REGISTER

OF

MINES AND MINERALS

COMPLIMENTS OF
LEWIS E. AUBURY
STATE MINERALOGIST.

Data Collected
March, 1902

THE Register of Mines and Minerals of the State of California, issued by the State Mining Bureau, is intended to give information concerning the gold mines—quartz, hydraulic, drift, placer, etc.—as well as a list of mills and arrastras; and also to give corresponding information relating to each of the various mineral substances mined or commercially utilized in the State.

This forms practically both a State and County Directory of the mines of California, the Register being printed so that each county is represented in a separate pamphlet. The Register will answer for the guidance of those who want to look at any particular mine, or to learn the essential facts concerning it.

Of course some names may be omitted owing to the reluctance or indifference of the owner or superintendent in furnishing the necessary data, or by being overlooked by the Field Assistant of the Bureau.

It is intended, however, that in time such omissions will be filled in, and in that event a supplement will be published and attached to the Register of each county. Such supplements will contain not only corrections to date, but the names of all new properties and owners.

It has been the intention of the State Mineralogist to obtain the desired information concerning the mines and minerals and to publish only the essential facts in as condensed a shape as possible. For this reason the tabular form has been adopted, so as to reduce the verbiage necessary in a printed report of the ordinary character, where the essential description, slightly varied, must be repeated in each paragraph.

Those things only are published which are of general interest and which the mine-owner has no reason to object making public. It is not considered the province of the Bureau to "expert" mining properties or to pass on their standing or value one way or another. Should more detailed information be desired by any individual, the addresses of owner and superintendent are given, and they may be communicated with.

At the same time the figures given under "developments" will show at once whether the mine is a fully developed one or a prospect, so that any possible misrepresentation may be checked.

The information printed is of such a character that it cannot do any injury to the reputation of the mine described, but will be of service to the owners and to the public. In order to have the data as correct as possible, only actual residents of the respective counties, familiar with their own localities, have been employed as Field Assistants to prepare the Register.

To accompany the printed Register is a topographical map of each county, showing all mineral locations, etc. These maps are on the large scale of two miles to one inch and produced in three colors. The mines are numbered in the table, and a corresponding number on the map indicates the exact location. One may find from this approximately how far he must go from any specified town or station to reach any particular mine, and may learn the location of railroads, roads, trails, etc.

The object of this publication is to give in as condensed and convenient form as possible, such information concerning the mines of California as is generally sought by intending investors or others interested, and to show the location of each mine in the respective counties.

Registers of all the counties of the State will be given to the public as soon as the work in each is completed and can be published.

It is earnestly requested, if any errors or omissions are noted, that the proper corrections will be sent at once to the State Mineralogist, State Mining Bureau, Union Ferry Building, San Francisco, Cal.

LEWIS E. AUBURY,

State Mineralogist.

INYO COUNTY

THE area of Inyo County is 12,100 square miles, bounded on the west by the Sierra Nevada range; on the east by the State of Nevada; on the south by San Bernardino County; and on the north by Mono County. Starting from the snow-clad summits along its western edge, the county extends eastward into the rainless deserts of Nevada, and therefore possesses a marked variety of climate. The crest of Mount Whitney, on the western edge of the county, is 14,898 feet above ocean level—the highest point on the American continent—while Death Valley is 427 feet below sea level, the lowest depression on this continent.

The county lies in the western portion of what is known to geologists as the "Great Basin," and in the northern part of the ancient evaporated sea known as "Lake Aubury." The ranges east of the Sierras have a general direction from northwest to southeast, and are of the monoclinal structure characteristic of the Great Basin. Evidences of volcanic activity are common everywhere in the county. The mountains are all rich in valuable minerals, and the valleys phenomenally so in rare salines. The accompanying pages show the location and distribution of these minerals.

The population of Inyo County in 1900 was 4377. The mineral product in the same year was as follows: Gold, \$214,000; silver, \$114,000; antimony, \$700; lead, \$38,840; borax, \$13,900; soda, \$50,000; salt, \$5,000—Total, \$420,586. As the total assessed valuation of the county in the same year was \$1,885,336, the total value of the mineral product was 22 per cent. of the total assessed valuation of the county. Inyo at present leads all other counties of California in the production of soda and lead.

The development of the mineral resources has been retarded by the lack of railroad facilities. The gold mining started from the placer work. Quartz mining is steadily growing in importance. The county is especially rich in lead ores, carrying gold as well as silver. While the annual production of antimony has not yet reached importance, the mines of the Wild Rose District show quantities of this mineral. Silver mining was at one time an important industry, but at present the silver produced comes from the gold and lead ores.

The borax deposits of this county are very extensive, and the supplies of salt, both as deposits and as rock salt, are large.

Owens Lake is the largest producer of "Natural Soda" in the United States. Government experts have estimated that there are several millions of tons of carbonate and bi-carbonate of soda held in solution in the waters of the lake. Sulphate of soda is found in vast beds covering large areas in the "dry lakes" of the desert regions.

Over 35,000 acres of niter lands have been located in the southeastern portion of the county, but are as yet undeveloped.

Oil indications are favorable in Owens Valley, and natural gas has been discovered in a number of places around the lake. Hot springs are numerous. Notable among these are the geysers and mud springs of the Coso District.

One of the largest undeveloped copper belts of the State is that in Saline Valley, the ledges carrying also both gold and silver.

Marble from this county was used in the construction of the Mills Building in San Francisco. Large quarries of dolomite of fine quality await better transportation facilities.

Other minerals of commercial value which are known to exist in quantity are asbestos, barite, bismutite, iron, platinum, potters' clay, sulphur, and compounds of magnesia and manganese. The following jewelers' materials have been found: Chrysocolla, datolite, fluorite, garnet, quartz, grossularite, lepidolite, and obsidian.

In the 4 mines comprising this group there is 840 ft. of antimony ore exposed from 2 to 8 to 1 to 3 ft. wide, high grade ore.

* REMARKS.—The Coso Hot Spring is the only mineral spring of any importance in Inyo County. The taste of this water is extremely sour. While the water deposits sulphur, there is no taste of sulphur in it. Springs of this character are exceedingly rare.
