculptor, of North Brixton.

**Durlston Head.**—On the 13th inst. the Crown Princess of Germany, with Sir Henry and Lady Ponsonby and others, visited Swanage. The party, on arrival from Cowes, drove through Durlston Park to Durlston Head, where they inspected the pavilion designed by Mr. Reginald Pinder, F.R.I.B.A., and other works now being effected there by Mr. George Burt (ex-Sheriff of London), of Purbeck House, to whom the property belongs.

The Student's Column.

AND SURVEYING AND LEVELLING.

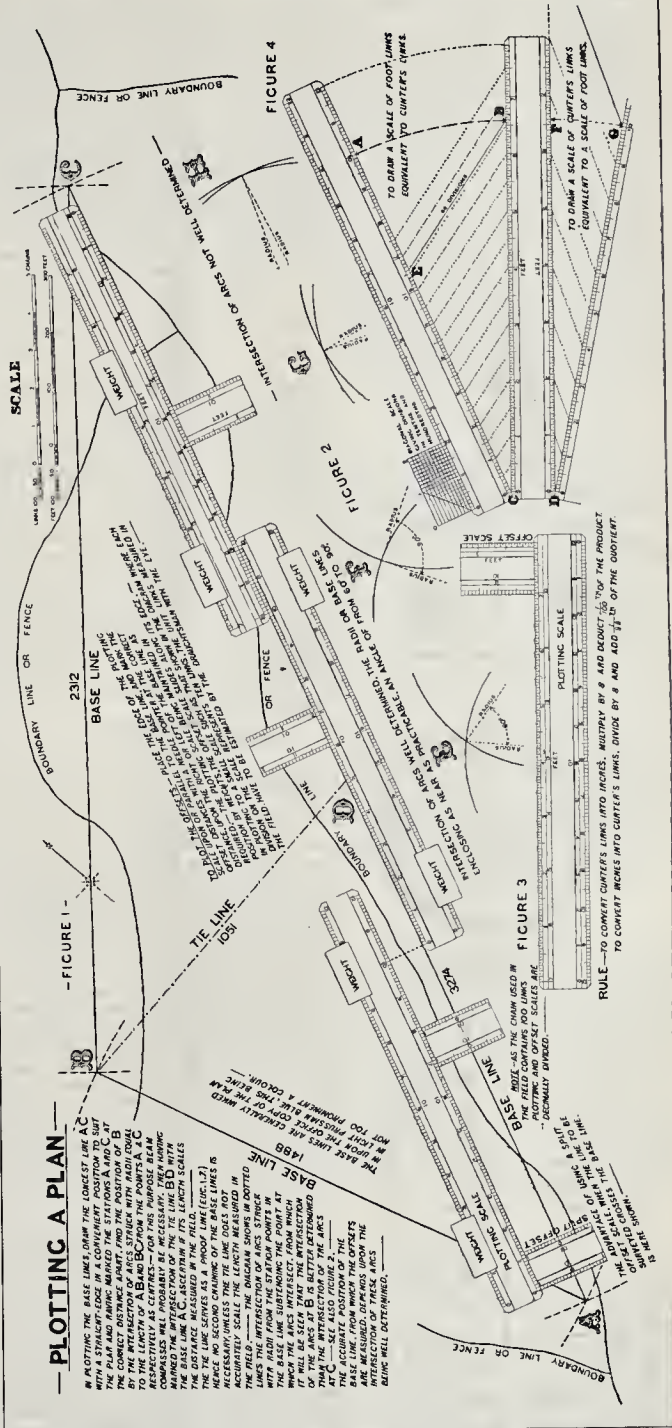

IX.—PLOTTING A PLAN.

IN chain surveying the accurate position of base lines from which offsets are taken, depends upon the intersection of measured distances. In fig. 1 the base lines B C, C A, measure respectively 14 chains 23 links, 23 chains 12 links, and 32 chains 2 links. The plan need not necessarily be laid so that the top of the paper represents direct north, as in an ordinary map; but lines should be placed in the most convenient position to suit the shape of the survey. It generally he found best to commence by laying the longest base line with the aid of a right edge. The position of the stations B and C at a distance of 3274 links (see fig. 1) are then marked with a needle pointer (see fig. 2) upon the line A C, and are temporarily marked for future reference in the process of laying out by surrounding the station point with a circle drawn in pencil, as shown at the station marked A and F in fig. 8. The position of the station at B is next determined by striking an arc from the station at A with a radius equal to 1488 links, and then intersecting it with an arc having a radius equal to 2312 links struck from the station at C. Figures 5 to 14 will appear in our next article.

Fig. 2 illustrates four different positions of the needle pointer for the determination of station points. In the first position, those at E and F are clearly defined, while those at G and H overlap one another to such an extent, that it is difficult to accurately mark their exact point of intersection. The angle between the base lines should, as near as practicable, be not less than 60° or more than 90°. If the sides of the angle A B C have been correctly measured in the field, and accurately plotted to scale; the tie line B D drawn from station B to 1580 links in the line A C should scale the length measured in the field, namely 10 chains 10 links.

If the chain used in the field contains 100 links, plotting and offset scales are decimally divided. The subdivisions upon the edge of the scale read simply a certain number to the inch marked upon the scale. Thus in the scales shown upon the line A C the mark 10 simply means that there are ten equal subdivisions to an inch. If, therefore, the scale to which the divisions are to be plotted be a scale of one chain to an inch, each subdivision upon the scale would represent ten links, and the unit lengths would have to be estimated by the eye. In some scales, divisions marked "feet" are shown upon one edge, which is intended to give the equivalent of foot links corresponding with the scale of Gunter's links marked upon the opposite edge. On reference to fig. 3 it will be seen that a scale of 3 Gunter's chains or 198 ft. (3 by 66 ft.) is nearly the same length upon the scale as two chains (200 ft.) upon the edge marked "feet." If the chain used in the field be the "feet" or any foot-divided chain, and the plan plotted to a scale of feet, with the use of the scale of decimal equivalents to an inch, the divisions marked feet upon the opposite edge of the scale mean nothing; but if the chain used in the field be a chain of Gunter's links, and the plan plotted to a scale of one chain to an inch, with the use of a scale containing ten or more divisions to the inch, then measurements taken with the edge of the scale indicating feet, will give the equivalent length in foot links. Sometimes it is useful to plot with a scale of links equal to a certain number of feet to an inch, when Gunter's chain has been employed in the field, and it is desired that the scale of the plan shall, for future reference, be an exact number of feet to one inch.

Fig. 4 shows the method of graphically converting a given scale of feet to a required scale of Gunter's links, and also a given scale of foot links to a required scale of feet. To draw straight lines, C A and C B, intersecting at C, are drawn at any angle apart. About 30° a Gunter's links is applied to the line C A and its subdivisions are pointed off upon this line. From C as centre with C A as radius, an arc distance C A is transferred to B. A line then drawn from sixty-six divisions upon the scale of Gunter's links to the point B, and the line C B, representing the length of one

— PLOTTING A PLAN —

IN PLOTTING THE BASE LINE, DRAW THE LONGEST FIRST, AND THE OTHERS FROM IT. THE CORRECT DISTANCE MARKED THE STATIONS A, B, AND C, AT THE POINTS OF INTERSECTION OF THE LINES A C AND B C, AND THE POINTS A, B, AND C, RESPECTIVELY AS CENTRES—FOR THIS PURPOSE BEAM COMPASSES ARE USED. THE POSITION OF THE STATION AT B IS DETERMINED BY SURROUNDING THE STATION POINT WITH A CIRCLE DRAWN IN PENCIL, AS SHOWN AT THE STATION MARKED A AND F IN FIG. 8. THE POSITION OF THE STATION AT C IS NEXT DETERMINED BY STRIKING AN ARC FROM THE STATION AT A WITH A RADIUS EQUAL TO 1488 LINKS, AND THEN INTERSECTING IT WITH AN ARC HAVING A RADIUS EQUAL TO 2312 LINKS STRUCK FROM THE STATION AT C. FIGURES 5 TO 14 WILL APPEAR IN OUR NEXT ARTICLE.

hundred Gunter's links, is then subdivided into sixty-six equal parts representing 66 ft., by drawing lines parallel to E B from the subdivisions upon the line C A to the line C B. Thus a series of similar triangles is formed, and a scale of feet equivalent to the given scale of Gunter's links is arrived at. Conversely to

draw a scale of Gunter's links equivalent to a scale of foot links, sixty-six divisions upon the line D F are transferred to the line D G, which is then subdivided into 100 parts by drawing lines parallel to a line joining the point G with the length of 100 divisions from D, measured in the continuation of the line D F.

RULE—TO CONVERT GUNTER'S LINKS INTO INCHES, MULTIPLY BY 9 AND DIVIDE BY 100 OF THE PRODUCT. TO CONVERT INCHES INTO GUNTER'S LINKS, DIVIDE BY 9 AND ADD  $\frac{1}{10}$  OF THE QUOTIENT.

**KINGSTON HOUSE, BRADFORD-ON-AVON.**

SIR,—Mr. F. Shum, F.S.A., in his paper on Kingston House, Bradford-on-Avon, read before the Archaeological Institute, and reported on p. 207, *ante*, says that that house was one of three built at the same period, and distinguished by the unique similarity of their style in ornament and general effect. One of these is "Kirkby," in Northamptonshire, the seat of Lord Winchelsea; and the second is Claverton, near Bath; and the third, Kingston House. He also says that the older parts of Kirkby House were built in the latter end of the fifteenth century.

If by "Kirkby House" is meant Kirby Hall, once the seat of the Marquis of Winchelsea, but now a ruin, no part of it is earlier than 1570, in which year John Thorpe says he laid the first stone. Kingston House certainly looks at least thirty years later than this, and resembles Kirby no more than it resembles any other of the numerous houses built between the years 1560 and 1620. Kingston House, in fact, belongs to a different type, for Kirby is built round a court, and Kingston House is a self-contained oblong. The ornamentation, too, of Kingston House is quite different from that of Kirby (which I know well), except that both houses are in the style of the Renaissance.—Yours truly, August 26th, 1887. J. A. G.

**LANDSLIP, DORKING TUNNEL.**

SIR,—I had the opportunity of inspecting this tunnel a few days since, and I thought, perhaps, a short report might interest your readers.

On the morning of the accident, it was through the tunnel, and to my profound surprise found that a very large portion of the outer wall of the tunnel was removed, consisting of the first course of brickwork, whilst not the slightest attempt had been made to support the centre of the arch, which was dangerously weakened. The whole structure is in a very dangerous state. The portion that has fallen is about 160 yards from the south or Holmwood end of the tunnel. On the right-hand side the brickwork has fallen, leaving a gap of about 27 in.; on the left it is very much larger, extending right across the crown of the arch, and many thousands of tons have come through, forming a huge sand hill.

The wall of the tunnel is built in sections of 12 ft., and the brickwork is of the very worst description, especially the hack rings or courses. Three of them have no mortar at all, and the bonding is very bad indeed. It is no wonder at this very spot, during the construction of the tunnel, two lives were lost, and the marvel is, not that the tunnel has fallen, but that it has held together so long. Near the mouth of the tunnel the bricks are slipping from the crown of the arch, and practically the tunnel must be rebuilt, or it will simply be a death-trap to some hapless train. How it has been patched and mended is visible on every hand, and deserves the closest attention of the Government Inspector. SURVEYOR.

**INSCRIPTION AT WELLOW CHURCH.**

SIR,—In the *Builder*, date 26th inst., I read on p. 205, last column, in a notice of the Hungerford Chapel at Wellow Church, "For love of Thee and Mary is sake.—Praye for them that this lete make." What 'lete' might mean no one was able to say. Does not the line mean "I pray for those who had this (chapel) built"? I think the expression "lete make" was commonly used in this sense in the fifteenth century. A similar expression, "machen lassen," "to have made," is used in modern German. E. T. S.

\* \* \* Of course that is the meaning. The Architectural Association Excursion party, to one of whom we are indebted for the notes on places visited, should have been able to make that out among them. We are obliged to our correspondent for calling attention to it.—ED.

**BRANNON'S FIREPROOF CONSTRUCTION.**

SIR,—There are three important references in your issue of the 13th inst., in respect to which I am sure the impartiality of justice always observed in the *Builder* will secure me space to make a few brief remarks.

In the third item of "Notes" there is a great misapprehension. Earl Wemyss referred to the special application of my method to the dome of St. Paul's Cathedral, but even there there is not the slightest ground for the suggestion of timber being so treated as to endanger rot. There never was a more thorough ventilation of the timber, nor so complete an insulation of it from the protecting material as well as from all fire danger.

Your correspondent, Mr. Knill Freeman, also asks for information as to the best mode of building to meet the danger of earthquakes. It was for this purpose, as well as to secure safety from fire, that I devoted myself to the development of my monolithic system. In the Essex earthquake, my house was in the line of greatest disturbance, and was

fairly rocked to and fro by it, although I only observed a few of my special precautions in the building. Not the slightest injury ensued, although Patrick's tall chimney-shaft at Harwich, to the north-east, and many chimneys to the south-west were thrown down. PHILIP BRANNON.

\* \* \* Earl Wemyss's remarks on the occasion referred to simply amounted to this,—that all buildings ought to be erected on Mr. Brannon's system, because he (Earl Wemyss) was satisfied with it. Such sweeping recommendations are of no practical value whatever. Mr. Brannon's letter would have been more to the point if he had explained exactly how he proposed to cover timber with a concrete, and leave it free for ventilation and inspection. As it is, his letter is a mere assertion of the perfection of his own scheme, which our readers can take for what they think it worth.

**Miscellaneous.**

**The Church of St. Mary-le-Strand.**—Mr. Henry Poole, well known as the (Westminster) Abbey Mason, writes to the *Times* to say that in consequence of the parapets and vases of this church having been declared to be dangerous by the report of a surveyor in 1878, Mr. Butterfield at that time requested him to examine them with care for the satisfaction of the late rector, whose leave had been asked for their removal. His report was strongly in favour of their stability. The question of the cornice was not then raised by any one. There was no excuse for speaking of the vases and parapets as otherwise than perfectly secure,—as secure against falling, under fair treatment, as they ever had been. After the repairs which this work received from him in 1878 Mr. Poole says he does not understand how the present proceedings can be necessary. "If these vases are to disappear, as the four vases did, some years since, from the angles of the tower, the work becomes one of mutilation. A piece of cornice has now fallen, and the removal which is going on of other vases seems to me to imply a great want of judgment on the part of somebody. The cornice could be examined and repaired without interference with the vases or parapets. It is much easier to kill than to cure. I think the course which is being taken shows panic rather than knowledge of business."

**Fountain at Brussels.**—One of the ornamental fountains which the English Waterworks Company at Antwerp has presented to the town was unveiled on the 21st inst., in the presence of the local authorities. It is the work of the Belgian sculptor, Jef Lambeaux. It has been placed on the Grande Place, the finest open space in the city. Part of the cost has been met out of Baron Noteboom's legacy for the embellishment of the public squares of Antwerp. The Brussels Museum has acquired another Rubens, representing Diana and her followers boar-hunting at sunset. The picture is well preserved.—*Times*.

**Yorkshire Penny Bank, Sheffield.**—The directors of the Yorkshire Penny Bank, having purchased a site in Fargate and New Surrey street (immediately opposite the site of the proposed Municipal Buildings), invited the following firms of architects to enter into competition for the proposed bank and hotel buildings.—Messrs. Smith & Tweedale, W. H. Thorny Perkin & Bulmer, Leeds; Mr. Jacobs, Hull; Messrs. Milnes & France, Bradford; Messrs. Flockton & Gibbs and Empsall & Smith, Sheffield. The directors decided to give the work to the architect whose design should be chosen, and to pay an honorarium of 25l. to each of the unsuccessful competitors. All the architects, except Messrs. Milnes & France, sent in designs. At the general board meeting held on Friday, August 18th., the plans of Messrs. Perkin & Bulmer were chosen, and they were appointed architects. The building will consist of bank premises, *café*, and hotel, in the Early Gothic style, and will be executed in stone. The cost of the buildings and site will be upwards of 13,000l.

**Pulpit, Oxford.**—A pulpit of elaborate design has been fixed in St. Barnabas Church, executed by Messrs. Heaton, Butler, & Bayne from the design of Mr. A. W. Blomfield. The Church of St. Barnabas is of the Basilica type, and the pulpit is designed with details of Italian type to suit the building. The material used is walnut. The framework is supported on six pedestals, and is spaced out into nine bays, each containing a panel with circle above it; in the circles are represented the nine orders of angels, and below, in the larger panels, figures of St. Clement, St. Ignatius, St. Polycarp, St. Chrysostom, St. Augustine of Hippo, St. Leo the Great, St. Gregory the Great, and St. Augustine of Canterbury. The costumes of the figures have been carefully studied, and it is claimed that they are architecturally correct. The remainder of the pulpit is covered with elaborate decoration in gold upon black ground. The staircase and balustrades are also decorated. The whole is surmounted by a very massive sounding-board, enriched with carvings; on the under surface is a painting of the Pelican.

**The Preservation of Scaffold Ropes.**—The *American Machinist* states that ropes used for scaffolding purposes, especially in localities where the atmosphere is apt to destroy hemp, should be dipped, when dry, in a bath containing 20 grains of sulphate of copper to a litre (1½ pint) of water, and kept in this solution for about four days. The sulphate of copper absorbed tends, it is said, to preserve ropes thus treated from attacks of parasites and rot.

**A Coast Guard Station** is to be built at Clacton-on-Sea, consisting of an officer's residence and eight residences for the Coast Guard men. Mr. W. T. Hook, Clacton-on-Sea, is the contractor for the work.

**LONDON.**—For new warehouse at Kentish Town, for Messrs. Schuppiener & Son:—  
 Illingworth ..... £2,426 0 0  
 Fuller & Co. .... 2,169 0 0  
 Lister & Co. .... 1,960 0 0  
 Wood Bros. .... 1,783 0 0  
 Leaver & Sons ..... 1,767 0 0  
 Ashford & Co. .... 1,750 0 0  
 Gould & Brand ..... 1,559 0 0  
 Morris & Luke ..... 1,530 0 0  
 Wall Bros. .... 1,484 0 0  
 J. O. Richardson ..... 1,369 0 0

**LONDON.**—For repairs and decorations at 14, St. John's Wood Park. Mr. Edward Power, architect:—  
 Gatfield ..... £385 0 0  
 Birch ..... 319 0 0  
 Hancock ..... 302 0 0  
 Hughes ..... 287 0 0  
 Dover ..... 269 0 0  
 J. O. Richardson (accepted) .. 251 0 0

**LUTON.**—For the erection of farm-house at Nether Crawley, for Mr. J. Crawley, under the superintendence of Mr. W. Bro, Union-court, Old Broad-street:—  
 William Dunham & Son ..... £1,450 0 0  
 Francis F. White ..... 1,360 0 0  
 George Kingham ..... 1,250 0 0  
 W. G. Dunham ..... 1,152 0 0  
 Richard Lord ..... 1,143 0 0  
 J. & A. Long ..... 1,112 0 0  
 Daniel Parkins (accepted) .. 1,073 0 0  
 [All of Luton.]

**MABLEDUBHAM.**—For new lodges at Mabledubham, Oxon, for Mr. J. D. Blount. Mr. W. Ravenscroft, architect, Reading:—  
 One Lodge. Two Lodges.  
 A. W. Dodd, Caversham .. 2,578 0 0 .. 4,742 0 0  
 S. Ewart, Reading ..... 350 0 0 .. 695 0 0  
 J. C. Cook, Reading\* ..... 326 0 0 .. 642 0 0  
 \* Accepted.

**PAIGNTON.**—For erecting and finishing a shop on the Gerston Estate, for Mr. A. Falk. Mr. S. Woodbridge, jun., architect, High-street, Brentford:—  
 C. & B. K. Drew (accepted) .. £160 0 0  
 [No competition.]

**PAIGNTON.**—For erecting and finishing a shop on the Gerston Estate, for Mr. Pethybridge. Mr. S. Woodbridge, jun., architect:—  
 C. & B. B. Drew (accepted) .. £208 0 0  
 [No competition.]

**READING.**—For alterations and additions to Trinity Congregational Church, Reading. Mr. W. Ravenscroft, architect, Reading. Quantities supplied by Messrs. Cooper & Sons, Maidenhead:—  
 J. C. Cook, Reading (accepted)\* .. £2,152 0 0  
 \* Subject to a few modifications. This was the lowest of nine tenders.

**READING.**—For alterations and additions to Orwell House, for Mr. O. Ridley. Mr. W. Ravenscroft, architect, Reading:—  
 Wheeler Bros., Reading (accepted) .. £750 0 0

**READING.**—For alterations to premises, Broad-street, Reading, for Messrs. Wellsted, Son, & Co. Mr. W. Ravenscroft, architect, Reading. Quantities supplied by Messrs. Cooper & Sons, Maidenhead:—  
 J. Bottrill ..... £398 10 0  
 W. H. Simonds ..... 371 0 0  
 J. H. Margraves ..... 341 1 0  
 S. Ead (accepted) ..... 322 0 0  
 [All of Reading.]

**SANDHURST.**—For new porch and vestry to Sandhurst Church, Berks. Mr. W. Ravenscroft, architect, Reading:—  
 Porch. Vestry.  
 Wheeler Bros., Reading\* .. £200 0 0 .. £200 0 0  
 \* Accepted.

**SOUTHWARK.**—For new street sewer, &c., Lorington-street, Southwark, for the Ecclesiastical Commissioners. Messrs. R. B. Grantham & Son, engineers, Northumberland-avenue:—  
 Bogers & Dickens, Chesterton-road (accepted) ..... £2,093 0 0

**STEPNEY.**—For constructing strong-room to the Stepney Branch of the London and South-Western Bank (Limited). Messrs. Thos. & Wm. Stone, architects, Great Winchester-street:—  
 W. G. Grogan ..... £474 0 0  
 J. T. Robey ..... 394 0 0  
 Godfrey & Son ..... 340 0 0  
 Atherton & Latta (accepted) .. 319 0 0

**STOKE NEWINGTON.**—For erecting house in Green-lanes, for Mr. A. Messrs. Mr. J. Groom, architect. Quantities supplied:—  
 Grover & Son ..... £2,958 ..... £333  
 Simpson & Co. .... 2,986 ..... 330  
 Lawrence & Sons ..... 2,879 ..... 268  
 Matlock Bros. .... 2,773 ..... 373  
 Jackson & Todd ..... 2,770 ..... 239  
 Exton & Burton ..... 2,717 ..... 315  
 H. H. Holloway ..... 2,450 ..... 419  
 A.—Deduct if Portland cement facing in lieu of Portland stone.

**STREATHAM.**—For proposed public hall and drill-room at Streatham. Mr. Edward Power, architect. Quantities by Mr. Mark W. King:—  
 J. Dover ..... £5,200 0 0  
 J. Smith & Son ..... 5,547 0 0  
 G. J. Smith ..... 5,550 0 0  
 J. C. Bowyer ..... 5,435 0 0  
 J. T. Chappell ..... 5,425 0 0  
 Kirk Bros. .... 5,329 0 0  
 Ingram ..... 5,311 0 0  
 R. J. Humphries ..... 5,195 0 0  
 D. Brown & Co. .... 5,125 0 0  
 W. M. Dalby ..... 5,072 0 0  
 A. M. Deacon & Co. .... 5,025 0 0  
 G. Stevenson ..... 5,004 0 0  
 A. & E. Brind ..... 4,975 0 0  
 H. Gaidfield ..... 4,859 0 0  
 H. Ockenden ..... 4,895 0 0  
 Newton & Idle ..... 4,837 0 0  
 J. O. Richardson ..... 4,580 0 0

**TUNBRIDGE (Kent).**—For the reconstruction of Great Bridge, Tunbridge. Mr. F. W. Buck, County Surveyor. Quantities by Messrs. Ruck, Son, & Smith:—  
 Contract No. 1.—Builders' Work.

J. D. Ridley, Middlesbrough. £3,900 0 0 .. 2,336 0 0  
 H. Young & Co., Pimlico ..... 3,185 0 0 .. 350 0 0  
 Jas. Farrow, Maidstone ..... 2,354 19 3 .. 459 1 5

### Recent Excavations in the Acropolis.

FEW weeks past we regretted the long delay of the second part of Dr. Rhomaides's work illustrating the now-famous Acropolis excavations. This second part makes a tardy, but still welcome, appearance. It is now possible to take something like a systematic survey of the discoveries, and to point out their exceptional value for the re-construction of the history of Athenian art. No discovery at all comparable has been made within the last few years; indeed, we may say not since the German excavations at Olympia. The Pergamene marbles, of sensational beauty though they are, and of great mythological interest, only confirmed what we already knew of the florid, overwrought character of the later Asiatic schools. But in the history of Athenian art there has always hitherto been a void that ached inexpressibly. We had our Parthenon marbles, but we knew next to nothing of the art that led up to them. This was the more tantalising, the more unendurable, because literary tradition respecting the early masters of Athens was not wanting; we knew of the existence of Antenor, Amphicrates, Endoios, Hegias, Kalamis, and of the subject of some of their works, but only by precarious conjecture could we picture their style. The famous *stèle* of Aristion, signed by Aristocles, was, indeed, the *locus classicus*, and from it, with marvellous ingenuity, a canon of opinion as to Attic characteristics was built up,—a canon now shown to be, in the main, correct. It is true we have not even yet discovered any statue inscribed with the name of a known sculptor; we have a number of bases inscribed, and a number of statues baseless, but as yet no combination has been effected; but the statues found are so many, so clearly marked in type, so manifestly the work of artists swayed by the impulse of a school, that we may safely base our conception of pre-Pheidian art henceforth on the material they afford us.

We can only give a brief summary of some of the chief points of interest connected with them, and we must refer our readers who desire closer detail not only to the work of M. Rhomaides, but also,—preferably as regards the discussion of style,—to an article in the last

number of the *Hellenic Journal*, by Mr. E. A. Gardner.

We must begin with a disappointing fact. The statues uniformly represent a draped female figure; but this figure we are unhappily unable to name. We cannot even say if she is a goddess or a human being. Inscriptions were found with the statues containing dedications to Athene. It was, perhaps, at first natural to suppose that Athene herself was represented, but there is positively no evidence for this theory: in fact, much against it, for the statues have no analogy with any known Athene type. The nearest analogy is undoubtedly the frequently-recurring type of the woman goddess, whose wide-spread early worship, specialised later with the cults of Athene, Aphrodite, Artemis, and whose closest affinity is to Aphrodite. But there is no necessity to suppose the statues represent a goddess at all; they may be the images of priestesses or even of worshippers.

We have not space to go in detail through the long series, we must select certain striking examples. Unmistakably the earliest in style, though possibly not in date, for there may have been intentional archaism, is the curious figure given in plate x. This is a good instance of a xoanon, or sacred wooden figure copied in stone. The lower part of the statue is practically a board with drapery indicated on it. This quaint, flat lady is own cousin to the well-known Nicandre figure found at Delos, but the Attic xoanon is a distinct advance on the Delian. Not only is the drapery plainly indicated, but the face is well modelled, the hair elaborately dressed, and the right hand advanced with a lively speaking gesture. The lower part of the arm in this and many other of the statues is inserted by means of a socket, thus of course the trouble of turning the elbow is avoided.

This xoanon lady is unique among the statues, the remainder are worked with a constantly increasing naturalism. Broadly speaking, they are characterised by massive elaborate drapery disposed with but little regard to the figure beneath, but very beautiful from the careful symmetrical arrangement of the folds; very frequently the under-chiton is of fine, wavy, crinkled material; while the over-dress falls in thick, parallel masses. The hair is usually disposed in stiff waves round the forehead and formal curls front and back. Some of the figures wear a wreath. Many of the statues have a very noticeable appendage to the head, consisting of a straight spike of bronze set upright in the crown. M. Kabbadias (the discoverer of the statues) thinks these spikes served to support a disk, probably of wood, which protected the statues from rain. As they were richly coloured,

some such form of umbrella would be very desirable. Mr. Ernest Gardner in his paper ingeniously suggests a very probable analogy. It has often been a puzzle how the terra-cotta figurines keep their strangely-shaped hats on. These hats have no crown. They are practically flat plates, rising to a point above. They have no visible attachment, and only a hair-pin run through the head (for the hair is too flatly dressed) could keep them on. Ladies of all times will suffer strange torments at the shrine of the becoming, but this seems going a little too far. Moreover, these impossible hats are worn by figures already veiled, and therefore needing no head-gear. Mr. Gardner suggests that they are merely a "survival, a reminiscence of the disk that used to protect statues in the open air reproduced in figurines which needed no such protection." The suggestion is an interesting one from the point of view of the terra cottas, because it is another link in the chain of evidence that goes to prove that these figurines were always, even in their most naturalistic days, tinged with ritual reminiscence. But this is by the way.

This is, perhaps, the right place to speak of the elaborate colouring of the statues. They have done no greater service than clearing up the fog that has hitherto rested on the question of colouring as applied to Greek sculpture. As yet no coloured reproductions of the statues have appeared, and, as our own study is based on the phototypes, which are alone at present accessible, we think it wisest to quote the testimony of Mr. Gardner, who speaks from personal observation. He resumes as follows,—“Colour is never applied in mass to a broad flat surface; thus neither the flesh nor the whole surface of the drapery are tinted, but they are left in the pure whiteness of the marble, relieved only with painted details and ornaments. The only exceptions are the hair, which was always of a uniform reddish-brown colour, and occasionally the under-garment; but this was only painted over its whole surface when but a small part of it showed, so that the extent of the colour was not limited. Thus in one case it is dark green, in another dark purple, but in neither case does much of its extent show. In other cases, besides the borders in the places already referred to we sometimes find the whole surface dotted with stars or other ornaments. The wreath\* also is generally painted. The commonest designs are the meander and the palmetto. The colours most used are dark green and dark purple; red and blue are also found. In the nude parts we find red applied to

\* Mr. Gardner says "stephane," an absurd hybrid of Greek and English. Why cannot he use an English word when he is writing in English, or else quote the Greek word in its proper form?

\* Les Musées d'Athènes en Reproduction Phototypique de Rhomaides Frères. Fonilles de l'Acropole. Athènes: Karl Wüberg. Londres: H. Grevel, 2nd livraison, 1887.

the lips and the iris of the eye; the eyebrows, the outlines of the eyelids, and the iris and the pupil are sometimes coloured with dark pigment." We have had coloured fragments before, but no instance in which we could judge of the effect of a coloured statue as a whole. Mr. Gardner unhesitatingly pronounces this effect to be pleasing,—the colouring is so applied "as in no way to obscure the modelling or to hide the texture of the marble,"—it is, in fact, as Mr. Ruskin would say, "entirely honest," and there results from it no displeasure to the understanding, but rather, to the eye, "a richness and harmony of effect that plain white marble would not possess. There is not the slightest tendency to the revolt of modern taste, such as is felt when we see a completely coloured cast; for it is the suspicion of inferior material and the hiding of true surface that most offends us. From the Acropolis statues these objections are entirely removed; in them the colouring adds to the effect of the sculpture, but takes nothing from it."

So far, we have said nothing of the expression in the faces of the statues, and yet it is for their expressiveness that they are chiefly remarkable,—that they are, with one or two exceptions, most distinctively Attic. We have reserved this Attic expressiveness for special consideration in relation to one statue by far the most advanced and the finest of them all (plate xiv). Most of the series owe their expression to the more or less frozen "archaic smile," but this lady smiles her own smile. The mouth is quite naturally moulded, and even the hair is no longer tortured and frizzed, but parted simply in the middle and falling in waves to either side. No archaeologist as he looks at this head can refrain from suggesting the name of Kalamis,—Kalamis, of whom we know so much by literary testimony, and simply nothing from monuments. The earth will possibly never give back to us a statue inscribed with his name; but till it does we may be allowed to fancy this Acropolis statue to be an example of that nameless charm which fascinated the ancient Greek and every other art critic. When Lucian fashioned his perfectly lovely woman he gave her the forehead, head, hair, the perfect eyebrows, and the soft moisture of the eyes of the Cnidian Aphrodite of Praxiteles; her wrist and delicate finger she would borrow from Alcamenes, neck, and mouth, and nose from Pheidias, but when all was put together she yet lacked something that only Kalamis could give, "modesty and a sweet, grave, unconscious smile," and a certain seamliness of vesture (*τὸ μέτρομα ἔργον καὶ ἀληθὲς καὶ τὸ φυσικὸν ἐκ καὶ ἰσχυρὸν τῆς ἀναβολῆς*). It is the charm that some old-fashioned portraits have, and a very few old-fashioned people, a certain "subdued and refined gracefulness," very rare and very haunting.

For the dating of the series of statues as a whole we are happily not left in doubt. The inscriptions are, from the forms of the letters, from about 525—500 B.C. The whole series of statues were found within a very limited area, stretching from the north-east of the Propylæa to the Erechtheum, close under the Acropolis wall. It is a fortunate accident that with them was found a quantity of refuse used in making the wall. The conclusion seems to be pretty safe that the statues were buried during the building of the wall. The deposit consists of three strata, each separated from the other by layers of wall refuse. From this regular disposition M. Khabdian concludes that what happened was as follows:—When the Persians laid waste Athens, they hurried the temple of Athene, knocked down the votive statues set upon it, upset the pedestals, and did all the sacrilegious damage they could in a short space of time. When the Athenians came back to their desolate city they resolved to restore the temples of the gods with even greater magnificence. But the votive statues, being merely votive, they did not concern themselves about. They used them as material for levelling the surface of the Acropolis. It is possible that, though they did not regard them as sufficiently important to be restored and re-set up, they may have desired by

hurrying them to preserve them from further desecration. The importance of these speculations is that if they are correct they fix the limits of the dating of the statues in one direction. If the statues were buried on the return of the Athenians after the Persian invasion, and if the rubbish layers belong to the Acropolis wall then rebuilt, they are none of them less than B.C. 480. Happily, with this dating, both inscriptions and *a priori* conceptions of style are at one.

#### NOTES ON THE WALLS OF CHESTER.

BY SIR JAS. A. PICTON, F.S.A.

WING to the differences of opinion expressed on an inspection of the walls of Chester by the Royal Archaeological Institute in 1886, it was thought desirable by some members of the British Archaeological Association, at their recent Liverpool Congress, to have as thorough an investigation of the walls as time and circumstances would permit. Accordingly a subscription was entered into to defray the expense of excavating. This was done by consent of the Mayor and Corporation, under the advice and inspection of the City Surveyor, and on the 23rd of August a visit was paid by a considerable number of members and friends.

The following notes were taken on the spot, without any preconceived theory to maintain, or any previous inferences to establish.

The first excavation was made in what are called the Kale yards, at a point a little south-east of the cathedral, which here very closely approaches the wall. There can be no doubt that here the wall is built on the old Roman lines, since there is hardly room for any deviation, owing to the rapid declivity of the land. Here a trench along the wall was sunk to a depth of 12 ft. to 15 ft. below the surface. The lower portion of the wall, which commenced at the bottom of the trench, was rubble work set in mortar or clay,—it is difficult to say which,—in thin layers. This was carried up about 5 ft. Then commenced courses of solid hewn stone in blocks 1 ft. to 1 ft. 3 in. deep, well squared, put together without mortar. This portion started about 6 ft. or 7 ft. below the ground level outside. This stone is of good quality, but a little above the ground-level the wall changes into coursed ashlar of inferior stone, much decayed on the surface.

The next observations were made in a large and deep trench sunk in a timber-yard outside the walls, a little south of the Phœnix tower. Here a large quantity of Roman remains were found loose, consisting of small altars or votive stones, portions of moulded cornices, &c. One flat stone with a memorial inscription was found imbedded in the wall. The solid hewn stone courses here go down to the bottom of the trench without any rubble substructure.

The third excavation was sunk along the east end of the north wall, with very interesting results. The same solid squared substructure was found, with several loose relics of moulded work. Here a peculiarity was observed. From the summit of the Roman wall a little above the surface, the wall was double, with an interval between. This was pronounced to be Mediaeval work of uncertain date.

Observations were then taken on the north wall, skirting the narrow valley formerly the fosse, but now occupied by the Shropshire Canal. Along this wall runs the cornice or string course so often referred to. Owing to the precipitous nature of the site it was impossible to gain access to the outside of the wall. Excavations were unnecessary, as the wall stands on the sandstone rock which is here scarped down perpendicularly. The general opinion appeared to be that the greater part of the wall, including the string or cornice, is of Roman origin, with repairs and insertions of subsequent date.

Passing by the water tower, and following the western wall southwards, we arrive at probably the most interesting point in the survey. The Roodee, a grassy plain, now the racecourse, was in the olden time covered with water, and the city wall was carried along the coast line, which here presents a somewhat

precipitous face of clay and soil. Here, outside the wall, lie courses of stones of great weight and magnitude. At the former inspection in 1886, it was argued with considerable plausibility that these stones had been laid here to protect the foot of the wall, and prevent a landslide of the bank, and that the city wall retains its original position; but the excavation, carried down about 15 ft. below the surface, presented a very different state of things. It was found that these large stones were merely the upper courses of a strong and massive wall built with square ashlar and carried down to the bottom of the trench. No one could doubt for a moment that this is Roman work of an early period and of excellent quality. What might be the thickness of the wall it is impossible to ascertain without excavations which were unauthorised.

The actual city wall, of Mediaeval origin, is not carried up in the plane of the Roman wall, but is set back about 8 ft. to 12 ft. To a minor extent this is the case in other portions of the walls, indicating that at some period, we know not when, the alignment of the walls had been laid out afresh.

Excavations were thus made on the east, north, and west sides of the city walls. Along the south side, abutting on the river, excavations were needless and impracticable.

Without entering into any hazardous speculations, a few inferences may be drawn which appear to be fully sustained.

First, as to the superior quality of the Roman work, both in materials and workmanship.

This was admitted by all who examined it. Whilst the Mediaeval facing of the walls is weathered and crumbled so as to require continual repair, the Roman stones which have lain exposed to the weather probably 1,500 years, are as sharp and perfect as when they were quarried, and those built into the walls retain their sharp angles and close joints.

Remark may naturally be made on the absence of tile courses, and of the stones being laid without mortar. The Romans had several distinct methods of constructive masonry, the most solid being that of squared stones called by Vitruvius *Isodomum*, or *Saxa quadrata*, which was employed where strength and massiveness were required. The large stones, possessing stability by their own weight, required little or no cement. The Pont du Gard, one of the finest Roman works extant, has no mortar in the joints. In one of the excavations at Chester a large lump of concrete was found of extreme hardness, consisting of lime, sand, and pounded tile.

Another question arises as to the comparative site and extent of the *enceinte* of the city walls.

Few cities exhibit in their plan more decided evidences of the original Roman *castrum* than Chester. Comparing it with the details given in the work of Hyginus, "De Castrametatione," written in the reign of Trajan, we find the oblong rectangular plan; the Via Prætorii intersecting the city in its length, crossed by the Via Principalis, with the Prætorium in the centre, now the site of St. Peter's Church. This area can easily be traced, extending from the north wall and fosse southwards to the castle mound and river Dee, and from the existing east wall westward to St. Nicholas-street. This on the western side does not correspond with the existing wall, showing a considerable extension westward, throwing the arrangement out of the symmetry always maintained in the Roman castrametation.

It has been supposed that this extension took place at the beginning of the tenth century, at the time when the city, after lying waste for more than three hundred years, was rehabilitated by Ethelreda, the Lady of Mercia, but the recent excavations have entirely invalidated his theory. The lower portion of the wall across the Roodee is of the most pronounced Roman character, as noted above. The probability is that the Roodee, having been originally a shallow lake formed by a bend in the river, gradually silted up and shrank away from the walls, and that this extra-mural plot was made use of to enlarge the city on the west side. This part of the city has always been very sparsely built on

nd now consists principally of grass-fields, with a few public buildings. This view is confirmed by a recent excavation in the loodee, which brought to light a wall, apparently a sea-wall or quay of the olden time.

The general result appears to be that the foundations of the walls were built by the Romans, and that a portion of the superstructure still exists, mixed with work of a later period. The Roman work is easily distinguished by the superior quality of the tone. The walls above ground are, for the most part, post-Roman of various ages. After the irresistible evidence of the excavations it is to be hoped that the question is now set at rest.

## NOTES.

**A**MONGST the legislative business on which the Parliamentary session is to be congratulated, there is one which is noteworthy from an industrial point of view, and that is, the issue of a report of the Committee on Forestry, which, though short, is very much to be purposed. It appears that, although the word "forest" does not convey to the modern Britisher the same impression that it did to our forefathers, there are still 27,210,000 acres of woodland in these islands, some belonging to the State, but the majority, private property. Timber is timber, and is therefore comparatively well looked after, generally speaking, as being worth more or less money; but possibly no department of agriculture is so deficient in any systematic knowledge or treatment as that of our trees, and the science of forestry is evidently limited to very few. The State, indeed, appears to be the most deficient tree-planter in the whole country, and a lamentable account of the Deputy-Surveyor of the New Forest, England's grandest possession of its kind, is a proof that the State is no more to be trusted than anybody else in the conservation of its property. There are 40,000 acres lying worthless and unprofitable, because by the Act of 1877 no planting may be done there. Large enclosures of beautiful oaks are over-ripe and doing actual harm, because the same Act forbids their removal. Now, it must be remembered that this same Act was passed by a body of worthy gentlemen who knew nothing about arboriculture, and consequently though really desirous of preserving the forest, defeated their own object from sheer ignorance. The appointment of a Forestry Board and School, such as is recommended in the present report, would prevent all this. We are one of the few countries which never attempt to take care of their woods; and though it is true that the age of wood is very much, though not entirely, superseded by iron and steel, very valuable additions may be made to English acreage, not only by looking after and improving the trees that still remain, but by re-clothing our bare hills in Ireland and Scotland, if the recommendations of the Committee be attended to in good time.

**T**HE scheme of the Charity Commission for the administration of the funds of the British Institution is now published. The most satisfactory feature about it seems to be in the steps which have been taken to ensure periodical publicity for the doings of the Trust. The statements as to what is intended to be done are rather vague; they only amount to this, that the Trust shall establish scholarships, to be called "British Institution Scholarships," of such annual value as they shall think fit, between the amounts of 50*l.* and 100*l.*, towards the encouragement of the study of art; which scholarships shall be awarded as the result of examination "or otherwise, as the trustees think fit." No scholarship is to be awarded to any candidate whose circumstances are not, in the opinion of the trustees, such as to render him or her a fit object of such benefit." This seems a most extraordinary clause to append to a scholarship attainable by merit. It is generally supposed that when a scholarship can only be obtained by working hard to surpass others, this question rights itself, as

only those to whom pecuniary assistance is of importance will go through the necessary trouble to obtain it. Here, according to the wording of the scheme, we shall have men incited to give proof of their proficiency first and then furnish proof of their poverty afterwards,—a most invidious kind of requirement, which will certainly be likely to keep out of the field people who are much hampered with that troublesome quality called self-respect. There is not a hint as to the nature of the manner in which the holders of scholarships are to apply the assistance beyond the cloudy statement that it is for the encouragement of the study of art. The representative trustees who are to administer according to the terms of this remarkably unbusiness-like document, are to be appointed as follows:—One by the Science and Art Department of the Committee of Council on Education for England and Wales; three by the President and Council of the Royal Academy of Arts; one by each of the following bodies,—the Royal Scottish Academy, the Royal Hibernian Academy, the Royal Institute of Painters in Water Colours, the Hebdomadal Council of the University of Oxford, the Council of the Senate of the University of Cambridge, the Senate of the University of London, and the Council of University College, London. This is in more ways than one an unsatisfactory list. The University bodies referred to in connexion with Oxford, Cambridge, and London, have no special claim to understand how art is to be taught or learned; their representatives will in all probability be merely persons with aesthetic "fads" of some kind or other. The Royal Institute of British Architects is, as usual in documents of this kind, entirely ignored, and we presume architecture, which, more than any art, requires means in order to travel and study it fully, is to be practically ignored as well as its representatives. The Institute of Painters in Water Colours, we understand, have declined to appoint a representative; and under the circumstances, we can hardly be surprised at their decision.

**T**HERE has been some mournful correspondence in the *Times* last week in regard to the modernisation and spoliation of Venice. One correspondent anticipates that the steam-launches will soon entirely drive off the gondolas; another writes that this consummation must be still far distant, inasmuch as the smaller side canals, with their low bridges, will not afford passage for the steam-launches. Both correspondents mourn over the disfigurement of the palaces by advertisements and of the canals by ugly iron bridges. Here we are entirely with them, for just the same reason that we object to ugly iron bridges on the Thames, and to vulgar and disfiguring advertisements on the buildings of any city,—of course *à fortiori* when the architecture to be disfigured is in itself of exceptional interest and beauty; but otherwise the principle is the same in London as in Venice. But where we cannot agree with the mourners is in the idea that it is the duty and the interest of the Venetians to keep their ancient city *in statu quo*, to erect no new buildings and to make no attempt at reviving or stimulating commercial prosperity, in order that Venice may remain as a picturesque spectacle for visitors. We have no right to require of the inhabitants of any old city that they should be content to reduce themselves to the condition of the custodians of a museum of art and archaeology. We question very much even the argument that it is to their interest to keep it so, in order to attract the foreigner and his gold. It is never to the interest of any community to remain in a fossilised state. Let not the reader imagine for a moment that we are indifferent to the disappearance of the ancient charm of Venice. To our natural feelings and associations this gradual dragging down of the old poetic places of the earth into the light of common day is a thing to grieve over from the very soul; it is the extinction of an interest which can never be replaced. But it is inevitable, except under conditions which we have no right to wish for. Human society,

with its living interests, is more, after all, than even old buildings. Better see Venice the seat of an energetic and active community, than a decayed society accepting alms as the showman of its decaying buildings. Only, let the modern Venetians endeavour to carry out their improvements in a manner worthy of the beauty of their ancient city. That, at least, may fairly be required of them, in their own interests as well as in those of the rest of Europe.

**A**RATHER peculiar railway-rates difficulty has arisen through the opening of the Hull and Barnsley Railway. In order to make the position of affairs understood, it should be stated that, prior to the opening of the new line, the rate for coal to Hull from all South Yorkshire collieries within a certain radius was 3*s.* 1*d.* per ton, nearly the whole district being served by the North-Eastern Railway. A speedy effect of the competition was a reduction of 3*d.* per ton in the rate, a similar concession being afterwards made in the case of the West Yorkshire collieries situated on these two lines, which had previously been subject to rates varying from 2*s.* 3*d.* to 2*s.* 11*d.*, according to their position. Other benefits have resulted to the collieries served by these rival lines, in rebates for use of wagons, &c., and, so far, the competition between the two companies would appear to be advantageous to the Yorkshire coal business. But it will be seen that, as is frequently the case, the benefit is obtained at some one else's expense. Many of the collieries on the Lancashire and Yorkshire Railway, who formerly had a share of the Hull coal trade, are now rendered almost powerless to compete, as they are unable to get reductions in their rates corresponding to those of their more fortunately-situated neighbours, and the same applies to those collieries from which coal is conveyed to Hull by water. The competition between the two companies is doubtless restricted to their own systems, and they would probably combine to keep up the rates on traffic coming to them from lines having no direct connexion with Hull. Be this as it may, the result is a fair illustration of the saying that "one man's meat is another's poison," some of the coal-owners being so handicapped by the benefits resulting to others from this battle of railway rates that they are quite in despair. In the meantime, the railway companies serving the Kent district are certainly losers in the new competition for the fruit traffic, to which we alluded some weeks back. The vessels chartered by the fruit-growers now run from Sandwich to London and back three times a week; and the hop-growers, in spite of the concessions they obtained last season, are about to avail themselves of this means of transit, and expect to effect a considerable saving by it. The success of this venture will naturally stimulate the efforts of those who advocate the extension and improvement of our waterways with a view to reducing transit charges.

**W**E print in another column a letter from a correspondent in the neighbourhood of Bath, which is worth the attention of those who feel concerned in promoting the proper carrying out of sanitary legislation. Our correspondent, Mr. Abercromby Wilson, it appears, has repeatedly drawn the attention of the Rural Sanitary Authority of the Bath district to the offensive state of a ditch which runs close past his and other dwelling-houses, and which removes, among other pleasant matters, the refuse of a brewery. He complains that not only has the Sanitary Authority (?) omitted to take any action in the matter, but that when another resident offered to obtain at his own cost the opinion and report of a competent sanitary engineer, the proposal was received only with ridicule. We should like to know whether the Rural Sanitary Authority in question can state another side to the case which would alter the aspect of it. On the face of it as it stands, it appears that the Sanitary Authority in question is neglecting an obvious duty.

A WORK of some importance has just been completed at Kinsale, viz., a large quay on the west side of the harbour, running almost the length of the town. It is faced throughout with concrete, and has landing-places and a pier-head. It undoubtedly adds very considerably to the advantages of Kinsale as a port of discharge. But though the Bay of Kinsale, if we may thus describe the estuary of the Bandon river on which it lies, is as fine a harbour as could be desired, it is irretrievably handicapped by its proximity to the still more magnificent harbour of Queenstown. It is not an hour's sail from the one to the other, and thus practically all the merchant shipping goes either to Queenstown, or, still bigger, to Cork. The mainstay of Kinsale is the mackerel fishing in the spring, when scores of craft lie in the bay and make it their headquarters for the season's fishing. But the quay in question is larger than is necessary for the discharge of fish, a good deal of which is taken off the boats at sea by steam carriers. There is also a tendency in the fishing-boats to go westward, where a good deal of the fishing itself is prosecuted. The opening of the new fishing schools at Baltimore, united to this tendency, is thus likely to decrease the traffic at Kinsale. The useful and important work to which we have alluded is thus not likely to be of the use for which its size and character fit it, and we fear that the future prospects of Kinsale, whether as a fishing or a general port, are not very bright.

WE have more than once drawn attention to the re-organisation of the publications of the German Archaeological Institute, by which the centre of gravity of the Association is shifted from Rome to Berlin. The change was clear gain to archaeology, at the same time it obviously somewhat left the Italian element of the Institute out in the cold. This has acted as a stimulus to local effort, and it is now proposed to form an Italian society with the title "Istituto Archeologico Italiano." The scheme was broached some time ago in a letter by Signor Ruggero Bonghi to *La Cultura*, and it has since received the adhesion of many noted Italian archaeologists, e.g., Fiorelli, the Director of Antiquities; Comparetti, Gozzadini, and others. The Roman archaeological harvest is certainly plentiful, and will no doubt supply material for a new archaeological periodical, but to the outsider, ignorant of local obstacles to co-operation, and burdened with subscriptions to countless *Bulletin*, *Mittheilungen*, *Notizie*, *Musei*, &c., the prospect of this new departure has its gloomy side.

AT the last meeting of the *Archäologische Gesellschaft*, at Berlin, a report of the final completion of the Olympia Museum was laid before the members. The King and Queen of Greece have given the new building the formal sanction of their presence. It stands on the slope of the hill *Druva*, on a terrace naturally formed. Its plan comprises a large central hall, two stories high, two side halls, and four corner rooms. The central hall is approached by a good-sized entrance-hall, with staircases to a clearstory gallery. The building is just large enough to allow of the pediment groups being set up in their natural disposition along the side walls. They are arranged according to the scheme proposed by Dr. Curtius, but Dr. Treu's variant scheme can be studied on the cast model placed for the purpose near at hand. It has been decided not to place the *Niké of Ptoonios* at its full elevation. The reason is not apparent, as the height given by the clearstory gallery is amply sufficient. The metopes are placed in one of the lateral halls, plaster casts of those found in the earlier French expedition, and now in the Louvre, are added to complete the series. Of course, the chief interest of the ordinary visitor centres in the little room which enshrines the *Hermes*. Up to the present time those who have made the pilgrimage to Olympia have seen the god lying flat on his back,—or rudely propped up. It was long undecided whether he should be placed on a new pedestal or whether the old original base should be mended up. We are glad to find this latter

course has been adopted. Still more satisfactory is it to learn that, spite of the current reports to the contrary, the statue has nowise suffered from exposure. The faint traces of red on the hair are still visible. Our account of the Museum is taken from a letter by Mr. Alfred Emerson to the *American Journal of Archaeology*, and from a report of the Berlin meeting in the *Berliner Philologische Wochen-schrift* of August 20.

WE recently drew attention to the remarkable series of marble statues found last spring on the Acropolis and just published in the second number of the *Musées d'Athènes*. We perforce passed over in silence a bronze statuette discovered in the same site and of even greater interest, because unique of its kind. Descriptions of this remarkable monument had reached England, but neither photographs nor drawings were procurable, the only accessible reproduction at the time being a rough woodcut in a Greek local paper. We are glad to find that in this month's issue of the *Εφημερίς Αρχαιολογική* full justice is done to this most curious and, in its archaic fashion, beautiful statuette. In *πλάσι* the figure is reproduced in its two side views, and Dr. Staes accompanies the plate with a full description. The statuette was found immediately opposite the north entrance of the Erechtheum. It is about 15 in. high, and represents the goddess *Athene* wearing her *egis*. The great point of interest about it is its very peculiar technique. It is almost flat, and, in fact, consists not of a figure worked in the round, but of two plaques of gilt bronze in very low relief, nailed together; it seems possible that between the two plates there may have been a piece of wood, to which they were nailed, and which has, of course, decayed. Portions of the figure,—e.g., the feet and right arm,—are worked almost in the round. The right side represents the figure, though not the face, almost three-quarters round; it is the best preserved, and the most carefully worked; probably it was intended to be most clearly seen. On the left side the *egis* hangs much further down than on the right. The face on both sides is absolutely in profile. The whole figure is slim and graceful. The goddess is represented as advancing probably to meet a worshipper; her right hand may have held a phiale. It is difficult to say what purpose the figure served. There is a hole at the top of the head and several other traces of attachment which seem to point to the conclusion that it was nailed to some piece of furniture. No specimen of similar technique is known in any other European museum.

IF we may credit all that has been written on the subject lately, yet another Dagon of our youth is marked for overthrow. Returning from his missionary labours in China, the Abbé Larrieu has published a pamphlet (Paris: Leroux) to show that the Great Wall of China not only does not, but never did, exist. We were diligently taught how, in the year 214 B.C., Che-Hwang-te, of the Ts'in Dynasty, "first universal emperor" of Cathay, began his project for everlastingly resisting attack by the hordes of the Heung-noo. Countless maps delineate his vast wall, some 1,300 miles in length, bounding the northern confines of Kan-sub, Shen-se, and Pe-che-le, and running from the province of Kan-suh to Tin-ye, on the Gulf of Lias-long. We call to mind many an illustration of its towers and intermediate curtains as they gradually disappear in direct course over the distant mountains and valleys. We are now told that all this embellishment is due to one Martini, a Jesuit priest, who visited China in 1650. His accounts have been copied by one writer after another. The Abbé avers that his precursor quite misinterpreted the signification of what the natives, in their ignorance of another tongue, called their *Wan-li-chang*,—the wall of a myriad li, or miles. He opines that the imperial scheme for a northern barrier, whilst certainly begun, has never yet been accomplished. Here and there along the line exist certain walls, but these, he contends, are

either village fortifications or, at most, for use only as barriers in the particular defiles where they stand. The towers remain, he admits; but these, we are now told by the Abbé, were never connected together by solid masonry of any kind, are far asunder, and are constructed of earth, faced in some instances with brick. On the other hand, one or two correspondents of the daily papers write to say that they, as well as Mr. William Simpson, have not only seen some miles of the wall, but have sketched and measured it.

A NEW archway has just been built in lieu of the wooden gate which opened into King's Bench-walk, Inner Temple, from out of Tudor-street. It stands on the spot which we once hoped would be chosen for the re-erection of the stones of Temple Bar. The roadway here passes between Nos. 6 and 7, King's Bench-walk, whereof the outer walls have in part been rebuilt. Mr. Arthur Cates's design has been executed in Portland stone, under the direction of Mr. W. Oldrieve. It comprises a Palladian arch, between a side doorway and a two-storied tower, intended for a keeper's lodge, octagonal on plan. To secure free way to the lodge door the north-eastern corner of No. 7, in the Walk, has been splayed off. On the keystone's outer side is carved "1887." Over the side doorway is a panel carrying the ancient cognisance of the Templars in their humility, which is now commonly represented by the Pegasus, in a cinque-foil, of the Inner Temple. The carving is supported by two small shields bearing the coat-arms of the late and present Treasurers of that Honourable Society. Were the octagonal tower repeated on the northern side we should have a gateway somewhat like that, perhaps designed by Thorpe, on the great north road at Burghley House, by Stamford.

AT a meeting held on Wednesday, 24th August, in the Brixton Hall, a committee was appointed to urge upon the Lambeth Vestry and the Metropolitan Board of Works the importance of securing Raleigh House grounds as a park for the people. This finely-timbered pleasure, about 12½ acres in extent, was bought in at a recent auction for 39,000*l.* It is understood that it may be purchased for 40,000*l.*, one half of which the Board of Works would be asked to contribute. The old property,—being a traditional home of Sir Walter Raleigh and situated in what was then known as Allington Hundred,—lies adjacent to Raleigh Hall, upon the northern slope of Tulse Hill. The river Effra, now flowing as a sewer, ran through the grounds, and a subterranean passage communicated with another old mansion upon the opposite side of the highway. Raleigh may justly be claimed among the worthies of Surrey; his memory is associated with West Horsley (where, in the south aisle of St. Mary's Church, it is said, his head lies with his son Carew); with Mitcham, where he sold his house for 2,500*l.* on proceeding to Guiana; and with Beddington. At Beddington Park, once the seat of the Carews, the orange-tree was first cultivated in England, the plants being grown from some seeds carried thither by Raleigh to his kinsman, Sir Francis Carew. We learn that a neighbouring and much more extensive estate, that of Brookwell, or rather Brookwell, Hall, is likely to be soon in the market, but this could only be rescued from the holders at a price of say about 100,000*l.* Meanwhile an effort is being made to secure, for Vauxhall, the Carroun House and Lawn estates, which the freeholder, Mr. Cobelclick, has consented to sell for 47,500*l.*

MR. JAMES EMERSON, of Northallerton, has bought, for 80,000*l.*, the remainder of Lord Ailesbury's Yorkshire estates. This portion consists of the Whorlton-in-Cleveland Castle and Swainsby property, in the Stokesley Union, North Riding. It embraces twenty farms with homesteads, and covers in all nearly 5,900 acres, whereof one-half is moorland. The rental is calculated at about 3,000*l.* a year. The whole estates have thus been disposed of

y the trustees for a total sum of 532,000*l.* Whorlton Castle formerly belonged to the barons Meinell, and is believed to have been rebuilt *temp.* Richard II. Over the main entrance are the arms of D'Arcy, Grey, and Meinell; but even in Camden's time the castle was old and in ruins. In the northern chancel wall of the older church of Holy Cross is a highly-ornamented canopy, beneath which is the oak-wood effigy of a knight, cross-legged. This is believed to be the monument of Sir Nicholas de Meinell, who, *temp.* Edward I., held the manor by fee of giving to the archbishop of Canterbury a drinking-cup for use by his grace on the day of his consecration. In King Charles I.'s reign the barony of Bruce of Whorlton was bestowed (August 1st, 1641) upon Thomas Bruce, third Lord Bruce of Kinloss and first Earl of Elgin. For services in the royal cause his son Robert was created Earl of Ailesbury, in the peerage of England, March 18th, 1664. He was ancestor to the Marquesses of Ailesbury.

WE lately had occasion to examine a variety of prints illustrating Inigo Jones's church of St. Paul, Covent-garden, as it appeared before and after the fire of about ninety years since. The drawings comprise those by Hollar, John Sellar, C. Campbell (a full set, to scale), E. Malton (May 21, 1774), A. Pugin (plan, to scale, November 1, 1823), J. Maurer, Hogarth, &c. All of these, though one of Hogarth's imperfectly delineate the eastern end of the church as resting upon a platform or base, which is mounted from north, south, and east by flights of steps that are made within the area of the stylobate. Hogarth's print, being "Rich's Glory," shows a range of steps between the two inner columns, only, of the pediment, which is plainly an error. The steps, the two eastern doorways, and, within our own memory, the railing, have been removed. Whilst the roadway at Covent-garden is practically horizontal, the fall being 7 in., southwards, across the whole width of the church, the church's present condition here gives some idea of the effect that would result from removing the steps now at the western front of St. Martin's-in-the-Fields.

THE Metropolitan Board of Works seem anxious to do all they can to prove (what required very little proof) their utter unfitness to meddle with London architecturally. Their proposition for treating the central space adjoining Piccadilly-circus, about which a question was asked in the House of Commons by Mr. De Lisle (who seems to be a member who may do good service in regard to artistic matters), is simply idiotic. Here is a fine open space obtained in a crowded and central position, and the Board propose to block the traffic and shut out the possibility of a fine architectural *place* by putting in the centre a shapeless block of shops, presenting no architectural form, meaning, or beauty of any kind. If, as asserted in an evening paper, this is the scheme of the new Architect to the Board, Mr. Blashill ought to have known better, and we fear that his undoubted capacity for the office in a practical sense is not supported by the degree of architectural taste and feeling which are desirable in an official who may have so much power over the architectural treatment of new sites in London. Mr. Alan de Taton Egerton, who answered Mr. De Lisle's question, said that though several schemes for dealing with the space had been before a Committee of the Board, no decision had been arrived at.

WE quote the following ominous paragraph from the *St. Albans Times*—

"THE ABBEY.—An ugly crack is visible above the eastern arch of the tower, both on its eastern and western face. It appears to the non-professional eye as though the south-east pier were sinking again. Possibly the alterations to the south transept have weakened it, or it may be that the increased weight in the tower is beginning to tell. It will be remembered that some years since additions of great weight were placed in the bell-chamber, and again, after the weight fell from the chiming apparatus, a new floor was added to the belfry, and a great many loads of gravel were placed between that floor and the old one. Or can it be that the

new cracks are wanted to prove the necessity of some other startling innovations in the way of 'restoration'? Experience teaches that when one part of the church approaches completion, some other part is found to be in a dangerous state and to urgently need attention! There seems to be only one opinion with regard to the wretched substitutes for the old turrets on the south transept, and that is that they are exceptionally ugly. It is to be trusted that whatever is done to secure the safety of the tower no attempt will be made to alter the character of the grandest Norman structure in England."

We are glad to observe that all the local papers are not under the thumb of Lord Grimthorpe. The tower is not perhaps truly called "the grandest Norman structure in England"; architecturally there are others that are finer objects; but it is unquestionably the most historically interesting and valuable. We have no doubt, however, that Lord Grimthorpe would be delighted to find an excuse to pull it down and set up a new tower designed by some clerk of works who would be willing to take his money and allow him to call himself the architect of it, unless something is done to tie his hands or those of the legal custodians of the building who have let him loose upon it.

#### LETTER FROM PARIS.

THE monument which a committee has proposed to erect by subscription to Sergeant Bobillot, who was killed in the Tonkin war, has given occasion for a competition which was decided during last month. Only nineteen sculptors responded to the invitation of the Committee, to whom the City authorities had lent one of the rooms of the Hôtel de Ville for the exhibition of the drawings. The small number of competitors and the weakness and want of originality of most of the designs are results not in favour of the principle of public competition in cases of this kind. The leading sculptors do not care about spending their talents on the chances of a competition, and the juries, to say truth, are often far too much swayed by private interests or partialities. In this case great surprise has been felt and expressed that the design by M. Choppin should have been passed over. This sculptor was associated in the matter with M. Constant Bernard, Secretary of the Société Centrale des Architectes, who designed the pedestal, and the whole work was generally pronounced the best realisation of the character of monument required. But the jury, in which the political element was rather predominant, decided otherwise, and gave the prize to M. Auguste Paris, the author of the mediocre allegory of "1789," which was bought by the Municipal Council from this year's *Salon*. The statue by M. Paris, a commonplace affair, is to be cast in bronze and erected on the Boulevard Voltaire, on a pedestal of which the principal face shows, among palms and laurels, a sahra, leaves of paper, and a pen, in recognition of the fact that the young sergeant formerly belonged to the Parisian press.

At the École des Beaux Arts, the competition in construction has closed without any "premier médaille" being awarded. The second-class medals have been awarded to M. Vallat, pupil of Donillard; M. Emery, pupil of M. Pascal; and M. Jost, pupil of M. André.

The competition for the painted decoration for the Mairie of the Sixth Arrondissement will be closed on the 30th of November.

There are to be placed, opposite the principal façade of the Hôtel de Ville, on two of the pedestals formed in the boundary-wall, two statues in bronze, of which we have already spoken, representing Art and Science; the first, which figured in this year's *Salon*, being by M. Marqueste, the second by M. Blanchard. Artistic merits apart, it is generally agreed that the municipal palace would be better without these seated figures, which do not harmonise with the general style of the building. It is with these statues as with the lamps which have been placed on other pedestals in a similar manner; their outlines cut across the lines of the façade in an unfortunate manner. The Parisian building authorities, who formerly placed these adjuncts there at the suggestion of Viollet-le-Duc, are now regretting it, and are rather disposed to make a clean sweep of them: certainly no one would complain. If one is bent on reproducing an ancient building on its old lines, it does not answer to embellish

it afterwards with statues and ornaments which are out of keeping with the harmony of the structure, and Ballu made a mistake in adding to a façade in so pure and elegant a style a series of adjuncts the uselessness of which is daily more obvious.

Internally, the sculptural decorations of the immense Galerie des Fêtes is being pushed on in preparation for the halls and entertainments of the winter. The decorative portion of the ceiling is executed by M. Corboz. Many sculptors, among whom may be named M.M. Moreau-Vauthier, Granet, Berthet, Perrin, Croisy, and Marioton, are completing their models of caryatides and seated figures to go along the coives and around the spaces which are intended for pictorial decoration. On its part, and before separating for the vacation, the artistic committee of the Hôtel de Ville, of which we spoke in our last, has commissioned the two architects, MM. Deperthes and Fournigé, to prepare, with the assistance of M. Lavastra, a general project of decoration, comprising this same gallery, the Salle des Caryatides and the neighbouring rooms, as well as the grand staircase, of which the ceiling has already been painted by the lamented Baudry. This same committee has resolved to utilise, in some of the reception-rooms, some of the fine tapestries belonging to the Municipality. Among the finest of these are "The Passage of the Granicus," and the "Entry of Alexander into Babylon," executed after the designs of Lebrun; two absolutely priceless fabrics, entitled "Les Chasses de Maximilian"; and, lastly, the tapestries called "De St. Gervais," which had been improperly sold, twelve years ago, for the benefit of the church of that name, and the restitution of which to the Municipality was the occasion of a curious lawsuit, about which the art journals of that date were much interested.

Amongst tapestries, the special museum of the Cohelins has been enriched recently by the acquisition of the Egyptian tapestries found in 1885 by M. Maspéro at Panopolis, near Thebes, where the first Coptic Christians of Egypt were buried. These very ancient pieces of work, which have been lately purchased by the State, are of great interest. Certainly, neither perfection of drawing nor variety of colouring can be looked for in these ancient examples, nor do they display the art and science of modern tapestry work, but in solidity and excellence of manufacture they show that modern industry has added nothing to this class of manufacture.

M. de Ronchaud, whose death we recently announced, has not been replaced at the head of the national museums, but there is talk of giving the appointment to the actual Directeur des Beaux Arts, M. Kaempfen, who has for many years been well known as an art-critic under the name of "Xavier Feyermet." In the meantime the void is filled, as far as the Louvre is concerned, by Admiral Paris, curator of the Musée de Marine, who has very naturally profited by the occasion to enlarge his own special department; but this provisional appointment is not likely to be permanent, and the worthy Admiral, whatever his technical knowledge in his own branch of work, is hardly equal to the situation of curator of a great art museum, a post which requires special faculties and special experience.

At the Gare St. Lazare the officials are now installed in the new pavilion at the angle of the Rue de Rome, and all the houses situated between the street and the Place du Havre are now in course of demolition to make room for the grand court, towards which M. Lisch isto erect a new façade, terminated, at the angle of the Rue d'Amsterdam, by a pavilion similar to that of the Rue de Rome. The result of this arrangement of the buildings will be to get rid of the stairs leading to the Salles d'Attente, which are such an inconvenience to passengers for Normandy, Brittany, and England.

The works for the new Bourse du Commerce, delayed for a long time by difficulties in regard to existing rights on the site, are now being actually pushed forward. The plans having been long completed, there is nothing more to wait for. The principal front facing the Rue du Louvre will have a pediment adorned with the arms of the city; above this will be a group of sculpture symbolising Commerce and Industry; on the ground-floor will be the police offices and the postal and telegraph offices. On the first and second floor will be 250 offices intended for general business, and having intercommunication by wrought-iron galleries. As the new Bourse

occupies the site of the old Halle au Blé, it is hoped that the architect, M. Blondel, will take steps, in conjunction with the Municipal Administration, to save the fountain called "De la Halle au Blé," near that edifice, which is the last remnant of the Hôtel de Soisson demolished in 1748, and was designed by Jean Bullant for Catherine de Medicis.

At the Exhibition works, the foundations of the Palais des Beaux-Arts and that for the "Arts Libéraux" are in preparation. These two edifices, which are similar in plan and arrangement, will each have a grand central nave surrounded by a gallery, and each will have a dome 55 metres in height. Between these two buildings is to be formed the central garden on the Champ de Mars, in the middle of which will be a monumental fountain with three basins one over the other, surmounted by a statue of France standing on the prow of a ship and holding in her right hand a torch which at night will be lighted by electricity. Beside her will be figures representing Science, Art, Industry, and Agriculture; at her feet, seated amid reeds, will be a figure representing the Seine, while Triton and Nereid figures disposed along the lower basin will represent the principal rivers of France. The piers of the Eiffel Tower have risen to a height of 15 metres, and we are officially assured that it is to attain to 30 metres by the 1st of January, and that it will be completely finished before the end of 1888.

In connexion with the Exhibition, definite arrangements have been officially made in regard to the work of the committees whose business it will be to organise the lectures on literature, art, history, archaeology, science, political economy, sanitation, public works; in short, upon everything that can be made the subject of a lecture, during the progress of the Exhibition. In the section of fine arts, the organisation of these lectures will be entrusted to MM. Bailly, Bonnat, Chaplain, Claretie, Massenet, Louis Gousse, Gouud, Eug. Guillaume, and Meissonnier. In the section of history and archaeology, the managers will be MM. Gaston Boissier, Durny, Fustel de Coulanges, Maspéro, Georges Perrot, Rambaud, Reinach, and Albert Sorel. The choice is an excellent one, and a set of lectures on these subjects, under the organisation of such a committee, will probably have a real value for learned visitors. An attraction of a different kind is to be furnished by two well-known artists, M. Alfred Stevens and M. Gervex, who have obtained authorisation from the Government to instal, on a part of the Tuileries site, an immense panoramic decoration, the cartoons for which are already finished, and which will consist of a kind of illustration of the period from 1789 to the present day, including portraits of more than 1,800 persons celebrated in politics, art, science, the army, &c.

Contrary to general expectation, it is the old Théâtre Lyrique, lately become the "Théâtre de Paris" which seems destined to receive the homeless company of the Opéra Comique, till the rebuilding of their own house. This theatre, which the Municipality seemed disposed to let to the State, rather than the Galé, is situated on the Place du Châtelet,—that is to say, a long way from the boulevards and from the fashionable quarter of Paris,—a circumstance not in favour of the success of the enterprise. Like the Du Châtelet Théâtre, which faces it, the Théâtre de Paris is the work of M. Davoud. It was inaugurated in 1862, burned in 1871 during the Commune, and rebuilt in 1872 by the same architect. The exterior façade is richly decorated in the style of the Italian Renaissance. The salle, which is decorated with paintings by M. Theodore Maillot, contains 1,600 seats,—a little less than the Opéra Comique; but its acoustic properties are excellent, and its means of egress are ample for public safety.

Now that the metropolitan railway seems, in spite of the vast petition movement organised in Paris in favour of it, to be adjourned to the Greek Kalends, public opinion is a good deal occupied about a scheme, not likely to be realised for a good many years to come, which would, however, exercise an immense influence on the commercial power of the capital. We refer to the maritime canal which the Engineer of the "Ponts et Chaussées" Department, M. Douquet de la Grye, proposes to establish between Clichy and Rouen, for a total length of more than 185 kilomètres, and which, with a minimum depth of 6 mètres, would permit all

the shipping which now stops at Rouen to come right up to Paris. The cost is estimated at 130,000,000 francs. The Municipality is greatly in favour of it, and, indeed, there is a large section among the deputies who are prepared to claim the condition of "arGENCY" from the Government for it.

The Conseil-Général of the Seine is about to vote also for work of considerable importance, to render navigable that portion of the Marne known as the *boucle de la Marne*. This will be a very useful improvement, the total cost of which will be about 1,400,000 francs. It will be of great service to the whole of the country to the east of Paris, and will also have the advantage, with a regular service of steamboats, of permitting tourists to visit the beautiful country traversed by this tributary of the Seine.

The ninth exhibition of the "Union Centrale des Arts Décoratifs," though not yet completely organised, is likely to prove of special interest, as it will be at once retrospective and international, thanks to the co-operation of the museum authorities of Berlin, Vienna, Brussels, Buda-Pesth, and South Kensington. The tasteful decoration of the nave of the Palais d'Industrie contrasts agreeably with the vulgarity of the industrial exhibitions which take place there annually. The pavilions for special exhibits, distributed among the trees of the garden, have a picturesque effect and great variety of construction, and the first-floor galleries, reserved for foreign exhibits and for those of the Union Centrale, are connected with the ground-floor by two staircases,—too grand for the occasion, perhaps, but the design and decorations of which are highly creditable to those who are responsible for them.

The death is announced of the painter, Eugène Médard, who has died from the effects of a painful malady, at the age of thirty-eight. He had studied successively under Léon Cogniet and with M. Gérôme, obtained a medal of the third class, 1879, and one of the second class in 1886. He made a speciality of battle pictures, and had exhibited in the *Salon* of 1886 a "Combat dans un Village," and the "Bataille de Buzenval," which was purchased by the State. These were his last exhibited works.

We may end with a piece of good news for archaeologists.\* The Château d'Anet, which is one of the architectural wonders of the Renaissance, is, it appears, to be rebuilt after the plans of Philibert Delorme. After the death of Diane de Poitiers, for whom Henry II. had it built in 1548, the château passed into the hands of different proprietors. At the Revolution it was confiscated, and sold in 1798 for 3,200,000 francs. Nothing of its past glory really remains save some ruins, a fine gateway, some sculptures by Jean Goujon, and the remains of a staircase. The ancient gateway of the interior court of the château has been rebuilt in the court of the École des Beaux-Arts.

#### BUCKINGHAM PALACE AND THE QUEEN'S JUBILEE.

On the 13th of July, 1837, her Majesty first entered into residence at Buckingham Palace. Ten years later, the St. James's Park front, 360 ft. in length, was added by Blore to the three sides of Nash's fabric. Sir Robert Peel had represented to the Government that then existing accommodation proved inadequate to the requirements of an increasing royal family. So the eastern railings were set forward, and the Marble Arch, which cost 80,000*l.*, and had been modelled after that of Septimius Severus at Rome, was in 1851 removed to Cumberland Gate. Blore's estimate of 150,000*l.* for the new works included certain rearrangements in the northern and southern wings, new kitchens, &c. The southern ball-room was added afterwards. John Nash's palace was erected during the reign of George IV., and completed *temp.* his successor. It is said to have been never occupied by the Queen's immediate predecessor on the throne. The original Buckingham,—or, to speak more

\* We leave the remark of our esteemed correspondent as an example of the different manner in which such a scheme may be regarded, and perhaps is generally regarded in France. In England, probably few of us would regard it as a matter of much archaeological interest, though some ruined building by Wren, for instance, was to be rebuilt from his drawings. It would never look like the work of Wren's day, and the interest would be, to the minds of most of us, of such a purely artificial character as hardly to be worth the money and trouble expended.—Ed.

correctly, Buckinghamshire,—House was built in 1703, from the designs of Captain Wynde or Wynne, pupil and executor of Inigo Jones, and architect of Newcastle, or Powis, House, Lincoln's Inn-fields.

A print of 1819 in our possession corresponds with the description of the house given by Hatton. It was built of red brick, in three floors; and had two wings, of two floors and an attic story, with which it was connected by circular arcades. The principal elevation had nine windows to each course, with two ranges of four pilasters, of the Corinthian and Tuscan orders, the latter being above. The wings, serving for servants' lodgings and for the kitchen and laundry respectively, were, as also the arcades, fronted with pilasters of the Tuscan, Doric, and Ionic orders. This house, designed by De Pœ in his "Journey through England," had been erected on the site of Arlington (Goring) House, the town residence of George and his son Charles (Goring), Earls of Norwich; which, in 1648, had been allotted to Speaker Lenthall. On September 21, 1674, it was, as Evelyn tells us, consumed by fire. Lord Arlington's property here passed to his daughter and heir, Isabella, Duchess of Grafton. She first let it to William, fourth earl and first duke of Devonshire, and subsequently sold it to the Duke of Buckinghamshire and Normanby.

Having its main entrance towards the south, Goring House stood over the south-eastern corner of the Mulberry Garden, which is at this date represented by part of the palace grounds, wherein a garden-party was lately given by the Queen. Emulating the example of Henri Quatre, whose enthusiasm had been fired by Oliver de Serres's work, 1690, upon silk-worm rearing, James I. issued a circular to all provincial authorities, requiring them to provide for the planting of mulberry trees in various parts of the realm. To such an encouragement of home manufacture of silk the king was further moved by a desire "to wean his people from idleness and the enormities thereof." He set about this project, on his own account, by walling in rather more than four acres of St. James's Park, close by the course of the Tyburn. Charge of the plantation, together with a sum of 950*l.*, and an annual subsidy of 120*l.* for expenses, was committed to William Stallone, Comptroller of Customs, and a successful rearer of silkworms in a venture of his own. In 1629, Lord Ashton was appointed Keeper. He sold his office for 100*l.* to George Goring, and with it, apparently, the site of Goring House. At the sale of Crown lands during the Civil War the garden was bought by Anthony Dean, of St. Martin-in-the-Fields parish, a prosperous shipwright at Harwich and Woolwich. Dean sold his lot to one Chipp, who retained it throughout the Commonwealth. It was during Chipp's possession that the Mulberry Garden was resorted to by pleasure-seekers whom Cromwell had ousted from Spring Garden. Henceforth, by name of Colby's Mulberry Garden, it became for a while the most favourite haunt of the kind in town. Its vast popularity, coupled with the perhaps not always perfectly correct deportment of the visitors, is fully vindicated by the comedies and other light literature of the period. Here Sir Charles Sedley found name and inspiration for the comedy he dedicated to one of the garden's chief votaries,—*la belle Steward*; and thither came many a prototype of Shadwell's *Mesdames Striker* and *Brisk*. Evelyn has sighed for us at the ladies' addiction to *romge*; so, leaving Popsy to enjoy the *olla podrida* prepared for his party by his lord of Sandwich's cook, and Dryden to Mistress Anne Reeve's good company, we will turn to some matters that are less familiarly known.

In the year 1666, Lord Arlington had taken Goring House. He dates hence, on June 1, 1672, an interesting account of the engagement in Southwold Bay (28 May). At the death of Charles Goring without male issue in 1670, the gardens were demised at a yearly rent of 1*l.* to Lord Arlington. Within a year or so they ceased to be visited by the public. By a conveyance dated November 22, 1681, he buys the site of his house and the adjoining grounds from Sir Thomas Grosvenor, Bart., for 3,500*l.* Westwards thereof lay an orchard and kitchen-garden that had been in tenure by the rich Hugb Audley. In 1689, Arlington House was

\* Circular to Sheriffs, Deputy-Lieutenants, &c., Harl. MSS. 793.  
† Edward (Bennet), Baron Arlington, 1683; advanced Viscount Thetford and Earl of Arlington 1672.

bought from the Duchess of Grafton by John Sheffield, Duke of the County of Buckingham. In his plans for rebuilding, he largely consulted the convenience and comfort of his loved and third wife, Katharine Darnley, widow to James (Amesley), third Earl of Anglesey, and daughter of Katharine Sedley King, James II. The Duke died on February 24, 1721; his widow, who set great store by her royal descent, on April 8, 1743, her only surviving son Edmund, died at Cirence, October 30, 1735, devising to his other all his Yorkshire estates. They were inherited by her grandson Constantine Phipps, at Lord Mulgrave. This Constantine was in 1741 to Lady Katharine Annesley, a daughter of the Duchess by her former marriage, by her son with William Phipps in 1718. Constantine Phipps, elevated Baron Mulgrave, September 3, 1707, had married (1743) Molly, eldest daughter of John Lord Hervey,—"Yonth's youngest daughter, sweet Lepel."

We are thus brought to an important, and we believe novel, chapter in the history of Buckingham House. By an indenture of June 1, 1741, the Duchess conveys it in trust to Thomas Falkland, Zachary Chambers, and George Bringer. This indenture recites, by the way, that by letters patent of September 28th, Charles II., the king had let, for ninety-nine years, running from St. John the Baptist's day, that piece of land called the Mulberry Garden in the parish of St. Martin-in-the-Fields. Reserving her own life benefit therein, she assigns the property upon such trusts as she shall by deed or will determine. By a deed of even date with the indenture she appoints in trust for Lord Hervey's benefit; and in the event of his not, within six months of her decease, formally signifying acceptance of the limitation, she appoints it to her executors for four years from her death, on trust, in favour of such persons as she should direct. After the said four years, and after Lord Hervey's death, in a case he should accept such limitation, the lease and premises were to go for default to or residuary legatees, in trust; and for default, then in trust to the person ultimately entitled to her personal estate. By her will, dated February 15, 1742, the Duchess devises all her personal estate to Constantine Phipps, and bequeaths her leasehold estates in Yorkshire in trust to him and his heirs. It is commonly stated that Hervey did not care to take possession. This statement hardly coincides with an "answer," sworn April 3, 1744, by Constantine for self and for his wife, then an infant, in certain Chancery proceedings Sheffield v. Earl of Orrey; instituted against them and the executors of the Duchess's will to obtain possession of the house. He answers clearly sets forth that very soon after her death Lord Hervey did take possession thereof, and continued in possession until his death on August 5, 1743. The Sheffield, who the suit is Charles Herbert, to whom, being then "under the tuition of Mons. Brézy, of Utrecht," the Duke, by his will of August 9, 1716, left the house, failing lawful issue. Herbert, a natural son of the Duke, took the name of Sheffield, in terms of clause 11 of his father's will. Lord Hardwicke's decision of December 4, 1745, was in his favour on all points. He was created a baronet on the 1st of March, 1756. In the Suffolk Papers may be read a letter (August 1, 1723) to Mrs. Howard, wherein the Duchess rebases the terms in which she is disposed to part with the house to the then Prince and Princess of Wales. The negotiations fell through, but in 1761 the house was bought for £1,000, of Sir Charles Sheffield, and settled upon Queen Charlotte, by the name of "The Queen's House," in lieu of Somerset (or Denmark) House, in the Strand.

We may add that the eulogy of "La Belle Stewart" (Duchess of Richmond), made by a Mrs. Goldsmith, together with those of the Duchess of Buckinghamshire and her son, are still preserved amongst the "wax figures" at West-Minster. The bodies of the two latter rest in the Duke's tomb in Henry VII.'s Chapel. Pope's epitaph for the Duchess was never described on the monument; that by the Duke or himself is a memorable composition, and has occasioned a considerable amount of theological discussion. The lines are altered somewhat from their wording as originally composed. In clause 13 of his will they stood as follows:—"Pro rege sado, pro republica semper." "Duhus, sed non improbus vixi / Incertus

morior, sed inturbatus / Humannu est uocare & errare / Christum advenor, Deo confido / Omnipotentu benevolentissimo / Ens entium miserere mei!"

RIVER CART NAVIGATION WORKS.

This undertaking, for which an Act was got last year and the contract operations of which are now in active progress, furnishes a practical and convenient example of that canal-making for inland ship navigation purposes which has of late been engaging so much attention all over the world. A work, comparatively speaking, of very moderate compass longitudinally, it is yet essentially typical in its conditions and aims, and may indeed in some sort be called the Mersey and Manchester scheme on a greatly reduced scale, and with certain differences in principle, of course. The Cart,—or, to be more precise, the "White Cart,"—falls into the Clyde near Renfrew, six miles below Glasgow, after having passed the town of Paisley three miles inland, and subsequently received the Black Cart as a tributary. The latter branch is not

possible to conceive. One fortunate feature, however, in view of an adaptation to ship-canal purposes consisted in the absence of important crossings, the requirements of one bridge only, and that an opening bridge, having to be met all the way from Paisley to the Clyde outlet. With the exception of a new cut to clear an awkward bend of the original course, the works keep to the line of the river, which otherwise is a fairly straight one. Part of the requisite wideening elsewhere is got by shaving away the left or west bank, but in following the natural trend of the stream much the larger portion comes off the other side. The finished result will be a channel with little of curve in it, 180 ft. wide at the surface, and possessing a centre depth of 18 ft. at high water. A towing-path, 20 ft. wide, will follow the right margin of the work from the Clyde outfall up to the new Paisley Harbour, the site for which has been chosen at a point which just stops short of the bouvas of the town. This harbour, a rough oval in shape, is formed by exaggerating the nominal breadth of the channel to a maximum width of 340 ft. at the widest section, and it is flanked on the west

Map showing Bearings of Paisley Ship Canal.

navigable in any practical sense. Over these three miles below Paisley the course of the White Cart is through an alluvial deposit of low general elevation and very nearly flat, the channel itself being tidal as high as the town. In spring tides and during floods the Cart in this its lower section has always been navigable in a kind of way for very small craft, even back to remote times. The inhabitants of Paisley, which is a place of some antiquity, long ago recognised the possibilities of their river, and in 1786 they actually set to work on the original channel, and in a rough and ready way deepened it to about 7 feet ordinary spring tides. Some further trifling repair work was done in 1836; and in 1853, agitation again coming to a head, estimates were taken for works to provide a uniform high-water depth of 12 ft. But nothing was done. Two years ago this perennial speculation on the lasting good to be derived from a purposeful enlargement of the river's course once more assumed the acute stage, and so much enthusiasm was aroused that nothing short of a scope of work which would give access to ocean-going ships, and equip the town for setting up as a kind of humble rival to Glasgow, could now satisfy the revived enterprise of the magistrates and merchants of Paisley. The necessary Act was promptly procured, and six months ago ground was broken. Paisley is a populous town of swift and steady growth, with a large and increasing share of many varied industries. It has even cultivated the building of steamers (small ones necessarily) on the banks of its puddle of a stream; and if once made a seaport *de facto*, it is expected that vessels of almost the highest class will be built on the newly-made banks, while, at the same time, the town will figure as an independent emporium, in direct touch with all the great ports of the world. If the Paisley experiment succeeds, many towns of similar geographical position and promise will no doubt be found likewise engaged in operations for bringing the neighbouring deep-sea tide to their own doors. The channel of the Cart has hitherto been less than 90 ft. wide on the surface, with variable depth, and a liability to shoal at points; the banks naked, destitute of trees, and presenting, particularly at times of fallen tide, an aspect the most unlovely it

side by 820 ft. of strong quay wall, and on the east by 1,100 ft. of the same. Operations under the contract will terminate immediately above the new harbour in a sunken weir, preserving the upper and untouched portions of the stream *in statu quo*. Borings over the course of the river show that the materials to be got rid of by excavation, dredging, and blasting, consist largely of sand and gravel, with some boulder clay; also a good deal of sandstone rock in the upper reach. The quay walls of the harbour are faced with a 24 ft. height of granolithic blocks, springing from a concrete base, 2 ft. thick, the interior consisting of concrete rubble. No locks of any kind enter into the plan of the works, and in this highly-important respect the new harbour of Paisley will offer an access from the ocean quite as unimpeded as that afforded by the older neighbouring harbour of Glasgow. Operations have been in progress since the beginning of the year, and the contractors have already made conspicuous mark on that portion of the removable strata situated above low-water line. It is expected that full completion will be reached by the autumn of 1889. Messrs. Miller & Bell, Glasgow, are the engineers; Mr. John Kyle, resident works engineer; and the contractors are Messrs. Mitchell & Ireland.

**The Pharmaceutical Society's New Building** in Bloomsbury square, for the Pharmaceutical Society of Great Britain (Messrs. Lansdowne & Harris, architects), is now rapidly drawing towards completion. With regard to the sanitary arrangements and the ventilation, Messrs. Robert Boyle & Son's system is being applied throughout. Boyle's patent heating tubes are also used for warming the fresh-air supply to the large Examination Hall.

**Civil and Mechanical Engineers' Society.**—We are asked to mention that the offices of this society have been removed to No. 6, Queen Anne's-gate, Westminster, and that in future the meetings will be held at that address.

**Royal Victoria Hall and Coffee Tavern.**—The above hall, formerly the Victoria Theatre, Waterloo-road, has been closed during the last three months for thorough re-decoration and renovation, and has now been opened.

"DRAKE'S" CHAIR.

THE "FORTESCUE" CHAIR.

Chairs in the Bodleian Library, Oxford.

## TWO CHAIRS FROM THE BODLEIAN LIBRARY.

The two chairs here given are in what is known as the "Picture Gallery" in the Bodleian Library.

The earlier of the two is a fine specimen of carved work, and is called the "Fortescue" chair, and "probably formed a part of the furniture of 'Saldon House,' Mnsley, Bucks, the seat of Sir John Fortescue, the friend of Sir Thomas Bodley, and the Chancellor of the Exchequer in the time of Queen Elizabeth" (vide card attached to chair). The total height of the back from the seat is 2 ft. 8½ in., and 1 ft. 9½ in. in breadth. The seat itself increases to about 2 ft. in the front and is 1 ft. 3¼ in. from the floor.

The second chair, or "Drake's," was made out of some of the wood from the ship which took Drake round the world. There is a curious inscription written on the brass shield in Latin on one side and English on the other. The latter runs as follows:—

"To this great ship which round the world has run,  
And match'd in race the chariot of the sun,  
This Pythagorean ship (for it may claim  
Without presumption so deserved a name),  
By knowledge once, and transformation now,  
In her new shape this sacred port allow,  
Drake and his ship could not have with'd from Fate  
An happier station or more blest estate,  
For, lo! a seat of endless bliss is given  
To her in Oxford, and to him in Heaven.

ABRAHAM COWLEY, 1662.  
Sent to the University of Oxford by order of John Davis, Esq., the King's Commissioner at Deptford."

The total height of the chair is 3 ft. 10½ in., the back being 1 ft. 8½ in. in breadth, and the seat 1 ft. 11 in. in front between the arms, and 1 ft. 8½ in. in depth. The back leans back slightly, and realises to some extent the last line but one of the inscription, being very comfortable to sit in.

**West Malling.**—A stained-glass window, to commemorate Her Majesty's Jubilee, has recently been placed in Addington Church, West Malling, by the parishioners. The window is of two lights, and contains figures of SS. Alphege and Frances, surmounted by architectural canopies, and was designed and executed by Messrs. Warrington & Co., of Fitzroy-square.

## OPENING OF THE ACTON DRAINAGE WORKS.

THESE works of sewage disposal, designed by Mr. William Nicholson Lalley, Surveyor to the Acton Local Board, were formally opened on Thursday in last week by Mr. William Robbuck, C.E., Chairman of the Board, in presence of a large company of gentlemen interested in the treatment of sewage.

Several months ago a detailed account was given in the *Builder* of some experiments in the treatment of sewage under the ferrous-carbon system, which is promoted by the International Sewage Purifying Company. The Acton Board has entered into a provisional agreement for seven years with this Company to treat the sewage of the parish at the new sewage works, occupying a site of five acres and a half in the vicinity of the town. It should be explained that Acton is at present allowed to use as a sewage outlet an old water-course (Stamford Brook), which now forms a sewer of the Metropolitan system; but this privilege only extends to the sewage of houses built before a certain date; and the drainage scheme now constructed has only to deal with the sewage of houses erected after that specified date. None of these latter houses have been connected with the new system, but the work will now be gradually proceeded with. In order to demonstrate the method of the new process, described as the magnetic-ferrous-carbon system of treating sewage, the Stamford Brook was tapped and the sewage allowed to flow into the works. The surroundings of the works are so admirably laid out with well-stocked flower-beds and carefully-gravelled paths, and the buildings, which include a commodious house for the resident superintendent, are so compactly arranged and pleasant in appearance, that the visitor at the first approach can scarcely resist the impression that he is not within the precincts of some wealthy-endowed benevolent institution. Some of the substantial details of the works have already been given in the *Builder*, but it may be here mentioned that in most similar schemes there are two levels for the sewers,—a high and a low. The high level sewer conveys the sewage from the high land in the north and north-west and

north-eastern districts of the parish; and the low-level sewer conveys the sewage from the South Acton district. The sewage is discharged into a channel extending along one side of the precipitating-tanks, of which there are five, three with a capacity each of 133,282 gallons, and two of 72,150 gallons. The low-level sewage is pumped into this channel from a well 36 ft. deep by means of two non-condensing engines, 35-horse-power, erected by Mr. James Watt (late Boulton & Watt), Soho Works, Birmingham. Running parallel with this sewage channel is a small narrow upper channel, which receives the chemicals from the mixing-room, and which, by means of a series of equidistant arms or spouts, delivers the chemicals, the compound sewage salt, and the ferrous-carbon in the form of a slurry or thickish black liquid into the lower channel at various stages of the progress of the sewage towards the precipitating-tanks. It was interesting to notice the crude sewage as it passed along this open channel rapidly undergoing chemical change. A great portion of the organic matter is here coagulated with the chemicals, carrying away all the matter in suspension, and the grosser portion of the company's solution still in the shape of ferrous iron. This coagulation is due to the presence of the compound salts, which consist of certain proportions of sulphate of alumina, sulphate of calcium, and sulphate of magnesia. After the coagulation takes place, then the ferrous salts come into play, defeating the organic matter in solution. The magnetic ferrous-carbon impregnates the fluid portion of the sewage, preventing decomposition. The treated sewage is then allowed to stand in the tank about three hours. The mode in which sewage is here passed into the tank is worthy of observation. The experience of the Company has led them to the belief it is better that the coagulation once formed should not be broken up, and consequently the treated sewage is passed into the tank with as little agitation as possible. With that object in view, Mr. Lalley devised a shoot, the lower end resting on a flushing-platform, so that the sewage slips down it at an easy incline, inasmuch as the platform rises with the sewage in the tank. This shoot also prevents the incoming sewage from stirring up the sludge as soon as it is

NEW HOLIDAY

med, which sometimes happens when the dge is allowed to fall freely into the tank. A purified effluent water is drawn from the tank by means of a floating suction, which sees the effluent from the surface without disturbing the sludge at the bottom of the tank. The precipitated effluent is of a reddish e, due to the presence of iron, it would not, is contended, be detrimental to any stream to which it may flow, but the company assert at, for the production of a bright pure effluent, toring through their prepared beds is necessary. Accordingly, one of the small tanks has on converted into a filtering bed, composed the following layers, — 4 in. agricultural in-pipes, packed close together, with abingle led in between them; 4 in. of pea gravel; in. of sand; then a layer of 10 in., composed 5 in. of magnetic spongy carbon and 5 in sand and gravel, thoroughly mixed together. ove this is a layer of sand 9 in. in thickness, d on the top of the filter is spread 1 in. of coarse agnetic spongy carbon. The liquid sludge is ept into a well, from which it is afterwards upped into a rotary agitator capable of containg 11,000 gallons, for the purpose of a further ixture with the company's chemicals, and so insuring the impossibility of putrefaction taking ace in the sludge after being pressed. Sludge is hitherto been made by the addition of ten fifteen per cent. of lime, without which it ould not press in the ordinary press. The mpany contend that by their chemicals they ain all the original manurial properties of he sludge which are driven off by the lime, hich liberates the ammonia and renders the osphoric acid insoluble, and, therefore, of no se for plant life. The pressing plant consis of two of Drake & Muirhead's (Maidstone) atent filter presses consisting of thirty ambers of 3 ft. internal diameter by 14 in. ickness. The sludge is forced direct into the resses, without the employment of compressed r, by specially designed duplex steam pumping gines, which are automatic in their action, he cakes when pressed fall into wagons, which an on rails to the grinding-room, where they e ground into a powder, which is put into egs and sold as manure.

Mr. William Swaker ably superintended the rrying out of the whole of the details of these orks.

**The Lambeth New Workhouse Buildings.**—An extensive block of new buildings is ow in progress in Prince's-road, Lambeth, for he Guardians of the Parish of Lambeth. The ildings are being erected on the site of the ld Workhouse, the greater portion of which as been taken down, and are chiefly intended s a test-house for alk-bodied papers, the guardians having decided that in future the resent Workhouse off Lower Kennington-road hall in the main be appropriated to the aged and infirm. Including the eastern portion of he old building, which has not been removed, he structure will have a frontage to Prince's- ead of about 300 ft. in length, and, being arried to a depth of 184 ft., will occupy a round area of upwards of 55,000 ft. The Prince's-road frontage contains a deep hasent and three floors, the blocks in the rear containing one floor only. On the ground floor of the block fronting Prince's-road are the inmates' day rooms,—six in number,—three for men on the west side, and also three for women on the east side, the master's offices being in the centre. All the upper floors will contain the dormitories. The one-story blocks at the rear will contain several work-shops, oakum room, and hand-mill house on the male side; whilst on the female side is the laundry block. At the extreme rear in the centre is the inmates' dining-room, an apartment, 50 ft. by 30 ft.; a floor above this being appropriated for the chapel. The basement of the front block contains the male and female receiving wards and officers' rooms, and stores; and also a number of work-shops. An open area in the centre, enclosed by the several blocks, contains six yards for the use of the male and female inmates, these yards being appropriated to the paupers, who are intended to be specially classified according to character and physique. Mr. T. W. Aldwinckle, of East India-avenue, E.C., is the architect; and Mr. W. Smith, of the Eldon Works, Harleyford-road, is the contractor. Mr. W. Chutter is clerk of the works. The estimated cost of the buildings is 20,000l.

THE INSTITUTION OF CIVIL ENGINEERS.

SUBJECTS FOR PAPERS.—SESSION 1887-88.

The Council of the Institution of Civil Engineers invites original communications on the subjects included in the following list, as well as on any other questions of professional interest. For approved papers the Council has the power to award premiums, arising out of special funds bequeathed for the purpose, the particulars of which are as under:

1. The Telford Fund, left "in trust, the interest to be expended in annual premiums, under the direction of the Council." This bequest (with accumulations of dividends) produces 260l. annually.
2. The Manby Donation, of the value of about 10l. a year, given "to form a fund for an annual premium or premiums for papers read at the meetings."
3. The Miller Fund, bequeathed by the testator "for the purpose of forming a fund for providing premiums or prizes for the students of the said Institution, upon the principle of the 'Telford Fund.'" This fund (with accumulations of dividends) realises 150l. per annum. Out of this fund the Council has established a scholarship,—called "The Miller Scholarship of the Institution of Civil Engineers," and is prepared to award one such scholarship, not exceeding 40l. in value, each year, and tonable for three years.
4. The Howard Bequest, directed by the testator to be applied "for the purpose of presenting periodically a prize or medal to the author of the greatest number of the uses or properties of iron, or to the inventor of some new and valuable process relating thereto, such author or inventor being a Member, Graduate, or Associate of the said Institution." The annual income amounts to nearly 16l. It has been arranged to award this prize every five years, commencing from 1877. The next award will therefore be made in 1892.

The Council will not make any award unless a communication of adequate merit is received, but will give more than one premium if there are several deserving memoirs on the same subject. In the adjudication of the premiums, no distinction will be made between essays received from members of the Institution or strangers, whether natives or foreigners, except in the cases of the Miller and the Howard bequests, which are limited by the donors.

List.

1. The Utilisation of Unused Sources of Power in Nature—such as the Tides, the Radiant Heat of the Sun, &c.
2. Tacheometry, or Rapid Surveying.
3. The distinguishing qualities of Clay to make good Puddles.
4. Colonial Woods suitable for Engineering purposes.
5. The Influence of Sea-Water upon Portland-Cement Mortar and Concrete.
6. The Wind-Pressure upon Structures, as influenced by (1) their superficial area; (2) the form or position of the exposed surfaces; (3) the shelter of adjacent bodies; and (4) the dynamic action of sudden gusts upon elastic structures.
7. The Working-Strength of Iron and Steel as affected by (1) the amplitude; (2) the frequency; and (3) the time-rate of the stress-variations.
8. Description of any new or peculiar form of Mountain Railways for very steep gradients.
9. Recent Irrigation-Works in California.
10. Machinery and Arrangements for Distilling Water by Multiple Effect.
11. The effect of Different Qualities of Water on the condition and duration of Cast-Iron Pipes.
12. On the Sale of Water by Measure.
13. Uniformity in system (international) of Coast-Lighting by lighthouses, light-vessels, and their auxiliaries, automatic lights, buoys, and daymarks.
14. Recent Improvements in Cable Tramways.
15. The Present Position of the Manufacture of Steel,—its defects, and suggestions for its improvement.
16. The action upon Basic Steel of (1) Chromium; (2) Aluminium; and (3) Tungsten.
17. The Use and Testing of Open-hearth Steel for Boiler-Making.
18. The Production of Aluminium and its Alloys, with their Properties and Uses.
19. Manganese in its application to Metallurgy.
20. Improvements in Zinc-Smelting.
21. The Application of Steel Castings and of Steel Forgings to the Construction of Ordnance and of Projectiles.
22. Rapid-Firing Guns.
23. On the Guiding by Hydraulic Pressure.
24. The most recent types of (1) Mail Steamers; (2) Cargo Steamers; and (3) War-ships.
25. On the Use of Liquid Fuel for Steam-Boilers and other Industrial purposes.
26. The Independent Testing of different types of Steam-Engines, including Triple-Expansion and Quadruple-Expansion Engines.
27. The Construction of the Working Parts of Steam-Engines, in relation to the high pressures and temperatures now becoming general.
28. The practical limit to the Working-Pressure of Steam in Marine Boilers.
29. Auxiliary Engines Connected with the Modern Marine Engine.
30. On Speed Indicators for Locomotives.
31. The Construction and Efficiency of Steam-Turbines.
32. The Transmission of Steam underground in the United States, with the results obtained.
33. Hydraulic Pumps for Working at High Pressures.
34. The Relative Economy of various modes of distributing Power over large Areas.
35. Descriptions of Hydraulic Rams and of Turbines, with actual quantitative results.
36. The means of governing and economising high-pressure fluid in Hydraulic Cranes, Engines, &c.
37. Tools used in the Building of Iron and Steel Ships, and in the Construction of Boilers.
38. Type-Composing and Distributing Machines.

39. On Natural Gas, and its applications to the Industrial Arts.
40. Compressed Oil-Gas, and its applications.
41. On the Spontaneous Combustion of Coal in Ships.
42. Appliances for the rapid Shipment of Coals, with a comparison of different methods.
43. Electro-Motors: their theory, construction, efficiency, and power.
44. The Construction and Maintenance of Secondary Batteries.
45. The Distribution of Electricity for the Lighting of Towns.
46. The application of Electricity to the Working of Street Tramways.
47. The application of Electricity to Smelting and Metallurgical Operations.
48. Means of insuring the Safety of Blast in Explosive Atmospheres.
49. Contributions to the Bibliography of special branches of Engineering.

PREMIUMS AWARDED, SESSION 1886-87.

The Council of the Institution of Civil Engineers has awarded the following premiums:—

The Howard Quinquennial Prize to John Percy, M.D., F.R.S., Hon. M.Inst.C.E., in recognition of his researches on the Uses and Properties of Iron.

*For Papers read and Discussed at the Ordinary Meetings.*

A Telford Medal and a Telford Premium to Alexander Blackie William Kennedy, F.R.S., M.Inst.C.E., for his paper "The Use and Equipment of Engineering Laboratories."

A Telford Medal and a Telford Premium to John Hopkinson, Jun., M.A., D.Sc., F.R.S., M.Inst.C.E., for his paper on "The Electric Lighthouses of Macquarie and of Tio."

A Telford Medal and a Telford Premium to Colonel Beasley Maitland, R.A., C.B., Assoc.Inst.C.E., for his paper on "The Treatment of Gas-Steel."

A Telford Medal and a Telford Premium to William Lowericks, M.Inst.C.E., for his paper on "Irrigation in White Egypt."

A Wait Medal and a Telford Premium to Edward Arnold Clowes, for his paper on "Printing-Machinery."

A Telford Premium to William Joseph Dibdin, F.C.S., F.I.C. for his paper on "Sewage-Sludge and its Disposal."

A Telford Premium to William Sano Crimp, Assoc.M.Inst.C.E., for his paper on "Filter-Presses for the Treatment of Sewage-Sludge."

A Telford Premium to John James Webster, M.Inst.C.E., for his paper on "Dredging Operations and Appliances."

A Telford Premium to John Kyle, M.Inst.C.E., for his paper on "The Colombo Harbour Works, Ceylon."

The Manby Premium to Lewis Henry Ransome, Stud.Inst.C.E., for his paper on "The Conversion of Timber by Circular-saws and by Band-saws in the Pine-growing districts of the United States."

*For Papers printed in the Proceedings without being Discussed.*

A Telford Medal and a Telford Premium to John George Gamble, M.A., M.Inst.C.E., for his paper on "Water Supply in the Cape Colony."

A Wait Medal and a Telford Premium to William Isaac East, Wh.Sc., Assoc.M.Inst.C.E., for his paper on "Setting out the Curves of Wheel-Teeth."

A Telford Premium to Joseph Hetherington, for his paper "On Utilising Waste Air in Filter-Pressing; with some results of Pressing Sewage-Sludge at Chiswick."

A Telford Premium to Killingsworth William Hedges, M.Inst.C.E., for his paper on "Central Station Electric Lighting."

A Telford Premium to Charles John Wood, M.Inst.C.E., for his paper on "The Molten Reservoir, Cape Town."

A Telford Premium to Alexander Leslie F.R.S.E., M.Inst.C.E., for his paper on "Salmon-Ladders in Scotland."

A Telford Premium to David Alan Stevenson, F.R.S.E., F.R.S.E., M.Inst.C.E., for his paper on "Aliss Craig Lighthouses and Fog-Signals."

*For Papers read at the Supplemental Meetings of Students.*

The Miller Scholarship to John Goodman, Wh.Sc., Stud. Inst. C.E., for his paper on "Recent Researches in Friction." Part II.

A Miller Prize to Sidney Herbert Wells, Wh.Sc., Stud. Inst. C.E., for his paper on "The Propelling Machinery of Modern War-ships."

A Miller Prize to Robert Francis Hayward, Stud. Inst. C.E., and a Miller Prize to John Platt, Stud. Inst. C.E., for their joint paper, "Experiments on Iron and Steel in Tension, Torsion, and Shear."

A Miller Prize to Ernest William Moir, Stud. Inst. C.E., for his paper, "Hydraulic Appliances at the Forth Bridge Works."

A Miller Prize to Alfred John Hill, Wh.Sc., Stud. Inst. C.E., for his paper on "The Use of Cast-Steel in Locomotive Construction."

A Miller Prize to Alfred Chatterton, B.Sc., Stud. Inst. C.E., for his paper on "Flour Mills and their Machinery."

A Miller Prize to Edward Carstensen de Segundo, Stud. Inst. C.E., for his paper, "Experiments on Steam-engine Economy."

**Scottish Building Grants.**—In terms of a Parliamentary Return relating to the sums annually voted during the past ten years to the four Scottish Universities and to the Royal Observatory and Royal Botanic Garden, Edinburgh, the expenditure for new works, embracing the purchase of sites, includes the items following:— Aberdeen, 5,167l.; Edinburgh, four grants in aid of, 20,000l. each; St. Andrew's, 879l.; Transmission, 1,033l.; and the Botanic Garden, 2,381l. The last-named amount does not include certain expenditure upon Inverleith House and the Edinburgh Arboretum.

\* Has previously received a Telford Premium.

† Has previously received a Telford Medal and a Telford Premium.

‡ Has previously received a Manby Premium.

§ Has previously received a Miller Prize.

"Charity": Design for Stained Glass. Small Reproduction from Working Drawing to show Arrangement of the Constructional Bars.

## Illustrations.

### "CHARITY."

CARTOON FOR STAINED GLASS WINDOW.

**T**HE unusual form of this window demanded a somewhat unusual character of design.

Given a window with a clear space of nearly 14 ft. high, over 9 ft. wide, and a single subject to fill it, a more or less pictorial treatment seemed desirable, subject to constructional considerations.

The space required not less than two upright bars, and, as an important centre figure was essential to the theme, it was necessary to avoid a centre upright.

These being the conditions, a design was adopted in which the architectural features were calculated to supply the place of the usual mullions, the upright bars being employed to emphasise the most important upright architectural lines, many of the horizontal bars answering a corresponding purpose. (See the accompanying small illustration from the working drawing.)

The composition divides itself mainly into three groups, one or two figures only crossing the upright bars so as to connect the parts into one subject.

The curtain behind the portico is deep blue, upon which the centre figure is relieved in

draperies of varied rubies. Otherwise the colours are nearly confined to the draperies, which, for the most part, stand either in close relation with each other, or directly on the greenish and greyish whites of the architecture.

The allegorical group which occupies the head of the window is treated as statuary in whites, like the architecture.

HENRY HOLIDAY.

### JESUS COLLEGE, CAMBRIDGE.

THE view shows in the foreground the new buildings which have of late years been carried out, and in the distance the ancient parts of the College (which have been altered and restored), together with the block of chambers built in 1870 under Mr. Waterhouse. The chief object of the erection of the new buildings has been to increase the accommodation for undergraduates, a large number of them having been obliged to reside outside the College in default of a sufficient number of sets of rooms being available for them within it. It was also necessary under the revised statutes to provide residences for two married Fellows as disciplinary officers of the College, as well as tutors.

The general character of the buildings follows that of its founder, Alcock, Bishop of Ely, to whom Henry VII. granted the Charter

of Foundation on June 12th, 1497, some two years after the site had been acquired and the buildings begun. There were then existing on the site the almost ruinous buildings of the decayed nunnery, which in A.D. 1133 had been founded and dedicated to St. Mary and St. Rhadegund. Mr. J. Willis Clark, in his valuable work "The Architectural History of the University of Cambridge," gives a very interesting account of the several buildings, both conventual and collegiate, together with many notes and sketches by the late Professor Willis. It will, therefore, suffice to say that the conventual plan has evidently much influenced that of the founder of the college.

Bishop Alcock restored the choir, tower, and transepts of the former conventual church, and used it as his College Chapel; after removing the two side chapels dedicated to St. Catherine and to St. Margaret some few years later (about 1510) the ruined nave was reconstructed at the expense of Sir John Roysley (Bishop Alcock died Oct. 1, 1500), partly as an ante-chapel and partly for residential purposes; and there have been found enclosed in these walls remains of the pillars and arches, and of other architectural features of the twelfth and thirteenth centuries, which were then standing in a state of ruin, thus preserving to our day the several steps of the architectural history of the church. The side aisles of the nave were, however, altogether removed, excepting some fragments in the present Master's Lodge, but by this means the area of the cloister court (on the north side of the church) was enlarged. The old refectory, stood on the north side of the cloister court, and on its site Bishop Alcock built his college dining-hall. Thus we find the unique plan (for a college) of a cloistered quadrangle. This cloister is now modernised, but the drawing shows the ancient design of the windows (from Logan) as they are proposed one day to be restored. The buildings on the east and west sides of the cloister court (including the library) are Bishop Alcock's work, with additions and extensions of 1503 (Lady Catherine Bray), 1638, 1718, and 1822.

The chapel, it should be noted, was ably restored by Pugin, and the restorations have been continued under Messrs. Bodley & Garner, whose plans are now under consideration for the necessary alterations involved in the re-arrangement of the fittings, by extending the choir, as in conventual days, across the tower into the nave, with screens across the transepts.

The newly-erected buildings are from the designs of Mr. R. Herbert Carpenter & Mr. Benj. Ingelow, who have also carried out the restoration of the old buildings forming the west side of the new court. The style and materials are both regulated so as to harmonise with Alcock's work, which had certain peculiarities of its own; as, for instance, the stepped parapets, which may be seen on his gate-tower; and on the gables of the hall. The heads of his windows are, as a rule, without cusping, but there are some exceptions, as, for instance, in the oriel of the hall, and this was felt to be sufficient authority for so treating the window-heads of the new block, while the more general type of ancient window (of which some few are fortunately preserved) was adhered to in the old wing, in place of the square-arched openings which had usurped their places in all portions except those which were not generally visible! This treatment has also been carried out in the alterations of the Master's Lodge. The low, flat pitch of the roof is also a characteristic of the founder's work. He used for the walls a very poor quality of bricks, such as is now not to be obtained, and it was therefore decided to use for the new buildings the red Haverhill bricks with dressings of Ancaster stone.

There are provided in the new block thirty-six sets of rooms for undergraduates, a lecture-room, servants' rooms, &c. The tutors' houses are treated in a more simple style with the same materials.

A new entrance-gateway has been formed in Jesus-lane, with a porter's lodge and inner gateway near to the court. This new court, formerly a part of Jesus-close, has been laid out and planted, as well as the new gardens, under the directions of the Rev. E. H. Morgan, tutor and dean of the College (whose residence is in the foreground on the left of the picture).

The College has a very large close on three sides, planted with magnificent old trees extending to the river Cam. At some time, if need be, the court will be completed by extending the

ADDITIONS TO JESUS COLLEGE.

buildings along its north side, where at present it is open to show the trees beyond it.

The Master's Lodge has been the last work undertaken, and it has been altered very considerably inside from its former dark, ill-ventilated, and inconvenient state, and a new staircase has been erected, and a new porch and window, with many other structural alterations.

The Undergraduates' Block, with the Porter's Lodge gates, &c., has been carried out by Mr. Jenley, of Waltham Abbey, the tutors' houses and the work to the ancient wing and offices by Messrs. Rattee & Kett; and the alterations to the Master's Lodge by Mr. Foster, of Hampton; the ironwork is by Mr. Jones, of Ainstable; and the grates by Mr. D. O. Boyd, of Maddox-street. The clerk of works (excepting for the lodge works) was Mr. Higgs. In the three niches of the new block are statues executed by Messrs. Singer, of Frome, the Blessed Virgin, St. Rhadegund, and St. John; the ancient statue of Bishop Alcock stands in a corresponding niche over his gateway.

The small scale plan with references shows the general dispositions of the buildings, the new portions being indicated by the darker tint.

#### RESIDENCES AT TUNBRIDGE WELLS.

THESE houses are situated in Limeshill-road, immediately facing the well-known Tunbridge Wells Common. They are built with red brick, having Bath stone and blue brick dressings and all courses, partly covered with ornamental plain weather tiling and half-timbered work, with stucco and incised work, the roofs being covered with red and black tiling. They are built on the hard white local sandstone, and are fitted with the electric light. Care has been taken with regard to the sanitary arrangements.

The houses have been designed to meet a demand in Tunbridge Wells for residences of an economical character, and yet possessing more artistic feeling than the common red-brick residences with which the place abounds.

The houses have been constructed by Messrs. Oakley & Drake, builders and contractors, of Tunbridge Wells, and have been designed by Mr. W. H. Oakley, architect, of London.

#### NEW PREMISES IN THE HAYMARKET.

THIS building, at the corner of the Haymarket and Coventry-street, being the first block erected in the Piccadilly Improvement scheme, is French Renaissance in character, and was designed by and carried out under the supervision of Mr. H. H. Collins, of Old Broad-street. The lower portion is built of Whitbed Portland stone and granite and the upper part of Beer stone.

It presented many difficulties in construction, the basement, ground, and first floors, and three upper floors, being entirely distinct and separated by fireproof construction. The basement and ground-floor being appropriated for shops, the first-floor being left as one large room for the purposes of an Exhibition-room or large hall, and the upper portions being intended for residential chambers, the whole weight is thrown on the lower floors, and the arrangement of the necessary ironwork required much careful consideration. The cost of the building has been about £1,000.

The contractor was Mr. Wm. Brass, of Old-street, E.C.; the ironwork and fireproof construction were supplied by Messrs. Dennett & Angle, with the assistance of Mr. Ordish, the engineer; the stained glass by Mr. Wm. Gibbs, of Kingsland-road; the ornamental ironwork by Messrs. Brawn & Co., of Birmingham; the mosaic paving by Messrs. Diespeker & Co.; and the carving was executed by Mr. Sanson.

#### SCHOOL PREMISES, DOVER.

ON one of our lithographic sheets we give a new and plan illustrating a block of school buildings with master's residence recently erected at Dover, on the side of Castle Hill, overlooking the town and commanding a view of the sea beyond.

The buildings were erected from the designs and under superintendence of Mr. J. Treadway Sanson, F.R.I.B.A., for Mr. J. Stanton Wise, F.A.S., to meet the requirements of a private high-class school for boys.

The master's house and school department

are kept quite distinct from one another, but have communication on each floor. The former is entered from the higher level, and the latter from the lower level.

The lower floor (there is no basement) of master's house contains, in front, kitchen offices, and towards garden front, private dining-room with steps down to garden. On the same floor of the boys' department are the dining-hall, assistant master's room, lavatory, &c. Each department has a separate staircase.

The plan of the principal floor is shown in the illustration, and above this (in master's house) are bed-rooms, bath-room, &c., and in the boys' department, dormitories, cubicles, bath-rooms (on each floor), and assistant masters' rooms.

There is also an isolated infirmary ward, with bath-room and nurse's room.

The buildings are in red brick and Bath stone, the roofs are tiled, and the joinery is in pitch pine.

The contractor for the works was Mr. W. J. Adecock, of Dover.

#### NEW PREMISES FOR THE LONDON AND COUNTY BANK, UPPER NORWOOD.
