Now, colour in a building is much the same as colour in a statue; it requires a large experience; and in architecture as in painting and sculpture, demands a refined taste to express a breadth that shall be perfectly harmonious and never bald. I take as an illustration the diametrically different treatment that a panel designed to be exposed on the south façade of a building in full daylight or sunlight, should receive, from what must be applied to the same panel if its mission is to decorate a staircase with a narrow top light. So consider the different treatment visible in the Venus of Milo, formed to be seen in the broad light of southern daylight in harmony with the large breadths of simple Classic wall surface, and the draped figure of a saint from its position in the over-arching porch of a Gothic cathedral. The colour in the two is absolutely opposite; first in the building, and, of necessity, in the details that decorate it.

Or take a façade of Bramante and one of a Romanesque building, and the difference is as light to dark, breadth of light to its opposite. The conditions under which every portion of the decoration of these opposite and contrasting works of art are so obvious that I suppose no one will take exception to the proposition that follows on, viz., That every detail must be modelled to contribute to the general tone, whether this be in the direction of breadth and light or in massive dark; or, further, that this will demand of the architect a knowledge of effect and a mastery of detail that can only be attained by dealing with each moulding and each relief as a part of a whole. The decoration should be plastic and amenable to each wish or fancy of its author.

Light and shade enter into the ultimate treatment of each angle, cornice, surface, and plane, large or small; therefore all combine to give "colour" to a building. If we accept the truth of this statement, how necessary, then, is it that the young architect should model.

Colour, then, can consist of the aggregate values of light and shade in its largest significance, and must be studied down to its smallest details. And this involves the consideration of how it is to be done.

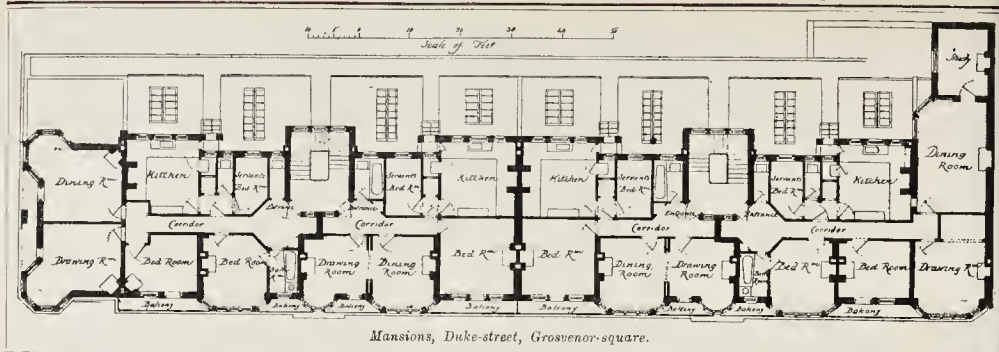

The historic method,—that is, a progressive course of graduated form from early to late in any particular style,—seems at first sight the most reasonable and satisfactory, so far as mere modelling goes, and is indeed so, if we aim merely to give a clear idea of form, surface treatment, and light and shade of particular parts of any building; and with this in view the student should commence with some rather simple panel, and learn the use of his material from the free imitation of the chosen object, never losing sight of the fact that many beautiful objects, such, for instance, as those carved in hard stone, wherein the greatest fineness of line is possible and is expressed, are clearly not suitable for copying in clay. In such a case a translation may be made.

Or again, a rough piece of wood-carving, partly saw-work and mainly gong-work, is not to be imitated in clay; here the careful and capable guidance of a good teacher is necessary. But enough remains that is quite right in method for the architect to copy accurately and even servilely.

The genius of the material deserves some study. Clay is plastic; it is added piece by piece, layer on layer, until the desired contours are reached.

\* A paper by Mr. J. C. L. Sparkes, of the National Art Training School, South Kensington, read before the Architectural Association on the 4th inst.

Mansions, Duke-street, Grosvenor-square.

This is the very opposite of a carving, when out of a block the desired contour and figure are cut; and it is sometimes difficult for a student to realise that he must not scrape and carve down a lump of clay to some smaller form.

For those reasons the examples should be wisely chosen in consonance with the genius of the material.

With this in view the architectural student should model not only architectural details, but also the human figure, for in this section of study colour will become one of the qualities he will learn to appreciate; and if he should be able to obtain any great power in figure modelling, the question of colour in his work will be constantly before him, and in that case he will, I am certain, not fail to admit its very great importance.

As to where this study can be carried on, I for a few minutes ask leave to call your attention to the isolation, if I may use the word, that surrounds the average Government Art School. The manufacturer does not, to the full of his requirements or opportunities, use the art school. In many cases the manufacturer is absolutely indifferent,—and a condition of isolation undoubtedly often exists between the school of art and the manufacturer. The connecting link is, I am convinced, to be found in the secondary, or technical, or advanced schools of art, where the classes shall be few, with masters who shall be specialists, the best men in their calling, and where the work shall be essentially practical and technical, and carried on to the farthest possible point. The art school has prepared the ground, the technical school sows the particular crop it is desired to raise, and the manufacturer and employer of art labour see their interests advanced by the excellent teaching their apprentices may obtain in these secondary schools. An important instance of such an extension of art-school work is seen in the Technical Art School at Kington, which has grown out of the Lambeth School of Art, an institution that, unaided, has done its share of work in helping the local manufacture to a name and an importance that has generally been admitted they have attained.

I invite the attention of all interested in this work to this school, where instruction is given by a modeller and sculptor, capable in all the varied sections of architectural decoration, and in figure no less.

I say sincerely that the entire district is deeply indebted to Mr. William Silver Frith for the work he is doing in the South of London.

I wish to say that the clear-sightedness of the City and Guilds of London Institute has allowed his absolutely necessary work to be done; and farther, I here wish to record my grateful sense of their liberality that so fully supports one of the most interesting and useful Art Schools in this city.

[Want of space this week compels us to hold over our report of the discussion which followed.]

**St. John's Church, Macclesfield.**—Mr. R. A. Briggs, A.R.I.B.A., writes:—"I notice that in the account of the consecration of St. John's Church, Macclesfield, in your last issue of the *Builder* you state the architects are Messrs. Valmister & Briggs, of Macclesfield. It should have been Messrs. Killmister & Briggs, joint architects, London."

## Illustrations.

### EXAMPLES OF ANCIENT WORK IN PORPHYRY.

THESE examples are given in this number as affording a kind of practical and artistic comment on the paper on Porphyry read by Mr. Brindley at the recent meeting of the British Association, an abstract of which is given in another column. The two sarcophagi from the Vatican illustrate the use of porphyry in relief sculpture; the seat illustrates its applicability to the symmetrical and conventional forms of classic ornament.

Howell & Son, of Bristol and London, with the terra-cotta work by Messrs. Doulton, of Lambeth, while Mr. Sprague is acting as general foreman. The architect is Mr. J. T. Wimperis.

The drawing from which the illustration is taken was in the Royal Academy exhibition of this year.

### WILLESDEN NEW PUBLIC OFFICES.

This design was submitted in the recent competition for the above offices by Mr. Arthur Ardron. It was proposed to use red brick and stone dressings for the external fronts, and straw-berly-coloured tiles for the roofs, excepting to tower and turret, which would be of lead.

Pavement, Lateran Church, Rome.

The fourth illustration, the Tomb of Costanza, is the most characteristic of the four, giving an example of a treatment in strongly marked and rigid lines of design precisely suited to the nature of the material.

The accompanying illustration of the floor of the Lateran Church at Rome is an instance of the use of porphyry for the larger central masses of the inlay.

### DUKE STREET MANSIONS, GROSVENOR SQUARE.

THIS block of residential flats is now in rapid course of erection in Duke-street, Grosvenor-square, close to the corner of Oxford-street.

The building will form a conspicuous feature from Oxford-street, and will be even more so when the remainder of Duke-street is widened, which work will probably be commenced very shortly. The end flanked by the two turrets faces towards the square, whence an uninterrupted view will directly be obtained, as the Duke of Westminster is about to demolish a block of houses adjoining, and form an ornamental garden in its stead.

The ground floor and basement are intended for business premises, while two entrances (with hooded pediments over), and staircases lead to the residential flats above.

There are four sets on each floor, varying somewhat in size, but each set is complete and self-contained.

The plans will explain the general arrangement, which broadly may be described as having every reception and bed room to the front, while the domestic arrangements, &c., monopolise the back.

The building is being carried out by Messrs.

The building to the right of the view shows a public hall proposed to be erected at a future time, and was not included in the stipulated amount of 6,000. The upper part of the tower would contain chamber for clock, water cisterns, &c.

### CHRIST CHURCH, PAIGNTON.

THIS church is being built to supply additional accommodation in the district of Paignton, on a site eligible for church, schools, and parsonage-house, given by the Ecclesiastical Commissioners (who have also contributed towards the endowment).

The foundation-stone was laid early in the year by the Bishop of the diocese, and the work is now being rapidly proceeded with. The church consists of a nave 30 ft. wide, with narrow aisles to be used as passages only, north and south transepts, chancel, 24 ft. wide, with apsidal end, organ-chamber, and vestry. A narthex is provided at the west end giving access both to the nave and aisles. The tower, which is at the south-west angle of the building, serves as a baptistery, and is furnished with a lofty spire, 150 ft. high. Accommodation is provided for 550 persons.

The walls are being built with local red sandstone, squared and toolled on the face both for the interior and exterior, with Bath stone for all dressings, with the exception of the plinth courses, which are of Marychurch limestone. The whole of the floor space, with the exception of the chancel and narthex, is to be laid with wood-block paving.

The design was chosen in a limited competition, and is the joint work of Mr. Edward Gabriel and Mr. W. G. Conldrey, under whose supervision the work is now being carried out.

the contractors are Messrs. C. & R. E. Drew, of Aington, Mr. A. Leeming, of Torquay, acting as clerk of works.

#### SKETCHES BY THE LATE MR. G. E. STREET.

THESE are reproduced from pencil sketches by Mr. Street. They are of interest, not only being his work, but as representing a method of rapidly obtaining the facts of a building in sketching, giving the main features in broad outline, and filling up enough of the detail to form a memorandum of the whole architectural treatment.

#### EGYPTIAN PORPHYRY.

The following is an abstract of a paper by Mr. W. Brindley, read at the recent meeting of the British Association at Manchester, on Egyptian Porphyry and its Uses, with an account of a recent visit to the ancient Quarries of the Eastern Desert in Egypt:—  
Many persons ask the question, what is Egyptian porphyry? The reply being, it is a red-purple coloured stone of considerable hardness, susceptible of a high polish, containing white and pink crystals of felspar in a silicious matrix. It was called porphyry from its colour, the imperial purple, the heir apparent to Constantine the Great being named the porphyrogenitus, or horn in the porphyry room, which was at Constantinople. In architecture under the Cæsars it was the most valuable material the empire could produce, and has descended so down to the present day, it being held in great esteem by art collectors of the world. Grand examples are seen in the obelisk columns of St. Sophia, Constantinople, and in some of the edifices of Rome. It was used for sculpture, sarcophagi, &c., and during the Middle Ages immense quantities were used for costly pavements, similar to the one in the sanctuary of Westminster Abbey, where a slab may be seen in the tomb of Henry III., concerning which Dean Stanley remarked "it is up the alley."

Modern writers differ as to the whereabouts of the old quarries, Pliny saying they were in Egypt, and capable of producing blocks of any size. These quarries were actually rediscovered by Burton and Wilkinson in 1823, and visited by Lepsius in 1845, but as neither of them had sought away specimens, nor taken any notes as to the quantity of porphyry remaining, their information was not of the practical value it might have been, and as in late years it has been announced that the quarries have been discovered first in one country, then in another, it became somewhat perplexing.

I have had the pleasure of examining rock specimens of all the localities mentioned by the modern authorities, and have found that none of them are antique porphyry, and therefore resolved to follow the footsteps of Wilkinson.

In company with my wife, in February this year I arrived at Cairo, and was fortunate enough to meet Sir Evelyn Baring, in being introduced to Mr. E. A. Floyer, a gentleman actually conversant with this Desert, and who was able to supply me with a map from Keneh on the Nile to the Nubian mountains, and then proceeded to the first Cataract on the Nile, especially to the ancient granite quarries that supplied the Egyptian temples with materials for her temples and obelisks. Here I observed that these quarries only supplied the deep red, but the rose and grey also, the colours often coming in combination in the same block. The so-called obelisk quarries, other large blocks remaining in the quarries all of Roman date, and the system of working was, in my opinion, by metal wedges, not wood, as is generally supposed,—the method being used to break up the immense granite statue of Ramesses at Thebes, and bring now to Keneh, where our caravan was met,—first of nine camels, which ultimately amounted to fifteen, and nineteen attendants, all with water, tents, and bedding, with provender for the camels, having to be carried for three days in case of emergency,—after several days through the obstruction of the Mudir, and the obstinacy of the Bedouin sheiks, we at last got on our way, and, passing through streets of mud-brick huts, soon reached the outskirts of the desert. The first day we went through a wide tract, with a well-trodden camel road.

The next day we encamped at an ancient Roman station, protected by a picturesque fort on an adjoining height, where fragments of

Egyptian porphyry were found. The following day at noon an important station, with reservoir, fort, and wells (now dry), was passed. The road now lay through an extensive open plain. In the evening the low rocks of the igneous range were reached, the gradual ascent from the Nile to this point being 600 ft.

The next day till noon our way was between hills of red granite and black shaly trap rocks; here part of a porphyry column was passed. At luncheon time another important station called the Monastery was reached, where lay a number of porphyry blocks partly buried in the sand. A ride of fifteen miles, through picturesque rocks with the high mountains in the distance, brought us to the charming valley of Waddi Kitkar, homed in on three sides with precipitous mountains 5,000 to 6,000 ft. high, the valley leading to a gorge in which is a dripping well of excellent water, with ferns, figs, and palms. Here the camels drank, a day's rest being taken in this valley, where was another Roman station. Soon after leaving Kitkar we reached the watershed, the altitude being 2,400 ft., the drainage going respectively to the Nile and the Red Sea. The immense porphyry mountain of Gehel Duchan we were now along side of, and arriving a few hours afterwards at an old Roman station, with an interesting fort at the foot of a mountain pass, we decided to encamp, whilst I made my excursions on Gehel Duchan to find the old quarries.

The Desert route thus passed over, with its forts and wells, must be older than the Christian era, as Strabo, who visited Egypt in the reign of Augustus, remarks about this route to Myos Hormos, which was the high way to India, as follows:—"Now watering places are provided, water is also obtained by digging to a great depth, and rain-water is found, although rain rarely falls, which is also collected in reservoirs."

I began my mountain ascent at 5:30 the next morning, in company with a Bedouin and a Loxor Arab. We followed an ancient Roman road which went direct from a well near our camp to the pass of the mountain. At an altitude of over 2,000 ft., we found a station similar to those in the desert. From hence to the summit of the pass the road is a narrow tract zigzagging on one side of a ravine, and very difficult of ascent, being partly covered with fallen rocks. At 8:30 we arrived at the top of the pass, the height being 3,100 ft. Here is a square watch-tower. I had now got very disheartened, not having found in ascending a fragment of porphyry. The view on the other side revealed a regular amphitheatre of rocks, all desolate, like an extinct volcano; while in the bottom could be seen an old town (the Medeneh), where my companions thought I was going, but spying, by the aid of a good field-glass, porphyry colouring on the opposite mountain, I resolved to go thither. To this my attendants most positively objected. What further encouraged me was that the old path I could see directed half of the way down,—one part going direct to the town, the other to the purple tinting opposite. We went on to the junction, my companions stopping behind, I taking from them my cold tea, lunch, and sketch satchel, making them tempting offers of good "backsbeish" to accompany me, but all with no avail; so I proceeded alone, when in about seven minutes I heard a noise and found they were following me. On arriving at the foot of the opposite mountain my delight knew no bounds, the ground being strewn with pieces of the most sumptuous porphyry, while a little farther on was the actual pitched way or slide, some 15 ft. wide, down which the blocks came, with piers at the sides for lowering them, while a number of blocks, some of large size and others broken, lay here; there were also adjoining a number of workmen's sheds. This road for a short distance was very good, but after while it became strewn with masses of rock, and in many places was utterly destroyed by the periodical torrents, the scrambling and climbing being most difficult under a cloudless sky. Near the top the road was good again, but, instead of it leading me into the quarry, I found it going over the mountain and could trace it winding down another valley. It was now noon and I was completely exhausted; so, finding shade under a ledge of rock, we took our lunch, after which I made a hasty sketch of a most marvellous view over the Red Sea, with Sinai in the distance. Now refreshed and retreating my steps, I began again to climb, shortly arriving at a number of workmen's huts, and next an extensive face of rock, in

which I expected to find worked veins of porphyry, but nothing could I see but "ochre" colour, when presently I noticed that the rock and all the loose masses were covered with wedge-holes the same as in the granite quarries of Assuan. I was at a loss to know for what purpose this stone had been quarried, or what it really was, it looking much like felspar; so knocking off with the hammer a flake chip, I immediately discovered that it was porphyry, all the solid rock and everything under my feet being the same precious material, the surface colour being simply an ochreous wash from some rocks above. Further examination showed me where the Romans had extracted their grandest masses, and not only do these quarries produce the usual spotted variety, but all the brecciated sorts and green greys. I noticed one plaster block of large size, part wedged off by a series of holes in the vertical face of the rock. It would have been almost impossible to expand wooden wedges with water in this position. I feel sure they used iron, or rather steel tools, for dressing the stone, and I do not see why they should not have used metal for wedges.

The road I mentioned before as going down in another valley I think was the road for blocks at a later date, as this would save twenty-five miles between this spot and the Monastery station; and in this valley is another town with workshops containing unfinished porphyry objects.

The altitude of the great quarry I found to be 3,650 ft. I now determined to return by a path I could see going towards the "Medeneh" (the old town). This path led me alongside of a number of small quarries, of this bed, but good colour, the porphyry being in a grey coloured granite, extremely rotten, breaking up like dried earth or decayed Purbeck marble. At one spot I observed a hump roughly shaped, and mortars part finished. We got into the valley at about 3:30, and found the old town on a slight elevation, out of the way of the torrents. It was much larger, but very similar to the stations along the Desert road. In the plain of the valley there is also a cistern, with piers all round, and plastered, on which are scratched rude drawings of ships with single masts.

Further up the valley is a small Roman temple, the portico of which is in granite, with a Greek inscription of the time of Hadrian, which reads thus:—"For the safety and perpetual success of our Lord the Emperor Hadrian and his whole house, this temple and its precincts were dedicated to the Sun-god, great Serapis, and the gods associated with him, by Epaphroditus Sigerianus, a slave of the Emperor, when Rhamnis Martialis was Prefect of Egypt, Marcus Ulpus Chresimus procurator of the quarries, and Rufus proculianus [superintendent of the marble works]." In a similar inscription at Djebel Faterch, Epaphroditus dedicated another temple to Serapis, A.D. 418, he is called "lessee of the quarries." Inside is a small altar. The whole is now in ruins. On the plastered wall of the cell, in large red letters, are W. 1823, L. 1845, S. 1877-78; following which had example, I added, in indigo, "W. B. 1887, and quarries," the letters meaning Wilkinson, Lepsius, and Schweinfurth, according to which later authority there is another station down the valley, and a depot further back for the loading of the blocks, which were taken to the Nile, a distance of 96 miles. The new route will be by a gentle incline to the Red Sea, which is about 25 miles. The Bedouin found in a ravine some good water, and we now made our way back for the camp, arriving at the Saddle Pass at five, it being sunset, and quite dark before we well reached the plain. When going on in single file, the Bedouin disappeared into a deep ravine, escaping with a cut leg, which he plastered with sand. We arrived at the camp very late, the dragoon having posted lanterns on the rock hillocks to guide us. After a day of rest and sketching, we returned for Keneh by the same route, arriving safely at the Nile after thirteen days spent in the Desert, and 170 miles of camel riding. Lastly, getting back to Cairo, terms for a concession to rework the quarries were agreed upon, which have since been ratified.

Trinity College, Dublin.—The alterations which were being made at this College are now completed. They include improvements in the ventilation, Boyle's ventilators being used.

**BUILDERS' BENEVOLENT INSTITUTION.**  
 ANNUAL DINNER.

The fortieth anniversary dinner in aid of the funds of this Institution was held on Thursday, the 3rd inst., at Carpenters' Hall, London-wall. Mr. Herbert H. Bartlett (of the firm of Perry & Co.), President of the Institution, occupied the chair, and was supported by Mr. H. Clifford Smith (Master of the Carpenters' Company), Mr. Basil E. Peto, Mr. H. Colls, Mr. T. F. Rider, Mr. George Plucknett, J.P., Mr. L. H. Isaacs, M.P., Mr. Banister Fletcher, F.R.I.B.A., and other friends of the Institution.

The Chairman gave the toast of "Her Majesty the Queen, the Prince and Princess of Wales, and the rest of the Royal Family."

Mr. Basil Ellis gave the toast of "The Army, Navy, and Reserve Forces," Major Bruton replying for the "Army and Navy," and Col. Banister Fletcher for "The Reserve Forces."

The Chairman, in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said that the history of the charity was an honourable one. Since its foundation it had granted relief to no fewer than 234 pensioners. During the past year ten deaths had occurred among the recipients, and nine persons who had been waiting for the benefits of the charity had been elected. The total number of pensioners on the Fund was now thirty-two men and thirty-three women. There was a large annual expenditure, and the committee were deeply anxious to obtain new subscribers, as many who had given regularly to the Institution had been removed by death. The income of the past year had not been sufficient to meet the expenditure, and it had therefore been found necessary to withdraw the balance of the reserve fund. There had been a large increase during the year in the number of applicants seeking election, and that would continue to be the case as the building trade and the population went on extending. The expenses of administration were as low as they could possibly be, and no expensive machinery was employed. It might be news to some of his hearers to learn that the building trade gave employment to more people than any other single trade in this country. It was an important trade, but was at the same time a life of great uncertainty, being continually subject to untoward events, any one of which was quite sufficient to plunge a man from a comfortable position into a condition of need. The fall was often very sudden, and it was important that those who were able should do all they could to mitigate and alleviate it. Good as donations were, annual subscriptions were much more valuable, as they could put the Association on such a basis as would enable the committee to provide not only for what they had actually in hand, but also for the claims which were always coming in. He was sorry to find that the annual subscriptions had fallen off, as many of the subscribers had died, while others, from causes beyond their control, had been obliged to discontinue their annual payments. He would, therefore, impress upon his hearers the desirability of each of them getting at least two friends who would be willing to give a small annual amount, as it would give the Committee greater confidence in administering the funds of the Institution.

The toast having been duly honoured, the Chairman next gave "The Health of the Carpenters' Company." The builders, he said, felt almost like "brother chips" in meeting in that fine hall, and chips, too, of a good old block. The Carpenters' Company had done much good work in building schools and establishing scholarships, and it gave the Builders' Benevolent Institution quite an important standing before the world when it was seen that they were being recognised and helped by one of the great City Companies.

The toast was very heartily received. Mr. H. Clifford Smith (Master of the Carpenters' Company), in returning thanks, said that there was a close connexion between his Company and the Builders' Benevolent Institution, for the carpenters were the only recognised builders at the time of the creation of the Company. They were all working on parallel lines for the benefit of the craft, although at opposite extremes. The Institution was holding out the hand of benevolence to those who had failed in the battle of life, while the Company was striving to prepare the rising generation to take a higher stand than their predecessors had occupied. He concluded by making an appeal

to the great employers of labour to make the Exhibition to be held by the Carpenters' Company in the Spring a great success.

Mr. L. H. Isaacs, M.P., gave—"The Chairman and President,"—adding that he had watched Mr. Bartlett's career with great interest, and it had not surprised him to find that gentleman occupying the chair on such an important occasion.

The toast was well received, and the Chairman replied in suitable terms.

Mr. T. F. Franklin proposed the toast of "The Vice-Presidents and Trustees," which was responded to by Mr. Thos. F. Rider and Mr. Howard Colls.

Mr. Basil E. Peto proposed "The Treasurer" (Mr. George Plucknett, J.P.), and referred in feeling terms to Mr. Plucknett's unremitting interest in the welfare of the Institution.

Mr. Plucknett, in replying, remarked that if all the London builders would exercise their privilege of subscribing to the Institution, the Committee would not have year by year to make such an urgent appeal to the old subscribers.

Mr. W. Shepherd gave "The Architects and Surveyors." Those engaged in the building trade know how important it was to have the sympathy and consideration of the two professions. To a certain extent the destinies of the builders were in their hands. The architectural profession had improved wonderfully, and great credit was due to the Royal Institute of British Architects for their efforts in raising the tone of the profession. As to the other portion of the toast, he did not know who would not place himself in the hands of a proper quantity surveyor. He complied with the toast the names of Mr. Banister Fletcher and Mr. C. B. Arding.

Mr. Banister Fletcher said he thought such meetings of architects and builders were of the highest value and usefulness. He begged the builders to consider the enormous difficulties under which architects laboured. Architects were commonly supposed to be antagonistic to the builders, but that was not the case. They wished to let the public know that their desire was simply to see that the work was honestly carried out, and that the builder should have his fair profit.

Mr. C. B. Arding responded for the Surveyors.

Mr. C. E. Edwards gave the concluding toast, "The Committee and Stewards," which was responded to by Messrs. J. T. Bolding and J. Hill.

In the course of the evening subscriptions and donations amounting to 701l. (of which sum 457l. appeared on the President's list) were announced.

**ELECTION OF A DISTRICT SURVEYOR.**

THIRTY-TWO gentlemen presented themselves at the Metropolitan Board of Works on the 4th inst. as candidates for the vacancy in the District Surveyorship of Charlton, Lee, and Kidbrooke, caused by the death of Mr. J. S. Edmeston, who was only elected to that office in January last.\* The election was conducted by ballot, in accordance with the Standing Orders of the Board of 1st April, 1887 (No. 8), regulating the election of District Surveyors, viz. :—

"That on the occasion of future elections of District Surveyors the number of candidates be reduced to six, at a Meeting of the Board, by one ballot, at which each Member may vote for six persons whose names are in the printed list; and that the result of such first ballot be ascertained by scrutineers, consisting of two Members of the Board, to be appointed for that purpose, together with the Clerk or his representative."

"That the six candidates selected in the manner prescribed by the foregoing Resolution be balloted for, each Member of the Board voting for one candidate only, until some one candidate has the votes of a majority of the Members present; and that at each ballot the name of the candidate having the smallest number of votes, and also names of all candidates who have less than 29 per cent. of the total number of votes, be struck off the list."

The following are the names of the candidates, the figures appended thereto indicating the number of previous applications made by each:—

Blackbourn, H., 3; Bridgman, H. H., 23; Brooker, J. W., 2; Cheston, H., 18; Coggin, C. T., 1; Cowper, P., 6; Eales, F. E., 5; Edwards, G., 10; Farrow, F. R., 3; Ferguson, J. M., 23;

\* See *Builder*, Feb. 5, 1887, p. 216.

† This information was, for the first time, printed on the cards distributed amongst the Members of the Board, but does not appear to have influenced the voting so much as might have been expected.

Francis, R. F. C., 10; Goodchild, J., 3; Grellier, W., 24; Hamilton, F. W., 5; Hamilton, J., 12; Hamilton-Gordon, G., 8; Harcastle, W. J., 10; Haslehurst, E., 12; Heyes, A., 5; Inskip, G., 18; Jackson, G., 18; Lean, G. A., 15; Nash, W. H., 17; Pelly, H. A., 8; Saunders, C. G., 5; Saunders, M. L., 8; Slater, J. B.A., 1; Spiers, W. L., 15; Stevens, W. H., 15; Stock, H. W., 18; Swatman, E. L., 3; and Woodthorpe, E., jun., M.A., 3.

The results of the voting were as follows:—

	First Ballot.	Second Ballot.
Bridgman, H. H. (24th application)	23	6
Grellier, W. (25th " )	16	—
Harcastle, W. (11th " )	31	6
Saunders, M. L. (9th " )	19	8
Spiers, W. L. (16th " )	38	23
Stock, H. W. (19th " )	27	7
Woodthorpe, E., jun. (4th " )	16	—

The foregoing seven names were returned, by the scrutineers as having the highest number of votes cast in the first ballot to reduce the number to six, but as there was a tie here between Messrs. Grellier and Woodthorpe, the Board resolved by show of hands to strike out both names without halloing as to which of the two should be retained, although not without the question being raised by Mr. Hughes whether that course could fairly be taken, having regard to the terms of the Board's Standing Orders, previously quoted.

The second ballot gave the results above indicated, and as there were fifty-one members of the Board present at the time it will be seen that all the candidates except Mr. Spiers received less than 20 per cent. of the total number of votes, and so Mr. Spiers was declared to be duly elected.

**AWARDS AT THE ADELAIDE EXHIBITION.**

The following are among the awards which have been made to exhibitors at the Adelaide Jubilee Exhibition. The order of merit gained is indicated by the figures in parentheses, the first order being notified by 1, the second order by 2, and the third order by 3:—

John Hall & Co., Stourbridge, glazed bricks, white and coloured, firebricks, &c. (1).

J. Cowan & Son, Blydenon-Tyne, fireclay, gas retorts, and firebricks (1).

Maw & Co., Shropshire, encaustic tiles (1).

Godwin & Son, Withington, near Hereford, encaustic and other tiles (1).

Webb's Worcester Tiles Company, Worcester, window and other glass (1).

Mark Abrahamson, Wornwood-street, London, Hayward's patent prism lights (1).

H. A. Cawkwell, High-street, Malvern, mosaic and encaustic tile (1).

Ashton & Green (Limited), tiles for pavement (2).

E. Smith & Co., Coalville, Leicestershire, ornamental wall and floor tiles (1).

Maw & Co., Shropshire, majolica vase and plates (1).

Belleek Pottery Co., Belleek, Ireland, china, Parian, and earthenware (1).

Watcombe Pottery Co., Devon, terra-cotta ornaments (2).

E. J. D. Bodley, London, chinaware (2).

Adderley & Lawson, Stoke-on-Trent, china and earthenware (3).

The Hastic Decoration and Papier Maché Co., 21, Wellington-street, Strand, London, fibrous plaster, carton-pierre, and papier-maché ornaments (1).

Hayward Tyler & Co., Whitecross-street, London, steam pumps (1).

F. W. Reynolds & Co., Acorn Works, Edward-street, Blackfriars-road, London, wood-working machinery (1).

**The Registration of Plumbers in Manchester.**

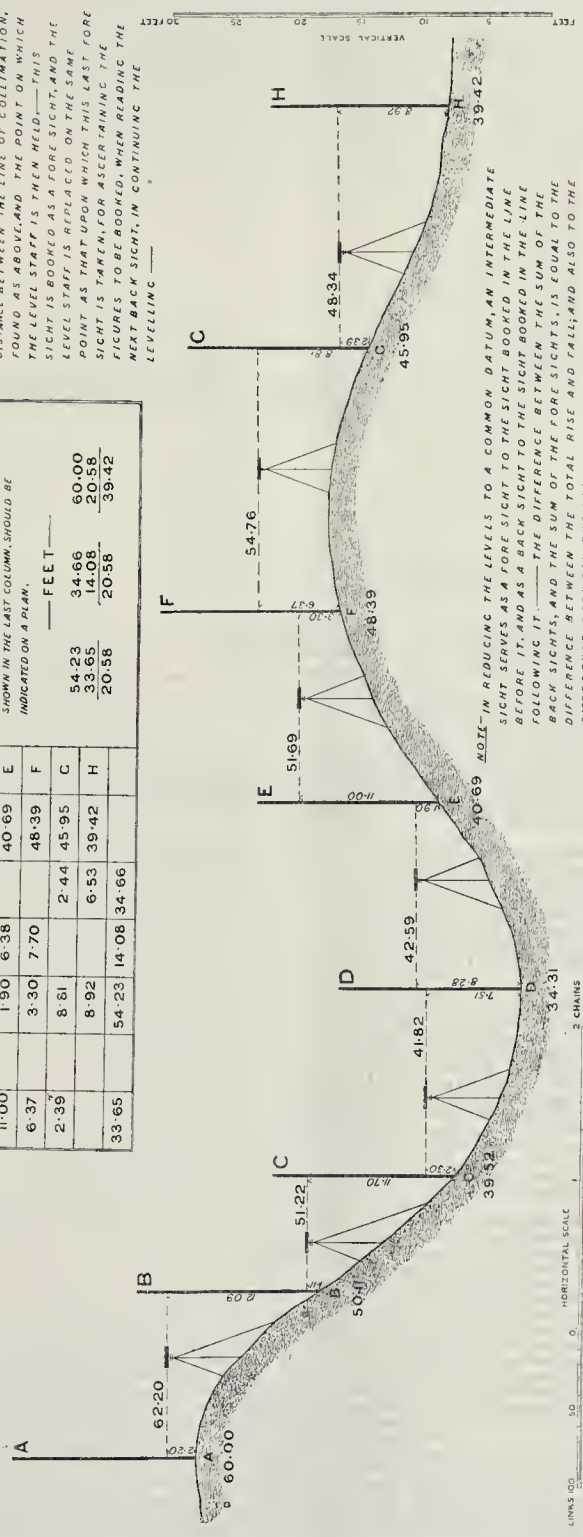

A meeting of the District Council, recently formed for the promotion of the registration of plumbers was held last week at the offices of Mr. Fred. Scott, 100, King-street. Mr. William Jaffrey was asked to take the chair, and there were also present nineteen members of the Council, representing master plumbers, operatives, and the public. On the motion of Mr. Jaffrey, seconded by Mr. M. Ingram, Mr. John Holden, F.R.I.B.A., was appointed Chairman of the Council, and thereupon Mr. Jaffrey vacated the chair for him. A communication from the Plumbers' Company of London, offering guidance to the local Council in organising, and containing a statement of the conditions of registration as presently enforced by the London Company, was read. A Sub-committee, including representatives of operatives and masters, was appointed to collect information and draft rules.

NOTE.—THE FIRST SIGHT READ OFF THE LEVEL STAFF IS BOOKED AS A BACK SIGHT, AND GIVES THE HEIGHT OF THE LINE OF COLLIMATION IN THE INSTRUMENT ABOVE THE POINT ON WHICH THE LEVEL STAFF IS PLACED.—THE LAST SIGHT READ OFF THE LEVEL STAFF BEFORE CHANGING THE POSITION OF THE INSTRUMENT, GIVES THE VERTICAL DISTANCE BETWEEN THE LINE OF COLLIMATION, FOUND AS ABOVE, AND THE POINT ON WHICH THE LEVEL STAFF IS THEN HELD.—THIS SIGHT IS BOOKED AS A FORE SIGHT, AND THE LEVEL STAFF IS REPLACED ON THE SAME POINT AS THAT UPON WHICH THIS LAST FORE SIGHT IS TAKEN, FOR ASCERTAINING THE FIGURES TO BE BOOKED, WHEN READING THE NEXT BACK SIGHT, IN CONTINUING THE LEVELLING.

BACK SIGHT DATE	FORE SIGHT DATE	RISE	FALL	REDUCED LOCAL LEVELS	REMARKS
2-20				60-00 A	
1-11	12-09	9-89		50-11 B	THE FIRST THREE AND LAST COLUMNS, GIVE THE ENTRIES MADE IN THE FIELD.
2-30	11-70	10-59		39-52 C	THE FOURTH, FIFTH & SIXTH COLUMNS, GIVE THE ENTRIES MADE IN THE OFFICE.
8-26	7-51	5-21		34-31 D	THE POSITIONS OF THE POINTS A, B, C, D, E, F, G, H SHOWN IN THE LAST COLUMN, SHOULD BE INDICATED ON A PLAN.
11-00	1-90	6-38		40-69 E	
6-37	3-30	7-70		48-39 F	
2-39	8-81	2-44		45-95 G	
	8-92	6-53		39-42 H	
33-65	54-23	14-08	34-66		

NOTE.—HORIZONTAL MEASUREMENTS ARE EXPRESSED IN LINKS, AND LOCALIZED BY DESCRIPTION. THE COLUMNS MARKED REDUCED LEVELS AND LENGTHS ARE THE COLUMNS USED IN PLOTTING THE LEVELS.

NOTE.—IN REDUCING THE LEVELS TO A COMMON DATUM, AN INTERMEDIATE SIGHT SERVES AS A FORE SIGHT TO THE SIGHT BOOKED IN THE LINE BEFORE IT, AND AS A BACK SIGHT TO THE SIGHT BOOKED IN THE LINE FOLLOWING IT.—THE DIFFERENCE BETWEEN THE SUM OF THE BACK SIGHTS, AND THE SUM OF THE FORE SIGHTS, IS EQUAL TO THE DIFFERENCE BETWEEN THE TOTAL RISE AND FALL, AND ALSO TO THE DIFFERENCE BETWEEN THE LAST AND FIRST REDUCED LEVEL.

The Student's Column.

LAND SURVEYING AND LEVELLING.

XX.—LEVELLING.

THE field work connected with the process of taking levels may be illustrated by the diagram headed "flying levels," that is, levels in which a description is not required of all the intermediate points upon which the staff is to be held in order to connect the work. Suppose the level of the point A is known by previous levelling to be 60 ft. above a given datum, and that it is simply required to ascertain the level of the point H. The distance apart, as well as the uneven nature of the surface of the ground between the points A and H, render it necessary to call upon intermediate points, such as B, C, D, E, F, and G, and to re-set up the instrument between each change of position in the level staff. The instrument is set up level between A and B; the staff is placed upon A, and found to read 2.20. This is booked as a back-sight, because we are looking back upon a point the level of which is already known. The telescope is then revolved horizontally; the staffman is directed to move forward to B, or to a point where the observer can read as great a height upon the staff as possible, owing to the falling inclination of the ground. The staff at B is booked as a fore-sight, because the observer is here looking forward to a point the level of which he does not yet know. Having read B he then moves the instrument forward, while the staffman is entrusted to maintain the foot of the level-staff very carefully upon the point B. To assist the staffman in so doing he generally employs a foot-plate or iron peg (*Builder*, May 7th, p. 686), and waves the staff upon it and from the telescope, over a vertical line as there shown (fig. 6) when the observer is reading the divisions. With the instrument in the new position between B and C, placed so as to read as low down as practicable upon the staff, the sight 1-11 is then read. This is booked as a back-sight, because when the level hook is reduced the level of the point B can be arrived at before the sight 1-11 is considered. Suppose the ground to be such that the instrument is placed upon the left hand of A, when the sights 2-20 and 12-09 are read, or upon the left hand of B, when 1-11 and 11-70 are read with the telescope pointing in the

same direction. The first sights taken with the instruments would still be hooked as "back-sights" for the reason above stated, although the observer would be looking forward, in each case, so far as direction is concerned.

The position of the level staff is localised, not that of the level. The level is simply set up in any convenient position for reading the staff. The intermediate spots upon which the staff is held between A and H can be described, if required, by letters referring to an accurate plan, from which the horizontal distances can be afterwards measured with a scale for the purposes of plotting, or the whole can be chained in the field as a section.

Where the ground is undulatory, and an accurate vertical section is required, it will be found necessary to take some sights between the first and last, with the level in any single position. These are called intermediate sights, and the entries for the diagram of "Level Book," page 2, will be found in the *Builder*, May 14, p. 734, Forms of Level Book, Nos. 1 and 4.

In the diagram of "Flying Levels," if the back-sight at A reads 2.20, the level of the line of collimation would be 62.20, and the level of the ground at B would be found by subtracting the fore-sight 12.09 from 62.20, giving a result of 50.11. Again, adding the back-sight, 1.11 to 50.11, we obtain the level of the new line of collimation between B and C, equal to 51.22, and subtracting the fore-sight 11.70 we obtain 39.52 as the level of the ground at C. Thus, by continuously adding the back-sights and subtracting the fore-sights taken between A and H, we may obtain the reduced level of the point H as 39.42. This will be clear upon reference to the diagram.

Now, if instead of first adding 2.20 to 60.00, and subtracting 12.09, we took the difference between 2.20 and 12.09 and subtracted this difference from 60.00, we should obtain the same result, 50.11, independent of any calculation for the level of the line of collimation. It will be seen that this is exactly the usual method adopted in a level book, in which columns are provided for the amounts of rise and fall; the difference constituting a rise when the fore-sight is less than the back-sight, as between D and C, or E and F; or a fall when the fore-sight is greater than the back-sight, as between A and B, or C and D.

**Truro Cathedral.**—We are asked to say that this cathedral is warmed by Mr. John Grandy's patent combined system of pure warm air and hot water. At the opening services an equable temperature of 57 degrees Fahr. was maintained throughout the building.

#### THE LAW OF LIGHT AS AFFECTING STREET IMPROVEMENTS.

At the meeting of the Metropolitan Board of Works on the 4th inst., Mr. Edwin Lawrence moved:—

"That it be referred to the Works and General Purposes Committee to consider and report as to the desirability of inserting in one of the Board's Bills a clause giving power to the Board, when forming new streets, to provide that all the ancient lights and other easements interfered with by the new buildings erected shall be dealt with by compensation and not by injunction."

Mr. Lawrence said he had supposed that his motion related to a matter of such importance that it might be formally agreed to refer it to the Works Committee without any remarks from him; but inasmuch as he found that some members of the Board were of opinion that the motion proposed to interfere with what was called the common law of the country, he thought he might be allowed to say a few words by way of showing the necessity of some change in the law. The members of the Board would he well aware that it was impossible to walk through any of the new streets opened out from time to time without seeing the dilapidated back premises which abutted upon property acquired by the Board adorned with large boards on which were painted the words "Ancient Lights." The presence of those boards meant that it would be in most cases quite impossible to erect new and important buildings fronting to the new streets without making terms with the persons claiming to be interested in the lights of the buildings behind; and by the existing state of the law such persons were practically able to impose what terms they chose, or else to altogether stop the progress of important buildings; in other words, the law, as it at present existed, facilitated the loving of blackmail. He might quote numerous instances of that, but he would mention only one, with all the details of which he was thoroughly familiar. He was interested, as trustee, in the erection of a handsome public building. There was a wall some 11 ft. or 12 ft. high behind the site, and beyond that wall, at a distance of 4 ft. 6 in., there was a sort of wooden shanty, somewhat resembling a bathing-machine. That structure had originally been mounted on small wheels, in order to evade the District Surveyor; but in course of time the wheels became buried in the earth, or were removed, and the structure rested for its whole extent on the ground. That illegally-constructed shanty had stood in that position for twenty-two years,—long enough to acquire a legal right to light in respect of a small

window, a window the light of which could not have sustained any real damage by the new building. The owner of that doubtfully-acquired right was advised by architects, surveyors, and lawyers to apply for an injunction, which he obtained, with the result that, although the injunction was eventually dismissed, the trustees lost considerably more than 1,000l. That was an instance of the way in which the operation of the present law by means of injunction frequently inflicted cruel injustice upon the owners of property. He had recently returned from America; while there, his attention had been called, by some of his American friends, to the absolute absurdity of the legislation of England passing a law sanctioning the making of new and important streets in London, while at the same time permitting the owners of "ancient lights" to obtain injunctions in restraint of that work. Of course the owners of all proved rights should be compensated, and compensated to the full, for the damage that they might suffer, and that was a course of procedure that would fully meet the justice of the case. But under the present law, which the Judges had very strictly interpreted of late years, with a tendency to greater strictness every year, the hardships were very great. About ten years ago there seemed to be some disposition amongst the Judges to relax the stringency of the law; but the prevailing tendency now was towards the utmost rigidity of interpretation, the Judges saying, in effect, "If the law is wrong, you must repeal the law; our duty is to administer the law as it exists." That rigidity of interpretation was adhered to by the Judges even in cases where people might have stolen or surreptitiously acquired their "rights" to light. Among other consequences of that strict interpretation of the law, the Metropolitan Board of Works, when they wished to complete the new streets which they formed, found themselves checked by injunctions, obtained by owners of old property often with a sole view to the levying of blackmail, and the result of that state of things was to throw an immense amount of business into the hands of people who went about acquiring and prosecuting these rights to "ancient lights" upon certain conditions as to sharing the plunder. He used the word "plunder" advisedly. People would not bid for the Board's plots of land where claims to ancient lights were raised, because they knew that to do so would be to bid for law-suits and injunctions; therefore until there was a change in the law the Board's street improvements would necessarily remain a long time incomplete.

It was resolved *nem. con.* to refer the question to the Works Committee.

"ST. AUGUSTINE."

Sir,—In your article on the restoration of the roof screen of St. Alban's, published October 29th, on the speak of Saint Augustine. May I say that Mr. Sturges has, I believe, conclusively proved the prefix of "saint," when applied to the famous Augustine, in your article. I quote the following, in support of my assertion, from his essay in the Journal of the Archaeological Association, pp. 295-6, &c. :—

"A not uncommon error amongst archaeologists to write and speak of Augustine, the monk archbishop of Canterbury . . . as Saint Augustine, a mistake which alone of the two Augustines should belong to St. Augustine, the father and Bishop of Hippo, who died 430 A.D., and to whom, by common, universal consent, it has been invariably given. . . Churches undoubtedly have been, and are being, occasionally dedicated to Augustine of Canterbury as Saint Augustine, and to Augustine of Hippo as Saint Augustine. The best writers on English Church history term him Augustine only."

Wheatly, in the calendar for the month of March, when naming Pope Gregory, has observed that his memory was celebrated in England for sending Austin the monk [not St. Austin], with forty missionaries, to convert the Saxons. . . . Proceeding to the calendar for the month of August, 28th of that month, we find thus written:—"Saint Augustine (that is, the father and author) was born at Tagaste, a town in Numidia, in Africa, in the year 354."

But, further, if additional authority is wanted, we find in the calendar prefixed to our Prayer-Book; that in the present edition, viz., May 26, Augustine, Archbishop, and August 25, saint Augustine, Bishop."

H. LITTLEDALES.

KENDALL ROAD SCHOOLS, COLCHESTER.

Sir,—In accordance with an advertisement appearing in your last issue [p.x.] which "invites architects to send in plans for schools to accommodate 300 children, about to be erected in Kendall-road, Colchester. Full particulars, with a copy of the preliminary design may, or may not, be had, and was duly favoured with a copy of the full particulars, which I considered to be totally adequate (evidently drafted by a novice) and inefficient to enable any one to prepare drawings of any degree of certainty as to what is really to be built, so very important points being omitted, the first of paramount importance, viz., cost per head; not even the roughest approximation being volunteered, whether 5s. or 10s. per head. Second. Who is to be the judge of the merits of the drawings sent in, and as to their being in accordance with the requirements of the Education Department. Further than that, it is not stated whether the preliminary design may, or may not, be awarded with a handsome bonus of 10s., or whether its contributor may get the work at the usual 5 per cent., and 2s. per cent. for quantities? It is to be hoped the persons who can afford to throw away time and money on such a speculation will be warned.

ONE WHO DECLINES, WITH THANKS.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS. 15,759, Heating Apparatus. R. P. de Ridder and W. Bennett.

This invention relates to the "small bore" system hot-water pipes, and the improvements are in the direction of providing for the escape of air or steam any should be generated in the pipes, or should be prevented from entering the pipes, and in the direction of providing for the escape of air or steam, in combination with a heating pipe, is placed at the highest point of the heating pipe, and safety-valves of special construction whereby air and not steam or water is allowed to escape as used. By the use of a relief valve the pressure can be regulated as desired.

3,256, Covering for Roofs. G. F. Jeffrey.

In some roof coverings in common use felted material is used, but this is liable to the inconvenience that when once laid, and after short exposure to the weather, it is difficult to remove the covering intact, so as to be equally serviceable in other places. The present invention is designed to obviate this defect. A fabric of jute is dressed with pitch (a mixture of drying oil and white lead or alkali); a second coating is applied to the outside face, and the covering is ready for use.

7,846, Dovetailing Machines. J. Anderson.

Upon a suitable frame or stand are mounted one or more horizontal spindles in adjustable positions, capable of being placed any desired distance apart, and having cutters fixed at either end, driven from a suitable countershaft. On each side of the main frame or stand is fitted in vertical position a bracket, carrying a table upon horizontal slides, upon which the wood is secured. Beneath

this is a rotating shaft carrying suitable cams, giving motion to the brackets, and lateral motion to the table, so that as the wood rises to the cutters, the desired angle is obtained to form the pin or tenon on the one piece, and on the other piece the holes or tails formed by the corresponding cutters. Dovetails of any space and size can be made.

11,787, Cupboard Turn. E. V. Bailey.

Instead of making the turn in a single piece, it is (according to this invention) made in two parts, jointed at their outer ends; one part is screwed, the other has a square gap at its end. The first is screwed on, and then the second piece is turned back, so that it locks and fixes the turn on the square screwed spindle.

12,031, Paints and Compounds. H. J. Allison.

This invention consists in grinding the pigments with oil obtained from the germs of Indian corn or maize, instead of linseed oil. It is claimed that the colours are more permanent, work much smoother, do not "chalk" or scale, and that the paints are cheaper. Dryers are mixed when found necessary, but corn oil has in itself considerable drying properties.

NEW APPLICATIONS FOR PATENTS.

Oct. 28.—14,663, P. Monro, Guides for Band-saw Blades.—14,886, A. Crossley, Refractory Bricks for Lining Furnaces, &c.

Oct. 29.—14,716, A. Hopkins, Fastening and Securing Wood-block Flooring, &c.—14,734, S. Carnaby, Opening and Closing Balanced Windows, Ventilators, &c.

Oct. 31.—14,776, S. Timings and S. Hill, Spring Catches or Fasteners for Doors or Windows.

Nov. 1.—14,847, B. and C. Townend, Preventing Draughts under Door-bottoms.—14,851, J. Coulter, Stone-dressing Machinery.—14,851, D. Nicholl, Construction of Temporary Structures.—14,897, P. Von Krystofowich, Artificial Granite.

Nov. 2.—14,955, D. Bostel, Syphon Flushing Cisterns.

Nov. 3.—14,973, P. Justice, Ventilating Buildings, &c.—15,002, H. Reinecke, Ventilating Closets.—15,003, W. Brandt, Fireproof Compositions, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.

12,291, W. Fraser, Automatic Door Closer and Check.—12,473, A. Harrison, Wood-block Flooring.—12,691, L. Chinery, Window-sash Sloncer.—13,675, T. Potter, Door Checks.—13,680, J. Season, Construction of Roofs.—13,692, J. Miller, Extinction of Fires in Theatres, &c.—13,826, G. Smith, Flush Cistern Appliances for Closets.—13,786, T. Hollwell, Fixing and Securing Sheets of Glass, Zinc, Slate, &c., to Roofs, Flats, or Sides of Railway Stations, Greenhouses, &c.—13,856, A. Heath, Securing Knobs to Spindles.

COMPLETE SPECIFICATIONS ACCEPTED.

Opens to Opposition for Two Months.

14,934, T. Cooke and W. Rogers, Raising, Lowering and Holding in Position Sliding Windows or Sashes.—424, W. White, Roads and Pavements, and Paving Blocks for same.—609, G. Brodie and J. Prior, Firebricks.—12,632, J. Lyman, Water-proof Compositions or Paints.—16,809, E. Hughes, Circular-saw Benches.—16,956, W. Stevens, Ventilating and Flushing Water-closets.—43, W. Marton, Domestic Firebricks.—4,048, P. Chinery, Window Fasteners.—11,283, W. Bull, Roofing Tiles, &c.—12,307, J. Peckover, Saws and Machinery for Sawing Stone.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT. SEPTEMBER 21.

By O. B. SMALLPRICE. Woking—1, Chertsey-road, freehold . . . . . £450 11, Chertsey-road, The Temperance Hotel . . . . . 600 Oldworth-road—Six freehold villa residences . . . . . 1,375

By WORSFOLD & HAYWARD. Ringwood, Kent—Two freehold houses . . . . . 306 A plot of freehold land, 3a. or 30p. . . . . 501 Three plots of land . . . . . 103

OCTOBER 25. By P. D. TRECKETT & Co. (At Kingston.) Kingston—Eleven plots of freehold land . . . . . 874

OCTOBER 31. By CHALMERS & SONS. High Holborn—No. 185, freehold . . . . . 2,380 Paddington—32 and 67, Amberley-road, 76 years, ground-rent 13s. . . . . 790 Clapham—67, Grandison-road, 95 years, ground-rent 6s. 10s. . . . . 225

By MR. DEAN. Clerkenwell—3 to 7 and 15, Spa Cottages, 23 years, ground-rent 24s. . . . . 740

By PROSSER & MORSE. Buckhurst Hill—Three freehold plots of land . . . . . 156

NOVEMBER 1. By A. RICHARDS. Westminster—23, 24, and 26, Pansbury-terrace, 43 years, ground-rent 18s. . . . . 1,030 28a, Pansbury-place, and 3, Rochester-street, 41 years, ground-rent 10s. . . . . 670

By W. HALL. Cheshunt—1 and 2, Victoria Cottages, copyhold . . . . . 200

The Society of Arts.—The first meeting of the one-hundred-and-thirty-fourth session of the Society of Arts will be held on Wednesday, the 16th of November, when the opening address will be delivered by Sir Douglas Galton, K.C.B., D.C.L., LL.D., F.R.S., Chairman of the Council. Previous to Christmas there will be four ordinary meetings in addition to the opening meeting. During the session there will be six courses of Cantor lectures, including "The Elements of Architectural Design," by H. H. Statham; "The Modern Microscope" (being a continuation of the recent course of Cantor lectures on the "Microscope"), by John Mayall, Jun.; "Alloys," by Prof. W. Chandler Roberts-Austen, F.R.S.; and "The Decoration and Illustration of Books," by Walter Crane.

Destruction of an Ancient Castle by Fire.—Last week the famous Polish castle belonging to Prince Czartoryski, near Cracow, was totally destroyed by fire. The building—one of the finest in Poland,—dated from the sixteenth century. The fire, which originated in the Prince's bedroom, destroyed the valuable library, the collection of paintings, and many other costly works of art.

## MEETINGS.

MONDAY, NOVEMBER 14.

*Surveyors' Institution.*—The President, Mr. W. J. Beadell, M.P., will deliver the opening address of the Session. 8 p.m.

*Leeds and Yorkshire Architectural Society.*—Mr. Basil Champneys on "Victorian Architecture and Originality." 7:30 p.m.

TUESDAY, NOVEMBER 15.

*Institution of Civil Engineers.*—Sir F. A. Abel, C.B., F.R.S., on "Accidents in Mines." H. 8 p.m.

*Manchester Architectural Association.*—Mr. J. Corbett on "House Water Fittings." 7:30 p.m.

WEDNESDAY, NOVEMBER 16.

*Society of Arts.*—Sir Douglas Galton, K.C.B., F.R.S., Chairman of the Council, will deliver the opening address of the Session. 8 p.m.

*British Archaeological Association.*—(1) The President, Sir James A. Picton, F.S.A., F.R.I.B.A., on "The City Walls of Chester." (2) *Resolutions of the Session 1886-87*, by Mr. T. Morgan, F.S.A. 8 p.m.

*Royal Meteorological Society.*—7 p.m.

*Builders' Foremen and Clerks of Works' Institution.*—Ordinary meeting. 8:30 p.m.

*Liverpool Engineering Society.*—A special General Meeting to consider alteration of rules. 7:30 p.m.

THURSDAY, NOVEMBER 17.

*Parkes Museum of Hygiene.*—The Earl of Meath on "The Importance of Open Spaces." 5 p.m.

*Royal Engineers' Institute, Chatham.*—Mr. F. R. Conder, on "Treatment of Sewage by the Iron Process, as used at Chichester Barracks and Windsor Castle." 6:30 p.m.

FRIDAY, NOVEMBER 18.

*Architectural Association.*—Mr. H. D. Appleton on "Our Sketching Club Scheme." 7:30 p.m.

*Institution of Civil Engineers (Students' Meeting).*—Mr. John Holliday on "Boiler Experiments and Fuel Economy." 7:30 p.m.

## Miscellaneous.

**Birmingham Architectural Association.**  
On the 4th inst. the opening *conversations* of this Association for the present session was held in the Assembly Rooms, Edgbaston. About 500 ladies and gentlemen attended. The Association, as many of our readers know, is the only provincial society affiliated with the Architectural Association of London. Drawings, &c., were lent by Messrs. Aston Wehli, W. H. Bidlake, W. Millard, F. Evans, Osborn & Reading, Henman & Timmins, Proud & Faulkner, Essex & Nicol, D. Arkell, Dunn & Hpkiss, J. J. Bateman, J. Cotton, J. A. Chatwin, V. Scruton, George & Peto, T. W. F. Newton, W. Hale, Hawley Lloyd, H. Naden, W. Lechaby, Phené Spiers, R. W. Laidell, Ingall & Son, J. P. Osborne, R. W. Edis, J. A. Cossins, J. Brooks, J. Douglas, E. J. May, A. Lee, J. Oldrid Scott, Freeman Smith, A. B. Phipson, Crouch & Butler, Wood & Kendrick, and C. E. Bateman. Mr. Harold Baker lent a collection of photographs. Amongst the visitors present were Mr. W. Kenrick, M.P., Mr. G. Dixon, M.P., Mr. Jesse Collings, M.P., Mr. L. Tait, Mr. Mabins, Mr. Tilden, Professor Smith, Professor Hillhouse (Mason College), the Rev. R. L. Porter, the Rev. J. Wood, the Rev. F. Williams, Mr. B. Windle, T. Bance, R. F. Martineau, H. Rogers, W. Player, J. R. Holliday, Major Brooks, Col. Tarte, Mr. J. Hardman, &c. Apologies for non-attendance were received from Sir T. Martineau (Mayor), Mr. R. Chamberlain, M.P., the Right Hon. J. Chamberlain, M.P., Sir James Sawyer, Mr. Dale, Rev. Canon Bowly, the Rt. Hon. R. W. Lyttleton, Mr. S. Timmins, Mr. T. Pratt, Messrs. A. Wehli, E. I. Bell, J. D. Malins, W. S. Till, J. H. Shorthouse, L. Smith, &c., and from the President of the Royal Institute of British Architects and the Presidents of seven other architectural societies.

**The Public Library, Edinburgh.**—Estimates for the erection of the Public Library Buildings, in Edinburgh, have been accepted. They amount to 19,385*l.*, which is 4,000*l.* or 5,000*l.* less than was anticipated. This leaves a margin of 10,000*l.* for furnishing, electric lighting, &c. The plans submitted by Mr. Washington Browne, which secured the first premium in the competition, have been altered to some extent both as regards the exterior elevations and internal arrangement. These alterations are considered as decided improvements and as giving enhanced value to the exterior, which has been raised 2 ft. in height, the projecting wing to the north now having its cornice on a level with the rest of the elevation. The high-pitched roof over the main building has also been heightened, the lantern at its summit being now 10 ft. higher than before. The total height from the level of George IV. Bridge will now be 118 ft. An alteration has also been effected on the principal doorway, which is now the centre of three equal arches, and a fourth arch has been repeated in the large window of the projecting wing.

## Conference on Technical Instruction.

An exceedingly interesting and important conference was held on Saturday evening at the Finsbury Technical College, to discuss the question of technical education, particularly as it affects the apprenticeship system. Mr. J. Rowlands, M.P., presided. Professor Silvanus P. Thompson (Principal of the City and Guilds of London Institute) opened the discussion with a paper on "The Present Position of the Technical Instruction Question." He referred to numerous institutions in the metropolis and the provinces wherein educational work of a technical character was going on, especially alluding to the group of agencies now established by the City and Guilds of London Institute, and contrasted the great efforts which were being made on the Continent to promote technical instruction with what had been done in this country. With regard to the future organisation of technical instruction, he contended that the Science and Art Department did not understand its first principles, and did not comprehend that the adaptation of the teaching to local wants and the adaptation of the design to the material were the very essence of technical instruction. The friends of the technical education movement might congratulate themselves that the Technical Instruction Bill of last Session was withdrawn before it reached Committee. The first and most important point of all for the national organisation of technical instruction was to secure the creation of a real Education Department under a real Minister of Education. We have some notes of the discussion which followed, but owing to pressure on our space we cannot give them this week. Mr. Owen Roberts (Clerk to the Clothworkers' Company) said that at a meeting of that Company a few days ago, a decision was come to to turn all the scholarships given by that Company to the London School Board into technical scholarships.

**The Late Mr. Hew M. Wardrop.**—We regret to hear of the death of this young Edinburgh architect, which took place at Udy Castle, Aberdeenshire, on the 4th inst. Mr. Hew Montgomery Wardrop was the second son of the late Mr. Maitland Wardrop, of the firm of Wardrop & Reid, architects. He received his early training as an architect in his father's office, and he was for some time thereafter an assistant to Mr. G. E. Street. He spent a year or two also abroad in the study of the great cathedrals of the Continent, and he was in the colonies also for a time on account of his health, which was never robust. On the death of his father, four or five years ago, he took his place in the business. Mr. Reid dying shortly thereafter, new arrangements were made, and the firm was merged in that of Wardrop, Anderson, & Browne. Subsequently it became Wardrop & Anderson, the senior partner being Dr. Rowland Anderson. Mr. Wardrop, who was only thirty-one years of age, had a very extensive county connexion, and had designed or carried out the restoration of several mansions-houses in various parts of the country. Among these may be mentioned Tillyfour House, Aberdeenshire; Pitmedden House, Aberdeenshire; Ballochmyle, Ayrshire; and Hoddam Castle.

**Society of Engineers.**—At a meeting of the Society of Engineers, held at Westminster Town-hall, on Monday evening, November 7th, Professor Henry Robinson (President) in the chair, a paper was read by Mr. Perry F. Nursey (Past-President), on "Primary Batteries for Illuminating Purposes." The author commenced by observing that there was a wide field open for electric lighting by primary batteries in houses generally, owing to the costliness of the steam-driven dynamo-electric systems. He then explained the principles of the primary battery, and outlined its history; after which he laid down the leading conditions which should obtain in a battery for electric lighting on a broad and general scale.

**The Old Chelsea Vestry-hall** has lately been externally renovated and re-decorated throughout. The contract has been carried out by Mr. W. H. McLachlan, of Berners-street, under the supervision of Mr. George Strachan, the Surveyor to the Vestry.

**House, Palace Court, Bayswater.**—Referring to our account of Mr. Fellows's House, Palace Court, Bayswater, we are asked to mention that the carving and sculpture is the work of Mr. Gilbert Searle, of Walworth.

## Inquests on Fires.

We consider that the powers which the coroner formerly possessed of holding inquests in cases of fire where no death occurred should be again restored to him. That he had this power in times past is certain; and, further, his power extended to the inquiry of other felonies, such as burglaries and prison breach. Hawkins, in his "Pleas of the Crown," contends that the power of the coroner in those cases was conferred upon him by statute (Edward I.), and was never expressly taken away from him. Some few years ago an attempt was made to establish the authority of coroners to hold inquests in cases of fire, but the question was settled by the leading case of "Regina v. Herford," in which Lord Chief Justice Cockburn, in delivering judgment, said: "We have the authority of three of the greatest writers who have expounded and illustrated the law of England for saying that the office of coroner with reference to felonies is limited to cases of homicide on view of the body." Again, Lord Cockburn stayed the coroner for Manchester, who had commenced an inquisition as to a fire, with this judgment: "As to the importance to the public that coroners should have the jurisdiction, there are two opinions. I express none. Some of the coroners in modern times have exercised this jurisdiction, some have not. If they are to exercise it in this and other felonies after the disuse of it for five or six centuries, let it be given them by the Legislature, and not revived by this court." The late Sir John Humphreys, coroner for East Middlesex, held an inquest at Hackney in respect of a fire where no life was lost. This he did at the special request of the churchwardens and inhabitants of the district, as fires were of such frequent occurrence. The case turned out to be one of arson, but the magistrates refused to reimburse the coroner for the expenses incurred in the holding of the inquest, on the ground that the said inquest was not legally held.—*Lancet.*

**Decrease of the Iron Manufacture in France.**—The influences supposed to operate by those who take a pessimist view of the state of British industries, will not find much support from the recent returns concerning French iron and steel trades and mining industries. The *Journal Officiel* brings the following statistics concerning French mines, &c., for 1885 and 1886.—The number of mines at work had sunk from 594 to 476, or a reduction of 28. Of 1,380 concessioned mines, therefore, only 904 were worked. Of the 476 which are worked only 204 yielded any profit. Two-thirds of the mines which are worked are collieries, and they employ nine-tenths of all the miners, and had an output of 19,500,000 tons of coal, 500,000 less than in 1884, and 2,000,000 less than in 1883. The selling price fell 60 c. as compared to the year before; still the selling price at the mines reached 11.73 f. per ton. The cost of getting fuel 43 c. from that of 1884. The number of workpeople engaged was 111,500, nearly 10,000 fewer than in 1884, and 15,000 less than in 1883. There was an increase of output of 543,000 tons in 1886, against that of 1885. The decrease in the production of iron is remarkable. In 1883 it amounted to two million tons of manufactured iron and steel; in 1884, 1,872,000 tons of crude, and 1,380,000 tons of iron and steel; in 1885, the two quantities were 1,634,000 tons and 1,236,000 tons; and in 1886, 1,508,000 tons and 1,234,000 tons. The number of steam-engines working steadily increased, but for the most part in small factories and in agriculture, whilst those in large industrial establishments decreased. The number of steam vessels, curiously enough, has remained almost stationary, although, by the law of 1883, the State has paid to the commercial marine, as premiums for registered cargo vessels, for building new ones, and on cargo freights,—a sum of twenty-six million francs, not reckoning the regular subventions to post-steamers. Equally noteworthy is the fact that the number of locomotives on the railways had decreased from 9,241 to 9,150, although 1,461 km. of new lines had been opened.—*Engineer.*

**Liverpool Corporation Free Lectures.**—Mr. MacBride, whose lectures on sculpture at the British Museum we have before referred to, has been giving a course of four lectures on sculpture at the Rotunda Lecture Hall in Liverpool, which have been, we learn from the Liverpool papers, very largely attended. Sir James Picton occupied the chair at the opening lecture.

PRICES CURRENT OF MATERIALS.

TIMBER.

Table listing timber prices for various types like Greenheart, Oak, Elm, etc., with columns for quantity and price.

TIMBERS (continued).

Table listing timber prices for Maple, Beech, Birch, etc., with columns for quantity and price.

### Recollections of M. de Lesseps.

THE two volumes of autobiographical reminiscences of M. Ferdinand de Lesseps, an English version of which has been published in London,\* contains less of interest to architectural and engineering readers than might have been expected, considering the nature of the work in connexion with which its author's chief reputation has been made. The rôle played by M. de Lesseps, who is, perhaps, more truly a citizen of the world than any other living man except Prince Metchnikoff, has been as much that of a diplomatist, a politician, and a financier, as of an engineer; and his two volumes are good deal occupied with matters which may be said to lie outside of our special province. Of engineering information, in the strict sense of the word, there is in truth little to be gleaned.—M. de Lesseps appearing in connexion with the Suez and Panama canal schemes, rather in the light of a general director and a diplomatic negotiator than an engineer. There is, however, a good deal in regard to the correspondence about the Suez Canal scheme showing the conflicting of various interests behind the scenes, which is of considerable significance now that the canal, once so contemned and prophesied against in this country, as a thing impracticable and vain, has been long ago quietly accepted as an accomplished fact. The statement of the Panama scheme from M. de Lesseps' point of view is also of some interest, though this is only sketched in a brief and general manner. M. de Lesseps is not autobiographical, in the usual and complete sense; he does not begin, it is to say, with a sketch of his parentage and genealogy, or an account of his boyhood. The "Recollections" open with an account of his mission to Rome in 1849, and as the whole of this portion of the work is entirely political, we may pass it over here without further remark. But the greater part of the rest of the first volume, as well as a portion of the second, is occupied with "The Origin of the Suez Canal," a title which, in fact, is made to include the main history of all the negotiations, disputes and difficulties connected with bringing it done,—the latter, we regret to say, mostly emanating from England.

The whole thing came about in a more or less accidental kind of way than would be generally imagined now. M. de Lesseps, having the good luck to have a mother-in-law who was both very wealthy and very much attached to him, was, after his recall from Rome, living on and managing for her an estate in France, on which he had restored an ancient castle which had belonged to Agnes Sorel. While thus occupied, he heard of the death of Abbas Pasha, the Viceroy of Egypt, and the succession of the youngest son of Mehemet Ali, whom he had known and taught to ride as a boy. On hearing of his former pupil's accession to power, he wrote congratulating him, and received in reply what he evidently wished for, an invitation to come to Cairo. The question of a Suez canal had been a favourite one with M. de Lesseps long before, and he had already, he tells us, studied it in every detail. Here was the opportunity, and the former riding pupil was primed with the idea, and seems to have fallen into it in a most docile and teachable spirit. As riding was the beginning of his acquaintance with the Viceroy, so riding seems to have had some influence in getting him the concession for the canal; or, at all events, M. de Lesseps thought so. The Viceroy called together all his generals to consult them on the question. "As I rode out with them on horseback, and as they were inclined to think more of a man who could jump a fence than of a *savant* and a book-worm, they were well disposed towards me." The Viceroy told the generals to seat themselves on some chairs in front of the divan, repeated the conversation he and M. de Lesseps had just had together, and asked for their opinions on the proposals of "his friend." "They stared at me and looked as if they thought that their master's friend, whom they had just seen put his horse over a wall, could not be otherwise than right; they raised their hands to their heads as their master spoke, in sign of assent. The dinner was brought in on a salver, and, just as we had been of one assent, so we all dipped our spoons into one and the same tureen, which contained some excellent soup. Such is the faithful and true narrative of the most important negotiation I ever undertook or am likely to undertake."

The idea of the canal had been made a favourite one in M. de Lesseps' mind by the perusal of the report of Napoleon's engineer, Lepère, in favour of the scheme; a report made by Napoleon's command during his early campaign in Egypt. Short and simple as was the first step, the consent of the Viceroy, there was much work to go through before the funds could be raised and the diplomatic fears and objections of various Governments overcome, England being, as every

one knows too well now, the principal and most persistent opponent of the canal; and the correspondence on the subject with Lord Palmerston and other persons high in power in this country, in which the same objections (very selfish ones, by the way, from an international point of view) were repeated over and over again, is not pleasant reading for Englishmen, and ought to be a lesson against the violent and pugnacious opposition of a scheme of the kind merely because it is new, or because it is supposed that somebody or other's interests will be hurt by it. The perseverance, energy, and diplomatic tact which M. de Lesseps showed in combating against this opposition comes out very well in the series of letters printed, and the author may be excused for his obvious egoistic satisfaction in the publication of correspondence which shows how everybody said he was wrong, and how, nevertheless, he was right all the time. It would hardly be in human nature, and certainly it was not much M. de Lesseps' nature, not to indulge in a good deal of the "I-told-you-so" spirit, with such unusually good material for it. His diplomatic instinct is displayed at an early period of the narrative, when at an audience of various important officials, including all the representatives of foreign powers, the Viceroy announced that he had resolved to open up the Isthmus of Suez by a maritime canal, and to entrust M. de Lesseps with the formation of a company, composed of capitalists of all nations, to which he could cede the right to execute this enterprise. "Then speaking to me, he said 'Is not this so?' I then spoke a few words, taking care to let the spontaneity and merit of the decision remain with him, to avoid ruffling the susceptibilities of foreigners." The Viceroy observed to the Consul-General of the United States, "Well, M. de Lesseps is going to start an opposition to the Panama Canal" (which was then a scheme talked of in America), "and we shall be done before you"; which, indeed, has proved strictly true.

It was a singular coincidence, as M. de Lesseps notes, that the house assigned to him by the Viceroy, the "Palace of the Muftis," was the one which had been the residence of the Egyptian Institute at the time of Napoleon's expedition, and that it was here that the scientific committee appointed by Napoleon to consider the practicability of the canal used to meet; so that there seems a remarkable continuity of events in the fact of the actual carrying out of the canal being designed and directed in the same house. M. de Lesseps himself seems to have been treated quite as a potentate, and was informed that he had twenty horses at his disposal, ten for harness

and ten for the carriage. M. de Lesseps, having the good luck to have a mother-in-law who was both very wealthy and very much attached to him, was, after his recall from Rome, living on and managing for her an estate in France, on which he had restored an ancient castle which had belonged to Agnes Sorel. While thus occupied, he heard of the death of Abbas Pasha, the Viceroy of Egypt, and the succession of the youngest son of Mehemet Ali, whom he had known and taught to ride as a boy. On hearing of his former pupil's accession to power, he wrote congratulating him, and received in reply what he evidently wished for, an invitation to come to Cairo. The question of a Suez canal had been a favourite one with M. de Lesseps long before, and he had already, he tells us, studied it in every detail. Here was the opportunity, and the former riding pupil was primed with the idea, and seems to have fallen into it in a most docile and teachable spirit. As riding was the beginning of his acquaintance with the Viceroy, so riding seems to have had some influence in getting him the concession for the canal; or, at all events, M. de Lesseps thought so. The Viceroy called together all his generals to consult them on the question. "As I rode out with them on horseback, and as they were inclined to think more of a man who could jump a fence than of a *savant* and a book-worm, they were well disposed towards me." The Viceroy told the generals to seat themselves on some chairs in front of the divan, repeated the conversation he and M. de Lesseps had just had together, and asked for their opinions on the proposals of "his friend." "They stared at me and looked as if they thought that their master's friend, whom they had just seen put his horse over a wall, could not be otherwise than right; they raised their hands to their heads as their master spoke, in sign of assent. The dinner was brought in on a salver, and, just as we had been of one assent, so we all dipped our spoons into one and the same tureen, which contained some excellent soup. Such is the faithful and true narrative of the most important negotiation I ever undertook or am likely to undertake."

The idea of the canal had been made a favourite one in M. de Lesseps' mind by the perusal of the report of Napoleon's engineer, Lepère, in favour of the scheme; a report made by Napoleon's command during his early campaign in Egypt. Short and simple as was the first step, the consent of the Viceroy, there was much work to go through before the funds could be raised and the diplomatic fears and objections of various Governments overcome, England being, as every

Recollections of Forty Years. By Ferdinand de Lesseps. Translated by C. B. Pitman. London: Chapman & Hall, 1887.

and ten for riding, besides "a state coach richly gilt, a barouche, a landau, and 'my lord.'" When he drove away from a conference with the Viceroy, in his state coach drawn by four white horses going at full gallop through the narrow streets of Cairo, the footmen, in spite of his admonitions, delivered blows with their staves right and left to keep off the native foot-passengers, who stood up unresentingly against the walls, exclaiming, "Ah, there is a great lord going by; glory be to God." Another little story shows in a more serious manner the amount of influence which M. de Lesseps possessed. Every one remembers the incident of the French men-of-war steaming away in procession before the bombardment of Alexandria. From M. de Lesseps' account, it appears that this movement, which occasioned such comment throughout Europe, was pretty directly due to him:—

"Being in London at the time of the English Expedition, I learned that Alexandria was about to be bombarded. No one else knew of it, so I came at once back to Paris, and begged MM. de Freycinet and Ferry to come from the Elysée, where a cabinet council was being held. I said to them, 'I warn you that Alexandria, which we have created, and which, thanks to the engineers, sailors, &c., whom we have sent out, has prospered, is about to be bombarded. Well, France must not be responsible for the crime. When I know it it had a population of 45,000, now it has 200,000 inhabitants. It was created by France, and we cannot bombard it.' A telegram was then sent to our fleet ordering it to withdraw. I relate all these facts, as they are but little known. Our Government, which behaved very straightforwardly in the matter, quite understood the situation, and could have no part or lot in the destruction of the town."

This, we admit, is "politics,"—very much so; but it throws such a light on the power and influence, in his own country, of the maker of the Suez Canal, that we cannot forbear quoting it.

The long story of the English opposition to the canal, about which much may be read in these pages, we cannot go into in detail. The account given of Lord Palmerston's objections and his reasons for them, both as to the matter and manner of them, is little credible either to his judgment or his good taste or courtesy; but, naturally, M. de Lesseps may be supposed to make the worst of him. The point which M. de Lesseps specially wishes to lay stress on about England is, that it was actually to our immediate interests to have a direct way to India, and yet we opposed the canal. The letters of this portion of the book give a vivid idea of the author's untiring and ubiquitous energy in opposing the opponents of his scheme, to which in general, however, he found the commercial magnates of this country favourable. Among the opponents was Robert Stephenson, strangely enough, who appears to have relied on a rather partial survey of the ground made by him in conjunction with some French engineers in 1847. M. de Lesseps says in a letter from Constantinople to Barthélemy St. Hilaire, "Mr. Stephenson admits, in a letter to the *Times*, that he only visited a part of the Isthmus. I know what part that is, for I myself saw the tracks of his carriage-wheels, which did not extend more than a league beyond Suez." Stephenson should have remembered in what a desert country he was travelling, and have had his wheel-marks obliterated. One of the principal bugbears which the author had to contend against was the idea entertained by many persons, based on the result of a survey made by Napoleon's engineers, that there was a considerable difference of level between the seas on either side of the isthmus. M. de Lesseps appears to have declined any belief in this theory from the outset,—be it one of those men who is not disposed to believe anything that is adverse to his own schemes; but in this instance a more careful survey, or one made under more favourable conditions (for that of Napoleon was made in the midst of warlike operations) dispelled this illusion, though with some difficulty; for so great was the respect entertained (and with reason) for Napoleon's brilliant band of *savants* of the former generation, that some of those who had

taken part in the more recent, and, as it proved, more correct survey, were at first inclined to doubt their own results.\* It is worth note that this is one of the very difficulties which have been made a good deal of in regard to the Panama canal, and M. de Lesseps, of course, argues from the one case to the other. He had declared from the first that the canal would not require locks, that it was to be essentially a maritime, and not an inland canal. In the course of his remarks on this point, in the first volume, he says (p. 141):—"I stuck to my text in spite of all opposition, and my obstinacy has had its reward. I intend to act just in the same way at Panama, though many engineers would prefer, on account of the difference in level, not of the seas but of the tides, to construct a lock. I will not have one at Suez, and I do not intend to at Panama, as thus I effect a saving of more than a million and a half." M. de Lesseps does not, however, explain in this passage why he means to work a canal without a lock, when there is a difference of some 20 ft. between the tide at one end and that at the other end of the canal; and more, when we come to the remarks on the subject of the Panama Canal, at the latter part of vol. ii, we read that in consequence of the Pacific tides being 19 ft. 6 in. at Panama, while the Atlantic tide at Colon is only 2 ft., "which would cause currents of four or five knots an hour in the canal, and create a danger to navigation," the method will be adopted of having a waiting basin and a tidal gate at Panama. That is not exactly the same thing as a lock, in one sense, but it is the same essentially, and means something very different from a maritime canal of the same class as that of Suez; and it is odd indeed after this to read (page 195) that "upon the proposal of the engineers of the Suez Canal Commission [for inquiring into the Panama Canal scheme] decided by a large majority against the system of locks, and declared strongly in favour of an open canal on the level, the feasibility of which seemed quite clear if the Colon-Panama line were adopted." So that apparently M. de Lesseps sees no difference between an open canal "on the level" and a canal with a tidal gate and a 19 ft. rise and fall of tide.

The summary given of the various schemes proposed for the Inter-Oceanic Canal is of considerable interest, as it gives the main facts as to what has been proposed within a small compass and in a readable form. The subject occupied the consideration of the International Congress at Paris in 1875, and a kind of international jury was formed to collect the necessary information and give an opinion in detail. This Jury or Congress was divided into five Committees, with the object that each should thoroughly inquire into one branch of the subject, one taking probable traffic, another probable income, another the question of rents, &c. Several schemes were ultimately brought before the Congress. Señor de Garay, on the part of the Mexican route, proposed a route by the Tehuantepec isthmus, with a canal 150 miles long, a summit level of 975 ft., and sixty locks, and which would have required twelve days for the passage of a vessel,—a scheme which was rejected at once. The Nicaragua scheme, of which a pretty full detail, with some illustrations, was given in our columns recently,† had, M. de Lesseps admits, a good deal to recommend it, and he speaks well of it as admirably conceived and propounded; which, it may be observed, is a good deal more fairness and courtesy than M. de Lesseps and his scheme have received at the hands of the projectors of the Nicaragua scheme. This and the Panama scheme alone were seriously entertained for final consideration by the Congress, and the Panama route was deliberately selected as the one possessing the greatest advantages, requiring no series of locks, with their costly constructions, and promising a quicker passage than any of the others. The voting for it, on May 29, 1879, was by the

large majority of 78 to 8, with 12 non-voters; some of whom, however, were the official or professional representatives of other schemes.

M. de Lesseps does not go into the present financial aspect of the canal scheme, no doubt because that would be very dry reading for a book of this kind. Nor does he say much about the progress of the work since 1879, which would also be dry reading. He brings before the reader at every opportunity the parallel between the opposition and the prophecies of failure which were made against the Suez Canal, and its triumphant success in spite of all; and the moral we are intended to draw is obvious; indeed, if it were not, the author saves any trouble by drawing it himself, on more than one page of his book, but avoids drawing any attention to the enormous discrepancy between the two schemes in regard to the natural difficulties of site in the two cases. He roundly asserts that the canal will be open in 1880. No one would be more glad to see it than we should, but we cannot at present see our way to accepting M. de Lesseps' *conteur de roses* prophecies. That the canal will ultimately be completed we believe, because France is so far committed to it now that it has become almost a point of national honour to carry it through, and it is in reality only a question of time and money; but how much of these two measures of value will be consumed over it yet remains to be seen.

#### DESIGNS BY THE LATE W. BURGESS.

noticed briefly some time ago a few of the first-published photographs of this series of illustrations of Burgess's decorative designs, edited and annotated by Mr. Pullan. The portfolio, including twenty-three subjects, is now complete, and forms a highly-interesting collection of designs,—not all, certainly, of the same interest, but all marked by the strong individuality of style and manner which belonged to everything that Burgess produced.

The photographs numbered 2 and 3 illustrate the design for the decoration of St. Paul's, which, though it was undoubtedly a remarkable piece of work in its way, was such a preposterous scheme when regarded as a work to be actually carried out, that only a very doubtful kind of credit attaches to it, though it was, perhaps, worth while to keep this memorial of it. We are disposed to think, however, that Burgess never regarded the design as one that would be carried out; in fact, he himself said to us in speaking of the St. Paul's decorative scheme, "Nothing will be really done"; and we suspect that, knowing that the scheme was out of the pale of practical probabilities, he simply amused himself with showing how he would have decorated St. Paul's if he had built it. It is impossible that he could ever have seriously supposed that he would be allowed to hack away the whole interior masonry to replace it with slabs of marble; and almost impossible to us to imagine that he could ever, in his inner mind, have seriously wished to do this. If he did, it said little for his critical judgment or his respect for the work of a distinguished predecessor.

Nor do the sculpture subjects which are illustrated entirely justify their position. We cannot say how much superior they may have looked in Burgess's original drawings, for they are the work of carvers, not of sculptors,—like most of the work done in modern churches. The selections from the Waltham Abbey reredos look much better in these photographs than in the actual work, because we get them apart from the tawdry colour with which the work has been bedizen; the figures have much point of pose and expression,—they tell their story well, in a sense; but they are only like Medieval sculpture a little better modelled than usual, though the decorative adjuncts are very good. It is otherwise when we come to purely decorative work. There Burgess was always picturesque, and always original, and forcible in his treatment of his subject and

\* See a summary of the matter at this stage given in the *Builder* for January 26, 1856.  
† *Builder*, October 1, 1887.

material. Plate 9, for instance, gives us the stall-ends from Cork Cathedral. Here there are no antiquated "poppy-heads" of the accepted form, which has been imitated *ad nauseam*, but pierced open-work scrolls of conventional foliage, graceful in design but perfectly solid and substantial in their full and well-fed stems and leaves, each with a bird sculptured in the centre of the principal compartment, and seen in outline in the midst of a nearly clear space. This is a charming bit of work, and an excellent study of what conventional foliage in its best form really means. The Pastoral staff, plate 14, of which, by Mr. Pullan's permission, we give a reproduction (see plate in this number), is a good example of the characteristic vigour with which Burges reproduced a Medieval idea; the crockets, and the position of the sculpture in the curve of the staff, are derived from Medieval work; but the device of the St. George and the dragon, and the bound woman below, is completely original as here applied, and the dragon growing out of the staff-end is Medieval in the best sense; it has the Medieval spirit, quite apart from anything like copyism. Still more may this be said of the decanter designs, of which also we give a reproduction; the force and vigour of the griffin handles, with their strongly-marked lines and savage grip on the hottle with their fore-paws, can hardly be too highly rated; this is one of the best pieces of modern grotesque to be seen. The basket-work business on the top of the decanters is a mistake, and forms an annoying blemish in an otherwise remarkably fine piece of work. The bodies of these decanters are glass, the necks of malachite and porphyry, the metal-work of silver, and the bosses inlaid with Greek, Roman, and Byzantine coins. These were designed by the artist for his own use, he having been in the habit of applying such fees as he got for literary work or in competitions in the production of objects of this kind made from his own design. A collection of glasses, with mountings, plate 21, shows also some curious and picturesque fancies in design, especially a hottle standing on two claws, and with a bird's head and beak for stopper.

It was hardly worth while to include in the set Burges's grotesque design of St. Simon Stylites, a good joke for the moment, no doubt, but not worth stereotyping; and it may be some question whether the kind of Medieval force exhibited in this collection generally will retain its hold permanently on the taste and interest of the modern generation. While the memory of Burges's career and talents is still present, all the work into which he put his own interest will be valued; but we doubt whether many people, even now, would care to furnish their houses with this type of work. It is powerful, but somewhat heavy and inelegant; admirable work of its kind, but not the kind to retain its hold on another generation. Its highest interest, perhaps, arises from the fact that it is thoroughly well done in its way, and that there is evidence in every line of it that the man who designed it enjoyed doing it,—a kind of interest which, unfortunately, very little modern decorative work does exhibit.

#### THE METROPOLITAN BOARD OF WORKS AND THE LAW OF LIGHT.

**N**EXT week we published [p. 686] a report of Mr. Edwin Lawrence's speech at a meeting of the Metropolitan Board of Works in regard to the law of light, the result of which was that the subject has been referred to a Committee of the Board. We have no wish to prejudge the report of the Committee in question, but it appears to be very doubtful if any improvement in the law in regard to the obstruction of light can be made without altering it *in toto* in respect to the erection of new buildings. So far as obstruction by new buildings for public purposes is concerned, the law is clear. It is laid down in express terms in Roscoe's "Digest of the Law of Light," in Article 33:—"An easement of light being an interest in land for which compensation may be claimed under the

Lands Clauses Consolidation Act, 1845, a person the light of whose house is obstructed by works in course of erection by a public body created by the Legislature to whose undertaking the provisions of the Act are applicable cannot bring an ordinary action for damages or proceed for an injunction, but must proceed under s. 68 of the Lands Clauses Act to obtain compensation." That statement of the law is based on several cases, in one of which it was attempted to obtain an injunction against the School Board for London. But these have lately been approved and, as it appears to us, amplified by Mr. Justice North in the recently-reported case of *Wigram v. Fryer*, "Law Reports," 36 (Chancery Division, p. 87 (October monthly number, 1887)). In that case the defendant Fryer had obtained, on a sub-lease from the executors of one Pink, a plot of land for the purpose of erecting thereon artisans' dwellings. Pink, in his turn, had obtained his lease from the Metropolitan Board of Works, who had taken the land in question under a special Act in order that artisans' dwellings might be built upon it. Through what we must regard as an extraordinary legislative oversight, the Board had no powers themselves to erect the buildings. "It cannot be done," said Mr. Justice North, "by the Board erecting the buildings themselves; it can only be done by letting or selling to some person who is to do the same thing." Fryer obstructed certain ancient lights belonging to Wigram, and the question was whether the ordinary rule of law, viz.: the granting of an injunction or of damages, applied to such a case as this. We do not propose to go through the reasons by which Mr. Justice North arrived at his decision. Suffice it to say in his own words that "the contention that by the Board's disposing of the property the right against them has ceased, and that there can be no right against Mr. Fryer for compensation, and therefore that there must be a right for an injunction, cannot be sustained." Finally, he said, "I am of opinion that what is being done here is in compliance with the Act, and that the plaintiff's remedy, if he is injured, should be by obtaining compensation and not by injunction." In this case the buildings were in a sense buildings for a public purpose; but, on the other hand, when the Board for the purpose of public advantage makes a new street, and, as a consequence thereof, persons under leases from the Board erect new buildings of a private nature, then there is really but an infinitesimal difference between the two cases. In the latter case, compensation should be granted in the way in which it is given under the Lands Clauses Act, and the ordinary legal remedies should be suspended. That, as we understand it, is Mr. Lawrence's contention, and this recent case of *Wigram v. Fryer* seems to extend the law so much that there should be no difficulty in carrying it a step farther. Without a careful perusal of a number of statutes it would be unwise to hazard an opinion on the actual rights at present of the Board or of the lessees, in the case of the erection of shops or other similar buildings. But it may possibly be found that even now the Acts, if there is an obstruction of light by such erections, override the ordinary law. If they do not, it would be but a slight step to make the law as laid down in the decision we have referred to, and others which precede it, applicable to all cases in which new buildings are constructed by the Board or their lessees.

#### NOTES.

**T**HE new "Sheffield Society of Architects and Surveyors," which held its opening meeting at the Montgomery Hall, Sheffield, on Tuesday last, seems to have made a good beginning, and promises to be an active and energetic Society. More than fifty members were present at the meeting, at which the President, Mr. T. J. Flockton, read the opening address, in which he described the objects of the Society, which included the formation of classes among the associates and students in the subjects of the design, construc-

tion, and the history of architecture; the preparation of candidates for examination by the leading societies; communication and exchange of opinion with the Royal Institute of British Architects, the Surveyors' Institute, and other kindred societies, and the receipt of their papers, and the ultimate formation of a library. He concluded by quoting the closing words of the President's address at the meeting of the Architectural Association, in which he counselled his hearers to uphold and extend the dignity and usefulness of their profession. Mr. C. Hadfield proposed a vote of thanks to the President, which was seconded by Mr. J. B. Mitchell-Withers. A number of paintings and engravings, lent for the occasion, were exhibited; among others, drawings in oil and water colours by Mr. Mitchell-Withers, and a design by the late Godfrey Sykes (lent by Mr. Hadfield) for decorating the ceiling of the old telegraphic newsroom at Sheffield, a design which unfortunately had never been carried out. Mr. Frederick Fowler, Vice-President of the Society, exhibited a number of photographs of the Forth Bridge work, of which his brother, Sir John Fowler, is chief engineer. Among the papers already announced for the session are one on "Registration," by Mr. T. Wreghitt Connon; on "The Value of Association and Federation," by Mr. J. Murgatroyd; on "Interest in Architectural Design," by Mr. C. Hadfield; and on "Architectural Education," by Professor Roger Smith. The Society at present numbers, it appears, seventy-three members, so that a large proportion of the actual members attended the opening meeting. We hope the Society will progress in numbers and in usefulness. The papers already announced, as noticed above, are all on rather general subjects; no doubt special subjects of artistic and scientific interest will be taken up in due time; this should be kept in view, as, after all, the real object of professional societies of this kind should be, in the words of the Charter of the Institute, "to advance the art of Architecture."

**T**HE important paper on accidents in mines, read by Sir F. Abel last Tuesday at the Institution of Civil Engineers, brings forward one curious and unexpected source of danger, arising out of the improved ventilation of mines in the present day. The old lamps of Davy, Stephenson, and Clanny were really safe, he said, in the very moderate ventilating air-currents then to be met with in coal mines; but the improvements in the ventilation of coal mines have led to a great increase in the velocity of air-currents therein, under which the old lamps are no longer safe, as, when exposed for a short period to currents of air charged with fire-damp and travelling at high velocities, a communication is likely to be established between the flame and the gas and air mixture surrounding the lamps. Sir Frederick Abel, as might have been expected, regarded a portable incandescent electric light as the miner's safety-lamp of the future; the two principal difficulties connected with this being those relating to cost and weight. The lamp must carry its own battery, primary or secondary. Mr. Swan has made a secondary-battery lamp which weighs only 7 lb., though this is heavier than desirable; thirty of them, however, have been in use at the Risca Colliery for three months. Since then Mr. Jas. Pitkin has constructed one with equal results, and between 5 lb. and 6 lb. weight. Sir Frederick referred to several primary-battery lamps, by Messrs. Tronvé, Coad, Schanschief, and Blumberg, which were successful, except in regard to the length of maintenance of light, which does not appear to have been got up to the requirements of mining work as yet, with primary batteries. The recharging of small primary batteries is more troublesome than the restoration of power in secondary batteries; the latter, however, pre-suppose the possession of a generator. As, however, there is every probability that a general electric lighting system will before long be in use in all important mines, the power for recharging will be at hand, and therefore the secondary electric lamp, all things considered, seems likely to be the safety-lamp of the future for coal mines.

**CAPTAIN SHAW'S** report on the Exeter Theatre fire is very strong in condemnation of the construction of the theatre, enumerating no fewer than twelve defects of construction in regard to danger from fire. Among these he specially mentions the introduction of shops into the side of the building most suitable for providing easy means of exit, for the purpose of securing a rental of 25*l.* a year only, so that for the sake of this small sum the audience were placed in continual additional jeopardy. Three other special points noted by Captain Shaw are that there was no provision made for dealing with an outbreak of fire in the flies, which was the very part where the greatest danger necessarily existed; that many of the passages and corridors which, according to the agreement and understanding, were to have been constructed of fire-resisting materials, supported and enclosed by brick walls, were of wood, enclosed by lath and plaster or by match-boarding; and that the exit from the stalls and dress-boxes, as originally designed, was cramped and tortuous, and was only partly rectified by the emergency exit, which brought the occupants of those parts into direct conflict with the whole of the occupants of the gallery and a portion of the dress-circle. Captain Shaw places the real responsibility for the disaster with the licensing authorities, considering that having accepted the theatre as built, and having licensed it, they had no right after that to shift any part of the responsibility on the architect or on other persons, and that the jury in censuring the architect have laid the foundation of a precedent which would lead, if adopted, to endless difficulties; and he asks why they should not also include the contractor, the clerk of works, the masons, plumbers, &c. This is not quite logical, as all these are supposed to work according to the architect's directions; but in his main position, that the authorities who have licensed the theatre are, from that moment, the really responsible people, is, no doubt, correct. This, of course, does not in any way preclude the moral responsibility of the architect in all such cases, as the designer of the theatre; it only places the legal responsibility on the proper shoulders.

**FROM** a letter published in last week's *Athenæum*, it appears that Mr. Penrose, after visiting the Tyrins remains in company with Dr. Dörpfeld, and making a more minute examination of them, has come to the conclusion that the objections which have been made to the assumed antiquity of these remains, and which he brought under the consideration of a special meeting at the rooms of the Society of Antiquaries some little time back,\* cannot be sustained. Mr. Penrose says in his letter (addressed originally to a member of the Hellenic Society);—

"The suspicious points [in regard to the remains at Tyrins and Mycenæ] were sufficiently brought forward in the discussion which took place in the summer of 1886, in the rooms of the Society of Antiquaries. I do not think that their discussion was unreasonable, but my late visit convinced me that they were all capable of explanation, and that both at Tyrins and at Mycenæ the parallel antiquity of Dr. Schliemann's recent discoveries and the great Pelægic works can be established. An important point in the controversy related to the use of the stone saw. It was argued that the evidence of this instrument on some of the stones in the palace proved it of later date than the walls of the citadel; but I found that this argument broke down; for there were evident marks of its use on the pillars of the great gateways both at Tyrins and Mycenæ.

Another very natural difficulty arose from the badness of the construction of the palace walls and the smallness of the stones used. The walls are certainly more carelessly built than one would have expected, and are generally composed of small stones; but there are exceptions, and one remarkable stone, which forms the floor of the bath-room, would have required as difficult handling as any of the stones of the fortress. There is also a harmony both in direction and extent, as marked by special quoins and returns, between the external walls and those of the palace, which very strongly points out their contemporary construction."

\* See full report in the *Builder* for July 10, 1886, p. 48.

**THE** Greek Government have decided to re-erect the great stone lion of Chæronea. Dr. Dörpfeld is to choose the exact spot, and to superintend this important work. The lion, it will be remembered, was seen by Pausanias. He says, speaking of Chæronea, "as one comes to the city there is the sepulchre of the Boeotians who fell fighting against Philip. There is no inscription, but the figure of a lion stands over it, a symbol of the brave spirit of these men. The inscription is left out, I suppose, because it was the will of the gods that the fortune of these men should not equal their courage." Of the 300 bodies originally buried there, 260 have been discovered, some with the lance-heads still adhering to the skull. The skeletons have been preserved by Fiorelli's gypsum method. The lion itself is a splendid specimen of fourth-century work. We are specially glad it is to be set up over the grave of the fallen, as it is one of those monuments which can only have its due artistic value when set up *in situ*.

**M. KIESERITZKY**, Sub-director of the Hermitage Antiquities, publishes,—we regret to say in Russian,—an interesting account of a statue of Aphrodite, recently acquired for the Hermitage Collection. The statue goes by the name of the Gatschina Aphrodite. Till quite lately it stood in that portion of the park of the Gatschina Palace known as the Menagerie. It is to the credit of the sculptor, M. A. Chijoff, that at the revision of the Gatschina sculptures, he called the attention of the Director of the Hermitage, M. A. A. Vassilichikoff, to the statue, and at his instance, "by the supreme goodness of his Imperial Majesty," it was safely lodged in the Imperial Museum. Truly, the climate of Russia is not well suited to the *al fresco* exhibition of valuable marbles. The statue is an excellent replica of the Capitoline Aphrodite type, with the accessory dolphin of the Medici type. It is in Parian marble, and of fine execution. It will certainly displace at once in public favour the wretched statue which goes by the name of the "Hermitage Venus." The most interesting point about the Gatschina statue is the head. The body accords so closely with the Capitoline statue that no further comment is needed. The head differs markedly. In fact, such resemblance as there is, is purely external, *e.g.*, the arrangement of the hair. The head, M. Kieseritzky thinks, must be compared, not to the Capitoline statue, but to a head in the Vatican Museum (Museo Chiaramonti, No. A, 513), found near the Baths of Diocletian, and representing a later, more idealised, less animate Aphrodite type. We are bound to say we take the comparison on trust from M. Kieseritzky, whose excellent eye for style is well known; the prototype plate that accompanies his paper is so utterly bad that no judgment can be based on it.

**HARROW SCHOOL** has long been in possession of a valuable collection of antiquities presented by Sir John Gardner Wilkinson, partly during his lifetime and partly by bequest on his death. These antiquities consisted of Egyptian antiquities, Classical antiquities, coins and medals, and fossils and stones from Derbyshire. When some years back we paid a visit to the collection, specially with a view to the inspection of the Greek vases, we found the objects of our research covered with dust and dirt, muddled up with fossils and odds and ends of every description, in the Vaughan Library. A boy must, indeed, have had a keen archeological "flair" to discover their merit. But as regards the Classical antiquities, Mr. Cecil Torr,—whose name, like that of another hero, should be written in golden letters on some Rhodian shrine,—has changed all that. With no small difficulty he got permission to attack the collection, mount, set up, and arrange the specimens, and have them transferred to the Museum of the School, where they are now duly exhibited. The catalogue of the Egyptian antiquities is by Mr. Budge, of the British Museum; that of the Classical antiquities by Mr. Torr himself. Both are printed at Mr. Torr's expense. Mr. Torr's

catalogue will, of course, be mainly in use by visitors to the Harrow Museum. It is well, however, that it should be widely known that the book is much more than a catalogue. To begin with, there is an excellent preface marked by the writer's well-known vigour of view and directness of expression, and dealing with that now momentous question, the claims of archeology in classical education. In the plainest fashion he gives a boy or a beginner of any sort directions how to set about Classical archeology, what books to read, and what to expect to get out of them. Further, each department of antiquities is preceded by a few introductory remarks, just enough to set the student looking aright; so that in vases, bronzes, terra cottas, gems, there is, at least, a solid foundation laid, and in the matter, *e.g.*, of Etruscan moulded vases and Samian red ware, just the information is given which the student often looks for in vain. We would only suggest the addition of a very brief bibliography of the subject, just to point boys on to the right literature.

**WE** have received from Mr. Stephen W. Williams, F.R.I.B.A., a reprint of his interesting paper read at the last annual meeting of the Cambrian Archeological Association, at Denbigh, August 23rd, 1887, on the remains of Strata Florida Abbey, in Cardiganshire. This was an abbey of Transitional date, of which the principal portions now standing are the west doorway, with a very deeply-moulded round-arched doorway, and the north-west portion of the north transept, but there appear to have been sufficient remains to make out the complete plan of the church, which is the usual plan of a Cistercian church, with a small square-ended choir, of no great length, and transepts with a series of six chapels, three on each side, on the eastern face of the transepts; as these chapels are square-ended, not apsidal, as they are often found. Mr. Williams makes out the nave piers to have been large square piers with semi-cylindrical shafts of large size at each end, the whole giving a large oblong mass of masonry more than twice as long as its thickness; on the sides towards the aisles each pier had a flat plaster or respond. The bases of the tower piers have been uncovered, and it is found that one peculiarity is that the west and eastern piers did not correspond; the western piers ranged with the thickness of the nave arcade piers, but the eastern ones, standing between the chancel arch and the range of openings of the transept chapels, are of larger area and of greater elaboration of plan. We should think it doubtful whether the western piers of the crossing were, as shown on Mr. Williams's plan, of less mass and length east and west than the ordinary piers of the arcade; it is certainly quite contrary to what we usually find in the tower piers in early work. Mr. Williams says, "Fragments found in the immediate vicinity of the piers which have been uncovered lead me to believe that the nave arcade was of pointed arches richly moulded, and carried on square piers with semicircular attached shafts on the line of the arches carrying the inner members, and with three-quarter nook shafts in square recessed jamb-moulds carrying the outer members of the arcade." He has not as yet found on the outer walls of the aisles any responds corresponding with those on the piers. From fragments found in the neighbourhood of the crossing it is believed that the tower arches were pointed and richly moulded.

**SOME** recent numbers of the *Venice News*, an English journal published at Venice, contain a short series of papers by Signor Boni, translated from *La Riforma*, on the ancient building called the Fondaco dei Turchi. The object of the paper is partly to give a history of the old building, and partly a history of and a protest against the restoration of it, which has practically amounted to rebuilding it. The ancient building had fallen into decay, but Signor Boni's position is that decay might have been arrested and the remains of the building preserved. Instead of this, it was determined to restore it, and, according to

nor Boni (who, however, takes rather strong view of these matters), it was rebuilt from the foundations, the sculptured walls touched up and improved, and the decoration, commenced in 1860, carried out scrupulously, as not to leave us the hope of finding any part, even the smallest, which may look upon with confidence as a relic of ancient palace? The *Fondaco* is now, says poor Boni, faced with marble, but an old man who remembered the ancient structure, told him the primitive walling was brick in stone dressings. We marble we should to this *congrua*. The marble seems more bald. Some remarks on the towers which now added we may quote at length:—

Any one who compares the modernised façade of the *Fondaco* (with that which is seen in photographs of the ancient palace) will perhaps find himself embarrassed on account of the addition of side towers, and the ornamental embattling of cornice. The existence of these towers is entirely proved by the wood engraving of 1500, once attributed to Dürer, and although the new towers cannot be considered as authoritatively correct, it is interesting to remember that the early Venetian palaces did have had the appearance of massive structures of brick, with strong towers at the angles, as against the frequent popular revolutions, and as to the incursions of the pirates, *pagana et bellicissima gens*. These forms became familiar to the minds of the Venetians, and two or three centuries ago when the city became rich and tranquil, when there was no more fear of incursions, Venice began to beautify itself, the principal palaces of its primitive palaces were preserved, and were adorned by clothing the brickwork, or building in sculptures or discs of precious stones, developing the vast breadth of brick wall a series of columns brought from the East, and painting and decorating the battlements."

The twenty-first Annual Convention of the American Institute of Architects was held in Chicago on the 19th, 20th, and 21st of last month. A long and interesting communication or report on education was presented by the Secretary to the Committee on Education, the course of which it was remarked that such has been said in regard to the elevation of the profession by a State system of examination and licences for architects, but it is to me that this but partially tends towards the end in view, and that a more important method is to raise its foundations by giving the professional training as good as possible, than to lift it by the hair, so to speak, by compulsory examination. Real improvement will only come through the better education and preparation of its members, how obtained, and by the resulting gradual elimination of ignorant men"; an opinion from another side of the water which may be of some interest here at the present moment. I read a paper on the "Paramount Requirements of Large Theatres," giving a very able and comprehensive survey of the subject, though containing nothing that would be new to most of our readers.

We have more than once called attention to the need of making the underground ways a connecting chain between the great way termini of the metropolis. An advance recently been made in this direction, though it should have been done long ago. We are to see the opening of a subway between the Metropolitan station and Praed-street station. Liverpool-street and Paddington on the north are now, therefore, directly connected with the Metropolitan Railway. It should be possible to make some kind of connexion with London, which is in many respects the most "vegetable" termini in the metropolis, being unconnected with the underground lines out of the direct route of omnibuses.

The thirteenth volume of the "Proceedings of the Association of Municipal and Sanitary Engineers" contains a number of interesting papers on sanitary and practical subjects, including one on Cremation, by Mr. Essie, on the Construction and Maintenance of Sanitary Roads, by Mr. J. W. Brown. James's paper on Refuse Destructors, with discussion which followed, of which we have not yet given the substance. The volume also includes papers on the Drainage of

Portsmouth, by Mr. H. P. Boulnois; description of the Sanitary Works of Kidderminster, by Mr. A. Conner; Asphalt and Concrete Pavements, by Mr. Strachan, &c. A great deal of the last-named paper, and of that on the Portsmouth drainage, also appeared in our columns at the time they were read.

It has been decided that the architectural section of the Glasgow Exhibition, for which a gallery has been set apart in the Exhibition buildings, is to be distinctly international in character, and an effort will be made to get together representative works from different countries. It has been also decided to admit photographs of work designed by the exhibitor only, and accompanied by drawings, if possible. The committee will also endeavour to get together some good models, and a limited selection of decorative objects, church-plate, &c., of the highest class, in order to give further interest to the Architectural Gallery.

The Mitcham Linoleum and Floor-cloth Company, we are glad to see, are offering prizes to a considerable amount for the best designs suitable to linoleum and floor-cloth. There is every room for improvement on the commonplace designs usually seen, and it is perfectly possible to render linoleum an artistic covering instead of a mere collection of commonplace trade patterns, and that without even adding to the expense of manufacture. The awards will be made by the Directors of the Company, assisted by Mr. G. H. Birch. It is to be hoped that some good designs will be secured in response to an invitation the spirit and intent of which are highly to be commended.

The acquittal of the driver and fireman of the train which caused the Hexthorpe calamity will have come as a surprise to many who read the evidence given before the Coroner; but there can be very little doubt that this leniency towards the men who immediately caused the disaster is really a kind of indirect expression of the opinion of the jury that the men were even more to blame than the company, and that after the evidence which had been given as to the confusion in signalling, and the culpable laxity and want of method in the arrangements made for an occasion of extra traffic and consequently extra danger, the blame resting with the higher authorities of the Manchester, Sheffield, and Lincolnshire Railway was so great that it would have been unfair to make scapegoats of the engine-driver and fireman. We do not see the logic of this. The extra difficulties put in the way of the men, and the want of properly worded and methodical instructions to them, would have been a good reason for a mitigation of sentence; but there is no doubt from the evidence that the driver was careless and did not see or attend to signals which he ought to have seen; and the culpability of his superiors does not remove all responsibility from him. The case is a very creditable one to the railway company principally concerned, and, though they cannot be made criminally responsible, we hope they will not be allowed to hear the last of it with the close of this trial.

**Sanitary Institute of Great Britain.**—At an examination, held November 10th and 11th, sixty-two candidates presented themselves, eight as Local Surveyors and fifty-four as Inspectors of Nuisances. The Institute's Certificate of Competency to discharge the duties of Local Surveyor was awarded to Messrs. Adam H. Campbell, John W. Hunt, and Donald Grant Macdonald. The Institute's Certificate of Competency to discharge the duties of Inspector of Nuisances was awarded to Messrs. W. J. Addiscott, F. A. Aris, R. Bell, R. Batland, W. S. Dovey, T. J. M. Flower, W. F. Fordham, C. T. Gardner, T. W. Golds, W. Grant, H. Hilliam, R. A. Houghton, P. Hoy, R. W. Jasper, D. Jones, T. A. Kitchen, J. W. Lear, W. Lee, D. G. Macdonald, A. McNair, S. Minty, A. R. Patrick, A. Perry, G. M. Pettit, J. Shelton, T. D. Stewart, J. Taylor, T. Thomas, E. Winter, R. White, and W. Yeo.

#### THE SURVEYORS' INSTITUTION.

MR. W. J. BEADEL, M.P., who is President (for the second year) of the Surveyors' Institution, delivered the opening address for the session on Monday evening last. After a few introductory remarks he said:—

I do not forget that with my present term of office closes the second decade of our existence as an Institution. It is not necessary to dwell at length upon what has been accomplished during that comparatively brief period in the life of a professional society; but this may be said, without fear of contradiction, that this Institution is an instance of progressive prosperity difficult to match elsewhere, whether regard is had to its early incorporation, to the status it has secured for its members, or to the extent to which it represents the profession in whose interests it exists. I wish it were possible to look back over the twenty years of our annals with unmixed satisfaction. As in all human affairs, if we have successes to chronicle so have we losses to deplore. Happily, our first President, Mr. John Clutton, is still with us (appliance), and long may he remain so; but we cannot help calling to mind on occasions like the present the many honoured contemporaries who have assisted in building up this Institution, and who are no longer by our side. . . .

Before passing to more special subjects, let me refer to an event which makes the year 1887 an *annus mirabilis* in our history,—I allude to the Jubilee of the reign of one of the most illustrious and most beloved of Sovereigns. This Institution, incorporated under a Royal Charter granted by her Majesty, availed itself of the opportunity of assuring her, in a dutiful address, that the surveyors of England were among the most loyal and devoted of her subjects (hear, hear).

The mention of the Jubilee year naturally leads one's thoughts to the vast changes in all matters relating to property which have taken place during the fifty years of Queen Victoria's reign. This period (comparing great things with small) as nearly as possible coincides with the age of the Land Surveyors' Club, which was, in a certain sense, the nucleus out of which this Institution was developed. It is no reflection on the memory of those who founded that Club to say that they would have been astonished could they have foreseen the enormous multiplication of transactions in every kind of property which has distinguished the intervening period of fifty years, and which all fall more or less within the province of the surveyor of the present day.

This great increase in the extent and variety of the surveyor's duties necessitates a more careful and accurate training for his life's work; and it is the boast of this Institution that it made haste to recognise the fact by making provision for the careful education of its professional successors. Among the Students whom I see before me is seated, no doubt, a future President of this Institution. If so, I hope, and am sure, that he will remember in his Inaugural Address to do us the justice of admitting that we did the best we could in our day to secure for those who will follow us the position to which we consider the surveyor entitled, but which he cannot attain without the special and exact training long looked upon as necessary in other professions (hear, hear).

It is impossible to exaggerate the importance of our Examinations with reference to the future of the Institution. When we applied for and obtained our Charter of Incorporation in 1881, it was resolved, after long and careful consideration, to postpone the compulsory Examination for Professional Associates for three years from the date of the Charter, and for Fellows for ten years from the same date, meanwhile introducing both Examinations in a voluntary form, in order to avoid the shock of a sudden transition from the old state of things to the new. Ten years seemed a period remote enough in 1881, and, as a matter of fact, was looked upon as too remote by some of the more sanguine promoters of our Examination system. More than six years of this period has, however, since expired, and we are now, so to speak, almost within sight of the time when our system of admitting members will undergo a complete change by the operation of Clause 29 of our Charter, which finally closes, in a year or two's time, the access to Professional Membership against all who are unwilling to submit themselves to the Examina-

tion tests. It has never been, and I trust never will be, the policy of this Institution to canvass for new members; but it is only just to remind those of our professional brethren who are eligible for membership, but who, being of mature years and of established professional position, are not likely to offer themselves for examination, that the period within which they can join the Institution without examination is rapidly drawing to a close under the terms and conditions of the Charter. I find that an impression prevails to some extent that the compulsory Examination for Fellows has already come into force; and I think it well, therefore, by this explanation to dispel the misapprehension.

It will be of some interest to review the progress made during the last six years towards leaving the Institution with examined men, in anticipation of the more exclusive system towards which we are hastening. Since the year 1881, 503 candidates of all classes have offered themselves for examination, of whom 345 have satisfied the Examiners. Of those 345, 185 were candidates for Studentship and 160 for Professional Membership. Of the 160 who have passed the Professional Qualifying Examinations, 127 (a large proportion) have since been elected, or are in process of election, as Members, and a large majority of the remaining 33 are taking steps for joining the Institution. Placing these 127 Members, by Examination, in comparison with the whole Professional Membership (that is, excluding Honorary Members, Ordinary Associates, and Students), it appears that the Members who have actually qualified by Examination, at the present date, already amount to nearly 15 per cent. of the whole Professional Membership, which, as I have already said, represents a very respectable leaven of the new order of things (hear, hear). This calculation leaves out of account about 100 Students who have already passed the first step in the Examination system.

It is impossible to forecast what the total increase in the number of Members will be (it will probably be considerable) in the next four years, but assuming, as we are justified in doing by statistics, that not less than forty will pass the Professional Examinations during each of those four years, it will be seen that we shall have on our Register at the end of the period the names of upwards of 300 Members possessing a certificate of having passed an Examination of the most exhaustive but most practical description in every kind of professional knowledge not absolutely dependent upon long experience.

It may be stated in connexion with our education system that the Institution carefully abstains from anything in the nature of teaching functions, and it is, therefore, with the greatest satisfaction I record the fact that the most cordial working relations exist between ourselves and valuable centres of professional instruction, such as the Royal Agricultural College, Cirencester, and the College of Agriculture, Downton (hear, hear).

Altogether, the Institution has reason to be proud of the success which has attended its efforts to secure a sound technical education for the rising generation of surveyors,—a success far beyond the most sanguine anticipations; and it only remains to urge all surveyors and land agents of standing (whether members or not of the Institution) to co-operate with the Council in this direction by seeing that their sons, their pupils, or their assistants do not lose the opportunity which our Examination system offers of obtaining certificates of competency, the value of which, in relation to their future career, must be admitted (hear, hear).

The remainder of Mr. Beadel's address was devoted to agricultural matters, and to the legislation or proceedings in Parliament in relation thereto. We quote one passage from this part of the address:—

The Select Committee on Forestry, to which I alluded last year, being reappointed, held another series of sittings, during which Mr. John Clutton and another of our members, Mr. Evan Powell, were called upon to give evidence, and a report of considerable value and interest has been issued, taking up very much the line of the views put forward by our Secretary, Mr. Rogers (hear, hear). The Committee, whose recommendations cannot be said to err on the side of extravagance, were apparently not altogether satisfied as to the possibility of establishing a School, and pro-

pose, as an intermediate step, to constitute a Board of Forestry, composed of delegates from various bodies, such as the Royal Agricultural Society of England, the Highland and Agricultural Society of Scotland, and this Institution. A Board so constituted would, no doubt, be better fitted for dealing with the subject than a sub-Department of State, and might be trusted to carry on its operations on sound and practical lines, and with a view to actual needs and possibilities. Steps are, I understand, being taken to ascertain the extent to which the societies invited to send delegates to the Board are prepared to co-operate in giving effect to the recommendations of the Committee. I believe I am not saying too much on behalf of our institution in stating that we shall be willing to do anything in this or in any other way which may seem to offer a prospect of bringing relief, however small, to the landed interests of this country (applause).

On the motion of Mr. E. P. Sqnarey, seconded by Mr. Wheeler, Q.C., a vote of thanks was given to Mr. Beadel for his address.

#### LUTON SEWAGE WORKS.

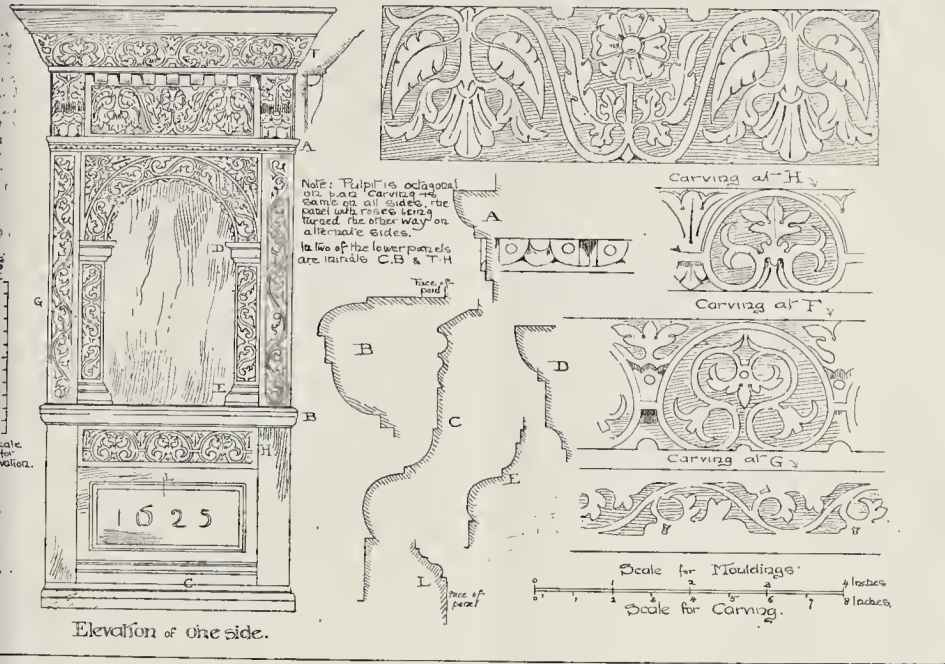

A Home Counties District Meeting of the Association of Municipal and Sanitary Engineers and Surveyors was held at Luton on Saturday, the 29th ult. The members met in the Council Chamber, there being present Mr. J. Gordon, of Leicester (President), Mr. Lewis Angell (West Ham), Mr. Ellice Clark (West Sussex), Mr. J. P. Barker (Islington), Mr. John Lund (Bedford), Mr. E. Sbarman (Wellingborough), Mr. G. Cannon (Aylesbury), Mr. W. H. Wilds (Hertford), Mr. J. P. Norington (Eulham), Mr. C. Jones (Ealing), Mr. W. Weaver (Kensington), Mr. G. Weston (Paddington), Mr. W. B. Bromley (Isleworth and Isleworth), Mr. T. G. Lawson (Southgate), Mr. W. Santo Crimp (Wimbledon), Mr. R. S. Lloyd (Messrs. Hayward Tyler & Co.), Mr. T. de Courcy Meade (Hornsey), and others. Also the Mayor (Councillor H. Blinfield) and other members of the Corporation, Mr. W. H. Leete (Borough Surveyor), Major Flower (Consulting Engineer of the Lea Conservancy Board), and other gentlemen.

Mr. W. H. Leete, Borough Surveyor of Luton, read a paper on "Luton Sewage, past and present." The population at the present time is about 30,500; rateable value, 104,316l.; municipal area, 2,600 acres; and there are thirty miles of roads and streets. Luton is situated at the head of the Lea waterbed, and above the intake of the New River Company and the large lakes on Luton Hoo estate. It has been jealously watched by the riparian authorities, and precautions constantly enforced to prevent pollution of the Lea and lakes. Of recent years, during droughts the Lea has been almost dried up. About the year 1800 there were only five streets in Luton, and within three years of that date the first bridge was erected over the stream. The original industry was malting, no fewer than sixty kilns being at one time worked, also a few tanneries, and there were six water corn-mills on the stream. The straw-plait industry was introduced by Lorraine plaiters, who left Scotland, owing to troublous times, in the reign of Mary Queen of Scots, and the trade has now an annual turnover of 1,750,000l. In 1821 the population was 2,980, and there were 586 houses. Up to 1850 the drainage was by open ditches and drains direct into the river. The Public Health Act of 1848 was adopted, and the first meeting of the Local Board was held on August 12, 1850. The owner of the Luton Hoo estate obtained an injunction to restrain the Authority from polluting the stream, and in 1856 a scheme was initiated, 1½ acres of land between Park-road and Windmill-road being purchased, and outfall works arranged, with engine and boiler, receiving tanks, filter-beds, and lime-mixing apparatus, in connexion with which an intercepting sewer was constructed about a mile in extent, on the advice of Sir Joseph Bazalgette. Extensions were made from time to time. In 1868 the Authority was served with notice to conform to the Act (cap. 154, July 30, 1868) for the preservation and improvement of the Lea. By the efforts of the late Mr. E. O. Williams, Alderman Higgins, and Mr. C. Bailey, Clerk to the Board, a clause was inserted in the Act, allowing Luton to continue discharging sewage water into the river after purification by Higge's

process, or such other which from time to time might be in use as the best known practicable process, providing they did not increase the sectional area of the existing sewerage and drainage works. From time to time, to meet the wishes of the Conservators, several processes were applied, such as Whitbread's, the Native Guano Company's, and others, but all failed to improve on the simple lime process. In rainy seasons the sewage is very much diluted with subsoil and spring water, and is continuously deeply coloured by dyes used in the local trade. During the past six years plaiting has become almost obsolete, owing to the enormous importation of cheaper foreign plaits, and the industry consists of making up the foreign-made plaits. This has driven the villagers into the town, and created a great demand for cottage property. Finding that the sewage could not be satisfactorily clarified by the use of chemicals and precipitation, the Authority, recently changed from a Local Board to a Municipal Corporation, in 1878 obtained a loan of 10,000l. for further works, which included the removal of the last remaining water-mill on the stream, providing a new outfall, purchasing five acres and leasing 17½ acres of land, which was terraced and drained, &c., laying down new machinery with rising main. After using chemicals and precipitating the solids, the partially clarified sewage was pumped upon the land, but the effluent remained highly coloured; 800,000 gallons of sewage were pumped six days each week. Chemical treatment was again tried, viz., Hill's salts of magnesium and tar, with lime, the patentee having the works at his disposal for six months, only to fail more signally, leaving the works in a filthy condition. Mr. John Hanson's black ash was also tried, but was found to be quite ineffective, not in the least touching the colour. Between 1876 and 1885 the population increased one-third, and complaints again arose. After much inquiry, the Town Council acquired the present farm, which comprises 71 a. 12 r. 27 p., at an average price of 128s. per acre. It adjoins the borough boundary, and its extremity is fully a mile beyond the pumping-station. Its greatest height is 184 ft. The soil, for the most part, has a shallow staple on a chalk base, somewhat loose, and free from large fissures. The land is served by a 16-in. rising main, 1,541 yards long, prolonged by a 12-in. main, 220 yards in extent, with eleven valves serving eleven levels from 10 ft. to 184 ft. There are four earth-made tanks, two at 62 ft. height, one at 117 ft., and one at 125 ft., each having a small sludge bed. The tanks will hold 1,023,700 gallons, and may be filled twice in twenty-four hours. They cost 9s. per 1,000 gallons. The conduits from the various levels are simply earth cuts to a fall of 1 in. per chain, following the contour of the hill-sides. They extend slightly over three miles, and cost 8½d. per yard. About 9 acres at the foot and side of the hill are levelled and ridged to secure uniform distribution of sewage without any large accumulation at the foot of the hill. The cost was 16l. an acre. The chief crop is rye-grass, with about 16 acres arable, growing corn for the Corporation horses. As to crops, some years we have been able to show a profit, but last year's superabundant produce caused the crops to be almost given away, entailing a deficit. As the sewage enters the works it passes through a series of screens. Three tanks, holding about 700,000 gallons, are used to hold the night flow. They are connected with a well in the new engine-house, 9 ft. in diameter and 14 ft. deep, into which the 18-in. suction-pipe of the new pumps is carried. The boilers are equal to 130 horse power. The new engines are 100-horse power coupled horizontal rotating high-pressure condensing engines. The pumps are 19½ in. diameter, of the horizontal double-acting type. The new plant is capable of raising 1½ million gallons of sewage per day of twelve hours, 200 ft. high. As to coal consumption, twenty days' working at various levels showed a cost of 4d. per thousand gallons, taking coal at 11s. per ton on the works. Two days' consumption of coal working to the highest lift, showed a cost of 7-16ths of a penny per 1,000 gallons. The new machinery was designed and executed by Messrs. Hayward Tyler, Howard, & Co., of London and Luton, the contract sum being 2,760l., which, with a few extras, will possibly bring the amount in round figures to 3,000l. The results of the working from May 21 to the present time have been very satisfactory.

# Pulpit, Huish Episcopi, Somerset.

... now disposes of its entire sewage with an outlet to the river. The dry-weather of sewage in twenty-four hours is 820,521 tons. In wet weather it is more than double. The old engines repaired will raise 800,000 gallons in twelve hours. With them and the new plant we can lift 2 1/2 million gallons in five hours. The town water supply equals 1,000,000 gallons per day. A few months ago there were over 2,000 cubic yards of sludge at the pumping station. It has all been removed to the neighbouring farms, and the sludge is now daily pumped with the sewage to new farm a mile distant. At the request of the Town Council, the whole of this work was designed and carried out by himself (Mr. ...), excepting the machinery, the design for which was the result of a competition. The engine-house, boiler-house, shaft, &c., cost £31. We have been able to keep within the estimate (20,000), and so far the result has been quite satisfactory. The Association may be expected more scientific work as regards construction of the tanks and conduits, a larger outlay was avoided on account of distance of the farm from the town and the river, particularly as we have a splendid chalk of a possible depth (as has been stated by geologists) of 300 or more feet.

The President (Mr. J. Gordon, of Leicester) read remarks from the Mayor and Major ... whom he described as the High Police Commissioner of the River Lea.

The Mayor briefly referred to the favourable circumstances which had attended the carrying out of a possible depth (as has been stated by geologists) of 300 or more feet.

Mr. J. Flower said that from much experience he had come to the conclusion that land the only absolute purifier of sewage matter is to render it fit to be discharged into a stream from which people drew their drinking-water. He had great respect for many scientific processes, and they would meet the needs of some places, while being totally inadequate in others. At Luton for a time chemical treatment supplemented by filtration on a small scale of land sufficed, but ultimately the sewage

became so loaded with chemicals and dyeing refuse as to render it exceedingly difficult of treatment; and chemical processes, which might be sufficient in other towns, had no effect whatever upon it. He felt that he should hardly be doing his duty as an official if he did not say how pleased those whom he had the honour to serve were with the honourable and thoroughly English way in which Luton had met the necessities of its position.

The party then drove in carriages to the sewage works, where they inspected the machinery and arrangements. They then proceeded to the farm and inspected the irrigation scheme, which was highly commended for its simplicity and effectiveness. A visit was then paid to the waterworks, for the inspection of the engine and pumps, which were highly approved. On returning the visitors were shown over the factory of Messrs. Carruthers Brothers, and witnessed the various processes of manufacturing straw and felt bonnets and hats. It had been intended to inspect the dye works of Messrs. T. Lye & Son, but time did not allow of it.

On returning to the Council-chamber the visitors and members of the Corporation were entertained at luncheon by the Mayor.

**Roman Frescoes purchased by Germany.**  
The famous frescoes in the Casa Bartholdi in Rome, by Cornelius, Overbeck, Schadow, and Veit, representing the history of Joseph, which were purchased some time ago by the National Museum of Berlin, are now being taken out of the walls by Professor Bandini prior to their despatch to Berlin.

**Restoration of the Cathedral of Upsala.**  
The restoration of the Cathedral of Upsala, the oldest edifice of this kind in Sweden, which has been in progress for some years, is nearing completion. The work, which involves the rebuilding of the principal tower, destroyed by fire many years ago, is being carried out under the supervision of Herr F. Langlet, architect to the Swedish Government, and a sum of 10,000 has already been expended thereon.

## PULPIT, HUISE EPISCOPI, SOMERSET.

This is an interesting example of Decorative work of the early part of the seventeenth century. Some of the ornament is very good of its kind, and the general effect is rich; but the curiously entomological appearance of the reversed feature shown in the upper hand of the detail drawings is certainly not to be commended; the lower portion looks more like the body and hind legs of a beetle than like any form derived from vegetation, and the curves of the different portions do not harmonise with each other. The other hands of ornamental design are much better in this respect.

## THE ARCHITECTURAL ASSOCIATION.

The second meeting of this Association for the present Session was held on the 4th inst. in the meeting-room of the Royal Institute of British Architects, Mr. John Slater, B.A. (President), in the chair.

The following seventy new members were elected, viz. :-

Messrs. G. S. Fleetwood, A. C. Williams, A. H. Knott, P. D. Smith, J. R. Cluis, A. H. Moore, P. A. Grinstead, E. R. Sequeira, E. D. Welby, A. C. Walker, J. Peter, G. H. Fox, T. F. Simpson, J. Gehlan, F. A. Huntley, A. Cordery, W. H. Brooks, F. Carless, A. T. Pope, E. C. Bailey, E. Carter, C. E. Gray, A. P. Cocks, C. H. Strange, W. H. Winder, W. M. Paton, E. Archer, R. Scorr, E. L. Waterhouse, E. G. Angel, O. Cortel, Ernest H. Selby, J. E. Jefferson, A. Gladding, H. G. Robins, F. J. Waller, A. C. Henderson, J. F. Parker, H. Rice, F. H. Greenway, H. N. Smith, C. N. Johnson, E. W. Wonnacott, F. T. White, H. B. Young, J. T. Masters, J. G. Whyte, C. L. Orme, H. W. R. Sheffield, C. H. Cheston, A. Field, A. B. Jackson, F. T. Davys, C. W. Ritches, T. P. Clarkson, A. T. Griffith, S. F. Bartlett, A. E. Hilsenrath, H. A. Green, P. G. Eade, W. G. Ingram, C. A. B. Smith, W. J. Roome, A. M. Wakley, J. Angold, D. Gibson, F. E. Hollinworth, E. H. Hill, R. B. Lindsey, and A. T. Walsley.

Mr. P. J. Marvin was next elected to fill the vacancy on the Committee caused by the resignation of Mr. Dawber.

Mr. J. C. L. Sparks next read a paper on "Architectural Modelling," which we printed last week (p. 665).

In the course of the discussion which followed,

Mr. Lawrence Harvey said that this year he had had a conversation with Professor Lasius, of Zurich, who considered modelling to be a very important subject for architects. The reason was that the sculpture on a building was part of the design, and could not be ignored. If, then, they did not understand modelling, another man brought in work which did not harmonise with the design of the architect. Another important thing, not only in the matter of modelling, but also with regard to carving, was that a totally different design had to be made, according to the material. Mr. Sparkes had mentioned the fact that marble could not be initiated in clay, nor could a marble design be carried out in Bath stone. The ornament must be different, and allowance must be made for thick instead of thin arteries. He might refer to a new invention of wood carving for doors. There was first the panel, on which woods of different colours were glued, the ornaments being carved out of the masses of wood. That got over one of the great difficulties in wood-carving, in working the background even. Mr. Sparkes had referred to colour, but what was colour in sculpture? They had to learn what colour in architecture was without paint being put on. Colour meant the difference of treatment of surface so as, by contrast, to bring up one surface above another. He would quote a case to show what Mr. Sparkes meant. He remembered seeing M. Guillaume carving a bust of the Archbishop of Paris, who was murdered by the Communists. M. Guillaume said he was carving the bust as a study of colour. On being asked what he meant, M. Guillaume explained that the Archbishop's face was of the most refined and intellectual character, and full of delicate lines. To bring out those he had treated the mire perfectly plain so as to have the polished surface contrasting with the delicate work of the face. That was what was meant by colour, and it was the same in every art,—the contrast between light and shade, between seriousness and liveliness; and as sculpture was one of the great means of getting that colour, it was perfectly indispensable for an artistic architect to study sculpture and carving.

Mr. Leonard Stokes said he agreed with Mr. Sparkes that modelling was very necessary to the architect, as he was expected to do a great many things other people could not do. For instance, he had to see round a corner, and unless he was able to model in his mind he could never realise what his building would be like. So long as architects could only grasp one elevation at a time their buildings would not be as satisfactory as if they were able to grasp the block or modelled mass in their minds. To be able to model detail was no doubt very useful, but more attention should be paid to form in masses, and perhaps less,—although these, too, were very important in their proper place,—to small matters such as panels. He agreed as to the necessity of the architect being able to show a modeller how a thing should be done, although the modeller might not always like it. Mr. Stokes concluded by proposing a vote of thanks to Mr. Sparkes.

Mr. H. D. Appleton inquired whether Mr. Sparkes had had any architectural students in his schools, and, if so, what amount of success they had achieved? It seemed to him that if architects were to be artists, and be capable of doing all the work they had to superintend, the life of an architect would not be worth living. He seconded the vote of thanks.

Mr. Frank Jones asked Mr. Sparkes whether he preferred modelling to seeing the building in perspective? He did not quite understand, too, whether Mr. Sparkes wished a model to be made of the whole building, or merely of some of the ornamental detail, of which they might get an idea if it were drawn out full size.

Mr. E. Swinfen Harris remarked that if architects wished to make sure that their buildings would be effective in appearance of outline, there was nothing so excellent as modelling them as a whole. In support of that, he might mention the buildings of Mr. George Devey, which were the results of models made to scale in wood. If the detail was to be beautiful, so should be the building as a whole. Nothing, therefore, was so important to the members of the architectural profession as to understand the modelling of their buildings to a relative scale, so that they might form an idea of the effect produced before all attempts to improve it were too late.

Mr. W. H. Atkin Berry, as an old pupil of Mr. Sparkes, supported the vote of thanks.

Mr. H. W. Pratt said that the subject of modelling was a very interesting one, and no doubt architects did not see their details carried out in plaster and modelled before being executed as much as they might do. The old question of expense had a great deal to do with that. If modelling were taught in secondary or technical schools they might be tempted to go in for a little too much ornament. No doubt the extent to which modelling might be carried would be an inducement to apply plaster ornament to wood backgrounds, and so on,—a species of ornament requiring to be used with the utmost care. Much of that kind of thing was to be seen now-a-days in chimney-pieces of wood with considerable ornamentation by the application of plaster, which, he considered, was a wrong application of the principle of modelling. With regard to carving in marble, stone, or wood, how did Mr. Sparkes propose that the modeller should go to work in order to produce what was required in those different materials? Modelling in plaster would not give the effects of marble or stone. He could understand in large work or in moulded work, where they had not an opportunity of judging the effect at great heights, or certain positions, proper models made beforehand might be of use. But in the case of small work, well within the range of the eye, he did not see how plaster would give the effect of the particular material intended to be employed. As to sculpture, he supposed no one would place a piece of sculpture on a building without first having a cast made of it. With regard to ornament, the same man who made the model would not be the person who would carry out the work, and it would put the carver on a lower scale than if he produced it from his own brain, and carved it by his own hand.

The Chairman said that Mr. Sparkes had referred very modestly to the Lambeth School of Art, but it was pretty well known that he had as much to do in raising the tone of artistic labour in Lambeth and Kennington as any man in London. It was curious how little attention was given in this country to matters connected with architectural education, which were considered of importance abroad. He believed that in the Ecole des Beaux Arts in Paris, as well as in almost every Continental and American Architectural School, modelling was one of the subjects young architects were compelled to study. And not only was modelling useful from an artistic point of view, in the arrangement of details, but it was also of extreme use constructionally. It was a matter of difficulty to tell if the roofs were all right from the drawings, and nothing could be more educational than for the student or office assistant to model his roofs in a piece of soap, or some similar substance. Every one, he supposed, would agree with what Mr. Sparkes said about material. It had struck him, when listening to Mr. Harvey's remarks about wood, that he was advocating the use of that material in much the same way as plaster was used in sgraffito decoration, which was not a proper treatment for wood. Mr. Pratt supposed that no one would put sculpture upon a building unless he had casts made first, to show the effect; but they had only to walk through some of the London streets to see that such was not the case. Anything more incongruous than some of the huge pieces of masonry or plaster on London buildings could hardly be imagined. Something had been said as to Mr. Devey's success being due to the fact that his buildings were modelled in wood, but it must be remembered that he was very fortunate in his clients, and never at a loss for any money to be expended. A great many of their clients, on the contrary, would look askance if asked to pay for models of buildings they were having designed. Mr. Sparkes had made a remark about the City and Guilds of London Technical Institute, and the members of the Architectural Association felt strongly that they also owed a debt of gratitude for the way in which one of the rooms of that body had been placed at the disposal of the Class of Masonry. He believed he was not saying anything which was not known when he added that the same Institute was considering how in various other ways architectural education in London could be fostered and helped.

The vote of thanks was then put, and was very cordially received.

Mr. Sparkes, in replying, said his meaning

was not that the architect ought to make full models, so to speak, of his buildings. That, he took it, belonged to another work; nor did he think that the architect, with all the things he had to learn pressing on his time, would arrive at a great pitch of success as an original modeller. What he meant was that by the practice of modelling that higher sense should be stimulated which one perceived was moving the greater architects. He could not express that by any other means than that of colour. He well remembered his first impression on seeing the façade of the Cancelleria at Rome; it was a new vision, for the old well-known parts had been so arranged that they produced quite a new effect. One might take the archaeological view of ornament, and demonstrate what the Egyptians, Greeks, Romans, and every other nation had used, but that was not quite the thing he wanted to bring out. After all, the use of the several parts was a matter of detail, but the effect they produced was what he should like young architects to study. To demonstrate the use of a modelled elevation, Mr. Sparkes referred to Mr. Herkomer's new house at Bushey which, he said, was one of amateur plan, and a building for which an American architect had given an elevation. The plan was extraordinary, but one of his (the speaker's) students made a model of it; it was a very difficult thing to realise without a model, as the house was one which would make an architect's hair stand on end. At the same time, it was an artistic building, with an enormous amount of light and shade about it. Mr. Herkomer was really erecting his house from the inside outwards,—building first the furniture, and then a shell which eventually would be enclosed in the external apartments. With this in view a number of wood-carving machines were employed, driven by a gas engine, and these machines working a number of drills, were used by workmen in sinking the ground of the ornament, leaving the pattern a mere silhouette which was then carved. That was, no doubt, saving of labour, but it took away the character of a hand-worked ground. On the same principle he also objected to Mr. Harvey's advocacy of gluing layers of wood together, and then carving panels out of such layers so as to secure uniformity of background. Why the very irregularity of the ground in hand work gave life, which a merely mechanic treatment took away. He had been asked to say how many architects he had had in his modelling classes. He did not know that he had any, and possibly that was the reason why he was addressing the Architectural Association (a laugh). The union of stone-carving and modelling had been a great success. The stone carver had a very limited outlook before him, and it was not likely he would trouble himself much about colour or the refinements of art, so he fell into the condition of unintelligent drudgery which was so common in this age of divided labour. But they had taken those men, and put before them a totally different ideal, by making them model from the finest forms. Such men, after a thorough technical knowledge of the treatment of stones of various textures, made most excellent designs. Mr. Harvey's remarks about M. Guillaume went to the point. The greatest sculptors worked for colour, and the balance of colour, and what was now done by the sculptor might be done by the skilful architect in his buildings if he knew the enormous capabilities of the material in proper distribution.

**The Sanitary Registration Bill.**—At the ordinary meeting of the Council of the Sanitary Assurance Association, 5, Argyll-place, Regent-street, on Monday last, Sir Joseph Fayre, K.C.S.I., F.R.S., in the chair, the following resolution was unanimously passed, on the motion of Mr. H. Rutherford, seconded by Mr. Andrew Stirling:—“That the principle of the Sanitary Registration of Buildings Bill, viz., that the law should forbid any building being used for public or semi-public purposes unless and until the arrangements for water-supply, drainage, and ventilation of such building shall have been certified as satisfactory by some qualified person,—having been very widely approved, a determined effort ought to be made to pass the Bill into law during the next session, and in order to facilitate its progress in Parliament it will be desirable to introduce the measure in the House of Lords.”

Pavement of North-East Room.

Table Stone.

Mosaic Border from North-West Room.

ROMAN REMAINS, TOCKINGTON, BRISTOL.

We give a few sketches taken from the remains of the Roman villa at Tockington Farm, near Bristol, for which we have not been able to find space hitherto. In the *Builder* for Oct. 22 last, our first article was devoted to a detailed description of the villa.

The illustrations here given include, as will be seen, the entire design of the pavement of one room, a mosaic border from another room, the arch of the hypocaust, and a few miscellaneous remains, illustrating a class of relics frequently found on the site of similar remains. The arch of the hypocaust is formed of the local lias stone, which splits readily into the apparently evenly-cut forms indicated.

ARCH OF HYPOCAUST

## Illustrations.

DESIGNS BY THE LATE W. BURGESS.

**T**HE designs for a pastoral staff, and for decanters, by the late W. Burgess, are reproduced from the portfolio of photographs of his work brought out by Mr. Pullan, some remarks on which will be found in another column.

## RESTORATION OF ALL SAINTS CHURCH, ASHDON, ESSEX.

The proposed work in connexion with the above consists not only of the rebuilding of walls, buttresses, windows, &c., as shown by hatched lines upon the plan given with our illustrations, but also of removing the lead from the roofs, thoroughly repairing and renewing the same, and re-covering the nave and chancel with tiles and the aisles with lead; taking up the present floors and removing the galleries, seating, &c., and laying wood-block flooring on concrete; removing old plaster; repairing the flint-work externally, and plaster internally, and also the stonework to windows, doors, &c., which is, unfortunately, of local "clunch," or chalk; removing the earth outside to below the floor-level, and forming a gutter round the building; a new oak pulpit; reseating in oak, with oak screens to form vestries and to the tower archway, &c.

Want of funds has prevented the promoters doing more than a small portion of this work. An oak pulpit, executed from the designs of the architect, Mr. John W. Alexander, of Middleborough, by Messrs. Rattee & Kett, of Cambridge, has been placed in the church in memory of the late rector, and the re-flooring and reseating of the church has been partially carried out by Messrs. W. Bull & Sons, of Saffron Walden.

The fabric is of historic interest, as it is considered to be upon the site of a minster erected A.D. 1016 to commemorate the battle fought upon or near its site, between Edmunde Ironsides and Cnut.

The Rector, the Rev. H. B. Swete, D.D., writes thus to the architect:—

"I have not had time to work out the history of our church and parish, my own studies lying another way. But I will put down what I have collected.

1. In Domesday (Essex D. p. cxli) the place is called Assenduna, and described as a domain held by Raif Baignard.

2. The Cotton MS., Vesp. F. xv., which contains a number of documents connected with the Cluniac Priory of St. Pancras, Lewes, has repeated references to the church and rectory of Ashdon (Essenduna, Assenduna, Asshendon). From these it appears that 'G. de Essenduna Miles' presented the benefice to the rector and monks of St. Pancras somewhere about the year 1200. Subsequent deeds seem clearly to identify the 'Knights of Essendun' with the Baignard family.

3. The chroniclers describe the battle fought A.D. 1016 between Edmunde Ironsides and Cnut at a place in Essex called Assandun. They add that on the site of the battle Cnut raised a minster, and that he endowed priests to sing for the souls of the slain. This minster was dedicated in 1020 by Archbishop Wulston of York, in the presence of Cnut and a great company of earls and bishops. But within a century it had given place to a small church under the charge of a parish priest.

4. Although Professor Freeman asserts the contrary, the weight of the evidence is in favour of identifying Assenduna or Ashdon with Cnut's Assandun. I have taken the trouble to go to Ashdon, the other claimant for this honour, and have sifted Professor Freeman's note on the spot. Both ancient spellings and topographical considerations point to Ashdon. Bartlow Hills, of course, had nothing to do with the battle. But the field below the church is full of the year 1200. It is a great mound at the foot of the field consists of cartloads of orcanic remains mixed with lime, among the remains being large quantities of river shell-fish, presumably brought by the Danes from the Essex coast, and bones of oxen,—the relics, I take it, of their last feast before the battle."

## ST. JOSEPH'S CATHOLIC CHURCH, SWANSEA.

This church, which is nearly completed, has been designed by Messrs. Pugin & Pugin. It consists of nave, aisle, chancel, two chapels at the chancel end, and one by the entrance to the church.

The nave is divided into seven bays, and is separated from the aisles by an arcading supporting the clearstory, which is pierced by three-light windows with tracered heads in each bay.

The west end is lighted by a four-light window with richly-tracered head. At the west end are two entrance-doors with tracered tympanums. There is a gallery supported by stone arches, and approached by a turret staircase, which forms one of the buttresses of the tower. The chapel at the west end is approached from the vestibule under the gallery. The baptistery is also approached from the vestibule, and is in the lower stage of the tower.

The tower and spire, which is not yet built, will rise to a height of 165 ft.

The aisles are lighted by triplet windows, with cusped heads in each bay. The respond of the nave arcading at the east end has been made sufficiently wide to admit of a small arch through which the priest can pass to enable him to administer the Holy Communion, the Communion-rail extending the whole width of the church.

The chancel is divided from the nave by a stone arch, 45 ft. in height. The mouldings of the arch die on a cap and shaft, supported by a canopied niche on each side, in which are placed figures of Our Lady and St. Joseph. The haunches of the arch are weighted by pinnacles, which rise to a height of 16 ft.

The roof of the nave is constructed with cross-braced principals supported on caps and shafts, the bases of which are corbelled out; in each principal is a curved rib; the roof itself is boarded, and divided into panels by moulded ribs.

The chancel is apsidal in form, having angle buttresses. It is lighted at the east end by a three-light window with tracered head. Over this window is a gable corbelled out and surmounted by a stone cross. The other bays of the chancel are lighted by two-light windows with tracered and cusped heads. The roof is similar in design to that of the nave, but richer in detail. The walls between the side chapels and the chancel are pierced with arches. There are rose-windows in the side chapels.

The total length of the church is 142 ft. inside, the width 56 ft., and the height 62 ft.

The sacristy, which adjoins the presbytery, is connected to the church by a cloister. The materials used are local stone for facing, with dressings of Bath stone, the latter being used throughout for the interior work, with the exception of the columns to the nave arcading, which are octagonal in form, and are of Dumfriesshire stone built in courses.

The building is being carried out under the direction of Mr. Cruikshank, the clerk of works.

## CRICKET PAVILION, CHARTERHOUSE, GODALMING.

THE pavilion, which measures about 100 ft. by 20 ft., has been erected on the playground, and contains, on the ground-floor, shop, bakery, and brewery, dressing and club-rooms, umpire's room, and roller-shed.

In the centre, on the first floor, is a large room for cricket dinners and the use of visitors at athletic sports, &c. A platform with stepped seats is placed in the middle.

The building is of framed timber, burntised, and filled with concrete of sileneitic lime, and fastened to dwarf walls of sileneitic concrete. The tiles are laid in concrete in the manner introduced by the architect, Mr. Ralph Nevill, F.S.A. Messrs. Tompsett & Kingham, of Farnham, were the builders.

The drawing was in the Royal Academy exhibition of this year.

## BINDON, DEVONSHIRE.

BINDON, near Axmouth, in Devonshire, must not be confused with Bindon in Dorsetshire. The Dorsetshire Bindon, which is near Wool, is celebrated for the ruins of its Cistercian abbey. The Devonshire Bindon consists of an old farmhouse, or grange, of which we give illustrations. It is very interesting as an example of one of the smaller manor-houses of the Middle Ages. The building itself is erected in the shape of the letter L, the perpendicular having two roofs, with a valley between, and the horizontal a gabled roof and a "lean-to." There is a forecourt, enclosed by stone walls, and entered by a semicircular arched gateway just at the angle of the two lines of the L, and facing into this court is the principal entrance of the house, consisting of a gabled porch, which appears to have been a subsequent addition, probably of Elizabeth's time. Entering by the porch, to the left is the hall, now used as a kitchen, and

very much modernised. It is, however, separated from the entrance-passage by a very pretty Early Perpendicular screen, similar in design to that of the chapel, shown in our illustration. Turning to the right, one enters the principal parlour, which, unfortunately, has been papered, but still retains its old carved stone chimney-piece, and is lighted by two three-light Perpendicular windows, which are shown externally in our view from the garden. The staircase has been altered at the same time that the porch was built, but the principal landing is in its old condition, and is extremely interesting. It has a finely-moulded ceiling, and a screen separating it from a very curious little domestic chapel; the great peculiarity is that this screen, instead of running north and south, runs east and west, and has a doorway with a finely-panelled oak door close to its western end. The screen was formerly open, but has been boarded up internally, and the chapel is now converted into a bedroom; it receives light from a large three-light Perpendicular window (now partly blocked up) on the south side. The exterior of this window is shown in our view from the garden, and the interior of it in our sketch of the landing and chapel. A very rich and beautiful niche, with the remains of a piscina under it, is to be seen in the easternmost jamb of the window. The exact date of this chapel can be fortunately ascertained, as there exists at Exeter a licence granted by Bishop Lucy to Roger Wyke in 1425, permitting him to have Mass said in this chapel. Several of the rooms, and especially the offices in the south wing, are in their original condition. They are plain, almost to rudeness, but very picturesque. We were told that about thirty years ago there existed a kind of tower or heavy stone building attached to this house, which went by the name of the jail, which was pulled down; and it is not improbable that this may have been the remains of a still earlier house, especially as some proportion of the walling and a little square-headed trefoil window near the porch also look like portions of some earlier structure. Bindon is, or was, at any rate, a short-time back, for sale, and it is much to be desired that it may fall into the hands of some one who will see to its preservation, as fifteenth-century manor-houses containing chapels are by no means common in England, and it is a remarkably interesting specimen.

## PRIORY OF ST. LEONARD, STAMFORD.

THE illustration represents the west front of this highly-interesting priory, which was built in the eleventh century, by William the Conqueror and Carleph, Bishop of Durham, upon the site of a monastery founded in the middle of the seventh century by Wilfrid, tutor of Prince Alkfrid. Here, we are told, lie the remains of Henry of Stamford, prior of Finchale, who was buried in 1320, and "after his interment a light like a sunbeam was seen shining upon his grave." The building, as now seen, was carefully restored by the late Marquis of Exeter, and consists of the west end of the nave, with five bays of the north arcade, and part of the clearstory. Only the two easternmost bays of the arcade can be said to be of the time of Carleph, as the details of the succeeding style gradually show themselves in the remaining bays, and are fully developed in the west front, which is a fine example of Transitional work. A. D. W.

**The Lenham Chimes.**—The old chimes in the tower of the parish church were started last week, after remaining silent for eight or ten years. The machinery, which had fallen into bad repair, has been restored and repaired, and nine times added as a Jubilee memorial, contributed by the inhabitants of Lenham. The whole of the work has been carried out by the well-known firm of Lund & Bockley, clock and carillon manufacturers, of Pall Mall, London. The same firm, we believe, has just erected a full quarter turret clock in the parish church of Birchington, Kent, as a Jubilee memorial.

**The Oder-Spree Canal.**—The canal now in course of construction between the rivers Oder and Spree, in Germany, will be 85 kilometres in length, and cost, it is estimated, about 630,000. The work on it, which was begun in October, 1886, will, it is expected, be finished in 1889. The canal will probably become an important agent in the commerce of Northern Germany.

New Cottages, Red Lion Row, Windsor.

VIEW FROM BIER-LANE

Plan of Cottages, Red Lion Row, Windsor.

IMPROVEMENTS AT WINDSOR.

We publish an illustration of some new cottages for the poorer class of inhabitants, which have recently been erected in the Bier-lane district of Windsor. They have been built by Mr. Richardson Gardner, M.P., on the site of Red Lion-row, from the design of Mr. Stephen Wyborn, architect, Windsor. From an sanitary and structural point of view these cottages are said to be satisfactory; and they are, moreover, let at a rental which brings them well within the reach of all. The *Builder* so long ago as 1871 condemned the Bier-lane district of Windsor; since which the whole of the old streets and alleys which disfigure and demoralise this Royal borough have been pronounced by

the Inspectors of the Local Government Board in their report of last January to be "still pitifully bad." The Rev. Arthur Robins, the Rector of the parish in which Bier-lane is situated, has long struggled, unsupported by those in Windsor who should have been the first to give him their moral and material support, to get human homes for the Windsor poor and to aid him in continuing the work of rescue originated in the town by the late Prince Consort. He has, however, never ceased until at last the reconstruction of the homes of the Windsor poor has begun; and, though the buildings are not of architectural interest in one sense, we are glad to publish an illustration of them as a memorial of the com-

mencement of an improvement long called for, and to which we have given whatever support was in our power.

SEWER VENTILATION.

At a recent meeting of the Wimbledon Local Board the following important report on sewer ventilation was presented to them by their Engineer, Mr. W. Santo Crimp, Assoc. Mem. Inst. C.E., a memorial having been presented to the Board on the subject:—

"The persons signing the memorial reside in all parts of the district, south of the railway; the complaints are, therefore, of a general rather than of a particular nature.

By far the larger proportion of the sewers in the entire district fulfil the conditions of perfect sewers, i.e., they have gradients sufficiently steep to render them self-cleaning, are thoroughly ventilated, and are frequently flushed. As it is proved by the memorialists that the emission of foul smells is of constant and general occurrence, the obvious conclusion is that the system of ventilation at the street level is an obnoxious one. In my opinion some other method should be adopted.

In experimenting on the Thornton Hill sewer, during the past summer, some unexpected and striking results were obtained. The sewer was trapped off the Worple-road outfall into which it discharges, and the syphon was provided with an air-pipe brought to the surface; the termination of the sewer, near the Ridgway, was furnished with a 6-in. pipe, to which a powerful fan was attached. All the known openings were closed, with the exception of the air-pipe at the foot of the hill, out of which the sewer air poured in a continuous stream. The fan was worked for some time and extracted large volumes of air, but all the time the air poured out at the foot of the hill in undiminished quantity. On trying the openings nearer the fan the air poured out of these as soon as the covers were removed, and at the nearest man-hole to the fan, distant about 400 ft., the air was not affected. The experiments prove how uncontrollable the gases are, and how useless shafts with furnaces would be. All through the summer the gases poured down the hills into the Worple-road outfall; in cold weather the gases travel up the hills: thus the difficulties of ventilation are increased.

It cannot be shown that the excessive ventilation of sewers,—which are too small for men to work in,—is necessary or of the smallest advantage if the gases can be disposed of elsewhere than at the street level; all that is required is that sufficient vent should be provided to render the admission of sewer air into our dwellings impossible. If houses are themselves properly drained, this is accomplished, even where sewers are unventilated, since if the gases were forced through the disconnecting trap, they would pass up the vent-pipe of the house-drain. If vent-pipes be provided for each of the sewers, and if these pipes are placed in carefully-selected positions, the necessity for the street openings would cease, and they might be closed. I suggest that this course be adopted; it is the best method of dealing with the question, in my opinion. Ventilating lamp-posts are, as a rule, the cheapest, and may be used in a great many cases; in others, pipes should be carried up trees and houses. All the sewers in the district can be treated

in the manner suggested at a cost of about 500l. As I have successfully dealt with upwards of fifty offensively-smelling manholes during the past five years, by the means suggested, success may be said to be assured."

#### NEW BOARD SCHOOLS IN LONDON.

THE deposit of plans customary at the closing of the year is already made by the School Board for London. At their offices on the Victoria Embankment may be seen those which relate to the next forthcoming school supply for the metropolis. Neglecting, for the present, two alternative sites, we find that the Board's plans concern thirty-two sites either for new or the enlargement of existing schools, being for thirteen on the northern side and nineteen on the southern side of the Thames. The southern district includes the two large divisions of East Lambeth and West Lambeth. In West Lambeth ten new sites are scheduled, their area extending over an estimate of 215,193 ft. superficial. Other sites are distributed throughout certain divisions, as follows:—East Lambeth Division: St. Mary, Newington, and St. Giles, Camberwell, parishes, three. Southwark Division: St. George-the-Martyr, St. Saviour, and Christchurch parishes, three. Greenwich Division: St. Giles, Camberwell, and Plumstead parishes, three. The West Lambeth sites lie in the parishes of Wandsworth, Tooting, Clapham, St. Mary Lambeth, St. George-the-Martyr, and Battersea. Chelsea Division: Fulham and Chelsea parishes, three; and Hammersmith, one, at Ellerslie-road, by Old Oak Farm, being about 72,780 square feet. Tower Hamlets Division: St. George-in-the-East and Mile End Old Town parishes, two. Hackney Division: Shoreditch, Hackney and Tottenham, and St. Matthew Bethnal Green, parishes, three. Finsbury Division: St. Mary Islington, and St. Luke's parishes, four. These areas, some of them being vacant spaces, make a grand total of nearly 755,000 feet superficial, or, say, 12½ acres, with a possible addition of rather more than 18,000 ft. having regard to the two alternative sites at Earlsfield, Wandsworth and Fulham. The figures show an increase over the estimates for last year, when a minimum of sixteen sites, equivalent to between 10 and 11 acres, were scheduled for appropriation by the Board.

#### INFRINGEMENT OF COPYRIGHT OF THE BUILDER.

COX AND ANOTHER v. PARDON AND OTHERS.

THIS action came on for trial before Mr. Justice Kekewich on the 11th inst. The plaintiffs, as the registered proprietors of the *Builder*, sought to restrain the defendants, Pardon & Sons, the printers, and the General Publishing Company, as publishers, of the *Brick, Tile, and Builders' Gazette*, from publishing and selling any number of that periodical containing any article, essay, note, or other matter copied or colourably altered from any article, essay, note, or other matter contained in the *Builder*.

Mr. W. Barber, Q.C., and Mr. Hadley appeared for the plaintiffs, and Mr. Henderson for the defendant Company. The defendants Pardon & Sons did not appear.

An interim injunction was, on the 16th of December, 1886, granted by Mr. Justice Stirling. It was alleged and admitted that the defendants copied *verbatim* several articles, essays, and notes from the *Builder* in infringement of the plaintiffs' copyright.

Mr. Justice Kekewich now made an order for a perpetual injunction, and ordered the defendants Pardon & Sons to pay 50l. damages and costs.

#### PICCADILLY CIRCUS.

SIR,—Would it not be well that this matter should be looked at in a broad way, without letting the existing lines of the buildings have undue influence? If a fine scheme were prepared, it could be carried out in parts,—perhaps realised in its completeness fifty years hence,—unless some public benefactors or unexpected windfall should hasten the process. Most of us are agreed that if a grand open space can be kept, it may be a success. It will, however, need to be shaped ruthlessly; the thoroughfares coming in at odd places and at varying angles would afford a splendid problem to any one, left free to settle for himself which are the essen-

tial, and which are the accidental, temporary features. The idea of a circus would probably disappear at an early stage, and most of the surrounding buildings would have new frontages before the place assumed a definite, monumental shape.

Are we, however, prepared to think of the matter otherwise than within very narrow limits? To leave things very much as they are,—to let the vacant bit of land against Shaftesbury Avenue to a speculator, and accept his view of the right design for a building which will pay,—to hoard round the two spaces in the centre of the place, and trust to something turning up to indicate a use to which they might be put,—would be following the accepted precedents;—not a very noble course, but a fairly safe one. Perhaps, however, middle courses may be worth considering still. These would, as I take it, involve the retention of the circus, and its completion in some sufficiently emphatic way. A building of less height than the existing buildings on the west side would fail to emphasise the circus form; the space would, with low buildings, be only a little less shapeless than at present. The vacant ground beyond the circumference of the circle might be liberally dealt with, not utilised to the last inch, but it would be necessary to use the larger portion of it in order to obtain a mass of building sufficiently powerful. Is the idea of continuing the street by archways under the buildings,—an idea which some members of the Metropolitan Board of Works seem to have thought worth consideration,—to be put aside if the points to be aimed at are the retention and completion of the circus, and the penetration of the circumference of the new portion by the roadway? Such archways would, of course, be of very large size, both wide and lofty. A large area, lighted from above, might be arranged so as to make the middle of the space under the archways brilliantly lighted, and be a novel feature, rising from the vaults of the archways, something like a lantern tower as seen from below, serving also for the lighting of corridors, &c., in the buildings, which should be of a public or semi-public character. The great gateway to Burlington House and the entrance to Somerset House are prominent London examples of the idea, and, if treated in a becoming way, something notable in the way of architectural character might result.

This, however, is only thrown out by the way,—a catholic spirit with reference to the unshaped future being reckoned praiseworthy. The idea of a completed circus being abandoned, archways and buildings over them and all similar schemes would vanish. But what should we then aim at in the near and in the ultimate future? Is any one ready to propose that a fine architectural place shall be created, and to point out what that would necessarily involve, who is persuaded and persuasive enough to make other people hold strongly the same opinion? I fear very much that the business will drift, and another opportunity will be lost for a long day. Perhaps some general discussion might help to clear the air, and enable people to see things in their right relative importance. Few could fail to vote for the fine architectural place, at once and with both hands, if some very rich person or the National Exchequer provided the funds. Very many people seem to think, however, that too much may be attempted in one generation, and that it may be better to advance a little gently in this place, as a good deal has been done already, and as London is large and ratapayers are human.

AN ARCHITECT.

#### "THE SIZE OF HOUSE DRAINS, AND THE USE AND MISUSE OF TRAPS."

SIR,—Mr. W. P. Buchan must be content with my reply to his strictures published in another journal, before his letter to you, p. 650 (which I have just seen), appeared. There is one misstatement in that letter, however, which perhaps I should notice. Mr. Buchan says that though thirty years ago I advocated the ventilation and flushing of sewers, it was not till ten years after that that the great truth was revealed to the world, by Mr. W. P. Buchan, that the best safeguard against the admission of foul air into houses was the use of disconnecting-traps between the house and the sewer! This is too ridiculous. There was no novelty in this idea in 1857, and in a paper which I read in 1858 to the Glasgow Architectural Society,—in the hearing of Mr. Buchan, I think,—which was

published, and noticed in the *Builder* of that period, I used these words:—"It requires but a moment's reflection to perceive that to prevent the foul air from getting into the house at all. It must not, and need not, be tolerated within our doors." At the same meeting exhibited a trap which I had designed to facilitate this complete disconnection,—a trap which, for the purpose, has not been material improved upon since by Mr. Buchan or any one else. I am tempted to refer to this subject chiefly because there seems to be a growing disposition among certain specialists,—and even architects, who should speak for themselves and claim as much ignorance as they please, to discredit architects as sanitary engineers. I must be quite clear, I think, that thirty years ago I did not require to be taught by Mr. W. P. Buchan; neither can I now tolerate the idea that architects are to be instructed and dictated by sanitary plumbers or sanitary doctors, however eminent, in one of the simple branches of their ordinary professional work.

JOHN HONEYMAN.

SIR,—In a letter on the subject of house drains published in your issue of November 6th, Mr. Buchan remarks that, in my statement, that the ventilator in a system of house drainage should be twice the area of the outlet ventilator, is absurd. This may or may not be true; I, of course, think that it is not true, and one of my principal reasons for this opinion is that I find from my own experience that the ventilation arranged as I proposed my paper on house drainage rest before the Sanitary Congress at Bolton is always satisfactory and I have never had a complaint of back-draw.

I think that Mr. Buchan proves too much; states that with a 4-in. outlet and a 6-in. ventilator the rate of admission of air was 80 ft. per minute, while with a 2½-in. inlet the rate of admission was increased to 400 ft. per minute; that with the same outlet of 4 in. in diameter a quantity of air in cubic feet passing through inlet was in the first case 157 and in the second 165 per minute; but this is contrary to the nature of things, and it is not possible that with the exertion of force the larger quantity of air should pass through the smaller opening; therefore either the conditions were not the same in the two cases, or the figures given are not mathematically correct.

If no more air be passed through the drain in the contracted opening than with the larger one, fail to see the force of Mr. Buchan's argument, what advantage he gains by increasing the speed of the current of air from 80 ft. to 400 ft. per minute. This increase of speed must be purely local, for if were continued any distance the quantity of air passed through the drain would be materially decreased, owing to the increased friction; I do the other hand, see disadvantages which may result from the increased speed of admission. If corners or angles be met with while the air is passing in at this speed eddies will be set up which have the effect of producing increased friction, thus reducing the efficiency of the ventilation, any such eddies must tend to produce back-draw which is what it is desired to avoid.

REGINALD E. MIDDLETON.

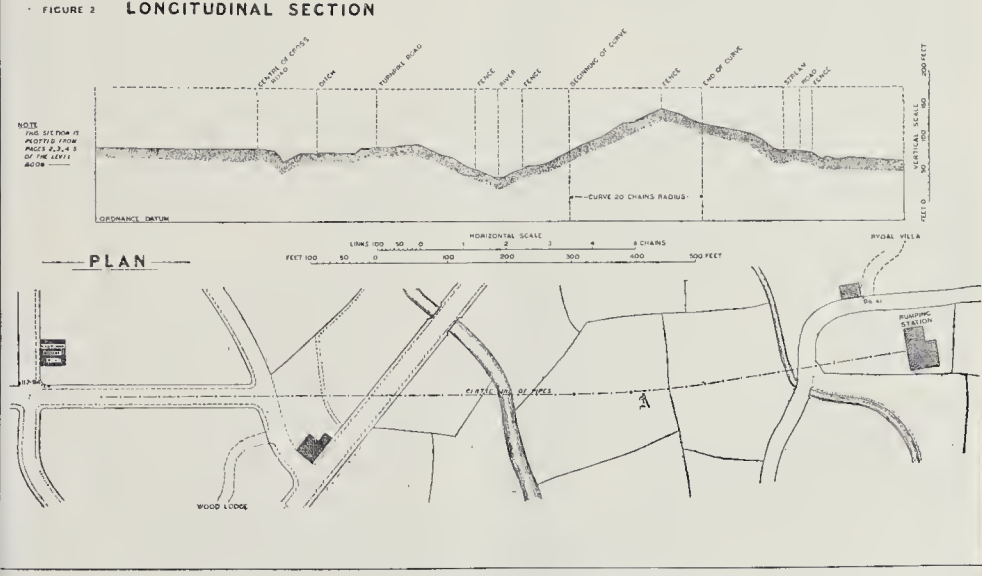

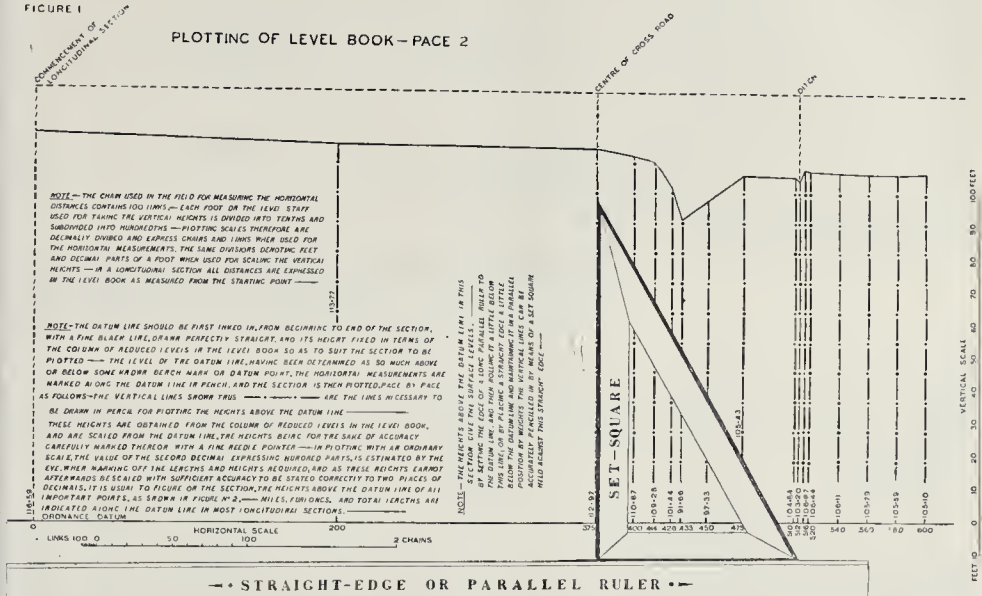

#### Birmingham Architectural Association.

THE first ordinary meeting of this Association the current session was held in the Librarian Queen's College on Tuesday evening, Nov. 11. Eleven gentlemen were nominated for membership. Mr. W. Doubleday (Vice-President) took the chair. A paper was read by Mr. J. Bradley, B.A. (Lond.), entitled "A Gossip of Old MSS." The lecture was illustrated many fine examples from illuminated manuscripts. A vote of thanks, proposed by Mr. Doubleday, and supported by Mr. W. H. Lake and Mr. Victor Scrpton (Hon. Sec.), unanimously accorded to Mr. Bradley for very erudite analysis of this once famous work. A response from Mr. Bradley was not terminated.

**Rochdale New Station.**—We are informed that the directors of the Lancashire and Yorkshire Railway Company have accepted an estimate of Mr. T. W. Helliwell, Brighton, to execute the whole of the zinc roofing glazing on their intended new station at Rochdale. The work is to be done on Helliwell patent systems of glazing without putty zinc roofing without external fastening solder. The total area is about 81,000 sq. feet of glass and 28,800 super. feet of zinc.

**New University in Washington.**—The Catholic community of Washington has determined upon building a new Catholic university for the city. It is to cost about 800,000 dollars, of which has already been collected, and work of erection is to begin at once.

The Student's Column.

LAND SURVEYING AND LEVELLING.

XXI.—LONGITUDINAL AND TRANSVERSE SECTIONS.

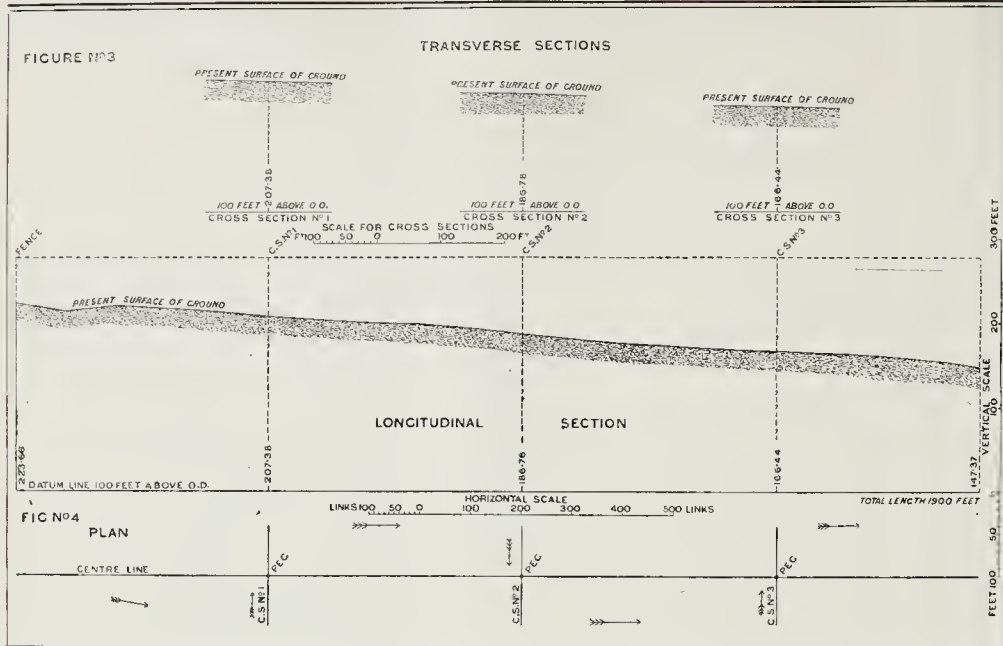

At least three assistants are required when taking a section,—two men at the chain and a man to hold the staff. The staffman calls out the number of links upon the chain at which the staff is held, and the surveyor books the total number of links in the column headed "Lengths" (*Builder*, May 14, p. 734), and describes the various positions of the staff (when necessary) under the heading "Remarks." When the ground

is of an undulating nature at close intervals, intermediate sights (*Builder*, Nov. 12, p. 686) are required to be taken. These occur as shown in the form of Level Book above alluded to, between the back-sight and fore-sight at any single setting up of the level. The chain usually employed in the field for measuring the horizontal distances contains 100 links. Each foot upon the level staff used for taking the vertical heights is divided into tenths, and each tenth subdivided into hundredths, as shown by figs. 1 to 3 of the *Builder*, Nov. 5, p. 652.

In a longitudinal section (fig. 2) all distances are expressed in the Level Book as measured from the starting-point. In transverse sections

(fig. 3) the distances are expressed as being so many links either upon the left hand or right hand of the centre line. Plotting scales are decimally divided (*Builder*, August 27, p. 315), and express chains and links when used for horizontal measurements, the same divisions denoting feet and decimal parts of a foot when used for scaling the vertical heights.

The datum line should be first ruled in indian ink when plotting a longitudinal section (fig. 1), care being taken that the line is perfectly straight and drawn long enough from the beginning to the end of the section to need no subsequent prolongation. Its nominal height is then to be indicated, and should be

fixed in terms of the reduced levels in the Level Book so as to suit the section to be plotted. The level of the datum line having been thus determined, as so much above or below some known bench mark or datum point outside the section, the horizontal measurements are then marked in pencil for the purposes of plotting the section, along the datum line. In the case before us these distances are to be scaled 0, 20, 37.5, 400, &c., links to 600 at the end of one page of the Level Book. The section is plotted page by page, as follows:—Vertical lines are first ruled in pencil through the marks at 0, 200, 375, &c., upon the datum line (see fig. 1) with the aid of a set-square sliding against a straight edge, set parallel to the datum line. The set-square employed should be long enough to draw these vertical lines of sufficient length so as to need no further prolongation when scaling the heights. These heights are obtained from the column of reduced levels in the Level Book and are scaled from the datum line, the heights being, for the sake of accuracy, carefully marked thereon with a fine needle pointer (*Builder*, Sept. 3, fig. 14, p. 348). A fine-pointed pencil is not accurate enough when the comparatively small scale of the section is considered. The points so pricked off are joined by a fine black line ruled in ink, and this is best done if the surface line is inked in before plotting another page of the Level Book.

The position of the datum points or bench marks are indicated upon the plan in fig. 2 near each end of the longitudinal section. Where the section is taken upon a curve, the radius of the curve (in this case 20 chains) is figured upon the longitudinal section. The tangent lines to this curve intersect at the peg A upon the plan (see fig. 2) off the line of the section. A horizontal line, as shown in fig. 2, is usually drawn above the section, parallel to the datum line. Dotted lines are drawn vertically from the line indicating the surface of the ground to this horizontal line at all points requiring description, and the description is generally written in at an angle of about 45° to this line, as shown. Where a peg is left in the ground upon the section at this point the vertical dotted line is carried down to the datum line, so as accurately to mark its position in a horizontal direction.

Transverse sections (as shown in fig. 3) have their position marked upon the longitudinal section as well as upon the plan. They are taken for a distance of either one or two chains as required upon each side of the centre line, and in order to continue the levelling between the bench marks, they are levelled alternately thus:—C. S. No. 1 is taken from right to left,

C. S. No. 2 from left to right, C. S. No. 3 from right to left, as indicated by the arrows upon the plan. This continuous method is found in practice to be the most satisfactory way of connecting transverse sections with a longitudinal section.

#### CHURCH-BUILDING NEWS.

**Acton.**—The memorial stone of the new Church of St. Alban the Martyr, Acton Green, was laid on the 18th ult. by Mrs. Nelson on behalf of Mr. O. Montague Nelson, J.P., of Hanger Hill, Ealing, who was prevented from attending by an accident. The parish is to be formed out of All Saints, South Acton. The church will be 135 ft. 3 in. from east to west, and 53 ft. 3 in. from north to south, internal dimensions; and will seat 750 adults, giving each the space required by the Incorporated Church Building Society. It will consist of nave and chancel, with north and south aisles, vestry, and organ-chamber, with heating-vents under morning chapel, 12 ft. by 29 ft., semi-octagonal baptistery, 20 ft. by 10 ft., two porches at the west end, and an entrance at the north-east corner of the nave; there will also be a lofty clearstory on an arcading of five brick arches springing from quatrefoil columns, and the height from floor to ridge of nave will be 55 ft. The building is to be in the Early English style, and is being carried out from a design and under the personal superintendence of Mr. Edward Monson, jun., A.R.I.B.A., of Acton. The walls are to be built of bricks faced externally and internally with best red local bricks, which are of a very bright colour, and will be relieved with dressings of Bath stone and blue Staffordshire brick bands; the roofs are to be of yellow deal of the hammer-beam form, double boarded, and covered with felt and North Welsh slating, an air space being left between the two lots of boarding to secure ventilation; the flooring of the aisles is to be of solid wood blocks on concrete, the other part will be laid with floor boards and joists. The building is to be warmed with hot air, upon Messrs. Haden's principle, and ventilation is to be provided for by means of vertical shafts carried up in the thickness of the external walls under each of the side windows, covered on the top with polished brass lit-and-miss gratings as inlets, and large openings in each gable and clearstory for outlets, — all thoroughly under control. The cost of the building (including seating, lighting, and warming arrangements) is estimated at 5,000*l.*, but it is only intended at present to erect the nave, aisles,

and baptistery, and to enclose the site with a substantial brick wall, and the contract for this has been taken for the sum of 3,500*l.* by Mr. Joseph Dorey, of Old Brentford.

**Birmingham.**—St. James's Church, Ashted, which has been closed for about two months for partial restoration, was re-opened on the 5th, by the Lord Bishop of Worcester. The interior of the church has been thoroughly repaired, the hot-water apparatus increased, and the timbers of the roof and ceiling that were decayed have been renewed. The south and east walls of the church, which were badly cracked, have been underbuilt. The organ has been moved to the east end of the church, and a baptistery formed at the west end. The work has been carried out by Messrs. Jeffrey & Sons, under the superintendence and instructions of Messrs. Osborn & Reading, architects, of Birmingham.

**Coombe-in-Teignhead.**—The renovation of the Church of Coombe-in-Teignhead has just been commenced under the direction of Mr. R. Medley Fulford, F.R.I.B.A., of Exeter. The general work has been entrusted to Mr. Hugh Mills, builder, of Newton Abbot, and the restoration of the old rood-screen has been entrusted to Mr. Harry Hems, of Exeter.

**Dodbrooke.**—Dodbrooke parish church has just been restored, and will shortly be reopened. The church is in the Perpendicular style, and the restoration has been in hand since September, 1886. A new north aisle has been added, thus providing about ninety additional sittings. The chancel has been entirely rebuilt, the flooring being of Hopton Wood stone and slate set in diamond pattern, the steps leading to the altar are formed of slabs of the same stone. The Communion-table is of oak and the choir-seats are of wainscot oak with linen-pannelled fronts. The east window is tracered and filled with cathedral glass. The north aisle is divided from the chancel and nave by three new Dartmoor granite arches and three old ones. The new chancel aisle contains two stained-glass windows, and the west window of the north aisle is also filled with stained-glass. The south aisle is, with the exception of the tower, the only part of the church which has been left intact, but the removal of the ceiling has exposed an oak roof with carving and bosses. A new roof covering the nave and north aisle is of the same pattern as that of the south aisle, but the material is deal instead of oak. The pulpit is the old one, of oak, and a new lectern, also of oak, has been added. The font has been re-erected on a stone base of Dartmoor granite. The west end gallery has been taken away. The new seats are of pitch-pine, with

linen-panelled backs and fronts. All the windows not stained are filled with cathedral glass, supplied by Mr. Horsman, of Plymouth. The total cost of the restoration is about 2,000l. The architect was Mr. J. D. Sedding, of London, and the contractors were Messrs. S. Farr & Sons, of West Alvington.

**Gullane (N.B.).**—A new church is to be erected at Gullane, N.B., from the designs of Mr. Honeyman, of Glasgow. The old church, an interesting building of the twelfth century, has been for many years ruinous. It will not be interfered with, but its most important remaining feature, the chancel arch, will be reproduced in the new building. The chancel will have an apsidal end, and all the walls inside will be faced with the local freestone. The contractor is Mr. George Easton, North Berwick.

**Lillington.**—The centre portion of the reredos for Lillington Church, near Leamington, has now been placed in position. It is a representation of the "Lord's Supper" in high relief, the figures being carved out of a solid block of Caen stone, about 18 in. thick. The panel is surmounted by a battlemented cornice, with a string of Early English carving beneath. This is supported by columns of Devonshire marble of rich colouring. The structure is not yet completed, inasmuch as side wings (which are designed to rise to a much greater altitude than the centre portion) have yet to be added. The whole of the work has been entrusted to Messrs. Jones & Willis, of Birmingham.

**Wainfleet (Lincolnshire).**—There has recently been erected a new chancel and vestry to All Saints' Church, Wainfleet. It is built of bricks with stone dressings, the internal walls plastered with rough stucco. The roof is of pitch pine, having moulded principals and ribs, and covered with lime slates. The new chancel and side arches are moulded, of Bath stone. Granite aspenlar paving is used. The stalls are of pitch pine. The hot-water heating apparatus is by King & Co., of Hull. The work done has cost about 850l., and has been carried out under the superintendence of Mr. J. B. Corby, architect, of Stamford, by Mr. John Holmes, builder, of Wainfleet.

**Woking.**—The foundation-stone of Christ Church, Woking (Station), was laid on the 10th, by the Duchess of Albany. The church will be built of red brick and stone, with wide and lofty nave, and no aisles. When completed will seat about 800. The character of the work is thirteenth century, from the designs of Mr. W. F. Unsworth, of London. The contractors for the first section of the work are Messrs. James Harris & Son, of Woking.

## Books.

**The Metal Turner's Handybook: a Practical Manual for Workers at the Foot-Lathe.** By PAUL N. HASLACK. London: Crosby Lockwood & Co.

MR. HASLACK is a practical man, who writes in a practical manner on a very practical subject. Still, this book is not without its faults. It consists of about 150 pages of small octavo of not very closely printed matter, and there are numerous illustrations incorporated in the text. The work is evidently intended for novices in the art of turning, otherwise it has no *raison d'être*, and it is from the novice's point of view that we shall criticise it. The author, after a few introductory sentences, commences at once with the simplest form of lathe used for metal work. On page 3 is a small illustration giving a general view of a plain lathe, and on succeeding pages are five other illustrations of similar types. It is here that we find the chief imperfection of the work. The tyro in trinary would naturally expect a description of the machine tool on which the art depends, but Mr. Hasluck gives no general explanation before proceeding to deal with the different patterns of tools made by the various makers he has selected for illustration. Thus the student is confused at first start with a number of terms of which he has no knowledge. We will suppose his natural intelligence will tell him which is the bed, gap, headstock, and so what parts some other of the simpler or more obvious terms refer; yet he can hardly be expected to know, without previous explanation, which is the "mandrel," "tail-pin," "cone-centres," "hack-gear," "bridge piece,"

"poppet," "tail-end," &c., all of which terms are used in the few pages which comprise the first chapter.

Mr. Hasluck courageously gives the names of makers and their list quotations for the various tools he illustrates. It is a practice to be commended, for cost is generally a prime consideration with purchasers of small machine tools. To go to makers' catalogues, however, is always dangerous, and the author has fallen into the usual error of such a course. The main part of his first chapter reads like nothing so much as a paste-and-scissors compilation of trade catalogues: a source from which the illustrations also appear to have been mainly taken. These are the only faults we have to find with the book, and to some extent they are apparent throughout its course. For the rest, there is a great deal of useful information and many sound ideas set forth in the limited space the author has allotted to himself in which to treat so large a subject. There are separate chapters treating of geared lathes, screw-cutting lathes, overhead gearing, slide-rests, chucks, cutter-spindles, cutter-frames, milling and planing attachments, circular cutters, slide-rest tools and cutter-bars, tool grinding, &c.

There is yet plenty of room for a good and not costly book on the lathe, of a thoroughly elementary and explanatory nature. The work under notice, as we have intimated, can hardly come under this definition; for a pretty wide knowledge of the lathe's mechanism is presupposed by the author. Mr. Hasluck, however, appears so well qualified for the task that we hope some day he may undertake it, although, to succeed, he must make up his mind to depend less on catalogue blocks, and have special sectional and other drawings prepared, with reference letters, to illustrate the text.

**The Wood Turner's Handybook: a Practical Manual for Workers at the Lathe.** By PAUL N. HASLACK. London: Crosby Lockwood & Co. 1887.

This is a companion book to that just noticed, and is, on the whole, a more satisfactory work. There is an absence of that catalogue element to which we have already referred, and the illustrations are generally better calculated to help the text. The author commences with illustrations and descriptions of lathes, and then goes on to treat of the important subject of the hand tools used for turning wood. In this section there are some excellent remarks on cutting angles. Rounding tools and various lathe appliances are next dealt with, and descriptions with illustrations of simple and automatic-feed rounding machines are also given; although it may be doubted whether these come strictly within the scope of a work on turning, an operation generally supposed only to be performed by means of the lathe. There is a good chapter on chucks, and another on fitting up a lathe. The latter has several good illustrations,—one, an outline drawing giving two views of a lathe, being furnished with reference letters. After this examples of work are given: "lady's companion, pin-cushion, chessmen," &c., and then come instructions for turning billiard-balls, the *Pons asinorum* of a amateur turner. The work concludes with a short chapter on copying lathes. On the whole, the book is to be recommended as fulfilling a definite purpose, and contains as much information as could be reasonably expected within its compass.

**Days and Hours in a Garden.** By E. V. B. 6th edition. London: Elliot Stock. 1887.

The dress of this little book is so pretty and graceful that, had it treated of the drier and most uninteresting subjects, there would have been found some few curious enough to turn its pages; but as it is, "the Garden Story" is as seductive as many of the three-volume novels that are drifting about, and when once the reader begins it he feels he must follow the footsteps of the months, and see the completion of the year's life. There are some quaint little illustrations and head-pieces, and though the language is somewhat flowery throughout, the wise may find many useful and practical suggestions for the making and keeping of a garden. The author is evidently a close observer of nature, animate and inanimate, and speaks of the flowers, and birds, and bees as if they and he were dear friends.

Each month is treated separately, and we hardly know which chapter is the pleasantest,

unless it be that on the "merry month of May." We cannot agree with the author, though, when he asks if it is not time the artists should cease trying to paint the May blossoms. Why should we be denied apple blossoms in our paintings whilst we have such artists as Mrs. Allingham (and others we could name) to paint them? Neither do we sympathise with the sorrow the author seems to feel on seeing the carts laden with daffodils going up to London. There are many dwellers in our smoky city who love the country sights and accents, and to whom a bunch of shining daffodils gives real pleasure. On the whole, the "Days and Hours in a Garden" are full of pleasant thoughts and musings, and when we have gone through the course of the year and closed the book, we learn (if we knew it not before) that "to the attentive eye each moment of the year has its own beauty."

## RECENT PATENTS.

### ABSTRACTS OF SPECIFICATIONS.

14,126, Chimney Tops. D. Wilkins.

The chimney-top which is the subject of this invention consists of an inner and outer case, the inner case reaching about half way up the outer case. The space left between these, forms the air-chamber for the purpose of receiving the smoke and down-draught, which is directed into the chamber by means of the conical-shaped cover over the inner case and then conveyed to the outer air through an opening left around the base of the outer case. The inner case is surmounted by a conical-shaped cover which is connected by rods slipping in rings, so that, when, in sweeping the chimney, the cover is raised by the sweep's brush, it falls back into its place when the brush is withdrawn.

16,213, Window-sashes. W. Murray.

According to this invention, the sliding sashes balance one another, although weights, moving in a groove in the lower sash, are fitted for balancing the upper sash when required. The beading which keeps the sashes moving closely together is fixed with a spring, allowing the sashes to be easily removed when required. A part of one side of the frame is made to fold back upon hinges so that the sashes can be taken out. The window in that case slides into the recess, and is thus removed from the groove on the opposite side. If desired the sashes can then be attached to hinges and swing horizontally.

16,293, Securing and Ornamenting Parquetry. J. Ickringill.

This invention relates to certain improvements in parquetry flooring, especially with a view to obviate the defect of the tendency for one strip to rise above another, and to conceal the means used for securing the parquetry strips; and for ornament. The pattern is laid in a geometrical manner, and the edges of the strips are grooved for the reception of tongues. Or, countersunk holes are sunk in the ground work, which, after the screws are inserted to fasten the work more securely, are plugged tight with hard woods in patterns.

16,390, Wood-block Flooring. L. Oppenheimer.

By this invention holes are made in the blocks, and they are fastened by nails or screws to each other. The foundation is the same as is in general use.

366, Ventilating Rooms, &c. T. Sterué (Paris).

The claim in this invention describes the arrangement as "Means or apparatus for ventilating rooms or buildings by the combination of a fresh air inlet apparatus composed of valves or flaps, which can only open inwards, with a foul or vitiated air discharge apparatus which can only open outwards, the inlet and discharge being identical with each other in construction, except that one is the reverse of the other."

11,109, Improved Chimney-top. J. H. Carrett.

According to this invention, a square earthenware pot having four openings is employed. Two of these are on one side, and two on the opposite side. Connected with the openings is an inclined plane or web running upwards, and also attached to each side. The top lip of each of these planes or webs projects beyond the centre of the pot, thus preventing a straight down-draught; for if the down-draught should miss the first plane and opening, it has still three others to pass; the four upward draughts are, however, sufficient to prevent this. The whole chimney-top is in one piece.

Large advertisement for HOBBS, HART, & CO., Limited, MAKERS TO HER MAJESTY BY SPECIAL APPOINTMENT. PATENT PROTECTOR AND LEVER LOCKS, for all Purposes. STEEL SAFES, STRONG-ROOM & PARTY-WALL DOORS, SELF-CLOSING DOORS, FOR THEATRES AND PUBLIC BUILDINGS, As approved by the Metropolitan Board of Works (used in large numbers at Covent Garden Theatre). IMPORTANT COMMUNICATION.—FIRE AT WHITELEY'S. HOBBS, HART, & CO., LIMITED. GENTLEMEN.—It affords me very much pleasure to express to you my satisfaction and admiration at the splendid fire-resisting powers of your Strong-room doors and Safes. The recent fire at my establishment in my opinion subjected them to the greatest possible test, and through all, they proved invulnerable. The contents of both Strong Rooms and Safes were entirely preserved, although the fire was of such intense destructive force. You will be pleased to hear that it has been decided to adopt your Patent Clutch-ribbed Doors for all the party-walls in the new building now in course of erection.—I am, Gentlemen, faithfully yours, (Signed) WILLIAM WHITELEY. ### The Old Châteaux of the Low Countries, and their Surroundings.

VERY few of the old Flemish châteaux retain their gardens and surroundings unaltered. The region in which the greater number of Flemish châteaux were situated was for a century the battle-ground of Europe, and before things had time to recover, most of the noble families to whom these estates belonged were ruined by revolution, their houses pillaged and burnt, gardens cut down, water-courses choked up, so that it is only here and there that we find a little nook of the pretty garden which has escaped; a broken moss-covered fountain, in which the Triton has been in vain blowing through the empty shell, from which the water has ceased to run for nearly a century; a terrace overgrown with weeds; or a picturesque summer-house forlorn and roofless. Fortunately, however, the engravings of Wenceslaus Hollar, Erlinger, Harrewyn, Vanweerden, Peeters, Vorstermans, Bruyn, Vanheil, and others have, in their illustrations of such works as "Brabantia Sacra et Profana," "Castella et Prætoria Nohillium Brabantia," "Les Dédices de Brabant," "Les Dédices de Holland," and the illustrations of a still earlier work, Ait-singer's "De Leone Belgico," left us carefully-executed bird's-eye views of so many of these buildings and their surroundings, that we are able, with a little study and care, to restore, mentally at least, the aspect of these beautiful homes of the old Dutch and Flemish nobles and country gentlemen; and when the difficulties of the situation are taken into consideration; when it is remembered how very little nature had done in the way of making this vast flat level country picturesque or pretty, we must admit that the art of rendering the surroundings of a house attractive and pleasant has seldom been so well understood or carried to so high a perfection as by the architects and gardeners of the Low Countries during the sixteenth and seventeenth centuries, and it is a remarkable fact that with such unpromising circumstances and conditions the Dutch set the example of gardening to the whole of the rest of Europe. We find imitations of Dutch gardening not only in England (in spite of the demolition of many of them wrought by "Capability Brown" and his school) and France, but even in Spain, Italy, and the south of Germany; in fact, one of the most perfect examples of a Dutch garden that we ever remember to have seen is that surrounding the little country chateau of the Prince-Bishops of Wurzburg at

Veitshöchheim, in Bavaria. So far had the Dutch, in the opinion of the people of the time, overcome all the difficulties that surrounded them, that even countries which possessed all the natural advantages of hill and dale, and of varied and distant landscape, absolutely sacrificed it all for the purpose of obtaining a perfectly flat, level garden, after the manner of the Dutch.

It is not our purpose here to enter at any length into the question of the architecture of Dutch and Flemish houses, except so far as it affects the arrangements of their gardens and other surroundings. As a rule, they were generally somewhat square and formal in design and plan, for, the site being perfectly level, both convenience and appropriateness suggested a somewhat symmetrical treatment, and the general squareness of design was best suited for buildings which were to contain square apartments, with flat ceilings, lit by square-headed windows, entered by square-headed doorways, with walls usually constructed of brick with stone bands, all of which were dictated by necessity and convenience. These old Low Country châteaux were thoroughly suited to the wants of those who inhabited them, and were not only comfortable but cheerful and dignified dwellings; they had none of the ostentations and pompous discomfort of the English "Classical" mansions: they had no useless Corinthian porticos darkening the windows, no sham pediments concealing the garrets, no imitation parapets to hide the gutters and make them leak into the bedrooms, no nymphs holding urns to serve as chimneys, no impracticable doors to keep some practicable one in countenance. Any symmetry or regularity which is to be found in them was the result either of convenience or necessity.

It is much to be regretted that so few of these interesting old mansions now remain entire. We come across them, however, in the districts surrounding Arnheim, Zutphen, Brabant, and Limburg, their stately avenues and extinguisher-crowned or bulb-capped towers adding a pleasant feature to the somewhat monotonous landscape. These spires or steeples crowning the towers are the only features that were purely ornamental, and did not result from necessity or convenience.

The principal buildings of a Dutch chateau were usually arranged round a square court with towers at the angles; examples, however, do occur in which the courtyard is polygonal or octagonal, as at Gæsbekke, Reves, Terelst, &c. This, which may be called the main building, was surrounded by a moat, which came right up to the walls, as is still the case at the great palace of "La Hague," and is shown in nearly all the illustrations in the works to which we

have referred. It was approached by one or more bridges, one arch of which was replaced by a drawbridge and defended by a strong gate or tower, which served not only for the purpose of defence, but the upper story of which very frequently formed a clock-tower and dove-cot.

One of the bridges led to the Bas Court, where were situated the stables, farm buildings, granaries, &c. These were, again, generally surrounded by a moat, and approached from the road by a drawbridge and gate; not unfrequently the clock-tower itself was situated in the Bas Court. Another bridge usually gave access to the great garden, or pleasureance, which was generally on the opposite side to the Bas Court, though there are examples of it being on the same side. The great orchard and the kitchen garden were close to the Bas Court, though sometimes divided from it by a moat. The whole of the gardens and surroundings were, again, enclosed by a large moat. Thus it will be seen that the space enclosed within the outer moat usually consisted of four islands, one of which was occupied by the principal buildings of the chateau, a second by the Bas Court, a third by the garden or pleasureance, and a fourth by the orchards and kitchen gardens. Occasionally, though very rarely, the pleasureance was on the same island as the main buildings of the chateau,—this appears to have been the case at Evershergh. Amongst the principal buildings of the castle was always a large hall; it was, however, generally, not an independent structure like the halls of our English mansions, but was arranged in the lower story of the building with rooms over it. One example, however, the castle at Tergeuren, had a magnificent hall, just like our English Mediaeval mansions. The chapel seems usually to have opened out from the hall, and in some instances the apex projects out over the moat, and is supported either upon a corbel or, as at Laer, upon columns and arches which rise out of the moat itself. At Herlicr the chapel appears to have been in the Bas Court, but judging from Erlinger's view it appears to be of a very much earlier date than the buildings of the castle, and it is probable that they may have had scruples about removing it, though convenience may have dictated a different situation for the main buildings of the castle, as it is not to be supposed that, in the Middle Ages, they would have deliberately set down a chapel among the pig-styes and stables of the Bas Court.

The great garden, or pleasureance, which forms such a beautiful feature in these Dutch châteaux, was nearly always placed in such a position as to be overlooked by the windows of the principal apartments of the castle. It was generally subdivided into square com-

partments by lofty clipped hedges, and sometimes by little canals and water-courses; the viviers or fish-ponds, which were such very important accessories to these houses, were generally placed in an isolated position, outside the pleasure-gardens, as at Haldenberge. This was not always the case, because the great moat round the house itself not unfrequently served the purpose, and at La Hague the moat is still called *Le Vivier*. This also appears to have been the case at Brochem,\* near Lierre, which, judging of it from the four drawings given in Someres and Ravenstein's "*Castella et Prætoria Brabantia*," must have been, as far as its surroundings are concerned, one of the finest châteaux in the Low Countries. At Bouchant, however, where there is another very fine castle, with buildings more Gothic in character than those at Brochem, although the moat round the castle is a regular lake as to size, we find three large fish-ponds as well; here, too, the moat is oval in form, and not

large vivier with a narrow causeway separating it from the river. A large square garden of a very elaborate description stands in the midst of the vivier, approachable only by the causeway. Dams, waterwheels, and sluices are hinted at, or represented in these old engravings; these were erected for the purpose of preventing the stagnation of the water. The great moat round the house appears always to have been upon a slightly higher level than the water-courses and canals surrounding the gardens, and waste leats appear to have been provided in every case, so that the surface water from the great moat could be drained off and its depth regulated by any surplus being carried off into the canals, and through them to a general "escape stream." The edges of all the canals, viviers, and water-courses are cut rigidly straight, and are not unfrequently furnished with a stone or marble lip. This was not done for the sake of appearance alone, but as a sanitary precaution,

only from 1757. Many of the illustrations are poor copies of those in Someres and Ravenstein. Several interesting facts, however, are brought to light by it; for we find that many of the châteaux had been rebuilt between the publication of the two works, notably the château at Breda, which had been re-erected by William III. of England.

The earlier engravings show very carefully the commencement of mischief in the buildings that are out of repair. Weeds are indicated in the moats, dams broken down, the edges of the ponds and canals are ragged and uneven, and the water stagnant; but where the mansions are in good repair we find everything neat and clean, and in good order,—swans in the moat, ornamental pleasure-boats on the canals filled with gaily-dressed people, and men fishing with nets and rods in the viviers.

We have alluded to the great garden, or "pleasance," which forms such a striking feature in the old Flemish country-houses.

The Château and Grounds of Brochem.

square or rectangular, as is usually the case. A curious feature also is the canal, which forms a second or outer moat, leaving a narrow causeway or strip of land between it and the great moat. The pleasure-garden and Bas Court have each the separate moat, and the avenues and water walks are remarkably extensive.

At Diepesteyn the fish-ponds are shown very large indeed; in fact, they cover a greater area than the castle and grounds together.† At Leew the fish-ponds are also very large, and this castle possesses the rather unusual feature of a garden attached to the house and enclosed within the same moat. It is true that in addition to this little garden we have the pleasance as usual on the opposite side of the moat; another peculiarity is the fact that the Bas Court is between the house and the pleasance. All the best apartments of the house, however, looked on to the little garden within the moat, of course, not into the Bas Court; a small kind of jetty bearing a wooden structure, probably a bathing or fishing house, runs out of the pleasance into the great vivier.

The château of Loupouge has an unusually

\* See view of this château subjoined.

† See plate of lithograph sketches in this number.

as it prevented the accumulation of weeds, scum, and vermin at the edges. With care and attention paid to regulating the levels of the water, and constant cleaning, these extensive waterworks were probably not so deleterious to health as is usually supposed; but of course, directly these precautions were neglected, and the sluices and dams allowed to fall into ruin, the effect was disastrous, and it is not surprising that the elaborate waterworks of these old châteaux became plague spots when the country was overrun by an invading army, the beautiful castle reduced to ruin, the gardens hid waste, the water-courses choked up, and the viviers overgrown with rank vegetation. Even when Harrewyn, Hollar, &c., made the drawings and engravings for the works which we have mentioned, several of the castles in Brabant had evidently fallen into bad repair, and some of them were completely in ruin. These views are not dated, as a rule, but we find upon Hollar's engraving of Antwerp Cathedral, in "*Someres and Ravenstein*," the date 1649, and there is every probability that the other views in this work were made about the same time. The work itself is dated 1694. "*Les Délices de Brabant*" is a very inferior book, and dates

This usually was nearly square in plan, surrounded by a moat, and subdivided either by clipped hedges or small water-courses. In nearly every case there is a centre object,—generally a fountain. These fountains sometimes consisted of a small pond, with a *jet d'eau*, but more frequently they were elaborately and beautifully designed structures, with basins, statues, and architectural details, and would appear to have been constructed either of marble or metal work (probably bronze). A remarkably elegant one is shown at Perche, in the centre of a "pleasance," with very elaborately-arranged beds, clipped hedges, &c. (see plate). At Wemmele, a curious summer-house of clipped greenery forms the centre object (see plate); and in the "*Château of the Lords of Daysbourg*," a tall clipped tree occupies this position. The paths sometimes radiate from this centre object, thus subdividing the garden into triangular compartments; but more generally the subdivisions are square, the four squares nearest to the centre having their inner edges cut away in the form of four segments of a circle, so as to leave space for a circular path round the fountain or other central object. At Ter-Veuren, a very large and magnificent château, the great garden is

subdivided into four equal squares. There is no object in the centre, which is simply formed by the intersection of four paths, but each of the four squares has its own centre object, which in each case consists of a statue upon a rather lofty pedestal, with a low-clipped circle of box round its base. Sometimes when the "pleasance" is large it is divided into two distinct parts by a little canal or a tall-clipped hedge, the communication between one part and the other being either by a bridge or by a little ornamental archway of clipped greenery. When this is the case the two portions of the garden are treated in a totally dissimilar manner, one generally having paths and hedges radiating from the centre, and the other laid out in squares. The great garden was nearly always inclosed by a tall clipped hedge, considerably higher than those forming the subdivision, leaving a pathway between itself and the canal or water-course, which formed the extreme boundary of the garden; sometimes this path had a tall hedge on either side. The hedges appear generally to have been 8 ft. or 10 ft. high, but those which formed the subdivisions of the great garden seem to have been about 4 ft. high. The spaces enclosed between the low hedges are either planted out as flower beds or planted with foliage of various colours clipped and arranged in elaborate patterns, not unlike those upon a Persian shawl. There are no indications of coloured earths being used; in fact, that kind of ornamentation was rather Italian than Dutch. Possibly the Italians, finding their climate too dry to get the plants which were clipped into these elaborate patterns in the Low Countries to grow with them, introduced the ornamentation by means of coloured earths as a kind of imitation.

There were always one or more summer-houses in the great garden or pleasance, frequently as many as four, one in each corner. They were most frequently composed of cut greenery, but were also occasionally of brick or stone. A good deal of elaboration appears to have been expended upon them. At Wemmelé, Gaebeck, and Perke there are good examples. Sometimes they were enclosed and had doorways and glazed windows, and were covered with domical roofs, but occasionally they were open all round.

A "Green Vault," composed of trees with their branches trained so as to meet overhead and thus shade the pathway, forming a delightful promenade in very hot or in wet weather, is another frequent feature. One is shown in our view of Brochem. Niches or archways cut in the tall hedges are also occasionally to be met with. These niches and archways are sometimes open, but not unfrequently they are filled with urns, statues, &c., as is also shown in the sketch of Brochem. Nothing could well be more beautiful than the effect of a white marble statue in such a position, and there is, perhaps, no more charming way of introducing statuary into a garden; the contrast between the white marble and the dark green of a clipped yew hedge is very beautiful.

The kitchen-gardens and orchards, which are often shown as being very extensive, do not call for any special description, as they were pretty much what those features of a country-house still are.

A belt of trees generally surrounded the whole domain, and a long avenue led up to the principal entrance or bridge leading to the chateau; if it was a large and important estate, there were several of these avenues, all radiating from the mansion. Ham House, near Richmond, in this particular strongly resembles the treatment of an old Flemish chateau, the kind of unenclosed park which surrounds it, and the long, straight avenues of trees, quite recall the surroundings of a chateau of the Low Countries. A labyrinth or a maze is sometimes to be seen, and what would appear to be ornamental vineyards seem to be indicated.

The little chateau of the Prince-bishops of Wurzburg at Veitshöchheim, to which we have previously alluded, possesses a most charming feature, though one which we should hardly have expected to find in the surroundings of an episcopal palace; it is no less than a complete open-air theatre, the auditorium

composed of various tiers of seats all covered with green turf, and the scenes of the stage are entirely of clipped greenery.

We do not find, however, any indications of the great isolated conservatory or hall-room which is to be found in some English houses, notably Kensington Palace. Possibly this was a more modern introduction, and may have been an imitation of the garden-hall, or belvedere, of the Italian Palazzo. These structures certainly found their way into Germany. We find two very remarkable examples in Prague, in the belvedere of the king's garden, and the so-called hall of Wallenstein's palace. Amongst the buildings of the Bas Court of these Flemish châteaux, it is true, we occasionally find buildings represented with great open arcades in front, but these must have been carriage or cart sheds, the fact of their being always in the Bas Court must exclude any idea of their having been intended as pleasure-houses or ball-rooms. Terraces with urns and statues on their balustrades, which form such a striking feature in some of our old English gardens, would not appear to have been very popular in the Low Countries, as in all the views we have examined we only find three châteaux which exhibit them to any extent; the most important is that in the castle of the Baron de Steil and Overhem, and here the terrace seems to have been rendered necessary by the fall of the ground, a circumstance somewhat uncommon in the Low Countries.

Some portion of our description of these Low Country mansions, and their surroundings, may recall to the minds of our readers the gardens at Hampton Court Palace, and no doubt as originally laid out they were completely Dutch in character. The water-works, canals, &c., are still pretty perfect, but the gardens themselves have been nearly spoiled through the English landscape-gardeners; great bald lawns, and huge, wide gravel paths, beloved by English gardeners and bated by every man who has the slightest feeling for picturesqueness, now occupy the site of the trim clipped gardens of former times. The old yew trees, it is true, are allowed to remain, but they are absolutely out of place amidst their modern surroundings. Not content with ruining the gardens at Hampton Court, a few years ago the forecourt, with its beautiful wrought-iron gates and enclosures, which gave such a scale and dignity to the east front of the building, were removed, portions of them being stowed away in the South Kensington Museum. Surely there is sufficient artistic taste in the country to see the propriety of replacing these, and to admit that Sir Christopher Wren understood how to treat the surroundings of his buildings in a more appropriate manner than the modern landscape-gardener does it. The present huge gravel path, or rather gravel desert, out of which the building rises, is destructive of all scale, and gives it an isolated and forlorn appearance. Now, it is just this kind of dull, dreary, isolation which the Flemish builders, and, for the matter of that, the old English builders as well, did everything in their power to avoid. There can be little doubt that the gardens and surroundings of old houses were designed and arranged by the architect of the house himself, and it is for this reason that they always seem right in scale and appropriate to the building; whereas the modern landscape-gardener, knowing nothing whatever about architecture, looks upon a garden simply as a garden, without any reference whatever to its surrounding objects. He has an idea handed down to him from the "Capability Brown" school that a great, unbroken lawn "gives breadth," that a wide gravel path "gives a noble approach," and, consequently, he will give you these features whether your garden is 30 ft. or three miles square. Now, the old designers of gardens, before they planted a tree or laid out a path, considered how it was to affect the buildings and other objects which were in its proximity.

In addition to the reasons that we have given for a very careful and exhaustive study of the scale of surrounding objects, the Flemings and Dutch had a still further reason for studying this point in the laying out of their gardens.

With them, distant views and even glimpses of a distant landscape were things to be thoroughly avoided. Even in England the Medieval, Elizabethan, and Queen Anne house-builders never went out of their way to obtain extended views from their houses; it was left to the dreary Classical architects, at the close of the last and the commencement of the present century, to stick their mansions on the top of some bleak, desolate hill, pleasantly exposed to the east wind, and unsheltered from the sun's rays during the dog days. But the Dutch and Flemings had every possible reason for excluding distant views. A vast level tract of unbroken country, with a sluggish canal flowing through it, was not calculated to form an enlivening prospect from a drawing-room window, and they consequently took great care that there should be no outlet beyond the pleasant gardens, high-clipped hedges, and avenues surrounding the domain.

The conservatories, orchid houses, forcing houses, palm-eries, ferneries, and other glass-covered buildings, which usually form such ugly adjuncts to our country houses, are, of course, not to be found in the ancient châteaux of the Low Countries; nor in the châteaux of the Low Countries do we find other hideous surroundings of the modern country house; they had no gas-works, engine-house, or steam-laundries to deal with. Whether they would have found some picturesque treatment for these hideous adjuncts of a modern country house we are unable to say, though from the pretty way in which they treated the various buildings of the Bas Court, from the beauty of all old barns, granaries, farm buildings, wind-mills, and water-mills, they might have hit upon some means of rendering these buildings at any rate less disfiguring to their surroundings than they are at the present day.

## NOTES.

DE LESSEPS has made a new application to the French Government to sanction the emission of a lottery loan for the Panama Canal. The sum for which he now asks is 565 million francs, with a further and undefined sum for the conversion of some of the actual debt. If this new Loan is sanctioned, M. de Lesseps states that, "on the day of the opening, in 1890, the Canal will have cost one thousand and five hundred million francs." This figure, however, large as it is, by no means represents the total cost at that date, according to the official statements made from time to time in the *Bulletin du Canal Interocéanique*. These comprise (1) the constituted capital of 300,000,000 francs; (2) the Loans of 1882, '83, '84, and '85, amounting to 629,832,500 francs; (3) the Loans of 1886 and 1887 (issued at 55 and 56 per cent. discount), which amount to 717,689,000 francs; (4) the Loans now in question, amounting to 565,000,000 francs, making a total of 2,212,522,500 francs, or 712,522,500 francs more than the sum now stated. It is not for us, but for the directors of the Canal, to explain this unparalleled discrepancy in their own statements. It is, however, the fact that the rebate or discount on items 2 and 3 amount, according to the annual balance-sheets published in the *Bulletin*, to 615,657,000 francs. This sum, though not received in cash, forms as integral a portion of the responsibilities of the Panama Company as any item of their capital; and the Company are under obligations to repay the whole of the larger sums, which we have calculated from their own numbers of obligations issued, at the date specified in the several conditions of Loan. We wait to see what explanation will be given of a misstatement which could hardly fail to mislead any public writer who had not access to the records published by the Canal Company. The *actif disponible ou réalisable* on the 30th of June, 1886, was 132,388,966 francs. The cash received for the loans of 1886 and 1887 (less any commission or banker's discount not published) was 320,371,180 francs. M. de Lesseps says that on January 1, 1888, the Company will have on hand about 110,000,000 francs, making the expenditure for eighteen months amount to

342,760,146 francs, which is equal to 13,710,400*l.*, or nearly 762,000*l.* per month. The excavation during the last six months of 1886 amounted to 5,044,000 cubic metres, that during the first six months of 1887 amounted to 6,900,000 cubic metres. In July and August of the present year 1,963,000 cubic metres were returned; the cube of September not having been published in the *Bulletin* of the 2nd inst., which admits a considerable falling off in the monthly total, owing to rain, floods, and want of workmen. For the fourteen months, therefore, the monthly excavation amounted to nearly a million cubic metres per month, instead of the three millions anticipated by M. Charles de Lesseps in March, 1886; and the cost, on the rough rule of dividing expenditure by cube of earth-work, was 15-24 shillings per cubic metre. Thus if the excavation yet unfinished be reduced, as proposed, to forty million cubic metres, and if it be executed at the actual rate of one million work is requisite for this alone, bringing us to March, 1891. This, however, takes no note of the cost and time required for constructing 12,000 ft. run of locks, in a country where skilled labourers are now receiving 26s. per day. And if it be proposed, as appears to be the case, to run the canal level from either end until it reaches the 14 kilometres of mountain, up which it is now proposed to raise the waterway, it is evident that the problem is not one of easy solution. As to the provision for the floods of the Chagres, the *Bulletin* of September 2nd last speaks of the commencement of the dam between Obispo and Santa Cruz, of which the last annual report of M. de Lesseps announced the abandonment.

THE judgment which Mr. Justice Kekewich delivered in the case of the Birmingham, Dudley, and District Banking Company v. Ross, on Saturday last, will, if it is upheld by the Court of Appeal, have a material effect on the administration of the existing law of light. There is a well-known principle of law that a man cannot derogate from his own grant: so that if A grant a building to B, and later on an adjoining piece of land to C, the latter cannot build so as to interfere with the light of B's house. In the case to which we have just referred, the Corporation of Birmingham demised to the plaintiffs' predecessor in title a house near a thoroughfare where new and important buildings were likely to be erected. They were erected on adjoining land, demised by the Corporation after that owned by the plaintiffs, and so obscured the plaintiffs' lights. Mr. Justice Kekewich held that primarily the above principle applied, and that the plaintiffs would, under ordinary circumstances, have been entitled to an injunction, but that the predecessor of the plaintiff in title "must be taken to have known what class of buildings were likely to be erected in a broad street in a commercial town." Knowing this, the plaintiffs were held not to be entitled to the relief which they would otherwise have received. This decision is in reality entirely a new one in point of law. It appears to raise many difficulties. For example: A man buys a house near a thoroughfare which is afterwards, and at a considerable distance of time, made an important street. Is the owner of this house bound to anticipate this change? We mention this as a possible difficulty, and showing the way in which the case in question may give rise to trouble. So long as the law of light in its present state exists we doubt both the practical wisdom and the legal soundness of this decision. There is also this to be observed, that the Corporation could have at the time of selling the house in question have made an agreement that a perpetual easement of light did not go with it. They not having done so, it seems to us the purchaser was entitled to believe that the usual easements went with the building he purchased.

AMONGST the various Bills for which application will be made by the Board of Works in the course of next session there are

none that relate to any metropolitan improvement on an extensive scale; such as, for instance, to another Shaftesbury-avenue or Charing Cross-road. As touching their yet uncompleted project of a direct thoroughfare from Gray's Inn-road, by the Holborn Town Hall, through Clerkenwell to Islington, the Board mean to ask for a two years' prolongation of the period, which is at present limited by their Various Powers Act of 1855. It seems that, whereas the Home Secretary has approved of the provision made by the Board for rehousing the working classes dispossessed in the region to the south-west of Farringdon-road, the Board still await Government sanction for their scheme as in continuation of the route. They are thus, in effect, hindered from purchasing more of the property along Exmouth-street and about Sadler's Wells. By the end of this current month the Board will have deposited with the various local offices concerned, all statutory plans, sections, proposals, and the like thereto, in connexion with their schemes, as follows. It is proposed to transfer and vest in the Board two plots of land in St. Giles's, Camberwell, parish, whereby approaches may be made to Dulwich Park from Court-lane and Dulwich Common-road, and to add the same to the Park which is already under the Board's control. Similarly, an extension of Kennington Park is contemplated, by including therein the piece of land that now lies between the Park northwards, and South-place. A recreation-ground for Lewisham will be provided by the enclosure and preservation as an open space of certain lands by the river Ravensbourne, and situated between Catford Hill and Ladywell. A foot-bridge will be thrown over the Mid-Kent railway, which passes through the ground marked out. At Fulham it is designed to improve the Middlesex approach to new Putney Bridge by a widening of Church-street. This involves the demolition of the houses along the southern side, and from School House-buildings along the northern side, of Church-street to where it meets the junction of the Hurlingham and King's roads. The Board of Works for the Poplar District will be called upon to contribute to the cost and maintenance of a bridge across the Limehouse Cut, with approach roads in Bromley (St. Leonard's parish), at a spot close by the North-Western and Dock Junction Railway. A new site, it appears, is chosen for the Thames Tunnel from Blackwall to Greenwich, somewhat to the west of that whose construction is sanctioned by an Act which was obtained in the session of this year. The Board again intend to apply for extended provisions under their Fire Brigade Act of 1865, with their Loans Act of 1869; and for power to inspect and license houses and other places of public resort used for stage plays, dances, music, or other entertainments.

IT cannot be said that the Metropolitan Board of Works has rehabilitated itself in public opinion by its recent proceedings. What is called the "Robertson Scandal" has been the main theme of debate. It will be remembered that in July last the Board, after investigating the serious charges made against Mr. T. J. Robertson, principal clerk in the Estates office of the Superintending Architect's Department, came to the conclusion that he was deserving of censure. Incidentally arising out of these charges against Mr. Robertson, imputations, more or less vague, were made against the Board itself,—or a section of the Board, at any rate; and the Board, in answer to these imputations, took the very singular course of appointing itself as its own committee to inquire into its own conduct. This inquiry, as might have been expected, led to nothing,—partly, as is alleged by the critics of the Board, because the Board could not compel witnesses to come forward, and because the evidence given by such witnesses would not be privileged, as evidence given before a Parliamentary Committee or a Royal Commission would be. The Board adjourned for the recess, and the matter slept for a time; but one of the first acts of the Works and General Purposes Committee, after the recess, was to

bring up a report recommending that "no further action be taken in relation to the vote of censure passed by the Board upon Mr. Robertson in July last." This was met by an amendment that "Mr. Robertson's engagement with the Board be terminated at the earliest period practicable." The amendment was lost, but only by three votes, and a further amendment, confirming the censure, was carried by a large majority. At the last meeting of the Board, a resolution was carried recommending that Mr. Robertson be removed from the Superintending Architect's department, and referring it to the Works and General Purposes Committee to consider to what position he should be transferred. At the same meeting a resolution was passed to the effect that if the Home Secretary or the Government cared to call for an independent public inquiry into the proceedings of the Board, the Board would give every facility for the holding of such inquiry. We hope that such an inquiry will be held, and that it will be thorough and exhaustive, for the Board and its officers ought to be placed above suspicion.

IT appears from a report by Mr. Wm. Crookes, Professor Odling, and Dr. C. Meynott Tidy, that the water supply of London during the month ending October 31st was of exceptional purity, as it had been during the three preceding months. During the months of July, August, and September the mean proportion of organic carbon in the water obtained from the Thames was 0.136 part in 100,000 parts of water, or less than one quarter of a grain per gallon. The supply during the past month was found to be practically identical with that of the preceding months; all the samples examined, whether derived from the Thames or the river Lea, were free from turbidity, and unexceptionable as regards colour. The public are warned that they must not expect this high standard to be maintained during the coming rainy season. The average degree of hardness was 13.19 degrees.

SIR GILBERT SCOTT'S design of the University Buildings in Glasgow, his largest secular work in Scotland, has now been completely carried out by the addition of the spire to the great central tower. Sir Gilbert's largest ecclesiastical work, the Cathedral Church of St. Mary, in Edinburgh, is imperfect as regards the two western spires and the chapter-house, which remain unbuild. Dean Montgomery is exerting himself with a view to raising a fund to meet the cost of erecting the spires. This work, if carried out, will give to the church a marked individuality not only in the city, but as regards the whole of Scotland, there being no ecclesiastical edifice north of the Tweed having three towers or spires. Glasgow Cathedral did, of old, possess three such features, but the central spire only now remains.

THE value of sea-water as a sanitary agent is well known; for the flushing of drains and watering streets it is invaluable; and its use in the form of hot baths is of great benefit in many complaints. Such being the case, it is a somewhat remarkable circumstance that greater use has not been made of the inexhaustible supply where it is available. North Shields is one of the very few places which have been quoted as using salt-water for flushing purposes, and, we understand, with the most satisfactory results from a sanitary point of view. The matter has been taken up by certain members of the Edinburgh Town Council with a view to the introduction of a plentiful supply of sea-water into the city, and we have no doubt that if the object is attained a great boon will be conferred upon the citizens.

WE are desirous to give increased publicity to the following memorandum in the *Journal of Proceedings* of the Institute of Architects:—

"A prize of ten guineas for the encouragement of the study of stereotomy,—offered by the President of the Institute and three other members of the Council,—will be given next year to the candidate

who submits the best working drawings and model of 'Vaulting at an Angle of a Cloister.' The models will have to be constructed, probably, in the rooms of the Institute, and in the presence of moderators appointed by the Council. The competition is an open one, but, obviously, only those who have had previous instruction in the science of masonry will stand any chance of obtaining the prize. Mr. Harvey has therefore arranged to open a special class this December, which, he states, is to be limited to sixteen pupils. Thanks, however, to him, there are now other young architects in this country competent to give instruction in the science of masonry, and other classes of instruction may be held, if the applications to attend Mr. Harvey's special class exceed, as will probably be the case, the limit of sixteen which he has fixed. Moreover, all students of masonry will do well to read the paper by the late Professor Willis, F.R.S., on 'The Construction of the Vaults of the Middle Ages,' in the *Transactions*, 1842.\*

Mr. Lawrence Harvey's attainments in regard to the class of subject referred to, and his success in teaching it, have been frequently referred to in our columns. We are glad also to see that the solid learning and merit of Professor Willis's brilliant essay are not forgotten by the present generation.

**A**n appeal is made for funds for the repair of Fairford Church, Gloucestershire, for which the large sum of 3,000*l.* (large in relation to the size of the church) is required, of which sum about 700*l.* have been obtained from the parishioners of Fairford and their friends. It is expressly declared that no attempt will be made to "restore" the damage and decay from which the stained glass has suffered, whether from the action of the atmosphere or at the hands of iconoclasts. It is stated that the windows require re-leading and the roof immediate repair for the safety and preservation of the church. The re-leading of the windows will be done upon the spot, and only one light will be undertaken at a time. When fragments of glass are obviously misplaced they will be replaced in their original position by the aid of the late Rev. J. G. Joyce's monograph, read before the Bristol and Gloucester Archaeological Society in 1878. No portion of a face or landscape which is missing will be replaced otherwise than by white glass; the fold of a robe, however, it is suggested, may be supplied by an unmistakable wash of colour on the white glass. The committee will have the assistance of Mr. T. Gumbier Parry in dealing with the windows, and every effort will, it is stated, be made to preserve the glass *in situ*. The estimated cost of the repairs to the windows alone (with the necessary contingencies) amounts to 1,000*l.* Mr. F. S. Waller, of Gloucester, is the architect for the proposed works.

**CAPTAIN MONRO**, her Majesty's Inspector of Constabulary, has intimated to the Edinburgh City Authorities his intention to report that he considers the central police establishment defective in its arrangements and accommodation. There are certainly good grounds for Captain Monro adopting such a course, although it is hard upon the Corporation that they should be called upon to overhaul a building the execution of which was placed in the hands of the architect of the Board of Works (the late Mr. Nixon) so as to avoid the probability of what has now taken place. The building was erected about thirty years ago, and is most defective as regards planning. The police-court room, and the accommodation provided for witnesses, are such as to entail great hardship upon persons of respectability who, from no fault of their own, are compelled to enter the premises. The building is neither admirable without nor within, and it would, in the long run, prove the truest economy to make a clean sweep of it and erect entirely new premises either on the present or another site.

**MR. AMBROSE M. POYNTER**, son of Mr. E. J. Poynter, R.A., has recently translated for private circulation Dr. Pietro Saccardo's report on the principal works executed to the basilica of St. Mark at Venice during the year 1885, and proposals for additional works to be carried out in the year 1886, to which we referred at length a year

ago (*Builder*, Dec. 4, 1886, p. 796). The report was reprinted in the publication called the *Archivio Veneto*, Series II, vol. xxxii., pt. ii., 1886. With regard to the works for the year 1886, the report concludes,—"We have before all to complete the repair of the principal façade in the last arches to the right, with which is connected the substitution of the antique slabs of marble on the south front as a work embraced by the same project and the same ministerial sanction. In the interior of this part the Capella Zeno has, of course, to be completed with the restoration of the semi-circular part, very much decayed through the saltness of the air, and with the re-application of the slabs wanting to the rest of the walls. Besides these there still remain to be applied, as has been said, a few pieces of the antique mosaics of the vault; and that of the semi-dome ought to be taken down and replaced, preserving the two angels and remaking the figures of the Virgin with the Child, as they are now reduced to a mere hlot of very bad restoration. For the model, not being able to count on the existing figure for an approximate reproduction, we shall have recourse to one similarly designed that exists in the semi-dome of the cathedral at Torcello, taking advantage of the scaffolding that is now there to make a tracing. . . . Turning to the exterior, we find that the lead covering of a part of the roof and of the apse is in want of renovation. In this last it will be advisable to make use of old sheets of lead in the parts which are visible from below in order to preserve their antique and picturesque aspect. The walls of the three lunettes above the façade have still to be restored, and the gables that belong to them, with their decorations in marble, as well as the two pinnacles placed between them." It may be assumed that the whole of these works have by this time been carried out, and, as will be seen, a part consists of a restoration of a restoration.

**BY** an order of the Ministry of Public Instruction of Fine Arts, published in the *Journal Officiel* of November 20th, the "Service des Monuments Historiques," which has since 1879 had possession of the east wing of the Trocadéro Palace for the establishment of a Museum of comparative Sculpture, is authorised to take possession of the west wing also, to give a further development to the museum, which will be indispensable in order to complete the series of works by French sculptors.

**I**n the Edinburgh Dean of Guild Court, held on the 17th inst., plans for the rebuilding of Newsome's Circus,—recently destroyed by fire,—were approved of. The new building will accommodate about 3,000 persons, and will cost about 5,000*l.* Noncombustible materials are to be used in every instance where practicable, and the seating is to be coated with asbestos paint. The general feature inside is an amphitheatre where no part of the audience will be over another except at the main entrance, where a small gallery is to be placed. In the event of a panic no less than eight separate exits will be available. An endeavour is to be made to push forward the construction of the building so that it may be ready for the Christmas holidays. This hasty mode of construction often leads to imperfectly-executed work, and is the cause of many of the mishaps which occur.

**WE** are very glad to find that between the liberality of the British School at Athens and that of the President of the Institute of Architects, who have each contributed 50*l.*, there is a travelling studentship in Greek archaeology worth 100*l.* to be competed for. It is not very clear whether the studentship is to be regarded as in connexion with the Institute or with the School at Athens; the latter proposed, the Institute is the authority to be applied to for particulars, so we presume it is a joint matter between the two Institutions; but the position is not very clearly defined in the note in the *Journal of Proceedings*, except that the terms and conditions are to be obtained "only at the office

of the Institute." The selected student will probably have to start for Athens early in January, and there hold himself at the disposal of Mr. Ernest Gardner, the Director of the British School.

**T**HE manager of the Donegal Industrial Fund, established to encourage Irish Industries, having invited us to look at some specimens of the work lately produced by distressed Irish ladies and by Irish peasants, we have visited the dépôt of the Fund at 43, Wigmore-street, and examined a small collection of *portières*, curtains, and other embroidered and lace fabrics, which exhibit excellent taste and skill, and look as if they ought to be exceedingly durable. The materials used are, almost without exception, of vegetable origin, and chiefly flax dyed with vegetable dyes to a variety of pleasant, soft, or sober colours. The designs are well drawn, and exhibit a very judicious restraint, and considerable knowledge and skill in the combination and distribution of forms and colours. The material has, unavoidably, a somewhat hard and coarse look when closely examined; and the majority of the ornamental patterns, founded on Celtic originals, appear a little coarse and barbarous beside the more delicate ones imitated from Italian work; but if the two are not seen together this objection is not apparent, and the simple vigour and conventional forms of the earlier style are in themselves very pleasing.

**T**HE cities of the Lombard plain, between Brescia on the east and Vercelli on the west, possess supremely fine examples of two schools of architecture, the brick and terra-cotta of the thirteenth, fourteenth, and fifteenth centuries, and the Early Renaissance or Bramante school. The Tower of Chiaravalle, the little façade of the Church of St. Maria in Istrada at Mouza, and the Certosa of Pavia, are three notable examples of the former. The sacristy of St. Siro at Milan, the Churches of S. M. Inconronata at Lodi and Pavia, and the parish churches of Saronno and Busto Arsizio are the finest examples of the latter. Lovers of architecture and the allied arts travelling in Italy often miss seeing these and other important but comparatively out-of-the-way works of art, for want of having their importance duly insisted upon in the usual guide-books. "Como and Italian Lake-Land,"\* by the Rev. T. W. M. Lund, though not a guide-book in form, is such in fact, with this further advantage, that it is evidently written by a man of taste and learning. It covers all the artistically important part of Lombardy, as well as the district named in the title. Intending travellers will do well to bear its existence in mind.

**T**HE article on "Architecture" in the "British Almanac and Companion for 1888," is a forcible and well-written sketch of the architectural work of the year, accompanied by some sensible and outspoken criticism on various points, concerning most of which we have already expressed ourselves to pretty much the same effect. The writer is an advocate of progress and an opponent of copyism, in which also we are with him.

**WE** have received from Messrs. Josiah Wedgwood & Sons a very elaborate illustrated catalogue of their tile designs for floors and walls. The reputation of this firm is, of course, historical, and we have no doubt the tiles are of excellent quality; but as they invite our criticism we cannot help expressing our surprise that manufacturers whose name has been connected with so much artistic work in the past should not have made more effort than appears here towards the production of what could be truly called artistic designs, instead of mere patterns on the old well-worn lines of squares and cross checkers and diamonds. Of course, it is necessary to have a certain number of easily-executed designs which will not be too costly for ordinary work; and the makers may say, no doubt, that the real object of a pattern-book is to show how every-day demands may be supplied. We find, however, little or nothing beyond this every-

\* London: W. H. Allen & Co. 1887.

day quality. We have no positive objection to make against the designs, unless with regard to the colour of some of them (No. 169A, for instance, one of the largest illustrations, is a very crude and harsh combination of predominating greens and reds); our complaint is that they are entirely uninteresting, and show no thought, invention, or feeling for artistic effect in the higher sense. To arrange bands and squares crossing each other, with different arrangements of squares and lozenges for filling in the centre, is a kind of thing that a child can do if you give him the pieces to put together; and among all the floor patterns we cannot see a single one of which we can feel that we would desire to lay our floor with for the pleasure of seeing it. All that can be said is that they are neat and more or less effective, and will "do" very well for their purpose. But surely something more may be done even with machine-made tiles than this. The designers came rather near evolving something in Nos. 171A and 173A; but they cannot escape from the mere juxtaposition of alternating arrangements of squares, &c. A study of such designs as those of the Arabic school might have suggested the step further in invention and contrivance which would have removed these from the category of "patterns" to that of "designs."

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The second ordinary meeting of this Institute for the present session was held on Monday evening last, Mr. Edward P'Anson, F.G.S. (President) in the chair.

#### Gifts to the Library.

Mr. J. Macvicar Anderson (Hon. Sec.) said it was not customary at the ordinary meetings to put forward presentations, but two gifts which had just come into their possession were of such special interest that he wished at once to acknowledge them. The first was a chronolithographic view of the Tower Bridge, sent by direction of Mr. George Shaw, Chairman of the Bridge House Estates Committee of the Corporation of London. Considering that this was one of the last works of the late Sir Horace Jones, Past-President, it possessed exceptional interest for the members of the Institute. The other presentation was "Architectural Drawing," by Mr. R. Phens Spiers, any work emanating from whom on such a subject must be of considerable value and interest.

Mr. Charles Fowler drew attention to a donation to the library which would be made in the course of a day or two. It had occurred to him that the Regulations of the Metropolitan Board of Works, on the various matters concerning buildings, did not exist in the library in a collected form. He had, therefore, asked the Superintending Architect to kindly furnish him, for the library, with a copy of the Regulations, and had obtained them in duplicate. These, he believed, would be more particularly useful to the younger members who were thinking of passing the District Surveyor's Examination.

Mr. C. J. Phipps, F.S.A., remarked that the Regulations were very illusory. When they had followed every line of them it would be found that the Building Act Committee of the Board wished a great many things more. In fact, they were not of the slightest value (laughter).

#### The School of Athens.

The President drew attention to the fact that the School of Athens had invited students to come there and study for four months, the only condition being that they should be prepared to assist in the excavations. The School was prepared to contribute 50*l.* towards the expenses of any student who desired to avail himself of the invitation, and the Institute was prepared to add another 50*l.* Application should be made before the 10th proximo to the Hon. Secs. of the Institute. There was only one studentship at present.

Mr. Macvicar Anderson said he must correct the President in one particular. The Institute was unable to contribute the 50*l.*, but Mr. P'Anson himself had liberally offered to find the additional 50*l.* out of his own pocket (applause).

#### Building and Decorative Stones of Egypt.

Mr. W. Brindley, F.R.M.S., read a paper on "Building and Decorative Stones of Egypt," of which the following is an abstract:—

**Limestones.**—The Egyptian quarries, which played an important part in the architectural history not only of Egypt but of the ancient Roman Empire, were nearly all on the east side of the Nile. The Pyramids being the most ancient and impressive remains, the author commenced by considering the material used in their construction. There had originally been seventy, of which twenty still existed. Much of the stone used was a nummulitic limestone, quarried on the spot in cubical blocks and huilt in steps. The triangular casing was a fine cream-coloured magnesian limestone, quarried at Toora and Masarah, and all cut out of the solid rock to the size required. Except in a few lower ones recently unearthed, these stones had all been used to build modern Cairo. A fragment shown by Mr. Brindley, which had the vertical and horizontal joints (giving the angle correctly), showed the surface wear of 4,000 years, with the original tooling of the joints. No stone could have worn better. The quarries immediately behind Thebes were of fine limestone, to which the Egyptians were very partial for sarcophagi and small sculptures, owing to the extreme fineness of the grain. It was like close chalk, only much harder and of warmer colour, and occasionally contained brown flints.

**Sandstones.**—Next in importance sandstone had been mostly used for the building of temples. It was of a warm grey colour with fine texture. The quarries, which were at Silsileh, consisted of extensive grottoes and open spaces, where the workmen had followed the best beds, cutting out the blocks with the greatest care and tooling them on the spot. They were then floated down the Nile on rafts. These stones were usually set dry, the finished faces afterwards being coated with stucco, in some cases hardened with alumen or gum, to receive colour decoration.

**Granites.**—The famous granite rocks of Syene formed part of the igneous range running parallel with the Red Sea. The ancient quarries were in the Eastern Desert, about two miles from Assouan (the ancient Syene) and very extensive, but the deepest not exceeding 80 ft. In the first was the so-called unfinished obelisk, which was a dressed mass of rock attached on the bottom bed and back to the parent rock; the length was 95 ft. and the width 11 ft. It had a series of transverse cuts on the top bed, indicating blocks for sarcophagi. Mr. Brindley had come to the conclusion that it was not an obelisk, but a bed of stone, dressed by a gang of task-workmen or convicts, to be cut up into sarcophagi, and that it was work of the Roman period.

**Mons Claudianus.**—The grey granite "Lapis Psaronius" (spotted like a starling) had been extensively used in Rome for the Forum of Trajan and the monolith pillars of the Pantheon. The quarries, which appear to have been worked only by the Romans, were near the porphyry quarries between the Red Sea and the Nile, and ruins of workmen's huts, a temple of the Roman era, and monastic buildings of a later date still existed there. They appear to have been worked only by the Romans. Mr. Floyer, in a letter to the author, states that pillars, 59 ft. by 8 ft. 6 in. diameter, accurately wrought, were still in the quarries. In history they were called the quarries of Mons Claudianus, but must have been worked previously to that period as they had been used for the Pantheon.

**Durability of Granites.**—The granites and syenites of Egypt had not worn well, compared with some inferior stones. The decay was chiefly from the peeling off of the polished surface. Patches, a few feet square and about an inch in thickness, all loose and ready to drop off at the slightest touch, were to be seen. The great polished blocks in the Temple of the Sphinx appeared generally sound, but if tapped with the rule sounded hollow, and the obelisks at Karnak were peeling. It should, therefore, be remembered with regard to our Cleopatra's Needle that he had not received it sound.

**Imperial Porphyry.**—The ancient Egyptians appeared never to have discovered their most beautiful stones; this had been done by the Romans, whose men of science had not neglected even places most difficult of access. For example, a noble red purple stone had been found on the summit of a desolate mountain

4,000 ft. high and 100 miles from habitations. A colony was established of thousands of workmen, who received their provisions from the Nile, stations being built, wells sunk, and huts erected on the route. This route Mr. Brindley and his wife had journeyed over on camels from Keneh, for thirteen days, in order to visit the quarries.\* The Bedouins in whose charge they had been were most trustworthy, and far more intelligent than is generally credited, having been most useful in Mr. Brindley's researches. The quarries were on Gehel Duchar (the mountain of smoke), which rose abruptly out of the plain in the shape of a long horseshoe; the valley between containing a small town, wells, and reservoirs, with a temple, in pink granite, of small dimensions. In addition to many ordinary roads and foot-paths there existed the remains of two grand block roads, with piers at the sides for lowering stupendous blocks by means of ropes. The porphyry was in masses, some 120 ft. wide, while many of the choicest varieties were only about 10 ft. wide, and appeared to have been upheaved through a mass of granite and blackshale, trap rock, the granite being burnt apparently through the heat of the porphyry. The whole mass appeared of fairly uniform texture, but some of the obtrusive parts were very different, being volcanic worn masses of variously-tinted porphyry boulders embedded in a purple felsite paste. This gloriously coloured stone was the only one in the scale of colour the Romans lacked, and it had never become a commercial material, having been imperial from the first, and worked only by and for the State. There still existed about 300 monolith porphyry pillars in Europe, and the stone was to be found in Asia as far as Baalbec and Palmyra. In all cases it still retained its freshness of colour, proving beyond a doubt its durability. The Romans had evinced great partiality to porphyry for sarcophagi. That of Nero was the first mentioned, and the largest known to exist were those of Helena and Constantia, the mother and daughter of Constantine the Great, now in the Vatican. A room named the "Porphyrea" in the Imperial Palace at Constantinople had been lined with porphyry brought from Rome by Constantine, and in the reception-hall of that palace there had been a large porphyry slab under a baldacchino, on which the Emperor stood at great festivals. What with Christian conquerors at Constantinople and Doge Dandolo little now remained. The most important monument erected by Constantine was the column 100 ft. high, built with eight cylindrical pieces, each 11 ft. long, and this was still standing, although damaged by fire and earthquake.

**Opus Alexandrinum.**—A great quantity of precious porphyry had been cut up for pavements in early Christian times. Some of the circular plaques were very large, one in St. Peter's being 8 ft. 6 in. across. According to Dr. Schneider, Prince Charles of Prussia had formed the most famous collection of ancient porphyry works of art, including a colossal statue of Minerva and a grand pavement of opus Alexandrinum, brought from Ravenna. Amongst the works in porphyry in this country might be mentioned the plaques and pavement to the royal tombs in Westminster Abbey and the pavement under "Becket's crown" at Canterbury. The South Kensington Museum contained some very beautiful examples of Renaissance and French work, and the British Museum some of the Byzantine period.

**Marble Verde Augustus.**—This was a green serpentine, and was called by other names according to the variations of the markings. It had been used by the Egyptians for small figures and by the Romans for articles of vertu. In the desert at Diu Station there had been workshops for small articles in porphyry and this serpentine. Mr. Mitchell, the geologist, had found it in an adjoining mountain while making his interesting collection of rock specimens of the Red Sea formation, which is now part of the new museum at Cairo.

**Oriental Alabaster.**—The lapis onyx or marble of the ancients was called onyx owing to its semi-transparency, like the fingernails. A number of old quarries had been discovered, and those near Benies-oeef had been re-worked for the great mosque of Mohamed Ali at Cairo. Alabaster was a favourite material with the Egyptians and Greeks, taking its name from the vessels for perfumed unguents.

\* See account of this journey in the *Builder* for the 12th inst., p. 683.

called "alabastra," and was for domestic purposes and the interior decoration of temples, as well as for sculpture and sarcophagi. The grandest sarcophagus yet discovered was that in the Sarcophagi Museum. Egyptian alabastra was usually white and yellow, with occasional thin markings of red and purple. Alabastra had been used by the Romans and Greeks for every description of decorative work.

**Breccia Verde.**—This was a very beautiful and rare marble conglomerate, found only in Egypt. The general colour was greenish, due to the quantity of green granite boulders, in addition to which were pieces of porphyry, red jasper, green felspar, different kinds of slaty rock and serpentine; the whole being cemented together by a greenish silicious paste. The quarries had been known and worked by the ancient Egyptians and were situated at Hammamat. There was a considerable quantity in Rome and Constantinople obtained during the Roman occupation, and during the Renaissance period much old material had been cut up for ornamental purposes by the French and Italians.

**The various Anathites.**—Dionites, felsites, and all similar very hard stones, used for sculpture and mummy cases, were all dykes or intrusive veins formed in the igneous rocks at Giza and in the Eastern desert.

**Gems and Ornamental Stones.**—The Egyptians had been great lapidaries, and used nearly every sort of gem stone known to us, except the diamond, ruby, and sapphire. The emerald mines at Gebel Zabara had been worked from early times down to that of Mohammed Ali; the gold mines were at Gebel Allakke, south of Assouan, and copper was obtained near the porphyry quarries.

**Quarrying and working hard Stones.**—Mr. Brindley was of opinion that the Egyptian methods were precisely the same as our own were up to a few years ago, viz.—heavy pick tools for scrubbie dressing and making holes or wedges, the hocks being split with metal wedges; dressing masonry surfaces with large and small picks; then rubbing down with flat stone rubbers and sand; and finishing with iron or copper rubbers and emery powder. The wedge holes, plentiful enough in the granite and porphyry quarries, were the same as ours. Some Egyptologists thought they had discovered the results of gem-stone drills and saws by a few holes and slabs being drilled, but a piece of granite (shillited) hored with a copper tube and coarse emery powder produced the same result as found in Egypt, while Dr. Schliemann told the author that he thought the stone hammer-heads of pre-historic times were bored with wood and emery powder.

In the discussion which followed, Mr. Waterhouse, R.A., in proposing a vote of thanks to Mr. Brindley, remarked that he had always considered porphyry was to building materials what the diamond was to other gems. It had hitherto been out of the reach of the ordinary architect, but he hoped Mr. Brindley could tell them something about the re-opening of the old quarries for the benefit of the present and future generations.

Mr. Aitchison, A.R.A., seconded the vote of thanks. Mr. Waterhouse's remarks as to porphyry were perfectly true, and he was afraid that although the quarries were renewed, it would not be available at a much lower rate than before. Even when landed on the shores of England it was a desperately hard material to cut, and would consequently be still very costly. He had had little opportunity of using porphyry, but what he had used had generally cost at the rate of 5l. per ton super, and that  $\frac{1}{2}$  in. thick. He had used occasionally for slabs and pavements, much the same way, but on a smaller scale, as it could be seen at Rome and elsewhere. The *Bas Alexandrinum*, he believed, was so termed not because it came from Alexandria, but because it was patronised by Alexander Severus. Many of the marbles, granites, and porphyries are magnificent materials for ornamenting the interiors of buildings, and porphyry had the peculiar advantage of becoming more and more polished by the agency of the traffic over it. Hard materials generally would polish under the heaviest traffic, and some of the hardest granite laid down in the streets of London had to be removed because it became too highly polished, and consequently very slippery. Some years ago, when he was at the St. Katharine's Docks, he found the staircases of the cranes so polished by the continual tramping up and down of the labourers, that it

had to be roughed every few years to prevent people slipping.

Mr. R. Phend Spiers, F.S.A., said that one of the most interesting points referred to by Mr. Brindley was the extraordinary preservation of the materials in Egypt, and it was impossible for those who lived in this damp climate to understand what a great element of destruction moisture was. Mr. Brindley had referred to the action of intense heat and cold on granite, but he (the speaker) had no idea that so much destruction of stone and granite surfaces could be produced without moisture. As an instance of the extraordinary preservation of materials, he might note one of the rock tombs standing opposite the Island of Philæ, with an inscription which, though it appeared to be of modern date, was really of the time of Rameses the Great.

Mr. Aitchison asked Mr. Brindley, in his reply, to say if anything was known as to where the porphyry enrichments of the tombs in Westminster Abbey had come from.

Mr. Topley, F.G.S., of the Royal School of Mines, said that Mr. Brindley had correctly asserted that alternations of heat and cold had as much effect in the disintegration of rocks as moisture had. The great agency of water in northern climes was by its freezing and expanding with enormous force, and thus breaking off the rocks. What happened in dry climates was precisely the same, but from an opposite cause. The great alternations of temperature between day and night acted so strongly in the contraction and expansion of rocks that they broke off as rapidly from the action of extreme heat as they did from intense cold. So much was that the case that he had been told that travellers in Arabia were sometimes woken during the night by a cracking all round, due to the contraction of the rocks which had been expanded during the daytime. An interesting question had been raised by Mr. Brindley as to the composition of the rock he had referred to as being red porphyry. Several papers had been written on the subject, but it was evident that the writers of them had examined the rock only in small pieces, and had not had the opportunity now afforded of seeing such large slabs. It had been spoken of as Breccia, and the first glance would lead one to think it was, but it would be well to have a further examination made of the larger specimens. Mr. Brindley had referred to the mosques near Cairo, but nothing had been said about the most wonderful mosque of all, viz., that of Cordova, which contained some 1,200 or 1,300 columns brought from all parts of the Mediterranean.

Mr. T. Graham Jackson, M.A., considered that Mr. Brindley was practically the rediscoverer of those porphyry beds, but whether it would become a material to be used by architects remained to be seen. If porphyry and green serpentine could be in any way brought within the compass of ordinary means it would be a very great aid to the development of schemes of permanent decoration.

Mr. Freeman (Penry) believed that some of the hieroglyphics showed the means used by the ancient Egyptians for transporting large blocks, but he was not aware that there was any indication of the way in which the masses of rock were detached. The method of cutting up a detached block was comparatively simple, but he had no knowledge of the ancients having had any explosive power. He believed that of late years great advances had been made in the working of those very hard materials, which would tend to introduce the much greater use of porphyry. There were now processes of sawing the porphyry and granite, by which as much work could be done in one hour as used in the olden times to occupy two days.

The vote of thanks was then put and carried with applause.

Mr. Brindley, in replying, stated that the ancient quarries of porphyry were situated about 100 miles from the Nile, and about twenty-two geographical miles from the coast. From the quarries to the coast there was a gentle incline all the way, and the district was now being surveyed for him. There were hieroglyphics and sculptures in the quarries which showed the ancient methods of drawing by oxen and slaves. With regard to the re-working of the quarries, he hoped to be able to ship the stone at the port of Myosothus, and bring it to London via the Suez Canal, selling it here for about 3l. per foot cube. Hitherto

he had had to pay 5l. per foot cube. He possessed a column for which he had refused 700l., but he was afraid now he would have to take less for it. He had received a piece of porphyry hored at Mr. Frooman's Granite Mills in Cornwall at the extremely rapid rate of  $\frac{1}{2}$  in. per hour. The serpentine should not be confounded with the English serpentine, or with that of the Italians. The latter was used with red porphyry, which came a few miles from Sparta, in Laconia. Its component parts were the same as those of the other porphyry, with a little colouring matter. As to the porphyry in Westminster Abbey, it was recorded that certain Italian workmen brought their materials with them, and the chips found in the Chapter-house were those which were knocked off. He was not the first discoverer of the quarries in modern times. Burton visited the quarries about 1832, and shortly after Sir Gardner Wilkinson wrote an interesting account of them, but did not bring away any chips. Lepsius had also visited the quarries, but the man who had done most was Schweinfürth, who had carefully surveyed and mapped the district.

APPRENTICESHIP AND TECHNICAL EDUCATION.\*

UNTIL the present time there have been,—at least in the majority of mechanical trades,—only two recognised kinds of apprenticeship. In one the apprentice, entering at about fourteen years of age, served his seven years as a workman, receiving for his work practically nothing beyond instruction in his trade, save a small pittance for his weekly maintenance, which may be taken to represent the modern equivalent of the board and lodging which in olden times the master gave his apprentice in his own house. In the other the young man is received into the works at the age of eighteen or nineteen as a premium pupil, to serve an apprenticeship of a very different and often very unsatisfactory kind.

But now, it would seem, there is a third sort of apprenticeship arising, in which the technical college or school plays a part; the work of the technical school or college being either preparatory or supplementary to the commercial apprenticeship in the shops. This remark must not be misunderstood. It is true that in France, and, to some extent, in Germany and elsewhere, a fourth kind of apprenticeship has been attempted, namely, one in which a training wholly within the walls of a college or school was substituted, or supposed to be substituted, in the place of an industrial apprenticeship. There is no need to refer to this matter in detail, because this kind of training does not exist in England, nor does it seem as if such would ever meet the requirements of British industries.

Assuredly, that is not the aim of the few existing British technical colleges and schools; they aim to supplement, not to supersede, the actual experience of the shops. The writer can answer for it that no Finbury student imagines that the work of the College can supersede the work of the shops. In the case of the day students, they know full well that their work is but preparatory; in the case of the evening students that their work is only supplementary. It is really a great gain to the members of the teaching staff that they come into contact with both kinds of student. It helps to preserve the balance in the character of the teaching, that it shall neither grow, on the one hand, too theoretical, nor yet, on the other, degenerate into merely teaching that which can be better taught in the shops.

There are, indeed, other ways in which technical teaching and industrial experience can be combined, as, for example, the way that has been followed out for some six or seven years with marked success in the Engineering Department of the University College of Bristol. That institution has induced a number of local engineering firms to enter into an arrangement whereby the engineering students spend the six winter months only at the college, and the six summer months in the works; the course extending over about three years. Of course these students enter works as premium pupils, not as working apprentices.

\* From a paper read by Professor Silvanus P. Thompson, Principal of the City and Guilds' Technical College, Finsbury, at a Conference on Technical Instruction, held November 5th, 1887.

The aim of the Finshury College differs distinctly in this, that its two years' course is designed to obviate the subsequent payment of a premium, and to enable the student when, at the age of about seventeen, he enters the works, to take his place there as a working apprentice the same as if he had been already apprenticed there for three years. This is, therefore, an attempt to create a modified apprenticeship lasting not more than five years, wherein the College course takes the first two years and the shops the last three. The success of the system has certainly surpassed the expectation. There are now, and their number is certain to increase, a few masters who, when they take an apprentice for a term of five or six years, expressly stipulate that they shall send their apprentice to the Finshury Technical College for the first two years. In some cases they pay the fees for the apprentice. Perhaps the time will come when the parent who apprentices the boy will on his part insist that the master shall send the apprentice for the first two years for a preliminary technical training. Many parents of small means do not quite like to take the responsibility of sending their boys for two years to a technical school or college on the chance that at the end of that time they may be able to find a master willing to take them for a shortened apprenticeship of only three years. Amongst our day students we have, as remarked above, a few who are actually apprenticed. One well-known electric-lighting firm which takes pupils at a very high premium, has voluntarily offered to the City and Guilds' Institute to take one student every two years in regular succession without premium, as a pupil. In another instance, an employer, who takes pupils at moderate premiums, makes it a condition that every pupil shall attend a regular evening course of instruction at the Finshury Technical College. The evening class fees at this College are in every case reduced to one-half for apprentices, whether indentured or not, and under this regulation there are some 250 apprentices attending the evening courses. In one case, a few weeks ago, a youth applied who had just had his indentures cancelled because his master was either unable or unwilling to teach him his trade, but kept him at odd jobs.

Now these things seem to indicate that this question of apprenticeship is really entering upon a new phase with the growth of technical classes. The new phase is certainly worthy of the attention of masters, and will assuredly receive sooner or later the attention of the various trade societies and organisations. Indeed, it is to be hoped that they will see their way to helping forward the movement. It is obviously to the interest of the various trades that the apprentices who have entered it should be as well and fully trained as possible. If, owing to the altered conditions of the time and the division of labour, the masters are unable to teach the apprentice his trade, then it should be regarded as a moral obligation (to say nothing of legal obligations) upon the master to afford his apprentice every facility for obtaining the instruction that he fails to impart. Nay, ought he not to do more than merely afford facilities; ought he not to provide them? Do those cabinet-makers of the Finshury district, who will not let their apprentices come to the Technical College classes at half-past seven to learn the technicalities of their craft,—for there are, unfortunately, some who will not,—know what an injury they are doing to those apprentice boys? Do they wish the ranks of the East London cabinet-makers to be filled with un-instructed workmen who can only do the one or two things that they have learned in their shop? Perhaps this paper may lead to a discussion that will throw some light upon this aspect of the question. The various trade organisations insist, and rightly insist, on the importance of regulations that will keep incompetent and untrained men from creeping into their ranks by indirect ways; might they not equally rightly insist on regulations that will preserve themselves from the incompetent men who necessarily grow up within their own ranks as the result of neglected and un-instructed apprenticeship?

#### *The Future Organisation of Technical Instruction.*

Another most important question arising out of the consideration of the present position of technical instruction is the form to be given

to its future organisation. It has become a question of national, one may say of imperial, importance; and it should be treated on no narrower a basis of consideration. So far, the only parts of the educational system in Great Britain that can be considered as organised on a national basis, are the elementary schools and a few normal schools under the Department of Education, and the classes in Science and Art, including the Normal School of Science and the National Art School at South Kensington Museum, under the Department of Science and Art. It is true that the three Welsh University Colleges are nominally under the Education Department; but practically, the so-called Education Department is a department of primary education only. It is also true that the University of London is nominally under Government, and nominally draws some 13,000*l.* annually from the Treasury; practically, it receives only about 2,000*l.*, and is self-managed. Beyond this, there is no national organisation of education. To complete anything like a national organisation, the following additional departments need to be organised: A Department of Secondary Education, including under its operations three classes of schools or colleges, namely (1) Higher Literary, or Grammar Schools; (2) Technical Schools and Colleges; (3) Schools of Commerce; A Department of Higher Education, including under its supervision (1) Normal Schools for Training Teachers; (2) University Colleges of the modern type; (3) the several Universities of Great Britain.

It will be seen that in the above classification, Technical Schools and Colleges have been placed along with the Grammar Schools and the future Schools of Commerce in a Department of Secondary Education. The Schools of Commerce do not yet exist; the Grammar Schools,—and under that term are included here not only the few higher middle-class schools, but the great so-called public schools of England, frequented almost exclusively by the sons of the rich,—are for the most part maintained upon old endowments originally intended for the poor. At present they stand in no relation whatever to our primary schools. Fancy a system of scholarships to take capable poor boys from the Board Schools of London to the great secondary schools of Eton or Harrow! Yet it ought to be the recognised course to the University from the primary through the secondary school. Think of the dislocation in our national systems of education that is involved in the fact that not one per cent. of the masters of our public elementary schools, probably not one per cent. of even the head-masters of our public elementary schools, have been trained even for so short a period as one year in any of our Universities. The organisation of secondary education is a matter of absolutely vital importance in this country, but one of which, in the clamour of party politics, scarcely a syllable is heard. The proper co-ordination and maintenance of the local university colleges, though of more pressing moment, is a minor matter compared with the task of organising secondary education.

But the immediate question before us is:—What is the best form to give to the national organisation of technical instruction? At present there appear to be three claimants to the honour of directing the future organisation. 1. The City and Guilds of London Institute, who have a claim by virtue of being, as it were, in possession of the field, by virtue of the large sums which they have expended upon the promotion of technical instruction, and by virtue of the fact that they have already, in their scheme of technological examinations, the germs of a national organisation. 2. The National Society for the Promotion of Technical Education, a body recently formed under the presidency of the Right Hon. the Marquis of Hartington. The claims of this body cannot be based upon anything that it has yet done, or upon the intimate knowledge of the subject possessed by its members, who are mostly eminent politicians. It is, nevertheless, a very powerful body; and its appearance upon the scene at this juncture should be considered as an important factor. 3. The Department of Science and Art situated at South Kensington.

The City and Guilds of London Institute has during the decade of its existence accomplished so much that its claims to be left in charge of the organisation are very strong; they would be stronger still if it were clear that its resources, great as they are, and generously as

they have been provided, were adequate to the permanent maintenance of the immense work now begun. The maintenance of the work it has undertaken will soon overtax its present means. Supposing that no increase is made in the grants to the Central Institution, and to the Finshury Technical College, still the Technological Examinations must be maintained. Last year they cost over 4,000*l.*, this year nearly 5,000*l.*, next year it will be 6,000*l.* In the meantime the available funds are decreasing. The Grocers' Company, which contributed 2,000*l.* per annum, now contributes only 1,000*l.* The Corporation of the City of London, which formerly contributed 2,000*l.* per annum, last year gave only 1,000*l.*, and has not yet sent any contribution for the year 1887. Under these circumstances,—unless, as can scarcely be expected, the generous contributors are prepared to capitalise their grants, it can hardly be said that the permanence of their organisation, even on its present scale, has been secured. It is not for me to suggest the ways and means, but it seems to me that an organisation that has shown such splendid promise should not be lightly thrust aside from taking charge of the work it has begun.

A powerful bid for the future management of technical instruction was made by the Department of Science and Art during the last session of Parliament, in the introduction of the abandoned Technical Instruction Bill. To understand aright the real importance of this move, a little knowledge of the operation of the Science and Art Department is requisite. It is notorious to all who have had anything to do with the South Kensington organisation, whether as students or teachers, how completely stereotyped are all the methods and ideas of that Department. Their training in art appears to be based upon the assumption that all originality must be ground out of the student by putting all students through the same mill. In science their assumption appears to be that any man who has passed an examination in a subject is fit to teach that subject; and that every graduate of an English university is fit to teach every subject in the whole round of the sciences. (See the Regulations in the Official Directory of the Department of Science and Art, July 1887, p. 31, Article 10.) They draw up a syllabus of twenty-five subjects called "Science Subjects," and refuse to recognise even the existence of any science teaching that does not fit to their artificial classification. Optics is not a science unless taught along with heat and acoustics. Heat is not a science unless taught along with optics and acoustics. Teaching about the steam engine is science; but teaching about the gas engine or the electric motor is not! There is a Government grant for teaching the one; there is nothing for teaching the others. The subjects must be taught in a cut-and-dried fashion on the syllabus prepared by the officials, quite irrespective of local industrial applications. Everything seems to be done that could well be done to prevent able and independent instructors from earning grants upon the successes of the best pupils, and to encourage the success of the mediocre "science teacher" in cramming mediocrities of his school for examination in a host of miscellaneous sciences. Cases have come under my personal knowledge that illustrate the system. In one, a most accomplished English chemist, trained during several years in the best laboratories in this country and in Germany, was disallowed from earning, on his successes as a teacher, grants which would have been allowed without hesitation had he been either a Master of Arts of Oxford, a Bachelor of Theology of Darham, or even the holder of a South Kensington Certificate in Chemistry. In another case, an accomplished engineer and draughtsman, who had served his time in the great firm of Maudslays, and who had occupied every post in engineering works up to manager, was disallowed as a teacher of machine construction and drawing because he had never passed the South Kensington examination, whilst at the same time any Board School teacher who had passed that examination was recognised as competent to teach, though he might never have been inside an engineer's drawing office in his life! Nor are the absurdities in the treatment of art less patent. A single example will suffice. At the recent exhibition in South Kensington Museum of the works which had won prizes in national competition, there were shown some wood-carvings executed

THE ARCHITECTURAL ASSOCIATION'S "SKETCHING CLUB" SCHEME.\*

"Our Sketching Club Scheme" is an organisation for assisting architecture students in their sketching tours. The method proposed to be adopted is a complete system of advisers and local representatives which, for lack of better names, we had called *consuls* and *vice-consuls*, the titles used for similar officials in the Cyclist Touring Club, an important organisation to which we are indebted for the first suggestions of our scheme. I may remark that we are not at all satisfied with the title of our scheme, and that some of the gentlemen who have kindly undertaken to help us strongly object to being called "*consuls*." We should, therefore, be greatly obliged if any gentleman can suggest better terms for both. The object of my paper to-night is to call attention to the movement and raise a discussion on the question of the desirability of the Association taking the matter up and making it one of its recognised methods of advancing the architectural education of its members, and in the event of this being agreed to, I would suggest the formation of a committee in order to carry on the work. And now I will endeavour to explain our scheme.

It is suggested to divide the whole of the United Kingdom into districts, following as much as possible the county boundaries, but in the case of the larger counties, of course, these have again to be divided. A *consul* will be appointed for each of these divisions, and up to the present we have succeeded in filling up twenty-seven of these, leaving twenty-five divisions to be filled up. We are in communication with several gentlemen about these places, but we make an urgent appeal to all those who sympathise with the movement to help us to fill up these vacancies as soon as possible. We have only succeeded in appointing ten *vice-consuls* up to the present, and we are particularly anxious to appoint as many of these as possible, as on them will fall the chief portion of the work, and certainly, from a student's point of view, the greatest benefit. It should, I think, be a great inducement for a student to feel that he was not only benefiting himself in his studies, but at the same time taking part in a work of permanent value, for if our scheme succeeds we hope that it will have the effect of recording in more permanent form than the perishing materials of which the actual buildings consist the architecture of our country. I think we might speedily succeed in interesting the clergy of England and Wales in our scheme. As a rule, they have a great interest in architecture, and from their position in the country they are able to afford valuable information, and often get permission to visit buildings to which the public are not admitted. The exact boundaries of the divisions cannot be defined until the appointments are made, as it is obvious that it is of vital importance to our scheme that the *consul* should have an intimate acquaintance with his district. We do not consider it a *sine qua non* that the *consuls* should reside in their divisions, and in England and Wales we have endeavoured to enlist the sympathy and assistance of the Diocesan Surveyors, and have succeeded in obtaining the consent, as will be seen, of several of these gentlemen to act as *consuls*. The following is a list of the divisions and the appointments made, and vacancies that have to be filled up:—

I.—Northern Division.

1. Northumberland.
2. Cumberland.
3. Durham—C. Hodgson Fowler, M.A., F.R.I.B.A., The College, Durham.
4. Mid York—G. H. Fowler Jones, 8, Lendal, York.
5. East York—John Bilson, A.R.I.B.A., 23, Parliament-street, Hull.
6. West York—J. D. Webster, F.R.I.B.A., 21, Church-street, Sheffield.
7. Lancashire—R. Knill Freeman, F.R.I.B.A., Bolton-le-Moors, Lancashire.

II.—Northern Central Division.

8. Cheshire—T. M. Lockwood, F.R.I.B.A., Chester.
9. Derbyshire—F. J. Robinson, F.R.I.B.A., Strand Chambers, Derby.
10. Nottingham.
11. Lincoln—James Fowler, J.P., F.R.I.B.A., Louth, Lincolnshire.
12. North Northampton and Rutlandshire—J. A. Gotch, F.R.I.B.A., Kettering.
13. Staffordshire—C. Lynan, F.R.I.B.A., Stoke-on-Trent.
14. Shropshire.
15. Leicester.

\* A paper read by Mr. H. D. Appleton, F.R.I.B.A., at the meeting of the Association on the 13th inst., as elsewhere mentioned.

III.—Eastern Division.

16. Norfolk—E. P. Willis, A.R.I.B.A., 6, Bank Plain, Norwich.
17. Suffolk.
18. Cambridge—W. M. Fawcett, M.A., F.R.I.B.A., 1, Silver-street, Cambridge.
19. Essex—Fred. Chancellor, F.R.I.B.A., 20, Finsbury-circus, E.C.
20. Huntingdonshire and Bedfordshire.
21. Hertford.
22. Middlesex.

IV.—Southern Central Division.

23. Warwickshire—F. B. Osborne, F.R.I.B.A., 13, Bennett's Hill, Birmingham.
24. Worcestershire—Aston Webb, F.R.I.B.A., 10, Queen Anne's-gate, S.W.
25. Herefordshire and Monmouthshire—E. Seward, A.R.I.B.A., Cardiff, South Wales.
26. South Northamptonshire—W. T. Brown, A.R.I.B.A., Wellington, Wellingborough.
27. Buckinghamshire.
28. Oxfordshire—F. G. Bruton, F.S.A., F.R.I.B.A., 17, New Inn-street, Oxford.

V.—Southern Division.

29. Gloucestershire.
30. West Kent—E. J. Bennett, A.R.I.B.A., 5, Harmer-street, Gravesend.
31. East Kent—H. Benstead, F.R.I.B.A., 86, Week-street, Maidstone.
32. Surrey—E. Locke, St. Michael's House, Basinghall-street, E.C.
33. Sussex—L. W. Rids, F.R.I.B.A., 7, Upper Woburn-place, W.C.
34. West Hampshire—C. R. Pink, Castle Hill, Winchester.
35. East Hampshire.
36. Wiltshire—C. E. Poating, Lockeridge, Marlborough.
37. Berkshire.
38. North Somerset.
39. South Somerset.
40. Dorsetshire.
41. North Devon.
42. South Devon—E. A. Appleton, F.R.I.B.A., Torquay, Devon.

VI.—Welsh Division.

43. Flint, Denbigh, Carnarvon, Anglesey—A. Baker, 14, Warwick-gardens, Kensington, W.
44. Pembroke, Cardiganshire, Carmarthenshire—D. E. Thomas, Haverfordwest.

VII.—Scottish Division.

45. South-east Scotland.
46. South-west Scotland.
47. East-central Scotland.
48. West-central Scotland.
49. Northern Scotland.

VIII.—Irish Division.

50. East Ireland—J. L. Robinson, A.R.H.A., 189, Great Brunswick-street, Dublin.
51. South Ireland.
52. West Ireland.
53. North Ireland.

List of Vice-Consuls.

6. West York—C. F. Terry, Buckingham Chambers, St. James-street, Sheffield.
11. Lincoln—R. Fowler, Louth, Lincolnshire.
14. Shropshire—W. A. Webb, Bomersville, Wellington, Salop; J. F. Fogarty, Priors Lee Hall, near Shifnal, Shropshire.
22. Essex—J. W. Lee, North-street, Colchester; H. Saul, Dover House, Fairport-road, Leytonstone.
29. Gloucestershire—G. W. Sadler, Junr., 6, Clarence Parade, Cheltenham.
33. Sussex—Eastbourne Division—C. O. Nisbett, A.R.I.B.A., 29, Oakley-square, W.
38. Wiltshire—C. Adye, Bradford-on-Avon.
42. South Devon—H. E. Mallet, 11, Burton-crescent, W.C.
41. Merioneth, &c.—Telfer Smith, Rhayader, Radnorshire.
46. Carmarthenshire—H. H. Moses, 55, Lower Cathedral-road, Cardiff.

With regard to the *vice-consuls* we are anxious to nominate as many for each division as will come forward. If possible they should be resident in their respective divisions, although a *vice-consul* living in London who had an intimate acquaintance with some locality in the provinces could render great assistance in connection with the central register.

The duties of a *consul* are chiefly to receive reports of the *vice-consuls* and check the information supplied by them, and supply information to students who intend making sketching tours in his division. It will be obvious that everything depends on the accuracy of the information registered, and we cannot expect all the *vice-consuls* to be equally qualified to make a good report on the buildings in his district. After this information has been checked and corrected, one of the *vice-consuls*, whose duty it will be to keep the register for the division under the superintendence of the *consul*, will enter the matter in the register and send a duplicate to the central office in London, where copies of all the reports will be filed. The form of the report should, I think, be based on the excellent examples to be found in Mr. E. Sharpe's book on the "Architectural Excursions in Lincolnshire," and to this might be added references to books which contain descriptions or illustrations of the building, a note whether the building has been measured, and, if it has been measured and not illustrated, a reference to the place where the drawing can be seen if possible. We have specially in view, as a first step, the indexing of what has been done in the way of illustrating

in the Young Men's Christian Polytechnic Classes. They were not great works of art; there was nothing really original in the design or treatment; they appeared to be ordinary subjects, perhaps a little stiffly copied, but still very creditable works. It was a pleasure to see them there, and to note that they had been awarded a medal. It looked like a new departure in South Kensington ways to see wood-carving recognised as an art, and encouraged. But this was not at all the official view. The state of official art may be judged when it is known that the medal awarded to these was not awarded to them as wood-carving at all, but simply as if they had been so much raised ornament in clay! There is the level to which the official mind can rise: raised ornament must be judged simply as a pattern, apart from the material in which it is to be executed, apart from all technical excellence. This is the very degradation of art. It is the divorce of the artist from the workman, the very thing that true technical education deprecates and seeks to remedy.

Nevertheless this body, which does not understand the first principles of technical instruction, which does not comprehend that the adaptation of the teaching to the local wants, and that the adaptation of the design to the material, are things of the very essence of technical instruction, is the body to which the abandoned Technical Instruction Bill proposed to hand over the national organisation of technical education! According to this Bill, this incompetent body was to be allowed to levy rates for the purpose of teaching to the most bookish of the scholars in our elementary schools its five-and-twenty specific science subjects, or anything else that it might choose to prescribe for the time being; and the term Technical Instruction was to be defined to mean "instruction in the branches of science and art with respect to which grants are for the time being made by the Science and Art Department, or in any other subject which may, for the time being, be sanctioned by the Department." The friends of the technical education movement may, indeed, congratulate themselves that this amazing bill was withdrawn before it reached Committee.

What, then, must be done for the national organisation of technical instruction? In the writer's opinion the first and most important point of all is to secure the creation of a real Education Department under a real Minister of Education. At present we have no Minister of Education, only a *Vice-President of Council*, whose duties appear to be extensive and peculiar. They comprise apparently the work of looking after the regulations for statute fairs and diseases of cattle, of super-vising the Elementary Education Department, and of superintending the proceedings of the Judicial Committee of the Privy Council. What is wanted is a real Minister of Education, presiding over an organisation in which the Elementary Education Department, the Science and Art Department, and the Departments of Secondary (including technical) and Higher Education, should all take their appropriate places under officials responsible directly to the Minister himself, and not to that mysterious body "My Lords of Council." No attempt by Parliament to organise technical instruction can be satisfactory unless it involves the appointment of a responsible Minister of Education, and a reconstruction of the whole Departmental machinery.

The "Empire Palace," Leicester-square, are informed that Messrs. Campbell, Smith, & Co., of Newman-street, who decorated the new Theatre, have been entrusted with the role of the decorative work at the "Empire Palace," Leicester-square, which is being done under the superintendence of Messrs. Romaine-Talbot & Tanner, architects, who designed the decoration of the Gaiety Theatre about a year ago.

A New German Canal.—In addition to the North Sea, Baltic, and the Oder-Sprea Canals, now in course of construction in Germany, a new one is under the consideration of the Government of Prussia and Lubeck for a canal between the rivers Elbe and Trave, whereby the city of Lubeck is to be placed in direct communication by water with the interior of Germany. The estimates and designs for this canal have already been prepared, and the work will, no doubt, shortly be taken in hand.

interesting buildings. Many of the best illustrations are in recent publications, such as our A.A. Sketch Book and other similar books. The professional press contains a wonderful collection of illustrations of old work, and the Transactions of other societies must be carefully searched for information. The work of keeping this index posted up to date with the vast number of publications will be a great work of itself. As the scheme gets into working order, and students avail themselves of it to obtain information, it is to be hoped that they will endeavour to measure up work that has not been previously illustrated, and it should be a point of honour with them to supply copies of their drawings to be deposited in the central office. A small collection of measured drawings exists in the library of the Institute, and some of the drawings which obtain the Architectural Union Company's prize are also deposited in the library. I think, therefore, that we could not do better than to add to the collection already begun, and I would suggest that, subject to the approval of the Council of the Institute, all the measured drawings obtained through the agency of this scheme should be presented to the Institute library, unless this scheme can be further developed, as I shall endeavour to indicate, and an imperial collection be formed at the Imperial Institute, when our scheme might furnish the section devoted to the United Kingdom. Should this scheme meet with your approval this evening, I hope that I may succeed in enlisting the practical assistance of all present as well as your sympathy, as already an enormous mass of information exists on the subject. One of our past Presidents has favoured me with the following list of books that must be consulted:—

W. Uccott's "Bibliographical Account of the principal Works relating to English Topography," 3 vols., London, 1818, 8vo. This is, of course, an antiquated book now, but the information in it, and in all works containing similar information, should be made use of, as we desire to have, first of all, as far as they can be got at in that way, the facts about each building as already shown by published works.

R. Gough's "British Topography; or, an Historical Account of what has been done for illustrating the Topographical Antiquities of Great Britain and Ireland," 2 vols., London, 1780, 4to., would thus come into notice also. R. Gough gave his books on British Topography to the Bodleian Library in 1799, and there is a catalogue of them (Oxford, 1814, 4to.).

M. J. Anderson's "Book of British Topography." The index is classified under counties. This is a comparatively new book, but refers only to books in the British Museum.

Mr. E. Sharpe's account of the churches visited in the Lincoln excursions of the Architectural Association, London, 1871, does admirably for a limited number of buildings what we wish to do for the whole of the buildings in the United Kingdom. It will be impossible (probably) to secure that every building shall be examined afresh by a competent person. It ought not, however, to be impossible to give in the great index some account of it after Mr. Sharpe's method.

"Notes on the Churches of Kent," by the late Sir Stephen Glynne, Bart. (London, 1877, 8vo.) is, of course, a very different work from Mr. E. Sharpe's, but it contains the carefully recorded views of a well-intentioned and by no means incompetent person. As edited by Archdeacon Harrison and the Rev. Scott Robertson, both possessed of good local knowledge, it is brought nearly up to date. The visits of Sir Stephen Glynne were in many instances made forty years ago and more. The book might be taken as a starting-point for the county with which it deals, the information in it being thrown into Mr. Sharpe's form or one still more approved. The size of this book may be illustrated thus:—

Mr. Sharpe's book deals with 1 + 13 + 14 + 8 = 36 buildings, and 103 — (say) 25 = 78 pages, are devoted to them, including summaries, appendix, &c., which make up a total of 152 pages in the volume, say two pages in a building. Sir S. Glynne's book deals with 312 churches in 351 pages, that is, 1·12 pages to a building. There are 129 parishes in Herts. Thus there is a piece of steady work cut out for the vice-consuls of a small county, and a fine task for the officers in a big one.

In a few "Hints on the Practical Study of Ecclesiastical Architecture and Antiquities," for the use of the Cambridge Camden Society,

4th edition, 1843, we have a form which was largely used for recording the whole of the features of a building.

In Whewell's "German Churches," 3rd edition, 1842, are some hints on methods of taking notes as to vaulting, and which would also deserve consideration.

The "Ecclesiastical and Architectural Topography of England," published under the sanction of the Central Committee of the Archaeological Institute of Great Britain and Ireland (Parkers, 1851), dealt with Oxford, Beds, Huntingdonshire, and Cambridgeshire. The method is good, and the observers were generally competent. The index of styles and lists of dated examples are good features. Domestic architecture is also brought in, as it, and, indeed, all structures, should be in our scheme.

With regard to unpublished matter, Sir Stephen Glynne had, when he died in 1874, surveyed and put on record his notes as to 5,530 churches. The Kent publication dealt with 312, leaving 5,218 not likely to be published now in any separate form.

Doubtless these papers could be obtained if properly applied for by any one duly empowered.

Mr. E. Sharpe intended to make a complete list, and give an account of the buildings in Sussex, and, I believe, did a large amount of the work (note the list of Mr. Sharpe's publications in the "Charente" Book, published by the Architectural Association in 1853). He visited all the churches in Sussex of ancient date which are worthy of notice, except two (letter of September 4th, 1853). The notes have been preserved. "The Churches of Sussex" was, I think, to have been the title of the book, as Prof. Willis on Chichester, Rev. J. L. Petit on Boxgrove, E. Sharpe on Shoreham; but the part, "The Church Architecture of the County of Sussex," by E. Sharpe, M.A., which would justify the comprehensive title, was never finished, though the publication was delayed for seven years, waiting for it.

The Ecclesiological Society, no doubt, has a great quantity of information obtained in the name of the Cambridge Camden Society, which has not been published, and, in addition to this, in the portfolios of architects all over the county lie innumerable drawings of interesting buildings; and may I appeal to them to send a post-card to me at 157, Wool Exchange, Coleman-street, E.C., if they are willing to place these at the disposal of our scheme? Practically speaking, the great bulk of this information is utterly lost to the public for want of proper indexing, and the question is, how can we make these dry bones live? I believe that by some such organisation as I have endeavoured to sketch out to-night much of the valuable work done can be made of living interest, and, in course of time, of great historical importance.

Of late years there has been a tendency to substitute sketching for measured drawings, and the result has been the production of much most delightful and interesting work; but for a register of this nature I am of opinion that, while sketchers should not be excluded, efforts should be made to obtain as many measured drawings as possible, and that there is an idea that, perhaps, after all, measuring is a better training than sketching, is, I think, indicated by the fact that the Institute has given the example of Mr. Burges's work as the method to be pursued for the Edis prize. I hope I shall not from this remark be thought to disparage sketching, but for the purposes of a register of the two I think that measured work will have the more permanent interest.

Now, when our scheme has got to work the student who has made up his mind which district he proposes to visit writes to the consul for that division and receives from him a list of the buildings of architectural interest and notes of the books which refer to the particular buildings and the number of buildings that have been already illustrated. The student is thus able to judge at once of the character of the work he is about to study, and to either read up beforehand the historical or antiquarian information that he may wish to acquire to render his studies complete or to take such books with him as will assist him in his investigations. Of course, I do not wish to recommend students to neglect those buildings that have been illustrated as I am quite aware that there are a certain number of buildings which it is almost essential that a student should study to really become efficient in his

art, but I am sure that there are many rich examples of architecture that have not been illustrated, and I can fancy the student would naturally be ambitious to venture on pastures new. From my experience, as secretary to the Annual Excursion of the Architectural Association, I know the difficulty there is in finding good and accurate information about the buildings in particular districts. Even when we have had the assistance of the local architects and the accumulated wisdom of the committee it has been the custom for some years past for the secretary to go over the ground before the excursion is arranged, and report on the number of good buildings to be found in the neighbourhood of the headquarters proposed. Now, much of this information the private student is quite unable to obtain, and it is to fulfil this purpose that our scheme was mainly started. To the student properly introduced to the consul special facilities for obtaining permission to visit buildings not usually open to the public might be granted, and generally the vice-consuls would act as guide, philosopher, and friend to the tourist; such necessary information as to board and lodging would also be supplied by the vice-consuls, and, possibly, in course of time, we might arrange tariffs like our prototype the C.T.C. The reason why the former attempts to form a register of buildings in the United Kingdom, as far as I am able to judge, have more or less been failures, seem to me to be on account of the want of youthful vitality in the undertakings, those who started them having, in the inevitable course of events, grown old and passed away, leaving no successors to carry on their work; but we hope to attract to the scheme a constant accession of young blood, so that the work being done by students for students it may, like our Association, always boast of perennial youth and enthusiastic support.

But it is always easy to create an interest in foreign missions, distance lending enchantment to the view; but "why should London wait?"

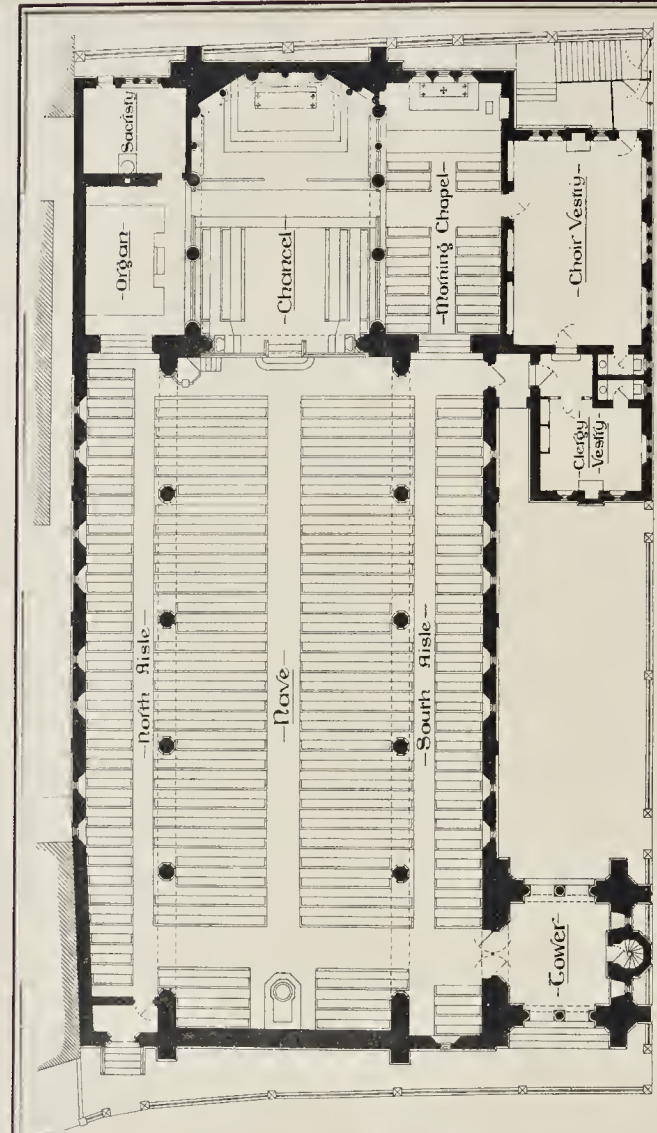

How many of us here to-night could give, say an American architect on a visit, a satisfactory list of the best buildings of architectural interest in London, the names of their architects, and the dates of their erection? It seems to me that there is enough scope in London alone to occupy the attention of a large committee for a considerable period, and how grateful the provincial students would be for carefully-prepared lists of buildings to visit for a holiday in London of fourteen days, and others for longer periods, I cannot say, but both from provincial architects and our American cousins I have had applications for such lists, and I have always regretted that I could only very inadequately supply the information required. A vigorous effort on the part of the London committee would be a splendid example to our country members, and the experience gained in arranging the register of the wonderful collection of buildings of interest to be found in London would be the best method of ascertaining what results could be obtained in the larger undertaking. When it is possible to enlist the co-operation of so many skilled hands, the individual labour need be but small. If each member of our Association living in London would undertake to work up only two buildings, we should have made a good start. Nearly all the London examples have been carefully measured, therefore it would be only necessary to obtain copies of those drawings, and register the other information, and a really splendid result could be obtained. I think also the Vacation visits might co-operate with this scheme.

A Herts organisation similar to the method pursued by the late Mr. E. Sharpe would, I am sure, most gratifying results produce, and there are still among our number a few of the original excursionists who worked under him, and who, I have no doubt, would be willing to instruct the present generation in the way in which they worked in their salad days. The annual excursion in August, too, might also take part in helping forward this work, and the week's excursion would be of great value to the vice-consuls of the district, as we invariably find that the provincial architects are glad to avail themselves of the opportunity of going round with our party, and often confess that they were not aware that so much good work existed in their particular neighbourhood. I have been kindly furnished by Mr. Holden, of Manchester, with a list of the buildings of architectural interest in the neighbourhood of that city, which has been prepared by the Man-

chester Architectural Association, and I hope to be able to enlist the co-operation of that association so that they may join in our scheme, and the information that they have already collected be made at once available for our register. I have no doubt that the other architectural societies could easily compile similar lists, and in this way a good start be made in the provinces. The historical side of the scheme would be the collection of well-executed and carefully-authenticated drawings of buildings which the inexorable hand of Time and the equally destructive hand of the restorer are fast removing from the face of the land.

In conversation with an eminent diocesan surveyor the other day, he remarked to me that much of the had restoration which had been carried out in the early part of the century in Caen stone is suffering as much from decay as the old work, and he prophesied that in a short space of time it will be difficult to distinguish between the restored work and the original work. One of the benefits of our register will therefore be to preserve the reputation of the original work; and had such a record been begun only one hundred years ago, how much might not have been saved that is already lost.

The President of the Royal Institute of British Architects, in his presidential address, remarked that "it had occurred to him that one most fitting work for the Imperial Institute would be the production of a thorough and complete record,—perfect in all its details,—of the more important architectural monuments contained in India, and the many historical sites and ruined cities to be found within the various dependencies of Great Britain and Ireland." This, no doubt, has already been accomplished to a slight extent by private enterprise and liberality, but there is no complete or national work of the kind, and I venture to hope that there may soon be found means by the agency of the new Imperial Institute to furnish the world with at least a catalogue of the historical monuments extant within the confines of the British Empire. I venture to suggest that we might help in this Imperial idea, by presenting the materials for the sections devoted to the United Kingdom. I have said that this scheme is for students worked by students, but if we might be allowed to work for an Imperial scheme as well as benefit ourselves, surely it ought to give an additional impulse to the movement. The President of the Institute referred to the fact that, unfortunately, architects as a corporate body had not been able to contribute to the funds of the Imperial Institute for reasons which many of us feel to be most unanswerable; but if silver and gold we have none, we can all help in placing on record the splendid inheritance which our forefathers have left us. The best work of the past was not true for an age, but for all time, and as we know that day by day owing to natural causes this is gradually disappearing, what more gracious part could we play than to endeavour to stay time's devouring hand and record what is left of our glorious heritage? The collected would be almost the complete architectural history of all time, and I can imagine no prouder position for the Association to occupy than to do its humble part in helping forward so monumental a work. What splendid material it would furnish for the future historian of our noble art! Again, the value to our colonists of a complete record of all the architectural buildings in the United Kingdom would be almost greater than to ourselves. We are accustomed to be surrounded by these relics of old times that, to a certain extent, we fail to appreciate them; but to those who come from new countries the opportunity of studying these works of art and comparing them in one collection would, I fancy, stimulate their enthusiasm, and they would with little trouble be able to concentrate their study of the actual buildings in the short space of time most of them have for such work, and to select those temples which best illustrate the particular branch of the art they are interested in.

The value of some such collection is so obvious that surely an appeal has only to be made to the Council of the Imperial Institute for it to be warmly taken up, and I would suggest that as soon as our scheme had succeeded in making some substantial progress, which could be done in a very short space of time, we should offer

to place the information it had collected at the disposal of the Imperial Institute as a foundation for the larger scheme, and that we should push on our own work as vigorously as possible, so as to create a good precedent for the other portions of the empire to take example by. Gentlemen, I simply suggest this ambitious view of my subject, in its ultimate development, for your consideration, but I hope that, should it not meet with your approval, it will not prejudice the simpler scheme out of which it has grown. The value of the great index of buildings of architectural interest is hard to exaggerate, and this could be compiled without the illustrations which I suggested for the larger scheme; but I venture to think that the collection, preservation, and systematic arrangement of carefully-measured drawings of old buildings is well worthy of the consideration of the Architectural Association as affording facilities for the study of civil architecture,—the leading object of the Association as set forth in the rules,—and, therefore, Sir, with your permission, I will conclude by proposing "That the Sketching Club scheme be adopted as one of the recognised methods of the Architectural Association, and that the Committee be asked to appoint a sub-committee to carry on the work."

[Of the discussion which followed we give a report on another page.]

### Illustrations.

#### REEREDOS, ST. PIERRE, AVIGNON.

ST. PIERRE D'AVIGNON is a "Monument Historique," and the most interesting of the buildings in the town after the cathedral and the Palace of the Popes. The church is said to have been founded in 433; it was, however, entirely rebuilt in 1358, and the west front, which is usually considered a *chef d'œuvre*, dates only from 1512. The reeredos that we illustrate, with the exception of the three full-length figures, which are evidently modern, seems to be of about the same age. The church possesses a pulpit, noted for its exceptional beauty, and some good pictures.

#### GATE AND GRILLE, ST. OUEN, ROUEN.

The Abbey Church of St. Ouen has sustained less damage than might have been expected, seeing that it has been twice desecrated by iconoclasts. Not only did the Revolutionists of the First Republic turn the church into an armourer's shop and erect a forge in it, but in 1562 the Huguenots made three bonfires in the building for the purpose of destroying the stalls, pulpit, organ, and priests' robes. Among other damage done at this time, the rich screens of gilt bronze in the arches surrounding the choir were destroyed. Some of the arches seem to have been subsequently built up, for it is recorded that "in 1743 the monks caused the five arches surrounding the sanctuary to be opened out for the purpose of placing in them iron grilles enriched with gilt ornaments."

The screen represented in our illustration is doubtless one of those erected at that time; it stands in the easternmost bay of the south arcade, next to the three which form the apse.

#### ST. BARNABAS CHURCH, TUNBRIDGE WELLS.

A CONSIDERABLE amount of the work of this church has been buried underground, and, unfortunately, the only site available was on an old filled-up stone quarry; consequently the foundations had to be carried down 24 ft. through the loose filling in to get to the solid rock. The church is being built of red brick, with pillars, arches, and dressings throughout of local stone, a very large amount of which is being used in the building. The chancel arcade arches are filled in with stone tracery. The roofs are to be of the best Crown Mosaic fir, which has been specially imported for this work. In the basement there is a groined mortuary. The doors and seats are to be English oak; carving will be liberally used. The work was commenced last September, and it is expected that it will be completed before the end of next year. The total cost of the building complete, with fittings, will be about 17,000*l.* Mr. Thomas Williams, of London, is the builder, and the church is being built from the design and under the superintendence of Meers, J. E. K. and J. P. Cutts, architects.

#### ARBRÖATH ABBEY.

THE remains of this interesting structure are situated near the centre of the town of Arbroath, in the county of Forfar. The abbey was founded in 1178 by William the Lion, and dedicated to St. Thomas à Becket, who was slaughtered at the high altar of Canterbury Cathedral in 1170, and canonised in 1173.

It has been the subject of much speculation why a Scottish king should dedicate one of the finest of our abbeys to an English saint; but as far as I am aware, no satisfactory explanation has been found. The Norman barons also contributed generously towards the endowment of the abbey, and in 1204 King John granted a charter of privileges to the abbot, monks, and citizens of Arbroath, "to buy and sell their proper goods, through our whole territories (England) with the exception of London, freely and without molestation."

The abbey was completed and consecrated in 1233, and was one of the richest and most magnificent in Scotland.

The drawing illustrates the south transept, known as St. Catherine's Chapel or altar, and shows the building as it now appears. The details are very delicate and beautiful, and many interesting peculiarities are to be found throughout the buildings. The stone used is of a dark red colour, which weathers fairly well, but the building has been subjected to a lot of bad usage.

The abbey possessed some famous men as abbots, amongst them being Gavin Douglas, the translator of Virgil. At the Reformation its wealth was converted into a temporal lordship, and in the seventeenth century the greater part came into the hands of the Panmure family, whose present representative is the Earl of Dalhousie. J. S. G.

#### ST. GEORGE'S (ALBANY MEMORIAL) CHURCH, CANNES.

WE give an illustration of this church, which was built from the design of Mr. A. W. Blomfield as a memorial to the late Duke of Albany.

We gave full particulars in regard to the church in the *Builder* of January 22nd and February 19th of this year (pages 165 and 304, of our last volume).

#### DESIGN FOR A CHAPEL.

This design is by Mr. J. O. Harrie, who gained the Soane Medallion in 1884 for a Design for a Theological College. The design now published was made with the idea of representing the interior of the chapel of such a college.

The drawing from which it is taken was in the Royal Academy exhibition.

#### FIFTY YEARS' PROGRESS IN ENGINEERING.

##### THE INSTITUTION OF CIVIL ENGINEERS.

THE President of the Institution of Civil Engineers, Mr. G. B. Bruce, in the course of his recent opening address, said that having entered upon his apprenticeship in the locomotive works of Robert Stephenson within a few months of the beginning of the present reign, he chose the state of Engineering then, and in the Queen's Jubilee year, as the subject of his remarks. Starting with the workshop, in 1837 machine-tools were practically unknown, reliance being placed upon the skill of the workmen, who could chip and file by hand almost as truly as the machine. It was scarcely credible, but it was a fact, that there was not a single crane in Robert Stephenson's shops in 1837, and the only steam-engine in that which was the most important locomotive shop in the world of that day was a vibrating pillar-engine, with a single 16 in. cylinder and 3 ft. stroke. About the only machine-tool, properly so-called, in the works was a planing-machine, which probably weighed about three tons. At the present time there were lathes 75 ft. long, weighing 100 tons, giving a yield of steel-turnings at the rate of 10 and 20 tons a-day, and planing-machines weighing 90 tons and operating over surfaces of 20 ft. by 15 ft. Referring to the change in the position of the workman, in 1837 the wages of an engine-erector in Newcastle were 28s. per week, working sixty-one hours; in 1887 the wages were 32s. per week, working fifty-four hours.

The increase in money earned was 39 per cent., and the rise in rate of pay per hour (from 452d. to 7-10d.) was 57 per cent. Taking into consideration that the prices of nearly all the necessaries and the ordinary comforts of life, with the exception of English beef and mutton, were considerably less now than in 1837, it was very clear that the position of the British mechanic had greatly improved during the reign of Queen Victoria, for though he only dealt with one class of workmen, the same circumstances had been at work in favour of them all. Speaking of foreign competition, the President said, "We are constantly told that the difficulty Britain has in holding its own in the markets of the world is due to our want of technical education. There is something in this, but in my judgment very little. The true cause of the difficulty is the large increase in wages and the diminution in hours of labour. It would be pleasant to think that this was not so, but I have not the shadow of a doubt that it is the main cause of the difficulty of meeting foreign competition." Turning from the workmen to the work produced by them, the President contrasted the 9 or 10-ton locomotive of 1837 with the 40-ton engine of to-day, noting also that the bogie truck, which was in the first instance sent out to America from this country, had been now largely adopted in the land of its birth, where for so many years it was not recognised. In the construction of public works great changes had occurred, mainly due to the very extensive introduction of iron and steel instead of masonry, and to the use of Portland cement concrete. These changes had had their greatest development in the case of bridges, the leading dimensions of many of the largest of which were mentioned. The substitution of iron and steel for brick and stone was not, however, in his view, an unmixed advantage. Whatever the cause, the graceful and time-honoured arch had largely given way to a substitute which had neither grace nor beauty about it, and which should therefore be avoided, except where the physical conditions to be obtained could not be secured by the adoption of the arch.\* In this respect the President ventured to think that former days were better than to-day, that the use of iron had been carried to an extreme, and that engineers would do well to retrace their steps and not use flat iron girders where a brick or stone arch was admissible. The progress of railways might be briefly told. In 1837, there were 200 miles of public railways open in the United Kingdom; in 1887, there were 13,332 miles open, representing a total capital of £28,354,254. The President dwelt at some length on the great development of iron and steel industries since 1837, the most important changes having been brought about by the inventions of Sir Henry Bessemer and Sir William Siemens, with the important modifications of Messrs. Thomas and Gilchrist, whereby these processes were now available in the case of ores formerly quite unsuitable. The manufacture of iron plates, and, later, of those of mild-steel, had enormously affected the progress of steam-shipping; for, while the tonnage of British steamers in 1837 was only 67,969 tons, it had risen in 1886 to 4,318,153 tons. In the interval the old form of engine had been completely altered, the side-lever type, consuming 6 lb. and upwards of coal per indicated horse-power per hour, giving place successively to the compound, the triple-expansion, and, lately, the quadruple-expansion engine, with a coal consumption about four times less; at the same time the effective speed of Atlantic liners had risen from about 9½ knots to 19 knots. The President next referred to sanitary engineering, in which, during the Queen's reign, the most notable advance had been brought about by the passing of the Public Health Act of 1848. The far-reaching consequences of this Act and its successors might be summed up in the fact that whereas in many cases 30 per 1,000, it was now below 20 per 1,000. In the application of hydraulic machinery to engineering, the progress during fifty years had been very great, especially in the direction of devices for the lifting and handling of goods, formerly entirely effected by human labour. At the present time, by the aid of hydraulic power, it was not uncommon for a steam collier of from 1,200 to 1,800 tons to

\* We are exceedingly glad to find that there is one engineer, at all events, who can see this.—Ed.

enter a dock at high-water, discharge her halleast, receive her outward cargo of coal, and leave at high water next day, all being done within twenty-four hours. Amongst the changes which the civil engineer had had a share in effecting during the last fifty years, none had taken so strong a hold on the imagination of the world as the application of electricity to the work and wants of man. The principles concerned were of older knowledge than the past half-century; it was mainly in the practical utilisation of this older knowledge that advance had been made. Reference was made to the electric telegraph, which had developed from the five-needle instrument of Cooke and Wheatstone, employing six wires and working at about the rate of four words a minute, to the system of multiplex and automatic telegraphy, by means of which six messages could be sent at once on one wire, with a speed of, say, 600 words per minute. Touching successively on the telephone, electric-light, and the application of electricity as a motive-power, the President hazarded the opinion that when some way should have been discovered of storing up in a more efficient and financially successful manner the unempowered forces of nature, such as the winds and tides, then would electricity become a factor in the world's life compared with which it was at present as nothing. In conclusion, the President remarked that he had purposely made no reference to instruments of war, whether guns or ships, holding that the "progress which spoke of "peace on earth" was more in accord with the sound of "Jubilee" than the development which dealt with munitions of war.

#### THE ARCHITECTURAL ASSOCIATION.

The third meeting of this Association for the present session, was held on the 18th inst., in the meeting-room of the Royal Institute of British Architects, Mr. John Slater, B.A. (President), in the chair.

The following new members were elected, viz., Messrs. S. H. White, A. Huddart, F. W. Dorman, J. S. Stuart, W. W. Kenworthy, E. Thornton, R. I. B. Proctor, F. W. Bedford, F. W. Shenton, H. Tooley, W. J. Roberts, W. B. Clarkson, E. Box, C. T. Lofts, S. B. Silcock, H. Ayling, P. Leeds, and E. P. Howard.

Mr. T. E. Pryce (Hon. Sec.) read a letter from Mr. Freeman, the Secretary of the Architectural Union Company, announcing a donation of twenty guineas to the library fund of the Architectural Association, for the purchase of books.

Mr. W. Burrell (Librarian), in proposing a vote of thanks to the Architectural Union Company, said it was an unsolicited gift, made without any advance on the part of the Association.

Mr. H. W. Pratt seconded the vote. The Chairman, in putting the motion, said the gift was a most acceptable one, as the number of books, especially in the lending library, was none too great. The resolution was then carried by acclamation.

The Chairman said that for the last few months the Carpenters' Company had been forming a library of works of reference, chiefly connected with carpentry, but including many others connected with building, and also a lending library. He had received a communication from Mr. Banister Fletcher, one of the Wardens of the Carpenters' Company, stating that any member of the Association furnished with a letter of introduction from the Hon. Secs., or with his ticket of membership, would have the advantage of using the reference library, and he able to take home books on paying a deposit of 5s., to be returned when the book was brought back.

Mr. F. R. Farrow (Hon. Sec.) announced that on the 15th inst. a meeting of the cycling members of the Architectural Association was held at 9, Conduit-street, when a resolution was passed to the effect that it was advisable to form a club to be called "The Architectural Association Cycling Club," having for its object the combination of architecture and athletics, by instituting cycle runs to places of architectural interest. It was further resolved that the subscription should be merely nominal. Mr. Herbert D. Appleton had been elected Captain, the Hon. Sec. being Mr. Leonard V. Hunt, 35, Queen Victoria-street, E.C. The meeting stood adjourned until December 5th. Members of the Architectural Association wishing to join the Cycling Club were requested to send their names to the Secretary.

Mr. H. D. Appleton then read a paper entitled "Our Sketching Club Scheme," which we print on another page.

Mr. J. A. Gotch seconded the motion with which Mr. Appleton's paper concluded. To make an index, he said, such as Mr. Appleton had foreshadowed, of all the references that had been made to buildings, was a task at the thought of which many men might quail, though such things, of course, could be done by the exercise of time and patience. On the other hand, the first aspect of the question, viz., the keeping of a list of buildings, would seem to be quite or nearly feasible. He would have great pleasure in undertaking the consularship, or whatever the post might be termed, of the district in which he resided. He believed that in that particular district it would be possible, first of all, to tabulate all the towns and villages, and then from personal knowledge to put down all the most notable buildings. It would be a difficult task to sift the good information, as many of the books were now out of date, and the illustrations were only of interest from a historical point of view, and as showing how wretchedly people used to draw (laughter). It was also difficult to obtain reliable information even from local architects and parsons. The latter, as a rule, would probably be found to be animated with an ecclesiastical and Gothic feeling, and would know nothing about domestic work, despising, or holding of little account, anything Jacobean. What they had to do, therefore, was to obtain the assistance of men of catholic mind, who would be willing to give information about anything, say from the prehistoric boat discovered at Brigg, down even to post-Reformation work.

Mr. F. T. Bagally proposed a vote of thanks to Mr. Appleton for his paper. The scheme seemed to be a most excellent one. The ordinary guide-books were nearly worthless for use when on a sketching tour, while such a list of buildings as was now proposed would be most helpful, especially if means were used to indicate the different degrees of importance.

Mr. S. F. Clarkson seconded the vote of thanks to Mr. Appleton.

Mr. F. M. Elgood said he thought that sketching tours might be started in connexion with the Cycling Club now about to be formed by some members of the Association.

Mr. W. Randolph remarked that he would be ready to contribute his quota of information regarding the district with which he was acquainted, viz., South Yorkshire.

Mr. H. W. Pratt suggested that the consuls and vice-consuls should be asked to supply information to head-quarters as soon as possible, so that it might not be necessary for students going to their several districts to trouble them. It would be well, too, if the consuls could in some way furnish information as to how certain buildings could be inspected, and if possible get permission for students and others to measure, sketch, or inspect the buildings. He would also advise that, say once a month, a district should be taken up and the information published in the "A. A. Notes." By that means the information would, in course of time, be available for reference, and would save people going over to head-quarters for it. The great indexing scheme would doubtless furnish work for several generations, and was rather an appalling task to talk about, let alone to commence upon, besides which much of the information got by the expenditure of considerable labour would not be of much value. He would, therefore, rather see an index attempted comprising fewer publications, but which might be the nucleus of a larger one. He was glad that stress had been laid upon the fact that the Architectural Association was the body best fitted to deal with such a task, because it was only young men who could give time to measuring work. When they got older and were engaged in practice they would have little time for such work; therefore it was most desirable that those who were in their articles should devote their time in measuring.

Mr. F. R. Farrow said he believed it would be necessary to centralise the information obtained, so that members could learn what they desired without troubling the consuls.

Mr. T. E. Pryce thought that active parties of cyclists might very well fish out a great deal of information which might be sent to head-quarters without troubling the consuls. He would like to see the scheme carried out in its integrity, but it was a difficult matter to draw the line as to what were the important

buildings in a particular locality. In a weak moment, a few years ago, he undertook to do something of the same kind for a local society, but he found, to his astonishment, that there was work for a long life-time in that one district alone.

Mr. Clarkson advised that discrimination should be used from the first with regard to the list of buildings. The index, in its main features, might be in existence in a couple of years, and could be added to as additional information came in.

The Chairman spoke of the scheme as one of great value, and referred to the part which Mr. Owen Fleming had taken in connexion with it. He might say, in reply to the questions, that a Roman wall would be a fit subject to deal with, and that the appointment of consuls should be left to the sub-committee. In county histories descriptions of buildings were to be found which were suggestive of things to be looked at. He was glad to hear what Mr. Appleton had said about the measurement of old work, which was of more use to students than any amount of mere sketching. He could also endorse what Mr. Appleton had said about London, for many years ago he used to take the opportunity, at times when there was little traffic about, of roaming through out-of-the-way streets, and he was astonished at the amount of interesting bits of old work he came across. He was rather sorry to hear Mr. Fratt say that as soon as an architect got into practice he had no time to measure anything. Such men as Street and others might be referred to as refusing that idea, and he hoped that many of them, even when they did get into practice, might not find it so entirely absorbing as to allow no time for picking out a little bit of work to be measured or sketched.

Mr. Appleton's motion was then unanimously agreed to, as was the vote of thanks.

Mr. Appleton briefly replied.

#### THE ASSOCIATION OF PUBLIC SANITARY INSPECTORS.

THE inaugural address of this Association for the present session was delivered by Mr. Hugh Alexander (Chairman of Council), Chief Sanitary Inspector, Shoreditch, at the Westminster Town Hall, on the 5th inst. In the course of it he said,—My first duty and privilege in the position I occupy by your favour this evening is to congratulate you on the great success that has attended our Association during the past four years. Like good and enduring institutions generally, its foundations being well laid, it has grown from its inauguration steadily, but surely, in popular estimation and in the good opinion of sanitary inspectors throughout the country, until now we number 200 members, 27 hon. members, including the names of many of the most distinguished scientists of the day; and 13 associate-members, who are gentlemen of position, interested in sanitary science in various ways. We have occasion also to rejoice greatly that the movement is spreading widely all over the land. One branch, which numbers fifty-two members, has been formed for the North-Western district, with its head-quarters at Liverpool; another branch, which numbers forty-eight members, has been formed for the Midland division, with its head-quarters at Birmingham; and several others are projected in various large centres of population.

This is a record which I cannot but regard as all of promise that before long all the competent sanitary inspectors in the Kingdom will be raised from indifference, and will take their part and shoulder to shoulder with their comrades in defence of their own interest and the interests of the public, which are one and indivisible in the great cause of sanitary reform.

And now, gentlemen, as I am sure of your concurrence in my estimate of what has been done, so also I am sure of your full sympathy or a few words in recognition of our great indebtedness to our distinguished President Mr. Edwin Chadwick, C.B., not only for the prestige our Association enjoys in having at its head a gentleman whose name is honoured throughout the world as the pioneer of sanitary reform, but for most valuable active interest in the development of our cause, the full success of which promises to be a fitting crown to a long life of the very highest usefulness devoted to the interests of the State, and to the interests of our common humanity.

I would also, in your name, like to bear testimony to the worth of our late energetic Chairman, and our invaluable secretary and treasurer, and to their self-sacrificing labours in laying down the foundations, and subsequently guiding the fortunes of the Association during the first four years of its existence. It was not a light undertaking for those gentlemen in the early days of our formation, to gather together the units of our force, and to give purpose and direction to its movements. Inspectors in those times were very much like "Hal" of the wynd; every man "fought for his own hand," and no one gave effective support to, nor received help from, the disorganised army to which he belonged, and the whole force was discredited in public estimation simply and solely for want of guidance and organisation. This was our condition when these three gentlemen pushed to the front and raised the standard of "The Association of Public Sanitary Inspectors," around which we are gathered this evening. Mr. Jerram has left the chair, and the Association has already testified its high appreciation of his labours. Mr. Legg still continues, and, I trust, will long continue, in the position of secretary, which he has so long filled with credit to himself, and with signal advantage to the Association. Mr. Raymond also retains his position as treasurer, a position in which he has won the high respect and gratitude of the Association for the very able manner in which he has discharged the duties of that important office.

What legislation may be proposed in the coming session we must be prepared to examine dispassionately, and disinterestedly, from the vantage-ground of our knowledge and experience of the law as it stands, and of the changes which we perceive are necessary, that we may, so far as we are able, prevent misdirection in legislation; for we must by no means overlook the fact that it is quite possible changes may not mean improvement, either for the public or for the officers of the public. It is therefore the duty of the Association, being forewarned, to be forearmed, and your Council, taking this view of their duty, and looking forward to the time which is now drawing near, presented so far back as March, 1886, a report on "the impending changes in sanitary law," as affecting initial procedure and the powers, responsibilities, emoluments, and status of sanitary inspectors, which report was presented by a deputation, introduced by our President, to the President of the Local Government Board, and received most favourably.

Gentlemen, that report was not adopted in hot haste, in the face of a Government Bill, but in quiet deliberative council eighteen months ago. In that report, while legislation was yet far off, it was declared that sanitary inspectors were placed in positions of great responsibility, armed with totally inadequate powers to efficiently respond to the expectations of the public; and that is the case still. That the sanitary enactments were unnecessarily complicated, unreliable in administration, and not calculated to encourage zealous officers in efforts to secure prompt abatement of nuisances, and they continue so to this day. It is further declared in the Council's report that the most essential amendments required in sanitary law to secure efficient administration are:—(1) That sanitary officers should be duly qualified, and should only be removable from their position by local authorities, for misconduct, neglect of duty, or proved incompetence. (2) That sanitary officers should be held more directly responsible for the abatement of nuisances, and should be required on their own responsibility to serve notices on behalf of local authorities, requiring all necessary works to be done for that purpose at their next meeting, and if approved to be adopted, and proceedings ordered to be taken for the abatement of nuisances. Penalties to accrue from the date of inspectors' notice. (3) That more simple, stringent, and summary powers should be given for the abatement of nuisances; and lastly, that a minimum rate of salary should be enacted for sanitary inspectors.

It is pretty certain that everyone will agree to the proposition that only a properly qualified man should be appointed to the important and responsible position of a sanitary inspector; but when we come to definitions, public opinion requires guidance and direction; and, above all,

local authorities, with whom rests the appointment of sanitary inspectors, should be restricted and protected in their selection of those officers by an enactment defining and prescribing essential qualifications in candidates for that position.

The absence of any legal or authoritative judgment upon the essential qualifications of sanitary inspectors, and the results naturally arising therefrom, suggested to the members of the Sanitary Institute of Great Britain nine or ten years ago the propriety of instituting examinations and granting certificates of efficiency; and it is reported that 238 aspirants have, up to June of this year, passed those examinations, and have gone forth stamped with the certificate of the examining body as fitted to fill the position of sanitary inspectors. But as to the examination, and as to the certificate of efficiency, there exist grave doubts as to the sufficiency of the one, or the reliability of the other, as a guarantee to the public of efficiency.

It has been said by some members of the Sanitary Institute that some form of examination must be better than none; but, on the other hand, it is alleged by experienced sanitary inspectors that unless an examination is all that it should be, its certificate of competency must be misleading and mischievous. The examination of the Pharmaceutical Society protects the public against poisoning, by taking care that only skilled and properly trained men are allowed to dispense medicine. A medical officer of health must be a man who has devoted his whole life to the acquirement of medical knowledge; and a sanitary inspector, whose business is not to cure diseased bodies, but to cure disease-breeding houses, it is contended should be a man trained and skilled in building construction, so that he may be competent to detect and to correct the errors and the misdeeds of builders and builders' workmen, and even the mistakes of architects, and to diagnose and trace out the hidden causes of disease, otherwise he and the dwellers in houses will be largely at the mercy of interested persons. Can it be maintained that any man taken from any walk of life is sufficient for these things, if coached for a few months, so as to secure the certificate of the Sanitary Institute? I think not; and I am not alone in that opinion. Mr. Cubitt Nichols, the adviser of the Home Office on Artisans' Dwellings Schemes, gave it in evidence to the Royal Commission on the Housing of the Working Classes that, in his opinion, all inspectors ought to be acquainted with building construction, and that even disciplined men of good character, like old soldiers, who are sometimes employed, are of no use unless they have served in the Royal Engineers. This testimony, from a gentleman of large experience and high authority, was fully supported by Mr. Owen, the secretary to the Local Government Board, and by Mr. Edwin Chadwick, our President.

The evidence of these eminent gentlemen I may very fully supplement with the expressed opinion of the Chairman of the Council of the Sanitary Institute itself, Captain Douglas Galton, one of our honorary members, and one of our most valued friends. In his address, read at the annual meeting of the Sanitary Institute, May 29th of this year, an address full of interest and suggestiveness, there is this passage as to treatment of infectious disease:—"The occurrence of a case of infectious disease in any house should be in itself taken as an index of the possibility of defects existing, and should be *prima facie* ground for a thorough examination of the premises and the surroundings by skilled persons."

I quite agree with Captain Galton, for I must assume he means men skilled and experienced in building construction. Nevertheless,—and it is something extraordinary,—it is not required by the Sanitary Institute that candidates for its certificate shall be practical and experienced builders; on the contrary, we cannot help observing that men whose life-long avocations have not had the slightest affinity with building operations of any kind, have been successfully coached up, and have passed the Institute's examination, and are now ready at any time, with the aid of the certificate they have secured, to assume the functions of a sanitary inspector.

We all remember that this examination was instituted ostensibly to improve the status and efficiency of sanitary inspectors, but there can exist no doubt in the mind of any experienced and observant sanitary inspector that it has

missed its aim from the very first, and that its certificate, granted as it is, wholesale to men who are not acquainted practically with every detail of building operations, is delusive and dangerous to the public, and, instead of elevating the position of sanitary inspectorship, tends largely to its degradation. I adduce in evidence of that the fact that it was some time back publicly and ostentatiously announced (as a rather good thing) that a labouring man, employed on a railway, had passed the examination of the Institute. And that announcement was followed very shortly afterwards by an advertisement issued by the vestry of a large metropolitan parish, for a man who held the certificate of the "Sanitary Institute" to fill the position of sanitary inspector, and the reward unblushingly offered for the man who held that distinction, a distinction certifying that he was a fit and proper man to discharge the duties devolving upon a sanitary inspector, was 30s. per week,—that is to say, the wages due to, and often obtained by, unskilled labourers.

Out of evil cometh good occasionally, and in this instance it was really fortunate that the members of the Vestry referred to were so mean as to permit the issue of such an advertisement, for, as the result showed, they had correctly gauged the value of the certificate of the Sanitary Institute, and they demonstrated its entire worthlessness to the public, in the fact that they had no trouble in getting what they wanted, and for the money they offered.

I will make no further comments on the facts I have adduced and the opinions I have quoted than this,—that they incontrovertibly demonstrate the necessity for a proper definition by law of "the essential qualifications required in a Sanitary Inspector," and to that I will only add and submit the following questions to you, and to enlightened local authorities, and to society generally:—(1) Can the certificate of the Sanitary Institute be regarded as a reliable guarantee of efficiency in any man seeking an appointment as a sanitary inspector? (2) Does the examination and certificate of the Sanitary Institute tend to improve the status and consequent efficiency of sanitary inspectors? or does it not rather tend to degradation and levelling down to the status of a day labourer?

#### ARCHITECTURAL SOCIETIES.

**Manchester Architectural Association.**—The ordinary fortnightly meeting of this Association was held on the 15th inst., in the Diocesan Buildings, Mr. T. Chadwick in the chair. Mr. J. Corbett, Sanitary Engineer, read a paper on "House Hot-water Fittings," which was elaborately illustrated. The development was traced from the crude "set pot" or water-hox in a cooking-range, to the present cylinder, with its necessary circulating pipes, safety valve, &c. Special appliances were described for intercepting and removing deposits of lime and mud from the boiler. Necessary precautions against frost were described, and instances were quoted of collapsed cylinders, frozen pipes, damaged boilers, &c. A vote of thanks, proposed by Mr. Hodgson, seconded by Mr. Woodhouse, and supported by the chairman, was carried unanimously.

**Leeds and Yorkshire Architectural Society.**—At the second meeting of the present session of the Leeds and Yorkshire Architectural Society, an address was delivered by Mr. Basil Champneys, of London, on "Victorian Architecture and Originality." Mr. H. Perkin, one of the vice-presidents, presided. The lecturer said that architecture was very much guided by precedents, and was bound more than any other art by mechanical and mathematical laws. It would therefore be unreasonable to expect any rapidity in its development or progress. They could find but two great original styles of architecture evolved by the inventive powers of humanity,—Greek and Gothic. In public taste, which must always be a factor in the development of style, there was no guidance for architects. But, however bad the conditions were, he saw no reason for despair so long as architects were not expected to do too much. Victorian architecture had accomplished a great deal, and had formed a scaffolding for successful enterprise in the future. It had shown that the essential principles of the two great schools of architecture had been mastered. By no conscious effort of originality would real progress

come about. A vote of thanks to Mr. Champneys for his lecture was proposed by Mr. Corson, seconded by Mr. Connon, and supported by Principal Bodington, of the Yorkshire College. Referring to a remark made by Mr. Connon, Mr. Bodington said that the very essence of success lay in their having an instructed public to deal with. It seemed to him that the basis of national art was to educate the public to whom they had to appeal. Those who had seen the Manchester Exhibition had been amazed at the strength and fruitfulness of English art in painting. He could not help thinking that if they could see collected together the best architectural works of the last fifty years, it was quite possible they might stand amazed at the fruitfulness and strength of English architecture.

#### ELLIOTT'S "PERFECT SIMPLEX" METAL WEATHER BAR.

This bar is adapted for all kinds of casements opening inwards, and is applicable to existing windows and doors. As will be seen by the accompanying section, which represents the casement when closed, the lower bar is constructed in sectional shape, somewhat like the letter L, and is screwed into a groove formed in the cill, the highest side of the bar being on the outside; or it can also be screwed on to an ordinary cill without forming any groove at all. The bar is

pierced in one place at the bottom, and a hole is also bored through the cill to carry off the condensation or other water that may accumulate in the bottom of the bar. The top bar is somewhat similar in shape, but of a smaller section, and is screwed into a rebate formed on the outer edge of the casement. This bar is also pierced to convey the condensation down through the bottom rail, as shown. The lower external angle of this bar is bevelled to form a drip, which is fixed flush with the bottom edge of the rebate in the sash. The long edge of the bar fixed on the casement laps on the top of the long edge of the bar fixed in or on the cill, and forms the outside joint of the casement, consequently the short edge of the small bar touches the inside face of the cill bar.

This weather-bar, which speaks for itself as to its efficiency, is manufactured by Mr. Samuel Elliott, of the Albert Joinery and Moulding Mills, Newbury.

#### Melbourne Centennial Exhibition, 1888.

As some misapprehension appears still to exist respecting the dates fixed in connexion with the allotment of space and the opening of the Melbourne Centennial Exhibition, we are requested by the Agent-General for Victoria to state that, as at present arranged, the opening ceremony will take place on the 1st of August, 1888, and that applications for space will be received up to the 31st of December next at the offices of the London Commission, 8, Victoria-chambers, Westminster.

#### ARCHITECTURAL ASSOCIATION.

##### "OUR SKETCHING CLUB SCHEME."

SIR,—Will you kindly allow me to invite the assistance of all who take an interest in the proposal made in the paper on "Our Sketching Club Scheme,"\* either by volunteering to act as vice-consuls or, if not able to undertake the regular duties, to furnish us with particulars of any buildings of interest they are acquainted with. Any information forwarded to me at 157, Wool Exchange, Coleman-street, E.C., will be most gratefully acknowledged. It should be tabulated in the following manner:—

Subject.	Name.	Place.	County.	Date of work, or style.	Architect.	Any features of particular interest.	Remarks. Especially note if illustrated or not.
----------	-------	--------	---------	-------------------------	------------	--------------------------------------	---

We hope that the value of such a register will be sufficient to induce all who have the power to forward the movement to the utmost of their ability. HERBERT D. APPLETON.

November 21st, 1887.

#### A SYMBOLIC STONE.

SIR,—After reading the article on "Christian Symbolism in Great Britain" which appeared in your Journal for the 5th inst., I am induced to call the attention of the writer or some member of the Surrey Archaeological Society to an interesting specimen illustrative of the subject which is now lying by the roadside near Weybridge, about a mile out of the town, and close to the large-cut of the river Wey; in fact, at present it does duty as a guard-stone to prevent carts, &c., damaging the Pelican Inn.

Although broken into two pieces, it will, on inspection, be found to be part of the cover of a stone coffin, and bears carved upon it part of a cross and an inverted omega over another.

When put together it measures about 3 ft. long, and appears to have been broken where the transept of the cross would occur, so that originally it must have been about 7 ft. in length. The omegas are very clearly defined.

I was informed that it was brought out of old Weybridge Church during its restoration.

The belief that it is well worthy of an inspection by some one interested in these matters, and that it deserves a better resting-place than it now has, is my excuse for troubling you with this note.

WILLIAM GIBSON.

P.S.—I enclose a rough sketch of it as I saw it a month ago.

#### MITCHAM LINOLEUM COMPANY'S COMPETITION.

SIR,—In your Note on the above in last week's issue [p. 695] you do not make any mention that the Company reserve the right to buy any of the designs sent in, and not remunerated, at one guinea each. Now this price, for anything of a design, drawn to 18 in. by 18 in. and coloured, is ridiculously small, even for the draughtsmanship. I think if the company were to alter this clause and allow an unsuccessful competitor to give them the refusal of his designs, at a price to vary from one to three guineas each, they would obtain more designs of a higher class; for competitors must bear in mind that "many will run and there are but few prizes." V. S.

\* \* \* We have received other letters raising the same objection, which we consider a very reasonable one.

#### THE METROPOLITAN BOARD OF WORKS SCANDAL.

SIR,—Referring to Mr. Richardson's speech, reported in the *Financial News* of Saturday last, in which a Mr. Fuller is stated to have bought a book of references from one of the officials, I have challenged Mr. Richardson to give the name and address of the Mr. Fuller referred to, and I now beg to disclaim all knowledge of such a transaction.

I am most desirous that this letter should have publicity, as I am the only surveyor practising in London by the name of Fuller who is a Fellow of the Surveyors' Institution.

GEORGE J. FULLER.

**Pulpit, Truro Cathedral.**—In our issue of the 12th inst. (p. 659), the pulpit of Truro Cathedral is described as being constructed of "Hopton Wood stone, from the Wirksworth quarries in Nottinghamshire": it should have been "Derbyshire."

**The Wintners' Company.**—Mr. William Wimple, of Queen Victoria-street, has been appointed architect and surveyor to this company.—*City Press*.

## PROVINCIAL NEWS.

**Newcastle-on-Tyne.**—The foundation-stone of the new College of Medicine, Newcastle, was laid on the 3rd inst., by the Duke of Northumberland. The design of the new structure is Elizabethan, and the site is in the Bath-road. The building is planned so as to leave a quadrangle in the centre. The western and southern sides are not being built at present, but in the future will be available for the extension of the physiology department, laboratories, animal pathology department, and a wing containing a residential hall for fifty students. The college now being erected consists of the principal and north front, facing Bath-road, and the east wing. This wing contains the anatomical department. On the ground-floor is the dissecting-room, 70 ft. by 30 ft., lit by a "ridge-and-furrow" roof. Adjoining are a large locker-room and lavatory. On the same floor is the anatomy theatre (for 150 students) and professors' private room. Above is a hone room, 20 ft. by 20 ft., and another room, 20 ft. by 15 ft. There is a basement, containing a summer dissecting-room, 20 ft. by 20 ft.; two rooms, 41 ft. by 30 ft., and 30 ft. by 28 ft.; a mortuary and infectious rooms, with private yard; also a heating vault, coal-cellar, store-rooms, &c. The walls of this wing are lined out with glazed bricks. The main front contains the entrance, in the centre under a tower, with oriel window corbelled out above the archway. On the right and left are rooms for the porter and registrar. The remainder of the ground-floor is occupied by the council and professors' room, 35 ft. by 25 ft., with a large hay window; a materia medica room, 25 ft. by 25 ft.; and a smaller lecture theatre, 38 ft. by 25 ft., having a private room for the professor and a dark room opening from it. An oak staircase, with double flights of steps, leads to the upper floor, which contains the library and examination hall, 80 ft. by 35 ft., and the museum, 60 ft. by 35 ft. The mullioned windows are being carried out in stone, and the walls and dressings in red bricks and terra cotta. The architects are Messrs. Dunn, Hansom, & Dunn, of Newcastle, and the principal building contract is in the hands of Mr. S. B. Burton, of Newcastle, and amounts to 15,000*l.*, the first portion of the building being entrusted under a 2,000*l.* contract to Mr. Walter Scott, also of Newcastle. The Normanby Brick and Tile Company, Middlesbrough, have the order for the red facing and moulded bricks, and Messrs. Doulton & Co., Lambeth, the terra cotta. Mr. Relph is the clerk of works. The total cost of the building will be about 25,000*l.*

**Stourbridge.**—On the 14th inst., Earl Beauchamp inaugurated the new Town Hall at Stourbridge. The building is Renaissance in style, the material used being red brick, with terra-cotta for the ornamental work. There are two main entrances from Market-street, and one for artists, as well as one from Smithfield to the back of the room. The hall is 76 ft. by 46 ft., and in addition it has a stage 34 ft. wide by 26 ft. deep. The height to the ceiling is 38 ft. A gallery at the opposite end of the stage will accommodate about 200 persons, and the floor of the hall will seat over 500. The doors have been fitted with double axle hinges, and there are eight exits from the hall to the corridors and six external exits. Cloak rooms, lavatories, and other accommodation, have been provided. The hall is lighted by ten windows, five on each side, of cathedral tinted glass, in stone mullions. The building is heated by hot-water pipes, supplied by Messrs. Jones & Atwood. In addition to the Town Hall the Commissioners are building in connexion with it, and of uniform design, a suite of public offices. The Commissioners' Room, which is to be 38 ft. long by 21 ft. wide, will have a strong room attached. There will also be offices for the Town Clerk, collector, surveyor, and other officials. One of the entrances to the Town Hall has been carried upwards so as to form a tower 100 ft. high, connected with which is an open balcony 55 ft. high. At the back of the public offices there will be the new fire-engine station, and this will be accessible from Smithfield. The total cost of the hall is about 4,500*l.*, and that of the Town Offices and Corn Exchange is estimated to be 2,400*l.* more. The architect is Mr. T. Robinson, of Stourbridge, the contractor being Mr. J. Guest, also of Stourbridge.

## DISSENTING CHURCH-BUILDING NEWS.

**Honor Oak.**—Two memorial stones of a Baptist school-chapel at Honor Oak, between Peckham and the Crystal Palace, were laid recently. The building will consist of a school-chapel measuring 61 ft. 6 in. by 32 ft. 6 in. inside, having a partly open-timbered roof and ceiled at a height of 25 ft., with inner and outer front lobbies, all doors opening outwards; and a vestry, 10 ft. by 12 ft., &c. The style is Early Gothic, and the materials to be used externally are red brick with Bath stone dressings, and slated roofs. The contract for the chapel has been taken at 1,093*l.* by Messrs. F. & H. F. Higgs, of Loughborough Junction. Dwarf walls and iron railings are to be erected around the whole of the site, upon which a new church is to be erected within four years, when the building now in progress will be used as a school. This is the second chapel erected during this year under the auspices of the London Baptist Association, the first being at Cann Hall-road, Stratford, which was opened in the Spring. The architect of both buildings is Mr. George Baines, of Great Winchester-street, London.

**Newton (Leeds).**—The memorial stones of a new chapel for the accommodation of Baptists, and Congregationalists were recently laid at Newton, near Leeds. The exterior of the new building will be in the fourteenth-century Gothic, slightly decorated, with an octagon end to Chapel-town-road. In the centre of the octagon the principal entrances and portico will be placed, and above there will be an apsed end of three two-light windows, supported with flying buttresses, and finished in gables. Above the latter there will be a central clock tower with traceried lights and dials in four sides. The scheme will entail the expenditure of 5,000*l.* or 6,000*l.*, exclusive of the site. Accommodation will be provided for over 500 worshippers. The building will be well lighted and have clearstory windows. The work will be carried out from the designs of Mr. Archibald Neill, of Leeds.

**Whetstone.**—The memorial stone of a new Congregational school-chapel at Whetstone has recently been laid. The style of the building is a very simple treatment of the Early Gothic. It is faced with white bricks with Bath stone dressings, and tiled roofs. The accommodation on the upper floor consists of the school-chapel, 60 ft. by 35 ft., seating about 350 adults, with a vestry, tea-making room, &c. Two fireproof staircases lead down to the lobbies. On the ground-floor will be an infants' class-room, 25 ft. by 18 ft.; a lecture-room, 30 ft. by 35 ft., with vestry, 14 ft. by 11 ft., and five class-rooms, 13 ft. 9 in. by 9 ft. 6 in. each. A corridor 6 ft. wide leads to the lecture-room and class-rooms. It will be heated by hot water. The contract for the main building, including lighting, heating, &c., is 2,007*l.* The architect is Mr. George Baines, of Great Winchester-street, E.C., whose designs were accepted in a limited competition. The builder is Mr. R. G. Battle, of Old Kent-road, S.E.

**York.**—A new Wesleyan chapel was opened in Bishopthorpe-road, York, on the 13th ult. The building will seat about 650 persons, has been erected from designs prepared by Mr. C. Bell, of London, and is in the free Italian style of architecture. It contains, besides the chapel proper, a spacious schoolroom with fifteen class-rooms opening into it, as well as an infants' schoolroom, &c. The cost will be upwards of 6,000*l.*

## STAINED GLASS.

**Blackburn.**—Viscount Cranborne a few days ago unveiled a stained-glass window which has been placed in the west end of Christ Church, Blackburn, at a cost of about 300*l.* The window has been erected, as an inscription on it indicates, as a "Jubilee" memorial. It is the work of Mr. Swaine Bourne, of Birmingham. The subjects treated are eleven in number, eight being arranged in two rows in the lights, with architectural canopies.

**Charlton Abbots.**—The east window of the Parish Church has been filled with stained glass, illustrating Faith, Hope, and Charity. The work has been designed and executed by Messrs. Warrington & Co., of London.

**Grappenhall.**—The parish church of St. Wilfrid, Grappenhall, near Warrington, has just received a considerable addition of stained glass. The present work consists of two five-

light windows representing the "Adoration of the Magi" and "Christ with the Four Evangelists"; two four-light windows illustrating "The Feeding of the Multitude" and "Acts of Charity"; and one window of three lights. This latter window contains nearly all the ancient glass, dating from the fourteenth century, which was scattered about in various windows in the church. These pieces have now been collected, and an arrangement designed to bring them into use, so that the whole should form one complete window. These additions were entrusted to Messrs. Mayer & Co., of Munich and London.

**Longton.**—A special service has been held in St. James's Church in dedication of two two-light windows which have been placed in the chancel as a memorial to illustrate and perpetuate the life and work of the Rev. Adam Clarke, late rector of the parish. The subjects of the windows were selected by a committee, and are as follows:—1, As teaching the ignorant, "Our Lord Instructing Nicodemus"; 2, As comforting the afflicted, "Our Lord Comforting Martha and Mary"; 3, As feeding the hungry, "Our Lord Feeding the Five Thousand"; 4, As visiting the sick, "Our Lord Visiting St. Peter's Wife's Mother." Each subject has been made to run through two lights, and is framed with architectural canopies and bases of late fifteenth-century character. The work was designed and executed in the studios of Messrs. Heaton, Butler, & Bayne, of Garrick-street, London.

**Rochester.**—A three-light stained-glass window has just been placed in St. Nicholas Church, Rochester, in commemoration of Her Majesty's Jubilee. It is the gift of Mr. W. Patten-Haymen, J.P. The lights are composed of heraldic devices, with emblems, &c., a large portrait bust of the Queen being placed in the quatrefoil. A similar window for the same church has also been placed as a memorial of the late Alderman Charles Foord by the family of the deceased gentleman. Both windows have been executed by Messrs. W. James & Co., Willes-road, Kenilworth Town.

**St. Columb (Cornwall).**—St. Columb Minor Church, Cornwall, has recently been enriched by the fixing of a four-light window at the east end. It represents four of the subjects from Our Saviour's life, viz., "The Annunciation," "The Adoration," "The Baptism," and "The Saviour Blessing the Children." They are surrounded by rich floral canopy work on alternate blue and ruby grounds, the bases being in keeping. The window is to the memory of the late Mr. Thomas Nicholls, and was carried out under the superintendence of the Vicar by Messrs. Gihls & Howard, of Charlotte-street, Fitzroy-square, London.

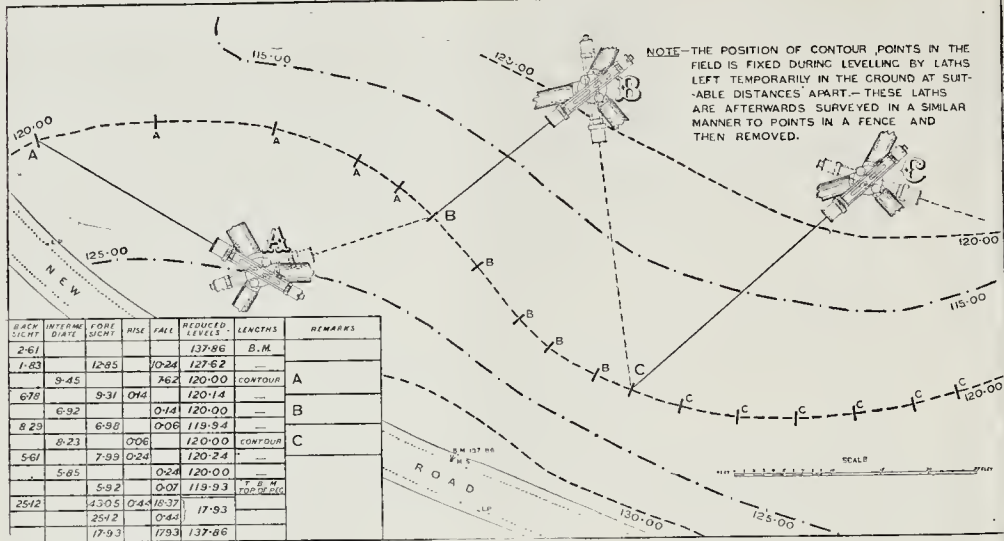

**Swansea.**—Sir John Morris, Bart., has lately had erected, at his seat, Havod, Sketty Park, a large painted window, to commemorate the Jubilee of Queen Victoria. In addition to a representation of Her Majesty and the royal symbols, the window contains the Morris arms, and the national emblems of England, Ireland, Scotland, and Wales are worked in as a groundwork to the whole. The window has been designed and executed by Messrs. Chas. Evans & Co., London.

**Wakefield.**—The west window of St. Mary's Church, Wakefield, has been filled with stained glass by way of memorial to the late Misses Scott, of St. John's, Wakefield. Figures of some of the greater prophets occupy the chief lights, with the patron saint and angels in the tracery. The work is from the studio of Messrs. Powell Brothers, of Leeds.

**Fiddrington.**—A two-light painted window to the memory of Mary Ann Hill Firth and Mary Ann Firth, relatives of the vicar, has recently been executed for this parish church by Messrs. Chas. Evans & Co.

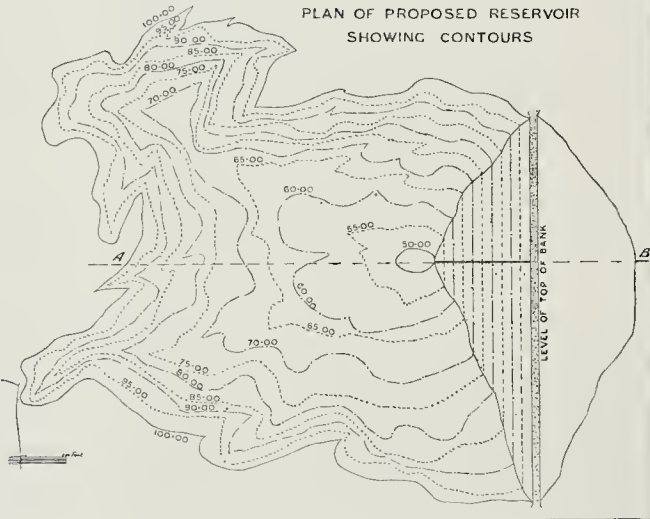

## DESTRUCTION OF A GERMAN CASTLE BY FIRE.

Last week the famous Castle of Jever, in Oldenburg, was almost completely destroyed by fire and water. The castle is the autumn residence of the Grand Duke of Oldenburg, whose arrival had been announced, and it is thought that excessive heating of the stoves of the castle caused the fire. The building, formerly the ancestral home of the Dukes of Anhalt-Zerbst, was one of the oldest in Germany, and famous for its fresco paintings and Gobelins tapestry. There is also a fine picture-gallery. Fortunately all these art treasures, as well as the antique furniture, were saved.

NOTE—THE POSITION OF CONTOUR POINTS IN THE FIELD IS FIXED DURING LEVELLING BY LATHS LEFT TEMPORARILY IN THE GROUND AT SUITABLE DISTANCES APART.—THESE LATHS ARE AFTERWARDS SURVEYED IN A SIMILAR MANNER TO POINTS IN A FENCE AND THEN REMOVED.

CONTOURING.

The Student's Column.

LAND SURVEYING AND LEVELLING.

XXII.—CONTOURS.

**C**ONTOUR plan enables the surveyor to judge the undulatory nature of any ground, and in setting out work to run lines approximately of equal level or of uniform gradient. It is prepared in the following manner. Suppose the altitude of the contour required to be 120 ft. above a given datum, and that the nearest reliable bench mark is known to be at a level of 137.86 ft. above the same datum, there is a difference of 17.86 ft. between the level of the bench mark and the required contour. The instrument is set up in a convenient position and adjusted, and if, for example, the staff reads 2.61, this is booked as a back-sight and shows the line of collimation to be at a level of (2.61 plus 137.86) 140.47 ft. above the given datum. Now the contour being 20.47 ft. below this, it is evident that the line of collimation must be lowered in position before a level staff, 14 ft. or 16 ft. long, could be read by the instrument when set up level. A fore-sight for the purpose of connecting the levels is taken in such a position that the staff is read near the top, say at 12.85, and the level is re-set in a new position to read near the foot of the staff, say 1.83. Reducing the book we find the level of the point upon which we changed the level of the line of collimation to be 127.62. The position of this point is not recorded in the level book, as it is not required to be indicated upon the plan, but we have by this means fallen from a known level of 137.86 to

a known level of 127.62, and have now only to fall 7.62 ft. lower to find the position of a point upon the required contour. Adding 7.62 to 1.83 we obtain 9.45 as the necessary reading upon the staff to give the height required, and this figure is then booked for reference in the intermediate column. If the staff reads less than 9.40 the staffman is told to go to lower ground, whereas if the staff reads more than 9.50, the staffman is told to come to higher ground. Except where extreme precision is required, the divisions indicating hundredths may be disregarded in reading the staff, but it is well to observe them in the Level Book for sake of accuracy in connecting the levels. Signals will have to be agreed upon by which the surveyor can communicate with the staffman when they are too far apart to be within hearing of one another. The position of the contour points in the field is fixed during the process of levelling by stout laths pointed at the ends, so as to be left temporarily in the ground at suitable distances apart. The number of laths required will entirely depend upon the intricacy of the ground and the size of the features. Laths are placed in positions determined by levelling at such points as will best define the shape of the contour, and these laths are afterwards surveyed in a similar

manner to points in a fence. It is advisable only to level and lath out as much as can be surveyed before leaving the ground for the day. The plan of the proposed reservoir shows contours at heights having an interval of 5 ft. between them. The altitudes are supposed to range between 50 ft. and 100 ft. Watersheds are indicated by a salient or outward bend in a contour line; watercourses by a re-entering bend in the contour line. The vertical interval at which the contours are to be levelled having been decided, a line of section is taken (sometimes called "the initial line"), upon which pegs as temporary bench marks are fixed near the level of each contour, and in running the required contours the instrument is set up so that the telescope, when levelled, may intersect the levelling staff which is held upon the initial point, or top of each contour peg in order to arrive at the reduced level to be read upon the staff for tracing the required contour. The areas of the contours enclosed can be he arrived at with the use of a planimeter (*Builder*, Oct. 29th, p. 618). The diagram indicates the method of calculating the area enclosed by the top bank contour. In this case the enclosure being large it is divided into three parts, an

one side being straight a triangle is formed in the centre the area of which can be most accurately calculated in the ordinary way by multiplying the base by half the height, as it would be waste of time to go round the boundary of any regular geometrical form with the planimeter. The two adjoining enclosures

to the triangle being irregular in outline are more accurately determined by the planimeter than by drawing "give and take lines" in the usual way.

The subjoined table gives a systematic method of drawing up the statement of capacities.

CALCULATION OF CAPACITIES.

REDUCED LEVEL.			PROPOSED RESERVOIR.				
Reduced Level.	Sq. ins. Area on paper.	Area in sq. feet.	Mean Areas.	Depth.	Cubic feet.	Content in cubic feet up to level.	Capacity in gallons up to level.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

16,701, Excavating. T. Whitaker.

This invention has for its object the application of the steam-crane machinery to excavating. On the top of a portable crane a swinging arm is swivelled. This carries an excavating bucket with a hinged or movable bottom, so as to allow the contents to escape. The bucket is provided near the top with a stirrup or bow, by which it is suspended to the hauling-chain of the crane, and is so arranged that in excavating the pull of the chain is always in a direction parallel to the face of the cut, and not direct to the jib head. Or the chain of a horizontally-moving crane carries an excavating bucket, which is guided up and against the face of the cutting by a radius rod projecting from the wagon. When the bucket is full it is swung round and emptied into a wagon behind the crane, or into any other desired place.

16,811, Door Checks, &c. H. Hoose.

This invention relates to a door check after the American pattern, but the arm, instead of being straight, is curved, and the end runs against a cylindrical buffer which gives ease and certainty of action. Mechanisms for regulating the pressure of the spring, &c., is also adaptable.

16,847, Bolts for Doors. F. H. Collins.

Instead of attaching the thumb-bit, push-piece, knob rigidly to the rod, it is by this invention allowed to have a slight rocking motion lengthways. The ends of the rod are formed two slots or recesses, one at each end of the part traversed by the thumb-bit. Into one of these slots one of the studs can fall, where it is retained by the action of a spring attached to the rocking thumb-piece. When a bolt is shot the stud nearest the fore end is engaged in the corresponding slot on the back of the thumb-piece. When it is desired to withdraw the bolt, the thumb-piece is turned so that the stud nearest the fore end of the thumb-piece can fall into the slot in which it was locked, and the thumb-piece can then slide to the other end of the rod to traverse, when the second stud falls into the corresponding slot, and is secured by the action of a spring in the same manner as the first stud.

8,939, Concrete Pavements, Floors, &c. J. & J. Crombie.

According to this invention the area to be covered is flagged with a layer of sand, and on this is arranged a system of moulding boards, which divide the area to be paved into the number of flags or slabs required. Then a layer of calico, cloth, cardboard, or some such suitable material is placed so as to make a fair and level surface, and to prevent the bed from being disturbed by the concrete when it is put into the mould. By this a level surface on both sides of the flags is ensured; the top sides of the flags being trowelled in the usual manner to make them smooth. The joints are treated with plumbago to prevent adhesion.

12,638, Flooring or Decking for Bridgework, &c. A. W. Ramage.

This invention relates to flooring or decking used in bridgework, culverts, landing stages, piers, &c., or for fireproof structures designed to bear a great strain per given area. It is impossible to describe in detail the improvements, but steel or iron in suitable segments is used, the decking being filled in with concrete or similar substance.

12,821, Weather-guard for Doors, Windows, &c. S. Pitt.

The guard which is the subject of this invention, instead of being in the usual form of a spring, is made of a cylinder or roller held by a spring, and so made as to effectually shut out draught. The inner part of the roll is elastic, while the outer portion is of hard felt or some durable substance.

NEW APPLICATIONS FOR PATENTS.

## MEETINGS.

MONDAY, NOVEMBER 28.

*Society of Arts (Lector Lectures)*.—Mr. H. H. Statham on "The Elements of Architectural Design," I. 8 p.m.  
*Local and Foreign Architectural Society*.—Mr. J. W. Cannon on "The Legal Registration of Architects." 7.30 p.m.

TUESDAY, NOVEMBER 29.

*Institution of Civil Engineers*.—Further discussion on Sir F. A. Abel's paper on "Accidents in Mines." 8 p.m.

WEDNESDAY, NOVEMBER 30.

*Society of Arts*.—Mr. E. H. Harnay on "Economic Illumination from Waste Oils." 8 p.m.

THURSDAY, DECEMBER 1.

*Parkes Museum*.—Sir Douglas Galton, F.R.S., on "Smoke and Fog." 5 p.m.

FRIDAY, DECEMBER 2.

*Architectural Association*.—Mr. F. T. Baggally on "Perspective Drawing." 7.30 p.m.  
*Institution of Civil Engineers (Students' Meeting)*.—Mr. A. W. Metcalfe on "The Classification of Continuous Railway Brakes." 7.30 p.m.

SATURDAY, DECEMBER 3.

*Association of Public Sanitary Inspectors*.—Dr. W. Collingridge, M.A., on "The Duties of Port Inspectors of Nuisances." 8 p.m.

## Miscellaneous.

**Tottenham Surveyorship.**—A correspondent writes:—"The Tottenham Local Board having advertised for the services of an engineer and surveyor, ninety-five candidates applied for the appointment, from which the following six were selected:—Messrs. F. W. Lacey, Brentford; F. Wike, Leicester; G. P. Laffan, Bridgwater; T. Bennett, Cheshunt; A. T. Davis, Stratford-on-Avon; and J. E. Worth, Burslem,—all of whom attended, with the exception of Mr. Wike, of Leicester, who had withdrawn. None of the candidates could have satisfied the requirements of the majority of the Board, judging from the fact that after interviewing them separately, they passed a resolution to select and interview six others. This treatment very naturally did not meet with the approval of the selected applicants, as Mr. Worth, of Burslem, threatened to, and Mr. Lacey, of Brentford, did, withdraw from the contest. The extraordinary resolution, however, above referred to was on the 15th inst. rescinded, and Mr. Worth was appointed Surveyor to the Board without opposition."

**Awards at the Adelaide Exhibition.**—With reference to the list of awards at the Adelaide Exhibition published in our issue of the 12th inst. (p. 684), we are asked to mention that Mr. J. F. Ebner's exhibit of mosaic, parquet, and artistic joinery, has been awarded a diploma of the first order of merit.—It should also have been mentioned that Messrs. Steven Bros. & Co., of Upper Thames-street, London, and Milton Ironworks, Glasgow, have been successful in securing the first award for their kitcheners, and the same for their ornamental and architectural ironwork, at the same Exhibition.

**British Archaeological Association.**

At the meeting of this Association on the 16th inst., Sir James A. Picton, F.S.A., President, in the chair, an interesting series of sketches of ancient buildings and recently discovered antiquities was exhibited by Mr. J. T. Irvine, the greater number being found in the neighbourhood of Peterborough. Mr. Thomas Blashill exhibited photographs of the Roman buildings at Treves. Mr. Williams exhibited some mortar of flint-like hardness, which had been sawn out of the Roodeye wall, Chester, as an example of the mortar used in its composition. There are a few fragments of Roman brick in its composition. After some other exhibits, a paper was read by the President on the walls of Chester. After referring to the differences of opinion relative to the age of the walls which have recently been put forth, the belief was expressed that the truth would be arrived at only by a critical investigation not only of the walls themselves but of the historical records. This the lecturer had endeavoured to accomplish. Commencing with the notices of old writers, many curious facts were elicited. Thus Giraldus Cambrensis speaks of the great quantity of Roman buildings which remained in his time. Roger de Hoveden, William of Malmsbury, Matthew Paris, and Higden, all speak of the walls, and the latter mentions the stones laid like the work of Hercules. Turning to the present condition of the walls, Sir James gave the results of the recent excavations. After comparing the ruins of Chester with the destruction of Anderida, which also remained desolate for many years, he referred to the continuous existence of Roman walls at both places. Turning to a series of elaborate plans showing the construction, he indicated that at all the points where excavation has been made and some others Roman masonry is visible. Speaking of one of the sculptured stones, on which the figure appears with a stole, he quoted Horace to show that stoles were worn by women were sometimes worn by men. An animated discussion followed, in which Mr. George R. Wright, F.S.A., described the fortunate coincidence which enabled the members of the Association to visit the walls during the recent Congress. Mr. Blashill referred to the construction of the Porta Nigra, Treves, in which no mortar was used, the masonry being put together with metal cramps. Mr. Loftus Brock, F.S.A., reported the latest results of the excavations, which at the Roodeye, he said, showed that the wall is backed up by 13 ft. of solid concrete.

**Engineering Feats.**—Our contemporary *Iron* says that "a very interesting engineering work is in progress at the New England Railroad Bridge over the Connecticut, north of Hartford. The new bridge, which is of steel, is to stand exactly where the old wooden one is, and the problem was how the work was to be done without interfering with the traffic. It is being effected in the following manner. A number of piles were driven, those under the eastern spans going 30 ft. into the river-bed, and being 50 ft. long. Above these piles temporary work was constructed to support the track, which was built up higher than it used to be. Then the trusses of the old bridge were removed in sections, and the old roadway remained held up by the piles and temporary work. It had been raised enough to leave a space where it used to be, and here the roadway of the new bridge is being put in. Thus the steel bridge is being built in the place of the wooden one, and when it is completed, all that remains will be to remove the elevated wooden track bed and let the trains run on the new bridge. The steel bridge will rest temporarily on the piling until its trusses are in place." To this we may add that such feats as this are not unknown in this country, though perhaps our renewals are on a smaller scale. For instance, a new iron girder bridge has been for some time in course of erection on the London, Chatham, and Dover Railway, just south of the Elephant and Castle station. This bridge, like its predecessor, carries four lines of rails. The old bridge was of iron, and its removal was necessitated by the widening of the Walworth-road at this point. The old bridge has been removed, the abutment set back some 8 ft. or 10 ft., and the new bridge is in course of construction, without raising the level or altering the course of the rails, and without any interruption of the traffic beyond the slackening of the speed of the expresses as they pass over the heavy wooden

staging or temporary bridge, which has three ways beneath it, one for foot passengers, one for the tramway line, and one for ordinary vehicular traffic. "The cross-beams which carry the longitudinal railway sleepers of this temporary bridge are so arranged that, now that the three main girders of the bridge are in position, the cross-girders are pushed in between the temporary cross-beams and connected to the main girders. When this work is completed the temporary bridge will be relieved of its duty and removed. The contractors for the work, which is being carried out under the direction of Mr. Mills, the Company's engineer, are Messrs. Yeung & Co., of Pimlico."

**Tramway Extensions in the Metropolis.**—The period has now arrived for giving notice in respect of Private Bill projects for the next Parliamentary session, which it is expected will include several applications for tramway extension in different parts of the Metropolis. In response to a memorial presented to them by upwards of 12,000 of the residents and owner of property in Balham and Tooting, the London Tramway Company are about to take the necessary steps for obtaining Parliamentary sanction for extending their lines from the present terminus at Clapham, through Balham and Upper Tooting, to High-street, Lower Tooting. From the company's present terminus the proposed extension would proceed along the east side of Clapham-common, thence along the Balham High-road, and on to Tooting, a distance of about three miles. The company will apply for powers to lay down a double line along the entire distance. In the session of 1886 a body of promoters designated the South Metropolitan Company sought similar powers. The project received the necessary sanction of the District Board and the Metropolitan Board of Works subject to the roadway being made 47 ft. throughout. This proviso caused the promoters to withdraw their application. The Harbour Board of Works will support an application for powers to extend their lines from Clerkenwell-road to the City boundary.

**The New Roman Catholic College Buildings at Tooting.**—The extensive new Roman Catholic College at Tooting, which when completed, is intended to be occupied as an educational establishment in connexion with St. Joseph's College at Clapham, is being rapidly proceeded with, the building having already been carried to the height of three stories. The site upon which the College is being erected embraces, with the grounds, an area of about 18 acres. It is known as the H. House Estate, which was some time since purchased by the Roman Catholic authorities. The estate was for many years in the possession of Alderman Venables, a former Lord Mayor of London, who occupied it as his country seat. It is bounded on the north-west side by Chrono-lane, Mitcham-road, Tooting, and extends in an easterly direction from the burial-ground of Tooting parish church to the southern boundary of Tooting Common. The portion of the site fixed upon for the college buildings forms about the most elevated part of the grounds, from which there is a commanding view southwards of the country around. The college buildings will cover a ground area of something like 25,000 ft., having frontages of about 200 ft. at 125 ft. respectively, the structure containing four stories besides a deep basement. The elevations are faced with red brick and stone dressings. Mr. W. Harvey, of Whitehall-place is the architect, and Messrs. Higgs & Hill are the contractors, the amount of their contract being about 30,000. The cost of the land is said to have been a little more than 15,000.

**Public Baths at Batterssea.**—The Bathing Vestry are about to erect public baths for the parish. The site fixed upon forms a portion of the Latchmere Allotment estate, about the centre of the parish. The baths will consist of two spacious swimming-baths, one first-class and one second-class, the arrangement being that on certain days in the week they are to be exclusively set apart for females. There will also be provided ten first-class and thirty second-class slipper baths, for males, while for females there will be six first-class and fourteen second-class baths of a similar character, the entire number of private baths provided being sixty, with a corresponding number of dressing-rooms. The designs for the baths have been prepared by Mr. Rowland Plumbe, architect. The estimated cost of the baths, including furnishing, is 15,000.

**PUTNEY.**—For new cemetery works, for the Burial Board of the Parish of Putney. Mr. J. C. Radford, C.E., surveyor:—

Geo. Belle	£10,290 0 0
Wilson & Wain	10,000 0 0
A. Kellie	9,376 0 0
A. H. Lisagann	9,100 0 0
T. Grant	8,900 0 0
Richard Mayo	8,740 0 0
W. R. Williams	8,650 0 0
G. Ogenton	5,443 0 0
G. Nesl	5,100 0 0
J. G. B. Marshall	5,000 0 0
Tomes & Wimpey	7,786 0 0
Nowell & Robson	7,725 0 0
W. Blackmore	7,700 0 0

Chas. Killingback	8,960 0 0
A. Lucas (accepted)	8,629 10 0
MacKenzie (withdrawn)	5,906 0 0
S. Saunders (withdrawn)	5,882 4 0

**SOUTHBOROUGH.**—For the enlargement of Christ Church, Southborough. Mr. Theodore K. Green, architect:—

Strange & Sons	£1,838 0 0
Gallard & Sons	1,798 0 0
J. Jarvis	1,693 0 0
Walls	1,612 0 0
Canby	1,393 0 0
Pannett & Sons	1,287 0 0

**SOUTHEND.**—For the works required in the erection and completion of barrack buildings, for the Salvation Army, in Clarence-road, Southend. Mr. E. J. Sherwood, architect, 101, Queen Victoria-street, E.C. Quantities by the architect:—

Schwartz & Co., Chelsea	£1,639 0 0
W. Watson, Ilford	1,615 0 0
Bater & Wiseman, Southend	1,420 0 0
J. Mandav, Wimbledon	1,420 0 0
E. Darke & Son, Southend	1,380 0 0
F. E. Woodhams, Southend	1,360 0 0
Newton & Ide, Clapham Common	1,349 0 0
J. W. Steward, Southend	1,330 0 0
G. Stephenson, Bishopgate-street	1,324 0 0
Wm. Fout, Henlon	1,310 0 0
Multon & Wallis, Gravesend	1,243 0 0
E. Jarvis, De Bary	1,183 0 0
F. J. Coombe, Laytonstone	1,140 0 0

**SOUTHWARK.**—For alterations at No. 194, High-street, Borough, S.E., for Mr. E. Leftwich. Mr. J. W. Brooker, architect:—

Jackson	£551 0 0
T. Gilbert	484 0 0

**WALWORTH.**—For repairs and decoration at the Cottage of Content public-house, for Mr. L. Rehm. Mr. J. W. Brooker, architect, 13, Railway Approach, London Bridge, S.E.:—

Jackson & Todd	£238 0 0
A. Tompkins	235 0 0
T. Gilbert (accepted)	230 0 0
J. O. Rickardson	168 0 0

**WANDSWORTH.**—For pumps, &c., at the new work-house of the Wandsworth and Clapham Union. Mr. T. W. Aldwinckle, architect, 2, East India-avenue, Leadenhall-street:—

Wentworth & Co.	£1,295 0 0
Hayward Tyler & Co.	950 0 0
Shand, Mason, & Co.	670 0 0
S. Owens & Co.	610 0 0

**WINCHMORE HILL.**—For building five huts and nurses' home at the Northern Hospital, Winchmore Hill, for the Metropolitan Asylums Board. Messrs. Pennington & Bridgen, architects:—

Ward & Lambie	£5,755 0 0
Grover & Son	5,932 0 0
Lambie	5,519 0 0
Scrivenor	5,493 0 0
Dearing & Son	5,484 0 0
Wall Bros.	5,269 0 0
Johnson	4,960 0 0
Lascelles	4,055 0 0
Norris & Luke	3,877 0 0

[Architects' estimate, £5,250.]

**\*\* SPECIAL NOTICE.**—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than 12 Noon on THURSDAYS.

TO CORRESPONDENTS.

Registered Telegraphic Address, "THE BUILDER, LONDON."

W. P. B. (we cannot continue the correspondence under the circumstances)—W. D. we will give notice for publication received other letters on the subject.—D. & R.—J. S.—A. L. R.—"Architect" (if you mean to make the matter, better take legal advice. We do not think it is for the dignity of the profession to give public prominence to disputes of that kind)—H. I. N. (should send amount)—E. & Co. (two later).

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline printing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications.

Letters or communications (foreign correspondence) which have been duplicated for other journals, are NOT DESIRED.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other strictly business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER, LONDON."

**CHARGES FOR ADVERTISEMENTS.**

SITUATIONS VACANT, PARTNERSHIPS, APRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 1s. 6d.  
Each additional line (about ten words) ..... 6d.

Terms for Series of Trade Advertisements, also for special advertisements on front page, Competitions, &c., are NOT DESIRED, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR lines (about THIRTY words) or under ..... 2s. 6d.  
Each additional line (about ten words) ..... 6d. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY.

Stamps must not be sent, but all small sums payable by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDINER, Publisher, Address: No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.

**SPECIAL—ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY MORNINGS.**

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to advertisements, and strongly recommends that the latter COPIES ONLY should be sent.

PERSONS advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, Covent-garden, W.C., free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

AN EDITION Printed on THIN PAPER, for FOREIGN CIRCULATION, is issued every week.

FIRE BRICKS.

STOUBRIDGE BEST FIRE BRICKS, 80s. M.  
Ditto FIRE GLAZ, 25s. a ton.  
Also in Stock: Fire Lumps, Fire Tiles, Boiler fittings, and Fire Covers.

### Architectural Drawing.

HIS delightful subject has been treated in a most practical manner in the beautifully illustrated work\* by Mr. Phené Spiers, who, as Master of the Architectural School at the Royal Academy, has a kind of special and official call to deal with this subject as a teacher; not, however, that there is anything "academic," in the restrictive sense of the word, in Mr. Spiers's book. We do not in England, fortunately, take that one-sided view of architectural training which in the French and German schools leads, as the author observes, to the study being limited to a full acquaintance with the accepted forms of Classical architecture, and their accurate and correct delineation; and Mr. Spiers's book is catholicity itself in this respect, the illustrations offered (mostly reproduced from the drawings of eminent architects) ranging from the most formally correct of Classic elevations to one of the most picturesque of Mr. Ernest George's tinted sketches, and including a considerable number of fine reproductions of pencil perspective drawings of Mediaeval work. The book is, therefore, in no way limited to the drawing-board and T-square class of drawings, though the consideration of these, under the subject of "Office Work," naturally forms an important section of the book.

Architectural drawing occupies a peculiar position among the various forms of draughtsmanship, owing to the fact that in architecture the drawing itself is not the ultimate end and object; the drawing is not the work, but only the representation of the work. This is most emphatically the case, of course, in regard to geometrical working drawings, which are hardly drawing in the usual sense, and the object of which is to show the facts of the building to be produced in such a way that other persons who have to work under the architect can assimilate them; and even a perspective drawing of a proposed building, though it may be so executed as to have considerable artistic effect and interest, is still not an end in itself. It is in this great measure which renders the architectural room at an exhibition so comparatively uninteresting to the majority of spectators; in the pictures, they have been looking at the artists' real work: in the architectural drawings they are only

looking at the shadow, as it were, of the actual work. And for this as well as other reasons, architectural drawing becomes to the outsider a kind of mystery of which he has not the clue; while to the architect it is a "mystery" in the old sense, a special professional accomplishment with a method and an interest of its own, appealing to the trained eye alone. It is one curious result from this, that a very practised artist in figure-drawing or landscape very often cannot delineate buildings correctly; that you will see perhaps in the work of a landscape painter of genius, who can draw and model the contours of a mountain with great exactitude, a column of a proportion and design such as no column ever had; and that a master of figure drawing cannot get a portico and its columns into perspective without having a model made of it. On the other hand, to the architect there is a special pleasure and interest in his methods of delineating his work, which often gives rise to a style of drawing specially architectural in its basis and feeling, even when it is not employed upon strictly architectural subjects. Mr. Spiers quotes an excellent remark on this point from Professor Ware, of Boston,—“Architectural drawing lies between mechanical and artistic draughtsmanship, partaking of the nature of both, but using a different intellectual method from either; I mean that an architect not only does a great deal of free-hand work when working with his instruments in a way which an engineer would consider very unworkmanlike, but that he uses a great deal of geometry in his free-hand work, in a way that an artist would find impossible. He employs, when sketching, the same intellectual processes as if he had in hand his compasses and set-square, instead of pencil and brush, correcting and justifying his judgment by purely architectural considerations.” This is very well put, and rather novel. As an example of the truth of it, we might refer especially to the sketches of two architects, Burgess and Viollet-le-Duc; the latter especially. Every thing he drew, even figures as adjuncts to his drawings, or the sketch designs for animals and foliage to be carved as decorations on some chateau he was restoring, took naturally and insensibly an architectural precision of line, and a tendency to such an outline as would fill up a geometrical space.

Architectural drawing groups itself naturally, it would seem to us, into three classes: drawings made to show what a building is to be; drawings made as a record of what it was, and to gain information; and drawings made with the object of realising on paper the picturesque qualities of a building, making a picture of it, in short. We are not including in this category the usual run of architectural per-

spectives, the main object of which is really to show what the building is like to those who do not understand the geometrical drawings, and which, to say truth, do not very often rise to the level of really artistic works of the higher order; it may, perhaps, be said that they could not do so without losing the clearness of definition of every portion which is their main practical object. We refer to such works as etchings of architectural subjects; works in which the knowledge of the architect is combined with the feeling of the artist, but which aim at giving what may be called the poetic effect of buildings rather than their architectural detail. This class of work, beautiful and fascinating as it is, does not, however, come properly within the scope of an essentially didactic treatise like that of Mr. Spiers; and his threefold division is into “Students' Work,” “Office Work,” and “Outdoor Work.” As far as the latter section includes the measuring and drawing of ancient buildings, it might also be called “students' work,” as its main object is study; but the “students' work” in Mr. Spiers's division of the subject means the elementary study of drawing and design, which every student has to go through before he can take any useful part in the second section of the subject,—that of office work. In his preface Mr. Spiers comments on the fact that in England the student is expected to assist in making working drawings almost as soon as he enters an office, and that thus the regular course of study in drawing which the pupil goes through in foreign schools he must in England go through only in a hap-hazard manner. Mr. Spiers accepts the fact without expressing any decided conclusion in regard to the respective merits of the foreign and home system, or, rather, of the foreign system and our own no-system. Some practical recommendations are given in regard to paper and drawing instruments, and the first section of this part of the work is devoted to draughtsmanship. Freehand drawing from the round is recommended as a necessary part of the student's work. In regard to outline drawing, there are some remarks which we should be disposed to query; among others, that quoted from Mr. Burgess, *re* the question of thick or thin lines:—“If the draughtsman uses thick lines, he will be induced to make his design massive and simple, and not give way to the vanities of crockets and pinnacles, because he will find that he has hardly got space to put them in.” Surely this is putting the cart before the horse; the designer's intention should govern the drawing, not the drawing the intention. Then two or three habits in regard to line drawing are referred to which we are inclined to think are really more a matter of fashion than is sometimes sup-

\* Architectural Drawing. By R. Phené Spiers, F.S.A., architect. London, Paris, New York, and Melbourne: H & Co. 1897.

posed. The practice of "black-lining" Mr. Spiers dismisses with costs, as all the artistic draughtsmen do dismiss it now; we do not defend it, and we agree that it is mechanical; but it has its practical use in defining the meaning of the lines in a geometrical elevation. What the author says, however, about it leading to inaccuracy by affording a means of covering defects, is partially true. The same objection would apply, however, to Mr. Stannus's system of "mass-lining," illustrated in an elevation in which the portions which come forward nearest to the eye are drawn uniformly with a blacker line, leaving the rear portions in a thinner line; we also observe that he draws a black line down both angles of a projecting wing which is in the middle plane of the elevation; this seems to us as "mechanical" as black lining on one side only, and not so effective. Mr. Spiers refers to the brilliancy given to a drawing by carrying through only two or three of the lines of a moulding, leaving the others visible only at the junctions or mitres; this is a modern method which has its merits, but which is getting rather abused just now, and it seems to be thought necessary to leave out half the lines in a drawing sometimes, to give it a sunlit effect. It is pretty, but it is a little bit tricky, and people will tire of it presently. Only a little while ago the young draughtsmen of the day settled that it was nefarious for an artistic architect to use a ruler in any perspective drawing, and all lines were to be drawn by hand. Now this is revoked, and some of the cleverest of the younger draughtsmen of the day, who certainly consider that they know all about it, send us perspectives with all the leading lines, vertical at any rate, religiously ruled. Which is right? We incline to the non-ruling side; and presently we shall probably find the fashion has gone round to that again.

Mr. Spiers devotes some space to the description of the French method of tinting elevations with shadows geometrically set out at an angle of 45°, so that the shadow really gives the extent of the projection. We agree with him that the effect of this method of getting up an elevation is charming when it is well done, but doing it well is a long business; and for practical purposes it may be a question whether the game is worth the candle. The builder who carried out the building would, after all, look to the plan and section for the projection, and not to the shadowing. Some very useful hints are given on the prosaic operation of laying on flat colours; and we also particularly agree with the recommendation that colours used on plans to distinguish material should, as far as possible, be arranged with some degree of harmony, partly on the ground (not an imaginary one) that constant gazing on crude combinations of gaudy colours has a tendency to hunt the student's sense of colour. The heated reds and Indian yellows with which some people get up their walls and floors and woodwork are enough to give one ophthalmia.

In the chapter on perspective the author rightly puts first, as the object of perspective, to assure the designer of the correctness of his design, and in another section he dwells on the importance of sketching designs in perspective. "There are some students who, when making elevational or sectional drawings, see, as it were, all round their designs; there are others to whom the drawing is merely a plane surface covered with various lines." There are some, we may add, who are nominally out of the student class, of whom this may be said. The author describes the use of the centroline, and also of what he truly calls the "complicated instrument" invented by a Frankfort architect for mechanically producing a perspective from a plan and section. A drawing and description of this was sent to us some time ago for notice, but we thought it, though clever, too unpractical to be worth wasting space over. Mr. Spiers admits that the outline made by it "must be finished by an artist"; and our opinion is that a draughtsman who could not make an outline perspective from plan and sections better and in less time than this cumbersome apparatus

would enable him to do it, had better retire from perspective business. These "perspective-made-easy" contrivances are of no use except for dances, and the less they draw the better. There is another paragraph in the chapter on perspective which gives us pause, and which we must quote entire, lest, peradventure, we misrepresent the author:—

"The distortion to which we have referred in paragraph 49 [the distortion of near objects in a perspective including too large an angle] is most apparent in spherical and cylindrical objects, such as domes, corridors of circular towers, columns, &c. A round ball, for instance, can only be rightly represented when its centre lies actually on the point of sight; at any other point on the drawing it becomes elliptical. This can be easily proved by supposing the ball to be enclosed in a cone, the apex of which is on the point of sight. The intersection of this cone by the plane of the picture will only be a circle when the axis of the cone is at right angles to the plane [the italics are the author's], and the only point where this occurs is on the horizontal line through the point of sight; in any other position the section is an ellipse."

We certainly opened the eyes of astonishment when we read this. That the intersection of a cone is not a circle save when the intersection is at right angles with the axis most people probably know, and that all other transverse sections of it are ellipses is also well known; but that there is any way of sectioning a sphere so as to make an ellipse out of it is certainly a novelty. Does Mr. Spiers seriously mean to affirm that there is any possible point of view from which the apparent bounding outline of a sphere ceases to be spherical? If so, we should be glad to have that demonstrated; if not, the author had better revise that passage in the next edition, and say what he does mean. At all events, it is quite impossible that the outline of a sphere can be distorted when viewed from any position, for the simple reason that all the points on such outline are necessarily at the same distance from the eye, the usual rays from which form an imaginary cone which encloses the sphere from whatever direction we look at it. Possibly Mr. Spiers may mean something different from what his words seem to convey; but, if they mean what they seem to mean, we have seen no passage in an educational book on perspective so extraordinary since the late Mr. Burchett attempted to demonstrate that a circle in perspective was not an ellipse, because the real diameter line of the circle was not the apparent diameter line or longer axis of the ellipse! Mr. Spiers seems in some odd way to have confounded spherical superficies with spherical section. Of course he is quite right about the distortion of spherical sections, such as the bases of domes which we see crawling down the walls vertically in so many interior perspectives, and the circular capitals and neckings of columns in the foregrounds of interiors, which we frequently see absurdly distorted in architects' drawings. But we defy Mr. Spiers, or all the Royal Academy, to distort the outline of a sphere.

In the section on design, Mr. Spiers seems to include "the copying of the Orders" as an essential part of the matter, though we are glad to see that he does put in an apologetic footnote to the effect that the Greek Doric and Ionic may be substituted for the Tuscan and the Composite. We are glad to get that recommendation, at all events. The object suggested in copying "the Orders" is the training of the eye to a recognition of proportion and scale. There could be no better study for this purpose than Greek architecture, certainly, and, if that were all, we would say well and good; but the conventional Roman Orders are things which somehow it is difficult for any one to touch without having his higher taste and his fancy injured thereby, and it is really time that kind of architectural baggage were thrown overboard.\*

With almost all that is said on working drawings we are entirely in accordance, and may congratulate Mr. Spiers on having been able to obtain such excellent examples of clear,

finished, and well-annotated drawings as those by Mr. Waterhouse and Mr. Rowland Plunbe which he has given as examples. This class of drawing is the plain prose of architectural drawing; its object is only the clear statement of facts,—required, as the author observes, to be more clear than ever now, because in these days of elaborate quantity-taking the contractor hardly looks at the drawings, and consequently never properly understands, as "workman" in the true sense ought, what he has to do, but only what he has to pay for and provide. Prosaic as are the working drawings, however, we should say that any architect who is worth anything has, or should have, a pride in getting them up not only clearly, but in a good and workmanlike, and even in a more or less effective style.

We have not space to go into the chapter on out-door work, further than to say that its recommendations appear to us all very good, and that it is illustrated by reproductions of some very beautiful drawings. In describing Mr. Street's manner of sketching, giving the leading lines and then just the commencement of the detail of each portion (a method which will be found illustrated in two sketches of his published in the *Builder* for November 12th, as well as in some previous numbers), the author mentions what we did not know before, that Mr. Street discarded the use of india-rubber altogether. It is very good practice to do so at times, and also to try sketching right off with a pen, taking careful note of proportions before beginning; this latter method, too, has inherent merits of its own, giving a very clear outline and detail which will not rub out. Among the sketches of Gothic subjects given are some excellent ones by the late F. P. Cockerell, whose hand we have only known as that of a Classic draughtsman; but the best of all the examples of this class are those of Mr. Gerald Horsley, which are unsurpassable of their kind. In Mr. George's tinted sketch (plate 13) before referred to, we do not quite like the way of accentuating the re-entering angles by dark black marks; this is hardly a pure water-colour effect, and represents something which does not exist in natural light and shadow effects. Mr. Allon's tinted drawing for the Liverpool Exchange competition is given in a tinted reproduction; we remember that and his Manchester Town-hall drawings very well; the reproduction hardly gives an idea of the brilliant and bright effect which he used to obtain by these rapidly-executed sepia drawings; a part of the effectiveness of them arose from the bold manner of leaving almost absolutely white spaces for the higher lights, never entirely covering the paper, giving a great look of freedom and transparency to the whole.

Mr. Spiers's hook is got up, we may add, in a manner worthy of the subject, and many of the drawings are so charming in themselves that the book may well have an attraction for general readers, while it is full of useful information and suggestion to the younger readers within the ranks of the profession. But we should like, for all that, to know the meaning of that mysterious passage about the sphere in perspective.

#### GYMNASIA.

FREEDOM from the bonds of tradition places our American cousins in positions for taking wide surveys and appropriating the best parts of different systems of physical education which we do not possess, but may well envy, as we gather from a "Circular of Information" on physical training in American colleges and universities, issued some little time since by the Bureau of Education.

Of the various ideals of manly excellence which have prevailed at different times,—the ancient Greek, which was an embodiment of the beauty and harmony of the body, and a joyous sense of living; the Mediaeval, with its monkish asceticism and contempt of the body on the one hand, and the military and aristocratic appreciation of bodily strength and skill in the camp and the field, on the other; and

\* Of course, the student must acquaint himself with the Roman Orders as matters of architectural history and development; but that is different from making them the basis of study in design.

the modern sanitary ideal, with its doctrine of a healthy mind in a healthy body,—we in England are still largely in bondage to the Mediaeval traditions of extremes,—of clerical indifference to bodily health and strength on the one hand, and exaggerated notions of its importance on the other,—while we have a very imperfect appreciation of the necessity which exists for their modification to meet the requirements of modern life, especially as it exists in

best way of removing it will be to give some idea of the construction and uses of gymnasia as displayed in the Report before us.

The American gymnasia are largely based on the German system, which is acknowledged to be the most perfect in Europe, but it is reasonable to expect that an ingenious and inventive people like the Americans would carry their system and apparatus beyond, or outside their models, and adapt it to their own

and domestic offices. The main floor, fig. 2 (for ground plan, fig. 3, see next page), contains the gymnastic apparatus, dressing-rooms, and bath-rooms,—the latter consisting of warm, cold, vapour, needle, shower, and douche baths. On the second floor there is a room "for the exhibition of trophies," and a rowing-room containing sixteen rowing-machines. The apparatus is arranged in a progressive series. "It is possible for a person to pass from the simplest movement in calisthenics up to the most difficult gymnastic feat without experiencing lameness for a day. Easy adaptation to the capacity of the individual and facility of application for remedying local defects and weaknesses are the distinguishing characteristics of the apparatus."

The Americans have not lost sight of the physical requirements of girls. The Bryn Mawr gymnasium was constructed with due regard for economy. In one haseament are howling-alleys, bath-rooms, and dressing-rooms. On the main floor is the large hall,—apparently without apparatus,—and a smaller room fitted with special apparatus. It is probable that calisthenics and "light" gymnastics (dumb-bells, clubs, &c.) are chiefly taught to girls, and when entertaining and varied, they are quite sufficient, all form of "heavy" exercise being objectionable alike from a physical and moral aspect.

In all the newer gymnasia the chief feature is their tendency to approach to those of ancient Greece in character, great facilities being afforded for social intercourse, for babbling, and for amusements. Elaborate anthropometric observations are carried out in all the best institutions, which serve as a guide to the director in apportioning the exercises of the several pupils, and afford also interesting scientific results.

The most ambitious and complete gymnasium with which we are acquainted is the building of the New York Athletic Club, which, indeed, is not a gymnasium only, but a fully-equipped club-house. The basement contains six howling-alleys and a rifle range. In the first story there are facilities for Turkish and Russian bathing, and a swimming-bath 66 ft. long by 20 ft. wide. The second story contains a reception-hall, parlour, reading-room, billiard-room, and a restaurant. On the third floor are a thousand lockers, a lavatory, douche-room, reception-room, and a sparring-room. The entire area of the fourth floor is occupied by the gymnasium; it is 22 ft. high, light and airy. Around this hall, 12 ft. from the ground, extends a track for the use of runners; twenty-two laps of it make a mile. The cost of the building was about £50,000. The club is in a flourishing condition, with 1,500 members and many persons waiting for admission. The admission is 50 dols., and the annual subscription 30 dollars.

#### NOTES.

THE scheme of the Oxford and Cambridge Schools Examination Board for commercial certificates will, it is to be hoped, cause more attention to be paid in the higher schools of this country to practical education. It should also be the means of ascertaining the soundness of the education given in the lower middle-class schools. No one will under-rate the advantages of a knowledge of Classical literature, but having regard to the fact that the majority of youths have to earn their own living, nothing can be more preposterous than that an ordinary boy should leave school without a sound knowledge of a single modern language. The great advantages of a knowledge of modern languages in the case of an architect, for example, are very obvious, and yet we have no doubt that there are numbers of youths destined for the architectural profession who are spending the greater part of their school time over Latin and Greek; and not only over Latin and Greek, but over the study of these languages simply as languages, and not of the literature and the society of ancient Rome and Greece. In how many schools is Greek art adverted to in the Greek curriculum, in which hours are spent over

Fig. 1.—Hemenway Gymnasium, Harvard University, U.S. America.

large towns. However excellent may be the results of athletic sports,—and we are second to none in acknowledging their great value,—they are only obtainable by a very small portion of our population on account of the difficulty and expense of providing playgrounds, and we are compelled, therefore, to look to gymnastic training, which can be carried out in a limited space and at many different places, as a substitute, and also to attract those who are dis-

ideas and wants. The Hemenway gymnasium attached to Harvard of which we give several illustrations, is considered the most complete institution of the kind in America, and it is closely followed by the newer, but less expensive, Pratt gymnasium at Amhurst, which, through its energetic director, Dr. E. Hitchcock, is best known in England. The cost of the construction of the former was about £32,000, and of the latter about

Fig. 2.—Main Floor of the Hemenway Gymnasium.

posed to neglect physical training altogether on the assumption that it is unnecessary or inconsistent with intellectual pursuits. It is not alone to our traditional taste for athletic sports, but also to a common belief that gymnastics are a sort of mountebankery which are suitable only to the circus or the stage, and, therefore, are attainable by few, and, in any case, not deserving the labour and attention of serious men and women. This is a very foolish prejudice on our part, and, perhaps, the

£13,000, while the furnishing cost 4,000 and 4,463 dollars respectively. The Hemenway gymnasium is under the direction of Dr. A. A. Sargent, who has invented much of the apparatus employed in this and other American gymnasia. The building is 125 ft. long by 113 ft. wide, and consists of a basement and two floors. In the basement there are rooms for base-ball, lacrosse, tennis, fencing, and sparring; eight bowling-alleys; lavatories, many hundreds of lockers,

Fig. 3.—Ground Plan of the Hemerway Gynnasium, Harvard University, Cambridge, Mass.

the manufacture of iambs, while not a moment is given to the ideas of the Greeks, expressed in sculpture or architecture! It is always surprising, indeed, that the Institute have not, by some memorial, directed the attention of school-masters to the desirability of bringing into greater prominence in boys' studies the art of Greece and the constructive works of the Romans.

THE Roman Municipal Council have recently effected what amounts to a *coup d'état* in favour of architects. Some years ago the Council gave notice that all building applications must be accompanied by the name of an architect who would be responsible for the due execution of the works. Finding that this regulation was evaded by the nomination of unqualified persons as architects, the Council lately called attention to the regulation, and intimated that, with a view to the protection of the public, in the future only such persons would be accepted as architects who could show that they were legally entitled to adopt that designation. The Council appointed a Commission to inquire into this question, and opened a register for the inscription of the names of duly qualified persons who should be so certified by the Commission. The Commission, in a report to the Council, which is printed in the *Transactions of the Italian Architects' &c. Society* (Anno. II, 1887, fas. 3), submit that out of 166 candidates who presented themselves for registration, 125 satisfied the Committee as to their training and proficiency, which appears to be a high percentage,—the failures being only about 18 per cent.—and gives a favourable impression of the condition of public education in Italy. The standard is high, and involves the taking of a degree in physics and mathematics in the University of Rome or Bologna, a residence of three years in a technical school, and a course of instruction in a school of art.

LORD HENNIKER, writing to a contemporary last week, draws attention to a some-

what remarkable railway rates case. It appears from his lordship's remarks that Mr. J. D. Kempson, of Birmingham, has recently declined to pay certain charges made by the London and North-Western and Great Western Railway Companies for conveyance of undamageable iron, on the ground that they were in excess of the Companies' statutory rates. The companies thereupon refused to carry the traffic without payment of their charges, Mr. Kempson eventually paying, under protest, and suing both companies in the county court to recover the excess. This, we are told, amounted in one case to fifty-one per cent. of the rate charged; and in the other to no less than sixty-four per cent. (the distances being, in each case, very short), and in both actions the amount has been paid into court. Lord Henniker, as Chairman of the Railway Rates Committee, considers that the fact of two of the leading companies preferring to take such a course rather than contest the cases has an important bearing upon the railway rates question. The first thing naturally suggested by reading these statements is, that if these companies have been overcharging Mr. Kempson to such an enormous extent, and have persisted in this course so far as to decline to convey the traffic at lower rates until the cases were taken into court, it may be taken for granted that this is anything but an isolated case, and that less energetic and determined traders are still being considerably overcharged. Another consideration is, that if rates so much in excess of the legal ones are really in force, and liable, when tested, to such sweeping reductions as those to which Lord Henniker draws attention, an all-round adjustment would result either in reduced dividends, or in long-distance rates,—which are frequently below the statutory maximum,—being forced up in order to avert such an effect. His lordship treats the case as turning upon the question of "terminals," though we should have imagined, from the wide difference between the amounts originally charged and the reduced

rates, that it was a matter of inaccurate classification,—that the traffic had been placed in the first instance in the wrong class, and that the Companies were eventually compelled to own that it had been improperly dealt with. In any case it was evidently a question that they did not care to discuss in court. They were doubtless unwilling to encounter Mr. Kempson again in the law courts, for in a previous case,—which *did* turn upon the rights of the railway companies to charge for terminals,—that gentleman elicited a deal of information as to the services and accommodation for which charges were made in addition to those for conveyance, which considerably opened the eyes of the public, and to which we have ourselves from time to time had occasion to refer.

WE have received particulars of what may turn out to be a very important enterprise in Ireland, and perhaps do something to encourage Irish industries in a more practical manner than has been evinced in some other schemes that have been preached by philanthropists. This is, the lease by a Liverpool engineer, Mr. Spargo, of the whole of the Marquis of Conyngham's estate in the Rosses, amounting to about 70 square miles, for the purpose of working it as a quarrying and mining district. The site appears to be a great granite deposit, and the report of Professor Hull, the Director-General of the Geological Survey of Ireland, is very favourable in regard to the quality and variety of the granite to be obtained here. According to Professor Hull, there are granites of many shades of colour, red, black, pink, and rose, and capable, he affirms, of receiving a polish not to be surpassed by granites from any other source. We should be very glad to hear of the success of the enterprise, especially if it will serve the double end of giving us more and cheaper granite and of finding remunerative employment for Irish labour. We shall be glad to see some specimens of the granite in due time.

THE lighting of private buildings by electricity is, though it may be slowly, yet surely progressing. Some of the houses in Kensington Court are already lighted in this manner, and the electric current has now been extended to some houses in the neighbourhood of Palace Gate. The dull, dim light given by the gas supplied to London is inferior to that given by good mineral oil, and we shall be surprised if in a few years an enormous change in the domestic lighting of our large cities is not seen. It is contrary to all experience that when Bond-street shops and Kensington houses enjoy a bright, clear light, shops and houses elsewhere should be satisfied with an inferior light, which adds to the household expenses by the way in which it dirties the interior of buildings.

WE mentioned a few weeks back a very complete and, indeed, exhaustive monograph by Dr. Mayer on the representations of Giants and Titans in Greek art. A similar work on a subject more widely popular has just been published by Dr. Oscar Bie, of Berlin, on the "Muses in Ancient Art" (*Die Musen in der Antiken Kunst*). Dr. Bie makes a careful catalogue of not only all actually extant examples, but also of works noted in literature, but which have since perished. He devotes a special chapter to the three most important sets of Hellenistic reliefs, i.e., the vases of Halicarnassus, the relief of Archelaos of Priene (in the British Museum), and the Pacca and Medici sarcophagus. A work such as this is of the greatest use for reference, even if its issue is no new discovery or interpretation. Dr. Bie, however, arrives at some not unimportant conclusions. The Muses were at first vague, both in personality and number, rather attributes of Apollo than distinct individuals; then they became three; later, under the influence of the Theogony, nine,—but still with common attributes; last, and only in late days, these functions are separate and stereotyped. The monograph is illustrated with woodcuts.

THE London world is, perhaps, just a little tired of Greek plays,—the fashion is over and passed,—but at Cambridge a settled and scholarly enthusiasm still maintains itself, nor is it at all likely to be a mere passing mode. The performance of the "Edipus Tyrannus," or, rather, the series of seven performances, was a fitting crown to a now goodly sequence of representations. Of course, in a tragedy so profound and so complex the main interest is human and dramatic; when Fate is weaving a web so terrible and so tangled it seems to matter little whether she set up her loom in a desert or a barn. Still, so harmonious was the picture presented to the eye at the rising of the curtain that a few words may be given to it. It may be noted in passing that the drop scene was the same as that used for the "Eumenides," nor could it be improved. The Delphic oracle is still the keynote of the piece, and we could have no better outlook than the view from Apollo's temple, the two reverend guardian eagles, the xoana at the portals, and the fountain of Castalia. The curtain drew up to disclose the palace of Edipus. The massive Doric columns were richly toned, the two lower drums a deep yellow, the third and upper one a creamy white. To the architrave were affixed gold shields. The metopes were decorated with a series of designs in relief, of Oriental character. Two butting bulls faced each other in the two centre metopes, followed each,—we must confess to our considerable surprise,—by two sphinxes in the next pair of metopes. It seems to us in the last degree improbable that Edipus would have decorated his palace with the effigy of the monster he had just slain. The slaying of the sphinx was in his days historical, not mythical, and if the scene were to be represented at all, not her decorative image alone, but the scene of her slaying, as seen *en*, on the recently acquired lekythos of the British Museum, would be chosen. The front of the palace was all ablaze with colour and hung with wreaths of flowers. When the four splendid young guards of Edipus took up their position in front the effect was most impressive. It was a pity that, as citizens of a plague-stricken city, these young guards were unable to conceal their amusement at the novelty of their situation. The scene at the opening, when the suppliants are assembled, was too crowded; but, later, when Jocasta offers incense, the grouping and colour were perfect. To dwell on details of acting would be here out of place, but it is impossible to leave unnoted the fine impersonation of Mr. Randolph. Probably most of those who know the play dreaded the last scene, when Edipus returns with blinded eyes, crazed with sorrow, broken by fate. No one who saw it but felt their fears were groundless. The blind hands feeling along the palace wall, the stricken face, the sense of sudden physical as well as moral shock, the utter humility that only the sensitive *δὲσπομος* could know, the hungry tenderness of the father, and yet the king through all,—all these, yet never a touch of over-statement,—made up a conception such as the modern Greek stage has certainly never seen before. It is saying much that, for this last act, finely suggestive though Mr. Stanford's music was, one wished it silent. Fate was too manifest to need a "Fate-motif."

THE collection of pictures, or rather sketches, on the Seine and Marne, by Mr. Aubrey Hunt, which is on view at the Goupil Gallery, shows their author to have a strong perception of effect in landscape, especially in the treatment of clouds, with an apparently ostentatious indifference to detail. Many of the small paintings are really smudges as far as everything but the general effect at a distance is concerned. There is a great deal of force and ability in many of them, as far as they go; but the whole impression produced is an unsatisfactory one, as if we were looking at a number of unfinished attempts which show great promise and never arrive at performance.

MESSERS. HOWELL & JAMES have had on view this week a valuable collection of

laces and embroidery, chiefly antique, which ought to be seen by those who care for such things. The work is, for the most part, in unusually good preservation, and it is especially noticeable how little the colours of most of the Italian embroideries are faded, compared with what one is accustomed to see in private collections. The exhibits consist of Italian and Persian embroideries on silk, Turkish embroideries on the usual coarse linen cloth, and Italian, Sicilian, Greek, and Spanish laces. The Italian work is naturally chiefly ecclesiastical; among it we noticed, especially, two fine altar frontals on white, and a chasuble and stole on a delicate pink ground, the whole of which is worked over in a solid pattern. There are several very beautiful Persian embroideries on the rare light blue ground, and a curious piece of Turkish work with figures that look rather like the Noah and his sons that we knew in our childhood. The laces, as laces, are, without doubt, very good and valuable, but as specimens of art workmanship, except for the general lightness and delicacy that lace has, we cannot say that we cared very much about them.

THE Exhibition of the Institute of Painters in Oil Colours, though, as usual, too large, and including a good many things that no one cares for (a point which, after all, it has in common with the Academy), contains a larger number than usual of paintings that are of considerable interest and originality. The President's one contribution is an exquisite head and bust of a very beautiful lady seen in profile, under the title "Henriette" (310). Mr. P. D. Millet, in his "Piping Times of Peace" (454) seems to have been aiming at an imitation of Sir James Linton's *technique* and style of subject; the result is not very interesting. Mr. Denby Sadler's "The Private Secretary" (383), where a pompous ass is dictating to a secretary who evidently has his measure, is one of the best pieces of humorous characterisation he has ever given us, quite as good as any of his monks, and is worth noting as a picture which really delineates *character*, and not merely personages. Mr. Stock's "Satan Dead at the Foot of the Cross" (557) is a powerful thing in drawing, and in its ghastly effect of colour; he will find few admirers for this class of work, but he is to be respected as an artist who is striving after the ideal in these realistic days. Among things that we noted specially, we may mention "Early Morning off Penzance" (13), one of Mr. Henry Moore's dark, cold, "wobbling" seas, which suggest disagreeable ideas about death by drowning in that ominous-looking depth of water; "A May Morning" (18), by Mr. Tom Lloyd; "Salisbury after the Floods" (103), by Mr. Jas. Webb, a rather too obvious attempt at the manner of Turner in treating such a subject, but a fine thing; "Your Little Bill, Sir" (123), by Mr. Frank Dadd, a clever study of manner and physiognomy; "A Priestess of Bacchus" (125), so-called, by Mr. John Collier,—no, Mr. Collier, she is nothing of the kind, she is a fine-looking lady of modern life who is amusing herself by a masquerade in a leopard skin; "Miss Nelly Tate as Alice in Wonderland" (143), by Mr. J. R. Reid, a remarkable piece of colour, well worth attention as something out of the way in portraiture, though the face itself is unpleasing in colour and wants transparency; "Autumn" (181), by Mr. R. W. Allan, a finely built-up and solemn landscape; "Santa Maria della Salute" (201), Mr. Arthur Severn—architectural details very scabbly; "Lengthening Shadows" (281), by Mr. Henry Gore, an exquisite little work with a remarkable effect of light in middle distance, and two small very-well studied figures in the foreground; "An Amusing Story" (283), by Mr. Seymour Lucas; "Hampton Court" (300), by Mr. Fulleylove, which does not accord with our notion of the prevailing colour of the scene; "Gingenti" (352), by Mr. Elgood, a fine representation of the old Doric ruin; "One of the Last Old Citizens" (360), by Mr. Arthur Severn, an old steamer on the Thames at Westminster, a variation on the theme

of Turner's *Temeraire*,—dangerous ground, but Mr. Severn has made something of it; "The Hill Side" (406), by Mr. Robert Carrick, an admirable bit of hill landscape, full of truth and careful study not obtunded; "The First Snow" (461), and "On the Marsh, near Bramber" (724), by Mr. Aumonier; "Old Batten's Farm" (568), Mr. J. R. Reid, a remarkable study of colour; "Autumn Sunshine" (637), by Mr. Ernest Parton; "Autumn" (650), by Mr. Keely Halswelle, a fine scene, and getting out of the author's too-long-followed mannerism; and a "Dissed Line Kiln" (702), by Mr. G. Marks. There are many other things worth looking at, if not remarkable paintings.

#### LETTER FROM PARIS.

BUILDING,—or rather builders,—have been mixed up in the recent political disputes which have been going through here; for the decorations conferred on the architect and contractors for the sumptuous residence for the chief of the State and his son-in-law have been among the matters commented upon in connexion with the recent scandal. It is, fortunately, out of our province to dwell on a subject which is not creditable to any one concerned; but we may contrast with this work, done at the expense of the State, the extensive work which the Duc d'Annam, though in exile, is still carrying on at Chantilly for the good of the public and at great expense to himself, in order to put this great private collection in the best possible condition before the Institut formally takes possession of its trust.

The political disturbance of the time has, however, no effect otherwise on the State building operations; the Exhibition works go on as if nothing unusual was the matter; and the Eiffel Tower continues to climb, and has passed its 40 metres of height.

The transformation of the Gardens of the Trocadéro for the exhibition of horticulture has been commenced, and in the Champ de Mars, around the new constructions, there are rising the plantations of the ornamental park which will extend to the entrance of the Pont de Jéna. In our last letter we described the fountain which M. de Saint-Vidal has designed for the portion of the garden situated under the arch of the Eiffel Tower. M. Coutan is executing another fountain for the wide space comprised between the pavilions of the "Arts Libéraux," the "Beaux-Arts," and the "Expositions Diverses." This fountain has two large basins, one over the other, adorned with numerous sculptures. The lower basin is decorated with figures representing "L'Union," "La Vérité," "La Fortune," and "La Pensée." It receives a fall of water from the upper basin, two metres higher, from the centre of which will emerge the "ship" of Paris surrounded by a group of children. In the middle of the ship a monumental group, thirteen metres high, will be placed, symbolising the genius of Progress, with wings outspread and surrounded by statues representing Art, Science, Industry, and Agriculture. Before this group is a figure of Fame, with the orthodox trumpet, and at the helm will be seated the figure of the Republic. A statue holding a shield with the arms of the City of Paris will stand in the lower basin. Groups of children on dolphins will complete this large composition, the model of which is now finished.

It has been decided that during the Exhibition the Champ de Mars will be open to the public at night, and brilliantly illuminated with electric light.

In spite of M. Heredia's return with a new scheme, nothing is yet settled about the Metropolitan Railway.

A large street improvement project, the idea of which dates back to 1867, is to be executed shortly. This is the carrying of the Rue Catincault from the upper portion of the high ground in the 18th Arrondissement, by a steel viaduct across the Montmartre Cemetery. The bridge will have a gradual fall, and will be carried on twelve cast-iron columns placed in pairs, about 20 metres apart. As the surface of Montmartre is perforated by old quarries, it is necessary to execute some subterranean work in the way of consolidating the foundations for the columns.

The Direction des Beaux-Arts has been very energetic of late, especially in regard to the "Service de bâtiments civils." The works at the

Museum being nearly finished, and the new sculpture saloon soon about to be opened, the department has turned its attention to Versailles and to its projected repair and restoration. As already observed in these columns, the palace is in a lamentable state of decay, and M. Leclerc, the architect of the Museum of Versailles, has prepared a report and estimate for the work, which will require 440,000 francs for absolutely necessary work to obviate further decay.

The new Directeur des Beaux-Arts, M. Castagnary, has at once occupied himself with pushing on the work of decorating the Panthéon, which has been going very slowly; and it is understood that the artists who are in arrears with their work will be given the option of entering into an engagement to complete it by 1889 or of retiring. Up till now MM. Puvis de Chavannes, Cabanel, Henri Levy, J. P. Laurens, T. Maillott, and Joseph Blanc are the only painters who have completed their portion of the decoration. There remain still to be fixed in their places the canvases of MM. E. Delaunay, Lenepeven (who has succeeded to Baudry's work), Humbert, and lastly Meissonnier, who, having regard to his usual style of work, seems singularly chosen as an artist to cover a portion of the great wall-spaces of a temple, and who has up to this date not given the least sign of life at the Panthéon.

An exhibition of the works of M. Puvis de Chavannes has been opened since the 18th of November in the galleries of M. Durand Ruel, Rue Lafitte. It includes a certain number of known pictures, as well as pastels, drawings, and works hitherto unknown. We have seen again here, with much pleasure, the admirable cartoons of the "Jeunesse de Sainte Geneviève," as well as the large compositions representing "Travail," "Repos," "Paix," and "La Guerre."

The Committee for the decoration of the Hôtel de Ville has been working hard for a month, and will in a short time submit to the Municipal Council a list of painters to receive commissions for the Salle des Fêtes, the principal salons, the Salle de Banquets, and the grand staircases. One of the staircases was to have been decorated by Baudry; M. E. Delaunay is to replace him, and probably no one can better do so. It is to be hoped that M. Puvis de Chavannes will have a considerable part in the decoration of the Municipal Palace. We do not know what will be the decision of the Council, but the idea of the Committee is that all the leading artists of France, without distinction of school or style, should take a part in the decoration, so that it should form for future generations a complete *résumé* of the art of painting in France at the latter part of the nineteenth century. As we have before observed, a considerable part of the work will be reserved for competition, in order to give a chance for the discovery of unknown talent.

The Municipal Council, which, in spite of its reputation as a Mercenas, has iconoclastic tendencies for everything which recalls monarchy, is insisting anew on the destruction of the expiatory chapel raised in 1826 on the place where Louis XVI. and Marie Antoinette were buried. It is the work of Percier and Fontaine, who gave it the form of an antique sepulchre. On either side are two galleries, imitating a series of tombs in the same style. The chapel, situated in the interior court, is surmounted with a dome, and decorated with a Doric order and pediment. The interior, which is on the plan of a cross, encloses a fine group in white marble, by Bosio, representing Louis XVI. supported by an angel, and a statue of Marie Antoinette, by Cortot. The erection, the decorative effect of which may be questioned, is, however, an interesting specimen of French architectural design of its period. As the work is the property of the State, however, it is not likely that the municipal authorities will get their way, and they will have to look elsewhere for a site for the statue to Danton which they wished to place here. Statues to Robespierre and Marat [?] are also talked of; also one to General Desaix, whose bust for some time surmounted a fountain constructed by Percier for the centre of the Place Dauphine, and which was demolished in consequence of the clearance in connexion with the Palais de Justice.

This "statue mania," which is spreading everywhere, and in some places creating a considerable obstacle to traffic, is extending also beyond Paris. Bernard Palissy has his statue at Boulogne-sur-Seine, Laplace and Condorcet their busts at Arcueil-Cachan;

Parmentier, the agricultural law reformer, is to have one at Neuilly; and one to François Millet, at first intended for Paris, and commissioned from M. Chapu, is now to be placed at Cherbourg.

Lyons wishes to have its monument to the Revolution, following suit with Paris; a competition has been opened for it, and M. Blavette, an able architect, has obtained the prenum. The sculptural portion will be executed by M. Peynot.

Two interesting exhibitions have been opened during the last month; one of the charcoal and other drawings of M. Léon Lhermitte, and one of the marine paintings of Emile Vernier, who died about six months ago. This last included 200 pictures and fifty water-colours and drawings, and some fine etchings. M. Lhermitte's exhibition shows him as an admirable interpreter of nature and of peasant life, in regard to which latter he somewhat recalls Millet.

The "Envois de Rome" of the Villa Medici students of this year are so poor and commonplace that the less said about them the better. No better success has attended the Chaudesaignes competition, in which thirty-two competitors (architectural students) took part, and which was thought so unsatisfactory by the judges that the prize was not awarded.

The Chamber is about to decree "la liberté des funérailles": this important enactment, which will considerably modify funeral usages, will have, as its first effect, to hasten the completion of the crematorium, before referred to, as cremation will then be a matter of choice, and in all probability there will be practical necessity for completing the crematorium.

The subject of lighting Paris by electricity is to come under the special consideration of the Municipal Council, Paris being considered to be at present behind several of the leading provincial towns in this walk of improvement. The idea of the Council is to establish a municipal electric power in the basement of the Halles Centrales, which will light that establishment and the neighbouring Place du Châtelet, the Avenue Victoria, and the Place Hôtel de Ville. Six companies have asked for concessions for the electric lighting of different quarters of the city.

In connexion with this subject we may mention a curious instance of the indifference and carelessness of the Paris administration. Though gas was the first cause of the burning of the Opéra Comique, though the company who suffered so much through this catastrophe are now occupying a theatre which is a municipal property, and though severe police regulations for safety have been imposed and insisted on in other theatres, the "Théâtre de Nations," provisionally the home of the Opéra Comique Company, is the only Paris theatre which is not lighted by electricity!

#### A FEW NOTES ABOUT MARYLEBONE MANOR AND PARK.

A VALUABLE and interesting series of prints, drawings, music scores, old advertisements, and the like, was exhibited last week at the "Old Mary-bone Gardens" bazaar in Portman Rooms, Baker-street. Mr. Harris's collection easily divides itself into two parts,—illustrating the two areas which be respectively north and south of Marylebone-road. Southwards is the Portland estate, to which we will advert presently; northwards extends Regent's Park, once chosen as the site of a palace for George IV. when Regent, to be approached by Regent-street and Portland-place.

The largest parish in London derives its title from the little village church of St. Mary-by-the-bourne,\*—the stream being the Aye brook or Tyburn,—which was built far away in the fields by Bishop Braybrooke in 1400 A.D., upon the removal of the St. John the Evangelist's Chapel that stood close by the site of the now Court-house in Marylebone-lane. The Lane, together with part of High-street, marks the banks of the stream after it skirted the western slopes of Barrow and Primrose Hills in its course through Ossulston hundred from the Shepherds' Well in the Conduit Fields

(Fitzjohn - avenue) at Hampstead. The Teoburne of Edgar's charter to West Minster gave name to the oftentimes shifted gallows. From time immemorial it had been held of the king by the abbots of St. Mary Barking. It was valued in Edgward's day at 100, but stands at 52 shillings in the Conqueror's survey. Some time in the twelfth century Tyburn Church was appropriated to St. Lawrence de Blakemore priory in Essex; and passing, at Wolsey's request, to his foundation at Ipswich, was ultimately taken, on the Cardinal's fall, by the Crown. In 1552, however, it was granted to George Cotton and Thomas Reeve, and did not return to the sovereign until its purchase, in 1821, of the Duke of Portland. Meanwhile the manor passed, in various portions, through various hands, and could count among its owners such noble houses as those of De Vere, Fitzalan, Stanley, and Howard. Towards the end of the fifteenth century it belonged, as a whole, to one Thomas Hobson, who, in virtue of an estate stretching between Tottenham Court and Edgware roads to Cricklewood and Hampstead, would at this day be, as Mr. Loftie observes in his History of London (1884), one of the richest subjects in Europe. The manor, exchanged by Hobson to Henry VIII., in 1544, was let by Queen Elizabeth for the yearly sum of 16l. 11s. 8d.; and, in 1591, to John Dixon for a term of thirty-one years. In 1611 her successor sold the property for 829l. 3s. 4d., with a reservation of the park, to Edward Forset, whose name is commemorated by the verse which Hogarth has copied into his picture of the church, and which is preserved in the now parish chapel:—

"These pews were made and tane in vnder  
In stone thers graven what is vnder:  
To wit a vault for buriall there is  
Which Edward Forset made for him and his."

A Forset's daughter and heir, Arabella, brought the property in marriage to Thomas Aaston. In 1710 their son, Sir John Aaston, sold it to John Holles, Duke of Newcastle, for 17,500l., the rental being computed at 900l. a year. His Grace's only daughter and heir married Edward Harley, second Earl of Oxford and Mortimer; and Harley's only daughter and heir, the Lady Margaret Cavendish, married, in 1734, William Bentinck, second Duke of Portland. Some seventy years ago the fourth duke of that house exchanged the manor to the crown for certain lands in Sherwood Forest, valued at 40,000l. We may here add that the Messrs. Tibbury's offices in High-street, always known as Oxford House, are reputed to have been the storehouse,—adapted from a girls' school,—of the celebrated library and MSS. collected by Robert and Edward Harley, the first and second Earls of Oxford, and which was secured by the nation for no more than 10,000l. It is very doubtful whether the Harleys ever inhabited the Manor-house, which subsequently became famous as Mr. de la Place's (in 1703), and his successor, Mr. Fountayne's, school for boys. It was demolished in 1791, and Devonshire-mews indicates its site.

The views of the Manor-house comprise two coloured drawings after Rooker (1790), and J. T. Smith's tinted plate (1807) copied from Gosselin's "long view," showing the garden, park, and environs as they appeared in the year 1700. This Manor-house is believed to have been built for the use of Henry VIII. when hunting over Marylebone Park; and to have been occupied by Queens Mary and Elizabeth. Here, on 3 February, 1600, Elizabeth feasted the Russian ambassador, who hunted in the Great Black Forest of Marylebone. The chase, with its preserves of "hare, partridge, pheasant, and heron . . . in and about the honour of his palace of Westminster" is that which is cited in Henry's proclamation of July, 1530, against hunting or hawking in the region "from the palace of Westminster [Whitehall] to St. Giles's-in-the-Fields, and from thence to Islington, to our Lady of the Oak, to Highgate, to Hornsey Park, and to Hampstead Heath." We have made numerous extracts from the Reports of the Historical Commission and Kalendar of State Papers (Domestic and other Series) in connexion with these lands. One of the earliest is under date July 14, 1530. It relates to the Commission of Inquiry in different counties concerning possessions held by Thomas, cardinal archbishop of York. Herein mention is made of the rectories of Blakemore, Guicemar, and Maryborne as royal properties devoted to the endowment of Wolsey's college at Ipswich.

\* The interior forms the scene of the marriage in Hogarth's *Rake's Progress*, 1735 (now in the House Museum), and the churchyard is depicted in his *Industry and Idleness*, 1747. Rebuilt in 1741 it is the existing parish chapel at the northern end of High-street.

Under date September 27, 1532, we read that the advowsons of Tyborn and Marybone manors, together with their tithes, formed part of a grant by the sovereign to one of the dean and canons of St. George's Chapel, Windsor.

In the indentment of Sir Nicholas Throgmorton, Sir Henry Isley, and Sir Thomas Wyatt, the rents of the rebels' march is set forth as from Kent to Southwark, thence by Brentford and Marylebone Park into London. Cunningham cites from the Board of Works Accounts of 1582 a payment for "making of two new standings in Marebone and Hide Parkes for the Quenes Majestie and the noblemen of France to see the huntinge"; the noblemen, by the way, being the Duke of Anjou, Elizabeth's suitor, and his court. Reverting to the State Papers we find a warrant, dated 25th January, 1612, awarding 100*l.* to William Stacey, under-keeper, for his great charge in keeping deer there for his Majesty's recreation in hunting. There are several later warrants to the like purport, and others which demonstrate that the Carey family for a while enjoyed the hereditary keepership of Hyde and Marylebone Parks. Thus, the royal sign manual to a warrant, dated 27th July, 1611, to Sir H. Carey (Lord Hunsdon) for 25*l.* 13*s.* 6*d.* on account of repairs and the building of six new bridges; on 27th February, 1615, Sir Philip Carey is made keeper of Marylebone Park for his life; on 29th September, 1629, Robert Korr, bed-chamber groom, is given a prospective grant of the keepership, with 8*d.* per diem, in reversion to Sir Philip and his son John Carey. In August, 1660, John Carey, master of the book-bonds, is vested with custody of the Park as long held by his ancestors. The duo care of the game sometimes inconvenienced those who did not profit by its custody, for under date 12th May, 1631, is a petition by the burgesses of Westminster against the drawing off, for the deer in the two parks, of the water "which rises from the springs and wastes of the park of Marybone and Thyourn." There is a warrant of 9th October, 1649, for the despatch of boat timber from the park to the yards to build the frigates. In the Molyneux MSS. will be found a certificate of Sir Thomas Cawarden, Knt., master of the tents and revells, of charges in his office. One charge is of *ccc.li.* for the Bankytone houses and other charges at Hyde and Marybone Parks prepared against the Marshall Seynte Andrews conyuge tithes,—of date 8th December, 1552. We will finish these extracts by quoting the following items from Robert Rede's account of disbursements to Secretary Windebanke, 5th January, 1639-40:—"the porters, for whipping the footman, 5*s.*; the smith, for making a key of Marrowbone Park, 2*s.* 6*d.*;" the man that brought it, 2*s.*"

At the beginning of his troubles Charles I. mortgaged this demesne, for 4,000*l.*, to John Wandesford and Sir John Strode, Commissioners for the King's Artillery. Their successors in title, Sir Nicholas Strode and John Wandesford, make petition to Charles II., in 1662. They set forth how, in exchange for this grant, munition of war, including powder and artillery trains, to the value of 18,000*l.*, had been supplied, and urge that Sir John forfeited both life and estate, and Wandesford suffered robbery and exile in the Royal cause; for it would seem that Cromwell had nullified the king's conveyance; and it is stated, settled the Park on Colonel Harrison's dragoons for their pay. After King Charles's execution, indeed, one of the first Acts of Parliament was to ordain that all royal parks and houses should be maintained for the benefit of the Commonwealth, and thrown open to the public. On Saturday, November 27th, 1552, a resolution passed for the sale of every royal park. Peter Cunningham records that Marylebone Park was sold to one John Spencer for 13,215*l.* 6*s.* 8*d.*, including 130*l.* for the deer (124 in number, and of various kinds), with 1,774*l.* 8*s.* for timber, exclusive of 2,976 tons reserved for the dockyards. He goes on to say that at the Restoration Charles's assignment was held to be good, and the park re-assigned to the original grantees for such term as should discharge the incumbrance thereon. A warrant of May 11th, 1664, responds to Sir Henry Bennet's petition, by granting to him a lease of "a moiety of Great Saint John's Wood, Marylebone, at a rent of 13*l.* 9*s.*; a quarter of said Wood, with Chalcoat's Lane [Chalk Farm], 6*l.* 17*s.* 2*d.*;

and Marylebone Park, at a fitting rent." Sir Henry Bennet was elevated Earl of Arlington, March 14th, 1663, with remainder to his only child, Isabella, who married Henry Fitzroy, first duke of Grafton. On November 22nd, 1675, Lord Arlington assigns to his elder brother, John, elevated Baron Ossulston, of Ossulston, co. Middlesex, on November 24th, 1682, and ancestor of the now Earls of Tankerville, the remainder, thirty-eight years, of his lease, as held at an aggregate rent of 36*l.* 1*s.* 6*d.*\* Numerous crown leases and sub-leases succeeded; yet of these it will be enough to say that the name of one lessee, circa 1750, is still preserved in the title of Hindo-street, Manchester-square. Upon the falling in, in 1811, of a lease to the Duke of Portland, the sites of Allsop's Farm, Kendall's Farm, Wolland's Farm, Park Farm and Fields, the Jew's Harp, Queen's Head and Artichoke, with other holdings, were laid out by James Morgan after John Nash's designs. The first idea was to build a royal palace on the acclivity occupied by Jenkins' nursery, and now the Botanical Gardens. But other counsels prevailed, and the several terraces, with the villas they surround, were planned and built by Nash and the two Burtons. The open area, into which the public were denied access until fifty years ago, extends over about 470 acres.

Of other places represented in this unique collection, we should mention two views (1822) of the parish church over against York Gate, built by Thomas Hardwick, 1813-17, and of which the front elevation was afterwards amplified to its present proportions. In our columns of the 31st of January, 1885, we gave an account of the extensive and costly alterations within, which have been carried out at Mr. Harris's hands. There is a view of the Marylebone Basin, showing people bathing in the pool. It was constructed in 1668 for the supply of water to Covent Garden and St. Martin's-lane. This became the site of the Portland, now St. Paul's Episcopal, Chapel, in Great Portland-street. There are, besides, water-colour drawings of Primrose Hill and the fields beyond; of the old Sick House (1803), now incorporated in the Workhouse, facing Marylebone-road, and pencil drawings (1866) of certain portions of the premises which were pulled down for the new buildings along the western side of Northumberland-street. An old joke is revived by the now scarce caricature showing Nash balancing himself upon the apex of his spire at All Souls' Church, Langham-place. A Pugin's drawing of the illumination of L. G. Otto, the French Ambassador's house, in Portman-square, on the night of the 29th of April, 1802, in celebration of the Peace of Amiens, is noteworthy in that it shows the "Concord" which the mob, reading as "Conquered" demolished entirely. Peter Cunningham (second edition, 1850) places this episode in Portland-place, an apparent error that subsequent writers have not been slow to follow.

#### ANTIQUITIES IN BRITAIN.

This was the subject of a paper read at a recent meeting of the Royal Archaeological Institute, by Mr. Herbert Jones, Mr. T. H. Baylis, Q.C., in the chair.

Mr. Jones, in the course of his paper, said that the first object to meet the eye of the traveller arriving at Carnac in Brittany is the large tumulus of Mont St. Michel, crowned by a chapel dedicated to that saint. This tumulus, oval in plan, is built up of small loose stones most difficult to dig into, its dimensions as given by M. R. Galles being about 377 ft. long, 190 ft. broad, and 33 ft. high. It was opened at great expense by the Société Polymathique in 1862, under the direction of M. René Galles, and M. de Freminville, by mining a tunnel into it from the end; but though they penetrated nearly half way through the mound, this search led to no result, though afterwards, by sinking a shaft from the top in front of the chapel, the chamber was reached. This was formed of comparatively small stones, and contained eleven celts of jade and jadeite, one of which was broken; twenty-six of fibrolite, and two of other stones: a magnificent necklace of 101 beads and nine pendants, many of a sort of turquoise called by the French *calais*; and a small necklace of beads, apparently of bone, less than one-tenth of an inch in diameter.

The interment was found between the floor of the chamber and the rock below, the remains being incinerated. It is very probable that other chambers still remain unexplored in Mont St. Michel, but any attempt to reach them would be very difficult. The lower surface of the cap-stone had cup markings in it. These excavations are described in the Bulletin du Société Polymathique du Morbihan, ann. 1862. The next tumulus in size in the neighbourhood is that called Le Monstoir, some distance from Carnac. This is also elliptical in plan, and is formed of a core of loose stones covered with earth. It is surrounded by a menhir or upright stone at one end of no great size. It was also opened by M. R. Galles in 1863, and is described in the Bulletin du Société Polymathique, 1864. At the base are traces of a Roman station. Three interments were found in this tumulus: in the centre, a cist containing a vase of peculiar shape; on the west a large dolmen; and at the east two small chambers. One axe only, perforated at the end, was found, but there were several fine flint flakes of the Pressigny class. None of the stones had markings on them. A very interesting tumulus, almost in its original state, covering a dolmen with the *alidé couverte* or passage to it perfect, is in the grounds of the Château of Kerado, about three miles from the village of Carnac. Some of the stones are sculptured, the cap-stone bearing the figure of an axe similar to the well-known one on the Table des Marchands at Lockmariaer. It was opened in 1863, when two stone celts were found, as well as a necklace of heads and pendants, many of which were of *calais*. It is also described in the Bulletin du Société Polymathique. The well-known tumulus of Gavr Innis, that of Mané er Broec near Lockmariaer, and the Butte de Tumiac, which stands on the point of land facing Lockmariaer and Gavr Innis, are all cairns of loose stones, like Mont St. Michel. The present owner of the island of Gavr Innis, Dr. De Cloasmeuc, the well-known antiquary of Vannes, has lately searched the tumulus there in hope of discovering a second chamber, but without result. It had been opened previously, in 1832, when the sculptured stones were discovered, and nothing then found has been preserved; the other two mounds yielded rich treasures. In the Mané er Broec, a splendid pendant of *calais* as large as a hen's egg. One of the axes of jadeite was nearly 16 in. long, and one of chloromelanite over 18 in. The jade and jadeite axes were all broken when found. Some of the stones were sculptured. The Butte de Tumiac was opened in 1853, but the chamber is now inaccessible. Sculptured stones were also found here, with many celts, &c. All the objects brought to light by the explorations of the Société Polymathique are preserved in their museum at Vannes, where they are excellently shown, the results of each excavation being kept together. The author could not deal in his paper with the other antiquities at Carnac and the neighbourhood, but he called attention to the fact that there are there two rectangular enclosures of stones, one with alignments commencing from it, and the fourth side of which is formed of a long low harrow. The other is unconnected with any alignments. Many visitors to Carnac, Mr. Jones said, will be sorry to hear that the chapel which has so long crowned Mont St. Michel is about to be replaced by a new one.

In the discussion which followed the reading of the paper,

Mr. Josh. Brown, Q.C., made some remarks on the alignments of Carnac, and upon our ignorance of their object and date. He considered some of the theories which have been advanced to account for them satisfactory.

Mr. Lewis mentioned the double circle of stones on the Island of St. Lanic, close to Gavr Innis, part of which is now under water, and called attention to the probable subsidence of the land in the Department of the Morbihan and in the coast of Brittany.

The Rev. Prebendary Scarth and the Chairman also made some remarks.

#### The Liverpool Exhibition Buildings.—

It is stated that a company is being formed to obtain possession of these buildings with the view of converting them to the purposes of a winter-garden and place of amusement.

\* Addenda Dom. S. r. 1347-1365. Paper of April 17, 1654.

\* See Calendar, December 9, 1689.

## THE HENLEY SEWAGE WORKS.

After the applications at Southampton, Eastbourne, and the Houses of Parliament, it is interesting to note the gradual spread of the Shone system of drainage. There are now twenty-two examples in operation. The difficulties which beset the disposal of the sewage at Henley were very severe, and three designs, based on the ordinary gravitation water-carriage plans of modern engineers, were consecutively rejected by the Corporation, as the Urban Sanitary Authority, not so much on account of the cost, although this was heavy, the engineer's estimates varying from 18,000l. to 20,000l., but because, on the one hand, it was not possible to drain into the Thames, the Conservancy Board resolutely refusing to have the river polluted; while, on the other hand, the levels of the proposed sewers did not permit of an outfall at any but a short distance from the mass of the town. One such scheme discharged the sewage close to the railway station on the east, and was consequently vigorously opposed. Another, the best of the three, was designed to take the sewage to a piece of land contiguous to the western borders of the town, where a pumping-station was to lift it 41 ft. to a reservoir, with filter beds and an effluent channel of 700 yards long, to the Thames. The gradients for the sewers in this case varied from 1 in 150 to 1 in 1,000, the main drain being 54 in. in diameter. This site, however, was close to the Mountfield-villas, the tenants of which were by no means pleased with this proximity of the discharge; whilst the landowners commenced legal proceedings to prevent their properties being damaged in value for building purposes.

Such was the condition of affairs when Mr. Shone was called upon to apply his hydro-pneumatic system. The main iron sewer-pipe, or, as it is technically termed, "the c. i. sealed outfall main," varying in size from 5 in. to 8 in. in diameter, commences at the eastern extremity of the town in the Reading-road, passing under Bell-street to a distance of three quarters of a mile beyond the extreme westerly limits of the town, and more than a mile beyond the outfall of the gravitation scheme, near the White Horse Inn, to the solitary site of Lambridge Wood, where the discharging station is situated at an elevation of 116 ft. above the level of the Thames as it bounds the Street of Henley. There are erected the receiving tanks, the engine, and the air-compressors. The compressed air is conveyed in a smaller iron pipe of 3 in. diameter, laid parallel with the iron sewer, but running, of course, in an opposite direction. From all parts of the town gravitation sewers feed the sewage into the pneumatic ejectors, which are placed in four stations at nearly equal distances apart. As often as these ejectors are filled the compressed air is automatically admitted and the sewage driven forward in the closed iron pipe without any gases escaping at all, as is the case with the ordinary sewers which have ventilators at every two hundred yards. At the receiving station the sewage is perfectly filtered in the tanks, and the effluent water is discharged into the soil and the chalk strata beneath, whilst the sewage solids, compressed and dried, sell freely for manure. Provision has been made for 6,000 inhabitants, the census of the town being at this time about 5,000. All litigation has been avoided, and the total cost of the completed works has been under 15,000l. The works have been already some nine months in operation.

## THE OFFICE OF CITY ARCHITECT.

In addition to Messrs. Charles Barry, W. H. Crossland, and Alexander Peebles, whose names have already been mentioned by us, we see that Mr. Francis Chambers and Mr. Goymour Cuthbert are candidates for this appointment. The *Daily News* says that Mr. H. H. Bridgman, C.C., having been solicited by several of his colleagues of the Court of Common Council to become a candidate for the appointment, has announced that, in the event of the Court deciding to suspend a standing order, it is his intention to present himself for that position. The *City Press* of Wednesday says that at the Court of Common Council to be held on Thursday, Mr. Sly was to present a report of the Officers and Clerks' Committee, submitting for the approval of the Court, in accordance with the reference of the 17th ult., draft duties of the office of Archi-

tect and Surveyor, and recommending that the age of candidates for the office should not exceed fifty years on the day of election. The same committee would report on the following references, viz.:—On a letter of the late Sir Horace Jones, City Architect, for a reconsideration of the terms of his appointment, and the arrangement of his staff. To consider whether the appointment of Vacant Lands Officer should be continued, and generally with reference to the same. And recommending the following increases of salaries to the undermentioned assistants in the Architect's Department from Lady Day last, viz.: Mr. Andrew Murray, principal assistant, from 600l. to 800l. per annum; Mr. Thomas Baker, officer for surveying the City lands and Bridge House estates, from 530l. to 550l. per annum; Mr. Alfred L. Gosling, second assistant (by annual increments of 10l.) from 400l. to 450l. per annum; Mr. Frederick Henry Williams, third assistant (by annual increments of 20l.) from 300l. to 400l. per annum; and further recommending that the appointment of vacant lands officer should not be filled up, but that its duties should revert to the Architect's department; also recommending that the allowance for office expenses and stationery should be increased from not exceeding 100l. to not exceeding 150l. per annum. Up to the time of going to press we had not learned whether this report was adopted.

## DISCOVERIES AT ROME.

We take the following from the Roman correspondence of the *Kölnische Zeitung*, which states that "two discoveries of importance for the topography of ancient Rome in the earlier imperial times have just been made. During the works now in progress on the left bank of the Tiber, parallel to the Via Giulia, behind the church of St. Biagio della Pagnotta, a tufa slab was brought to light. It is one of the series of slabs, 5 ft. 3 in. by 2 ft. 6 in., with which the Romans marked the line of the shore, and was distant 40 ft. from the present bank of the Tiber. As it was found with the inscription downwards, the workmen did not take care of it, and broke it to pieces. Fortunately, it has been possible to collect the inscription, which is as follows:—*Paulus Fabius Persicus | C. Eginus Marullus | L. Sergius Paulus | C. Obellius Ru . . . | L. Scribonius | curatores riparum et alvei Tiberis ex auctoritate Ti. Claudi Caesaris Aug. Germanici Principis S. C. ripam cippiis positiss terminaverunt a Trigario ad pontem Agrippae.* In the first place, it enumerates four hitherto unknown senators to whom was entrusted the care of the banks and the bed of the Tiber; it also shows that the collegium appointed under Tiberius, in the year 15 A.D., for superintending riparian works (to which, under the presidency of a Consul, four senators belonged, whose tenancy of office was for one year), was still in existence under Claudius. Paulus Fabius Persicus is the Consul for the year 34. The stone, at present the only proof of riparian works under Claudius, exactly defines the sketch of shore from Trigarium to the Agrippa Bridge. There are various records in existence regarding the Trigarium, situated in the ninth region, and which was apparently a racecourse. The slab now found proves that the Trigarium was situated here on the Tiber, at the western boundary of the ninth region. The statement in the inscription, "Ad pontem Agrippae," is a novel topographical determination. We receive the first intimation of this bridge, which connected the fourth and fourth regions. The place where the inscription has been found is almost midway between two bridges. The upper, 'Ponte Sisto,' appears sometimes as 'pons Aurelius,' sometimes as 'pons Antoninus,' and also as 'pons Janicularis,' and was probably built by Aurelius Antoninus Caracalla. Later it was restored by Valentinian and Valens, and towards the side of the Champ de Mars adorned with a triumphal arch. The other bridge was first called 'pons Neronianus,' and, later, 'Triumphalis,' and traces of it are still left (near S. Spirito). The stone containing the inscription was distant from the latter 1,508 ft.; from the former, 2,165 ft. (in the line of the river). As the existence of a third bridge between the two mentioned was not known, it was assumed that one of the latter bore Agrippa's name; but a new dis-

covery settled all disputes. The unknown bridge was found. During some works at the river bank antique masonry was observed, 525 ft. below the Ponte Sisto, opposite the present Vicolo del Polverone. It was the abutment of a bridge, consisting of large tufa blocks, and bound together by iron clamps imbedded in lead. Afterwards a pier 22 ft. wide, and still three courses of masonry high, was discovered in the river bed, consisting, like the abutment on the bank, of blocks 4 ft. high, the clamps of which measure up to 1 ft. 4 in. This is the solid and handsome construction of the Augustan age. In these remains the Agrippa bridge may be recognised, and as Caracalla constructed a bridge only 525 ft. higher up, the former must have been unfit for use during Caracalla's reign, or it did no longer meet the requirements of his time."

The *Tablet* reproduces the following item from a Roman correspondent of the *Frankfurter Zeitung*: "Some time since, owing to the exertions of the Passionist monk, Father Germanns, two chambers of a Roman house of the fourth century were discovered under the high altar of the church of SS. John and Paul, on the Collian Hill. Quite lately another large chamber has been discovered beneath the nave of the church, which seems to have been the *tabularium* of the house. The traces, very well preserved, are visible of what must have been valuable paintings representing wild beasts, sea-horses, and other decorations. Especially remarkable are two pictures of unquestionable Christian character. One represents the patriarch Moses in the act of removing his shoes before approaching the burning bush, a subject which is also represented in one of the pictures in the catacomb of Calistus. The other represents a woman praying: she is clad in a tunic, with a veil on her head, a necklace of pearls, and arms outstretched. This is believed to be the first specimen of a Roman house in which scenes of a Christian character have been found represented. Such subjects have hitherto been found only in the catacombs."

## ARCHITECTURAL SOCIETIES.

*Birmingham Architectural Association.*—The second ordinary meeting of this Association for the current session was held at Queen's College on Tuesday evening last. Mr. W. Doubleday (Vice-President) in the chair. The following gentlemen were elected members of the Association:—Messrs. S. Harris, J. Goode, G. Cox, B. Walker, H. Wigley, C. Lea, G. Ward, H. Bewlay, John Ward, A. Harrison, and T. Keys. A paper on "German Romanesque" was read by Mr. A. Reading. A vote of thanks, proposed by Mr. H. H. McConall, and supported by Messrs. Newton and Victor Scruton (hon. sec.), was unanimously accorded to Mr. Reading for his interesting lecture; and after a response from that gentleman the meeting terminated.

*Edinburgh Architectural Association.*—The usual fortnightly meeting of this Association was held on the 24th ult. in the Architectural Hall, 42, George-street. Mr. Hippolyte J. Blanc, President, occupied the chair. After the usual preliminary business was disposed of, Mr. David MacGibbon, architect, read a paper entitled "The Architecture of the South of France: Gothic Period." After referring to the characteristics of the Early Romanesque architecture of Provence, it was pointed out how those were superseded in the fourteenth century by the introduction of Gothic details from the North, which were gradually engrafted on the native style, while in many cases designs in Northern Gothic were imported wholesale. These changes were illustrated with sketches from most of the towns of Southern France. Attention was then drawn to the important specimens of Medieval military architecture still preserved in the towns of Carcassonne and Aigues-Mortes, the walls and gates of which remain unchanged from the thirteenth century. The peculiar keep towers of the Riviera, similar in many respects to those of our own country, were described and illustrated. The lecture concluded with a description of the island and fortified monastery of St. Honorat, in the Bay of Cannes, a place of great interest from its containing examples of every period of Provençal art. At the close of the lecture a vote of thanks was awarded to Mr. MacGibbon for his paper.

*Glasgow Architectural Association.*—The third

Deerhurst Church: Capitals in Nave, illustrating the Development of Gothic Foliage.  
 Drawn by Mr. E. W. Collier.

Cripplegate, in which capacity he acted as architect to the Industrial Dwellings built with parochial trust funds in Nile-street, Hoxton, which were frequently referred to in the *Builder* at the time of their erection, and which were opened by the Prince and Princess of Wales.

**BUILDERS' BENEVOLENT INSTITUTION.**  
 ELECTION OF PENSIONERS.

An election of two pensioners on the funds of this Institution was held at Willis's Rooms, St. James's, on Thursday, November 24th, Mr. Herbert H. Bartlett, the President, in the chair. There were four candidates for the two vacancies, viz., three men and one woman. The poll was open from two to four p.m. Shortly after the close of the poll the scrutineers, Messrs. Thomas Stirling and T. F. Rider, announced the results of the polling to be as follows, viz.,—James Picking, 25, Shillington-street, Clapham Junction, aged 61, builder (fourth application), 1,018 votes; George N. Cott, 12, Mordaunt-street, Brixton, aged 69, builder (third application), 1,497 votes; John B. Axford, 2, Brosley-terrace, Strand Green, aged 63, builder (first application), 2,306 votes (including 300 added in respect of former contributions); and Ann Winter, 47, Maygrove-road, Bromdesbury, aged 62, widow of Benjamin Winter, builder (second application), 1,235 votes (including 210 votes added for her late husband's contributions). The successful candidates were therefore declared to be G. N. Cott, and John B. Axford.

Among the friends of the Institution (other than those already named) who took part in the proceedings were Messrs. G. Plucknett, J. P. (treasurer), C. Bussell, J. T. Holding, W. Scrivener, R. Perkins, G. B. New, T. G. Smith, and R. Richardson. A vote of thanks to the Chairman closed the proceedings.

**Robert Boyle & Son (Limited).**—The second annual meeting of the shareholders in Robert Boyle & Son (Limited), was held on Wednesday, November 23rd, at Cannon-street Hotel, when a dividend of twelve per cent. for the year was declared on the ordinary shares of the Company, free of income-tax, one-sixth of the profits being also placed to the reserve fund, and a balance carried forward to next year. The Chairman, Mr. Gilbert Wood, in moving the adoption of the report and accounts, congratulated the shareholders on the prosperous state of the business, and upon being again able to declare a dividend of twelve per cent., which he considered was due, not only to the recognised merit of their ventilating appliances, but to the very able management of Mr. Robert Boyle, the managing director, who was, uniting in his efforts in the interests of the Company, and also of sanitary science.—The Managing Director, in the course of his remarks, stated that there was a highly satisfactory increase in the business, which he attributed to not only the improved form of the air-pump ventilator they were now making, but to the fact that they had also tried as much as possible to meet the requirements of their clients with regard to cost, and the quality of the articles supplied, the present form of the air-pump ventilator, though much more efficient, being now sold at about fifty per cent. less than previous and inferior forms, besides being made of a more ornamental character, of the best rolled-steel plates, galvanised, while the workmanship was of the highest class. He also stated that the foreign agencies were developing in a very satisfactory manner, and yielding good results, the air-pump ventilator and other appliances having been introduced with considerable success to a large number of important public buildings in Germany, France, Belgium, Holland, Spain, America, the Colonies, and other countries, the Danish Government having also adopted the ventilators on their new ironclads, whilst the German Government had in contemplation the adoption of the air-pump ventilator on the whole of the railway-carriages on the German lines. Agencies were also being established in Norway and Sweden, from which orders had already been received. The election of directors and auditors and a vote of thanks to the Chairman brought the proceedings to a close.

**CAPITALS, DEERHURST CHURCH.**

These capitals, drawn by Mr. E. W. Collier, furnish a very curious example of the experimental transition from the Norman to the foliated type of capital. We do not suppose that they represent the process by which Early English foliage was evolved; probably the mason who carved them was a little behind the times, and inserted bits of carved foliage, such as he had seen elsewhere, into the scalloped capital, which he could not bring himself entirely to part from; but they are not the less interesting.

**OBITUARY.**

**Mr. Edmund Woodthorpe.**—We announce with much regret that Mr. Edmund Woodthorpe died suddenly, on Saturday last, at Horsaey (while staying with friends), aged 74 years. He was the son of a former Town Clerk of London, and was elected an Associate of the Royal Institute of British Architects as far back as 1839, becoming a Fellow in 1846. For nearly half a century he was District Surveyor for Limehouse (this district including the parish of St. Anne, Limehouse, St. John, Wapping, the Precinct of St. Katherine, and the Hamlet of Ratcliff), receiving this appointment in 1839. He was also District Surveyor for the Northern Division of the City of London. The gross receipts, according to the last return furnished by the Metropolitan Board of Works from the District of Limehouse were 519l. 4s. 10d., and for the Northern Division of the City 885l. 15s. 11d. Mr. Woodthorpe was also Surveyor to the Girdlers' Company and to the parish of St. Giles's,

of the present series of lectures in connexion with this Association was delivered on the 22nd ult. by Mr. G. Washington Browne, architect, Edinburgh, his subject being "The Monastic Orders and Buildings in Scotland," the honorary president, Mr. T. L. Watson, occupying the chair. The importance to the architectural student of a knowledge of the origin and development of the monastic system was not, the lecturer feared, sufficiently recognised. That, in studying its architecture, the interest of knowing what causes, social and religious, led to the results everyone admires, might be deepened, a brief history was given of the rise of the various orders, their spread over Europe,—and in Scotland specially,—the routine life of the monks, and the canonical rules they professed, particularly as these affected either the arrangements or decorations of their religious house. By a comparison of numerous examples of the abbeys and priories of the different orders in Scotland it was shown that considerable latitude was taken in their interpretation of these rules. Thus Melrose, a Cistercian foundation, violated the prohibition against figure sculpture. This and other variations were caused by artistic feeling and practical exigencies, resulting in a character peculiar to Scotch monastic buildings.

**Manchester Society of Architects.**—The prize of the Manchester Society of Architects for the best essay descriptive of the Architecture of the Manchester Town-hall, has been awarded to Mr. Percy Scott Worthington, B.A., of Corpus Christi College, Oxford, son of Mr. Thomas Worthington, of Manchester. The prize is the gift of Mr. Margatroyd, the President of the Society.

### Illustrations.

#### NOTRE DAME, CHALONS-SUR-MARNE.

**N**O architect travelling in the North of France should omit visiting this delightful example of twelfth-century Gothic. The town of Chalons-sur-Marne is in itself sleepy and uninteresting, the military element alone giving it any appearance of life, and but for the two churches the traveller would find little to detain him. The cathedral is a large unfinished medley of styles, possessing some features of much heauty, but so overpowered by the great ugly Renaissance additions that the visitor turns his back upon it with a sigh of relief, feeling that he may give his undivided attention to its humbler neighbour, the Church of Notre Dame.

This building was consecrated in the year 1183, and, fortunately, has been maintained in a very fine state of preservation. That it merits careful study is amply proved by the numerous references to it to be found in the dictionary of M. Viollet-le-Duc, and the drawings of it made by the late Mr. Burges.

The Cathedral consists of a nave and aisles, with two western towers,—these being crowned by wooden spires of very skilful construction covered with lead,—north and south transepts, choir, with chevet, and two eastern towers which have been left unfinished; the height of the nave is just under 70 ft., and the width nearly 30 ft. The groining throughout is of the simplest character, with holdy-projecting ribs, which in nearly all cases are carried down to the ground by means of shafts. The carving is curious and of several dates; that at the west end of the nave appears to be the oldest, and has a decidedly Romanesque character; the caps to the pillars in the choir are, perhaps, the latest examples in the church, and have ordinary knob-like leaves, as is usual in this date of work.

It is impossible, however, to give a concise description of this building, as its beauties and ingenuities can only be learnt by close and personal examination. The illustration will, in some small measure, indicate the general design; what is wanted is a monograph completely illustrating the building. This would be a great labour, but there can be little doubt that it would be well repaid. A.B.M.

#### INTERIOR, HOLCOMBE, KENT.

The illustration is an interior view of the drawing-room at Holcombe, recently erected for Mr. George Winch, from the designs of Mr. John Belcher.

The chimney-piece is of marble and alabaster, with a carved frieze. The ceiling of the ingle

nook is groined, and the walls are covered with decorated leather. The front is treated in colour, and the columns are of a bright red mahogany with carved and gilt caps.

The work has been carried out by Messrs. Foster & Dicksee, of Rugby, and the carving by Messrs. Farmer & Brindley.

The drawing was in the recent Royal Academy exhibition.

#### THE TOWER, CHURCH OF ST. JEAN, MAESTRICHT.

This church is a somewhat neglected treasure. It is one of the fine less-important ecclesiastical edifices of which Maestricht boasts, beside its Cathedral of St. Servais and its other Romanesque Church of Notre Dame. Our illustration is reproduced from drawings made by Mr. John B. Gass, A.R.I.B.A., of Bolton.

#### ADDITIONS TO "THE LITTLE HOUSE," WARGRAVE, HENLEY-ON-THAMES.

Our drawing of "The Little House," at Wargrave, near Henley-on-Thames, for Sir Morell Mackenzie, M.D., shows the new additions recently carried out. The gable shown as fronting towards the street is the end of the old house, but remodelled to correspond with the new parts. Red bricks have been used for the walls of the ground-floor, the upper parts being timbered, and the panels are filled in with rough-cast work, coloured yellow ochre. Messrs. Silver & Sons have carried out the work. Mr. Arthur Ardron is the architect.

#### A DOCTOR'S HOUSE AND STABLES AT SWINTON, MANCHESTER.

As the ground-floor arrangements of this house are shown by the small plan accompanying the sketches, it is only necessary to state, as regards the house, that the drawing-room is on the first floor, and is L-shaped, being placed over the consulting-room and surgery. The bath, w.c., and linen-room are over the waiting-room and passage. There are six bedrooms. The washhouse and larder are in the basement, the whole of which is utilised.

The material used is red pressed brick for facing, and red tiles for the roof. For internal joinery, where not exposed to rough wear, Californian red pine has been employed, and has been found to stand well after a test of two years. The house has been substantially built throughout, at a cost of under 1,500, including all fittings. Messrs. Gerrard & Sons, of Swinton, were the contractors.

The stables provide accommodation for two horses, and have hay-loft and pigeon-cote over. The material for outside work is similar to that of the house, the total cost being under

3000. Mr. Edward Wood, of Manchester, was the contractor; and the architect is Mr. J. Langham.

#### THE CARLSBRÜCKE, PRAGUE.

This massive stone bridge over the Moldau was begun in the reign of Charles IV., 1357, and finished 1503. It measures 1,572 German feet, and is ornamented on each side with twenty-eight statues of saints. According to the Popish legend, St. John Nepomok, the patron of bridges, was thrown from this bridge, 1383, by order of Wenceslaus IV., because he refused to divulge the secret confided to him by the Queen in confession. The illustration is from a sketch by Mr. W. A. Pitt.

#### ATRIUM PORTAL, ST. EMMERAN'S ABBEY, RATISBON.

This very unique screen-wall and portal to the Abbey Church of St. Emmeran, Ratisbon, possesses much that is interesting and original in its details. It faces an open "platz," and the entrances give access across the enclosure behind to the twelfth-century Paradise-porch of the Abbey.

The screen is composed of two stories, the lower one having two large entrance archways with arcaded recesses between and on either side. The upper story is divided into three bays of five arches each, the centre ones being slightly larger, and carried on detached columns with holdy-carved capitals; the wall at the back of these recesses is plastered, and covered with dehased eighteenth-century frescoes, probably concealing others contemporary with the design.

The has-relief in the centre recess of the lower story is a good example of German sixteenth-century sculpture, and was, doubtless, obtained from a series of stations of the Cross; the archedoever it has specially-devised corbels for its accommodation. From the variation of the mouldings and the peculiar jointing it would appear that this central recess with its panel was an afterthought, and formed no part of the original design, though probably the work of the same designer. The arch-mould to the recesses on either side of the entrances returns in an ingenious manner above the abacus of the column, and it should also be observed that apparently these arches are cut out of one single stone, as no joints can be discerned, though the other arches are jointed in the usual manner.

**Stanningley.**—A window has lately been placed at the eastern end of St. Paul's Church, Stanningley, near Leeds. The subject is the "Ascension," and the window is by Messrs. Mayer & Co., of Munich and London.

**WATER SUPPLY.**

*Crail (N.B.)*.—The new water supply for Crail was turned on on the 22nd ult. for the first time by Provost Peattie. The scheme consists in abstracting a portion of the Lochton Burn above the farm steading of Toldrie, above where there is no chance of pollution by sewage, and conveying the water by means of a fire-clay pipe, 10 inches in diameter and 1,920 yards in length, to filters and a service reservoir constructed on the town's land near Bihonfield. A strong spring entering the burn about 680 yards from the filters has been intercepted and taken into the reservoir. The two filters are 15 ft. by 14 ft. each in area, and are capable of passing a supply of 21,000 gallons per day. The service reservoir is 30 ft. by 14 ft., and 10 ft. deep, and holds 25,425 gallons. To keep the sun from acting on the filtered water a galvanised wrought-iron roof has been constructed over it. The medium of filtration is sand, which is laid on in layers commencing at the top with 18 in. of fine sand, 3 in. of gravel the size of peas, 3 in. of gravel the size of hazel nuts, and ends with 15 in. of broken metal, in which the drain-pipes leading away the filtered water to the service reservoir are laid. The main pipes to the town are 4 in. diameter, and 2,100 yards long, while there are 1,800 yards of distributing pipes. The engineers were Messrs. Leslie & Reid, Edinburgh, and the contractor Mr. R. B. Stewart, Glasgow. The total cost of the scheme has been 1,800*l.*, and the domestic rate has been fixed at 1s. 2d. per 11. — *Glasgow Herald*.

*Leeds*.—A special meeting of the Leeds Town Council was held on the 18th ult. to consider the water question. Mr. Alderman Woodhouse, Chairman of the Waterworks Committee, moved the following:—

That, in accordance with the recommendation of the Waterworks Committee, the Council resolve as follows:—  
1. That notwithstanding that the Corporation of Leeds have always regarded the valleys of the Nidd, Laver, and Burn, as the watersheds to which they would have recourse for any future extension of their works, in consideration of the Corporation of Bradford withdrawing their proposed application to Parliament for the Burn water, and in further consideration of that Corporation undertaking not to either directly or indirectly oppose the Corporation of Leeds when they shall, in the future, seek Parliamentary powers to appropriate the waters of the Burn and the Laver, the Corporation of Leeds shall undertake neither directly nor indirectly to oppose the Corporation of Bradford in any application which that Corporation may hereafter make to Parliament for the watershed of the river Nidd.

2. That the Council further undertake (for the considerations aforesaid), if requested by Bradford, to supply water at cost price to so much of the out-townships within the limits of the Bradford area of supply as are contiguous to Leeds, such temporary supply in no way to prejudice the rights of Bradford over such out-townships, and such supply to cease when requested by Bradford; if being further agreed that, in the event of excessive drought, or other unforeseen or unavoidable cause, the Corporation of Leeds shall in the first instance supply their own water consumers, and being liable to supply any water consumers within the Bradford area, the Corporation of Leeds shall further not be responsible for any accidental stoppage of the supply, nor for any defect in the quality thereof, and in the event of a dispute between the Leeds and Bradford Corporations shall be subject to and not extend beyond the duties and liabilities of the Corporation of Leeds as contained in their existing Waterworks Acts, and the rights of all persons entitled to a supply of water under the same.

This was unanimously agreed to.

*Liverpool*.—Rear-Admiral Sir George Nares, on behalf of the Board of Trade, has been holding an inquiry of which the object was to determine the depth at which the pipe-line of the Wyrnwy water supply should be laid under the river Mersey, and the manner in which it should be laid. The case on behalf of the Liverpool Corporation was to the effect that the pipes should be laid beneath the bed of the river at Fidler's Ferry, and sunk 5 ft. or 6 ft. below the bed of the river, and it was contended that no risk either from dredging or from the possible sinking of vessels or the dragging of anchors would be involved. The scheme suggested on behalf of the Manchester Ship Canal was that of a tunnel at a considerable distance below the bed of the river, through which the pipes should be laid, and this was strongly objected to by the Liverpool Corporation, on the ground, as it was put by Sir F. Bramwell in his evidence, that it would be butting "a crock and idle expenditure on the Liverpool Corporation for the sake of a chimney." Mr. Leader-Williams, the engineer of the Manchester Ship Canal, gave evidence on behalf of that undertaking.

*Yeaddon*.—The shareholders of the Yeaddon Waterworks Company, at a meeting held on the 4th ult., took into consideration a new scheme or the supply of the company's district with

water. This new proposal is to bring the water from Romhald's Moor, a distance of six or seven miles from Yeaddon. The water will be collected in a reservoir, which will be constructed on the moor. This reservoir will have a capacity for 33,000,000 gallons of water, and will give a daily supply of 111,000 gallons to the consumers. The meeting unanimously decided to adopt this scheme, which, it was stated, would not cost more than 15,000*l.*

**LAMBERT'S GUN METAL GLOBULAR BIB VALVES.**

MESSRS. THOMAS LAMBERT & SONS, of Short-street, Lameth, have sent us one of their new registered gun-metal globular high-pressure bib-valves for hot or cold water. These valves have been constructed especially for durability under hard usage; they are of superior finish, and are said to be capable of withstanding heat longer than any other valve at present in use.

*Lambert's Globular Bib-Valve.*

The spindle, which revolves only in its position, being held fast by a collar in the valve cover, has a strong square thread on which the disc works. The seating attached to this is removable for repairs, and it is guided by two wings cast up on it, sliding freely between those cast in the casing. The screws in the flanges are sunk flush with the surface to admit of valve being kept polished, and it is fitted either with a horn knob, or with a born crutch handle, as shown in the engraving, such handles being non-conductors of heat.

**The Proposed Lock and Weir at Richmond.**—An important step has been taken by the Richmond and Twickenham authorities promoting the movement for the erection of a lock and weir at Isleworth Ferry with the view of ameliorating the condition of the Thames in these parishes. An influential conference of all parties interested has been held at the offices of the Board of Trade. In addition to deputations from the Richmond and Twickenham authorities, there were present Sir Frederick Nicholson, Chairman of the Thames Conservancy; Sir Dignby Murray, a Conservator; Mr. Labouchere, M.P.; Sir J. Whitaker Ellis, Bart., M.P.; Mr. Bigwood, M.P.; and Mr. J. B. Hilditch, Engineer to the Thames Conservancy. Mr. Calcraft presided, and intimated that the Board of Trade had no statutory power over the Conservancy, but he would make the suggestion that the Board of Trade name some eminent engineer who should report to them on the whole question of the condition and improvements of the river on the upper district. All parties in the room agreed that the suggestion was one that should be accepted as a solution. It is understood that there is reason to believe that the Board of Trade will agree to this suggestion. Already the Richmond and Twickenham authorities are taking steps to appoint an engineer to represent their interests at the inquiry in connexion with the preparation of the report, and it is understood that the Thames Conservancy will also appoint an engineer to represent their interests in the matter. The cost of these proceedings is to be borne equally by the Thames Conservancy Board and the Richmond and Twickenham authorities. Sir Whitaker Ellis, Bart., M.P., has given 50*l.* towards these expenses. It is expected, therefore, that the whole question will be settled by means of a friendly arrangement, and that a Royal Commission will be unnecessary.

**SHORLAND'S IMPROVED MANCHESTER GRATE.**

This grate is very simple in construction, and, as will be seen by the accompanying section, consists of a warm-air chamber placed at the back of the fire, between which and the fire is a fire tile, with openings for the passage of flame and smoke. The flame and smoke pass through these openings, and down between the fire tile warm-air chamber, and down between the warm-air chamber into the smoke-flue, in their passage warming the air-chamber. The door over the fire is perforated to allow of the escape of smoke. The ashpan or regulating air-box is provided with a sliding grid, which regulates the draught of the fire. This ashpan is loose, and can be removed, and the ashes cleared out. Cold air is brought from the outside to the warm-air chamber, and is there heated by the waste heat of the fire, and is then conveyed by pipes, and delivered into the same room, or to any contiguous apartment.

The advantages of the grate, as enumerated by its maker, Mr. E. H. Shorland, of Manchester, are:—1, It will burn coke, anthracite, or common coal equally well; 2, Consumes its own smoke; 3, Cures smoky chimneys, by the ample supply of warm air into the room, by the draughts created in the neck of the chimney, and by the special construction of the fire-box; 4, Great economy of fuel by making use of the spare heat, which otherwise would all pass up the chimney, and ensuring by its construction more complete combustion and increased radiating power; 5, Ventilates the room in which the fire is situated; 6, Maintains a uniform temperature in all parts of the room, and prevents draughts; 7, Warms additional room or rooms by pure warm air.

**COMPENSATION CASE.**

**BURNES V. GREAT EASTERN RAILWAY CO.**  
MR. UNDER-SHERIFF GIFFY and a special jury sat at the Royal Court, Southend, last week, to hear the compensation case of Burnes v. Great Eastern Railway Company. The company had acquired, under compulsory powers, land belonging to the trustees of Mr. James Burnes for the purposes of the extension of their line from Shenfield Junction to Southend. The claim was for the land taken and damage by severance to the remainder. The principal question in the case was as to whether compensation should be allowed for sand and gravel removed by the Company from their cutting through the land taken. The claimants contended that they were entitled to remuneration for the sand and gravel to the full amount of what was removed, at the ordinary market value. The Company, on the other hand, submitted that no additional compensation should be awarded, as the claimants could not, the Company held, have sold the sand and gravel supposing that they had dug it. Argument took place also upon the question whether the land possessed prospective value beyond its mere agricultural value, on account of its being near to Southend. The jury, after consultation, returned a verdict of 3,060*l.*

**DILAPIDATIONS.**

**BATTAM V. KNIGHT.**  
This case was heard before the Official Referee on the 25th ult. The plaintiff claimed 108*l.* The defendant paid into Court 15*l.* The counsel engaged were Messrs. Messrs. J. V. Austin and R. M. Bray. The surveyors for the plaintiff were Messrs. Kingwell Cole, Battam, and Delissa Joseph; for the defendant, Messrs. H. J. Thurgood, E. H. P. Eason, and Banister Fletcher. Verdict for the defendant, with costs.

### ALLEGED NEGLIGENCE BY CONTRACTORS.

COX v. WADDELL AND SON.

The plaintiff in this action (tried in the Queen's Bench Division of the High Court of Justice last week, before Mr. Justice Manisty) was a land agent, and about seven o'clock in the evening of the 27th of January last he took a cab at Putney Bridge Station to go to his residence at Fulham. The night was foggy, and in the High-street, Fulham, the cab ran upon a heap of earth, and was overturned. This heap had been placed there by the servants of the defendants, who were employed to remove some pipes which were in the road. The case for the plaintiff was that the heap was unlighted, and that he himself was much hurt.

The jury gave a verdict for the plaintiff, damages 150*l*.

### ST. AUGUSTINE AT ST. ALBAN'S ABBEY.

SIR,—These of your readers who are passively interested in this saint, of whom the Venerable Bede speaks as "the beloved of God," and whom Capgrave describes minutely as "very tall by stature, of a dark complexion, his face beautiful, but, withal, majestic," were probably a little surprised to hear what Mr. H. Littlehales had to say about him in your issue for the 11th Nov. [p. 687].

Referring to that communication and the use made of Mr. Surtees as an authority, Mr. Henry Hicks Gibbs,—at whose sole cost the work I have for the last four years been engaged upon in renovating the high altar screen at St. Alban's Abbey, is being executed,—says, in a letter received a few days ago—

"One does not know what other arguments Mr. Surtees may have adduced, but those which Mr. Littlehales gives are far from being conclusive, or, indeed, from even raising a presumption. They amount simply to this, that Wheately, writing in the last century, said what was quite true, that Pope Gregory sent Austin the monk to England (obviously Austin was not then canonised) and that in his calendar of saints he gives the birth and percentage of the greater St. Augustine. Mr. Surtees does not (in this extract) tell us what Wheately says of him of Canterbury under the date of May 26th. The argument from the Prayer Book would prove also, and quite as well, that St. Margaret and St. Edward the Confessor were not canonised and that St. Anne was!"

St. Augustine still stands in my studio. Perhaps, ere he takes his departure for the niche prepared in the days of Abbot William of Wallingford,—i.e., just about the selfsame time that the art of printing was just brought into England by Caxton,—Mr. Littlehales will have had opportunities for looking up his subject a little closer, and be able to explain clearer why he considers the "Apostle of England" has no right to a nimbus?

HARRY HEMS.

Exeter, Nov. 25th.

### SALT-WATER FOR ROAD-WATERING.

SIR,—In the "Notes" in your issue of last week [p. 728] you allude to the use of sea-water, and state that for the "... watering of streets it is invaluable." May I mention that there is one (at least) detrimental point with reference to this, as observed from the experience of some ten years of street watering with sea-water in this island, viz., that immediately foggy or other damp weather sets in the roads are in a terrible plight through the heaving of the salt, which, after a whole summer's watering, has completely soaked the roads to a good depth, thus (in the case of macadamised roads) creating a vast amount of mud, which would not be so much the case after the use of fresh-water only. Further, after a considerable amount of "soaking rain," the salt, heaving, seems to disintegrate the roads, rendering them loose (under heavy traffic, at least, such as we have with our stone), and they are soon spilt. And further, should a heavy frost follow and then a thaw (rapid), the roads are fearfully cut up by the "flaking" that takes place.

After a thaw too, preceded by a fall of snow, a similar experience occurs, and the gathering of mud on one's shoes, which at every tread lifts a cake of this thawed road, is unpleasant to the last degree.

Intending users of sea-water for this purpose should, therefore, well consider its results "all round," and my experience in this neighbourhood may be interesting to your readers who take an interest in this question.

Ile of Portland.

### STATUS OF SANITARY INSPECTORS.

SIR,—The excellent and timely address of the Chief Sanitary Inspector of Shoreditch, as reported in your paper of Nov. 26th [p. 753], contains words spoken in season, and words that should be carefully read over, not only by local authorities, but by all persons who hold and seek the position of sanitary inspector. I have for some time thought that the certificate of the Sanitary Institute, as at present

granted, was not a sufficient safeguard for local bodies to work upon, and, as Mr. Alexander puts it, there is no provision made for testing the candidate's knowledge of what a building should be. As far as local authorities are concerned this shortcoming can be remedied if in their advertisements for chief inspectors they required them to hold not only the certificate of the Sanitary Institute, but also, at least, the "advanced certificate" for Building Construction from the Science and Art Department; preference should also be given those candidates who had served say three or four years as assistants. Until some such restrictions are made the status of the sanitary inspector will never rise higher than the present level.

With regard to the holding of the certificate of the Sanitary Institute, it stands to reason that one who has sat and passed the examination must know more of his work than one who has sat and failed. Take, for example, the late examination: there were 8 surveyors, 5 failed, 3 passed; 54 as inspectors, 31 passed, 23 failed; surely the 3 and 31 were more up to their work or qualified for it than the 5 and 23.

Why does not the Sanitary Institute set to work and get the Charter granted them as laid down in Section I. of their Constitution? I believe more members and associates would be induced to come forward than heretofore.

I may add that great complaints were made by the provincial candidates at the recent examinations, that five of the examiners had been giving preparatory lectures on the subjects which the candidates were to be examined in, thus heavily, but not intentionally, handicapping the candidates who did not reside in or near London. I think if this were discontinued in the future, better grace will be shown, and a more satisfied feeling will prevail in the minds of provincial candidates.

Plymouth.

W. J. ADDISCOTT.

### SIZE OF FRESH-AIR INLETS FOR DRAINS.

SIR,—On p. 718, in the *Builder* for November 19, Mr. R. E. Middleton would make it appear that the indication of 400 ft. per minute through the fresh-air inlet being reduced to 23-in. diameter was wrong, because the 6-in. diameter inlet only showed 80 ft. per minute, and he says the small inlet shows 165 ft. per minute, while the large one only shows it 137. Now, when the motive power is the wind, Mr. Middleton need not expect it to be as mathematically exact during one minute as another, although it sometimes comes remarkably near it. However, in this case, my 23-in. hole was possibly barely that, while the thickness of the rim of the anemometer would reduce the area in the smaller opening in greater proportion than in the larger one. The 23-in. hole was cut in a piece of sheet-lead so that friction in the small hole was about *nil*. The experiment proved that in making the openings in the fresh-air inlet grating larger than the outlet-pipe would be no advantage; while reducing its size, as stated, simply caused the air to blow in more quickly at the inlet-plate.

W. P. BUCHAN.

Glascow.

### SCOTCH NEWS.

Edinburgh.—The *Scottsman* reports that a meeting of the Joint Committee of the Corporations of Edinburgh and Leith was held on the 23rd ult., to consider the report recently issued by the Burgh Engineers of both towns against the pollution of the water of Leith in the harbour. The Committee agreed to recommend to the Corporations to proceed with a Bill in the next session of Parliament for powers to execute a scheme on the lines of the report of the engineers; also craving a remit to prepare plans and estimates for giving effect to the same, to be submitted to the Corporations for their approval. The scheme recommended by the engineers proposes to establish a new intercepting sewer, beginning at the Black Rock, in the Frith of Forth, passing along the east end of the Edinburgh Dock, through the Leith Links, along Duke-street, Leith, intercepting the Greenside sewer in Leith Walk, thence, through Springfield, on to Broughton Burn sewer, and stopping at Colbride, at an estimated cost of 47,000*l*. The Lord Provost's Committee of the Edinburgh Town Council have since approved of this scheme.

Kilmarnock.—The new Conservative Club here is nearly completed. The buildings are situated in Sturrock-street. The total cost will be about 1,200*l*. On the ground-floor are a reading-room, a billiard-room, and a recreation-room. On the second floor is a large hall, capable of accommodating from 400 to 500 persons, with adjoining retiring-rooms, &c. The buildings are erected of Giffnock stone in the Italian style of architecture. The architect is Mr. R. S. Ingram. The following are the contractors:—Mason work, Mr.

James Wallace; joiner work, Mr. William Hamilton; slater work, Mr. John Ford; plumber work, Mr. William Murchland; iron railing, &c., work, Mr. Robert Paton; painter work, Messrs. R. C. Robertson & Son.

### PROVINCIAL NEWS.

Bolton.—The Blair Convalescent Hospital, which has been erected as a result of the munificence of the late Mr. Stephen Blair, formerly M.P. for Bolton, at Bromley Cross, near Bolton, is now practically completed, and will shortly be opened for the free admission of convalescents "without limit of domicile." The late Mr. Stephen Blair died in 1870, and by his will he bequeathed 30,000*l*, 20,000*l* of which was to be devoted to the erection of the building, and 10,000*l* for endowment purposes, on condition that within three years of his death a suitable site was given. The late Mr. James Knowles, J.P., of Eagley, near Bolton, generously gave the site of five acres, on which the building is erected. The commission for the new building, &c., was placed in the hands of Mr. Medland Taylor, architect, of Manchester. According to the *Manchester Courier* the hospital is divided into three portions. The central block contains the matron's rooms, the administrative offices, the dining-room, the library, &c., whilst the male quarters are to the east, and those for the females and children on the west. In each case there are fine day-rooms, the children being in a separate room, and the men have also a smoke-room. The sleeping arrangements are most carefully planned, individual privacy being attended to. The frontage, which extends 240 ft., is Gothic in style, corridors of red brick with terra cotta ornamentation being alternated with the coursed stone of which the hospital is built.

Dewsbury.—On the 24th ult. a meeting of the Queen's Jubilee Executive Committee of Dewsbury took place at the Borough Offices, under the presidency of Alderman T. B. Fox, ex-mayor, who was re-elected chairman. The Secretary (the Town Clerk) reported that arrangements had been made with the Vicar of Dewsbury for the purchase of a portion of the vicarage grounds, near the District Infirmary, as a site for the technical school, at the price of 1,000*l*.; and, after some discussion on the report of a sub-committee, the requirements as to floor-space were agreed to. It was decided that the sub-committee should prepare instructions for architects, and that those carrying on their profession within the municipal borough should be invited to send in plans in a competition.

Newcastle-on-Tyne.—The Throat and Ear Hospital, at present temporarily located at the corner of Blackett-street and Clayton-street, is to have a permanent building commenced very shortly. Plans for it have been prepared by Mr. James C. Parsons, architect. The estimated outlay is 2,000*l*, exclusive of site and furniture.

Newton Abbot (Devon).—The memorial stones of the new Mid-Devon Constitutional Club were laid on the 17th ult. The site is on the property of the Earl of Devon in Union-street, a new thoroughfare opening out of the main street, Cutenay-street. Messrs. J. W. Rowell & Son, of Newton Abbot, are the architects, and Mr. F. A. Stacey, of Newton Abbot, is the contractor. The external facings of the wall are of buff pressed bricks from the Great Western Potteries, relieved with red brick and stone dressings.

### CHURCH-BUILDING NEWS.

Burston.—A reredos has just been erected in the ancient parish church of Burston, near Horley, Surrey, from the designs of Mr. B. Edmund Ferrey, F.S.A. The lower part of the composition, up to a height of about 3 ft. 6 in., is quite plain, and principally of Forest of Dean stone; the material used above is Corse Hill stone. The central portion of the reredos is higher than the "wings," and is surmounted by a rich cresting. The only subject is the Agnus Dei, in high relief, contained in a cinquefoiled-headed arched recess, and this is flanked by rich oblong and square cusped and carved panels. The "wings" are each divided into three shouldered and cusped arched panels. The work was executed by Messrs. White & Sons, of Vauxhall Bridge-road.

Falmouth.—The Prince of Wales recently

laid the foundation-stone of the new parish church of All Saints, Falmouth. It is being erected on a site given by the Earl of Kimberley, situated at the top of the Killgrew-road. The ground-floor is in the shape of a parallelogram, having nave and chancel of the same width throughout, and arcades of six bays on either side. The chancel opens on the north and south sides into shallow transepts. The width of the church is 50 ft., and the total length is 120 ft. It is to be built of Plymouth limestone, with dressings of Doulton stone, and will accommodate 700 persons. The estimated cost is 6,000. Mr. J. D. Sedding, of London, is the architect; and the contractors are Messrs. J. & G. Kelway.

**Gunnersbury.**—The new church of St. James, Gunnersbury, has lately been consecrated, the foundation-stone having been laid on April 19th. The building is Early English in style. The site, which has been given by the Rothschild family, faces the High-road, and is opposite the end of Cambridge-road. At the present time only the nave and aisles, with baptistry and entrances, are built, the funds not permitting of the church being completed. The nave and aisles, 71 ft. long by 60 ft. wide, will seat just over 500 persons, the end bay being utilised as a temporary chancel and vestry. The church is being built in Kentish rag stone, with Bath stone dressings. The west front shows a lofty gable, with broad buttresses and two double-tiled windows. The side aisles at the west end are flanked by buttresses finished with gables. In this front is an octagonal baptistry flanked by the side porches with the tiled roofs. The aisle windows are arranged in triplets with lancet heads and between the buttresses, the clerestory windows being in two lights. The roof is hoarded; the nave, arcade, arches, and dressings being in stone. The windows are set in deep splayed jambs and arches. The roofs are covered with Broseley tiles, and finished internally with boarding, stained and varnished. The floors of the entrances are tiled, and the aisles are finished with wood-block paving. The total cost will be about 5,300. The architects are Messrs. T. Chalfield Clarke & Son, London; the builders being Messrs. Dorey Bros., of Brentford.

**Knottsgley.**—This church has been re-opened, having been closed for some months during restoration. It was one of the few remaining churches fitted with galleries, and in which the old fashioned high-backed pews were retained. These pews filled not only the nave but encroached into the chancel, the floor of which was on a level with the nave, and one-half of the congregation sat with their backs to the Communion-table, facing the other half of the worshippers. The pews have during the recent restoration all been cleared away, and are being used to form a panelled deal round the church. The nave has been entirely re-seated with framed pitch-pine seats, stained and polished. The floors,—except the aisles and passages, which are tiled,—are laid with wood blocks. The roofs have been stripped, repaired, and re-laid with grey stone slates. New windows have been built on the north side and all the windows glazed with ornamental lead glazing. The east window has been filled with painted glass. The chancel has been enlarged, and a new stone pulpit, font, and lectern provided. The architects were Messrs. Demaine & Brierley. Mr. Volston, of Stamford, was the contractor. The pulpit, font, and lectern were supplied by Messrs. Jones & Willis, of London; and the oak work in the choir was done by Messrs. John Fall, Thorpe, & Sons, of Leeds; while the brass work was done by Messrs. Guest & Chimes, of Cotherham; and an embroidered altar cloth was worked by the East Grinstead sisters. The total cost of the repairs has been 2,100.

**Knotty Ash.**—A new pulpit has just been placed in the Church of St. John the Divine at Knotty Ash, near Liverpool. The whole of the site is composed of Devonshire marble. The body of the pulpit is of oak, and of octagonal form. It stands against the north wall, and on the five sides facing the congregation are recessed and groined niches, each flanked by a slender buttress, above which are pinnacles, diagonal on plan, and terminating with crockets and pinnacles which cut into the line of foliated rince above. The niches are all once headed and grained, the statues standing upon fair pedestals. Mr. Harry Hems, of Exeter, has carried out the work, from designs by Messrs. Bridge & Deacon, of Liverpool.

**London.**—St. Peter's Church, Safron-hill,

Holborn, is one of several built from the designs of the late Sir Charles Barry about fifty years ago, and in it, as in most of the churches built at that time, the problem was to obtain the greatest number of seats possible. In its original state it consisted of a centre and two side aisles, the former wide and filled with free seats. There was a very shallow communion enclosure at the east end, the rails returning north and south, and the space between the rail and walls fitted with pews. In front of the rail was the accustomed three-decker, north and south galleries, and two deep west galleries, in one of which was placed the organ. The church has recently undergone considerable alteration. The two west galleries have been removed entirely, and the proportions of the arcade, which was, to a great extent, marred by the former erections, have been shown to advantage. The large west window, which was formerly blocked up, has now been opened out, and the result is a large and imposing church. The whole of the ground-floor has been re-seated with open pews of pitch pine. A lobby has been formed at the west end; and a similar screen at the east end of the north aisle to enclose a choir-vestry. The north gallery has been shortened one bay, and the organ placed on the ground-floor. A chancel has been formed at the east end, approached by two steps, enclosed by an ornamental pierced oak dwarf-screen, and a prayer-desk and choir seats on each side, also of oak. The sacrum has been raised two additional steps and paved with encaustic tiles of an ornamental character. A dorsal has been placed at the back of the table, and ornamental coloured hangings along the east wall. The whole of the windows have been filled with coloured glass in ornamental designs, two of the windows being memorials. The church has been decorated throughout and embellished by the use of stencilling in string-courses, labels over the arches, and the window and wall at the east end. The old pulpit and lectern still remain, and are much out of character with the rest of the fittings; but it is hoped these will be speedily superseded by appropriate ones by the help of some generous donors. The warming has been improved by the substitution of three Gurney's stoves for the old ones. The gas-lighting has been entirely re-arranged, and consists of an ornamental brass corona suspended from a bracket over each arch of the arcade, giving light to the galleries as well as the nave. There are also two ornamental standards in the chancel. The general contractors for the works were Messrs. L. H. & R. Roberts, of Rheidol-terrace, Islington. The oak work in the chancel is by Messrs. Bennett, of Glasgow. The glazing is by Messrs. Herrold & Co.; the tile pavement by Messrs. Carter, Johnson, & Co.; the gas-fittings by Messrs. Hodges. The whole of the works have been carried out from the designs and under the superintendence of the architect, Mr. J. Douglass Mathews, F.R.I.B.A., at a total cost, including the heating and lighting, of about 1,500.

**Pentney (Norfolk).**—On the 17th ult. the Bishop of Norwich re-opened the interesting church here, which has been closed for some time past for restoration. The works done consist in taking up the old flooring, and relaying a solid deal wood-block floor by Mr. Roger Lowe, of Farnworth-by-Bolton; setting back the chancel to its original line, and raising it one step above the nave floor; and re-seating with pitch-pine the whole of the nave and chancel, and putting a screen across the west end of the church to form a vestry, in the same position as the old deal one. The organ, formerly at the west end, has been placed in the chancel on the north side. The pulpit, reading-desk, and lectern are in oak, and, together with the entire fittings of the church, have been designed in the characteristic Perpendicular style prevalent in this part of Norfolk. The fabric of the church has not been touched in any way beyond making it water-tight. The carving to the pulpit was done by Mr. J. E. Knox, of Doris-street, Lambeth. The works have been executed by the builder, Mr. W. H. Brown, of King's Lynn, from the designs and under the superintendence of Mr. E. Guy Dawber, architect, London.

**Peterborough.**—The new church of All Saints, situated in the Park-road, the foundation-stone of which was laid last year by the Bishop of the Diocese, has been opened for service. The building is in the Decorated style, and consists of a high tower of four stages surmounted by a

low spire, the body of the church consisting of nave, chancel, and north aisle. At present only the ground stage of the tower has been completed, and about two-thirds of the nave and aisle. The chancel is complete, and the nave is carried the length of two bays. Across the west end, and thus dividing the nave in the centre, a brick wall has been put up, which can be taken down, and the remainder of the nave added when sufficient funds are in hand. Sutton stone, with Clipham and Bath stone dressings, has been used for the exterior, and the interior stonework is of Bath stone and brick, flat pointed, and distompered for decoration. The total length of so much of the church as erected is 67 ft. from the east end to the temporary west wall; the width will be 40 ft. The roof of the nave and chancel is pointed, the exterior being covered with tiles and the interior panelled and ribbed with deal. The roof to the aisle is covered with lead on the exterior, and in the interior it is panelled with deal. At the east end of the church there is a large five-light window; the windows in the south aisles have three lights each, and are square headed, while on the north side they have two lights, and are pointed. The floors are of wood blocks; deal in the nave and aisle, but oak in the chancel. The church will be seated with chairs. The room formed by the lower stage of the tower will be used as the vestry. The pulpit and communion-table are of oak, and the font is of red Runcorn stone. The building is heated by one of Musgrave's stoves. The total cost, as far as it has proceeded, is a little over 2,000. The architect is Mr. T. L. Moore, of Hampstead, and the contract has been carried out by Alderman Thompson, of Peterborough.

**Putney.**—St. John's Church, Putney.—On the 9th ult. the dedication of the additions to St. John's Church took place, the Bishop of Rochester officiating. The works, which have been carried out under the direction of Messrs. Lee, Bros., & Pain, architects, Adelphi-terrace, comprise the new chancel and north chancel aisle. The architects' designs included the enlargement of the clergy and choir vestries, but the execution of this work has been deferred for the present. The builders were Messrs. Adamson & Sons, of Putney; the wrought iron chancel screen and gas-fittings were supplied by Messrs. Hart, Son, Peard, & Co.; the marble mosaic pavement of sacrum was executed by Messrs. Diespeker & Co.; the tile paving of chancel was supplied by Messrs. Minton & Co.; and the warming apparatus by Messrs. Perkins.

**Ulleskelf.**—The Church of St. Saviour's, a "chapel of ease" to Kirby Wharfe, has just been consecrated. The building is in a Late Gothic style of architecture, and will accommodate about 180 people. It consists of nave and chancel, 21 ft. wide and 65 ft. long; vestry, 14 ft. by 12 ft.; organ-chamber, porch, &c. The walls are built of brick, with moulded strings, &c., and stone tracered windows, and the roofs are slated. A bell-turret covered with lead, and containing a bell, marks the division between the nave and chancel. The inside walls are coloured, and the ceiling plastered under the rafters, and divided into panels without moulded ribs. The floors are of wood blocks under the seats, and the aisles are tiled. The seats, pulpit, &c., are of deal, and panelled, stained, and varnished. The warming is by Musgrave stoves. Messrs. Demaine & Brierley, of York, are the architects, and the work has been carried out by the following contractors:—Brickwork and plastering, Mr. Kidd; stonework, Mr. Flows; carpenter's and joiner's work, Mr. Bellorby; slating, Messrs. Wood & Co.; plumbing and glazing, Mr. Hodgson; painting, Mr. Pearson; ironwork, Mr. Varvill.

**Wednesbury.**—A new chapel has just been erected at St. James's Church, Wednesbury, in memory of the late Colonel J. N. Bagnall, the style being of the early fourteenth century. The new chapel, or north aisle, is 33 ft. long by 21 ft. wide, and will accommodate 110 worshippers. It is fitted up with an altar, piscina, &c. The exterior of the building is faced with ashlar stonework, from Codsall quarries, and the floors are laid with blocks. The nave has been painted and decorated by Mr. Simkin, of Wednesbury, and a new heating apparatus has been provided by Messrs. James Russell & Sons, of the Crown Tube Works. The architects were Messrs. Horton & Scott, of Wednesbury, and the work has been executed by Messrs. Bernard Clarke, Sons, & Co.

SCHOOL-BUILDING NEWS.

**Cardiff.**—A new Board School has been opened at Cardiff. The school is in the Domestic Gothic style, and is divided into three departments, rooms for 360 girls being provided on the ground-floor, for 360 boys on the first floor, and for 515 infants on the ground-floor, adjoining the girls' school. Both the girls' and boys' departments are divided into one main and four class-rooms, each department having cloak and store-rooms and lavatories attached. A marching room and a gallery running the entire length of the boys' and girls' departments have been provided. The latrines are provided with Messrs. Boves Scott & Read's patent trough closets, which are flushed by 100-gallon cisterns. The work was carried out under the supervision of Mr. A. Llewellyn Batchelor, of Cardiff, by Messrs. Stephens & Bastow, of Bristol. The cost has been about 12,800*l.*

**Fairlie.**—On the 22nd ult. the new school which has been erected for Fairlie by the Largs School Board was formally opened by Mr. C. S. Parker, M.P. The building stands on the rising ground at the back of the Free Church, and cost, including access and a bridge over the burn, about 1,800*l.* Mr. Walker, Fairlie, being the architect. It will accommodate about 180 scholars.

**Guisborough.**—The foundation-stone of a new Grammar School at Guisborough has been laid by the Marquis of Ripon. Old scapelled ashlar for the former school and almshouses has been used for the external walls up to the window heads of the ground-floor, relieved with buff terra-cotta plinth, string courses, and millined windows. Above the ground-floor red pressed bricks, in Flemish bond, pointed with black ash mortar, are used, and relieved with terra-cotta dressings. There will be a bell turret on the roof, and the roofs will be slated. The master's house will consist of a study, drawing-room, butler's pantry, kitchen, &c. The first floor consists of five bedrooms, corridor, dressing-room, bath-room, &c., to the master's house, and two attics above. Over the school part of the building will be a class-room, master's room, and a dormitory the size of the school-room beneath. The buildings are being erected from plans prepared by Mr. Alfred Waterhouse, R.A. Mr. A. White, of Guisborough, is the contractor, and Mr. John Cook is clerk of the works.

**Leeds.**—The additions recently made to the Leeds Girls' High School have lately been inaugurated. A large cloak-room, 43 ft. by 20 ft., has been added, with two of Bradford & Co.'s drying-closets at one end, so that wet mantles may be dried in a short time. Adjoining this room is a new lavatory, 38 ft. by 15 ft., containing twenty-four basins. On the mezzanine floor above these rooms are provided three small class-rooms and three music-rooms, so that piano practice may not be heard. A new class-room, 38 ft. by 18 ft. has been placed on the first floor. The architects are Messrs. Chorley & Connon.

STAINED GLASS.

**Edgbaston.**—The unvailing of a new east window at St. James's Church, Edgbaston, took place on the 19th ult. The treatment of the window is designed to show Our Lord as King and High Priest, crowned and holding the sceptre. Standing on either side are the figures of the four archangels, SS. Raphael, Michael, Gabriel, and Uriel. In the upper part of the lights are angels holding shields, and above, in the tracery, are three angels playing upon instruments of music. The rest of the window is filled in with foliage. The work has been executed by Messrs. John Lee & Co. of Birmingham, from designs by Mr. Wyndham Hughes.

**Manchester.**—The Dean and Churchwardens of Manchester Cathedral have accepted the offer of a well known citizen to place a stained-glass window in the Cathedral in memory of General Gordon. The window consists of five lights and tracery, and is in memory of Gordon's last days at Khartoum. Gordon is the central figure of the composition, and is surrounded by his fellow-sufferers, who look appealingly to him, whilst his own gaze is turned to the Desert and the Nile. Above and around are angels bearing palms and crowns. The window is the work of

Messrs. Wilson & Whitehouse, of Vernon-place, Bloomsbury-square, London.

THE STUDENT'S COLUMN.

OWING to the necessity of some alteration in the scale of the illustrative diagrams, we are obliged to hold over this week's portion of the Student's Column, and will give it next week in a double chapter.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

13,352, Fire Escape from Buildings. J. B. Foulds.

In order to allow any one to save himself by the window, by this invention a small apparatus is made, slipping or sliding on a rope, provided with double friction and stop-clutches to control the descent.

15,011, Coating Water-pipes. D. J. Duncan and H. C. Mylne.

According to this invention, the pipes are placed in a tank in which a protective gummy mixture is kept heated and liquid, and are rotated therein on frames specially made for the purpose.

15,078, Glazed Pavement Lights. H. Snley.

The object of this invention is to make the lights in such form that the noise of overhead traffic is reduced to a minimum. The cast-iron frames are so made as to admit of blocks or wedges of wood or packing of other suitable material being fixed between each pane of glass. The wooden wedges prevent the feet of passers-by touching the frame, or, in some cases, the glass, and the blocks are struck by first being dried in a furnace and then fitted. The action of the air then makes them fast by reason of the moisture in it.

15,875, Preventing the Rattling of Windows and Doors. J. Copnard.

This invention consists of a box or case in which is a spring. On the end of the spring is a wheel or roller. The spring in the case is bent in the form of a V, with the roller at the top end of one of the arms; when, therefore, it is placed in position, this roller is pressed against the frame, but assists in travelling up or down, and prevents the frame from rattling in the grooves in which it runs.

15,945, Grates and Fireplaces. C. Swindell.

The idea embodied in this patent is to control the consumption of fuel and throw out more heat into the apartment, and to modify the draught at will. A movable panel works at the back of the stove grate, and is moved by chain or lever into different positions, according to the strength of the draught required. The fire-box is also movable, and may be placed higher or lower, backwards or forwards, as desired. Thus the heat is utilised to the greatest advantage in warming the apartment.

17,019, Building Hollow Walls. G. M. Henley.

Dovetailed or rebated bricks are used by the inventor to make the bond, so that the inner wall is perfectly bonded at the quoins and the reveals with the external wall without the use of wall ties, and in a manner which gives free space for ventilation throughout the building.

78, Automatic Door Holder. J. B. Gray.

By this invention a small ball or roller is held vertically downwards and urged down by a spring. The roller is also controlled by an adjustable break. It runs along when the door is opened by hand, but by a projection or shallow ledge it may be fixed so as to prevent the door being moved by the wind, although it is not so firmly fixed but that it may easily be moved by hand.

9,009, Improved Wood Screw. T. R. Weston.

The point of the screw which is the subject of this patent is fluted, and is to be driven in like a nail until the thread of the screw is reached, when it is turned and screwed home in the ordinary way.

NEW APPLICATIONS FOR PATENTS.

Nov. 18.—15,806, J. Johnson, Chimney-top, &c., 15,814, J. Carr, Paperhangings and Paper Combined Paste and Size.—15,868, R. Shaw, Drain-pipes, &c.

Nov. 19.—15,889, T. Grimbleby, Double Bar Lock Roofing Tile.—15,966, W. Thompson, Brick Machines.—15,926, O. Bowen, Portland Cement.

Nov. 21.—15,981, J. Eardson, Double Flush Water-Waste Preventing Valves.—15,986, W. Lake, Devices for Preventing the Slamming of Doors.

**The Atlantic-Mediterranean Canal.**—Two Government Commissioners in France having pronounced favourably upon the scheme for a canal from the Bay of Biscay to the Bay of Toulon, a company has been formed for carrying the undertaking out, and recently one of the promoters, a M. Wickersheim, gave some particulars of the same before an influential meeting at Toulon. It is decided that the canal shall start at Bordeaux and follow the left shore of the Garonne for a length of 85 kilometres. It will cross that river at Castalfarrasin, and continue along the right shore to Toulon, where a large harbour is to be constructed. Hence it runs to Narbonne, and then, trending towards the Mediterranean, to Grissan, where another harbour is to be constructed similar to that at the mouth of the Amsterdam Canal. The entire length of the canal by this course will be 525 kilometres, and it will be fitted either with thirty-eight low or twenty-two high locks. The depth has provisionally been fixed at 25 ft.; but, if the French Government should desire it, it will be 30 ft., so as to allow of the passage of ironclads. Vessels passing through the canal will be towed by means of locomotives running on tracks alongside it, the rate of progress being about eighty miles an hour. The entire passage is computed to occupy from five to ten days, according to the size of the vessel. M. Wickersheim finally expressed the belief that, apart from the great commercial benefits to be derived from this canal, it would be of immense strategical value, whilst it would greatly reduce the importance of Gibraltar to England.

**"Protected" Fire Risks.**—The New York Board of Fire Underwriters has taken a new departure in the regulation of insurance policies. Twelve members of the Board have been appointed as a "Protective Committee," whose duty shall be to prescribe requirements on application for the proper construction or improvement and effectual protection of any mercantile or manufacturing risk, including provisions for automatic sprinklers and like approved appliances. When a property-owner has complied with the requirements of the committee in the construction and protection of any building, it will be classed as "protected," and the committee is authorised to fix a reduced rate of insurance. The committee is also empowered to modify or cancel all such contracts if deemed necessary or advisable. In the event of a claim for loss or damage to a protected risk issued under this plan, the committee will adjust the claim and apportion the amount for which each company is liable. The amount of insurance to be placed on any risk is to be distributed among all of the insurance companies entering the agreement. — *New York Times*.

**Messrs. Ashton & Green** have lately opened an iron foundry at Bow Bridge, E., where they will turn out a large variety of stoves, ranges, and other light castings. The works are very conveniently situate at the water side, and whilst the shops are light and spacious, every appliance is provided that will tend to expedite and economise production. Already about two tons of work is being turned out per day, and the *Ironmonger* pronounces the castings produced as equal to the best Scotch work. In stoves and grates the firm have a variety of new designs, and these include one constructed on Dr. Teale's principle, and fitted with firebrick sides and bottom.

**Proposed Improvements in the City.**—At the last meeting of the City Commission of Sewers, Mr. Under-Sheriff Rose-Innes moved,—

"That this Commission is of opinion that the approaches to the Tower Bridge, the completion of the widening of Ludgate-hill, and the widening or other alteration of the eastern end of Newgate-street, are matters of urgent importance, not only to the City of London but to the whole Metropolitan area, and that they are impeded solely by financial questions. It, therefore, refers these three necessary great public improvements to the Finance Committee, with instructions and power to confer with every necessary authority interested therein, and so soon as the Finance Committee is satisfied that they can be carried out without overburdening the present ratepayers, the Finance Committee prepare a Bill, if possible, for the next Session of Parliament, in order to carry out its arrangements."

The motion was negatived by 38 to 15.

**Battersea Public Baths.**—Mr. Rowland Plumbe writes to say that the designs for these, mentioned in our last, were not prepared by him solely, but in conjunction with Messrs. Horace T. Bonner and Charles Jones as joint architects.

**Civil and Mechanical Engineers' Society.**—We have received the syllabus of meetings of this society for the session 1887-8. The meetings are to be held in the Townhall, Westminster, on Wednesday evenings, at 7 p.m. The following is the list:—Dec. 7, Opening Address by the President (Mr. R. E. Middleton, M.Inst. C.E., M.I.M.E.); Dec. 21, Paper on "The Roof of the National Agricultural Hall, Kensington," by Mr. A. T. Walmisley; Jan. 4, General Meeting for the presentation of accounts, and paper on "Salmon Passes," by Mr. A. Fairlie Bruce; Jan. 18, paper on "Steel Sleepers," by Mr. H. T. Munday; Feb. 1, paper on "The Use of Ammonia as a Refrigerating Agent," by Mr. T. B. Lightfoot; Feb. 15, paper on "Sea Water for Street-watering," by Mr. S. Harding Terry; Feb. 29, paper on "Our National Defences," by Mr. William C. Street; March 14, paper on "The Construction and Use of the Hopper Dredger," by Mr. A. C. Schönberg; March 28, paper on "The Development of Machinery in Relation to Hand Labour," by Mr. Ambrose A. Myall; April 11, paper on "Theatres and other Public Buildings," by Mr. Walter Emden; April 25, paper on "Railways for Rural and Undeveloped Districts," by Mr. James B. Walton; May 9, General Meeting for the presentation of report, election of Council, &c. Visits to various works in progress will be made during the session. The annual dinner will be held at the Holborn Restaurant, on May 23rd, 1888.

**London's Revenue.**—Some idea of the vast importance of the question of London government reform may be formed from an examination of the returns, issued yesterday, showing the income and expenditure of the various local authorities of the metropolis for 1886. The total receipts of the metropolitan vestries and district boards during the year amounted to over three millions and a half, of which the sum of 3,307,935l. was raised from the rates. This represented an average rate of a fraction under 2s. 7d. in the pound on 25,739,910l., the assessable value of the metropolis outside the jurisdiction of the Corporation of the City of London. The receipts of the Corporation during the year amounted to nearly a million and a quarter, of which over half a million was raised from the oppressive coal duties. The revenue of the whole of London last year, therefore, amounted to over four millions and three quarters. That the expenditure of such a large sum of money annually raised for purposes of local government should be in the hands of men who, for the most part, have no claim to be regarded as representatives of the ratepayers, is perilous to the best interests of the latter. — *Daily Chronicle* (Nov. 26).

**The Washington Monument.**—The great equestrian bronze statue to be erected to the memory of Washington in the capital of the United States is now progressing towards completion. It is being executed by Professor Siemering, of Berlin, and the various parts are now being cast in that city. Part of the pedestal represents a fountain, whence water flows into two basins, whilst on another are gilt animals in relief, representing the fauna of America. On the pedestal is also a group with a female figure in the centre representing America, on each side of whom are American soldiers and citizens of the time of the War of Independence, who, kneeling, offer banners and laurel wreaths to the ideal representative of America. This figure wears a Phrygian cap, her hair falling loose over her shoulders. There are also portrait medallions of the great commanders during the war.

**John Wesley's Chapel.**—The Episcopal Chapel in West-street, close to the two main thoroughfares of Shaftesbury-avenue and Charing-cross-road, is announced to be sold by auction on the 15th inst. It is stated that the chapel was used by John Wesley, who preached in it for more than half-a-century. Whitfield frequently preached in it, the first time in 1750. Wesley's pulpit still remains in the church, and the portable pulpit he used when preaching in the streets is in the vestry. Services have been conducted in the church until August last, when the incumbent died. The property will be offered either as a church or as a commercial building site.

**Evidently a Joke.**—According to the *Poll Mall Gazette*, "the Grosvenor Gallery split is going to lead to the opening of a new gallery. Messrs. Hallé and Carr will be the managers, and it will, we understand, be called the Halicarnassian."

**Value of New River Shares.**—At the Auction Mart on the 23rd ult. Messrs. Edwin Fox & Bousfield submitted to auction about one-half a King's freehold share, and a smaller part of an Adventurer's freehold share, also thirty-seven 100l. fully-paid new shares, and 3,000l. Four per Cent. Debenture Stock. The King's and Adventurer's shares are freehold estates, and pass by deed, as with all real property, these were offered in lots of 130th of a share in each lot, the dividend on which last year was 21l. 15s. each lot, and sold at from 700l. to 720l. each, giving as the value of a freehold share from 84,000l. to 86,400l. The new shares paid last year 12½ per cent., and realised from 325l. to 327l. ex div. The Debenture Stock (Four per Cent.) fetched 117 to 117½ per cent., also ex div. The total amount realised was 53,136l.—*Standard*.

**Registration of Plumbers in Dundee.**—One day last week Mr. W. R. E. Coles, Clerk of the Plumbers' Company of London, attended at the Town-hall, Dundee, to issue certificates of registration to plumbers from Inverness and Aberdeen. He afterwards met the Committee of the District Council for Forfarshire, Fifeshire, and Perthshire, which has its headquarters at Dundee. Dr. Anderson presided. The formation of technical classes for the plumbers of the district was discussed, and further consideration of the matter was deferred until the next meeting of the Council.

**West Ham Hospital.**—The *Stratford Express* says that the Committee for erecting this building, in reply to an advertisement inviting designs, have received twenty-two sets of plans. Mr. Angell, being a member of the Committee, was requested to report on the merits of such plans, but declined, and the reference was made to Professor Roger Smith, who reported upon the merits of the various plans submitted, and, in the result, the Committee adopted the design with the motto "Hygeia." Upon opening the sealed letter bearing this motto, it was found that Messrs. Houston, of Essex-street, Strand, were the authors, and the premium of 50l. was awarded accordingly.

**Dr. Chambers's Statue, Edinburgh.**—The *Scotsman* reports that he has been unanimously agreed, at a meeting of the Lord Provost's Committee of the Edinburgh Town Council, to recommend to the Council that Dr. Chambers's statue be erected in the centre of Chambers-street, opposite the entrance to the Industrial Museum.

**The New Alderman.**—Mr. James Ebenezer Saunders, F.S.A., who was last week elected an Alderman of the City of London in succession to the late Sir William L'Arthur, is, as many of our readers know, an architect and surveyor. He was elected a Fellow of the Royal Institute of British Architects in 1866, and has had an extensive practice.

**Migration of Industries.**—It is announced that the Dowla's ironworks are to be removed to Cardiff. —The *Manchester Courier* says that Messrs. Sharp, Stewart, & Co., the well-known locomotive builders, of Manchester, are about to remove their works to Glasgow.

**Locks for a Lunatic Asylum.**—We hear that the Kent County magistrates have intrusted Mr. James Hill, of Queen Victoria-street, with the order for 450 special locks, with master-key arrangements, for the Barming Heath Lunatic Asylum.

**Edinburgh Joiners' Wages.**—The *Scotsman* says that the committee met on the 25th ult., when it was reported that three out of those employers who had notified a reduction had withdrawn their notice, and agreed to pay the standard wage, namely, 7d. per hour.

**Wood-working Machinery.**—Mr. J. Stafford Ransome, Assoc. Mem. Inst. C.E., is contributing a series of articles to our contemporary the *Timber Trades' Journal*, entitled "How to Select Wood-working Machinery."

IMPORTANT COMMUNICATION.—FIRE AT WHITELEY'S.
WILLIAM WHITELEY, Westbourne Grove,
London, Oct. 12th, 1887.

HOBBS, HART, & CO., LIMITED.
GENTLEMEN.—It affords me very much pleasure to express to you my satisfaction and admiration at the splendid fire-resisting powers of your Strong-room doors and the Safes.
The recent fire at my establishment in my opinion subjected them to the greatest possible test, and through all, they proved invulnerable. The contents of both Strong Rooms and Safes were entirely preserved, although the fire was of such intense destructive force.
You will be pleased to hear that it has been decided to adopt your Patent Clutch-related Doors for all the party-walls in the new building now in course of erection.—I am, Gentlemen, faithfully yours,
(Signed) WILLIAM WHITELEY.

### Travels in Tunisia.

OW that the old and Classic shrines of the architectural pilgrim in Greece and Italy have become well-worn ground, there is a natural tendency on the part of architectural students and sketchers to make the most, while they are still unhandicapped, of some of the regions that have not been so much visited, sketched, and written about. A little while ago we noticed the excellent and elaborate work by Mr. T. G. Jackson on the architectural remains on the east coast of the Adriatic; and now we have a book,\* the joint production of two English travellers, Mr. Alexander Graham and Mr. Ashbee, on the architectural remains in what is, apparently, a still more inclement neighbourhood for the traveller and sketcher,—the region about Tunisia. Not that there is any difficulty in getting to Tunis itself, of course, but the penetration of the country in order to get at the desired architectural remains appears to be a pretty rough business, not to be undertaken by those (if there are any such) who want an architectural holiday in kid gloves. Our two travellers, however, seem to have been equal to anything of this kind, even to swimming across a river with their clothes packed on their heads, which was a necessary condition of progress at one point; and they have produced a hook which contains much information and a good many admirable illustrations, especially of the Roman remains of the country, accompanied also by notes on the general state of the country and population, over and above those details which are of special interest to architectural readers.

The first characteristic of Tunis, the authors note, is its excessive and pervading whiteness, all the cities in the neighbourhood being white, but Tunis the whitest of all:—"If economical in most things, in whitewash the Arab is extravagant. He applies it without discrimination,—from the mosque to the kouthba, from the palace to the hovel. Bricks or mud, marble or stone, iron or lead, all pass under the same brush; inscriptions are choked up, tracery is hidden, and carved capitals of beautiful design are thus made to look like stucco imitations." There was a time when this might nearly have been said of England,

and it is on record that London was at one time called "the white city" in consequence of its general white plaster physiognomy, a fact or supposition which was urged on us by a member of a certain Society the other day as a reason for leaving the old plaster on Staple Inn, instead of uncovering the older timber work. It is a curious feature in architectural history, this persistent recurrence of the desire to whitewash everything, developing itself as luxuriantly in the æsthetic taste of the Arab of the nineteenth century as in that of the English churchwarden of the eighteenth; and it is, perhaps, still more singular that those who hold up their hands in horror at the idea of now whitewashing an ancient building will nevertheless regard with reverence the whitewash of a former generation, apparently on the principle that "whatever is, is right." Not that our authors condone the Arab whitewashings, if we understand them rightly, but they note that it renders the cities "beautiful at a distance," and as part of the landscape. The whiteness seen in the general view, however, is much diversified in the interior of Tunis; the labyrinths of streets, the flying arches from house to house across the narrow thoroughfares, the shops with their painted wooden columns, and the wooden doors with quaint devices formed by numberless nail-heads (this latter feature being apparently a kind of charm, or so regarded) relieve to some purpose the otherwise monotonous white surfaces. A curious superstition is mentioned which we have not heard of before, that the constant use of black along with white voussoirs in the arches is a piece of moral symbolism; it is the emblem of sin or imperfection, more especially when one black voussoir is inserted as a keystone where all the rest is white; to build it or leave it all white would be to assume perfection, and leave the construction open to the revenge exercised upon it by the spirit of evil, who has to be propitiated by this form of recognition, provided for with black paint if "constructive polychromy" is wanting. If this be the case, it is a curious instance of the influence of superstition on architectural detail. It would be naturally supposed that the black and white voussoirs were the offspring of a pure desire for picturesque effect; at all events, they seem, whether from association or not, to harmonise remarkably well with the Arab style of building generally.

The contrast between the modern and the ancient architecture of the neighbourhood is a very marked one. The authors give the following brief general description of the typical Arab town:—

"Low, brick-built, whitewashed houses, consist-

ing generally of one story, with arched doorways more or less pretentious, and barred windows planned externally without any attempt at symmetry, turning their backs, as it were, on narrow, tortuous, ill-paved streets, in which all kinds of ordure and objectionable matter are deposited. In the midst is a mosque of one uniform pattern, differing only in size and extent from that of some other town. On higher ground stands the military Governor's residence, the Kasba, or citadel. The whole is enclosed with a whitewashed rubble wall, encannelled, pierced for musketry, and buttressed at intervals; pretty at a distance, but much less so in close proximity, and quite useless for purposes of defence. Such is the ordinary Tunisian town, almost devoid of architectural pretensions, if we except the Roman shafts of marble or stone that are conspicuous at corners of the streets, the support and mainstay of ill-constructed buildings."

These Roman hits built-in form, one might say, the only connexion between the architectural present and the architectural past. Of the latter the Consular report of Colonel Sir Lyon Playfair, for 1886, quoted by the authors, says:—"Great Roman roads radiated from Carthage, and even an immense series of secondary ones can still in many instances be traced by military columns, testifying to the ancient prosperity of the country and to the genius of its occupants, whether Punic or Roman. Every town on the course of these roads had its temples, basilica, palaces, forum, and theatre; its theatre and amphitheatre. Triumphal arches and city gates are still found in all their classic grandeur, and at every step the traveller meets with Roman farms\* of almost monumental grandeur." The mosques of Tunis possess obviously some interest, as indicated by their picturesque gateways, but they are so jealously guarded from the incursions of the unbeliever that the authors can give no report as to their interior merits. One of the mosque entrances, that to the women's mosque at Tunis, is given in a phototype; like some of the other doorways illustrated, it is a curious combination of a reminiscence of the Classic framework combined with Moorish details; there is a built-up pilaster with a surbase and plinth on either side, a capital with a necking, and the survival of the architrave in the form of a flat arch; and within this framework is the horseshoe arch and thin shaft of Moorish architecture, brought here by the Moors when expelled from Spain. Mr. Graham's drawing of this door was published in the *Builder* of January 10, 1885. The entrance to the Kasba at Susa, given in another plate, is also a curious combination of reminiscences of quasi-Classic general form, with corrupt or quasi-Moorish detail; the cornice showing nearly the outline of a Classic

\* Travels in Tunisia; with a Glossary, a Map, a Bibliography, and Fifty Illustrations. By Alexander Graham, F.R.I.B.A., and H. S. Ashbee, F.S.A., F.R.G.S. London: Dulau & Co. 1887.

\* Printed "farms" in the book: possibly it should be, "forms."

cornice, with a kind of reminiscence of triglyphs below: the circular arch beneath springing from a clumsily-designed pilaster with capital and base, but the arch in sub-orders in the Gothic manner. Several other doorways are illustrated, and they are among the most picturesque illustrations in the book, and full of character and suggestion, both in their general forms and detail.

Even the larger palatial buildings of the modern period, though picturesque, are, in most cases, it would appear, of very flimsy construction, or are in a state of semi-ruin, partly owing to the practice of each new Bey building himself a new palace, the old abode of his predecessor being either dismantled or allowed to moulder away as it will. The Bardo, the palace of the last Bey, is, the authors say, so defective in construction that, though it has not been dismantled, in a few years it will be unsafe for occupation. It appears to contain a curious collection of things,—shards from Carthage, mosaics from Italy, furniture from France, tawdry hangings, glass, and gilding, &c., “an unseemly collection of things good and bad, but mostly bad.” The Dar-el-Bey, or town palace, presents internally the same spectacle of a mixture of incongruous objects; but as a building it is, judging from the view given of the interior court, a very charming piece of architecture in a strongly-marked Moorish style, though built only in the beginning of the present century. The arcade is curious in detail, presenting something very like a thin Classical column to begin with, on the capital of which is mounted an oblong block on end, with the surface inlaid in panels, and from this spring the borse-shoe arches with their black and white voussoirs. The general effect of the whole is charming, except the mass of bare wall at the top, which sadly wants “treating” in some way. There is some talk, we are told, of converting this palace into a museum, a purpose for which the authors pronounce it to be very well suited, and in which capacity it would supply a want in Tunis.

In strong contrast with these picturesque but mostly perishable buildings of the modern period are the grand remains of the Romans and Carthaginians, who, in an architectural sense, were probably practically Romans, deriving their style from the great city of which Carthage attempted to be the political and commercial rival. The illustrations of these are the real objects of greatest interest in the book. The illustrations are, we presume, from the drawings of Mr. Graham; the authors have not given any direct clue to the distribution of the joint work between them, but these illustrations, reproduced in two tints from water-colour drawings, resemble in manner those of Mr. Graham's in illustration of Roman triumphal arches, which have already appeared in the same method of reproduction in the pages of the *Transactions of the Institute of Architects*. The first of these remains which is given is that of the aqueduct of Carthage, which marches over the plain in the usual magnificent manner so characteristic of the Roman aqueduct. In the portion shown in the view the aqueduct is in only one tier (about 70 ft. high), built in a kind of concrete in sections 3 ft. 8 in. in height; the piers, instead of having any spread at the impost, batter slightly inwards with a set-off like that of a Gothic buttress, only carried all round the pier, and from this spring the arches. The authors note that in another part of its course the aqueduct did present a grand series of superposed arches rising to the height of 120 ft., where it crossed the Oued Mellian, but it was destroyed by a French Government engineer in order to assist in making a new bridge, and because he said the aqueduct obstructed the waterway of the river. This it may have done, no doubt; but nothing short of absolute necessity could have justified such a destruction of the finest portion of one of what are really the greatest remains left by the Romans in their capacity of builders. The most interesting and least known of the Roman monuments described are, perhaps, those of Sbeitla. Here are the cellas and a

quantity of the remains of three temples which stood side by side, with the porticos nearly in a line; the colonnades are all overthrown, but, from the interesting view given of the actual state, there seems to be enough remaining to justify the restoration given on the next plate. A triumphal arch here, of which an illustration is given of the actual state, appears to have differed from the usual or most familiar model of Roman triumphal arches in having not merely applied columns on its face but advanced wings on either side of the archway, with columns spread out from the body of the structure and carrying cross lintels, one of which is still protruding from the face of the masonry above the anta, though the column which once sustained its other extremity has disappeared. The buildings, we are told, were constructed with a very hard compact limestone, “quite white when quarried, but acquiring a rich golden hue after long exposure to the sun. The other facing materials were limestone also, but of different shades of colour, from pale rose to deep red, from light grey to dark slate.” This latter piece of information is interesting, as it gives a rather new idea as to the use of a constructive polychromy in Roman masonry. The authors do not mention where they got the information as to the first-mentioned limestone “being quite white when quarried”; but we presume the same stone is now to be found and experimented on in the neighbourhood.

The authors have added to their book a very useful bibliography, or list of the works which have been previously written on the neighbourhood of Tunis; and a remarkably long list it is, showing that there is no want of literary information to be had about the country, though we presume that a good deal of this runs in the same tracks and does not take us into the less easily accessible places. They have also added a small map of the neighbourhood, an addition which saves a good deal of trouble to the reader desirous to follow the run of the country described. We may congratulate them on the production of what is a very pleasant and readable book in itself, though its chief value and interest consist in the description of the great Roman remains that were visited, and in the admirably executed and produced illustrations of these and of some of the Moorish buildings. In a practical sense, also, the book will be of use to any who may wish to explore the same line of country, in giving information as to the means (or no-means) of getting about, and the various and apparently not slight difficulties they will have to contend with.

#### “WHITELEY v. BARLEY.”

“SECRECY,” it has been often said, “is the badge of fraud.” If, however, the decision of Mr. Justice Mathew in the case of *Whiteley v. Barley*, delivered in the High Court on the 21st ultimo, be upheld on appeal, it would appear that the fullest publicity given through local journals, and transparent honesty on the part of the officers of local authorities, will not avail to save them from the pains and penalties imposed by the Public Health Act on jobbery and corruption.

We owe no apology to our readers for bringing this, the latest case, to their notice, as it concerns the character and welfare of an honourable profession, which has never yet been adequately remunerated for good service rendered to the public, and is for that reason exposed to manifold temptations.

The action referred to was brought by an informer under the 193rd section of the Public Health Act of 1875, to recover certain penalties from the Surveyor of the Corporation of Ramsgate. Under several contracts made by the Corporation for the improvement and drainage of the town, the Surveyor was instructed by formal resolution of the Works Committee to take out the quantities of the contract work, his fees being calculated at a sum equal to 2½ per cent. on the amount payable by the Corporation under the contracts; and, as is customary in such cases, the amount of these fees was charged in the contractor's accounts,

and received by him upon obtaining a certificate from the Surveyor that the works had been completed.

There were contracts also for main drainage works which the defendant Barley was appointed to supervise as engineer by a special resolution of the Council, and for extra services in respect of these contracts he was entitled to receive also a percentage on the cost, together with a sum equal to 1½ per cent. on the amounts certified for taking out the quantities as a necessary part of the preliminary engineering work.

It was proved beyond all question that there was no attempt at concealment in the transaction. All was fair and above board, and, although the fees payable to the Town Surveyor passed through the hands and accounts of the contractors, still there was no ground for saying that they came from any other source than the borough funds, lawfully chargeable under the terms of the contracts with such payment. It was alleged at the trial that the Surveyor was bound to account for them, less his expenses out of pocket, but the jury found that such an arrangement was not in fact made.

After some consideration, and with evident reluctance, the judge held that the Town Surveyor was a party “concerned and interested” in these contracts within the meaning of the statute, and inflicted four several penalties of 50*l.* each, or a sum of 200*l.* in all,—just one year's ordinary salary of the unhappy delinquent, whose honesty and *bona fides* from first to last had never been impugned; and further, in addition to these penalties, he was, in pursuance of the same section, declared incapable of continuing in his office, or holding any employment under the Act.

It may be expedient to strive to make men virtuous by Act of Parliament, and we certainly do not desire to throw blame upon the Legislature for a laudable effort to check the plague of secret “commissions,” and put their heel upon the whole tribe of petty pilferers and speculators who are a standing disgrace to local self-government, and the gravest obstacle to its extension and development; but we contend that this practical interpretation of a well-meant clause is a *robuetio ad absurdum*.

If sound in law, and we fear that it will be so held, the position of a Town Surveyor, always inadequately paid, may become well-nigh untenable; and it behoves the Surveyors' Institution, or the Association of Municipal Engineers, to bestir themselves to obtain an amendment of the Act without delay. It has been done before when a similar paradox was brought to light, and by following the lines of the amending Act, known as the 48 & 49 Vict., c. 53, there will be no difficulty in amending the statute, so that real offenders will be punished as they deserve, whilst taking the sting of injustice out of a very salutary enactment.

It was the decision of the Court of Appeal in *Burgess v. Clark*, followed by an equally startling interpretation of the Act in *Todd v. Robinson*, some weeks later, which brought about the amendment of the law. In the first case, the Clerk of a Local Authority was held liable and fined in the sum of 50*l.* for letting rooms in his own offices to the Board at a rent payable to himself, this being held to be an unlawful bargain. In the second case, the Clerk of a Sanitary Authority held a few shares in a gas company which had contracted to light the public streets at a price which would leave a small profit to the company. He was held to have an “interest” in such contract, and was also fined 50*l.* under the section.

These and other similar anomalies induced the Legislature to amend the Public Health Act by providing that a formal resolution of the Authority approving the transaction, after seven days' notice of the meeting published in a local newspaper, should render the letting of rooms and lands, or the holding of shares in any public company which had contracted with the Board, no longer unlawful. Moreover, the written consent of the Attorney-General was made necessary in certain cases.

We think that the case now under review

will serve to indicate the necessity of a still further revision, so as to extend the exemption from liability to honest servants, in all transactions and bargains openly made and approved by the employing authorities.

The resolutions of a public body, publicly advertised, ought to put every ratepayer on his guard, and in this wise many meritorious officers will be saved from a public condemnation, which ought to be reserved for a class of "pestilent fellows" who love darkness because their deeds are evil.

## NOTES.

**M**R. SPIERS has sent us a letter and a diagram in reference to our remarks about the sphere in perspective in our notice of his book on architectural drawing, which we are unable to publish this week, as the diagram was sent late and requires an alteration in the scale of the lettering before it can be reproduced. We may say at once, however, that Mr. Spiers did not intend to suggest that a sphere *per se* could, in any position, be seen as distorted, but only that its projection on the plane of the drawing involved distortion under certain circumstances. We thought he could hardly intend the former meaning, but the sentence struck us as not very clear in its expression. Even on this ground, however, we do not think the question, also referred to in Mr. Baggally's able and practical paper read at the Architectural Association (and printed in another column), is practically quite such a simple one or so easily disposed of as one or two correspondents who have written to us appear to consider it, for reasons which we will give when we print Mr. Spiers's letter and diagram.

**T**HE *New York Herald* has published a statement of the expenditure on the Panama Canal to the 30th of June, 1886, which has been drawn up by Signor Armero, the agent of the Columbian Government. Among the items to which Signor Armero directs special attention are the following, the prices being stated in dollars:—Stables, 600,000; buildings for offices, private residence for manager, country seat for same, grounds, &c., 5,250,000; central hospital at Panama, hospital and ambulance at Colon, sanatorium at Tahago, and the pharmaceutical staff cost, together, 12,760,000; the offices at New York, Paris, and Panama cost 8,400,000; and there is an item of 2,000,000 for the cost of entertaining guests invited to accompany M. de Lesseps to Panama to inspect the canal during a week's sojourn. It will have to be very clearly shown on what evidence Signor Armero gives figures which, as is the case with the above, are not to be found in the yearly statement of accounts furnished by the Directors of the Canal Company. Indeed, it has to be made more clear than is at present the case, in what currency the dollars above stated are calculated, as the value of the American dollar would give a much larger sum than the accounts of the Company show; while, at the same time, the heavy charge of 1,784,000, for preliminary expenses does not appear in the table. The total given by Signor Armero is 164,900,088 dollars. The total expenditure to June, 1886, according to the balance-sheet rendered by M. de Lesseps on June 30th, 1887, was 640,173,195 francs. It is a remarkable thing that among the numerous reporters who have from time to time given accounts of the state and progress of the enterprise, only two, as far as we remember, namely, Herr Bayeler and Mr. Rodrigues, seem to have taken the necessary precaution of consulting the series of the *Bulletin du Canal Interocéanique* for definite statements as to work done and cash laid out.

**T**HE displacement of the centres of productive industry from their inland homes to places accessible by water still goes on. The great Atlas Works of Messrs. Sharp, Stewart, & Co., of Manchester, are, as we mentioned last week, to be closed, the business being transferred to Glasgow. Had

the Manchester Canal experienced less delay in obtaining Parliamentary sanction, it is possible that a movement so disastrous for Lancashire would not have taken place. But our manufacturers cannot afford to wait. The *Staffordshire Advertiser* announces the probable re-introduction into Parliament of the Upper Trent Navigation Scheme, which was thrown out by the landowners' opposition last year. The magnificent waterway of the Trent, neglected as it has long been, is unrivalled in the kingdom for its natural capabilities, and the work necessary for putting Birmingham in direct water connexion with this arterial channel is surprisingly little. It is estimated that goods may be conveyed the 170 miles from Birmingham to the Estuary of the Trent for 8s. per ton, or about half of the lowest rate practicable by railway. As compared with existing charges, of course, the reduction will be much more considerable. The Warwick Canal Company co-operates in the promotion of the new navigation, the opening of which can be hardly less than of vital importance to Birmingham.

**T**HE recently-decided case of Bateman v. The Poplar District Board of Works seems to show that some amendment is required of the Metropolitan Local Management Act, 1855. The houses on one side of a road at Poplar were drained into a 9-in. drain running under the yards and gardens at the back of the road, and this was connected with a main sewer. The Court of Appeal held that this drain was not a sewer, and so was not the property of the District Board. The question then arose, it being discovered that another drain belonging to different premises had been connected with the first mentioned one without the knowledge of the District Board, whether this circumstance made the first-mentioned drain a sewer? Mr. Justice North held that it did not, because the defendants could not have known of the connexion with reasonable care. Certainly a connexion surreptitiously made could not well alter the position of the Board; but, on the other hand, it seems to us that such a drain as this should be vested in the Local Authority immediately it is made. It is essentially a "trunk" sewer or drain, not appertaining to any individual house, and it falls within the category of general drains, which ought to be under the charge of the local public authority.

**I**T is reported that Mr. T. J. Steel, of Gracechurch-street, has purchased for the sum of 200,000, the Strand property of Lord Salisbury. The property in question, whereof the sale was mooted rather more than two years ago, comprises Cecil and Salisbury streets, together with part of the ground between Savoy Mansions (now being built) and the Adelphi, lately washed by the Thames, and extends over about 66,000 feet superficial. On this fore-shore stand some stables, &c., and the tenement which until about 25 years ago was known as the "Fox under the Hill." Its signboard remains across what used to be an approach to the halfpenny steamboat pier at the foot of Ivy Bridge-lane. In the account of a fire in Cecil-street on the morning of Sunday, September 5th, 1880, it was announced that the flames broke out in a house which was "once the residence of the Cecil family . . . and in one of the rooms, which amid all alterations has been preserved intact, Queen Elizabeth when a guest of the Cecil family is said to have slept." That can hardly be the case, inasmuch as by 1695 had been pulled down the two tenements known as "Great Salisbury House" and "Little Salisbury House." These, combined, formed the original Salisbury House, one of the famous Strand palaces, which was built westwards of the garden of Carlisle, since Worcester House, by Sir Robert Cecil, James I.'s Lord High Treasurer, elevated Baron Cecil in 1603, and advanced Earl of Salisbury the 4th of May, 1605. Queen Elizabeth was present at the house-warming on the 6th of December, 1602. The ground was traversed by the brook Ulebrig, which crossed the Strand beneath the Ivy Bridge. A view of the house may be seen in

the Fauntleroy Pennant at the Soane Museum, and in Wilkinson's "London Illustrated," after Hollar. William, second Earl, divided his father's house into two, as indicated. He reserved one portion for his own town mansion, Great Salisbury House. The other portion, Little Salisbury House, was rented to persons of quality, and was at one time occupied by William Cavendish, third Earl of Devonshire, husband to Elizabeth, daughter of William, second Earl of Salisbury. This latter house's site was leased out, in 1692, for Salisbury-street, since rebuilt by Payne, the architect, the crescent and flight of steps at the southern end being added when the brothers Adam obtained their Act in 1771 (Geo. III., c. 34) for making encroachments upon the riverside. The western front of the crescent stands over Ivy Bridge-lane, which is overlooked by the hack bay-windows of the street. A further portion of the estate was let on lease, and covered by a range of shops, the Middle Exchange, reaching from the Strand to the bridge, or stairs, at the river's bank. Proving a failure, the Middle Exchange, together with what remained of Great Salisbury House, was demolished in 1695, and their site appropriated for Cecil-street, whereof the eastern side lies within the Precinct of the Savoy, and abuts against Carting-lane, alongside of the Savoy Theatre. It was whilst standing before the door of his patron, the Earl of Devonshire's, house here that Hobbes was seen and cordially recognised, in June, 1660, by Charles II., who was driving along the Strand. At the sign of the Globe, in Cecil-street, lived, until 1715, Partridge, cohhler, astrologer, and almanack-maker, whom Swift pertinaciously killed in 1708. His almanack, *Merlinus Liberatus*, did not die with him. In 1723 were advertised "Dr. Partridge's night-drops, night-pills, &c., sold as before, by his widow at the Blue Ball, in Salisbury-street." In Cecil-street lived Patrick, ninth Baron Gray (1706), and Sir William Dawes, Archbishop of York, during the interval 1721-4: these at the end house on the western side. No. 18, eastern side, was, in 1800, tenanted by Dr. Wollaston, the celebrated chemist and natural philosopher, who invented the reflecting goniometer, discovered palladium and rhodium, and familiarised us with the practical uses of the camera lucida and the blow-pipe.

**A**T the annual presentation of prizes last week to students attending the Life School of the Royal Scottish Academy, Sir William Fettes Douglas, the President, delivered an interesting lecture on the Beginnings of Art. He inferred from the discoveries of Schliemann amongst the ruins of Troy that, upon the whole, the Greek record was the least broken, and the most steadily consecutive. "Art," he said, "is the truest and most subtle guide when men seek to judge of works of unknown provenance, and it would be well if archaeologists and ethnologists would look to it for the assistance they need." From the carvings found in the Dordogne cave, in circumstances and surroundings showing a state of wretched barbarism, he judged that they were the work of "a race who had not been always savages, but who were the degraded outcome of a degraded civilisation,—a civilisation which probably existed before that of Egypt."

**I**N a recent issue (Oct. 8) we drew attention to a remarkable discovery made by the French excavators at Mantinea,—three marble reliefs representing the contest of Apollo and Marsyas. It will be remembered that the great interest of the reliefs was that, presumably, they once decorated the basis of certain statues made by Praxiteles and described by Pausanias. Since our last notice a good many particulars have come to light. The reliefs have been taken to the Central Museum at Athens, casts are already made, and they are shortly to be published either in the *Ἐπιγραφαὶ Ἀρχαιολογικαί*, or the *Bulletin Hellénique*. Meantime, we may state that each relief measures c. 1.5, and that the marks of cramp-irons which served to attach the slabs are still visible. The composition is disposed as

follows:—In the centre relief, Apollo seated holding his lyre; in front, Marsyas playing on the flute, near him a Syrtian; in each of the two remaining slabs three Muses. Unhappily, not only the style of the reliefs, but the form of the cramping-irons used leaves no doubt in the minds of experts that the relief is of much later date than Praxiteles; so we are bound to relinquish that cherished hope. The further interesting question remains, are the reliefs seen by Pausanias? Pausanias distinctly says (viii., 9, 1) he saw "the Muse and Marsyas playing on the flute" (*ἑνὶ τῷ βᾶβρω Μοῦσα καὶ Μαρσῖας ἀιδῶν*). It has been proposed to amend the singular into the plural in order to admit the other six Muses. It seems to us perfectly obvious that no such emendation is necessary. Pausanias, in his perfunctory way, glanced at the front of the basis, saw one, and only one, draped figure playing on the lyre, and concluded it was a Muse. He says nothing whatever of Apollo. The Muses have, it is reported, all the air of being copied from statuary types, and are, therefore, not successful in relief composition. The figure of Marsyas is in the, no doubt, typical attitude of the Myron replicas.

THE Greek Archaeological Society have laid bare the foundations of the small temple to Roma and Augustus, on the Acropolis. The site is twenty-five metres to the east of the Parthenon. The building was of white marble, circular, and surrounded by nine Ionic columns. The diameter is seven metres. The existence of such a temple has been known since the days of Cyriac of Ancona. The priest of Augustus, who, no doubt, presided over this temple, had a special, inscribed seat in the theatre; and there is also a seat inscribed with the joint names of Demos, the Graces, and Roma. From another inscription (C. Corpus, 478) we learn that Roma, as a goddess, had a joint sanctuary with Augustus on the Acropolis. A short account of the excavation appears in the *Berliner Philologische Wochenschrift* for the 3rd inst.

AN invention has been recently patented which promises to be of material service in all cases where the flow of water, gas, or electric fluid has to be varied at stated hours. Constant attendance and supervision are now required for the purpose, and when the variation has to be made late at night, or early in the morning, the expense of watching is an object as well as the risk. The improvements in question have been made by the Right Honourable Major-General Sir J. C. Cowell, K.C.B., an officer of the Royal Engineers. A wheel is driven by clock-work, so as to make one revolution in each cycle of periodic variation required. This wheel bears a horizontal ring or disc, the surface of which is made to rise or fall in proportion to the variation of supply required from time to time. A regulator is raised or lowered by the revolution of this curved surface, which opens or closes the pipe or channel through which the current of fluid passes. The utmost accuracy is thus attainable, both as to the time and the quantity of supply; and the motion of machinery may be stopped, modified, or set going at the exact time required, without the need of any attendant. In cases where machinery is driven by turbines, and where arrest at a late hour, or starting at an early hour is required, the time-regulator will perform the function of an un-sleeping engineer. The lowering of a gas supply over a large area, say at one or two o'clock in the morning, may be punctually secured by the same means. Mechanical men will readily recognise the valuable service that may be rendered by the Time-regulator.

FLATTED houses are now becoming common, owing to the high prices of building sites within cities. Where portions of these tenements are owned by different parties, nice questions are apt to arise as to the rights and duties of the respective holders. A strange hitch of this sort has arisen in Edinburgh. The fronts of two contiguous houses in the High-street, which had been discovered to be in a dangerous condition by the Burgh

Engineer, were ordered to be taken down. The frontage was seven stories, and the proprietors of the five lower stories have rebuilt their portions, but the owners of the two upper floors decline to proceed. The roof has been propped up, and there is considerable risk of its being displaced by a high wind. The matter is under the consideration of the Dean of Guild Court. We have heard of instances where a tenement has been taken down and has not been replaced for years owing to misunderstandings between the joint owners, but never of a case like the present. There would appear to have been no arrangement entered into between the owners, as should have been done before building operations were commenced.

THE new premises for the accommodation of the Elder Chair of Naval Architecture and Marine Engineering, Glasgow University, are now completed and occupied. These buildings, which also comprise a principal gateway and janitor's house, are the donation of Sir William Pearce, Bart., M.P. The picturesque and impressive facade of the old College in High-street, with its bold corbelling, has been incorporated in the principal front of the new edifice, the entire stonework having been successfully transported from east to west. The masonry, which is of a very vigorous character, dates back to A.D. 1632-58. The entrance for pedestrians is through the original archway, conspicuous by its massive rusticated quoins and vousoirs, which opens into a handsome arcade piazza. The ancient sculptured acutcheon bearing the Royal Scottish Arms and the monogram "C. R. 2," a fine old carved shield with the arms of the University, and a tablet relating its foundation by Bishop Turnbull, A.D. 1451, and the curiously-carved window-head and dormers, on which may be recognised the arms of England, Scotland, Ireland, and France, are embodied in the structure. These several features have been grouped with the new work, which is designed in harmony with the mixed Jacobean and French style of the old College. A Latin inscription above the principal entrance records the circumstances of Sir William Pearce's gift. The access to the classrooms is by a circular stair tower, and the carriage entrance gates are flanked by massive stone turrets, rusticated to match the principal arch, and surmounted by high-pitched conical caps. The malleable iron gates, which are of imposing dimensions, have been designed by the architect in the old Scottish style of ironwork. The entire structure constitutes a stately and interesting entrance to the University precincts,—a link between the present and the past. It may be added that the doorway of the former Fore-hall has been re-erected in its wonted position at the head of the quaint "Lion and Unicorn" staircase in the Professors' Quadrangle, itself a relic of the old college. The architect of these buildings is Mr. Alexr. George Thomson, I.A., Glasgow, who, in October, 1883, advocated in the press the removal and re-erection of the ancient stonework and decorative features as an adjunct to the University in its new site at Gilmour Hill.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third ordinary meeting of the present session of this Institute was held on Monday last, Mr. Edward PAnson, F.G.S. (President), in the chair.

#### Obituary.

Mr. W. H. White (Secretary) announced the death of Mr. Edmund Woodthorpe, Fellow. The President.—It is not my intention to trouble you with any long speech on the subject of the announcement which has just been made to you. I am quite sure I have only to mention the name of one who was so universally known amongst us, for a more cheery, bright, and honourable man did not exist in the profession. Gentlemen, with these words I will say no more, because you will have in the Proceedings a short paper I have written my-

self, and I have no doubt also that the professional papers will deal with the subject.

Professor Kerr.—I am glad to be allowed to say a word on this subject. Nothing could be added to the very feeling testimony which you have borne to Mr. Woodthorpe's memory. We all knew him so exceedingly well, both in this room and professionally at large. He was, as you have said, a most honourable man, most genial in his ways, and most useful as a member taking part in our discussions. But there is one thing I must say, if I may be allowed to do so without verging upon indiscretion. We know that Mr. Woodthorpe held two very important offices, and that he and his family must have been largely dependent upon the income derived from those offices. The headship of his family has now devolved upon a most worthy son,—a man of high education, character, and estimation. I think I may say that we hope the authorities will not overlook the claims of the son, as a matter of respect to the father. If it should be, as I think it will be, decided elsewhere, that this will be mentioned to the Metropolitan Board of Works, quasi officially, I am quite sure this meeting will authorise the Council, or any representative of the Council, to recommend this gentleman as successor to a father so very much respected as a public officer of the highest standing, and possessed of great wisdom, as I can testify from his management of our affairs in connexion with the District Surveyors' Association. I think, therefore, that it would be a most graceful testimony to the respect in which Mr. Woodthorpe was held, if some favour were shown to his son (applause).

#### The Institute Examination.

The Secretary next announced that at the Examination lately held, twenty-five candidates were examined, of whom nineteen had passed, and were qualified to become candidates for the Associateship. The following were the successful candidates, viz.:—Messrs. A. T. Bolton, E. J. Brydges, Thomas Davidson, E. H. Dawson, G. A. H. Dixon, J. W. Donald, G. W. Darrell (from Sydney), S. G. Gosse, R. M. Groggin, Thomas Henry, George Hornflower, L. V. Hunt, W. C. Jones, John Peter, A. B. Pite, G. W. Sadler, jun., H. A. Satchell, A. Sykes, and W. H. Woodroffe. These, with the twenty-five candidates who had passed in March, made altogether forty-four who had been successful this year (applause).

The Secretary further announced that the Ashpitel Prize had been awarded to Mr. Thomas Davidson, aged twenty-three, formerly of Scarborough, and now of London.

#### Theatre Construction.

Mr. Ralph Nevill, F.S.A., then read a paper entitled "The Auditorium of a Theatre," of which the following is an abstract:—

The author, after a few introductory remarks, dealt with the plan of a theatre and the arrangement of seats. In England, within the last few years, various efforts had been made to meet modern requirements. The drawings which he was able to exhibit by the kindness of Mr. Phipps and Mr. Verity would confirm that statement. Mr. Irving's plan was bad, for the people at the back could only see the lower half of the stage. The system of seating at the Haymarket was the best artistically, and the proportions allotted to the various parts of the audience were commercially most satisfactory; the system was also economical in first cost, and in proportion of cubical space to accommodation. The pit, which should be as large as possible, would, with good accommodation, always prove a financial success. The stalls should be only slightly curved, having no central passage, and the seats should be regularly alternated, so as to afford a clear view between the heads of those in front. The visible openings of boxes should not be more than 5 ft. or 6 ft. high. The gallery should be at the back, and not in the circle. It was important, artistically, as well as for acoustic reasons, that the ceiling of the auditorium should be as low as possible.

Acoustics.—The circular form of building afforded no advantage, the best being a triangle with the stage at the apex, as in the theatre at Bairenth, although seats arranged on a curved plan allowed a greater number to receive unimpeded waves of sound. In a plan by the author,  $\frac{1}{2}$  the diameter was taken for the height from the stage level to the springing of the ceiling; this was lower than most modern

theatres, the height of which, apparently, measured as much as the diameter. The lesser height was, however, an artistic and economical, as well as acoustic, gain. Flat ceilings rendered the hearing in the upper part defective; if curved, the sound was collected and delivered in a body on to the upper circle. Ventilation and fire risk were also connected with the ceiling; the introduction of the sunlight rendered it more easy to ventilate through the centre of the roof, and some suggested a cupola, but this he considered impracticable and undesirable. Proposals had been made for reversing the draught by ventilating through the stage, but most architects would agree with Professor Roger Smith that all draught should be from the actor to the audience. Professor Smith quoted, in his treatise on acoustics, some experiments to the effect that though sound travelled better with the wind than against, yet it travelled better still across the wind. If this were true, and the author believed it was, one great objection to the central ventilating fin disappeared. Saunders, Professor Smith, Mr. Sabomone, and nearly all English theatrical architects, upheld wood, while Lachez, followed by some of the French architects, demanded solid construction. A house for music required an amount of resonance, while in one for acting sound should be delivered pure and distinct. Wood was, therefore, as had for the latter as steno or hard walls for other reasons. Plaster was the suitable substance, supplemented by drapery where necessary. Wood might be a suitable lining to solid walls if carefully selected, put together like cabinet work, and well oiled and varnished; but floor boards nailed to wooden joists, or match boards papered or painted, had no heauty of tone, and the consequent vibration interfered with the purity of the sound. In Terry's Theatre no wood was used in this way, but, instead, concrete floors and partitions of plaster on wire netting and iron uprights. The ceiling should be treated as a resonant surface, constructed of iron and plaster, with a second roof over enclosing a sufficient hollow. The spaces under the floor and orchestra should also be hollow. Any resonant substance used should be of homogeneous character.

**Lighting.**—This ought to be regarded by the manager as a potent means of inspiring an audience. It might be accepted that the electric light would be used, but, nevertheless, provision must be made for gas. To be successful artistically, the light must be various. In the event of fire the electric light would be extinguished; the gas might light, therefore, never to be put out, but turned low during the performance, and turned up full between the acts, the electric light being turned quite out in the first case, so that the eye was entirely drawn to the stage. The front of the circles was the natural place for electric lights. Putting them high up in a cupola, and using ground glass globes for electric lights, was to be strictly condemned; the latter, though much used, destroyed the brilliancy of the light. The lights to the passage and on the stairs should be on a separate system altogether from that of the auditorium or the stage, and should be controlled from the front of the house. To protect against rushes of carbonic gas extinguishing the light, at certain points, such as the entrance to stairs and opposite doors, small flues and openings with thick glass fronts should be provided in the walls for lamps or gas-lights.

**Ventilation.**—The electric light rendered no great provision of fresh air necessary during a performance. It would, however, be always requisite to provide an exit for impure air; and, as long as gas was used behind the scenes, there must be sufficient ventilation to take away the enormous and dangerous heat at the top, without creating a draught to the stage. The sun-burner ought to be in a little cone or drum of its own, and have an outer ring to the shaft, which should be opened by the same action that turned up the light, in order that ventilation might be accelerated between the acts.

**Exits and Entrances, Stairs, &c.**—Necessarily the site largely governed both exits and entrances, and the important point was to get plenty of doors leading out of the auditorium. Any part accommodating more than 200 persons

should have more than the usual two doors. The pit holding 350, in a plan of his own, possessed four doors and an extra one in the middle. All doors should have the upper panels glazed, should open outwards, and be self-closing, so that, when the audience were out, the doors would be closed to fire. No more dangerous arrangement could be concocted than a long straight staircase. The straight exit from Terry's Theatre had been made a great deal of in the public press, but having passed down it, he would rather take his chance anywhere in the passages of a burning theatre than be one of a crowd going down it. No flight of stairs should be long without at least a small landing that might afford opportunity to resist pressure from behind. The best form of landing-stair was undoubtedly such as that to the gallery at the Prince of Wales's Theatre, in which four flights of four steps each went round a centre. The rounding-off of the corners was a great improvement. The great desideratum in a staircase was that a crowd could pass from top to bottom without any great pressure at any point, and in a continuous stream. A circular staircase would best attain this, the difficulty of the difference in the width of tread being overcome by using an ellipse for the plan, in which the steps were set to a very large radius, and the small ends used as landings. There was another form of the ellipse still more easy, and often applicable to a theatre—that was by forming the ellipse round a triangle. The Metropolitan Board of Works required that every staircase should be solidly closed in on both sides. The author ventured to say that regulation was a dangerous mistake. A staircase in a public building should be open at the sides from top to bottom; there should be no part from which the passengers were unable to see what took place all the way down, and, especially, to see the way out. Mr. Nevill considered it would be of the greatest advantage if all the staircases could be concentrated in one building, and he under one general control and supervision. A design for such a staircase, on the triangular plan, was exhibited; each flight rose 8 ft. 6 in., the height of the floor. A separate staircase started from each corner,—one to the pit circle, one to the upper circle, and one to the gallery. The central space was left open, and the whole lighting carried up to a good height to allow smoke or gas to escape upward. Iron foot-roads should be built into the stair on the inside, up which firemen could climb if required.

**Fire Risks.**—At the present moment this was the point of most interest in connexion with theatres, and after deprecating more than a certain degree of legislation and State interference, the author expressed his belief that in London, in a well-regulated theatre, fire risks were of the slightest. The only particular danger in a theatre, above other places, was the reckless use of gas behind the scenes and the extreme combustibility of the woodwork over the stage. Electric light and fireproof paints, together with the careful use of iron and concrete in the structure generally, would minimise the danger. Some form of fireproof curtain must be obtained, and sufficient of the top of the stage should open to form a chimney. It was an advantage to substitute iron in the seats where feasible, to avoid a blaze as much as possible. The seats should be cut off by a fire-resisting partition or wall from the corridors. The opening in the top of the stage should not be too large, and the same action which opened it should open a valve at the bottom for inlet of air. Referring to the fireproof curtain, Mr. Nevill mentioned several, such as hydraulic curtains of two thicknesses of iron, solid oak or teak, asbestos, silicated cotton curtains, and the water curtains of Captain Heath and M. Marinus. A very useful addition to a theatre would be a separate door and small iron stair in a fireproof shaft for firemen to enter from the outside.

The reading of the paper not being concluded until a quarter to ten,

Professor Kerr moved the adjournment of the discussion, as the subject was one of too great importance to be dismissed in the quarter of an hour which remained to them that evening.

Mr. Walter Emden said he had been invited to be present with a view to taking part in the discussion, and he was afraid he would not be able to attend at the adjournment.

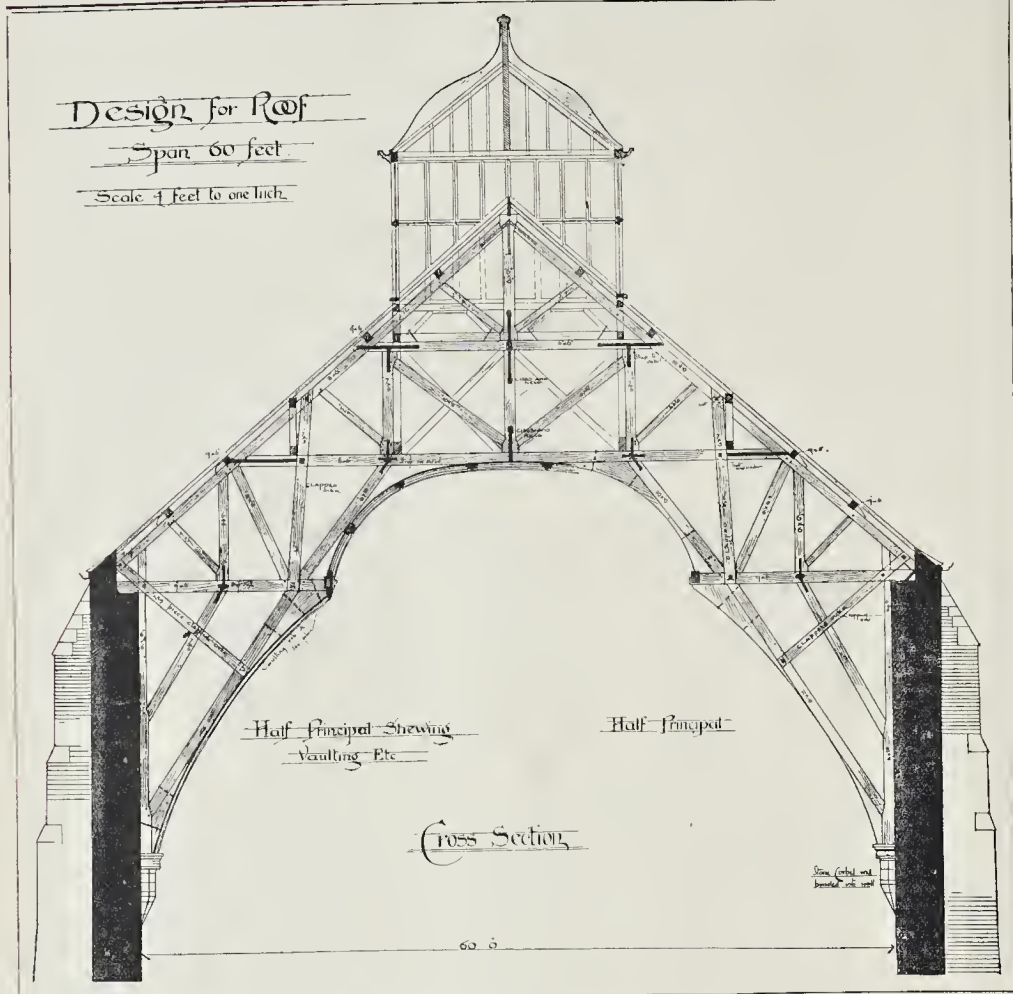

The President believed the paper would lead

to a long discussion, as the subject was one of extreme interest. They had, however, still a quarter of an hour before them, and there was no reason why they should not occupy that time in commencing the discussion, at any rate.

Mr. Walter Emden then said he would be pleased to follow the paper as far as he could; at the same time, there was in it so much of pure theory and assertion, and so much which was opposed to practice, that it would be impossible to go through it in anything like a satisfactory manner. He would, therefore, only take up one or two points, which seemed to him those on which he could more particularly touch. The first was the placing of the pit people in a better position. No manager could afford to make his theatre a "Royal Pit Theatre," by giving the best portion of his house to the frequenters of the pit. Mr. Irving's plan of putting the pit people a long distance back was not advisable, as they would not be able to see, they would be pretty well suffocated by the heat, and a great portion of them would not hear what was going on. At the same time, the ordinary theatre which obtained favour in England, with its pit and stall tier, its dress-circle tier, and its upper-boxes and gallery tier, was the one most suited to the habits of the people. With regard to acoustics and the use of wood, it had now been proved that iron and concrete were equally good conductors of sound, creating a much better and more resonant sound than wood construction. No doubt plaster on wire would act in much the same way, but was it necessary? In the case of Terry's Theatre, the partitions between the boxes were not of plaster, but were of hollow fire-brick. As to staircases, there was no elliptical one which would be helpful in case of a crush, although a crush was sometimes stopped by a square staircase. People often got out better by a straight staircase, but whether the straight or square form was the better was a question that might be debated for ever without any satisfactory conclusion being arrived at. By using an elliptical staircase, he was quite sure no one would be saved. He had had experience of one in his late offices, and everybody stumbled who came up it, as the tendency of the eye to look in a curved direction gave the body a proneness to swing over. What was required was to make the staircase as straight and clear as possible for people coming down, and particularly when in a state of panic. The lecturer had made a mistake in stating that theatres were generally lit by gas or electricity commanded from the side of the stage. That was not so; for, according to the regulations, there must be a separate meter in the front of the building to command the lighting of the house, the only portion of the front of the house commanded from the stage being the sunlight. As to theatres being fireproof, he could absolutely affirm from experience that no theatre had been built, before Terry's, that was really what could be termed fireproof. The circles or tiers were built in the ordinary way, with iron girders and columns, but the intermediate construction between the girders had, up to the present time, been of wood, and, although a small portion of concrete might have been used in the corridors, the tiers which carried the public had been built of wood. There was no doubt that it was a perfectly easy matter to build a fireproof theatre, so far as the auditorium was concerned, and of materials that would not communicate fire. The difficulty and danger was from the stage, and it was that portion of the building which required to be dealt with in the most experienced manner. As the lecturer had not travelled outside the question of the auditorium he himself would stop at the fireproof curtain. An iron curtain would probably buckle under the action of heat more quickly than a wooden one, and in doing so, its immense weight might pull down the proscenium walls and wreck the theatre. What was wanted most was to save the audience by giving them time to get out of the building. In order to do that something was wanted which could be readily at command. An ordinary asbestos sheet curtain on an iron grille could be used in the same manner as an ordinary green curtain, going up and coming down between the acts, and such a curtain, especially if of double thickness, would stand for a sufficient time to allow the house to be emptied. The line of sprinklers over the curtain would keep it cool, and it would probably stand when everything on the

\* And how is the exit to act, unless there is an inlet of corresponding superficialities? Unless this is supplied in a proper place, the requisite exit can only act by drawing in fresh air from places not intended.—doors, &c.; i.e., by creating draughts.—Ed.

stage was burnt out. Therefore, as long as the curtain stood, the theatre would practically consist of two buildings,—one on fire and the other not. He did not consider sprinklers to be useful when they were automatic, though they were serviceable if placed under the control of valves. A sprinkler with a small spray of water was not intended to extinguish a great fire, but rather to attack the fire in its incipient stage. A pail of water could have saved the Exeter Theatre had it been applied to the part of the horder which first took fire. As to the system stated to have been used at Drury Lane in 1812, so far as it went, it was upon much the same system as the modern idea of sprinklers. It consisted of rows of pipes pierced with holes. These might have rusted or otherwise got out of order, and were probably found expensive to deal with, owing to want of pressure, because the water-supply then came from Adelphi Terrace. He believed the arrangement had not fallen into disuse so much because of its ineffectiveness as from want of the necessary pressure, and from the pipes being left unused, and getting out of order. And though the present sprinkler was a very effective and useful appliance, it would be wrong to exaggerate its use; it was simply serviceable in arresting a fire in its incipient stage.

Mr. Alfred Darbyshire said that he had come from Manchester to take part in the discussion. As it had been decided to adjourn it, he would ask to be allowed to send his contribution in the form of a written document, as in all proba-

bility he would be unable to attend when the matter came up again.

Mr. Robert Walker seconded Professor Kerr's proposal for the adjournment of the discussion. The paper they had heard contained a great deal that was valuable, and also much that was startling to those who knew anything about theatres and theatre-building. It had fallen to his lot during the last twelve years, as District Surveyor of a central part of London in which fifty per cent. of the largest and principal theatres were situated, to have a great deal to do with them. He had seen many theatres destroyed, and many reconstructed and rebuilt, and, from the experience he had been compelled to gain in active service, he differed from a great deal that Mr. Nevill had advanced. He was therefore prepared, if the discussion were adjourned, to re-open it on its resumption. But he would like in the most emphatic manner, as a practical architect, associated officially with the supervision of a large number of the London theatres, to protest against one expression which had fallen from Mr. Nevill. That gentleman had said that the public were under great obligation to managers for providing theatrical entertainments, and that (though he was not quite sure he had caught the exact words) the question of the number of exits, and the absolute safety of the public in the buildings as regarded the exits, were not altogether subjects for legislation of the most direct character. Now, he must dissent entirely from that view, and believed that it was their business, as professional men, who had to overlook those build-

ings, to see that there was the minimum of danger attaching to them. And, so far as they could, by legislative enactments, bring their influence to bear, it was their solemn duty to see that such enactments were carried out as necessary for the absolute safety of the public. He would, therefore, warn his hearers, as professional men, that unless they adopted that as a principle of their professional career and practice, the public would sweep them away.

Mr. E. J. Tarver\* then proposed a vote of thanks to Mr. Nevill.

Mr. Octavius Hansard seconded the motion, adding that he hoped the members would have copies of the paper *in extenso* before the discussion was resumed.

The resolution, on being put to the meeting, was very cordially received.

Mr. Nevill briefly acknowledged the vote of thanks and begged the members not to go too much upon the abstract of his paper, which was wanting in the great amount of detail he had given in the paper itself.

It was then agreed to adjourn the discussion to the first meeting of the Institute in February next, by which time the members would have the complete paper with the plans accompanying it in their hands.

The President stated that the next meeting would take place on the 19th inst., when the winner of the Edis Prize would be announced, and other important business be transacted.

The proceedings then terminated.

\* Some remarks which Mr. Tarver intended to make in the discussion will be found on another page.

interested

THE GRISSELL GOLD MEDAL  
DESIGN FOR A ROOF.

We give a small-scale drawing and details of the design to which the Grissell Gold Medal

and the usual prize of ten guineas were awarded by the Council of the Royal Institute of British Architects last January. The author is Mr. James Strong, of Liverpool. The subject set

was a design for a roof over a railway station, 60 ft. span, without floor supports; wood construction, without iron ties; central lantern light; height of walls, 40 ft. In the illustration, the lower part of the walls is omitted.

THE ASSOCIATION OF PUBLIC  
SANITARY INSPECTORS.

On Saturday last, Dec. 3, at the meeting of this Association at the Westminster Town-hall, Mr. Alexander (Shoreditch) presiding, a paper was read by Dr. W. Collingridge, Medical Officer of Health for the Port of London, on "The Duties of Port Sanitary Authorities conferred in the Public Health Acts of 1872, 1875, and the Diseases Prevention Act of 1883 had, he said, placed Port Inspectors, so far as their duties were concerned, in the same position as Inspectors of Nuisances of Urban Sanitary Authorities, ships being now legally considered as "houses." It would be difficult to exaggerate the importance of the duties of sanitary authorities on which the country relied for protection against invasions of cholera from foreign countries in a city which was the centre of commerce of the entire world. As on shore, the duties divided themselves into two parts: first, prevention; second, cure. In recommending preventive measures the inspector could often do more by persuasion than by compulsion, but he must be thoroughly acquainted, not only with the technical duties of an ordinary inspector, but have a thorough acquaintance with the construction of ships of all classes, from the stately liner to the humble barge. The first essentials were effective ventilation and the frequent cleansing of the bilge water. That the effect of the appointment of Port Inspectors has been valued and appreciated by those most concerned was strongly evidenced by the increasing number of liners and ships which now made arrangements to have their crew's quarters cleansed at the earliest possible moment after their arrival. The first point in dealing with the second part of the subject, the cure of disease, was to secure at the earliest possible moment notice of the outbreak of infectious disease. The lecturer strongly commended to the imitation of the whole metropolis a regulation which had worked well in the Port of London and in seven of the largest ports in the kingdom. The masters of ships were bound to report forthwith—that is, within two hours or so,—any case of infectious disease, under a penalty of 5*l.* The patient was also compulsorily removed into hospital. Public opinion was fast becoming ripe for demanding compulsory notification of disease, and a regulation enforcing that principle all over London could not be long delayed.

In the discussion which followed, and in which Mr. Alexander, Mr. Jerram, Mr. Fairchild, Mr. Fuller, and other members took part, the speakers one after another objected strongly to the policy of putting the Inspector of Nuisances under the direct control of the Medical Officer. If they were ever to raise the status of inspector, as they were endeavouring to do, his authority should be collateral with, but on no account subjected to, that of the Medical Officer of Health.

After a vote of thanks had been accorded to the lecturer, Mr. Middleweek (Kensington) moved a resolution in favour of the compulsory notification of infectious disease, which, after discussion, was unanimously adopted.

During the evening an application from the North-Western District (Liverpool) for affiliation to the Association was dismissed and adopted, and Liverpool was decided upon as the place for holding the forthcoming third provincial meeting.

A PROPOSED IMPROVEMENT IN THE  
CONSTRUCTION OF THEATRES.

The following communication was intended to be read by Mr. E. J. Farver at the Institute meeting on Monday evening last, as a contribution to the discussion on Mr. Ralph Nevill's paper, elsewhere reported; but, owing to want of time, it had to be omitted.

"I should mention, at the outset, that I have obtained a provisional patent for this improvement, which is tantamount to saying that it is, to the best of my belief, an original invention, so far as anything in this world can be said to be original; for I hold the truth of the old adage that 'nothing comes from nothing,' and I admit that this idea has been suggested to me by the ancient Roman amphitheatres.

If, however, the ghost of one of those old builders were to accuse me of copying his ideas

and were to contest the patent with me, I should reply, in the first place, that his patent was extinct; and, secondly, that the idea is altered to suit modern wants.

We always speak of the ancient Romans as a practical people, and, in this case, the opinion is borne out by their sensible arrangements for rapidly filling and emptying their vast amphitheatres. Remove the upper crust, as it were, formed by the tiers of seats, and the sub-structure is found to consist entirely of staircases, so that the mass of spectators must have melted away after the performance like a film of ice in a rapid thaw.

It is hardly necessary to say that a Roman amphitheatre is utterly unsuited to modern dramatic performances, consisting, as it does, of one continuous slope of seats rising from the arena to the back benches, whence our actors would be almost invisible and inaudible.

How, then, can the Roman system of staircases be applied to modern theatres?

This is the problem which I have endeavoured to solve, with the object of saving life in the case of fire or panic, and I have done so with a result,—on paper,—which has far exceeded my expectations.

An outbreak of fire during a performance is, happily, a very rare occurrence; still, it has happened, and may happen again, or it may be suspected, and the suspicion may produce a panic. Any means, therefore, of reducing to a minimum the distance between any seat in the house and the outer air must be a distinct gain in theatre-building.

Now, if we examine any ordinary theatre (I do not mean a circus or a lecture theatre, but a theatre with the usual arrangement of dress-circle, upper circle, and gallery), we shall find that, with the occasional exception of the gallery, these portions are invariably approached from a corridor behind the highest row of seats in each portion, and, supposing the pit to be on the street-level, every seat in these portions has to be approached, first by an ascent to these respective corridors, and then by a descent to all but the back rows of seats.

Many theatres are constructed with the dress-circle on the street-level, or nearly so, and with the pit and stalls below that level, a system which renders it impossible to have dressing-rooms, &c., below the pit, and one which is, so far, wasteful of space. Even in such cases the upper circle and gallery have to be approached by the ascent and descent that I have described and, the gallery being generally the fullest part of the house, this long route affects the safety of the largest section of the audience.

By reversing the point of approach, that is to say, by ascending immediately to the front or lowest tier in each portion, it is obvious that the distance between any seat in the theatre and the outer air is reduced to a minimum.

On working out a set of 1-in. scale plans of a theatre of precisely the same dimensions as an existing one in London which contains 700 seats, I was delighted to find that I obtained 1,064 seats, or half as many again.

This satisfactory result dispelled the objection that would be raised to the loss of seats where the emerging stairs occur.

Moreover, by placing these stairs at the extreme sides of the auditorium, the audience would, in case of panic, immediately diverge towards the doors by which they entered, instead of converging, as they often do now, and they would also find themselves close to an exit door at the foot of each staircase.

Another advantage of this system is that any draughts admitted through the doors would be directed into the body of the house and be carried off by the ceiling ventilator, instead of giving one a stiff neck as they do now from behind.

There is yet another minor advantage in the fact that one enters facing the numbers on the backs of the seats, which can thus be easily found.

The entrances are not so far forward as to involve the danger of running towards a fire breaking out on the stage; the movement is rather sideways.

Comparing the number of steps (each 11 in. by 6 in., as required by the Metropolis Management and Building Acts Amendment Act, 1878) in this design with those of the existing theatre that I have alluded to, taking the pit as the datum level, I find that that theatre has twenty-six steps up to the dress-circle corridor (mine only fifteen), fifty-three up to the upper-circle cor-

ridor (mine only thirty-four), and eighty-four up to the gallery landing (mine only fifty-one).

It will be noticed that the position of the gallery in my design admits of a flatter gradient, and consequently an easier ascent to the back seats than a gallery which is placed further forward. This, of course, is due to the angle of the radial line struck from the foot of the stage.

Lastly, I would point out that my system admits of a cantilever construction, and thereby obviates the necessity for supporting columns, which are fidgeting, however small they may be.

I am quite prepared to find that long walk accommodation objected to by those who think that repeated refreshments during long waits are necessary for the revenue of the manager. Other people, however, consider this a doubtful blessing, and find the repeated return of young gentlemen, smelling of cigarettes, a nuisance.

The diagram plan is merely suggestive. There are dozens of ways of treating the stairs and gaining saloons, &c., where the headway admits of it, and I see no reason why the curved dress-circle corridor should not be rendered picturesque, by cross arches and a skilful treatment of the recesses at the ends.

It has been arranged to exhibit the diagrams at the adjourned meeting to discuss Mr. Nevill's paper in February.]

THE SARCOPHAGI OF SIDON.

THE following communication, which has been received by the Chairman of the Palestine Exploration Fund from Professor T. Hayter Lewis, appears in the *Times* of Thursday last. Professor Lewis has returned from a visit to Constantinople, where he was allowed by the Director of the Imperial Museum to see the photographs of the sarcophagi:—

"The following notes were made chiefly from descriptions given by his Excellency Hamdi Bey personally to myself, and are to a large extent in his own words. They may form useful addenda to the very admirable account given in the last Quarterly Statement, and also to Hamdi Bey's own description in the last number of the *Revue Archéologique*. I had not seen these until after my return to London. The shaft was about 16 ft. by 13 ft., and 50 ft. deep. In chambers leading out of it, of which he gives plans and sections in the *Revue*, were found the following:—

Three Phœnician anthropoid sarcophagi, two of these being in white marble (one male and the other female), and the third in black marble (female).

Seven sarcophagi of Greek design, of different epochs, carved out of Greek marble blocks.

Three of these are similar, and one simply in the form of pedestals, without any figure sculpture, but with beautifully moulded and enriched cornices and bases, which much resemble those of the sarcophagus in the British Museum brought from Crete. The covers are coped, and with pediments and acroteries. The fourth is of the peculiar tall Lycian form, surmounted by a curved roof, with gables, of which we have two good examples in the British Museum. But, in place of the usual panels in and beneath the gables, the Sidon tomb has griffins and other sculptures which are purely Greek. On one of the long sides there are, splendidly-sculptured, two cars, with four horses each, in full career. On the other side is a hunting scene. The fifth sarcophagus (not in the Lycian form) is equally well sculptured with Assyrian subjects.

The sixth represents a Greek Ionic temple with antæ, but with three-quarter columns only between the two antæ, and three-quarter columns to the sides. Between each two columns or antæ is a female figure showing signs of deep affliction. In all there are eighteen of these statues. The temple rests on a stylobate, having a finely-moulded base and surbase, the dado being enriched with figures, partly sculptured and partly painted. The cover represents the roof of a temple, and in the pediment at each end is a fine group of sculpture. As a curious variation from the temple form, there is along each side, surmounting the cornice, a tablet, on which is carved a funeral procession. Such a decorative feature is not unusual in sarcophagi of late date, one such being in the British Museum, but I can call to mind no example of such a feature surmounting the cymatium in any temple.

All the above sarcophagi show large remains of coloured decoration, and, as described to me,

confirm Hittorff's theories as given in his work on Sicily.

The seventh sarcophagus is the grandest of all. It is out of one block of white marble, about 11 ft. long, with a coped and pedimented cover, and having no columnar decoration, but with an enriched cornice and base, the panels between these, on each side, being filled with sculptures of marvellously fine execution. On two of the sides the subject is the chase; on the other two are represented combats between warriors both on horse and foot. One prominent figure reminded Hamdi Bey of that of Darius in the famous mosaic from Pompeii (and having seen this recently I quite agree with him), and certain characteristics on another of the principal figures induces him to assign it to Alexander.

In any case, there can scarcely be a doubt that the sculptures represent a battle between Greeks and Persians, and most probably between Darius and Alexander. The cover of this magnificent tomb is of the ordinary coped form, but is enriched with rows of heads on the eaves line and on the ridge,—a very unusual style of finish, but which may be seen partly carried out on a small scale on one of the Greek sarcophagi figured in Sir C. Fellows's "Asia Minor." At each end of the eaves is a lion. This also reminds one of the lions' heads and fore paws sculptured in the roof of another Lycian tomb figured in the same work.

The architectural details of all these sarcophagi, so far as I can judge from the photographs, are of the Greek type of the best period, without a trace of Roman influence, and the sculpture appears to be of the highest class. It is altogether different from the bold style of the Pergamus sculpture, and much more nearly resembles the beautifully delicate carving of the Parthenon frieze, of which the horses, the figures, and the drapery of the Sidon monument strongly remind one.

Hamdi Bey thinks that it is probably by Lysippus or his school; but as to this, only some one specially qualified by a study of ancient examples (and such a one, no doubt, he will consult) could give a definite opinion. He will have to determine, to begin with, whether the sculpture is the product of an artist accustomed to work in marble, or whether it is not that of one accustomed to work in bronze. I can only venture to suggest, from certain details, that the latter is the case.

But it is not only by the sculpture that this monument has been adorned. It has been so, in the most careful and artistic way, with colouring, which was (and I trust still is) in a perfect state of preservation, and producing a charming effect, each of the different reds, purples, violets, &c., being put on in various tints and gradations with great delicacy, gold being sparingly applied and with great judgment. The spears, &c., are of bronze. The flesh of the figures is not coloured.

To show the care which has been taken with this decoration I may mention that the portions of marble which have been left uncoloured have been treated in three different ways,—viz. (1), by the ordinary finish; (2), by being slightly roughened; and (3), by an exquisitely finished surface such as one finds in the finest Greek sculpture.

As to the date of all these works, except the one with the well-known Phœnician sarcophagus (to which I allude below), there is no guide whatever beyond what the sculptures tell. The absence of any inscription is not surprising, inasmuch as very few of the sculptured sarcophagi (chiefly Græco-Roman) left to us are inscribed, and I have Hamdi Bey's authority for saying that there is not a line, not a word, which could give a clue to the date, nor anything definite as to the persons for whom these splendidly-adorned tombs were made.

How was it that a great sepulchre should have been hewn 50 ft. deep in the solid rock, chambers carved out from it, these immense blocks of the finest marble brought from Greece, carved by the best Greek sculptors, painted (it would seem) by the best Greek artists, and then lowered into their resting-places in times of no great antiquity, and yet not a single record of any kind he left to give a clue to the names of those for whom such great works were done? Possibly, in the careful study which Hamdi Bey is giving to the subject, this question may receive an answer.

It will be months before the sarcophagi can be seen by any one, as it would be highly dangerous to expose them, however slightly, to

the dust and damp of a Constantinople winter, as would be the case if they were uncovered before being placed in the building now being erected for their reception. To preserve their colouring during their removal from Sidon the greatest care had to be taken. The workmen were required to wear gloves, and the sculptures were protected by having cotton wool stuffed behind them most carefully. This was done by Hamdi Bey himself, the whole then being covered by layer upon layer of soft material.

The last sarcophagus to which I shall allude is the famous one of the Priest and King Tabutei, the account of which occupies a large portion of Hamdi Bey's article in the last *Revue Archéologique*. It is of black marble, the inscription on it showing it to have been the tomb of the son of Esmuzar, King of Sidon (I give the name as spelt on the tablet in the Louvre). But Tabutei's tomb differs in many important particulars from that of his father. Both are anthropoid, but Esmuzar's, of which we have a copy in the British Museum, shows the human form only in the head and shoulders, the lines of the sarcophagus being carved thence straight down in a tapering form to the raised tablet which marks the position of the feet. This is the case also with ten out of the eleven other sarcophagi in the Louvre brought from Sidon, and in the only one (I believe) in the British Museum brought from the same site. But Tabutei's tomb has the flowing lines which may be seen in the numerous Egyptian anthropoid sarcophagi which are in the same collection and in our own Museum, and which give, to some extent, the outlines of the figures. One corner of this tomb has been cut off, thus giving it an irregular shape, and this part has been polished, and a band of Egyptian hieroglyphs, which passes round the block, is carved round this polished corner.

We can scarcely suppose that a king who could afford to have so splendid a tomb made for him would accept an imperfect block of marble for it, and it seems likely, therefore, that it was made originally for another person in ancient times in Egypt, and repaired and reused at a later period for Tabutei.

The descriptions and drawings of this interesting tomb will form one of the most attractive chapters in the detailed and illustrated account of the Sidon monuments which Hamdi Bey is now preparing for publication; and considering the amount of care which he took in their preservation, every one will be glad to concede to him the full honour and credit of first conveying the description of them to the public in an authentic form. No doubt it would have been better to have retained them on their ancient site, if they could have been so retained with safety. But my experience in the East makes me confident that such a course would have resulted in the eventual destruction of these splendid monuments by Moslem fanatics and Arab dealers.

Athenum Club. T. HAYTER LEWIS.

#### COMPETITIONS.

*Proposed Public Building for New Barnet.*—The New Barnet Public Building Committee having invited architects to send in competitive designs for a building to contain a large hall, about 75 ft. by 55 ft. (to seat not less than 700 persons); second hall, about 40 ft. by 25 ft., with ante-rooms and other requisite offices; also public and professional offices, caretaker's apartments, &c., the cost not to exceed 5,000*l.* have, we are informed, received sixteen sets of the assembly-rooms, New Barnet, on Tuesday evening, December 13th.

*Walton-le-Dale Sewerage Scheme.*—Some little time back the Local Board of Walton-le-Dale, near Preston, Lancashire, advertised for schemes for the sewerage and disposal of the sewage of their district. In response to this, many schemes have been sent in. The ultimate decision as to the merits of the various schemes was submitted to Mr. Thomas Fenwick, C.E., of Leeds, and we are informed that he has just awarded the first premium to Mr. William Wrennall, C.E., of Liverpool, and the second premium to Messrs. H. T. Johnson & Co., civil engineers.

*The City and Guilds of London Institute.*—The prizes and certificates gained during the past year will be distributed on Thursday, the 15th inst., at Carpenters' Hall, by Sir John Lubbock, Bart., M.P.

#### Illustrations.

##### THE VILLA MONTECCHIO, NEAR VICENZA.

WE give illustrations of the Villa Montecchio, near Vicenza, the property of the Contessa Maria Nievio-Bonin, which has been lately restored by Signor Michele Cajarati, a talented architect of Milan.

The villa still retains (in part) its ancient walls, though these have been merged in the extensive alterations necessary when transforming a ruined castle of the sixteenth century into a princely villa of the nineteenth.

The old castle suffered all the vicissitudes of war; in that stirring time it was stormed by the Vicentines in the days of Ezelino, 1232. Its fortifications were destroyed by the Paduans in 1386, so that Antonio della Scala, of Verona (who had erected them anew after the attack of the Vicentines) had to abandon the castle finally in 1387. The Counts Nievio had the first investiture of the land. It then passed to the Sanbonifacios, of Verona, and the family of Montecchio (Montague), so well known as that of the fair Juliet, is said to have sprung from this ancient house. In the last century the castle was converted into a villa in the Classical style by its owners the Counts Nievio; but the effect was bald, and the plan so inconvenient that it was again altered, though with little success, later on, and has now received its latest transformation at the hands of Signor Cajarati.

The Villa Montecchio (its high southern façade crowned with crenelated parapets imitated from the fourteenth-century old castle of Colleone in Thiene) rises on an elevated plateau,—a broad terrace 625 ft. long (running westward across its southern front),—commanding fine views over a country dotted with hill villages, church spires, and country-houses,—the snowy peaks of the Alps in the background, and the deep blue sky of northern Italy overhead. The gardens round the palace are formal in design, while conservatories full of exotics and tropical plants are added to beautify the interior.

The external walls, from basement to cornice, are covered with mouldings, carvings, and traceries of fantastic variety and colour,— arabesques, scrolls, coats of arms, monograms, and full-sized figures of warriors and historical personages, such as one sees painted on palace fronts in the backgrounds of Giovanni Bellini and Vittore Carpaccio's pictures in Venice.

##### MANTELPIECE AND PORCH IN TERRA COTTA.

THESE were designs made by the architect, Mr. W. H. Sugden, as a commission for a client, but owing to circumstances they were not carried out. We give them as what appear to us good examples of characteristic terra-cotta treatment.

##### SWIMMING BATH, BOURNEMOUTH.

A NEW swimming-bath and private baths are now in course of erection in the Bath-road, Bournemouth. The illustration gives the view of the entrance as it is approached from the pier. The site is on ground much lower than the road, and it was necessary to keep the roof of the swimming bath as low as possible to avoid interfering with the view of the houses on the opposite side of the road.

The bath is 75 ft. long and 30 ft. wide. The depth varies from 6 ft. at one end to 3 ft. 6 in. at the other. It is constructed of Portland cement concrete, and lined throughout with white glazed bricks. The dressing boxes are of pitch pine, and a gallery is arranged overhead to enable visitors to view races or entertainments.

The elevation towards Bath-road is faced with Farcham red bricks and red Mansfield stone dressings, and the roofs are covered with strawberry-coloured tiles.

It is proposed during the winter months to maintain an even temperature of 75° in the swimming-bath, and the heating is obtained by the admission of steam into the water through a perforated copper pipe. A Cornish boiler supplies the steam for this purpose, as well as for pumping the salt water from the sea. The water is pumped up through a suction-pipe,

Nos. 461 &amp; 463 OXFORD STREET. W.

GROUND FLOOR.  
NORTH ROW.

FIRST FLOOR.

which is carried out to the head of the pier into deep water, so as to ensure its purity.

Eight private baths are also to be constructed of concrete and glazed bricks, and to be sunk below the floor and entered by steps.

Ladies' and gentlemen's waiting-rooms, with lavatories attached, and an entrance-hall, complete the arrangement.

The building has been carried out from the designs of Mr. John Pollard, engineer.

#### NOS. 461 AND 463, OXFORD-STREET.

This building is part of the large reconstruction of premises on the south side of Oxford-street, on the Duke of Westminster's estate, and was recently erected from the designs of Messrs. Thomas Chatfield Clarke & Son at a cost of about 6,000l.

The basement, ground, and first floors are devoted to the purposes of business, so that clear space and good light were here the primary considerations.

The large amount of glass on the ground and first floors in the Oxford-street elevation was necessary for the exhibition of furniture and fine-art goods.

The second, third, and fourth floors of the

premises are used as a private dwelling, and are fitted with every comfort and convenience.

The front, which partakes largely of the style of the Brothers Adam, is executed in Portland stone and red brick, the roofs being of green slates.

The contractors were Messrs. E. Lawrance & Sons, of Wharf-road, City road; the carving was executed by Mr. Anstey; and the constructional cast-iron work was supplied by Messrs. Young & Co., of Ecclestone Ironworks, Pimlico.

#### SIDLESHAM VICARAGE, SUSSEX.

This house has been erected by a grant of 1,500l., given by the Ecclesiastical Commissioners, who are landowners in the parish, aided by a sum of 100l. voted by the Chichester Diocesan Association. These sums together have covered all expenses connected with the building, including the drives and approaches. The accommodation is that laid down by the Commissioners, with the addition of a dressing-room and two attics and an increase in the size of the dining-room beyond the minimum recognised by them. To obtain this result careful attention to economy was given by the architect, who had, however, to provide that

everything should be thoroughly substantial, or he would find it vain to submit his drawings to the thorough criticism of the Commissioners' architect. The lower story is enclosed with 16-in. hollow walls of red brick, and the first floor with weather tiling secured on brickwork. The works have been carried out by Mr. W. Irish, of Lavant, near Chichester, under the direction of Mr. Lacy W. Ridge, the Diocesan Surveyor.

#### HOUSE AT CHARING, KENT.

This house has been erected for Mr. Frederick Hardwick, M.D., on a fine site close to the railway station, and overlooking the ancient and interesting village of Charing, in Kent. There are good views in all directions except towards the south-east. That towards the north, which includes Charing Church and the remains of the Archbishop's Palace, backed by the Chalk Downs, is so particularly interesting that special provision has been made for its being seen from the drawing-room. Beyond the rooms shown on the plans, the house contains two large attics, one smaller room, and a box-room on the second floor; and a cellar in the basement.

The tender of Mr. Thomas Coast, of Charing, was accepted at a sum of 1,436l. 5s. for the house and stables. There has, however, been some additional outlay on the buildings, grounds, and fences. The works have been satisfactorily carried out by Mr. Coast and local tradesmen working with him, under the direction of the architect, Mr. Lacy W. Ridge.

#### ANCIENT MONUMENTAL SLAB.

The slab from the Cathedral at Siena (of which an illustration is given) is incised and filled with mastic. The arabesques in the border are black marble and mastic.

The present cathedral is only the transept of the original design; the drawings of the whole scheme, made by the architect, Maestro Landi, still exist. The part used as the choir contains the grand pavements by Beccafumi, which are chiefly in dark grey marble inlaid upon white. These are now visible, the planking having been recently removed which covered them for the past century or more.

The drawing is an illustration from a work to be published almost immediately, on "Ancient Sepulchral Monuments," by Mr. W. Brindley and Mr. W. S. Weatherley.

**Society of Engineers.**—At a meeting of the Society of Engineers, held at Westminster Town Hall on Monday evening, December 5th, Professor Henry Robinson, President, in the chair, a paper was read on "A New Formula for the Flow of Water in Pipes and Open Channels," by Mr. Edgar C. Thrupp. The author said that, having worked out, by means of graphic diagrams, a formula for the flow of water in pipes, based on a large number of experiments by M. Darcy and others, with some by himself, he was induced to try, this year, how far experiments on the flow of water in open channels (such as those by Darcy and Bazin, and by Major Cunningham) would be amenable to the same mode of treatment. The results were not only satisfactory, but unexpectedly threw light upon some points in the question of the flow in pipes, which had before been difficult to explain. He had thus been enabled to obtain a general formula, applicable both to pipes and open channels, and taking into account the effects on velocity of the varying relations between hydraulic depth and roughness of surface, in a manner that had not hitherto been done. After describing the experiments of Professor Osborne Reynolds, which brought out the curious fact of a "critical velocity" at which eddies come in, for a limited range of velocities, after which an even flow again takes place, the author described the apparatus he had himself used, and showed the graphic results of experiments, which he had also reduced to tabular forms. He then gave Reynolds's formula, and Hagen's, of which latter his own was a modification, the changes introduced having for their object to express the effects of various degrees and kinds of roughness in the surfaces flowed over, with varying hydraulic depths. He concluded by justifying the effort to make a more accurate formula, by comparing the results of experiments with the results obtained by calculation.

PREMISES IN OXFORD STREET.—MR. T. CHATFIELD CLARKE, F.R.I.B.A., ARCHITECT.

PERSPECTIVE AND APPARENT FORM. ARCHITECTURAL ASSOCIATION.

The fourth meeting of this Association for the present session was held on the 2nd inst., in the meeting-room of the Royal Institute of British Architects, Mr. John Slater, B.A. (President), in the chair.

The Chairman announced that a requisition, signed by several of the members, had been received, asking the Committee to convene a special business meeting, to take such steps as might be necessary for insuring the proper observance of Rule 22. It would be impossible to hold the special business meeting on the Friday fortnight, as Mr. T. G. Jackson, of Oxford, would then read a paper entitled "The Proposal to make Architecture a Close Profession by imposing tests of Examination and Registration." By that time, however, the Committee would have fixed the date for holding the special meeting.

Mr. W. Burrell (Hon. Librarian) announced the donation to the library of two copies of the "Architect's Register" and the "Transactions" of the Civil and Mechanical Engineers' Society.

Mr. F. T. Bagallay, A.R.I.B.A., read a paper entitled "Perspective Drawing, and the Apparent Form of Objects." The following is the substance of it:—

The outline of most objects, at any rate of inanimate objects of simple form, such as buildings, is sufficiently constant to enable us to predict, pretty accurately, how it will appear from a given point of view under certain given circumstances, and even to draw on a sheet of paper or other surface an outline which, looked at in a particular way, will, theoretically, exactly resemble the outline of the object when looked at in a similar way. Further than that,—and this is what we usually try to do,—we may, by choosing our conditions carefully, draw an outline which, looked at in an ordinary way as drawings are generally looked at, will resemble the outline of the object itself with something very closely approaching to accuracy.

This is all that perspective science pretends to do, or can do. It enables us by a simple scientific method, when we know the real form and outline of an object, to make a drawing on paper which, looked at in an ordinary way, so strongly resembles the outline of the object as seen from a particular point of view that we cannot see where the two differ, and hardly that they do differ. Put in that way, it does not sound very much. But, when we think how immeasurably more is thus done for the sense of sight than can be done for three at least of our other four senses, it seems a great deal, and we cannot, moreover, escape the conclusion that some power, necessary to produce accurate impressions, must be wanting in our powers of vision, at least under some circumstances, or we could not possibly produce anything differing from something else as much as a drawing differs from a building, but which at the same time presents to the eye a scientifically correct impression of the other thing in a most important particular.

My interest in this subject was first stirred by a paper read before this Association on November the 24th, 1876, by Mr. Augustus Frere, which he called "Binocular Perspective and Natural Drawing,"—a clever paper, in which, after pointing out that the greatest masters have frequently not drawn in accordance with the laws of plane perspective, the author went on to show that we had been furnished with two eyes because "with one eye we have little cognisance of visible position"; that an ordinary perspective drawing represents things only as we see them with one eye; and that "our eyes have no inborn power of distinguishing the forms or magnitudes of objects, nor can they discern their distance from themselves." After going very carefully into the structure of the human eye and the laws of vision, Mr. Frere ended by giving us a set of rules for producing pictures of what we see with two eyes.

As a matter of fact, it does not need much demonstration to prove that it is, not only practically but theoretically, impossible to represent on a flat surface, or to a small scale, even the truest outline of a solid object as we see it with our two eyes. I do not mean that our imperfect skill stands in the way. If a draughtsman were ever so skilful, he could not do it. As pointed out by Mr. Frere, Leonardo da Vinci paid much attention to perspective, and

"came to the conclusion that objects could not be represented in a picture as seen in nature"; and Malton, in his book, says,— "Artists would have all objects represented in perspective as they appear to the eyes. There is no such thing to be done. It is not in the power of art or science to represent on a plane any single object as it appears."

What stands in the way is not so much a difficulty as an impossibility; and, if by binocular perspective, is meant a science to enable us to draw objects as we see them with two eyes, in the same way that ordinary plane perspective does enable us to draw objects as we see them with one eye, then no such thing as binocular perspective can possibly exist.

Forgive me for calling your attention for a moment to the simple natural laws which govern our sight of objects. We see an object by means of rays of light reflected from the object upon the retina of the eye. These rays, originating in a luminous body, proceed from that body in every direction, and striking upon surrounding objects are reflected from every part of those objects in every direction. Such of these reflected rays as happen to enter the pupil of one of our eyes strike upon the retina and produce a sensation which we describe as seeing the points from which the rays were reflected. All rays of light proceed in straight lines; that is to say, they do so in a vacuum; and the refraction that they undergo

book is seen by both eyes, but each sees a different view of it which, if drawn, would be wrong to the other. This experiment presents, of course, merely an extreme case of what occurs, to some extent, with every solid object we look at, though usually it is in a much smaller degree.

With respect to the vanishing of vertical lines, there can be no sort of doubt that, as we look at them, we see them vanishing, both upwards and downwards; and so with horizontal lines at right angles to the axis of vision, or, to use a perspective term, horizontal lines parallel to the plane of the picture. Such lines also seem to vanish both ways.

Let A, B, E, F (fig. 1) be the front elevation of a tower, and G, H, L, M its side elevation, and suppose O to represent the position of a person's eye, then he would see the top angles of the tower by means of the rays A O, B O, and the points at the sides of the tower, just opposite to him, by means of the rays C, O, D, O.

Now project these two pairs of rays on a plane, and suppose this person to be judging of the width of the tower at the top, and also immediately opposite to him, remembering that the eye only sees direction. A and B must appear closer together than C and D, for they appear to be between C and D; that is, the top of the tower must appear narrower than the part immediately opposite to or nearer the eye. This is expressed by saying that the apparent length of a line is measured by the size of the visual angle.

Again, let A, B, C, D (fig. 2) be the front of a long building immediately opposite the eye of the spectator at O. If he looks up at E, the nearest point of the cornice, he looks along the ray, O, E; if he looks at B, he looks along O, B. Now, E and B are at the same height, but O B is much longer than O E (fig. 2), therefore E must appear higher than B, or the line E B vanishes downwards towards B. This has nothing whatever to do with a man's turning his head, as is often asserted. The result is not in any way different if he keeps his head and his eye perfectly still; except that he does not see so far, and, therefore, the diminution is not so perceptible. It is simply due to the fact that a line of a certain length at a distance subtends a smaller visual angle than a line of the same length nearer to the spectator. The base of the triangle, in fact, remains the same, but, the sides being longer, the angle contained by them is more acute. To say that, when a man moves his head to look at a thing, he alters his horizon line or vanishing points, or anything else of the kind, and that that is the reason certain lines seem to vanish, is to say that the laws of perspective govern those of vision, which is absurd. Leaving out of account a slight change in the position of his eyes, what he sees when he turns his head is exactly what he would see if he held it still, if only his eyes had sufficient range. The vanishing depends only on the positions of the points looked at, and the position of his eyes, not in the least on the direction in which he looks.

Of course, if lines parallel to the picture plane seem to vanish in one direction, they must seem to vanish in both; that is, vertical lines seem to vanish downwards from the point nearest to the eye as well as upwards from the same point, and horizontal lines seem to vanish to the left as well as to the right. In fact, in any two parallel lines the points nearest to the eye must look farther apart than any similar pair of points farther away, because the rays from them contain a larger visual angle, and if we could project the rays on to one plane, the further pair of points would certainly appear to be between the nearer ones.

In the horizontal cornice, therefore, the line appears to vanish to the horizon on both sides of the spectator, and, as we see no angle in the middle, it might easily be concluded that it does not vanish in a straight line, but in a curve of some sort. At first sight it seems impossible that it should be otherwise. But it must be remembered that the line we are looking at, however much produced, never would really meet the horizontal plane. The appearance of meeting is due to the deficiency in our eyesight before referred to, namely, that the eye, as a piece of mechanism, can only tell us the direction of a point, and not its distance from us. If it were otherwise, we should see exactly what exists, and there would be no question of appearances. If, once more, we think of the rays which

carry the picture of the cornice line to the eye; we see that they will all lie in a plane surface, in which the line itself and the centre of vision of the eye are also situated; and the appearance of the line is exactly the same as the appearance of that plane surface would be, because the line is a part of the plane surface. It is like looking at the edge of a sheet of paper from a point in the edge. The horizontal plane is another similar plane, also passing through the centre of vision, and meeting the first in a straight line; as one leaf of a sheet of writing paper meets the other at the fold. As the eye is situated at a point on this line, and looks round at what it can see of these planes, namely, their thickness or section, always, of course, a straight line, the farther the eye looks to right or left, the nearer the planes appear to approach each other, until at  $90^\circ$  on each side they seem to meet.

Thus we seem to see parallel straight lines meeting at both ends, or that would meet if produced, which is a thing that cannot exist and cannot be drawn on a plane surface.

It can, however, and must, be represented on a spherical surface if such a surface is used. The early masters of perspective, the architects and painters of the Renaissance, were especially fond of exercising themselves in that way, by painting architectural features on domes in such a way that, standing in the centre under the dome, the drum seems to be lengthened upwards, or the surface of the dome disappears, and other buildings, usually very magnificent ones, seem to be seen surrounding the opening. Even Correggio had the bad taste to do something of the sort in the cathedral at Parma, and innumerable more dreadful instances by lesser masters are to be found, as you know. The process is quite simple, and the rules of plane perspective can be used, the base line in plan being made a circle, struck from the station point, and the heights being measured vertically, and not on the spherical surface.

A perspective drawing may, of course, be equally well made on any surface, mechanical facilities for execution being neglected. I mean, theoretically, it may just as well be made on one surface as another. Circular panoramas are drawn on cylindrical surfaces, merely in order to get a more extended view into the picture without apparent distortion.

The process of making a drawing on a cylindrical surface is similar to that described for a spherical one, and indeed it is the same for any surface, remembering that, in setting out on plan, the picture plane must be of the same plan as the surface drawn on, and that, in setting up heights, they must always be set up vertically, finishing, of course, on the picture plane. It is to be remembered also that the lines of the drawing are what is called a conical projection of the lines of the object on the surface of the picture; and that they will not be straight lines when projected on curved surfaces.

If we leave theory and come to practical matters, the question presents itself,—can we make any alterations in the science of perspective, as it is now understood and practised, that will be an improvement, in the sense of enabling us to represent, by any scientific process, more exactly what we see? I believe there are many persons who still believe that to be possible, notwithstanding the fact that no advance has been made since Dr. Brooke Taylor first clearly enunciated the true principles of plane perspective, and put it upon a firm scientific basis in his book published in 1715. Dr. Priestley in 1770 said, respecting this matter: "Of all the imitative arts this of perspective . . . has actually been brought the nearest to perfection . . . as much is known as we can imagine will ever be made use of."

A few years later, in 1779, Thomas Malton, in his well-known treatise, made a very explicit declaration on the subject. He said, "I maintain that all which can be done by rule is (he means 'has already been') performed on the most perfect and infallible principles that can be devised; that perspective is absolutely at its *ne plus ultra*."

I firmly believe that no improvement is possible, and that every one who examines the subject more than very superficially will come to the same conclusion. The limitations of our science of perspective seem sufficiently serious when stated in words. It only enables us to draw what we see with one eye, stationed at one particular spot; and, still worse, the picture itself, to be seen correctly, must also be

looked at with one eye, stationed at one particular spot. In practice these are not such serious matters, for our eyes are not very fastidious or ready to discover small inaccuracies, and memory and imagination often come to their aid when looking at a perspective drawing, and correct many of the errors that a trained eye would otherwise detect. But yet it is obviously worth consideration whether or no these defects could be overcome.

Binocular perspective we have already examined, and found that to draw things as we see them with two eyes is quite impossible. The next point is not worth examination, for, obviously, we see a different view of a solid object every time we shift the point from which we look at it; and, equally obviously, we can only draw one view at once on a flat surface.

The possibility of removing the remaining defect, namely, that a perspective drawing must be looked at by one eye stationed in a particular spot, is worth a trifle more consideration, if only because it is so often asserted that the use of a curved picture plane would overcome it. Every writer on perspective has pointed out what I have already referred to, namely, that all our rules are merely directed to finding out where the rays which carry the image of an object to the eye would cut the surface on which we draw, if we held it up between the eye and the object, and the rays could pass through it. The fact that a section through those rays looks the same as the object itself is the very foundation of perspective science. We begin by making a plan of the rays and of the surface to be drawn on; that plan enables us to see where certain of the rays would cut the surface. If we are going to draw on a flat piece of paper, of course the plan of the paper will be a straight line; if on the walls of a circular room or on a dome, the plan of the circular or domical surface will be circular; but to draw the plan of a flat piece of paper as a circle will, obviously, get us into considerable difficulties, and, however we overcome them, the result cannot be right. It must not, however, be forgotten that it is impossible to make persons look at a drawing with one eye and from one particular point; and that, when looked at from any of the other possible points (which are a great many times more numerous than the single right one), any and every drawing will be more or less wrong. It is a legitimate question, therefore, whether by sacrificing absolute correctness as regards one point of view we could not get more nearly correct (or, at least, less wrong) as regards all the other points. I am inclined to think we could do so, but it would be at an expenditure of time and labour very much greater than the advantage gained. All that is necessary is, to treat our drawing on the flat paper as a development of the drawing we should get on a spherical surface. We must use, of course, a circular picture plane in the plan, and circular height lines of various diameters, according to the points at which they cut the sphere, and very nearly all the lines that are straight in the real object will, of course, become developments of circular arcs,—that is, elliptical,—so that the labour of making such a drawing would be colossal.

The rules of perspective are so perfect that, if only means could be found to make people look at a drawing from the right point of view, no distortion would be apparent, however much the picture were extended. We all know the rule that the picture must be confined within a visual angle of  $60^\circ$ ; and the reason usually assigned is the right one, namely, that it is all the eye can conveniently grasp at once. A person always wants to grasp the whole of a picture at one view; and he gets far enough away from it to do so. If we have drawn more than is contained in that angle, no one will look at our picture near enough to see it properly. I would add, as equally important, that we should always draw as much, at least, as will be contained in a visual angle of  $45^\circ$ , and with a similar object, namely, to induce the spectator to go far enough off. I believe that one very important condition of success, in making a perspective drawing, is to arrange matters, as far as possible, so that any one who looks at the drawing will be inclined to look at it from somewhere about the right point of view. A good deal may be done in this way without in the least affecting the grouping of the picture or the choice of the point of view. Besides the

suggestion already made, I would propose that the picture plane should always be arranged somewhere about from 1 ft. 6 in. to 2 ft. distant from the station point in plan, because that is the most convenient distance for looking at a drawing that is neither very delicate nor very large and coarse.

Another thing that should always be arranged is to get the point of sight absolutely opposite the centre of the picture in plan; it is very easily done, and interferes with nothing. In ninety-nine cases out of a hundred, people hold a drawing exactly opposite to them in looking at it, and not on one side or the other. I always commence setting out a perspective drawing in this way.—Taking the plan, I choose a station point at the spot from which I judge the station point will look best or be most seen; the rule about twice the height of the nearest angle is not of much practical use; experience, or, failing that, common sense, is a far better guide. I then make up my mind how much of the object I want to get into my picture, and draw lines from the extremities to the station point; then I find the visual centre of the picture by bisecting the angle; then measure the angle, and, if it is less than 45° or more than 60°, I shift the point a little nearer to or further from the object; always along the central ray. When all this is settled it is time enough to think about the picture plane. As far as the view of the object is concerned, this may be anywhere and at any angle, it will not affect the view at all; but, in order to get people to look at the picture from about the right point, I draw the plane at from 1 ft. 6 in. to 2 ft. from the station point, as nearly as the required size of the future picture,—if any size is specified,—will allow; and always absolutely at right angles to the central visual ray; because then the station point is opposite the middle of the picture, where any one naturally tends to look at it. There is only one more matter that I will detain you by noticing. It is a connection with vertical lines and other lines parallel with the picture plane. I claim no originality for my theory that such lines appear to vanish, but I shall be disappointed if I find have failed to show quite clearly that they do. "Well, if they appear to vanish," I can imagine many people asking, as I have been asked dozens of times before,— "Why not draw them so?" The answer appears to me perfectly clear and conclusive. In Mr. Burchett's words, it is this,— "The appearances of the representations of objects are subject to the same optical laws as the appearances of the objects themselves"; that is, if two lines in an object, which are really straight and parallel, appear to vanish, then the representations of those lines on a sheet of paper will only appear to vanish in the same way if they also are really straight and parallel. There is not one optical law for the appearance of a straight line on a building and another optical law for the appearance of similar straight line on a sheet of paper. A, B, C, D (fig. 3) represent the face of a

Fig. 3.

seen from E, and A', B', C', D' represent the perspective view of it on a sheet of paper; then the visual angle, A, E, C, is the same as the visual angle A', E, C'; hence the apparent length of A, C is the same as the apparent length of A', C'. For a similar reason the apparent length of D, D' is equal to the apparent length of B', B'; the lines B', A', and D', C', will appear to vanish exactly the same extent as the lines A, and D, C. With reference to this same

point, some people contend that, because a sphere always appears to the eye to have a circular outline, therefore it should always be drawn as a circle. That is far from being the case, for, if it were so drawn on a plane surface, it would only appear circular to the eye when exactly opposite the point of vision,—a circle which is not just opposite the eye will always appear an ellipse, and, if you want the appearance of a circle you must draw an ellipse.

In conclusion, I may say that I do not regard this subject as of purely theoretical interest. To every draughtsman and sketcher and designer I believe a knowledge not only of the rules of perspective, but of what the eye or eyes are likely really to see, is of the utmost importance in enabling him, for one thing, to tell what his eye do actually see. A sketcher, ignorant of such things, has to fumble and try again and again before he can make his lines fit one another and appear correct, for it is almost impossible for such a man to find out what he does really see. It enables the designer to know far more accurately what his designs will look like when executed. "Nothing," says Dr. Brooke Taylor, "ought to be more familiar to a painter than perspective, for it is the only thing that can make the judgment correct and will help the fancy to invent with ten times the ease that it could do without it."

It is only a minor advantage that an exact knowledge of the subject will prevent draughtsmen from wasting time and perhaps spoiling their drawings, by trying to do what is impossible or wrong.

I will end with a quotation from the work of Thome Malton. He says that "perspective is allowed by all who are well acquainted with it to be the basis of all the polite arts which have their foundation in drawing."

Mr. W. H. Atkin Berry, in opening the discussion, said that Mr. Baggally had shown how much science and mystery underlay the rules they were in the habit of using for everyday perspective. It was, he thought, fortunate that a sort of rule-of-thumb process existed which enabled them to make perspective without having a thorough knowledge of all the underlying theory. He confessed he was still in the dark as to the theory of the vanishing of vertical lines. He had often asked himself how it was that lines drawn vertically upon the paper appeared correct, if they should theoretically be made to vanish? Then, again, a tower or column built with perfectly vertical sides did really appear to widen at the top. That brought them to the matter of the diminution of columns, which was done for the purpose of getting over the apparent widening of the mass as it extended upwards. That fact seemed contradictory to the theory of vertical lines vanishing upwards. Supposing, also, a tower to be drawn with perfectly upright sides, and with no attempt to make them vanish, on looking at the drawing with one eye, at the actual distance to scale of the station-point, the lines would appear as they would in actual execution, showing that it was needless to provide for the upward vanishing. As to the distance of the station-point from the picture-plane, no doubt theoretically it might be desirable to fix a distance of 1 ft. 6 in. or 2 ft., but it seemed to him it must so much depend upon circumstances that it would be almost impossible to adhere to such a rule. They could not tell from what distances their pictures would be seen. If exhibited in the Academy they might by good fortune be hung "on the line," or they might be "skied," while the drawing might be of large or small buildings. He had found the best way of choosing distance from an object was to fix the station-point at an angle of about 48 or 50 degrees away. Then he would regulate the picture-plane entirely by the size of the drawing required, and not bother himself about the distance from which it might be viewed. Did he understand Mr. Baggally to say that a sphere in perspective should be made like an ellipse?

Mr. Baggally replied that he had meant to say that a sphere always looked to the eye circular in outline, but when drawn on a flat surface it must usually be drawn as an ellipse. Mr. Berry continued that he did not doubt the accuracy of the statement, but he should have to think it over. He concluded by proposing a hearty vote of thanks to Mr. Baggally for a paper from the personal of which

the members could not fail to derive great benefit.

Mr. F. R. Farrow said the difficulty brought forward by Mr. Berry arose from the fact that Mr. Baggally had taken the view of the effect produced on the retina by the rays of light, but had not told them that they really saw with the brain, and not with the eyes. The images formed on the retina were quite distinct from the impression produced in the brain when looking at an object. Most of those who had studied optics would know that the retinal image appeared on the retina reversed, but it was not seen in that position, because it simply conveyed an idea to the brain of what was seen. If, then, it was borne in mind that what depended on the brain and not upon the eye, they would at once understand how vertical lines did not appear to converge in reality. When looking at a tower, the top did not appear to be narrower, but appeared wider than the bottom, that being the correction made by the brain, acting on past experience, and overcoming the theoretical effect. The view was, therefore, right that on the image on the retina the top of the tower would be narrower than the bottom. In looking at a photograph taken by a lens not specially adapted for counteracting that tendency, they would be seen that the lines did tend upwards. The tower would appear narrower at the top than at the bottom, because the camera was simply acting in the same way that the eye acted in producing the retinal image. Mr. Baggally had said that one eye could not tell the distance of an object, but it was hardly true in its entirety, because the notion of distance was arrived at not only from the view got from the convergence of the two eyes, but also from the past experience of how lines tended towards the horizon. On looking at a horizontal cornice the point nearest to the eye would seem higher than the point furthest away, so that in looking at it with one eye the same effect would be got of horizontal lines tending towards the horizon, and not appearing perfectly horizontal. Mr. Baggally had also referred to the fact of two eyes being necessary not only for telling the distance, but also the solidity of an object. No doubt that was the case regarding near objects, but when they were far off it was by inference from past experience, and not by the eye, that their solidity was known.

After a few remarks from Mr. H. O. Cresswell, not reportable on account of their reference to blackboard diagrams,

Mr. E. W. Pratt said he believed the subject had been treated some years ago before the Association. As to the distance of the spectator being 1 ft. 6 in. or 2 ft., a considerable amount of judgment was necessary in the matter. He was inclined to recommend that in preparing perspectives of a certain size the plan should be made to the right scale instead of attempting to get what would become a picture out of all proportion or distorted. It seemed a pity in drawing street architecture that the station-point was not put near the picture, because, although it was nice to see an elevation in a narrow street as though it could all be seen, yet it did not give a true idea of the building itself as actually seen. In drawing such an object as a spire in perspective, they should, he thought, always curve the lines, so as to form an entasis on paper as well as in the actual building of it, otherwise the lines would not appear to be straight, but rather to go in at the sides. Mr. Pratt congratulated Mr. Baggally on the excellent paper he had given, and concluded by seconding the vote of thanks.

Mr. A. O. Collard said that Mr. Baggally appeared to have mostly dealt with such work as the illustrations in the journals, which was the sort of work to which architects generally confined themselves, pictures "on the line" at the Academy being rather beyond their scope. Perspective, although a most admirable acquirement in their professional work, was somewhat overrated by architects themselves, while the public, on the other hand, were distinctly unenjoyable of architectural perspectives. Architects were naturally very much preoccupied in favour of the buildings they designed, and wished to see them carried out, and in putting perspectives of them before their clients they were always taken from the very best points, and possibly where the buildings, as was often the case in London, could hardly be seen at all. Then, again, architects were fond of putting some big buildings on the wrong side of the perspective

and in that way creating an impression that the building was much finer than it really was. That was what was vulgarly termed "faking-up" (laughter).

The Chairman said the meeting had listened with great attention to Mr. Baggallay's able paper, and many of them would read it with even greater interest, because he believed they were, like himself, in Mr. Berry's position of not being able to follow the whole of it. The question of the vanishing of vertical lines was a curious one. A most difficult question was that of single vision with two eyes. There was no doubt that on each retina there was a distinct image formed of the thing looked at, and yet practically one object only was seen. Mr. Farrow was quite right in saying that the retinal image was reversed, and that it was an act of the brain which enabled one to see the object the proper way up. In looking at any particular point with one eye it was difficult to say how far off it was in a direct line, and even with two eyes it was often impossible to state the distance of such a thing as a wire stretched horizontally. There was nothing one was more likely to do in walking across a field, with a wire fence, than to run against that.

The vote of thanks was then put, and was very cordially received.

Mr. Baggallay, in replying, said that on every disputed point he was ready to maintain his position. As to the vanishing of vertical lines, he had said that they could see them vanish with their eyes, and when they drew lines on a sheet of paper they saw them also vanish, exactly in the same degree as the vertical lines in nature vanished. In the case of columns, entasis was not given to counteract the tendency of a vertical object appearing to spread. Those who invented entasis took a tip from nature. In trunks of trees, limbs of animals, &c., the point where they were attached to something solid was thicker than the other end. The thinning did not occur in a straight line, but in a curve, and that natural peculiarity was imitated when entasis was given to columns. He had not been able to see that the top of a tower or of a column, however high, looked wider than the bottom. People said it did, and he must try and believe it; but he had never himself been able to detect it. The point on which he was weakest was the making of the plane 1 ft. 6 in. or 2 ft. from the point of sight, but that was only a rough sort of estimate, and if Mr. Berry made his drawing to be hung on the walls of the Academy, he had better take a little longer distance (laughter). What he had meant to convey was, that the point of sight should not be taken too close. The work going on between the retina and the brain was a difficult subject. He did not agree with Mr. Farrow's theory, but he was not prepared to prove that it was wrong. He did not see how the brain could arrive at any conclusion, except through the retina, on what it saw at the moment. Memory might help to correct what the retina stated to the brain, but as far as what was seen at the moment was concerned, he could not believe that the brain had any knowledge except from what the retina told it. As to seeing objects upside down, it had been clearly explained by the fact that though seen in that position, their appearance relatively to one another was exactly the same as if they were seen the right way up. Mr. Pratt had referred to a paper on the same subject read some years ago, and he (the speaker) had already given the date of it, viz., November 24th, 1876. They might find an explanation of what Mr. Slater had said about the wire in the fact that it was very much in the plane of the eyes, and there was little or nothing around or about it to compare with it or to show its position.

#### CASE UNDER THE METROPOLIS MANAGEMENT AND BUILDING ACTS (AMENDMENT) ACT, 1882.

##### TEMPORARY STRUCTURES.

On Friday, December 1st, at the Wandsworth Police Court, before Mr. Paget, John Foster, of 5, Mount Pleasant, Marton-road, Wandsworth, was summoned by Professor T. Roger Smith, District Surveyor of West Wandsworth, for having erected at 5, Mount Pleasant a wooden structure of a movable or temporary character without having obtained the licence of the Metropolitan Board of Works, required in accordance with Section 13 of the above-named Act. Mr. Barnard appeared for the complainant, and Mr. Bell for the defendant.

The structure complained of was erected in the forecourt of the house; it was 17 ft. long, 7 ft. 5 in. wide, and 8 ft. high; and formed a lean-to addition to the house, and was used as a shelter for goods exposed for sale. It consisted of wooden rafters supported by two horizontal timbers, one fixed to the wall of the house, and one carried by three wooden posts standing in sockets let into the ground. The roof was of canvas laid on the rafters. The front and two ends were open, and to the posts in front was fixed a tradesman's sign-board.

On behalf of the District Surveyor it was contended that this was a wooden structure of a movable or temporary character, and that the licence of the Metropolitan Board of Works should have been obtained for its erection.

For the defendant this was disputed, on the ground that the structure was set back some distance from the road; that the construction was very slight; that no part was fixed; and that the whole could be removed in a few minutes.

The Magistrate held that it was a structure to which the requirements of the Act applied, and that no licence having been obtained for its erection, he must order it to be removed.

#### SALT-WATER FOR STREET-WATERING.

SIR.—Your correspondent's experience is interesting, but engineers will distinguish between his facts and his theory.

It is obvious that the inconvenience he describes [p. 788, *ante*] is not the fault of the salt-water. On the contrary, frost is much less liable to injure the road watered with salt-water than that watered with fresh-water, as it rarely happens in England that the frost is sovere enough to freeze salt-water at all, especially at some inches under the surface.

As regards the phenomena observed after "soaking rain," they are also without doubt wrongly attributed to the salt, as salt does not "heave," i.e., I suppose, expand when wetted, as any one may easily prove for himself.

H. D. PEARSALE, C.E.

#### BIRMINGHAM, DUDLEY, AND DISTRICT BANKING CO. v. ROSS.

SIR.—We think your editorial remarks upon this case, in your issue of the 26th ult. [p. 728], are somewhat misleading. The buildings are not upon adjoining sites; they both front a main street, but between them, and at right-angles to the main street, is a public thoroughfare, 30 ft. wide, called Warwick-passage. This passage was designed and laid out at the time the lease of plaintiffs' property was granted, and their buildings were designed and built with numerous windows facing to it, with full knowledge that a building would be erected on the opposite side of the passage as soon as the land could be let.

Mr. Justice Kekewich did not alter the rule of law, that a man cannot derogate from his own grant, but followed a dictum of Lord Justice Cotton in a previous case, to the effect that an implied grant could be qualified by circumstances in the knowledge of the grantee at the time of the grant, and held that the plaintiffs' professor in title knew that a building would be erected on the opposite side of Warwick-passage; that the defendant's building was not an unreasonable height; nor, having regard to the locality, higher than might have been anticipated when the plaintiffs' lease was granted.

This decision seems to us in accordance with common sense, but we understand the plaintiffs will appeal.

DEMPSEY & HEATON  
(Defendants' Surveyors).

Birmingham, December 6, 1887.

#### "ST. AUGUSTINE AT ST. ALBAN'S ABBNEY"

SIR.—Referring to a letter from Mr. Hems [p. 788], embodying part of another from Mr. Hicks Gibbs, published in your issue of last week, and relating to the question as to whether Augustine, the missionary, has a just claim to the title of "saint," Mr. Hicks Gibbs writes to say that my quotations from Mr. Surtees "amount simply to this, that Wheatly, writing in the last century, said what was quite true, that Pope Gregory sent Austin the monk to England (obviously Austin was not then canonised). . . ."

This he seems to consider as in some mysterious way an argument in favour of his subsequent canonisation, and apparently considers that though the best writers on English church history term him Augustine only, as Mr. Surtees remarks, and I will add also the best writers on English history, all these authorities are valueless, Augustine not being canonised at the time to which they refer. When, however, authors of the twelfth century, and later, are found sedulously bestowing the title on St. Gregory, and as carefully withholding it from Augustine, I think this argument is proved to be of little service.

I quote the following to substantiate my statement:—

"In the meantime Augustine was sent by Pope St. Gregory into Britain."—Jeffrey of Monmouth,

of the twelfth century; Thompson's translation, 1711, p. 367.

"St. Gregory commissioned the servants of God, Mellitus, Augustine, and John, with several others who feared the Lord, to preach to the English nation."—"Ordericus Vitalis" of the twelfth century, Forester's translation, 1853, pp. 347-8.

"St. Gregory . . . appointed Austin, or Austen, a monk of the convent of St. Andrew's at Rome, with forty other monks, to go into England. . . . they made a stop, and sent back Austin their leader, to represent these difficulties to St. Gregory."—Henry's "History of England," 1774, vol. ii., p. 136.

In conclusion, let me remark that one satisfaction is, at any rate, ours. If the named figure is a mistake, it will not in any degree add in symbolical inaccuracy that of Mr. Cottingham's lady bishop at Rochester. H. LITTLEHALES.

#### "STATUS OF SANITARY INSPECTORS."

SIR.—I was glad to see in your issue of last week [p. 788] Mr. W. J. Addiscott's letter under the status of Sanitary Inspectors, and more especially that part of the letter which dealt with the Sanitary Institute examination, and the hardship which provincial candidates have to undergo in competing with those who reside in or near London, and thus are able to attend the lectures, while the provincial candidate, let him be ever so willing, is unable to do so unless at considerable expense.

Another hardship which they have to undergo is in the fact that the examinations are always held in London, and thus they have to incur considerable expense compared with their London brethren; for instance, in my own case, should I go up for the examination, my railway fare alone would amount to over 3*l.*, and, together with the fees for examination (which are ridiculously high), hotel expenses, &c., would bring the sum total to between 12*l.* and 14*l.*, not to mention loss of time, &c.

Why cannot the Sanitary Institute hold an examination in the North of England, as they hold their congresses, and thereby bring it nearer the doors of Scotch and North of England candidates? I am certain that if the Institute could only see it in their power to do so, they would confer a great boon on candidates in the North, and materially add to the number of candidates.

ROBT. A. WILSON.

Lee Mount House, Burntisland.

#### DEODORISING WATER-CLOSETS.

SIR.—Herewith I send you a simple method of deodorising a w.c. when supplied with water from a separate cistern. I have tried it for three months, and it answers very well.

Take a bottle about 5 in. deep for a flushing cistern, or larger for a supply cistern. Such bottles as those used for citrate of magnesia are the best. Fill it with permanganate of potash, cork it securely, bore two holes in the cork with a large pin, then suspend it upside down in the cistern by a string or wire passed round the neck and bottom of the bottle and tied to a piece of wood across the top of the cistern or to a hook hooked over the side. The bottom should be covered by the water when the cistern is full. This arrangement will cost 3*d.*, and last five or six months. It will keep the water charged with permanganate in proportion to the time that elapses between each discharge of the closet or the number of holes in the cork.

HENRY OUGH.

#### THE RECENT MEETING OF SANITARY ENGINEERS AND SURVEYORS AT LUTON.

SIR.—The reference in the paper read by me [see *Builder*, p. 696, *ante*] relative to the trial of the Native Guano Company's process was, I regret to say, made in error.

W. H. LEETE, Borough Surveyor.  
Luton, December 8th.

#### Royal Institution of Great Britain.

Mr. Hubert Herkomer, A.R.A., Slade Professor of Fine Art in the University of Oxford, will deliver three lectures at the Royal Institution early next year, viz., Jan. 19, "The Walker School"; Jan. 26, "My Visits to America"; Feb. 2, "Art Education."

**Trade Smoking Concert.**—The third annual smoking concert of the office staff of Messrs. Wm. Brass & Son, builders, and their friends, was held on Saturday evening in the large dining-saloon of the Falstaff Restaurant, Eastcheap. Over 300 persons were present, including representatives from many of the building firms. Mr. R. Fraser was in the chair, and Mr. G. Bland in the vice-chair. Mr. A. Cox was the accompanist at the pianoforte. The programme was diversified. The concert was under the management of Messrs. W. Arnold, C. R. Crispin, W. R. A. Hughes, and Mr. G. W. Norris (hon. sec.).

LAND SURVEYING AND LEVELLING.

XXIII.—RAILWAY QUANTITIES.

THE diagram illustrates a working contract section for a line of railway, 6 furlongs 1 chain in length. The surface levels of the natural ground having been plotted by the method explained in our article (*Builder*, November 19th, p. 719), vertical red or blue lines are ruled upon the section at each chain's length perpendicular to the datum line. The level of the datum line having been determined, the heights of the surface levels above the datum line are then written, as shown upon these vertical lines, just above the datum

line. These heights should be derived as much as possible from the figures contained in the column headed "Reduced Levels," in the "Level Book," and should be only scaled as a check upon the plotting or at points where no reduced levels are given in the "Level Book." The level of the upper surface of the rails should next be figured upon the section. This is arrived at by first "grading" the section by stretching a piece of cotton over portions of the irregular line which indicates the present level of the ground, and adapting the cotton line by successive rising or falling gradients to allow of the amounts of banks and cuttings in each case appearing equal to the eye. In so grading a section, regard must be had to what is termed the "ruling gradient," namely, 1 in 100, or such other maximum inclination as is decided to be adopted. At each change of gradient a vertical black line is drawn in between the datum line and the surface level, and the heights of the rail level scaled off the section are figured upon these vertical lines. The horizontal distance is then scaled, and the inclination of the gradient calculated. If it is desired to make the gradient so found to rise or fall one unit in a certain multiple of chains, the height of the rail level at the further end can be raised or lowered the fractional tenths and hundredths of a foot which will enable the gradient to work out to this exact number in the given distance without remainder. The levels of the rails at each chain's length, or of the "formation level," from 9 in. to 2 ft. below the level of the upper surface of the rails, is next arrived at by calculation, and figured upon the section. Thus, referring to the diagram, the difference between the heights 109.90 and 122.20 gives 12.30 ft. in a length of 3 1/2 chains (2,277 ft.), which is equal to a rising gradient of 1 in 185 or '567 ft. per chain (66 ft.). Hence, if we alternately add 0.35 and 0.36 at each chain, we shall find we obtain 122.20 at a distance of 3 1/2 chains from the point where we measured 109.90. Thus if either the rail level or the formation level (if preferred) be 109.90 at 6 chains, it will be 109.90 plus 0.35 equals 110.25 at 7 chains; and 110.25 plus 0.36 equals 110.61 at 8 chains. The upper row of figures upon the section shows the amount of depth of the cutting or height of the bank. The surface level at 6 chains being 118.50, by subtracting 109.90 from this we obtain 8.60 depth of cutting. The surface level at 7 chains being 111.80 and the formation level (or it may be the rail level) 110.25, the amount of cutting is here seen to be 1.55 as figured upon the section.

The quantities of earthwork can be most readily arrived at by the use of Bidder's tables (sold in sheets, at 2s. each or mounted 3s. 6d.). The section is headed with the number of the railway, in this case No. 1, and the banks and cuttings are each numbered in order, the banks in this section numbering 1 to 5, and the cuttings 1 to 4. A viaduct is indicated in the place of a high embankment between 9 and 15 chains and a tunnel in the place of deep cutting between 23 and 26 chains. The adoption of a viaduct or tunnel in the place of a bank or cutting is generally a question of expense, the cheapest being usually recommended, but it is also dependent upon the geological formation and the nature of the property. The diagram illustrates the application of Bidder's tables in tabulating the results.

A form of level book sometimes employed in railway work is also shown, in which columns are provided for the heights of formation levels, embankments, and depths of excavations. Widths of roads, and the natural slopes of earths, should be thus tabulated.—

**WIDTH OF CENTRE.**

Occupation Roads	16 ft.
Single Line Railway	18 ft.
Ditto	20 ft.
Public Road	28 ft.
Double Line Railway	30 ft.
Ditto	33 ft.
Turnpike Road	38 ft.

**NATURAL SLOPES OF EARTHS.**

*Table of Angles made with Horizontal Line.*

Gravel, average	40°
Dry Sand	38°
Sand	22°
Vegetable Earth	28°
Compact Earth	50°
Shingle	35°
Rubble	45°
Clay, well drained	45°
Ditto, wet	16°

**XXIV.—PARLIAMENTARY WORK.**

The preparation of plans for Parliament connected with projected schemes having reference to railways, tramways, docks, subways, water or gas supply, and other works, is generally effected by correcting such portions of the Ordnance map as show the country which lies between the limits of deviation to be indicated upon the deposited plan. Prior to the publication of an Ordnance map, showing any particular country to be traversed, it was the custom to trace the parish or tithe map and to correct this tracing upon the ground. The minimum scale for plans to be deposited under Standing Orders is 4 in. to the mile, and the minimum scale for such portions as require to show enlarged plans of buildings is six chains to the inch. The diagram, fig. 1, shows the form of a finished plan. The numbers in each enclosure refer to the Book of Reference, and are inserted by one of the reference clerks engaged by the solicitors to the undertaking, whose duty it is to describe each enclosure, and to state the names of the owners, lessees, and occupiers in proper Parliamentary form. The rules and regulations to be observed are published under the name of "Standing Orders" of the Houses of Lords and Commons. It is the surveyor's work to see that all roads, fences, streams, buildings, county and parish boundaries, centre line of proposed work, with ticks indicating miles and furlongs, are accurately shown upon the tracing which is handed to the solicitor for reference.

An accurate plan is important, in order to make an accurate section. The section is seldom chained from end to end, but its position in open country is measured from well-defined points in the fences, and in towns from the corners of buildings shown on the plan. These measurements should be scaled off the original map, and figured upon the tracing that is to be used for setting out in the field. The minimum scale for sections to be deposited under Standing Orders is 4 in. to the mile horizontal scale, and 100 ft. to the inch vertical scale. The minimum scale for cross sections

and sections of road alterations is 40 ft. to the inch. Fig. 2 shows a portion of a Parliamentary section, in which it will be observed that according to the Standing Orders the section is drawn to the same horizontal scale as the plan. The mileage and furlong points correspond with the plan. The depth of all cuttings and embankments at their deepest points over 5 ft. above or below the rail level are stated, the heights (calculated) and the inclinations of the proposed gradients are also given. Roads that are crossed upon the level, and all public roads are noted, and the method of dealing with them described (see also cross sections) 100 ft.

**PARLIAMENTARY REGULATIONS FOR RAILWAYS CROSSING ROADS.**

	Turnpike road.	Public road.	Occupation road.
	ft. in.	ft. in.	ft. in.
Clear width of under bridge, or approach	35 0	25 0	12 0
Clear height of under bridge for a width of 12 ft.	16 0	—	—
Ditto, for a width of 12 ft.	—	15 0	—
Ditto, for a width of 9 ft.	—	—	14 0
Ditto, at springing	12 0	12 0	—
Over bridge. Height of parapets	4 0	4 0	4 0
Approaches. Inclination	1 in 30	1 in 20	1 in 16
Ditto. Height of fencing	3 0	3 0	3 0

**Maximum Limits of Deviation.**

In towns, 10 yards each side of centre line.  
In the country, 100 yards, or 5 chains nearly.

**Maximum Deviations of Level.**

In towns, 2 ft. In the country, 5 ft.

**Maximum Deviations of Gradient.**

Gradients flatter than 1 in 100, deviation 10 ft. per mile steeper.  
Ditto, steeper, 3 ft. per mile steeper.

**Maximum Deviations of Curves in Construction.**

Curves upwards of 1/2 a mile radius may be sharpened to 1/3 mile radius.  
Curves of less than 1/2 mile radius may not be sharpened.

Fig. 6 shows the half-mile sections which have to be taken when a railway is intended to form a junction with an existing or an authorised line of railway. The Standing Orders state that the scale shall be the same as the general section, and that the gradients of the existing or authorised line of railway shall be given for a distance of 800 yards on either side of the point of junction.

**RECENT PATENTS.**

**ABSTRACTS OF SPECIFICATIONS.**

**14,984, Sliding Sashes. T. Cooke and W. H. Boyens.**

This invention relates to an appliance for assisting in the raising and lowering of sashes and sliding windows, and holding them in position when raised. A spring, formed of a loop-shaped metal bar, is fixed at its end either to the side of the sash or the jamb of the window, and carries in a band formed at the middle of its limbs the axis of a barrel or hollow roller, the axis being fixed with the barrel revolving loose upon it, between the limbs of the spring. The barrel contains a volute spring, the inner end of which is fixed to the axis, while the outer end is fixed to the barrel. Thus, assuming the barrel to be turned upon its axis so as to wind up the spring to a greater or less extent, while the barrel is pressed with its periphery against the jamb of the sash by means of the spring, it will be seen that if the sash be moved in the direction in which the barrel is rolling upon the jamb or sash, it will allow the spring to unwind; whether its direction be upward or downward, the power of the spring will assist the power of the hand in applying the motion, while in moving the sash in a contrary direction, the barrel will be rotated so as to wind up the spring again. If the sash be left in any intermediate position, it will be held there by the frictional pressure of the barrel against the jambs or sash caused by the spring.

**16,809, Feed for Circular Saws. E. Hughes.**

By this invention wheels and gearing are dispensed with, but the rollers generally used with the feed are retained. An endless band or chain is passed round a number of sheaves or carrying drums or rollers, and round a rotating wheel, sheave, or drum, from which it receives motion. On the bed of the machine are one, two, or more rollers, with sheaves at one end round or almost which the band or chain also passes. These rollers are mounted in slots or on movable brackets, so as to be easily adjusted to the thicknesses or inequalities of the surface of the timber, and may either be tightened into position or left loose so that the weight of the chain or band will hold them with sufficient force against the timber to feed it. The brackets are somewhat in shape like "lazy tongs," to allow for adjustment.

16,956, Ventilating and Flushing Water-closets. W. J. Stevens.

A rim runs round the whole of the basin, and terminates at the back in an up-current ventilating-shaft communicating with the outside air. A flushing rim curves inwards and downwards, causing the water to flush out the pan with great force.

17,057, Preventing Escape of Gas. H. W. and A. F. Cole.

A frame is disposed about the burner in such a way that it becomes heated by the flame. The tap or valve is provided with a spring or equivalent means of causing it to close the gas passage when released, and a detent is so placed as to engage with an arm handle of the tap and hold it open. It acts by the difference of temperature actuating mechanism which closes the valve and shuts off the supply.

NEW APPLICATIONS FOR PATENTS.

Nov. 25.—16,234, J. Sheldon, Wall Ties or Bond Iron.—16,233, C. Onions, Flushing Cisterns.

Nov. 26.—16,262, F. Seyde, Metallic Lathing or Backing for Plaster or Cement Partitions and Ceilings.—16,265, A. Johnstone, Molding Tools.—16,264, A. Hildig, Opening and Closing Fanlights, Skylights, &c., and Retaining them in any desired Position.—16,300, O. Elphick, Automatic Flushing Tanks.

Nov. 28.—16,322, W. Birdthistle, Draught and Dust Excluder for Doors, Windows, and Skirtings of Rooms.—16,349, A. Spies, Blocks and Other Mouldings for Building Purposes.

Nov. 29.—16,397, J. Pollock, Lock and Latch Furniture.—16,399, E. Kent, Automatic Ventilating Apparatus.

Nov. 30.—16,456, F. Cook, Preventing Air and Dust passing under Doors.—16,459, D. Knowles, Sash-fasteners.—16,478, W. Sawdon, Floors for Ball-rooms.—16,488, H. Howard and Others, Syphon Cisterns for Flushing Water-closets, &c.

Dec. 1.—16,505, W. Phillips and E. Verity, Sash Windows.—16,506, F. Collins, Sash-fasteners.—16,507, F. Collins, Indicator for Door Fastenings.—16,508, T. Switzer, Water-waste Preventers.—16,512, B. Clark, jun., Automatic Grip Handle and Lock or Latch for Doors, Sashes, &c.—16,529, S. Bond, Apparatus to be used in Making Bricks, Tiles, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.

12,654, H. Lomax, Door Fastenings.—13,859, H. Steven and J. Walker, Fastenings for Securing Rain-water and Other Pipes.—13,939, J. Gregory and F. Gilfort, Domestic Fire Escape.—14,257, P. Keogan, Fastening Window Casements, Show Case Doors, &c.—14,507, C. Watts, Balancing Elbow Levers for Opening Greenhouse or Other Lights, Ventilators, or Windows.—14,955, D. Bostel, Syphon Flushing Cisterns.—15,023, J. Lander, Artificial Stone for Flooring, Fencing, Decorating, &c.—15,065, F. Ransome, Manufacture of Cement.—15,406, A. Orr, White Lead.—15,520, W. Stanford, Jointing Stoneware and Other Pipes.—3,563, G. Girling, Artificial Stone.—15,203, J. West, Water Waste Flushing Cisterns.—15,342, S. and S. Chatwood, Hydraulic Lifts.—15,531, J. Dyson, Inlet Ventilators.—15,599, R. Lee, Blowpipes.—15,771, F. Crane, Varnishes.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to Opposition for Two Months. 388, A. Beauvais, jun., Automatic Bist for Double Doors.—777, N. Leroy, Portable Wooden Houses.—1,294, T. Brown, Raising, Lowering, Balancing, and Holding, in Closed or Open Position, the Sashes of Sliding Windows.—1,338, T. Ward, Hoisting Apparatus.—1,448, J. Bidder, Chimney Cowl or Ventilator.—3,650, T. Jones, Ladders.—4,369, E. Burt, Slide Rule for Cubing Timber, &c.—14,405, J. Cathie, Open Fire-grates.—909, J. Jeffreys, Ventilators.—1,790, J. and E. Podmore, Sash Fasteners.—3,512, A. Kitson, Step Ladders and Trestles.—7,571, J. Tuckett and G. Foster, Mortise Lock.—14,897, P. von Krystofovitch, Artificial Granite.

Barbary—57 and 59, Bride-street, freehold. 820. Camden-road—109, Brockley-road, 61 years, ground-rent 6s. 770. Haverstock Hill—42, Adelaide-road, 52 years, no ground-rent. 680. 16, Frovot-road, 35 years, no ground-rent. 720.

By J. DAWSON & SON. Lincoln's Inn-fields—7, 8, 10, and 13, Portmouth-place, freehold. 2,330. Lincoln's Inn-fields, Box-yard—Freehold block of buildings, area 4,000 ft. 3,200.

By FAIRBROTHER, ELLIS, & CO. Hendon—The Midland Hotel, freehold. 7,700. 2 to 9, Hamilton-terrace, freehold. 2,820. Cricklewood—The Cricklewood Tavern, freehold. 5,625. 1 to 16, Cricklewood-terrace, freehold. 3,500.

By RUSHFORD & SEEVERS. South Kensington—29, Queen's Gate-mews, 64 years, ground-rent 6s. 1,100. Wandsworth-road—An improved rent of 45s., term 22 years. 545.

By FOSTER & GAWWARD. Poplar—1, 2, 3, and 4, Sophia-street; and 1, 2, and 3, Elizabeth-terrace, 79 years, ground-rent 8s. 325. Wood-green—3 to 17, Somerset-terrace, 89 years, ground-rent 22s. 10s. 365. Stoke Newington—15, Painthorpe-road, 82 years, ground-rent 5s. 5s. 227.

By E. OWEN. Fulham—Ground-rent of 47s., reversion in 97 years. 1,610. West Hampstead—1, Howard-street, 60 years, ground-rent 15s. 70s. By TORLES & HARDING. Baywater—10s, Porchester-mews, 51 years, ground-rent 2s. 600.

MEETINGS.

MONDAY, DECEMBER 12. Society of Arts (Cantor Lectures).—Mr. H. H. Statham on "The Elements of Architectural Design." 111. 6 p.m. Leeds and Yorkshire Architectural Society.—Annual Dinner. TUESDAY, DECEMBER 13. Institution of Civil Engineers.—Mr. E. Hopkinson, M.A., on "Electrical Tramways: the Beesbrook and Newry Tramways." 8 p.m. Manchester Architectural Association.—The Rev. R. H. Snape, of Bolton, on "Scottish Cathedrals." 7.30 p.m. WEDNESDAY, DECEMBER 14. Society of Arts.—Sir Philip Magnus on "Commercial Education." 8 p.m. Liverpool Engineering Society.—Address by the retiring President, Mr. J. J. Webster. FRIDAY, DECEMBER 16. Architectural Association.—Mr. T. O. Jackson, M.A., on "The Proposal to make Architecture a Liberal Profession by imposing the Test of Examination and Registration." 7.30 p.m. Institution of Civil Engineers (Student's Meeting).—Mr. J. H. Parkin on "River-gauging at the Vyrway Reservoir." 7.30 p.m. Edinburgh Architectural Association.—Annual Dinner.

Miscellaneous.

Blair Convalescent Hospital, Turton.—Referring to the notice in our last of the Blair Convalescent Hospital, Turton, near Bolton, we are asked to mention that the whole of the ground floors have been laid with Lowe's Patent System of Wood Block Flooring.

Birmingham and Canal Communications.—The Birmingham Gazette says that since their appointment the Canal Inquiry Committee of the Town Council have been fully occupied in making inquiries and accumulating a large amount of information. They have devoted their energies to the best method of improving communication with London and other places, as well as to the consideration of the Severn plan or Bristol Channel scheme. It will be remembered that a circular was issued by the committee to the principal traders of the town and district, containing a series of inquiries as to the traffic between Birmingham and various large ports. Many replies were received, and the information thus conveyed has been carefully collated. At the same time the circulars elicited a number of contradictory opinions. A new proposal to connect Birmingham with Hull by way of the Tame Valley and the Trent, a bill to authorise which will shortly be laid before Parliament, will also have to receive the consideration of the committee.

The Metropolitan Board of Works.—The agenda-paper for the meeting of the Metropolitan Board of Works to be held this Friday, the 9th inst., contains the following recommendations of the Works and General Purposes Committee:—

That the resignation of Mr. W. Conquest, of the Engineer's department, be accepted as from Christmas next; and that, from the same date, a retiring allowance of 2667 13s. 4d. a year, being forty-sixths of his salary of 5000 a year, be granted to him.

That the resignation of Mr. W. Grove, of the Engineer's department, be accepted as from Christmas next; and that, from the same date, a retiring allowance of 1952 a year, being thirty-nine sixths of his salary of 3000 a year, be granted to him.

That for a present no action be taken with respect to the resignation of Mr. J. McDouall, of the Engineer's department; and that the subject be further considered at the end of three months.

That the vacancy in the Architect's department, caused by the retirement of Mr. A. Clemence, be filled by the appointment of an officer in the third class, at a commencing salary of 1200 a year, and that it be referred to the Committee to prepare and issue an advertisement inviting applications for the post.

That the Architect do prepare a specification and schedule of prices for works and repairs to buildings that have become the property of the Board in connexion with street improvements and improvements under the Artisans, &c., Dwellings Acts; and that, to enable this to be done, the Architect be authorised to employ temporarily a surveyor at 31.3s. a week.

The Office of City Architect.—In addition to the candidates for this office whose names we mentioned last week, Mr. Herbert D. Appleton has come forward. The Court of Common Council, at its meeting last week, refused by a large majority to limit the age of candidates to fifty years, as proposed by the Officers' and Clerks' Committee. The proposal to suspend the 83rd standing order of the Court was also negatived by a large majority. In consequence of this, Mr. H. H. Bridgman, who is a member of the Court, will not be a candidate. The election will take place on Thursday next, Dec. 15, and will be by ballot.

Festivity at Exeter.—At Fair Park, Exeter, on Saturday evening last, Mr. Harry Hems entertained to supper his numerous employes, to celebrate the twenty-first anniversary of his arrival at Exeter.

The Slate Trade.—Stocks going at present low, and the demand very high, it was decided, at a meeting of the local quarry owners held at Carnarvon last Saturday, to advance prices from the 1st proximo.

PRICES CURRENT OF MATERIALS.

Table with columns: MATERIALS, £. s. d., and £. s. d. Rows include Timber (Greenheart, B.O., Teak, E.I., Sengon, Foot cube), Ash, Canada, Birch, Elm, Fir, Daniec, Oak, Canada, Pine, Canada red, Lath, Dantisio, St. Petersburg, Wainscot, Birs, Odess, Deal, Finland, 2nd and 1st, set, 100, Riga, St. Petersburg, 1st yellow, 2nd, white, White Sea, Canada, Pine, 1st, 2nd, 3rd, Spruce, 1st, 3rd and 2nd, New Brunswick, &c., Battens, all kinds.

Table with columns: L. s. d., E. s. d. and various materials like TIMBER (continued), METALS, COPPER, etc.

Table with columns: L. s. d., E. s. d. and various materials like METALS (continued), OILS, TERPENTINE, etc.

Table with columns: L. s. d., E. s. d. and various materials like DARTFORD (Kent), HACKNEY, HAMPSTEAD, etc.

LONDON.—For proposed alterations and additions to No. 29, Upper Brook-street, for the Right Hon. the Lord de Remy, Mr. J. Sargeant, surveyor, Grosvenor-gardens, S.W.—

Table listing contractors and amounts for No. 29, Upper Brook-street. Includes Styles & Son (£1,105 0 0), A. J. Thompson (1,025 0 0), Birmingham (1,007 0 0), Army and Navy Auxiliary Co. (968 0 0), J. T. Chappell (775 0 0), and A. & E. Braid (705 0 0).

LONDON.—For the erection of the Carlyle Club, Old-street, R.C. Mr. G. Hubbard, architect. Quantities by Mr. J. Sargeant.—

Table listing contractors and amounts for Carlyle Club. Includes Steel Bros. (£5,720 217), J. Morter (5,677 62), A. Hood (5,854 16), Hearle & Son (5,857 393), Harris & Wardrop (5,373 158), Patman & Co. (5,173 290), Colls & Son (5,130 141), A. & E. Braid (4,850 312), and J. T. Chappell (4,800 131).

PAIGNTON.—For the erection of an ironmonger's shop and dwelling-house, on the Oerston Estate, Paignton, for Mr. H. Baare. Mr. S. Woodbridge, jun., architect, 210, High-street, Brentford.—

Table listing contractors and amounts for Paignton. Includes M. Bridgman (£671 2 0), Webber (864 16 0), and Rabich (accepted) (653 10 0).

ROTHAMPTON PARK.—For making-up and kerbing of roads, at Rothampton Park, for the Board of Works for the Wandsworth District. Mr. J. C. Radford, surveyor.—

Table listing contractors and amounts for Rothampton Park. Includes Turner (Alton-road) (£1,344 0 0), Lucas (1,261 0 0), J. Neal (1,270 0 0), and Adams (accepted) (1,183 0 0).

Table listing contractors and amounts for Rothampton Park (continued). Includes Turner (Beshborough-road) (£917 0 0), Lucas (769 0 0), Adams (744 0 0), and J. Neal (accepted) (690 0 0).

Table listing contractors and amounts for Rothampton Park (continued). Includes Turner (Hlyeth-road) (£310 0 0), Lucas (295 0 0), Adams (290 0 0), and J. Neal (accepted) (235 0 0).

SOUTHBOROUGH (Kent).—For the enlargement of Christ Church, Southborough. Mr. Theodore K. Green, architect.—

Table listing contractors and amounts for Southborough. Includes Strong & Sons (£1,938 0 0), Oallard & Sons (1,798 0 0), Jno. Jarvis (1,699 0 0), Wallis (1,412 0 0), W. H. Canty (1,363 0 0), and Punnett & Sons, Tonbridge\* (1,287 0 0).

ST. MARY CRAY (Kent).—For extensions and repairs at the Gray Library and Reading-room. Mr. St. Pierre Harris, architect, 1, Basinghall-street.—

Table listing contractors and amounts for St. Mary Cray. Includes W. R. Taylor (£657 0 0), E. A. Dowers (659 0 0), T. Knight (535 0 0), F. Wood (523 0 0), Taylor & Son (436 0 0), Hart Bros. (423 0 0), and Somersell & Son\* (406 0 0).

WALWORTH.—For alterations at the Montpelier Assembly Rooms, Walworth, for Mr. Thos. Butt.—

Table listing contractors and amounts for Walworth. Includes J. Besie, Westminster Bridge-road (accepted) (£856 0 0).

### Archaic Architecture at Corinth.

**A**MONG the papers included in the volume recently issued by the Athenian Section of the German Archaeological Institute, great interest attaches to the report by the

present Director, Dr. Dörpfeld, on an accurate exploration of the ruins of the archaic Doric temple at Corinth. The work done here is worthy to be compared in interest with that of the Archaeological Institute of America at Assos, conducted, and admirably published, by Mr. J. Thacker Clarke. In some important respects it was not so well rewarded. No sculptured slabs were unearthed, and none of those details of frieze and cornice which enabled Mr. Clarke to reproduce the complete Doric order of the temple at Assos. In both cases the general plan was deeply encumbered with earth, but proved recoverable in all leading particulars when this was removed. The hexastyle of Assos revealed the greatest peculiarities and variation from the type which is elsewhere all but general. The Corinthian has the usual distribution of the cella between naos and opisthodomos, entered respectively from a pronaos and epinaos, each in antis. But at Assos there was neither epinaos nor entrance to the cella on the west, but the plain wall was carried across the rear at the same distance from the steps as upon the sides. Upon the elevation there were these anomalies: the sculptured design upon the architrave, and the drums of the columns so set that the arrises, and not the centres of the channels of the flutes, were in line with the axes of the plan. The slope of the profile of the cehinus of the Corinthian example verges to the later and more erect type.

This temple was built of the porous limestone of the district, but a smooth surface was given to it by a very thin coating of exceedingly fine stucco. This method of producing the appearance of a nobler material was employed at Ægina and in many temples of later date, as, for instance, in the great temple of Zeus Olympias at Elis. The Corinthian is the earliest example preserved, and remote as must be its date, it proves that already marble had been used for temple structures, and with such delicacy of treatment and workmanship as to induce attempts to obtain the same effect by a system of imitation at the cost of considerable labour. The Roman colonists of the restored city evidently repaired the temple, which might

have suffered from mere lapse of centuries, apart from violence done to it in the devastating conquest by Lucius Mummius. Traces are apparent of their repair of the stucco coating, and a number of thick tiles bearing Latin impress show that they gave it a new roof. In later times it was exposed to those agencies of ruin, storm, earthquake, and despoiling for building materials, which have proved equal to overturning and all but entirely obliterating even such a colossal structure as the Temple of Artemis at Ephesus. Stuart, at the end of the last century, found eleven columns still erect, inclusive of one of the western pronaos and some architraves in position. The pronaos columns had disappeared when the French scientific expedition explored the site in 1820, and only the seven columns remained, which are still standing. These the Greek Government have caused to be secured by underpinning against ruin, which was otherwise too certainly impending.

The progress of excavation soon revealed that no general foundation had been prepared for the building, but that separate foundations were brought up from the solid rock at some depth below for each several column and for the various walls. These foundations had, indeed, been removed from the greater part of the area; their places, however, could nevertheless be determined by manifest traces of the preparations made to receive them. The uneven and sloping rock had not been reduced to a level, nor had the builders been content to simply make smooth surfaces; they sank distinct heds for their lowest courses, and thus inscribed their plan as on a sort of very uneven drawing-board. With this guidance it became demonstrable that the temple had been rightly conjectured by Stuart to be hexastyle; it proved, moreover, to have had fifteen columns on flank, and thus to have been a precedent for the beautiful temple of Apollo at Bassæ, erected at the best period of Greek architecture. Lines of foundation within the limits of the cella testified for interior columns, but did not afford more than a presumption of their exact number and spacing. In the opisthodomos, and near the line of the partition wall, was found preparation for a square solid base, directly opposite to the entrance. It is fair and natural to conclude that this supported the pedestal of a statue,—that of the god or goddess of the dedication. The assignment of this position agrees so far with that which Mr. Cockerell gives conjecturally to the statue of Apollo at Bassæ. Inasmuch, however, as at Corinth there was no door of communication between the two apartments, it seems probable that we have here, as in the case of the Erechtheum, a double temple, and that the eastern

naos was assigned to an associated divinity or hero. Pausanias, who mentions other examples of combined temples, unfortunately gives us no assistance towards the attribution of this. What is remarkable, in any case, here is that some superior distinction is given to the western and smaller apartment by the more important dimensions which are afforded for its epinaos, or ante-chamber, as compared with the eastern pronaos. It has a depth of 4.23m., as against 2.71m., a difference of some 4 ft. 6 in.

The only reference which Dr. Dörpfeld makes to an application of definite proportions in the design of the building is as between the relative lengths of the naos (16 m.) and the opisthodomos (9.60 m.), which, he remarks, compare exactly as 5 : 3. But the question is deserving of closer examination if we are to derive the most interesting information of all from the results of this excavation. In the appendix contributed to the splendid work of Mr. Cockerell on the temples of Ægina and Bassæ, will be found some deductions respecting the ruins, which were obtained by comparison of the dimensions furnished by Stuart. These were sufficient to establish that even at the very early date which the design must certainly be referred to, the same principles of adjustment of dimension by strict numerical proportion were in vogue which were developed to the last perfection by Ictinus at Athens and Bassæ. The recognition of the principle is distinct, though its application is naturally more crude. There is the same observance of a symmetry between the height and spacing of the columns, and of accurate proportion between lower diameters and void intervals. This lower diameter is too nearly one-fourth of the height of the column for the intention to be missed; and the upper diameter, lower diameter, and abacus have the same relative proportions of 3 : 4 : 5 which govern those of the two Æginetan examples.

It was by Athenian architects of the great age that the application of definite proportion to architecture was most profoundly studied as a theory, and most sedulously and scrupulously carried out in practice in executed works; but if genius in the arts, and indeed in philosophy also, culminated at Athens, it was not exclusively native there. It is highly probable that this particular subject may have been primarily dealt with in the flourishing but unrecorded days of archaic Corinth. This city was renowned from earliest times as the home of inventive genius, and did much to vindicate its repute in later historic times. Legend, as usual, was attached to a national characteristic, and it ascribed to the Corinthian hero Bellerophon

phon the invention of the bit and bridle,—hence his Pegasus on the wide-spread Corinthian cornice. Pindar adds as other "antique devices" to credit of the city, the origination of the highly-artificial structure of the enthusiastic dithyramb, and of the twin pediments as crowning members of the temples of the gods. On the grand archaic François vase at Florence we have an elevation of a proper Doric façade, distyle in antis, but roofed peculiarly, with no appearance of a pediment,—evidence not to be neglected of the late origin of an architectural feature which was afterwards found susceptible of such noble treatment. Theydides credits Corinth with the construction of the first trireme,—a model which continued serviceable so long, but of which it has tasked the ingenuity of modern constructors to recover the particulars. It was a Corinthian who afterwards so modified this construction as to foil the onset and manœuvres of the trained Athenian seamen, and so contribute importantly to the rescue of the Corinthian colony of Syracuse.

Instructed by examples of other temples we look in the first instance for an accurate proportion of the length and breadth of the main plan. The dimensions are given as 53·30 m. : 21·32 m., which compare with absolute accuracy as 5 : 2 ; that is, a double square and a half. In the larger dimensions of the Parthenon the ground plan of 4 : 9, a double square and a quarter, fails of like exactness,—though only by an excess of 0·124 ft. in a length of 228·141.

The echinus of the capital at Corinth exceeds one-tenth of the front top step by as much as 2 in., and no other plausible comparison presents itself. The abacus of the eastern front of the Parthenon is exactly one-fiftieth of the breadth (100 Greek feet) of the top step ; the same dimension applies to the angle abaci of the west front, but there the intermediate smaller abaci are regulated by the proportion of 7 to 8 to the interval from one to another. In the Thesæum the abacus is measured by one-twelfth of the top step.

The temple at Corinth follows the usual Doric rule of closing up the columns at the angles, out of regard to the position of the terminal triglyph above. It exhibits, however, a marked example of archaism in a considerable difference of both diameter and interval of columniation between the front and flanks. The architrave stones built into the old wall of the Athenian Acropolis are of such different lengths as to show that this was the case with the temple they belonged to or were intended for ; and the same applies to the probably different temple, of which the plan has recently been laid bare close to the Erechtheum.

The difference at Corinth is between a lower diameter of 1·72m. on front, and 1·63m. on flank, or about  $\frac{3}{8}$  in. in favour of the front. At the same time the more open interval between the columns is 2·28m. front, as against 2·07 m. on flank. This difference of full 8 in. was made subject to strict regulation. On the front the diameter of the column is to the void interval proportioned exactly as 3 : 4 (1·72m. ÷ 3 = 0·57 : 2·28m. ÷ 4 = 0·57). The like comparison on the flank brings out the proportion of 4 : 5 (1·63m. ÷ 4 = 0·407m. ; 2·07m. ÷ 5 = 0·41.)

A contrast so manifest was given up by later Greek architects as too sudden and harsh ; that it should ever have been applied so strongly is a fact which seems to account for the extraordinary pains which the architect of the Parthenon thought it worth taking in introducing comparatively minute variations of dimensions which no eye could distinctly appreciate or even detect, but which were counted on to produce, nevertheless, an effect of relief of monotony and softening gradation. The stouter angle columns have naturally a broader abacus than those intermediate. Nothing could have been more simple and easy than to make all these others absolutely identical repetitions ; instead of this we find that while the intermediate abacus of the eastern or chief front is adapted for the angle columns on the west ; the smaller western abacus then exceeds those of the south flank, which are nearly uniform, while those on the north flank decrease

within moderate but not doubtful limits from east to west. The spread of the echinus of the capital follows the varying breadth of the abacus, but the diameters of the columns apart from those by the angle vary quite inconspicuously.

In the cursory examination which Mr. Penrose in 1846 was able to make he did not detect any curvature of the stylobate of the Corinthian temple, that is, any rise towards the centre upon the principle now so fully illustrated in the "Principles of Athenian Architecture." Dr. Dörpfeld, however, with superior opportunities, certified the fact that even this refinement was among the *archaia sophismata* with which Pindar credits the Corinthians. That the foundations rested undisturbed on the solid rock made it certain that the observable difference from the horizontal was not due to subsidence.

#### OUTFALL OF THE RIVER WITHAM.

**T**HE lowering of the water level of a river into which land is drained is, for drainage purposes, equivalent to raising the land by as much as the water level is lowered. A remarkable operation of this kind has been effected this year at Boston, in Lincolnshire, where the low-water level of the tidal portion of the river Witham has been lowered several feet at the outfall of four of the main drains of the country, by works executed under the direction of Mr. John Evelyn Williams, C.E., and the effect of this on the drainage of a large tract of low-lying land cannot be stated at less in importance than the virtual raising of that land several feet out of the water. The river Witham may be said to run in an eastwardly direction from Lincoln to Boston and thence to the sea, or rather to the great estuary called the Wash, which receives also the waters of the rivers Ouse, Nene, and Welland ; but for practical purposes of drainage the tidal levels of the estuary may be considered to be those of the open sea. From Lincoln to Boston is thirty-two miles, and from Boston to the sea eight miles, reckoning the distances each way from the sluice upon the river called the Grand Sluice, situated about half a mile above Boston Bridge. Thus, between Lincoln and the sea the river is divided into two portions, an inland portion of thirty-two miles above the Grand Sluice and a tidal portion of eight miles below it. Into this lower portion of the river three of the main drains of the country have their outfall, through sluices called respectively the Black Sluice, about a mile and a half below the Grand Sluice, and on the right bank of the river ; the Maud Foster Sluice on the left bank, about two miles below the Grand Sluice ; and the Hobhole Sluice, about four miles below it, and also on the left bank of the river. The sills over which the water runs out of the drains are at the lowest possible levels to which in each case the water can be drained from the land, and every engineer places the sill of a sea sluice as low down as possible, having regard to the lowest level to which the water falls outside the sluice,—not necessarily quite so low as the lowest level to which the water falls, but always with some reference to that level.

The sills of these sluices on the tidal portion of the Witham are at various levels, and, making any necessary allowance for difference of opinion amongst the engineers who have from time to time carried out the former works of the Witham drainage as to the exact height above low water at which the sill of a sluice should be laid, the various levels at which these sills have been placed indicate very different conditions of the river at different times. Taking the low-water level of ordinary spring tides in the estuary as a general datum from which to reckon the levels of all the sills, the sill of Hobhole Sluice is 1·80 ft. above datum, that of Maud Foster Sluice is 5·0 ft., Black Sluice 2·40 ft., and the Grand Sluice 6·80 ft. above datum. As this last is eight miles up the river, it would not be expected to be at the same height above the general datum level as the sill of Hobhole Sluice is, because the tide might very probably not ebb out so low at the

Grand Sluice as it does at the mouth of the river ; but, as the original sills of the Grand Sluice are 6·80 ft. above the level of low water at the mouth of the river, the fact indicates an extraordinarily bad state of things in the river at Boston, for in that length of river, from the sea upwards, if it were in anything like a tolerable condition for navigation, the fall in the surface of the water at low water would not be more than 1 ft., and probably less, or even perhaps none at all. The "Grand Sluice" was placed there to prevent the tidal water passing further up the river. It is an old work, about which there has been much contention whether it should be removed or not. It has nearly ruined the shipping trade of the port of Boston, but the works recently carried out seem to have revived the trade. Either the removal of the sluice or the execution of the present works was absolutely necessary. The sluice was made in the interests of the owners of the fen lands, and the whole history of the Witham Drainage shows that there has been a continual neglect of the lower or tidal portion of the river, forming the navigable channel from the sea up to Boston, until now that this most important work at the lowest part of the outfall of the river has been done ; a work which has been equally beneficial to the town of Boston, as a port, and to the neighbouring land in respect of drainage ; but the "Grand Sluice" remains. It seems that nobody has been able to persuade the Drainage Commissioners to remove it. Most people say it ought never to have been placed there ; but, being there, the Commissioners have hitherto let it remain. It has, however, been enlarged by the addition of another opening, and its discharging capacity has been made to correspond in some measure with that of the improved channel below it. Before these outfall works were commenced the engineer reported to the Witham Outfall Board, in 1873, that between Boston Church and the Grand Sluice the capacity of the channel for the discharge of ordinary floods was as much as one-fourth less than that of the Grand Sluice itself, and only one-half of the capacity of the river above the sluice, for carrying off a flood. He found, commencing at the lowest point of the outfall of the Witham Drainage, viz., at low water in the estuary, that a spring tide rose 21 ft. in Clayhole, but only 14 ft. 11 in. at Hobhole Sluice, and only 12 ft. 6 in. at the Black Sluice, and the same at the Grand Sluice. Thus the low-water level at Hobhole Sluice was 6 ft. 1 in. above that in the estuary. At the Black Sluice it was 8 ft. 6 in., and at the Grand Sluice 8 ft. 6 in. above the low-water level in the estuary, the reason being, plainly, that the river was full of silt. Upon this report being made, proceedings were taken to deal effectually with the long-standing question of the Witham Outfall, beginning, as every other engineer had previously advised, at the lowest point, and making the improvements gradually upwards.

In May, 1887, Mr. Williams reported that the works were then completed. The most important section of the works is the forming of the new outfall channel between Clayhole, in the estuary, and Hobhole Sluice, in the river,—a work locally known as "The Cut through the Clays." The first sod of this new channel was cut on December 14th, 1880 ; it is three miles in length, and is a mile and a half less in length than the old circuitous channel through the shifting sands. At each end, where the new cut joins,—at one end the sea at Clayhole, and at the other the river near Hobhole Sluice,—a piece of the ground was left in, and an embankment raised upon it high enough to exclude the tides from the workings inside. Between these two embankments the excavation was carried on by means of three powerful steam-narrows, eight locomotives, and numerous barrow and wagon roads, and the extreme ends were afterwards excavated by dredging. The total quantity of excavation was nearly two million cubic yards. Its sectional area is greater than that of either the Suez Canal or the Amsterdam Ship Canal. The first vessel passed through the new channel on April 7th, 1884, and the permanent closing of the old channel was then actively proceeded

with. To effect this it was necessary to form an embankment across it, about half a mile in length, which now joins the parishes of Fish-toft and Wyberton. The old channel was finally closed on August 29th, 1884, and the advantage of the shorter and deeper outfall to Clayhole was immediately seen in the increased velocity of the ebbing waters, and this improvement steadily increased with the advance of the work towards completion in the river above; for, besides this lower and most important portion of the new works, below Hobhole Sluice, the river upwards from this sluice to the Black Sluice has been very materially improved by dredging and the training of the channel by means of fascine work, and in that portion of the channel between the Black Sluice and the Grand Sluice the discharging capacity has been enlarged by dredging and the filling of barges by hand labour. The contracted section of the channel along the Church-street frontage has been considerably widened and improved by a new breastwork of timber piling. The navigable depth of the river has been increased 8 ft., and, whereas before the works were carried out the navigable capacity of the Port of Boston admitted vessels of 300 tons only, the formation of the new channel and the other work done in the river have had the effect of admitting vessels of 2,000 tons. With the old circuitous channel the scouring energy of the ebb tide was distributed and broken in struggling seaward through the shifting sands, the channel shifting sometimes a mile from east to west in a few weeks. The incoming tide swept over these broken sands and carried in suspension great quantities of sand and mud as far as the Grand Sluice. The estuary common to this river and those others we have named is a large bay, two thirds of which consist of beds of shifting sands, laid dry at low water. The depth of the estuary varies from 1½ fathoms to 18 fathoms. The foreshore of the coast, where the Witham debouches, is a hard, stiff clay, known by the name of the Scalp, which forms a long elbow. At this elbow the river Welland joins the Witham almost at right angles, and before the new cut was made, the waters of the Witham and the Welland met here and spread themselves out and lost their velocity, and with it the power to move the sands and mud in any defined channel, and the deposit of silt at this point was much increased by the stagnation caused by the two rivers meeting almost at right angles. With these unfavourable conditions of outfall it was impossible to avoid frequent and disastrous floods, as well as the uncertainty and difficulty attending the navigation at those times. On the completion of the new channel the combined scour of the land flood and the tidal waters was concentrated and utilised in maintaining the shorter and deeper outfall to Clayhole; and the incoming tide, instead of rushing up the river as before, heavily charged with matter in suspension, now flows gently in from the estuary, and comparatively clear. With respect to the benefit to the land to be derived from the lowering of the low-water level of the river opposite the respective outfall sluices, it cannot, perhaps, be taken to be actually as much, foot for foot, as this lowering is, because it is the extent of the lowering in dry weather; whereas, as Sir John Hawkshaw said, in a report to the Commissioners of the Witham Drainage in 1861, it is mainly on the depression of the low water in time of floods that the drainage depends. Nevertheless, with so great a depression in the low-water level of the tidal waters as has here been accomplished, that of the flood waters must necessarily follow to almost as great an extent. The absolute gain or depression already acquired on the low-water level at the several sea sluices is as follows, viz.:—At the Grand Sluice, 4 ft.; at the Black Sluice, 4 ft.; at the Maud Foster Sluice, 4 ft. 3 in.; and at the Hobhole Sluice, 5 ft. 6 in. The total expenditure, including Parliamentary expenses and land, has been 167,941l. The total area drained into the Witham Outfall is about 700,000 acres, but of this area only 194,649 acres contribute towards the cost of the improvement and maintenance of the outfall works.

## NOTES.

**FIRE** returns relating to all authorised gas undertakings in the United Kingdom, the one comprising those belonging to local authorities, the other those other than those of local authorities, have recently been issued. Out of a total authorised capital of 73,069,670l., the sums of 36,639,856l. and 19,723,040l. have been paid up or borrowed, the first by the Companies, the second by the local authorities. The numbers of 1,133,897 consumers are supplied by the former, and of 996,480 by the latter. The large quantity of 8,657,731 tons of coal have been carbonised, yielding 87,931,537,054 cubic feet of gas. There are 19,143 miles of gas mains and 413,921 public lamps lighted. According to these figures rather more than 40,000 cubic feet of gas are supplied to each individual, but, while the Companies supply 49,000, the authorities only supply 26,000 cubic feet per consumer. We venture to question how far this part of the return is reliable. The number of consumers given appears to be incredibly small, whether compared with the population of the United Kingdom or with the quantity of gas manufactured, which is 9 per cent. more than the quantity sold. The consumers, we are told, are calculated according to the number of accounts. They thus represent families, rather than individuals, a consideration which would make the number of gas users, according to the average number of inhabitants per house, amount to between 11 and 12 millions of persons. But the number is no doubt larger, as the proportion of large houses using gas to small ones not using it must render an average unreliable. The local authorities do far less in the way of public lighting than the companies, the latter providing a public lamp for every 4·4 individuals, the former only one lamp for every 6·4 individuals,—counting them as consumers. The local authorities spent 3,127,047l.; paid 951,636l. in interest; and made a profit of 350,532l. during the last year. Corresponding returns are not made by the companies.

**THE agenda** paper for the meeting of the Metropolitan Board of Works to be held a few hours after this number of the *Builder* is published, contains the following paragraph in the summary of the Works and General Purposes Committee's Report, viz.:—

"5. Reporting for the information of the Board certain circumstances which have now for the first time come to the knowledge of the Committee with respect to Mr. Hebb, the Assistant Architect, and recommending that Mr. Hebb be called upon to resign."

We notice this paragraph with much astonishment, not unmingled with regret, for we had hoped that, regarding the letters made public last Saturday, such an explanation would have been forthcoming from Mr. Hebb as should have led the Committee to take a less drastic view of the matter than they appear from their recommendation to be inclined to take of it. It is stated, however, that he has been condemned unheard. We confess ourselves surprised that the Committee should have so precipitately resolved upon their recommendation; and if the Board adopts it, after its halting determination merely to censure another official whose conduct, as it appears to us, was far more blameworthy than that which is attributed to Mr. Hebb (so far as we are aware of the charge against him), we shall know what to think of the Board's sense of justice. That Mr. Hebb has been very indiscreet is evident; but it appears to us that the Committee proposes to visit that indiscretion with too severe a punishment, and we hope that the Board will take a more lenient view of the case.

**A LONG** paper on the subject of theatre construction (which is in everybody's mouth now) was read by Mr. T. L. Watson, on the 12th, before the Architectural Section of the Philosophical Society of Glasgow. In the course of the paper Mr. Watson drew attention to the New York Building Law in regard to theatres, which provides that every

theatre shall have one front to the street and a certain amount of free space on either side of the auditorium portion also:—

"Every such building shall have at least one front on the public highway or street, and in such front there shall be suitable means of entrance and exit for the audience. In addition to the aforesaid entrances and exits on the public highway, there shall be reserved for service in case of an emergency, in every and all such buildings, an open space equal to one-eighth of the width of the building, outside to outside measurement, and in no case less than 3 ft. in width in the clear in its narrowest part, on the side not bordering on the street, where said building is located on a corner lot, and on both sides of said building where there is but one frontage on the street or public highway.

"Said open space shall begin on the line of the proscenium wall, and shall extend the full length of the auditorium proper to the wall separating the same from the entrance-lobby or vestibule. A separate and distinct corridor shall continue to the street, from each open space, through such superstructure as may be built on the street side of the auditorium, said corridor to be reduced in width not more than may be required for the thickness of the outer wall forming one side of said corridor. The openings into and out of said corridor shall not be reduced in width more than 3 ft. less than the width of said open space, said openings to be provided with doors or gates opening towards the street."

An event mentioned in the latter portion of the paper may serve as a caution in regard to the "sprinklers" which are now so much recommended for stopping a fire on the stage. It is related that at the Ambigu Theatre in Paris, during the day, one of the scene-shifters made a mistake with the new apparatus for drenching the stage with water in case of fire. Some time before the doors opened the water inundated the ground floor of the theatre and damped the scenery, the ropes, and the new iron curtain. The consequence was that when the actors were on the stage the iron curtain remained immovable, and the performance was delayed half an hour. Mr. Watson accordingly recommends automatic "sprinklers." We should not trust overmuch to these. We have a strong impression that they would fail when wanted as often as not.

**WE** are glad to find that the inaugural address of the new Lincoln and Merton Professor of Classical Archaeology and Art at Oxford has been published in pamphlet form. Prof. Gardner took for his subject, "Classical Archaeology, wider and special," and the address has a special value just now, as it affords a sound basis for fixing the relation between classical archaeology,—still, so to speak, in its probation,—and those kindred subjects, classical literature and classical history, which are already well established as matters of University teaching. The distinction which Prof. Gardner so clearly establishes between the wider and the special archaeology has, no doubt, always been dimly felt, but till now has been inarticulate; and it is because of this mental confusion that much distrust of archaeology has arisen. The subject matter of both the wider and the special is the same, but they differ in point of view and method. "The wider archaeology takes its start from historical record, and never loses sight of its position as one of the handmaids of history; the narrower and more special archaeology claims, and has successfully established, a position as an independent branch of study, with methods and conclusions of its own." Oxford is not likely to neglect the wider view, and she is fortunate in having chosen for her new teacher a scholar who, highly-trained specialist though he is, yet never loses sight of these wider relations.

**AT Pompeii** the excavators have come upon a fountain decorated with a piece of mosaic of unusually fine workmanship. The fountain is in the form of a niche, on the ceiling of which Venus is represented just at the moment when she issues forth from the sea-shell. A little love-god is also rising from the water, and the goddess holds him by the hand. Beneath this group are a number of Nereids and boys with dolphins. On the shore of the sea two draped female figures are represented: one is standing, the other seated; both make gestures of amazement at the birth of the goddess. Opposite them is another female

figure, and a fourth, between them, turns her back to the spectator. The ground of the whole is blue, with a border of shells. It is reported to be the finest fountain mosaic ever discovered. The house in which it was found has not yet been completely excavated.

IT is proposed to restore St. Nicolas Church, Keyingham, East Yorkshire, at an estimated cost of 1,200. The chancel was recently restored by the Ecclesiastical Commissioners, under the superintendence of Mr. Ewan Christian. It is stated that the nave and aisles have become not only dilapidated, but unsafe through the decay of the beams of the roof. The parish is a purely agricultural one, and an appeal has been made to the inhabitants of the East Riding of Yorkshire for assistance. The spire of the church serves as a landmark in the navigation of the Humber. A sum of 452l. has been promised towards the restoration.

WE are informed that the wooden doorway and hood formerly at Fairfax House, Putney,—a very pretty specimen of seventeenth-century design,—has been purchased by Mr. Seymour Lucas, A.R.A., who proposes to erect it in front of his house, New Place, Woodchurch-road, Hampstead. We gave an illustration of the house in our last volume, and a detail of the staircase [vol. lit, p. 263], and some further notes and sketches by Mr. J. Alfred Jones [p. 517].

THE Disney Professor at Cambridge (the Rev. G. F. Browne, B.D.) proposes to deliver six lectures on Tuesdays, January 31 to March 6, at 2.30 p.m.; the first lecture in the Senate House, the remaining five at the Museum of Archaeology, on the interesting subject of the Sculptured Stones of pre-Norman type in the British Islands. The subjects and lectures will be arranged under the following heads:—1, General Survey, Jan. 31; 2, Anglian Stones,—dated examples, Feb. 7; 3, Anglian Stones,—undated examples, Feb. 14; 4, Anglian Stones,—Runic and other Inscriptions, Feb. 21; 5, Anglian Stones,—the Christian Story and the Sagas, Feb. 28; 6, Anglian Stones,—Connexion with Rome, Ravenna, &c., March 6.

THE Winter Exhibition of the Society of Painters in Water Colours contains a number of beautiful things, pre-eminent among which is Mrs. Allingham's one contribution, "East and West" (174), a seaside scene where a beautiful English lady is seated in the foreground reading a letter from her husband in India, while her child with the Indian nurse is seen a little way off. As usual in Mrs. Allingham's works, the little bit of story in the picture is completely told, and the face of the principal figure is lovely. The whole represents the artist's highest style of work. Perhaps the work which will strike visitors most, next to this, is Mr. A. Goodwin's "Gate of Zoar" (198), a kind of sequel to a former picture. It represents the destruction of the Cities of the Plain, seen from a distance, a red rain descending from an awful and portentous mass of almost solid-looking sulphurous cloud. This kind of effort at imagining something beyond nature is a dangerous direction for an artist to wander into; the thing is very powerfully done, but it is not the kind of subject one would like to see very much of, even from an artist of Mr. Goodwin's imaginative power. Among the works which are really "sketches and studies" are some by Sir Oswald Brierley, and a frame of "Six Albuin Sketches" (121) by Mr. Walter Field; but most of the drawings, as usual, are as finished as those to be found in the Spring Exhibition. Mr. A. Goodwin sends a series of charming views of English towns,—Rochester, Worcester, Bristol, and others,—which bid fair to rival Turner's vignette illustrations of localities. We have only the fault to find of want of force in the one giving "Bristol," which is taken at the docks with the bow of a ship in the foreground; but it is a little too polished up for the subject: no one ever saw Bristol look as clean and bright as in that picture. Mr. Alfred Hunt is a rather larger

contributor than usual, and seems to be specially studying contrasts of the same scene under different lights; "Whitby" in morning and evening, for instance (85 and 127); "Robin Hood's Bay, Showery Evening" (35, a very fine work); and "Robin Hood's Bay, Afternoon" (163). Among others who are well represented is Mr. Cuthbert Rigby, whose "Early Morning, Beoley, Derbyshire" (34), is one of the freshest and brightest bits of morning effect we have ever seen in a drawing. Mr. H. S. Marks has several interesting figure studies marked by his peculiar humour; the best, perhaps, is that of the cynical old gentleman reading "A French Novel" (47); the Puritan "Secretary" (183), sealing a letter, with a face of business-like decision, is also very good; and there is a very delicate humour in the two entitled "Sunshine" and "Rain" (29 and 36), the same figure at the door of a house looking outward in the one and inward in the other,—a kind of reminiscence of the old form of weather foreteller with figures that move out and in. Mr. Nattel's works are exceedingly good, especially "On the Bench, Studland" (135). Mr. Herbert Marshall has visited "Fowey" (53) with good results. Mr. R. W. Allan's drawings of towns have force and originality of style, but tend to exaggeration; in "Middelburg" (62) the shadow on one side of the street seems like some solid substance laid down on the roadway. Mr. Tom Lloyd's "Anxious Mother" (84) is one of his prettiest if not one of his finest works. In a drawing called "Lawn Tennis" (112), Mr. C. Robertson gives foreground study of a profusion of flowers, brilliant, but as hard as if they were cut out in steel. Mr. G. H. Andrews's "Bad Weather in the North Sea" (133) is a large and rather remarkable study of a ship in a gale of wind; but the surface of the water is not "watery," though the tumultuous movement of it is well suggested. In "No Customers" (150), Mr. Arthur Hopkins gives a very highly-finished study of vegetables and green-grocery miscellanea, which is really a triumph in its way. A considerable number of the late Mr. Collingwood Smith's works are hung at the lower end of the room.

THE citizens of the "Burgh of Newport, Fife," seem to be an uncanny set of people (in their own estimation, at any rate), if we may judge from an official advertisement which appeared in the *Dundee Courier* last week. The advertisement is question, signed "Thos. Congleton, Clerk to the Commissioners of the Burgh of Newport," sets forth that "the Commissioners invite competitive drainage schemes for the burgh, with relative plans, and offer a premium of 200l. for the scheme with plan adjudged best, and 100l. for the second best, as these may be awarded by such person or persons of skill and experience as the Commissioners shall appoint, but only on the conditions following, viz.:—That the schemes and plans for which the premiums are awarded shall become the absolute property of the Commissioners, who shall have right to carry out same, in whole or in part, without employing the successful competitors, or any of them, or being liable to them, or any of them, in any fee, commission, or charges, in connexion therewith, or with the work done or otherwise." Even assuming that the "Burgh of Newport" is as small a place as the "premiums" offered are insignificant, and that consequently only a small scheme of drainage is required, the Commissioners ought to be told, by "such person or persons of skill and experience" as they say they propose to "appoint," that they cannot reasonably expect engineers of capacity and experience to compete. The smallness of the premiums offered is only equalled by the comprehensiveness of the "conditions following." We cannot imagine that any self-respecting civil engineer will respond to this invitation. Possibly a few tyros and people who are not engineers at all may compete, with the result that the Burgh Commissioners may find that, through being "owre canny," they have got a system of "drainage" with the levels all wrong and the falls all inclined upwards! Such things have

happened before now under similar conditions, and they have tended neither to economy nor healthfulness.

#### THE ROYAL ACADEMY STUDENTS' DESIGNS.

THE designs submitted by the students for the various prizes given by the Royal Academy were publicly exhibited at Burlington House on Monday and Tuesday last. The innovation of allowing the exhibition for two days instead of one only, as before, is an improvement which might be extended further, even to exhibiting them for a week: many would be glad to look at them if more time were allowed.

The following is the list of subjects and prize-winners:—

- Historical Painting: "Captives."—Gold medal and travelling studentship (200l.), Arthur Trevelthick Nowell.
- Landscape Painting: "Sunset after a Storm."—Turner gold medal and studentship (600l.), Arthur Trevelthick Nowell.
- Landscape Painting: "An Old Water Mill."—Creswick prize (200l.), Stephen Briggs Cahill.
- Painting of a Figure from the Life.—Silver medal, 1st, not awarded; silver medal, 2nd, William Farran Littler.
- Painting of a Head from the Life.—Silver medal, 1st, Minnie Jones; shubhook; silver medal, 2nd, Mand Porter.
- Copy of an Oil Painting: "Man in Armour," by Van Dyck.—Silver medal, 1st, Arthur Claude Cooke; silver medal, 2nd, Thomas Henry Jones.
- Copy of a Landscape: "The Leek," by John Constable, R.A.—Silver medal, not awarded.
- Cartoon of a Draped Figure: "Demosthenes on the Sea Shore."—Silver medal and prize (250l.), Alfred Bernard Styles.
- Design in Monochrome for a Figure Picture: "John and Zebebel."—2 Kings ix. 30-33.—Armitage prizes, 1st (300l.) and bronze medal, William Farran Littler; 2nd (100l.), Walter Stanley Pater.
- Design for the Decoration of a Portion of a Public Building: "Summer."—Prize (400l.), Wm. Ernest Reynolds Stephens.
- Drawing of a Figure from the Life.—Silver medal, 1st, not awarded; silver medal, 2nd, Herbert James Draper.
- Set of Six Drawings of a Figure from the Life.—1st prize (500l.) Chas. Thos. Rudin; 2nd prize (250l.), Stephen Briggs Cahill; 3rd prize (150l.), William Farran Littler; 4th prize (100l.), Percy Short.
- Drawing of a Head from the Life.—Silver medal, 1st, Joseph Walter West; silver medal, 2nd, Mary Catherine Abercrombie.
- Drawing of a Statue or Group.—The two silver medals for this were not awarded.
- Drawing of a Statue or Group.—Prize (100l.), Lydia Bacon King.
- Perspective Drawing in Outline (open to Painters and Sculptors only): "The Exterior of St. Paul's Church, Covent-garden."—Silver medal, Edith A. Cooper.
- Line Engraving of a Drawing of a Figure from the Life.—No competition took place for the Gold medal and prize (250l.) given for this subject.
- Competition in Sculpture: "An Act of Mercy."—Gold medal and travelling studentship (200l.), George Jas. Frampton.
- Set of Three Models of a Figure from the Life.—1st prize (200l.), Wm. Goscombe John; 2nd prize (100l.), Wm. Ernest Reynolds Stephens.
- Model of a Design: "An Episode of the Deluge."—1st prize (200l.), Wm. Goscombe John; 2nd prize (100l.), Arthur George Walker.
- Design for a Medal: "A Prize Medal for a School of Art."—Silver medal, not awarded.
- Model of a Figure from the Life.—Silver medal, 1st, John Rollins; silver medal, 2nd, Jas. Nesfield Forsyth.
- Model of a Statue or Group.—Silver medal, 1st, Andrea C. Lucchesi; silver medal, 2nd, Chas. John Allen.
- Model of a Statue or Group.—Prize (100l.), Wm. Henry Prosser.
- Design in Architecture: "A Railway Terminus."—Gold medal and travelling studentship (200l.), Robert Weir Schultz.
- Set of Architectural Drawings: "St. George's Church, Bloomsbury."—Silver medal, 1st, Percy Norman Gingham; silver medal, 2nd.
- Set of Architectural Designs (Upper School).—Prize (250l.), William Leek.
- Set of Drawings of an Architectural Design (Lower School).—Prize (100l.), William Alford.
- Perspective Drawing in Outline (open to Architects only): "The Caryatid Portico of the Erechtheum."—No competition took place for the silver medal given for this subject.
- The Landseer Scholarships in Painting and Sculpture, of 40l. a year each, tenable for two years, given for the best work done in the examination for passing into the Second Term of Studentship, have been awarded:—in Painting, to Ernest W. Appleby and Herbert James Draper; in Sculpture, to William Goscombe John and William Ernest Reynolds Stephens.

In Architecture, the Gold Medal and Travelling Studentship, for a design for a railway station, has been awarded to a very clever and original design by Mr. R. Weir Schultz, the only one of these designs which travels much out of the beaten track of railway station architecture. The author has evidently set himself to consider fairly how a railway station can be expressed in architecture in a simple, suitable, and unpretending manner, discarding conventional architectural ornamentation and adopting a simple and bold treatment with little ornament; and what little there is has a definite meaning. The main portion of the end of the building is treated with a great gable with massive piers at the angles of the building, \* Disqualified, owing to having received the same prize in 1885.

and a great semicircular window; the general idea is that of King's Cross improved upon. It is a pity that the author has stuck to the old system of dividing up his semicircular window with four perpendicular mullions cutting into the circle,—the worst way of dividing up a circular window, but one sanctioned by long habit. Over the keystone of the window a large clock is corbelled out, with a gablet over it, and flanked by bas-relief figures of Day and Night. The offices form a long low block running across the front, with a gateway in the centre with a deeply-recessed arch with carved soffit, the whole centre entrance forming a solid mass of masonry treated with a quasi-Doric cornice and an attic over, in which are medallion auto-relief portraits of Brunel, Watt, and Stephenson. The range of offices on either side is treated with what may be called a Tuscan order in which the entasis of the columns is a good deal overdone: this portion might be improved in detail. The author has reproduced the figures from the Temple of the Winds over his central entrance, which is also flanked by two figures of lions on pedestals on either side. As a whole, the design shows originality and thought, and is decidedly the best of the set, though not so taking or effective in mere drawing as some others.

No. 331 is a design of considerable merit, more decidedly Classic in detail. The whole rests on a high rusticated podium, which runs all round the building, over which in front is a screen wall with an Ionic order, stopped by angle pavilions at either end; but as the author has used his Ionic columns rightly, not as angle columns, but as columns in a range terminating in piers or *ante*, why did he in his entrance pavilions use the corrupt form of the Ionic column with the volutes at an angle of 45°? Are not students at the Royal Academy taught that this form is only a corruption invented to facilitate the use of the Ionic column in all positions? Whereas the true form with the flat volutes was meant to be used exactly in the kind of position in which the author has the order here; so that he has thrown away his opportunities in this detail. There is a prettily designed clock tower on the left; but a defect of the design is that the effect of the large semicircular window at the end of the main building is lost, as only a little bit of the curve appears above the screen range in front. The author has suggested that he is up with the times by labelling his design "electric railway terminus." No. 332 has a good idea in his front, with the deeply-recessed arch round the great window carried down to the ground in front; but unfortunately the plan shows that this bold front composition has no reference to what is in the rear of it. No. 333 shows the iron roof with no screen between two towers, which are kept as solid masses below, with elegant cupolas above; but the design of the lower buildings in front is fragmentary, and seems to have no relation to the whole. No. 336 has placed a hotel block in front of the station, falling back in an elliptical recess in the centre, the lower portion of the recess containing a top-lighted waiting-hall, the outer line of which projects, and completes the ellipse. This is an idea, but not a good one; it weakens the centre, and is of little practical advantage on plan. No. 337 takes somewhat the same leading idea as the prize design, but with less refinement of feeling, and more pretensions detail; and the same may be said of No. 338, which is the better one, however, and the perspective drawing is a very good and effective one.

The elevation by Mr. Leck of a London street front, to which the prize of 25*l.* has been awarded, is a picturesque design with some good bits of detail about it, and a corbelled out above which develops into a circular lunette below with some pretty decorative treatment. The semicircular-headed windows on the first floor are here again divided by the upright mullions cutting into the circle, which, to our eye at least, are so disagreeable. No. 352, a coloured elevation of a design of somewhat the same type, has a good deal of merit, so has No. 350, but it is spoiled by the ugly scrolls standing out on the slopes of the gablets. Among various designs for "a monumental fountain," most of which are not very successful, the best, perhaps, is one in a style we have little sympathy with, No. 345, a Roman one with an architectural background, showing a heavy rusticated Doric order, the details well

put in. Most of the designers have attempted to make the fountain too much of an architectural erection with a fountain attached to it, rather than a fountain pure and simple.

The sketches abroad by the Travelling Student for 1886 (Mr. Maclaren) are in every way to his credit, in number, choice of subjects, and execution. They comprise pencil sketches and a good many studies of coloured detail. The pencil sketches in England by the Travelling Student of 1887 (Mr. E. H. Sedding) are more slight, but very good of their kind.

Perspective, which is illustrated in the same room, does not seem to be an attractive subject to Academy students; only two or three seem to have gone in for it; the prize has gone to a lady for a drawing of St. Paul's, Covent-garden (the subject set, apparently), which does not strike us as a very successful effort. Only one competitor, apparently, has appeared for the prize for measured drawings; the drawings of St. George's, Bloomsbury, which he has submitted, are clear and complete, not very finished in execution, but showing the facts well.

The prize for the sculpture composition, the subject being "An Act of Mercy," has been rightly awarded to Mr. Frampton for a very well-modelled and expressive group of a young girl giving water to a prisoner who is bound. The contrast between the youthful figure of the girl and the wrinkled and haggard expression of the captive is finely felt, and the whole is a well-modelled and well-composed group. Among the other designs submitted we may mention No. 292, a wounded soldier tended by a man and woman, and 293, a large group of the Angel of Death releasing the captive; the recumbent figure of the dying man is a fine one, and there is a noble conception in the work.

Of the designs for a tempera painting for wall decoration,—subject, "Summer,"—the one selected for the prize is the only one that is really and in the full sense decorative work, and therefore the award cannot well be questioned; but the composition is not very interesting; it is a kind of echo of Mr. Albert Moore, and represents some listless young women with no particular expression, lying about on a marble seat in various attitudes of *dolce far niente* enjoyment. We cannot care for such a work; decorative painting on a large scale is, or should be, an opportunity for realising a great idea; here there is little or no idea to speak of; still, the group is well designed for its purpose as far as effect and manner of treatment are concerned. No. 157, a Florentine scene of the Renaissance time, has merit of the same kind; and No. 156, a rustic scene, is good as a picture, and the single figure cartoon is a very nice one, but the composition fails in a decorative point of view from want of massing of the figures; the outline of the group being ragged, so to speak, two figures standing up above the rest at two points, and then a great gap between them. It is one desideratum in decorative figure painting, as in decorative bas-relief, that the group of figures should fill the space pretty evenly, and harmonise with the lines of architectural composition and construction. In this respect the prize design is a success, and most of the others are not.

The subject for the cartoon study of a draped figure is Demosthenes practising his voice on the sea-shore; and here the cartoon to which the prize is awarded at first strikes one as by no means the best; it is theatrical in effect, and, to our thinking, not so well drawn as one or two of the others. But it has the merit of being a *bona-fide* attempt to realise the subject. The other figures merely represent a man posed in a certain attitude, with his drapery blown about by the wind; one competitor has hit on an original treatment in showing us Demosthenes with his back to us facing the sea, which forms an element in the drawing. There is something to be said for this way of treating the subject, in the way of dramatic and picturesque effect; but it is not treated so as to make the most of the expressive action of the figure whose face is hidden from us. In Mr. Sykes's figure there is no "posing." Demosthenes is in full shout against the noise of the sea, with his mouth wide open, in the evident exercise of great exertion; that is a realisation of the subject; the others are not.

Having looked at the architectural drawings first, we are going backwards through the collection, and come now to the two rooms of oil-paintings, which are hung first in order in the rooms. The paintings for the Turner Medal are a curious collection. It seems to be an

understood thing with the competitors that they are to be Turneresque or nothing, and the attempt to give sunset & a Turner result in the most tremendous displays of crimson and yellow, alarming to contemplate. The prize work by Mr. A. T. Nowell (who has also gained the prize in historical painting) is far away the best, and, in fact, has hardly any rival among the others, and it is free from the sensational colouring which characterises so many of the others. There are one or two that deserve note, however; No. 25 shows a fine study of sunlit clouds, and No. 30 an effect of clear light and open sky over a dark hill, which is certainly fine, though the author has not quite accomplished what he aimed at. In regard to the historical paintings we feel a little doubtful about the verdict. The prize painting (subject, "Captives") represents a scene where a young man, clad in a leopard skin, is bound to a tree, and a young woman in the foreground is being bound by a soldier and a monk. The subject suggests the story of Laon and Cythna in the "Revolt of Islam"; we know not whether this was the intention. The woman, who throws herself forward with outstretched arms towards her companion in affliction, stretches out a most tremendous length of right-leg behind her into the foreground, reminding one of the style of Fuseli's figures; we should like to see Mr. Harry Furness's version of that figure; it would not leave him much room, however, for "happy exaggeration." There is some good painting in the picture, but it is too sensational, and we were disposed to think there were finer qualities in the painting numbered 5, with the old captive Gaul sitting in the foreground and the Roman soldiers looking on. The best after this, perhaps, was the modern treatment of the subject, the handiwork "Captive" in a railway carriage; but it makes a very disagreeable picture.

The exhibition of the designs was largely attended, and seemed to attract a good deal of public interest.

#### THE SPHERE IN PERSPECTIVE.

The following letter and diagram forwarded by Mr. R. Phené Spiers arose out of our remarks on a passage in his book on "Architectural Drawing" (p. 762, *ante*), and will be of interest to many of our readers, though it will be seen that practically Mr. Spiers's view does not differ much from ours:—

Sir,—I am obliged to you not only for your favourable notice of my work on "Architectural Drawing," but for the opportunity you give me of explaining more clearly the objects I had in view in referring to the projections of spheres in perspective.

The paragraph you have quoted must be taken in context with the previous paragraphs, and then, I think, will not seem so strange.

If I understand your question rightly, you do not take exception to the actual fact, viz., that the sphere can only be mathematically represented as a circle when its centre is on the point of sight, but to its application in the making of perspective drawings.\* In that case I am in accord with you, and the illustration I enclose will, I think, more fully explain my meaning. I have in this illustration drawn a sphere on the left, as I consider it always should be drawn (with one exception, which I will refer to later on), and on the right a sphere projected, as regards its main form, mathematically; as regards its outline approximately only because I have desired to show the method by which I arrived at its projection. I have assumed the sphere to be intersected by a number of vertical planes (parallel with the picture plane for convenience of projection), and I have put in perspective each section of the sphere. This shows as a matter of fact that if projected mathematically the sphere becomes an ellipse when not on the point of sight. In the illustration, A B is the horizontal line, C the point of sight, and C D represents the distance of the spectator from the picture plane. Now if this drawing be held at a distance, C D, from the eye the projection on the right should appear circular, that on the left elliptical; I say *should*, because it happens unfortunately in this particular instance, having taken a distance point too close to the picture plane, and a sphere too much out of the range of vision, the

\* That was our meaning.—Ed.

eye is unable to embrace the point of sight and the sphere at the same time; and therefore it is necessary to look askance to see the sphere, thereby changing position of the picture plane; but even looking askance at the projection I have given of the sphere, if the drawing be brought to within about two-thirds of the distance C D, it will be seen that the figure on the right has the appearance of being circular, whilst that on the left looks elliptical. It follows, therefore (and this was the exception I desired to make) that if a drawing is being prepared which will always be seen from one point of view (as in a peep-show, for instance) it is necessary to take cognisance of the fact and project the various features exactly, even although in its preparation the spheres should come out as ellipses. It also suggests to the draughtsman: firstly, the great importance of selecting his point of view so as to avoid great distortion (in the drawing of a dome or circular vase, for instance, to make it come, if possible, on the vertical plane intersecting the picture plane in the point of sight); and, secondly, the invariable necessity there will always be of "cooking" or correcting certain features, because the representation of a building on a vertical plane is not always the way in which the building might actually be viewed except at a long distance off, and also because the drawing will not necessarily be looked at from the point of view from which it is actually drawn. This explanation will, I hope, serve to place the subject in a clearer light before your readers.

R. PHENÉ SPIERS.

Carlton Chambers, 12, Regent-street.

N.B.—There is one other passage in your notice which I should be glad to refer to, viz., the use of drawings in France with the shadows projected at 45°. They are not sent to the contractor as working drawings, but used only for the purposes of study; in fact, they take the place of our perspective drawings, and guide the architect in his design, whilst they serve also as competition or exhibition drawings. As a rule, the French do not make perspective drawings, and their architecture, I think, loses in consequence.

\*.\* There is another point, however, in regard to the theoretical distortion of the sphere in a perspective drawing, which we have not seen alluded to, and which suggests the idea that after all there is a screw loose in the theory of perspective, as set forth by those whom we may here call the "distortioners." When drawing circles in perspective, which appear on the paper as ellipses, we are not merely concerning ourselves with projection on the plane of the

drawing; we are drawing them as we see them. Let A represent a geometrical elevation of three circular bodies, either circular discs or spheres, placed in succession on any level base, such as the top of a wall. In the geometrical elevation, their outlines, whether they are spheres or discs, will alike be circles. Move to one side so as to

take them in perspective, and if they are discs, we shall see them, as at B, as a series of ellipses; observe, we do not merely draw them or project them so, but we see them so, as may be practically proved by holding up a divided scale at a fixed distance between the eye and the object, and measuring its apparent length and breadth by the scale. But if the three objects are spheres, when we take them in perspective they are spheres still,—their apparent outline and perspective are perfectly unaltered, and they appear as at C. It is true that we do not see actually the same horizon-line on any of them that we saw when we were in front, and the horizon-line of each sphere is, in the case of C, in a different plane in reference to the baseline on which the spheres are standing; but we see them all as true spheres just the same as before.

Whereupon we put two questions:—(1) Is there not something illogical in a system whereby we are to draw circles in perspective as we actually see them in fact, and spheres as we never see and could not see them? And (2) Would any painter who had to introduce a spherical object into a picture,—say, a globular termination to a gate-pier,—venture to draw it in an elliptical and distorted form because it was on one side of his picture and out of the line of sight?

#### SIR F. LEIGHTON ON THE ARTISTS OF THE RENAISSANCE.

THE following is a portion of the address delivered by the President of the Royal Academy at the distribution of prizes to the students on Saturday last:—"The production, both in sculpture and painting, of the middle period of the thirteenth century has a character of transition. In painting, the works, for instance, of Cimabue and of Duccio are still impregnated with the Byzantine spirit, and occasionally reveal startling reminiscences of classic dignity and power to which justice is not, I think, sufficiently rendered. In sculpture, the handiwork of Nicolo Pisano is full of classic art. I see in it, indeed, the tokens of a new life in art, but little sign of a new artistic form,—it is not a dawn; it is an after-glow, strange, belated, and solemn. In the art of Giotto and the Giottoesques the transformation is fulfilled. It is an art lit up with the spirit of St. Francis, warm with Christian love, pure with Christian purity, simple with Christian humility; it is the fit language of a pious race endowed with an exquisite instinct of the expressiveness of form, as form, but untrained as yet in the knowledge of the concrete facts of the outer world; an art fresh with the dew and tenderness of youth, and yet showing, together with this virginal quality of young life, a simple forcefulness prophetic of the power of its ripening day. Within the outline of these general characteristics individuality found sufficient scope. Awe of the doom of the wicked and a sense of inexorable retribution inspired in minds of a certain stamp works full of a Dantean severity and force; to others militant Christianity and theological allegory furnished a grateful field. Local particularities of temperament were reflected in local artistic production; in the work of the Florentines we trace that grave sobriety which so strongly marked them in the early days of their republican freedom, and of which, later on, Pandolfino was to draw an interesting picture. Among the Siennese, on the other hand, the love of splendour and luxury peculiar to them translated itself in the gay profusion of gold ornaments which, in their pictures, bespangled and enriched the gorgeous raiment of their virgins, saints, and angels. The main external characteristics of this early phase of art, however, are, I repeat, a keen sense of the expressiveness of form, which translates itself in beauty and flow of line, ignorance of the facts of nature resulting in drawing empty as well as inaccurate, and, we must add, a com-

plete indifference to landscape, with which, in fact, it deals symbolically rather than by imitation. Soon, however, the agencies which were at work in the world of general culture made themselves felt also in art. You will remember that I pointed out to you a two-fold current in the intellectual evolution. On the one hand, a reaction against the fetters of monkish rule and the doctrine of the inherent depravity of humanity, together with a growing interest in man and in the phenomena of Nature; and, on the other, an ever-increasing interest in the achievements of the pre-Christian ages, and especially the age of the supremacy of Rome. Now these two agencies merged to a great extent one into the other in the general intellectual movement; but in Art, at least in the arts of painting and sculpture, for some lapse of time only one of them made itself felt,—to their great gain,—namely, the impulse to study man and the world he inhabits; the impulse, in fact, to study Nature. The humanists, in their almost superstitious reverence for the masterpieces of classic literature, were pursued by the temptation to repeat, like parrots, words which clothed ideas not their own, and expressions which responded to nothing in their minds. The artists were more fortunate; of ancient painting nothing, of ancient sculpture little only, was before them; and after the date of Nicolo Pisano that little seems for a considerable period to have exercised small influence on them. And so it happened that while men of letters were thrown into the pursuit of knowledge which they found clothed in a perfect artistic form at a time when their heads were, so to speak, hardly strong enough to carry the intoxicating draught, artists, unhampered by the crushing example of a past perfection, were flung straight on to the bosom of Nature,—where safety is. Other circumstances also helped to shape their course. One of the most distinctive features in the economy of the Italian Republics was the free and unchecked development of the individual. The age was one in which every individual was gauged exactly according to his intrinsic worth; every capable man got the full value of his capability; to every capable man all things were open. Accordingly, the study of the individual forced itself upon the artist, and the acuteness of observation, which was innate in the Tuscans, became manifest in a marvellous subtlety in the rendering of individual character. Such portraits as those of Mellini and Palmieri, the medals of Pisanello, and the frescos of Masaccio and Ghirlandajo will at once occur to you. Whether they use the pen, the pencil, or the chisel, the Florentines of the Renaissance are unsurpassed in their vivid portrayal of individual men. In its turn the scientific spirit took possession of the Arts. The once forbidden, now frequent, representation of the nude human form led to a desire for the knowledge of its marvellous mechanism and its secret structure. Anatomy, accordingly, was pursued with zeal. Perspective, too, was keenly studied: a science especially indispensable to men whose love of architecture as an adjunct to figures amounted almost to a passion, and was, no doubt, in great measure, the outcome of the haunting impression of architectural grandeur produced in them by the sight or by the accounts that reached them of the stupendous ruins of ancient Rome. And in the train of perspective the cognate mysteries of foreshortening claimed their votaries and exercised a fascination, of which, indeed, the results were sometimes not a little ludicrous. The prophet of foreshortening was Paolo Uccello. There is in Florence, among other works of his that might be described to much the same effect, a battle-piece, in which a strictly foreshortened warrior and his charger, foreshortened for the last time, for they lie stark and dead in the forefront of the canvas and the fight, a horse kicking the spectator, and a pile of lances disposed upon the ground, with unblushing intent to display the artist's science, have an altogether comic effect. By the side of this scientific fever the joy in re-discovered Nature manifested itself in a new delight in landscape. The summary indication of earth and vegetation which sufficed to the school of Giotto soon gave way to an almost unbridled exuberance of treatment. Who does not remember the riot of hill and dale, of tree and shrub, of vineyard and pleasure-grounds of birds and beasts, in which, on certain walls of the Campo Santo of Pisa, Gozzoli, for instance, celebrated the joyous spectacle of the world?

And when to this spirit of simple gladness is added the spirit of science of which I have spoken, we get such amazing studies of leaf and flower as Leonardo loved to draw. Thus to Tuscan artists the new movement brought the love of nature and the light of science. I have said that the revived classicism for some considerable period affected but little the outer form of their art. It did, however, at an early date largely modify the subject matter with which artists dealt. Mythology had laid a powerful hold on the humanists. The objects of Pagan and of Christian worship were mixed in a strange promiscuity within their minds. The attributes of heathen gods were given to the Almighty, of whom they loved to speak as Jupiter Altitonans, high-thundering Jove. But over the artists also the heathen fables cast their spell; gods and goddesses, satyrs and fauns, dryads and nereids invaded their fancies and once again impelled their hands; and Pagan myths took their place in the studio by the side of Christian verities, objects of equal homage. You foresee, however, that under Tuscan pencils these pagan themes will assume a thoroughly changed complexion; and it may be interesting to compare, in passing, one with another, by a special instance, the treatment of kindred subjects by a Florentine painter and a Florentine poet. Some portions of the famous picture of "Spring" by Botticelli, in the Gallery of the Belle Arti in Florence, recall certain stanzas in the "Giostra" of Poliziano so vividly as to suggest that the painter must have had them in his mind when he conceived the picture. Yet, see how wholly different they are in the order of emotion they evoke! How luminously joyous, how serenely sweet, and, in this sense, how classic is the sentiment exhaled from the music of Politian's lines! How full of twilight and of subdued strange sadness is this loveliest of Botticelli's works! The matter is classic, the spirit modern and Christian. The Renaissance has laid a stronger grip on the poet than on the painter. But, as is natural, the action of this complex movement on artistic development varied in its conflict with the Medieval spirit according to the human stuff on which it worked. Before the close of the fourteenth century the exclusively religious and didactic phase of art had spent itself. The days were past when the doctrines of the Faith, its comfort and its terrors, the science of government, and its precepts of morality, spoke to the masses, in urbane but lofty artistic language, from the walls of church and council chamber. Giotto had clothed in forms of art the spirit of St. Francis, and had gone to the grave. Simone Memmi, the champion of militant orthodoxy, but with the fire of St. Dominic, and the far greater painter Ambrogio Lorenzetti, whose solemn frescos in the Communal Palace of Siena are a great sermon on the virtues which build up a well-ordered State, both these had ceased to live; and now a period had begun in which worldly subjects and classic mythology were to invade Art; a period in which it lost for a time much of its ethical elevation, but during which the nourishing elements of knowledge were being eagerly absorbed and assimilated, which alone could equip it for its final and its highest triumphs. Yet even when the flood-tide to which Petrarca had opened the gates of Medieval civilisation was, as it seemed, sweeping everything before it, the old flame of religious fervour was not everywhere spent. Even in the middle of the fifteenth century the streets of Florence, have seen, in his silent cell, a pious monk, absorbed in his work, catching no echo of the outer din, gazing with rapt eyes on a world of love and ecstasy, the radiant creation of his own pure and reverent soul. And if the ecstatic spirit survived in Beato Angelico alone, perhaps, in this undimmed serenity, the graver spirit of religion, the Christian sadness, still touched and tinged the mind of a Signorelli, a Botticelli, a Perugino; cast a tender light over the first youth of Raffaello Sanzio, and at last found its fullest expression in the sublime creations and its saddest cry in the rugged sonnets of Michelangelo Buonarroti. But, perhaps, the various operation in the province of art of the two main motive forces of the Renaissance,—the impulse towards the scientific study of nature and the impulse to reinstate the classic spirit,—may be best illustrated by three typical artists whom I have already named,—Leonardo da Vinci, Raffaello, and

Michelangelo. Of the scientific impulse we see the fullest expansion in that miracle of many-sidedness,—Leonardo. A never-sated hunger for knowledge in every form, a desire ever burning to lift up the veil from every secret of Creation, possessed and marked him through life. The hidden structure of the bodies of men and of animals, the structure of plants, the ways of rushing waters and of wandering winds, and every riddle in the book of Nature, were objects of his ardent curiosity and unwearied study. How far beyond the horizon of his day his prescient spirit carried him along the fields of science in which art is not involved, others, better than I, can tell you. But we cannot, in this strange man, separate the scientific investigator from the artist. In his moody and fitful spirit, unrestingly straining forward in the quest of some intangible new perfection, it was the same haunting sense of mysteries unsolved that led him, now towards scientific prophecy, and now to the creation of a type of human beauty more subtle and complex than any the world had seen before. The influence of the revival of classicism, both in its spirit and as a form of aesthetic expression, is seen at its meridian in Raffaello. To him the knowledge of such masterpieces of ancient sculpture as were brought again to the light in his day came when his precocious gifts were already about to reach maturity; and their example found a fruitful soil in his singularly well-poised genius, filled as it was with a stately sense of beauty and chastened by a mind of rare refinement. Whatever was best in the classic spirit was absorbed and eagerly assimilated by him, and imparted to the work of his best day that rhythm, that gentle gravity, and that noble plenitude of form which are its stamp, and proclaim the brother of Mozart and of Sophocles. In these two artists, then, we see the affluence of the Renaissance in two distinct forms,—in its avidity of research with Leonardo, in its classic serenity with Raffaello. It remains for me to speak of one, the greatest, far, of all, on whom, as an artist, the old world had no direct hold or influence, though it coloured his intellect by blending into his Christian orthodoxy some tinge of that Platonic mysticism which, since Marsilio Ficino first taught it, had fascinated the choicest spirits of the age. I speak, of course, of Michelangelo. His contact with the Renaissance as an artist is traceable only in the scientific spirit and its interest in man; for to the artist Michelangelo, who saw in the human form a dim reflection of the Divine beauty, man was the all-absorbing and exclusive object of study. All else was indifferent to him; to him a plain mass of green or gray sufficiently signifies the earth. Only once, and because the subject,—the temptation of Eve,—demands it, does a melancholy-looking trunk, with a few leaves, intrude into his work to represent the green glory of the forest. Giotto himself is not more scornful of its charms. And this I wish you to note of Michelangelo as distinguishing him from Raffaello,—the type of human form which he lifted to the fullest expressional force is the last development of a purely indigenous conception of human beauty, whereas the type which we know as Raffaello's is a Classic ideal warmed with Christian feeling. Sublimely alone as Buonarroti's genius stands, towering and unapproached, like some unscathed, heavenward, mountain peak, it does but mark the highest summit reached, in the magnificent continuity of its evolution, by the purely native genius of Tuscan art. Reaping, with full hands, all the knowledge of his day, and conscious of its worth, Michelangelo flung that knowledge as fuel into the furnace of his Medieval ardour, and in him we see, at the height of the Renaissance, the supreme type of a Medieval artist, yet, be it remembered, a type which without the Renaissance could not have been. As firm in his faith, and of a soul as high, he was the spiritual son of Dante and his peer; a Tuscan, a Christian, and, in the language of his art, an immortal poet. In his grave the art of Tuscany was buried; no flower grew over it. When he died in 1564, one Florentine of genius was still alive,—wild Benvenuto, to whom a short span was yet allowed. For a few years longer a Venusti, a Bronzino, a Daniele da Volterra remained to show how dull a thing art may become when the soul has gone from it and rhetoric replaces feeling. For a few years yet good Giorgio Vasari, King of Chroniclers, strutted in garments which he believed to be his master's; and then final night closed over

Fig. 1.

Fig. 3.

Fig. 2.

the art of Florence. The light of Italian art passed from the valley of the Arno to Venice, the city on the sea."

**Home of Industry, Bethnal Green.**—The new Home of Industry, Bethnal Green-road, E., was opened on the 18th of November. A building has been purchased and fitted up at a cost of 8,000l., for the purpose of training boys for emigration, and for other philanthropic work carried on by Miss Macpherson. The architect was Mr. George Baines. The contractor was Mr. H. L. Holloway, of Deptford.

#### SOME OLD ENGLISH CHAIRS.

Of the three chairs illustrated, fig. 1 represents an old oak chair in St. Mary's Church, Guildford. The back is covered with elaborate ornament, carved, incised, and applied in rounds. The church contains some carefully-preserved examples of old fresco decoration.

Fig. 2 represents an old oak arm-chair in East Horsley Church, Surrey. It is of the Jacobean period, and the curious flowing ornament on the back panel and at the head is given in detail.

The church also possesses some other interesting examples of woodwork of this period.

Fig. 3 is a sketch of an old chair in Little Bookham Church, Surrey. The church contains some interesting examples of Norman work, and also some good specimens of oak panelling, with incised ornament.

#### THE NEW METROPOLITAN SEWAGE WORKS AT BARKING OUTFALL.

As we have from time to time informed our readers, the Metropolitan Board of Works is now engaged in the construction of extensive works at Barking Outfall, with a view to the deodorisation, to some extent, of the sewage of the northern half of the metropolis. That some such palliative or curative measures are urgently called for, the foul state of the Thames in the neighbourhood of Woolwich during recent summers has amply demonstrated; whether the chemical treatment resolved upon by the Board will be effectual we have strong doubts, and have already given expression to them. As the works now in progress at Barking are to be completed next year, and as they will, we fear, comparatively useless unless the chemical process adopted be at once economical and effective, we cannot but think that the subject is one deserving the widest and fullest discussion. Yet what do we find? The Board is to be asked, at its meeting to be held a few hours after these lines are published, to assent to the following motion:—

"That it be an instruction to the Works and General Purposes Committee to print, for circulation amongst the members of the Board only, the report presented to them by Sir Henry Roscoe, M.P., F.R.S., upon the deodorisation of the sewage at the outfalls, and the state of the Thames."

Why should this important report, by an eminent scientist, be circulated "amongst the members of the Board only"?

It is not our purpose here, however, to discuss the chemical aspect of the question, but rather to chronicle the progress of the very elaborate works now in course of construction at Barking, which we had an opportunity of visiting two or three weeks ago. They have been designed by the Board's Engineer, Sir Joseph Bazalgette, and the contract was let to Messrs. John Mowlem & Co. some nine months ago. The amount of the contract is 406,000l., and probably we shall be within the mark if we say that the cost of the works when completed will be 500,000l. Half a million of money is a large sum to spend upon what many competent

chemists and engineers regard as a mere experiment. If the experiment turn out successful, so much the better for the long-suffering ratepayers. If it fail, they will be in for further heavy expenditure to carry the sewage down to Canvey Island or elsewhere.

The works included in the contract consist of precipitation reservoir or tanks; sludge-settling channels; pier and jetty for discharging the sludge into ships and for general purposes; engine and boiler-houses for lifting the sludge and the effluent water; iron water station; settling pond for river water; superintendent's house and twelve workmen's cottages; liming station; and tramways and pipes for various purposes.

The sewage will be conveyed from the northern outfall sewer into precipitating tanks placed on the north side of the existing reservoir. There will be thirteen of such tanks, and the sewage will be admitted into each of them in succession and allowed to remain in a quiescent state to admit of the deposition of the sludge. When the solid matters in the precipitating channels are deposited, the effluent water will be run off into the river direct if the state of the tide is favourable; but otherwise into the existing reservoirs, to be stored there until the tide has fallen sufficiently to admit of its discharge. The sludge will be run off into sludge-settling tanks to be placed on the west side of the sewer, near the river, where it will be allowed to settle again, so as to allow of the removal of muck of the liquid. This liquid will be drawn off and will be used for mixing the lime water, which will be admitted into the northern outfall sewer nearly half a mile above the precipitating tanks, where there will be stores for the lime and chambers for mixing it. The settled sludge will be run into stores under the tanks, and will be lifted and passed through pipes to a pier to be constructed in the river for the purpose of being loaded into ships and carried to sea.

There is a supplementary store for sludge in case of the sludge ships being delayed by stress of weather, and there are stores for the iron, and sheds for its manipulation and introduction into the sewage.

There will be engine-houses with engines for lifting the sludge and effluent waters, and for lifting the water containing the iron and lime; coal stores; a settling pond for purifying the river water for use in the various operations, and residences for the superintendent and some of the workmen. Tramways will be laid for conveying coals from the river to their various destinations in the works.

The works now in progress consist of excavations, concreting, and brickwork for the precipitation reservoir, liming station, and sludge-settling channels; foundations for engine-house and boiler-houses, and a jetty for loading steamers. Two chimney-shafts, service-tank for river water, twelve workmen's cottages, and a dwelling for the superintendent have been completed.

The old channel at Gallon's Sluice has been diverted into a new channel, which has been recently formed. Embankments have been formed from spoil for the purpose of receiving tramways in connexion with the various works. The principal works at present carried out consist of excavations, concrete, and brickwork foundations for the structural works.

The works have now been in hand, as already mentioned, about nine months, the first two months of which the contractors were engaged in building temporary jetties in the river Thames and Barking Creek, sinking a pump and getting plant on to works. In the remaining seven months they have excavated upwards of 220,000 cubic yards of ground, principally in long trenches for the walls of the sludge-settling channels, and in holes 6 ft. square for the brick piers to carry the arching over; they have used more than 135,000 cubic yards of concrete, and built 2,600 rods of brickwork, the works so far executed being of the estimated value of 170,000. The works cover an area of about eleven acres.

The number of men employed on the works at the present time amounts to about 2,200, and the quantity of permanent material unloaded amounts to 1,600 tons per day, and there are over forty boilers under steam.

The whole of the works are under the personal superintendence of Mr. G. Marshall, Assistant-Engineer to the Metropolitan Board of Works; and of Mr. J. Jackson, General Manager, and

Mr. W. Eowell, Engineer, to the contractors. There is, it goes without saying, some admirable plant on the works, some quick-travelling steam cranes being especially effective and easy of manipulation.

#### GLASGOW INTERNATIONAL EXHIBITION.

The contractors have now been at work for fully six months, and the building, including its 475,000 square feet of roofing, is already almost completed in the rough. The great central dome, with its four flanking towers, is almost the only portion still awaiting much of finishing work on the outside, and even here the ribbing and piecing operations are far advanced, promising a full crowning of the edifice within the space of a few weeks. The architectural effect of the design,—a strictly Oriental one in its more prominent features,—is not unpleasing; but the position or site which has been assigned to the erection is far from setting off its good points to the best advantage. On two sides,—east and south,—the houses of the city impinge quite closely on the building, the only separation being the breadth of a not very wide streetway. These houses are of the "flat" order common in the large towns of Scotland, compact, and of considerable height; and a glance at once shows that this unfortunately close overlooking of a large and wide-spreading, but relatively not at all lofty structure, has the effect of crowding and dwarfing the latter to a somewhat damaging extent, while at the same time diverting attention from the graceful lines which the elevation undoubtedly possesses. The situation of last year's Edinburgh Exhibition was much happier; in grounds exclusively its own, and sufficiently remote from the nearest city buildings to escape all injury likely to arise from the harshness of an abrupt contrast. As regards the Glasgow exhibition, extraordinary effort is being put forth to reinforce the main building with extraneous attractions, and to a large extent the open or park side to the north, with the river Kelvin crossing Clydeswards on an easy curve, lends itself very freely to this end. The Kelvin is being deepened to a uniform depth of 6 ft., and next year, over the two or three furlongs of its course in the immediate vicinity of the Exhibition building, fancy craft of all kinds, including steam and electric launches, working ship models and torpedo boats, will be found moving briskly to and fro. A chronic foulness has long afflicted this once crystal tributary of the Clyde; but the evil will at least be mitigated if not removed by the cleansing expedients now being energetically taken in hand, these consisting of an extension of the left bank sewage culvert right down to the Clyde, and certain up-stream restrictions governing the inflow of refuse matter. Other extraneous attractions are comprised in a timber and plaster reproduction of Glasgow's ancient episcopal palace, to be utilised in housing the Antiquarian Section of the Exhibition, an electric fountain of 120 ft. base diameter, a switchback railway, a terra-cotta fountain, 85 ft. high, presented by Doulton & Co., Lambeth, &c. The rather unhappy financial results lately attending one or two similar Exhibitions elsewhere have been exercising the minds of the guarantors not too pleasantly; but, in any case, the event of next year, regarded simply as a display, is almost certain to rank as a high success. Considering the plethora of grand exhibitions which the present and recent years have produced, Glasgow's effort may have been dated just a little too late for a signal financial triumph; but having put its hand to the plough, it is not likely that the City will grudge either pains or outlay to secure a creditable issue. The works contract now in course of fulfilment involves expenditure to the amount of about 60,000.

#### ARCHITECTURAL SOCIETIES.

*Birmingham Architectural Association.*—The third ordinary meeting of the current session was held at Queen's College on Tuesday evening last. Mr. W. Doubleday (vice-President) took the chair. A paper was read by Mr. Whitworth Wallis, F.R.G.S., on the "Temples, Forum, Theatres, and Tombs of Pompeii." The lantern views illustrating the lecture were of the most interesting description. Temples, theatres, tombs, frescoes, statuary, &c., succeeded each other in an almost bewildering

variety. The City of the Dead became, indeed, for the time a city full of life and vivacity. The drapery of the statues which have lately been unearthed rival those of the best Greek period. A vote of thanks, proposed by Mr. W. Doubleday and supported by Messrs. Newton and Victor Scruton (hon. sec.), was unanimously accorded to Mr. Wallis for his very interesting lecture, and after a response from that gentleman the meeting terminated.

*Manchester Architectural Association.*—The last ordinary meeting was held at the Diocesan Buildings on the 13th instant, Mr. A. H. Davies-Colley (President) in the chair. The Rev. R. H. Snape read a paper on "Scotch Cathedrals." He prefaced his remarks by saying that as he had spent several of his earlier years as an architect and had visited the whole of the English as well as the Scotch Cathedrals, he claimed some right to speak on this subject. Our views of cathedrals must be very much modified when we come to Scotland, as they are more correctly speaking simply kirks, numbering in all about fourteen. Transepts, cloister courts, and crypts are non-existent except in a very few cases; towers and spires are also few and very irregularly placed. The round arch is to be found in nearly every style, but the Perpendicular has hardly an example. The crypt of the Glasgow Cathedral is the finest in England or Scotland. The abbeys more than rival the cathedrals. A discussion followed in which Messrs. J. T. Hodgson, H. M. Mee, T. Chadwick, Ward, and the chairman took part.

*Edinburgh Architectural Association.*—The usual fortnightly meeting of the Association was held on the 8th inst., in the Architectural Hall, 42, George-street; the President, Mr. Hippolyte J. Blanc, occupied the chair. After the usual preliminary business and admission of new members, Mr. John Wallace read a paper on "Italian Monuments." After an introduction explanatory of the scope and object of the paper, in which precedence was given to the Early Renaissance tombs of the fifteenth century, not only as being of singular interest from their intrinsic excellence and suitability for their purpose, but as throwing valuable light on the rise of Renaissance art and the influence this department of design had on architecture proper, the Gothic tombs of the thirteenth and fourteenth centuries were referred to in detail. The tombs of the Scaligeri at Verona were described and instanced as being, *facile princeps*, of supreme importance, because giving dated examples of the best Gothic work during the whole time of its prevalence in Verona. The earliest examples of Renaissance tombs,—those of the quattrocento period,—were next spoken of, Tuscany being the home of their birth and most perfect development. The Florentine school of sculpture being at its strongest at that time, and the best masters of the craft devoting their best energies to this class of work, it was not to be wondered at that for combined architectural and sculptural effect these tombs stood unrivalled. The love of pomp and ostentation was shown to have gradually produced decadence and prevented the healthy development that might otherwise have been expected from the early promise of Renaissance art,—combined, however, with increased robustness of character,—to be commended had the standard of refinement and excellence in sculpture been preserved. The decay of taste during the cinquecento period, with its grandiose effects, were traced to the same insidious influence, only partially assisted by the genius of Michelangelo, whose well-known tombs of the Medici family in the church of St. Lorenzo at Florence were claimed to rank with the best works of this master. The vagaries of the Baroque School were then referred to, and instances given of the debasement of art by this licentious school, till, by the middle of the seventeenth century, the last degradation was reached. Reference was then made to the modern Italian tombs, as exemplified in the Campo-santo at Genoa, regret being expressed that effort should be so misdirected; ignoble realism in the dexterous representation of lace and ribbons, and the trivial accessories of modern dress being aimed at, to the exclusion of the higher qualities of sculptural design. The value of a study of these ancient monuments was expressed with a view to improvement in this department of design in modern work. The paper was illustrated by a collection of photographs. At the close a hearty vote of thanks was awarded to the lecturer.

THE GALERIE DES MACHINES

#### THE "GALERIE DES MACHINES" FOR THE 1889 EXHIBITION.

We give a view of this immense iron structure, but a small part, however, of the vast show with which Paris is preparing to astonish the world in 1889. The "Galerie" is being erected at the south side of the Champ de Mars, parallel with the Avenue Lamotte Piquet.

The architect for the work is M. Dutert, assisted in the iron details by M. Constantin, engineer-in-chief for the metallic construction of the Exhibition.

The gallery is 420 metres in length, and 43 metres in height, and 115 metres wide; in other words, a span of nearly 380 ft.

It is intended that the structure should be completed during the course of next year; the total cost will be about three millions of francs.

#### Illustrations.

##### CATHEDRAL, CHALONS-SUR-MARNE.

**W**E gave recently Mr. Mitchell's fine drawing of the interior of this cathedral; we have now the pleasure of giving two more drawings by him, one showing the exterior of the cathedral (some description of which will be found on page 770, *ante*) and the carved capital of one of the nave piers, a fine and interesting example of Early Gothic work, with reminiscences of Greek detail in parts.

##### CHURCH OF ST. AUGUSTINE, HEDON.

THE borough of Hedon, though now only small and insignificant, was formerly of some considerable importance, and dates far back into history, having had a charter granted to it by King John. We are told that when Hull was but a fishing village, Hedon was a thriving seaport, enjoying the benefit of an extensive maritime commerce. Possessing at one time three churches, it is now reduced to one, which we must confess constitutes the only

object of interest in the town. However, its dignified appearance, purity of detail, and convenient size, eminently fit it to be a worthy model, which may be studied with profit again and again. It is yearly becoming better known to architectural students, a number of whom, of late years, have taken full advantage of easy access to such a fine example of Medieval art, and no doubt will soon be known as "a measured building."

As will be seen from the perspective view, it is cruciform on plan, and exemplifications of every style of Gothic may here be found, from Transitional to Late Perpendicular. The earliest part of the fabric is the south transept, the door of which is round-arched, with fine bold mouldings. This transept was almost entirely rebuilt some years ago, by the late Mr. G. E. Street. A fine rose-window from his design fills the gable. The chancel and north transept follow in point of time, appearing of about the same date, and being of pure Early English. The front of the north transept presents as fine a study as can be found in a moderately-sized church. It is shown in a geometrical drawing given on another plate, along with sections of the mouldings. The nave is of five bays, the four adjoining the tower of the Geometrical period; the remaining bay and the west front of the ensuing period of the Later Decorated style. The tower is about 130 ft. high.

The nave, north transept, and chancel were restored about ten or twelve years ago by a since-deceased local architect. Before this, the whole of the roofs were of flat pitch, and covered with lead, the gables having been taken down to the eaves level, and the west window was filled with tracery of a most atrocious design. The chancel still retains a good Perpendicular window.

Nothing remains of the Lady-chapel except a part of the east wall, which has been incorporated in a vestry of the Late Gothic period.

##### CANDELABRA FROM ITALIAN MUSEUMS.

THESE two examples of Italian candelabra are from drawings by Mr. R. A. Briggs. That

marked A is a fine work in bronze, standing about 6 ft. high, and is in the Bargello at Florence. It bears on the base the device of the Medici, a shield studded with little round knobs, which are supposed to represent pills.

The one marked B is executed in marble, and is in the Museo Nazionale at Naples.

##### THE NEW LIBRARY FOR LAMBETH.

WE give an illustration of the new library building which is being erected in the South Lambeth-road, S.W., for the Lambeth Libraries Commissioners. The entire cost of the building and site is being defrayed by Mr. Henry Tate.

The materials used in the construction will be red bricks, with Portland stone for dressings, green slates for roofs, and copper domes to turrets. The interior facings of reading-rooms, &c., will be of stock brick, relieved with red bands and arches, the roofs being open timbered, and with skylights over. The floors of the public lobby, &c., will be of wood blocks, and the corridors tile-paved. The front part of the building shown on our illustration is a house for the librarian. The general dimensions of the various rooms are:—Newspaper and periodical room, 48 ft. by 27 ft.; reference-room, 27 ft. by 28 ft.; lending libraries and book-store, 48 ft. by 23 ft.; women's reading-room, 13 ft. by 13 ft.; private room, 13 ft. by 12 ft.; public lobby, 20 ft. by 20 ft. In the basement is a heating-chamber and book-room, &c. The architect is Mr. Sidney R. J. Smith, and the builder Mr. Nightingale.

##### HOREHAM HURST, SUSSEX.

THIS country residence, recently erected in Sussex, is situated on an elevated site in park-like grounds at the extreme corner of Hellingly Parish, adjoining the Horeham Manor Estate.

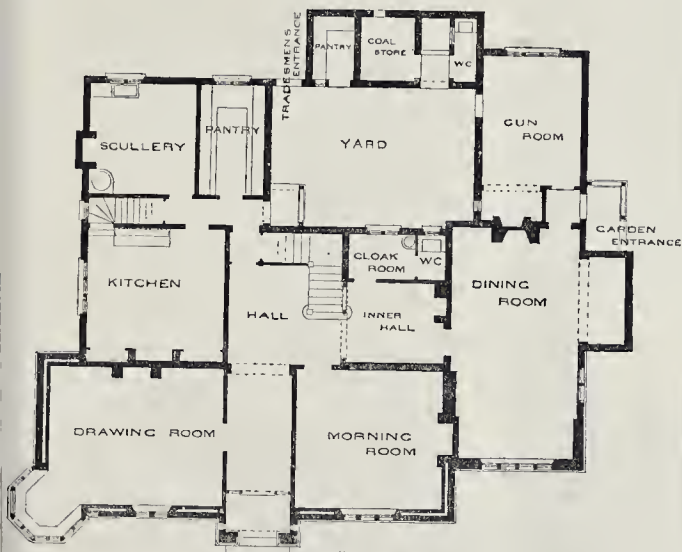

It commands in all directions lovely views of the county scenery and also a view of the sea beyond Eastbourne.

In designing the elevations the main object in view was to produce a comfortable home in character with the old Sussex style, and this has

THE PARIS EXHIBITION OF 1889.

Plan of House, Horeham Hurst, Sussex.

been obtained by facing the building externally to the first-floor level with dark red bricks and Bath stone dressings, the floor above that being constructed with massive horizontal and vertical timbers placed about 2 ft. apart showing externally and filled in between the double lath and plastering, with 3 in. cavity, and finished

outside with solid cement and rough-cast shingle of a warm yellowish tint, the roof being covered with dark brown tiles and bright red ridge tiles. The house is approached from the entrance lodge (which is of similar design) by a winding avenue of oaks. Owing to the utilisation of existing buildings on the site the relative position of

the kitchen and dining-room was unavoidable.

The work has been carried out by Mr. Daniel Ashdown, builder, of Horeham-road, Sussex, under the superintendence of the architect, Mr. H. Percy Monckton.

#### ELECTION OF CITY ARCHITECT.

The election of a City Architect and Surveyor to the Corporation of London, in the room of the late Sir Horace Jones, took place on Thursday afternoon last, at a meeting of the Court of Common Council. The following were the candidates:—Mr. H. D. Appleton (age 34); Mr. Charles Barry (63); Mr. Francis Chambers (58); Mr. Goymour Cutburt (38); Mr. W. H. Crossland (52); Mr. T. Milbourn (52); Mr. C. N. McIntyre-North (50); Mr. Alexander Peebles (47); Mr. J. H. Smith (34); Mr. B. Tabherer (56); and Mr. J. Tanner (53).

A proposal was made that the voting should be by ballot, and this was eventually agreed to, and it having been announced that Messrs. Chambers and Smith had withdrawn, the voting was proceeded with, with the following results, viz.:

Appleton, 2 votes; Barry, 45; Cutburt, 6; Crossland, 31; Milbourn, 4; McIntyre-North, 3; Peebles, 85; Tabherer, 4; Tanner, 0.

As none of the candidates had a clear majority of votes cast, the three standing highest in the list were again voted for, when there were for Mr. Barry, 43; Mr. Crossland, 20; and Mr. Peebles, 107.

Mr. Peebles was accordingly declared elected.

**Lectern, Tunstead Church.**—A carved oak eagle lectern, a replica of one supplied to the English Church at Nenilly, near Paris, has recently been executed for Tunstead parish church, by Messrs. Jones & Willis.

**Proposed New Theatre for Edinburgh.**—We learn from the *Scotsman* that in the Edinburgh Dean of Guild Court plans have been lodged for the erection of a theatre on ground immediately to the south of West Nicolson-street, Edinburgh.

## THE APPRENTICES' EXHIBITION.

The Apprentices' Exhibition, opened at the People's Palace, Mile End, on Saturday last, by H.R.H. the Prince of Wales, is, on the whole, a creditable display of work, and though it contains nothing particularly noteworthy, it may be visited with advantage by those for whose special behoof it has been opened, viz., young workmen, and apprentices, and lads about entering upon apprenticeship. There is much in the exhibition to interest the general public, of course, and the exhibits of the students of the Polytechnic and similar institutions serve to show that, while there is, and has been, much talk of late years about technical education, some little amount of practical work is being done; but, to our thinking, one defect of the exhibition is that the consecutive processes of the various trades represented are not in all cases so fully shown as they might be. The exhibits fill two long and well-lighted galleries, parallel to each other. In the one to the left hand of the entrance some of the building trades are tolerably well represented, and there are a few exhibits pertaining to the same trades in the other gallery.

The students of the School of Art Wood-Carving show a number of specimens, most of them exhibiting much merit, considering the age of the pupils, and giving promise of greater achievements in a year or two.

A few of the Cabinet-making students of the Polytechnic Young Men's Christian Institute exhibit a number of articles of furniture which are, as a rule, well designed (we do not understand that in any case the designs are by the makers of the articles), and constructively far superior to much of the "shoddy" work which is to be seen on sale in the Tottenham Court-road and elsewhere. A dressing-table by John Slade, a cabinet by Albert Atkinson, and tables by O. R. Burke and W. T. Wilkinson (all apprentices), may be named as examples.

Some of the students of the Plumbing Classes of the same excellent Institution show a very fair collection of specimens of craftsmanship, under the appropriate motto "Nothing like Lead." John James Green, Thomas C. Fenn, and H. E. Belton are exhibitors of some good examples of pipe-bending and wiped joints, and there are also several examples of bossed leadwork, the most successful and practical of which is a lead finial by Thomas Miller Ross, an apprentice of six years' standing. The portrait-husts executed in the same manner also exhibit much skill, but lead is a material which does not lend itself to agreeable effects when used for portrait husts. There was little or nothing in this collection, by the way, which was illustrative of the principles upon which plumbing work should be done, which is the more to be regretted, inasmuch as skilled workmanship in execution will not only not atone for work planned on wrong principles, but may, in conceivable cases, intensify the evils and dangers resulting therefrom.

Several students of the same Institution exhibit good specimens of modelling in plaster, but there is nothing noteworthy about them; like the specimens of metal-chasing and repoussé work adjoining, also by students of the Polytechnic, they are fairly good, and that is all. Mr. E. King, a die-sinker, who has been three years at his trade, receives a special award for a panel bearing an expressively-modelled lion in relief. Another student of the same Institution, John Smart, a stone-mason, aged 23, exhibits a well-executed though somewhat heavily designed window; and adjoining, Horatio Canwick, aged 22, and Alfred Horne (age not stated) exhibit specimens of fine-jointed brickwork, such as is the vogue in "Queen Anne" work.

Among the best specimens of wrought-iron work shown by the students of the Institution several are marked "not for competition" (why, we are not told); but not coming under this restriction is a lantern by Albert Higgins, age 13, which exhibits some very delicately-executed work.

Some other students of the same school exhibit panels of carved wood, many of them very good in execution. J. Davis, aged 20, a joiner, exhibits his skill in staircase work.

Passing now to exhibits not by students of the Polytechnic School, we may mention as meritorious the staircase models shown by A. J. Down (aged 20), E. C. Davis (age not stated), and J. Irving. Passing by some more specimens

of plumbing work of no special interest, we come to a screen containing drawings executed by the students of the People's Palace Art School, and to another screen containing mechanical working drawings executed by students of the Polytechnic Day-school; some of the last-named drawings are models of what mechanical working drawings should be, with dimensions, &c., clearly figured. Next is a screen containing a number of well-executed drawings giving details of building construction by Robert Sinclair, in which we noticed some points that appeared open to criticism; for instance, in the drawing showing a queen-post roof-truss, the projection of cornice shown in a large-scale section of the outer wall seems to be greater than would be safe in execution.

Messrs. Perry & Co., of Tredegar Works, Bow, the well-known builders, exhibit a carpenter's shop, occupied by E. P. Trent and P. N. Smith, two of their apprentices. Here the various processes of mortising, tenoning, scarfing, sawing, &c., performed by hand, as in pre-machinery days, are exhibited in the execution of actual work. The apprentices here, as at several of the other stands, are habited in Mediaeval costumes similar to those which were to be seen at the shops in "Old London" at the recent South Kensington exhibitions.

J. J. Thompson, aged 18, a pattern-maker, who has been four years at his trade, exhibits a well-made model of an iron roof suitable for a railway station; but this should not be exhibited with the carpentry exhibits, as it was when we saw it.

Bookbinding, printing, coopers' work, silversmiths' work, meteorological glass-blowers, surgical instrument makers, watch and clock makers, opticians, drawing instrument makers, organ-builders, lead glaziers, electric-lighting apparatus makers, tinsmiths, brass-finishers, powderers, japanning, wire-working, fret-cutting, and potting (some of Messrs. Doulton's apprentices sending some vases of good outline), shoe-making, basket-making, carving, upholstery, and weaving are among the other trades exhibited.

Exclusively women's industries do not seem to be so largely represented as we had expected in an exhibition held in the East End of London; but of needlework and articles of clothing, executed by young girls apprenticed to milliners and dressmakers, there is a small but representative show.

Some of the pupils of the Jews' Hospital and Orphan Asylum, West Norwood, are exhibitors of simple articles of joinery made as the result of technical instruction received in the workshop of the Institution for four hours weekly. The exhibits are by boys of thirteen or fourteen years of age, who have only received technical instruction for the few hours named during periods of from four to twelve months. Though the articles exhibited are of a very ordinary kind, they certainly give good evidence of what can be accomplished with tools by boys in school workshops; and the knowledge of the use of tools is likely to be of no slight value to the boys when they leave school, whatever trade or calling they may choose to follow.

The Exhibition is to remain open until the 31st inst.

## THE INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting on Tuesday, the 6th of December, the paper read was on "Electrical Tramways: the Bessbrook and Newry Tramway," by Edward Hopkinson, M.A., D.Sc., Assoc. M. Inst. C.E.

Although a number of electrical tramways had been constructed in the United Kingdom during the last few years, there had hitherto been no attempt at the regular haulage of minerals and goods, nor at the operation of cars larger than the ordinary tramway type. Probably in no case had the effective power of any single motor exceeded about 4-horse-power. The principal object of the present paper was to describe the construction and to discuss the working of the Bessbrook and Newry Electrical Tramway, which had been designed for the haulage of heavy goods as well as for passenger traffic. The length of the line was rather more than three miles, with an average gradient of 1 in 80, the maximum gradient being 1 in 50. According to the conditions of the contract, ten trains were to be run in each direction per day providing for a daily traffic of 100 tons of

minerals and goods, and capable of dealing with 200 tons in any single day, in addition to the passenger traffic. The electrical locomotive was to be capable of drawing a gross load of 18 tons on the up-journey, in addition to the tare of the car itself and its full complement of passengers, at an average speed of six miles per hour, and a load of twelve tons at an average speed of nine miles an hour. Also, the cost of working, as ascertained by six months' trial, was not to exceed the cost of steam-traction on a similar line. The line was formally taken over by the company, as having fulfilled the conditions of the contract, in April, 1886, and had since been in regular daily operation. It was worked entirely by water-power, the generating station being adjacent to the line at a distance of about one mile from the Bessbrook Terminus. There were two generating dynamos of the Edison-Hopkinson type, driven by belting from the turbine-shaft, which was extended into the dynamo-shed for the purpose. The turbine could develop 62 horse-power, and each dynamo was intended for a normal output of 250 volts, 72 amperes, though they were capable of giving a much larger output. The current was conveyed to the locomotive-cars by a conductor of steel, rolled in the channel form, laid midway between the rails, and carried on wooden insulators nailed to alternate sleepers. The conductor was not secured, but was simply laid upon the insulators which fitted into the channel, and while allowing for longitudinal motion to compensate for changes of temperature, held it laterally. At one point the line crossed the county road obliquely, the crossing being 150 ft. in length. In this case the conductor on the ground level was not feasible, and an overhead conductor on Dr. John Hopkinson's system was substituted, by which the collector on the car consisted of a bar only, which passed under the supports of the overhead wire, and made a rubbing contact with its under surface. This system had been found to give very satisfactory results in practice.

The locomotive equipment of the line consisted of two passenger-cars, each provided with a motor. The body of the car was carried on two four-wheel bogies, the motor being fixed on the front bogie, so as to be entirely independent of the body of the car. The longer of the two locomotive-cars was 33 ft. in length, and was divided into three compartments, the front one covering the motor, and the two others forming first and second class compartments, together accommodating thirty-four passengers. The front bogie carrying the motor had an extended platform projecting beyond the body of the car, and communicating by a slide door with the dynamo compartment, thus giving the driver direct access to all parts of the driving machinery, which were at the same time entirely boxed off from the passenger compartments. The weight of the locomotive, including the dynamo, was 8½ tons.

Apart from the electrical working of the line, an important and novel feature was the plan by which the wagons used on the line could also be used on the ordinary public roads, so avoiding the necessity of trans-shipment, and enabling goods to be loaded at the wharfs and drawn to the line by horse-power and again delivered where required. The plan was originally suggested by Mr. Alfred Holt, M.Inst.C.E., of Liverpool, and was embodied in the Lancashire Plateways Scheme, for which a Bill was lodged in the autumn of 1882 and subsequently withdrawn. The idea had been worked out in a practical form with great success by Mr. Henry Barcroft, of Newry, one of the directors of the Tramway Company. The wheels of the wagons were constructed without flanges, with tires 2½ in. wide, which was sufficient for use on ordinary roads. Outside the tramway rails, which weighed 41.25 lb. per yard, second rails were laid, weighing 23.75 lb. per yard, with the head 3 in. below the head of the larger rails. The flangeless wheels ran upon these lower rails, the ordinary rails forming the inside guard. The front part of the wagon was supported on a fore-carriage, which could either be pinned or allowed freedom of motion as in an ordinary road vehicle. There was a single central coupling arranged to engage in a jaw on the fore-carriage, so as to guide it when not pinned. Shafts were attached to the fore-carriage when the wagon was to be used on the ordinary roads. The wagons were of sufficient strength to carry a load of 2 tons, and their weight without the shafts was 23½ cwt. Experience had

HOREHAMHURST, SUSSEX.—MR. H. P. MONCKTON, A.R.I.B.A., ARCHITECT.

CANDELABRA FROM ITALIAN MUSEUMS.—FROM SKETCHES BY MR. R. A. BRIGGS.

struction of machinery generally would be much advanced by its careful adoption. Though technical education has made such strides in the last few years, there is still much to be done. We have several first-rate engineering laboratories, but they are not open to the profession; the Institution of Mechanical Engineers have made inquiries into the strength of materials, of riveted joints, and other questions of interest; but, speaking generally, the carrying out of experiments is confined to manufacturers, contractors, and others, who have large means at their disposal. As a rule, the makers of experiments are quite willing to publish them; but, in my opinion, it should be possible for all men to experiment at a merely nominal expense in establishments provided at the public cost and under the guardianship of the scientific institutions of the country. The making of experiments is not a simple mechanical matter, to be done by any one; not only is the greatest care required in correcting and tabulating results, but a direction is also necessary. A man may have every facility to hand and give his life to the work, and yet produce little or nothing worth recording; while another man who has not these facilities might, if he had them, afford very valuable information to the world. Experiments, if made at the public expense, would, of course, be public property. Exhaustive information is required in ventilation, which is little understood, on the behavior of materials as affected by fatigue, on the flow of fluids, and many other subjects. All these questions are, no doubt, being investigated by individuals; but such investigation by single persons is very apt to be directed only to support some already preconceived idea, and experiments carried on by several experimentalists in a public laboratory would, in my opinion, afford a more satisfactory and reliable result in a shorter space of time.

A meeting was held a short time back at the rooms of the Society of Arts to discuss the advisability of the promotion of technical education, when amongst the speakers were Lord Hartington, Lord Rosebery, Sir Lyon Playfair, Mr. John Morley, Sir Bernhard Samuelson, Sir John Lubbock, Mr. Acland, Professor Stewart, and others, and the conclusion arrived at by all the speakers was, that if we are, not only to retain, but to extend, our hold on the commerce of the world, greater facilities must be given for technical education. It was stated at the meeting, and my own information on the subject fully bears out what was said, that although English workmen are, as a rule, fully as well educated for their several occupations as their fellows on the Continent, yet technical education there is progressing relatively more rapidly than it is here, and that wherever its standard is highest, there also is the rate of wages increased; and therefore if we wish to maintain and improve our commercial position, so also must we improve our own technical knowledge and that of our workmen, both for their sakes and our own. As regards commercial technical knowledge, the opinion expressed is not so favourable to this country as that already recorded; it is said that our manufacturers are not as ready to adapt themselves to the requirements of different countries as are those on the Continent; that they do not provide full information as to their manufacturers in the language of the country where they wish to make sales; that their agents are frequently ignorant of the language of the country and the business habits of the natives; that they do not exert themselves to the same extent or live such steady lives as the agents of German houses, for instance. One consequence of this is that English houses have employed German agents abroad, who have worked well for their employers for a time, but who have, when they got firm hold of the business, transferred their services to their own countrymen resident in their own country. This remark is worthy of notice; for I understand that German firms doing business in England are subject to exactly the same treatment as their English rivals, and that they now find that they, as well as the English firms, cannot safely employ Germans as their agents; if they do, they are liable to find their business transferred to the Fatherland. With regard to the technical education of workmen, it is right and necessary that even greater facilities should be afforded for their information; but the best results will not be obtained until the trades unions recognise the fact that to bring men to one uniform level of wage, whether that level be high or

low, is not the way to benefit their constituents nor the country; nor does it conduce to obtaining or retaining good workmen. If there be a uniform rate of wages in any branch of any business, the tendency must be to produce stagnation; no man has any inducement to excel in his work; and if his personal character be such that he feels he must excel, whether he be paid for it or not, he naturally looks out for some other country where his abilities may have free scope, and we thus lose our best men and only keep those who are mediocre. If a man might look to rise to be foreman or manager through the excellence of his labour, this might be sufficient inducement to cause him to do his best; but a good handicraftsman is not necessarily, or even frequently, a good foreman or manager.

When the trades unions, or the men who compose these trades unions, are alive to the fact that to insist on one uniform level rate of wage is to destroy and enervate the energies of the men, to make the prime cost of manufacture higher, and therefore the rate which manufacturers can afford to pay for wages, lower,—that the only stimulus which it affords is to the manufacturer, to cause him to produce or obtain machinery which will do the work as well as the men will, and which can be managed by labourers at a further reduction in the wages rate—when they see that it is to their interest, and is, in fact, necessary to their existence, that better work should be done at the same or a lower price, though possibly at a higher wages rate, in order to increase the output by improving our markets,—then we shall not only pick up any leeway we may have lost, but shall more than retain our commercial position amongst the nations, but not sooner.

The same remarks apply to a uniform number of hours worked: this practice must also produce stagnation, for the strong man gains nothing by his strength, just as with a uniform rate of wages the clever man gets nothing for the use of his brains, or the industrious man for his industry. Working fewer fixed hours must also reduce the wages rate, for no manufacturer can afford to pay the same wages when his machinery runs only for eight hours as he can when he can run it for ten hours or longer. Mechanics in America no doubt receive higher wages than are given in this country, but they work far longer hours for this wage than our workmen do, and in most places the cost of living is far greater than it is here.

#### ENGLISH BRICKMAKING PLANT IN GERMANY.

THE HENNIGSDORF BRICK AND TILE WORKS, NEAR BERLIN.

The following is a translation from the *German Brick and Tile Gazette* of November 11th:—In the 25th number of our Journal for the year 1884 we gave a description and prospective sketch of the Hennigsdorf steam brickfield. For the benefit of those of our readers who have not seen that number, we give a short *resumé* of the article referred to. The Hennigsdorf brickfield lies about ten miles north-west of Berlin, on the right or western bank of the navigable river Harvel. The raw material which is used in these works is a hard marly clay, and cannot be used without being washed. The yearly make of the brickfield is at the present time about six millions of ordinary German bricks, of which two-thirds are hard-burnt and selected qualities for ordinary buildings, and one-third are facing and moulded bricks of a lemon yellow colour. The bricks are burned in two newly-built ring-kilns with eighteen chambers each, and in two German kilns; and the manager, Mr. A. Sandner, has been able to reduce the number of waters in the ring-kilns (which, with those light-coloured bricks is always very high unless great care has been exercised) to from 1½ to 2 per cent., and the breakages to from 0·7 per cent. to 1 per cent. The bricks are manufactured partly by hand and partly by machinery, the washed clay having been previously prepared in pug-mills, of which there are seven in one long row. The material which is fed into these pug-mills is taken from the slurry-backs, of which there are 120, each having a capacity of 300 cubic yards. Before the material is dry enough for use it must remain in the backs from six to eight weeks, as the water is removed entirely by the action of sun and air, though the sandy bottom materially assists in

the process. The clay, obtained from a distant clay-pit, has until now been washed on the brickfield by six ordinary wash-mills. The plant is so arranged that the four kilns, with their coal sheds, lie nearest the Harvel, leaving ample room, however, for stacking the finished bricks on the water's edge. To the westward of the kilns or further from the Harvel are twenty-one drying-sheds, each capable of containing 30,000 bricks. These sheds are built parallel to each other with their ends towards the river, and in the centre of them stands a massive machine pressing house, the upper part of which also carries the shafting and pulleys for transmitting power from the engine to the pug-mills. North and south of this pressing house are respectively three and four pug-mills, which are spaced 66 yards apart, and are arranged parallel with the gable ends of the drying sheds. About 100 yards further westward are the engine and boiler houses, and to the north and south of these stand the wash-mills, three on each side, in a parallel line to the pug-mills, and about the same distance apart. Power is transmitted entirely by wire ropes from the engine to the wash-mills, and also to the pug-mills, through the press-house, as already described. The clay-pit, of colossal dimensions, whence the raw material is obtained, lies four miles to the north of the brickfield, and is connected with it by a narrow-gauge railway. The filled trucks were drawn by a small locomotive, built by Krass & Co., of Munich, to the brickfield, where the material was stored near the wash-mills, for further use, as required. The great cost which this mode of transport involved, and which was chiefly due to the fact that the Government only allowed the line to be used in the winter months, and to the heavy repairs to the permanent way, caused the owners of the brickfield, at Mr. Sandner's suggestion, to remove the washing plant from the brickfield to the clay-pit, and to bring the washed material in a pipe line direct to the slurry backs at the brickfield. The new slurry plant in the clay-pit, including the pumps, has been supplied by Messrs. Taylor & Neate, of Rochester, England, who make a speciality of the erection of such machinery, and has now been successfully at work for three weeks. Accepting the kind invitation of Mr. Sandner our correspondent visited the brickfield and clay-pit on October 31st last, and the following description of the new machinery is compiled partly from personal observations and partly from information kindly supplied by Mr. Sandner. After a short inspection of the brickfield a special train, consisting of a small open omnibus drawn by the above-mentioned locomotive, took us to the clay-pit in thirty minutes. The slurry plant itself consists of a single wash-mill erected on the lowest point of the clay-pit, similar to that illustrated by us on p. 549 in 1886, only the Hennigsdorf mill has six horizontal arms and three harrows slung by chains, the tyres of which drag through and stir up the clay. The diameter of the wash-mill pit in which the harrows revolve is 20 ft., and its depth is 4 ft. 3 in. The material is shot into the mill from barrows, while water is added in a continuous stream, and so regulated that the slurry to be transported consists of one part clay and two parts water. This slurry passes through a fine grating, which keeps back the coarser portions, &c., and then runs into a large sand trap which lies a little lower than the wash-mill floor where it deposits the finer particles of sand, and then flows on to the suction pit of the pumps. The wash-mill normally makes twelve revolutions per minute. The slurry is then forced by the three-throw pumps through a cast-iron pipe line four miles 670 yards long. The pumps, which are of the plunger type, have a normal speed of twenty-one revolutions per minute, and a 15-in. stroke; a pressure gauge is fixed in connexion with the air vessels, which registers the pressure in the pipes. The pressure with slurry of the above-mentioned thickness (that is 1 part of clay to 2 parts of water) amounts to between 120 and 135 pounds per square inch, but a larger proportion of clay increases the pressure, and a less proportion of clay reduces it. A specific gravity tube is used to determine the proper consistency of the slurry and should register "12 B" when the correct thickness is arrived at. The motive power for the whole plant, that is for the slurry pump, water pump, and wash-mill is furnished by a semi-portable compound engine by R. Wolf, of Magdeburg, and is

transmitted by leather belts. At the present time the actual output, which can at any time be considerably increased, is 390 cubic yards of slurry, or 130 cubic yards of solid clay per day, or 39 cubic yards of slurry per hour, and the velocity in the pipe line is 30 in. per second. The pipe line, which is 5 in. diameter, has been laid so that the gradient changes from rise to fall every 550 yards throughout the whole distance. Rather more pressure is required for this arrangement, but it has the advantage that in case of breakage a small section only need be emptied, and for this latter purpose inspection pipes with two doors each have been fixed in strong brick pits every 550 yards. At the end of this pipe line are a series of distributing pipes with sliding sluces, so that the slurry can be sent to the north or south divisions of the slurry back as required. The new plant has now been working perfectly satisfactorily for three weeks, the few small difficulties incident to every new undertaking having all been overcome, and having been chiefly due to the bursting of defective pipes. The entire cost of the plant, including the pipe line, has been about 3,700l.

#### COMPETITIONS.

**Baptist Church, Moseley-road, Birmingham.**—After a year's consideration, and with professional assistance, the committee of the above church have, we are informed, selected Mr. Ewen Harper, architect, of Birmingham, to carry out the work, at a cost of about 4,000l. The other competitors were Mr. J. A. Cousins, Messrs. Ingull & Son, Mr. Hughes, Mr. Sutcliffe, and Mr. Newton.

**Heating and Ventilation, Congleton Town-hall.**—In the competition for heating, ventilation, &c., of these buildings, the plans of Messrs. Sgden & Son, architects, Leek, have been awarded the first premium.

**Wesleyan Chapel, Blackpool.**—A new chapel is to be built for the Wesleyans at South Shore, Blackpool, and a number of architects were selected to submit designs for the same, the result being that the drawings prepared by Mr. J. H. Burton, of Ashton-under-Lyne, were adopted by the unanimous vote of the Trustees.

#### "TOBOGGANING SLIDES" AND THE BUILDING ACT.

ELKINGTON v. SMEE.

This was a case (heard in the High Court of Justice, Queen's Bench Division, before Mr. Justice Wills and Mr. Justice Grantham) stated by Mr. Biron, the magistrate sitting at Lambeth Police Court, and raised the question whether a "tobogganing slide," erected on the grounds of the Crystal Palace, was a building within the effect of the Metropolitan Building Act, 1855, so as to make it necessary for notice of the erection of the structure to be given to the district surveyor under section 38 of that Act. The respondent was the builder of the slide, and the contention on his side was that the slide was not a "building" within the meaning of the Metropolitan Building Act, or, if it was, it was exempted from the operation of that Act by section 21 of the Crystal Palace Company's Act, 1881, which provides that "the main building, conservatories, and waterworks of the company, and the conveniences, and other works immediately connected therewith shall be exempted from the operation of part 1 of the Metropolitan Building Act, 1855." But the section adds, that "this exemption shall not extend to any dwelling-house or building except as aforesaid upon any part of the property of the Company." The tobogganing slide was erected by a company called the Tobogganing Company, under an agreement with the Crystal Palace Company, by which the former company received a licence to enter on the premises and erect the slide, the Palace Company receiving one-tenth of the net receipts. The slide and the structure connected with it were detached from the main building of the palace, and comprised besides the slide, 425 ft. in length, a pavilion at one end, 63 ft. long, part of which was occupied by an engine-room with brick walls and concrete foundations and roof, containing the engine used to work up the empty sleighs. The magistrate held that the structures were "buildings" within the meaning of the Metropolitan Building Act, but was also within the exemption of section 21 of the Crystal Palace Act. He accordingly dismissed the summons against the respondent for not giving the notice above-mentioned.

Mr. Horace Avory appeared for the appellant; and Mr. Murphy, Q.C., and Mr. Wilely Wright for the respondent.

After some argument upon the terms of the Acts, The Court allowed the appeal, holding that the

structure was within the Metropolitan Building Act, and not within section 21 of the Crystal Palace Act. The case was accordingly remitted to the magistrate.—*Times*.

#### THE PERSPECTOGRAPH.

SIR,—Mention being made of the above instrument in your leading article of the issue of the 3rd inst., I would, with your permission, make a few remarks on the subject.

I have used an apparatus of this kind during the last four years, and made a considerable number of perspective outlines with it. I have it in daily use still, and shall be glad to explain its working to any one who takes an interest in this matter.

The Perspectograph produces a pencil outline, which, of course (in common with all outlines), "must be finished by an artist." A very clever perspective draughtsman may do the outline just as good, but not better, as the outline made by the instrument always is perfectly accurate, and no one can do it as quickly without sacrificing a great amount of accuracy.

Although the Perspectograph is neither so complicated as is generally thought, nor difficult to work, it has the disadvantages of being delicate, expensive, and requiring much floor-space, for which reasons it is not suitable for general office use.

C. W. ENGLISH.

#### PROVINCIAL NEWS.

**Birmingham.**—We hear that extensive additions and improvements to the Queen's Hospital, Birmingham, are to be made, at a cost of 5,000l. to 6,000l., and that the committee have called in the assistance of Mr. Ewen Harper, architect, of Birmingham.

**Farnborough.**—The Farnborough Hydro-Therapeutic Establishment was formally opened a few days since. The baths, which are attached to the Queen Hotel, Farnborough, are designed for the treatment of chest diseases, rheumatism, gout, and kindred complaints, on the Pine system, now so much in vogue at Reichenhall, Ischl, Baden-Baden, Homburg, and other German spas. The building consists of special inhalation rooms, robing rooms, and baths, for the treatment of the various diseases for which Pine extracts are used. Attached to the establishment are complete Russian vapour and Turkish baths, fitted up with special douche and spray arrangements. The cooling room or lounge is divided into cubicles for the use of bathers who desire privacy. The steam-heating, water supply, and pumping arrangements, as well as the special fittings were intrusted to and carried out by Mr. John Smeaton, of Great Queen-street, London. Messrs. McWilliam & Sons, of Bournemouth, were the builders. The baths are formed of glazed brick throughout.

**Moreton-in-Marsh.**—On the 2nd inst., the Rt. Hon. Sir Michael Hicks-Beach formally opened a public hall in Moreton-in-Marsh as a memorial to the late Earl of Redesdale. It is the gift of Mr. Freeman Mitford, C.B., and is Tudor in style. It is built of local stone, from the quarries at Borton-on-the-Hill. The hall is 70 ft. by 25 ft., and is panelled with oak up to the height of about 4 ft. At the north end is a dais a few inches above the floor level, and at the other end the approach from a solid oak staircase is shut off by a carved oak screen, while above is a small gallery. The roof is supported by carved oak beams, and is roofed with Dean Forest slabs, and in the centre there is a clock-tower surmounted by a vane. The architects were Messrs. Ernest George & Peto, of London, the builders being Messrs. Peto Bros., also of London.

**St. Helens.**—The extensions of the St. Helens Corporation Gasworks are so far completed that on the 16th ult. gas was being made in the new retort-house. Prior to the commencement of these extensions, gas was made in a house containing seven arches, each arch having fourteen retorts capable of producing altogether 800,000 cubic feet of gas per day. From the retort-house the gas passes through a condenser to be cooled, then through a scrubber into the purifying-house, and through meters to the holders, from which it is distributed by mains throughout the town. The new works, so far as they are completed, include a retort-house 183 ft. long by 65 ft. wide, which will hold 212 through retorts, the generator furnaces for which have been erected from the designs of Mr. C. C. Carpenter, of Vauxhall, London. There are 424 mouthpieces. They are charged by West's patent machine. When in full operation it is estimated that 1,250,000 cubic feet of gas per day will be made, and the old retort-

house will be converted into a purifying-house, the present one being inadequate. Up to the present the cost has been about 15,000l., which is lower than the original estimate. The remainder of the works, which will cost about 8,000l., will not be completed until next year.

**West Bromwich.**—Last year plans were prepared for rebuilding the receiving wards of the Union workhouse, and for providing a new building for the accommodation of vagrants as well as for a new Board-room and Union and relief offices. These buildings have just been completed, at a cost of about 11,000l., and were formally opened on the 18th ult. The recent works included the removal of the old dilapidated receiving and vagrant wards, by which space has been obtained for the new receiving wards and for the opening out of a roadway along the front of the master's residence, from which easy access is obtained to the several departments of the workhouse. The receiving wards for men and women are placed on either side of the porter's lodge, adjoining the principal entrance from Hallam-street. Each contains receiving, day, and sleeping-rooms, bath-room, lavatory, and clothes store. The vagrant department is now entirely detached, and placed on the Lyndon side of the workhouse premises. It includes a residence for the labour master, he and his wife respectively having control of the male and female vagrants, who are accommodated in distinct buildings, on the combined separate cell and associated ward system. The new Board-room, union and relief offices occupy a position slightly to the south of the main entrance, and are a prominent feature in the Hallam-street front. They form a detached block of buildings. Gas is laid on throughout these buildings, the fittings being specially made by Messrs. Best & Lloyd, of Cambray Works, Handsworth. The furniture throughout has been manufactured by Messrs. Marris & Norton, from designs by and under the superintendence of the architects, Messrs. Henman & Timmins.

#### Working Hours on the Railway.

It is a matter of notoriety that some of the most pronounced examples of overwork have been, and continue to be, furnished by the experience of railway employes. That accidents occur from time to time which are more or less directly attributable to mismanagement in this particular is not remarkable. The wonder rather is that we do not often bear of them. We are not ignorant that on the railway the observance of a settled scale of working hours is at times a somewhat difficult matter. The length of journeys, unexpected delays from weather and the like, the utility of special aptitudes possessed by particular men and required at a given time, are some of the circumstances which may render the due allotment of time for purposes of work a matter for careful consideration. When, however, we find men employed on trains in the most responsible positions for more than thirty hours at a stretch we are surely justified in crediting their superiors with most culpable negligence. Necessity is said to have no law, and on this principle it seems to be assumed that the driver of a locomotive should be virtually a part of his machine. We fail to see the point, and the public, we are assured, will hardly allow that the personal risk which they incur by such a proceeding can be excused by the maintenance of a solid dividend for the benefit of shareholders. What is wanted is a larger staff of subordinate officials, who shall be available to relieve one another at reasonable intervals. An ordinary working period of twelve hours per day is, we take it, sufficiently long for this class of workmen, as well as for artisans engaged in other occupations.—*Lancet*.

**The Electric Light in India.**—The electric light has been introduced into the East Indian Railway colonies, at Giridih, by the manager, Mr. Walter Salses, M.Inst.C.E., F.G.S., and marks the opening of a new era in Indian mining. The machine used is a 30-hp. dynamo, worked by a 24-horse-power vertical engine, which is supplied by steam from the pit-winding engine boilers, so that the cost of working is practically nil. The lamps are of the usual incandescent form, with carbon filaments in hermetically sealed vacuum globes, which give a brilliant, steady light. The miners are said to be delighted with the innovation, and go to their work with greater confidence than before.—*Indian Engineer*.

**The Student's Column.**

**LAND SURVEYING AND LEVELLING.**

XV.—DETERMINING DISTANCES.

**T**HE Tacheometer (figs. 1 to 6) and the Omnimeter (figs. 10 to 14) enable the surveyor to determine the horizontal distance of a point from either instrument by means of a vertical measurement read off a level-staff. In the tacheometer two parallel horizontal wires are placed in the diaphragm at a given distance from each other and at equal distances from the central horizontal cross wire which appears in a level. If, as in fig. 6, the distance apart of the two parallel wires from each other be one-hundredth of the focal length of the object-glass, every foot which is read upon the level staff will represent 100 ft. of horizontal distance when the instrument is set up and its telescope adjusted in a level position. In the same manner, 2 ft. read upon the staff would represent 200 ft. of distance. Figs. 1 and 2 show the special form of construction recommended for tacheometers, but it is manifest that the diaphragm arrangement could be easily added to any levelling instrument simply by inserting two extra cross-hairs at the correct distance apart. The diaphragms in figs. 5 and 6 omit the central horizontal cross-hair used for taking levels, as shown in fig. 4. In fig. 4 the

cross-hairs are fixed so as to record a horizontal distance of 200 times the height read upon the staff; fig. 5 is set to record 50 times, and fig. 6 100 times the distance. The eye-piece, as shown in fig. 3, is fitted with a slide and rack so as to be traversed up and down to the positions shown by the dotted lines, by turning the milled-headed screw, D. The diaphragm itself remains fixed. A tacheometer is almost invariably made with a three-screw tribach, because they are generally sold upon the Continent, where a three-screw hase is preferred.

Fig. 7 shows an ordinary telescope without a stop-piece, in which the angle between the inclined line and the horizontal has not a constant value for different relative positions of the eye-piece and the object-glass. The introduction of the stop-piece in figs. 8 and 9 serves to maintain a constant value, but by thus choosing certain rays and rejecting others, the effective power of the object-glass becomes diminished; hence the object-glass is made large in order to balance this defect by allowing more light to enter the telescope. The measurement is calculated from the centre of the instrument in both the tacheometer and the omnimeter.

The Omnimeter (figs. 10 and 13) has a powerful microscope, Q R, permanently fixed at right angles to the telescope, C D. Both microscope and telescope move upon the same axis at right angles to one another in every position. Thus the line through the centre of C D is always perpendicular to the line through the centre of

Q R. Hence, in fig. 11, if M A represent the central portion of a level staff, the distance O A can be calculated from the readings given by the scale (fig. 14), coupled with the difference of the divisions read upon the staff (fig. 11), thus:—

$$OA = \frac{MN \times OA'}{M'N'}$$

$$AN = \frac{MN \times AN'}{M'N'} = \frac{AN' \times OA}{OA'}$$

$$OA' = \frac{MN \times OA}{MN}$$

The scale (fig. 14) is placed in fig. 10 at S T (see plan in fig. 12). This scale is usually 4 in. in length, divided into 100 equal parts, the principal divisions being pointed out by numerals engraved over or near them, so as to be readily read by the microscope Q R, and each of these 100 parts is halved by an un-numbered line, so that the whole scale is divided into 200 equal parts. By the addition of a micrometer screw, E F, the scale can be moved backwards and forwards exactly one of these 200 subdivisions. The circle E F of the micrometer screw is further divided into 100 equal parts by lines properly marked and numbered. Each of these 100 parts is divided into five equal parts by means of an attached vernier (see fig. 14). Hence the 4-in. scale S T is accurately and visibly divided into 100,000 equal parts.

Books.

Vestiges of Old Newcastle and Gateshead. By W. H. KNOWLES and J. R. BOYLE. Newcastle: Andrew Reid. (In progress.) This is the first number of a publication intended to be completed in twenty parts, giving sketches and historical notes of buildings of old Newcastle and its neighbourhood. The vignette shows a charming bit of picturesque street building, "No. 37, The Side." This quaint name originated from the street being on the side of the hill on which the castle stands. Three full-page plates are given, including one of the well-known "Black Gate" leading into what was once the castle precinct. The notes of local history and tradition are interesting and well written.

A Handbook for Steam Users, being Rules for Engine Drivers and Boiler Attendants. By M. POWIS BALE, M.I.M.E., A.-M. Inst. C.E. London: Longmans, Green, & Co. This book consists of a number of rules or hints on various subjects connected with steam machinery. The whole is arranged in four chapters, but each subject is treated separately and independently under a distinctive heading. There is a legitimate scope for such a book, and the author has executed his task in a satisfactory manner. Even practical men of long experience, who know all about the matter to begin with, may find in glancing through the pages of the book useful reminders on things not often put in practice, even if known. There would be far fewer machinery accidents if the teachings enforced by Mr. Powis Bale were more scrupulously observed.

The Brassfounder's Manual. By WALTER GRAHAM. London: Crosby Lockwood & Co. This is a seventh edition of a small manual which first saw the light over twenty-five years ago. In the year 1861, no doubt, it was a meritorious publication, but it has not been brought up to date in the last edition.

Pneumatics, including Acoustics and the Phenomena of Wind Currents. By CHARLES TOMLINSON, F.R.S., F.C.S. London: Crosby Lockwood & Co. 1887.

This is a fourth edition of a small handbook that has been for some years before the public. It is of an elementary character, and possesses the merit of being expressed in clear and simple language, which renders it especially fit for the instruction of young persons. A large part of the book is naturally devoted to the barometer, the necessary points to be observed for obtaining a good and reliable instrument being set forth. The causes of winds and atmospheric phenomena are also discussed. Another section of the book treats of the propagation of sound, and its reference to musical intervals. An appendix deals in detail with such matters as the anemometer, air-pump gauges, the glycerine barometer, and the Springley pump. There are also some remarks on weather forecasts. There are several illustrations of the usual type, but no index.

The Portable Engine; its Construction and Management. By WILLIAM DYSON WANSBOROUGH. London: Crosby Lockwood & Co. This is an interesting little book, treating of a subject of no little importance, with which the author has a practical acquaintance. It is intended for "owners and users of steam engines generally," and Mr. Wansborough sticks creditably to his text without wandering too far into those more abstruse problems that may be supposed to appeal more especially to manufacturers and designers. The historical data contained in the preface are interesting. The credit of originating the portable engine is accorded to Richard Trevithick; although the creation of the versatile Cornish miner bore little more resemblance to the modern portable than the engines of the Comet to those of a torpedo boat.

The book opens with an elementary description of the high-pressure steam-engine and the locomotive boiler. All we have to do and fan with in this are the terms. For an expansion "high pressure" should be substituted "non-condensing." Now, when we have marine condensing engines working at an initial pressure of 180 lb. to the square inch, it is time the use of "high-pressure" should become obsolete as a distinctive defini-

tion of engines often working at lower pressures. Many non-technical readers, especially, no doubt, those of agricultural pursuits, will thank the author for his explanation of the mechanical draughtsmanship by aid of such familiar objects as a cup and saucer and tea-spoon. "Units of Connexion" is the title of an excellent chapter full of information for the tyro. Under the head of "Construction" the engine and boiler are dealt with in two separate chapters also capable of instructing any person of ordinary intelligence on the main features of the subjects treated of.

Perhaps, however, the bucolic section, which should supply a large contingent of Mr. Wansborough's readers, may find "d = \sqrt{\frac{S D}{C}}" a little puzzling, but application to the nearest schoolmaster would, doubtless, put matters in a clearer light. But when we come to "the slide valve and its action," and find ourselves plunged into Zeuner's graphic theory, it is, perhaps, necessary to qualify what has been said above about the author sticking to his announced intention. We fear that here the average village schoolmaster will hardly be able to pull our agricultural friends through, but they can take refuge in a comforting alternative of skipping without, perhaps, losing much of practical importance; although, of course, we by no means wish to undervalue Zeuner's beautiful expositions when in their right place. A short chapter on the indicator diagram follows, and the book concludes with "Hints to Purchasers."

There are a great many excellent illustrations. In these a preference is shown for the designs emanating from a limited source; but they are, doubtless, none the less valuable on this score.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

176, Ventilating Apparatus. T. S. Wilson and H. T. Johnson.

According to this invention an improved apparatus is fixed in the chimney-breast for ventilating apartments. The combination with one or more gas or atmospheric burners with a chimney open at both ends, and enclosed in a cylindrical shell open at the bottom, and with its upper part bent backwards and opening into the flue, the whole being enclosed in a casing (fitted in the chimney-breast), is claimed. Open louvres or perforations admit the air from the apartment, and an aperture at the back near the top allows the exit of air into the flue.

437, Chimney Cowls. J. D. Thompson.

Double cones, with annular sheet metal ring cones, are the chief features of this invention, which is for the purpose of preventing blow down in shafts or chimneys.

743, Ventilating Apparatus. E. J. Dive.

This apparatus is composed either of two plates capable of sliding one upon the other, or of a panel provided with a certain number of holes which can be uncovered at will by means of a plate actuated by a cord, the said panel being placed at any point, to establish communication with the outer air. The holes which convey the air from the outside are placed in an oblique direction, so that the air rises to the ceiling and becomes slightly heated before spreading in the apartment.

6,307, Improved Water Tap. E. Zahn.

The outlet is either in the shape of a V or half-ball, and the spindle of the valve is placed directly over it. The valve itself is of the same shape, and the valve spindle and handle are attached to each other, and move in a horizontal position. The upper part of the spindle passes through a stuffing-box. The means employed to open the tap are wheels or rollers attached to the valve, which, by a turn of the handle, will carry the valve out of its resting-place; the wheels rolling up in a groove in the outer case.

10,636, Draught Regulators. T. Baker.

The draught regulators are made so as not only to come down from the top of the fireplace as an ordinary blow-off, but two side fan-like pieces are fitted which, when drawn forward or downward, induce so great a draught that even inferior coals may be burnt with a bright glow. The appliance thus fitted also answers as a fireguard, and a convenient and simple covering to the fireplace when it is not in use during the summer months.

12,473, Wood Block Flooring. A. Harrison.

A groove is cut on all four sides, making the lower portion of the block narrower than the upper. As the means of bonding the blocks together, a metal tongue, such as may be made out of ordinary hoop-iron, for instance, is inserted.

## MEETINGS.

SATURDAY, DECEMBER 17.

Crystal Palace School of Engineering.—Award of Certificates. 1 p.m.

MONDAY, DECEMBER 19.

Royal Institute of British Architects.—Papers on "The Recent Development of the City of Vienna," by Mr. Frederic R. Farrow (Holder of the Godwin Bursary), and Mr. Thomas Birchall. 8 p.m.

Society of Arts.—Mr. H. H. Statham on "The Elements of Architectural Design." 1V. 8 p.m.

Surveyors' Institution.—Adjourned discussion on "Alloiments." 8 p.m.

Inventors' Institute.—Various papers on "Inventions Suitable for the Household." 8 p.m.

TUESDAY, DECEMBER 20.

Institution of Civil Engineers.—(1) Further Discussion on Dr. Hopkinson's paper on "Electrical Tramways." (2) Time permitting, Papers by the late Hamilton Goodall, Assoc. M.Inst.C.E., on "The Use and Testing of Open-hearth Steel for Boiler-making." 8 p.m.

WEDNESDAY, DECEMBER 21.

Civil and Mechanical Engineers' Society.—Mr. A. T. Walmisley, M.I.C.E., on "The Roof of the National Agricultural Hall, Kensington." 7 p.m.

Royal Meteorological Society.—Four papers. 7 p.m.

Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting. 8.30 p.m.

Liverpool Engineering Society.—Associated Soiree.

THURSDAY, DECEMBER 22.

Edinburgh Architectural Association.—Mr. P. Geddes on "Architecture and Decoration in their Social and Economic Aspects." 8 p.m.

## Miscellaneous.

**St. Pancras.**—The foundation-stone of the new church for the district of Holy Cross, St. Pancras, was laid on the 6th inst. by the Right Hon. G. J. Goschen, on the site in Cromer-street, Gray's Inn-road. The church, which will seat 500 persons, is built in memory of Commodore Goodenough, who was killed on the island of Santa Cruz, and will have a nave, aisles, and chancel, with two small transepts and morning chapel. It will be entered from the west by two porches leading into a narthex forming the baptistry, with four nave arches on each side on Pennant stone columns supporting a lofty clerestory. At the east end will be five lancet windows under deeply-moulded arches, and below, a reredos of alabaster. Under the church will be a large room for parochial purposes and a library. The cost of the building when complete will be 7,500l., but the church proper will be finished first, leaving the lower portions until funds can be obtained. The architect is Mr. Joseph Peacock, the builders being Messrs. Kilby & Gayford. It will be of brick, with Bath stone, and the roofs covered with tiles.

**Dohcros.**—The east window in Dohcros Church, near Oldham, is now filled with a painted window. The subjects represented are the Crucifixion and its antitype, "Moses and the Brazen Serpent"; with figures of St. Mary, B.V., and Our Lord as Prophet, Priest, and King, &c., in the side lights. The window is Classic in style, and the ornament has been kept in sympathy with the architecture of the church. The whole of the work was designed and executed in the studios of Messrs. Heaton, Butler, & Bayne, of London.

**Society of Engineers.**—The thirty-third annual general meeting of the Society of Engineers was held on the 12th of December, at the rooms of the Society, 9, Victoria-chambers, S.W. The chair was occupied by Professor Henry Robinson, President. The following gentlemen were duly elected, by ballot, as the Council and officers for the ensuing year, viz.:—As President, Mr. Arthur T. Walmisley, as Vice-presidents, Mr. Jonathan R. Baillie, Professor Henry Adams, and Mr. Robert Harris; as ordinary Members of Council, Messrs. R. W. P. Birch, W. N. Colam, W. Schönheyder, W. A. Valon, C. Anderson, J. H. Cunningham, J. W. Restler, and J. W. Wilson, jun., the four latter gentlemen being new Members of Council; as Honorary Secretary and Treasurer, Mr. Alfred Williams; and as Auditor, Mr. Alfred Lass. The proceedings were terminated by a general vote of thanks to the Council and officers for 1887, which was duly acknowledged by the Chairman.—The annual dinner of the Society took place on Wednesday evening at the Guildhall Tavern. Professor Henry Robinson, C.E., the retiring President, occupied the chair, and among those present were Mr. Aird, M.P., Mr. A. Manning, C.E., Mr. W. Airy, Mr. A. T. Walmisley, C.E., President-elect, Messrs. Phillips, Baillie, Birch, R. Harris, C. Horsley, Alfred Williams, hon. secretary and treasurer, and Mr. C. J. Light, secretary. The President, in proposing "Success to the Society of Engineers," said the Society never was in a more prosperous condition nor its work more appreciated than now. The published reports of their Transactions were sought for over the length and breadth of the world. Taking the whole of the year broadly, it showed a successful and altogether satisfactory state of affairs. Considering that it was part of their system to afford to the younger professional men opportunities for educating themselves and gaining experience, he was glad to be able to say that he believed of the long period of depression, and probably of disappointment to them, was coming to an end. He believed that for all young engineers who properly qualified themselves and showed an aptness for their profession there was a good future open. Mr. Alfred Williams, "the father of the society," responded. Mr. Perry F. Nursey proposed the next toast, that of the President, and the President, in the course of his reply, proposed "The President-elect," to which Mr. Walmisley replied.

**The Philharmonic Music Hall, Cardiff.** Last week the Philharmonic Music Hall, Cardiff was re-opened, after having undergone complete alteration and renovation. About seven weeks ago, the building was closed to the public, and the work which was then begun was kept going practically day and night until the opening. Every particle of the inside was swept away, and a new proscenium, boxes, balcony, and promenade erected. The building is now in the hands of a Company. The alterations were carried out by Mr. J. E. Jackson, builder, Cardiff, from plans and under the superintendence of Messrs. James & Morgan, architects, Cardiff. The decorations were executed by Messrs. Geo. Jackson & Sons; and the Lincoln work by Messrs. Fredk. Walton & Co. Entire new scenery has been set by Mr. H. Churchward.

**South Weald, Brentwood.**—There has been erected here a monument of Sicilian marble, having a Latin cross, 6 ft. 6 in. long, resting horizontally on five octagonal moulded and dispersed shafts, beneath which is a moulded slab richly carved with orchids, a favourite flower of the late Mr. O. E. Coope, M.P., to whose memory it has been erected, together with the elaborate alabaster reredos in St. Mary's, Whitechapel (noticed in a previous number of the *Builder*), from the designs of Mr. E. C. Lee, architect, and executed by Messrs. Harp, Son, & Hobbs, of London and Manchester.

**The Plumbers' Company.**—At the examination, held on Saturday, there were twenty-five plumbers from various districts of London, Hertford, Crewkerne, and Brighton. The practical branch of the examination included pipe-bending, joint-wiping, and roof work; and the theoretical branch, questions relating to the several subjects of plumbers' materials, house-fittings, and sanitation. The examiners were Mr. Hudson (assistant chairman of the Registration Committee), Mr. Webb, Mr. Lyne, Mr. Lobb, Mr. Taylor, and Mr. Millis. Eight plumbers passed.—*City Press.*

**Prizes for Art Workmanship.**—The judges appointed by the Council of the Society of Arts have awarded the following prizes for objects submitted in the Society's Art Workmanship Competition.—Class I.—Painted Glass.—Second prize (15l.) to William Glasby, John E. Penwarden, and A. Lawrenson, for a painted panel, "Music," from a design by Henry Holiday. Class II.—Glass Blowing in the Venetian Style.—First prize (10l.) to T. Smith (workman), W. Fraunce and W. Watkins (assistants); second prize (5l.) to J. Hughes (workman), A. Johnston and H. Hart (assistants). Class IV.—Inlays in Wood.—Third prize (10l.) to F. Spalding, for a fancy octagon table. Class V.—Lacquer.—First prize (25l.) to Thomas W. Hay, for a specimen of lacquer on wood. Class VI.—Decorative Painting on Wood or other Material.—First prize (25l.) to John Eyre, for painting on wood for piano front, subject, "Vocal and Instrumental Music." Class VII.—Hand-tooled Bookbinding.—First prize (25l.) to T. G. Cadden-Sanderson; second prize (15l.) to Fred. Müllen. Class VIII.—Repoussé and Chased Work in any Metal.—First prize (25l.) to R. Holloway, for capital of column in hammered gilding metal; First prize (25l.) to A. Hahert, for specimens in silver and other metals, of repoussé and cast chasing work; Second prize (15l.) to W. Bullas, for repoussé curtain in brass, for drawing-room stove. First, second, and third prizes were offered in each class, but were not in all cases awarded.

**The Home Iron Trade.**—The English iron market shows a distinct improvement, and the prices of all descriptions of iron and steel, almost without exception, are higher than they were a week ago. There is a steady demand for pig-iron, and large purchases of iron have been made for speculative purposes, as it is fully expected that another "boom" will soon set in, especially in view of the probable larger demand from America, should the reductions in the tariff charges foreshadowed in President Cleveland's message to Congress become a reality. The week has seen a general rise in ordinary pig-iron of from 3d. to 6d. per ton, and in hematites, 1s. 6d.; but in some of the Scotch brands the week's advance has been as much as from 1s. to 2s. per ton. The rise in Scotch pig-iron warrants is nearly 2s. on the week. The improvement in the shipbuilding trade has sent up quotations of finished iron to the extent of 1s. 3d. a ton, whilst steel has experienced an improvement of as much as 5s. per ton, and Scotch steel-makers, in view of their rise in hematites, decline to do business except at an advance of 10s. on the last price, which was 6l. 5s. per steel plates. Never before during the year has the outlook been so bright, and we can only express the hope that the better condition of the iron trade will prove of a permanent character.—*Iron.*

**The Guano Process for Precipitation.**—The Governors of Wellington College have renewed their agreement with the Native Guano Company for five years, on the basis of an increased subsidy for the use of the process. According to the report of the Bursar and medical officer of the College "the system works well and with great ease." Moreover, we learn that before renewing the contract a special committee of the governing body made full inquiry, personally inspecting the sanitary processes in operation at other public institutions. They reported that the method adopted at the college, under the advice of Mr. Baldwin Latham, was, "under the circumstances, the most advantageous that could be used," and this expression of official satisfaction is formally recited in the deed of agreement.

**The Mersey Railway Branch to Birkenhead Park.**—It is stated that Messrs. John Waddell & Sons, Edinburg, have also completed the contract for this railway. The branch connects the Mersey Railway with the Wirral Railway at West Park Station, in the vicinity of Birkenhead, and opens up the coast resorts of New Brighton, West Kirby, and the Dee side to Liverpool for the first time by direct through communication with the Mersey Tunnel. We understand that the contractors have accepted an estimate from Mr. T. W. Hellivell to do the whole of the glazing and zinc roofing required on Park Station. Mr. Hellivell, it may be mentioned, did the whole of the glazing on Green Lane Station, Borough Road Station, and Shore Road, where the railway was opened two years ago.

**The Art-Union of London**—The Art-Union of London having attained its year of jubilee, the Council have issued an address drawing public attention to the results of its fifty years' work, and pointing out "the advantages which it affords to its members, in the hope of attracting new subscribers, and thereby increasing its means of public usefulness." The objects of the society, as stated in the Charter, are to promote the knowledge and love of the Fine Arts, and their general advancement in the British empire, by a wide diffusion of the works of native artists; to elevate Art and to encourage its professors, by creating an increased demand for their works, and an improved taste on the part of the public. It is under the direction of a Council of the Members, whose services are honorary. In furtherance of these objects, the society has collected and disbursed no less than 594,000*l.*, to which considerable sums were added by prizeholders, in order to acquire works of higher value than the amounts of the prizes. The Art-Union claims to have been largely instrumental in creating the picture-buying public of the present day. "At its inauguration, in the year 1837, the number of purchasers of works exhibited in the public galleries was exceedingly limited, being confined to a small circle of wealthy amateurs. In one year alone, 1841, when Art-Union subscriptions amounted to 5,300*l.*, and the first prize of the year was Mr. Maclean's "Sleeping Beauty" price 500*l.* (which was afterwards sold for 1,000*l.*), the list of artists whose works were purchased by the Art-Union comprised Ward, O'Neil, Witherington, Woolmer, Copley-Fielding, Creswick, Clint, David Cox, Corbould, Duncan, Uwins, Callow, Abelson, Frupp, Jutsum, Varley, Prout, Lee, De Wint, and others of lesser note, and there are very few of the Royal Academicians who have not received the support and patronage of the prizeholders of the Art-Union." The Art-Union also claims to have kept alive the art of line-engraving and that of medal die-engraving. On these and other grounds the Art-Union "still looks confidently for support to all lovers of art."

**The Empire Palace, Leicester-square.**—Messrs. Campbell, Smith, & Co. send us an account of the work they have carried out here. The scheme of decoration of the auditorium is somewhat Persian in character, the large oval ceiling being a kind of sumptuous Persian carpet. The sunlight will be a large flower in coloured glass, with the stamens and pistils of the flower electric lights. The general colouring is in turquoise and indigo blue, rose colour and crimson, with black and gold. The columns all round the theatre are white, with characteristic ornament in two blues and gold. This treatment is applied to the various box fronts, using in (as far as possible) the raised ornamentation already existing. The back and ceiling of the gallery circle is treated with ruby and gold leather paper. The three other circles which are Louis Seize in treatment, are severally rose and gold; blue, white, and gold; and white and gold, the latter with plush panels. The upper circle is lighted by eighteen lamps of Persian design, in coloured glass, with gold frames. The walls of the private boxes are all covered with a highly-enriched gold leather paper. The pit entrance is decorated with Egyptian ornament, leading down to a solid gold leather paper on the lower walls, and the white and gold treatment of the ground floor. The foyer (which is Renaissance in character) is entered by a grand staircase, Pompeian in treatment. The entrance-halls are Indian, and are coloured with black and gold, and a deep rich crimson. The work has been done under the superintendence of Messrs. Romaine-Walker and Tanner, architects.

**Obituary.**—The death is recorded, at Giessen, of the architect Heinrich Ernst Schirmer, who was for thirty-five years in the service of the Norwegian Government, and during that time erected a number of public buildings in Norway. His principal work was the rebuilding of Thronbjørn Cathedral, carried out between 1869 and 1871. The Norwegian Storting twice refused Schirmer a pension for his long services, and it was in consequence of this refusal that he returned to Germany. The deceased was born at Leipzig, and had attained his seventy-third year.

**The Priory Church at Brecon** has received an addition to its stained glass of a window from the studio of Mr. Taylor, of Bernets-street, the gift of Mr. Annerin George, in memory of his wife and daughter.

**Marble Replaced by Tin.**—The *New York Times* says that the Board of City Trusts, Philadelphia, on the 15th of November "signed a contract by which the famous marble roof of Girard College will be replaced by an unsightly structure of tin. The cost of the work will be \$20,000. That of replacing the marble would be \$20,000. The defect in the roof was discovered about six weeks ago, when water was found leaking into the building. An examination of the marble revealed the fact that the surface was rapidly turning into lime. The Board of City Trusts met, and upon discussion of the matter made up their mind that the practical decomposition of the roof was due to the action upon it of an atmosphere impregnated with anthracite coal smoke. The roof had stood 41 years, and they concluded that \$20,000 would be too much to invest in another structure of the same prospective life." The same paper says that Thomas M. Walter, the architect of the building, died at an advanced age a few weeks ago. "The College was the pride of his life, although he had designed the extension of the National Capitol and many other famous buildings. He was therefore kept in ignorance of the mishap, which was partly due to the use of the roof, against his wishes, as an observatory for visitors."

**Edinburgh Police Courts.**—The Edinburgh Plans and Works Committee have recommended that provision be made for the better class of witnesses in the police court, and that double windows be placed in the courtroom. It was moved that in view of the report of her Majesty's Inspector of Constabulary as to the whole accommodation in the police chambers the matter should be delayed. The Lord Provost thought that this showed the importance of having new Municipal Buildings, as, in a short time it would be found that in rejecting the Bill they would have to go to far greater expense than otherwise would have been the case. The recommendation was, however, adopted.

**Wesley Chapel, New Swindon.**—The Wesley Chapel, New Swindon, has, during the past month, been closed for extensive alterations. A hot-water heating-apparatus has been put in by Mr. James Gray, of Danvers-street, Chelsea. The building portion of the work was carried out by Mr. J. Webb, of Swindon, who is also laying down wood-block flooring. Three cathedral-glass windows have been executed by Messrs. J. Hall & Sons, of Bristol. The building is a large one, seating nearly 1,000 persons on the ground-floor. The total cost of the works now carried out is 220*l.* The work has been carried out under the supervision of Mr. A. G. White, of New-road, New Swindon.

**Residential Flats in Westminster.**—A large block of residential flats is being erected by Messrs. J. W. Hobbs & Co., Limited, of Queen's-buildings, Southwark Bridge-road, S.E., in Carlisle-place, Victoria-street, Westminster. The building is six stories in height, and has a frontage of 227 ft., with an elevation Classical in style, consisting of a central block and two end wings, flanked by composite pilasters, and faced with marble and stone dressings. A large block, consisting of about fifty flats, erected by the same firm, on the opposite side of Carlisle-place, is now approaching completion, about thirty flats being occupied. The architect for both blocks is Mr. George Baines.

Sole agents for the current week's issues must reach the Office before THREE o'clock p.m. on THURSDAY.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS OF ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY morning.
The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that all the above OFFERS ONLY should be sent.
PERSONS Advertising in "The Builder" may have copies addressed to the Office, 46, Catherine-street, Covent Garden, W.C. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.
AN EDITION Printed on THIN PAPER, for FOREIGN CIRCULATION, is issued every week.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied inasmuch from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum. Prepaid. To all parts of Europe, America, Australia, and New Zealand, 28s. per annum. To India, China, Ceylon, &c. 30s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

Now ready, SINEPENCE RACE. READING CASES, (By post carefully packed), 1s.

Best Bath Stone. CORSHAM DOWN. FARLEIGH DOWN. BOX GROUND. COMBE DOWN. WESTWOOD GROUND. STOKE GROUND. WANDELL, SAUNDERS, & CO., LD., CORSHAM, WILTS.

Best Bath Stone. Pictor's Monks' Park. Combe Down. Corsham Down. Stoke Ground. Box Ground. Winsley Ground. Farleigh Down. West Wood. PICTOR & SONS, Box, Wilts. [ADVT.]

Doubling Freestone. The stone from these quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England. THE CHELYNCH STONE. Is of the same crystalline nature as the Chelynch Stone, but finer in texture, and more suitable for fine moulded work. THE BRAMBLEDITCH STONE. HAM HILL STONE.

Greater facilities have been provided for working these quarries, and the stone can be supplied in large quantities at short notice. Prices, and every information given, on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, near Ilminster, Somerset. London Agent—Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [ADVT.]

Doubling Free Stone. For prices, &c., address S. & J. STAPLE, HAM HILL STONE, Quarry Owners, Stone and Lime Merchants, Stoke-under-Ham, (Ground or Lump), Ilminster. [ADVT.]

Asphalts.—The Soyssel and Metallo Lava Asphalt Company (Mr. H. Gleun), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tun-rooms, and terraces. [ADVT.]

Asphalts. Soyssel, Patent Metallo Lava, and White Asphalts. M. STODART & CO. Ofice: No. 90, Cannon-street, E.C. [ADVT.]

SPRAGUE & CO., LITHOGRAPHERS, Employ a large and efficient Staff especially for Bills of Quantities, &c.

22, Martin's-lane, Cannon-street, E.C. [ADVT.] Garside's Noted Bedfordshire Coarse and Fine Silver Sand.—Is perfectly free from impurity, and the best and cheapest in the market. All quantities in stock, for every purpose required in the building trade, for filtration, or for nursery purposes. All pure grit! Apply to GEORGE OARSDIE, JUNR., Leighton Buzzard. [ADVT.]

HOBBS, HART, & CO., Limited, MAKERS TO HER MAJESTY BY SPECIAL APPOINTMENT. The Bank of England and its Branches, including New Law Courts Branch, now building. PATENT PROTECTOR AND LEVER LOCKS, for all Purposes. STEEL SAFES, STRONG-ROOM & PARTY-WALL DOORS. SELF-CLOSING DOORS, FOR THEATRES AND PUBLIC BUILDINGS, As approved by the Metropolitan Board of Works (used in large numbers at Covent Garden Theatre).

IMPORTANT COMMUNICATION.—FIRE AT WHITELEY'S. WILLIAM WHITELEY, Westbourne Grove, London, Oct. 12th, 1887. HOBBS, HART, & CO., LIMITED. GENTLEMEN.—It affords me very much pleasure to express to you my satisfaction and admiration at the splendid fire-resisting powers of your Strong-room doors and the Safes. The recent fire at my establishment in my opinion subjected them to the greatest possible test, and through all, they proved invulnerable. The contents of both Strong Rooms and Safes were entirely preserved, although the fire was of such intense destructive force. You will be pleased to bear that it has been decided to adopt your Patent Clutch-ribbed Doors for all the party-walls in the new buildings now in course of erection.—I am, Gentlemen, faithfully yours, (Signed) WILLIAM WHITELEY. Offices and Warehouse: 76, CHEAPSIDE, London; Manufactories, Wharncliffe Works, Arlington-street, London, N.

### Ancient Sepulchral Monuments.

THE very fine illustrative volume published by Mr. Brindley and Mr. Westley under the above title\* is, as we are told in the brief preface, "the outcome of

what was originally a comparatively small collection of drawings of ancient sepulchral monuments made at different times, to aid those who, rebelling at the ordinary modern monument, desired a worthier and more satisfactory memorial." It has been expanded into what is intended as a text-book of monuments of this kind, from the earliest to the latest times, the drawings being for the most part to a uniform scale of one inch to the foot, with in many cases sections and details one-fourth the real size. The book, as may be seen at a glance, must have been the work of years. The drawings have mostly been carefully made, and are very well reproduced, and comprise an immense number of examples which are not only very fine in themselves and historically interesting, but which are also very suggestive as starting-points from which to work out new ideas in monumental designs of this kind.

The subject is so large that it may be fairly said that no single volume could well be a text-book of it, if we are to understand by that a book of reference which will contain examples of every type of monument which has been erected by mankind to commemorate the departed; and it would hardly be possible for any one, except with an almost unlimited command of time and funds, to produce a really complete *corpus* of examples of this class of architectural designs. The subject is endless, in fact, and it is no slight credit to the authors that they have illustrated it so largely as they have in one folio volume; but it cannot be regarded as giving a complete illustration of the subject. Among the well-known types of monument, we hardly find the Greek tombstone with bas-relief subjects illustrated so well as it deserves to be; the drawings given of these show very well the various beautiful types of foliated ornament which form the finish to the apex of many of these works, and which constitute a kind of comparative study of the Greek anthemion ornament used

in this portion in so many various forms and with so many curious and significant differences of detail; out of the bas-relief sculpture subjects the best that are available have hardly been selected, and those which are given are too small a scale for full justice to be done to them; they are the smallest in scale of all the drawings in which figures are introduced, and they certainly deserved a large scale and careful illustration more than any of the Renaissance monuments to which fuller justice has been done. Nor do we find any example of the very best type of English Renaissance monuments, such as we see exemplified in the Clopton monument at Long Melford, and the Paston monument at North Walsham. We may also question whether all the monuments figured here are really such as would present themselves as models to those who desire "a worthier and more satisfactory memorial" than the modern monument. This remark is, in fact, a little out of date now, for there have been some very fine monuments executed of late years here and there, some of them worthy to take rank with the very best in this book (e.g., Mr. Gilbert's Fawcett monument in Westminster Abbey), and on the other hand some of those that are given are, though historically valuable, not such as we should be prepared to hold up as by any means models for imitation. We should imagine, for instance, that the monument on plate 161, with its coarse Classic details and broken pediments, or 164, with an urn in relief on a pyramidal slab, or Nos. 205 and 206, or No. 208, a pyramid with spheres at the base standing on a surbase with a heraldic sculptured panel, would be the kind of thing which would suggest in the mind of most persons a desire for a "worthier" monument, something with more refinement of detail and more seriousness of aim and feeling about it. These examples were, however, necessary in a historical point of view; we only demur at being asked to admire them or to consider them as examples of what a monument ought to be; the expression in the preface rather leads to the conclusion that the authors regard all these as good examples; and here we must differ.

That is, however, all the criticism we have to make on the book, which is a very fine and a very useful one. Some of the plates which now appear in it have been previously published in our pages, one a fortnight ago, the marble tablet from Siena (*Builder*, December 10, p. 519), and one or two more a good while previously, one of these being one of the finest and most characteristic in the book, the highly-enriched cross standing in relief against a wall in the cloister of San Juan de los Reyes, at Toledo. The classes of monuments are arranged in groups, and in each

group as far as possible chronologically. We commence with Egyptian obelisks, of which five are given, including two drawings of that monument of remarkable vicissitudes which is dated in the corner of the plate "Heliopolis, B.C. 1500; Alexandria, B.C. 23; London, A.D. 1878"; and who knows where next? For it may outlast several more empires, for anything we know. Then follow some of the Assyrian obelisks now in the British Museum, with their tops worked in steps or stages, two of them in sloping lines, like an imitation on a small scale of the type of tower with inclined plane stages round it, which has sometimes been made to do duty for the mythical Tower of Babel. An important distinction between these and the Egyptian type is that, whereas in the latter the ornaments and sculptures and hieroglyphics are worked in intaglio out of the main surface of the granite, in the Assyrian examples the sculpture subjects are enclosed in panels formed by sinking the ground, and leaving the figures in relief on it, their upper surfaces being on the same plane with the main surface; in other words, in the Egyptian examples, it is the design that is incised; in the Assyrian examples, the spaces round the figures are incised, and the figures left in relief.

The obelisk is one well-marked and distinct type of monument. If we were to endeavour to classify the forms of monument that have been used we might, perhaps, divide them into the obelisk form, the cross (which may be called the Christian parallel to the obelisk); the sarcophagus, with or without a figure on it; the upright sculptured slab, including the Greek stele; the horizontal sculptured slab; similar forms of slab with only inscriptions and no carving except a little bit of decorative heading or border; and the arched recess, Gothic or Classic, with a figure included within it. The sarcophagus is one of the most long-lived and most constantly-recurring forms; there is something in its heavy solid form and horizontal lines which suggests, more perhaps than any other of the accepted monumental forms, the idea of imperishable endurance; and accordingly we have it used almost *ad nauseum* in modern burial-grounds, as a mere exterior form from which all use and all its original meaning as the receptacle for the body has departed; and in many examples, such as the tomb from St. Cecilia in Trastevere at Rome (given in plate 174), the figure, which originally should have been enclosed in the sarcophagus, is sculptured as reclining on the top of it. The sarcophagus seems to have been the originating form of the late English table-like monument. The two forms are shown together, whether intentionally or not, in the two late English tombs given on plate 203,

\* Ancient Sepulchral Monuments; containing Illustrations of over Six Hundred Examples from various Countries and from the Earliest Periods down to the End of the Eighteenth Century; with descriptive and general Index, by William Brindley and W. Samuel Westley, F.R.I.B.A. London: Printed for the authors by Vincent Brooks, Day, & Son. 1887.

both of which are nearly alike in the design of the side, but in one the top is made in pediment section, in the other it is flat. Among the examples given are the two from St. Apollinare in Classe at Ravenna, which are called sarcophagi, but which have lost the old Roman form, and become more like cabinets, with a semicircular top, and in one case an arcade in relief at the side, in the other case a frieze with vine scrolls and figures of peacocks. These are very interesting, and the first named one is a good bit of miniature architectural design, but they have lost the characteristic massiveness and imperishable appearance of the Roman sarcophagus. Some of the examples given in this book are of interest not only as varieties of sarcophagus form, but as constituting examples of different phases and styles of ornamental treatment: there is the characteristic Etruscan one in the British Museum, with its reminiscence of a temple roof with roll tiles and antefixa, and the band of foliage carved out of the surface of the stone, dividing the height in half; there is the Roman example found in London in 1853 (plate 21) and now in the British Museum, the sides decorated with a large spiral ornament in flutes, which is interrupted in the middle of its length by a medallion with a head in alto-relief within it, and the one (B.C. 298) in the Vatican Museum (plate 20), a solid-looking piece of work showing, however, the want of fancy and imagination of the Romans, the whole thing being a Roman Doric architrave and entablature with a boldly-moulded base added at the foot of the "entablature." It is noticeable that in this portion of a Doric order, from which the column is omitted, the triglyph is placed at the angle, as in Greek work, apparently showing that the Romans, when there were no columns to trouble them, preferred that treatment to the one they adopted over the column order, of thrusting the triglyph away from the corner. There is an Egyptian sarcophagus given on plate 5, with a pedimented head and hanging wreaths, executed in a manner suggestive of no surface carving or indications of leafage on them; but is this one (at Mehallat el Kehir) in the true sense Egyptian? The authors do not suggest a date. It looks to us more like a Roman idea executed by Egyptian hands.

The treatment of the cross in monumental work is a curious study of variety in the way of regarding and treating the same object, when we see, as here, a number of examples from different countries and periods together. One of the most curious and interesting is one on the first page in which crosses appear (plate 30), a slab built, we are told, into a ruined church in Athens, and showing a cross with two cross arms (like a double transept) one above the other, formed by an interlacing ornament, and with a base looking like an outlined section of steps. In two circles under the main arms of the cross are figures of birds, over them two paterae. The whole thing is so curious in its mingled suggestions and reminiscences, half Classic, half Byzantine, that it is to be regretted the authors did not give some further information as to its position and probable origin. There is, however, practically no letter-press to the book, and no information about the examples, except that dates, or approximate dates, are given or suggested to many of them in the index. The Byzantine tablets from Rome and Torcello on plate 32, in which the design consists of a decorative arch, with a cross under it, are, like the Athenian example just referred to, very interesting from the architectural point of view. They are so much alike in design that they must have originally belonged to the same locality or have been even worked by the same hands. They form a curious link between Classic and Mediæval art. The surfaces of the crosses on them are decorated with the old Roman ornament of two strap forms interlaced so as to make a series of intercepted circles, but at the ends and junctions of the cross arms the two bands or straps are intertwined in a manner quite at variance with Classic

feeling. On either side of the cross is a leaf which seems a last reminiscence of the Classic acanthus, a kind of mimicry of it, with all the life and flow gone out of it, and on the extrados of the arch is a series of small scrolls springing out of the extrados moulding in a manner curiously resembling the Gothic gable crocket of later days. The various examples of crosses worked on the faces of upright stones, especially the Celtic ones in Scotland, the Isle of Man, and elsewhere, are full of suggestions in decorative design which might be worked out afresh with new detail. A great many examples are given of the form of equal-armed cross worked upon or into a circle, which is so effective in a decorative and symbolical sense, and has been treated with such variety of method and detail. Among other forms of cross delineated here we may notice the type of flat slabs cut out into crosses, of which the richly-decorated example at Kilkispeen, in Ireland, is one of the most remarkable (by the way, no indication or information is given as to whether this cross is or is not monolithic, but we presume it is); and another which is variously illustrated is the type showing a small cross on the top of a very long and thin stem. This is shown in several varieties: a Celtic one from Tiam; several from Gosforth, Cumberland; a country cross from Jouarre, in France, a very curious example, labelled early fourteenth century, and consisting of a thin round pole with a little quasi-Romanesque capital on the top (which, by the way, looks much earlier than fourteenth-century), and the cross on that. Is this a wooden or a stone cross? The texture of the drawing does not give any indication, and there is no note of this, so we presume it is stone, but it is a remarkably thin and long affair to execute in stone. A later one at Auvergne, but of the same general type, follows, and one from a church in Lincolnshire, with a crucifix and a curious little kind of section of a roof over it; and one from Tarragona, with a shrine and little figures on the top of the shaft, the cross and crucifix above. All these, differing in detail and coming from different parts of the world, show, nevertheless, the prevalence throughout Christian countries at one time for this peculiar form of monumental cross, of which, probably, many examples have disappeared, their slender proportions being such as to render them peculiarly liable to injury.

Of horizontal slabs, a number of most interesting and varied examples are included, some of them of great beauty of design; we may draw attention especially in this respect to the Early English examples shown on plate 110, and one of those from Wales (No. 2, plate 113). A considerable number of the Renaissance examples of monuments are given, though not the best available, with the exception of the tomb of Filippo Decio, of which there is a reproduction in the Florentine Court of the South Kensington Museum, and of which admirable drawings, by Mr. Oakshott, were given in the *Builder* for June 21 and 28, 1884. The delicacy of the detail is hardly done justice to in the manner of illustration adopted here.

A good many of the late Renaissance tombstones, with their pretty and naive little ornaments of vases in relief and cherubs' heads are given, interspersed with simple tombstones without any carving, but merely decorated by ornamental enrichments and by the manner of shaping the head. As this or something analogous is the only form of monument that the majority of persons can afford, a selection of examples and hints is of practical value; otherwise we should have said that the space given to them was somewhat disproportionate. The appearance of the urn in bas-relief on some of these reminds us that the urn form of monument does not appear in the book otherwise than as a sculptured adjunct in this way. The adoption of it gave rise to a fearful number of commonplaces; some of them, however, were as good as some of the other commonplaces of seventeenth and eighteenth century work given in the book; and the urn form has a certain claim to be recognised. It stands

on just the same footing as the sarcophagus; it is the retention, as a monumental feature, of a form which was at first used for the practical purpose of holding the ashes of the dead; and if (as we have little doubt) cremation becomes the mode of burial of the future, the urn form of monument is likely to have a practical meaning again, and the consideration of its effective treatment, both in a symbolical and in a decorative sense, will become one of the frequent tasks of the designer of modern sepulchral monuments.

#### A SANITARY HITCH.

THE account given in our last number of the expenditure of nearly half a million of money in outfall works, for one side of the Thames alone, coupled with the evident uncertainty of purpose betrayed by the effort to keep secret a scientific report as to what these works are expected to effect (an effort which has been so far successful, though we perceive that Mr. Rider Cook intends to raise the question again), is a matter of very serious consideration for the ratepayers and residents of London. The outstanding loans of the various metropolitan authorities, at the end of the financial year 1884-5, amounted to 35,856,494*l.* Of this sum, which does not include the capitals of the gas and water companies of the district, 18,434,101*l.* is owed by the Metropolitan Board of Works, and 5,582,031*l.* by the School Board. The former, spending 920,000*l.*, draws from the rates 760,000*l.*, the latter 887,000*l.* per annum. The Metropolitan Board of Works have spent 6,346,892*l.* on main drainage and main sewers, a sum which it is now proposed to increase by probably another million. Their expenditure in 1885 on the maintenance of the sewerage and pumping was 75,886*l.*; to which 107,063*l.* was added for "sewerage experiments and deodorising," making a total of 182,950*l.* At the same time the Thames, according to no vague rumour but to the definite statement of naval officers stationed on the river, was worse last summer below London than it ever was before. It was as bad at Greenwich as it had previously been at Woolwich. Not only so, but a new feature declared itself in the river. Persons wrote to the daily newspapers with Thames water, which was at all events inky enough to allow of the letters being read and printed. Ink is probably the right word; for it has been pointed out, ever since the details of the present mode of treatment were made known, that a combination of iron and lime always blackened sewage effluent at some distance from the outfall, even when it appeared bright and clear in the first instance. This result of the 107,000*l.* spent in experiments is not encouraging. Nor does it by any means form a good argument for the patient waiting of the ratepayers while the Board consider a report that they will not allow to see the daylight.

At the same time, the Urban Sanitary Authorities have incurred an outstanding debt of 81,500,000*l.*; the Rural Sanitary Authorities owe 1,485,000*l.* The expenditure of the former in the year 1884-85 was 14,232,565*l.*, not defrayed out of loans, and 4,150,000*l.* out of loans. The expenditure of the Rural Sanitary Authorities, from both sources, was 497,000*l.* Nor are these Authorities less in the air as to any efficient sanitary measures than the Metropolitan Board of Works. To the present hour, when the Local Government Board exerts a pressure on the authorities of some dangerously unsanitary places, what is the first step taken in consequence? A deputation is appointed, consisting, for the most part, of wholly inexperienced persons, to go round the country and see what other people are doing. Time, no doubt, in one sense of the word, is thus gained; in another sense it is lost, and money too. In one instance, mentioned in our columns in the present year, the results of such expeditions and of the subsequent deliberations on them has been the expenditure of 90,000*l.* on outfall works for 11,000 persons, with the effect of producing an intolerable nuisance, freely commented on in the press and in Parliament. Such is the

present outcome of an expenditure of ninety millions sterling, together with an annual outlay of fifteen millions a year, an expenditure blindly, steadily, and rapidly increasing.

It is not the magnitude of the thing that alarms us; it is the inadequacy of the results obtained. Nor is it so much the actual inadequacy of these results in itself, as the want of any definite, systematic, business-like attempt to grapple with the subject by bringing into a focus all that is actually known. The concealed reports and the picnic visits are consistent parts of the same want of system. However anxious a sanitary authority may be to know which plan would be likely to suit them best, they are provided with no information on the subject. The Local Government Board will offer no opinion, and institute no inquiry, except for the purpose of sanctioning or otherwise an application for loan. The entire disconnexion of all sanitary authorities throughout the country is such as to confine the knowledge which may anywhere be obtained from experience to the smallest number of people, and to prevent it, as far as possible, from becoming public property.

We are not aware of the manner in which this general and contented ignorance is fostered by that remarkable feature of our day, the advertisement system. No ill to which flesh is liable is without a cheap, ready, and certain cure, as per advertisement. If anything were needed to make confusion doubly confounded it would be this chorus of interested advice. We are not about to suggest any method of getting out of the difficulty. Not that we regard it as insuperable. If sanitary matters were taken up by the country with a patient resolve to get at the truth, and to fix and publish, step by step, the progress that is made, the matter would, we believe, be easy of attainment. But we do think it the duty of the press to call attention to the enormous and increasing expenditure; to the fact that expenditure is increased, perhaps more often than not, in the teeth of the definite knowledge of competent experts; and to the fact that one great and ever-increasing incense-cloud of dangerous and disgusting vapour is steadily ascending, most perceptibly as the temperature rises, from so great a portion of the island.

## NOTES.

 R. JACKSON paid far too great a compliment to the agitation of a small clique of persons for the registration of architects, in making it the subject of a paper before the Architectural Association, who, as one of the members observed, would have been only too glad to hear him on some more interesting subject. With his general views we are in concurrence, though we think he underestimates the possible importance in the future of the examination for entrance to membership of the Institute of Architects, and the meritorious efforts which the Institute has recently made to render membership of its body in future something like a pledge of professional proficiency in that department of professional knowledge which can be tested by examination. However, Mr. Jackson upheld the artistic standard in architecture, and for that, at least, we thank him. His paper afforded an opportunity for the promoters of the "Bill" to advertise themselves afresh, and to receive some compliments on their "honest intentions," concerning which we will only say that people are to be judged in such respects by their actions rather than by their professions; that those who believe in the disinterested aims of persons who commenced operations by sending round among the profession a printed statement that they represented the Institute and other societies which had categorically refused to have anything to do with them, must be very simple-minded and charitable people indeed; and that the idea of the social status of the profession being raised in this kind of manner is too grotesque for comment. We observe that the promoters of this Bill have been asking, through our advertisement columns, for subscriptions

in aid of their project. With their business relations with the publishing department of this journal we do not interfere, but we hope no one will be foolish enough to throw away any money in response to their appeal. As one example of the degree to which registration may be expected to raise the standard of architecture, we may mention that we were offered the other day an illustration of a new building by an architect whose name has figured among the promoters of this proposed Bill (not one of the signatories to the advertisement), which, though it was in other respects our interest to publish it as an illustration of a building likely from circumstances to be talked about, was such a wretched design that we felt we could not discredit our pages with it, and preferred to decline it. The argument is hardly any better in regard to mere constructional matters. The worst constructional disaster of this age,—the worst, perhaps, of which we have any record in English history,—was the fall of the Tay Bridge. This was unquestionably in great part the fault of the engineer, who practically confessed as much in the most pathetic manner, by dying of a broken heart; for that, we believe, was about the truth. But what possible Registration Act could or ought to have kept Sir Thomas Bouch out of the engineering profession? He could have passed any examination; he did a great deal of good work; but he for once unhappily took his responsibilities too easily, and he and others paid a fearful price for it. The remedy for such disasters is in a higher and stricter sense of responsibility among engineers and architects, and you cannot secure that by Act of Parliament.

CONSIDERABLE alarm, we are told, has been excited in the North of England by visits that have been recently paid by members of English ship-building firms to Spain, and by the opening of negotiations for the purchase, on the banks of the Bilbao river, of sites for the establishment of ship-building and marine engine works. Assuming the truth of these accounts, as at least showing that there is something in the wind, the gravity of the indications they offer can hardly be exaggerated. In the movements that have already taken place, transferring the centres of production from inland towns to seaboard or river-served towns, the great difference between the cost of land and water carriage has been put forward as a satisfactory reason for the change, great as has been the sacrifice of capital involved. We have ventured to ask whether, if these great industries once took wing, it was so certain that it would be on our own seaboard that they would always alight. In the case of two very important businesses the sea, it appears, is about to be crossed. The addition of a ship-building movement to that already noted as to the cotton industry and the manufacture of artillery is an unwelcome feature in the case. It is all very well to lay the blame on the trades unions; indeed, there can, in our view, be no question that the measures adopted by many of these bodies with a view of keeping up the rate of wages have had a directly opposite result. But the real source of difficulty and of danger lies lower. Trade-union restrictions are rather symptoms than original causes of the difficulty. The true origin of the trouble is the fact that as the productions of a country where the rate of living is, from climatic causes, necessarily high, meet with unchecked competition from the productions of those countries where it is low, the first may be gradually elbowed from the market; and the true point for the investigation of impartial and clear-minded statesmen is, whether in the measures that have been taken of late years for reducing the price of certain elements of the cost of living we have not been actually placing our own producers more and more at the mercy of their foreign competitors.

WE have not space for more than a line or two of reference to the temperate, clear, and judicious paper, by Sir Juland Danvers, on the "Defects of English Railway Statistics,"

read before the Royal Statistical Society on Tuesday evening last. It is seventeen years since Sir J. Danvers turned his attention to the working out of the average receipts and expenses per passenger and per ton of goods per mile. He is now able to state that on the East Indian lines last year each passenger was conveyed at the cost of about 0 82 pie, or, at the present rate of exchange, of 1s. 6d. per rupee, a little more than three-tenths of a farthing per mile, at a profit of about seven-tenths of a farthing; and each ton of goods was conveyed at the cost of 2 15 pies, or about eight-tenths of a farthing, at a profit of one and four-tenths of a farthing. The Statistical Society can render no better service to the country than by exerting its influence in pressing on the Government that powers should be given to call upon railway companies of the country to keep and to publish such accounts as have been long and vainly demanded by the professional authorities cited by Sir Juland Danvers.

WE are glad to learn from the last issue of the *Classical Review* (i. 10) that there is every hope that something like systematic excavations under English auspices will be undertaken in Cyprus. Archaeological, like other duties, begin at home, and it is better that we should gather in the harvest of our own island, where we have not to cope with the difficulties of Turkish firms and political jealousies, than expend our efforts further a field. Not long ago we called attention to the remarkable results of a tentative exploration of the site of ancient Marion (Poli-tis Chrysoikhou), the two unique vases,—the *Edipous* *lekythos* and the *Pasidades* *alabastos*. These have happily now, as we learn from the same journal,—an invaluable medium for archaeological news,—passed into the keeping of the British Museum. It is the success of this excavation that has "at last goaded the British public into action." At the last meeting of the Hellenic Society it was decided to appeal to the public for subscriptions. The Oxford and Cambridge travelling studentships are to be turned to account in connexion with the work. The sanguine *Review* hopes that the Government will make a special grant.

THE *Berliner Philologische Wochenschrift* (Dec. 10) reports the accidental discovery, in the island of Cos, of some sculptured remains, which point plainly to the site of the once famous temple of *Æsculapius*. An altar has been found, and a marble snake, the sacred attribute of the medicine god. It will be remembered that Strabo (book xiv., c. ii., *et seq.*) gives an account of this temple well calculated to excite archaeological curiosity. It was, indeed, as we know from many sources, only third in importance to those of *Epidauros* and *Athens*. Strabo says:—"In the suburb [of Cos] is the celebrated *Asclepion* full of votive offerings, among which is the painting of *Antigonos*, by *Apelles*. It used also to contain the '*Apophrodite rising from the Sea*' (*Anadyomene*), but that is now removed to Rome." He goes on to say that *Hippocrates* learned much of his medical lore by studying the inscriptions engraved in the temple recording cures wrought there. It is true the two chief works of art mentioned by Strabo are pictures which must in any case long ago have perished; but then, who knows how many of the "votive offerings" and the medical inscriptions are yet below ground. The excavation of the *Asclepion* at *Athens* recently yielded a rich harvest, but there is much as to the details of the cult and ritual of *Æsculapius* still to learn. It is not reported yet whether the site is to be systematically excavated.

COARSE CRAIN pit sand is well known to be more suitable material for making concrete than river sand, and owing to difficulty in obtaining the former a French concrete-maker has devised a machine for separating sand from ordinary earth by washing. The apparatus consists of a copper cylinder 3 ft. 3 in. in diameter. It is pierced with holes of varying size, the smallest being at the top and the largest, about 2½ in. in diameter, at the bottom.

The shaft on which the cylinder revolves is hollow, and through it water circulates under pressure, escaping into the cylinder through holes provided for the purpose. Hydraulic power is used for turning the cylinder at the speed of one revolution per minute. The earth is introduced at the top of the cylinder, where the smallest holes are situated, and there is an internal screw which causes it to travel through. In this way the materials of varying coarseness are separated, falling into suitable receptacles below, and are set apart for their respective uses, the coarsest being used for road-mending or concrete-making. The water escaping carries off fine sand and vegetable earth, and is run into one of two troughs in which it is kept stirred by revolving blades. The fine sand is gradually deposited, and the water, holding vegetable matter in suspension, passes to a series of basins in which the earth is deposited, and finally flows away to the river. The fine sand is used for the cement-mortar, and the *limous* is in demand for agricultural purposes. A plentiful supply of water is necessary for the successful working of the system, but in the case under notice its use has led to a considerable reduction in the price of cement pipes, together with a better quality. An account of the working of this machine may be found in the "Mémoires de la Société des Ingénieurs Civils" and in the "Proceedings of the Institution of Civil Engineers" for the present year.

DR. FRANK, of Charlottenburg, has recently given some interesting facts relative to the use of magnesia salts in place of plaster of Paris. Large quantities of potash are manufactured at Stassfurt, and magnesia salts are produced as a by-product. The possibility of finding some useful field for this has for some time occupied the attention of those interested in the industry. It was known that a mixture of chlorid of magnesium and magnesia would produce a cement, but it was not found a practical success owing to the tendency to swell and blow common to calcareous cements. Dr. Grundmann, of Herschberg, has, however, recently introduced a process which promises to relieve the overburdened potash manufacturers of some of the troublesome by-product. The magnesia is calcined and carefully slaked, and the casting made from it is afterwards exposed to the action of carbonic acid gas. The result is much the same as when a coke fire is made up in a room recently plastered in order to harden the material, as the coke fire also creates carbonic acid gas. There is a natural carbonate of magnesia, known as magnesite, which is of great hardness and density, taking a good polish. The material produced by Dr. Grundmann's process resembles magnesite in these respects. The magnesia can also be used for cementing, and in this way an artificial dolomite is made when combined with marble, or it can be used by builders as a stucco. Further particulars may be found in Glaser's "Annalen für Gewerbe und Bauwesen."

THE results of some German experiments, made by Herr J. Bauschinger, to give information on the elasticity and strength of the wood of larch, pine, fir, and deal, have recently been published. The tests were made on pieces taken from stems 13 ft. 1½ in. long, cut off 1 metre from the ground. A large number of experiments were made, the following being some of the chief conclusions arrived at. Crushing strength and density vary with the degree of moisture; bending and crushing strength form the best basis for estimating the quality of the timber; the bending strength is greatly influenced by the nearness of branches to the critical section; the modulus of elasticity and the bending and crushing strength are connected by some law, which can probably be represented by a simple linear equation; where the rings of growth have the same breadth in various samples, those with the greater proportion of summer growth are the stronger. The connexion between the crushing strength and density may be approximately represented by the formula,  $B = 1,000 \delta - 100$ , where B is the

crushing stress in kilogrammes per square centimètre, and  $\delta$  the density. These tests are quoted in the "Proceedings of the Institution of Civil Engineers," vol. lxxxix., p. 5.

"LA NATURE" gives some particulars communicated by Mr. H. Bonnami of an apparatus for testing the setting of lime and cement. It consists of a tube having, at its lower end, a flange which rests on the piece tested. On one side of the tube is a set screw, and inside it there is a rod, attached to the lower end of which is the needle by which the test is made. This needle is 1.180 in. long, and has a cross sectional area of 0.0015 square inch, or one square millimètre. On the upper end of the rod is a table upon which zinc discs, each weighing 1.76 oz., are placed to the required number. The rod weighs also 1.76 oz. On the side of the rod opposite the set screw there is a notch, the upper surface of which forms an inclined plane. Against the latter the end of the screw presses, and it will be obvious that the rod may be raised or lowered in the tube by turning the set screw either one way or the other. The setting of the cement is shown by the weight required to cause the needle to penetrate a certain depth, the latter being registered by a scale on the upper part of the rod. The instrument is described in the "Transactions of the Institution of Civil Engineers," and in the original communication in *La Nature* tables were given showing the difference in the progress of the setting of various products.

THE measured drawings and studies submitted for Col. Edis's prize for "the best series of measured drawings and sketches of any buildings in Great Britain and Ireland, of any style of architecture current between 1600 and 1800," has only been responded to by three competitors, whose merits, however, seem on the whole pretty evenly balanced, though we do not question the decision arrived at in favour of Mr. Greenslade's set. We understood from the terms in which Col. Edis announced, at a meeting one evening, his intention of offering the prize, that his idea was to make a practical protest in favour of measured drawings as against picturesque sketching, and therefore we were surprised to find perspective sketches included; but these appear to be secondary to the measured drawings, which in all the three sets seem to have been carefully done, and are, moreover, very neatly and effectively drawn without losing practical clearness. The author of the premiated set has taken the old Exeter Guildhall as his principal subject. The sketches by the late Mr. Devey, which have been hung at the Institute, are beautiful examples of picturesque sketching, getting a great deal of effect by a few broad washes of colour here and there on a toned paper. In the Arbitration Room have been hung the drawings submitted for the special Travelling Studentship in connexion with the Archaeological School at Athens. This, as elsewhere mentioned, has been awarded to Mr. R. Elsey Smith, whose drawings seem to show a fitness of things in the selection, as he alone exhibits drawings of Greek detail sketched on the spot, and also shows by one or two drawings from casts of figures and busts that he is equal to making a satisfactory drawing of a bit of antique sculpture, which may be of practical advantage, or even necessary, in work in connexion with the School at Athens.

THE best portion of the Exhibition of the Society of British Artists, in Suffolk-street, is in the first two small rooms, among the water-colours, where there are a good many very nice things, mostly small and slight, but interesting and original; among the larger and more finished works is a fine and solid, though rather loaded, drawing by Mr. Bernard Evans, of "Bolton Abbey from the Moors" (28). There are two noteworthy drawings by Mr. Fraser, "Barling Gap, Sussex" (173), and "Brighton Trawlers" (93); in the latter the craft are plunging through and throwing up the water with great vigour, but the artist has not got the surface and transparency of water,

only its movement. As to the large room, it contains a few good things amid a number of works either hopelessly mediocre or ostentatiously eccentric. The "Birth of Venus," by "Mr. William - Stott of Oldham," as he chooses to be called, is a mere monstrosity; and we cannot but wonder that Mr. Arthur Hill, who can paint the figure well, as shown in his "Young Slave" (240), should be content to exhibit in a gallery where such a production as this "Birth of Venus" is given a central and prominent place. Most of the things which are out of the run of commonplace are absurd eccentricities,—clever sometimes, but not worth going to an exhibition to look at, certainly not Mr. Whistler's scratches (we cannot call them drawings) which are hung on the stairs. The staircase and entrance have been treated as a "symphony in white," and look very well, but that only makes the greater part of the interior contents of the rooms the more disappointing.

WE frequently hear that very queer appointments are made to Surveyorships of Local Boards and Sanitary Authorities, and a query we have received this week seems to indicate that this idea is founded on fact. A correspondent writes to us on the headed paper of a certain provincial Highway and Sanitary Authority, under the signature of "Nemo," but with his name on the corner of the paper and "C. E." after it, to ask us to "give him the formula" for calculating the cubic contents of an apartment, which is a simple parallelogram with a semi-octagon lay at one end of it and a semi-circular bay at the other: heights figured. This problem seems to be too much for the "C. E.!" People who are so ignorant of their profession have no right to trouble a journal with "problems" which they ought to have been familiar with in their pupillage; and if "Nemo" asks us any more questions of the kind we will give him an answer, but we will give it with his name and address. In the present case we merely tell him that he will find the "formula" for the area of a circle in any primer of geometry, and he had better get one and improve his education; the rest of the matter, of course, does not even require a "formula." The question is, how did this gentleman come to be in a position to have his limited knowledge put to such exacting tests?

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The fourth ordinary meeting of the present session of this Institute was held on Monday evening last, Mr. Edward P'Anson, F.G.S. (President), in the chair.

*The Edis Prize, Drawings by the late Mr. George Devey, &c.*

Mr. J. Macvicar Anderson (Hon. Sec.), announced the winner of the Edis Prize to be Sidney K. Greenslade, of 42, Ockenenden-road, Islington. He further intimated that the Studentship of 50l. instituted by the Committee of the British School at Athens, with a similar sum added by Mr. P'Anson, had been awarded to Mr. Ravenscroft Elsey Smith, son of Professor T. Roger Smith.

Mr. Macvicar Anderson also pointed out that on the screens were to be seen two different sets of drawings of great interest and excellence. One set had been executed in the South of France by Mr. Needham Wilson, Soane-Medallist in 1886, and to whom the Council had awarded the money premium connected with the medallion. The other set consisted of sketches by the late Mr. Devey, lent by his executors for exhibition. These were of great interest not only from the fact that Mr. Devey was no longer with them, but also from their intrinsic beauty and artistic excellence.

#### Proposed Art Exhibition at Munich.

Mr. Macvicar Anderson then read the following letter, addressed to the Secretary of the Institute:—

"Foreign Office, Dec. 15, 1887.  
SIR,—I am directed by the Marquis of Salisbury to state to you, for the information of the Royal Institute of British Architects, that his Lordship has been informed by the German Ambassador at this Court that, with the support of the Bavarian Government, the third International Art Exhibition will be opened at Munich from

the 1st of June next until the 3rd of October, and is intended to celebrate the hundredth anniversary of the first Art Exhibition held in that capital. His Lordship is of the opinion that this Exhibition is under the patronage of H.R.H. the Prince Regent of Bavaria, and, as it is especially desired to obtain the co-operation of foreign artists, with the view of enhancing its interest, he has been requested to name it known to British artists.

I accordingly enclose you copies of the programme and regulations of the Exhibition, in order that publicity may be given to its objects, and am to request you to inform me what prospect there is of British artists taking part therein.—I am, Sir, your most obedient humble servant,  
(Signed) JAMES FERGUSON.

Mr. Anderson added that an answer would be sent to the effect that the Council would have great pleasure in giving publicity to the communication, with a view to British architects taking part in the Exhibition.

#### The Recent Development of the City of Vienna.

Mr. Frederic R. Farrow (holder of the Godwin Bursary) then read a paper on "The Recent Development of the City of Vienna," of which the following is an abstract:—

The author commenced by describing the separation between the City of Vienna and its surrounding town by a system of fortifications existing previous to 1857, and the proposals made to remove the separation, leading to the decree of the Emperor, issued Christmas, 1857.

**Decree of the Emperor.**—This decree provided for the removal of the fortifications, the appropriation of the area partly for open spaces, partly for sites of public buildings, for the formation of a boulevard round the city and a quay next the Danube Canal, for the sale of surplus land to form a fund from which were to be erected numerous public buildings, and for the promotion of a competition for designs of the proposed scheme.

**Carrying-out of the Decree.**—The competition was held, an official plan subsequently prepared in the Office of Works of the Ministry of the Interior, and the work commenced. The Stadt Park, the Palace Court, People's Garden, Rathhaus Garden, and the Place in front of the Votive Church laid out as open spaces. The building fund was established by the sale of surplus land at prices ranging from 150,000, to 300,000, sterling per acre, from which was defrayed the cost of erecting public buildings on the plan.

**Museum of Applied Art.**—Erected for the purpose of a Museum and Technical Art School during the years 1868-71 from the designs of the late Freiherr von Ferstel, Royal Gold Medalist, at a cost of 65,000.

**Cur Saloon in the Stadt Park.**—A building used as concert-room and café, designed by J. Garbeu in florid Italian Renaissance.

**Opera House.**—Was the first public building erected on the Ring, having been built during 1861-1868 from the designs of Vander Nüll and Von Siccardsburg, at a cost of 500,000, for the accommodation of an audience of 3,000 persons.

**Academy of Fine Arts.**—Facing the Schiller Platz, designed by Baron von Hansen, and erected in 1874-76. Contained galleries for casts and pictures, library and reading-room, and accommodation for students of architecture, sculpture, painting, and etching.

**Museums of Art and Natural History.**—These twin museums, intended to form, with the Imperial Palace now in course of erection, one grand conception, from the designs of Semper and Hasenauer were commenced in 1872 and completed in 1884.

**Houses of Parliament.**—In Classical Greek style, designed by Baron von Hansen, consisted in the main of a one-story building on a basement, and provided for a House of Peers and a House of Representatives, with the necessary offices, &c.

**Rathhaus.**—Designed by Freiherr Friedrich von Schmidt, Royal Gold Medalist, whose plans were selected in open competition. Erected in 1872-1884, in Modern German Gothic style, with an admixture of Renaissance features. Included a grand ball-room, 12,000 ft. superficial area and 45 ft. high, with its attendant snapper-rooms, salons, &c., a council chamber and municipal offices.

**University.**—The buildings contained forty-six lecture-rooms for 6,000 students in the faculties of arts, laws, medicine, and theology; three large halls for festive occasions; examination-rooms, and a fine library, on the model of the Ste. Geneviève at Paris, for 32,000 volumes and 520 readers. The buildings were designed by Baron von Ferstel, commenced in 1874, and completed in 1885.

**Court Theatre.**—Designed by Semper and

Hasenauer in florid Renaissance, thus contrasting with the other buildings in the same group,—the Houses of Parliament in Greek, the Rathhaus in German Gothic, and the University in severe Italian Renaissance.

**Ring Theatre and its Commemorative Building.**—On the site of the Ring Theatre, destroyed by fire, 8th December, 1881, *Das Kaiserliche Stifungshaus* had been erected, from the designs of Baron von Schmidt. This building contained a commemorative chapel and suites of residences in "flats." These latter were especially noteworthy, as showing the latest phase of feeling in Vienna in respect to such domiciles, the rooms being for the most part entered directly from a vestibule or corridor, a distinct departure from earlier types of plan, in which the only means of access to many of the apartments was by transit of other rooms.

**The Bourse.**—Designed by Baron von Hansen, and erected in 1870-1875 at a cost of about 350,000. The great hall, of basilican form, 195 ft. by 130 ft. in extreme dimensions; offices for bankers and stockbrokers, a corn exchange, &c.

**Hotels on the Ring.**—The Grand Hotel, on the Kärntner-ring, with 300 visitors' rooms; the Hotel Imperial, also on the Kärntner-ring, formerly the Palace of the Duke of Württemberg, and the Hotel Austria, on the Schottenring, each with 150 rooms, and the Hotel Métropole, on the Franz Josef's Quay, with 400 visitors' rooms.

**Palace of the Grand Duke William.**—On the Park Ring, overlooking the Stadt Park, designed by Baron von Hansen.

**Houses in "Flats."**—The "Heinrichshof," one of the largest in Vienna, situated on the Ring, and built from the designs of Baron von Hansen. The house "Zur Kugel," or Globe House, erected in the Hof, in the Baroque style prevalent in old Vienna, from the designs of Ludwig Tischer, combining café and restaurant with dwellings on the upper floors, planned on the most modern system, with the rooms entered from vestibules or corridors. House of Herr Neumann, in the Rudolfs-platz, with stone façade, an exception to the stucco generally used in Vienna. The "Arkaden-Häuser," near the Rathhaus, luxuriously fitted blocks of residences, with cafés and restaurants on the ground floor. A group in the Stadiongasse, also near the Rathhaus, planned on the older system of residences in "flats." The Schwarzenberg group, containing 100 dwellings in three blocks, also planned on the older system. The private house of the brothers Böhm, in the Maria Lifer-strasse, with the ground floor arranged for shops and small residences for letting, and the third floor also arranged for letting, and the Commercial Bank, a combination of business premises and residences on the upper floors.

**Other Developments of Vienna Architecturally.**—The author briefly noted some of the churches of Friedrich Schmidt, the Brigittenau, the Weissgärber, the Lazzaristau, and the octagonal planned and domed Gothic church in Pfinzhaus.

Mr. Thomas Blashill, Superintending Architect to the Metropolitan Board of Works, next read a short paper on the subject of "Architectural Design in Viennese Buildings." He commenced by referring to the drawings and photographs he had obtained during a recent visit to Vienna, which illustrated most of the important new buildings. A plan, prepared in the office of the architect to the municipality, showed the situation and surroundings of the city, which, as regarded latitude and altitude, only slightly differed from London. The climate, however, differed materially, and the general brilliant sunshine makes Vienna, to English eyes, first of all, bright. It could not be called a manufacturing or commercial city, but more the residence of the Emperor and wealthy classes. In some of the enclaves were important villas, but the middle classes lived mostly in flats, in which accommodation was far more expensive than a house and garden in London. The working population occupied houses of some architectural pretensions, with rather high rooms, in which, however, they were closely packed. From an elevated point, near the beautiful "Volks garten," the chief of the new buildings could be seen: the Hof, or Court, theatre, now being completed by Baron von Hasenauer, sumptuous in design and decoration and open on every side; Ferstel's University, and his Votive Church; the Palace of Justice; the Town Hall, by Baron von Schmidt; and the Houses of Parliament, by

Baron von Hansen. These names would be familiar to the Institute as those of past or present Honorary Corresponding Members. Following along the wide Ringstrasse were the two Imperial museums, and opposite to them the new palace of the Emperor was slowly rising. Blocks of private houses filled up intervals and formed backgrounds to the view. The new Opera-house, rather beyond the view, was a fine Renaissance building, possessing an auditorium very successful in respect to sight and sound. The grand church of St. Stephen was a rare ancient example of the Gothic style, but the Votive Church and the Town-hall were almost the only modern instances of Gothic in that area, the group of spires in the latter forming a picturesque feature above the horizontal lines of the general mass of buildings. The sober character of the great mass of Italian designs was striking. Doorways, windows, &c., seemed old friends of thirty years' standing, and, though specimens of good Renaissance were not wanting, there was little or nothing of the very "Free Classic" which, in the interval, had flourished in London. The Houses of Parliament was the only instance known to Mr. Blashill of the successful use of the Greek style in a large and complicated design. In this work it was developed into life and beauty. The building was of greyish-white marble, and the interior richly designed in coloured marbles, adorned with figure sculpture and harmonious decorations. Figure sculpture was a striking feature of the new architecture of Vienna. It was very cheaply executed, and was employed in every situation in which the human figure could be placed in the exterior of a building, and also much used in interiors. The bold elevation of the University building furnished a good example of external *sgraffito* work. In Vienna, it seemed probable that it would long retain its freshness. Terra cotta was used in enriched friezes and figure sculpture. Although much used, brick was seldom seen in the elevations of important buildings, much of the architecture being executed in cement upon a structure of brick. Stone was not the local building material, but good grey marble, reddish-white marble, and light grey limestones were obtained for important buildings, besides the richly-coloured marbles lavishly used inside the Houses of Parliament. Portland cement had been much used, but old work executed in a local plaster were well, and this plaster was still used. The new improvements were the result of a grand combination of tact, talent, and business capacity, and were worthy of study. Having referred to the employment of women as bricklayers' and masons' labourers, Mr. Blashill concluded by expressing his thanks to Baron von Hansen, Baron von Hasenauer, and Baron von Schmidt, who had received him cordially, and rendered him much assistance.

Mr. William Woodward, in opening the discussion, said he had listened to Mr. Jackson's remarks before the Architectural Association the other evening to the effect that the history of architecture was mere antiquarianism, and that building operations were confined to the builder. He had also heard Prof. Kerr, in an eloquent and commendatory peroration, endorse to some extent the views laid down by Mr. Jackson.

Prof. Kerr protested that Mr. Woodward was not correctly stating what took place.

Mr. Woodward continued that he was, therefore, not surprised at the absence of the representatives of high art, and of artistic architecture, on the occasion of the reading of papers on the laying out of streets ("a voice: "Query")? Mr. Woodward then went on to criticise the way in which the Metropolitan Board of Works laid out new streets in London.

Mr. Henry Dawson proposed a vote of thanks to both the readers of the papers. They were very much indebted to Mr. Farrow for the painstaking manner in which he had brought the different features of Viennese architecture before them. It would take too long to enter into a discussion of the details contained in the papers, but he believed they formed, taken together, one of the most useful contributions of the kind the Institute had had for some time past.

Mr. Arthur Cates in seconding the vote of thanks, said he considered the members were very much indebted to Mr. Farrow and Mr. Blashill. Mr. Farrow had had the advantage of visiting Vienna as Godwin Bursary, and it was to their respected friend, Mr. George

Godwin, that they owed a great deal of what Mr. Farrow had given them (applause). The result of Mr. Farrow's labours showed how great an advantage was to be derived by a young man from obtaining the Bursary so liberally and generously founded by Mr. Godwin. He was sorry, therefore, that on the last occasion on which the Bursary was offered there was no competitor for it. Whether that arose from the profound ignorance of modern languages which characterised the generality of the young men of the day, or from indifference to foreign ideas, he could not say, but the fact that there was not a single competitor for the Godwin Bursary was not creditable to the Institute or to the profession at large. They were especially obliged to Mr. Blashill, considering the high position he occupied, in devoting so much attention to what was being done in Vienna (applause). Thus that evening they were favoured on the one hand with the views of the student, and on the other hand with those of the mature official, highly placed. He believed, indeed, that London, which had suffered so much in years past from great neglect, would derive much advantage from the studies Mr. Blashill had so well made and put before them that evening. There was a curious parallelism between what had been done in London and what had been done in Vienna. About the year 1856 a great project was set on foot in London for what was called the Public Offices, and a very beautiful plan by a Belgian architect, he believed, was presented for reconstructing the district between Whitehall and Westminster Bridge. The result could be seen in the Foreign and Home Offices, and in the shattered scheme for the Admiralty and War Offices, which had been withdrawn in order that the old and somewhat wretched buildings of the Admiralty should be extended with buildings of a similar kind, while part of the site acquired for the Public Offices was to be sold as a commercial speculation to meet the cost. When they considered the expenditure on those Viennese buildings, they ought, as a nation, to be ashamed of themselves. The contrast between what could be seen in Vienna, Prague, Munich, Dresden, Berlin, and other Continental cities in the way of a wise expenditure for the improvement of these cities, and for the people's pleasure, and what was done in this country was very great indeed. He could not say that the Continental architecture was in all degrees perfect, but it did show much consideration for general harmony of composition, for outlay, and for liberality of conception. He knew of nothing finer than the great staircase of the University of Vienna, or the large hall of the Reichsrath, and the same principles governed the whole of the designs. The key to that was doubtless the fact that the architects were subjected to academic training, which might produce some hardening of the eye and hand, but which, at the same time, gave that idea of harmony and power of general disposition which was so important, but which unhappily so many English architects neglected. He did not know that our public bodies were so much to be blamed. The architects themselves had not the courage to lay down their plans with due regard to liberality of disposition, but were always overcome with the idea of economy, encouraging their employers to cover every inch of the ground, and especially so in London. As Mr. Farrow had shown, ground in Vienna was at least as costly as in London, and while house-rent was more than double, yet they were ready to make open spaces for the beautification of the city, and the benefit of the public at large. In London, and in England generally, in place of that wise and generous expenditure, every scheme was spoilt and blasted by what could only be termed a profligate parsimony and a wasteful economy. There was a curious parallelism also between Vienna, Paris, and London. The Ring Strasse of Vienna was constructed upon the site of the old fortifications. In Paris, again, the magnificent boulevards occupied a similar place. In London there were no boulevards, but about the year 1750 a scheme was set on foot for forming a new road from Islington to the City. In 1757 an Act was passed authorising the formation of the "New Road," which was now known as Marylebone-road, Euston-road, and the City-road, with an express provision that the road should be of a certain width, and that no buildings should be constructed within 50 ft. of the line. Any one

who walked along the New-road of to-day would say that it was one of the most miserable examples to be seen in any great metropolis (applause). If its wretched shops could be cleared away, and the road restored to its original state it would be evident that a magnificent opportunity had been lost for placing public buildings along the line, and making a fine Ring Strasse. The opportunity had gone, and he only referred to it as a warning, so that in future care should be taken that no more of such buildings were erected on the western part of the thoroughfare, which had been saved by the fortunate intervention of the freeholder. London, at one time, had magnificent streets and open places, but in too many instances the buildings had been brought up to the edge of the road. He had been much struck, in successive visits to Vienna, with the development which had taken place there. Mr. Blashill had shown that the success used externally was not of an offensive character. Mr. Blashill had spoken well and truly of the respect in which the Baron von Hansen was held by his pupils. Some three or four years ago, when the Baron entered on his 70th year, it was the subject of general congratulation, and the period was marked by great festivities. The Academy at Athens, to which reference had been made, was a building of exceedingly pure Greek work, and its design and execution were of the highest character, while the marble masonry was in accuracy and fineness almost equal to the best masonry in the Parthenon. Mr. Cates bore willing testimony to the extreme kindness and courtesy with which the Viennese architects received their brother professionals from England. Of all kind friends he had met there, the kindest was Baron von Hansen, who, old as he was, still devoted himself to the completion of the decoration of the Reichsrath.

Professor Kerr thought the discussion had gone into a very proper channel. They were indebted to Mr. Woodward for bringing it into that channel, and to Mr. Cates for the remarks he had made, but what they must bear in mind was this, that the authorities in this country could not exercise full powers over the architectural decorations of the metropolis. They, as architects, might fret under such a state of things, but when they considered that the Metropolitan Board of Works was under the control of the ratepayers, and Parliament the same, it was obviously impossible to achieve such works as were accomplished by Imperial Governments on the Continent. Public architecture did not flourish under a Government like ours, and he was afraid it never would except in this way. If they went through the City of London they would see many buildings which, with all their faults, constituted a series of works which were considered by foreigners to be exceedingly creditable to English taste and English enterprise. And it must be borne in mind that our system of architecture was different from any Continental system, relying, as it did, on individuality of design and effort. Whatever was done in this country was accomplished by the hive of bees working each one by itself. What was accomplished on the Continent was done by centralised power. This ought to be borne in mind, and they should take to themselves the credit of at least doing their own work in their own way, and in such a manner as to be considered honourable by those who were strangers. At the same time, it was well that the Institute should never cease to deplore the fact of the public authorities not being alive to the great principle that the decoration of a town "pays" (applause). What would France be without the liberal expenditure upon art which characterised her Budget every year? England had no Art Budget, and they, as architects, could not too often impress upon the public and the Government the great economical maxim that the expenditure of public money upon art was a beneficial expenditure for the nation at large, and a most profitable investment. (Applause).

The President said it was now fifty years since he saw Vienna, and six years since the first steps were taken to embellish and improve that ancient city. What had fifty years of comparative peace after twenty or thirty years of desolating war not done? It had not only affected Vienna, Paris, Brussels, and Berlin, but London also, and in spite of the shortcomings of our administrators and the little interest that was admittedly felt by this nation in art, he would ask what had not been accom-

plished in London? London was a fine city among the fine cities they had been talking about, and in spite of what had been said regarding the much-abused Metropolitan Board of Works, what finer work had been accomplished amongst the cities of Europe than the Thames Embankment, which had been carried out by that much-maligned Board? (applause). Some reference had been made to the satisfactory use of plaster on the new buildings at Vienna, and he might add that in some of the noblest works plaster had been very satisfactorily used. The Farnese Palace at Rome was plastered externally, the dressings being of stone. Many of the finest palaces at Genoa were plastered, and if it were applied as plaster, and did not pretend to be stonework, it might be satisfactorily applied even in the grandest buildings. The resolution was then put, and carried by acclamation.

Mr. Farrow, in returning thanks, added that as an illustration of the enormous rentals paid in Vienna for a suite of rooms on a flat, one gentleman he knew, with a salary of 300*l.* a year, was paying 100*l.* for his rooms on the third floor of one of these buildings. The *straffito*, which was used somewhat largely in Vienna, was to a greater extent used in Buda-Pesth. Besides the numerous Bohemians who came to work in Vienna, large numbers of Italians also came, the latter being employed in masonry work.

Mr. Blashill also returned thanks, and bore testimony to the excellent practical information which Mr. Farrow had given them that evening.

The President announced that the next meeting, which would be a special general one, would be held on the 16th proximo, for the award of prizes and studentships, the work for which was to be submitted before the 2nd of January.

Mr. W. H. White (Secretary) announced that the Exhibition of Candidates' Drawings for Studentships, Prizes, &c., which would open on Friday, the 13th of January, at noon, would close on Saturday, the 21st of January, at four p.m.

The proceedings then terminated.

#### THE CONSTANTINOPLE MUSEUM.

Sir,—My report to the Chairman of the Palestine Exploration Fund (printed in your paper of the 10th inst.) respecting the Sidon sarcophagi has, I find, attracted much attention.

These monuments will be bonded in the Museum at Constantinople when the additions to it are completed; and as I find that its existence even is very little known I think that a short description of its present position and that of the School of Art which is connected with it may not be uninteresting to your readers.

The Museum is located in the gardens of the Seraglio, and may be approached either by the tramway leading to St. Sophia or by water, the visitor landing at the quay under the old walls, which are there well seen.

A good opportunity is also thus afforded of seeing the well-known inscription upon them, the greater part of it being very well preserved.

The Museum building was formerly the Tchinihi-Kiosk; in itself an object of interest as it is said to have been built A.H. 870 (A.D. 1466), and to have been the first monument erected by the Turks after their conquest of Constantinople.

It was repaired and embellished A.D. 1590, and is in a beautiful position, is very picturesque both externally and internally, and is very fairly lighted.

The collection is at present small, but comprises several objects of great interest. Amongst them may be noticed a marble sarcophagus splendidly sculptured with mythical scenes (Ariadne, &c.), and supposed to be of the time of the Antonines, a large collection of gold and other objects found by Dr. Schliemann at Hisarlik, and three terra-cotta sarcophagi found at Clazomenae, which are considered by the Director to be Assyrian. To me they appear to be more nearly allied to Greek art. These sarcophagi have no covers, but there is a fourth sarcophagus, not yet exhibited, which has a circular-headed cover.

The Museum possesses, also, one of the serpent beads of the famous bronze tripod in the Hippodrome and two bronze figures of

extreme heauty, though somewhat injured, and assigned by various authorities to the age of Polyctetes and Praxiteles,—certainly before Lysippus. They are said to have been found at Tarsus. Of these and the other interesting contents of the Museum there is, unfortunately, no catalogue.

When I visited the Museum some few years since there was a very good one, drawn up in French by M. S. Reinach, from whose description much of the above is given. But this is now out of print, and no other has been issued, the Director waiting, as he told me, until the new objects from Sidon, &c., can be properly housed and classified. The absence of a catalogue and of any descriptive notices on the objects, together with the difficulties which are placed in the way by the attendants of making even rough sketches, seriously interfere with the utility of this otherwise very interesting collection.

In the same garden, equally well-placed with the Museum, is a school of art, to which his Excellency Hamdi Bey pays great attention, he being, I am told, encouraged in this work by the direct approval of the Sultan himself.

I went all over this school at the invitation of Hamdi Bey, who is anxious to make his work widely known, and to have the co-operation in it of European societies and lovers of art generally, by furnishing him with casts, copies of Transactions, &c.

There were at the time of my visit, I was told, 130 students of various nationalities,—no test of any kind being required. They were being instructed in separate classrooms in perspective, drawing from casts and from life, colouring, the elements of architectural design, and, generally, in all the work of an art school. The only objection as to the architectural work which I had to offer was that the teaching was altogether French as regarded the style of design, although the school had the beautiful forms and details of Byzantium at its very doors.

But this matter may be (and I trust will be) remedied, and the school then be of much benefit to native art. It certainly appears to have a very successful beginning.

T. HAYTER LEWIS.

*Athenæum Club.*

#### THE PROPOSAL TO MAKE ARCHITECTURE A CLOSE PROFESSION BY IMPOSING THE TEST OF EXAMINATION AND REGISTRATION.\*

The subject on which I propose to address you to-night is not one in which I have myself taken any pleasure, nor does it fall within the usual scope of those which are discussed by your Society, which has for its object the improvement of its associated members in that noble art to which we have devoted our lives. The proper subject for our habitual thoughts is not architects, but architecture; not ourselves, but our art; and I would much rather have talked to you about brick and stone, timber and marble, than about Acts of Parliament, registers, and examinations. But however much we may grudge the time which it is necessary to bestow on questions of professional practice, it is obvious we cannot afford to neglect such questions entirely, especially when they affect not only the personal well-being of architects themselves, which is or should be a very secondary consideration, but the actual well-being and progress of architecture.

Such a question is the one which I have chosen to speak about to-night. It is obvious that so sweeping a revolution as that by which what is now a free and liberal art, to the pleasures and honours of which all may aspire who can obtain employment, would be converted into a close profession like law, physic, and divinity, to which admission could only be obtained by apprenticeship, payment of fees, examination, and diploma, could not be effected without influencing for good or for evil the progress of architecture in the kingdom. It is, therefore, a matter which ought to be thoroughly considered in all its bearings, and from all points of view, both by those who follow architecture as a profession and by all others outside our ranks who value the progress of art among us. Nothing could be more

disastrous than that such a radical measure should be hurried through Parliament and become law without any real certainty that it is desired by the public, or even by the whole body of architects; without any clear prospect that it would help to improve the architecture of the day, or even that it would not, on the contrary, fatally injure it; without due consideration for the case of those on whom the new restrictions would press with undeserved hardship; and, above all, without proper intelligence of the undoubted blessings of liberty from State or bureaucratic control which we should sacrifice. This thorough and impartial consideration the proposition has never yet received. The advocates of the measure have had their say, and have probably said all that is to be said on their side of the question. Those who object to it have been generally silent; the success of the scheme seemed to them unlikely, and the attempt to carry it out not dangerous; and they have consequently turned away with a feeling of security from the discussion of a question which, while it remained a mere question, was uninteresting to them. The time has, however, arrived when their views ought to be known, and the arguments against the proposed change ought to be listened to with equal attention to that which those of their opponents have received. It is for this reason, therefore, that I have chosen as my subject to-night "The Proposal to make Architecture a Close Profession by imposing the Test of Examination and Registration." It seemed to me also that the discussion which I wish to provoke would, with special propriety be begun by one, like myself, who is not a member of the Institute or any other architectural society, and who may therefore be regarded as in a special way able to look at the matter impartially.

The history of the scheme and its growth from a mere speculative idea into the concrete form of a Bill, which it was sought to bring into Parliament last session, is given briefly in the *Journal of Proceedings of the Royal Institute of British Architects for November last*. From that account it appears that the Council of that Society for 1859-60 reported that "the establishment of a system of compulsory examination, extended to all architects, whether members or not of this Institute, was considered desirable." The first step taken towards this end was the establishment of voluntary examinations of candidates for admission to the Institute, which, after some twenty years, became compulsory. The further extension of this examination is now seriously contemplated, and Mr. Connon, the author of a paper in the *Journal* I have just cited, says that "should compulsory registration become an accomplished fact, the registering and examining authority should alike be vested in the Institute."\* Meanwhile, however, in the absence of any sort of coercion, it would appear from the same account that these examinations have not been attended by a great measure of success. From 1861-51, while the examinations were voluntary, the average number of candidates who passed annually was less than three; while, since 1882, when the examination for admission to the Society became compulsory, the number has risen only to twenty or thirty, although, according to one statement, no less than 400 students, on an average, enter the profession yearly. It is clear, therefore, that we are very far from the state of things contemplated by Mr. Connon under which the Institute would hold the keys of admission to the profession.

As a step towards the attainment of that object, it is now proposed that all the local architectural societies in the kingdom should accept the Institute as a common head, to which they should be affiliated, so that the parent society should stand to architects in the same relation as the Incorporated Law Society to solicitors and attorneys. But in spite of the analogy, this dignified position will not, it seems, be willingly accorded to the Institute by those who promote compulsory registration, and it is from the dissentients that the first tangible scheme for closing the architectural profession has seen the light in the form of a Parliamentary Bill. Whether if registration were carried the Institute would have the management of it or not it is unnecessary to discuss here. I should myself agree with Mr. Connon that it would be the natural and most convenient plan; but this is only a matter of detail, and I wish to-night to confine myself to

principles. Setting aside this point, the Bill, of which I dare say most of those in the room have seen an abstract, may be taken to give correctly in the main the nature and scope of the restrictions which it is desired to place on the pursuit of our craft. I propose to examine them in detail.

The Bill calls itself "The Architects and Engineers Act," but it includes surveyors also within its jurisdiction, and its object is to combine architects, civil engineers, and surveyors,—surely a strangely heterogeneous assembly,—into a close profession of which the members are to be registered after a qualifying examination, and of course payment of certain fees. After a certain date it is proposed that any unregistered person calling himself an architect shall be fined 20*l.* for the first and 50*l.* for each subsequent offence; that no public body shall give him any appointment; that his certificate shall have no legal value; and that he is to have no *locus standi* in a court of law for recovery of his professional charges. The only way to registration is to be in the first place by apprenticeship to a registered architect for a term in general of five years, and afterwards by examination. The term of apprenticeship is reduced to two years in the case of assistants of five years' standing and students who have passed the examination of the Institute or others like it; while assistants of eight years' standing are excused the examination, though one reads with surprise that even they are expected to serve an apprenticeship of two years beyond that time. Such is the outline of the Bill, which may be summed up in three words: registration, to which the avenue is by apprenticeship and examination.

Looking more closely at the details of the Bill one cannot but be struck by the unequal measure meted out to apprenticed pupils and assistants. The apprenticed pupil may present himself for examination after five years' pupillage, but the salaried assistant after serving five years must undergo two more as a pupil before he can do so. Now it is likely that before he became an assistant he had been some years learning his business in an inferior capacity, so that probably he would have undergone a probation of nine or ten years before, in the opinion of the framers of the Bill, he was qualified to offer himself for examination. But during these five years the assistant is at least as likely as not to have made better use of his time than the pupil, and it is simply unjust that the man who can afford to pay a premium should be floated into the profession at the end of the time, while, from want of a golden key, his poorer companion has to go to school again for two years more. This is a hard case enough, but what must we say to that of the assistant who is to be subjected to two years' apprenticeship after eight years of service as a draughtsman, which probably implies twelve years or more of training, for a profession to which the man with a premium in his hand may obtain admission after five years or less. If the final qualification is to be by examination, what need is there for the further qualification of apprenticeship? If an assistant or any one else can pass the examination, that ought to be enough. But this evidently is not the intention of the Bill, which proposes to adopt the restrictions of the old trade guilds and modern trade unions. Like them, it makes apprenticeship the only door of entrance, and as no architect in his senses would take pupils without a premium, their services being of little or no use even at the end of their term, the result would be that there would be fewer architects to share the same amount of work, and that poor men, however well qualified, would be left on the outside of the door, while a golden shower of premiums would fall on those who are on the right side of it. As the same fortunate persons are to have the sole right to hold public appointments, it is easy to see who would be the gainers and who the losers by the new state of things. Although the Bill professes to be drawn in the public interest, it is not our fault if it awakens that incurable suspicion with which we regard those who propose that certain privileges and advantages should be conferred on them because it will be for the public good that they should enjoy them.

The preamble of the Bill, however, boldly takes its stand on the ground of public interest. It runs thus:—"Whereas it is expedient that persons requiring professional aid in architecture, civil engineering, or surveying, should

\* A paper by Mr. T. G. Jackson, M.A., F.S.A., read at the Architectural Association meeting, at 9, Conduit-street, on Friday, December 16, 1887, is elsewhere mentioned.

be enabled to distinguish qualified from unqualified practitioners, be it therefore enacted," &c.

This beginning would naturally lead one to suppose that the Bill emanated from the public, anxious to protect itself from incompetent practitioners. Nothing, however, can be farther from the fact. The scheme for closing the profession, and this Bill, which is the first outcome of it, are the offspring of architects; they come from within the profession itself and not from without, and this alone is enough to justify the outside public in regarding it with suspicion. The general body of mankind is, in fact, wholly in the dark about us; they neither know nor care whether we are organised into a close profession or not. I have even heard it said that nineteen men out of twenty, in a mixed company, if questioned on the subject, would be obliged to confess that they had never even heard of the Institute, a statement so nearly, if I may say so, bordering on profanity, that I should hesitate to repeat it had I not heard it from the lips of a member of the Council of that respected body. Nothing can be more complete than the indifference of the outside world to these plans for revolutionising our condition, except its ignorance of them.

There has not been the least sign that any one outside our own ranks is otherwise than satisfied with things as they are, unless it be Lord Grimthorpe, who wrote to the *Times* approving the idea of examination, but saying at the same time, that there was nobody among us fit to be examiner. To his support, such as it is, the promoters of the Bill are, so far as I am concerned, heartily welcome; but with this solitary exception, I know of no instance in which the public have given any sign that they require the kind of protection the Bill offers them; nor do I believe that if they had it they would attach the least importance to it. Had it been otherwise, surely the tentative and imperfect tests of qualification, which have been afforded by the examinations of the Institute would have attracted some attention. But who can recall an instance in which membership or non-membership of that or any other architectural society told to an architect's advantage or disadvantage? What employer ever troubled himself to inquire how many and what capital letters the architect whom he thought of employing could write after his name? On the contrary, it is notorious that an architect may reach the highest grade among his brethren, and, in the estimation of the outside world, without being a member of any architectural society, in proof of which we need look no further than the list of architectural members of the Royal Academy. Obviously, the public are wise enough to trust rather to their own eyes than to those of other people; they are content to judge architects as they do painters and sculptors by their works, and they find in them a better guarantee for good workmanship than would be afforded by any diploma or registered certificate of competency.

As to the protection against bad work which it is pretended the Bill would give, the public have already taken the matter into their own hands without any aid from us, by erecting an elaborate machinery of local boards, sanitary authorities, and district surveyors. If this machinery is properly worked, nowholesome and unsubstantial building ought to be impossible, and if bad work does manage to pass through such a sieve it would probably pass through any other that could be devised. If the surveyor does his business it is impossible for drains and soil pipes to convey sewer gas into houses, or for the construction, so far as the plans go, to be insecure, and any subsequent failure must be the result of bad workmanship or wilful negligence on the part of the architect or builder in carrying out the work. Against negligence, of course, no diploma is any protection. Whatever certificates of competency an architect may have it will not be enough that he should know how things ought to be done; the public will not rest satisfied with that, but will insist on seeing that he does it. No one can seriously believe that they will dismiss their local surveyors and shunt their Building Acts and By-laws as unnecessary when the world is supplied with a duly certified and registered body of architects. The regenerate architect, if ever he comes into being, will have to pass local boards and their surveyors just as we unregenerate have to do, and be well very sanguine if he supposes his diploma will be of any assistance to him or will be

regarded by the outside world as affording any security which would enable them to dispense with that of the Local Government Act. So far as public security goes, the proposed measure would add nothing to it; the present machinery is sufficient if properly administered, and if necessary its efficiency can be increased and its powers enlarged. Society may safely be left to take care of itself in this respect, and it is certainly no business of ours to undertake to defend it against ourselves.

In support of the scheme for closing our profession a great point is made of the analogy of other professions which are already closed. In the paper by Mr. Connon, to which I have already referred, we read,—"The demand is no new thing. It has already been granted by the State to the clergy of the Established Church, to military and naval officers, to members of the Civil Service, to physicians, surgeons, and apothecaries, to solicitors and barristers, to chemists and druggists, to dentists and veterinary surgeons, to metropolitan surveyors, to colliery managers, to certified teachers, to ships' captains and mates, and to steamship engineers." But the analogy sought to be drawn between these professions and our own craft is fallacious. Many of them have inherited their privileges and monopolies either from trade guilds and mysteries of the Middle Ages or from ecclesiastical usurpation, and cannot be said ever to have received them directly from the State. Others, again, like doctors and chemists, have to deal with matters of instant life and death, and it is clear that we have a right to feel sure that the man who serves us knows the difference between Epsom salts and oxalic acid. With a still larger number of cases, such as those of officers in the army and navy or the Civil Service, District Surveyors, and certificated teachers, we have absolutely no analogy at all, for all these persons are public servants paid by the State, and the public which pays has, therefore, a right to be assured that they are worth their wages before it engages them. In our case there is nothing parallel to this, for the State certainly does not engage to find a practice for those of us who prove, by examination, that we are competent to undertake it. Neither is our case analogous to that of the Church. The established clergy enjoy emoluments and immunities at the public expense, and some of their acts have a certain legal value. It is evidently only in virtue of these endowments and official duties that they are under State control, for in the case of other denominations which enjoy no such privileges there is no State control whatever, and any one who pleases is at liberty to undertake the office of minister without incurring any pains and penalties. So also in the case of certificated teachers, the Government interferes only where there is a question of receiving a grant of public money. Schools that receive no Government aid may employ uncertificated teachers if they please. The analogy attempted to be drawn between these cases and our own is entirely fallacious, but even if there were anything in it it would not be worth much as an argument unless we are prepared to invite the State to play a paternal part and close every profession that is now open for fear an innocent public should be imposed upon by incompetent professional men.

But it is time to point out that the Bill offers no sort of protection against the worst kind of building that goes on in our midst. It only aims at preventing people who do not know how to build calling themselves architects, a matter which need not trouble us very much, and it leaves the "jerry-builder" unharmed so long as he does not offend our respectability by ranking himself as one of us. There are, of course, bad architects in the world, but there are few of them who do not know how to build houses that will stand, and be wholesome to live in. It is not, so far as I have observed, in their buildings that the evils occur which are generally complained of. I remember a case where, after a family had lived a few days in a new house, all the drains were mysteriously choked up, and where, on examination, it was found that the leader soil-pipe was carried into the ground and the end turned up and closed without any pipe drain from it at all; but this house was one of a dozen or so built by a speculative builder without an architect. I remember another case in the present year where a house fell down, which proved to have been designed, not by an architect, but by a plumber. And let it be observed that with

cases like these no Registration Bill would interfere. Let the builder call himself a builder, and the plumber a plumber, and they would incur no penalty. If they avoided the sounding title of architect they might go on designing and building these filthy and insecure habitations as long as the District Surveyor let them. To make the Registration Bill efficacious it would be necessary to insist on the employment of a registered architect on every building that is put up. This would be protection indeed with a vengeance, but though it is difficult to regard it seriously, I observe in the same journal to which I have more than once alluded that one gentleman actually suggests that local authorities should be required to condemn plans prepared by any other than a properly-qualified architect.

Here at last we seem to have the *reductio ad absurdum* of the whole scheme. It begins by shutting the door against all but those who can afford to pay the premium of apprenticeship, and having thus limited the number of architects to a fortunate few it proceeds to sweep into their net all the building operations of the kingdom. Surely the widest imagination can go no further, and may well rest satisfied with the glorious prospect of such a good time to come.

Before leaving this branch of the subject it is necessary to notice one strange argument, I must, I fear, call it a selfish argument, in favour of making architecture a close profession. It is supposed that in some mysterious way the social status, as it is called, of the profession would be thereby raised,—an idea which embodies a sort of complaint that architects are not thought of as highly as they deserve.

Now, even if it were true, I must object that this is an unworthy argument, which we ought to be the last persons to employ. But I believe the complaint to be wholly unfounded; there seldom was a time when the calling of an architect stood higher in public estimation, certainly there never was a time when so many young men of higher culture and superior position flocked into it. Among people of educated taste it seems to me that architects and their works receive quite as much attention and commendation as they deserve; and I am far more afraid that our profession will become fashionable than that it will be despised. But however this may be, it is certain that it will gain no additional respectability from the Registration Bill, nor will those who now think themselves too low on the social ladder find themselves raised by a single step if that Bill becomes law.

Setting aside, however, this Parliament-made gentility, which may be left to dazzle those who fancy it, and the more solid advantages of loaves and fishes, which the Bill is to confer on the new profession,—setting aside, in fact, architects themselves altogether,—let us turn to the far more important question of what the revolution will do for architecture.

The object which its promoters have in view is thus stated by Dr. Connon. He says, "That the largest proportion of the profession are as well educated and as highly trained as they would be under an Act of Registration is probably true. What is sought is the exclusion of those who sink far below the standard which should be the lowest level of fitness." It is intended, therefore, that the unworthy should be shut out by the test of examination; but nothing is said of the exclusion of those who, for want of means, are unable to undergo the compulsory apprenticeship which the Bill requires, whether they are able to pass the test of examination or not.

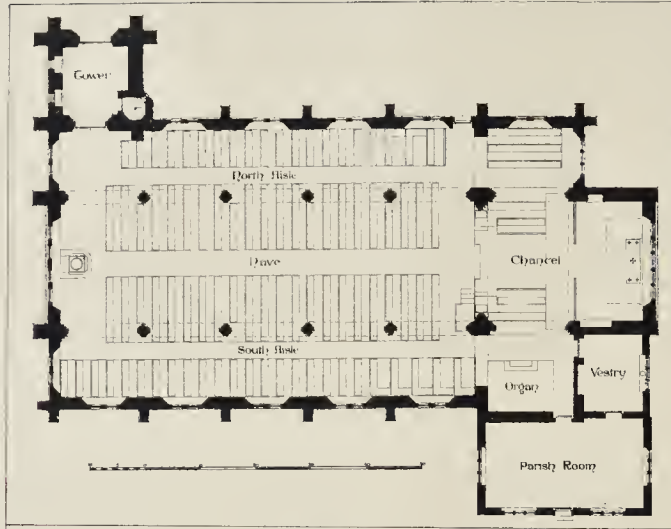

This condition would have the effect of narrowing the field to those who can afford to pay for entering it, and there would certainly be no gain to architecture in this. Every one must know of cases of men who have risen from assistants into architects and done excellent work, though they have never gone through a regular pupillage, and who would have been lost to the profession had the proposed Bill been in force.

But we are told, further, "that the profession of architecture would benefit greatly by the universal education of its followers which would follow from legal registration." And this brings me to what is, perhaps, the most misleading of fallacies, and one which seems to underlie all that has been written and said on the side of registration, namely, the confusion of examination with education.

Now, there are several ways of employing

ST. ANDREW'S PARISH CHURCH, LONGTON, L.

HIRE.—MESSRS. J. E. K. AND J. P. CUTTS, ARCHITECTS

examination. Students may be examined by their teachers with a view of seeing whether they have properly understood what they have been told, and of correcting any misapprehensions they may have fallen into. That kind of examination is itself a means of education, and is both useful and necessary to the student, who might otherwise be a long while in discovering his mistakes. It is obvious, however, that the examination for admission to a profession is not of this kind. There is another kind of examination like that at our old Universities, which are both teaching and examining bodies, where the teachers are also the examiners, and do in a manner review in the University schools the result of the University curriculum. This kind of examination is less educational than the other, and many University teachers of the present day advocate the abolition of University examinations as the best thing that could happen for University education. Clearly, however, the examinations at Oxford and Cambridge have little in common with that we are considering. The third type of examination is that for admission to the public services by examiners who have had nothing to do with the education of the candidates, but simply admit or reject them according to their success in answering a certain number of questions. This kind of examination has been adopted in dealing with public appointments, less for the sake of guaranteeing the efficiency of the public servants than for satisfying the people that Government patronage is fairly and impartially distributed. Such examinations are perhaps necessary, but, if so, they are necessary evils; it is obvious they are of no educational value to the student like the first kind, nor do they enable him to gauge his own knowledge like the second kind; they do not follow at the end of a long course of study directed by the same body which conducts the examination, and which therefore knows how to bring out and sift the knowledge of the candidates; they must therefore be general and superficial, taxing the memory rather than the intellect, and they often degenerate into something like a game of skill between the examiner and his victim, in which luck and accident play not the least part.

It is to this last class of examinations that ours would inevitably belong, and I can conceive nothing more likely to divert the studies of architectural students into unprofitable channels, or to put before them a wrong object for their efforts. To work with the object of passing a board of examiners is a very different thing from working to acquire knowledge. The object is not education, but a diploma; and the man will read, not to clear up his own ignorance and fill up the gaps in his knowledge, but to prepare himself with such scraps of information as may come in usefully and help him to fill up his examination paper. Cram, with all its hateful parody of real teaching, would become the order of the day. We should have superficial text-books by the dozen to save the student the trouble of thinking and searching for himself, and to give him just that kind of smattering which would pass muster with the examiners, without planting in his mind any germ that might afterwards grow up into accurate and scientific knowledge. Independence of thought and freedom of research are impossible under such a system, and without these nothing original can ever be produced. The question with the student would be, not "what do I most want to know?" but "what will pay best in the examination?" That this is the result of the system of examination for the public service is too notorious to be questioned; cramming has become a lucrative profession, and has created a special literature of its own, which all sound scholars would wish to put on the fire back. It is only too certain that the same effect would attend the establishment of a qualifying examination for our own calling; it is the merest fallacy to suppose that it would be an educational measure, and its actual result would be that real architectural education, so far from being promoted, would be positively obstructed.

But a greater difficulty than ever presents itself when we come to the subjects which intending architects are to take up. A formidable list is given in a collection of papers on education read at the Conference of Architects last summer, for a copy of which I am indebted, I believe, to Mr. Cates. It ranges from mathematics in its highest branches to the history of architecture in all ages and

countries, freehand, linear, and perspective drawing, experimental mechanics, heat, optics, acoustics, electricity, with laboratory practice in all; then follow chemistry, also with laboratory practice; and languages, either French or German, or both. All this we are told is comprised in the first year's course of an architect's training in America, and we can only wonder at the astounding powers of digestion which an American architect enjoys if he can get any nourishment out of such a surfeit of good things.

But the most surprising thing, after all, is that in all this magnificent programme for an architect's studies, architecture itself is forgotten. The student may bring up for examination a pitiful smattering of the great sciences I have enumerated, which is all he can hope to acquire in so short a time, and which he will do well to forget as soon as he can for fear it should lead him into danger, and he may show that he knows something of the various styles of architecture of other ages and of all countries, which is, after all, a matter rather of antiquarianism than of art. He can also be examined in the elements of construction; he can be asked how he would lay his drains, how he would warm and ventilate his rooms, how he would roof over an irregular space, how he would construct a vault or a spire or a dome, or any other part of a building. But all this is not architecture; this is but the builder's art. Architecture begins after all that; it assumes that the building is well planned and constructed,—*tout cela va sans dire*,—and then it steps in and makes it artistic and beautiful. But this is an intangible operation that cannot be brought to the test of examination; as well might you try to examine painters or sculptors in their arts, and if there is no actual standard by which to try them, neither is there any by which you could try an architectural design or pronounce its author qualified or unqualified to practise. You can examine a candidate in building construction, and if he shows ignorance you can, without fear of contradiction, pronounce him unfit to be an architect on that score; but what examiner would dare to design a candidate on the ground that his design was artistically bad? One may easily imagine the outcry that would be made, the prejudices that would be offended, and the hassle the examiner would have to fight with men of rival schools. He would be told at once that he had exceeded his powers, and had no right to prevent a man from earning his bread in the profession because his work did not happen to suit an examiner's taste. And the objection would be a very fair one, for architecture can no more be brought to the bar and tried by a fixed code than the other arts, and no board of examiners would ever dare to attempt it.

This being so, it follows that any man who passed in building-construction and knew how to lay his drains, would, under the proposed scheme of registration, be ushered into the world as an architect; and not only so, but he would receive, as it were, the Government stamp or hall-mark to certify to the world that he was, in every sense of the word, a genuine architect, although he might be more incapable than his own office-boy of producing an architectural design that was decently tolerable to an artist's eye. If this is what is meant by raising the status of the profession, we may, in all conscience, pray heartily to be left where we are.

It is, no doubt, the impossibility of applying the test of examination to the artistic side of our work that has driven the advocates of higher examination for architects to attach an exaggerated importance to the scientific side. After reading the astounding list of sciences that we are invited to learn, one is reminded, with Mr. Aitchison, of the knight in "Wonderland," who was equipped with a mousetrap lost he should sleep at a place overrun with mice, and a heave! lest he should meet a swarm of bees in his travels. We architects have no occasion to enter the laboratory of the chemist or the physicist; the little knowledge we might pick up there would be worse than useless, and in any real difficulty we should be forced, after all, to rely on the advice of the chemist or physicist himself. We need know no more about optics than the simple laws of perspective. In questions of heat and electricity we must be guided by the advice of specialists, and it is enough for us to know to whom to go, and such general facts about those matters as lie within the reach of every layman. Of

mathematics a very little indeed will be found practically sufficient, and I fail to see in what an architect would be the better for knowing much of botany or even geology. In all these things we must, like other people, be content to accept the result of other men's studies and to believe those who have made these sciences their life's work. Life is not long enough for all this. No architect over did or ever will make himself master of such a mass of scientific matter, and if we merely dabble in it we shall only be wasting our time, or, at the best, acquiring that little knowledge which is proverbially dangerous.

The main point which I want to make clear to-night is that the examination test to which it is proposed architects should be submitted cannot be applied to the artistic, but only to the constructional qualifications of the candidates; that is to say, not all to their skill in architecture, but only to their knowledge of building.

Consequently, as it admits men to our profession on mechanical grounds alone, it lowers architecture to the level of a mechanical art, and the change, if it ever came to pass, could not fail to be detrimental to the pursuit of architecture as a fine art. It would open still wider the breach which unfortunately divides it from the sister arts of painting and sculpture, and in so doing would condemn it to a lifeless monotony and hopeless unprogressiveness. It is, believe me, in the extending of an architect's skill into the decorative arts, in the closer union of himself with other artists, in the cultivation of the power to ornament his own handiwork, and so of introducing consistency and harmony into what otherwise is a mere jangle of jarring notes struck by unsympathetic hands, that the hope of architecture among us lies. The true brethren of the architect are the painter and the sculptor, not the surveyor and the engineer, and those are no true friends of our art who would try to persuade us otherwise.

Let it not, however, be supposed that I undervalue any plan for protecting the public against bad building. Against bad architecture nothing can protect them except their own good taste, but against bad building it is possible to erect safeguards. This, however, I repeat, has already been done by a legal machinery independent of us, which renders any safeguard of our own devising superfluous. If it be thought that the present system of supervision by local boards is inefficient, that is a matter for the public to see to; it may easily be made more stringent, and its area of jurisdiction may be widened so as to cover the country as well as the towns. So far from wishing to supersede the present system, I would see it improved; in particular I should like to see the office of local surveyor in small country towns undertaken by persons of higher qualifications, and in London and the larger towns I would have the number of District Surveyors increased till they were able to exercise such supervision over buildings in progress that bad construction could not escape detection.

Let it not be supposed either that I undervalue the importance of improvement in architectural education; only let it not consist in superficial dabbling in a host of scientific subjects, none of which we shall have time to master, and about which in the end we must take the opinion of experts, but in such matters as really belong to our craft; not in chemical analysis of our building stones, but in practical masonry; not in botanical classification of our timber, but in actual carpentry and joinery; not in the theories of optical science, but in the study of light and shade and perspective effects. A month spent on a building in progress under the eye of a friendly clerk of works will be of more use to a student than a year spent in the laboratory of the chemist or the experimental philosopher. It is a piece of training that I always recommend to my own pupils after they have seen something of office work, and I am sure there are few better.

Lastly, let me not be supposed to undervalue the constructional part of an architect's work because I say that this part is not architecture, but building. Architecture follows building, and therefore building must precede architecture and is included within it. There can be no good architecture without good building, and I firmly believe that no man ever has been or ever will be a good architect without being first a good builder. The great masters of old are at least as remarkable for

skilful construction as for beautiful design; and it will be admitted that the same is true of the most eminent architects of our own day who have certainly shown themselves as attentive to strength and convenience as to purely artistic quality in their work. Sir Charles Barry, Mr. Street, and M. Viollet-le-Duc certainly cannot be accused of want of constructive knowledge; no engineer could have more skilfully saved the great central towers of St. Alban's and St. David's from ruin and set them on new and substantial legs again than Sir Gilbert Scott; and I wonder how many of those who boast of their practical knowledge in comparison with those whom they call the "artist architects" would venture to give a lesson in building construction to Mr. Pearson, Mr. Butterfield, Mr. Waterhouse, Mr. Norman Shaw, or Mr. Bodley. There is no more fatal error than to suppose that the two sides of our profession are antagonistic, and nothing can be more injurious to architectural study than to consider the one and ignore the other, as any scheme of examination that can be devised is bound to do.

Before we set to work on any revolutionary plans and upset our present constitution let us consider how architecture in England compares with that of other countries where it enjoys State protection and control, and where something like State education is provided for its students. I quote from a paper read at the late Conference by Mr. Philip Spiers, whose knowledge of the training of architects both in England and France entitles him to speak with authority. He says,—“There is no national school of architecture here; there is no traditional teaching of 200 years as in France; so far as architectural design is concerned I am inclined to think this is a positive advantage, and that in consequence English architecture is at present in a much more healthy state than that either of France or Germany. In ecclesiastical architecture it has always been so, and of late the progress made in domestic and town architecture has been such as to outstrip entirely our foreign contemporaries.”

One may without vanity accept this picture as a true one. Travel where one may on the Continent one cannot but be struck by a certain tameness and hardness, and a cast-iron monotony that characterises even the best work one sees. Perhaps our worst English work is worse than anything we see abroad, but our best is incomparably better; it bears signs of life and progress and of wholesome originality that are wanting elsewhere; and foreign architects themselves now look on English architecture and architects with a respect unknown before.

The cause of this may be found in our freedom from the shackles of State control on the one hand, and the encroaching influence of State protection on the other.

Liberty and free trade are necessary to the growth of art, and any measure for controlling or regulating the pursuit of architecture stifles that element which belongs to art and brings into prominence that which is purely mechanical.

In Italy and Austria the architect is a man who has failed to qualify himself as an engineer. It is the engineer who restores ancient buildings and builds new ones, while the architect figures as little better than a clerk of works.

Can anything more expressively illustrate the tendency of legislative interference to eliminate that element which constitutes the difference between a mechanical and a fine art? Such would be inevitably our fate if architecture were made a close profession. Hitherto we have been free; in our freedom lies our hope of the future; our true wisdom lies in guarding it jealously against State interference and bureaucratic control. If engineers and surveyors choose to put the chain round their necks it is no affair of ours; but let us, at all events, beware how we sacrifice that proud independence under which we have won for our country a foremost place in the ranks of art with the promise of still greater achievement in the future.

A report of the discussion which followed will be found on pp. 894-7.

**Social.**—The “Mutual Cycling Club,” formed by the office staff of Messrs. Colls & Sons, gave a smoking concert at the Surrey Masonic Hall on the 14th inst., presided over by Mr. W. A. Colls. Among those present were representatives of several leading firms. A long and varied programme was given.

### Illustrations.

#### NEW CITY OF LONDON COURT, GUILDHALL.

THE New Court Building occupies the sites of the Old Court, the Land Tax Offices, and the “Tap” of the Guildhall Tavern; it will ultimately, on the expiration of a short lease, be extended over the site of No. 84, Basinghall-street, and the design has been made with the view of covering the entire area.

On the ground-floor will be offices for clerks and bailiffs, on the upper floor the judge's court, 45 by 26, and the registrar's court, 36 by 26, each with a private room attached and approached by a separate stair and

City of London Court.—Plan of Ground-floor.

entrance. The general entrance will be in the centre of the façade from Guildhall Buildings, and will open into a hall and staircase giving access to the offices on the ground-floor and to the courts above. In the basement will be lavatories and stores for books, papers, &c.

The style is late Gothic, harmonising with the Library and the new Council Chamber. The external moulded work will be in Portland stone, with grey Penryn granite plinths, the walling of Kentish rag; internally, the hall and staircase will be of Bath stone, the open roof of oak; the courts will have wainscot panelled ceilings.

The plan has been designed with the view of obtaining ample space and plenty of light, with good ventilation. The warming will be effected by means of hot-water coils and pipes, as well as open fireplaces.

The amount of the contract is 13,637*l.* (estimate, 14,500*l.*); the architect is Mr. Andrew Murray, A.R.I.B.A.; the builder being Mr. James Morter, of Stratford.

#### STALLS, WESTMINSTER ABBEY.

We give a sheet of measured drawings and details of one compartment of the stalls in Henry VII's Chapel in Westminster Abbey, made some time since by Mr. G. G. Woodward. From the data given in Scott's “Gleanings from Westminster Abbey” it would appear that the work was probably executed somewhere between 1512 and 1516. Some further information as to the work will be found in Mr. Woodward's notes on the face of the drawing.

We subjoin an illustration of one of the panels from another portion of the stalls, to a larger scale, from a sketch by Mr. R. W. Paul. The work shown here is unusually fine and holds in character for the period at which it was presumably executed.

#### ST. ANDREW'S CHURCH, LONGTON, LANCASHIRE.

This church is being built alongside and to take the place of the old parish church built in 1770,—a square structure without any points of interest,—which will be pulled down when the new building is completed. The new church, which is approaching completion, is being built of brick faced externally with Yorkshire parpoint stone, with red Runcorn stone dressings externally and internally, the wall spaces between the stone internally being

measurements are however correct, and the detail has been put in from careful sketches and an Elevation to 1/4 Scale made on the spot. All heights are believed to be accurate.

Note. These Stalls are in Oak (? Chestnut) and were probably erected soon after the building of the Chapel 1510. The six most Easterly on each side are said to have been added in the reign of George I. They are far inferior in detail to the earlier ones. No two Canopies are exactly alike through out.

chester. The chief features inside are the  
 ty arcade and chancel arch with handsome  
 uted columns. The roofs are of pitch pine,  
 th boarded ceilings, and covered with West-  
 oreland slates. The seats and fittings will  
 so be of pitch pine. Mr. Fecitt, of Blackburn,  
 the builder. The contract, exclusive of the  
 nder and parish room, is 4,231l. Messrs.  
 E. K. & J. P. Cutts are the architects.

**CHETHAM HOSPITAL, MANCHESTER.**  
 PEOPLE who visit Manchester nowadays find  
 ry few objects of ancient architectural in-  
 erest, the tide of modern improvement hav-  
 ept away nearly every vestige of them,  
 d, even to the majority of the inhabitants of  
 a busy city, the fine old College now called  
 chetham's Hospital is practically unknown.  
 This relic of old Manchester stands on a

naturally defensive site, formed by the junction  
 of the rivers Irk and Irwell, and on a small  
 plateau some 40 ft. above the water-level. The  
 Hospital stands on the site of a series of ancient  
 buildings, and is supposed to have originally  
 been occupied by a Saxon stronghold and after-  
 wards by a Baron's Hall of the ancient  
 Norman line of the Gresleys and De la Warres,  
 who were lords of the manor. Thomas de la  
 Warre, the last Rector of Manchester, had suc-  
 ceeded to the manorial rights in the year 1398,  
 and in 1425 he almost entirely rebuilt the  
 old Baron's Hall as a College for the use of a  
 warden, eight fellows, four clerks, and six  
 choristers, who officiated in the neighbouring  
 Collegiate Church till the College was dissolved  
 in 1547.

In 1481 James Stanley, a son of the first  
 Lord Stanley, became warden, and that was

the first connexion of the Derby family with  
 the College. In 1547 the College was dissolved  
 and became the property of the Earls of  
 Derby, till the confiscation of their estates  
 under the Commonwealth.

The Civil Wars left the College in an almost  
 ruinous state, and it was then Humphrey  
 Chetham began the negotiations which ended  
 after the Restoration in the feoffees acquiring  
 the buildings, and, under the proviso of  
 Humphrey Chetham's benevolent will, forming  
 it into what was then termed a hospital where  
 a certain number of poor boys selected from  
 several neighbouring parishes were fed, clothed,  
 and educated till of sufficient age to be appren-  
 ticed to some useful trade, and as such, with the  
 addition of a most valuable collection of ancient  
 books, well known as the Chetham's Library, it  
 continues to this day.

The hospital consists of an extensive range of buildings, but as the plates show only the parts adjoining the great hall it will be scarcely necessary to refer to them in detail, though a few remarks concerning more particularly the illustrations may be found interesting.

It is most difficult to ascertain with any degree of certainty the different dates of erection, as the buildings have been so altered and extended as to defy any discovery with regard to the periods when they were built. The cloisters do not seem to form an integral part of the first building, and alterations have obliterated any means of ascertaining their date, though it is assumed that the old entrance to the courtyard was done away with when the large staircase was erected. Mr. Henry Taylor thinks that the angle nook, bay, and small staircase were added some fifty to a hundred years after De la Warre's death, and the large staircase when Humphrey Chetham's feoffees altered the College, and he thinks further that the roof of the Great Hall is the old one of the Baron's Hall re-used, which is probable. It will be noticed that the angle nook is ingeniously twisted, evidently to make room for the then existing door to the courtyard, and has been taken advantage of in erecting the staircase. The curious old screen, the "dole window" at the high table end, and the ancient canopy are of much interest. A cleverly-planned little room exists over the bay, and quadrifol openings are cut giving a view of the hall.

The usual butteries open off the Great Hall, and at the back exists the ancient smaller hall, now the feoffees' room, elaborately panelled and decorated, and together with the present reading-room containing some valuable ancient furniture.

Altogether, this building forms an interesting and absorbing study, and as one of the few remaining objects of archaeological interest in Manchester deserves special attention. Mention should be made of the fact that the famous Doctor Deo inhabited the College when it was partly ruins, and tradition still points out the scenes of his wild incantations, and many are the legends existing describing the fearful deeds there enacted. While he resided in the College it was shunned as an "uncanny" place.

I gladly acknowledge my indebtedness to Mr. Henry Taylor and to his valuable book on "The Old Halls of Lancashire and Cheshire" for many facts stated above, and to the Governor of the Hospital for his kindness in giving me all facilities for measuring.

J. N. W.

#### THE ENGINEERING AND APPLIED SCIENCE DEPARTMENT OF KING'S COLLEGE, LONDON.

We have received the following communication from King's College as to the above:—

"This Department is now entering upon the fiftieth year of its existence; a life short enough, it is true, when compared with those of some of our ancient foundations, whose chief object was to furnish a so-called liberal education, but comparatively old amid the numerous Technical Colleges which have sprung up of recent years to meet a want which King's College was one of the first to recognise and to satisfy.

In 1838, the technical 'Department of Engineering and Applied Science' became a distinct branch of King's College. From the first the Council have sought, in arranging a curriculum, to combine a thorough knowledge of the theoretical portions of the subjects taught with a practical acquaintance with the methods by which the theories are applied in the various experiences of engineers, whether civil or mechanical, electrical or hydraulic, military or sanitary, metallurgical or chemical. The lectures themselves illustrated largely by diagrams, models, or experiments, have always been supplemented as far as possible by individual instruction and frequent practice in the laboratory, workshop, or drawing-office, as well as on the field; or by visits to manufactories.

The subjects recommended for study are Mathematics, Mechanics and Physics, Chemistry and Metallurgy, Mineralogy and Geology, Photography, Drawing, and Workshop practice, with Surveying and Civil Engineering, Manufacturing Art and Mechanical Engineering, and Building Construction and Architecture. An intelligent student may thus fit himself for any professional position by a sound knowledge covering

a wide range of subjects. Or he may specialise in any branch of Engineering, or of 'pure science,' in which he may develop an interest.

The tendency of modern education on these subjects being increasingly practical, it may be of interest to sketch the manner in which this class of teaching is carried out at King's College.

The period of time proposed for the course of studies is three years; and during the whole of that time the student is expected to attend the drawing classes, where he receives personal instruction in the different branches of Geometrical Engineering, Mechanical, and Architectural drawing.

Workshop practice is progressive, and also extends over the entire three years of study. By making for himself various articles or models of wood, the student first learns the use of the lathe and the tools of the carpenter's, turner's, joiner's, and patternmaker's shops. Passing thence into the foundry he receives instruction in moulding and casting in iron or brass; in the fitting shop he acquires the use of metal-working tools; in the smithy he gains experience at the forge; and after some practice in metal turning, and with the machine tools in the shop, he is taught the art of working in sheet metals. Finally, under adequate supervision, he is encouraged to design and construct suitable machines or models. The workshop is placed in the charge of an experienced mechanical engineer, with trained assistants in each branch of the work. All the lathes, drilling, planing, slotting, and other heavy machinery are driven by steam power, but the lathes are convertible, so that they may also be worked with the treadle.

The Chemical Laboratories are two in number; in the Junior Laboratory the second year's students, having already in their first year attended a course of lectures on Experimental and Applied Chemistry, are trained in the use of the blowpipe and in conducting such analyses as may be ordinarily required in the practice of their profession. In the Senior Laboratory those students who wish to make a special study of Chemistry may undergo a complete course of instruction in analytical or research work; and for the encouragement of such original research a Scholarship has been founded in memory of Professor Daniell, the first holder of the Chair of Chemistry.

The Metallurgical Laboratory, together with the lectures on Metallurgy, are attended in the third year of the course; and in this year, or in his fourth if he should elect to prolong his studies, a student may gain the Siemens Gold Medal and prize, founded by the late Sir William Siemens, 'with the object of stimulating the students of King's College, London, to a higher standard of proficiency in Metallurgical Science.' This department is one of the most recent additions to the College, and is fully equipped with assay, muffle, and large brass-melting (crucible) furnaces, lathe, and testing machinery; it is intended for instruction in assaying and mineral analysis, in the treatment of ores and metallurgical products, and in the practical examination of the properties of the metals and their alloys.

The Physical Laboratory, in which Sir Charles Wheatstone conducted his historical experiments with the electric telegraph, and to which he bequeathed a large collection of apparatus, is also attended during the Course. Here the student gains experience in the use of the apparatus, in the methods of physical measurement, and in the investigation of physical and mechanical laws. An installation of dynamo-electric machinery, with the necessary instruments and apparatus for measuring and dealing with large currents, has lately been added in order to meet the increasing demand for a thorough practical knowledge of electrical science and methods.

The Photographic Laboratory is used during the last year of study. It has recently been much enlarged by the addition of a new glass-house and developing room, and now affords facilities for practice with the older wet-plates, and in the manufacture and use of the more modern dry-plates; for portraiture, copying or enlarging in the glass-houses; for architectural studies in and around the College; and for landscape work after College hours.

There is also a single-lever Testing machine of the Kirkaldy type, presented by the Clothworkers' Company, and placed under the joint control of the Professors of Mechanical Engineering and Metallurgy. It is capable of

tensile, transverse, torsion, or compression tests up to a strain of 50,000 lb., and is used to demonstrate the mechanical tests usually applied to materials, and the resistance of bodies to rupture by different strains.

Museums containing large collections of physical apparatus, chemical specimens, minerals, rocks, and the like, are available for the assistance of students to a right understanding and appreciation of the lectures.

In the Mathematical Course, the students of each year are arranged in classes according to their knowledge and capabilities, and thus receive personal assistance suited to their calibre.

In addition to these classes already described, many of the Lecturers, whose subjects do not permit of laboratory demonstration, give facilities to their pupils for acquiring an insight into practical work outside the College. Thus, the Professor of Civil Engineering supplements his lectures by a course of instruction in surveying in the field, so that the students may become proficient in the use of the instruments employed for this purpose, and the method of arranging and calculating the measurements obtained. The Professor of Mechanical Engineering is accustomed to take his classes to factories and workshops in the neighbourhood of London, where they may study the application of the principles and devices they have learned in the lecture-room; and thus, under the guidance of the Professor, they obtain a valuable working knowledge of machine construction and management. In the Geology course, also, opportunities have from time to time been afforded of accompanying one of the Professors on field expeditions.

Thus it will be seen that the student, fresh, it may be, from the school-room, is first thoroughly grounded in the theoretical portion of a subject by means of lectures, and is then encouraged to confirm, enlarge, and apply his knowledge by means of experimental work performed by his own hands. Such is the scheme recommended for students in general; but, in addition to the matriculated students who are attending the whole or a greater part of the Course, there are many 'occasional' students, who, requiring a special knowledge of one or more subjects, devote their whole time to these in the Laboratory or the Class-room for periods varying from a month to three or even four years, according to the circumstances and requirements of the student."

#### THE ARCHITECTURAL ASSOCIATION.

The fifth meeting of this Association for the present session was held on the 16th inst. in the meeting-room of the Royal Institute of British Architects, Mr. John Slater, B.A. (President) in the chair.

The following new members were elected, viz.—Messrs. H. H. Dunn, G. P. D. Saul, S. A. Stanger, J. G. Henderson, D. F. Pitt, P. R. Smith, P. Hayton, Jun., J. H. Seakins, A. F. Faulkner, E. A. Masey, F. C. Eden, F. Bonch, H. W. Bannan, E. Osborn, H. J. Hicks, E. L. Lutyens, G. P. Wagstaff, and W. E. L. Wears.

The Chairman said that at the last ordinary meeting he announced that a requisition had been sent in by several of the members asking that a special business meeting should be convened to consider the construction of one of the rules. A sub-committee of the general committee had been sitting to consider the question of the affiliation of provincial societies, and had presented a report which, if carried, would involve the alteration of several rules. It, therefore, seemed needless to have two special business meetings following each other, and, as Mr. Somers Clarke, who had promised to read a paper on the 20th January next, would then be abroad it had been decided to hold the special business meeting on that date. At the next ordinary meeting, on the 6th proximo, he would be able to announce the proposed alterations in the rules relating to affiliated societies, to be discussed at the same time.

Mr. T. G. Jackson, M.A., then read a paper entitled "The Proposal to make Architecture a Close Profession by imposing the Test of Examination and Registration," which we print *in extenso* on other of our pages.

The discussion was opened by Mr. G. A. T. Middleton, who, as a member of the committee which had drafted the Registration Bill, thanked Mr. Jackson for his criticisms, as it was only by honest criticism that the Bill

— Greyfriars to Guildhall Buildings —

CITY OF LONDON COURT: GENERAL AND DETAIL ELEVATIONS.—MR. A. MURRAY, A.R.I.B.A., ARCHITECT.

could be so altered as to make it thoroughly acceptable. Mr. Jackson seemed to think that the machinery at present existing was sufficient for the protection of the public, but that was not the case. Under the action of the Bill it would be found that all the registered architects, engineers, and surveyors would be competent men, which could not be said of all the members of those professions at the present time. It was proposed to include engineers and surveyors under the Bill, but their examinations would be distinct, and, in fact, the Bill would provide for three professions. The examinations to be fought shy of were such as those for the Civil Service, where the competitors had to work for a post, and to cram themselves with merely superficial knowledge. A real examination, like that of the Institute, did not require that kind of cramming, and those who studied to pass it were much improved by the preparation.

Mr. Bernard Dicksee drew attention to the fact that the proposed Bill would interfere with men at present in the profession, but who did not come under the qualifications mentioned in the Bill (applause). Were such men to be turned out of the profession, because the Bill would make it a *sine qua non* that every architect must be articulated, unless he had been in practice prior to 1852?

Mr. William Woodward said he presumed that the object of the promoters of the Bill was first to inquire whether the public would be best protected if such a Bill were passed. They had thought, and with some reason, that much of the discredit into which architects had recently fallen had been from a defective architectural knowledge. Many had asked whether such a Bill would convince the public that registered architects were better able to carry out works, or whether membership of the Institute was not synonymous with its recommendations. He therefore thought the discussion should turn more in the direction as to whether membership of the Institute, with its compulsory examination, would not carry more weight than registration would, if the Bill should be passed. It would have been better if an architect less distinguished than Mr. Jackson had taken up the question, as he, in consequence of his assured position, could look somewhat lightly on the endeavour of the rising generation to satisfy the public of their ability to carry out the works which might be entrusted to them.

Mr. H. R. Gough said he had come that evening expecting to hear some crushing arguments used against the Bill, but he was extremely glad to find that the arguments used had been so weak. (Cries of "Oh, oh," and laughter.) One thing that had perhaps attracted more attention than any other was the inclusion of the engineers and surveyors. But, he would ask, who was the engineer of fifty years ago? Was he not the architect? It was simply because architects had become such specialists that some of them could afford to despise construction. It would be almost impossible in a Bill of the kind to leave out the engineers; for many of them were now practising as architects, and *vice versa*. An architect ought, to a great extent, to have the knowledge of the engineer, the same knowledge being required to put a bridge across a river as to put a girder across a big building. Many who wished to look upon architecture as an art pure and simple said that a man's qualifications could not be tested by examination; but was any one bold enough to say that the medical profession might tear up its Acts of Parliament, and the public be as well or better off? It was the quacks who called themselves architects that they desired to get rid of. Mr. Jackson had said that the Bill had been promoted by a body who would not look on the Institute as a great central body. That was not the case, because the promoters of the Bill had carefully made the Institute, so far as architects were concerned, the central body. He could not see why surveyors should not be included, as they were undoubtedly as much a branch of the profession as the engineers.

Professor Kerr.—I venture to think the time has come when the meeting ought to be called upon not to misinterpret Mr. Jackson's views (cheers). There are some to whom his phraseology may be obscure (laughter), but there are others who remember in very old times when the phraseology was in every one's mouth in this room, and was used to good purpose by many distinguished men now dead, but who, I hope, have left some behind who can speak the same language

(applause). Without myself professing to be much of an artist in practice, I may say this,—that I recognise the artistic feeling, the artistic pre-eminence of those men whom Mr. Jackson represents here to-night (applause). And when he speaks of architecture being an art, and being in some way distinct from that which precedes it,—as engineering and construction,—why should it be said that he is proposing to consider construction to be the work of the builder, and the work of the architect to be the beautification of some other man's construction (applause)? Such criticisms, sir, are utterly unworthy of answer, and I hope Mr. Jackson will not take the trouble of answering them (renewed applause). Now I hope the meeting will understand Mr. Jackson's views, and see what he is contending for as regards art as a substantial, and not an unsubstantial thing. He is contending for this great proposition,—if you will allow me to put it in other language,—that England can afford, and that England ought, to maintain an architectural profession more or less suggestive of pure art. That I understand to be Mr. Jackson's proposition, and that pure art cannot be taught I understand to be his position also. I remember poor William Burges many a time, in his enthusiastic way, railing that to the wall against all opposition. Burges was not a man,—as some few may remember,—to enter into a detailed and logical programme. He went at a conclusion and declared it in a straightforward manner, caring not who opposed him; and those views of architecture which he expressed, and those which, I hope, will long be upheld in this country (applause). At the same time, I think Mr. Jackson, and those who follow him more closely than I do, will not misunderstand the views of the other side of the question as regards the movement at present on foot. It must be understood very clearly, and borne in mind by every one,—and especially by the young men whom we see here,—that the architectural profession, like all else, is undergoing a very great change at this moment in our country. The profession, as it existed when I humbly entered it, was an entirely different thing, as it seems to me, from the profession into which you are about to enter, and into which some of you have entered. It is not a change in the architectural profession alone, but a change of the whole social scheme of this country. That is a point, however, into which we cannot afford time to go; but it will be quite sufficient to lay that principle down, and I am very sure it will be understood by all thoughtful men, however young. Now, amongst the changes which are taking place, and which have taken place, and more particularly in connexion with our own profession, there is one great change which is taking place,—and I mention it as an illustration,—in the Royal Institute of British Architects, at this moment. Many years ago, when the members were few,—and I do not say more select than at present, because it is a mistake to suppose that they were more select than they are now,—the prominent men were, in a certain sense, more prominent before the public and the world at large, as the representatives of art and learning. The Institute was then almost exclusively a learned society. The time and the necessity for that condition of things have passed away. The existence of the Royal Institute of British Architects as a learned society, pure and simple, on anything like the lines of the other learned societies of London is no longer required by the public. The change that has taken place,—and I cannot go into the minutiae of it,—is caused by the fact that the public and professional necessities of this country, outside and inside the Institute, do not require the Institute exclusively to confine its attention to art and learning. The consequence is that we are running the risk at present of losing touch with art and learning to a great extent. In order to prevent that, many of those who are at the head of affairs in the Institute are now adopting machinery,—which Mr. Jackson has referred to, and which other gentlemen have referred to,—which is perfectly in accord with the spirit of the age, namely, admission by examination, which constitutes an educational test so far as it can be applied and taken for what it is worth. It is not their intention,—as I understand, for I am not one of them,—to constitute an academic test as we did in the old examination, which

Mr. Jackson referred to,—though I wish that examination were in existence now, for it was a great deal better than the present one (laughter). It is not their policy, as representatives of what may be called the future professional union which the Institute is to constitute, to establish an academic test of education, but it is their policy to establish an ordinary practical test, not for the sake of keeping out so much as of letting in; though, of course, they are pretty much the same thing (applause). Then come my friend Mr. Gough and his adherents with the Registration Bill. What is that? It is a perfectly honest attempt, as I read it, for I like to look at men's principles as being honest until we can prove them to be otherwise, and I see no reason for any jealousy in connexion with the movement they have entered on. Their object is this: to extend the principle of what we may call educational exclusion or inclusion,—call it what you please,—so that it shall operate all over the country. And in course of time, if any registration can be established,—and registration, remember, is simply entering one's name on the register,—if so, in course of time by this simple means you will find that those who are worthy to be architects will be, they say, recognised by the public at large, and that those who are not architects will find they are at a proper disadvantage in consequence. That is a perfectly honest object, though I myself do not believe they can accomplish it. I do not see how it is to be done, and I cannot see any chance of the Bill being read, even for the first time (laughter). At all events, let us give them a fair chance, and believe that their motives are quite as honest as the motives of those who do not think with them. Now, so much for the old Institute, and so much for the new Institute. The times move, and we move with them, and those of you who study the new philosophy will know what I mean when I say that you cannot help yourselves. Now we will turn to the Architectural Association. The Architectural Association, although not a State-recognised body, is an exceedingly useful body in its purposes, and always has been. The object of the Architectural Association is primarily education in a purely practical way, and not in an academic way, to suit the purposes of the time, day by day, whatever they may be. That is the purpose of the Architectural Association, and for want of a better means,—and I do not know that we could have a better means,—we established the means of mutual instruction. We said,—"Let us meet together, and talk, and then we shall find that we shall instruct each other." That is your position now, and I should stick to it (hear, hear). It makes one proud to belong to the architectural profession when one hears a man like Mr. Jackson read such a paper (applause), and what struck my mind in listening to him was this. You, gentlemen, here are full of enthusiasm for your art, and you have the whole world before you, and what occurs to my mind is this, we must not let the art die out; and the question is whether under the pressure of the times the art is to die out or not (cries of "No, no"). I do not wish it to do so. Mr. Jackson has quoted very distinguished names of men who have not been members of the Institute. Why they are not members of the Institute I have never been able to discover; but I know some of them, and I know they are men who never do anything without a reason. I should like to know, then, what their reason is. It may be this. Has the time come when a new body must be formed of distinguished artists, not in the Royal Academy, because it is no use for half a dozen architects to be elected by a parcel of painters (laughter),—has the time come for establishing, probably in the Royal Institute of British Architects, a nucleus of art composed of great artist-architects elected by artist-architects (cheers)?

Mr. Arthur Coates.—I have listened with great satisfaction and pleasure to the admirable paper with which Mr. Jackson has favoured us, and although he has made an onslaught on the Examination, in the success of which I take the deepest interest, I generally and cordially agree with him in his observations with regard to examinations generally. I believe with him that nothing can be more fatal to education, or to the sound acquisition of knowledge, than examinations badly conducted. The examinations of the Civil Service, which are based on cramming, are fatal, not only to knowledge, but also to the power of acquiring knowledge.

The examinations we desire are those which should teach the student what to learn. It is not so much what the student absolutely knows, but he should also have the power of acquiring knowledge, and of how, when, and where to acquire it. Unfortunately, when thirty-five years ago or more this Association proposed to the Institute to establish an obligatory examination, some men, who were very dear friends of mine, thought an obligatory examination undesirable, and fell into what I think was a great error by establishing a voluntary one. Latterly, an obligatory examination has been established for admission to the Institute, and has been in operation for some time; and, although not quite a success in the way of numbers, it has been a thorough success in the advantages offered to those who have passed it. I know I am speaking to many who have prepared for that examination, and I appeal to them whether the preparation and examination has not been to them an advantage which they would be loth indeed now to forfeit (applause). That examination was established after a considerable amount of discussion, with the view to meet the requirements of all. Since that time the views of the prominent members of the Institute have taken a considerable advance, and it was with very great satisfaction I found at the conference meeting on education that more extended views were supported. And not only by gentlemen living in London, but largely from provincial men, there was a general idea that the architectural student, thrown into the office practically without guidance, with little opportunity given him or direct object in his studies, might most likely waste his time, and find when he quitted the office that he had acquired a great deal that was useless, and very little that was useful; that, in fact, his time had been practically wasted. Now, the desire of those who are now taking a lead in the matter forward, is, that from the very moment the young man enters the profession he shall have before him in each year a definite course of study which his principal shall be bound to see that he follows; that he shall, by two or more examinations, have the opportunity of testing the amount of knowledge he has acquired; and nothing is more important than an examination as a test. It has fallen to my lot, within the last few years, to come into contact with a great number of young men, many of whom have told me that they know a great deal. They have said in good faith, and with every confidence, that they were thoroughly acquainted with certain matters, but when I have asked them to give me evidence of it they have said "it had slipped their memory," or that they "did not know it as well as they thought." What we wish to do is to remedy this, to give them a certainty of knowledge, and to help them to cultivate accuracy of expression, so that from the earliest times and from their first entrance into the office the mind, the eye, and the hand shall act together, and that when they read a book they shall read it not simply with their eyes but with their minds and intellect: when they sketch it shall not be merely making a pretty picture, but they shall sketch the subject as a work of architecture, showing appreciation of its construction and the motives of its designer. It is only by a gradual course that the young man can be led up to acquire such habits. Mr. Jackson has taken up a position which he is fully entitled to take, but it is a position, remember, to which few of us can hope to attain. I think it is almost a misfortune that he should have expressed himself in the terms he did in regard to the acquisition of knowledge, because though he himself stands with many others in such a position that his own words may be very applicable to himself, it is different with the poor student,—the man of imperfect education; and there is no greater scandal in this country than the way young men are turned out from the public schools, not even taught how to acquire preliminary knowledge; and it is one step towards removing that blot that I hope the Institute will take, when it has instituted a preliminary examination throughout the country, which the young man entering the profession will pass, and for which the schoolmaster will be bound to educate his pupils. These examinations would not be held simply by the Institute, but by all the associated societies throughout the country, and the announcement you made this

evening struck me as one of great interest, when you spoke of affiliated societies. One great object we have in view would be to forward in every great town, and in the provinces, the formation of societies of architectural students, with aims and objects similar to those of the Architectural Association, which would be looking to that Association, and taking from it their aspirations. This working harmoniously would bind the younger members of the profession together in one link throughout the country, and it is absolutely essential for the welfare of the profession that something of the kind should be done, and that thus the young men passing from grade to grade at last would pass the final examination, and enter the Institute. No other stamp should be wanted than membership of the Institute after a course of education such as that. There is no cramming for it. It will be a systematic and thorough education of all essential principles, which are required for the acquisition of the knowledge necessary for the architect. There will be no deviation from those glorious principles of liberty and freedom, of which Mr. Jackson spoke so warmly. There will be no closing of the profession. I cannot imagine anything worse than the idea of establishing a close profession in architecture. But I cannot help thinking that, by the agency of the Institute, with the co-operation of the societies throughout the country, and of this Association, which has already done so much, we shall raise the position of the profession, and give the young men that which they have not now, viz., an opportunity of reasonably acquiring that knowledge which is essential for the practice of architecture (cheers).

Mr. Cole A. Adams proposed a vote of thanks to Mr. Jackson and said he would have done so with even more pleasure had his paper been on some other subject. The matter was hardly a happy one, he thought, to bring before the Association, which was a body of students, to whom questions of art and practice were more useful than the politics of the profession, which were better kept out of sight there. He would not speak upon the question of registration, but hoped that Mr. Jackson would see cause, after what had fallen from Mr. Gates and other speakers, to lend his support to the Institute Examination, and not to throw cold water upon it.

Mr. Edgar Farman seconded the vote of thanks, and said, with regard to the last speaker's remark that he wished the matter had not been brought before the Architectural Association, that it seemed to him that if the proposed measure was going to affect anybody, it would be those students who were at present working for a place in the profession; therefore in his view no better subject could have been selected for debate.

The Chairman said he could not help thinking that Mr. Jackson had done a great service by calling attention to the subject (applause). The more it was discussed the better, and he entirely agreed with what had been said as to the desirability of not making an examination the be-all and end-all of the student's life and education. An examination had no force whatever unless it was purely educational in its purposes and aims. With regard to one very celebrated man, who had been mentioned (Mr. Street), he believed he was at one time strongly opposed to an obligatory examination, but changed his mind, and considered the examination established by the Institute, and the training for it, to be a good thing for students. All students, it should be remembered, had not the advantage of being under the training of a man like Mr. Jackson. As a matter of fact, a great many architectural students had no education at all, and the only way attention could be called to the necessity for education was by establishing some examination which would give them something to aim at.

That, he believed, was the sole ground the Institute had taken up, in establishing the examination. He could not quite follow Mr. Jackson's analogy when he seemed to say that three voluntary students had passed per annum, and only twenty or thirty per annum the obligatory examination. When the examination had been made absolutely compulsory, and ten times as many came in, it did not seem to be such an extreme failure. No doubt the Institute would be glad to see more candidates, and certainly the provinces were sending up increased numbers. Indeed, a student educated in a provincial office had turned out to be the

best man of the year, and had gained the Asbipiel prize. Mr. Jackson, again, did not seem to be quite consistent when he said that in connexion with the construction of many of their public buildings, they had the assistance of the District Surveyor, who was trained to look after those buildings. But how did they know that those District Surveyors were properly trained except by their having passed an examination? Surely, also, there were many buildings in the country with which the District Surveyors had no opportunity of interfering. He was not going now to discuss the vexed question of Registration. He entirely agreed with the opinion expressed by Professor Kerr, and he could not see how the Bill was to pass.

The vote of thanks was then put, and met with a very hearty reception. Mr. Jackson, in reply, said—I am extremely indebted to those gentlemen who so kindly proposed a vote of thanks, and also to the meeting for so cordially passing it. As I said when I started, registrations and architectural politics are not what I should have liked to talk about to-night. Our business, as I said, is not with ourselves, but with our art; and your society,—which is especially constituted for your mutual improvement by the discussion of our art,—is one perhaps that at first sight does not seem the right one to speak to on the subject. At the same time, consisting as you do principally of the younger members of the profession, who are to make the profession in future, I do think it is a matter you ought to make up your minds about, for it concerns you a great deal more than it does us older men, whether you are to be combined in a close profession from which the promoters of the Bill think all improper persons will be excluded, or whether you will retain that liberty which I have tried to persuade you to-night to retain, and which is essential to your success in promoting the art to which you devote yourselves. Therefore I hope I have done some good by directing your attention to this matter, and I trust that the further discussion which must follow if the Bill is brought into Parliament, will find you to a great extent well prepared to consider it from every point of view. Many criticisms have been passed on my paper, but there is one point which I think has not been touched upon, and perhaps I did not make it so clear as I intended; that is, that any scheme of registration which is to bind architects into a close profession can only have the effect,—if it succeeds at all in doing what is intended,—of preventing builders from calling themselves architects. You will not prevent their going on and building badly; you will probably prevent their ranking themselves nominally among yourselves; but they will find other names under which they will continue their evil practices, and the Registration Bill will do nothing whatever to stop bad building. It seems to me,—and I am confirmed by one of the papers contributed to the interesting collection of papers on education read at the Architectural Conference,—that the Bill would have the effect of forming, not, as the writer said, two classes, but rather, I think, three classes of people concerned in building. There would, first of all, be those who have been called "artist-architects." It is not a name I like, because I believe an architect cannot be such unless he is also an artist (applause). But we will not quarrel about names. Then there will be the "registered architects" (laughter); and there will remain the third class, the "jerry builders" (renewed laughter). The registration scheme will divide us into three classes. We shall all go on our separate ways, perfectly happy, I dare say; but I do not see that any of the three classes will be the better for the change, unless it be the third, for it is pretty certain that the effect will be to throw more work into the hands of the "jerry builder." I am quite certain the other two classes will suffer: if a certain number of men are trained to look upon the mechanical side of our art, what I call the building side, too exclusively, they will degenerate and architecture will lose a great many good men, whereas, on the other hand, if you form a class of men to look only on the artistic side, they will suffer still more. In one matter in which I have been misunderstood, Professor Kerr has been so kind as to correct a false impression. I certainly hoped in all I said to make it clear that I placed the utmost value on the constructional qualifications of the architect. I thought I stated distinctly that no man could be a good archi-

fect unless he were first of all a good builder. Good architecture implies good building, and the progress architecture has made in every age and country has come from constructional necessities and inventions, and so it will be in the future. Then, as to what I said about there already being sufficient protection against bad building, it was pointed out that in the country the surveyors are not, perhaps, always up to the mark, and one speaker suggested that the distribution of registered architects over the country might better that state of things; but I understood him also to suggest that country surveyors themselves should be required to be registered architects. I do not see why they would be in any way a different body of men from what they are now. Why do not architects seek those appointments? Because it is not worth their while (laughter), and it will be no more worth their while if the Registration Bill passes. The same class of men will present themselves, and if they are to pass the registration examination, what kind of examination will it be that will allow the local surveyors of country villages to go out to the world stamped as architects? Is that the qualification you expect the public to accept as a guarantee of competency? Another gentleman could not understand what I meant when I said that the true brothers of the architect were the painter and sculptor, and not the surveyor and engineer. He said it was only in large and important buildings that you are able to call in the painter and sculptor, and that people in ordinary practice have no opportunity of employing those persons. That is not what I meant. It is, of course, only on rare occasions that we are able to employ painting and sculpture to any great extent; but what I meant to say was, that the kind of studies to which we should devote ourselves were the studies that would be more akin to those which occupied the painter and sculptor than the mere mechanical pursuits of the surveyor and engineer,—that we should, to a certain extent, be painters and sculptors. An architect who has had no training in the allied arts can have no proper idea of decorating his buildings with painting and sculpture if he has the chance. Training of the artistic kind will, on the other hand, bring him into sympathy with the painter and sculptor, and will reflect itself on his architecture in a different way from the case of a man who is not brought up as an artist (applause). With regard to what Mr. Gates has said, we know his enthusiasm in the cause of education. Like him, I wish that the Examination, conducted by the Institute, should have that educational character and merit which he desires; but I do think that the Institute, in putting the Examination first, has "put the cart before the horse." I would be behind no one in wishing to see some general scheme of education to which all architectural students could be admitted, and I should like nothing better than that the Institute should put itself at the head of such a scheme. They may reply that they are not an educational body, but for my own part I wish they were. I should like to see a regular scheme of education, to which all architectural students could have access; where they will be sure of hearing lectures, and having instruction given in constructional and artistic matters, in the literature of the past, and in the antiquarian study of our art, which they should all know, although it is not architecture. If some general scheme could be arranged, which would put the means of education of that kind within the reach of every student, in a way that no one now is able to find, I think it would be an extremely good thing for architecture, and also the individual. In what I said about examinations, I was careful to distinguish that there are several kinds. There is only one kind necessary, that in which the teachers examine their students for the purpose of seeing if they have understood what they have learned. What I object to is a qualifying examination. In the latter case you simply teach the man to work for the examination; in the former case, you teach him to acquire knowledge, and the examination forms a mode of testing whether he has acquired it or not (applause). The meeting then terminated.

"Architecture in the Past" is the title of a paper by Mr. William Simpson in the last number of the R.I.B.A. Journal.

#### ARCHITECTURAL SOCIETIES.

*Royal Institute of the Architects of Ireland.*—On Saturday last the annual meeting of the Royal Institute of the Architects of Ireland was held in their rooms, 37, Dawson-street. Mr. Thos. Drew presided. Amongst those present were, Messrs. S. Symes, J. L. Robinson, J. R. Carroll, J. J. O'Callaghan, G. C. Ashlin, W. Byrne, —Cochrane, Belfast; J. H. Fullerton, Armagh; C. M. Carthy, W. M. Mitchell, R. Miller, W. Stirling, F. Butler, Albert E. Murray, hon. sec. and treasurer, &c. The Hon. Secretary (Mr. Albert E. Murray) read the annual report, which reviewed the work of the Institute during the year. Thirteen meetings of the Council were held, a fact which showed that that body had not been unmindful of the duty entrusted to them. They had to record with regret the death of two of their life members,—Mr. W. H. Thompson, of Belfast, and Mr. Henry Hill, Cork. They hoped to have many new members added to the Institute. The Council had acted very successfully as a Board of Arbitration, and if its services in that capacity were more frequently availed of, as between architects and clients, much costly litigation might be prevented. The question of architectural federation was making steady progress, and last year a Bill was printed and circulated, called "The Architects' and Engineers' Registration Bill," the object of the measure being that after its passing, architects should be obliged to undergo an examination before entering the profession.—Mr. Robinson, in moving the adoption of the report, said that no doubt there were a great many people who were not properly qualified at present practising as architects, which was a great grievance to the regular members of the profession. He criticised the action of the Board of Works in furnishing plans for nothing in the case of many buildings to the detriment of the profession.—The Chairman remarked that these plans were frequently totally unsuited to the sites and requirements.—Mr. Robinson said that that was invariably the case. He thought that patronage ought to be more equally divided. The architects as a body were very much dissatisfied with the arrangements which existed at present.—Mr. Carroll seconded the motion, and the report was adopted.—A communication was received from the Committee of the Technical Schools, and it was resolved that a donation of three guineas should be made to them on behalf of the institution. Alike sum was also voted to the Architects' Benevolent Society.—The Chairman read a statement with regard to the position of architects in connexion with the Building Acts and the power of the municipal authorities to interfere in the case of new buildings. He advocated that some step should be taken to ascertain the statutory powers of the Corporation in this matter.—The following gentlemen were elected on the Council for 1888: Messrs. Albert E. Murray, Sandham Symes, J. J. O'Callaghan, J. R. Carroll, George C. Ashlin, Thomas Drew, Charles Geoghagan, James H. Owen, William Mitchell, Thomas Deane, and J. L. Robinson.—Messrs. J. H. Fullerton, Armagh, and R. Langishee, Athlone, were elected Fellows. Messrs. J. H. Pentland and T. M. Deane were reappointed auditors.—Mr. S. Symes was presented with an illuminated address on the part of the Institute in recognition of his services as hon. treasurer. The annual dinner was afterwards held at the Grosvenor Hotel.

*The Sheffield Society of Architects and Surveyors.*—The second meeting of this Society for the present session was held at the School of Art on the 13th inst., to hear an address Mr. J. W. Cannon, F.R.I.B.A., of Leeds, on "The Legal Registration of Architects." Amongst those present were Messrs. T. J. Flockton (President, in the chair), J. B. Mitchell Withers, C. J. Innocent, C. Hadfield, E. Holmes, W. F. Hemsoll, E. M. Gibbs, J. Fawcett, W. F. Ragg, R. Davidson (Borough Surveyor), A. F. Watson, T. Winder, J. M'Inery, E. M'Dougall, A. J. Greenwood, J. W. Wardle, C. Gibson, H. Wehster, H. W. Lockwood, W. Poits, S. Kedward, J. Norton, W. J. Taylor, J. E. Benton, J. E. Wigfull, C. M. Hadfield, C. B. Flockton, T. W. Moore, W. T. Campsall, W. Watkin, Banks, J. H. Thomas, and W. C. Fenton (hon. sec.). In the course of an able and interesting address Mr. Cannon advocated the legal registration of architects on the basis of the existing registration of the legal and medical professions. He showed its advantage (1) to the student, (2) to the architect in prac-

tice, and (3) to the public. He urged the desirability of union amongst architects in pressing this question forward for the consideration of Parliament. A discussion ensued, in which Messrs. Hadfield, Innocent, Holmes, Fenton, Gibbs, and Hemsoll took part. Eventually, on the motion of Mr. C. J. Innocent, seconded by Mr. C. Hadfield, a hearty vote of thanks was unanimously accorded to Mr. Cannon for his address.

#### COMPETITIONS.

*Gloucester New Public Baths.*—The Corporation called in Mr. T. Roger Smith, F.R.I.B.A., to advise upon the sixty plans received in the above competition, and under his advice have awarded the first premium of 50*l.* to Mr. J. Fletcher Trew, architect, of Gloucester, for the set of plans under motto "5,680*l.*" and the second premium of 25*l.* to Mr. J. Cook, architect, of Manchester, for the set of plans under motto "6,000*l.*" It is proposed to publicly exhibit all the plans in the Corn Exchange, Gloucester, on Tuesday and Wednesday, the 3rd and 4th of next month.

*New Barnet Public Building Competition.*—We are informed that the New Barnet Public Building Committee met on the 13th inst. to inspect the eighteen sets of designs sent in by architects. Nine were selected for further consideration at a meeting to be held the first week in January, 1888. From eight to ten o'clock the same evening the public were admitted to view them. Eight of those selected for further consideration bear the following mottoes:—"Ego Animo," "Enterprise," "Justice," "Pro Bono Publico," "Spes" A (there were two designs under motto "Spes" and the Committee marked them "A" and "B" respectively; "B" was rejected), "Well-considered," "1887," "5,000*l.*" and the ninth bears a device of a star in a circle. The nine rejected designs were not considered by the Committee suitable for the district.

*Sheffield Board Schools.*—At the meeting of the Sheffield School Board on the 15th inst., Mr. Leader, on the minutes of the Buildings Committee, called attention to the competitions that had recently taken place amongst architects for the best plans for new departments. It seemed to him (according to the report in the *Sheffield Daily Telegraph*) that the competitions were conclusively in favour of the capacity of Mr. Innocent (the Board's architect) to produce the required plans, and he therefore suggested that the Board might very reasonably discountinue these competitions, which took up a good deal of time, and also involved some expense. Mr. Fletcher (chairman of the Committee) said he believed the views of Mr. Leader were shared to a considerable extent by the Committee.

#### Working Lads' Institute, Greenwich.

On the 8th instant the West Greenwich Barged School and Working Lads' Institute, Bridge-street, Greenwich, was opened by Mr. F. A. Bevan. The building consists of a reading and refreshment room, entered from the front vestibule; a kitchen, a gymnasium, and an infants' room (with gallery), all on the ground-floor. A wide staircase leads up from the hall to a teachers' room on the Mezzanine floor, and to the first floor, which contains a large school-room with a platform at one end and an open-timbered hoarded ceiling; class-rooms and other accommodation. The second-floor consists of two large rooms, which may be used as dormitories for boys, and the caretaker's apartments. Good cellars are provided, and the school is heated by low-pressure hot-water pipes. The total cost, inclusive of lighting, heating, &c., is about 2,000*l.* The architect is Mr. George Baines, of London, the contractor being Mr. H. L. Holloway, of Deptford.

*Telephones.*—The Equitable Telephone Association has just completed an installation of their "Swinton" telephones at 27, London-wall, whereby all the different floors of the warehouse are put in direct communication with one another and with the general and private offices. The same company has at present in hand a similar installation, with twenty-seven telephones, in the new warehouse and offices of the Co-operative Wholesale Society, Limited, Leman-street, Whitechapel, and has also received an order to fit up telephonic communication between all the different wards of the Hospital for Consumptives, Ventnor, Isle of Wight.

LINE OF FRONTAGE UNDER THE  
PUBLIC HEALTH ACT.

NANKIVELL v. THE BOURNEMOUTH COMMISSIONERS.

In this case, heard in the Queen's Bench Division of the High Court of Justice (before Mr. Baron Pollock and Mr. Justice Hawkins), an important decision was given as to the meaning of the provisions of the Public Health Act, 1875, in cases stated by them, to be restated on any point on which, though they have taken evidence, they have not given a finding or a distinct statement of fact, and the Court consider it material and therefore necessary that they should do so. The case had arisen in this way. There had been a complaint against Mr. Nankivell for making an addition to his house, by erecting a stable in his front garden beyond the line of houses in the "street." The houses, as usual in such places as Bournemouth, are detached, standing in gardens, and the stable was not united to the house. The complaint was under Section 156 of the Public Health Act, which provides that it shall not be lawful in any urban district, without the written consent of the urban authority, to bring forward any house or building forming part of any street beyond the front wall of the house or building on either side thereof, nor to build any addition thereto beyond the front of the house or building on either side. The defendant, before the magistrates, contended that the place was not a "street," and that the house was not part of a street within the meaning of the statutes, and that the stable was not an "addition to the house" within the Act. The magistrates, in stating a case for the opinion of this Court, stated that the stable was structurally separate from the house, and stated the question as to whether the place was a street, but not whether the stable, apart from its being structurally separate, was an addition to the house, and whether the house was part of a "street," within the statutes. The case had been opened and partly heard, and the Court were of opinion that they could not decide the case without distinct findings or statements of fact upon these points.

Mr. Foote, on the part of the defendant, submitted that the case should be sent back to the magistrates to be restated on that point. The cases, he said, established that, though the Justices could not alter their judgment, a case could be sent back to them to be restated on any point. [To this the Court assented, though the Master of the Crown Office asked "provided they have taken evidence on the point."] No doubt, but here the evidence was taken, so that the magistrates have all the materials before them. And it is submitted that the case should be sent back to them, to be stated (1) by their finding and stating whether the new building was in fact "an addition to the house," if its being structurally separate did not prevent its being such addition; and (2) whether the house was part of a "street" within the 156th Section of the Statute. This latter point, he said, had been distinctly raised before the magistrates, but they had not given a sufficient finding or statement of fact to raise it.

Mr. Bosanquet, Q.C., on the other side, did not object to the case being restated on the first point, as to whether the stable was "an addition to the house," but as to the other point, he insisted that the case could not be restated so as to raise a new question, and the question now raised in the case was "whether the place was a street."

Mr. Foote urged, in reply, that this would not raise the question which he desired to raise and had raised before the magistrates, viz., whether the house was "part of a street" within the Act. It was undoubted and laid down in the Act itself that any road, lane, &c., would be a "street." The real question was whether this house was part of the street.

The Court were clearly of opinion that this was so, and that the magistrates ought to let them know what they had found to be the fact, as to whether this was a new building and an addition to the house, and whether the house was part of the street.

Case sent back accordingly.—Times.

CASE UNDER THE METROPOLITAN  
BUILDING ACT.

A SOMEWHAT important point was raised last week by Mr. Knightly, District Surveyor of Hambleton, before Mr. Paget.

A builder, named Heath, removed some 15 ft. of earth from beneath a bay window of two stories, and underpinned it with concrete. He gave no notice, and on being requested to do so, wrote, refusing, saying he preferred to be summoned.

His contention was that as he had not removed any of the walling, it was only a necessary repair. Mr. Knightly contended that as no brickwork was removed it could not be a repair, but that it was work affecting the construction of an external wall; that the bay window formed part of the enclosing walls of the structure, and that what had been done came within the meaning of the phrase "other work." Section 9 he quoted, also 1st Rule of 1st Schedule, and By-law 3, which directs the use of concrete for foundations.

Mr. Paget said the question was difficult, and that

he was willing to grant a case, but as both plaintiff and defendant asked him to decide, he said, addressing defendant, "Why did you not give notice? If you were sitting in a chair and someone came and cut off the legs, your position would resemble the bay window after the removal of the supporting earth, and your seat would be found to be very uncomfortable. I shall fine you 10s., 2s. costs, and allow the District Surveyor one guinea for his attendance."

THE THEATRE MANAGERS AND THE  
OFFICERS OF THE METROPOLITAN  
BOARD OF WORKS.

SIR,—In your last issue reference was made to the case, which has since been very widely noticed in the daily press, of the Assistant Architect to the Metropolitan Board. There is little to be said in palliation of the unfortunate error of judgment to which he has been owing; but perhaps you will permit me to point out that the conduct of the theatrical managers is an indirect testimony to the stiffness (not unknown to many London architects) with which this official must have insisted on the observance of the orders of the Board. What the managers complain of is not that Mr. Hebb got orders for the play, but that they got nothing in return.

[We may here mention that the case referred to was discussed at the Board meeting held last week, and its further consideration was adjourned until the second meeting after the Christmas vacation.]

"ST. AGUSTINE AT ST. ALBAN'S  
ABBNEY."

SIR,—My attention has been called to a letter in your issue of the 10th inst. [p. 824], written by Mr. H. Littlebales, and I dare say you will allow me to correct an error into which he has fallen in his comments on a letter of mine to Mr. Hems, of Exeter. I have not that letter before me, but I am quite sure that I did not, as Mr. Littlebales supposes, allege that the mention of Archbishop Augustine by his name alone without the prefix of Saint, was in any way "an argument in favour of his subsequent canonisation." My point was that my critic was mistaken in arguing that his being so mentioned was a proof that he was not canonised afterwards, and was, in fact, not canonised at all.

I do not think we can recognise Henry or any modern historian as an authority on the subject. They must, of necessity, be only compilers from ancient historians.

To some of these ancient historians Mr. Littlebales rightly appeals, but I do not know on what grounds he considers those particular ones worthy to be ranked among "the best writers of English History." Ordericus Vitalis does, as he says, at least in one passage, call the Archbishop "Augustine," while he calls the Pope who sent him "Saint Gregory." So also does Roger de Wendover, writing at about the same time; but while Roger usually calls him "Vir Domini" and often "Beatus Augustinus," he calls him also "Sanctus Augustinus." I apprehend that one such affirmative instance must outweigh a shoal of such negative instances as those quoted from translations of Ordericus and Jeffery of Monmouth.

Gocelin, a historiographer of St. Augustine (A.D. 1080 or 1090) (see the Acta Sanctorum), calls the Archbishop (as he does also the Pope) sometimes by his name alone, sometimes "Beatus," when writing of his acts in this life, but he calls him also and not seldom "Sanctus Augustinus," and he expressly says that by a decree of the Council of Clovesroo, A.D. 747, his name was inserted in the Litany.

Neither Henry nor Hume asserts that Augustine was not canonised; but even if they had done so I should prefer the authority of Roser de Wendover and Gocelin to theirs; and I should be satisfied that Pope Innocent knew what he was talking about when, in 1356, he ordered the Feast of St. Augustine of Canterbury to be kept as a "double."

The negative argument which Mr. Littlebales adduced from the reformed English Calendar would de-canonicalise forty-three out of the fifty-four "black letter" Saints, Popes' concilia and formal canonicalists to the contrary notwithstanding.

As to the statutes in the high altar screen at St. Alban's, St. Augustine's canonisation was not a necessary condition of his admission into

that company, for I have admitted among the saints some few others, who, for their connexion with St. Alban's, were worthy of such commemoration.

HENRY HUCKS GIBBS.

December 20, 1887.

\* \* \* We cannot find space for any further correspondence on this subject.

WALTON-LE-DALE SEWERAGE SCHEME.

SIR,—I read with some surprise in the issue of your journal for the 10th inst. [p. 803] that "some little time back" the above Authority advertised for competitive schemes, and that Mr. Thomas Fenwick, C.E., of Leeds, has awarded the premiums.

The words "some little time back," and the name of the adjudicator in this matter, prompt me to write to you to say that "some little time back" means two years within six weeks since the schemes were deposited with the Board. This long delay has, no doubt, been a disappointment to others along with myself; but this is augmented by the news that the adjudicator, to the best of my knowledge, has not carried out a sewerage scheme under the modern requirements of the past twenty years of the Local Government Board.

Therefore, if experts are invited to compete, as I have no doubt some have done, it is most unfair to my mind that a non-expert should be the judge in such matters.

I have refrained from expressing an opinion as to the time the Board have taken, but this case suggests the question whether or not the Local Government Board should not exercise some restrictive power to limit local authorities and prevent them, with the time of an industrious class of professional men, to say nothing of the large amount of capital and time expended on a scheme of this magnitude.

COMPETITOR, M. Inst. C.E.

OWNERSHIP OF DRAWINGS.

SIR,—Can any of your numerous readers inform me who has a right to the plans of the buildings completed under an architect, who wrote to the proprietor as follows:—"According to promise, I herewith enclose my professional charges for preparing plans and details of, and superintending the erection of, your new premises, as above, viz., I agree to charge you for the above works, five per cent. upon the cost of same."

JUNIAS.

\* \* \* Unless any stipulation to the contrary be made (which does not appear in this case as stated above) we are advised that in law the building owner has the right to the plans; see the case of Eddy v. M'Govern, in "Roscoe's Building Cases," p. 31. As a matter of equity we dissent from this, holding that the plans are the architect's means of working in order to carry out a design, and that they should be his property; but the law appears to be the other way.

PARISH TAKING OVER ROADS.

SIR,—What are the requisites to be fulfilled before the parish takes over a new road?

Is it at the pleasure of the Vestry whether a new road shall be taken over or not, although the parties interested may be able to show that the usual conditions have been fulfilled, or is there any, and what, remedy in case of refusal of the Vestry?

Reference to statutes or cases will oblige.

FIREHOLDER.

"Whiteley's."—The "Universal Provider's" premises in Queen's-road, Bayswater, are rapidly rising from their ashes. As we have on two or three occasions mentioned, the "Doulton-Peto" hollow terra-cotta or fire-brick flooring is being adopted throughout the new buildings. We published a section and full description of this flooring in the *Builder* for Dec. 19, 1885, p. 877, and a section of it is now appearing in our advertisement columns. By the use of this flooring the iron joints are entirely covered, and a good key is left for plastering. The flooring is light, and permits of ready and rapid fixing with very little support in the way of centering, which can be suspended from above, and struck as soon as the cement joints are set, when the plasterers can commence work underneath. The same system is being adopted for the roofs of the new buildings, which will be flat. This method of flooring deserves to be better known than it is, on account of its lightness, rapidity of construction, and fire-resisting qualities. About 116,000 ft. super. of flooring are now being laid at Whiteley's on this system. Mr. W. Brass is the general contractor, and Alderman J. E. Saunders is the architect.

Dec. 10.—16,939, A. Hobson and J. Croft, Heating Air for Warming and Ventilating, &c.—16,997, H. Parker and A. Winder, Water-closet Cisterns.—17,005, H. Steven and J. Walker, Domestic Fire-grates.—17,041, T. Martin, Gate Latch.

Dec. 12.—17,100, F. Vengara, Substitute for Glass for Ornamental Purposes.

Dec. 13.—17,121, J. Lister, Sash Locks.—17,136, A. Carter, Automatic Flushing Tanks or Cisterns.

Dec. 14.—17,189, F. Cook, Preventing Air and Dust passing under Doors.—17,179, H. Frost, Flushing Cisterns and Water-waste Preventers.—17,197, A. Bayley, Fixing and Securing Ornamental Substances for the Decoration of Bar Fittings.—17,205, T. Bailey jun., Window Fasteners.—17,206, A. Hopkins, Water-closet Apparatus.

Dec. 15.—17,271, J. Honeyman, Water-closet Cisterns, &c.—17,281, S. Tuddenham, Ornamentation of Art Metal Work by the Use of Glass Globes or Balls.—17,285, H. Hancock, Curing Smoky Chimneys.—17,294, C. Wright, Telescope Screw Fasteners for Windows, Doors, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.

12,084, W. Baldwin, Preventing Concussion in Water-pipes.—16,159, J. Lee, Groove and Tongue Cutting Machines.—15,306, J. Pauwels, Water Meters.—15,644, J. Pettor, Joints of Gas, Water, and Other Pipes.—15,739, J. Stephens, Portland, Roman, and Other Cements.—15,773, F. Crane, Varnishes.—16,389, T. Grimbley, Double Bar Lock Roofing Tile.—15,996, W. Lake, Preventing the Slamming of Doors.—16,234, J. Sheldon, Wall Ties or Bond Iron.—16,262, F. Seyde, Metallic Lathing or Backing for Plaster or Cement Partitions and Ceilings.—16,289, A. Illidge, Opening and Closing Fanlights, Skylights, &c., and Retaining same in any Position.—16,490, W. Knight, Reversible Metallic Tread, for Steps, Stairs, &c.—15,992, W. Wade, Sheet Steel Panels for Doors.—16,137, R. Deacon, Stop and Catch for Doors, Windows, Gates, &c.—16,238, C. Onions, Flushing Cisterns.—16,300, O. Elphick, Automatic Flushing Tanks.—16,322, W. Birdthistle, Draught and Dust Excluder for Doors, Windows, and Skirtings of Rooms.—16,339, E. Kent, Automatic Ventilating Apparatus.—16,456, F. Cook, Preventing Air and Dust passing under Doors.—16,505, W. Phillips and E. Verity, Sash Windows.—16,507, F. Collins, Indicator for Door Fastenings.—16,529, S. Bond, Apparatus to be used in the Manufacture of Bricks, Tiles, &c.—16,577, J. Tourtel, Automatically Closing Doors.—16,601, O. André, Glazed Roofs.—16,610, R. Adams, Opening and Closing Swing Windows, &c., and Fastening same at any desired Angle.—16,677, E. Nunn, Metal Laths for Building Purposes.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to Opposition for Two Months.

16,312, W. Illineworth, Joiner's Adjustable Bench Stop.—414, T. Whalley, Water-closets.—2,112, J. Harris, Water-closets, and Ventilating Soil Pipes of same.—2,118, A. Walker and D. Bell, Raising, Lowering, and Securing Window Sashes.—2,305, H. Doulton and W. Rice, Ornamenting Pottery, Tiles, or Glass.—4,053, R. Nimnes, Casement Stay.—9,457, S. Hill and B. Hodges, Spring Hinges for Swing Doors.—15,096, S. and A. Penn, Fireplaces of Kilns or Ovens for Burning Bricks, Tiles, &c.—1,114, W. Barnes and Others, Paint Brushes, &c.—2,428, Sir G. Chubb and H. Ball, Locks and Door Fastenings.—9,033, F. Naumann, Faced Bricks.—12,304, W. Heath and W. Geddes, Fireproof Curtains for Theatres, &c.—15,092, H. Reinicke, Ventilating Closets.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

DECEMBER 12.

By JOHN LEES.

Crownhart, Surrey—Freehold Brick and Tile Works; the residence called Drewsham; the Brickmakers' Arms public-house; and Waste Farm, together about 106 acres, including mortgage £5,020

By J. DAVES & SON.

Battersea—5 to 11 odd, Alphen road, 90 years, ground-rent 27*l.* 830

2 to 12 even, Khyber-road, 90 years, ground-rent 30*l.* 1,240

111 to 125 odd, Ingham-street, 62 years, ground-rent 25*l.* 1,125

By W. BRATHWAITE & GREEN.

Soho—43, Gresh-street, freehold 1,520

Clapham—17, Lambour-road, 87 years, ground-rent 6*l.* 330

19, Offerton-road, 80 years, ground-rent 6*l.* 300

Peckham—154, 156, and 172, Camden-grove North, 79 years, ground-rent 19*l.* 745

127, Chamber-well-grove, 79 years, ground-rent 8*l.* 325

Chelver, Sussex—Holly Grove, and 12*1/2* acres, copyhold 3,520

By W. HALL.

Haverstock-hill—3, Matland Park-road, 64 years, ground-rent 9*l.* 450

By DRIVER & PERFECT.

Stoke Newington—2 and 6, Millard-road, 85 years, ground-rent 11*l.* 445

Islington—401, Caledonian-road, 60 years, ground-rent 1*l.* 305

Canonbury—54, Pyrland-road, 62 years, ground-rent 6*l.* 410

Gray's Inn-road—44, Acton-street, 60 years, ground-rent 21*l.* 300

Whitechapel—10 and 13, Sutton-street, 10 years, ground-rent 18*l.* 75

DECEMBER 13.

By DRIVER & CO.

Regent-street—An improved rent of 638*l.* 3*l.* 4*d.*, term 29 years 49,000

By CHURCHWOOD, GILBERTSON, & CO.

City, Carter-lane—Freehold rent of 242*l.*, reversion in 8 years. 8,500

By BROAD & WILTSHIRE.

Finchbury Park—10, Portland-road, 71 years, ground-rent 16*l.* 600

Peckham—3, East Surrey-grove, and 2, Canon-street, 76 years, ground-rent 10*l.* 270

Old Kent-road—26 and 28, Kingslake-street, and 60, Surrey-grove, 29 years, ground-rent 12*l.* 100

Camberwell—173, Beresford-street, 18 years, ground-rent 10*l.* 115

Deptford—Ground-rents of 10*l.* 5*l.*, term 56 years 775

Fulham—1, Ashbocking-terrace, 83 years, ground-rent 6*l.* 315

DECEMBER 14.

By D. J. CHATTELL.

Gray's Inn-road—13, Colthorpe-street, 32 years, ground-rent 10*l.* 375

Widmore, Kent—1, The Old Wesleyan Chapel, freehold 135

By T. WOODS.

Hempton, Wolsley-road—Christleton Villa, 97 years, ground-rent 4*l.* 170

By W. B. HALBERT.

Bovey Heathfield, Devon—An improved rental of 25*l.* a year, term 32 years 190

By REYNOLDS & EASON.

Croydon—1 to 8, Croydon-cottages, freehold 1,620

1, Elmwood-road and stabling, freehold 460

Two plots of freehold land 450

By MOSS & JAMESON.

Soho—12, 13, and 13a, Gresh-street, and a ground-rent of 56*l.*, reversion in 34 years, freehold, area 10,909 ft. 18,000

Holborn—3, Fullwood-street, freehold 26

Harrow—A plot of freehold land 383

DECEMBER 15.

By RUSWORTHY & STAVENS.

Brompton—13, South-street, 37 years, ground-rent 8*l.* 310

25, Alexander-square, 134 years, ground-rent 4*l.* 605

By FARRBROTHERS, PALMER, & CO.

Paddington—13, Edbrooke-road, 75 years, ground-rent 7*l.* 500

By G. A. WILKINSON.

Peckham—3 and 4, Stanley-gate, 56 years, ground-rent 7*l.* 4*l.* 350

Chelsea—An improved rent of 79*l.*, term 21 years 810

Whitehead's-grove—The Brompton County Court, 21 years, no ground-rent 1,265

Greenwich—1 and 13, Church-street, freehold 1,230

1 to 5, Pennell's-court, freehold 250

1 to 4, Conduit-terrace, 34 years, ground-rent 18*l.* 290

By E. SIMSON.

Brixton-road—36, Holland-street, 12 years, ground-rent 4*l.* 8*l.* 4*d.* 1,168

Rotherhithe—98, Althorn-street, freehold 415

Lambeth—35, Leuneth-walk, freehold 350

83 and 86, Crosswall-road, 35 years, no ground-rent 690

By C. P. WHITELEY.

Herne-hill—143, Dulwich-road, 79 years, ground-rent 14*l.* 310

Brixton—30, Fulwood-road, 75 years, ground-rent 4*l.* 10*l.* 235

Clapham—48, Landon-road, 60 years, ground-rent 4*l.* 10*l.* 245

9 and 10, Willing-road, 87 years, ground-rent 10*l.* 10*l.* 360

Merton—1 to 6, Wandie-terrace, freehold 900

By RICHARDSON & BARTON.

Notting-hill—10, Emslie-street, freehold 760

By BRADSHAW BROWN.

Poplar—5, 6, and 7, Lodge-street, freehold 500

Stepney—126, Eastfield-street, freehold 160

By MESSRS. CADWIN.

Chelsea—49, Walton-street, 42 years, ground-rent 8*l.* 8*l.* 1,270

41, Orington-street, 44 years, ground-rent 6*l.* 570

Maide-vale—12, Carlton-road, 61 years, ground-rent 8*l.* 800

By F. J. BUREY.

Rotherhithe—25, 26, 28, 29, and 30, Adam-street, freehold 1,940

By DOWSETT & CO.

Shaftesbury-avenue, West-street—Freehold chapel, Sidmouth, Devon—The Woodlands, and 11 acres, freehold 1,400

Wokingham—An enclosure of freehold land, 65 acres 1,300

Crowthorne Farm, 29a, 2r, freehold 550

An enclosure of land, 15a, freehold 500

An enclosure of land, 29a, 1r, 19p, freehold 500

An enclosure of land, 51a, 3r, 34p, freehold 1,200

Euston-road—1, Crescent-place, 19 years, ground-rent 17*l.* 17*l.* 1,400

By NEWBOLD & HARDY.

Islington—213, Liverpool-road, freehold 175

38, High-street; and 1 and 2, Smith's-buildings, freehold 1,450

255 and 257, Liverpool-road, freehold 1,360

182 and 183, Upper-street, copyhold 2,000

32, 34, and 38, High-street, freehold 3,920

3,220 ft., 910*l.* a year.

3,690 ft., 1,320*l.* a year.

Miscellaneous.

**The Building Sites in the New West End Thoroughfares. Important Lettings.**

The second public letting of the building sites in Shaftesbury-avenue and Charing Cross-road, belonging to the Metropolitan Board of Works, took place at the Auction Mart on Friday, the 16th instant, in the presence of a very crowded attendance of builders and capitalists, one of the largest rooms at the Mart being inconveniently filled. The plots submitted were six in number, and comprised the most valuable sites in the two thoroughfares. Mr. Robert Reid conducted the auction. The sites were described as having commanding frontages to Piccadilly-circus, Charing Cross-road, and Shaftesbury-avenue, and as specially suitable for the erection of banks, insurance offices, residential chambers, or other public buildings. The first lot submitted comprised a plot having a frontage of 93 ft. 5 in. to Charing Cross-road, and covering an area of 4,160 ft. It was stated that as regards this lot the Metropolitan Board, by deed dated November 25th, 1887, had granted to the Marquis of Salisbury and the trustees of a settlement of the family estates, a perpetual right of way over a portion of the land comprised in the lot, to be formed into a roadway 12 ft. in width, with a headway of at least 12 ft. in the clear to and from Charing Cross-road, and that the lessee would have to take the lot subject to this grant. After some spirited bidding the lot was let on a rental of 310*l.* per annum. All the other lots were also let in rapid succession; a plot in Charing Cross-road, adjoining the last-named lot, having a frontage of 40 ft., and covering an area of 1,246 ft., being let for 155*l.* per annum. A plot at the corner of Shaftesbury-avenue and Dyott-street, Bloomsbury, having a frontage on the north-west side of Shaftesbury-avenue, and 52 ft. on the west side of Dyott-street, and covering an area of 2,950 ft., was let for 120*l.* per annum. Another plot at the corner of Shaftesbury-avenue and Denman-street, Soho, and close to Piccadilly-circus, having a frontage of 56 ft. on the north-west side of Shaftesbury-avenue, and of 98 ft. 9 in. on the south side of Denman-street, and covering an area of 3,400 ft., was let for 610*l.* per annum. This was followed by another lot in Shaftesbury-avenue, adjoining the last lot, having a frontage of 75 ft., and covering an area of 3,220 ft., which was let for 910*l.* per annum. The last lot was described as a very important and commanding plot at the corner of Shaftesbury-avenue and Piccadilly-circus, having a frontage of 108 ft., and covering an area of 3,050 ft. The auctioneer drew attention to his being on the direct line to Regent-street, and as one of the most valuable sites at the West End. It was let for 1,520*l.* per annum, the aggregate amount of the lettings being 3,625*l.* per annum, on leases for a term of 80 years. The lowest amount to be expended in building on the six sites is 27,000*l.* The conditions provide that the several buildings are to be erected subject to the approval of the Board or their architect, that plans are to be submitted by the several lessees within three months after the date of the letting, and that within two months after the plans have been approved, the construction of the buildings is to be commenced.

**The Mission Church, Lowden-road, Herne-hill,** was reopened on Monday last. A chancel has been erected, and rooms for Bible classes and mothers' meetings, the additions being in exact accordance with the original building. The work has been executed by Mr. C. Good, builder, Camberwell, under the direction of Mr. H. Lovergove, F.S.I., who has given his services.

**British Archaeological Association.**

At the meeting of this Association on Wednesday, December 7th, Mr. Thomas Morgan, F.S.A., in the chair, Mr. Earle Way described further discoveries of Roman remains at Southwark, during the progress of the works for the new street through the Mint. These include evidences of the existence of buildings of various kinds, the water-supply to them having been by terra-cotta pipes, several of which about an inch in bore and 25 in. long were found. Considerable quantities of Roman pottery have been discovered at a level about 12 ft. or 14 ft. below the present surface. Not the least curious of the finds was that of a dog's skull, with some of the teeth purposely broken, possibly to prevent certain kinds of game from being destroyed. It was found on part of the site of the palace of the Dukes of Suffolk. Mr. R. Howlett exhibited an ancient MS. of the early part of the fifteenth century, curious for a record by which it is apparent that 160 of its pages were written between February 7, 1402, and April 22nd. The parchment has been that of a still more ancient MS. unincised to an even surface. From a word or two that can be detected, the earlier MS. was one on Canon Law. A paper was then read on a Roman bronze sword found at Basingstoke, Hants, by the Rev. Canon Collier, F.S.A., read in the author's absence by Mr. Loftus Brock, F.S.A. Mr. Romilly Allen, F.S.A. Scott, described the remarkable cross at Rithwell, N.B., which has recently been set up within the church in a very praiseworthy manner by the Rev. M. McFarlane, aided by a Government grant. A paper was next read by the Chairman on the work of the Association during the past session, and the proceedings were brought to a close by another paper on "Relics of Mary Queen of Scots," prepared by Mr. H. Syer Cuning, F.S.A. Scot.

**Artisans' Dwellings, Lisson Grove.**

The Artisans, Labourers', and General Dwellings Company, whose houses of the cottage type at Shaftesbury Park (Clapham Junction), Queen's Park (Harrow-road), and Noel Park (Hornsey), are well known, are taking a new departure in the erection of dwellings in flats. This, the Company's first experiment of the kind, consists of large buildings in Lisson-grove, providing accommodation for 250 families, the tenements being mostly of two or three rooms each, though there are single-roomed tenements and four-roomed tenements. The buildings are being carried out by the Company, from plans by Mr. F. T. Pilkington, architect, Mr. Wear being the managing foreman on behalf of the Company. The buildings are solid and substantial, with the principal façades of red brick and moulded concrete, the general architectural effect being more elaborate and less monotonous than that of most blocks of buildings of the kind. The concrete dressings, trusses, copings, &c., also the concrete steps of stairs, flue-blocks, and partition walls (3-in. slabs stiffened with iron) have all been made in situ. The iron girders, &c., have been supplied by Messrs. Measures Brothers, and the flat roofs have been covered with asphalt by the French Asphalt Company (Limited), of Cornhill, in an admirable manner. We may possibly have more to say of these dwellings later on.

**The Vacant District Surveyorships.**

At the meeting of the Metropolitan Board of Works on the 16th inst., Mr. W. Shepherd moved the adoption of the Building Act Committee's report with reference to the decease of Mr. E. Woodthorpe, late District Surveyor for the District of the Northern Division of the City of London, and the District of St. Anne, Linehouse, St. John, Wapping, the Precinct of St. Katherine, and the Hamlet of Ratcliff, and recommending—(a) That a District Surveyor be appointed for each of the two districts; that the usual course be taken for filling the office of District Surveyors for such districts; that advertisements be issued inviting candidates for the appointments, and that the Board do proceed to the elections on Friday, the 13th January, 1888. (b) That Mr. J. D. Mathews, Mr. G. Elkington, jun., and Mr. C. Foulsham, District Surveyors, who have addressed the Board on the subject, be informed of the course taken. This was agreed to.

**Appointment.**—Mr. F. S. Granger, M.A., A.B.L.S., Nottingham, has been appointed Lecturer in Classics and Philosophy to the Nottingham University College. We understand that this appointment will not interfere with Mr. Granger's other duties.

**Crystal Palace School of Practical Engineering.**

The certificates of merit to the students of this school in the winter term just closed were distributed on Saturday last at the school by Mr. W. H. Preece, in the presence of a large number of the students and their friends. Mr. Shenton, the Superintendent, having read the report of the examiners, which was of a satisfactory character, Mr. Preece delivered an address to the students, in the course of which he said that the art of engineering was constantly embracing a wider and wider area. In days of old it was said that an ounce of practice was worth a ton of theory, but that notion was now thrown to the winds, and at the present time theory and practice must go hand in hand. It was impossible for an engineer to visit that school and see the drawings and models and apparatus without feeling that the course of instruction pursued in it was of the most satisfactory character. There was a close attention to detail which was the root of all human progress, and the result was that the students of that school had acquired a high reputation in all parts of the world to which they had been sent.—Mr. Wilson, the principal, stated that, including those now in it, there had been 690 students in the school since it began fifteen years ago; that 172 of them became Students of the Institution of Civil Engineers, and that out of that number sixty-six had already passed to the grade of Associate-members of that institution.

**Obituary.**—The Newcastle Chronicle announces the death, on the 14th inst., of Mr. John Lowry, the senior partner of the well-known firm of John and William Lowry, builders and contractors, Corporation-street, Newcastle.

Mr. Lowry, who was in his sixty-fourth year, was a son of the late Mr. Joseph Lowry, builder, Raffles, near Carlisle. He came to Newcastle about forty years ago, and in conjunction with his brother has carried on an extensive business as a contractor during that period. During the great strikes that occurred many years ago in this district in connexion with the building trade, Mr. Lowry was the Chairman of the Master Builders' Association. He leaves a widow, two sons, and two daughters.

**Compensation for Defective Drainage.**

Damages for injury brought about by defective sanitary states of dwellings are by no means common, and for this reason alone it is worth recording that towards the close of last month 100l. were awarded as compensation to a gentleman who had lost his daughter by reason of the defective drainage of the house he occupied. We are not aware of the particular circumstances of this case, but as a general principle we think that the responsibilities of landlords who seek to make gain by letting houses which are, in point of health, unfit for human habitation need to be strongly pressed home; and every such case as the above aids in this direction.—*Lancet.*

**A New Hot Water Pipe-Joint**

has just been invented at the Tydesley Ironworks, owned by Mr. John Grundy, of London. It is to be used in the fitting up of his combined apparatus (pure warm air and hot water) for heating churches, schools, and public buildings. It is claimed for the new pipe that it is impossible for the joint to blow off or become loose during expansion and contraction. Provisional protection has been secured by the patentee.

**Shakespeare Memorial Tower.**

The magnificent gift of Mr. George Childs, of Philadelphia, presented to the town of Stratford-on-Avon, was specially designed by Mr. J. A. Cossins, architect, of Birmingham. The clock is by Mr. J. W. Benson, of Ludgate Hill, London, and strikes the hours and quarters upon hemispherical bells.

**Blinds.**—We understand that Messrs. James & Son, Aldersgate-street and Piccadilly, have received the appointment of Blind Makers to Her Majesty's Works and Public Buildings in the London District, also to the Royal Palaces, and at Hampton Court, Kew, and Richmond, the museums, post-offices, Houses of Parliament, Royal Law Courts, &c.

Messrs. Pontifex & Wood.—It is announced that the old-established business of engineers, copper-smiths, white lead and chemical manufacturers, carried on by the above-named firm for upwards of a century, has been converted into a limited company. No shares, however, will be issued to the public.

**Horeham Hurst, Sussex.**

In our notice of this building, under "Illustrations," last week, the words "filled in between the double lath and plastering" should have been "filled in between with double lath and plastering." London.—Messrs. T. & W. Farmicoe have just completed and fixed a stained-glass window at Christchurch, Jamaica-street, E. The subject is "The Ascension."

### Some Recent Illustrative Works.

HERE has probably been no period when there were so many illustrative books of architecture brought out, and of so high a class generally, as in the present day. If some critics think we have forgotten how to build in these days, we at all events know how to draw buildings, and the collections both of measured drawings and of picturesque views of architecture drawn by architects during the present generation will be regarded by our successors as a very noteworthy contribution to the illustration of the architecture of the past. We are speaking here not of books which have a special literary value,—essays on history or topography accompanied by illustrations,—but of books which are of value as collections of illustrations, apart from any literary matter in connexion with them. We noticed one at some length the other day, a work on sepulchral monuments, which, as dealing with a subject which has not received much systematic illustration, seemed to claim special attention; and we have three others now before us, each with a special interest of its own.

Mr. Ernest George's book of views in Venice,\* represents that type of architectural illustration in which the architectural and the purely artistic elements are combined in about equal proportions. His etchings are all of architectural subjects, but they are of value not so much as representations either of architectural topography or architectural detail, but as artistic pictures from architectural materials. Etching is a form of execution peculiarly suited for this artistic treatment of buildings. It is not the best method by which to give their detail as it would strike an architect. But it is one of the very best mediums for rendering the picturesque and poetic aspect of architecture, the expression of its deep shadows and its broad sun-lit masses. In searching in Venice for examples of architectural effect adapted to treatment by etching, Mr. George has in the main avoided the most well-worn ground. The only one of the prominent and world-renowned architectural features of Venice which he has included among his subjects is the Dogana and Santa Maria behind it, from the lagoon, which he has treated in a manner characteristic of etching, the buildings with their solid masses and deep shadows forming the only worked-up portion of the

picture, the sky and the water hardly touched, the latter only sufficiently to give the requisite effect of reflection. Etching in its purest form is taking darks out of a pervading light, just as engraving in its purest form consists in taking lights out of a pervading dark; and a subject for etched effect is pre-eminently one with plenty of light in it, broad masses of light which can be passed over almost untouched by the needle and give the full value to the darks which are worked out of the plate; and there is nowhere greater scope for an effect of this kind than in a place like Venice, where water, with its wealth of reflected light, pervades every scene, and leaves the etcher so many opportunities of broad and striking contrasts of light and shade. The Rialto nominally forms one of the illustrations, but it is not the familiar view of the whole bridge, but a drawing showing one end of the bridge and one of the approaches to it. In the other illustrations we are taken into the smaller canals and under the shade of gloomy old walls and dark little bridges, not showing much architectural detail that is of any special interest, but full of the artistic incidents of light and shadow to be found in such combinations of houses, bridges, and water, the possible beauty and poetic suggestiveness of which are, perhaps, better realised by the medium of drawing than by the sight (and smell) of the scenes themselves. The bridge behind the Fondaco dei Turchi, with the picturesquely corbelled out balcony or gangway on the right of the picture, is one of the best of these back canal drawings; the next, the Rio de Baratter, with its perspective of bridges, is nearly as good, only the bridge crossing the front of the scene is a little too black and loaded for the rest of the drawing, on which it forms rather too prominent a black space. One of the best points in this drawing is the excellent rendering of the character of the long poles rising out of the water on the left,—two of the well-known painted poles used for boat-mooring and as "fenders"; the rather bent line of these long poles, and the way they rise out of the water, convey an idea of their mobility in comparison with the masonry adjoining; they seem to quiver in the water. The dark corner near San Stefano, with the mass of dark crumbling wall on the left and over the bridge, intensified in its grimness by the piece of sunlit building standing up white on the left, and the sky reflection from the centre of the canal, is another most effective picture. The view of the bridge from the portico of the Scuola de San Rocco is another which may be picked out as especially effective, particularly in the sunlit effect given to the bridge by the slight manner in which it is touched. The interior of St. Mark's is one of the least successful of the series, partly because the subject is

one that does not take so kindly to etching as those out-door scenes amid the light of the waters and the sky: the effect is grim and dirty rather than rich; it seems to us that the surface has been too much covered, and that a more light and reticent touch, more of sparkle and less of covering the spaces with lines, might have been more successful. In general, however, this is a collection marked throughout by a perception of picturesque effect, as well as of the true powers of etching. The few words prefixed to each plate, on a separate page, hardly constitute anything that could be called a literary contribution to the subject; they serve to explain the plates, and it can hardly be said that the author is as picturesque with his pen as with his etching-needle. We may note one point, however; that Mr. George does not admit that Venice is so much spoiled as people say; he is moderate in his remarks about the steam launches,—“They are restricted to the Grand Canal, and they are a boon to the poor, who alone use them.” Most visitors, who go either to sketch or write about Venice, regard it so entirely as a place made for their enjoyment of the picturesque, that we are glad to come across an artist who does seem to remember that there are native inhabitants, and that they have some rights of their own to improved accommodation and transit.

While Mr. George has been etching corners of Venice in this catholicity of spirit, Mr. Niven has been etching in different quarters of London with a more definite purpose, that of making a record of London churches which have been destroyed, and a practical protest against the threatened destruction of others. His volume\* consists mainly of etchings, but with a few photolithographs, giving drawings of churches which have gone, from authentic sources, and drawings of those which remain, but whose existence is supposed to be threatened. Drawing with this special object, and with a view to exhibit the architectural qualities of each of these ungratefully-used edifices, Mr. Niven does not probably aim at anything like the artistic effect and broad contrasts of light and shadow which characterise Mr. George's Venetian sketches. His drawings of the exteriors of the churches included are clear and precise, not heavily worked up or shaded, but intended to show the architecture clearly, with a little effect given by touches here and there; one or two of the interiors, as that of St. Mildred's, Bread-street, are highly finished, and are good examples of what may be termed the engraving style of etching, and in the view

\* London City Churches, destroyed since A.D. 1860, or now threatened. Illustrated and described by W. Niven, F.S.A., architect; with eighteen etchings and seven photographs. London: Pettitt & Co 1887.

\* Etchings of Venice. By Ernest George. London: The Fine Art Society. 1888.

of St. Michael, Bassishaw, there is a striking effect obtained by showing the church tower white between an avenue of darkly-shaded warehouses,—a true etcher's effect. This is a book, however, with an object apart from artistic effect.

The buildings illustrated are all Wren's, and the author in his preface takes the conservative side unreservedly, and quotes various opinions as to the evil and barbarism of removing any of the old churches from the city. Among these is a rather far-fetched argument from Mr. W. Morris, that every loss of a church from the city is the loss of a part of a great design, "for it was, no doubt, in the mind of Wren that all the churches should form a support to the grand central mass of St. Paul's." We should doubt very much that there was any such definite idea in Wren's mind. A certain number of churches had been destroyed, and were to be rebuilt; and Mr. Niven himself remarks on a point which he thinks has been overlooked, that in rebuilding a church Wren, even while employing his own style, endeavoured to build it in somewhat the same general outline and proportion as before; if it had had a spire, he would create a spire in Classic form to replace, to a certain extent, that which was gone. We should think this both reasonable and right in itself, and very likely to occur to Wren; but it is not in favour of the idea that he was regarding the whole of the new churches *en masse* as supporters to St. Paul's, but rather that he was regarding each on its own merits and the special requirements of the site. With Mr. Niven's conservative attitude, nevertheless, we are, as far as our feelings and preferences go, in entire sympathy; we would not willingly see a single church of Wren's pulled down if it could reasonably be avoided; but there are cases in which it can hardly be said that it could be reasonably avoided. We have nothing to do in these columns with religious or ecclesiastical questions as such; but we see as a matter of fact that many of these churches, owing to circumstances (chiefly the decline of residence in the City on the part of those who do business there), are practically empty and only keeping up a sleepy ceremonial service attended by a few persons; and in that case it needs either a very firm belief in the future resurrection of daily worship in churches, or a decided value and interest in the architecture of the church, to justify people in saying that this or that church ought to remain intact as long as it will last, as an architectural monument, when the ground is so much wanted practically for other purposes, in a region which is yearly becoming more and more crowded. There are cases in which this ought to be said; that of St. Mary-le-Strand is one of them. To remove that would be to remove most of the picturesqueness of the Strand, for it is St. Mary's with its steeple which fills the vista and forms its architectural effect and interest. But take such a church as St. Ethelburga in Bishopsgate Ward (Plate 5 in the book), which Mr. Niven "greatly regrets is now seriously threatened"; it is certainly of interest historically, but is it otherwise a kind of building to lament over or make any scruple about removing for the use of the site for modern purposes? One can never see an old thing go without a pang; but there must be a limit to this kind of conservatism, and in a crowded city especially it is impossible that every building merely because it is of historical interest, can be preserved independently of modern requirements.

Such a consideration, however, does not lessen,—on the contrary, it rather increases,—our debt to Mr. Niven for giving us such an interesting and well-executed pictorial memorandum of churches which have gone and churches which may have to go; and the illustrations afford an interesting group of examples of the simpler forms (mostly) of Wren's architectural treatment of churches; sometimes, it must be confessed, of his weakness as well as his strength. For instance, Mr. Niven laments over the destruction of the tower of All-hallows, Bread-street, which he speaks of as "decidedly handsome"—a rather dreadful sort of phraseology for an architect to use. We

must say that we cannot see much reason to lament the decease of a tower with such very weak general design and such *rococo* details,—gargles sculptured in relief over the belfry window, and long sticks of pinnacles with rosettes hanging down their sides: these things represent the poorest type of architectural detail, and it is better, on the whole, to forget that Wren ever did anything so bad than to struggle to keep them in existence in honour of his memory, or because they are there now, and have been there a long time. The interior of St. Mildred's, Bread-street, was well worth giving, and is worth preserving, if possible, as an example of one of Wren's admirably-treated domical interiors, in spite of the bad character of some of the decorative detail, which cannot spoil the generally fine design of the interior. St. Benet's, Gracechurch, and St. Michael, Crooked-lane, were towers of much more architectural value than All-hallows; in the latter Wren seems to have been imitating the outline and general disposition of a Late Gothic tower, and travestied the proportions of its pinnacles; in St. Benet's and St. Michael he was inventing spire-like terminations to the towers in accordance with his own taste and style, and was much more successful. Mr. Niven does not narrate the circumstances under which St. Benet's was pulled down in 1867, "to the disgrace," he says, "of all concerned." There may have been two sides to this matter also. St. Benet's Fink, destroyed in 1844, was a highly characteristic example, with its pentagon plan contrived for making the most of an awkwardly-shaped site, a relic which it was a great pity to have lost, as it illustrated a characteristic feature of Wren's practice, his ability in planning and in turning to account an unpromising site. The interior of St. Mary Abchurch, with its curious and effective arrangement of the pendentives under the dome, is done justice to in one of the best etchings in the book. The tower of St. Antholin, given on plate 14, goes far to vindicate those who protested against its destruction; it is one of the best designed of that type of Wren's towers which imitated Gothic lines and terminated in a spire; we may add, however, that it looks much better in Mr. Niven's cleanly-executed and delicately-finished drawing than it did in the reality,—in those latter days of its existence, at least, when it was darkened with soot and weather. We join with the author in regretting the destruction of St. Michael, Queenhithe (Plate 19), in consideration of the admirably characteristic arrangement of its windows,—a circular upper or clearstory window resting on the keystone of each of the lower windows; Wren's variety in this matter of the grouping of details was very great. The tower has character, too; but what would be said to an Institute or an R.A. student who were to submit such a design now?

Whether we agree or disagree with the views expressed as to the claims of all these churches to be or to have been preserved, there can be no question that Mr. Niven has done an excellent piece of work in getting together illustrations of those which have disappeared, and giving admirable drawings of those which are or may be threatened; in the latter case the illustrations may be of service in calling attention to their value (where they are really valuable) before it is too late, and, if the destruction is inevitable, in furnishing a record of them drawn from the actual building while yet existing. One or two of the illustrations we have made arrangements with the author to reproduce at an early date, both as examples of the book and of interest to themselves. Mr. Niven has added plans of some of the churches in which the plan has any special character, and also, what is of considerable interest, a plan of the City, showing the churches at the beginning of the present century,—those that are still remaining being shaded, those that are destroyed shown black. The plan serves to show at a glance that we have knocked a good deal more out of Wren's London than most people probably realise. We have every now and then the question coming up of whether a church should be removed, and

people think "it is only one church, after all," but they would, perhaps, be surprised to see on this map how many are gone.

Mr. Niven's hook is a holograph, in a sense; our next is a monograph, that of Long Melford Church,\* by Mr. E. L. Conder. The Institute of Architects, Mr. Conder mentions in his preface, had for many years recommended Long Melford Church as a subject for their measured drawings competition; Mr. Conder's partial drawings of the church gained him a silver medal, and he wisely determined to carry through what he had begun. He has produced a very fine and complete monograph of a very remarkable church, one of the finest specimens of its date and style which exists. We visited it many years ago, that and the perhaps still finer church at Lavenham, in one day of glorious summer weather, and shall never forget the joint impression of the church and the scene in which it stood; the long elaborately-decorated building, and the long sloping lawn, which might be accepted as the village green, with a row of noble trees overhanging one side of it. The church is thus an old friend, but we should not the less have appreciated such an excellent and careful series of measured drawings as this in any case. The church is, as every one knows, of very late date and style, but it is an unusually rich example of a parish church of that date, and of unusual size, its appearance of external richness being increased by the extensive use of stone inlay in flint walling, as common in that district. The Lady-chapel, placed on one side of the east end (i.e., it is of the width of the centre and south aisles, excluding the north one), is the most remarkable part of the church, and is full of rich and delicate work, both internally and externally; it seems to have been through an extraordinary history, having been converted in 1670 into "a publick schoole for Melford"; and after it lost this office it was entirely neglected, and in 1823 the windows were blocked up with lath and plaster, and the chapel used as a store-room and coal-cellar. Mr. Conder observes that the clearing off of the whitewash, and the repair of the inner roofs, is all that is now wanted to put the Lady-chapel into a reputable condition. It is to be hoped this may be accomplished. Mr. Conder shows the hideous western tower with strict accuracy. We cannot but wish the removal of that were made another part of the restoration. It is well worth pulling down.

Mr. Conder's monograph does not come under the category of those in which the literary text is a mere perfunctory accompaniment to the illustrations, for he has taken a great deal of trouble to collect what can be collected of the history of the church, and his book contains a good deal of interesting information as well as careful drawing.

## RAILWAY MAKING IN THE HIGHLANDS.

THE NEW ARGYLLSHIRE LINE.

THE mainland of Scotland to the north-west is so essentially mountainous, and moreover so cut up by transverse arms of the sea which in numerous cases penetrate many miles into the interior, that one glance at a map of the requisite orographic clearness seems to shut out definitely all prospect of the district ever becoming traversed by railways. And the region is withal so comparatively denuded of population, and so unproductive in merchandise much sought after in the southern markets, that, in this regard, but small inducement is held out to railway enterprise, even were the country an eminently accessible one, as it is the reverse. Fish, cattle, and sheep are the only important products in demand for distant markets, and the industries herein concerned have been greatly hampered in development owing to the very tedious modes of transit so long existent. But the north-west of Scotland, though otherwise comparatively poor, is very affluent in magnificent scenery; so affluent

\* Church of the Holy Trinity, Long Melford, Suffolk. A monograph by E. Lauriston Conder, Architect, London: Dryden Press (J. Davey & Sons). 1887.

that, in large measure to assist visitors to an easier participation in these fine scenic effects, it is slowly but surely becoming pierced by the enterprise of the railway capitalist, aided by the ingenuity and plaudite of resource brought to bear by the railway engineer. The north-west coast is already touched at two points:—Strome Ferry, opposite Skye, by the Dingwall offshoot of the Highland Railway from the east coast; and Oban, 60 miles to the south, by the farthest north-west reach of the Caledonian system, approach being made by way of Stirling, the Perthshire straths, and the Pass of Brander, Loch Awe. A Bill was sanctioned in last session of Parliament which will add a third point of touch with the outer ocean, namely, Crinan, on the Sound of Jura, in the track of an increasing stream of summer traffic, and long well known to travellers by the Royal West Highland route of the Macbrayne service of steamers. Crinan is fully thirty miles on a bee line from Greenock and Helensburgh, where may be said to terminate a variety of railway projections from Glasgow and inland, the Firth of Clyde and its numerous branching arms seeming here to bar all further progress to the west on the part of the iron horse. These impending stretches of sea might certainly be "got round," in the engineer's sense, with the result of extending the railway system whose

at the cost of about thirty miles of added way, and with the part compensation of catching up Inveraray by the detour; but Inveraray, though the county town, is really a very small place, and thirty miles of track in the Highlands mean a good deal of money. The loch is temptingly narrow, and it has been decided to "float" the metals over instead, and that almost in a literal sense. Before crossing however, the line,—a single one of the ordinary narrow gauge,—bends sharply round to the south-west down the loch side as far as Newton Bay, which is the chosen point of passage, with the hamlet of Furnace on the opposite side, a mile away. Newton Bay Ferry is one of the most notable features of the undertaking. The wider ferry between Helensburgh and Sandbank will (in the goods department of the traffic) be served by the North British Company's Burntisland and Granton truck-bearing steamers, now, and for a long series of years, successfully at work on the eastern firth, but destined to be relieved from east coast service altogether on the completion of the Forth Bridge, and the consequent discontinuance of the Burntisland ferry, so far, at least, as truck-transit is concerned. But the mode of transportation at the Loch Fyne crossing will differ widely from that so long in use on the Firth of Forth, and differ also from all other modes hitherto employed anywhere. Quite a new

matematically almost, one by one to the varying levels of the meeting tracks, the aforementioned pivot arrangement permitting the pontoon, with its embraced ferry steamer, to alter bearings for the few feet necessary at each succeeding change of tide-level. The metals of the steamer connect readily with those of the gangway, and the entire train steams easily on board, and *vice versa*. This loading and unloading contrivance is, of course, duplicated on the other side of the passage. As another highly interesting feature it may here be mentioned that it is in contemplation on the part of the engineers to exact from the crossing locomotive the steam necessary to set the engines of the train-bearing boat in motion,—in short to cause it to "work its passage," the chief motive herein being a very nice minimising of the oncost charges of the service.

From Sandbank on Clyde waters to Newton Bay Ferry on Loch Fyne the distance by the chosen track is twenty miles, an excess of only about five miles over the direct distance, and a very reasonable result withal, considering the rather unaccommodating character of the surface of this part of the country. The steepest gradient is 1 in 50. Leaving Furnace, on the western shore of Loch Fyne, the line keeps the waterside for a short distance downwards, after which, parting with the loch on a gradually rising slant, it strikes inland, and shortly, with the aid of two trifling bits of tunnelling, clears the 400 feet summit level of this western section of the work, and at once commences descent to the Atlantic. The route here is through the beautiful Glen Add, a section which for grandeur of scenery is one of the finest of a very fine series. For about a mile the River Add passes through a very narrow gorge flanked by almost precipitous hills. Down this gorge the railway threads its way, the engineers having taken advantage of a mere foothold of margin, quite at the edge of the torrent, for the purpose of carrying their work through a pass which, to the ordinary observer, seems impassable. The scenic effect here will be magnificent. Fifteen miles from Furnace the seashoard terminus is reached on the shores of Loch Crinan, an inlet of the Sound of Jura, which in its turn is a readily accessible arm of the outer ocean. A fork five miles in length leaves the main line at Kilmichael Market (a noted emporium for Highland cattle, situated a short distance to the north-east of Crinan), and bending south-eastward, once more catches up Loch Fyne waters in order to find terminus at Ardrishaig, the centre of the Loch Fyne fish traffic, and forming the eastern mouth of the well-known Crinan Canal, as the other or main terminus (Crinan) is the western end of the same.

The financial scope of the work, which is to be styled the "Clyde, Ardrishaig, and Crinan Railway," is 180,000*l.*, with borrowing powers to the limit of 60,000*l.* more. Operations are to be commenced early in the year, and it is reckoned that from eighteen months to two years will suffice for completion. Immense quantities of fish are captured in Loch Fyne and within the outer seas, and the line, although built primarily out of other inducements, will no doubt carry off a large share of this traffic, bringing perishable goods to suitable markets at a great saving of time, and with much thrift in the matter of labour in trans-shipping. From Newton Bay a steamboat service will connect with Inveraray, the county town, situated ten miles higher up the loch on the other side. The new railway has been privately promoted; under agreement, however, with the North British Railway Company, who are to work it, and with the prospect, no doubt, of ultimate amalgamation, as in the case of the Glasgow Underground Railway.

NOTES.

**S**INCE going to press last week more full and explicit information has reached us as to the proposed excavations in Cyprus. The Society for the Promotion of Hellenic Studies has issued a preliminary programme. The

present terminus is Helensburgh, on the north shore of the Clyde; but this so obviously involves a wearily tortuous track thrice or four times multiplied in length and cost, with no set-off worth mentioning in the way of additional traffic inducement, that such an expedient is not to be thought of, not at least simply and exclusively as a means of getting to the nearest Atlantic seaboard. The feat is to be attempted on another plan, the authors of which are Messrs. Formans & McCall, Civil Engineers, Glasgow. By a service of saloon passenger steamers of the highest Clyde class, with another service of railed truck-bearing goods craft superadded, the North British system, from the existing terminus at Craigendoran Pier, Helensburgh, with a call perhaps at Greenock and Gourock, is to be made to leap the ten miles of firth and loch barrier over to Sandbank on the Holy Loch, where the newly-designed Argyllshire Railway is to begin. Here the untutored eye discerns nothing but huge mountainous masses barring the track-maker's way even more effectually than the broad firth water did; but by hazarding a detour to the north through the narrow defile in which Loch Eck lies, a natural fault in it is made use of as a pass, and the banks of Loch Fyne are touched at Strachur after about fifteen miles of progress, and that without encountering a higher summit level than 120 ft. above that of the sea. From this point the head of Loch Fyne might have been doubled,

type of railed craft is to be provided for the service. Passenger trains as well as goods trains, and these in all cases accompanied by their respective locomotives, will run on board side also with a minimum of delay, the calculation being that fifteen minutes will fully suffice for the single mile of crossing, reckoning from the instant of train arrival on the one side to that of train departure on the other. Tide deviation at Newton Bay has 10 ft. as the extreme limit, and in order to meet the very stringent requirements of the Board of Trade as affecting permissible gradients on which to embark and disembark trains, recourse has been had to an ingenious contrivance. Some short distance away the single line of rails branches out into five separate tracks; these arrive at the water edge abreast, so to speak, but on divergent levels, the difference being 2 ft. between each, or 10 ft. (the full range of the tide) between the highest and the lowest, an arrangement which, it will be seen, leaves at disposal one practicable level at all times of the tide. The ferry steamer is received into a kind of chair or dock, composed of a huge pontoon rising and falling with the tide, which pontoon is anchored, as it were, to a vertical pivot whose foundation is firmly imbedded in the rock below. (Connecting the pontoon with the shore is a gangway, metalled, and identical in dimensions with the track itself. As the tide rises or falls the shore end of the gangway shifts and adjusts itself, auto-

Society itself contributes 150*l.*, and the Managing Committee of the British School at Athens contribute the like sum on condition that the control of the exploration be in the hands of the Director of the School, Mr. Ernest Gardner, and that those who take part in the work enroll themselves as students of the School. Cambridge and Oxford send out respectively Mr. M. R. James and Mr. D. G. Hogarth, both names already known to archaeology. Zoology and the interests of natural science generally are entrusted to Dr. F. H. H. Guillaud, and an architect, Mr. R. Elsey Smith (as was stated in our report of the Institute meeting last week), is to be sent out at the joint cost of the Royal Institute of British Architects and the British School at Athens. The British Museum, in the past and present, is represented by the active sympathy of Sir Charles Newton and Mr. A. S. Murray. Sir Charles Newton has long been unwearied in his efforts to call national attention to this archaeological field. The Committee wisely refrain from stating precisely what sites they intend to begin operations with; ample discretion is to be left to Mr. Gardner when he reaches the field of action. His work at Nankratis has abundantly proved his capacity. Nothing seems wanting but money, and it remains to say that subscriptions may be sent to either Mr. Walter Leaf, the Hon. Treasurer, Old Change, E.C.; or to the account of the Cyprus Exploration Fund, at Messrs. Roberts, Lubbock, & Co.'s, Lombard-street, E.C.

**A**N enthusiastic writer in the Roman paper *La Riforma*, commenting on the law recently passed in the Italian Chamber for the preservation of national monuments, alludes in terms of admiration to the law passed in England in 1861 (he says, but he must be wrong in his date), punishing the destruction or mutilation of public works of art. He also refers to the Ancient Monuments Protection Act (Sir John Lubbock's Act), to which he attributes a scope and power which it is far from possessing. The English law, he says, provides that the cost of preserving national monuments shall be defrayed by the State; local inspectors are to be appointed to report on the condition of public monuments; persons defacing or injuring a public monument, are punishable with fine or imprisonment and the cost of the reparation; in the case of the offender being the owner of the monument he is judged as if he had no property in it; the several things in the schedule of the Act as well as the necessary space for preserving them are declared to be national monuments, and the Government have power to enlarge the schedule after the passing of the Act. The writer concludes by saying that in England every building, whether it be public or private property, is a national monument if it serves to embellish or to illustrate the history of the country. This will be news to most people here, and it would appear that the Italian author has not learned to discriminate between compulsory and permissive legislation, and has overlooked the fact that Sir John Lubbock's Bill does not deal with buildings at all. As regards the preservation of antiquities, England is far behind.

**C**LOSE on the announcement of the valuation of the metropolis for 1886-7 comes the report of the estimated requirements of the Metropolitan Board of Works for 1888. This amounts to the formidable sum of 1,803,849*l.*, of which 1,075,551*l.* is to be raised by rates. In consequence, the rate for the ensuing year is placed at 8*39d.* in the pound, being more than four times the rate struck by the same authority in 1856, which was 2*09d.* in the pound. The rateable value in 1856 was, in round figures, 11*5* millions; that for 1886, 30*5* millions. The total incidence of metropolitan rates for 1884-5 was 6,531,317*l.*, of which 759,514*l.* was for the Metropolitan Board of Works. The rating of this body has, therefore, increased by nearly 42 per cent. in four years. The interest on borrowed money now amounts to 940,586*l.* in the year, being about the same figure as the addition made to the loan debt in the same time.

**T**HE quinquennial increase in the gross rental of the metropolis has been little more than half as much between 1881 and 1886 as that which took place between 1876 and 1881. In the earlier period the increase was very nearly 21 per cent.; in the latter, it has been a little under 11*5* per cent. For the decade 1876-1886 the increase has been 36*6* per cent. This we may compare with the increase of population in the decade 1871-1881, which was 22*6* per cent. For the last ten years, therefore, the rise in rent has been by 60 per cent. more rapid than the increase in population; or, in other words, while each Londoner had to pay 6*l.* 5*s.* rent in 1876, he has to pay 7*l.* 7*s.* in 1886. In 1881, however, for which year we have both census and valuation, he had to pay also 7*l.* It remains to be seen whether there has been a diminution in the rate of growth of the population during the last five years, or whether there has been a real check on the steady increase of house-rent per inhabitant.

**W**E have received the prospectus of "The Italian Exhibition," to be held in the coming year, 1888, in the buildings and grounds lately occupied by the American Exhibition at Earls Court, Kensington. We are promised an "exhibition of the arts, manufactures, and products of the newest Great Power of the Old World, United Italy." This sentence, and some others in the prospectus, are perhaps due to the fact that the proposed Exhibition is being engineered (perhaps "bossed" would be the better word) by Mr. John R. Whitley, the "Organiser and Director-General" of the late American Exhibition, concerning which we could not find much to say at the time, from the almost utter dearth of exhibits of interest to our readers. Let us hope that the Italian Exhibition will be more worthy of a visit than was its American predecessor. Mr. Whitley says he believes that "the display in every branch of fine arts [sic] will be the most important ever made by Italy in a foreign country." Whether ancient or modern works, or both, are here included we are left in some doubt, probably because Mr. Whitley himself has no very clear idea on the subject, as may be inferred from the following paragraphs from the prospectus:—

"It is impossible, until the various contributions are sent in and arranged, to state in what way and to what extent each constituent of the wonderful whole which the name of Italy brings before the cultivated mind is to be displayed in the capital city of the modern Italians' warmest national friends and allies.

Suffice it to say, that from Etruscan tombs, from Rome and the Campagna, from the buried cities of Pompeii and Herculaneum, from the relics, Italian in origin and character, which the legends left behind them in these northern islands, ample guidance may be obtained for reconstructing something of that ancient life, the study of which forms so important a part of modern education. Every boy and girl who learns history, and every grown person who has heard of Virgil or Horace, is interested in this part of the subject."

Among other attractions, we are promised "models of celebrated Roman, Florentine, and Venetian buildings." This item alone, if adequately conceived and carried out, would of itself constitute a rather "large order." No doubt there is much which Englishmen would like to see in an Italian Exhibition, and we can only hope that the performance will be worthy of this preliminary flourish of trumpets.

**A**NOTHER of the liberal advertisements to architects who may be supposed to be willing to compete for anything or everything appears in our advertisement columns of this week; an offer of 5*l.* 5*s.* for a sketch design to the respectable dimensions of 4 ft. to an inch, for a front elevation in the old English half-timbered style. The designer is not to be engaged to carry out the work, but the advertisers want to get hold of his ideas at a cheap price. If they want anything worth having it is worth a great deal more than that, and all the answers they will get will probably be from needy persons of no standing in the profession, who will respond to any invitation of the kind on any terms. But this is nothing to another announcement in our advertisement

columns to the effect that the Managers of St. Andrew's School, Guernsey, invite "School Architects and others" to send in designs for re-building their schools.—"5*l.* will be given for the best design." It is difficult to understand whether this is impudence or ignorance; we presume it is the latter. What sort of persons do the advertisers imagine will respond to that kind of invitation? Possibly some architects' pupils who want to try their hands, though we should doubt if even they would not think it beneath them. There is one point which the promoters of the school would do well to consider, viz., that it is their moral duty to build schools on the best sanitary principles; that it is a very great wrong to bring children into ill-constructed and ill-ventilated schools; and that it is out of the question that they can have the plans and advice of any competent person for the sum they are ignorant enough to offer, unless he gives it them out of charity.

**I**N the course of next month the Royal Academy will have three new Associates to elect. Mr. W. B. Richmond is spoken of as a very probable candidate, and certainly has high claims, though we have never been able to like his mannered style of portrait-painting. It is rumoured that there should be place found for an architect among the three; if so, Mr. Ernest George certainly has about the best claim among the outsiders. We know not whether it is contemplated to do tardy justice to Mr. Alfred Hunt by electing him an Associate; to our thinking, the justice would now be so exceedingly tardy that it would hardly be a compliment.

**T**HE list of awards in the Art Department of the Adelaide Jubilee Exhibition is rather amusing reading. The prizes are distributed in classes of first, second, and third order of merit, and the manner in which the three degrees of comparison are apportioned is curiously significant of the attitude of the Colonial mind towards painting. Mr. F. G. Cotman comes into the first order, for "A Rebellious Sitter," Mr. Holman Hunt's "The Ship" is in the second order. This is not one of the best examples of what Mr. Holman Hunt can do, but to be let down to the second order of merit is sad indeed! Mr. Mark Fisher is let down to the third order; Mr. Paed (for "Seeing them Off") is advanced to the first order. The P.R.A. gets a first order; so does Mr. C. E. Perugini, while Mr. W. B. Richmond is reduced to the second order. In water-colours Mrs. Allingham is in the second order (!) while Mr. Callow and Mr. Dobson are in the first order, and Mr. Walter Duncan and Mr. Fulleylove in the third order! After this it may be said, what is the good of sending art to Adelaide? There seems to have been some enthusiasm for English architecture, however, for all the architects who are selected for awards are put in the first order. They are Mr. Aitchison, Mr. Jas. Brooks, Mr. Edis, Messrs. Ernest George & Peto, Mr. T. G. Jackson, and the "Royal Institute of Architects" generally for "a series of Photographs of Buildings erected from designs by Members and Associates of the Royal Institute of British Architects." This is satisfactory so far, and English architecture ought to feel complimented; but the pictorial awards certainly "give us pause."

**C**ABLE tramways have not as yet found much favour on this side of the Atlantic, but there are places where horse-power is inapplicable, and the cable becomes a necessity if a tramway is to be constructed. Edinburgh, being a city built upon hills, is one of these places. The steep gradients between Princess-street and the northern parts of the city have proved most trying to horses, and it is really pitiable to see an omnibus, drawn by three or four horses, toiling up the steep incline from Pitt-street or Stockbridge. A complete cable-tramway, between the southern end of Hanover-street and the northern end of Inverlich-row, has just been completed. The length of the cable is 17,000 ft., and its approximate weight twelve tons. It is made of crucible steel wire,

3 in. in circumference. The engines are situated in Henderson-row, and the cars provided are each fitted for the accommodation of sixty persons. This additional facility of access to the vicinity of Newhaven, Trinity, and Granton will doubtless be gladly taken advantage of, not only by the inhabitants, but also by visitors to the city, and it may also give a stimulus to building operations in and about these marine suburbs.

**A**LTERATIONS have been effected in Dr. Rowland Anderson's design for the Buccleuch memorial, in order to fit it for the reception of Mr. Boehm's statue of the Duke, which has now been set up in its place. The statue is enveloped in canvas, awaiting the day when it will be unveiled, for which ceremony arrangements are being made.

**A** BOOK on "Detail and Ornament of the Italian Renaissance" is to be brought out shortly by Mr. Batsford, consisting of drawings made by Mr. G. J. Oakshott. The author says his object has been to bring together a collection of fine examples of Italian Detail in a small compass, such as may be useful to architectural students and art workmen, taking the examples from notable buildings, but avoiding such as have already been much illustrated. Mr. Oakshott's ability and painstaking qualities as a draughtsman will ensure a good execution of the examples selected, and the book will, we hope, be one of considerable interest and value.

**T**HE late Dr. William Chambers, of Edinburgh, during whose occupancy of the civic chair the last City Improvement Act was carried through, and who, after the expiry of his tenure of office, restored, at his own cost, the Cathedral Church of St. Giles, is to be commemorated by a statue erected to his honour. The site chosen is in Chambers-street, which is the most important of the improvements effected under his auspices. The statue is to be of bronze, 10 ft. high, placed upon a stone pedestal, and a sum of 1,000*l.* is to be expended upon it. It is proposed that the work should be thrown open to competition among British sculptors. The late Sir George Harrison, another chief magistrate of the city, is to be commemorated by the erection of an ornamental gateway at the eastern approach to Blackford Hill, which was secured by Sir George as a public park when he was Lord Provost. Out of a number of designs submitted, one by Mr. Sydney Mitchell has been accepted. A monumental character will be imparted to the gateway by the introduction of a bronze medallion of Sir George Harrison, after the bust in the Council Chamber by Mr. Charles M'Bride, sculptor.

**T**HE *Bookbinder* for December 23 gives four examples of recent bindings or covers specially designed for various publishers, of which, however, one only has any merit at all, the remainder being merely coarse sprigs of flowers, &c., with no design of any kind in them. The one which has something of artistic effect is Miss Orrin Smith's design for a Tennyson, bound by Jas. Burn & Co., for Macmillan & Co.; this is a diaper design in gold on a black ground,—the kind of thing which Rossetti initiated in the design for binding his own poems: it represents an oak leaf and an acorn alternated, but the leaf is poorly designed, and the whole thing rather thin. If this is the best that can be produced of contemporary binding, we are in rather a poor way. One or two fine illustrations of old buildings are given as usual: the *Bookbinder* will form as it goes on an interesting repertory of these.

**T**HE collection of drawings by Mr. Russell Dowson, chiefly illustrative of Eton, at the Galleries of the Fine Art Society, is well worth looking at. The topographical interest of many of the Eton scenes, showing various corners of old picturesque buildings, is considerable, and the execution and artistic feeling of these drawings is of a high standard. We may mention especially "Arch into Playing

Fields" (1), "The Rafts" (2), "Old House in Weston's Yard" (8), "Head Master's House from Weston's Yard" (17), "Slough Road looking North" (37). Mr. Dowson is, we believe, connected with the school as a teacher of art, and has made a very good use of his opportunities in giving these pictorial illustrations of Eton.

**T**HE collection of foreign pictures at the Goupil Gallery is not a very remarkable one, though it contains some good things. There is a large work by Professor Müller, representing the Courtyard of the Doge's Palace in old Venetian days, with a group of Oriental visitors; it is drawn and painted with the artist's usual learning, but the arrangement of the figures is theatrical, and the prevalent tone of the architecture dull and unreal. Artz's "Orphelinat de Katwyk" is a very good interior and figures, of similar merit to some others that we have noticed by the same artist. There is a *Gerôme*, fine in its way, "Awakening," but even more than usually devoid of feeling or sentiment. Among other works that may be mentioned are two very good little pictures of Venetian canal scenes, by Signor F. del Campo; "Breakfast on the Banks of the Seine," by Mr. Ridgeway Knight, equally good in landscape and figures; "Grandmother's Comfort," by Israels (not a very good specimen of the master); pictures by Danbigny and Dupré, of which the same may be said; a Corot, "The Storm"; and "Salomé," by M. Carolus Duran, a picture showing some very fine painting, though very unattractive.

#### THE PANAMA CANAL.

MR. H. B. SLAVEN, the chairman of an American Dredging Company, which has been engaged in the shallow waters at the Atlantic end of the Panama Canal since the commencement of the works, has given an opinion as to the general state of the enterprise, which is published at length in the *Bulletin du Canal Interocéanique*, under the heading "Une Opinion Compétente." The facts stated or admitted by Mr. Slaven are of value as being the evidence of a strong supporter of M. de Lesseps, and one who has a deep personal interest in the continuance of the works for which he contracts.

Mr. Slaven, by way of introduction, repeats the familiar statement that the Canal is more than half made. As the last return of excavation given in the *Bulletin* only amounts to 39,000,000 cubic metres, it would seem that Mr. Slaven is regarding the lengths taken in hand by contractors rather than the bulk of earth moved. There is now, he tells us, a length of 20 kilometres open to ships drawing 15 ft. of water. This depth, it appears from the section published in the *Bulletin*, is only three-fifths of the designed depth; and in many parts the 11 ft. left in consists of hard rock, which cannot be dredged without blasting. We pass over any estimate of what will be done at any future time, as well as the comparisons made between the efficiency of French and American contractors. The total contents of the first 20 kilometres, measured from Colon, do not exceed, according to the detailed estimates given formerly in the *Bulletin*, ten millions of cubic metres, or one-fiftieth part of the total cutting, so that the amount actually dredged in the seven years during which operations have been going on is not by any means overwhelming. It requires some explanation to justify the statement that more than half

"There remains," says Mr. Slaven, after some remarks in the future tense on other parts of the line, "a section of the length of 25 kilometres, which includes the crest or dorsal spine of the isthmus. The heights vary from 50 ft. to 387 ft. above the mean tidal level"; that is to say, that the cutting will vary from 76 ft. to 413 ft. in depth. "After mature examination, after having reckoned that this will take more time and will cost more money than he at first supposed, M. de Lesseps has concluded that he must enable ships to cross the isthmus in the shortest possible time. For that he has modified his plans by constructing temporary locks for this section, and he will thus

gain much time for the opening of the Canal." Mr. Slaven continues that this is the same course that was taken with the Suez Canal,—a comparison than which nothing could be more misleading. There are no locks in the Suez Canal, nearly the whole of which is made through sand easy to dredge; and the deepening of which, by the same method by which it was commenced, was a very simple and easy operation. In the Panama Canal, the 100 ft. or 120 ft. which it is proposed to leave in below the "temporary" waterway consists mainly of rock, and its removal could only be effected by a repeated series of very costly operations. Meantime, the "temporary" line would still have to be carried through a cutting from 293 ft. to 313 ft. deep at the summit.

Being asked how many "temporary locks" were to be made, Mr. Slaven replied that this was not yet determined. He supposed four. M. Eiffel, who is called "the constructor of the tower of 300 metres at Paris," is to be contractor for these works, "which will be made principally of iron, and worked by hydraulic force." These data would give a lift of from 50 ft. to 60 ft. to each lock, involving a water-pressure the resistance to which would be questionable even for the most solid works, and which would at once sweep away any lock which it was attempted to construct, as proposed by M. de Lesseps, *dans les barrages ména*. The largest lock in the world is at St. Mary's Falls, in the United States. It is 515 ft. long, 80 ft. wide, and 18 ft. deep. At Birkenhead a head of 13 ft. gives a velocity to the issuing water which destroyed the outlet works. The most absolute solidity of construction would be required for any works intended to raise large vessels, by any method, to a height of 100 ft. or 120 ft. above sea-level, and it is evident, from Mr. Slaven's remarks, that the question of what he calls temporary locks is one as yet unstudied.

We do not, on the present occasion, intend to do more than call attention to the evidence unconsciously given by Mr. Slaven. It is a highly significant fact that at a time when M. de Lesseps, having already incurred a liability to shareholders and bondholders of 1,347,552,500 francs, is applying to the French Government to aid him to raise 600,000,000 francs more, having done little more than a quarter of the work estimated, and that of the easiest kind, he has ceased to supply his shareholders with the accounts hitherto given of the monthly progress. For July last 911,000 cubic metres are returned as excavated during the month, and for August 1,052,000, instead of the 3,000,000 a month promised. But the *Bulletin* has given no monthly summary since August, although there are not a few notices of the stoppage of many of the "chantiers" by continued rain. But to find that Mr. Slaven, with every wish to say what is most favourable to the enterprise, can only point to the execution of three-fifths of the easiest part of the easiest section of the work in seven years is highly instructive. No let or hindrance has opposed this part of the work with the exception of the one grave difficulty of the climate. Dredgers can work under continued rain, which excavators can not do. Too many has been said as to the progress of the Panama Canal in the future tense. We should like to have a little more information in the present tense.

#### SIR ROBERT RAWLINSON, C.B.

The long-expected retirement of Sir Robert Rawlinson from official life is at last about to take place. At the ripe age of seventy-six, Sir Robert thinks it is time to rest from the toils of office. He has held his appointment of Chief Engineering Inspector to the Local Government Board ever since that Board was formed, and his name is synonymous with the progress of sanitary engineering, of which he may be said to be the father.

Born in 1810, at Bristol, Robert Rawlinson, whose father was a builder and an engineer, commenced his career at an early period under the paternal eyes. At the age of twenty he was sent to Jesse Hartley, the famous dock engineer, and remained with him at the Liverpool Docks for five years. He was then engaged for four years under Robert Stephenson on the London and Birmingham Railway, now part of the North-Western, and here he was resident engineer on the important cutting near Blisworth. He underpinned up-

wards of a mile in length of rock resting on clay, in a cutting 55 ft. deep, and executed the whole of the masonry, bridges, culverts, &c., of the heaviest cutting on the line. When, in 1840, the line was completed, he obtained the appointment of Assistant Surveyor to the Corporation of Liverpool, which post he retained for three years. He then was recommended by Jesse Hartley for the post of Engineer to the Bridgewater Canal Trust, in which he remained for four years, during which time most important works in connexion with the feeding of the canal, and its improved working, were brought about by him.

His next public work was in connexion with the building of St. George's Hall, Liverpool, of which Mr. Elmes was the architect. In 1847 Mr. Elmes became a victim to consumption, and was compelled to leave this country for a milder climate. Before leaving he confided the completion of his great work to Sir Robert. The late Sir William Tite supposed that young Rawlinson held but a subordinate position, and was clerk of the works, but this Sir Robert has refuted. He has satisfactorily proved that Mr. William Hughes was clerk of the works, and that he himself really took the place of Mr. Elmes, in regard at least to the constructive portion of the work.

The water-supply of Liverpool next engaged his attention, and he submitted a scheme for supplying the town from Bala Lake and the River Dee. This scheme, the wisdom of which has been justified by events,—for Liverpool has had recently to adopt something very similar in taking water from the River Severn,—was considered too vast for the wants of Liverpool, and was therefore rejected.

When, in 1848, the Public Health Act was passed, Mr. Rawlinson was appointed first Engineering Inspector, and ever since that date his career has been inseparably bound up with the progress of sanitary engineering. He inspected a great number of towns, commencing with Dover, and completely reorganised the drainage and sanitation of the principal provincial towns of this country. He retained his appointment for seven years, at the end of which he found his private practice increasing to so enormous an extent that he retired from office and devoted himself to the more lucrative occupation of consulting engineer. He was consulted for upwards of fifty towns, and devised schemes of water-supply for Birmingham and Wolverhampton. The city of Carlisle owes its sewerage system to him, which he completed at a cost of less than 23,000*l.*, though other engineers had estimated the cost at as much as 70,000*l.* and 80,000*l.* During this period he constructed upwards of a hundred miles of sewers.

In 1855 Mr. Rawlinson was appointed Engineering Commissioner to the Sanitary Commission that was sent out to the seat of war in the Crimea. The operations of that Commission are matter of history, and it will suffice to say that whereas before the arrival of the Commission the death-rate among the troops had reached the alarming figures of 420 per 1,000 per annum, when they left it had declined to but little over 2 per cent. Here Rawlinson was wounded whilst in the pursuit of his duties, and he had to return home to be cured; but his services were not forgotten, and when a Permanent Army Sanitary Commission was formed in 1860, he obtained a seat on it which he has always retained.

Mr. Rawlinson's next great work was the administration of the fund raised for the Lancashire Cotton Famine. He carried out public works in ninety-three Lancashire towns, involving an expenditure of 1,650,000*l.*, every penny of which has been refunded. The administrative charges did not amount to more than 3*s.* 6*d.* per cent. The cotton operatives were saved from starvation and pauperism, and the Lancashire towns were drained and paved. It is estimated that the streets and roads thus improved represent an area of 800 acres, and a length of 400 miles. For his distinguished services to his country, Mr. Rawlinson was made a C.B. Subsequently, on the recommendation of Mr. Gladstone, he received the honour of knighthood in 1883.

Sir Robert Rawlinson has served on numerous Commissions, and was Chairman of the Rivers Pollution Commissions of 1865 and 1868, and of the Royal Sanitary Commission of Dublin of 1873. He is a Vice-President of the Society of Arts, and a member of Council of the Insti-

tution of Civil Engineers. Sir Robert is the author of numerous scientific reports and papers, and of "Suggestions" for the use of local surveyors and sanitary engineers, which have been accepted as authoritative both in England and abroad. His work on "Chimney Shafts" is also well known to the readers of the *Builder*.

#### THE ROOF OF THE NATIONAL AGRICULTURAL HALL, KENSINGTON.\*

THE erection of a National Agricultural Hall in the west end of London was the original conception of the late Major Burnaby, M.P. for Leicestershire, who, taking great interest in the military tournaments which had been so successfully carried out at the Agricultural Hall, Islington, naturally desired to see these displays executed, not only in an area of larger dimensions, but in a situation more readily approached than that in the north of London. The position chosen was a site formerly occupied by a market garden upon the western side of the Addison-road Station of the West Metropolitan Railway, to and from which station frequent trains run in connexion with the suburban lines of the metropolis and all the principal main railways of the kingdom. The site occupies 6½ acres of ground and commands three good entrances, a railway entrance upon the east side, a carriage entrance approached from the Hammersmith-road upon the south side, and a goods entrance approached at the north-west corner from Blyth-lane. (See Plan in the *Builder* of October 3, 1885.)

As soon as a company was agreed to be formed, the late firm of Messrs. Henry E. Coe & Stephen Robinson were selected to be the architects. They consulted the author with Mr. Max am Ende, M. Inst. C.E., as to the best form of structure to be complete in itself for covering as much unimpeded space as practicable, and the capital of the company was fixed at 200,000*l.* Shortly afterwards a design in iron was ordered to be prepared by Messrs. Max am Ende and A. T. Walmisley, and it was agreed that they should be engaged as joint engineers to assist the architects in the preparation and carrying out of the ironwork contract. This design was illustrated in the *Builder*, dated October 3, 1885. The light appearance of the construction which has been adopted was attained not by any sacrifice of safety, but by adaptation of every detail to meet the various stresses found by calculation in order to avoid any unnecessary surplus material, and by a careful study of all the possible stresses resulting from equal and unequal loading, including the effects of wind pressure in varying directions. In bridge construction, where the various parts are perpetually exposed to a damp atmosphere, or in a railway station roof, constantly subject to the influence of the fumes from the locomotives, the use of webs and flange plates seems quite reasonable, but in a roof such as that now under consideration, where all the ironwork is under cover, and where such deteriorating influences are seldom at work, it was felt that an opportunity was presented for a greater development of the parts, and a design remarkable for an entire absence of long wide plates and webs was accepted in which the various parts of wrought-iron work are composed wholly of flat bars and angle irons riveted together, plates being only introduced where required for covers in the joints. This arrangement gives a light appearance, and is especially appropriate for wrought-iron construction (see illustration). The death of the chief promoter of the undertaking, Major Burnaby, M.P., and also of one of the architects, Mr. Robinson, caused some delay, but subsequently a contract for the erection of the whole building was let to Messrs. Edwin Lucas & Son, of Kensington, for 131,000*l.* (see the *Builder*, [May 23, 1885, p. 748], the execution of the ironwork, amounting to about 1,200 tons, being sublet to Messrs. Handyside & Co., of Derby, and the glass and zinc work to Mr. T. W. Helliwell, of Brigbourne, Yorkshire. Messrs. Franklin & Andrews were appointed the quantity surveyors. Shortly after a portion of the work was completed, the resignation of the architect, Mr. Henry E. Coe, on account of ill-health, and his death very soon afterwards,

\* By Mr. Arthur T. Walmisley, M. Inst. C.E., being a paper read before the Civil and Mechanical Engineers' Society, at the Town Hall, Westminster, December 21, 1887. Mr. R. E. Middleton, M. Inst. C.E., President, in the chair.

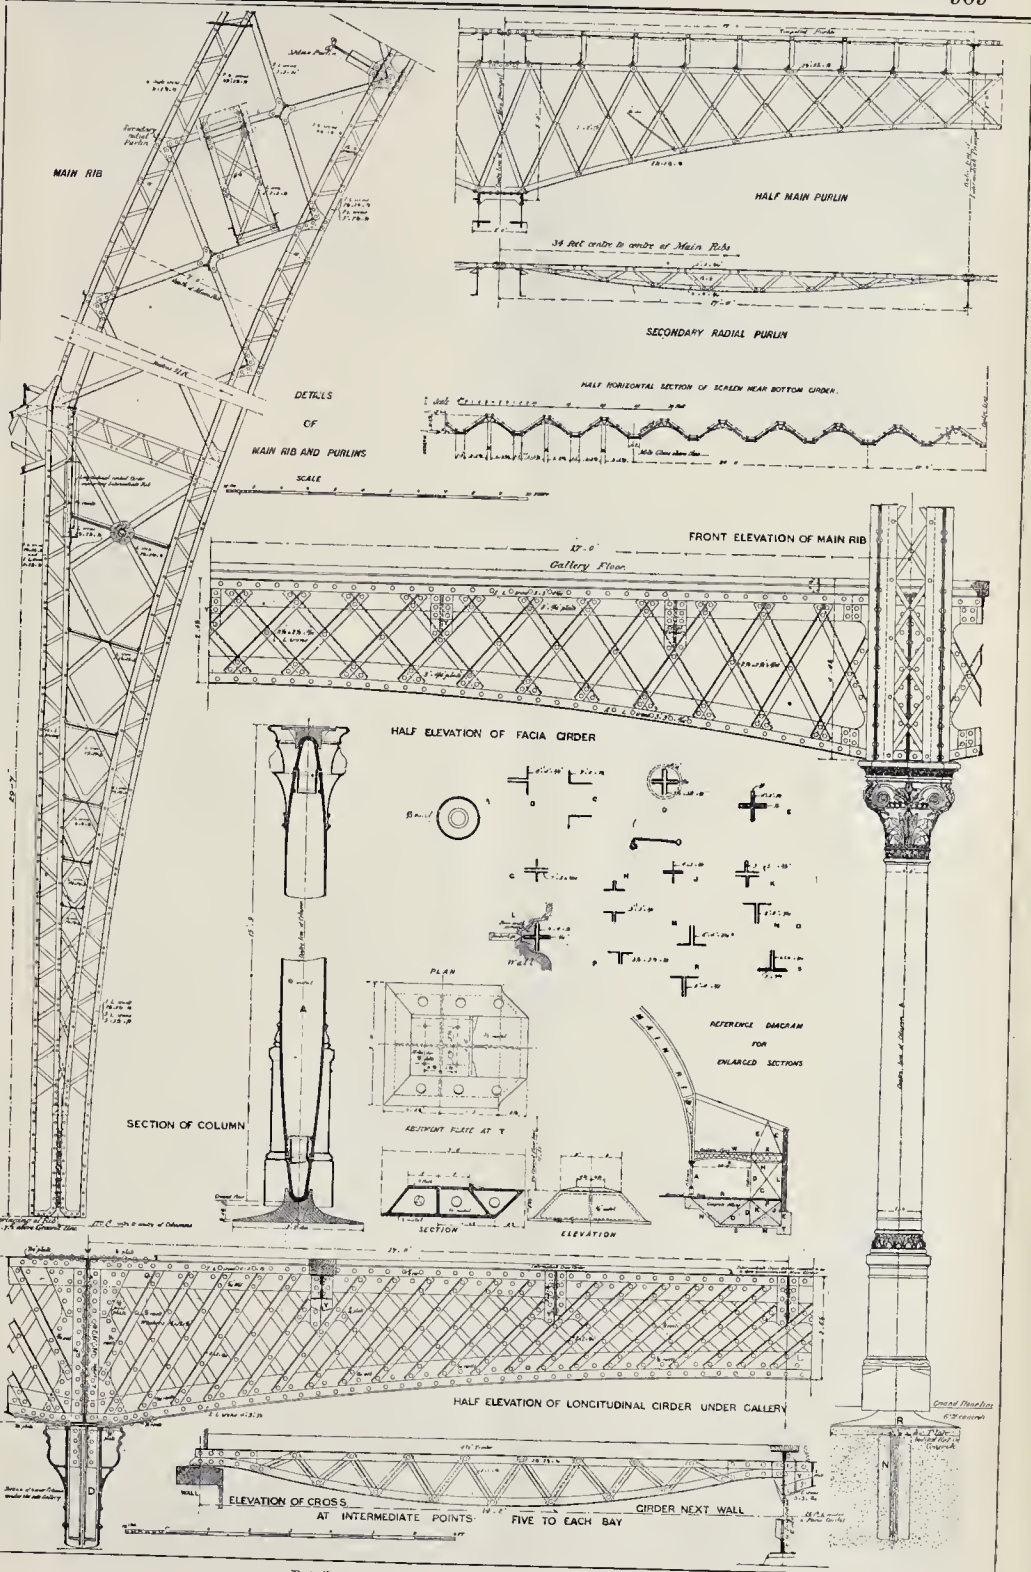

caused the course of events to become somewhat altered.

Mr. James Edmeston, F.R.I.B.A., was appointed architect to the National Agricultural Hall Company, and was entrusted with the execution of the work. Messrs. Handyside & Co.'s and Mr. T. W. Helliwell's contract were each transferred, so as to be held by them direct from the Company, Messrs. Lucas & Son being left to carry out the whole of the remaining building operations, which included Company's offices, refreshment-rooms, and a minor hall, the details for which were prepared by the architect, Mr. James Edmeston. The minor hall forms an annex to the great hall, and it is intended to be used separately for smaller exhibitions or concerts. It is situated close to the north-east corner of the main building, and is very easy of access, being the nearest portion of the building to the hooking-office upon the west side of the railway station. The railway entrance to the main building displays good architectural features. This elevation, designed by the late Mr. H. E. Coe, is of an Italian character, with a façade of brick and stone (see *Builder*, Oct. 3, 1885).

The Great Hall of the main building covers a rectangular space of over two acres and a half, being 440 ft. by 250 ft. between walls, and its erection was personally superintended by Mr. am Ende and by the author. The main ribs have a clear span of 170 ft., and are placed 34 ft. apart, forming eleven bays between the end screens. The clear height to the crown of the roof is about 100 ft. The main ribs are of box girder shape, 7 ft. deep and 2 ft. wide, the lattice construction adopted, enabling the material to be placed further away from the axial lines than is usual when plates are introduced. Although the soffit of each main rib is semicircular from a level of 15 ft. 9 in. above the ground, the central portion of the main rib itself springs from a higher level, and should, therefore, be properly described as a segmental rib. The open space under the curved roof amounts to 374 ft. by 170 ft., or nearly an acre and a half in the clear. This is surrounded by a gallery, 40 ft. wide upon the north, the west, and the south sides, and 26 ft. wide upon the east side. The gallery is covered by a lean-to roof, which shuts against the curved rib upon the north and south sides, and is attached to the horizontal member of the screens upon the east and west sides. Below the top of the roof over the side galleries the arched rib forms on each side an ornamental spandrel (see small view on p. 911), which rests upon a column, the resistance to the thrust being assisted by the lean-to roof over the gallery. The connexion between the main rafter of the side roof, and the arched rib is formed by a top plate, which practically acts as a hinged or spring joint, whereby the complication of a fixed connexion does not occur in the calculation of the stresses. The main rafters of the side roof are connected to a braced vertical frame of 14 ft. effective depth, and the thrust is thus conveyed down to a foundation girder 12 ft. deep, which is continued horizontally underground to carry the base of the columns supporting the main arched ribs. Thus the surrounding brickwork is not called upon to resist any portion of the thrust of the arched roof, as the side frames through which the gallery floor passes form a self-contained system of ironwork in which the thrust is ultimately conveyed to the ground. The chief points of support to these side frames are formed in each case of two main concrete blocks, one placed at the lower outside corner under the outside wall, a cast-iron bed-plate being built into this concrete block to receive the side frame, and the other concrete block placed under the base of the pivoted column. The foundation girder of the side frame is buried with its top flange laid 6 in. below the floor level, and is embedded in a mass of concrete to protect it against the effects of dampness.

The mechanical couple required at the springing of the rib to maintain its rigidity is supplied by the main rafters and the transverse floor girders of the side galleries. The upward pressure below the column is neutralised by the whole weight of the structure resting upon the column, which is, under all circumstances, sufficient to resist the upturning action of the abutment when the wind is blowing upon the opposite side. If this result were not obtained, some anchorage would have been required to resist the upturning

National Agricultural Hall, Kensington.

force. Upon the author's assumption that the wind may be taken as acting normally, the maximum and minimum loads upon the pivoted column under the springing of the rib amount to 82½ tons and 49½ tons respectively. These columns are made of cast iron, and are constructed with a true hall-and-socket bearing at each end, which is concealed at the top by a foliated capital, and at the base by a casting which gives the appearance of an ordinary column.

By the introduction of the pivoted connexion, the strains which these columns resist are always vertical, and therefore definite. This would not be the case if the connexions were made rigid, as the fascia girders supporting the inner sides of the gallery are continuous girders, and would be constantly exerting excessive bending moments of various intensity in the columns, to say nothing of the indeterminate stresses which might be caused by the ribs. These fascia gallery girders have curved bottom flanges and continuous girders of the same type are placed vertically immediately below the point of junction of the side roof with the curved rib and radially throughout the curved rib at distances, 18 ft. 6 in., to act as main purlins. These purlins have been made continuous from screen to screen, not only to provide longitudinal resistance to the lateral pressure produced by the wind upon either screen rib, but also to avoid the necessity of strengthening the flanges of the purlins in the centre between the main ribs, and for appearance's sake to avoid great differences in the size of the diagonal bars forming the web. Another point of detail is the simultaneous application in the arched roof of radial and tangential purlins. Between each main rib is fixed an intermediate rib supported by the main purlins, dividing the bays into longitudinal distances of 17 ft. Under the ventilator surmounting the curved roof these intermediate ribs are made of additional strength, and the secondary purlins to which the covering is attached are introduced at about 6 ft. apart. They are fixed in a radial direction between the main purlins, and are placed in a tangential direction over them, thus not only supporting the weight, but also resisting any tendency of the glass and zinc covering to gravitate downwards over the curve of the roof. Between the ventilator and the side roof a steel-framed ladder of light construction is introduced in place of the ordinary gauries upon either side. These ladders travel upon a rail fixed parallel to the gutter at the springing of the rib, and run upon a girder at the junction with the ventilator roof.

The screens which close the semicircular ends of the arched roof consist of a vertical ridge-and-furrow construction, whereby the appearance of the usual heavy horizontal members in a gable screen is avoided. This construction offers great resistance to wind pressure, combined with a minimum amount of weight and material. The framework of this part of the structure is made of mild steel.

The covering follows the zigzag-shaped surface resembling corrugations, and presenting a near approach to a folded curtain screen.

The wind bracing has not been indiscriminately introduced throughout, as is so often done, but has been confined to the side roofs and the two end bays of the curved roof, the nine intermediate bays of the curved roof where it is not required being free.

The inner longitudinal girders to the gallery floor, at a distance of about 14 ft. from the outside walls upon the north and south sides, are continuous girders. The cast-iron columns upon which they rest contain the wrought-iron member of the braced framework. This member, which is formed of four angle-irons in a cruciform section, takes the tension produced by the thrust of the roof, and is jointed by over angle-irons to permit the body of the column being slipped over it during erection. The caps and bases to these columns were made as split castings, i.e., castings made very thin (about 1-16th inch in vertical lines) upon opposite sides, but of the proper thickness all round, so as to be easily divided into two upon these vertical lines when required to be fixed, and so as to provide a true curved surface at the joints. They are then joined by a plate let into the surface and connected by tap screws. This vertical member is thus constructed to act both as a strut and a tie. The intermediate rib girders and the intermediate purlins in the arched roof have their bottom flange constructed in a fish-belly shape, with the object principally of preserving a uniform section for the diagonal bars. At the east and west ends the columns are also placed 34 ft. apart, the same as those upon the north and south sides, dividing the span of 170 ft. under the screens into five bays. The travelling stage employed and designed by Messrs. Handyside & Co. for erecting the ironwork was illustrated in the *Builder*, May 29, 1886, p. 775. It included a substantial staircase and top platform, made 62 ft. wide, so as to overhang 14 ft. in a longitudinal direction upon each side of two adjacent main ribs (34 ft. centres) during erection. Compared with other roofs of large span, the ironwork is both a little wider and a little higher than St. Pancras Station. The outline of the main rib of this roof differs both from the form of the catenary and the parabola, to which curves it has sometimes been erroneously compared. The main ribs in this roof are firmly bolted down to massive abutments by four 3-inch bolts at the foot of each principal. Owing to the spread given to the feet of the ribs and the holding-down bolts being placed at a distance apart of 11 ft. 5 in., they act with considerable leverage and prevent the stresses in the rib causing any change of angle at the feet of the rib. The theoretical effect of this arrangement is similar to that produced by making girders continuous over piers, and reduces the stresses in the rib to about half the amount that would exist if the ribs were hinged or unsecured at the abutments. By this means a great saving of metal is effected, which is an important consideration

in roofs of large spans, as the load increases in a much greater ratio than the span. In addition to the massive abutments there are also horizontal girders running across the station below the level of the rails to carry the platforms, the underneath portions being let for cellars; and with a view to ensure perfect stability, a wrought-iron tie runs below these girders, consisting of a ½ in. plate riveted on to the bottom flange of the wrought-iron main floor girders.

The roofs over St. Enoch's Station, Glasgow, 198 ft. span, and the Central Station, Manchester, 210 ft. span, are similar in type to the roof over St. Pancras Station, London (240 ft. span). The anchorage plate in the St. Enoch's Station is made to spread principally upon the inside of the main ribs, whereas in St. Pancras Station it spreads principally upon the outside.

In the Central Station, Manchester, it spreads both upon the outside and the inside of the main rib. In St. Enoch's Station the feet of the main ribs are constructed of cast iron. These are bolted down to massive foundations by four anchor bolts, 2½ in. diameter, with a distance between the bolts of 19 ft. 7 in. The thrust of the rib in the Central Station, Manchester, is resisted in a similar manner, but here the distance between the anchor bolts is 17 ft. 6 in. It will be seen from the above description that the only difference with regard to the way in which the thrust is resisted is, that in the case of the St. Pancras rib (M.R.) the abutments are aided by a tie across the foot connecting the feet of the main ribs, but as the horizontal thrust of this roof must be practically taken by the heavy brick piers acting as abutments, and secured by the anchor bolts, the theoretical conditions in each roof are the same. In the form adopted for the National Agricultural Hall roof, as previously remarked, no anchor bolts are necessary. In the main roof over the Crystal Palace building at Sydenham (104 ft. span), although the depth and section of the rib are such that the arches throw a very small horizontal thrust upon their supporting structure, the whole force of the wind has still to be resisted, and to effect this the columns are thoroughly braced together by cast-iron girders and wrought-iron tie-rods. The same method has been adopted in the roof over the Royal Aquarium, Westminster, which has a span of 35 ft. 6 in., the only difference being that the diagonal bracing is not spread out so much, comparatively speaking, as at the Crystal Palace.

In the roof over the Derby Market Hall, which has a span of 43 ft. 3 in., it might be supposed upon first entering the building that the thrust of the roof was communicated to the walls through the side galleries, whereas the upper parts of the gallery framing, with some additional parts, are constructed to form horizontal girders, the inner flange being supplied by the cast-iron gutter, while the outer flange and bracing are supplied by the additional wrought-iron plates and bars

which are introduced. These girders, being connected together at the ends, form a rigid horizontal framework, and are as effectual in their action as ties across the roof.

In the roof of the Albert Palace, Battersea, unlike previous roofs of arch construction, the thrust produced by the arched roof is communicated through the roof over the side galleries to the columns by a cast-iron fan-like bracket, forming a rigid connexion. The effect of this is to produce a cross strain upon the columns, owing to the absence of bracing, and therefore the supporting columns are thickened where required to give the necessary strength.

The Royal Agricultural Hall at Islington was designed by the late firm of Messrs. Peck & Coe, of which firm the late Mr. Henry E. Coe, the original architect for the National Agricultural Hall, was a member.

The building at Islington covers a space of 384 ft. by 217 ft., occupying less than two acres. The thrust of the main span is taken by a double row of columns placed 11 ft. apart, and braced together in couples by strong cast-iron framework, assisted by brackets above the capitals to the columns. The whole forms a wide base, and is firmly bolted down to brick-work foundations.

In the Coventry Market Hall, designed by the late firm of Messrs. Coe & Robinson, the thrust is taken by the side brick arches assisted by the base of columns being bolted down at the foundation. The space here occupied by the side arches is economised in the National Agricultural Hall building by the form of the main rib, these being carried down vertically (see illustration) below the junction of the side roof, to the supporting column, so that no portion of this part of the main rib occupies space in the vertical area of the gallery. The impediment produced by the diagonal bracing in the gallery of the Crystal Palace, Sydenham, is also avoided in the National Agricultural Hall, the only portion causing obstruction in the gallery of the latter building being limited to 14 ft. nearest the outside wall, the remaining 26 ft. of floor space nearest the gallery railing being quite free from all obstruction. The building was opened Christmas, 1886.

The cost of the iron and steel work erected complete has been from 26l. to 27l. per square of 100 ft. superficial area. The building has, since its completion, been styled "Olympia" for sake of brevity, a title particularly appropriate to the Exhibition which the managers of the Paris Circus Company are now conducting.

The author has subjoined a calculation of the stresses in the main ribs, assuming the wind to blow horizontally and to act normally upon the curved surface with a wind pressure of 30 lb. per foot snper. The Metropolitan Board of Works have no fixed rule upon this point. The unit pressure they adopt depends upon the height and position of the building under consideration, and the method which is best to adopt in estimating the amount of pressure is also much open to dispute. Further experiments need to be made before a satisfactory conclusion can be arrived at.

CALCULATIONS ACCOMPANYING DIAGRAM OF STRESSES.

The equations have been deduced from the following works:—"Civil Engineering," by Professor Rankine; "Die Lehre von der Elasticität und Festigkeit," by Winkler; "Stresses of Rigid Arches," by W. Bell, M.Inst.C.E.; and "The Theory of Arches," by Max am Ende, M.Inst.C.E., have been employed in the following consideration of the calculation of stresses in the main principal:

I. E - Fz + 2H(b + y) = 0.
II. E Fxy - 2Hy(b + y) = 0.
III. E Fxz - 2Vz^2 = 0.

E = Sum.
F = Force at the various points.
z = Leverages of forces.
H = Horizontal thrust at the crown.
b = Vertical distance of H from the crown.
y = Vertical distances of points round which moments are taken from crown.
x = Horizontal distances of points round which moments are taken from crown.
v = Vertical shearing force at the crown.

Table showing Values of y and y^2.

Table with 2 columns: y, y^2. Values range from 1.8 to 58.7.

Table showing Values of x occurring in Equations.

Table with 6 columns: Poits., 1, 2, 3, 4, 5, 6. Values range from 17.8 to 82.7.

Table showing Values of Fx.

Table with 2 columns: Point, Products. Values range from 56.990 to 1,175.744.

Tables showing Values of Fxy.

Table with 6 columns: Point, Fx, Fy, Fxy. Values range from 58.91 to 1175.744.

Statement of Equations for Dead Load.

Load being symmetrical.
Equation I. and II. only will be required.
I. - 2 x 3541 + 2 x 6Hb + 2H154 = 0
II. - 2 x 13781 - 2Hb154 - 2H6324 = 0
Solving H = -19.7
b = + 4.3

Table of Wind Pressures.

Table with 6 columns: Points, Area of inclined surface, Angle of inclined surface, Normal pressure per sq. ft., Total normal pressure in lbs., Total normal pressure in tons.

Table showing Values of z and z^2.

Table with 3 columns: Point, z, z^2. Values range from 17.8 to 82.7.

Table showing value of x for Wind Forces.

Table with 6 columns: Points, 1, 2, 3, 4, 5, 6. Values range from 17.25 to 97.75.

Table showing values of Fx.

Table with 2 columns: Points, Products. Values range from 1.91 x 17.25 to 1,901.9795.

Table showing values of Fxy.

Table with 6 columns: Point, Fx, Fy, Fxy. Values range from 32.9475 to 1506.9215.

Table showing Values of Fxz.

Table with 4 columns: Point, Fx, Fz, Fxz. Values range from 32.9475 to 1506.9215.

Statement of Equations for Wind Forces.

I. - 3588 + 2 x 6Hb + 2H154 = 0
II. 151503 - 2Hb154 - 2H6324 = 0
III. 259227 - 2Vz^2 = 0
Solving.
H = + 12.5
b = - 17.5
V = + 6.27

Strains in Abutment Framing.

These strains are worked by the method of moments, combining the thrust of the arch rib with the loads on the galleries as they occur in the various members.

The following letters are the reference letters against the different parts shown in the diagram.

+ denotes compression.
- tension.

Table of Maximum Strains in Abutment Framing on the Weather Side.

Table with 2 columns: Point, Tons. Values range from 10.28 to 1.13.

Maximum Strains in Abutment Framing on the Lee Side.

Table with 2 columns: Point, Tons. Values range from 53.10 to 59.90.

The greatest stress in the flange of the arch rib occurs where the curve of equilibrium is farthest removed from the neutral line of the rib by taking moments round the flanges.

Stress in flange at a = - 16.83
b = + 63.33
Stress in one set of diagonals = 3.10
between a and b = 6.5 tons,
each set being in duplicate,
stress in each bar =

A vote of thanks to the author, proposed by Mr. James B. Wallton, seconded by Mr. B. Houghton, was carried unanimously.

New Market for Carlisle.—The foundation-stone of the new market here was laid on Tuesday, the 20th inst., by the Mayor of Carlisle, Mr. W. J. R. Crowder, J.P. The external walls are of red stone, from quarries at Annan, Newbiggin, and Wetheral. The glazed bricks for lining the inside of the market are supplied by Messrs. Craig, of Kilmorock. The concrete flooring is by Messrs. Robertson, of Workington; builders' work by Messrs. H. & R. H. Hodgson, of Workington; and carpenters' and joiners' work by Messrs. W. & H. Davidson, of Carlisle. Mr. Henry Creswell Charlton is the clerk of works. The architects are Messrs. Cawston & Graham, of London; and the buildings are to cost 30,000l. Externally the building is of rock-faced ashlar up to the plinth, with quoins, cornices, and window jambs tooled; the general walling is of random sneaked rubble. There are six principal entrances, with circular columns and carved capitals. An arcade entrance from the principal street, and a Jubilee tower, 160 ft. high, at the north-west corner, are features of the building. There are terraces on two sides, supported on stone columns.

#### DESIGN FOR A RAILWAY STATION.

WE give the perspective, detail, and a portion of the plan and section of this design by Mr. R. Weir Schultz, which obtained the Academy Gold Medal for architectural design. We commented on the design in our general remarks on the Academy students' competition designs, pages 834-5, ante.

#### "SUMMER": DESIGN FOR THE DECORATION OF A PUBLIC BUILDING.

This is the design by Mr. E. R. Stephens which obtained the Royal Academy prize of 40l. for the best design for a decorative painting for a public building in the recent students' competition. The illustration is from an outline drawing made for the purpose by the author, the original drawing being retained by the Royal Academy for the present. It is, we understand, to be executed in some suitable position, not decided on yet.

#### KEW CHURCH, SURREY.

It having been determined to enlarge the parish church of St. Ann, Kew, by a prolongation eastward, a difficult problem had to be solved; the existing style (if it had any) had to be preserved. It was stipulated that the mausoleum of the Cambridge Royal Family should, in any enlargement, occupy in the new work the same relative position as it did in the old; this mausoleum, with its terminal semidome, with an organ-chamber above it completely blocking the east end. Moreover, the church was covered with a peculiar roof, spanning its whole width, which rendered an eastern finish very unpromising; and internally the tower was coiled with a very low and gloomy segmentally-arched vault, springing from the cornice above the Tuscan colonnade.

The work has comprised the extension of the nave and aisles by one bay, a new south porch, the erection of a chancel and aisles, with a central apse. The mausoleum was re-erected with its dome eastward of this, and is entered from a doorway behind the reredos, and under the east window, which is lighted in part from an area formed by screen walls which connect the dome with the body of the apse. In erecting the chancel and aisles advantage was taken of the height of the churchyard above the floor of the church, and their floor is level with this.

Over the chancel, which is square on plan, is a low circular concrete dome, carried on an octagon clearestory, pierced with circular and semicircular openings in its cardinal and angle faces, and this clearestory both stopped the roof and gave altitude within.

The construction of the old nave roof permitting it, the ceiling was cut down and a new panelled one constructed at as great an elevation as practicable, following in its curves the lines of the chancel arch, and in this semicircular groins were cut over each bay of the colonnade.

The church was re-seated throughout and warmed with a circulating system of hot water, the total cost of the works being 5,167l.

Mr. H. Stock, 9, Deunman-street, London Bridge, was the architect; Messrs. Goddard & Sons, of Farnham, were the builders; and Messrs. W. Baily & Son, of Gracechurch-street, executed the warming work.

The church was re-opened on July, 1884. The drawings from which the illustrations are taken were in this year's Royal Academy exhibition.

#### THE INSTITUTE OF BUILDERS.

##### DISCUSSION OF SANITARY MATTERS.

At the meeting of this Institute held on the 15th inst., Mr. Robt. J. Waller in the chair, in the absence of Mr. J. Howard Colls, the President,

The Secretary having read the minutes of the last meeting,

Mr. John T. Chappell read a paper on "Sanitary Matters." He began by saying that the subject of his paper, "Sanitary Matters," was one which he was sure was not only of individual but of universal interest and importance; and to deal with it adequately was a most difficult task. What he proposed to do was to give them his own opinions upon the question, based upon experience and careful observation. He did not think it necessary to dilate at length on the various methods in vogue for the disposal of human excreta amongst the ancients, or, indeed, of those of any period, until we approached very nearly the most primitive customs was, he supposed, what was termed, not very euphoniously, the "privy system," and a very offensive system it was, with absolutely no recommendations on the score of sanitation, but many horrible disadvantages and dangers. By far the most important division of his subject was, however, "the sewer, or water-carriage system," and, assuming that an adequate supply of water was available, he thought it would be generally admitted that it was the system best adapted for our large cities and towns, and was almost universally accepted as the best mode of disposing of what we included in the term "sewage matter." It was of the first importance that the sewers should be of proper design, and the tubular or egg-shaped sewer which was most generally adopted seemed to answer its purposes very well. In constructing these sewers materials should be used as far as possible impervious to moisture, and with the internal surface very smooth, and the whole absolutely watertight. As an example of this kind of work he could not do better than refer to the very excellent specimens carried out under the direction of the Metropolitan Board of Works. It was important that the gradients of sewers should be sufficiently sharp to ensure the rapid flow of the sewage, and that the sewers should be laid at a sufficient depth to enable an adequate fall to be given to house-drains in connecting them with the sewers. This latter point, he feared, had not in the past been sufficiently considered,—doubtless, in some instances, owing to the expense

attending it, but with the result that it had been necessary to connect the house-drains too near the bottom of the sewer,—in his opinion a most serious drawback, as it often results in the house-drains being water-logged. He was strongly of opinion that in the construction of new sewers there were now not few civil engineers who (wherever practicable) would not provide for their being of sufficient depth to admit of the house-drains being connected much nearer, if not actually at the very top, of the sewer. Personally he would prefer the latter course, as it would prevent what was, he felt sure, too commonly the case, imperfect connexion of the house-drains, by means of which the smooth and even surface of the sewer was entirely destroyed at such points, rough and uneven projections, &c., which were a fruitful source of obstruction, being often caused. These might, in his opinion, be entirely avoided by the introduction in the crown of the sewer of key or junction locks constructed with removable discs, so as to admit of the various sizes of house and other branch drains being connected without any cutting or making good other than the joint between the pipe and its connexion with the key or junction lock. With regard to this suggestion he considered the facilities it would give for ventilation of even greater importance. Another important point in the construction of sewers was the provision for adequate and periodical flushing, and of inlets for inspection. Turning to the subject of house-drainage, he thought great advance had been made in the last few years, so much so that the arrangements that had been in existence for the past ten years without alteration would generally be found not only defective, but detrimental to health, if not absolutely dangerous. This state of things was principally caused by the absence of an intercepting chamber between the house-drains and the main sewers, and of adequate provision for the inlet of fresh air through the house-drain or for the ventilation of the same. In consequence of this and the multiplication of traps, syphonage of the latter was a common occurrence, with the result that vapours and gases which, he believed, might without much difficulty be entirely obviated. Proceeding to deal with what he considered the desirable approach to perfection, he would first refer to the sewers, from which, unless proper ventilation, flushing, &c., were provided, the greatest source of danger probably arose. Some of his remarks might not meet with the approval of those who advocated the closing of street gratings and supplying only "vent" pipes, thereby destroying all chance of true ventilation. It was perfectly true that in many cases such gratings were nothing but outlets for the emission of foul vapours and gases, in consequence of no other means of escape being provided for them. What appeared necessary to him, therefore, was to prevent the accumulation of such vapours and gases, and not the expenditure of our energies in the attempt to find a solution for the dispersal of that which he was strongly of opinion might entirely be avoided. This, he said, could be attained not by closing up the street gratings, but by materially increasing their number and providing escape for the vitiated air. He would suggest that for this purpose outlets of not less than 9 in. clear internal diameter should be provided on the top of the sewers, from which a ventilating-pipe should be continued of a like diameter, until it reached a vertical pipe, or column, when it might be reduced to 6 in., and carried to a height of not less than 15 ft. from the surface of the ground. He did not know any reason why the lamp-posts should not be utilised for the purposes of these vertical pipes. This would necessitate the substitution of other lamp-posts for those now in use, and the size would have to be increased; but from the bottom of the pipe upwards it might be reduced to 4 in. internal diameter. A special lamp would, of course, be required, and he would recommend its being of an octagonal pattern, the top being covered with a clear space of about 5½ in. internal diameter continued through it from top to bottom, so as to admit of the cast-iron lamp-post,—at this point say 5 in. over all internal diameter,—passing through it. The inside portion of the lamp should be enclosed by a reflector. The lamp could then be slipped over the top of the column down to its resting-place about the usual length, and be supported by a moulding

or other ornament. An ornamental cap of lozenge pattern could then be placed at the top of the column, the whole being of an ornamental or artistic design. The reflecting cover of the lamps would be very much increased in this way, and an escape from the heated air being provided around the top of the lamps, the column above it would also become heated, and thus increase the upward flow of the air in the shaft. Three burners would, of course, be necessary in each lamp to prevent shadows, but as the light would be increased by the reflectors the burners need not be so large as those at present in use. Fresh-air inlets should be provided in the roads and be placed as nearly as possible midway between the outlets. He would now make a suggestion that he feared would not meet with approval in the same direction. It was that these outlets should be supplemented by utilising that portion of the house-drain between the intercepting trap and the sewer. On the sewer side of the intercepting trap he would take a branch pipe of not less than 4 in. internal diameter, and continue it up the house to the highest point, and of course as far as possible from all windows and chimneys. It was important in connexion with this method of ventilation that the area of the intakes should be at least one-fourth in excess of the aggregate area of the outlets. The levels of the inlet gratings being much lower than the outlets, and not subject to the friction caused by bends, &c., the greater atmospheric pressure at the intake point would insure a constant flow of fresh air through these apertures and up the outlets. While aware that on this point there was a considerable difference of opinion, he held that one pound of fact was worth a hundred-weight of opinion, and he was prepared to prove that, under the circumstances indicated, these surface gratings would be found to be neither more nor less than intakes of fresh air and not outlets from the sewer. Returning to the question of house sanitation, he thought they must all admit that the best known mode of securing this much-desired object was that the house-drains should be thoroughly disconnected from the sewer, and that on the house side of the intercepting trap there should be a fresh-air inlet, so as to produce a current of air through the house-drains, with an outlet at the top of the soil-pipe, and any other ventilating-pipes that the length and position of the drains might necessitate, particularly at all dead ends. Mr. Chappell then proceeded to discuss at some length the employment of traps, and said that none should be placed between the fresh-air inlet and the ventilating outlet, thereby insuring a thorough current of air. They should only be introduced to the various apparatus, and so ventilated as to prevent the possibility of syphonage. Dealing with the position, size, and description of house-drains, he would assume that they were thoroughly disconnected from the sewer. He might take it for granted that the drains would be constructed of a proper size and have a proper fall. His was in favour of a large size, nothing less than 6 in., and oftentimes 7 in. or 8 in. By employing pipes of a large size they got the advantage of providing a free passage for the air, or, at least, a much more perfect passage. In the case of terraced houses the pipes would generally have to pass under the house; but in detached and semi-detached houses, the pipes should pass outside. The drains from the sewer and intercepting traps should be of stoneware pipe, but pipes passing under the house might preferably be of cast iron. All the branches used should be of the Y-pattern. On the sewer side of the trap, and on the top of the drain, in the position previously indicated, he would provide a junction for ventilation. Assuming that the connexion with the sewer was on top, that would form a continuous ventilating-pipe, of course carried up to the highest point of the house. It was doubly necessary that there should be such a ventilating pipe where the connexion of the house-drains was made near the bottom, as in such a case the vapours and gases in that portion of the house-drain between the sewer and the intercepting trap and the area, were put under pressure in that portion of the drain, and unless there were means of ventilation, these gases and vapours would be forced through the intercepting trap, and pass through the remainder of the house-drains, and not, as was too often thought, escape by the fresh-air inlet. The atmospheric pressure at this point would, of course, drive such vapours through the house. A ventilating pipe on the sewer

side would effectually prevent this. The intercepting trap should be of the syphon type. He advocated the fresh-air inlet being on the house side of the syphon quite open and level with the area paving. This could also receive the surface drainage of the area. The size of this inlet should be determined by the aggregate area of the outlets of the soil-pipes and ventilating pipes, and should, in his opinion, exceed them by at least one-fourth. This inlet should communicate with an inspection chamber, all of which should be on the house side of the syphon, and as near thereto as possible. This chamber, he would recommend, should not be less than 3 ft. in length, and, say, 1 ft. 6 in. in width. Branch drains from rain-water pipes and basement closets should be brought in at the sides, whilst at the opposite end of the chamber the house-drains should be continued, and, wherever practicable, he would recommend that they should be 9 in. above the level of the entry to the intercepting trap. The channels from the chamber should be narrow and deep, and so insure a better flushing of the intercepting trap. All pipes should be laid with a true and regular fall, most carefully jointed in Portland cement, and bedded and covered in concrete. As far as practicable soil-pipes should be outside the house. Closets on the basement might be of the wash-out construction if outside the house, but whenever inside should be preferably of the valve pattern. The valve box should be provided with two connexions, one to receive an inlet ventilating-pipe 14 in. diameter, continued through the outer face of the wall, and there increased to not less than 2½ in. At the opposite side of the valve-box should be a connexion to receive a 14 in. outlet, the same to be continued through the wall in like manner as the former, but of the same size, thus forming an outlet, and ensuring a current of air, thereby preventing any smell from gases passing through the pan or valve, if out of order from any cause. Baths, sinks (except in the scullery), lavatories, and washing-troughs should all be provided with P-traps and inspection caps of adequate size, and fitted as close under each apparatus as possible. No D-traps should be used. None of the traps should connect with the soil-pipe, but open into a vertical waste-pipe of ample size, which should be properly ventilated, and be open at the bottom, and empty itself over a gully grating. For the scullery sink a fat-trap should be furnished. It might be objected that by leaving the waste-pipe open it would be liable to be frozen up, but he thought this objection only applied in colder climates than our own, or where, as in the northern parts of the kingdom severe frosts were of more frequent occurrence. In such cases the pipe might be fitted to the drains in the same way as the soil-pipe, but if that were done it was absolutely necessary not only to continue the waste-pipe up as a ventilator, but that from the top or crown of every trap there should be also a ventilating-pipe from that point connected with the main waste (such connexions always having an upward tendency, or serious consequences might result). He thought that if ever the suggestions he had made were carried out they would have habitable houses, as far as sanitation was concerned. With regard to the constant service water supply, and no one would think of having an intermittent supply if he could obtain a constant one, the rising main should terminate with a ball-valve over the cisterns for supplying the closets, flushing-tanks, &c. Branches should be made from the constant-service rising main to all sinks and baths or any other necessary draw-off tap, so as to obtain a supply of pure water. To prevent waste of water each cistern should of course have an overflow pipe near the top of the tank, passing through the nearest outer wall and then emptying, and so give warning that some attention was necessary. Having given some further details, Mr. Chappell, referring to his remark that a pound of fact was worth a hundredweight of opinion, instanced a large building of his own, planned and arranged by himself, and in which there were about forty-three closets, twelve baths, and about forty sinks, with lavatories, &c. The main drain was 9 in. diameter, with various-sized branches. There were several stacks of soil-pipes, all continued up to the top as ventilators, and the fresh-air inlet was a cast-iron grating (in the centre of a large yard), taking the surface water, the open space in which was

considerably larger than the aggregate area of the soil pipes; and although the building had been in work for something like three years, and had been tested at all times and seasons, still, under no circumstances whatever had it ever been found that the current passed upwards, nor any smell perceived from the fresh-air inlet. Now, from what he had stated, it might be thought a very simple matter to carry out the sanitary arrangements of any building, but he ventured to think that even the most skilled experts often failed in laying down their plans; for very considerable difficulties arose in the details, the neglecting of any one of which might destroy the whole principle, and thereby, instead of insuring perfect sanitary arrangements, have quite an opposite effect. He thought these facts fully warranted the views he had advanced, and if the explanations he had attempted to give were found to be of any practical assistance he would consider himself amply repaid for the time and attention he had given to the subject.

Mr. Titmuss asked if Mr. Chappell advocated the trapping of the soil-pipe under the bottom?

Mr. Chappell said by no means.

Mr. Titmuss went on to say that the grease-trap was one of the chief difficulties, and was a very great bugbear in connexion with the sanitation of dwelling-houses.

Mr. Chappell said he fully agreed with that. He thought a good deal of the difficulty might be got over by a proper arrangement. The scullery sinks should discharge over a grease-trap, in which should be fitted a removable bucket to act as a strainer to collect the grease, which would be cooled by the surrounding water in the trap, and could be periodically removed. Some similar arrangement might possibly be made to fit under the scullery sink, and the grease removed and secured as an article of commerce.

Mr. Titmuss said that the real difficulty of the plan advocated by Mr. Chappell was in getting the grease-traps cleaned. This was not a nice job for any one to undertake, and as it generally fell to the domestic servants of a house to undertake it, it was not surprising that they were inclined to neglect it. He looked upon it as an objectionable feature that the servants had the job of cleaning the trap, and thought if some plan could be devised to obviate this difficulty it would be very advantageous.

In reply to some further observations,

Mr. Chappell said that he had sometimes found the deposit of grease in a trap quite solid and as hard as a cricket ball. There were several points which rendered the subject a difficult one to deal with in a practically satisfactory way.

Mr. Titmuss said that some sanitarians advocated traps at the bottom of soil-pipes as preventing sewer gas getting up the pipe and so into the house. He quite agreed that the drain pipes under the floors, and the soil-pipes, should be of iron. He thought there was a good deal in the suggestion made as to a ventilating lamp, and very much approved of the idea.

Mr. Chappell said that if the house-drains could be connected to the top of the sewer, and the ventilators made as he had indicated, he believed that sewer gas would be almost if not entirely prevented, but as we had to deal with things as we found them, we must do the best we could, and if intercepting traps, fresh-air inlets, and thorough ventilation of house-drains, were adopted, with the further safeguard of the ventilating pipes from the sewer side of the intercepting trap, each house would be practically safe. There would still, however, be the question of ventilating the sewers, but he felt confident that the day was not far distant when some solution of this difficulty would be found and its adoption insisted upon.

Mr. Scrivener thought it an objection to the proposed lamp-ventilators that they would not have the heat of the lamp during the daytime, when the lamp would, of course, be extinguished.

In reply to this Mr. Chappell thought that, from the fact of the intake ventilators being so much larger in area and at a lower level, the consequent greater atmospheric pressure would always ensure a current of air from the intakes.

Mr. Titmuss said that the water companies provided one of the difficulties in the way of improvement by each insisting upon fittings to their own approval,—one wanting one kind and another another kind.

THE INSTITUTION OF CIVIL  
ENGINEERS OF IRELAND.

We take the following from the address recently delivered to this Institution by Mr. John Purser Griffith, President:—

Fifty-two years have passed since twenty engineers, practising in Ireland, met in the office of Public Works in the Custom House of this city, for the purpose of forming a Society of Civil Engineers. At their first meeting, on the 6th of August, 1835, Colonel John Fox Burgoyne was called to the chair, and in his opening address he pointed out the objects aimed at. I cannot do better than quote his own words:—

"You are well aware that in spite of the efforts of many able and eminent men, the profession has been at a low ebb in Ireland. Persons without education or skill have been frequently employed in operations of importance, and the consequence has been, as might have been anticipated, bad or injudicious works, wasteful or fruitless expenditure. It will be your effort to prevent the recurrence of these evils, and you are now adopting the measure best calculated to enable you to do so with effect, by organising a society for your own improvement."

"Let us not overlook another essential benefit to be derived from such societies,—namely, that they encourage harmony and kindly feeling, and lower down among men of the same class, and mitigate dissensions."

The name adopted was "The Civil Engineers' Society of Ireland." It embraced in its member-class civil engineers, military engineers, and architects engaged as such in the United Kingdom, and among its first members were Colonel John Fox Burgoyne, John Radcliffe, Richard Griffith, and Charles Blacker Vignolles, names which have become household words among us. Most of the members were scattered through the country, and the meetings were only held half-yearly, at the Custom House. From 1837 to 1844 no reference appears of the proceedings in our minute-book. In the latter year a meeting was summoned to determine whether the Society should be continued or not. We rejoice to-day that there were three men connected with it who, in the face of much discouragement, resolved that it was "expedient to maintain the Institution, and to place it on such a basis as might render it permanently useful." This resolve was followed by the adoption of new rules for the management of the Society, and at the same time the name was changed to "The Institution of Civil Engineers of Ireland."

The progress of the Institution was now steady. The number of its members increased; its meetings were frequent; useful papers were read, giving rise to interesting discussions. Moreover, the publication of the Transactions was begun, and by this means the interest of members scattered throughout the country was increased. Under the new by-laws, architects were no longer eligible for election as members. We have not sufficient information in our minute-book to explain why this course was adopted. Suffice it to say that by common consent the professions have long been considered distinct in these countries, and each has its own distinctive institutions. It is, therefore, from no disrespect that we do not now admit architects as such to our member-class. I think it will be of interest to try and clear up our ideas with respect to the distinguishing features of the professions of civil engineering and architecture, and to this end I would quote the opinions of some of the most eminent representatives of these professions. Mr. William Pole, F.R.S., the present honorary secretary of the Institution of Civil Engineers, points out that "according to the strict derivation of the term, an engineer is a person who sets his mental powers in action, in order to discover or devise some means of succeeding in a difficult task which he may have to perform."\* Can any higher ideal be set before us than this combination of thought and action, of theory and practice?

With the great impulse given to hydraulic works in the eighteenth century throughout Europe, the need arose for competent men to carry out such works. "The architects found these new studies foreign to their own business, and were, moreover, already well occupied in their more legitimate employment. Hence a new class of practitioners became necessary, who should devote their attention to hydraulic constructions, with all their necessary mechanical arrangements; and with these soon became associated the erection of buildings of a massive and unartistic character. Thus the new class of men undertook to design not only

river and hydraulic works, hut roads, bridges, docks, harbours, mills, and machinery. Such a class required a new name. It was noticed that the kind of work undertaken by these practitioners was exactly analogous to that allotted to the 'engineers' of the military service, and the new profession adopted the same title, prefixing, however, the word 'civil,' to indicate that they were civilians, and so to distinguish them from their military brethren. Hence the origin of the present term, 'civil engineer.'"

The field in which the civil engineer labours is extensive and ever-increasing. In the words of Thomas Tredgold, "the scope and utility of civil engineering will be increased with every discovery in philosophy, and its resources with every invention of mechanical and chemical science."

Mr. James Fergusson, in his "History of Architecture," says,—

"Architecture is nothing more nor less than the Art of Ornamental and Ornamented Construction. The art of the civil engineer consists in selecting the best and most appropriate materials for the object he has in view, and using these in the most scientific manner, so as to secure an economical but satisfactory result. Where the engineer leaves off, the art of the architect begins. The structural features being correct, it is the province of the architect to add beauty to them."

It will thus be seen that, although the works constructed by the civil engineer may be destitute of architectural ornament, yet no architectural work can be considered worthy of the name unless designed on sound structural principles. Architecture, therefore, seems to me a department of civil engineering, and I cannot but think it a matter for regret that it should have become a separate profession.

From its formation till the year 1853 the Institution of Civil Engineers of Ireland occupied rooms in the Custom House, kindly placed at its disposal by the Public Works Commissioners. We should never forget how much we owe to that body of public servants, and to our first President, who was their Chairman. In the year 1853 rooms were taken in 41, Upper Sackville-street, where the meetings were held, and to which the books and collection of models were transferred, in consequence of the rooms at the Custom House being required for the public service. The Sackville-street rooms had to be given up in 1861 for financial reasons, chiefly due to a falling off in members, and ever since we have been indebted to the Board of Trinity College for permission to hold our meetings within these walls. In 1873 it was decided to obtain rooms outside college, where members could have access to the books and papers belonging to the Institution. A Royal Charter was obtained in 1877, and in 1879 we moved to our present house in Dawson-street. The wisdom of the course adopted has been fully proved by the great additions made to the member and associate classes. Since 1873 the number of members has doubled, and that of associates quadrupled. Nor must we forget that this period corresponds with Mr. John Chaloner Smith's term of office as honorary secretary of this Institution. It is with sincere regret that we lose his services. None but those who worked with him can fully appreciate the loss which we sustain by his retirement from the most important official position in connexion with this Institution. The Smith premium will, we rejoice to think, perpetuate his name and serve to remind us of his ungrudging and unselfish service of fourteen years.

Having thus briefly sketched the history of the Institution, Mr. Griffith proceeded to discuss various topics of professional interest.

**A New Small Pox Hospital.**—The Metropolitan Asylums Board are about to erect a large small-pox hospital at Darent, the intended outlay for the new building being 66,000l. It is to be erected on the Gore Farm Estate, which was purchased for the purpose in 1883, on which 24,000l. has already been spent, in addition to 11,000l. in the erection of a pier. It is intended for convalescent small-pox patients, and will provide 728 beds.

**The Art-Union of London.**—We have received from the Art-Union of London their plate for 1888. It is a reproduction in line-engraving, by Mr. Lumb Stocks, R.A., of Mr. J. B. Burgess, A.R.A.'s picture of "A Spanish Letter Writer."

\* This is a tolerably vague definition, however, and might apply equally to a great many other branches of human effort.—Ed.

\* If this was meant to take construction out of the province of the architect, we need hardly say that we repudiate it in toto.—Ed.

Mr. Chappell, on this point, said he thought that the sanitary registration of buildings, as had been proposed, was very well in its way, but what he thought of more importance was that a clear and definite system should be laid down, as was the case in New York, where, if a person wanted to connect the drainage of any building to the sewer, he had to apply to the Health Office and obtain a printed form of specification with blanks to be filled in by the architect or sanitary engineer, and submitted, with a plan, to the authorities for their approval. The work was then carried out under the superintendence of the architect or sanitary engineer, as the case might be, and when done it was inspected and certified by public inspectors under the control of the Health Office. This method of procedure came to his knowledge through a gentleman he had employed in his office within the last two years, who, on his return to America, finding how nearly his (Mr. Chappell's) views accorded with those in operation in New York, sent him copies of the documents in question as well as the regulations there enforced, and which seemed to him exceedingly well worked out. If we could have something similar in this country, it would not fail to prove of great advantage, and give valuable results, and he thought that in time we should come to this.

Mr. Titmass said "quite right" to that. The fact was they might take all possible pains to secure the best results in sanitary matters, but the actual work had to be done by others; and it was a too common occurrence that the result was unsatisfactory, and complaints were justly made of imperfect drains, drains clogged up, and so on.

Mr. Gough said that as a visitor he should like to say a few words from his point of view as an architect. He was pleased to hear hitherto condemning traps, and approved the suggested lamp-ventilator, but could not agree in using iron pipes for the purposes mentioned in the paper. In a house to which he had been called where iron pipes were used he found them so corroded as to be blocked up, and since then he had strongly condemned the use of such pipes. He wished he could hear such matters as these discussed at the Institute of Architects, but he was afraid some of his profession did not regard these matters with the interest they ought.\*

Mr. Franklin suggested that the iron pipes might be lined with lead, and the danger from the corrosion of the iron pipe, pointed out by the last speaker, would thus be met.

Mr. Chappell said he did not propose iron piping alone, but iron piping with a thick coating of a suitable and proper composition, applied whilst the pipes were hot, which would effectually prevent oxidation. He did not object to stoneware pipes provided that they were strongly bedded, and the other necessary conditions carried out. The repairing of pipes lined with lead would be a very expensive matter.

A Member said he thought the grease-trap trouble was the greatest of all. It was not only the grease which got into it, but large quantities of other matters, tea leaves, &c.

After some further discussion, during which Mr. Titmass said that the escape of water from baths, lavatories, &c., into drains was objectionable, as the soap in the water coagulated.

Mr. Chappell said he thought that bath and lavatory wastes should empty into the main waste, and be open at the top, whereby a through current of air would be obtained from the waste-pipe, the same being open at the top.

A vote of thanks was passed to Mr. Chappell for his paper, and

The Chairman announced that at their next meeting a paper would be read by Mr. F. J. Dove on "The Relation of the Architect's Profession to the Building Trade."

The proceedings then terminated.

**Illustrations of Chatham Hospital.**—The name of the author of the measured drawings of this building in our last should have been A. Needham Wilson, not J. Needham Wilson.

\* We thought that these matters had been pretty well discussed at the Institute of Architects of late years. At any rate, we call to mind certain papers by Mr. E. C. Robins and others, including the winners of the Godwin Bursary.—Ed.

## The Student's Column.

## LAND SURVEYING AND LEVELLING.

XXVII.—DETERMINING DISTANCES.

FIG. 9 shows how the angle of a building may be correctly determined with reference to the position of a base line, when that building is so situated that it is only possible to connect it by one line A C to the main base lines from which an estate is being surveyed. The distance of the point B along the base line being fixed, measure the lengths B D, D C, and C B, so as to be able to plot the triangle B D C, and measure the lengths C E and B E, so as to be able to plot the triangle B C E. Then, if the face of the building, D E, be straight the line C E, when plotted, should appear as a continuation of the line D C.

Fig. 10 shows a method for connecting a base line for an off-road with a main base line. A pole is placed in the middle of the off-road, at E, so as to equalise the offsets upon either side, and another pole higher up the road, not shown in the diagram, but also placed in the centre of this road. A pole is then fixed at C, so as to be in line with the two poles fixed upon the off base line and also upon a point in the main base line B A. The direction of the line C E is determined for purposes of plotting by measuring the sides of the two triangles B E C and C E K, the points B and K being taken upon the main base line B A in such positions that the lines B E and E K touch the corners F and H of the adjacent buildings. Then, by recording the distance of F from B, when measuring B E, and the distance of H from K, when measuring E K, a valuable check upon the position of these corner boundaries is obtained. They are also surveyed in the ordinary way, when taking the offsets measured from both the lines B A and C E. The same method is adopted for fixing the direction of P N in fig. 11, but in fig. 11 the triangles do not extend to the points F and H as in fig. 10. When a piece of open ground exists at one corner, as shown in fig. 10, the lines B A and C E may be connected by the triangle C D L, in which C M is measured as a *proof* line. In the triangle B E K the line E C forms the *proof* line. Upon a hard road, when frequent traffic might upset the position of poles temporarily set up in the centre of the road they may be fixed very often in gully-grates and wedged up. A chalk mark across the grate will enable the position of any pole to be easily re-determined if disturbed by passing traffic. This method has been supposed to be adopted in fixing the base lines O S and S W in fig. 11.

Fig. 12 shows a method which can be adopted for determining the angle between the sides B E and B F of an old building supposed to be out of the square in plan. The direction of the side B F is first produced by fixing a pole at A, and the direction of the line B E by fixing a pole at C. The measurement of the line A C fixes the angle A B C. A similar plan could be adopted in the case illustrated by fig. 15 for connecting the base lines A D, D C, C B, and B A. At A and C the triangles have been formed in the same way as the triangle N O Q in fig. 11. At B and D the lines in the triangles M B L and E D F (fig. 15) are ranged as a check in the same straight line. Figs. 16 and 17 show a method of connecting base lines by chain measurements when the angle formed by the base lines at their intersection is very obtuse. Fig. 18 shows the method adopted for calculating the unmeasured length B E of a base line, B D, after measuring a portion, E D, of this line, and taking the angles at the extremities of the measured portion by viewing a distant object A. Fig. 19 shows a means of arriving at the height of a tower, A C, by taking an angle at D, and measuring the distance equal to B D. If an obstruction prevents the distance B D (fig. 19) being accurately measured, the formula given in fig. 18 may be used, B E in fig. 18 being supposed to correspond with B D in fig. 19.

Various other cases will arise in practice, each of which must be dealt with according to its special circumstances. All we can do is to suggest examples which we think to be of the most frequent occurrence, but we trust the study of the cases we have illustrated may help the student to form a correct judgment in applying main principles to such cases as may come under his care. We have endeavoured to make our articles as practical as possible, and

to describe methods of work which we ourselves have found to combine accuracy with expedition.

## OWNERSHIP OF DRAWINGS.

SIR,—I have not been able to refer to "Roscoe's Building Cases," quoted by you in reference to this matter, but I am under the impression that "Ebdy v. M'Govern" only settled this point, viz., that in the event of the works not having been executed, the drawings should belong to the proprietor, and not to the architect, to enable him (the proprietor) to carry out the building when desired;—as to whom the drawings should belong to after that being quite another matter. I should like to be corrected in this view if I am wrong.

THOMAS OLIVER.

Newcastle-on-Tyne.

## NON-ACCEPTANCE OF LOWEST TENDER.

SIR,—Referring to the lists of tenders published by you on the 12th of November last, p. 690, there appears one for a parish room, All Saints, Rotherhithe. It may be seen that of five bidders, my tender was the lowest by 27*l*. After some delay I was again invited to send in an amended tender against one other competitor, with considerable alterations in the specification. This I complied with, submitting a tender for 557*l*, when, after another three weeks' delay, I was informed by the architect that Messrs. A. White & Co.'s tender had been accepted; but I am still ignorant as to what the amount of that tender was, but was told that the job was postponed until the Spring (but I see it is in full operation).

Now, as to whether it was strictly just to ask me to again compete, your numerous readers will form their own opinion; but surely it could not be right to select a builder who stood fifth from the bottom of the list?

J. BULLERS.

George-row, Bermondsey, Dec. 21.

## ALMANACKS AND DIARIES FOR 1888.

"WHITAKER'S ALMANACK" for 1888 (published at 12, Warwick-lane, Paternoster-row) is fuller and more varied in its contents than ever. It has been extended by about forty pages, and several new features have been introduced. It is not quite free from mistakes, but it is nevertheless a remarkable compilation, and the Editor is quite justified in saying that since his almanack was first published, twenty years ago, "You'll find it in Whitaker" has become an oft-repeated remark when information is sought.

Messrs. Hudson & Kearns, of 38, Southwark-street, again send us a parcel of their admirable professional and trade diaries, especially prepared for the use of architects and builders. "The Architect's Diary," adapted for the use of architects, surveyors, and civil engineers, is sent to us in two forms, Nos. 12 and 13,—the first having one page to a day and the second two pages to a day, and sold for 4*s*. 6*d*. and 5*s*. 6*d*. respectively. These diaries contain a great mass of legal and professional information, and each may be said, in fact, to provide for all possible professional requirements of the kind. "The Builder's Diary," No. 11, selling for 4*s*. 6*d*., is planned on the same comprehensive lines, only more so, if anything. These diaries supply a real want, and are well and carefully got up. The same publishers send us a specimen of their general "Diary for 1888," and samples of their registered date-indicating blotting-pads, of which we have spoken with commendation in former years.

The "City Diary and Almanack" for 1888 (published by W. H. & L. Collingridge, City Press Office, Aldergate-street) is another hardy annual, this being its twenty-fifth appearance. It contains a great deal of information about "the grand old Corporation," as well as other City and metropolitan matters, and is published for one shilling.

Mr. John E. Sears, A.R.I.B.A., sends us "The Architect's, Surveyor's, and Engineer's Compendium" for 1888, edited by himself and published by E. Marlborough & Co., 51, Old Bailey. It fairly merits its sub-title of "Professional and Office Diary and Directory of Manufacturers" ("appertaining to building" being understood). Several important improvements have been made in the work; a Certificate-Record is added, and, taking a hint from the *Builder*, a map of London (in sections), showing the boundaries of Surveyors' Districts under the Building Act, is given. In a mere passing notice like this, written immediately

the work comes to hand, we cannot, of course, vouch for the accuracy of all the matter therein contained, but, with this reservation, we may commend the publication as one of exceeding usefulness and value for the office.

"The Railway Diary and Officials' Directory" for 1888 (published at the price of one shilling by McCornodale & Co., Limited, Cardington-street, N.W.) and the "Railway [sheet] Almanack" (expence, same publishers) contain much authoritative information and statistics of interest to all who travel and all who own railway stock.

"Calvert's Mechanics' Almanack and Work-shop Companion" for 1888 (published by John Heywood, 11, Paternoster-building, price 4*d*.) well maintains its established character for usefulness, though we will not pledge ourselves to the accuracy of all the recipes and formulae given in it. Some particulars of the renewal of King's Cross Station roof are given (with diagrams) from a paper by Mr. R. M. Bancroft, read before the Society of Engineers this year. It is not generally known that until their renewal, in iron, within the last few years, the arched roof-principals were mainly of wooden planks, laminated, as illustrated in the *Builder* at the time of their erection, about the year 1851. Mr. F. J. Bancroft contributes some useful memoranda on building and engineering matters. Altogether this is a very handy little almanack.

Messrs. Griffith, Farran, & Co., of St. Paul's Churchyard, send us a specimen of Blackwood's Shilling Scribbling Diaries, interleaved with blotting-paper.

From Mr. Alfred S. Tucker, mason, &c., of 1431, Euston-road, we have received a handy little thing for the waistcoat pocket. It is a combination of a four-fold pocket foot rule, with scales of  $\frac{1}{2}$  in.,  $\frac{3}{4}$  in., 1 in., and 1 1/2 in. to the foot, and a calendar for the year 1888. It is printed in gold, black, and red, and the scales are as accurately divided as is possible by printing. A linen lining runs through the card, so that the joints where it is folded will not easily break or wear. It may be had for two-pence, and the profits, if any, will be devoted to a charitable object.

## VARIORUM.

The *Insurance Year Book*, 1888 (published by Simpkin, Marshall, & Co., Stationers' Hall-court), is the third issue of a very useful handbook, and it brings to a focus much statistical and other information as to the position of insurance offices. It may be advantageously consulted by persons effecting insurance. It is sold for one shilling.—Some little time ago we received vol. ii. of *The Architects' Register* (published by W. Pope, 16, Holborn, price 2*s*). It is very nicely printed, and is mainly filled by reprints of papers read before the Architectural Association and other bodies, but these are not always given fully. This is notably the case with Prof. Corfield's lecture (it was not a written paper) on "House Sanitation," of which a full report will be found in the *Builder* for Jan. 29 last.—The *Intelligence Quarterly*, published by W. Bartolomew, 25, Paternoster-row (price 1*s*.), is a very useful compilation of special information about London and its suburbs, suitable for the wants of visitors, tourists, &c. It contains a large number of maps, and upwards of 80,000 references to streets, public buildings, hotels, &c. But the advertising element is somewhat obtrusive.—

The volume of *Transactions of the Manchester Statistical Society*, Session 1886-87 (published by John Heywood, Manchester and London) contains some interesting papers on technical education, co-operation, &c., dealt with, of course, from the statistician's point of view.—From Messrs. Cassell & Co. we receive a parcel of their popular magazines, which are both cheap and good. The *Quiver* (which lately commenced a new and enlarged series) is well illustrated and printed, and among the contributors are the Dean of Canterbury and Professor Blaikie. In the first number of the new volume was a paper on "Noteworthy Chiroch Roofes," with sketches of examples at South Creake, Walsingham, and Knapton, all in the county of Norfolk. *Cassell's Family Magazine* has also just commenced a new volume. It is a very readable and well-illustrated miscellany, containing much useful information as to new inventions and "notions" under the heading "The Gatherer." *Little Folks*, the popular

magazine for children (published by the same firm), commences a new and enlarged series with the January number, and is sure to increase its already great hold upon the favour of parents and children, both for its illustrations and reading matter. Among the contributors is Mr. Walter Crane, whose pencil limns some quaint conceits under the title "Lancelot's Levities," the one representing "A Dandy Lion" being a clever combination of animal and plant life. Each of the three magazines we have named is obtainable for sixpence.—The Religious Tract Society (56, Paternoster-row) send us their old-established and admirable magazines the *Leisure Hour* and the *Sunday at Home*. Both are well illustrated and varied in their contents. In the first-named there is an amusing story entitled "The Defeat of Antiquarius at Thrasymene," which graphically depicts the discomforts of tourists in unfrequented parts of Italy. In an account of "The Late Edward Thring," some interesting particulars are given of Uppingham School, of which Mr. Thring was the well-known head-master. The *Sunday at Home* contains the first of a series of articles on "Paris at the time of the Reformation," by Mr. Richard Heath. The *Girl's Own Paper* and the *Boy's Own Paper* are two other monthly magazines issued from the same office. The former devotes a good deal of space to art industries, and the number for January contains an illustrated paper by C. Harrison Townsend on "Mosaic Work, and How it is Executed." The *Boy's Own Paper* goes in for tales of adventure and deeds of daring, Mr. Talbot Baines Reed and Mr. J. F. Hodgetts being among the contributors. The mysteries of "alley tans" and "commoneys" are no doubt fully treated of in the articles on "Marbles in Twenty Ways." All four magazines are capital in their way, and cost only 6d. each. From the same Society we receive *The Child's Companion* and *Our Little Dots*, two excellent magazines for children, well illustrated and printed. "Little Dots" is specially designed for infants, and the reading is in large clear type. Each of these magazines costs but a penny per month. With the January numbers colored plates are given. *Friendly Greetings, The Cottage and Artisan*, and the *Tract Magazine* are other publications issuing from the same office, but some of the illustrations in these are not up to the mark.—It is announced that Mr. A. Wyon is writing a work on "The Great Seals of England."—Mr. William Muir writes from the "The Blake Press," Edmonton, that he has produced for subscribers, through his agent, Mr. Quaritch, fifty copies each of Wm. Blake's "America" and "Europe" during the year past, and that he hopes to issue his "Urizen," "Song of Los," and "Gates of Paradise" in 1888.—*Decoration*, a monthly journal devoted to the illustration of the decorative arts, and to the interests of the house-painting and art-furnishing trades,—published since its first issue more than seven years ago by Messrs. Sampson Low, Marston, & Co.—will henceforth be published by Mr. P. L. Deighton, at 6, York-street, Covent-garden. He promises some enlargement of the journal, of which Mr. Moyr Smith will continue to act as the art editor.—*Scientific News*, a periodical for general readers, has hitherto been published monthly, but will, beginning with the new year, be published weekly, at 138, Fleet-street.—"Fair Faces, or Types of Female Beauty" is the title of a special series of full-page engravings, from drawings by Miss Margaret Thomas, to be commenced in the January number of Mr. Francis George Heath's pictorial monthly, *Illustrations*.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

43, Domestic Fire-grates. W. H. H. Marten. The object of this invention is to provide a double grate capable of being rotated, enabling each of the grates to be utilised for either of the rooms in which they are placed, and assuming there is a fire in only one of the grates, permitting such grate to be turned from one room to the other when desirable.

424, Paving Blocks and Roads. W. White. According to this invention, asphalt or concrete composition is run into moulds of suitable shape, and having projections and sockets which interlock so as to form a secure paving. Instead of forming the compound block wholly of asphalt or composition, embedded therein are one or more pieces of wood or other suitable material in such wise that the pieces

of wood or material appear on the surface of the compound block. This can be conveniently effected by placing the pieces in the bottom of the mould before the asphalt or composition is poured in.

734, Treating Wood. Thomas Royle. The process of treating wood for the extraction of water, &c., is by this invention carried on by the use of a continued current of heated fluid, and in a more rapid manner than has hitherto been the case. The fluid, such as tar, creosote, &c., is forced into the pores of the wood, so as to take the place of the moisture which is expelled by the preliminary treatment.

12,247, Apparatus for Shaping and Trimming Slate. A. Spamer.

In order to dispense with the cutting plate or template employed when slates are trimmed by the hammer, and to save the time occupied in the preliminary marking of the slates, an apparatus is provided by this invention which claims not only to effect these purposes, but to prevent much of the breaking of the slates when being trimmed for roofing purposes. The table on which the slates are laid is provided with notched marks or gauges, and the knife is made to fall with a double-edged lever, which gives it weight and accuracy in stroke. Curves or shaped lines may be cut with the shears by moving the slate while under the blade of the knives carried by the levers.

12,488, Ventilating, Disinfecting, &c. J. McConnell.

The appliance which is the subject of this patent is actuated by the rotation of propelling fans effected by the flow of water, steam, or compressed air, or other fluid, the pressure required being very low, and is reversible in action, so that by the same apparatus air may be drawn from or admitted into the apartment.

13,656, Fixing Roofs, &c. W. Rickwood.

According to this invention, instead of using zinc, lead, or wire clips, a metal button or plate is pierced to receive nails or screws for fastening the buttons to boards. The lower end of the plate is thickened and tapped to receive a screw to be inserted after the roof covering has been placed in position, and is provided with a circular or other shaped button screwed on as far as may be necessary to press upon the slate and thus prevent its rising.

NEW APPLICATIONS FOR PATENTS.

Dec. 16.—17,326, J. Hill, (Opening and Closing Fanlights.—17,348, E. Robbins, Clear Crystal Concrete Material, or Buildings entirely of Primary

Lights. Dec. 17.—17,396, R. Dickinson, Slow Combustion Stove Grates.—17,398, E. Tapsell, Utilising the Waste Heat generated by Register and other Stoves for Warming, Ventilating, &c.

Perkes' Museum.—Dr. Angel Money on "Hygiene in Childhood." 5 p.m.	
FRIDAY, JANUARY 6.	
Architectural Association.—Mr. A. Oliver on "Brasses of the Fourteenth and Fifteenth Centuries." 7.30 p.m.	

Miscellanea.

**Registration of Plumbers in Scotland.**  
The monthly meeting of the District Council for Perthshire, Perthshire, and Fifeshire was held in the Town House, Dundee, on Saturday last. Ex-Provost Ballingall presided, and presented certificates of registration to several members of the trade. The secretary drew the attention of the Council to pamphlets which are being circulated in Scotland by a new organisation, which adopts the title of "The Scottish Society for Registration." This title, he remarked, seemed to be wider than the facts warranted, for the aim appeared to be to vest the control of the registration in the hands of four master plumbers, whereas the Ancient Guild of Plumbers of London, founded by Edward III. (commonly called the Worshipful Company of Plumbers), and not connected with any plumbers' societies or trade organisations, was recognised as the only examining and certifying body for the registration of plumbers for the United Kingdom, in conformity with the resolution of the Congress of Metropolitan and Provincial Plumbers, held in London in 1884. The certificates were granted to those who were not only qualified to superintend, but also practically to execute, all branches of the trade. The Council wished to direct the attention of plumbers as a body to the importance of loyally supporting the registration system under the Worshipful Company of Plumbers, that the trade might not become damaged by the action of unqualified men.—*Dundee Advertiser*.

**Schools, from an Architect's Point of View.**—At a recent meeting of the Worcestershire Association of Church School Managers and Teachers, held at Worcester, the Sheriff (Mr. Ernest Day, architect and surveyor) read a paper on "Schools, from an Architect's Point of View." He said that a good plan for boys' and girls' schools might be carried out by providing a lofty central hall or schoolroom, communicating with class-rooms for boys on the ground-floor, and over these rooms class-rooms for girls communicating with a gallery running round the central hall, the girls of course having separate approaches, but so arranged that they might have access to the central hall to mass the whole school as occasion might require. This plan was on the lines of Sir Titus Salt's schools at Saltaire, but he thought it questionable if the Education Department would sanction such a scheme. In elementary school planning there were some essential points to keep in view. The site should be selected in as central a position as possible in the district where school accommodation was needed. It should if practicable be of ample size to afford good playgrounds and to secure plenty of light and a good circulation of air round the buildings for the purposes of ventilation. Good-sized, properly-paved playgrounds were very desirable in order that children might enjoy reasonable recreation, which added much to their physical strength and greatly augmented their mental faculties. The general arrangement of each school must depend upon the number and classes of children; if a mixed school for, say, 622 children, he should appoint as follows,—allow for boys 171, girls 171, infants 280, and generally a portion of about one-third class accommodation for boys and girls in each case, although where funds allowed he preferred providing a general room and class-room to accommodate respectively all the children in the boys' and girls' schools. The floor area should not be less than 10 ft. per child, except for infants, which would suffice at 8 ft., and the cubical air-space for each boy and girl should be 200 ft., and each infant 130 ft., although the Education Department would sanction a much lower standard.

**Water Supply of Cheltenham.**—The *Cheltenham Examiner* says:—Some months ago reference was made in our columns and at meetings of the Town Council to a very misleading statement as to the character of the water supply of Cheltenham, made in the report of a committee appointed by the British Association "for the purpose of investigating . . . the quantity and character of the water supplied to various towns and districts" from the Permeable Formations of England. On attention being drawn to the report it was at once admitted that its reference to the water supply of Cheltenham was founded upon an error, into the origin of which it is not necessary now to inquire; but we are pleased to state that in a later report of the same committee just issued an ample *amende* for the error is made. We quote the paragraph referring to the subject at length:—

"Cheltenham Water Supply is derived from springs issuing at the base of the sands of the Inferior Oolite, which yield a water described by the Rivers Pollution Commission as 'palatable, wholesome, and well-suited for domestic purposes, and is also much softer than most spring waters from the same strata.' Mr. McLandborough, O.E. (the engineer to the works, into the reservoir holds 200 days' supply, and is delivered on the constant system; he has gauged the springs on the hills above the reservoirs since 1884, and has never found them fall. During the severe drought of 1884 they yielded a volume equal to half the average daily supply of the period gauged. The minimum yield of the spring was in December of 1884, when the reservoirs were more than half full, and would have enabled the Corporation to give a full supply if the drought had continued into the spring of 1885. In the Eleventh Report of your Committee, by a most unfortunate misprint, the reservoirs are described as 'dry' during the drought of 1885, instead of 'short,' as reported by a correspondent, in which statement he was obviously incorrect. Your Committee much regret that the condition of the Cheltenham Waterworks should have been misrepresented by them, as they were fully aware of the ample supply and pure quality given to the town by the Corporation, the purity of which has been testified to by Drs. Allen Miller, Frankland, Way, and Tidy, and Professor Voelcker."

**Wilton Park, Beaconsfield, Bucks.**—The restoration of the mansion at Wilton Park, at Beaconsfield, Bucks, has been recently completed by Messrs. Bywaters, of King-street, London, under the direction of Mr. Arthur Vernon, architect. This important fabric, in the midst of one of the loveliest parks in the country, had been allowed to become greatly dilapidated during the present century, and a very large outlay has been incurred in the restoration of the mansion, stabling, and out-houses.

**Street Improvements at Chelmsford.**—The Chelmsford Local Board have recently carried out, under their Surveyor, Mr. Charles Pertwee, extensive street improvements in kerbing and tar-paving footways, the contractors for the kerbing being Messrs. Ringe & Nicholls, of Chelmsford. The kerb is of Hopton Wood and York stone, 12 in. by 4 in. and 12 in. by 5 in. The contractors for the tar-paving were Messrs. A. C. W. Hobman & Co., of London. Mr. James Maddocks, the Board's road foreman, has acted as clerk of works.

**Free Church, High Wycombe.**—A limited competition has been recently held for the erection of a new Free Church structure at High Wycombe, Bucks. Plans were submitted by Messrs. Paul & Bonella, of London; Mr. Willis, of Derby; Mr. Charles Carter, Great Marlborough; Mr. Thos. Thurlow, High Wycombe; and Mr. Arthur Vernon, of High Wycombe. The design by the last-named competitor has been selected. The accommodation required is for 450 persons, and the intended outlay is 2,000l.

**Artesian Wells.**—Messrs. C. Isler & Co. write to say that at Messrs. Seabrooke & Sons, Grays, Essex, an 127 ft. deep artesian bored tube well, including the lining of the same with 5 in. internal diameter pipes, was completed in less than a week, through chalk and flints, the rapidity with which this work was executed being attributed to their improved method of well boring. The same firm are at present engaged at Fulham on the new site of the premises of The Maltese Company, Limited, fixing two 420 ft. artesian bored tube wells, from the designs and under the superintendence of Mr. Arthur Kinder.

**Burning of the "Grand" Theatre, Islington.**—Early on Thursday morning, and only an hour or two after the building had been crammed with a large audience to witness the pantomime, the Grand Theatre at Islington was completely burnt down (at least, so we gather from the somewhat meagre reports to hand up to the time of our going to press). Fortunately the few persons who were on the premises at the time were rescued, but eleven horses, in stables at the rear belonging to the London General Omnibus Company, were killed by a falling wall, and a young man was injured by the falling debris. As to the cause of the fire, it is stated in an evening paper that "from investigations hurriedly made there is little doubt but that the fire broke out on the 'O.P.' side of the stage, a spark from one of the gas jets having probably been blown to some of the scenery and then been fanned into a flame by the back draught after the house was closed." The theatre was only built four years ago, on the site of the previously-existing "Philharmonic" Theatre (formerly a music-hall), which was burnt down in September, 1882. The theatre now destroyed had a seating capacity for 3,000 persons, and was described at the time of its erection as of "fireproof (!) construction," and "planned in conformity with the requirements of the Metropolitan Board of Works." Mr. Frank Matcham was the architect.

**The New Junction Railway in North-West London.**—The new Junction Railway in North-West London, which is to be opened on Monday next, and which will have the effect of bringing into direct communication with each other the two principal railway systems in the country,—the London and North Western and the Great Western lines,—consists of a short line about four miles in length, which leaves the Great Western main line about midway between the Ealing and Acton stations, and proceeding in a south-easterly direction, partly on embankment and partly in cutting, joins the North and South Western Railway near the Acton station of that line, the Great Western Company effecting, by that angular route, a communication with the London and North Western, and also with the North London Companies, at Willesden Junction. In its passage eastward the line runs almost parallel on the north side, with Uxbridge Road, and High-street, Acton. The new route will place the whole of the North London system, both east and west of Dalston Junction, in immediate communication with the Great Western, and will also enable the last-named company to run their trains from Willesden Junction to Euston Station, as well as to Paddington, under agreement with the London and North Western Company.

**National Smoke Abatement Institution.** The annual meeting of the National Smoke Abatement Institution was held a few days since at the offices of the Institution, 2, Victoria Mansions, Westminster, Sir W. F. Pollock in the chair. The report of the Council was read by the secretary, and the proposals submitted by the Council for the programme of the operations for next year were adopted. A series of meetings for the reading and discussion of papers dealing with the subjects of smoke prevention and fuel economy were arranged, and a conference will also be held at which sanitary inspectors and medical officers of health will be invited to attend, in order to compare the existing by-laws, which regulate the emission of smoke in the provinces, and to suggest a basis for further action, with the object of bringing more prominently forward before the public the necessity for the amendment of the existing Smoke Nuisance Acts.

TO CORRESPONDENTS.

Registered Telegraphic Address, "THE BUILDER, LONDON."
G. K.—J. P.—H. H. M. C.—O. B. amounts should be sent.
All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.
We are compelled to decline pointing out books and giving addresses.
Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.
We cannot undertake to return rejected communications.
Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED.
All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

Best Bath Stone.
CORSHAM DOWN. | FARLEIGH DOWN
BOX GROUND. | COMBE DOWN.
WESTWOOD GROUND. | STOKE GROUND.
The BATH STONE FIRMS, Limited.
HEAD OFFICES: BATH.

Doubling Freestone.
THE CHELYNCH STONE.
THE BRAMBLEDITCH STONE.
The stone from these quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England. It is of the same crystalline nature as the Chelynch Stone, but finer in texture, and more suitable for firemodelled work.

HAM HILL STONE.
Greater facilities have been provided for working these quarries, and the stone can be supplied in large quantities at short notice.
Prices, and every information given, on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, near Ilminster, Somerset.
London Agent — Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [Adv.]

Doubling Free Stone For prices, &c., address S. & J. STAPLE, Quarry Owners, Stone and Lime Merchants, Stoks - under - Ham, Ilminster. [Adv.]

Asphalte.—The Seyssel and Metallo Lava Asphalte Company (Mr. H. Glenn), Office, 28, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tnn-rooms, and terraces. [Adv.]

Asphalte.
Seyssel, Patent Metallo Lava, and White Asphaltes.
M. STODART & CO.
Office: No. 90, Cannon-street, E.C. [Adv.]

SPRAGUE & CO.,
STATIONERS, &c.,
Keep a Special Stock of Sundries for Professional Offices.
22, Martine-lane, Cannon-street, E.C. [Adv.]

Garside's Noted Bedfordshire Coarse and Fine Silver Sand.—Is perfectly free from impurity, and the best and cheapest in the market. All qualities in stock, for every purpose required in the building trade, for filtration, or for nursery purposes. All pure grit!
Apply to GEORGE GARSIDE, JUNR., Leighton Buzzard. [Adv.]

HOBBS, HART, & CO., Limited, MAKERS TO HER MAJESTY BY SPECIAL APPOINTMENT.
The Bank of England and its Branches, including New Law Courts Branch, now building.
PATENT PROTECTOR AND LEVER LOCKS, for all Purposes.
STEEL SAFES, STRONG-ROOM & PARTY-WALL DOORS.
SELF-CLOSING DOORS, FOR THEATRES AND PUBLIC BUILDINGS,
As approved by the Metropolitan Board of Works (used in large numbers at Covent Garden Theatre).
IMPORTANT COMMUNICATION.—FIRE AT WHITELEY'S.
WILLIAM WHITELEY, Westbourne Grove,
London, Oct. 12th, 1887.
The recent fire at my establishment in my opinion subjected them to the greatest possible test, and through all, they proved invulnerable.
You will be pleased to hear that it has been decided to adopt your Patent Clutch-related Doors for all the party-walls in the new buildings now in course of erection.—I am, Gentlemen, faithfully yours,
(George) WILLIAM WHITELEY.
