Debugging Wikisource metadata management

(User:Tpt)

Wikisource mission statement

"Provide an open online universal repository of free texts and primary sources, collaboratively curated by volunteer communities in all languages, integrated with Wikipedia, Wikimedia projects, and other sources, reusable by all."

Problem:
- Discoverability
- Reuse

What are the readable books of Wikisource?

All main namespace pages?

→ Lots of not proofread things + parts

What are the readable books of Wikisource?

Category:Index_Proofread?

→ But what are the main namespace pages?

Goal:
Have good metadata

Use case

- Discovery (search)
- Exportation
- Citations
- Easier editing (less fancy wikitext)
- Display only main namespace pages?

My proposal

Wikidata: bibliographic data

Commons: scan data
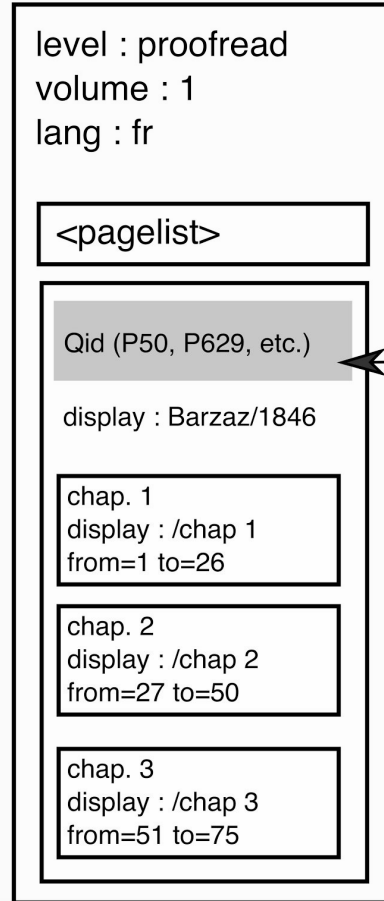

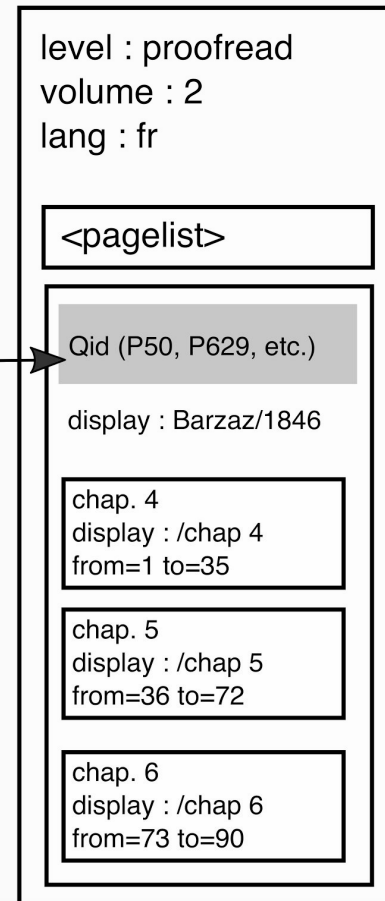

Wikisource: content/proofreading

From File:Goat_close_up_03.svg by LadyofHats
and File:Superman_Clipart.svg by Offnfopt

The super goat: Index: pages

Proposal

Thank you all!
