ovale, need not be necessarily congenital, if it became developed in a subject having the orifice open. The probability, however, would be that the contraction was congenital. 15. The proof that the contraction has arisen during extra-uterine life may be derived from the fact of the lesions being recent. 16. A frequent complication of pulmonary contraction is consecutive tubercularisation.

In relation to the epidemic of cholera at St. Petersburg, M. Delpech read, at the meeting of the Académie de Médecine on the 8th inst., a note containing a statistical account up to July 19. From July 14 to 19 respectively, the new cases amounted to 47, 57, 29, 31, 33, and 33, or a total of 230, with a mortality of 119. The total number of cases that have occurred between August 17, 1870, and July 19, 1871, has been 6817—viz., 4568 males and 2249 females. Of these 2797 have died—viz., 1938 males, and 859 females. M. Delpech observes that an epidemic which has now lasted nearly a year cannot be regarded as a mere passing epidemic, while, on the other hand, it cannot be considered as of a very menacing character, since during so long a period it has given rise to only 2797 deaths—i.e., less than ten per diem, if we compare the total mass with the duration. Females, it will be observed, have constituted only about a third of those attacked, as well as of those who have died. At Tambow, in the neighbourhood of Moscow, the epidemic has declined, but still continues to excite uneasiness. M. Briquet cited some facts in corroboration of the opinion contained in the recent report of M. Fauvel, that cholera may remain stationary in a country for a while, ceasing during the winter, and reappearing in the hot weather; and there is good reason to suppose that the epidemic now observed in Russia is a simple reappearance of the epidemic of 1865, not yet exhausted there.

In the *Gazette Hebdomadaire* of the 11th inst., M. Dechambre makes some interesting observations in relation to the "Medical Constitution" of Paris which may have their useful application among ourselves. He says that he does not regard the resumption of the publication of the Weekly Bulletin of Deaths as a matter of much consequence, for, in spite of the improvements that have been made in it, and the pains taken with it, it can never give other than a very incomplete, very vague, and, in several respects, an incorrect idea of the public health.

"In the first place, it is only a necrology, and it has been amply shown that the number of deaths, according to categories of diseases, by no means exhibits the relative frequency of each category. The prevalent diseases are not the prevalent deaths. The second term being known, we have to deduce the first from it by an approximative calculation of the degree of fatality attaching to different diseases. Such a calculation is impossible by reason of another defect in this description of statistics—viz., that they bear on a symptom or groups of symptoms rather than on defined diseases. According to what arithmetical computation, for example, can we deduce from the number of deaths from 'diarrhoea' or 'puerperal affections' during a certain period of time the number of cases of diarrhoea or puerperal affections which prevailed during such period? Again, can we admit somewhat rashly the accuracy of the declarations, on the fact of which the diagnosis has been adopted? Lastly, the number of causes of death not susceptible of being arranged in so summary a return as this is such that it often exceeds the two-thirds, and even the three-fourths, of the sum total of the deaths. What leads us to make these remarks is that, precisely at this time, the Bulletin fails to give in any manner a representation of the Medical Constitution of Paris. Everyone must be aware that the dominant feature of this Constitution consists in the frequency of gastro-intestinal, bilious, or choleric affections. Two of the statistical elements of the Bulletin correspond to this group—cholera and diarrhoea. Cholera figures for two or three cases, and diarrhoea for the thirtieth or fourteenth part of the specified causes of death, which are, as we have just said, only a third or a fourth of the total mortality. Moreover, it is by no means certain that the cases of 'diarrhoea' of the Bulletin are those which belong to the present diarrhoeas of the constitution, for these last scarcely prove fatal, and much less so

even than in *cholera nostras*. It is, therefore, allowable to suspect that the diarrhoea patients killed by the statistical bulletin were at least in part the subjects of phthisis or typhoid fever. Diarrhoea, indeed, is far from being the proper and significant characteristic of the intestinal affections observed at the present time. In the first place, it may be absent altogether, and then we are not able to state, speaking rigorously, that a certain disorder is a character of a Medical constitution. It is only a symptomatic expression of it; and it is the nature of the diarrhoea which truly characterises, or rather which contributes by its concordance with other morbid phenomena to characterise, what is termed the peculiar genius of the prevailing disease. The Bulletin says nothing of all this, and we may add that it could say nothing of it, its wrong not being in not speaking, but in being dumb from its birth."

M. Dechambre states that, from its symptomatic point of view, the derangement of the digestive organs now prevailing in Paris is especially characterised by *embarras gastrique* and colic. These he describes in a detail which we have not space to follow, and then observes that, in a clinical sense, the nature of the affection may be regarded as a bilious derangement (*état bilieux*), sometimes remaining simply as such, and at others rising to the height of a "bilious fever"—most of the patients, in fact, exhibiting sub-icteric complications. He warns Practitioners against the temptation to the employment of antiphlogistics, which the acute character of some of the symptoms, such as fever and abdominal pain, would seem to justify. Still, leeches or cupping-glasses may sometimes be applied to the abdomen with advantage when the pain is not only severe, but continuous and limited in extent, indicating a pathological action supervening on the principal affection. But neither the full, painful distension nor severe colic should deter from the rapid employment of evacuates, whether accompanied by local antiphlogistics or not. An emetic should be followed by laxatives, and although the colics may be temporarily increased, benefit will soon ensue.

PARLIAMENTARY. — CHOLERA AT SECUNDERABAD — REPORTED CHOLERA BETWEEN CRONSTADT AND THE THAMES—VACCINATION ACT—UNIVERSITY OF LONDON—CONTAGIOUS DISEASES ACTS—METROPOLIS WATER BILL—FOREIGN DECORATIONS—DR. EDMUNDS'S SUPPOSED CASE OF CHOLERA.

In the House of Commons, on Thursday, August 10,

In reply to Mr. Brady,

Mr. Grant-Duff said he was not aware that one-sixth of the whole number of men of the 18th Hussars, stationed at Secunderabad, besides women and children, had died of cholera. He was informed that the whole number that had died was thirty-nine, including one woman and four children. The whole number of men was 386. The cholera made its appearance on May 25, and was supposed to have been brought in by travellers. On June 23 the regiment was perfectly healthy. Evidence very unfavourable to the Secunderabad Barracks was given before the Royal Commission of 1863, and in 1866 they were reported upon not very favourably, though he was also bound to say not very unfavourably. In 1869, however, a very much better report was received; for during the virulent cholera epidemic of 1868 they seemed to have been extraordinarily healthy.

On Friday,

Mr. Stapleton asked the Vice-President of the Council whether it was true that two cases of cholera occurred on board ships which arrived in the Thames on Saturday; that there was no detention or disinfection at Gravesend, and that the clothes of the deceased sailors were landed.

Mr. W. E. Forster was glad to be afforded this opportunity of stating the real facts of the case. Two ships arrived in the Thames on Saturday from Cronstadt, and in each ship a man had died of cholera. From inquiries he had made he learnt that they died at Cronstadt. The clothes of one of them were landed almost immediately, and afterwards destroyed at the office of the Board of Works. The clothes of the other man were burnt on board the ship. He would state the purport of the different orders which had been issued with regard to cholera by the Privy Council. An order was gazetted on July 29, and issued on August 1, empowering the nuisance authorities in England to remove to a Hospital any persons suffering from cholera who might arrive at any English port,

and to cause the clothing and bedding of such persons to be disinfected, and if necessary destroyed. They were likewise empowered to cause the ship to be disinfected. A similar order, dated August 3, was issued for Scotland. An order was issued on the same day enabling the Customs officers to prevent the entry into any port in England or Scotland of vessels coming from a port infected with cholera, till the local authorities had had an opportunity of exercising the powers conferred upon them by the order he had just quoted. The department received an intimation respecting the ships referred to about two o'clock, and about eleven o'clock that evening another order was issued prohibiting the admission into port of any vessel on board of which cholera had occurred until the clothing and bedding had been destroyed.

The Vaccination Act (1867) Amendment Bill passed through Committee.

On Saturday, amongst the votes in Committee of Supply was one of £2320 for the University of London buildings.

On Monday,

In Committee of Supply on the army estimates, on vote nine a long discussion on the working of the Contagious Diseases Acts was raised by Mr. W. Fowler, who moved to omit the pay of the police employed under the Acts. He took the opportunity of discussing the recent report of the Commissioners, and drew from it materials for impugning the principle of the Acts. Mr. Henley also spoke earnestly against this legislation, and warned the House against departing in these matters from moral principles founded on Christianity.

Mr. Bruce, on behalf of the Government, urged that it was impossible for them to sweep away those Acts at once in the face of the evidence as to the diminution of vice and disease which they had brought about, and of the admitted necessity to replace them by legislation of a wider character, as to which the Government had not had the opportunity yet to make up its mind.

Mr. Tipping approved the general working of the Acts, and with much antiquarian learning—going back as far as forty centuries—argued that repressive measures had always failed. Mr. Mundella, on the other hand, opposed the Acts, and quoted some of the most unsavory details of the evidence against them.

Mr. G. Gregory complained of the unfairness of calling on the House to decide in the absence of the evidence, and Mr. Percy Wyndham condemned the not always unintentional misrepresentations of the opponents of the Acts; while Mr. R. Gurney supported the reduction of the vote with a view of stopping compulsory examination; and, after some observations from Mr. Cardwell, deprecating precipitate judgment, Mr. Fowler's amendment was negatived by 56 to 44.

On Tuesday, in the House of Lords,

The Metropolis Water Bill was read a second time.

In the House of Commons,

Mr. Eastwick asked the First Lord of the Treasury whether he would recommend that the officers who specially distinguished themselves in serving with the ambulances during the late war between France and Germany might be allowed to accept and wear the decorations tendered to them by foreign Governments.

Mr. Gladstone said that he could not promise any relaxation in the existing law until the Secretary of State for Foreign Affairs had carefully inquired into the matter, in order to see whether the rules could be modified for the public advantage.

Mr. Denman asked the Vice-President of the Council whether his attention had been called to a letter signed by a Dr. Edmunds, and published in a newspaper that morning, stating that he had been called in to attend a typical case of Asiatic cholera.

Mr. W. E. Forster: I am informed by the Medical Officers of the Privy Council that immediately on seeing this letter Dr. Buchanan was sent from the office to examine the case, and make a report. I am very glad to say, from that report, that there is reason to believe it was not a case of Asiatic cholera, although there were symptoms at first that might have excited suspicion that such was the case. The patient seems to be a respectable artisan, employed in some works, and also a school teacher, and was taken ill last night on returning from a school treat. Certainly, when Dr. Edmunds was called in this morning the patient had a bad attack of cholera, and was in a state that might naturally have excited suspicion that the attack was Asiatic in its character, though there is now reason to suppose that it was not so; at any rate the patient is now much better. I rather regret that Dr. Edmunds did not wait a few hours before writing to the *Times*, because if he had so waited I do not think he would have thought it necessary to

write a letter causing needless alarm. But whether he was right or not in doing this, there is one matter to which I should wish to call the attention of Medical gentlemen throughout the metropolis and the kingdom generally. Dr. Edmunds appears to have contented himself with sending this letter to the *Times* instead of communicating with the sanitary authorities of Marylebone, which, undoubtedly, it was his clear duty to do. If Medical gentlemen entertain any suspicion of such cases in their own neighbourhoods they should immediately send to the sanitary authorities, whose duty it is to take all proper measures for disinfection.

The Vaccination Act (1867) Amendment Bill was read a third time and passed, an attempt to strike out the clause relieving a recalcitrant from further penalties after he has been fined 20s. being defeated by 57 to 12.

ARMY MEDICAL DEPARTMENT.

THE Director-General presents his compliments to the Editor of the *Medical Times and Gazette*, and begs to inclose for insertion a list of candidates of H.M.'s British Medical Service who were successful at the competitive examination in February last, and who have passed through a course at the Army Medical School.

Army Medical Department, August 9.

List of the Candidates of H.M.'s British Medical Service who were successful at the Competitive Examinations held at London in February and at Netley in August, 1871, after having passed through a Course at the Army Medical School, Netley.

AGNES NORMAN, the infant-murderess, was on Monday sentenced to ten years' penal servitude.

MODIFICATION OF CANQUOIN PASTE.—M. Demarquay employs the following modification of this celebrated caustic, which renders it very easy of application, whether it be old or recent:—B. Chloride of zinc, 10 parts; glycerine, 4; and flour, 20 parts.—*Union Méd.*, Aug. 12.

BRITISH MEDICAL ASSOCIATION.

VISIT TO PLYMOUTH.

CONCLUDING NOTICE.

(From our Special Correspondent.)

THE meeting which has just concluded has been, on the whole, most successful, and much enjoyed by all the members of the Association who were present. The success, however, has been due rather to the excellent provision made by the local members for the enjoyment of the surrounding objects of interest, both on land and sea, than to the interest attaching to the business of the meeting.

After the general meetings, and the addresses on Medicine and Surgery were over, the members, with one consent, availed themselves of the many opportunities afforded them of escaping from the business of visiting the various sections, which were consequently miserably attended throughout. Excursions were organised, and ready to start daily, any time between noon and five o'clock, and large numbers visited the objects of interest in the vicinity, some going on steamers up the rivers Tamar and Tavy, which afford some scenery not to be equalled in England; others making bolder flights, and landing on the isolated rock whereon stands the Eddystone lighthouse, which, owing to the calmness of the sea, was fortunately approachable.

On Wednesday evening the President gave a *soirée* at the Royal Hotel, which was most numerously attended by both ladies and gentlemen, many of the non-Professional inhabitants being present to do honour to the Medical guests. Dr. Johnson there exhibited some microscopic specimens of diseased arteries of the kidneys, to which he had alluded in his address in the morning, and many beautiful photographs of Plymouth and the neighbourhood decorated the walls. The President had, moreover, provided some very excellent part-singing for the entertainment of his guests, which was executed admirably by the Plymouth Vocal Association.

On Thursday morning, at eight o'clock, about 120 gentlemen sat down to an excellent breakfast given by the Temperance League; after which, Mr. Bowly, the President of the League, addressed the assembly on the subject of total abstinence. Several Medical men spoke on the occasion, their opinions for the most part being, that moderation in indulgence, and not total abstinence, was the maxim to be most strongly advised.

At the third general meeting, the report of the Reform Committee, of that on the Observation and Registration of Disease, and the draft report of the joint Committee of the British Medical and Social Science Associations were read and adopted. It was also resolved that the Committee on the Observation and Registration of Disease should be reappointed.

Professor Lister, in his Address in Surgery, then spoke for two hours of his antiseptic system of treatment as applied in that science. He attributed its failure in some quarters to the non-acceptance of the germ theory, and to the want of a practical knowledge of the manner in which the treatment should be applied, being himself perfectly satisfied of its great value and entire efficiency in Surgery. Noticing the difficulties he had had to contend with in selecting appropriate materials as vehicles for carbolic acid, he gave a description of the fabrics he now uses, and of the method of applying them, illustrating the manner in which this was done. Mr. Lister has now ascertained by experiment that it is not necessary to use, for the production of spray and the cleansing of sponges, a solution of carbolic acid stronger than one part to a hundred.

All the sections were very thinly attended; nevertheless, the presidents and secretaries stood nobly to their work, and in some instances very interesting discussions took place.

In the Medicine Section a paper was read by Dr. Barham, of Truro, on the health of Cornish miners, which contrasted unfavourably with that of the miners in Northumberland, Durham, and Staffordshire, chiefly owing to the early age at which children in the former county are sent to work in the mines. Dr. Murray and Dr. Johnson read papers on cholera, their views on its pathology and treatment being antagonistic; but while Dr. Murray appears undecided in his selection of remedies, Dr. Johnson is energetic in declaring that the eliminative treatment is the only safe method to be adopted. After some discussion on the use of purgatives in the early stages of cholera, Dr. Murray stated that, while he was in India, out of

505 Medical men only eight were in favour of the use of purgatives. The subjects of other papers read in this section were:—"The Therapeutics of Rheumatism and Neuralgia," by Dr. De Berdt Hovell; "Paralysis of the Bladder treated by the Continuous Galvanic Current," by Dr. Althaus; and "Konmiss," by Dr. Jagielski.

The Surgical Section was the most fully attended of any, and some interesting papers were read and amply discussed. Mr. Southam, of Manchester, read a paper on "Excision of the Tongue," for the more effective performance of which he has contrived a forceps which completely grasps the tongue at its root, confining the action of the écraseur to the part requiring to be removed. Mr. Lund read a paper on "Antisepsity in Surgery"; Mr. Furneaux Jordan one on the "Extension of Inflammation from the Epididymis to the Urethra"; Mr. Steele, of Clifton, one on "Excision of the Scapula"; Dr. Rawdon Macnamara read a paper on "The Treatment of Aneurism by Compression"; and Mr. MacCormac read some "Notes on Ambulances."

In the Midwifery Section, under the presidency of Dr. Beatty, papers were read—by the President on "Fibro-Cystic Disease of the Uterus," and on "The Radical Cure of Retroflexion of the Uterus"; by Dr. Meadows on "The Treatment of Fibrous Tumours of the Uterus"; by Dr. Barnes on "Hypertrophous Elongation of the Cervix Uteri"; by Dr. Tilt on "Hysteria"; and by Dr. Swayne on "The Treatment of Hæmorrhage after Abortion."

In opening the Public Medicine Section, Dr. Stewart, the president, gave a most interesting address on the subject of sanitary reform, giving especial emphasis to the fact that the Profession now fully recognise that Medical men live by the cure of disease, and not by disease itself. Some very good papers were read in this section, and the attendance was fair. Dr. J. Ingleby Mackenzie read a paper on "The Climate of Sidmouth," and Dr. Merrifield one on "The Meteorology of Plymouth." Papers were read, also, on "Poor-law Medical Reform," and on "Provident Dispensaries"; and a very interesting and instructive one on "Sewage Irrigation," by Mr. Hope, who appears to be a thorough master of the subject. Dr. C. Bell Taylor had made arrangements to read a paper on the "Contagious Diseases Acts," but, owing to some informalities, the President of the Section decided that it could not be heard. When this decision was arrived at, Dr. Taylor imputed motives to the President for the repression of the paper which provoked from him a grave and well-merited rebuke.

The public dinner on Thursday evening was well attended, about 150 being present, but the arrangements were defective; much annoyance being caused to some worthy members of the Association by their being left to find seats wherever they could, instead of having places provided for them within the magic circle of which the President was the centre. The waiting was so bad that it was difficult to obtain anything, and the "far-famed band of the Royal Marines" played so loudly as almost to render conversation impossible.

The annual museum, under the efficient management of Mr. Henry Greenway, was excellently arranged, and many objects of great interest were to be found there. Most members, with much curiosity and care, examined Mr. Sayre's apparatus for the treatment of hip-joint disease, and Mr. Mayer who exhibited it, demonstrated its application on a little patient in the Royal Albert Hospital, when the instantaneous relief from pain and anxiety exhibited by the child fully proved its efficacy. Messrs. Mayer and Meltzer also exhibited amongst numerous other instruments a special support contrived by Dr. Taylor, of New York, which, while preventing forward motion of the trunk, permits all others to take place freely.

Dr. Steele, of Clifton, exhibited a small flexible probe consisting of a thin rod of guttapercha capped by a piece of silver. Some very striking coloured drawings by Mr. Jonathan Hutchinson were present, showing the ravages occasioned by syphilis after some cases of vaccination. Mr. Greenway exhibited a model of a Hospital in which each patient is to be isolated in a glass compartment ten feet square. Among the exhibitors in the drug department the most noticeable were Messrs. Southall, Son, and Dymond, of Birmingham, who showed beautiful specimens of cinchona and opium; Messrs. Howard, the well-known quinine manufacturers; and Messrs. Balkwill and Son, local chemists.

THE vestry of Marylebone have given a gratuity of ten guineas to each of their sanitary inspectors for the extra services performed by them during the prevalence of small-pox.

BRITISH ASSOCIATION
FOR THE ADVANCEMENT OF SCIENCE.

REPORT OF THE FORTY-FIRST MEETING.

EDINBURGH, August 9, 1871.

SECTION D.—BIOLOGY.

DEPARTMENT OF ANATOMY AND PHYSIOLOGY

(Continued).

THE CERVICAL VERTEBRÆ OF THE STEYPIRETHYR.

By Professor Turner, M.B.

DR. TURNER first described the cervical vertebræ of a large female whale stranded at Longniddry in 1869, and also the cervical vertebræ of a large female steypirethyr stranded at Northmaven, Shetland, in October of the same year, many of the bones of which are in his (Professor Turner's) possession. After giving the principal measurements of the vertebræ of the Longniddry steypirethyr, the author went on to state that the transverse process of the atlas was not perforated by a foramen. Those of the second, third, fourth, fifth, and sixth, each possessed a large oval foramen at the root. The seventh cervical vertebra had only its superior transverse process well developed; the inferior was marked simply by a slight ridge on the body of the bone. In the Northmaven specimen the inferior transverse process of the sixth vertebra was only partially developed, so that it did not give the superior process, and the boundaries of the ring were imperfectly formed. The steypirethyr is not an uncommon whale on the Scottish coasts. In addition to the two specimens already referred to as obtained in 1869, the author had identified the great whale stranded at North Berwick in October, 1831, dissected by Dr. Robert Knox, and the skeleton of which is in the Museum of Science and Art, with this species. Another specimen of the species was a whale stranded at Aberdour in July, 1858, which he had been able to identify from the nasal bones preserved by Dr. M'Bain.

THE CERVICAL VERTEBRÆ IN THE CETACEA (THE PIKE-WHALE, THE GREAT RORQUAL, NARWHAL, AND PILOT-WHALE).

By Professor Struthers.

The author dealt mainly with the conditions of stiffness and mobility of the vertebræ, and the various degrees of development of the transverse processes. The seven vertebræ were present as a mammalian affinity, and their conditions are modified by function. The Surgeon gives his patient a movable or a stiff joint, according as he desires, by practising either rest or motion, and the same law would no doubt act in the whale's neck. The great ring of the transverse processes contains a large vascular plexus, as it contains an artery in man; but that is not its meaning. It is the walls of the ring which are developed for ligamentous and muscular attachments. The lower processes he divided into three stages, and compared these to three stages of the corresponding parts in man. The arches of the vertebræ, supposed to show a difference between the razorback and sibbaldins, he showed to differ so much in his two specimens of razorback that little reliance could be placed on this character. The ligaments between the front vertebræ had been dissected with difficulty, and the author demonstrated their modifications in the whales. One of the razorbacks was the Peterhead whale, in which he had found the rudimentary bony hind limb, the sixteenth pair of ribs, and the rudimentary muscles of the fingers; the other was a larger one from Caithness. The pike-whale, showing the dissection of the soft parts of the neck, had stranded at Aberdeen last year. The next specimens exhibited were from the narwhal, male and female. Possibly in adaptation to the possession of the great tusk, the vertebræ were movable, while in the female, without the tusk, they were less movable. The male showed also an additional joint, on the same side as the tusk, between the atlas and axis. Passing next to the stiff-necked whales, Professor Struthers exhibited a large series of specimens from the globiocephalus, obtained from the flock which stranded near Edinburgh some years ago. They showed progressive ankylosis of the vertebræ, and degeneration of the transverse processes. The younger ones showed even the rudiments of the epiphyses of the vertebral bodies, or vertebræ themselves rudimentary. The last neck exhibited was that of a "right" whale, the interest attaching to which was that, though probably a Greenland "right" whale, it presented more of the characters of the "right" whale of the South Sea. He had gone to dig up the buried bones of a whale in the nursery of Mr. Roy, of Aberdeen, and his disappointment in finding it only a globiocephalus was more than compensated by his seeing this neck

lying open in the nursery, and Mr. Roy had kindly presented it to him. The conclusion he drew from the study of this neck was that the supposed differences between the "right" whale of the North and South Seas were possibly not such fixed characters as had been supposed. The Professor, in concluding, alluded to the great difficulties, and even risk to health, attending the dissection of these enormous animals. It was difficult to say whether it was worse on the sea-shore in a wet day, or in the confined and putrid atmosphere of the College-room. No one who had not tried it could realise the difficulties that attended the research.

Professors Thomson, Turner, and Macalister, and Dr. Murie joined in the discussion, Professor Turner expressing that the series of specimens exhibited were the finest he had ever seen. The variations of construction in the cetacea were numerous, and a large collection of such specimens was important. A special vote of thanks was awarded to Dr. Struthers.

COMPOSITION OF THE CARPUS IN THE DOG.

By Professor Flowers, F.R.S.

A short descriptive paper read for Mr. Flowers by Professor Allen Thomson.

THE BEARING OF MUSCULAR ANOMALIES ON THE DARWINIAN THEORY OF THE ORIGIN OF SPECIES.

By Professor Macalister, M.D.

Professor Macalister said there were usually adduced three arguments from anatomy in support of the evolution theory of the origin of man. The first of these is derived from embryology, the second from rudimental structures, and the third from anomalies. The object of this paper is to endeavour to determine the precise value of the last of these arguments. This may be stated thus:—It is the experience of anatomists that structures are variable, that in scarcely two subjects are the parts similar to each other, and that often very great varieties are noticed. As these varieties simulate the normal arrangements in lower animals, it is inferred by some that they are evidences of a genetic affinity. The first point to determine is, Do the anomalies of parts in man resemble the normal structures of lower animals? The evidence in determination of this point were drawn by the author from the muscular system, and he classified muscular anomalies according to their relation to lower animals. The first class consists of those separate muscles which are normal in lower animals, and only rarely present in man—such are the muscles known as occipitoscapular, peroneus, levator claviculæ, etc. The second class consists of those separate muscles which exist as anomalies in man, but do not exist as normal in lower animals, such as the sixteen abnormal laryngeal muscles described by different authors. The third class consists of such muscles as are distinctive of man, and which are sometimes anomalously absent in him, and, still more rarely, of some of the peculiarly human muscles, rarely present as anomalies in lower animals. The fourth class consists of muscles common to man and other animals, but which normally are differently arranged in both. In man such muscles are often found arranged according to lower animal types, and this class contains by far the largest number of anomalies. How to account for these anomalies has long been a point of dispute. There are two hypotheses which seem competent to account for them. One large series like the second class is accounted for on functional grounds; but this hypothesis is incompetent to explain the occurrence of all, as some anomalies are sources of weakness, and absolutely destroy function. That function is a factor, however, seems plain from three considerations:—1. Muscles which have a great variety of function have a wide range of variation. 2. Muscles which have no function, like those of the whale's paddle, are very variable. 3. Those muscles which have single definite functions vary very little. The second hypothesis is that of reversion, that such anomalies are produced by the tendency to revert to some earlier structural condition of some former stage of parental condition.

In the discussion which followed, Mr. Bogg said the question was—What was the aim or intention of the anomalies referred to? He regarded man as a little universe, having in his mind as well as his body the characteristics of the land of creation, and having these anomalies retained in his structure to indicate, not that he was evolved from the lower animals, but that the Creator evolved the lower animals from himself, and that as He could not create any animal which had no connexion with the Person who produced it, they could not exist without having in their own structures types of those which existed in the Creator, and consequently in man, who was the image of the Creator.

Professor MACALISTER preferred to adhere to a negative

rather than the positive side of the argument. He thought they were shut up at present to the evolution hypothesis, and the proper way to pursue this investigation further would be to tabulate all the muscular anomalies in man, and do the same in regard to the lower animals, and compare the two, so as to see whether the grouping of anomalies in man was the same as in the lower animals. He had drawn out such a table regarding man, and would leave it to someone better qualified than he was to make out a similar table regarding the lower animals.

WORKING MODEL OF THE CIRCULATION.

By Professor Rutherford, M.D., F.R.S.E.

Professor Rutherford made a communication descriptive of an apparatus he had invented, and which was before the section for demonstrating certain points in the mechanics of the circulation, the phenomena of the pulse and the pressure of blood. He illustrated from it how the pulse is produced, why it is that with dilated capillaries there is a pulse in the veins, and why there is no pulse in the veins when the capillaries are contracted. He further showed why it is that the arterial is higher than the venous pressure, and the causes of variation in the amount of the arterial pressure.

ON THE ANATOMY OF THE THORACIC VISCERA OF THE ELEPHANT.

ON THE MAGNETIC AND DIAMAGNETIC PROPERTIES OF THE BLOOD.

By Dr. Arthur Gamgee, F.R.S.E.

ON THE EXISTENCE OF HEMOGLOBIN IN THE MUSCULAR TISSUE, AND ITS RELATION TO MUSCULAR ACTIVITY.

By E. Ray Lankester.

ON BACTERIA IN WATER.

By Dr. Ferrier.

Dr. Ferrier gave an account of certain experiments made by him in conjunction with Dr. Burdon-Sanderson, with a view to discover the circumstances which determine the existence of bacteria in the liquids and tissues of the body. The paper had reference to certain results obtained in the course of an investigation into the ultimate nature of contagion. It was shown that in the test-liquids which they used for the detection of organisms in contagious fluids, no spontaneous evolution of organisms takes place. The occurrence of organisms in these liquids was in proportion to the degree of external contamination. Fungi are the chief form which is derived from the air. The occurrence of bacteria is, however, due to water. It was shown that every kind of water, with the exception of freshly distilled water, teems with invisible germs of bacteria. These cannot be detected by the microscope, or by the electric beam in the manner adopted by Professor Tyndall. The purest-looking ice-water was found to contain as many germs as others which had not the same apparent purity. Different varieties of water possess the zymotic power, as they term it, in different degrees. The water supplied by the London water companies was examined, and different degrees of bacteria impurity were found to exist. They further showed that the animal liquids and tissues do not in the normal state contain the germs of bacteria, and that the occurrence of these, and consequent putrefaction, was due to contact with surfaces of ordinary water. Bacteria seemed to be the pioneers, if not the producers, of putrefaction. It was found that meat, milk, wine, etc., do not putrefy if they are kept from contamination with water, or any surface which has not been superheated, or rendered innocuous by some anti-zymotic which is fatal to the life of bacteria. The experiments further showed that there is no developmental connexion between bacteria and torula; consequently Hallier's theories fall to the ground.

SOME NEW EXPERIMENTS RELATIVE TO THE ORIGIN OF LIFE.

By Dr. Charlton Bastian, F.R.S.

Dr. Charlton Bastian described some new experiments, the results of which led him to the conclusion that living matter might arise *de novo*, and that this living matter might go on to the development of certain common organic forms, just as surely as any speck of crystalline matter in a fluid might take on and assume certain definite characters which belonged to the saline substance in its crystalline condition. His experiments showed that living organisms had been found in fluids that had been exposed to a temperature higher than was sufficient to destroy germs.

ON THE RELATIVE POWERS OF VARIOUS SUBSTANCES IN PREVENTING THE GENERATION OF ANIMALCULES, OR THE DEVELOPMENT OF THEIR GERMS, WITH SPECIAL REFERENCE TO THE GERM-THEORY OF PUTREFACTION.

By Dr. John Dougal.

In the discussion on the above papers, Dr. M'KENDRICK said

that the experiments he had made did not warrant him in adopting the conclusions on either side of the question. With regard to Dr. Bastian's experiments, he observed that the germs or ova of living creatures must always be more delicate and likely to be destroyed than the creatures themselves.

Dr. LANKESTER considered the question to be still open. He did not see why theologians should denounce the supporters of spontaneous generation, because the Church in former ages had believed that organic beings might arise from inorganic substance. Dr. Bastian wished them to believe that his experiments had proved spontaneous generation; but there were other and more interesting spheres of observation, and he (Dr. Lankester) thought that it was in the slimy deposits in the depths of the sea that they must look for the solution of the difficulty. The question should not be regarded as irreligious. Philosophers were quite justified in looking for the truth, and no theory or view should be suppressed that might at last turn out to be true.

Mr. LEIGHTON, Liverpool, said that in all the discussion it was assumed that what was inorganic was without life; but this opened up the question of matter and spirit; and on what ground, he asked, did they assume that matter was inert?

ON THE ORIGIN AND SOURCES OF FIBRIN IN THE ANIMAL ECONOMY.

By Dr. John Goodman.

Dr. Goodman's paper was put in and received as read; after which the President closed the Department with some observations on the theories of the origin of life. He held that as yet the representatives of the different theories had left much undecided, and that the whole question remains *sub judice*.

On the whole, the work of the Department of Anatomy and Physiology was worthy of the section. It was solid, laborious, and earnest.

DEPARTMENT OF ANTHROPOLOGY.

The Department of Anthropology is now amongst the most popular of the meetings of the Association, and with a little more care in the selection of papers would be one of the most interesting and useful. We shall cull from its proceedings this year the passages that are, to our taste, most deserving of notice.

PROFESSOR TURNER'S ADDRESS.

Professor Turner, who presided over this department, opened with an address, in the course of which he said:—Those who are conversant with anthropological literature will, I doubt not, have little difficulty in calling to remembrance various writings in which errors, not only in the description of objects, but in the general conclusions arrived at from their examination, would have been avoided if the previous trainings of the authors had been of a wider nature—if they had fully appreciated the import of the processes of growth and development; nay, even the aberrations from the normal state through pathological changes occurring during embryo or adult life, to which man is subject in common with other vertebrates. It is, I trust, needless for me to enlarge further on this topic, so that we may next proceed to inquire briefly into the part which an anthropological department may play in the proceedings of the British Association. In societies devoted solely to the consideration of anthropological questions, and acting as independent bodies, such as the Anthropological Institute of London, or the corresponding society in Paris, all the subjects included within and constituting the science of man naturally fall within the scope of inquiry, and come under discussion as opportunity offers. But in this department of the Association we have not that complete independence of action which these societies possess. We are only members of a still larger body, and the functions which we perform must be duly subordinated to the common good; and, owing to our recent introduction into the programme of its proceedings, much of the ground which many would consider we were fairly entitled to cover has been largely preoccupied by other and older departments. As the physical aspects of our subject are based on anatomy and physiology, many of the papers on the structure and function of the human body and its constituent parts may doubtless be claimed by the Department of Anatomy. Other papers in which comparisons are instituted between human and animal structure, the zoologists may consider they have a title to. To some extent, also, the habits of man and numerous important questions of a social nature are discussed in the section of Economic Science and Statistics. The time when man first appeared on the face of the earth, the twenty-two formations in which his remains and those of contemporary animals are found, may come under the consideration of the

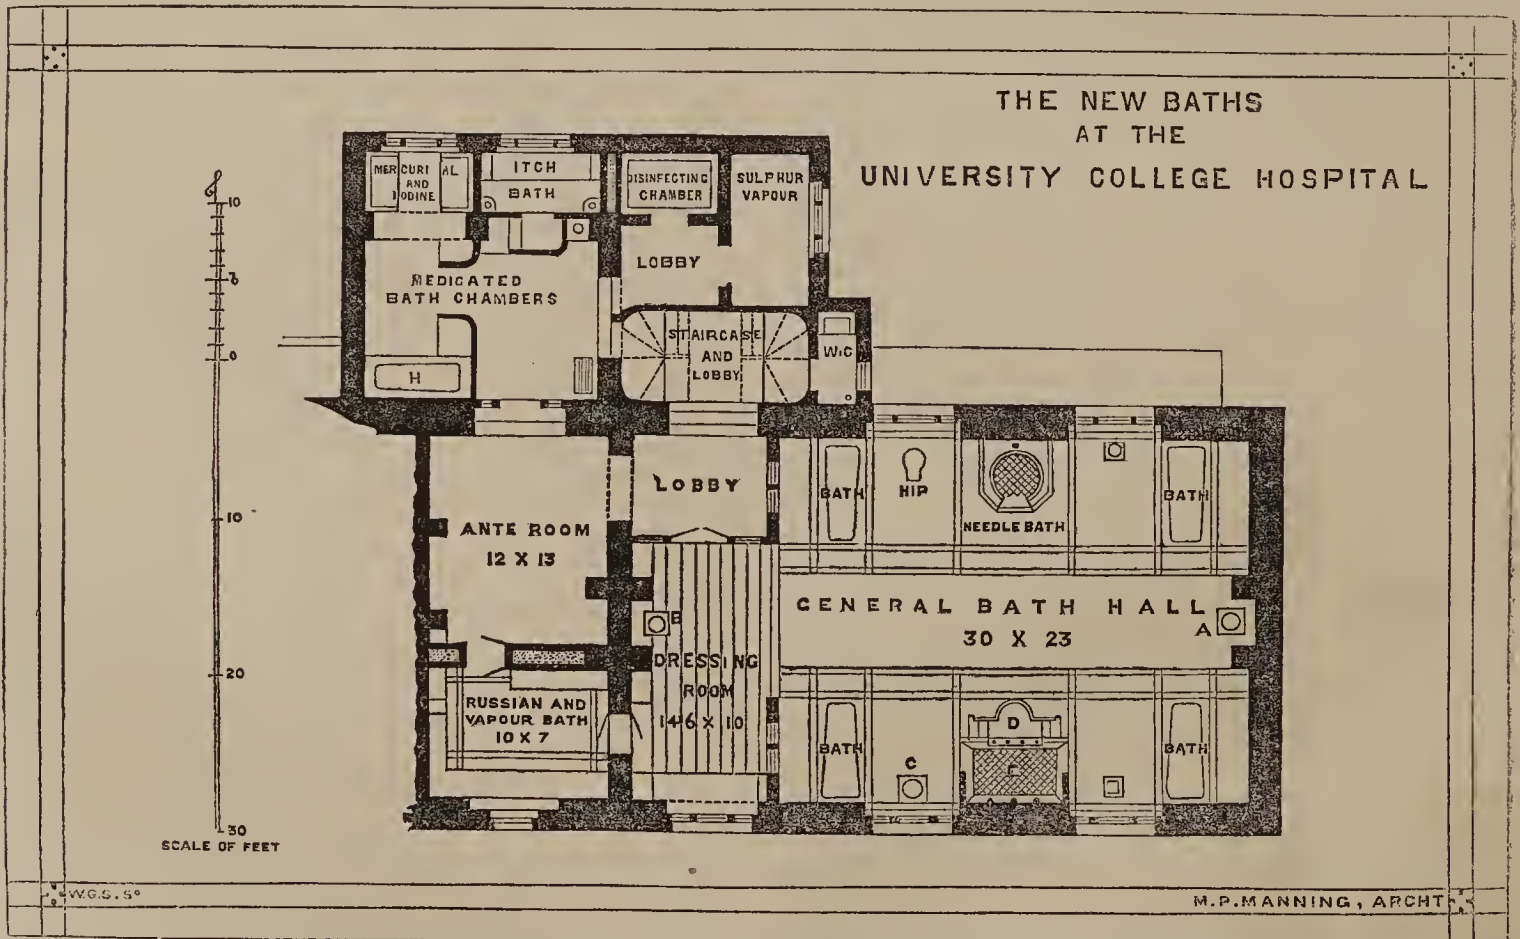

geologists. As our subjects, therefore, dovetail so intimately with those other sections of the Association, questions may occasionally arise, whether papers submitted for perusal come more appropriately within their province or within ours. Probably the most satisfactory mode of solving this difficulty would be for the different sections concerned to come to a common understanding that all papers which treat of the origin and progress of mankind should be forwarded to this department. Again, if a separate Ethnological Department or subsection were formed, as has been suggested, or even ethnological papers were read, as was for so many years the case, in the Geographical Section, not only would all those communications on the characteristics of the different varieties of man, or their distribution over the globe, but even papers on comparative philology, and on questions appertaining to the early history of man, and to his primitive culture, in all probability be subtracted from our proceedings. Without doubt, all ethnic questions form an integral part of anthropological study, for ethnology is one of those subjects which form the groundwork of our science; and as it is an axiom that the whole is greater than and includes the part, all these questions naturally fall to be discussed in this department, and should not be divorced from their natural allies. The decision of the General Committee, that the ethnological papers should be transmitted to this department, was but to restore them to the place they originally occupied in the proceedings of the Association—(applause)—for in its early years ethnology was a subdivision of Section D. The brief history of this department teaches us that its struggle for existence has been a severe one. It was only after the dissociation of the ethnological papers from the Geographical Section that our proceedings acquired much vitality, and to remove them from us now would be a severe blow to our usefulness. As the "noblest study of mankind is man," the subjects which come within the scope of our inquiries in this department are amongst the most important in which a body of scientific men can be engaged. Let us

approach their consideration with a spirit of due humility and reverence; let our discussions be so regulated that our desire may be, not to attain merely a personal victory in argument, but, if possible, to get at the truth. And if we claim to be called anthropologists, let not men say of us that our right to be so regarded is rather owing to our proficiencies, in the old Aristotelean meaning of the term, as discussers of persons—mere gossips—than to our qualifications as patient and humble students of the great science of human nature.

On the motion of Dr. SHARPEY, a vote of thanks was given to Professor Turner for his address, and carried with acclamation.

THE NEW BATHS AT UNIVERSITY COLLEGE HOSPITAL.

It has been said with great truth that one particular in which the therapeutic machinery of our English Hospitals falls lamentably short of that of Continental Hospitals, is in the matter of baths. The first step towards remedying this deficiency has now been taken at University College Hospital in the erection of a service of baths available for the treatment, not only of skin complaints, but a variety of diseases, such as rheumatism, paralysis, neuralgia, syphilis, sciatica, and many others. These baths, which are now complete, have been provided through the energy of Dr. Tilbury Fox, the Physician to the Department for Diseases of the Skin in the Hospital, and the Hospital authorities are to be congratulated upon such an important addition to their Institution. The cost has been about £1800. A good idea of the general plan and arrangements of the baths will be gathered from the accompanying illustration. The baths are entered by a staircase from the

out-patients' department of the skin infirmary. To the right is the entrance to the general bath-hall; to the left of the landing that to the section set apart for the treatment of contagious skin complaints. The baths may, indeed, be regarded as consisting of two distinct portions. The itch and lousy patients will not be allowed to mingle with the others, not even in the waiting-room. This is an excellent arrangement. We may say that the great object has been to avoid the use of paint and woodwork as much as possible, and hence there is a large amount of cement-work. The walls are cemented, the partitions of most of the baths

are made of brickwork coated with cement, and the floors are tiles, so that everything can be kept clean with little trouble. There is a special and separate drainage from the baths, with a good outfall into the main sewer in the adjoining street. The general bath-hall is thirty feet by twenty-three; it has attached to it a convenient platform where the patients can undress. There are four ordinary porcelain baths, in which simple alkaline, acid, bran, and such like applications will be made; a needle bath; a special douche bath, in which wave, solid column douches, and showers of different kinds may be given. This bath-hall is warmed by two large steam coils,

one at either end; the floor is tiled. The Russian bath is heated by radiation, and the flues are made of fire-tile, the object being to prevent any exposure of heated iron surfaces by contact with which the air might be more or less charged. There is special provision made for the admission of fresh air directly into the room, and the exact regulation of the warming current, which is gently warmed before it actually enters the room by being made to pass along the under surface of the ordinary fire flue. This room can also be used as a steam vapour bath.

In the other section of the baths there is a very compact arrangement; the bath on the left is the sulphuret of potassium bath. Adjoining this place is a box for steaming or fumigating an arm or a leg, as the case may be. Then come the boxes in which patients will be given mercurial and iodine fumigation-baths, and these are constructed on a novel principle. There is at the bottom an iron gas-chamber, which has a special flue of its own. The gas is used to heat the upper surface, upon which the mercury or antimony is placed, the vapour of which passes into the box above through special openings in the floor of this latter box, which is made of stone. There is a small space betwixt the upper wooden box and the lower iron gas-chamber. The box in which the patient sits is supplied with a steam-pipe, which enters beneath the stone floor of the box itself, and there is a special flue guarded by a valve for the egress of the steam and the vapours, and this flue joins the gas-flue above; a like arrangement is to be found in the "sulphur chamber." The itch bath is lined with cement, and has marble fittings, one being a marble seat upon which the patients will sit to rub in the parasiticide; whilst the water-supply is so arranged that the whole body of the patient can be freely and thoroughly rinsed from top to bottom after the proper treatment for the destruction of the acari has been effected.

The disinfecting chamber is intended to be heated to about 220° or 230° F., and provision is made for the passage of the contents that escape from within through the fire itself before being carried aloft. Sulphur and chlorine can be readily introduced into the chamber. This brief sketch will enable our readers to judge of the completeness and compactness of these excellent baths, which do great credit. We must not omit to mention Mr. Michael P. Manning, whose clever handiwork is seen in other Hospitals, and Messrs. Jenkes and Co., who have really done their work in a truly admirable and a most careful manner. These baths will well repay a visit.

HEALTH OF THE METROPOLITAN POLICE.

THE report of Mr. T. Holmes, Chief Surgeon of the Metropolitan Police, on the health of that force during the year 1870, is incorporated with that of the Commissioner, instead of being addressed to the divisional Surgeons and circulated to them with printed copies of the monthly tables of sickness, as was done with the four previous annual reports. It has thus become a public official document, from which much interesting information may be collected.

The authorised strength of the metropolitan police on December 31, 1870, was 9160 men of all ranks, deducting from whom the men employed on special duties, public and private, there remained available for police duties proper a total force of 7889 men. This is the estimate of the Commissioner, but for the purpose of Medical statistics Mr. Holmes calculates the average annual strength from the number of men of all ranks for whom payment was made to the divisional Surgeons on June 30 and December 31, being respectively 8602 and 8797, giving a mean strength of 8700. Such a method of estimating the annual mean strength gives only an approximate result, as the numbers, being calculated on the maximum numbers under the care of each Surgeon during the half-year, exceed the actual average strength of the force. Adding the 455 men in the four outlying dockyards, who are under the care of naval Surgeons, the total force included in the "morning states of numbers sick, on sick leave, and detached," appears to be 9155. The method adopted by Mr. Holmes of calculating the average numbers of daily sick, is by adding together the sick on 100 days in the year taken

indiscriminately from all seasons of it—viz., the first ten days in each month, except April and August. This gives—

On the sick list	231.44
On sick leave	37.95
Detached	38.21

307.6

The total average daily loss from sickness, calculated in the same way, for the year 1869 was 340.9, the reduction being mainly in the number of detached men, though the other items also show a slight decrease.

This gives an average daily percentage of sick of all kinds of 3.3, or, deducting the detached men, of 2.9. The former figure is slightly lower than last year, 3.3 in place of 3.6, the latter a little higher, 2.9 in place of 2.8. Mr. Holmes then proceeds to explain that, in consequence of a slight accidental error in reckoning the total force in 1869—viz., the Woolwich Dockyard division having been enumerated twice over—each of these rates for 1869 appears one decimal point too high. This is evidently a clerical error, which, if the nature of the mistake in 1869 had not been stated, would not have attracted notice; but the strength for that year having been too high by the number of men at the Woolwich Dockyard, the ratios calculated on that strength would be too low, instead of too high. The conclusion, however, is correct that the total average loss from sickness in 1870 was .4 per cent. less than in 1869, and the total average of men sick and on sick leave exactly the same.

The method of estimating the average daily sick appears to us to be an arbitrary deviation from the usual mode, and to interfere materially with any attempt at comparison with the Medical statistics of the army, in which the average daily sick is calculated from the numbers remaining in Hospital at the end of each week. This gives a sufficiently accurate result, taking one week with another, of the fifty-two weeks in the year. Mr. Holmes probably thinks that by making his calculations on the sick of 100 days he has a more extensive basis of observation than if he only took the last days of fifty-two weeks; but it appears to us that his hundred days, composed of the first ten from each of ten months, the other two months being entirely omitted, represent the average of the year much less accurately than do the fifty-two days on the system of weekly returns. Mr. Holmes's plan has certainly simplicity to recommend it, as, in order to divide any sum by one hundred, it is only necessary to tell off two decimal points from the right. The returns of the divisional Surgeons being furnished monthly, there would be no great difficulty in showing the total number remaining throughout the month, which, divided by the number of days in the month, would give the daily average for that month, and the sum of these averages for the year, divided by twelve, would give the average daily sick for the year with almost absolute accuracy, or the total number remaining throughout the year might be divided by 365. Comparing, as far as may be done under these circumstances, the average daily sick of the metropolitan police in 1870 and of the troops quartered at London and Windsor during 1869, we find the latter to be the greater by 1.1 per cent.

We find that among the police of the metropolitan divisions and Woolwich Dockyard, which are under the care of the divisional Surgeons, the strength being 8700, the total of cases treated was 6758, the total of men sick was 4642. The cases are, therefore, at the annual rate of 776.7 per 1000 of the strength, being 70 per 1000 in excess of the ratio of admissions among the troops at London and Windsor during 1869. The number of deaths was 42. The death-rate, calculated on the strength, 8595, (a) (omitting 105 men employed as public carriage attendants, the deaths occurring among whom not being entered in the morning states) is 4.83 per 1000. The total number of deaths was 44, which, on the total strength of 9155, gives a death-rate of 4.80 per 1000, which, compared with the death-rate of 8.28 per 1000 among the troops at London and Windsor in 1869, was remarkably low.

The number discharged with pension, on account of Medical unfitness, was 192, being 20.9 per 1000 on the strength (9155), the rate of invaliding in the Foot Guards in 1869 having been 26.05 per 1000. The voluntary resignations without pension or gratuity were 232, of whom those who resigned on account of ill-health form an unknown, but doubtless a very considerable proportion, which in future reports it would be well to estimate, as, in consequence of the police being able to leave the service when they please, any man who finds that the work does not suit his health can quit it for some other

(a) By a clerical error in text given 8585.

employment—a facility which does not exist in the army, and which, as remarked by Mr. Holmes, is too much overlooked in comparing the health of the metropolitan police with that of soldiers stationed in London.

The rates of mortality and invaliding from phthisis in the metropolitan police during 1870—viz., 1.86 and 3.49 per 1000, the numbers being 16 and 32 in the respective strengths (8595 and 9155), as compared with the losses by this disease among the Foot Guards in 1869—viz., 2.66 deaths, 10.28 invalids per 1000 men—show (from the death-rates being so nearly similar, and the invaliding-rates so strikingly different) what must be the influence on the health-returns of the police of the “unknown proportion” of the voluntary resignations without pension on account of ill-health. The subsequent history of men so resigning would, if traced, most probably show a marked prevalence of phthisis or other tubercular affections attributable to exposure on night duty, etc., and running on within a short period to a fatal termination. Mr. Holmes, however, is of opinion that the number of voluntary resignations is not sufficient to exercise any very great influence on the sick-rate, even allowing that all were for the cause of ill-health, which he says they were not; nor does he even believe any large proportion of them to have been so.

The police force certainly appears to enjoy a remarkable immunity from venereal diseases. Only twenty-three men were reported as suffering from such ailments, and were struck off pay while unable to do their duty. We are told, however, that the number suffering from concealed venereal diseases, but still able to do duty, is probably considerable, but is believed to have been diminished by a request which has lately been forwarded to the various Hospitals not to receive police-constables as out-patients without the sanction of the divisional or chief Surgeon expressed in writing. The fact of the men being deprived of pay while unfit for duty in consequence of venereal diseases implies, as almost a matter of course, that no man will voluntarily come before the Surgeon for such cause, and that those who do come under the notice of the Medical officer are most probably suffering from the more severe forms of disease manifestly disabling them. There being no prohibition on marriage among the police, the liability to venereal diseases must be very much diminished. The number of married men, however, is not mentioned in the report under notice, but, even allowing it to be the maximum observed among men in the same class of life, it is difficult to believe that the prevalence of venereal diseases among the unmarried men of the force is anything like fairly represented by the number given above. A policeman has immense facilities for getting Surgical advice and treatment gratis on every beat, and, however much we may admire the general efficiency of the force, and appreciate its protection to our lives and properties, we must decline to believe that the men composing it are such absolute purists in morals.

The list of deaths during the year includes two from scarlet fever, one from typhoid fever, and one from “fever.” No death from small-pox. There is no statement of the causes of admission under treatment, but the small number of deaths from contagious febrile disorders, and no death having occurred from small-pox, show a remarkably satisfactory state of general health.

We hope in future years to see the vital statistics of the police force extended in several directions. There is an extensive field for observation among a body of 9000 or 10,000 men living in our midst with their families under circumstances so nearly similar to those of persons of the same class of life of the civil population. The registration of diseases among them would be a very important step in the direction of the organisation of similar registration among all classes, and, until such a system be established, would serve temporarily to indicate the advent and progress of epidemics. Mr. Holmes is of opinion that the percentage of sickness might be reduced to some extent by more strict Medical supervision. He is opposed to the men belonging to sick-clubs, since they have under that system a great interest in keeping themselves as long as possible on the sick list, inasmuch as they receive more from the club than is deducted as sick-stoppage from their pay, so that they receive actually more when sick than well. Mr. Holmes further remarks that the establishment of a central Hospital, to which severe and doubtful cases could be sent, would give much increased facility for detection of imposture and for efficient treatment, but would involve a considerable increase of expense; that acute and urgent cases are not very numerous in the force, and, when they do occur, there is no difficulty in procuring their admission into the general Hospitals. But the bulk of the cases, being chronic affections of the respiratory

organs and rheumatism, are not such as can often be received in metropolitan Hospitals.

We strongly suspect that the desired amount of Medical supervision will never be attained so long as the work is to be done by men engaged in the struggle for private practice. Why not utilise for this purpose the services of naval and military Medical officers retired on half-pay?

PRECAUTIONS ISSUED BY THE MEDICAL DEPARTMENT OF THE PRIVY COUNCIL AGAINST THE INFECTION OF CHOLERA.

1. As Asiatic cholera is now prevailing in foreign ports within a week's voyage of this country, and may probably extend to others which have still quicker communication with England, it is not unlikely that, within the next month or two, occasional cases of the disease may be brought into the ports of this country.

2. A recent Order of Council, dated July 29, has given power to the respective local authorities to deal with any such cases, if they arrive, in a way to protect the population, as far as practicable, against surprise. But, as cases of choleraic infection have innumerable degrees of severity, it is possible that some such cases, slightly affected, will, notwithstanding the vigilance of local authorities, be landed without particular notice in English seaboard towns, whence then they may advance to other and perhaps inland places.

3. Former experience of cholera in England justifies a belief that the presence of imported cases of the disease at various spots in the country will not be capable of causing much injury to the population if the places receiving the infection have had the advantage of proper sanitary administration; and in order that all local populations may make their self-defence as effective as they can, it will be well for them to have regard to the present state of knowledge concerning the mode in which epidemics of cholera (at least, in this country) are produced.

4. Happily for mankind, cholera is so little contagious, in the sense in which small-pox and scarlatina are commonly called contagious, that if reasonable care be taken where it is present, there is scarcely any risk that the disease will spread to persons who nurse and otherwise closely attend upon the sick. But cholera has a certain peculiar infectiveness of its own, which, where local conditions assist, can operate with terrible force, and at considerable distances from the sick. It is characteristic of cholera, not only of the disease in its developed and alarming form, but equally of the slightest diarrhoea which the epidemic influence can cause, that all matters which the patient discharges from his stomach and bowels are infective, and that, if they be left without disinfection after they are discharged, their infectiveness during some days gradually grows stronger and stronger. Probably, under ordinary circumstances, the patient has no power of infecting other persons except by means of these discharges, nor any power of infecting even by them, except in so far as particles of them are enabled to taint the food, water, or air which people consume. Thus, when a case of cholera is imported into any place, the disease is not likely to spread, unless in proportion as it finds, locally open to it, certain facilities for spreading by indirect infection. In order rightly to appreciate what these facilities must be, the following considerations have to be borne in mind:—First, that any choleraic discharge cast without previous thorough disinfection into any cesspool or drain, or other depository or conduit of filth, infects the excremental matters with which it there mingles, and probably, to some extent, the effluvia which those matters evolve; secondly, that the infective power of choleraic discharges attaches to whatever bedding, clothing, towels, and like things have been imbued with them, and renders these things, if not thoroughly disinfected, as capable of spreading the disease in places to which they are sent (for washing or other purposes) as, in like circumstances, the cholera patient himself would be; thirdly, that if, by leakage or soakage from cess-pools or drains, or through reckless casting out of slops and wash-water, any taint (however small) of the infective material gets access to wells or other sources of drinking-water, it imparts to enormous volumes of water the power of propagating the disease. When due regard is had to these possibilities of indirect infection, there will be no difficulty in understanding that even a single case of cholera, perhaps of the slightest degree, and perhaps quite unsuspected in its neighbourhood, may, if local circumstances co-operate, exert a terribly infective power on considerable masses of population.

5. It might be supposed that, under those provisions of the Sanitary Act, 1866, which relate to precautions against dangerous infections of disease, security could be taken, as regards the infective discharges of cholera, against various kinds of personal conduct which would be dangerous to the public health; above all, that, under those provisions or otherwise, the universal disinfection of such discharges could be enforced. Undoubtedly everything possible in this direction ought to be done, wherever a case of cholera is known to exist. Too much importance cannot be attached to the precaution of thoroughly disinfecting, without delay, all discharges from the stomach and bowels of persons suffering under the disease, as well as all bedding, clothing, towels, and the like, which such discharges may have imbued; and, of course, neither choleraic discharges, nor any slops which may contain traces of them, should ever (even when supposed to be disinfected) be cast into any position from which they may get access into drinking-water. The duty of observing those precautions is one which ought never to be neglected; but populations cannot prudently stake their lives on the chance that it will be completely fulfilled for them. Apart from all question of negligence, the degrees of cholera are too many, and the slight and incipient cases far too apt to escape observation, for any such defence against its infection to be more than partial. And the main object for endeavour must be to secure such local circumstances that cholera contagium, though not disinfected, shall be unable to act extensively on the population.

6. The dangers which have to be guarded against as favouring the spread of cholera contagium are particularly two. First, and above all, there is the danger of water-supplies which are in any (even the slightest) degree tainted by house-refuse or other like kinds of filth, as where there is out-flow, leakage, or filtration from sewers, house-drains, privies, cesspools, foul ditches, or the like, into streams, springs, wells, or reservoirs from

which the supply of water is drawn, or into the soil in which the wells are situate—a danger which may exist on a small scale (but, perhaps, often repeated in the same district) at the pump or dip-well of a private house, or on a large and even vast scale in the source of supply of public water-works. And secondly, there is the danger of breathing air which is foul with effluvia from the same sorts of impurity. Information as to the high degree in which these two dangers affect the public health in ordinary times, and as to the special importance which attaches to them at times when any diarrhoeal infection is likely to be introduced, has now for so many years been before the public that the improved systems of refuse-removal and water-supply by which the dangers are permanently obviated for large populations, and also the minor structural improvements by which separate households are secured against the dangers, ought long ago to have come into universal use. So far, however, as this wiser course has not been adopted, temporary security must, as far as practicable, be sought in measures of a palliative kind. (a.) Immediate and searching examination of sources of water-supply should be made in all cases where the source is in any degree open to the suspicion of impurity, and the water both from private and public sources should be examined. Where pollution is discovered, everything practicable should be done to prevent the pollution from continuing, or, if this object cannot be attained, to prevent the water from being drunk. (b.) Simultaneously, there should be immediate thorough removal of every sort of house-refuse and other filth which has accumulated in neglected places; future accumulations of the same sort should be prevented; attention should be given to all defects of house-drains and sinks through which offensive smells are let into houses; thorough washing and hinc-washing of uncleanly premises, especially of such as are densely occupied, should be practised again and again. (c.) Disinfection should be very freely and very frequently employed in and round about houses, wherever there are receptacles or conduits of filth, wherever there is filth-sodden porous earth, wherever anything else in, or under, or about the house, tends to make the atmosphere foul. In the absence of permanent safeguards, no approach to security can be got without incessant cleansings and disinfections, or without extreme and constant vigilance against every possible contamination of drinking-water. [For detailed advice on disinfection, see the office memorandum on that subject.]

7. In view of any possibility that the infection of cholera may again be present in this country, it is desirable that in each locality the public should ascertain to whom it practically has to look, in case of need, for its collective safety against such dangers as the above. The responsibility is, in a large proportion of cases, mixed. The most critical of all its branches, the responsibility of providing for the unpollutedness of water-supplies, is, in many very important places, in the hands of commercial companies; and it is to be hoped that these companies, informed as they must be of the calamitous influence which some of their number have exerted in previous epidemics of cholera, will remember, if the disease should again be present here, that each of them, in its daily distribution of water, has hundreds, or even thousands, of human lives in its hands. But, except to that extent, the responsibility for local defences against cholera, both as regards water-supply and as regards local cleanliness and refuse removal, is vested in the local authorities—the “sewer authorities” and “nuisance authorities” of recent statutes. These authorities—the town councils, improvement commissioners, local district boards, boards of guardians, and select and common vestries, of their respective areas of jurisdiction—are all, either electively or directly, so constituted as to represent the will of the local rate-paying population; and each such population has had almost absolute means of deciding for itself whether the district which it inhabits shall be wholesomely or unwholesomely kept. It is greatly to be wished that the former of these alternatives had, from long ago, been the desire of every local constituency in the country. It may fairly be believed that, in considerable parts of the country, conditions favourable to the spread of cholera are far less abundant than at former times of visitation; but it is certain that in very many places the conditions of security are wholly, or almost wholly, absent; and it is to be hoped that, in all this large class of cases, the authorities, under present circumstances, will do everything which, in the remaining time, can be done to justify the trust reposed in them by the Legislature for the protection of the public health.

8. It is important for the public very distinctly to remember that pains taken and costs incurred for the purposes to which this memorandum refers cannot in any event be regarded as wasted trouble and expense. The local conditions which would enable cholera, if imported, to spread its infection in this country, are conditions which, day by day, in the absence of cholera, create and spread other diseases—diseases which, as being never absent from the country, are, in the long run, far more destructive than cholera; and the sanitary improvements which would justify a sense of security against any apprehended importation of cholera, would, to their extent, though cholera should never reappear in England, give amply remunerative results in the prevention of those other diseases.

By direction of the Lords of the Council,

(Signed)

JOHN SIMON.

Medical Department of the Privy Council Office,
August 10, 1871.

WATER-SUPPLY.—The New River Company undertake, or rather engage to undertake, to provide a constant supply of the purest water in the district at present dependent on the Company, while the general question of water-supply is under discussion.

OBSCENE ADVERTISEMENTS.—Of late obscene announcements on “pillars and posts” have been less common than formerly. There is all but a complete cessation of the system of putting filthy little handbills into the hands of passengers in the streets. But some relics of the past dirty announcements remain. It is evident, however, that the publishers of such outrages against decency are amenable to punishment. On Saturday last Sir William Rose inflicted a fine of 40s. on a man for posting in a public place an indecent advertisement. If this law were strictly put in force, the streets would be purged of a nuisance which is an outrage upon decency.

REVIEWS.

Selected Obstetrical and Gynecological Works of Sir James Y. Simpson, Bart., M.D., and late Professor of Midwifery in the University of Edinburgh. Edited by J. WATT BLACK, M.A., M.D., M.R.C.P.L., Physician-Accoucheur to Charing-cross Hospital, London, and Lecturer on Midwifery and the Diseases of Women and Children in the Hospital School of Medicine.

THE late Sir James Y. Simpson was undoubtedly a very high authority on many of the subjects treated of in this volume; and now that he is removed by death, it was desirable that a complete edition of his works should be produced under the editorship of a Physician who had the advantage of being his assistant for several years, and of acquiring during that association a knowledge of his opinions, writings, and mode of practice. The way in which Dr. Black has performed his task justifies the confidence placed in him by Sir James Simpson's representatives. Whilst the book before us contains the most important of Sir James's contributions to the study of Midwifery and Female Diseases, which, in some form or other, were already before the public, it has the additional merit of bringing to light for the first time his original “*Lecture Notes*,” on which was founded his course on midwifery. This is the more satisfactory, as we learn it had been Sir James Simpson's intention to publish an outline of his systematic lectures, a project deferred by his accumulating engagements, and at last frustrated by his death. These “*Lecture Notes*” are calculated to serve as a guide both in the study and teaching of practical obstetric science, and we are reminded by their publication of similar abstracts of the oral teaching of other great teachers—of Astley Cooper, Abernethy, and Blundell. We may observe, *en passant*, that the present volume is but the first of three which are to appear on subjects identified with Professor Simpson's name, the two coming ones, which are already in the press, consisting of his “*Clinical Lectures*” and his treatises on “*Hospitalism*” and “*Anæsthesia*.” These latter-announced volumes must be left to speak for themselves when they appear, and we now proceed to consider the one lying before us. It is somewhat bulky, but this was unavoidable, considering the length and importance of the articles it contains; and if the title which the editor has selected—“*Obstetrical and Gynecological*”—would have been thought pedantic by Smellie or Burns, modern criticism will excuse it because of its comprehensiveness. The work itself is divided into six parts, viz.:—1st, *Lecture Notes*; 2nd, *Pregnancy*; 3rd, the *Fœtus and its Appendages*; 4th, *Parturition*; 5th, the *Puerperal State*; and 6th, the *Non Puerperal Diseases of Women*. These are again subdivided into different sections, and are furnished with numerous woodcut illustrations. The whole is supplemented by a copious and clear index, which for reference is invaluable.

The lecture notes, though concise, contain plain directions for any and every emergency to be met with in obstetric practice, clothed in clear and unmistakable language. The section on pregnancy commences with the well-known paper on its duration, in which Sir James Simpson establishes the fact that the period of human pregnancy is not absolutely definite and precise; there follows, *inter alia*, the original note on the therapeutic effects of the salts of cerium in allaying the attendant vomiting. The chapter on the fetus and its appendages contains an interesting detail of the rudimentary reproduction of extremities after their spontaneous amputation. We have not space to follow the editor minutely, but we cannot refrain from directing attention to the late Professor's employment of chlorate of potash in placental diseases, which he believed to be effectual in checking the repetition of abortions in women whose tendency to them was confirmed, and in producing a healthy and fruitful condition of the uterus. Under the head of parturition there are the papers on the management of placenta prævia, wherein Simpson first advocated the plan of separating and removing the placenta, on albuminuria in puerperal convulsions and peritonitis, on the difficulties of labour occasioned by the sex of the child, and on the various obstetric operations. The succeeding division gives a valuable article on puerperal fever, its propagation and communicability. The sixth and last part is devoted to the non-puerperal diseases of women; here we find the important memoir on the uses and application of the uterine sound, together with notes on various local applications to the interior as well as to the cervix of the womb; dilatation of the cervix, retroversion, fibroid and polypoid

tumours, carcinoma, spurious pregnancy and infecundity, pass under notice; whilst Simpson's views on the treatment of ovarian tumours, and on ovariectomy itself, are reproduced *in extenso*. The palliative treatment by iodine injections and by tapping is carefully weighed and contrasted with the total extirpation of the tumour; and, with characteristic frankness, Sir James Simpson does not shirk the responsibility which must attach to the operator. He was in the habit of putting this question to himself:—"Am I conscientiously entitled to inflict deliberately upon my fellow-creature, with my own hands, the imminent and immediate chance of death for the problematical and prospective chance of his future improved health and prolonged life?" And his answer to this question was:—"That, when the health and life of the patient were not immediately threatened by the stage and progress of the malady; when the tumour was a source of inconvenience and deformity rather than a source of danger; and when the evils of the disease were as yet prospective rather than real—the conditions for resorting to ovariectomy were unjustifiable. But that, if the health of the patient were becoming rapidly undermined by the disease; if the progress of the affection showed that before long it would inevitably prove fatal; if the question were thus reduced to one of certain and not distant death from the malady, or, possibly, an entire escape from the affection, with prolonged life and health, from the operation; and if, in addition, the ascertained or apparent freedom of the tumour from adhesions, and other circumstances, were such as to present no counter-indication—then he believed that ovariectomy might be undertaken under conditions far more justifiable and legitimate than could be urged in favour of capital operations generally; for whereas about 35 per cent. of those operated on for ovarian disease die, there is a still larger rate of mortality after operations for hernia, stone, and aneurism, as well as after amputations generally, as shown by the statistics freely introduced into the volume.

In this notice we have attempted but little more than to give an idea of the contents of this valuable book. To many of our readers, doubtless, the chief of the papers it contains are familiar. To others, although probably they may be aware that Sir James Simpson has written on the subjects, the papers themselves will be new and fresh. To the first class we would recommend this edition of Sir James Simpson's works, as a valuable volume of reference; to the latter, as a collection of the works of a great master and improver of his art, the study of which cannot fail to make them better prepared to meet and overcome its difficulties.

Risultamenti ottenuti nella Scuola di Chirurgia della regia Università di Padova col Bichloruro di Metilene quale Anesthetico Generale.
Per il Dottore PAOLO ROSSI. Padova. 1871. 8vo. Pp. 15.

Results obtained in the Surgical School of the University of Padua with Bichloride of Methylene as a General Anæsthetic. By Dr. P. ROSSI.

THE author gives us as his general conclusion, after a trial of bichloride of methylene in 108 operations, in only eight of which cases was there any vomiting, "that even from the results obtained in the Surgical School of Padua, chloromethyl merits the preference over chloroform." He gives an accurate account of the discovery of this anæsthetic by Richardson, in 1867, and its first employment in a Surgical operation by Mr. Spencer Wells in November of the same year. Since July, 1868, it has entirely replaced chloroform and ether as a general anæsthetic in the University of Pavia. In all minor operations local anæsthesia by the ether spray is preferred.

A considerable part of this pamphlet is taken up by a translation of a paper by Mr. Spencer Wells, published last April by one of our contemporaries, in reply to a statement that the new anæsthetic was only useful for short operations. Mr. Wells's experience in about 250 operations fully accords with that of the Paduan school. It is very pleasant to see the authority of our London school cited as it is in this contribution of an Italian Surgeon; and Mr. Wells may be justly congratulated on the allusions to him as "*grande ovariectomista*," and as "*immortale Chirurgo*."

THE latest news from South America tells us that the health of Buenos Ayres is completely restored. Winter has set in, and the Doctors were saying it would be the healthiest winter the city had known for some years. Sanitary reforms are about to be carried out on a large scale.

NEW BOOKS, WITH SHORT CRITIQUES.

Our Eyes, and How to Take Care of Them. By H. W. WILLIAMS, M.D. Wm. Tegg.

*** This is a sensible little *brochure*, and is well worthy of commendation. It has had a "great success" in America. The author gives a popular explanation of the organ of vision, and the various disorders and diseases to which it is subject. But he is particularly careful to recommend his readers not to treat these disorders and diseases, but to apply ere it is too late to some respectable Surgeon. It is the exception to the rule that we recommend "popular" works on Medicine or Surgery; but this is one of those exceptions which we are pleased to acknowledge.

On Bone-setting (so-called), and its Relation to the Treatment of Joints Crippled by Injury, Rheumatism, Inflammation, etc. By WHARTON HOOD, M.D., M.R.C.S. Macmillan and Co.

*** This is a reprint, with considerable additions, of a series of interesting and instructive papers, which originally appeared in the pages of a contemporary. In a very plain, sensible, and practical manner Dr. Hood describes the manœuvres and manipulations of the bone-setters in cases of distortion and loss of power. He shows that Mr. Hutton invariably said, in all cases brought under his notice, that the "bone was out," and when he relieved the patient would declare he had put the bone in place. Dr. Hood's book is full of instruction, and should be read by all Surgeons.

PROVINCIAL CORRESPONDENCE.

LIVERPOOL.

August 15.

THE remaining part of the report of Drs. Parkes and Sanderson on the sanitary condition of Liverpool has just been presented to the Town Council. In it the authors consider:—1. The mortality of Liverpool as compared with that of other large towns. 2. The comparative mortality of different districts in Liverpool itself. 3. The comparative mortality in certain selected streets. 4. The sanitary condition of those and other similar streets.

Under the first head, Liverpool appears to great disadvantage, her mean annual mortality per 1000 during the decade between 1861 and 1871 having been 38.59, while in Manchester, the town which came nearest to her, it was 30.2, and in Bristol only 22.5. The mortality is very properly divided into ordinary and extraordinary. The ordinary annual death-rate—*i.e.*, that which exists when no particular epidemic disease prevails—is about 35 per 1000; while during the prevalence of typhus, cholera, or similar scourges it may amount even to 50 per 1000.

In reviewing the causes of the frequent epidemics which afflict the town, the report points out the peculiar dangers to which its abundant communication with all parts of the world exposes it, and the great facilities for the spread of infectious disease, when once introduced, afforded by its local conditions as a large port; and among precautionary measures it suggests the isolation from the permanent population and the healthy accommodation of the crowds of emigrants which pass through it; and likewise that monthly reports of the condition, as regards epidemic diseases, of Germany, Ireland, and the other countries whence emigrants are chiefly drawn, should be obtained, so as to put the town upon its guard.

On investigating the mortality of different districts, the authors point out that there are some—such as Rodney-street, Abercromby, Castle-street, and St. Peter's Wards—in which it may compare favourably with that of any town in England; while in others the death-rate, at all times excessive, reaches during the prevalence of any infectious disease a fearful height. The difference in these different districts cannot arise from any general conditions of climate, but must be the result of modes of life, varying densities of population, local sanitary defects, conditions of soil, or some such causes.

In order to carry the analysis further, the authors of the report selected four streets, two healthy and two unhealthy, for comparison. The two healthy ones were Rodney-street and Egerton-street, the former inhabited by professional men and families of independent means, and the latter by clerks, Custom-house officers, and skilled artisans in the receipt of good wages. Rodney-street is as healthy as any healthy country village with an equal number of inhabitants, while Egerton-street, though

possessed of a higher mortality, contrasts very favourably in this respect with the town generally, the death-rates being as 26 to 35. In the two unhealthy streets—viz., Addison-street and Sawney Pope-street—the enormous proportion of 45.4 and 55.86 deaths per 1000 per annum of their population is reached. These streets are terribly overcrowded by the most drunken, dirty, and improvident classes of the community; and when it is considered that they are but representatives of a very large number of streets, there ought to be but little surprise at the fact of Liverpool's high mortality. A frightful contrast is presented between the first and last of the streets mentioned above in respect of the deaths of children under 5 years of age. In Rodney-street there die annually 4 per cent. of these; while in Sawney Pope-street the percentage rises to 26; and in some others even much higher. Of course the excessive infant mortality reduces the average length of life, which in one or two cases is only 10 years, that of the town generally being 23 years. The three principal causes of children's deaths are, in their order of frequency, the exanthemata, diarrhoea, and bronchitis (including pneumonia); while, in non-epidemic years, by far the most potent causes of death, in the older inhabitants of the unhealthy districts, are bronchitis and phthisis.

With reference to the sanitary condition of the selected streets, the authors strongly condemn the courts which abound in various parts of Liverpool, and which, indeed, do seem to have been constructed with a view to the exclusion of as much air and light as possible. Entered by a dark and narrow passage from a dirty street, and completely blocked up by a high wall at the opposite extremity, it is no wonder that Drs. Parkes and Sanderson consider that "few constructions could be better adapted for the spread of contagious diseases." Against the cellars, also, they speak with equal force, and, as anyone who knows anything of Liverpool cellars of the poorer sort knows, with equal justice too; for, even when these places are not used as dwelling-rooms, they become the receptacles of all the filth and garbage of the house, and in weather like the present become the sources and centres of danger to the health of the neighbourhood in which they abound. It is recommended, therefore, so to close the cellars "as to render them inaccessible to the occupants of the houses or courts."

With regard to the causes of a misery and poverty greater than the authors of the report could have believed to exist in any town in this country, they are just what everyone who for any time has resided in the town, and taken the trouble to inquire into its condition, has made up his mind about, and which we ourselves have many times mentioned when writing on this subject—*i.e.*, the irregularity of the labour market, the improvidence and careless habits of the people—and especially of the Irish—and the great intemperance.

The report contrasts most strongly the filthy and miserable condition of the interior of the houses, the thresholds of which Englishmen's jealousy for the liberty of the subject so often makes a barrier to improvement, with the cleanliness and good condition of the exterior courts themselves, over which the Corporation exercises control. These, for the most part, are well paved; many have hand-pipes of water; and galvanised iron receptacles, into which all the dry rubbish may be (but too often, alas! is not) put, are placed in convenient places. Very favourable judgment is passed on the efficiency of the trough water-closets, which, through the energetic action of Dr. Trench, have now almost universally taken the place of the filthy middens, and to the condition and actual working of which the reporters paid special attention, in consequence of a discussion which has for a long time been maintained in Liverpool on the subject. The words of the report are explicit:—"As an apparatus for the speedy and safe discharge of large quantities of excreta into a drain, we regard the trough-closet as superior to any other with which we are acquainted." As a qualification to this, it is stated further on that while six selected streets, with a population of 4748 souls, "do not show any decided evidence of improper sanitary conditions of either water-supply or sewerage, the entrance of sewer air into many of the houses is quite certain, and must contribute to the fetor and unwholesomeness of the atmosphere, which is the main sanitary defect in the poor houses of Liverpool." Where lies our hope of improvement? "The remedies are to be sought, first, in the introduction of greater volumes of pure air among the crowded quarters and into the houses of Liverpool; and, secondly and chiefly, in the improvement of the morals of the people, and in the cultivation of habits of temperance, self-restraint, and forethought." This candid report does not conclude, as too many critics, after a very hasty consideration of

our unhappy conditions, have done, without paying a well-merited tribute to the energy and zeal in sanitary matters displayed by the Corporation, acting under the advice of its very able Health Officer, Dr. Trench, and his predecessor, Dr. Duncan.

As yet we are free from cholera, but, in anticipation of its probable arrival, orders have been given to the staff sub-committee to make a provisional contract "for the erection of a temporary cholera Hospital, if required, to contain not more than twenty beds, and to make such other arrangements as may be necessary."

GENERAL CORRESPONDENCE.

THE UNIVERSITY OF LONDON.

[To the Editor of the Medical Times and Gazette.]

SIR,—The University of London is a national institution, if being founded and supported by the funds of the nation constitute an institution a national one. But this is its sole claim to the rank. It is in no sense a university for the people, nor is it a popular university. The number of its graduates is ridiculously small compared with the national wealth expended upon it, and its influence on the real advance of national culture has been at least equalled, if not surpassed, by that of many voluntary associations, and has never approached that exercised by the older universities. Its chief function has been that of a Medical examining board, but the number of its Medical graduates, although large out of all proportion to the graduates in Arts, is ludicrously small compared with the number of Medical graduates poured forth by the universities of Scotland and Ireland. It is not a university in which the average English lad can be certain, with a fair training and fair work on his own part, to obtain a degree, but it is rather a corps of examiners, largely paid by the State, whose aim seems to be to maintain an ephemeral reputation by putting unfairly difficult questions to candidates, and rejecting all who do not answer them in a special form. The national value and use of the University is sacrificed in order that a select few, some of whom are mentally exhausted and injured by the effort, may obtain its degrees. And yet, with all this exclusiveness, it is notorious that the highest standard of mathematical and classical acquirement the University can produce is far surpassed by the standard set up at Cambridge and Oxford, and the University has but a very small proportion of the leading cultivators of the natural sciences, and not a poet, or historian, or statesman, or great writer in its list of alumni.

I may quote the result of the last matriculation in proof of the justice of my remarks. It is stated that two-thirds of the lads who presented themselves on that occasion were rejected. Now, when it is remembered that no lad would think of attempting to matriculate without an average education and a special preparation, and that the very large majority must have worked—and worked hard—before they ventured, I maintain that the rejection of two out of three proves that the examiners did not perform their duty to the State and country which pays them. To set an average schoolboy on the commencement of a university career a difficult paper in natural philosophy, and to insist on its being answered, besides by no means easy papers in Greek, Latin, arithmetic, mathematics, and modern languages, is to provide for the certain rejection of the majority of English boys.

A very real complaint against the mode in which the University performs its examining functions is, that its questions for pass examinations are not only unnecessarily difficult, but are essentially unfair. For instance, take the last preliminary scientific examination—an examination, be it remembered, intended for students in general science, and by no means exclusively for Medical students. The paper on zoology contained a question on the comparative anatomy of the kidneys—a purely anatomical and physiological question; and amongst the questions in botany was a question on the vegetable alkaloids, which would be likely to be known by none except by advanced students in Medicine. These, Sir, to candidates are very real grievances, and if Parliament is to continue to vote large sums for the maintenance of this University, the question will undoubtedly before long be put, What benefit does the University confer on the nation in return? The annual production of half a score of well-educated Physicians and barristers, who would most certainly be equally well produced elsewhere, will, I suspect, be thought an inadequate return. The truth is, that the University should have pass examina-

tions for its degrees which the average Englishman with fair work and training may be sure of passing. The examinations for honours, on the other hand, should be made as high as possible, and in some respects might well be made higher than at present.

I am, &c., M.D.

"QUICK WITH CHILD."

LETTER FROM DR. C. R. BREE.

[To the Editor of the Medical Times and Gazette.]

SIR,—I must confess that I read Mr. Weightman's letter with extreme surprise. Dated from the "Temple," there must, I think, be some mistake, and that Mr. Weightman has been personated. The horrible law upon this subject is not as Mr. Weightman states it, and the "quick with child" notion did not arise in my imagination.

It is not the duty of the jury of matrons to determine whether the woman is with child or not, but to decide whether she is "quick" with child: or, in the words of the law as laid down by the judge to the jury of matrons—taken, be it remembered, from women standing in or prowling about the court—to find "whether the prisoner be with child; if a quick child or not." Now for proof that this is so.

Let me call Mr. Weightman's attention to the case of *Rex v. Wright*, Norwich, Lent Assizes, 1832 (*Medical Gazette*, 12, 585, p. 24, and quoted by Taylor, "*Medical Jurisprudence*," p. 583), a case which he seems never to have read. In this case the woman was found guilty of the murder of her husband. She pleaded pregnancy, and the judge empanelled a jury of matrons, who found that the prisoner was "not quick with child." Now, this woman would inevitably have been hanged had not the Medical men of Norwich interfered and represented to the judge that proper means had not been adopted by the old women to ascertain the fact of quickening. She was then examined by some Medical men, found to have passed the period of quickening, and to be "quick with child"; therefore she was respited, and delivered four months afterwards of a living, healthy, full-grown child. This case completely cuts away the ground from beneath Mr. Weightman's feet, and shows, not only what the law is, but its truly horrible nature. Dr. Taylor, who speaks most indignantly of such a state of the law (*op. cit. passim*), says that—"The occurrence of such a case as this should lead to the total abolishment of the jury of matrons;" and yet, forty years after, such a disgraceful mode of obstructing justice and causing grievous wrong finds an advocate from the "Temple" of justice itself.

Sir, I maintain that every assize town contains at least two or more competent obstetricians, whose assistance ought in these cases to be obtained. If they disagree, then let them call in a third. If they still doubt, give the woman the benefit; or, rather, spare the judicial murder of an innocent unborn babe.

Mr. Weightman's remark about Medical dictatorship comes badly from one, the members of whose profession occupy such a large portion of the House of Commons, and who get all the rewards of the State.

The members of the Profession to which I have the honour to belong pass their entire lives in performing the highest duties of humanity. Their greatest reward, and generally the only one they get, is the consciousness of having exercised their functions in a uniform stream of benevolence and kindly feeling. Actuated by such impulses, I feel certain that one or other of the Medical members of Parliament will not allow another session to pass without getting rid for ever of a "jury of matrons." They will be supported by ninety-nine out of every hundred members of the House.

Colchester, August 12.

I am, &c.,
C. R. BREE, M.D.

P.S.—"The bare proof of pregnancy should itself be sufficient. Such is the law of France by Art. XXVII. of the Penal Code. Besides, the means taken by our law to determine the question are bad, and quite unfitted for the present state of society. A jury of matrons may easily be deceived with respect to pregnancy, and still more so with respect to the sign of quickening as it concerns another female."—*Taylor, "Med. Jur.,"* p. 583.

GLYCERINE IN RHAGADES OF THE ANUS.—Dr. Weisse relates a case in which extremely painful rhagades of the anus that had caused most severe suffering for several weeks were at once successfully treated by the effectual application of glycerine.—*Wiener Zeitung*, July 25.

NEW INVENTIONS.

ARNOLD AND SONS' IMPROVED PORTABLE ENEMA (REGISTERED).

(*Arnold and Sons, Instrument Makers by Appointment to Her Majesty, St. Bartholomew's Hospital, etc., 35 and 36, West Smithfield, London.*)

THIS enema consists of an indiarubber bottle, which is specially prepared to stand any climate, and is fitted with a reversible pipe and mount, to which is arranged a cap, so that a patient can with safety carry the fluid with him, and by simply taking off the cap and reversing the rectum-pipe it is then ready for use. The advantages of such an instrument will at once be seen, as there is no possibility of its getting out

of repair. The mounts are made of brass, and carefully turned on the inner side and every part which comes in contact with the fluid, so as to prevent the possibility of corrosion. They are fitted in various ways, and answer equally well as an enema or vaginal syringe. A smaller size is made for injecting the urethra, so that the patient can readily and without fear of breakage carry with him the injection and syringe ready for immediate use.

OBITUARY.

WILLIAM CRISP PECHEY, M.D. ST. AND., M.R.C.S., WAS born at Biggleswade, Beds, December 17, 1838. Descended through several generations on both sides from members of the Medical Profession, he very early showed great love and aptitude for natural history studies. Educated first at Hill House, Beacondale, and afterwards at Mr. West's, of Amersham, he passed some time as pupil with Mr. Foster, of Huntingdon, and finally became a student at the London Hospital.

Diligent as a student, and still devoted to anatomical and natural history pursuits, he was appointed one of the yearly prosectors at the College of Surgeons, and, had his health been good, would probably have taken a high position in London. Unhappily an attack of hæmoptysis drove him from England, and after several voyages to Australia and India he settled, in 1863, in New South Wales, first at Rockleigh and afterwards at Fort Bourke. Here, with a practice of about a hundred miles' radius, thrown entirely on his own resources, he lived a life of interest and excitement, with ample opportunities for prosecuting his favourite pursuits. In 1868 he returned to England, but increasing illness compelled him soon to leave

again for a warmer climate. Having sold his Australian practice, he attempted this time to settle in the Fiji Islands, where he hoped the possession of a cotton plantation would afford him ample leisure to study the rich fauna of the place. The climate, however, was ill-suited for him; he rapidly became worse, and very speedily he returned to England, where, after lingering some few months, he died at the house of his mother, at Walthamstow, on June 22 last. He has left nothing behind him except a not inconsiderable museum, the results of his collecting in various places, especially rich in Australian birds, and a little work on the Fiji Islands, published only a short time before his death, and giving a remarkably graphic and sensible account of the aspect and opportunities of those rising colonies. All who knew him deplore in his too early death the loss of an acute and indefatigable intellect, which, had life and health been spared, might have done good work in science, and of a true and noble-hearted friend.

CHARLES ASPRAY, L.S.A.

CHARLES ASPRAY was born on November 22, 1804, in the town of Olney, Bucks, where his family had followed the practice of Medicine, from father to son, for six generations. When quite young his father sent him to London to study at Guy's Hospital. In 1826 he became a Licentiate of the Apothecaries' Company. For twenty-six years he laboured in his Profession, holding many union and club appointments, and nobly exposed himself during a severe outbreak of cholera at Olney. Extremely sensitive—perhaps too much so for a Medical Practitioner—he suffered from his sympathy with his patients, and gained the esteem (and one might say the affection) of all who knew him. To the great regret of his numerous friends, he left Olney in 1852, wishing to give his children the advantage of a London education.

For the last three years he suffered considerably from mental depression, occasioned by hepatic derangement. His weakness was much increased by a chronic bronchitis. He gradually sank, and died on August 2, aged 66, the immediate cause of his death being disease of the liver.

Mr. Aspray was a man of acquirements, and an able Practitioner. He was born, we believe, in the very house occupied formerly by the poet Cowper, and leased after the poet's death by "Dr. Aspray"—one of the best-known Surgeons in general practice in the part of the country in which he practised. Dr. Aspray was the Medical attendant of the Throckmortons, at Weston Underwood, the intimate friends of Cowper; and he attended the family at Clifton Great House, where Lady Austen resided. He was the friend of Bull (of Newport), Sutcliffe (of Olney), John Newton, and Andrew Fuller.

T. M. KENDALL, F.R.C.S.

THE death of this gentleman occurred somewhat suddenly at King's Lynn on Tuesday morning. Mr. Kendall was in his 52nd year, and was the Medical attendant of the Prince of Wales when at Sandringham. Mr. Kendall was a Fellow of the Royal College of Surgeons by election, 1857, having become a Member of the College in 1842. He was also a Licentiate of the Society of Apothecaries; was educated at St. George's Hospital. He was Senior Surgeon, and formerly House-Surgeon, of the West Norfolk and Lynn Hospital, Admiralty Surgeon and agent for Lynn, Inspector of Army Recruits, Medical Inspector of Seamen, Surgeon to Great Eastern Railway and Sutton branch of the Great Northern Railway, Medical Officer of the Freebridge district of the Lynn Union, Surgeon of King's Lynn Union-house and Infirmary, etc., etc.; also a member of the King's Lynn Town Council, and *ex officio* member of the several governing bodies of the town. Both in public and private life Mr. Kendall was greatly respected.

RALPH MONTAGUE BERNARD, F.R.C.S., ETC.,

BECAME the victim of an accident last week. He was walking along the cliffs of Gwbert, in the Bay of Cardigan, with his wife; the edge of the cliff gave way, and he fell on the beach seventy feet below. He sustained a severe fracture of the skull, and died in a few minutes. He was a Fellow of the Royal College of Surgeons, Surgeon to the Bristol Royal Infirmary and Bristol Police. He was also Consulting-Surgeon to the Bristol Eye Hospital. He was formerly Surgeon to Bridewell and the Eye Hospital.

GEORGE DAVID MACLAREN, DEPUTY INSPECTOR-GENERAL OF HOSPITALS AND FLEETS,

DIED a few days since. The deceased became an Assistant-Surgeon December 28, 1837, and Deputy Inspector-General

January 15, 1866. He was appointed to the Greenwich Hospital pension on March 28, 1866. By his death a vacancy has occurred in the list of Staff Surgeons and Surgeons on the pension-list of Greenwich Hospital.

JOHN DUNWOODIE, SURGEON R.N.,

ASSISTANT-SURGEON of Portsmouth Dockyard, died on the 7th inst. The deceased was engaged in his Professional duties on Friday fortnight, apparently in his usual health, and at 6 p.m. had an attack of epilepsy. At one time favourable symptoms appeared, but a succession of fits rendered all chance of recovery hopeless, and the deceased expired on Monday morning. He was appointed Assistant-Surgeon of Portsmouth Dockyard on September 21, 1870, shortly after his return to England, invalided from Yokohama, where he was in Medical charge of the sick quarters.

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentlemen passed their Examination in the Science and Practice of Medicine, and received Certificates to practise, on Thursday, August 10, 1871:—

Garton, William, St. Helen's, Lancashire.
Pearce, Joseph Channing, The Manor House, Brixton.
Wheeler, Daniel Martin Brumwell, Chelmsford.

The following gentlemen also on the same day passed their first Professional examination:—

Hansell, William Charles, Guy's Hospital.
Kessen, Andrew Emerson, Guy's Hospital.
Le Mottée, George Herbert, King's College.
Paul, Frank Thomas, Guy's Hospital.
Spark, Sidney Walter, Guy's Hospital.
Whitmore, William Tickle, St. Bartholomew's Hospital.

APPOINTMENTS.

* * * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

BAINES, M., M.D. Lond.—Certifying Surgeon for South-Western District under the Factories Act.

LAW, W. T., M.R.C.S. Eng., L.S.A. Lond., Resident Physician, Royal Infirmary, Edinburgh.

MAY, Mr.—Medical Officer to the Parochial Board, Aberfoyle.

MOORE, EDWIN, M.D., M.R.C.S.E., L.S.A.—Honorary Medical Officer of the Preston and County of Lancaster Royal Infirmary, *vice* Dr. Nulling, deceased.

SMITH, W. R., L.R.C.P. and L.R.C.S. Edin.—House-Surgeon to the Huddersfield Infirmary, *vice* E. J. H. Booth, M.R.C.S., L.S.A., resigned.

WALKER, S., M.R.C.S. Eng.—Surgeon to the North Riding Infirmary, Middlesbro'-on-Tees, *vice* J. Ellerton, M.D., resigned.

WHITEHEAD, ALFRED, M.R.C.S.E.—Resident Medical Officer to the Birmingham and Midland Free Hospital for Sick Children.

WILSON, RICHARD LANGFORD, M.R.C.S., L.S.A.—Medical Officer for the Second District of the Brixworth Union.

BIRTHS.

BARRY.—On August 13, at Clifden-road, Twickenham, the wife of D. P. Barry, M.D., late Staff Surgeon-Major, of a daughter.

DOMENICHETTI.—On August 16, at 10, Scarsdale-villas, Kensington, the wife of Richard Domenichetti, M.D., Staff Surgeon-Major London Recruiting Staff, of a daughter.

EVANS.—On August 10, the wife of Nicholl Evans, M.D., Cheshunt, Herts, of a son.

FAGGE.—On August 10, at Lutterworth, the wife of Herbert W. Fagge, M.D., of a son.

FARRINGTON.—On August 8, at Grassmere House, Diss, the wife of Dr. Anthony Farrington, of a daughter.

HOCKEN.—On August 8, at Wood-green, Middlesex, the wife of C. E. Hocken, M.D., of a daughter.

JEAFFERSON.—On August 15, at 7, Tyndale-place, the wife of J. B. Jeafferson, Surgeon, of a son.

LANGLEY.—On August 8, at Rathdrum, co. Wicklow, the wife of Harley Langley, M.D., Surgeon Bombay Army, of a daughter.

MARRIAGES.

DOUGLASS—WATTS.—On August 10, at the Parish Church, Croydon, Robert Bruce Douglass, of Brompton, to Sophia Louisa, eldest daughter of the late Henry Watts, M.D., and niece of Mr. and Mrs. Rawlings, of Bensham House, Croydon.

HALE—POOLE.—On August 10, at St. John's, Paddington, Charles Douglas Bowdich, eldest son of Robert Douglas Hale, M.D., of Queen Anne-street, Cavendish-square, to Bertha Maria, daughter of the late John Poole, Esq., of Avenue House, Upper Clapton.

HINCKS—POLLARD.—On July 4, at St. George's Cathedral, Georgetown, Demerara, British Guiana, Francis Hincks, Esq., youngest son of Sir Francis Hincks, C.B., K.C.M.G., late Governor of British Guiana, to Alice Josephine Cory, youngest daughter of the late J. H. Pollard, M.R.C.S.E.

KINGHAN—SPENCER.—On August 10, at St. George's Church, Campden-hill, George Fitzmaurice Kinghan, of Dublin, to Mary Emily, only daughter of George Spencer, Surgeon, of Kensington-park-road, Notting-hill.

PEARSE—RADCLIFFE.—On August 10, at All Saints' Church, Kensington, Lieut. Arthur Napier Pearse, son of George Pearse, M.D., Hon. Physician to her Majesty, to Alice Ekins, second daughter of the late Capt. Charles Wilbraham Radcliffe, 7th Bengal Cavalry.

DEATHS.

A'BECKETT, ARTHUR MARTINÀ, F.R.C.S., at Sydney, of serous apoplexy, suddenly, on May 23, in the 59th year of his age.

ADCOCK, ALICE MARY, infant daughter of John Adcock, M.D., Army Medical Staff, at Sandgate, on August 9.

ARPHORPE, WILLIAM, M.D., formerly of Prince's-street, Leicester-square, at Melbourne, Australia, on May 29, aged 60.

BERNARD, RALPH MONTAGUE, Surgeon, Clifton, Bristol, at Gwbert, near Cardigan, South Wales, on August 10, aged 55.

CHITTY, FREDERICK AYNOTT, son of Aynott Chitty, Surgeon, Dedham, Essex, of pyæmic fever, after vaccination, on August 9, aged 16.

KENDALL, THOMAS M., F.R.C.S., L.S.A., at King's Lynn, on August 15, aged 51.

NESHAM, MARGARET, wife of William Nesham, Surgeon, at 39, Northumberland-street, Newcastle-on-Tyne, on August 13, aged 68.

SYNNOTT, ROBERT, M.D., late of 2, Royal-avenue, London, at Lisnascia, co. Down, on August 9, in his 53rd year.

TOMKINS, HANNAH, relict of the late William Tomkins, M.D., of Yeovil, Somerset, at the residence of her daughter, on August 10, aged 78.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.

BOURNEMOUTH GENERAL DISPENSARY.—Resident Surgeon; must have both Medical and Surgical qualifications and be registered. Applications and testimonials to B. A. Rugg, Esq., for the President of the Dispensary, on or before August 28.

BRADFORD INFIRMARY AND DISPENSARY.—Physician; must be a Graduate in Medicine of one of the Universities of the United Kingdom, or a Fellow or Member of one of the Colleges of Physicians. Applications and testimonials to Mr. C. Woodcock, Bradford, on or before August 30.

BRISTOL GENERAL HOSPITAL.—Assistant House-Surgeon; must be duly qualified and registered. Applications and testimonials to the Secretary on or before August 25. Election on the 30th.

CHESTER GENERAL INFIRMARY.—Visiting Surgeon; must have both Medical and Surgical qualifications. Applications and testimonials to the "Chairman of the Board of Management," on or before August 28.

COUNTY ASYLUM, BURNTWOOD, LICHFIELD.—Assistant Medical Officer; must be duly qualified. Applications and testimonials to Dr. Davis, Medical Superintendent.

COVENTRY PROVIDENT DISPENSARY.—Surgeon; must be a Member of one of the Colleges of Surgeons of London, Dublin, Edinburgh, or Glasgow, and must hold in addition a Licence from one of the Royal Colleges of Physicians, or from the Society of Apothecaries. Applications and testimonials to the "Honorary Secretary," on or before August 31.

MIDDLESEX HOSPITAL, W.—Physician; also Assistant-Surgeon. Applications and testimonials to Mr. H. N. Custance, Secretary-Superintendent, on or before August 22.

NORFOLK AND NORWICH HOSPITAL, NORWICH.—House-Surgeon; must have both Medical and Surgical qualifications. Applications and testimonials to Mr. T. R. Tallack, on or before September 8. Election on September 16.

PARISH OF UNST, SHETLAND.—Medical Officer. Applications and testimonials to Mr. White, Inspector of the Poor.

QUEEN'S COLLEGE, BIRMINGHAM.—Medical Tutor and Joint Demonstrator of Anatomy. Applications and testimonials to the Secretary on or before August 31.

QUEEN'S HOSPITAL, BIRMINGHAM.—Fourth Physician; must be a Graduate in Medicine of a British or Irish University or Graduate in Medicine of a Foreign or Colonial University, and F. or M.R.C.P.L., F.K.Q.C.P., or F.R.C.P. Edin. Applications and testimonials to the Special Committee on or before August 25.

ST. GILES'S AND ST. GEORGE'S, BLOOMSBURY, PARISHES OF.—Assistant Medical Officer; candidates must have the qualifications prescribed by the General Orders of the Poor-law Board. Applications and testimonials to Mr. John Robinson, Clerk, Vestry Clerk's Office, Broad-street, W.C., on or before August 21.

UNIVERSITY OF DURHAM COLLEGE OF MEDICINE, NEWCASTLE-ON-TYNE.—Medical Tutor. Applications and testimonials to Luke Armstrong, Esq., College of Medicine, Newcastle-on-Tyne, on or before August 31. It is particularly requested that no *original* testimonials be sent.

POOR-LAW MEDICAL SERVICE.

** The area of each district is stated in acres. The population is computed according to the census of 1871.

RESIGNATIONS.

Bishop Stortford Union.—Mr. F. D. Beck has resigned the Sawbridge-wood District; area 7397; population 3050; salary £75 per annum.

Bury Union.—Mr. Francis Nuttall has resigned the First Tottington District; area 8887; population 13,259; salary £60 per annum.

Lexden and Winstree Union.—Mr. E. L. Fenn has resigned the Eighth District; area 11,640; population 3366; salary £60 per annum.

APPOINTMENTS.

Godstone Union.—Arthur G. R. Harris, M.R.C.S. Eng., L.R.C.P. Lond., to the Southern District.

Holborn Union.—Tom Robinson, L.R.C.P., M.R.C.S.E., L.S.A., to the First District.

Hoo Union.—George P. Applin, M.R.C.S. Eng., to the Workhouse and the District

ROYAL COLLEGE OF SURGEONS.—The following is an abstract of the unconfirmed minutes of the meeting of the Council on the 10th inst.:—Messrs. John Taylor Porter, L.S.A., and James Gledall, L.S.A., both of Sheffield, elected on the 13th ultimo, were admitted Fellows of the College, their diplomas bearing date, respectively, April 22, and August 21, 1840. Mr. John Buck Stedman, L.S.A., of Godalming, Surrey, was *elected* a Fellow of the College, his diploma bearing date March 5, 1841. The Council having confirmed their resolution of the 13th ultimo removing Mr. Frederick Henry Morris from being a Member of the College, it was resolved—"That the secretary do inform this person of such removal, and do call upon him to return his diploma as required by clause 5, section xvii. of the By-laws; and that Dr. Hawkins, the Registrar to the General Council of Medical Education and Registration, be informed that his removal was in consequence of his conviction for a criminal offence." The Council adopted the recommendation of the Court of Examiners that the subjects for the preliminary examination for 1872 should be the same as the present year. The museum and library were directed to be closed as usual during the month of September. Sir William Fergusson, Bart., and Messrs. Hilton, Hawkins, and Smith, were elected members of the Committee appointed to report on the mode of issuing the several diplomas granted by the College. The following donations were accepted, and thanks of the Council voted:—From Sir William Fergusson, a copy of the engraving of "Henry VIII. presenting the Charter to the Barbers and Surgeons," and a copy of the same in oil; from Mr. Edward Cock, three copies in different stages of the engraving of Sir Joshua Reynolds's picture of John Hunter, together with an engraving of the picture of Sir Astley Cooper. Letters were read from Drs. Hawkins, Carpenter, and Pitman, representing respectively the General Medical Council, the University of London, and the Royal College of Physicians, in reference to the formation of a Joint Examining Board for each division of the United Kingdom. The scheme was approved by the University of London, subject to a slight alteration in resolution X. thereof, and by the Royal College of Physicians. Mr. Birkett, in the absence of Mr. Quain, and in pursuance of the notice given by the latter at the last meeting of the Council, moved—"That a committee be appointed to investigate the expenses of the College in all its departments, and to report thereon, with a view to the diminution of expense where practicable." The motion having been seconded by Mr. Hancock, and the votes of the Council taken thereon, a majority was in favour thereof, whereupon Messrs. Hilton, Quain, Hawkins, and Birkett were elected members of such committee. Mr. Hawkins gave notice of the following motion for the next meeting of the Council after the quarterly meeting in October—viz., "To take into consideration the question of placing those who pass the examinations for the Fellowship in classes according to merit."

MEDICAL QUALIFICATIONS.—The following is an analysis of the Medical licences possessed by the 133 candidates examined at the last meeting of the Court of Examiners of the Royal College of Surgeons of England:—M.D. Edin., 1; M.D. Toronto, 2; M.D. Queen's University, Canada, 1; M.B. Edin., 3; M.B. Aber., 2; M.B. Dub., 2; M.B. Toronto, 2; L.R.C.P. Lond., 2; L.R.C.P. Edin., 6; L.R.C.P. Edin. and L.S.A. Lond., 3; L.S.A. Lond., 27; L.F.P. & S. Glasg. and L.S.A. Lond., 1; and L.K. & Q.C.P. Ire., 1.

THERE were sixty-one small-pox cases in the Canal-street Hospital, Manchester, last week. Eight patients had been admitted during the week, and one had died.

SMALL-POX has broken out at Stafford. In one family the father and mother have died, and the disease has appeared in another part of the town.

VACCINATION IN MARYLEBONE.—Mr. Dawn, the Vaccination Officer, reports that out of 3627 cases of default, reported between March, 1869, and August, 1870, only two persons absolutely refused to have their children vaccinated, and they have been prosecuted.

ACCIDENT TO A PHYSICIAN.—A sad accident has, we regret to say, occurred at Godney-hall, near Wisbeach. Dr. Crowden, accompanied by Mrs. Crowden, was driving along the road at the top of Southcan Bank, when the horse took fright, and, dashing down the embankment, overturned the gig, and threw them both out. Dr. Crowden had his collar-bone broken, and his wife, besides being severely bruised and shaken, had both ankles broken. One leg has been amputated five inches above the ankle, and hopes are now entertained of her recovery.

AT Hull, on Tuesday, the master of a vessel trading to Cronstadt was fined in the maximum penalty of £20 for taking his ship into dock, in breach of the Privy Council quarantine orders, before the crew had been Medically examined, although he had been warned.

THE *Times of India* says that cholera has broken out at Linjah, in the Persian Gulf, and the mail steamers have not, in consequence, been calling there. Cholera also exists at Bahrein, on the Arab littoral, and in the Turkish camp at Khatif. Dr. Hart, of H.M.S. *Euphrates*, serving in H.M.S. *Maggie* in the Persian Gulf, has died of cholera at Bahrein. The heat in the Gulf was such, when the last steamer left, that twenty-four men of the crew of the *Maggie* were *hors de combat* from heat-apoplexy, and thirteen men of the crew of the *Bullfinch*, from the same cause. At 8 o'clock p.m., the heat was 104° Fahr.

THE foundation-stone of a new Hospital for the west-end of Glasgow was last week laid by Mr. Walter Montgomerie Neilson. The Hospital is to be erected by public subscription; it will contain 332 beds, and provide a theatre for the Medical school.

CRYSTALLISED ACONITINE. — MM. Duquesnel and Gréhaut have announced, in a recent communication to the Académie des Sciences, that they have succeeded in obtaining aconitine in a crystallised state. It is only slightly soluble in water, but dissolves in alcohol, glycerine, ether, benzine, and especially chloroform. It is decomposed at a temperature of 138° C. It is poisonous in almost infinitesimal doses, and is very analogous in its effects on animals to curarine.—*Gazette Hebdomadaire*, Aug. 4.

NOTES, QUERIES, AND REPLIES.

He that questioneth much shall learn much.—*Bacon*.

A Member.—The library and museum of the College of Surgeons will be closed during the ensuing month of September.

L. D. S.—This qualification does not exempt you from serving on juries, neither is it registrable; write to Dr. Hawkins, 32, Soho-square, and Mr. Trimmer, Royal College of Surgeons.

Banting.—Dr. Cheyne, a Scotchman, weighed in 1715 more than thirty stone, but afterwards, by changing his habits and living on milk and vegetables, reduced himself to less than half that weight.

Anxious.—No definite period has yet been fixed for the poison of hydrophobia to lie dormant in the system. Cases are recorded in which the attack has followed the bite after an interval of six months, but these cases are not very well authenticated. There is some doubt whether the case referred to by our correspondent was a genuine case of hydrophobia.

Reader.—Sir Theodore Mayerne was Physician to four kings—viz., Henry IV. of France, James I., Charles I., and Charles II. of England. He was a man of singular address, and distinguished for his knowledge of chemistry and natural philosophy.

THE AMALGAMATION OF THE BRITISH AND INDIAN MEDICAL DEPARTMENTS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Every now and then one hears the question raised, whether it would not be advisable to amalgamate the British and Indian Medical Services. Some change is almost certain. It can hardly be expected that the present dual system will continue in India, and many seem to think that by joining the two services they would retain to the officers of the British Medical Department the prizes of the British Service Indian appointments; and, no doubt, looking at the matter from a purely British Medical Service point of view, this would be satisfactory to some, but it must be remembered that the Indian Service Medical appointments, taken as a whole, are very much more lucrative than those of the British Medical Department while serving in India, and that, in all probability, if the two departments are amalgamated, instead of the Indian pay of the British being raised to that of the local, the pay of the local will be lowered to that of the British. You are probably aware that the pay of the Local Service in India is much better in every way than that of the British while serving in India. So that, if once these services are made into one, the Profession at large will have lost the best-paid Medical service in the world. Would it not be better to try and retain this lucrative service for those who come after us, even if the price of so doing had to be paid in the shape of the present British Service being turned out of India? In time to come, looking at the matter from a Professional point of view (the Profession being considered as a whole), there would be quite as many appointments if the two services were separated as if they were amalgamated, and by retaining the old Indian as it is or extending it; appointments out in India would retain their present value, and the Indian Service would offer a field for those bent on the public service, the like of which they will never have offered to them if the Indian Service is amalgamated with the British and the pay reduced to the British standard. Of course, if by amalgamating the two services the pay of the British would be raised to the pay of the local, the case would be different; but do you think, Sir, there is any chance of that in the present age of economy? And as a step once taken is not easily recalled, it would be well for us to be very careful and not deprive our Profession of openings in life in the future merely for the sake of pleasing a few men at present serving in the British Medical Department. There may be reasons for making the two departments one that may carry the day; but calling attention to one pretty obvious result of the junction may make people a little cautious.

I am, &c.,

LOOK FORWARD.

Bombay.—The *Bombay Gazette* of the 6th ult. has an able leading article on the contemplated enlargement by Government of the Insane Asylum at Colaba. The writer is of opinion that the projected building is altogether a mistake, and shows by facts and reasons that the locality of the Asylum, with the single exception of being near the sea, is most objectionable. Every other topographical circumstance is against it; such as the roaring noise of the sea, the proximity of two graveyards, the glaring light of the lighthouse, and, most important of all, the utter absence of soil for gardening and farming operations, which are considered in every establishment in Europe and America a *sine quâ non* in the good treatment of insane patients. The water-supply is also imperfect. The *Gazette* insists that no alteration in the building at Colaba can supply the wants of the district, and protests strongly against the expenditure by Government of three laes for an all but useless building. It certainly appears to us that the *Gazette* has treated the subject with much ability, and that its remarks are fortified by truthful reasoning.

MEDICAL OFFICERS OF THE ROYAL ARTILLERY.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Under the above heading you had an editorial article in your *Gazette* last week. In it you completely ignore and set aside the existence of Assistant-Surgeons as being competent to take Medical charge of a battery of artillery. Your article was solely in favour of the Surgeons and Surgeons-Major, though you commence your leader by saying, "the prospects of Medical officers of this branch of the service are likely to be injuriously affected by the proposed change of organisation; yet, at the close of your article, you say, speaking of a battery, "it would hardly give sufficient employment to two Medical officers; and a Surgeon or Surgeon-Major would scarcely appreciate the position of Medical officer to a battery without an assistant." I would ask, Is not an Assistant-Surgeon equal to this duty? Is he to be set down such an ignoramus that he cannot take charge of a battery of artillery except under the surveillance of a Surgeon or Surgeon-Major? In common charity, let me beg of you do not administer so unkind a snub to those Medical officers who have the greater part of the work to do, for your paper has a world-wide circulation, and as your article now reads, a most undeserved snub is given to those who, with every respect for your editorial pen, are ever willing to sign themselves as I do now,

August 7.

Yours faithfully,

ASSISTANT-SURGEON ROYAL ARTILLERY.

** Our correspondent appears to have quite misapprehended the tenor of our remarks. On again reading them, he will observe that, so far from ignoring the existence of Assistant-Surgeons in charge of batteries of Royal Artillery, we distinctly alluded to them as likely to retain their present positions, quite independently of the Surgeons-Major and Surgeons now in charge of brigades. The method of disposal of the latter class of officers will present a considerable difficulty if the battery be substituted for the brigade system.

Sanitas.—The *Borough of Marylebone Newspaper* of last week contains a sensible letter with the above signature. After quoting a paragraph from the *Pall-mall Gazette*, respecting the evil influence exerted on health by the non-emptying by contractors of dust-bins sufficiently frequently, *Sanitas* says—

"And now I wish to improve on the above; the remarks are all very well, only they convey an erroneous idea as to the real subject of complaint, and concerning the persons more immediately to blame. The nuisance could be at once done away with if householders would prohibit the practice by lazy servants of making the dust-bin a receptacle for all kinds of decaying matter and other rubbish. If nothing but cinder-ash were permitted to be thrown in the dust-bin there would be no 'nuisance' at all. Cabbage-stalks, potato-peelings, fish-bones, and all such useless articles, could be burnt. These regulations should be enforced by the authorities, who should institute a house-to-house inspection and levy a fine in all cases of neglect; if this plan were carried out we should hear no more of the dust-bin as a fever-nest and a propagator of cholera, which it now is."

STATISTICS OF THE CONTAGIOUS DISEASES ACT.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Through your exceptionally impartial conduct, I have been enabled, on two former occasions, to call the attention of your readers to certain facts and figures, derived from the reports of Parliament of 1868 and 1869, which demonstrated that, up to that period, the Contagious Diseases Acts, so far from mitigating disease, had been attended by an increase in the numbers of soldiers suffering from venereal maladies; that, taking all the stations at which the Act of 1866 had been two full years in operation, the number of cases of disease treated the second year was greater than the number treated the first year. Here are the figures:—

Year.	Average strength at all stations.	Total number of cases of disease.	Percentage.
1867	15,930	3542	24.1
1868	15,308	3958	25.9

And they show conclusively that that disease is really aggravated by such measures. Since my last communication, the report of 1870 has been published; and, in conjunction with my friend, Dr. Hooppell, an eminent statistician, I have gone carefully over the figures. This document professes to give the number of cases of disease contracted in the districts themselves which are subjected to the Acts, for every year, from the introduction of the first Act (1864) to March 26, 1870. Such a basis of statistical compilation must necessarily be a very untrustworthy one; as, in many, if not all, of the cases, the statements of the patients themselves and mere conjecture must have been the groundwork of the conclusions come to. But, laying these considerations altogether aside, the return is crowded with errors of fact, and blunders of calculation of the most egregious kind; for instance, in the return of 1870, such things as the following occur:—From the previous returns we know that, at Sheerness, in 1867, 13.1 per cent. were treated in all throughout the year. The return of 1870 says that 14.06 of the whole number of soldiers at the station caught disease in the district itself—that is to say, more men caught disease in the district than had it altogether. The next year there is a remarkable fall; 3.92 per cent. are set down as having caught disease in the district, little more than a quarter of the number so set down the year before, yet the total number

treated in Hospital was 11.8 per cent.—almost as large a percentage as the year before. At Woolwich, we know from the Lords' report that the total number of men treated in Hospital in 1867 was 1283; the return of 1870 says that that number and nine more caught disease in the district—of course, the following year there appears again a marvellous reduction. At the same station the return says 288 men caught disease in the district in two months of 1866, whereas we find from the Lords' report that those 288 men were the whole number that were treated in three months at Aldershot. Again, according to the return of 1870, 1717 men caught disease in the district from April to December, 1867; the truth being that only 15.26 men were treated altogether in that time. Nor is this all; in addition to those errors of fact, the blunders of calculation in the returns of 1870 are most disgraceful. The cases which occurred during a few months of a year are taken as a basis, and the number which might have occurred in the rest of the year are then estimated from these, and put down as actually occurring. The errors sure to arise from these are very great, as the amount of disease in different months varies exceedingly. Then the framers of the tables has obtained his final percentages by adding together the percentages at the different stations, and dividing by the number of stations, apparently oblivious of the fact that there were widely differing numbers of men at the several stations, and that, to take a plain illustration, 23 per cent. on 14,000 and 4 per cent. on 2000 do not make 13½ per cent. on 16,000. Again, he has added in fresh stations every year, so that there can be no comparison between the different years, although they are written one under the other, inasmuch as the circumstances of the different stations are so diverse, and the amount of disease at them so unequal, that the constant adding the statistics of new stations to the general mass cannot fail to vitiate the whole. The conclusion come to by the compilers of this return, by the methods of calculation now described, was that disease had diminished one-half among the men at the stations at which the Acts were in force. The only real conclusion that can be drawn from the figures, which are the data of all the rest contained in the document, is that the amount of disease contracted in the districts which were under the Acts both in 1863 and in 1869 had diminished from 13.91 per cent. in the former year to 11.79 per cent. in the latter. But not even on this can any reliance be placed, for reasons already given. Here are the facts, and I leave your readers to draw their own conclusions as to the trustworthiness of the *ad captandum* statements which are so prominently provided by interested promoters of this iniquitous measure.

Nottingham. I am, &c., THOS. WORTH, M.R.C.S.E.

COMMUNICATIONS have been received from—

Mr. ASPRAY; Mr. STILLIARD; Mr. SAYCE; Mr. G. WILMOT; Mr. MARTIN MURPHY; Dr. BREE; LOOK FORWARD; Mrs. BAINES; Mr. W. T. LAW; Mr. S. WALKER; Dr. E. MOORE; Dr. ELLERTON; Mr. JOHN SIMON; Dr. STEVENSON; Mr. T. WORTH; Mr. J. WICKHAM BARNES; Dr. MORELL-MACKENZIE; Dr. B. W. RICHARDSON; Dr. F. R. HOGG; Mr. J. CHATTO; Mr. H. MORRIS; Dr. J. J. RIDGE; Dr. WHITMORE; Dr. DAY.

BOOKS RECEIVED—

Report of the Birmingham and Midland Hospital for Women—Bulletins et Mémoires de la Société Médicale des Hôpitaux de Paris, tome septième—Twenty-fifth Report of the Commissioners in Lunacy to the Lord Chancellor—Dr. R. A. Vance (New York) on Syphilitic Epilepsy—Dr. Mapother's Animal Physiology—Wormell's Mechanics, second edition—Wormell's Natural Philosophy, second edition—Our Eyes, and How to Take Care of Them, by Dr. H. W. Williams—A Manual of the Laws affecting Medical Men, by Robert George Glenn, L.L.B.—The Articles and Preparations of the British Pharmacopœia, pointed according to their Relative Values, by Dr. A. Harvey and Dr. D. Davidson—The West Riding Lunatic Asylum Medical Reports, vol. i., edited by Dr. J. Crichton Browne—Professional Grievances, by Dr. W. Ogle.

PERIODICALS AND NEWSPAPERS RECEIVED—

Nature—Pharmaceutical Journal—Mechanics' Magazine—Western Daily News—The Buxton Advertiser—The West Country Lantern—Food Journal, August—Dublin Quarterly Journal of the Medical Sciences—Australia Medical Gazette—The Times of India—American Journal of Insanity, July—Medical Press and Circular.

APPOINTMENTS FOR THE WEEK.

August 19. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 9½ a.m.; King's, 2 p.m.; Charing-cross, 2 p.m.; Royal Free, 2 p.m.; Hospital for Women, 9½ a.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

21. Monday.

Operations at the Metropolitan Free Hospital, 2 p.m.; St. Mark's Hospital for Diseases of the Rectum, 2 p.m.; St. Peter's Hospital for Stone, 2½ p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

22. Tuesday.

Operations at Guy's, 1½ p.m.; Westminster, 2 p.m.; National Orthopædic, Great Portland-street, 2 p.m.; Royal Free, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

23. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1½ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew's, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas's, 1½ p.m.; Samaritan, 2.30 p.m.; King's College Hospital (by Mr. Wood), 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

24. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; Royal Orthopædic, 2 p.m.; West London, 2 p.m.; University College Hospital, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

25. Friday.

Operations at Central London Ophthalmic, 2 p.m.; Royal London Ophthalmic, 11 a.m.; South London Ophthalmic, 2 p.m.; Royal Westminster Ophthalmic, 1½ p.m.

VITAL STATISTICS OF LONDON.

Week ending Saturday, August 12, 1871.

BIRTHS.

Births of Boys, 1055; Girls, 1002; Total, 2057.

Average of 10 corresponding weeks, 1861-70, 1966.8.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	805	763	1568
Average of the ten years 1861-70	756.8	719.7	1476.5
Average corrected to increased population	1624
Deaths of people above 90

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1871.	Small-pox.	Measles.	Scarlet Fever.	Diphtheria.	Whooping-cough.	Typhus.	Enteric (or Typhoid) Fever.	Simple continued Fever.	Diarrhoea.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.978 in.
Mean temperature	68.3°
Highest point of thermometer	88.2°
Lowest point of thermometer	51.9°
Mean dew-point temperature	57.0°
General direction of wind	E. & N.E.
Whole amount of rain in the week	0.00 in.

BIRTHS and DEATHS Registered and METEOROLOGY during the Week ending Saturday, August 12, 1871, in the following large Towns:—

Boroughs, etc. (Municipal boundaries for all except London.)	Estimated Population to middle of the year 1871.*	Persons to an Acre. (1871.)	Births Registered during the week ending Aug. 12.	Deaths Registered during the week ending Aug. 12.	Temperature of Air (Fahr.)			Temp. of Air (Cent.)	Rain Fall.	
					Highest during the Week.	Lowest during the Week.	Weekly Mean of Mean Daily Values.		In Inches.	In Centimetres.
London	3263872	41.8	2057	1568	88.2	51.9	68.3	20.17	0.00	0.00

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29.98 in. The highest was 30.89 in. at 9 p.m. on Sunday, and the lowest was 29.88 in. at the end of the week.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871. As the population of Dublin and its suburbs showed a decline between the Censuses of 1861 and 1871, the enumerated number in April last has been inserted above for that city, the population being assumed to be now stationary.

ORIGINAL LECTURES.

LECTURE ON OPTIC NEURITIS FROM
INTRACRANIAL DISEASE.(a)

DELIVERED AT THE LONDON HOSPITAL.

By J. HUGHLINGS-JACKSON, M.D., F.R.C.P.,

Physician to the London Hospital and to the Hospital for the Epileptic and Paralysed.

1. *The Value of the Ophthalmoscope in Diagnosis.*—The Physician is as much indebted to Helmholtz as the Ophthalmic Surgeon is. You cannot investigate cases of cerebral disease methodically unless you use the ophthalmoscope. It will not pass nowadays to say that a patient is amaurotic. The amaurosis may depend on most different causes. In a former lecture (published in the London Hospital Reports, vol. iii.) on cases of Cerebral Hæmorrhage, I have given illustrations of the value of the ophthalmoscope in helping us to observe the width of tissue-changes in cases of Bright's disease. One of the cases there reported is important as showing you how a blunder may arise if we do not use the ophthalmoscope. A patient was hemiplegic of the left side, and afterwards became blind. We saw post-mortem disease—remains of blood-clot—in the right *optic* thalamus. Now, we might have supposed that disease of the thalamus *opticus* had caused the amaurosis, but the ophthalmoscope had shown us the intraocular changes which occasionally occur with Bright's disease. The loss of sight had nothing to do with the lesion of the thalamus. Then, in some cases we “see syphilis,” so to speak, in the fundus oculi. In the first volume of our Reports I have recorded the cases of three children, each of whom had choroiditis from congenital syphilis; one of the three was hemiplegic, another paraplegic and idiotic. The inference was warrantable—for treatment, at all events—that in the hemiplegic and paraplegic child there had been changes in the pia mater analogous to those we saw in the fundus oculi. In some cases of tubercular meningitis tubercular disease of the choroid is seen during life. As the diagnosis of no acute cerebral disease—in adults, at least—is so difficult as that of tubercular meningitis, this is a most important point in doubtful cases; and most cases are doubtful. A patient who has valvular disease of the heart may become suddenly amaurotic of one eye, and we may then see something of the embolic process as it affects the vessels and other elements of a nerve-termination. These are but crude hints of the value of the ophthalmoscope as an aid to investigation. I refer you to most valuable papers by Dr. Clifford Allbutt (*Medical Times and Gazette*, 1868), or, better still, to his forthcoming book on Medical Ophthalmoscopy, for a knowledge of the great importance of the ophthalmoscope in the investigation of Medical cases.

2. *Morbid Ophthalmoscopic Signs rarely absent in Amaurosis from Cerebral Disease.*—There nearly always are abnormal ophthalmoscopic appearances when amaurosis, excluding temporary loss of sight (See No. 7), attends cerebral disease. I mention this as it is sometimes taken for granted that because sight fails from *intracranial disease* there will be no abnormal ophthalmoscopic appearances. One hears it said, “The changes are in the head, not in the eye.” It matters not how amaurosis is caused, there are, with rare exceptions, changes to be seen in the fundus. In Physicians' practice we mostly see double optic neuritis, or its sequel, optic atrophy. In a few—a very few—cases of amaurosis there are no morbid ophthalmoscopic appearances. In the few cases of hemiopia I have seen there have been none. In one of these cases total blindness followed, and then the discs showed signs of simple atrophy.

In no case can you say with certainty that there are absolutely no abnormal ophthalmoscopic signs unless you have examined the eyes by the direct method.

3. *Optic Neuritis the commonest Ophthalmoscopic Condition in Cases of Cerebral Disease—Optic Neuritis as important in the Diagnosis of Cerebral Disease as Hemiplegia.*—I wish to speak in

(a) This lecture was delivered several years ago, and, with modifications, again in June last, in reference to particular cases of cerebral disease. As since 1863 I have published numerous papers on Medical Ophthalmoscopy (Royal London Ophthalmic Hospital Reports), this lecture necessarily involves considerable recapitulation; but there is no impropriety in reproducing in a condensed form the facts stated in former papers, and the opinions therein expressed, now partly modified.

this lecture of the commonest abnormal ophthalmoscopic appearances which occur in *Medical practice*—of optic neuritis and its usual sequel, optic atrophy. We often see a pathological condition of the end of an important cranial nerve where it breaks up into an elaborate nerve-termination as plainly as we see pathological conditions of the skin. Observe, I say a “pathological condition”; for optic neuritis is not a symptom, or, at all events, it is not a symptom in the same sense that hemiplegia or convulsion is. In a case of optic neuritis with convulsion, the proper comparison is of *amaurosis* with convulsion and of *optic neuritis* with the pathological condition of *grey matter*, on discharge of which the convulsion depends. We shall see (No. 5) that the pathological condition, optic neuritis, is sometimes unattended by the symptom amaurosis.

The great object I have in view is to show you *how* optic neuritis is of value in diagnosis. I think I do not exaggerate in saying that it is of as great value in diagnosis as hemiplegia; but its value is of a totally different kind. Hemiplegia points to the *position*(b) of intracranial disease; double optic neuritis does not point to the position of intracranial disease, but is most important evidence as to its *nature* (See No. 9).

4. *The Stages of Optic Neuritis.*—I now tell you what you see in cases of optic neuritis at different stages. In the sense that there are abrupt differences, there are no stages; there are gradual changes from the beginning of the process through its ascent to a climax of acute change, and in its descent to the permanent change—atrophy. Nevertheless, although the changes are gradual, the appearances are strikingly different at different times, and most unlike at the two extremes—the height of acute change and permanent atrophy. We will make four stages. You will have gathered from what I have just said that this division into four is arbitrary. I used to make two stages only. It is, I think, convenient to make four, for learners, at all events. The following is an account of what is seen at different stages of a severe case. I use the expression “severe” advisedly, as cases vary so much in degree and progress that I do not pretend to be able to describe “typical” cases. Particularly observe that cases do not always run through these stages. There may be retrocession from either the first or the second stage, and *not* a progress to atrophy. I speak of what you may see by the indirect method of examination:—

(a) *The Onset.*—The disc is redder (and more coarsely red), slightly swollen, and therefore prominent. Its edge is indistinct, and the arteries are slightly obscured from the swelling. The veins are large, dark, and tortuous.

There are two sources of difficulty here:—

1st. You must not mistake a physiological peculiarity for a pathological condition. For this reason I have given as the stage of onset an account of appearances of neuritis decidedly begun, one about which, I think, no mistake could easily be made. You may say that the existence of defect of sight will help you to determine whether what you see is an individual peculiarity or a morbid change; but the defect of sight may be owing to a fault of accommodation. Besides (see No. 5), there may be no defect of sight when there are extreme ophthalmoscopic changes. This matter is one too important for me to handle here. I must refer you to works on ophthalmic Surgery, and particularly to Liebreich's Atlas (Swanzy's translation). (See, also, remarks by him, Clinical Society, October 28, 1870, *Lancet* report, November 5, 1870.)

2nd. The condition may be the early stage of the swollen disc (Stauungspapille of Graefe). I think in the swollen disc the swelling more rapidly develops, and smooths off more gradually into the fundus, and that the surface is more uniform and glistening. I confess that this attempt to show the difference in the two things is of little value, and that I often cannot tell by the ophthalmoscopic appearances whether there is optic neuritis or the swollen disc.(c) That there are two different things clinically I have no doubt; and although it is reasoning in a circle, I may say that you can sometimes infer by clinical

(b) It is not meant that the *mode of onset* of hemiplegia is of no value in the diagnosis of the nature of the lesion. What is meant is, that the *range* of the paralysis, when developed, is no evidence of the nature of the lesion. Yet it must be admitted that when hemiplegia is very extensive in range—when there is lateral deviation of the two eyes and of the head, as well as palsy of the face, arm, and leg—the diagnosis of a *sudden* lesion, and, therefore, inferentially of embolism or clot, is much assisted.

(c) Liebreich, after speaking of the elements in the diagnosis of the several forms of neuritis (engorged papilla, neuritis descendens, and neuritis intra-ocularis), says:—“Unfortunately, however, such perfect transitions exist that in but a *small* number of these cases is the certain arrangement of the morbid condition in its *proper class possible*.” (No italics in original.) See also the papers of Clifford Allbutt on what he names “Ischaemia of the Disc.”

evidence whether what you see is neuritis or the swollen disc. I shall have more to say on this point later on.

The changes of this stage may gradually disappear. There is frequently, if not mostly, no defect of sight in this stage.

(b) *Second Stage*.—In this condition the disc is quite lost in a patch, which is about two or three times the diameter of the normal disc. The arteries are not traceable, or only faintly here and there, in the patch, which from great swelling is much raised above the neighbouring fundus. The veins are very large and tortuous, and are more or less obscured in the patch, and seem to “knuckle” over its edge. There are scattered blotches of effused blood on and beyond the patch, especially near its margin. There are often, also, near the edge, small shapeless white patches, sometimes edged with blood. Occasionally there are, especially near the macula lutea, brilliant white spots, quite like those sometimes seen in cases of Bright’s disease. (d)

It is of very great importance to recognise that the appearances of this stage may clear away, the discs resuming a nearly healthy aspect. As, however, it is by no means easy to declare that a disc is absolutely healthy—since the physiological differences are very great—it is best to say that after stage *b* the abnormal ophthalmoscopic appearances remaining may be so slight that a critical examination by the direct method is necessary for their detection.

(c) *Third Stage*.—The descent to atrophy begins. The blood has cleared away. We again see something like a disc, but there is much swelling, and the edge of the so-called disc merges into the fundus. We trace the arteries again, but they are still partly obscured, and the veins are tortuous.

This third stage may be taken for the first stage. I believe it is the stage which is usually first seen by those who do not look into the eyes until sight fails. It is sometimes called the swollen disc.

(d) *Fourth Stage*.—The stage of permanent atrophy. The disc is now white; its margin is distinct, but not so clearly defined as in health, and the vessels are traceable, the swelling having disappeared.

But there are two kinds of optic atrophy. If, then, we see an atrophic disc, not having any account of the earlier conditions, we have to determine whether the atrophy really is consecutive to inflammation, or whether there has been slow atrophy from the first, without inflammation. Observe: atrophy may be the result not only of the quasi-simple neuritis I have described, but of syphilitic or albuminuric neuro-retinitis. Liebreich says:—“If the atrophy be complete it is of course impossible to decide by which of the different forms of neuritis it has been produced. The only question, then, is to discern that the atrophy is consecutive upon a neuritis—that is to say, to distinguish it from other forms of atrophy. For this purpose the ophthalmoscopic appearances supply us almost always with sufficiently well-marked signs.”

The atrophy which begins by a non-inflammatory process has quite a different clinical significance from that following neuritis. It may be called spinal, because it is the form of atrophy which sometimes occurs with—I do not say, occurs from—a certain spinal affection: locomotor ataxy. It may be called more simply a progressive atrophy, because it is an atrophic change from the beginning, and progresses slowly.

In the atrophy after optic neuritis the edge of the disc is not distinct; the whiteness is a more opaque whiteness; the lamina cribrosa (e) is not well seen, from remains of effusion; the arteries are thin, and the veins remain irregular, and we occasionally see very small whitish patches, extending over the boundary of the disc on to the neighbouring fundus.

As to the simple or spinal atrophy, I quote what Liebreich says of “an atrophic, slightly excavated papilla, taken from a man aged 40, suffering from locomotor ataxy and completely blind. The bluish-grey colour, and great disturbance of the lamina cribrosa, and of the nerve-boundaries, combined with the repletion of the vessels, especially of the veins, which,

(d) Hutchinson (Royal London Ophthalmic Hospital Reports, vol. v., p. 308), in some cases of optic atrophy in children, no doubt the sequel of neuritis, has seen at the yellow-spot region groups of highly refractive globules, resembling at first glance clusters of spiders’ eggs. Dr. Herm. Schmidt and Dr. Wegner (*Archiv. f. Ophth.*, Bd. xv., Abth. iii., s. 253–275) report a case of cerebral tumour in which the ophthalmoscopic signs were quite like those in a case of kidney disease. (See Dr. Noyes’s report on “Ophthalmology,” *New York Medical Journal*, February, 1871, p. 210.) This report contains many particulars of great interest to Physicians as well as to Ophthalmic Surgeons.

(e) Liebreich says (“Atlas,” p. 26) that the veiling of the lamina cribrosa is of the greatest possible importance for the differential diagnosis of the various forms of atrophy, and that it has not yet been appreciated as it ought to be.

although thinner than in the normal eye, are considerably larger than in other cases of atrophy, all these appearances, although not characteristic of spinal amaurosis, seem to me to occur most frequently in such cases.”—“Atlas,” p. 26.

5. *No Defect of Sight in some Cases of Neuritis*. In all cases of cerebral disease the ophthalmoscope should be used, whether the patient has defect of sight or not. For it is quite certain that there may be extensive changes of neuritis; those even of Stage *b*, for instance, when the patient does not know that there is anything the matter with his sight, and when he can read the very smallest of our test-types. The early stages of optic neuritis (*a* and even *b*) are, I believe, not unfrequently overlooked by those who do not use the ophthalmoscope until sight begins to fail. Thus a much later stage (*c*) may be taken for the first stage of the neuritic process. Indeed, optic neuritis may be altogether overlooked by those who do not use the ophthalmoscope by routine in cerebral cases, as the neuritis may retrocede from the second stage (*b*)—(*vide supra*)—in which stage, as above remarked, there may be no defect of sight. And when there is failure of sight it is often quite out of proportion to the abnormal ophthalmoscopic appearances, or, more correctly, to what we should theoretically infer from the degree of these appearances. This is so, also, of syphilitic and albuminuric neuro-retinitis, even when in the latter there are hæmorrhages. Hence, in cases of cerebral disease you use the ophthalmoscope as a matter of course, just as you examine the urine as a matter of course. If you do not, you will often overlook a very striking pathological condition. At all events, you must never omit to use this instrument when the patient has severe headache. [I have spoken of conservation of sight in neuritis so many times that I will here say nothing further. It was first, I believe, pointed out by Blessig. (See Royal London Ophthalmic Hospital Reports, 1865; *Medical Times and Gazette*, February 8, 1868, and June 3, 1871); in the last paper I give the opinions of Ophthalmic Surgeons.]

6. *Optic Neuritis almost invariably Double*.—As the title of this lecture implies, I speak of cases occurring in Physicians’ practice. But it is a rare thing to see unocular optic neuritis, I believe, even in ophthalmic (f) practice; but it unquestionably occurs. I have seen it also in a case where the symptoms seemed plainly to indicate intracranial tumour. I have seen it of the right eye in a patient who had, as the autopsy showed, gliomatous tumour of the left cerebral hemisphere; (g) but, I repeat, it is very rare indeed for Physicians to see an unocular optic neuritis—in other words, it is rare in cases where there are special nervous symptoms such as convulsions and hemiplegia. One eye may suffer more than the other, but nearly always both suffer somewhat; nearly always at the same time; and they are nearly always in the same stage.

We are not to be satisfied with what the patient says of the sight of each eye. This is seemingly an absurdly unnecessary remark; but it is well to make it, as I have known instances of error resulting from investigators merely writing down in notes of cases what the patients say of their sight. A patient may say that he has lost the sight of but one eye, when the sight of the other also is very much impaired. We should test both eyes by reading, and use the ophthalmoscope. I have known a patient say that he only had defect of sight of one eye, and yet with the “good” eye he could read but very large print, and the optic disc of this eye showed marked atrophic changes. His account was received as correct by several observers; therefore, I may mention that Dr. Hermann Pagenstecher, who saw the patient, agreed with me that there was marked atrophy of each optic disc. This patient misled more than one investigator into the belief that disease of the *right* hemisphere, which he evidently had, had caused loss of sight of the *left* eye only. (His case is recorded in a paper on Convulsions, *St. Andrews Reports*, vol. iii.)

7. *Paroxysmal Failures of Sight in Optic Neuritis*.—Although sight may be good in acute neuritis, it may fail occasionally for a minute or two, and the degree of failure varies from a little dimness to total darkness; the last is rare. More frequently, however, temporary failure of sight occurs in patients whose fundus presents no abnormal appearances. These cases must be considered here, as neuritis may supervene. The temporary defect may possibly be owing to failure of accommodation, or

(f) See cases by Brudenell Carter, *Lancet*, November 5, 1870.

(g) This case, of which the life history was taken by myself and Mr. G. Ernest Herman, will be published in the next number of the *Roy. Lond. Ophth. Hosp. Reports*, as part of a paper by Dr. Hermann Pagenstecher, of Wiesbaden, together with an account of a microscopical examination of the eyes by that distinguished ophthalmologist. Dr. Pagenstecher saw the patient during life.

possibly to irregular action of the external ocular muscles. When there is total darkness it cannot be thus caused. I used to call cases of temporary failure of sight Epilepsy of the Retinæ; but, since I cannot know that the retina is really the part at fault, I now use the term Epileptiform Amaurosis. I do not speak of temporary alteration of vision caused by stooping or by getting up suddenly. I read you a case which I recorded (Royal London Ophthalmic Hospital Reports, 1863):—One morning, Julia W., a middle-aged woman, came to me, saying that for five whole minutes she had been "blind." She was at the time seated peeling potatoes. The blindness came on suddenly and left suddenly. It was not total darkness, but "dark," which was the word she used herself in describing it. It was not from failure of accommodation. I asked her to look through a very strong convex glass. It was not like that, she said. It was not spots, nor specks, nor clouds, nor colours. When I saw her a minute afterwards, she could read well with each eye, and the fundus of each, as seen by the ophthalmoscope, was normal. She had headache across the forehead, which continued the next day. She said it felt "tight" across the forehead. She had no giddiness. She was regular, but subject to dyspepsia.

I do not know what importance is to be attached to these temporary losses of sight when the appearances in the fundus are normal, and when there are no other nervous symptoms. The patient whose case I have related kept well for about two years, when I lost sight of her. I think we can attach little evil importance to them if the patient suffers no severe pain in the head and has no other nervous symptom. If there be severe and continued pain in the head, and especially if there be purposeless vomiting, the future onset of double optic neuritis is to be feared. Again, if the patient have any other local nervous symptom, the onset of neuritis is to be feared.

The most interesting association of paroxysmal failure of sight is with convulsions *beginning unilaterally*. In a few of these cases there is defect of sight about the time when the spasm begins in the hand, face, or leg, and there may be either simple failure of sight or there may be coloured vision. In these cases the onset of neuritis is to be feared, especially if there be severe pain in the head. I have recorded two cases of this kind (*Medical Times and Gazette*, June 6, 1863), but I was unable to hear what became of the patients. A patient, whom I still frequently see, consulted me in 1862, because he had had a fit which began in his left cheek. At the same time his eyes "became dim and sparkled." He became insensible. After this visit he ceased to attend, but some months after I sought him out, and then found that he was blind of the left eye, and partially of the right, from the effects of optic neuritis. He had left hemiplegia also. He subsequently had seizures in which spasm attacked the face or hand on the left, and in which he had "sparkling" before his eyes (Royal London Ophthalmic Hospital Reports, vol. v. part 4, p. 293). So we see that temporary loss or disorder of vision may precede optic neuritis, may occur with optic neuritis before sight is affected, or may occur when the optic neuritis has much damaged sight.

(To be continued.)

ORIGINAL COMMUNICATIONS.

CASE OF CEREBRAL RHEUMATISM TREATED BY COLD BATH.

By W. MOXON, M.D., F.R.C.P.

In the following case, after other measures had failed, cold immersion was tried as a last resource to endeavour to bring down the temperature in a case of cerebral rheumatism. Success, such as it was—and it was painfully far from being complete—gives a certain encouragement to the use of this means in practice.

R. B. H., aged 23, a policeman, was admitted to Guy's Hospital, under Dr. Moxon's care, November 27, 1870. He was a strong-looking young man, with dark hair and eyes; he had always enjoyed good health, and lived well. This was his first attack. Three days before admission he awoke in the morning and found his ankles swollen a little; he kept about that day in pain. The next day his knees also were swollen and painful; still he could walk, though in much pain. He then had a sleepless night, and on the following morning was quite helpless; his hips sharing now in the trouble, and his hands being affected. He was then admitted, and offered the

usual appearance of a case of acute rheumatism of medium severity. The joints very painful; the skin covered with slightly acid perspiration; the urine loaded with lithates; the appetite lost; his pulse was 119, full, regular, and compressible; the first sound of the heart was weak and short, otherwise the state of the chest was healthy and its movements free; axillary temperature 101°.

He was at once put under a treatment by alkalies; a scruple of pot. acet. and a scruple of pot. carb. given eff. rvescing with citric acid every four hours, until the urine should become alkaline. This happened within twenty-four hours, and then the doses were reduced to half the quantity, which sufficed to keep up the alkaline state. The sweat at the same time became neutral. Ten grains of Dover's powder were given at night, and a rhubarb purge was twice given on account of obstinate constipation. The temperature fell a little the next day (to 100°), but other joints had been attacked. The next day it rose to 102°, and he was plaintive, sleepless, without appetite, tongue covered with a brownish fur, the heart's sounds free from murmur, but the first sound nearly inaudible; sweats profuse. The next day he was no better; the sweat had again an acid reaction. The tenderness of the knee-joints was chiefly seated over the internal lateral ligament, where it was exquisite, while other parts of the joint bore handling pretty well. The temperature was 100.4°; the first sound of the heart very indistinct. The pulse then gradually came down to 86, and reached 74 by December 8, the temperature in the meantime rising to 103°, and the respiration numbering 38. The diaphragm was now kept quiet in breathing, and some pain suffered on deep inspiration. As yet, however, no further abnormal sound was heard in the chest. For the next four days his pulse was between 70 and 80, and the temperature varied from 104° to 101°.

On the 13th a sudaminous rash appeared over the trunk, and a rub was heard over the heart's surface synchronous with its action, but only during inspiration, and only over the heart on its left side. He was too ill to be raised in bed. Although his whole condition was worse than ever, he now said he was much better and free from pain; but his eyes glistened with a singular appearance, and his manner was excited. In the night he was delirious, and the next morning his temperature was 105°, pulse 102, respiration 32; perspiration and urine were acid in reaction.

The next day the temperature was 106°, pulse 104, and he was quite delirious. A slight systolic rub was to be heard over the heart, but only on inspiration, so that the probability of pleurisy outside the pericardium was inferred. A grain of antimony was given every quarter of an hour until four grains were given, but the temperature rather rose than fell.

The condition of the patient was now very threatening. Muttering delirium, carphosis, and intense heat showed that he would soon be sinking. He was then taken from his bed and put into a cold bath, the temperature of which was 64°. The water was about twelve inches and a half deep in the bath, and its temperature rose during the immersion from 64° to 68°, whilst the patient's temperature fell from 106.2° to 98°. When in the bath water was poured over his head to prevent cerebral congestion, if it be so caused. On removal from the bath he was put to bed, and rubbed dry and wrapped in woollen blankets. He was quite conscious all the time he was in the bath, and continued so for a quarter of an hour afterwards, but his delirium and carphology then returned gradually, and his temperature rose slowly and gradually, reaching, at five o'clock in the morning, 105°; the patient very delirious. Dr. De Liefde, the House-Physician (who carried out my wishes with his usual ability and firmness), then gave brandy up to three ounces in the course of three hours, but without any benefit. At half-past nine the next morning Dr. De Liefde saw him, and thus described his condition:—"He was very delirious, caught hold of the bedclothes, the curtains, or my coat and hands. The pulse was 172 per minute, as far as I could ascertain, but full; his face looked congested; he mumbled with his lips, and his skin was of an arid heat; the temperature of axilla 108°. Considering that, in my opinion, he was materially benefited by the former bath, which, I believe, had already prolonged his life, I determined to follow out the instructions of Dr. Moxon, and immersed him again. He looked very blue in the face and was very delirious, so I did not keep him in longer than four minutes, and, on removal, had him rubbed again by the nurses. His condition was not much changed by the second bath; he remained blue; temperature 103.2°; pulse 152; and continued to be delirious. On my return to the ward after an absence of half an hour, he had died ten minutes ago."

The foregoing case may prove interesting to those who have

joined in the disposition to attempt the reduction of extreme pyrexia by direct application of cold water. I was led to employ the cold bath through the belief that patients in cerebral rheumatism with intense fever die of the heat immediately—indeed, are in a way seethed to death in their own fluids. As to the partial success obtained, it should be noted that it is by no means a usual thing for patients in cerebral rheumatism, when delirium has once set in, to be brought out of it by any remedial means. In one case when the temperature was 109° I ordered the patient to be bled, and he died during the operation. To another patient, whose temperature was 104.5° , and whose manner was becoming excited, I had brandy administered in one-ounce doses frequently repeated; but the temperature rather rose than fell, and although the patient recovered afterwards while taking quinine, yet the benefit by no means distinctly followed the use of that drug.

The history of the present case shows, on the other hand, an immediate decided and great relief from the use of the cold bath, all the active symptoms disappearing with the fall in temperature. It is true this benefit was only temporary, but so was the remedy; and though when the remedy was repeated a less effect was got, yet it will be seen that the patient was then so far gone that the House-Physician did not think it safe to reduce his temperature below 103.5° , itself a temperature of high fever with delirium. The use of cold suddenly to such an extent was determined on in this case partly on account of the urgency of the case, and partly because it seemed to me desirable to get the effect of it decidedly, so that as little doubt of its efficacy as possible should remain in the minds of those who saw the trial. But it is probable that an equally good effect would be more surely and safely got by cold sponging or continuous cool bath. Cold sponging in high fever has, I believe, fallen out of use very undeservedly. Several cases of threateningly high temperature (107° to 109°) have been recently treated at Guy's under the supervision of our able House-Physician, Dr. Douglas; and he, watching the immediate result with a care I know well I can rely on, is satisfied of the great benefit its effects at the time of its application; while I can confirm the belief in its efficacy from my observation, though that has been usually less immediately at the time. As we know that such a temperature as we were dealing with actually causes the white blood-corpuscles to cease their movements and contract closely, while at 113° some elements of the blood begin to coagulate, it is certainly necessary to prevent the temperature reaching these heights by all possible means, and we do possess entirely efficient means. It is our fault if the patient dies of being too hot.

SPECIFIC ULCERS ON THE LOWER EXTREMITIES.

By C. HOLTHOUSE, F.R.C.S.

AMONG the many anomalies, or apparent anomalies, in connexion with the subject of syphilis must be reckoned the occurrence of certain ulcers on the lower extremities, having specific characters and yielding only to specific treatment, yet occurring in persons who are otherwise perfectly healthy, and in whom there is no antecedent or hereditary syphilitic history. "It is not very rare," observes Dr. Paget, "to find patients who have continued for ten or more years subject to these ulcers, but to no other form of syphilis." (a) I have met with several such cases, and the following may be regarded as a typical one.

M. F., aged 29, a healthy, fresh-coloured, good-looking young woman, well-grown, with a remarkably fine set of white even teeth, free from any traces of struma or syphilis, and with no history of syphilis, either hereditary or acquired, was admitted into the Westminster Hospital under my care on June 7, 1870, with a large oval patch of diseased and ulcerated skin on the upper and front part of the left leg, and partly surrounding it. The patch measured eight inches and three-quarters by four inches and a half, reaching as high as the lower half of the patella, and four inches and a half below this, which was its short axis. It was of a livid red colour, thickened, and raised above the surrounding healthy skin, and its surface uneven from tuberculous-looking elevations and numerous small ulcers, roundish in form, from the size of a florin to a pin's head, in various stages of spreading and healing; the first sloughing, the second granulating.

History.—Had been under my care three years before for a

similar ulceration in the same site. Although one of the ulcers was larger and deeper than any of the existing ones, and had been preceded by a "lump," which appeared without obvious cause, it healed perfectly under the use of iodide of potash, and she left the Hospital well in February. In the following June, when the cicatricial skin had nearly returned to its natural colour, the patient struck her leg against the bedstead, and slightly grazed the new skin. This was followed by inflammation of the part, and small vesicles formed, which broke, and left ulcers; some of these healed, while fresh ones formed, and this has been going on for the last two years, in spite of treatment by various Medical men, and a residence of several weeks at the seaside. Finding no improvement, she left her situation, and went home to her parents in Derbyshire, where she has been attended by their own Doctor for the last six months, taking all this time cod-liver oil and steel wine, and applying a lotion of nitrate of silver to the sores. As this treatment proved of no avail, she determined on coming up to London, and again placing herself under my care. She was at once ordered five grains of iodide of potash three times a day, and black wash to the ulcers, while the students were specially invited to watch the results.

On July 13 the note is—"All the sores have healed, but the skin is of a leaden colour, tuberculated, slightly warty, and with numerous bridles or tongues running obliquely downwards and slightly inwards. The cicatrix has more of a strumous than a syphilitic character."

It ought to have been stated that this patient has ten brothers and sisters, all remarkably healthy and fine-grown, she being the eldest but one. Her father and mother are also both living, and very hearty.

ON A MODE OF FORMATION OF URINARY CALCULI AND THEIR SPONTANEOUS PASSAGE THROUGH THE URETHRA.

By BERNARD KRAUS, M.D.

IN our number for June 3, page 629, we inserted a paper by Dr. Kraus bearing the above title, and he has since published in the *Allgemeine Medicinische Zeitung*, of which he is the editor, an account of an examination that he has made of the calculi and of the urine in two of the cases in question. This was performed immediately after the calculi, expelled during a strong flow of urine, had been received in a glass vessel prepared for the purpose. These analyses, Dr. Kraus observes, confirm in the most decided manner all his published observations relating to the peculiar form of catarrh of the bladder combined with the phosphatic diathesis first described by himself, the condition of the bladder during this affection, as also of the nature of the catarrhal product and of the sediment prior to its formation into conerctions.

In the first case, the small stone weighed fifty-four milligrammes, was of a pure white colour, and consisted almost entirely of phosphates, there being only slight traces of carbonate of lime, and none whatever of urates or oxalates. The second calculus, weighing more than forty milligrammes, was externally covered with blood, owing to bleeding of the urethra having been caused by its passage. After it was washed, it was also of a milk-white colour, and entirely resembled the other in its composition. In both cases the urine also furnished entirely similar results. Immediately after being passed it was of a reddish-yellow colour, and turbid, the upper portion becoming clear after standing a few minutes, while the lower became more turbid. Its specific weight was 1020. Immediately after being passed it was slightly alkaline throughout; but after some minutes it was amphigenous in its upper strata, and alkaline in the lower. At the end of an hour it was acid in the upper and alkaline in the lower strata. Of abnormal matters, there were only traces of albumen, phosphate of lime in lumps, and a very small amount of carbonate of ammonia. A purulent mucus was at once deposited, which under the microscope could not be distinguished from pus. The triple phosphates were from the commencement swimming throughout all the strata of the urine, giving it the appearance of coagulated milk; and in ten or fifteen minutes they had collected together at the bottom of the vessel. There were large masses of bladder-epithelium, and phosphate of lime was in abundance; but there was no trace of epithelium of the kidneys or of the passages. Uric acid was diminished, while urophæsin,

(a) "Holmes's Surgery," second edition, vol. i., p. 192.

uroxantin, urea, the chlorides and sulphates exhibited no difference to normal urine.

A portion of this urine having been allowed to dry in the sun, small concretions were soon formed from the phosphate of lime and triple phosphates, which entirely resembled the composition of the calculi above described. Rubbing them between the fingers gave a sensation like that from sand, and the beautiful triple-phosphate crystals shone in the sun like diamonds. The conglomeration of the sediment also took place when the urine was rapidly cooled.

"These very interesting chemical results of the examination of the calculi and the urine, in which the former, so to say, exist in a nascent state, throw life upon the condition which I have described as a peculiar catarrhal affection of the bladder dependent on the phosphatic diathesis, and confirm the correctness of my symptomatic and diagnostic indications. It is thus made evident that there is a form of catarrh of the bladder in which the triple phosphate and phosphate of lime play the chief part by depositing in masses, and that these crystals can be immediately produced in the bladder itself, since the kidneys are entirely unconcerned in the process, inasmuch as epithelium, neither of the kidneys or the passages, has been found in the sediment. It has been, moreover, shown that this form of calculous formation is entirely free of urates or oxalates, no other constituents than the phosphate of lime and triple phosphate being present. It is demonstrated by this examination of the urine that only very small portions of the phosphate and triple phosphate are concreted, inasmuch as the calculi are expelled from the bladder amidst a mass of similarly formed sediment. It is possible that the concretion may take place in the urethra itself, as it is otherwise not explicable why the mass should not form into large calculi in the bladder.

"In calculi of other forms of composition, and especially the oxalate, the urine does not contain similar salts, as is observed with regard to these phosphatic calculi. Almost every atom of the oxalate is utilised for the formation of the calculus, while in this formation there is contained dissolved in the urine as much lime as would equal in weight that which has been expelled. It is, moreover, evident that these calculi are solitary, as by means of the catheter we are able to convince ourselves that beyond the small stone expelled no other concrement exists in the bladder, and that several of these concretions do not take place at the same time. The most careful examination made by the most practised hand is unable, after the removal of the small calculus, to find any other in the bladder; and this seems to favour the view that this kind of calculus may be first formed within the urethra itself—apparently in its prostatic portion.

"As a further result of the foregoing examination of the urine is the confirmation of my assertion, that this description of concretion takes place within the body when there is a deficiency of water, and when the urine is wanting in sufficient warmth to hold the phosphates in solution or suspension. I have often witnessed after colds the sudden production of the febrile action which I have already described as characterising the period of formation of the calculus. The purulent mucus, and pus in its most decided form, which, besides the sediments, occur in such large quantities in the urine in this form of disease of the bladder, and which in former communications I have in part appreciated, were also found on the examination of the urine in the present cases. Again, this offers a proof that the pus cannot exert the deleterious effect attributed to it by the earlier clinical observers; for these patients who furnished the calculi and the urine for examination had been passing purulent mucus for years, and yet, except when threatened with obstruction of the urine by the calculi, enjoyed the best health."

ON RHEUMATISM.

ITS NATURAL AFFINITIES.

By J. JAMES RIDGE, B.A., B.Sc., B.S., M.D. Lond.

(Continued from page 215.)

In the last paper on this subject I stated my belief that the most obvious way of obtaining a knowledge of the correct pathology of rheumatism is to study its natural affinities. By these I mean—first, diseases which are excited by causes similar to those occasioning rheumatism, and which may be excited simultaneously, or may alternate with it, or exist altogether separately from it; and, second, more remote diseases which are consistent with rheumatic symptoms, and often associated with them.

I.—DISEASES EXCITED BY THE SAME CAUSE AS RHEUMATISM.

The diseases I shall chiefly mention under this head are those in which the cause is obvious, and the most obvious cause is cold, generally associated with damp. I do not now discuss the question whether this is the only exciting cause of rheumatism, nor whether there must necessarily be a predisposing cause. I believe predisposition generally exists, and, on the other hand, also, that there may be repellant influences which obviate the effect of cold in some cases. I will not discuss the question, either, whether the predisposing cause is a morbid poison in the blood. I wish to point out the effect which "cold" has in producing morbid action, which, as far as we can possibly know, would not have occurred without that cause; also, the relations which exist between these diseases and the disease called "rheumatism."

The diseases rightly or wrongly attributed to cold are legion. Let us take a few:—

a. *Herpes and Impetigo*.—We see these shading into one another by insensible degrees, and not always according to the intensity of the cause. The character of the eruption, whether more pustular or fibrinous, varies obviously to a greater extent with the state of health of the individual. Herpes is a very common attendant upon catarrh. It occasionally happens that symptoms of great fever, attended with wandering pains, will occur, generally after some exposure to cold or damp; and we may be unable to say whether an attack of acute rheumatism is impending, or what the disease is. Shortly, however, we see a crop of herpetic vesicles appear, generally about the mouth in adults, or face and body too, in children. Together with this we may have mucous inflammation of the nasal and other similar membranes, or such may be quite absent. Less frequently, perhaps, but certainly sometimes, we see serous inflammation of the joints—in fact, acute rheumatism—with this eruption of herpes in full bloom, and running its course simultaneously. It seems to me, then, that the true explanation of one of these groups will be the best guide to the true explanation of the rest, and that the introduction of a poison in one alone is gratuitous and unnecessary. We have every reason to believe that the cause which seemed to produce both the herpes and the serous inflammation at the same time, and which we know is capable of exciting each separately, was really the cause of both; and still more, that the pathological process concerned in their production was identical, the different symptoms being the result of the textures affected, and not due to any specific difference in the diseases. I submit, also, that we have every right to believe this until the different process concerned in the production of the two diseases is demonstrated; and this, I think, never has been done.

b. *Thoracic Inflammations*.—According to Dr. Fuller, we ought to exclude these from a list of diseases produced by cold, because the thoracic organs are well protected from the external atmosphere, and the effects of cold, as he describes them, do not include any of the well-known symptoms of these diseases; that is, it does not cause pain, local inflammation, cough, etc. But I need not stay long to refute this argument. Dr. Fuller—like Canute retiring from the waves—must give way to the universal testimony of mankind, that cold does excite thoracic inflammation, even though everybody is not always suffering from it; so he must enlarge his ideas of the effect of cold, and admit that it has powers other than he was once willing to attribute to it.

Considering the *lungs* first, we find:—

1. Inflammation of the parenchyma and serous covering, pneumonia, pleuro-pneumonia, and pleurisy, produced by cold. The existence of these, both as results of cold and as complications of rheumatism, needs no proof from me. No doubt any of these may occur in pyæmia; but here, as Dr. Bristowe has shown, the inflammation is caused mechanically by embolism, and the only effect of the vitiated state of the blood is to influence the course of the inflammation, rendering it more uncontrollable and more prone to suppuration. But this is not the general course of so-called rheumatic pneumonia or pleurisy, any more than of the "common" kind. There cannot be pointed out a single symptom, in the affected parts themselves or among the general symptoms, which will enable one to say which is rheumatic pneumonia, and which is only common; the diagnosis of the former can only be made by the presence of inflammation of the serous membranes of the joints. This articular inflammation may seem to have been excited by the same cause, may affect a similar tissue (as in pleurisy), and may pursue the same course, yet in the one case we are told that the existence of a *materies morbi* is absolutely necessary to account for the symptoms which are admitted to be produced without it in the other.

2. Inflammation of the mucous membrane, bronchitis, and—closely allied to this, though strictly not a lung affection—common catarrh. These mucous inflammations are less common in association with rheumatism, though sometimes existing with it. But not unfrequently they seem to be a sort of alternative to rheumatism. A person is exposed to cold; he experiences the malaise which precedes the local symptoms of catarrh; the fulness of head is present, he has also wandering pains in all parts of the body, and these sometimes so severely in the joints that he expects an attack of rheumatism; but in a day or two the local nasal inflammation is established, with (it may be) slight bronchitis; the pains then cease and the general symptoms are less severe. Sometimes, on the other hand, we have the same train of symptoms; the "cold" seems to be coming on, and the coryza may have been partially established; but this process is arrested, and the symptoms bloom into a case of acute rheumatism. The morbid action thus seems uncertain where to fix itself, and, in all probability, the constitution, hereditary or acquired, is the main element in the settlement which gives

"—To airy nothing
A local habitation and a name."

Similarly, at the termination of some cases of rheumatism, we sometimes see that as the joint-affection subsides a bronchitis develops. In fact, the inflammation set up in the one region seems to act as a natural counter-irritant to the inflammation in the other. Nevertheless, the impression of cold as the exciting cause, or the predisposition of the patient to inflammatory action, may one or both be so great that serous and mucous membranes alike shall be simultaneously (and, surely, similarly) affected.

I would venture the suggestion that a distinction may be drawn between the rheumatic and the strumous constitutions—that the former, as a general rule, is more prone to primary serous and fibrous inflammations, the latter to mucous and parenchymatous inflammations. Proliferation of cells and perambulation of white blood-corpuscles—in other words, rapid and defective elaboration of tissue-elements with great pyopoietic tendency—seem characteristic of the strumous constitution, and, perhaps, are more easily set up in the mucous and parenchymatous tissues, whose products (mucous corpuscles, lymph corpuscles, or, in general, cells) are connected more or less closely with the distinctive constituent of pus. On the other hand, fibrinous effusions seem more specially the product of inflammation, whether simple or rheumatic, of fibrous or serous tissues, the characteristic constituent of which—fibre—is the form most readily assumed by the effused products. Severity of inflammation, whether in consequence of intensity of predisposition or of exciting cause, approximates the fibrous and serous inflammations temporarily to the habitual condition of mucous inflammations; and so pus is more or less abundantly formed. Thus, a strumous individual will be liable to inflammatory action from causes too slight to affect a person in equally good health, but rheumatically inclined; if both have fibrous or serous inflammation set up, the strumous man will have it more severely, and is more liable to pus-formation, and in him, *à fortiori*, catarrhs of various kinds will be more readily established. In all fibrinous effusions corpuscles exist, many of which are indistinguishable by the microscope from pus corpuscles; a greater production of these, with the slight invisible alteration necessary to make perfect pus-cells, together with a less plastic fibrin, is all that is required to render the effusion puriform. There is no hard-and-fast line between the two; it is all a question of degree. So, also, the two constitutions I have attempted to distinguish shade imperceptibly into one another, are well seen only in typical cases, and doubtless may vary in vividness, even in the same individual, at different times. But if this is the true view of the facts, and there is this connexion between rheumatic and other inflammations, there is no stronger argument against its specific origin.

In the case of the *heart* we have two serous membranes, and no mucous. Peri- and endo-carditis are both common, but, strangely enough, are regarded very differently. It is allowed that pericarditis may be either rheumatic or simple; but if endocarditis occurs, it is immediately concluded that the cause must be a circulating poison—generally the rheumatic, sometimes the gouty, or the morbid blood of Bright's disease. But, surely, if it is admitted that inflammation of the exterior of the heart can be excited by simple cold, no serious reason can be alleged why the interior cannot be simply inflamed in the same way. The intervention of a poison ought to be proved before we are called upon to believe it, and to alter our treatment on that ground. With regard to these diseases, Sir T.

Watson, in the passage before quoted, admits that the products of rheumatic and simple carditis are the same; and yet, although the same exciting cause produces similar symptoms and similar results, we are required to believe that the genesis of the disease is quite different if a single other serous membrane happens to be simultaneously, though similarly, affected, and that a different line of treatment is to be pursued!

Endocarditis is, however, not altogether a true serous inflammation, though perhaps not less so than the articular affections. The tissue, at least, primarily affected is generally the sub-serous fibrous tissue, most abundant in the valves. The rarity of its occurrence without accompanying arthritis probably accounts for its being usually regarded as due to rheumatism—in other words, as something specific.

c. Peritonitis.—Here, again, a serous membrane sometimes becomes inflamed as a result of cold. When it is thus non-traumatically excited, suppuration is rare. It is less often associated with arthritis than the previous diseases, but sometimes is, and then the same remark as before applies, that no specific difference can be shown to exist between the two forms. It is often accompanied by a herpetic eruption about the mouth.

d. Meningitis, Cerebral and Spinal.—Dr. Allbutt(a) relates a case of spinal meningitis in which the symptoms resembled closely those of the ordinary form, but which subsided suddenly in forty-eight hours on the supervention of articular inflammation. In other cases cerebral symptoms seem to supplant the morbid action in the joints; and a see-saw process has sometimes been observed between them. The nature of the cerebral symptoms, which vary considerably, has been much disputed. There are cases, however, where post-mortem examination has revealed the usual products of inflammation of the meninges, even including pus. More often, perhaps, nothing special has been found, and the delirium, etc., have been attributed to heart affection, or regarded as a special neurosis. Sometimes all the typical symptoms of heat-stroke are present; there seems then to be a paralysis of the heat-regulating centre. If the cerebral symptoms occur first, there is no indication which would enable us to distinguish rheumatic from non-rheumatic cases. When they are subsequent to joint affection, if there are post-mortem appearances at all, they in no wise differ from those of simple meningitis; and, when nothing abnormal can be found, the symptoms have so much analogy with the neuroses as to warrant the belief that the morbid process is similar—at least, until we have some ocular, or very cogent, demonstration of the existence of a poison. The occurrence of simple cerebral meningitis, apart from any joint affection, but distinctly due to cold, is doubtless rare, but might appear more frequent if the sufficiency of this cause were recognised. Spinal meningitis is more commonly regarded as a simple inflammation.

e. Certain Neuralgiae and Paralyzes.—I cannot mention all of these affections which have been attributed to cold; some unquestionably are caused thereby. This proves that cold can exert a distinct and powerful influence upon nerve-fibres. Whatever this influence is—whether the facial paralysis often produced is due to depression of the function of the implicated nerves, whether the neuralgic pain of other cases is due to the same depression of sensory nerves, or whether in reality the nerves are unduly excited and excitable—is of no importance in this connexion. Inflammation of the neurilemma may or may not be one of the links in the chain of causation; some say so, and if it be, it is an inflammation established by cold. There are some cases of rheumatism, especially some chronic cases of one painful joint, or one painful region, in which neuralgia seems to me to be the real morbid action, unassociated with inflammation; they are non-febrile cases, and require different treatment. There are thus, I believe, two distinct varieties of lumbago—neuralgic and inflammatory—not at first sight very different, but amenable to different remedies. The relation between neuralgia and rheumatism is a difficult question to discuss, but the connexion (of whatever extent it is) which seems to exist between them would rather suggest the neurotic origin of rheumatism than the septic or blood-poisoned origin of the neuralgiae excited by cold. With regard to paralysis, the extent to which real loss of voluntary power over muscles, both in so-called muscular rheumatism and in the acute joint affection, sometimes exists, deserves recollection in connexion with those paralyzes which cold undoubtedly can produce in face, shoulder, and elsewhere.

f. Scleritis and Iritis.—The existence of the former has been accounted for by the fibrous structure of the sclerotic.

(a) *Medical Times and Gazette*, April 4, 1868.

This affection, or a tendency to it, seems to be present sometimes without any subjective symptoms. I have noticed in some cases a zone of injected vessels, of small but inconstant breadth, surrounding the cornea, while no complaint has been made by the patient. This has occurred in articular rheumatism, but also in two cases where, but for that, I should never have thought of rheumatism; one was a case of pleurisy, a second attack rapidly succeeding the first, in which a slight stiffness in one shoulder-joint at one visit was the only rheumatic symptom complained of; the disease was distinctly traceable to cold. Sometimes the scleritis is more intense and painful, occurring with, and also without, articular pain.

There is a form of iritis which has generally been distinguished as "rheumatic." A similar disease occurs as the result of cold without articular inflammation. Dr. Anstie (b) is of opinion that the term "rheumatic iritis" will soon be consigned to oblivion, since we shall be able to trace its connexion with affection of the nerves of the iris. I hope to assist in the process.

These, of course, are not all the diseases which cold can excite, nor all the complications of acute rheumatism; but I think they are sufficient to show that no difference exists between rheumatic and non-rheumatic diseases excited by cold. If a difference is recognised, great uncertainty must enshroud every cold-excited inflammation in which arthritis is not also present; and I cannot but think that, apart from preconceived ideas, it must seem obvious that the genesis of a disease cannot be so very different, merely because it is in one case associated with articular inflammation and not in the other, while exciting cause, symptoms, and result remain the same. If we are asked to believe the reality of this great distinction on the ground of the presence of a subtle *materies morbi*, this is no real explanation, even if one were required. But when this *materies morbi* is no longer called subtle, but a definite, abundant, continually reproduced and continually excreted acid, lactic or acetic, I hardly know which to wonder at most—the boldness which can deliberately contend for the existence of this undemonstrated and undemonstrable poison, or the credulity which can unhesitatingly adopt this hypothesis as the principle and guide to treatment.

If the complications of acute rheumatism are thus in no wise due to the circulation of a poison, but to the impression and remote influence of cold on the nervous system, we are brought far on our way to the adoption of a similar view with regard to rheumatism itself.

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

VICTORIA-PARK HOSPITAL.

CASES OF PARACENTESIS THORACIS.

(Under the care of Dr. PEACOCK.)

DURING the last few years four cases in which paracentesis was practised have occurred in Dr. Peacock's wards at this Hospital. Of these cases we are able to give reports, and we believe they will be found to possess considerable interest to our readers.

Case 1.—Purulent Effusion in the Left Pleural Cavity in a Child—Paracentesis twice practised, and the tube the second time left in—Complete Cure.

The child, a female, aged 9, was admitted into the Victoria-park Hospital on April 27, 1866. She was then reported to have been ill for five weeks, but the history of her illness was very incomplete. She complained of pain in the left side, and had great difficulty of breathing, with feverishness and prostration of strength, but without lividity. The left side was found to be generally much enlarged, and there was a very marked bulging in the left upper mammary region. The movement of the side was abolished, and there was entire dullness on percussion, and the respiratory sounds were only feebly audible at the upper part of the side, and were entirely absent below. The heart was greatly displaced, being situated to the right of the lower part of the sternum. The right side of the chest was resonant on percussion, and respiratory sounds

were loudly heard there, and the movement was very much exaggerated. She lay on the left side. The pulse was feeble and rapid—132 in the minute; the breathing also rapid—64. The tongue white, with the tip red, and the papillæ projecting. There was great reason to fear, from the general symptoms, that the child was tuberculous, but it was evident that there was extensive effusion in the left side of the chest, and that immediate relief must be obtained. It was therefore determined at once to puncture the chest. This was done on the 28th, and eleven ounces and a half of pus were evacuated, when the air began to enter, and the tube was removed and the aperture closed. The evacuation of the fluid was attended with very decided relief. The left side of the chest diminished in size, the irregular enlargement in the mammary region was less marked, and the breathing was much freer.

The following notes were taken on April 30:—The breathing is very much relieved, though still short and hurried, the respirations numbering 60 in the minute; pulse 120, and sharp; tongue red, with the papillæ projecting; dullness on percussion still very marked over the whole of the left side, and the movement very imperfect. There is some return of vesicular respiration over a large portion of the upper part of the side, and bronchial respiration is heard to the left of the spine in the dorsal region. The cardiac sounds are most distinctly heard to the left of the lower part of the sternum. The resonance on percussion is clear on the right side of the chest, and the respiration is puerile, and attended with a slight sibilant wheeze. She prefers to lie on the left side, but can lie on the back, and for a short time on the right side. She takes her food well. The bowels are regular, and the urine is passed naturally.

May 2.—She is capable of sleeping tranquilly when lying on the right side, and her appearance is very much improved. The pulse is still quick. The chest is decidedly enlarged on the left side, especially in front. The side is everywhere dull on percussion, and the movement imperfect. The respiration is almost entirely bronchial. The heart is becoming again displaced to the right side. She has a cough, but no expectoration.

On the 4th, the side being much distended, the chest was again punctured, and a large quantity of pus evacuated, the canula being left in, and the opening closed by a plug, which could be removed, so as to allow the secretion to flow out at intervals.

On the 7th her condition was very much improved, and her breathing easier. She slept comfortably lying on her back, somewhat inclined to the right side. The left side is much smaller than before, and continues quite dull on percussion; but there is a return of the respiratory sounds at the upper part of the chest, both before and behind. The discharge from the side is lessening, amounting to about one ounce twice daily, and it consists of healthy pus. Her tongue is clean, but still a little furred towards the root, and the papillæ are somewhat red and projecting. She takes her food well, but her bowels are somewhat torpid.

9th.—She has continued to improve. The side continues entirely dull on percussion, and is generally full; but there is a decided increase of the space over which the respiratory sounds can be heard, and her breathing is obviously much fuller and freer. The heart still continues somewhat displaced to the right side. She prefers to lie on the back, but can lie on the right side. The respiratory sounds on the right side are puerile, and are attended by some sibilant rhonchus. Her pulse is quick, but probably from excitement. The tongue has a white fur on the dorsum. She takes her food well, and the bowels are regular. For the last few days the discharge has been smaller, but to-day, on changing the position of the tube, fully four ounces of pus escaped.

16th.—The left side of the chest is contracting, the falling in of the upper mammary and infra-clavicular regions being very marked, but the movement has not to any considerable extent returned. The dullness on percussion is, perhaps, somewhat less complete. There is very obvious return of the natural respiratory sounds in the left spinal and dorsal regions, and to a less degree in the infra-clavicular and axillary regions. The respiratory movements on the right side are less exaggerated, and the sound, though still puerile, is less so than before, and is not attended by any sibilus. The heart's sounds are still distinctly audible to the right of the lower end of the sternum. The pulse is quick, probably from excitement. The respirations 28 in the minute. Her cough, which had ceased, has returned, but she does not expectorate with it. Her appetite continues good. The canula has been removed since the 14th, and the opening has been kept plugged with a piece of lint.

(b) Reynolds' "System of Medicine," Art. "Neuralgia," vol. ii., p. 738.

The discharge amounts to about two ounces daily, and is still decidedly purulent.

28th.—Her general condition has considerably improved. The left side of the chest has continued to contract, but the dulness on percussion is less marked, especially at the posterior part. There is a decided return of the respiratory sounds, which are everywhere feebly audible except in the lower lateral region. The heart's sounds are still heard to the right of the lower end of the sternum, but are the most distinctly heard in the natural situation. The respiratory movements on the right side are full and free, and the sounds natural, though somewhat puerile. There is still a little discharge from the side.

On June 17 pleural crepitation was heard over a large portion of the left side, and she was otherwise improving. The discharge from the side was very trifling.

On the 18th the opening had entirely healed.

On July 4 the following notes were taken:—There is very marked contraction of the left side of the chest, more particularly beneath the clavicle. The respiratory sounds are everywhere heard, but only very feebly in the lower parts of the chest, and there is still considerable pleural crepitation to be heard. In every respect she has greatly improved. The tongue is a little mottled, but the pulse is quiet and the respiration natural. She takes her food well, and the bowels act regularly.

She was discharged cured on the 12th.

In this case the result was more favourable than could at the time of the little patient's admission into the Hospital have been anticipated. There was great reason to fear that there might be tuberculous disease of the lungs; but after the pus was evacuated the child greatly improved, and was, indeed, discharged from the Hospital nearly well, with, however, as might be expected, considerable contraction of the left side of the chest.

SATURDAY, AUGUST 26, 1871.

NOTES ON PUBLIC HEALTH.

WE must acknowledge that, just at the end of the late session of Parliament, her Majesty's Government did manage to pass three Bills which may come under the title of sanitary measures. The Vaccination Amendment Act Bill makes the appointment of Vaccination Officers by guardians of unions or parishes obligatory, instead of only permissive; and the House of Lords fortunately struck out Clause 10 of the Bill, and so saved us from the absurdity, to use a very mild term, of a Bill that, while affecting to make vaccination compulsory, allowed anyone to purchase exemption for twenty shillings. The Metropolis Water Bill is hardly likely, as we pointed out last week, to be of much use; but we may hope for some real solid

benefit from the Bill which has changed the Poor-law Board into the Local Government Board, and has transferred the sanitary powers of the Privy Council and the Home Office to the new department. Mr. Stansfeld is placed at the head of the new Board, and the nation may be congratulated on the transference of any powers to him from the present Secretary for the Home Department.

There is not much to report this week as to the progress of Cholera. It continues to prevail, and rather to increase in Königsberg. On the 15th, 70 persons were attacked by the malady, and 34 died; on the 16th, 80 were seized, and 27 died; on the 18th and 19th, it is reported, 111 new cases occurred, with 56 deaths; and on the 20th, there were 87 fresh cases, and 32 deaths. It was reported at the end of last week that cases of cholera had occurred in the neighbourhood of Stettin, but this seems at least doubtful. According to a telegram from Berlin, dated on the 22nd, there have been a few cases at Dantzic and Elbing. It is stated that in the Russian province of Sumalki cholera is on the decrease. The whole number of cases that had occurred was 443, and of these 83 had died, while 190 had recovered. In Persia the disease is raging terribly; a telegram from Tabreez states that in that city alone the deaths from it in the first week in August averaged 200 a day.

Dr. Buchanan, who has been charged with the supervision of the precautions against the importation of cholera into the Thames, has been in communication with the Board of Customs, the Trinity House, and the Thames Conservancy, as well as with the authorities at Gravesend, and the health authorities of all the riverside districts below London-bridge, in order to obtain their co-operation in organising and carrying out a complete and uniform system of supervision. As ships are boarded by the Custom-house officers at Gravesend, the necessary work for detecting the presence of cholera among the crews will be merely carried out at that place; but of course the expenses of supervision, of disinfection, and of removing and providing for patients, will not all fall on Gravesend, but will be equitably divided among the various river districts.

On the 18th the Sanitary Committee of the City Commission of Sewers met, and expressed their desire to co-operate in every way with the Privy Council in endeavouring to secure a more stringent examination of ships entering the port of London, and thus to lessen the chances of the introduction of cholera.

Medical inspectors are appointed on the Tyne to examine ships from Königsberg, Cronstadt, and other places on the Baltic; and arrangements are being made to establish a floating Hospital. The Chatham Board of Health have applied to the War Department for the use of a small disused fort near Fort Pitt, to be converted into a cholera Hospital if needed. Chatham itself is in good sanitary condition, and, since the water supplied by the water company has superseded that taken from wells near inhabited houses, the annual death-rate of the town has been reduced 2 per cent. Mr. Netten Radcliffe is now visiting the ports from Boston to Southampton.

The fatal cases of diarrhoea in London, which had been 110, 201, 225, and 299 in the four previous, rose to 425 last week, of which 388 were of infants aged under 2 years, and 18 of persons aged 60 years and upwards, leaving but 19 as occurring among children and adults aged 2 years and under 60. These 425 deaths from diarrhoea in London exceeded by 222 the corrected average number in the corresponding week of ten years 1861-70, and were equal to an annual death-rate of 7 per 1000 persons living; in the West group of districts this death-rate from diarrhoea was 8 per 1000, in the Northern group 6, in the Central and Eastern groups 7, and in the Southern group 6. The deaths referred to cholera and choleraic diarrhoea in London, which in the three previous weeks had been 17, 18, and 15, rose last week to 40, of which 33 were of infants not exceeding 1 year.

SEA-BATHING.

ABOUT this time of year our brethren are wont to be consulted on the relative merits of sundry health-resorts; what particular climate or what particular exposure will suit dear So-and-so; who shall try the east coast, or south coast, or the Alps, or what not. Often, also, those who go to the seaside will desire advice as to the propriety of bathing in the open sea. Not all will do so, however, and of those who neglect the precaution a large proportion are almost certain to sin against the rules which ought to be observed in taking advantage of this health-giving practice.

The first thing to be insisted on is, that sea-bathing is not suitable for all; the next, that at certain periods of the day, and under certain circumstances, it is likely to do more harm than good. Neither is it advisable for a man, much less for a woman, to rush hot-foot from London and London modes of life to the sea, and forthwith plunge into its refreshing waters. It is quite true that a strong man may laugh at precautions, and may behave much as he likes; but, then, he does not *need* sea-bathing, nor will it do him any particular good. It is perhaps with ladies, nervous and delicate, that the most elaborate precautions require to be taken, as it is assuredly to these sea-bathing does most good. It will be remarked that we speak entirely of bathing, and make no reference to the sea-air, which to many is an absolute tonic. That may be enjoyed without too much rule or regulation; not so with the bathing.

Let us suppose, then, that we have to deal with a lady patient, of no great original strength, and whose powers have been severely strained by the overwork of a London season. For such there is no better remedy than a week or two of sea-bathing at some retired spot. First, however, there will be the journey from town, more or less fatiguing, according to the distance of the place selected. This ought to be chosen with reference to the patient's strength of body and constitution. Should the strength be but small and the constitution weak, a breezy place on the south coast should be selected, whilst those of greater stamina might try Ilfracombe, the Yorkshire coast, or even further north on the same side of the island. At all events, the journey will be quite enough for one day. A short walk by the seaside, or a short row on the water, with the fresh smell of the sea-air and sea-water, will suffice for an introduction to a new mode of life. With the change of abode a total change of diet and mode of life is advisable. The old motto "Early to bed and early to rise" should be adopted—but gradually, and by no sudden jerk; the feeling of fatigue will readily induce the habit of early retiring to rest, and the systematic practice of rising earlier and earlier every morning will by degrees induce the other.

The second morning really begins the seaside life; but it is not yet the time for plunging into cold salt-water. A pailful or two should be used as an ordinary bath in the bedroom, the precaution being taken of raising the whole to a temperature of about 60° Fahr. by warming a portion of the water considerably above that degree. Next should come the walk, drive, or row in the open air, an early dinner, followed by a rest on the couch, a little more exercise in the evening, an early supper (not later than eight or nine), and to bed at or before ten. The next morning the water might be tried cold, and so, perhaps, for the next; after which, if the weather is not too oppressive, a bath in the open sea might be tried about mid-day, the period for bathing being made earlier and earlier each day, but never within two hours of breakfast. In about a week the bath may be taken before breakfast, the latter being slightly postponed for the purpose; but bathing at this time should not be attempted earlier, and sometimes not so early, for it is in such matters that judgment is best shown. Certainly no delicate individual ought to attempt an early morning bath without first going through a course such as we have indicated.

One grand rule is, never to bathe soon after a meal, or with a

stomach at all full; neither should the bath be attempted by a weakly individual on one altogether empty. Perhaps the condition most suitable in every respect is attained by a cup of warm new milk partaken of after dressing, and just before starting for the sea itself. A strong, hardy man may outrage both rules; not so one who is weakly and delicate.

The great test of the efficacy of sea-bathing is the feelings of the individual on coming out of the water. The first day the patient should not remain above a minute or two in the water; not much more than is required for one or two complete immersions, and at no time, except he be a swimmer, more than five or ten minutes. After a good immersion over head and ears, and a good dry with a rough towel, the patient, having quickly dressed, should take a little stroll along the beach. If now he feels warm, comfortable, and exhilarated, the bath is as certain to do him good as it is certain to do him harm should he feel cold and depressed, if his hands and finger-nails remain blue and pinched, and the cutis anserina be generally developed. These are sure signs either that the bath disagrees, or that some indiscretion of diet or what not has been committed. There is a common dread of going into the water if the body be greatly heated; this is quite unfounded if the individual be strong, and the immersion be sudden and complete; but a little caution is required on the part of the weakly. In all cases sudden and complete immersion is desirable.

Many other points might be alluded to and hints given, but these meanwhile must suffice. We only add one more. It will add greatly to the patient's comfort and enjoyment if, about the second day, a slight cholagogue be given. A little podophyllin or calomel will not be amiss; but we know none better than our old friend a blue pill in the evening and a black draught in the morning, due consideration being had for the strength of the patient.

DR. SANDERSON ON THE ORIGIN AND DISTRIBUTION OF MICROZYMES (BACTERIA) IN WATER, AND THE CIRCUMSTANCES WHICH DETERMINE THEIR EXISTENCE IN THE TISSUES AND LIQUIDS OF THE LIVING BODY.

THE Thirteenth Report of the Medical Officer of the Privy Council contains a most interesting and instructive appendix bearing the above title, in which Dr. Sanderson continues his researches on the intimate pathology of contagion. In his previous report the author defined microzymes as living particles which in their earliest stage are spheroids, but subsequently elongate into rods, and their existence was said to be associated with the commencement of putrefactive decomposition of nitrogenous compounds.

The purpose which Dr. Sanderson had immediately in view in instituting his experiments (in which Dr. Ferrier was associated with him) was to examine into the origin, growth, and development of microzymes, to investigate the conditions which are fatal or favourable to their existence, so as to be enabled to approach one degree nearer to an understanding of their influence on the processes which go on in the living body. Though the question of spontaneous generation is only incidentally touched upon, a heavy blow is dealt to it, for it is shown that, as regards the animal liquids and tissues and the liquids used as tests for the presence of microzyme germs, no spontaneous evolution of any organic form ever takes place; so that, it is significantly added, it is quite unnecessary for the purpose in hand either to deny or to assert its possibility under other and different conditions. He shows, however, that liquids which contain no particle distinguishable under the highest powers of the microscope possess the property of evolving microzymes without contact with external media, and must therefore contain the germinal substance from which these organisms spring. Nevertheless, he believes that here we have to do with particles so minute that they do not

interfere with the homogeneity of the liquid. The peculiar manner in which microzymes (bacteria) grow on the surface of liquids in rods which adhere together by their sides, after the manner of columnar epithelium, appears to be new. When growing on moist surfaces, these rods, with their intervening jelly, sometimes form the masses of microzymes to which Cohn applied the term "Zoogloea."

As regards the chemical composition of microzymes and their relation to the media in which they grow, it is assumed from their deportment with reagents that the particles are albuminous, and it is known that their growth is attended with absorption of oxygen and discharge of carbonic acid; that they are remarkably independent of the chemical constitution of the medium, provided that they are supplied with oxygen; and that they take nitrogen from almost any source which contains it, and use it for the building up of their own protoplasm. This last power indicates their place in nature as the pioneers, if not the producers, of putrefaction. The evidence bearing upon this function elucidated by Dr. Sanderson's experiments is, that so long as the germinal matter of microzymes is excluded, animal fluids or tissues withstand decomposition for very long periods, whilst the slightest contact with media containing this material at once determines septic changes. Consequently, it can be asserted positively that, under certain circumstances, the presence of microzymes excites putrefaction; but the facts do not, in his opinion, afford grounds for stating that they are the cause of putrefaction, or that if it were not for them the process would be postponed indefinitely. We may remark that the assertion of some chemists, that organic matter may, under the influence of heat and moisture alone, undergo decompositions which present all the chemical characters of putrefaction, even though no organisms be present, receives strong confirmation from some recent experiments of Hoppe-Seyler (*Med.-Chem. Unters.*, p. 565, 1871), which tend to prove that temperature has more to do with putrefaction and fermentation than has the presence of organisms, and that it is requisite to distinguish between the ferment and the organism producing this.

Dr. Sanderson divides his memoir into three sections. The first gives an experimental determination of the conditions which govern the development of microzymes in certain organic liquids to be used as tests (animal fluids and Pasteur's solution); the second is on the distribution of the germinal matter of microzymes in ordinary water; whilst the third treats of the circumstances which determine the existence of microzymes in organic liquids and tissues.

Under the first head the following are the chief results obtained:—1. No evolution of organisms takes place in superheated liquids, provided that the air with which they are in contact has also been superheated, whether they are kept at an ordinary temperature or at that of the body; whilst organisms appeared in the same liquids which had not been superheated. 2. Thoroughly boiled liquids, preserved in tubes first prepared and sealed, remain perfectly free from organic forms. 3. Superheated liquids, when freely exposed to the air, become eventually covered with tufts of penicillium. 4. The germinal matter from which microzymes spring *does not exist in ordinary air*, whilst the activity of the development of penicillium is in proportion to the degree of exposure to such air. Next, as regards the relation of water to microzymes, it was found—(a) That water is the primary source from which the germinal particles of bacteria are derived, whenever they seem to originate spontaneously in organic solutions. (b) Distilled water may be obtained free from germinal particles, whether of microzymes or fungi, and the zymotic property of ordinary distilled water is acquired either by mixture with other waters or by contact with the surface of vessels. On this is founded a method of ascertaining the amount of zymotic impurity of two waters, by comparison of the degree of opalescence produced by each in Pasteur's test-solution (composed of a solution of sugar,

tartrate of ammonium, and yeast ash) in the same time and at the same temperature. (c) The germinal particles of microzymes are rendered inactive by thorough drying, without even the application of heat; and the contamination of water by apparently dry surfaces happens only in those cases in which desiccation is incomplete. (d) Disinfectants—such as ozone, permanganate of potassium, carbolic acid, quinine, peroxide of hydrogen, chlorine, and the application of heat—may be so applied as to prevent the development of microzymes without stopping the germination of penicillium. (e) Filtration exercises no perceptible influence on the zymotic property of water.

The third section of the Report is perhaps the most interesting of all to the Medical Practitioner. In this section it is shown—(a) That normal tissues and liquids—muscle, cellular tissue, blood, urine, saliva, and probably milk—do not possess the zymotic property, and that they contain no microzymes potentially or actually. (b) The liquid products of inflammation (pus) are occasionally zymotic, but not always so. Further experiments seem to be required in this direction, and we may confidently look for them from Dr. Sanderson.

The whole tendency of the Report is to prove that fungi are not developed from microzymes, and that their apparent association is one of mere juxtaposition. The grounds of this conclusion are thus concisely stated:—1. The prompt appearance of torula cells in Pasteur's solution whenever it is exposed to the air, and the rapid development and luxuriant fructification of the higher form (penicillium), show that, so far as the chemical composition of the liquid is concerned, there exists in it all the conditions favourable to the process. 2. When precautions are taken to prevent contamination by impure surfaces or liquids, the development which ends in penicillium goes on from first to last without the appearance of microzymes. 3. Whenever it is possible to impregnate the test-liquid with microzymes without at the same time introducing torula cells or germs, the development of the former begins and continues by itself without any transformation into the latter. Thus fungi are not developed, *notwithstanding the presence of microzymes*, in the same liquid in which, *microzymes being absent*, but air having access, they appear with the greatest readiness. Such are the very important conclusions arrived at by this skilful observer. Rightly to appreciate them, the account of the experiments themselves must be read. We commend the whole of Mr. Simon's Report to our readers, and have only to add that it may be purchased for 4½d.

THE WEEK.

TOPICS OF THE DAY.

WE notice that a proposal to range successful candidates for the Fellowship of the Royal College of Surgeons in classes, according to the proficiency displayed in their examinations, is to be submitted to the Council of the College by Mr. Charles Hawkins. We trust that so mischievous and impolitic a proposition will not for one moment be entertained by the Council of the College. Surely there are enough ranks and grades in our Profession already, and enough jealousy and heartburning is caused by them without introducing new ones. The effect of such a proposal, were it made law by the Council, would be to change the Fellowship from a popular and coveted distinction to a most unpopular and unattractive one. What rising young Surgeon would submit to an examination which, on the whim of an examiner or the accident of a particular question, might brand him, as far as the Profession and the College of Surgeons are concerned, as a second-class man throughout life? With regard to the public, indeed, they would know or care but little about the matter. They bestow their patronage on those who can render them the aid they require, and do not stop to inquire into the mystery of Medical diplomas. But this does not diminish the impolicy of this proposal. To draw

such a distinction between Fellows of the same College will be to introduce a source of jealousy and discontent, which will not only diminish the esteem in which the College is held and the good feeling which prevails amongst its Fellows, but will certainly deter men from seeking the Fellowship. In this country it is not a new, but an increasingly true complaint, that we are becoming more and more under the domination of the Chinese system. The examination test is enforced everywhere, and it is final; but with it do we produce great men or great discoveries? Is it not rather that we are lapsing more and more into a uniform mediocrity? It is certain that our greatest men in Physic and Surgery would assuredly have been rejected at many of our modern examining boards. John Hunter would not learn Latin and Greek to please his brother William, and Liston could certainly not have passed an examination in *Materia Medica* at the University of London.

We are informed by the editors of the "Manchester Medical and Surgical Reports," that they are endeavouring to collect and collate statistics of the major operations in the chief public Hospitals of England during 1871. Next year they propose to extend their scheme, and to issue, in a separate form, returns of all the important operations performed in 1871 throughout the United Kingdom, arranged in reference to meteorological conditions and locality. They propose to include in these returns Operative Midwifery and Ophthalmic Surgery. To obtain the desired information, they intend to issue blank forms to every public Medical charity in the United Kingdom. We need not say that such a work, if well done, cannot fail to be valuable; and we hope that Messrs. Bradley and Walter Whitehead will meet from the Surgical staffs of the Medical charities all the aid and information they ask.

Surgeon-Major Atchison's letters to the *Times* on small-pox encampments (which, republished in a separate form with his letters on cholera and the Contagious Diseases Acts, we are glad to see have now reached a third edition) may, perhaps, yet bear fruit in a cholera epidemic. Segregation by camping the sick out in some airy situation, and on the subsidence of the disease burning the encampment, is the formula he recommends; which, put in practice during a severe epidemic of cholera at Meean Meer, in 1861, speedily arrested the disease. Should the experiment be tried in the neighbourhood of our towns, the means have been suggested by Mr. Netten Radcliffe, who has designed a tent for four beds which can be furnished at a very moderate cost. The tent is sixteen feet long by fourteen wide, and thirteen feet high. It weighs a hundredweight, and can be erected in a quarter of an hour. The tent is to be obtained at Pigott's, in Bishopsgate-street.

The Medical attendants and Sisters of Mercy of the Small-pox Hospital at Hampstead applied last week, through Mr. Poland, the barrister, to Sir Thomas Henry, for summonses for libel against the proprietor and publisher of the *Echo* newspaper. The libel was contained in the description of the case of a child which lost its eyesight in an attack of small-pox through which it was nursed at the Hospital. The child had bedsores and ulceration of the cornea, and the article undoubtedly attributed neglect to the Medical and nursing authorities of the Hospital. Sir Thomas Henry refused the summons—principally, as it seems, from the report of the case in the *Times*—because the article in the *Echo* was confirmed by the child having become blind; as though blindness was not too common a result of small-pox! Sir Thomas Henry is reported to have said, "There was no pretence, perhaps, for attributing neglect, but still it was a matter of opinion." In our opinion, however, the Medical and nursing staff have been unjustly used in the matter. The article undoubtedly attributed neglect, and the staff, we think, had a right to claim a public investigation into the whole matter.

A telegram from New Brunswick communicates the melancholy intelligence of the death of Renforth, the stroke-oar of

the Newcastle crew in the Anglo-Canadian boat-race. It appears that the boats started at 7.25 in the morning in smooth water, the Brunswick crew taking the lead. The Tyne boat drew a-head for a short time, but at three-quarters of a mile the lead of the Brunswick boat was three lengths, when Renforth was seized with a fit of apoplexy, which resulted in his death. The Tyne crew gave up.

THE LOCAL GOVERNMENT BOARD.

On the 19th instant the Queen was pleased to appoint the Right Hon. James Stansfeld to the office of President of the Local Government Board. On that date the Poor-law Board ceased to exist, and the new department established by the statute 34 and 35 Vic., cap. 70, was constituted. All communications relating to the administration of poor-laws, Local Government Acts, and sanitary matters should now, we are informed, be addressed to "The Local Government Board, Gwydyr-house, Whitchall."

TESTIMONIAL TO E. COCK, ESQ.

UPON the retirement of this gentleman from the appointment of Senior Surgeon to Guy's Hospital, with which institution he had been connected for nearly half a century, a number of the past and present students determined upon presenting him with some mark of their appreciation of his long and valuable services, and the deep interest he has always taken in their welfare. In order to carry this out, a subscription was entered into, and on the 28th ult., in the presence of some of the staff, and a goodly gathering of old Guy's men and the present students, Mr. Cock was presented with a very handsome and massive silver epergne, made by Messrs. Hunt and Roskill. Dr. A. S. Taylor kindly undertook the presentation, and, in doing so, availed himself of the opportunity to speak of their long connexion with Guy's, and being the only two left of what might be called the old school. He also spoke of the universal estimation in which Mr. Cock was held, not only in this country, but also on the Continent. "Having," he said, "many, very many, opportunities of meeting with Medical men all over the country, I can say, without the slightest hesitation, that I never yet heard one single unkind word said of Mr. Cock; neither have I, after all these years of most intimate acquaintance with Mr. Cock, ever heard him say an unkind word of anyone." Mr. Cock, in a somewhat characteristic but very appropriate speech, thanked them all for what, he said, he should look upon with the greatest pleasure and pride.

A GOOD EXAMPLE.

THE old adage, "If you want your work done well do it yourself," is being acted upon by the Health Committee of Middlesborough-on-Tees. They are going from house to house in the town, to ascertain for themselves whether any nuisances exist, and determining the best mode of getting rid of them. This is an example worthy of being followed—it certainly appears the best way of putting a town into a thoroughly sanitary condition.

INCREASED WATER-SUPPLY IN LONDON.

MR. BRUCE'S Water-supply Act will come into operation at the expiration of eight months from the passing of that measure. We are glad to record that the Grand Junction Water Company have, in a letter to Dr. Lankester, suggested as an auxiliary to the present water-supply that stand-pipes should be put up, from one to two hours during the day, in all courts, alleys, and places where imperfect water-storage was provided. The Company have handsomely offered to bear the expense, and to provide extra supplies of water for the purpose of flushing when deemed necessary. The suggestion should at once be acted upon, and it would be well if the other water companies in the metropolis would act as justly and as liberally to their customers as does the Grand Junction Company.

INFRINGEMENT OF SANITARY LAWS.

In most large towns, and London in particular, infringement of various sanitary laws is constantly being practised. If proper vigilance were displayed by the authorities, it is difficult to suppose that the accumulation of filth, and the abominable stinks which now abound, would not cease to exist. We commend the conduct of Dr. Syson, Medical Officer of Health of the town of Salford, to his brethren in the various towns of the kingdom. Last Thursday week two men were summoned before the police magistrate for conveying offensive matter, which gave off a very great stench, along Irwell-street during prohibited hours. It was urged that, seeing the precautions that were being taken, both locally and nationally, on account of the apprehended visitation of cholera, the Bench would mark their sense of the importance of carrying out sanitary regulations by imposing a heavy penalty. Walker was fined 40s. and costs, and Carter was dismissed, as he simply acted under his master's order.

FROM ABROAD.—TREATMENT OF PNEUMONIA—M. BESNIER ON THE MEDICAL CONSTITUTION OF PARIS.

M. PAPILLAUD terminates an interesting paper published in some recent numbers of the *Gazette Médicale* on the "Treatment of Pneumonia" with the following conclusions:—1. Bleeding is hurtful in the treatment of malignant or adynamic pneumonia. 2. It is also injurious, whatever may be the form of the pneumonia, in feeble or debilitated subjects. In robust subjects it may be serviceable as an expedient for the relief of the embarrassed respiration, but opium may render the same service without producing the inconveniences consequent on the loss of blood. 3. In the treatment of pneumonia, tartar emetic is a remedy of the first rank, by reason of its antipyretic, antiphlogistic, and decongestive action; but there is no need to raise the dose beyond from 10 to 20 centigrammes, nor to continue its employment for a longer period than from two to four days. 4. Alcoholic liquids, in doses varying from 30 to 100 grammes, according to the subjects, are medicinal agents which, whether by aiding organic combustion or from other as yet little known modes of action, powerfully contribute to the resolution of pneumonia. 5. A formula combining these three medicinal agents—opium, antimony, and alcohol—is that which will best meet all the ordinary indications in the treatment of pleuro-pneumonia.

We are glad to find M. Besnier has recommenced the interesting Reports on the Medical Constitution of Paris as evidenced by its Prevalent Diseases, which he has for a long time past (until interrupted by the events of the last year) addressed quarterly to the Paris Hospital Society. The members of this Society, comprising most of the Practitioners holding public appointments, supply him with the material whence his deductions are made. The present report only relates to the months of June and July, 1871, and is, in fact (owing to the paucity of facts as yet readily obtainable), merely a preliminary glance at the Medical "situation" of the capital.

1. The fact of most interest recorded is the entire disappearance of the epidemic of small-pox, which has prevailed since November, 1869. M. Besnier observes that he confines himself to a statement of the fact without offering any absolute interpretation of it, believing, however, for his own part, that this epidemic, like others, has become extinguished under conditions which are absolutely unknown, and quite unconnected with our means of action.

2. During these two months the atmospheric vicissitudes have been remarkably variable, the early great heats of July having been suddenly followed by a great fall in the temperature, accompanied by abundant rains. Consequent upon this, the diseases usual in spring-time supervened upon estival affections, especially in the form of rheumatism, pneumonia,

and pleurisy, accompanied by some connected affections, and especially anasarca.

The most remarkable affection observed in the Versailles army, as regards its frequency, was *albuminuria*. The causes of such predominance are not readily seized, for the subjects of the disease were of vigorous constitutions, and but little exposed to the hardships usual among armies in campaign. The soldiers, the objects of constant solicitude, were well fed and very well clad. They had to undergo none of the long marches or other excessive fatigues of ordinary warfare. Long before this epoch, indeed, the frequency of anasarca and albuminuria was positive, and dropsy was one of the prevalent diseases of the siege, due in great measure to the combined influence of faulty hygiene, alcoholism, and misery. There can be no doubt that atmospheric conditions have exercised their influence in producing this remarkable recrudescence, but M. Besnier also attaches great importance to the abuse of alcoholic drinks. Attached to the *Maison Municipale de Santé*, he has had the opportunity of observing among the civil population, also, alcoholism in all its forms on a very large scale. Albuminous anasarca and alcoholism are two elements so connected that it is very often difficult to separate them, the accidental causes to which the patients themselves refer the dropsy only acting in proportion to the predisposition inherent in the subject. In anasarca from cold, properly so called, albuminuria only appears at a late period, and is slight and fugacious, or even entirely absent.

3. Since the entry of the Versailles army into Paris, a considerable number of cases of typhoid fever have been met with in the military Hospitals, but this has generally been of a mild character. At a somewhat later period the same disease has prevailed in the civil Hospitals, and even seems to be on the increase. M. Bergeron reports the case of a child who left the Hospital early in July, after a residence in it of more than two months, and who presented an unique example of a double relapse of typhoid fever, accompanied by all its classical symptoms, the eruption included.

4. Thus far no account has been received of affections due to the direct action of the sun, although, amidst the constant movements of the troops during the great heats of July, and the extensive reparations of the ruins caused by the bombardments and fires, numerous cases of insolation must be supposed to have occurred. In the children's Hospitals tubercular meningitis was met with in unusual frequency.

5. As to intestinal affections, these have been only met with in the form of simple or biliary or choleric diarrhoea, usual at the time of the year.

PARLIAMENTARY.—THE VACCINATION AMENDMENT BILL—METROPOLITAN WATER-SUPPLY—DR. GORDON AND SURGEON-MAJOR WYATT—THE LATE WAR MEDICAL REPORTS.

On Thursday, August 17, in the House of Lords,

The Vaccination (1867) Amendment Bill was read a second time.

Lord Shaftesbury, after adverting to the great Parliamentary influence of the metropolitan water companies, and the inquiry by a Royal Commission, declared that the present supply was inadequate, and that there was scarcely a pint of good pipe-water to be had in London, while the water in the wells was still more deleterious. There was hardly a great town in the kingdom that was not better provided with water than London, and he trusted that the Government would deal with the question next year.

Lord Halifax said that the Metropolis Water Bill, although not all that could be wished, would insure a constant supply, and that further legislation would be desirable next session to insure a more abundant supply of pure water for the metropolis.

In the House of Commons,

In answer to Mr. Eykyn,

Lord Enfield said: As the services of Dr. Gordon in Paris last winter were performed with the knowledge of, and under the express direction of, the War Office, he would, I apprehend, be permitted to accept and wear any distinction, not being the

decoration of a foreign order, if the French Government had asked it for him, but I cannot ascertain that any such application has been made in his behalf. I should be glad to take this opportunity of assuring that gentleman, as well as Surgeon-Major Wyatt, who performed such good and humane service during the siege of Paris in administering to the comforts of the sick and wounded, that my words last Friday evening had only reference to the volunteer ladies and gentlemen who worked so honourably under the Red Cross, and not to them, as I was quite aware that these distinguished Medical officers were acting under orders and authority from home, that they had sent in the report of their humane labours to the authorities of the War Office, and that their duties had been performed with earnestness and kindness; while, on the other hand, the work of the other ladies and gentlemen had been spontaneous and without the direct control or supervision of any Government officials, but not the less involving care, danger, and responsibility. I had to draw the distinction between the official and non-official character of the work done under the Geneva Convention.

On Friday, August 18, in the House of Lords,

The Vaccination Act (1867) Amendment Bill went through Committee. On the report being received,

Lord Redesdale moved the omission of clause 10, which exempted persons who had been fined the full penalty, or two penalties of any amount, from any further proceedings. The clause had been hailed with triumph by the opponents of vaccination, who justly thought it destroyed the whole effect of compulsory vaccination. The poor would naturally think that if the rich were let off with a fine of 20s., the penalty ought in their case to be reduced, and such a resistance to the measure would spring up that the whole object of former Acts would be done away with. The Lancaster Union had petitioned against the clause.

Viscount Halifax hoped the House would not strike out the clause, as it might entail the loss of the Bill. He admitted that there were objections to its principle, but it had been unanimously recommended by a Committee of the House of Commons. Determined opposition had been offered to vaccination by a limited number of persons, on grounds which he deemed unreasonable, and while this feeling existed, it was the opinion of Mr. Simon, the Medical officer of the Privy Council, that the penalty now proposed would answer all the practical purposes of the Act. It was desirable that the public feeling should go with the Act, which would be the case if the exceptions were very few, whereas otherwise a counter-feeling might be excited. The strongest advocates of vaccination deprecated repeated fines and imprisonments, which still left the defendants' children unvaccinated.

Lord Redesdale presumed the noble viscount would think it was useless to fine a man more than twice for drunkenness. The clause would give up the whole principle of compulsory vaccination.

Their Lordships divided, when there appeared—Contents, 7; non-contents, 8; majority against the clause, 1. The clause was accordingly struck out.

In the House of Commons,

Lord Elcho, referring to the fact that during the late war two distinguished Medical officers were sent out by the Government to accompany the French army, and to report generally on its sanitary arrangements, said he had reason to believe that these reports contained matter which would prove very valuable, not only to the Medical Department, but to civilians as well, and asked the Secretary of State for War whether he would consider the desirability of publishing those reports.

Mr. Cardwell said that the objection to publishing reports of this kind was, that officers who were commissioned to watch the proceedings of foreign armies of course were received with great courtesy, while their criticisms, to be at all valuable to the Government at home, must necessarily be free and unreserved. He therefore could not give any pledge as to publishing these reports.

Lord Elcho said that possibly the right hon. gentleman might be able to look into the reports himself, and see whether there really was anything in them that could be considered offensive to a foreign Power.

Mr. Cardwell said he should be very happy to consider any suggestion which might be put before him. But, lest he should be misunderstood, he might say that his objection had reference, not to the contents of any particular reports, but to the principle of publishing these reports at all. For if it were once understood that these reports were to be published, the

Government would get no more really valuable reports in future.

The Metropolis Water Bill was returned from the Lords with some amendments, which were agreed to.

On Saturday, in the House of Lords, the Vaccination Act (1867) Amendment Bill was read a third time and passed.

In the House of Commons,

Mr. W. E. Forster said the House of Lords had struck out of this Bill the tenth clause, which mitigated the penalties. That clause was passed in this House by a majority of 57 to 12, and expunged in the other House by a majority of 8 to 7, the total number of Peers voting being just about equal to the number of members on the Select Committee, which, after a long and careful consideration, came to a unanimous conclusion in favour of the clause. He should have had no hesitation whatever in asking the House to disagree to the amendment if the period of the session would allow of such disagreement being made without loss of the Bill; but as this was not the case, he feared the House had no choice but to accept the amendment. Although the clause was, doubtless, an important one, he might remark that it was not necessary to the other parts of the Bill. The right hon. gentleman concluded by moving that the House should agree to the Lords' amendment.

The motion was agreed to.

On Monday, amongst the Bills which received the royal assent in the usual form were the Factories and Workshops Act Amendment, the Vaccination Act Amendment, and the Metropolis Water Bills.

AUTOBIOGRAPHICAL RECOLLECTIONS OF THE PROFESSION.

No. XV.

By J. F. CLARKE, M.R.C.S.,

For nearly forty years on the Editorial Staff of the "Lancet."

A STRANGE CHAPTER IN THE HISTORY OF MEDICINE.

Animal Magnetism at University College Hospital—Experiments with it as a Curative Agent—Baron Dupotet, Laplace, and Cuvier on Mesmerism—Experiments on the O'Keys—The "Unknown Tongues" and Edward Irving—Mesmerism by Water and Metals—Sleep-waking—Unconsciousness and Insensibility from Mesmerism—Case of Imposture.

THERE is no chapter in the history of Medicine more astounding and bewildering than the episode of 1837-38, when for a time animal magnetism or mesmerism engrossed the attention of the Profession. It was not a mere popular mania, like that of "brandy and salt" or the "magnetic rings"; on the contrary, it engaged the minds of some of the greatest physiologists of the time, and its "manifestations" were witnessed by philosophers, poets, literary men, and "amateurs." Moreover, there was in the commencement of the trials of the "agent" such an air of probability and truthfulness that it convinced many of the most profound thinkers that it was a reality. Even sceptics shook their heads, and, whilst declaring their unbelief in many of the phenomena, could only exclaim with Franklin, "There is something in it." So long as the inquiry was conducted within what may be said to be reasonable bounds, no one could justly complain that it was not a fit subject for investigation. And here I think it right to say a few words upon a matter which at the time gave rise to a good deal of unnecessary vituperative discussion. Was Dr. Elliotson, in his experiments on magnetism, actuated by a true spirit of philosophic inquiry, or was he influenced by sordid and unworthy motives? Having watched him carefully throughout the entire proceedings, I am firmly convinced that his conduct, however reprehensible at last, for his credulity and the extravagances into which it carried him, was entirely free from suspicion. At the time, I differed in opinion on this point with my principal, but I never wavered in my conviction; and now that nearly forty years have elapsed I maintain that conviction. Though in the course of the inquiry he occasionally seemed to set "facts" and theories at defiance, it must be remembered that

he attempted to account for most of the phenomena obtained by animal magnetism on purely scientific and physiological grounds. That he was mistaken few will deny; but to say he was an "impostor" would be as ungenerous and unjust as to charge Johnson with imposition because he believed in ghosts. It will be remembered that when the great lexicographer was taunted with this belief, he asserted that he had seen the apparition of old Cave. When asked to describe the appearance of the apparition, he replied—"Why sir, it was a kind of shadowy being." In justice to the memory of my preceptor, it is only right to quote what he said in the course of his investigation:—"I have little respect for authorities; when I see the facts like those in the cases manipulated upon by Baron Dupotet, I must believe them. The whole Profession may laugh, but I must believe that there is a peculiar power which gives rise to the phenomena which I have observed, and that it is not sufficiently known and appreciated. They were not, however, without the authority of great men, as believers in mesmerism. Laplace, the great mathematician, second only to Newton, thus expresses himself concerning it:—"Of all the instruments which we can employ, in order to enable us to discover the imperceptible agents of nature, the nerves are the most sensible, especially when their sensibility is exalted by particular causes. It is by means of them we have discovered the slight electricity which is developed by the contact of two heterogeneous metals. The singular phenomena which result from the extreme sensibility of the nerves of particular individuals have given birth to the existence of a new agent, which has been denominated animal magnetism; to the action of the common magnetism; to the action of the mineral magnetism; and to the influence of the sun and moon in some nervous affections; and, lastly, to the impressions which may be experienced from the proximity of the metals or of running water. It is natural to suppose that the action of these causes is very feeble, and may easily be disturbed by accidental circumstances; but because in some cases it has not been manifested at all, we are not to conclude it has no existence; and we are so far from being acquainted with all the agents of nature, and their different modes of action, that it would be quite unphilosophical to deny the existence of the phenomena merely because they are inexplicable in the present state of our knowledge." Cuvier also fully admits animal magnetism. "We must confess," says he, "that it is very difficult in the experiments—which have for their object the action that the nervous systems of two different individuals can exercise one upon the other—to distinguish the effect on the individual upon whom the experiment is tried from the physical results produced by the person who acts for him. The effects, however, on persons ignorant of the agency, and upon individuals whom the operation itself has deprived of consciousness, and those other animals present, do not permit us to doubt that the proximities of two animated bodies in certain positions, combined with certain movements, have a real effect, independently of all participation of the fancy. It appears, also, clearly, that these effects arise from some connexion which is established between the nervous systems." With the authority of two such individuals, one of them a profound mathematician, the other a distinguished naturalist, there can be no disgrace in taking the trouble to inquire into the effects of mesmerism—not, of course, going into anything supernatural, but only as to its production of such effects as we have observed in other cases, such as sleep, coma, sleep-waking, loss of power and sensation in the limbs, etc.; these we often saw. So, also, we had seen persons who appeared to be asleep, but who were sensible to external objects; and, again, we saw some faculties possessing extraordinary sensibility, whilst others were more obtuse than natural. This was the extent to which the inquiry would be carried." This was extracted from a lecture delivered by Dr. Elliotson in August, 1837, and reported by myself in the *Lancet* at the time. It would have been well for science, and well for the able lecturer himself, if he had followed out his own programme. But he went far beyond the line which I am certain he had then marked out for himself. No doubt, dazzled and astonished by the effects which, as appeared to himself and others, had resulted from experiments upon the O'Keys, he was encouraged to go too far. The mere physical phenomena were sufficiently striking; but what if these illiterate and hysterical girls were gifted with a prophetic spirit? In an evil hour he determined to solve this question. It resulted in disaster. It covered for a time the subject of animal magnetism with ridicule and contempt, and ruined one of the ablest, most single-minded, and ardent inquirers that has ever existed.

It is necessary, in order to understand how Dr. Elliotson,

then in the zenith of his fame and usefulness, became associated with animal magnetism, to state a few facts. Early in the year 1837, a Frenchman, by name Baron Dupotet, obtained an introduction to him. The Baron had long practised mesmerism in France, and he had the reputation of being able to cure epilepsy and its cognate diseases or disorders by that agent. Elliotson immediately entered heart and soul into the subject. He had long been of opinion that if Medicine were to be improved in its practical value it must be by therapeutics. He used to say—"We know quite enough of physiology and pathology, but we are profoundly ignorant of curative treatment." Accordingly, he placed at the disposal of Dupotet several cases of epileptic girls then under his care at the North London Hospital. I well remember the first appearance of the Baron. He was a small, spare man, with a pale intellectual face. He did not speak English. The thumb of his right hand was wanting, and to this many attributed the results arrived at by his manipulations on sensitive and hysterical girls. However this might have been, it is certain that he succeeded in producing sleep of the most profound kind in several individuals. Moreover, the epileptic seizures, in some cases, were, for a time at least, arrested or mitigated—no uncommon circumstance when any new agent is employed. The *modus operandi* was as follows:—The patient was seated in a chair. The Baron stood before her. Fixing his glance earnestly and steadily upon her, he commenced his manoeuvres. He "passed" one or both of his hands, extended, in a perpendicular direction, commencing at the forehead, and terminating at the chin. In most cases sleep of the most profound character was speedily produced. After allowing the patient to be insensible for a few minutes, he aroused her to consciousness by passes from right to left, and from left to right. These "passes" differed from the previous ones, inasmuch as the thumb of the operator on one side, and his forefinger on the other, were applied with some force to the eyebrows of the patient, who, by this means, was speedily restored to consciousness. It may readily be imagined that, under these circumstances, patients affected with epilepsy and hysteria soon crowded the out-wards of the Hospital. Amongst others who presented themselves for treatment were two sisters, Elizabeth and Jane O'Key. Elizabeth had long been subject to epileptic fits. She was, I believe, one of the foremost actors in the farce of the "unknown tongues," which shortly before had attracted immense attention in the *séances* of that remarkable preacher, Edward Irving. (a)

At first the experiments on the O'Keys were quite legitimate and intelligible, but they soon became of a most objectionable

(a) When a boy, I constantly attended the "orations" of Mr. Irving, at the Caledonian Chapel in Cross-street, Hatton-garden. It was at the time he was in the full blaze of his popularity. His chapel was crowded, mostly by members of the "upper ten thousand," who each paid his guinea for a seat. The carriages of the audience stretched far into Holborn, and hundreds of persons were unable to obtain admission to the "conventicle." A small boy, I walked in unchallenged, and took my seat on the pulpit-steps. I had the gratification of hearing his great sermons on the "Prophecies" and "Judgment to Come." No addresses ever given from the pulpit were more fascinating or more astounding. The preacher—a tall gaunt man, with prodigious energy, and a voice of surpassing power and sweetness—rivetted the attention of his audience. He had a face indicative of great mental power, and a forehead of grand proportions. He had, moreover, a squint, which gave to his eyes, on occasions of unusual importance, a power and attractiveness it is impossible to describe. I remember, at the interval of thirty-six years, with what delight I listened to his marvellous harangues. He had chosen for his text, on one occasion, a single line from the prophecies of Daniel—"And dominion was given." Never shall I forget the masterly manner in which he handled the subject. The great Napoleon Bonaparte had died only four or five years before. His memory was fresh in the minds of all, and the influence of his great achievements was still felt and acknowledged. Irving had a strong, and, I believe, an honest, conviction that the second coming of the Messiah was at hand. His argument was to the effect that "dominion" had been given to Bonaparte as a preparatory step to that advent. "Dominion," he said, was given to Alexander as a foreshadow and preparation of the first coming. "He conquered from the shores of the Euphrates to the Ganges; and Bonaparte conquered as wide a range of the civilised globe." His "heresies" drove Irving from Hatton-garden, and his admirers built and endowed for him the church in Regent's-square, so long presided over by the late amiable and able pastor, Dr. Hamilton. But symptoms of that aberration of mind, to which, in his later years, Irving's splendid intellect succumbed, had begun to develop themselves, and he was soon ejected from his new "tabernacle." He afterwards preached in Newman-street and at Islington-green, and other public places. It was at a meeting at Islington-green that Elizabeth O'Key first developed her powers as an enunciator of the "unknown tongues." There was an epigram published at the time, and now all but forgotten. It is not altogether unworthy of being repeated here, to show of what kind of jargon the "unknown tongue" consisted. A literary man, of some repute at the time, was present at one of these exhibitions. The only words he could clearly make out were "Bowley Bum." He wrote:—

"The meaning of Bum I know very well,
But the meaning of Bowley I cannot tell;
But it seems to me a regular 'hum'
To listen to girls chaunting 'Bowley Bum.'"

character. Elizabeth O'Key was a girl of about 17 years of age, and of extraordinary cleverness and shrewdness. She was below the middle height, indeed rather diminutive, but she had a fine expression of features and a well-formed head. She had full dark eyes, with long black lashes, "the jetty fringe" falling upon her cheek in such a manner that it was sometimes quite impossible to tell whether she was asleep or not. That this peculiarity gave her immense power in appearing to be asleep when she was not I am quite convinced. I am, moreover, convinced that she feigned some of the phenomena which were exhibited, whilst I feel as certain that others were really the production of "mesmerism." Thus, I believe that the sleep, coma, and sleep-waking(b) were the result of the passes, or of the influence of the nervous system of the operator, upon the person operated upon.

One of the most curious circumstances connected with the mesmeric experiments was that under the influence of the "agent," O'Key expressed herself in a peculiar manner. She clipped her words, and talked on subjects quite different from those which occupied her mind at the time she was operated upon. When she returned to her usual condition, however long the interval, she would resume her natural way of talking, and would pursue the train of thought which occupied her mind at the time she was placed under mesmeric influence. This was a fact, I believe, few at the time disputed. At all events, it was one of the few experiments which, after being repeated again and again, appeared to be satisfactory, inasmuch as the results were invariable. That, under mesmeric influence, she and her sister Jane—a tame prototype of Elizabeth—were quite insensible to pain, as were many others, I do not doubt. Some of the means employed to test their insensibility were of a very cruel kind, and such as Dr. Elliotson and those who acted with him did not countenance. But some of the spectators resorted to them without the knowledge of Dr. Elliotson. Thus, on one occasion, a needle was discovered to have been inserted in a very sensitive part, and its presence was unknown to O'Key.(c)

It is unnecessary to follow in detail all the various experiments which were performed to test the powers of mesmerism. Indeed, the reports which at the time appeared contain so much irrelevant matter—I may say, so much "twaddle"—that it is marvellous that they were permitted to appear in the pages of a Medical journal. It must be remembered, however, that the *séances* were attended by many of the most eminent persons of the time, and the public mind was much agitated on the subject. I avoid referring particularly to the nonsense talked by O'Key in the mesmeric state, however amusing it sometimes was; it had, in my opinion, no bearing upon the *physical* phenomena she exhibited. Amongst some of the more unsatisfactory experiments(d) were the attempts to prove that O'Key could be mesmerised by water, and by being placed in contact with various metals. Thus, it was attempted to be shown that water "mesmerised" by placing a finger of the operator in the fluid for a few seconds, would "magnetise" O'Key the moment she brought her mouth in contact with the water. It was further attempted to be shown that, if two fingers were placed in the water instead of one, the effect was more decided. Dr. Elliotson believed in the "measurement" of the agent, as it were, and would "mesmerise" one sovereign by holding it in the hand for a few seconds, and then repeat the experiment with two sovereigns, to show the more powerful influence of the latter when touched by O'Key. Experiments of this kind—and they were many—were repeated, and before audiences who for hours together waited with the greatest patience to witness the results. There were so many sources of fallacy in them that it is marvellous that there could be found any persons who could place any reliance upon them. The late Mr. Faraday did not; but Sir Philip Crampton and Mr. Herbert Mayo (one

foremost amongst Surgeons, the other "*nulli secundus*" as a physiologist) did.

To my mind, these experiments were complete failures. There were no consistent results. So, again, the experiments which were performed to determine whether O'Key could be mesmerised by reflection were failures. These experiments were performed as follows:—A small hand-mirror was held at some distance from O'Key, whose back was turned to the operator, and certain "passes" were made, with the expectation of her being "fixed" by this means. Of course, expecting something was going on, she occasionally dropped into the arms of those near her; but the results of these proceedings were so uncertain that I attached no importance whatever to them. It is a fact which will scarcely be credited at this time, but is not the less a fact, that on one occasion I saw Dr. Elliotson, Mr. H. Mayo, and Dr. Lardner, at one end of the North London Hospital, O'Key being at the other, "passing" a small mirror, at a distance of sixty yards, with the expectation that they could "fix" her. She was, after an interval, fixed, and the operators believed from the influence exerted upon her by the reflected "mesmeric rays"!

One experiment stands out in striking contrast to those just mentioned; it was one of the most extraordinary kind, but could not be questioned as to the fairness with which it was performed, nor as to the result. An eighty pound weight, placed on the floor, was attached by a rope to O'Key's right arm, which was carefully bandaged to prevent any injury to it. A few "passes" were made above her arm, and the weight was lifted two or three inches from the ground—this, too, at an angle the strongest man could not have effected. The explanation given was "a convulsive action of the muscles, consequent upon mesmerism." Now succeeded a course of experiments to prove that one of the perceptive faculties—"sight"—could be exerted successfully (to use the language of Mr. Mayo) "in unaccustomed corners and angles of the frame." Experiments on this point were tried over and over again, but not a single satisfactory result was obtained. It seems ludicrous even to read of, and how much more so was it to witness, a watch placed at the pit of the stomach, or at the point of the elbow, with the expectation of O'Key being able to *see* the time! It might be supposed that credulity could not go beyond this. I shall, however, in my next show that it did, and with disastrous results to mesmeric prophecy and Dr. Elliotson.

ARMY MEDICAL DEPARTMENT.

THE Director-General of the Army Medical Department presents his compliments to the Editor of the *Medical Times and Gazette*, and begs to inclose for insertion a list of candidates who have competed successfully for appointments in her Majesty's British Medical Service at the examination held at the London University on the 9th inst.

Army Medical Department, August 22.

List of Gentlemen who Competed successfully for Appointments as Assistant-Surgeons in her Majesty's British Medical Service at the Competitive Examination held at the London University on August 9, 1871.

Order of Merit.	Name.	Marks.	Order of Merit.	Name.	Marks.
1.	Cottle, E. W.	2060	8.	Bridges, W. P.	1875
2.	Connolly, P. S.	2055	9.	Rogers, J. G.	1865
3.	Dwyer, C. E.	2020	10.	Ash, R. V.	1825
4.	Blood, R.	1970	11.	Grant, W. C.	1782
5.	Fasken, W. A. D.	1959	12.	Connolly, B. B.	1720
6.	Edge, J. D.	1890	13.	Barrow, H. J. W.	1665
7.	Drury, R.	1885	14.	Barrow, F. E.	1654

THE Committee of the Seamen's Hospital have, through their secretary, written to the Privy Council, urging that, in view of the anticipated early appearance of cholera in the port of London, they are of opinion that the sanitary inspection day by day of all ships, barges, etc, in the River Thames from London-bridge to Woolwich, together with the Regent's Canal and the several docks, basins, and creeks adjacent, is a work of such public importance that it should not be left for voluntary performance by a charitable institution armed with no authority whatever, and, moreover, dependent even for its ordinary expenditure on the bounty of charitable individuals to the extent of £5000 in every year.

(b) Dr. Elliotson explained in his observations that we were ignorant of the causes of many of the phenomena connected with the nervous system, but many of these, if not all of them, he contended, might be produced by mesmeric influence. He particularly dwelt, on several occasions, on the remarkable state called *somnambulism*, which bore in most respects a close analogy to the sleep-waking of O'Key, who could be put into a state of unconsciousness and insensibility at the will of the operator. In this state, O'Key could answer questions, perform different feats she could not do in her normal state, and when roused to consciousness would have no recollection of what had occurred in the abnormal condition in which she had been placed.

(c) There was, however, one case operated upon—a girl of the name of Ross—which would appear to throw some doubt on this point. This girl having been put *apparently* under the influence of mesmerism, requested that two of her teeth might be extracted. They were extracted without the slightest evidence of pain having been inflicted. This girl afterwards admitted that she was "shamming."

(d) These were afterwards repeated by Mr. Wakley, and proved to be mistakes, as I shall show in a future article.

BRITISH ASSOCIATION
FOR THE ADVANCEMENT OF SCIENCE.

REPORT OF THE FORTY-FIRST MEETING.

EDINBURGH, August 9, 1871.

ANTHROPOLOGICAL DEPARTMENT.—(Continued.)

ON DEGENERATION OF RACE IN BRITAIN.

By Dr. J. Beddoe.

THE athletic movement in English schools and elsewhere was doubtless in part due to an undefined idea that the development of the body was becoming neglected as civilisation progressed. But the good results of this movement are by no means unmixed, and, such as they are, they affect chiefly those classes which stood least, or among the least, in need of improvement. There is still as much need as ever that the facts relating to this subject of national physical degeneration should be investigated and confronted; and the late Franco-German war has opened the minds of many to this necessity, by once more demonstrating that victory marches with the armies of those whose physical as well as their moral organisation is superior. We are told that the inferiority of the soldiers of France to those of Germany was as conspicuous in their size, strength, endurance, and marching power as it was in discipline and subordination. It is true that the Germans were, to a somewhat greater degree than the French, the picked men of their country; but this, though it prevents the comparison of the two from being altogether fair as between the two countries, in no way impairs my argument, for if the Germans were picked men, they were picked on physical grounds, and the value of their physical superiority remains equally conspicuous. Looking at the matter *à priori*, one would say that in some classes and in some districts it is not unlikely that some improvement may be taking place. Some of the conditions of life are improved and improving—for example, in the upper class of townspeople, who are, on the whole, more healthily lodged, and perhaps less sedentary than they used to be. The Factory Acts have checked the deteriorating agencies of our manufacturing system. The peasantry of some parts of Ireland, the Highlands, and Wales may be better fed than they were a generation back. It does really seem as if the cotters of Cardiganshire had improved in physical development since the last century, when they are described by a traveller as five feet two or three inches high, whereas now they are not a remarkably small people. But, on the whole, I much fear that the conditions, the *milieu*, as the French anthropologists call them—which act on the physique of the British, tend rather to grow worse than to grow better. To begin with, there is the one great and inevitable evil—the gradual accumulation of our people into large towns, and the relative, and often even absolute, dwindling of the rural population. Large numbers of people are constantly being employed in in-door occupations, mostly sedentary, and some nocturnal and exhausting; and the demand for the labour of women and children also increases. Changes are taking place in the dietary of the working classes, and, as their wages rise, it seems to be supposed that they are better fed, but on closer investigation this seems very doubtful. Of the four countries—England, Wales, Scotland, and Ireland—the first, which is the richest, and considered to be the most advanced in material civilisation, and whose habits and modes of life are more and more imitated by the others, is, according to Edward Smith's reports on the subject, the one in which the people are most scantily and ill-nourished. The scarcity of milk especially, as to its supply to children in towns and in dairy districts, is a growing evil, and one of national importance. Here I may mention, as having probably a relation to the quality of the food, and possibly to this very defect of milk, the apparently growing evil of unsound teeth, which, again, seems to advance *pari passu* with the advance of material civilisation, and is worst among the English and the townsmen of the United States, not so conspicuous among the Scotch, and decidedly at the minimum among the Irish. Certain changes in the process of natural selection, as it operates on our people, seem to me to be on the whole detrimental to the standard of physical type. Emigration drains away large numbers of the stronger and more energetic young men from the best of our districts; so do the military and civil service in India; and the voids are supplied to a less extent than they used to be from the rural population, wherein the rates of marriage and of birth are much less than in that of the towns. The classes that yield

the largest number of births are, beginning with the least important—1st, fishermen; 2nd, miners, especially coal-miners, and the like; 3rd, the proletariat of large towns. Whatever may be said of the two former, this last and most important is, physically, about the worst developed in the kingdom. Formerly it did not tend to increase in numbers, relatively, to other classes, because the death-rate in the worst quarters of towns was so high as to balance or overbalance the birth-rate—such was the case not long ago in Liverpool, for example. But the effect of sanitary improvements has been so considerable, that the rates of sickness and death in these quarters are being decidedly ameliorated; and this improvement, regarded dispassionately, is no more an unmixed good than are good things in general; for the increase in the number of survivors brings about a disproportionate augmentation in the numbers of the class in question, and thus lowers the average standard of physical development. In thus speaking of probable causes of physical degeneration, I am merely giving a sketch of a few of them by way of example. Many others will readily occur to those who give but a few moments' thought to the subject. My object really is, to urge on those who have leisure, opportunity, and goodwill to assist in working out a very practical and important department of anthropology, or, if you prefer it, of social science, that they should direct their efforts to the collection of facts bearing upon it. Thus a careful examination of the registers in a few densely peopled districts, checked and supplemented by personal inquiry by persons of local knowledge, might clear up much that is yet doubtful about the acclimation of new-comers in towns, and the operation on them and on the natives of natural selection. It seems desirable also to me, and not only to myself, but to divers men of eminence and weight as scientific inquirers, among whom I am permitted to name Mr. F. Galton and Dr. Farr, that the actual average condition of our population, or of some representative sections of it, as regards stature, bulk, strength, and like particulars, should be ascertained as exactly as possible, so as to furnish a starting-point for further inquiries.

Discussion.

THE PRESIDENT said that of late years he had had through his hands a large number of the crania of ancient inhabitants of these islands; and it was most interesting to compare the teeth in the skulls of these more primitive people with the teeth in the skulls of the moderns. He hardly ever found decayed teeth in one of those ancient craniums, whereas he scarcely ever found the skull of an adult modern in which some of the teeth were not decayed, while a considerable number had lost their teeth altogether; so that it was clear that, whatever advantages civilisation might bring, it did not improve the condition of the teeth.

MR. PICTON thought that if the conclusions were true at which the writer of the paper had arrived, it was indeed a lamentable future which we had before us. But he confessed that he could not come to the same results; nor did he think that any of the statements put forward by Dr. Beddoe would at all bear out those conclusions. It would be admitted on all hands that our population never increased so fast in the whole period of our history as it had done during the past century. Did that indicate a better or a worse state of health? It was generally considered as being an evidence of the good sanitary state of a community that the death-rate was diminishing—that was, conversely, of course, that the population was increasing. All the efforts of our sanitary reformers, and the laws passed every session on sanitary affairs, were in that direction. He rejoiced when the death-rate was diminished, and considered it an indication that our population was improving in constitution, in physique, and in health. He was not aware whether the present standard of the French army was higher or lower than it was at the time of the Great Napoleon. He rather thought it was higher. But, taking our own army, the standard of recruits was, he believed, not lower, if it was not higher, than it was forty or fifty years ago, which did not, in that respect, indicate any diminution in the average size of our population. With the hours of labour shortened for the working population, with better wages for them, and with greater means of comfort than were before placed at their disposal, it would indeed be strange if the result should be a deterioration of our race. He could not believe it. All the facts of the case seemed to him to warrant an opposite conclusion.

DR. KELBURN KING wished to say a word in favour of little men and middle-sized men, as against large men. The French, as a general rule, were a smaller race than the Germans; yet, as a matter of fact, the small men of the French nation had beaten the big men of the German nation; and it was quite on the cards that they might do so again. The fact of the French

having been defeated on the last occasion need not make the little men despair. They had the history of the past, and the hope of doing better in the future.

Mr. VIVIAN would advise men to go in for teetotalism if they wished to enjoy many days.

Mr. SEWELL pointed out that the deterioration of agricultural labourers in the North of England had been attributed to the immoderate use of tea. If any change had come about, it was, to a great extent, owing to alteration in our national beverages. He wished all his friends drank good, pure beer, or, if they did not like that, good, pure milk; but he was afraid it would be a long while before they got those things in sufficient abundance and purity to keep them all in good health.

Professor BELL, St. Andrews, said there could be no doubt of the fact that one-half of the human family died, all the world over, before they reached 14 years of age; and that of this proportion something like one-half in our large towns died before they reached 10 years of age. Examining the statistics on the subject more closely, he found that, before children were 1 year old, a much larger mortality occurred; and when he came to analyse the matter still more, he found that the diseases which created that large mortality were preventible diseases—diseases chiefly to be put down to improper rules regarding food, air, and clothing.

ON CENTENARIAN LONGEVITY.

By Sir Duncan Gibb, M.D.

The author recorded the facts of four persons he had seen, and who had reached 100 years. In them all the functions of breathing and circulation were performed with the most complete and perfect integrity, there being an absence even of those changes usually seen as the result of ordinary old age. The chest was well formed, and of fairly good capacity; the cartilages of the ribs were not ossified; the voice was good, clear, sonorous, and powerful, though a little cracked and tremulous in tone—its power depending upon the capacity of the chest and integrity of the lungs. The heart—the great organ of the circulation—was quite healthy, and free from the chief sources of trouble in old persons—namely, fat or its compounds. The circumstance, although it did not prevent moderate calcification of the bloodvessels, yet was a conservator of all the tissues of the body, and especially prevented the occurrence of those changes which tend to shorten life. There was an absence of the atheromatous changes commonly observed in old people. This explained the appearance of the countenance in all, and imparted a sort of silvery expression, with apparently great toughness of the skin, which the author deemed an essential peculiarity in persons over 90. All the special senses were unimpaired except hearing. The eye was clear in all, the sight excellent, all could read ordinary type without spectacles; there was no arc or ring round the clear part of the eye, as observed in most old people. The sense of smell was good; none smoked, used snuff, nor chewed tobacco. The hearing was somewhat impaired in three; in one of the males it was so acute that he could hear the slightest sound. The mental faculties were active in all, the memory good. The general health was capital in all, appetite and digestion good—the latter, indeed, uncommonly strong; all possessed the good, sound teeth they had masticated with when young. From this it was readily understood their digestive powers were capital. Taking, then, the condition of mind and body presented by the four undoubted centenarians, it may be said that in all there was an absence of those changes usually observed in persons approaching the allotted period of threescore and ten. These changes have reference chiefly to the condition of the bloodvessels and other tissues which are so seldom found absent. Suffice it to say that complete composure of mind throughout life has had much to do with the condition of body permitting the attainment of such great longevity; there was no hereditary condition; also, to interfere with nature's laws under such circumstances. Climate does not seem to interfere with longevity, for centenarians are said to be numerous in Russia. To reach that age not only must the constitution be a naturally good and healthy one, but all the great functions of life must be performed without any impediment. If the special senses are co-ordinately good, they assist in keeping up the condition favourable to longevity. But there is one change antagonistic to extreme longevity, and it is the most important one—namely, the predominance of the atheromatous element which leads to those changes, in the bloodvessels especially, which close life at the natural period. Simplicity of regimen and avoidance of those elements of food which in their assimilation help to bring on those changes may ward it off altogether, although the author

was not able to make out whether the four centenarians he spoke of had been in any way particular on this point. In conclusion, he said he believed all centenarians were tired of life, however extraordinary it might appear, and were thankful when it pleased God to remove them from this world.

ON THE COMPARATIVE LONGEVITY OF ANIMALS OF DIFFERENT SPECIES AND OF MAN, AND THE PROBABLE CAUSES WHICH MAINLY CONDUCE TO PROMOTE THIS DIFFERENCE.

By George Harris, Esq., F.S.A.

The author stated that authors of high repute and great credit—modern as well as ancient—afforded extraordinary accounts of the longevity attained by certain animals. Smellie, in his "Philosophy of Natural History," mentioned some instances. Elephants lived beyond 200 years; in proportion to the size of their bodies, birds lived longer than either man or quadrupeds; and swans had been said to live 300 years. Buffon informed his readers that he had seen carps of 150 years of age; and he mentioned one which he supposed to be 200 years old. Pike had been known to live to 267 years; and parrots and several other animals, including some reptiles, were also said to afford extraordinary instances of longevity. Few domesticated animals were long-lived. The habits into which they were forced were contrary to nature. They took but little exercise; they fed on artificial diet; and their instincts became blunted. It was, accordingly, among wild animals that extraordinary instances of longevity were afforded. Passing on to speak of longevity in man, Mr. Harris said it might be assumed that the real and only scientific test as to the capacity of any particular individual frame to last for a greater or less period of time, turned on the constitution of such frame, whether as regarded its material texture, its temperature, its organisation, or its fluids, more especially the blood. Proved longevity depended mainly on natural constitution. Nevertheless, inasmuch as whatever might be the natural constitution, there were certain causes which would tend to abridge longevity—such as incontinence, intemperance, unwholesome diet, and adopting many artificial habits—were there not, also, certain causes which, in a corresponding manner, would tend to increase longevity? In fact, the real and sole question which arose was, Could any measure be adopted which would have the effect, to any important extent, of checking waste or expenditure on the one hand, and of increasing growth or reproduction on the other? And this was a subject open to experiment, in many ways, of a most interesting kind.

Discussion.

Dr. MURIE had examined about 5000 animals; and the very diseases which he had ordinarily found in man he had discovered traces of in those animals—only, in some cases, modified. He had found consumption—modified in many ways, but still pure consumption—disease of the heart, disease of the bowels, diarrhoea, dysentery, and all the affections of the stomach and the intestines; and these were all produced by the same causes which we, as beings ourselves, were subject to.

Mr. RAY LANKESTER desiderated the statement of any new facts in the last paper. They had all been before the public for a considerable length of time. What they wanted was the result of further observations, and the sifting of evidence.

The PRESIDENT asked, with reference to what had fallen from Dr. Murie, if the animals he had examined were not all animals living in a state of confinement? One could hardly look upon animals in confinement in the Zoological Gardens as animals living altogether in a natural condition. He should be inclined to think that the diseases which Dr. Murie found in these animals were due to precisely the same causes as the diseases of civilised men—such as confinement, crowding together, want of exercise and of natural and proper food, and various circumstances of that kind.

SECTION D.—DEPARTMENT OF ZOOLOGY AND BOTANY.

Dr. Wyville Thomson presided over this department, and read a very able paper on "The Structure of Cronoids."

ON THE DEVELOPMENT OF FUNGI IN THE THORAX OF LIVING BIRDS.

By Dr. Murie.

Dr. Murie referred to the circumstance of lowly organised vegetable structures being not unfrequently found growing in animals and man, both externally and internally. For the most part these affected the skin, giving rise to several cutaneous diseases. They also flourished in the alimentary canal; and among others, one peculiar form (*Sarcina*) had been described by the late Professor Goodsir; from the human

stomach. In nearly though not all instances where vegetable organisms flourished within the living body, it was in organs where a certain amount of air had free access. It was more difficult, though, to account for the cases where vegetable parasites arose in (so to speak) closed cavities. The instances which he (Dr. Murie) brought forward as coming under his own observation were three in number—viz., a fungus-like growth in the abdomino-pleural membrane of a kittiwake gull, a great white-crested cockatoo, and a rough-legged buzzard. After a general description of the specimens in question, the author referred to them as in some ways bearing upon those doctrines whereby living organisms were supposed to originate out of the tissues themselves. Other weighty reasons undoubtedly might be given to the contrary; but as every fact, either furnishing doubtful evidence of, or opposed to, the spontaneous generation theory might be useful at the present juncture, he thought a record of such worthy of being brought before the Association.

Mr. COOKE and Professor PERCIVAL WRIGHT questioned whether the vegetable structures spoken of by Dr. Murie might not be Algæ.

Dr. BASTIAN said the question calling for most consideration was, how these vegetable forms came to be found in a place cut off entirely from communication with the atmosphere. After mentioning the hypothesis that the spores of the fungi or algae might have penetrated the tissues of the lungs or other vessels, and so reached the thoracic cavity, he explained his own views on the subject, illustrated by his experience in finding in the brain, and other portions of the human body isolated from the atmosphere, immense numbers of living organisms shortly after death, which, so far as could be ascertained, had no existence when the patient was alive. Either these organisms must have been previously present in the blood in a latent state—their germs being so minute as to be undistinguishable—or they must have come into existence by spontaneous generation.

ACTION OF HEAT ON GERM-LIFE.

By Dr. Crace Calvert.

The paper described a series of experiments made by the author for the purpose of determining the effect of heat on living organisms. He took a solution of white of egg full of microscopic life, and a solution of gelatine full of microscopic life, as also solutions of sugar and hay. These solutions were put into little tubes and submitted to temperatures of 100°, 200°, 300°, 400°, and 500° Fahr. It was found that at 100° the living organisms were not at all affected; at 200° they were not affected; at 300° they were still alive—three or four vibrios in each field; and it was only at 400° that life disappeared. The same solutions were then put on little slips of glass, dried, some in the air and some at a temperature of 212°, and introduced into tubes. As before, it was only at 400° that life disappeared. By another experiment, it appeared that in a fluid where life had been destroyed by heating to 400°, no life was subsequently developed; whereas in one which had been heated to some of the lower temperatures, such development took place. If, said Dr. Calvert, there was such a thing as spontaneous generation, he could not understand why there should not have been life reproduced in his tubes which had been heated to 400°; whilst a little life was reproduced in one heated to 300°, and more in one heated to 200°. It appeared to him that Medical men would do well to consider the temperature at which life was destroyed. Admitting that contagious disease was due to the introduction into the system of a germ of some kind, either vegetable or animal, so far as his experiments went, a temperature of 400° was necessary to destroy such germs on clothing to which they might have become attached.

ON PROTOPLASMIC LIFE.

By Dr. Crace Calvert.

If the white of a fresh egg be taken and mixed with water and examined under the microscope, not the slightest life was to be seen, but at the end of twenty minutes or half an hour, plenty of life might be discovered. In such experiments a fluid must be employed, and whatever fluid was employed, if examined under the microscope, it showed life. Common distilled water, if kept for two or three days, showed life; but after many failures, he discovered an apparatus by means of which he had been enabled to get distilled water which would keep free from life for three months. Having thus got a pure medium without life, the question was whether he could generate life in it. He introduced distilled water into twelve tubes, and left them exposed to the air for twenty-four hours. It was in winter; in the summer he should have left them for ten minutes. Another series of tubes were placed near putrid meat, and then closed. Life appeared in twenty-four days in

the tubes containing distilled water which had been exposed to the air, but a portion of the same water which had not been exposed to the air showed no life. The tubes which had been placed near putrid meat showed life in eight days. The distilled water was thus impregnated with more life by being placed near a source of putridity. Up to this point he had been using hydrogen to wash his apparatus. He replaced the hydrogen by oxygen, and found that by using water saturated with oxygen he produced life in three or four days instead of eight days. Then taking water into which a little albumen had been allowed to run without being exposed to the air, he found life developed in two days. The general result of the experiments was, that life was produced if the fluid under examination was left exposed to the air for a very short period. If perfectly sweet eggs were covered with varnish, they would keep for eighteen months, while if not so covered they would not keep as many weeks. But if there was such a thing as spontaneous generation, why should not the egg covered with varnish decompose as soon as the other?

Dr. NEVINS said the Rev. Mr. Dallenger, of Liverpool, by means of experiments with water produced by the combination of hydrogen and oxygen, had arrived at similar results.

Mr. MACKNIGHT expressed a hope that the experiments which had been described would set for ever at rest, unless something could be shown in opposition to them, the miserable delusion of spontaneous generation, and that the scientific world would not be bothered with the resuscitation of exploded errors.

Sir WALTER ELIOTT remarked that it was only fair and philosophical to carry on inquiry as long as anything could be gained by it, and not to set down a question as settled in the present state of our knowledge.

Dr. BASTIAN said that Pasteur had admitted that various organisms were destroyed in fluids at the temperature of boiling water. Similar statements had been made by Huxley. Indeed, with the exception of perhaps a few individuals, he should say it was Dr. Calvert against the great mass of biologists and chemists who had argued the question, when Dr. Calvert wished them to believe that organisms were not destroyed in boiling water. Again, Dr. Calvert had not explained in any way how he found out that in some of his experiments the organisms remained alive. He (Dr. Bastian) had made very simple experiments to test the question at issue. On boiling pond-water he found that, when the fluid was heated to 60° C. or 140° Fahr., and exposed for ten minutes to that temperature, the amœbæ and infusoria which it contained were destroyed. So, also, with regard to the bacteria and vibrios, referred to by Dr. Calvert, he had found that they were apparently killed by being exposed to 60° C. Then he had found that, while a certain solution, if unboiled, would soon become quite turbid and swarming with vibrios, the same solution, if boiled, might be kept for weeks without such development. The results of his own experiments, as well as those of others, he found it very difficult to reconcile with the presence of germs in the atmosphere.

Dr. CALVERT, in replying, claimed to be able to distinguish a living vibrio from a dead one.

SECTION C.—GEOLOGY.

ON GEOLOGICAL SYSTEMS AND ENDEMIC DISEASES.

By Dr. Moffatt.

In a paper which he read last year, the author had stated that the district in which he lived consisted geologically of the carboniferous and the new red or Cheshire sandstone systems; and that the inhabitants of the former were engaged in mining and agriculture, and those of the latter in agriculture chiefly. Anæmia with goitre was prevalent amongst those on the carboniferous system, whilst it was almost unknown among those of the Cheshire sandstone, and phthisis was also more prevalent among the former than the latter. As anæmia was a state in which there was a deficiency of oxide of iron in the blood, he examined chemically the relative composition of wheat upon a soil of Cheshire sandstone, carboniferous limestone, millstone grit, and a transition soil between the Cheshire sandstone and the grit. The analysis showed that wheat grown upon Cheshire sandstone yielded the largest quantity of ash, and that it contained a much larger quantity of phosphoric acid and oxide of iron than that grown upon the other formations. The analysis also showed that the wheat grown upon the carboniferous system was deficient in phosphates or nutritive salts. With the view of ascertaining whether the bread of those who dwelt upon the two systems was relatively as deficient in the nutritive elements as the wheat, he collected twenty samples of bread used by twenty different families living on each system, and the analysis afforded results as conclusive as the examina-

tion of the wheat. The deficiency of the nutritive salts in the bread, compared with those in the wheat, was remarkable, no doubt owing to the removal of the bran from the flour with which the bread was made. From statistics it was found that the number of deaths from anæmia was greater on the carboniferous than on the new red sandstone system at all elevations, and that there was a greater number of deaths from cancer on the red sandstone than on the carboniferous system. The number of deaths from struma diminished with the increase of elevation. On the carboniferous formation on both sides of the estuary of the Dee, at a mean height of 30 feet, the number of deaths per 1000 of population from struma was 14 and 22 greater than it was on the Cheshire sandstone of nearly the same elevation; while at a mean height of 500 feet it decreased to only three above it. This diminution with elevation in the death-rate of strumous persons he attributed to meteorological causes, the chief of which he believed to be atmospheric ozone. The practical deductions to be drawn from this inquiry were, that all young persons living on a carboniferous formation having symptoms of incipient goitre and anæmia ought to be moved to a soil upon red sandstone; that persons of strumous habit ought to reside upon sandstone of an elevation of at least 800 or 1000 feet above the sea; and that both classes of persons should live upon food—both animal and farinaceous—which contains the maximum quantity of oxide of iron and the phosphates of nutritive salts. Medical men could not too much impress upon the minds of the public the importance of using flour made from the whole of the wheat or “whole grain.”

Mr. G. A. LEBOUR, H.M. Geological Survey, said that in a part of Northumberland, where the carboniferous district contained a thin bed of limestone, the inhabitants suffered very much from goitre.

Professor YOUNG said that those who undertook investigations of this kind should limit their examinations to one class of diseases, or a group of diseases, sufficiently distant pathologically as not to interfere with one another.

Sir RICHARD GRIFFITH said that in Ireland they had plenty of carboniferous limestone, and not a case of goitre was known in those districts.

Professor HULL added his testimony to the healthful character of the new red sandstone of England as a foundation for houses and towns. He thought the towns of England should be built on the sandstone, and that the coal measures should be given up to the production of coal, oil, etc. In Birmingham, which had never been visited by cholera, the new red sandstone was peculiarly adapted to promote the health of the inhabitants. It was porous and dry, and the most wonderful natural filter which existed in these islands. However, the most healthful situations and formations might be converted into pestiferous dens by the neglect of ordinary sanitary arrangements, and he hoped that increased attention would be paid to those ordinary sanitary arrangements.

A MEMBER said he thought Dr. Moffatt's deductions were mere coincidences, and that they were not traceable to the causes to which he referred. The character of the food was very fluctuating, depending as it did on the state of the markets and crops, and it was also a fact that the people were largely fed with food which was imported.

Dr. MOFFATT, in his reply, said that goitre was found to decrease after the introduction of a different kind of food. He also mentioned that the sheep in that district were peculiarly subject to anæmia.

SECTION F.—ECONOMIC SCIENCE AND STATISTICS. PRESIDENT'S ADDRESS.

The President of Section F, Lord Neaves, in his introductory address, dwelt with much common sense and not a little quiet humour on various topics. That relating to the deductions from the Registrar's returns was, perhaps, best. On this point he said that the Registrar-General's returns for Scotland were in a very satisfactory state, and in respect to vital statistics Dr. Stark's reports contain the most valuable and most interesting information. One singular result that seems to have been established by the tables there given is, that at every quinquennial period of life from 20 years of age up to 85, married men die in Scotland at a much lower rate than unmarried men. Sometimes the difference is very great, particularly between 20 and 45, up to which period it approximates to as high a rate as two to one; but after that, the difference, though less, is still very considerably in favour of the married men. The subject is more complicated as regards women, from obvious causes, though here, too, marriage seems to be the more favoured state. As regards

both sexes, the advantage on the side of marriage is easily accounted for up to a certain point. Generally speaking, those who marry are likely as a class to be better lives than those who do not. The unmarried will infallibly include a greater number of sickly or diseased constitutions than the married class. Without professing myself an implicit believer in Darwin, I acknowledge the truth of several of his statements in his “Descent of Man,” as to what he calls sexual selection. As a general rule, the attachments that lead to marriage will be prompted by considerations that are intimately connected with health and strength. Good looks, cheerful tempers, and buoyant constitutions are great attractions, and those who are wholly devoid of these, as well as those who are the victims of bad health, will often be excluded from having tickets in the matrimonial lottery. No doubt, causes occur not unfrequently which disturb these natural tendencies. Some of these causes are allowable or laudable, others are the reverse. In a few cases affection leading to marriage may be inspired by great virtue, or by great talent, or high accomplishments, though not associated with health or strength. In other cases, connexions may be formed that are wholly unconnected with love—as where rank, or wealth, or influence may overcome the natural repugnance excited by deformity or disease. Burns I think it is that says—

“Be a lassie ne'er sae black,
If she hae the penny siller,
Set her upon Tintoek tap—
The wind will blaw a man till her.”

Still, as a general rule, both men and women who are married are likely, on an average, to have more health and vitality than those who remain single. As regards the male sex, again, those of them that are of dissolute habits or unsettled and thriftless dispositions are not so likely to marry as those who are orderly and well-conducted, and in favourable circumstances of life. But after making allowance for these elements, it still appears that the death-rate of married men is at all periods of life lower than that of the unmarried. This can be accounted for only on the footing that marriage is favourable to health by conducing to regular habits of life, and by giving natural scope to the domestic affections. It cannot be doubted, for instance, that an old man who has a wife to take care of him will be much better looked after than if he lived alone. It is not necessary, in adopting this view, to suppose that the married life is to be wholly free from sorrows, cares, and anxieties. Even these are not always prejudicial to health, and we are, perhaps, the better for them when they are well encountered. Neither is it essential that the matrimonial current should always run a smooth course. Most of us, probably, would agree with the view taken by Paley, who, when an old clergyman at an episcopal dinner asserted that he had been married for forty years, but had never had a difference with his wife, observed quietly to the bishop that “it must have been very flat.” An occasional ripple will occur in all water, unless it be frozen over, and perhaps after marriage, as well as before it, there may be truth in the maxim, “Amantium iræ amoris redintegratio.” In referring to this matter, it has occurred to me to consider whether, if the lower death-rate of married persons is an ascertained fact, this may not partly account for the general success of life insurance offices when well conducted. It is clear that an office transacting on the usual calculations of mortality has advantages of various kinds. In particular, its Medical examinations, which are a most important part of its constitution, exclude hazardous lives, except, at least, at extra premiums. The rank of life, probably, of parties effecting insurances may also benefit the office; but if married men are to a certain extent to be considered as selected lives, this also, I should think, must tell in favour of the office.

ON THE SCIENTIFIC ASPECTS OF CHILDREN'S HOSPITALS.

By Dr. William Stephenson.

The Edinburgh Sick Children's Hospital was established eleven years ago to provide for the reception and Medical treatment of the children of the poor during sickness, and to promote the advancement of Medical science, with reference to the diseases of childhood, and to provide for the more efficient instruction of students in this essential department of Medical knowledge. At present it contained seventy-four beds—thirty-two for ordinary patients and forty-two for fever cases. Children's Hospitals, he said, were needed for scientific requirements, and to arrive at any important clinical results they had to group together large numbers of cases, such as could only be done in Hospitals of considerable size. It was recommended that students should be made to study the

diseases of children before receiving their diplomas, and reference was made to the advantages of such an institution for training nurses.

Lord NEAVES said there could be no doubt of the importance of the Children's Hospital to the Medical School; but he said that such an institution would have a prejudicial effect on society if parents were to be allowed to take their children there whenever they were ill with measles or hooping-cough. In the administration of these Hospitals they must take care that in relieving special cases they did not give encouragement to improvidence.

Dr. DAVID MURRAY said he believed that the outdoor department of the Edinburgh Hospital for Sick Children did a great deal of mischief. Parents brought their children labouring under dangerous diseases to the Hospital, where they were collected in groups, and the effect was to spread the diseases.

1. ON CERTAIN CASES OF QUESTIONED LEGITIMACY UNDER THE OPERATION OF THE SCOTTISH REGISTRATION ACT—2. THE ILLEGITIMACY OF BANFFSHIRE—3. THE EXPEDIENCY OF RECORDING STILL-BIRTHS.

By George Veten, Esq.

1. This paper had reference to the subject of adulterine bastardy. It touched upon the conflict between the legal presumption in favour of a child born in wedlock being the lawful issue of the spouses and the mother's conviction of its illegitimacy; and showed the course followed in the registration of such cases.

2. This paper gave elaborate details regarding the illegitimacy of births during the four years ending 1861, and embraced a supplementary appendix relative to the four years ending 1869, the records of which are the latest available. It showed, *inter alia*, that, with a few rare exceptions, the county of Banff has always exhibited the largest percentage of illegitimacy—viz., about 16 per cent.—the ratio for Scotland being between 9 and 10 per cent. Very considerable difference exists in the different parishes; the maximum rate being upwards of 25 per cent., and the minimum as low as 6 or 7 per cent. As a rule, the seaboard parishes gave a lower percentage of illegitimacy than inland ones. Neither the excess of females over males, nor the comparative number of houses and windowed rooms (as ascertained at the census) affords any satisfactory solution of these differences; but with regard to the county generally, the comparative paucity of marriages may have something to do with the large amount of illegitimacy. The paper, which was accompanied by several tabular appendices, also contained some curious particulars relative to the occupations of the mothers of illegitimate children, the number of cases in which the paternity was acknowledged at registration or found by decree of court; and the number of children legitimated by the subsequent marriage of their parents.

3. This paper mentioned that, while these births were recorded in France and some other Continental countries, they were not registered either in England or Scotland, and showed that the statistics of the subject are very imperfect. The still-births in Glasgow during the three years subsequent to 1849 were estimated by the late Dr. Strang to have amounted to one in twelve, or upwards of 8 per cent. In France their percentage amounts to between 4 and 4½ per cent., and in Paris to about 7½ per cent. The ordinary proportion among legitimate children is from one in eighteen to one in twenty of all births, and among illegitimate children three times greater. More males are still-born than females—viz., 140 to 100. It also referred to the difficulty of defining the terms "still-birth" and "viability," to the suppose prejudice against the registration of still-births, and the desirability of their being recorded, on the ground of public policy and in the interests of Medical science. The paper concluded with a recommendation that the experiment should be tried in Scotland, and gave some practical suggestions as to the mode in which it ought to be carried out.

SECTION G.—MECHANICAL SCIENCE.

ON A NEW SYSTEM OF WARMING AND VENTILATION.

By J. C. Morrison, Esq.

Mr. Morrison said: At the meeting of the British Association at Exeter, Professor Archer very kindly read for me a paper descriptive of my system of ventilation applied to dwelling-houses. To-day, I intend to call your attention to other applications most intimately connected with sanitary science. In carrying out my system, I have had forced on my conviction the very close relationship between ventilation and vitality, which form the subject of this paper. That the relation may more clearly appear, I shall, with your kind permission, read to you, from page 219 of the Association's *Transac-*

tions of 1869, the short outline of my system by the editor:—"The main features of this novel system of warming and ventilating consist in so circulating pure fresh air (through a warming chamber) into the room, and of foul air (through the fire) into the chimney, that all local currents are resolved into one, which, describing an unbroken circuit, forms an upper warmer current from the fire to the opposite wall, and an under colder current (under the floor) from the wall back again to the fire, when, after supporting combustion, the products escape up the chimney. The vacuum thus produced by the warmer current through the chimney creates the now colder current from the atmosphere, which, passing through the heating-chamber, supports the respiration of any number of individuals." From this extract you will readily perceive that, imitative of nature, I produce, by mechanical means, an artificial trade-wind. Commingled with this air in motion, I propose to carry, in a circuit and by a current, the conditions of life to plants and animals—firstly, by an outward current from any centre to any circumference, to carry the conditions of life to them, and, secondly, by the veins of the returning current of the circuit, to remove from them their exhalations. For several years I have had in contemplation the carrying out of such a system, in exact imitation of the currents of the atmosphere and the circulation of the blood; and reflecting over the fact that one grain of musk has been known to perfume a room for thirty-six years without sensibly losing weight, it occurred to me to take advantage of this extreme divisibility of matter in nature, and, by copying her in other respects, to carry by artificial appliances all such substances as by solution in spirit, water, or other simple mediums can be so divided, and consequently evaporable into any current of air passing over them. Acting on this thought, to carry by a current of purified air any amount of required heat, moisture, or medicine to the lower animals, and from them their exhalations, I submitted at the last meeting of the Highland and Agricultural Society of Scotland my proposal to the test of the judges, and had the satisfaction of being by them awarded the Society's medal. Encouraged by this mark of approval of my efforts, I have built an addition to my house, so that one room, in particular, may be placed at the service of the Medical Profession, to test, by actual experiments on climate, the power of pure fresh air, chemically pure water, heat, light, and exercise on the human system. Through this room a general current of air passes and commingles, consisting of a purified and warmed current across the entire floor, rising to meet a descending cooler and purified current from the entire ceiling; these, having intermingled, support respiration, and then pass, by a ventilating shaft, to be burned in the fire. After thus supporting combustion, the products pass into the chimney. Into this general current I can at will diffuse, by a branch circulation, a second current, which, having passed through a solution of any medicine, joins the main current, and is now inhaled as perfumes are from flowers.

CONCLUSION.

The meetings of the Association were continued to Wednesday, the 9th, the business interspersed with excursions (not over numerous) and the usual games of the philosophers—the red lions offering, of course, their annual wag of tail and fearful roar. At the concluding meeting, presided over by Sir Wm. Thomson, various grants of money for scientific purposes were voted, and Dr. Carpenter, F.R.S., was elected—we state the fact with infinite pleasure—President of the next meeting, to be held at Brighton in 1872.

REPORT OF THE POOR-LAW BOARD.—II.

(Continued from page 197.)

TURNING to that portion of the report which relates to the sick, we find that even up to the date of the Report much progress had been made in providing additional Infirmary accommodation. This has enabled effect to be given to one of the principal objects of the Legislature in passing the Metropolitan Poor Act, 1867—namely, to secure the treatment of the sick and infirm in buildings and under control entirely distinct from the rest of the poor. The new wards provided with this view have, moreover, facilitated the arrangements for relieving the crowded state of certain of the workhouses, and have thus enabled the workhouse test to be more rigidly carried out. The adoption of this test is further encouraged by the induce-

ments which the recent Metropolitan Poor Amendment Act offers to boards of guardians to refuse out-relief, and to suggest as an alternative resort to the workhouse. Under the provisions of that Act the guardians can claim to be repaid from the Metropolitan Common Poor Fund a sum of 5d. per head per day in respect of every adult pauper maintained in the workhouse, provided that the building be not crowded beyond its limit of proper capacity as certified by the Poor-law Board. By this arrangement the granting of out-relief is discouraged, whilst all temptation to overcrowding is withdrawn.

At the date of the report additional buildings had been completed and occupied in the following places—viz., Bethnal-green Parish, Hackney Union, Hampstead Parish, Islington Parish, Paddington Parish, Strand Union, Wandsworth and Clapham Union, and Woolwich Union. In Camberwell, St. Luke (Chelsea), Fulham Union, St. George-in-the-East, Kensington, Lambeth, Poplar Union, Shoreditch, Westminster Union, and Whitechapel Union, arrangements were in progress, or plans actually in course of execution, for additional infirmary and other accommodation.

It will be remembered that a fierce and angry controversy raged in the parish of St. Pancras on the question as to whether the new Infirmary erected at Highgate for that parish was or was not needed. The difficulty has been solved by combining the Strand and Westminster Unions, and the parishes of St. Pancras and St. Giles-in-the-Fields and St. George, Bloomsbury, into the Central London Sick Asylum District. The managers of that district then purchased the Highgate Infirmary, and it has thus been utilised for the benefit of the other places named above, as well as for that of St. Pancras. It is now in full working order, and affords beds for 523 pauper patients.

The Sick Asylum for the Poplar and Stepney Unions is spoken of in the report as being nearly ready for occupation, and, as we have already announced, it is now in use.

Additional accommodation has also been obtained in the metropolitan workhouses by the removal of the imbecile inmates to the asylums which have been provided at Leavesden and Caterham by the managers of the Metropolitan Asylum District. The number of inmates in those Asylums on May 12 was as follows:—At Leavesden, 1594—viz., 715 males and 879 females; at Caterham, 1364—viz., 543 males and 821 females. The total number of inmates for which the metropolitan workhouses have been certified is 27,140.

In determining the numbers for which both the new and the old buildings should be certified, the Poor-law Board have adopted, as regards sleeping-rooms, the following scale, which will be recognised as that of the "Cubic Space Committee":—

Class of Inmates.	Amount of Space in Dormitories.
Sick	850 cubic feet.
Lying-in women	1200 " "
Sick cases of an unusually offensive character	1200 " "
Infirm persons occupying the same room day and night	700 " "
Infirm persons able to leave their dormitories during the day	500 " "
Healthy persons	300 " "

This scale has, however, been departed from in cases where modification was required, owing to the peculiar construction of the wards.

It is evident that recent Poor-law Legislation—the outcome of the public demands on behalf of the sick poor—has already borne abundant fruit in the shape of bricks and mortar, building contracts, and pavilion-planned infirmaries. Whether the result will be commensurate with the cost, it is of course too early to anticipate; nor does the Report before us attempt to argue the point. But, be that as it may, there can be no question that, whether our efforts result in failure or in success, we shall have at least the satisfaction of knowing that we have not failed for lack of readiness to spend money.

(To be continued.)

THE SANITARY COMMISSION AND THE CHOLERA IN INDIA.—The Sanitary Commission, without giving a decided opinion, continues to discountenance the theory that cholera is spread either by tainted water or human intercourse, and to lean to Dr. Bryden's view of the disease being borne on the air, while, however, distinctly disclaiming everything like partisanship, and proposing merely to give a fair and judicial summing-up of the evidence of the year.

ENGLISH HOSPITAL AT METZ.

DECEMBER, 1870; JANUARY AND FEBRUARY, 1871.

(From a Correspondent.)

DR. WOODHAM WEBB undertook, on December 7, 1870, the charge of a part of the Caserne du Génie at Metz as a Hospital for wounded and sick French soldiers. He had then, as assistants, Mr. Crookshank and myself, all of us forming part of Dr. Frank's staff, the Metz Hospital being a branch of his ambulance, of which the head quarters were at Epernay.

The Caserne du Génie is a large building, consisting of a central pavilion and two wings. The whole of it had been used as a Hospital since the middle of August. The central pavilion was handed over to us. It contained, when we took possession, about 200 men, a larger number than it could conveniently accommodate. Of this number, about forty were convalescent and awaiting their turn to be sent home. In a short time our number became reduced by evacuations and deaths to 150, at which it remained till our giving it up. As vacancies occurred, Dr. Webb was allowed to fill them by selecting cases from some other temporary Hospitals in Metz, so that we had a succession of severe and interesting cases.

A few days after our arrival Mr. Fosbroke was added to the staff, and subsequently Mr. Walker.

The pavilion contained three large rooms, capable of accommodating thirty-five patients each, and six smaller rooms. The large rooms were lighted by several windows on both sides; the smaller rooms had windows on one side only; all were tolerably lofty.

The sewage system was exceedingly simple: large open tubs were placed on each landing, into which the urine and fæces from the neighbouring wards were put. The tubs were emptied once a day. We were anxious to alter this, chiefly on account of its appearance, but could not succeed in getting workmen to put up closets. By the help of disinfectants we never had any bad smell. A disinfectant which we found very convenient for the tubs was "Mudie's." It is a powder, consisting chiefly, I believe, of sulphate of iron.

Our wounded patients had nearly all received their wounds in the three days' fighting near Metz in August. The sick were suffering from debility after typhoid fever and from dysentery. All had gone through the miseries which a long siege must bring to Hospital patients—little and bad food, little or no wine, and the want of proper attention, necessitated by the mass of wounded thrown on the hands of the Medical Intendance. As soon as we took over the place we had the floors thoroughly scoured and the walls whitewashed. Carbolic acid was used freely.

In the nursing we were helped by two English ladies, who had been engaged in that work through the war. Each of them had the charge of a small ward. The remainder of the nursing, storekeeping, etc., was undertaken by the sisters of the Convent of St. Chrétienne, which is only a few minutes' walk from the Caserne. These sisters are, in ordinary times, occupied in teaching, but since the fighting in August have turned their hands to nursing. We found them most efficient nurses, and, although the English system of treatment and dressing differs in many respects from the French, they fell into our way very readily. Their strict system of discipline is most conducive to the good working of such an undertaking, and to their constant and untiring attendance on the patients we must attribute much of what success we obtained. The rough work was done by military *infirmiers*, who are, as a rule, lazy and troublesome.

Rations of bread, meat, and vegetables were supplied by the German authorities. We received from the dépôt of the English Society, at Metz, a large supply of Liebig's extract, preserved meat and vegetables, concentrated soup, etc. We put the majority of our patients on a more liberal diet than they had had before, and allowed a good quantity of wine, under which treatment those who were not too far gone improved.

Owing to the press of work at the beginning, it was impossible to keep accurate notes of many individual cases, so that I can only give general results of the great number of cases. Of the Surgical cases a large number were gunshot fractures of limbs, which had united more or less firmly, with sinuses leading down to dead bone. These, as well as most of the

other cases, were complicated with bedsores. After giving them two or three weeks of improved diet, these cases were treated according to the condition of the parts. Seven were amputated, of which four had completely recovered before we left, two died, and one had not completely recovered. In less severe cases the sinuses were syringed out daily, and frequently examined, incisions for the removal of loose fragments of dead bone or for the better examination of the parts being made when necessary. Several of these cases recovered completely; others were in a fair way to recovery with time.

There were also a number of cases of long and deep sinuses caused by traversing gunshot wounds of the thigh and buttock without injury to the bone. These cases were frequently complicated by abscesses forming in the neighbourhood of the sinuses. In such cases the sinuses were often kept open by the presence of a piece of cloth which had been carried in with the bullet and had remained in when the bullet had passed out or been extracted. Bits of clothing are extremely difficult to find, and cause as much or more irritation than the bullet itself. These cases were treated by laying open, when possible, the sinuses. About half a dozen cases of hospital gangrene broke out in the Hospital; a great many more were sent to us with the cases which came almost daily from other Hospitals. We treated them with strong carbolic oil (one to six and one to ten), with a solution of chloride of zinc (gr. xxx. ad. ʒj.) and with a strong solution of sulphurous acid. All of these methods checked the progress of the disease at once. The French Surgeons treated some with the actual cautery, others with a strong solution of citric acid, with good success.

The large suppurating surfaces left by the separation of the sloughs we treated with a solution of sulphurous acid, which promoted rapid healing.

REVIEWS.

A Manual of the Laws affecting Medical Men. By ROBERT GEORGE GLENN, LL.B., late Scholar of Magdalene College, Cambridge, of the Inner Temple, Esquire, Barrister-at-law. London: J. and A. Churchill.

WE must confess to having felt startled and somewhat dismayed when this large octavo volume of 460 pages first came into our hands. We had not thought that such a tome could be needed to give us "the laws affecting Medical men" in their Professional capacity. But we had not expected so full and complete an account of all the laws affecting us in all our relations; in our student-life as well as our life as full-blown members of the Profession. Mr. Glenn has done his work thoroughly and well. The first hundred pages (nearly) of his book are devoted to the laws and regulations of the Licensing and Qualifying Bodies, the Royal Colleges, Universities, etc., of the three divisions of the kingdom; and he also gives a brief history of each College, Faculty, and Society. He also describes the General Medical Council, its composition, duties, and laws; the laws and regulations of registration; and the powers of the Council over the Licensing and Qualifying Bodies. Chapter V. is devoted to the "Offices held by Medical Men," and is divided into eighteen sections, each of which treats of a distinct office, as Surgeon in the army, in the navy, in passenger ships, in merchant ships; Medical inspectors of various kinds, workhouse and parish Medical officer, public vaccinator, Medical Officer of Health, and so on; and under each head will be found all details respecting appointment, pay, tenure of office, duties and rights, powers, etc. Chapter VI. is on the "Rights and Privileges of Medical Men," and has sections on recovery of charges, actions for defamation, privileged communications, protection from unregistered and unqualified Practitioners, exemptions, and on "The Study and Practice of Anatomy." Chapter VII., "On the Duties and Liabilities of Medical Men," treats of negligence and malpraxis, punishment of abuses, duties of Medical men as witnesses, of the registration of births and deaths, the treatment of lunatics and the management of private lunatic asylums, the validity of gifts from, and contracts made with, patients, and of the regulations respecting the sale of poisons. In Chapter VIII. we have fully and minutely set out "The Law affecting Medical Men in their relation with their Partners, Apprentices, and Assistants." A chapter is given, also, to the "Registration of Pharmaceutical Chemists, Chemists, and Druggists." And last, though certainly not least, the appendix contains an "Essay on Medical Etiquette," by Dr. A. Carpenter. We have thus given a sort of table of contents of the book as really the best, and, with the space at our command, almost

the only, way of showing its value, and the great use it may constantly be to the practising Medical man. We need not point out the great convenience of having the existing law on all the subjects and matters above mentioned brought together for us, and set out by a legal authority. Mr. Glenn's style is clear and good, and his language as simple and free from technicalities as it well can be, so that the non-legal mind may easily, we should think, get a clear and definite idea of his meaning. But, of course, it must not be expected, to use his own words, that his book will, "on every occasion, obviate the necessity for consultation with a lawyer." Dr. Carpenter's essay on Medical etiquette is a valuable and very useful addition to the work. He observes that his subject "divides itself into three principal heads:—

"1. How to get into practice without lowering the dignity of the Profession.

"2. The conduct to be observed in holding intercourse with members of the same Profession, especially in the matter of consultations.

"3. How to hold intercourse with the public so as to avoid the appearance of quackery."

Under all these heads Dr. Carpenter gives sound and good advice, and all Medical men may read his essay with profit; while to young Practitioners it will be of special use in helping them to steer clear of the many shoals, quicksands, and rocks that beset their early course.

We will only observe further that Mr. Glenn has taken unusual pains to provide that any and every subject of which he has treated can be easily referred to. Besides a copious and well-arranged index, he has given a "Table of Cases," a "Table of Statutes," a "Chronological Index to the principal Statutes relating to, or directly affecting, Members of the Medical Profession, including Chemists and Druggists," and "An Alphabetical List of the Principal Authorities on Medical Jurisprudence." And in the appendix will also be found, "Plain Instructions as to the Execution and Attestation of Wills," and a set of "Forms" of the legal instruments which Medical men may have need of, such as a "Deed of Co-partnership between two Medical Men," an "Agreement for Sale and Purchase of a Practice," an "Agreement between a Medical Man and an Assistant," a "Contract between Guardians and Public Vaccinators," and so on.

It appears to us that Mr. Glenn has ably and diligently carried out a very useful and valuable intention.

GENERAL CORRESPONDENCE.

HOSPITAL NURSING.

[To the Editor of the Medical Times and Gazette.]

SIR,—In a certain small Hospital where—Figaro here! Figaro there!—it is my lot to be House-Surgeon, Clinical Clerk, Accoucheur, Secretary, and Physician-Extraordinary, amongst heart-breaking difficulties to contend with, the inability to retain good nurses brings down one's grey hairs with sorrow to the grave. Old or young, repulsive or attractive, no sooner is a woman found useful than she falls ill, inclines to the bottle, retires disgusted with the work, or else goes in for flirtation, culminating in pregnancy or marriage—the latter condition of minor secondary importance. Long ago we had a one-eyed peck-marked treasure, a most attentive old lady without money in the savings bank, but she even fascinated a drunken dragoon, and, as soldiers say, her "knapsack was packed."

On the principle of the waiter who employed his leisure waiting elsewhere, I ran down the other day to Alder-shot to pick up a few wrinkles. There a military female Hospital succeeds admirably. The nursing is conducted on the "sister system" by four women, who have worked harmoniously together nearly five years, without falling sick or taking a lengthened holiday. During this time 1327 cases of parturition, and 331 of ordinary disease were treated, as well as the cooking provided for 872 infectious cases. In addition to food, beer, and washing, the "sister" in charge and the midwife each receive two shillings, the nurse and cook eighteenpence a day. Taking it turn about to sit up at night when there are bad cases, they are willing and competent to fulfil each other's duties, and although charwomen are employed, the head "sister" would not refuse to scrub the floor in an emergency. A word for

the Medical officer, the key-stone of the arch. He has "done the State some service," and nobly earns his regimental pay.

What with the horrors of the Commune, female agitators, and girls of the period, the fair sex latterly have lost ground. Still, instances of Christian self-denial and of heavenly charity are constantly found. For instance, the quiet, unostentatious good done by the "sister system" in London alone shows how "divine a thing a woman may be made." Many an aching heart, many a sorrow that no excitement of balls, everlasting gaiety, and (not to mince the matter) of drink could alleviate, finds rest and comfort in thus following the Divine footsteps in relieving others afflicted. Besides, the occupation at times must be far more congenial than being a companion to a nigger-driving old lady, or, when suffering from neuralgia, to live by teaching hopeless children. There must be plenty of old maids in the world. Although a dog and a garden afford average Hobsonian contentment, a man happily married to a nice woman with a little money invested in Indian railways will ever be the envy of a

POVERTY-STRICKEN OLD BACHELOR.

LEGAL INTELLIGENCE.

AN EXTRAORDINARY REPORT OF THE LUNACY COMMISSIONERS.

A VERY extraordinary discovery has recently been made by the Lunacy Commissioners of a wealthy, educated man, once an officer in the army, who some years ago took lodgings at an hotel, and was eventually found by the Commissioners to be immured in a dark room, in a condition too revolting to describe. One symptom of insanity appears to have been an idea fixed upon his mind that he could not rescue himself from his position. He was at once removed, by order of the Commissioners, to a lunatic asylum. He at that time presented quite an inhuman appearance, but, after some months' detention in the asylum, was released, as the Lords Justices had directed him to be restored to the full management and control of his property, which was very considerable, he being tenant for life of large landed estates in this country and the colonies. He has also a life interest in personalty to the value of over £100,000, and a mansion at the West-end of London, which he had verbally given to his aunt. He passed seven years at the hotel in question, and it has been ascertained that at first he paid two and a half guineas a week for his rooms—a not exorbitant sum; but the charge was raised from time to time to £200 and £300 a year, besides £180 for board, consisting of two frugal meals.

The Commissioners report that in 1858 he informed his aunt, who paid him a visit at the hotel, that "life was a burden to him," and he deplored his possession of so much property. His habits were then those of a gentleman, and he was extremely cleanly in his person. In 1859 he suddenly went to Germany, but shortly returned to the hotel, and ceased to hold any communication with his relatives. After 1863 no one was admitted to his room but his agent and the manager of the hotel. His aunt wrote to him on several occasions up to the spring of 1867, but never received any reply. She also went to the hotel once a year, but could never obtain an interview. Her last visit was in April, 1870. From 1860 the supposed lunatic's agent had charge of about seventy horses, which were never used, besides thirty carriages, likewise never used. No accounts were found by the Commissioners to have been rendered by the agent, though he had the management of farms, houses, horses, etc.

Here the matter is left by the Lunacy Commissioners. If this gentleman were really not insane, his eccentricity must have approached very near to insanity, and there is at least grave suspicion of undue influences brought to bear upon an unbalanced mind; but nothing can excuse the conduct of those who connived at and profited by his prolonged detention at the hotel, and who perpetuated the horrors and misery, even though self-inflicted, in the midst of which this unhappy man was found.

SANITARY MEASURES AT CHATHAM GARRISON.—A committee of officers are very vigilantly carrying out sanitary measures. They see that all refuse is promptly cleared away, the drains daily flushed, and chloride of lime freely used wherever necessary. The barracks have now an ample supply of excellent water furnished by the water company under a contract with the Government.

OBITUARY.

ARTHUR MARTIN A'BECKETT, F.R.C.S.E.

The sudden death of that able and valued Practitioner, Mr. A. M. A'Beckett, has caused considerable grief and universal regret. Among all classes of society his loss will be felt, for it was not only among his Professional brethren he was esteemed, but his friendship, zeal, and activity extended among all others, when opportunities offered where good example could be shown, whether in the cause of benevolence, temperance, or in charitable actions. The following quotation may be applied to him:—

"Lives of great men all remind us
We can make our lives sublime,
And, departing, leave behind us
Footprints in the sands of Time."

He was impressed with the characteristics of benevolence in its highest form, and morality in its strictest sense. He passed his existence in carrying out the two great precepts of the founder of the Christian faith, in honouring his Maker and loving his neighbour as himself.

Mr. A'Beckett was born in Golden-square, London, in 1812, and, after serving the usual term of apprenticeship, became a student in Medicine of the London University in 1834. After the usual course of study, during which he obtained prizes in that University, he became a Licentiate of the Apothecaries' Company in 1835, and passed his examination as a Member of the Royal College of Surgeons on March 9, 1838, and became a Fellow of the same College on December 13, 1855. He served as Staff Surgeon in the British Legion in Spain from 1835 to 1837, on the staff of Sir De Lacy Evans, and received the order of a Knight of San Ferdinand, also an order for distinguished conduct on the field of battle, and another cross and gold medal for the battles of San Sebastian and Irun. How much his conduct, both Professional and otherwise, was appreciated during his service in Spain, is known from the following extracts from letters sent to him by Sir De Lacy Evans and Mr. Rutherford Alcock (now Sir R. Alcock, K.C.B., Her Majesty's Envoy Extraordinary and Minister Plenipotentiary at Peking, China, and previously her Majesty's Ambassador at Japan). Sir De Lacy Evans says, in a letter dated June 19, 1838:—"It is with the greatest pleasure that I offer you the expression of my entire and very high satisfaction with your conduct during the two years of our service in Spain, both as a gentleman and member of our society and as a Medical officer. My own knowledge of your conduct, acting, as you were, so immediately under my observation, together with the uniformly strong and gratifying reports to me by your superiors of the useful and skilful assistance they derived from you, have, I assure you, impressed me with a sincere interest in your future happiness, prosperity, and Professional advancement. Your exertions in our large Hospitals in Spain, as Staff Surgeon, have given advantages, in point of experience, of a various description, which few, I believe, at your age have possessed. I have every reason to believe that you fully profited by these rare opportunities."

In the letter from Mr. Rutherford Alcock, late Deputy Inspector-General of Hospitals, British Legion, Spain, dated June 18, 1838, he says:—"I must not allow you to embark for another land without conveying to you not only my best wishes for your prosperity, but my conviction that you cannot fail to attain success in the practice of your Profession. In the service of Spain, where, for two years, you were constantly under my observation in the field, and in the Hospitals, your gallantry and intelligence in the first, and uniform zeal and ability in the last, were too obvious to be either overlooked or forgotten. When the Royal Military Order of San Fernando was conferred upon you, I considered it due to you, not less for your exertions and services under fire, than for the more painful, trying, and important duties which you so conscientiously discharged in the wards of our Hospitals in Vittoria and San Sebastian. I have shared the same quarters with you, slept in the same bivouac, and watched you and worked with you among sick and wounded. In all these various situations your conduct as a gentleman, your skill and humanity as a Surgeon, and your ready compliance as a soldier with all instructions, however hazardous or trying the execution, makes me regret that a land so distant should render our meeting again for many years improbable."

He embarked from England for Sydney, New South Wales, in June, 1838, to practise his Profession in this colony, and

how well by his indefatigable exertions, zeal, and high Professional knowledge he succeeded in obtaining, and steadfastly maintaining, a high position, and an extensive practice in the colony, is well known. During a residence of upwards of thirty years in Sydney, he twice visited Europe, the last time with the intention of retiring altogether from his Profession with a competence, but heavy losses from money invested in the colony by failure of companies, compelled him to return to New South Wales in 1865, and recommence the practice of his Profession, previous to which he visited and studied under some of the most distinguished of the Professors of Paris to observe the latest improvements and suggestions offered in Medical and Surgical practice in the Hospitals of that city. He was one of the first members of the Legislative Council of New South Wales, for several years one of the Surgeons of the Benevolent Asylum, and, previous to his last visit to Europe, an Examiner of the Medical Faculty of the University of Sydney, and a trustee of the Australian Museum. He was a trustee of the Sydney Grammar School, and a Fellow of the Royal Geographical Society of London. He was a brother to the late Gilbert A'Beckett, one of the early contributors to *Punch*; to the late Sir William A'Beckett, Chief Justice of Victoria; and the Hon. Thomas A'Beckett, of Melbourne. In concluding this brief sketch, we will append the notice of Mr. A'Beckett's death, as published in one of the Sydney journals, as follows:—

"The death of the late Arthur Martin A'Beckett is a great loss to the Medical Profession, as well as to the community at large. As a Medical Practitioner he has long been favourably known in Sydney, and his skill and ability in the treatment of disease have always been held in the very highest estimation by his brother Practitioners as well as by the public. But skill and ability were not the only qualifications of our departed friend. The best qualities of head and heart were his. Sterling honesty and outspoken truthfulness were his great characteristics. Honest and honourable himself, he was the fearless and unflinching opponent of every form of dishonest and dishonourable practice in others. To every species of imposture he was a sworn foe. His aim ever was to render the Profession which he practised worthy of the respect and esteem of the world, and no line of conduct met with his approval which was not in accordance with this end. Such men as Mr. A'Beckett we can badly afford to lose."

PROFESSOR FREDERIK HOLST, M.D., OF CHRISTIANIA.

In our impression of June 17 we announced the death of this eminent Physician, which took place on the 4th of the same month, in the 80th year of his age. From an address delivered by the President of the Norwegian Medical Society, at a meeting of that body held on June 7, we learn that Frederik Holst was born August 14, 1791, at Holmestrand. Having received a preliminary education at the Cathedral School, Christiania, he matriculated as a Medical student in the University of Copenhagen on July 29, 1815. Whilst resident in the last-named city he attended the *clinique* at the Frederiks-Hospital. Early in 1816 he was admitted Licentiate in Medicine of the Norwegian University; and on June 18, 1817, he was the first to receive the degree of Doctor in the same Faculty in that then recently founded institution. His thesis on this occasion was a dissertation on the disease called "Radesyge." The following year Dr. Holst was nominated to the post of Medical Officer of Health to the city of Christiania, and at the same time gave prelections on osteology and the science of bandaging. During the years 1819, 1820, and 1821 he travelled at the expense of the State through Denmark, Germany, France, Great Britain, and Ireland for the purpose of studying subjects relating to Medical police, the poor-law, prisons, and lunatic asylums. In 1823 he was appointed Member of the Medical Faculty, and shortly afterwards he was nominated Professor of Medicine, the functions of which station he continued to discharge for a period of forty-one years. He lectured at the University on Pharmaceutics, Toxicology, and State Medicine, and he founded the Pharmaceutical Muscum in connexion therewith.

The results of his experience of prisons, acquired during his three years' travels, were published in 1823, under the title of "Reflections on the more Modern British Prisons, especially with respect to the Necessity for Improvements in Prison Discipline in Norway."

Dr. Holst now rapidly rose to a high position in his Profession, and in due time received public recognition of his abilities and untiring industry. In 1832 he was created Knight of the

Order of Vasa, in 1838 Knight of the Order of the North Star, in 1847 Knight of the Order of St. Olaf, and in 1865 Commander of the same Order. No less than sixteen scientific societies claimed him as a member or honorary member, while he was one of the founders of the Norwegian Medical Society. In 1856 he established a fund for discharged prisoners, and in 1859 one for distressed Norwegian Physicians and their widows. Professor Holst possessed considerable literary abilities, and as far back as 1826 started the first Medical journal ever published in Norway, under the name of *Eyr*, which he continued to edit in the face of great difficulties during its course of eleven years. He afterwards became, and continued to be for seven years, one of the editors of the *Norsk Magazin for Lægevidenskaben*, a journal first published in 1840. As the President well observed, Dr. Holst was one of the most zealous members of the Norwegian Medical Society, and his interest in its proceedings remained undiminished when his bodily health no longer permitted him to take part in its meetings, as a letter to the Society dictated by him not many days before his death testifies. This letter concludes with words to the following effect:—"Now, with the feeling that my course in this life will probably soon be ended, I cannot refrain from conveying to the Society, most of whose members have been my pupils, my heartfelt farewell and thanks for its many tokens of regard towards me; and I invoke a blessing on its future labours in the cause of science and humanity."

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentlemen passed their Examination in the Science and Practice of Medicine, and received Certificates to practise, on Thursday, August 17, 1871:—

Allen, Marcus Henry, Regency-square, Brighton.
Birch, Robert, Lichfield.
Bonser, John Hanbury, Sutton-in-Ashfield.
Butler, Francis William, Spring-grove House, Peckham.
Hosford, Joseph Alexander, Cumberland street, Barnsbury.
Sarjant, Josiah John, Millwall, Poplar.
Steele, Edward Henry, Dorchester.

The following gentlemen also on the same day passed their first Professional examination:—

Dixon, Thomas James, Guy's Hospital.
Murphy, Robert William, Guy's Hospital.
Pitts, Robert Zaccheus, Middlesex Hospital.
Stoney, Percy Butler, St. Bartholomew's Hospital.

APPOINTMENTS.

*** The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

MORGAN, E. R., M.R.C.S., L.S.A.—House-Surgeon to the Royal Free Hospital, *vice* A. Thomas, L.R.C.S., resigned.

STOKER, WILLIAM THORNLEY, M.D., L.R.C.S.I., etc., Demonstrator of Anatomy in the Royal College of Surgeons—Surgeon to the City of Dublin Hospital, *vice* Dr. Purser transferred to the Medical Department.

MILITARY APPOINTMENTS.

3RD FOOT.—Staff Surgeon William Collis, to be Surgeon, *vice* Thomas Teevan, appointed to the 30th Foot.

26TH FOOT.—Staff Assistant-Surgeon William Carpenter, M.D., to be Assistant-Surgeon, *vice* John Gray, M.D., appointed to the Staff.

30TH FOOT.—Surgeon Thomas Teevan, from the 3rd Foot, to be Surgeon, *vice* Alfred Hooper, appointed to the Staff.

44TH FOOT.—Staff Assistant-Surgeon Thomas Moore Kirkwood, to be Assistant-Surgeon.

MEDICAL DEPARTMENT.—Surgeon Alfred Hooper, from the 30th Foot, to be Staff-Surgeon, *vice* William Collis, appointed to the 3rd Foot; Assistant-Surgeon John Gray, M.D., from the 26th Foot, to be Staff Assistant-Surgeon, *vice* William Carpenter, M.D., appointed to the 26th Foot.

BENGAL ARMY.—MEDICAL OFFICERS.—To be Surgeons-Major, Surgeons John Barclay Scriven and Joseph Walter Raleigh Amesbury. To be Surgeons, Assistant-Surgeons William Edward Allen, Rivers Mantell, M.B., Edwin Clement Bensley, James Fawcus, M.D., Thomas William Sheppard, John Ellis, M.B., Edrick Selous, Charles Peter Costello, James John Durant, Ferdinand Odevaine, George Grant, M.B., George Cochet Chesnaye, John Duncan, M.B., Edward Ord Tandy, Francis Parsons, Frederick George Constant, M.D., James Hunt Condon, William Roe Hooper, Mark Henry Lackersteen, M.D., and Henry Seymour Smith.

MADRAS ARMY.—To be Surgeon-Majors, Surgeons John Thomas Williams, Alexander Adam Renton, and John Anderson Cox, M.D. To be Surgeons, Assistant-Surgeons John Bilderbeck, Robert Edmund Pearse, George Dalziel Riddell, Aeneas M'Leod Ross, and Joseph Dougall.

BIRTHS.

DIPLOCK.—On August 16, at Ranelagh House, Fulham, the wife of Thomas Bramah Diplock, M.D., of a son.
 HEARNDEN.—On August 21, at Down House, Sutton, Surrey, the wife of W. A. Hearnden, M.D., of a daughter.
 HYDE.—On July 2, at Poonamallee, Madras, the wife of John Martin Hyde, Staff Surgeon, of a son.
 MATTHEW.—On August 18, at 20, Warwick-street, Regent-street, W., the wife of Charles W. Matthew, M.B., of a daughter.
 MORIARTY.—On August 22, at the Control Barracks, Woolwich, the wife of Dr. Moriarty, of a daughter.
 SPAULL.—On August 19, at 2, Vale-place, West Kensington, the wife of B. E. Spaul, Surgeon, of a son.

MARRIAGES.

BARON—JONES.—On August 17, at Bromyard, Herefordshire, Thomas Baron, Surgeon, Nantwich, to Eleanor, only daughter of the Rev. J. P. Jones, Independent minister.
 BOREHAM—SIMPSON.—On August 16, at St. John's, Paddington, William Chalklen, eldest son of William Wakeling Boreham, J.P., of Haverhill, to Mary Catherine Frances (Fannie), only daughter of William Simpson, M.R.C.S., of the same place.
 BUTLER—SMITH.—On August 22, at St. John's, Woolwich, William Harris Butler, L.R.C.P. Edin., M.R.C.S. Eng., L.S.A., to Harriet Ann, eldest daughter of Mr. R. Smith, both of Woolwich.
 FAIR—DUKE.—On August 22, at Monkstown Church, Alexander William Fair, Esq., 48th Regiment, eldest son of Capt. T. Fair, Kingstown, to Annie, second daughter of Valentine Duke, M.D., Blackrock, Dublin.
 GUNTHER—TOMPSON.—On August 15, at St. Mary Magdalen's Church, St. Leonard's-on-Sea, Dr. Theodore Gunther, of Hampton-wick, to Florence Georgina, fourth daughter of the late Arthur Tompson, Esq., of Belton, Suffolk.
 KARKEEK—HEARD.—On August 22, at St. Mary's, Truro, Paul Quick Karkeek, Surgeon, The Ferns, Torquay, only surviving son of the late F. W. Karkeek, Esq., of Pentrene, Truro, to Clara, elder daughter of Mr. Heard, Boscawen-street, Truro.
 ONLEY—LLOYD.—On August 16, at St. Michael's-in-the-Hamlet, Martin Guy Black Oxley, M.D., to Emma, younger daughter of the late Richard Lloyd, of Grove-park.
 RATTON—BELLORD.—On August 22, at St. John's Church, Duncan-terrace, James J. S. Ratton, M.D., Madras Army, to Alice Mary, second daughter of James Bellord, Esq., Barnsbury-street.
 SELOUS—MARQUETTI.—On August 22, at the parish church, Finchley, Edric Selous, Surgeon H.M. Indian Service, son of F. L. Selous, Esq., of Wargreave, Bucks, to Caroline Josephine, eldest daughter of J. J. Marquetti, Esq., of St. John's Wood.
 YOUNG—TAYLER.—On August 22, at the parish church, Cowden, T. Pallister Young, LL.B., B.A., of 1, Beaufort-gardens, Lewisham High-road, and 29, Mark-lane, to Marion Elizabeth (Minnie), only daughter of Caleb Tayler, M.D., of Lewisham-road and Mapletreuse, Cowden, Kent.

DEATHS.

ADCOCK, JOHN LYDIAT, infant son of John Adcock, M.D., Army Medical Staff, at Sandgate, on August 26, aged four weeks.
 CASEY, THOMAS, M.D., at St. Alban's, on August 21, aged 76, having survived his wife three months.
 GROSVENOR, EMMELINE PERSHALL, the infant daughter of George Fox Grosvenor, M.D., at 121, Ladbrooke-grove, Kensington-park, W., on August 16, aged eight months.
 GRYLES, WILLIAM, M.D., Civil Surgeon, late of Enniskillen Dragoons, at Cocanada, Madras Presidency, on July 1, aged 41.
 HAGON, ALFRED, only surviving son of the late Richard Hagon, Surgeon, of Aldborough, Suffolk, at Higham Ferrars, Northamptonshire, on August 14, aged 29.
 KNOWLES, ESTHER, the beloved wife of Edmund Yalden Knowles, Surgeon, suddenly, at Farnham, Surrey, on August 21, aged 57.
 LESLIE, SUSANNA, relict of Patrick Leslie, M.D., at Wilton-place, on August 20, aged 89.
 MILLAR, CHRISTIANA DUNCANSON DUNCAN, wife of John Millar, M.D., F.R.C.P.E., at 48, Albany-street, Edinburgh, on August 19, deeply regretted.
 PEARL, Mrs., the wife of Dr. Pearl, at Hall Court, Ripe, Sussex, on August 20.
 THOMAS, DAVID JOHN, M.D., F.R.C.S.E., formerly of Llwyn-y-Berllan, Carmarthenshire, at 129, Collins-street East, Melbourne, Australia, on June 1, aged 58.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.
 BOURNEMOUTH GENERAL DISPENSARY.—Resident Surgeon; must have both Medical and Surgical qualifications and be registered. Applications and testimonials to B. A. Rugg, Esq., for the President of the Dispensary, on or before August 28.
 BRADFORD INFIRMARY AND DISPENSARY.—Physician; must be a Graduate in Medicine of one of the Universities of the United Kingdom, or a Fellow or Member of one of the Colleges of Physicians. Applications and testimonials to Mr. C. Woodcock, Bradford, on or before August 30.
 BRISTOL ROYAL INFIRMARY.—Dispenser; must be competent to take entire charge of the Dispensary Department. Applications and testimonials to the Committee, on or before September 9.
 CHESTER GENERAL INFIRMARY.—Visiting Surgeon; must have both Medical and Surgical qualifications. Applications and testimonials to the "Chairman of the Board of Management," on or before August 28.

CHRISTCHURCH UNION.—Medical Officer for the Eastern District. Candidates must be properly qualified and registered. Applications and testimonials to Mr. Henry Pain, Clerk, on or before September 4. Election the same day.

COVENTRY PROVIDENT DISPENSARY.—Surgeon; must be a Member of one of the Colleges of Surgeons of London, Dublin, Edinburgh, or Glasgow, and must hold in addition a Licence from one of the Royal Colleges of Physicians, or from the Society of Apothecaries. Applications and testimonials to the "Honorary Secretary," on or before August 31.

GOWER UNION (WESTERN DISTRICT).—Medical Officer for this district, including the Workhouse. Candidates must have the qualifications prescribed by the General Orders of the Poor-law Board. Applications and testimonials to the Clerk, Quay-parade, Swansea, on or before September 9. Election on the 12th.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, BROMPTON, S.W.—Dental Surgeon. Applications and testimonials to the Secretary.

ISLINGTON, VESTRY OF ST. MARY.—Medical Officer of Health and Analyst. Candidates must be duly qualified and registered. Applications and testimonials to Mr. John Layton, Vestry Clerk, on or before September 18. Further particulars may be obtained at the Vestry Office.

LEXDEN AND WINSTREE UNION.—Medical Officer for the Eighth District. Candidates must possess the qualifications prescribed by the General Orders of the Poor-law Board. Applications and testimonials to Mr. W. Howard, Clerk to the Board, on or before September 5. Election on the 6th.

NORFOLK AND NORWICH HOSPITAL, NORWICH.—House-Surgeon; must have both Medical and Surgical qualifications. Applications and testimonials to Mr. T. R. Tallack, on or before September 8. Election on September 16.

PARISH OF UNST, SHETLAND.—Medical Officer. Applications and testimonials to Mr. White, Inspector of the Poor.

QUEEN'S COLLEGE, BIRMINGHAM.—Medical Tutor and Joint Demonstrator of Anatomy. Applications and testimonials to the Secretary on or before August 31.

UNIVERSITY OF DURHAM COLLEGE OF MEDICINE, NEWCASTLE-ON-TYNE.—Medical Tutor. Applications and testimonials to Luke Armstrong, Esq., College of Medicine, Newcastle-on-Tyne, on or before August 31. It is particularly requested that no original testimonials be sent.

UNION AND PAROCHIAL MEDICAL SERVICE.

** The area of each district is stated in acres. The population is computed according to the census of 1871.

RESIGNATIONS.

Settle Union.—The Settle District is vacant; area 18,496; population 3187; salary £35 per annum. The Horton-in-Ribblesdale District is vacant; area 17,258; population 417; salary £6 per annum. The Workhouse is vacant; salary £18 per annum.

APPOINTMENTS.

Bodmin Union.—Henry G. Curran, L.R.C.S. Ire., L.K.Q. Coll. Phys. Ire., to the Second District.

Chelmsford Union.—Wm. R. Horniblow, L.R.C.P. Edin., M.R.C.S. Eng., L.S.A., to the Second District.

Dewsbury Union.—Edward J. H. Booth, M.R.C.S. Eng., L.S.A., to the Mirfield District.

Farringdon Union.—George H. Maskelyne, M.R.C.S. Eng., L.S.A., to the Buckland District.

Hunslet Union.—Wm. Pogson, M.R.C.S. Eng., L.R.C.P. Edin., to the Fifth District.

Lewes Union.—Walter F. Crosskey, M.D. & M.C. Univ. Glasg., to the New Workhouse, the St. Ann's Workhouse for Children, and the Lower District.

Newbury Union.—George Henry Watts, M.R.C.S. Eng., L.S.A., to the Third District.

Taunton Union.—Walter H. Reed, M.R.C.S. Eng., L.S.A., to the Churchstanton District.

As a fitting memorial to the late Dr. Kelly, it has been decided to erect a Cottage Hospital at Crook, Bishop Auckland, at a cost of £800.

A SPECIAL vote of thanks was given at the meeting of the managing committee of the Children's Hospital, Birmingham, last week, to Dr. Heslop, for "various important improvements made in the Hospital at his cost."

SIR ALEXANDER ARMSTRONG, K.C.B., having completed his annual inspection of the Royal Naval Hospital and the several other naval Medical establishments at Plymouth, has gone to Falmouth to inspect the sick-quarters of the training-ship *Ganges*, at that port, and thence returns to London.

SMALL-POX is prevalent in the city of Waterford. A number of cases have been reported during the last few days.

SMALL-POX AT CHORLTON.—The report to the Chorlton Board of Guardians on Friday last showed that six cases of small-pox had been admitted during the week, which, with thirty-seven cases remaining in the Hospital the previous week, made a total of forty-three patients. Of these, four had been discharged, and one had died who was unvaccinated.

THE deaths in Paris during last week were 828, against 676 in the previous week. There were 31 deaths from cholera, 55 from diarrhoea, and 1 from cholera. The Government is adopting precautions against cholera, but no serious cause for uneasiness has yet arisen.

THE Medical Officer's report of small-pox patients at the Canal-street Hospital, Manchester, showed remaining last week 67—discharged, 14; remaining, 53. No deaths occurred during the week. The number of unvaccinated children reported during the week was 153. During the same week, by the assistance of the relieving officers, in the house-to-house visitation, 210 unvaccinated children were found, 113 of whom, however, were under three months old.

THE CHOLERA.—On Monday afternoon, the schooner *Progress*, Captain Innes, arrived off Broughty Ferry, Dundee, from Königsberg with a cargo of flax. She was visited by the Sanitary Inspector and the Custom-house officials, who learned that one of the crew, a nephew of the captain, had been seized with cholera on August 5, the day after the vessel had left Königsberg, and had died within twenty-four hours. The vessel then put into Dantzic, where the body was buried, and she afterwards set sail and arrived here yesterday. A telegram intimating the arrival of the vessel, and that cholera had been on board, was immediately transmitted to Dundee. Dr. Pirie left with the first train thereafter for Broughty Ferry, and, in company with the Custom-house officials and the police officials appointed for the purpose, proceeded to the vessel, and made a thorough examination. He learned that the facts reported regarding the death of the nephew of the captain were quite true, but the rest of the crew were all found to be in good health, and none of them had been ill during the voyage excepting the man that had died. The bed- and body-clothes of the deceased had been destroyed immediately after his death, and the roundhouse in which he had lain was thoroughly washed out afterwards. Before leaving the vessel Dr. Pirie disinfected the compartment with carbolic acid. The vessel was then allowed to proceed to Dundee.

CHOLERA IN GERMANY.—It is officially notified that cholera has appeared at Pillkallen, Oletzko, Lyck, and Insterburg, and for all these districts a sanitary committee is established.

THE French Government is adopting precautions against the cholera, but up to the present time no serious cause for uneasiness has arisen.

A DECREE of the Italian Ministry of the Interior orders sanitary measures for vessels arriving from the sea of Azof.

AT the expiration of eight months from the passing of the new Metropolis Water Act, every company shall, when required so to do, furnish "a constant supply of pure and wholesome water sufficient for the domestic purposes of the inhabitants." The water is to be laid on at such pressure as will cause it to reach the top story of the highest houses.

IN the week ended August 12, only one death, that of an infant under 12 months of age, was registered in the parish of Clifton, Bristol, showing a rate of mortality of 1.9 per 1000 per annum.

UNDERTAKERS AND THE REDUCED DEATH-RATE OF CALCUTTA.—The *Indian Daily News* tells the following sadly amusing story:—"The Chairman of the Justices while out, as usual, inspecting the several divisions of the town, met an undertaker on the Dhurumtollah-road, and asked him how his business was getting on. 'Very dull,' replied the undertaker, with a sigh, adding, 'we will have to apply to you for compensation, as the drainage and waterworks have done it all.'"

HOW PHYSICIANS ARE TREATED IN EGYPT.—A horrible occurrence, says the *Egyptian Messenger*, took place last week at Cairo. The wife of a certain Marselli, an Italian, having lost her sight after a long and painful ophthalmia, in which the assiduous care of Dr. Altieri Marrullier was of no avail, the husband conceived the idea of depriving the unsuccessful Physician of his sight. He procured a bottle of sulphuric acid, and, having waylaid the Doctor, threw its contents in his face and in that of his secretary, Mr. Griffith, who accompanied him. Both victims are in great danger of losing the use of their eyes.

TIN DRAINAGE-TUBES.—Dr. Heiberg, writing concerning his experience derived in Professor König's clinic, at Rostock, states that tin tubes form a cheap and admirable substitute for the silvered tubes lately recommended by Professor Hueter. Metal has many advantages over the organic materials of which drainage-tubes are ordinarily made, and those made of tin can easily be pierced with holes or bent to the required angle. They always keep their metallic lustre, and can be cut by a pocket-knife. While introducing the tube Dr. Heiberg passes into it a rounded wooden plug, which projects somewhat, in order to prevent injuries from its cutting edge.—*Centralblatt*, August 5.

ANGLO-AMERICAN HOSPITAL, NAPLES.—We trust that our Government will interpose and obtain the withdrawal of the peremptory order, received by the managers of this Hospital from the Neapolitan authorities, to close this useful and much-needed institution, which for upwards of thirty years, without let or hindrance, has continued its good work up to the present.

THE Hospitals in Russia would appear to be sadly mismanaged if the Hospital at Kertch may be taken as at all typical of such institutions there generally. British subjects have been frequently taken to the Kertch Hospital, and the invariable complaint is—"scarcity of nourishment, bordering on starvation, and an utter want of feeling or sympathy for the sick among the attendants." There is no pharmacy in the Hospital, the *infirmiers* purchasing the medicaments. The high range of mortality in a time of epidemic need excite no wonder when the dirty habits of the people and the mismanagement of the Hospitals are taken into account.

THE GERMAN SCIENTIFIC AND MEDICAL ASSOCIATION.—The forty-fourth meeting of this body will be held this year at Rostock, during the week September 18 to 24. As the accommodation in so small a town is limited, early application should be made by intending visitors, to the managers, Drs. Thierfelder and Karsten, at Rostock.

NOTES, QUERIES, AND REPLIES.

He that questioneth much shall learn much.—*Bacon*.

Will "An Old Pupil of John Abernethy" favour us with his mode of treating cholera?

G. H. S.—Linacre was the founder of the College of Physicians of London and was its first President. He held that office during the last seven years of his life. He died in 1573, at the age of 63. The first edition of Harvey's "Doctrine of the Circulation of the Blood" was published in 1628.

A *Guardian* (*Hackney*), A. B., and others complain that Sir H. M. Beach was incorrect in his statement in the House of Commons respecting the number of persons vaccinated in Hackney. They state that the returns quoted by Sir H. M. Beach extended only to Michaelmas last, and as some 20,000 persons have since been successfully vaccinated in the district, the statistics quoted are calculated to place Hackney in an unfavourable light before the metropolis. We understand the guardians have ordered the publication of a statement in correction of Sir H. M. Beach's mistake.

A *Lover of Tea* inquires if there is not some mistake in the following extract from the British Consul at Ragusa, Mr. Paton. Mr. Paton says—

"Tea and coffee are the sure and rapid destroyers of the nervous and muscular system, for there is reaction and prostration after the digestion is terminated, and at the very time when all the vital forces are required for the purposes of assimilation, which is just as important as that of digestion."

Under proper regulations, and taken at proper times and in proper quantities, tea and coffee may assist both digestion and assimilation.

PRECEDENCE IN INDIA.

An Indian Army Surgeon writes:—"When John Company handed over India and its officers to the Queen, all ancient rights and privileges were guaranteed to the honourable John's officers. Rank was, I presume, one of those rights; yet, by a warrant of precedence, published in this country a few days since, I am every day of my life superseded by an officer who is my junior in the service—*i.e.*, a captain of infantry—who, as Deputy Commissioner, takes precedence in his own district above lieutenant-colonels in the army. Giving local rank to Commissioners and Deputy Commissioners is, in reality, analogous to giving them substantive rank, as they are but seldom met except within their own beats. Why should not the Medical officers in civil employ have rank given to them on the same terms as civilians? One half the Medical officers in the Bengal side are in civil employ, and it is but reasonable to expect that those so employed should have better than their military rank accorded to them, if fourth-class educational men are to have a good position in the social scale now laid down. Then, again, Sanitary Commissioners and Inspector-Generals of Gaols supersede men who are in the same Profession and much longer in the service. The Medical officers and engineers have reason to grumble at this new warrant, of which I send you a copy. The following is the relative rank of Medical officers:—Assistant-Surgeon, under six years, as Lieutenant; do., above six years, as Captain; Surgeon, as Major; Surgeon-Major, as Lieutenant-Colonel, but junior to that rank; Deputy Inspector-General of Hospitals, as Lieutenant-Colonel; Inspector-General of Hospitals, as Colonel."

What took away Cholera from Cairo.—B. B. W., writing to the *Times*, says—"But far above all medicines in the thoughts of the Cairenes was the rise of the Nile, as the supply of sweet water over the surface of the Delta. Many watched for it night and day—it was slow of rising that year. But when the floods came down and swept away the impurities of the land, and brought drinkable water close to every household, then, as anticipated, the cholera king took his departure, and the city gradually regained its usual aspect."

MEDICAL REFORM.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—The little world of Medicine has for some time been in a constant state of agitation, striving might and main to reform the education of the Profession. In following the course of this movement, it has exceedingly surprised me to find that, as far as I am aware, no information has ever been given us of the standard which will be demanded. The desire seems to be to force every man to give proof of being well educated. But is there not a delightful vagueness in all this? Are there not fearful rocks ahead? What is, or is not, essential to a good Medical training? Is it not possible that, when the reform is carried—that is to say, when the long talked-of Bill is passed—we shall somewhat resemble Robinson Crusoe and his boat, or the painting in the Vicar of Wakefield? Our work will apparently be accomplished, but we shall be unable to turn it to account, so many the difficulties, so numerous the conflicting opinions. One gentleman of high eminence actually proposed that, before becoming a student, every man should pass an examination at least equal to the London Matriculation; and, some time later, another examination, resembling, as far as one could gather, the Preliminary Scientific. Perhaps this amounted to saying that the London M.B. should be the standard. May I be pardoned for saying his plan was an impossible one. Now, let me not be misunderstood; no man more deprecates the great ignorance of many of his *confrères* than I; nor, however, am I venturing to draw up a plan of reform. As a man who has mixed almost more with clergymen and lawyers than with Doctors, I may be considered to be something of an outsider, and thus, perhaps, shall be able to show that the whole question of reform is a most difficult one; let this be said with due deference to the great lights of the Profession.

What is a Doctor's career? One generally involving incessant labour, much night and Sunday work, very little leisure, and very few holidays. As a rule, half our Doctors at least are almost wholly cut off from all cultivated society, and pass their time associating exclusively with the poor. Then look at another drawback—the incessant sale of drugs—for it amounts to nothing else! If a man wishes to avoid this annoyance it becomes almost impossible to get a general practice; or, should he settle down as a consulting Practitioner, ought he not to have a good fortune, and be prepared to wait for years for a success which does not always come? Compare this with the career of a clergyman. If a man of fair ability, there are, for instance, not a few well-paid posts as assistant masters in good schools to reward him, or he can get curacies at from £90 to £150 a year in all parts of the country. In a few years he can rise, and usually does rise, and I have known quite young men, without any influence, obtain incumbencies. Probably the said clergyman does not earn, in the long run, as much as the Doctor; but there is less difference in this respect than people think, and his receipts are clear, while the Surgeon's have often to be greatly reduced to pay for his drugs, horses, and assistants. The clergyman is received into better society, has infinitely more leisure, associates chiefly with people of education, and leads an incomparably pleasanter life. And do we not all admit that, man for man, the clergy are superior to ourselves—better educated, members of better families, and exercising greater social influence? Could we really raise our standard of education to any marked extent? I think not, for the other professions and trades would then afford higher advantages, and one of three results would and must follow—either, that the employment of unqualified Practitioners would increase, to make up for the deficiency in registered men; or, that assistants would be still more extensively used; or, that the out-patient department of all our Hospitals would become the only refuge for the majority of the poor. The hardships of a Surgeon's lot are, of themselves, enough to keep away any large number of really good, well-educated, refined men, unless the remuneration were made very high; and then the poverty of the working classes, who form three-fourths of the sick, would cut them off from the Doctor, and drive them to chemists and Hospitals.

From what I have seen of Medical students and of the following examinations, I cannot but think that the highest minimum standard at present practicable is the work required for the L.R.C.P. and M.R.C.S. of London; and had all our Practitioners passed these tests there would not be so much to complain of after all.

And now, before drawing this long letter to a close, let me point out an evil which, if continued, will infallibly ruin every plan of reform, however promising, and bring to nought the labours of all our reformers. It is the execrable system of unqualified assistants. With that trades'-unionism too common amongst us, proposals are made that no unqualified person should be permitted to practise for gain, and that a clause to this effect should be inserted in the new Bill; but attend! Surgeons are still to have assistants, for whose services they can charge! We who know what unqualified assistants too often are—how seldom in later life they distinguish themselves in practice, how few the honours they take when they attend a Medical school—must feel the full force of this terrible evil. Raise, if you will, the standard of education, and thus reduce the number of registered Surgeons, and then, to make up, thousands of fresh assistants would be sent forth to earn money for their masters in return for services too often worth nothing at all.

At the present day, when certain diplomas are deservedly sneered at, hundreds of Surgeons—aye, and among them men, to my knowledge, whose names have figured in connexion with the recent movement—have branch practices, attended to not seldom by men far inferior to a respectable chemist's assistant. Such cases I know at this day. And is it not common to find Surgeons who sigh for Medical reform employing unqualified assistants in preference to qualified men?—because, they tell you, the former are cheaper and harder workers. And is it very uncommon for a simple dispensing assistant to be sent to scores of complicated cases? And what more common than that young pupils should be given exclusive charge of serious illnesses? Who, again, has not seen young students left in sole charge of the out-patients of a large Hospital? Who has not known important Infirmaries intrusted to the care, for a week or ten days, of students not too brilliant nor too learned?

And now, finally, we find a Scotch University, in its desire to foster a higher standard of education, after a period of quiescence, about to recommence its old system of selling its highest degree in Medicine. Such is human consistency! The men who think the ordinary M.R.C.S. an ignorant being have ten thousand reasons to prove why pupils, dispensers, unqualified assistants, and students should in some towns attend to one-third—may I not even say to one-half—of all the sick. In any plan of reform, these crying evils ought to be duly cared for.

I am, &c., AN OLD UNIVERSITY COLLEGE MAN.

"DYTE v. THE ST. PANCRAS GUARDIANS" APPEAL FUND.

Dr. Bathurst Woodman begs to acknowledge the receipt of the following subscriptions to the fund now being raised for the purpose of carrying on the appeal in the above suit, the history and particulars of which, together with a report of the trial, he will be happy to forward on application:—

	£	s.	d.
W. Marrant Baker, Esq., F.R.C.S., St. Bartholemew's Hospital	1	1	0
Dr. Barnes, Grosvenor-square	1	1	0
Dr. Billing, Grosvenor-gate	1	1	0
F. Gordon Brown, Esq., M.R.C.S., Finsbury-circus	0	10	6
Dr. Andrew Clark, Cavendish-square	2	2	0
George Critchett, Esq., F.R.C.S., Harley-street	2	2	0
T. B. Curling, Esq., F.R.S., Grosvenor-street	2	2	0
Dr. Herbert Davies, Finsbury-square	2	2	0
Dr. Langdon Down, Welbeck-street	2	2	0
Dr. C. R. Drysdale, Southampton-row	1	1	0
Dr. Edmunds, Fitzroy-square	2	2	0
Peter Gowlland, Esq., F.R.C.S., Finsbury-square	1	1	0
Dr. Hardwicke, Maida-hill	1	1	0
Jonathan Hutchinson, Esq., F.R.C.S., Finsbury-circus	1	1	0
Dr. Hughlings-Jackson, Bedford-place	1	1	0
Dr. Little, Brook-street	2	2	0
James Luke, Esq., F.R.S., Maidenhead	1	1	0
Dr. Morell-Mackenzie, Weymouth-street	2	2	0
C. F. Maunder, Esq., F.R.C.S., New Broad-street	2	2	0
F. B. Pearse, Esq., F.R.C.S., Haverstock-hill	2	2	0
Walter Rivington, Esq., F.R.C.S., Finsbury-square	1	1	0
Edward Symonds, Esq., Camden-town	2	2	0
James Teevan, Esq., F.R.C.S., Chesham-street	2	2	0
James Watkins, Esq., Gloucester-road	1	1	0
Dr. W. Bathurst Woodman, Christopher-street	1	1	0
A. K.	1	1	0
One Behind the Scenes	1	1	0
A Hater of Injustice	1	1	0
F.R.C.P.	0	10	6

Further subscriptions will be received by Dr. Bathurst Woodman, Hon. Sec., 6, Christopher-street, Finsbury-square, E.C.; or may be paid in to the account of the Fund at the London and Westminster Bank, Lothbury.

"QUICK WITH CHILD."

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I am well aware of the recorded cases of error in the verdicts of juries composed of matrons, but I have yet to learn that any jury, special or common, male or female, or even purely Medical, is faultless; or, indeed, that any human tribunal is free from error. Dr. Bree himself says, "It is often a most difficult thing to discover whether a woman is with child or not, and eminent and experienced men are sometimes deceived." I was also perfectly aware of the French and American law on the subject, but I was dealing with the English law, and I still contend that it is not open to the grave imputations cast upon it by Dr. Bree. I even suggested the adoption of the principle involved in those laws. Before terminating the present discussion I must remind your readers that I have given my authority for both the law and its mode of operation. Blackstone is neither a mean nor a mediæval authority, albeit he is ignored by Dr. Bree, who affects to expound the law upon his own authority, and in opposition to the ruling of the learned judge. That the law is based upon any such vulgar error as that quickening takes place only after a certain period of gestation I utterly deny. A child may be "alive in the womb" at any period of gestation, and this vitality the law requires to exist at the time of the investigation. Dr. Bree has, however, borrowed his idea from "Taylor's Medical Jurisprudence" (an assertion there made upon no authority whatever, and where a definition of the law is not even attempted—and even if it were would carry with it no weight *per se*, as Dr. Taylor's work, though invaluable as a work on Medical science, is no authority as an exponent of the law, and is never quoted as such in any court of justice). I am no stickler for the law as it is, if it can be amended with effect, but I deny that it is "horrid, murderous, unjust, disgraceful," or based upon any such notion about the period of quickening as has been suggested. If Medical science is not yet sufficiently advanced to discover for certain whether a child is "alive in the womb" or not, by all means let the woman have the benefit of the doubt; and, as I before suggested, let pregnancy alone, and not vitality, be the test. It is much to be deplored that there is no court of appeal in criminal cases, and that erroneous verdicts or doubtful evidence can only be supervised by the Secretary of State; but we are not discussing now a revision of our whole criminal code.

I am, &c., HUGH WEIGHTMAN.

1, Mitre-court, Temple, August 21.

The following card has been sent us by a subscriber:—

26, Rothbury-villas, Tollington-park, N.

DR. REYNOLDS,

Surgeon and Accoucheur.

Advice and medicine during illness, 3s. 6d. per week.

Attendance and medicine during illness, 5s. 6d. per week.

Mr. W. J. Stracey, of Brixton Vicarage, Norwich, says that—"Cases of fever, especially of scarlet-fever, are apt to break out in new-built houses about eight or nine months after the same have been completed. This is said to arise from a decomposition which takes place in the hair used in the mortar or plaster of the walls, through the action of lime. And it does appear to me that, if this is found to be a common occurrence, and very nearly at the very same period after completion, many families, if they were aware of this fact, might be able to remove for some weeks so as exactly to avoid this risk." The moral is, that no house, however new and clean, and perfectly ventilated, is proof against scarlet-fever, if the infection is introduced.

Hackney and Kingsland.—Public opinion has all but universally condemned the proceeding. The "notice" is, as far as we know, the solitary exception.

Begging-Letters.—We would warn our readers against appeals from private sources for help for needy Professional men. In real cases of distress reference will always be allowed to the leading men of the Profession. Private begging-letters cannot be regarded with too much suspicion.

Spiritualistic Ghost Stories.—The *Spiritualist* says—"Spirits have bodies: they have also more senses and powers than ourselves. The lowest spirits live upon the earth, and seem to be chained to the scene of their former crimes; they have also more direct power over common matter, we think, than the higher ones. This is why places where great crimes have been committed are often haunted. Spirits differ in their religious and other opinions; there is no more uniformity on the other side of the grave than on this side." Query: The proof.

Plymouth.—The Plymouth Guardians are in a considerable fix. Mr. Lupton, elected by the Guardians to succeed Mr. May, has declined to accept the appointment. "He felt bound to decline the appointment, being of opinion that he should thus be acting right towards other gentlemen." The Guardians, after a "debate" respecting their late resolution to have three instead of four Surgeons to the union, and after causing a vast amount of ill-feeling and annoyance, have begun to see the error of their ways. It is probable that at the next meeting, looking at the tone of the discussion, the Board will determine on having four Surgeons and four relieving officers.

DREAMS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Can you or any of my Professional brethren tell a remedy or cure for dreaming? I have for many years been a martyr to dreams—some pleasant, some disagreeable. As soon as I fall asleep I am invariably troubled by them, and as a consequence I wake in the morning unrefreshed, languid, and good for nothing. I have tried all sorts of remedies, varying my dinner hour so as to go to bed with a full or empty stomach, etc., but hitherto in vain. I should say that I sleep quickly and soundly, and that, although a married man, temperate in all things, I am sometimes troubled with nocturnal emissions. Any suggestions that you can afford me to insure a good night's rest, free from dreams, will be most thankfully received by
Yours, &c., M. D.

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29'69 in. The highest was 29'91 in. at the end of the week, and the lowest was 29'26 in. on Friday afternoon.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871. As the population of Dublin and its suburbs showed a decline between the Censuses of 1861 and 1871, the enumerated number in April last has been inserted above for that city, the population being assumed to be now stationary.

ORIGINAL LECTURES.

ON THE INFLUENCE OF THE
NERVOUS SYSTEM ON DISEASES OF THE
ORGANS AND TISSUES.

By THOMAS LAYCOCK, M.D., etc.

Professor of the Practice of Medicine, of Clinical Medicine, and of Medical Psychology and Mental Diseases, in the University of Edinburgh.

(These lectures have been revised, and somewhat extended, by Dr. Laycock.)

LECTURE V.

A CLINICAL TROPHIC AND VASO-MOTOR ANATOMY
OF THE BRAIN AND CORD, FROM A NEW POINT
OF VIEW.*(Continued from page 212.)*

ANOTHER and more important difficulty is, that there is so much irregularity in the distribution and development of the arteries that clinical deductions therefrom must necessarily be uncertain. The posterior communicating artery may be double, or be much smaller on one side than on the other, while the anterior communicating in such case will be larger, to equalise the blood-supply; so that here no valid deduction can be made. When we consider, however, that it is to the great laws of development we have to look for the better comprehension of the meaning of all these anomalies and irregularities in development whatever, this and similar questions are approached by my method from a wholly different point of view. It may be held as a principle that irregular or imperfect development of an artery on one side indicates irregular or imperfect development at some stage of evolution of the parts from whence the arterial development has begun, although there may be a rectification at some subsequent stage. Serres shows this law very conclusively. If, he says, a monster is born without a cerebellum, there is no vertebral artery; if without a corpus callosum, no artery; if without cerebral hemispheres, the internal carotid is reduced in size to "zero." On the contrary, the size of the artery indicates the extent of development. Thus, the size of the intercostals is in direct relation to the size of the spinal cord, and the volume of the spinal arteries in direct relation to that of the external carotid and of the ophthalmic artery, because the parts supplied by these correspond to the regions of the trunk. Further, amongst the encephalic arteries of embryos, those of the tubercula quadrigemina, median lobe, and olfactory and hippocampus lobes correspond in size to the internal maxillary artery and the arteries of the cord, because those nerve-centres and parts of the maxillary area are in direct developmental relation. On the other hand, the arteries of the corpora striata and corpus callosum and the posterior cerebral and cerebellar arteries are developed in inverse relation. In truth, we want a pathological anatomy of the development of arteries. Anatomists have given us with infinite care and minuteness detailed accounts of arterial anomalies, but beyond the bare facts we know nothing. Now, I more than suspect that if inquiry were made into the pathological antecedents of persons whose bodies manifested these anomalies in the development of the encephalic arteries, we should find that they had some unsymmetry of cranium, and had exhibited a tendency, at least, during life to encephalic neuroses. Unfortunately, to combine clinical teaching with minute pathological research is impossible in the lecture-room; it is in asylums, in which the brains of the epileptic and the insane can be deliberately examined, that research of this kind is possible. I am not aware, however, that any minute anatomical researches into the distribution and anatomical condition of the encephalic arteries have been made in relation to the numerous problems involved.

The facts to be observed include some which appear utterly diverse until linked together by the principle of the method I recommend. Thus, the development of the hair of the head—and I may add of the trunk and the limbs—is in relation with that of the nerve-centres; so also as to the bones, not only of the cranium and the face, but of the limbs. As to all these points, it is necessary to remember in observation the laws of symmetry and of conjugation. It is noticeable as to the hair in various ways. Two of these have been already indicated—viz., symmetrical greyness and baldness; but the mode of distribution, and the development, and atrophy of the hair in the embryo and at successive ages are of importance. Thus, the

direction of growth of the hair at the crown is from a centre; so also of the eyebrows from the median line when they meet across the nose. In like manner baldness begins at the vertex, and when it commences at the temples a central tuft is sometimes left on the forehead, or one on each side with a connecting bridge. Not less obvious is the same law in the distribution of the hair on the limbs and trunk. In osseous development it is everywhere manifest with commissural integration, such as occurs in the formation of the basilar process, and of the occipital and frontal bones; there is also corresponding arterial integration and union of nerve-centres. According to this method two lines of comparative research would be needed; by the one we should inquire into the order of embryonic human evolution, by the other ascertain the order of development in vertebrates generally. To permanent forms of one or other of these evolutions anomalies in arterial and cranial development could be referred, and therewith, perhaps, some anomalies of mental manifestations due to hereditary tendencies.

To apply these views clinically, it is necessary to consider the anatomy of the nerves in relation to the bloodvessels. For example, the ophthalmic artery, a branch of the internal carotid, supplies, besides the eye, an important clinical region—viz., the sinuses, the lachrymal gland, the muscles of the eye, the eyelids and eyebrows, and the frontal muscles. Besides the obvious emotional relations of these parts, here are situate the seats of frontal headaches, coryzas, supra-orbital neuralgia and leprosy, exophthalmos, œdema and pigmentation of eyelids, due to trophic changes. Clinically, we conclude there must be a common centre, or centres, of motor, vaso-motor, and trophic action; anatomically, we derive no information as to this fact, because the integration of ganglia in the occipito-spinal region, with which the trophic, sensory, and motor nerves are connected, is too complete to be easily unravelled. It is possible, however, to obtain sufficient general knowledge by what may be termed circumstantial evidence. The face and cranium are made up of coalesced vertebræ. Let us suppose the trigeminus or fifth nerve represents three of these, then the ophthalmic branch will enter into the primary elements of one vertebra, and that the most anterior, and we can, therefore, classify the ophthalmic artery with it, and the ophthalmic ganglion with both. Turning to the anatomy of the fifth, we find that both the motor and sensory fibrils emerge close to the junction of the crus cerebelli with the pons; hence "coarse" lesions at this point would affect both the peripheral and central terminations through the trunks of the nerve, but dynamic changes would be influential lower down, at the ganglionic centre in the cord. Now, the sensory branch of the fifth arises from the "grey tubercle," which is in intimate connexion with the sensory centres of both the vagus and glosso-pharyngeal nerve. Here, then, is the spinal centre, and here are, probably, those trophic commissural connexions which determine the morbid conditions I have mentioned.

Clinical facts plainly show that this region is spinal. The eyebrows fall off in leprosy (an affection of spinal nerves); the eyelids are œdematous and pigmented diastaltically in connexion with certain uterine and urinary disorders, as I showed in a former lecture; the eyes stare not only in mania and in certain emotions, but also in a cardiac neurosis with vascular bronchocele, known as Graves' disease. Further, experimental researches by Claude Bernard show that pinching the motor roots of the seventh and eighth cervical and first dorsal nerves excites a projection of the ball of the eye, together with dilatation of the pupil. Hence, the term "oculo-spinal" Claude Bernard has given to the corresponding portion of the spinal cord. It follows, therefore, that there are two centres in the occipito-spinal region. I have marked off one for changes in relation to mental states, another for corporeal conditions. As the eyebrows seem never to become grey from emotion, they are spinal in their trophic relations.

A similar general fact comes out when we trace the causal connexions of epilepsy, hysteria, and of other convulsive diseases with or without abolition of consciousness. Some of the phenomena are very distinctly manifested in viscera connected with the spinal cord, others with muscular structures of the face that subserve to the manifestation of the various states of consciousness, more especially of emotions, others with purely mental tissues. The connexions of the third and seventh pairs of nerves with the occipito-spinal region are of this class. Laughter and weeping are emotional changes. When, however, they occur morbidly, with an imperfect abolition of consciousness, they are spinal, and differentiate hysteric from epileptic convulsions; and to these we add other spinal phenomena, such as globus, flatulence, limpid urine, and probably an orgasm of the uterus. Hydrophobia, whether we regard its sensorial or

convulsive phenomena, holds an intermediate place between hysteria and epilepsy, yet with a spinal-tetanic character; in all these the region of the lower or animal instincts is more or less involved. The region of epilepsy has a wider range, because the vascular system of which it is the seat is of much wider extent. Downwards the symptoms are chiefly convulsive, upwards chiefly sensory, until we see in the so-called "petit mal," and in epileptic delirium, mania, and automatic impulse, phenomena exclusively cerebral. It is because the epileptic vascular area includes the cerebellum—the great trophic centre, and the sensory system of the head and cranium—that mania and dementia are more apt to follow upon epilepsy than on hysteria, and all those trophic changes in the skull which coincide in long-standing cases of epilepsy. In epilepsy, the hereditary transmission of defects in cerebral nutrition is more certain than in hysteria, and this, I think, because of the connexion of the cerebellum with the genetic glands. In hysteria the symptoms are more obviously dynamical; it is only when the phenomena become epileptiform that the prognosis as to consecutive brain-change becomes more important. From this point of view the *ejaculatio seminis* during an epileptic paroxysm is not without meaning in investigating the causal relations of solitary vice and sensual indulgence to epilepsy and brain-disease. I may add here that the pathological observations made by Gall, Serres, and others, indicate that this region is in anatomical and physiological relation with the sexual organs, but perhaps more especially that of which the superior vermiform process or median lobe is the centre, and which has direct commissural connexion with the brain. With a knowledge of these facts, we can understand not only why this region is the seat of vaso-motor neuroses, like puerperal and hysterical convulsions, catalepsy, and convulsive epilepsy, but why certain morbid sensorial conditions (*æsthesiæ*) are caused by sexual excesses, and why utero-ovarian changes, whether during pregnancy or otherwise, induce, by direct or diastaltic action on the basilar centres, peculiar modifications of the appetites and instincts. To this group belong those changes in cerebral function and structure leading to insanity which supervene in certain kinds of epilepsy, more especially that termed the "petit mal," which is, in fact, a *sensory* epilepsy.

To understand more clearly the clinical relations of these cerebellar regions to the appetites, instincts, and intellect on the one part, and to the spinal cord and sexual organs on the other, we must revert to the connexions of the spinal arterial system with the basilar system. It is divisible into two distinct elements—the anterior and the posterior. The anterior spinal artery commences in development as a double artery, and is completed as an integrated trunk, like the aorta, anastomosing with the sacral artery. Ascending upwards in front of the spinal cord, the integration ends at the lower edge of the medulla oblongata, and then by a short trunk the blood is poured into or from the vertebral artery on each side. According to my rule this divergence to each side indicates a corresponding lateral commissure between the parts above and the medulla oblongata, probably the decussating pyramids; while in like manner the longitudinal integration indicates a central spinal commissure, extending from the point of integration at the lower edge of the medulla oblongata downwards along the whole length of the anterior columns.

It is otherwise with the posterior spinal arteries. They arise in development from a portion of the spinal cord corresponding to the second lumbar vertebra, or, in ordinary phrase, are distributed there. In either case they are connected one on each side with the vertebral artery of their own side a little lower down than where the anterior spinal join, and, running parallel with each other downwards on the posterior surface of the cord, correspond to a longitudinal and lateral commissure, which connects each half of a segment of the spinal cord with that above and below. From this point of view, the transverse anastomosing branches which connect each posterior spinal artery with the other along the whole length of the cord correspond to the transverse decussating fibrils or commissures of the cord which connect the two halves of the segments transversely, and of which I have already pointed out the clinical significance.

One other important clinical fact must be mentioned. Both the vertebral and the spinal arteries have intimate anastomoses with the vessels of the spinal muscles; so intimate, indeed, that the latter must be considered as in the same vaso-motor areas of activity; so that there is a sort of analogy between the relations of these spinal muscles to the cord and those of the cranium to the brain; and so, also, as to certain sensory nerves. Bearing these and other facts in mind, we will illus-

trate their practical application. 1. In congestions and inflammations of the cord and its membranes the vaso-motor system of the cervical muscles is included, as is shown by the retraction of the head in cerebro-spinal meningitis, or "purple" fever, and in cerebral meningitis of children. A study of the connexion of the spinal arteries through the "reinforcing branches" with those of the spinal muscles enables us to understand this pathognomonic sign, and also why ice-cold applications to the spine are so directly indicated in these cases; but it also warns us not to adopt the too mechanical theory of the cerebro-spinal circulation of the descriptive anatomist. 2. We can have clearer views of the headaches and backaches (*rachialgia*) so common in various diseases. The coronal headache, often associated with nervous heat and baldness of the crown, is probably a neurosis due to changes in the sensory centres situate in the occipito-spinal region, upon which the other symptoms of "nervousness" also depend. The occipital headache has a like origin, but lower down—more, in short, in the cerebellar area. 3. Pain in the lumbar region is a very distressing symptom in various fevers—more especially in small-pox, yellow fever, and remittents and intermittents—in cases of nervous debility from sexual excesses, and in diseases of the kidneys, uterus, ovaria, and testes. Where is the seat of this lumbar pain? It is often muscular, but often, I think, in that spinal region where the posterior spinal arteries terminate, or, more correctly, whence they arise, and which I name the genito-spinal. It corresponds in the cord to a point opposite the second lumbar vertebra, and has direct diastaltic connexions with the occipito-spinal region, and especially with the areas supplied by the anterior cerebellar and posterior cerebral arteries. The nerve-centres comprised in these areas are the essential cerebral mechanism in all vertebrates. 4. It is from these intimate connexions that lumbar pain is so constantly associated with frontal headache, especially in fevers and in spermatorrhœal debility, the line of communication being probably the fornix. 5. Since all this region is the primary region of the senses and of the animal instincts and appetites, on like grounds we can understand how it is that affections of the genito-spinal region—as diseases of the kidneys, spermatorrhœa, and other like disorders—not only affect the nutrition and functions of the cerebellum and other centres in the occipito-spinal region, but also of the nerves of sense—more especially of the retina—by vaso-motor diastaltic action on the cerebral ganglia. In like manner we can understand how there is a close connexion between morbid changes in the retina, as revealed by the ophthalmoscope, and structural diseases of the brain and spinal cord, and how lesions of the sensory portion of the genito-spinal system, such as those which constitute the anatomy of locomotor ataxy, may extend upwards according to the "Wallerian" law of degeneration, and bring on mental diseases dependent on vascular degeneration, like that termed mania with general paralysis.

It is essential, however, to the clear understanding of the connexion of these clinical vaso-motor areas, to take into consideration the trophic and vaso-motor areas of the mental regions proper of the encephalon, more especially with regard to the effects of excessive mental labour or brain-work. I have indicated various points of this division in my psychological text-book, (a) to which I refer you. I would only here observe that the same principles which I have applied to the vertebral vaso-motor system are available to the cranial proper, as represented by that of the internal carotid system. The anterior cerebral arteries are united by the anterior communicating artery representing the anterior commissure. Now, this commissure is sometimes represented by integration of the two anterior cerebral arteries. Follow, however, their branches, and you will find that they subservise to the functions of two commissures of the hemispheres—the transverse or corpus callosum, which combines the two, and the inferior longitudinal, which combines the brain-activities of each. Hence vaso-motor disorders of this anterior cerebral system are likely to induce that disordered unity of consciousness which is the predominant character of delirium and insanity. On the other hand, this region may be unaffected while the posterior cerebral region is disordered, in which case the instincts and appetites may be insane and the intelligence untouched. In this mental area, also, the law of arterial development coincides with that of cerebral and mental development, for the radicles of the external carotid system extend back to the posterior regions of the convolutions, in accordance with the law of cerebral development, which is backwards as well as forwards. In short, all the higher

(a) "Mind and Brain," second edition, vol. ii., p. 475.

convolutions are later in development, and occupy the lateral anterior and posterior regions of the cranium.

It is within this mental area, to mention an illustrative example, that the phenomena of true aphasia are manifested; not, however, merely as restricted by pathologists to structural lesions visible to the eye, but when manifested as mutism in certain cases of melancholia, in dementia, cretinism, and idiocy. You will easily gather from all these facts proofs of the principle I laid down when discussing the methods of clinical observation of the nervous system, that you cannot separate those of the mind (so-called) from others of the brain without falling into gross errors of pathology, diagnosis, and treatment.

ORIGINAL COMMUNICATIONS.

THE ALICE HOSPITAL AT DARMSTADT.

By CHARLES MAYO, M.D.,
Fellow of New College, Oxford.

A SHORT description of a temporary Hospital, constructed and worked by Englishmen during the late war, may be of interest to those who are likely to have the duty of arranging similar establishments.

The chief object of the Alice Hospital was originally to receive cases of typhus, typhoid fever, and dysentery coming from the neighbourhood of Metz, where these diseases had become epidemic, and were threatening to spread with violence. A large building constructed to hold the war material belonging to the engineers, and not designed for human habitation, was given up to me by the Hessian War Office, and the necessary structural alterations were undertaken according to my requirements by Government officials. It had been at first proposed to put patients into this building; but my experience of the system of temporary buildings used in the American war led to the determination to keep the stone fabric solely for domestic purposes, and to house all the sick in wooden "barracks," as the Germans call such structures. Accordingly, having staked and measured out the ground, I commenced by putting up four barracks in *echelon*, the centre of the *echelon* being near the outermost corner of the stone buildings; and a covered way, boarded on one side only, to connect all the barracks with the domestic offices. The dimensions of each barrack were these: length 112 feet, breadth 25 feet, height of side walls 10 feet, height of gable $21\frac{1}{2}$ feet. A small room 11 feet by 9 was cut off on each side of the eastern entrance; and the latrines, two in number, approached through a little *pronaos*, having windows on both sides, projected from the outermost corner of the opposite end. This was the space in which thirty beds were placed, every bed having a window on each side, and having about seven feet of the length of the ward allotted to it. For ventilation, there was a "roof-rider" (to translate the expressive German name for it) or small roof perched on the top of the main one, throughout the length of the barrack; it was about 4 feet wide internally and 2 feet above the main roof; and at each side was furnished with hinged lids worked by strings, throughout the whole length, while the extent of opening could be further varied by the removal of planks, which were merely nailed on, and were accessible from the outside. There was also a continuous line of lids 10 inches deep along each side wall just above the ground. All the windows were, of course, made to open; and on the south side, in addition, the spaces between the windows were turned into lids, so that the whole side wall from the level of the window-sills upwards could be laid open to the sunshine.

The materials used were rough timber and planking, hollow and perforated bricks for the side walls to the height of $1\frac{1}{2}$ feet, and asphalt paper or felt to cover the roof. The walls were of double planking, the interval being filled with straw, and the roof had an inner coating of thin canvas, over which paper was pasted, so as to enclose a layer of air about six inches thick between that and the outer planking. The haste with which it was necessary to erect the barracks compelled me to use whatever materials could be procured with the smallest delay; and as it was impossible to get 150 window-frames made and glazed at a few days' notice, I used small iron skylight-windows of various shapes and sizes set upright, four in a group, which gave a rather grotesque look to the buildings, but answered admirably. The soil was a dry sand, ninety feet deep; therefore I dispensed with a wooden floor, and laid down the gravel of the district (which is really not gravel, but

decomposed granite) instead. The surface of this was frequently removed and replaced by fresh, and the result proved that, where the nature of the soil permits it, this plan is preferable to any but the best wooden floor.

The heating was effected by two large brick stoves and three iron stoves in each barrack. During the depth of winter it was found impossible to keep up the temperature at night. The contents of cups and bottles were frozen quite solid within three or four feet of the stoves; but no one appeared to be any the worse for it.

There were no drains. Under the seat of each latrine was placed a tub made of half a petroleum cask, with a couple of iron handles nailed on to it, containing a solution of sulphate of iron. These tubs were withdrawn from the outside once or twice daily, and emptied into pits dug at a distance. The pits were about eight feet deep, and were filled up when their contents rose to about half that height. All other refuse was disposed of in a similar way.

Finding that the results of the Alice Hospital were very favourable, the Government added four new barracks of about the same size for thirty beds each. These were built with a little more deliberation, and rather more solidly. They had wooden floors, and the timber framework of the walls was filled in with hollow bricks throughout. They were arranged in a second *echelon* parallel with the first, and were in like manner connected by covered ways with the domestic buildings. Besides these barracks there were a small building containing an operating room, a reception room, and a post-mortem room, a dead-house, and a small separate barrack for six beds for isolating small-pox and other cases. Moreover, I had a ninth large barrack for thirty beds at the garden of the Sisters of Charity, about a mile and a half distant, which was a little larger, and was more solidly built than any of the others.

The disinfectants used were sulphate of iron for the latrines, etc., and liquor sodæ chlorinatæ and solution of permanganate of potash in the wards. We had one case of pyæmia, in a man who came from another Hospital, and no gangrene. In the first twenty weeks we received about 700 patients, and had twenty deaths; after that time, however, a number of hopeless cases were sent to us from Hospitals which were to be closed, and the rate of mortality was higher in consequence. We had about 180 wounded, the majority of them very severe cases. Small-pox was imported several times, but we succeeded in preventing it from spreading.

The nursing was done by a society established and superintended by H.R.H. the Princess Alice. Ladies of the neighbourhood gave great assistance in the kitchen and linen-rooms. Some of the French soldiers, of whom about 250 were patients in the Hospital, made excellent ward attendants. The funds were supplied in the first place by the Red-Cross Society, and afterwards by the German Government. A fuller account of the Hospital will shortly be published.

URETHRAL FEVER.

By J. FAYRER, M.D., C.S.I.

In the month of June, 1871, I was consulted by an English gentleman, 43 years of age, of robust and muscular frame, and who had been in India for some years, though not a constant resident, of Calcutta, on the subject of a stricture of many years' duration. He was in good health, of temperate habits, married, and regular in his mode of life; much of his time spent at sea. He informed me that several previous attempts had been made, at long intervals, to dilate the stricture, but without any very satisfactory results, each attempt to pass a bougie or catheter having been followed by fever. He had been able, himself, to pass No. 4 at times, but apparently this size had never been exceeded.

Lately the stricture had been very troublesome and irritable. Attempts to micturate were frequent, disturbing his rest at night, and rendering him very uncomfortable during the day. I passed No. 6 metallic bougie with comparative ease, without causing much pain, and only a trace of hæmorrhage. At this time he had been remaining quietly at home for some days; his bowels were regular, and his general health very fair.

I passed the instrument (No. 6) at about 8 a.m. He was free from uneasiness all day; took his wonted food, and passed water in a better stream than usual. There was neither hæmorrhage nor pain. At about 5 p.m. he began to feel chilly and uncomfortable. He felt weary; pains in the limbs and body supervened; shortly after a rigor came on, which was

rapidly followed by others, each more severe than the last, and when I saw him a little later, they were so violent as to assume the aspect of general convulsions. He was almost unable to speak, but he made me understand that although his body, especially his back between the shoulder-blades, was intensely painful, he had no pain in the bladder, urethra, or perineum, and that he had passed urine in a fuller stream than before. Hot fomentations to the back gave him relief; warm brandy-and-water with quinine and opium were administered. The convulsions lasted for several hours, were followed by slightly increased heat of the body, with great prostration, and this again by moistness of the skin, which did not amount to free diaphoresis. His pulse, from soon after the commencement of the rigors, was much depressed, rapid, and very feeble; at times could scarcely be felt at the wrist. His face was congested, and his appearance that of extreme suffering.

He gradually recovered, and regained his strength, but he looked broken and aged by the attack. Throughout he steadily maintained that he had no pain in the urethra, and that the urine passed more freely and less frequently (though still in ample quantity) than before. A herpetic eruption on the lips followed. For several days he continued to take quinine, and was kept fully under its influence; his bowels were regulated, and as good a diet as he could take, with a very moderate amount of stimulants, given. He has for some years abstained almost entirely from stimulants, but apparently had lived more freely in former years.

In about a fortnight, having recovered and being encouraged by the improvement already made, he was anxious to continue the treatment, and accordingly at about 9 a.m. I again passed an instrument. On this occasion, No. 8 passed with no more difficulty than No. 6 on the first occasion. I observed that there was a certain amount of spasm, and that the urethra grasped the bougie tightly. There was only a slight tinge of blood, but he passed water freely immediately after the instrument was withdrawn. The urine was clear and natural. He said that as the instrument passed through the stricture it gave him considerable pain, perhaps rather more than on the last occasion.

I gave him gr. x. of quinine with opium gr. ij., immediately; and ordered it to be repeated in about six hours. He passed the day well, and felt no inconvenience except that the quinine slightly affected his hearing, and the opium made him feel rather drowsy, until about 4 or 5 p.m., when he was again attacked with rigors and vomiting, but not so severely as on the former occasion. There was neither pain nor difficulty about the urethra; a very small quantity of water was passed with ease, and the bowels acted. The rigors were neither so severe nor so prolonged this time, but when they ceased he passed at once into a state almost amounting to collapse; the face being deeply congested, and the pulse intermittent (about 140) and frequently barely perceptible. His condition was most alarming, and I feared that he would not recover. Stimulants, quinine, and diuretics were given; hot fomentations and sinapism were applied to the loins, for after the first discharge no urine was secreted for several hours. He was conscious, but seemed so exhausted that he could not at times speak even in the faintest voice.

The following day he remained in much the same condition; the skin was moist, and the temperature but slightly exalted. Towards the evening he voided a small quantity of urine; the irritability of the stomach, which had been very distressing, subsided, and he gradually, but very slowly recovered. For many days he remained in a state of great prostration; and when he was sufficiently recovered to enable him to move, I sent him out of town for change of air. He had then the gait and aspect of quite an aged man. He continued to take quinine, and had no recurrence of anything like a paroxysm of ague. I have since heard that he is better, but is still weak. The urethra on this occasion was apparently slightly benefited; he never had any pain, even on pressure, over the seat of the stricture, and he passed water in an improved, but by no means a fully natural, stream. The improvement was, however, purchased at such cost—so terrible a risk of life—that I did not deem it right to make any further attempt to dilate the stricture at present.

I have before, in making some remarks on urethral fever, expressed my belief that it is more prone to occur in a malarious climate like that of Lower Bengal than elsewhere. I have no recollection of ever having seen it in such a marked and severe form as in Calcutta; for not only does it sometimes supervene here after catheterism in difficult strictures, where the instrument is passed with difficulty, and the patient's constitution is irritable from the effects of the disease, but in slighter cases,

and sometimes even when there is no stricture at all, and the instrument has been passed for other reasons.

The case I have just related seems to support the view I have advocated. The patient was a healthy man, free from visceral disease, and not, as far as I could judge, previously influenced by malarious cachexia. Though a resident of Calcutta, he was not a constant one, and as great part of his time was spent on board ship at sea, he might fairly be supposed to be, as he looked, in good health. He admitted that his stricture was an irritable one, much worse at times, and that every attempt to dilate it, especially in this country, had been followed by a certain amount of constitutional disturbance, though far less than on this occasion. He informed me, also, that some of the operations had been attended with considerable difficulty, pain, and hæmorrhage.

I had not the least difficulty in introducing Nos. 6 to 8 into the bladder. There was certainly some obstruction, chiefly arising from spasm; but it was easily overcome, and there was scarcely more than a trace of hæmorrhage. But the treatment was commenced at a most unfavourable season, when malarious influences were exceedingly rife, intermittent fever, neuralgia, and other disorders expressive of its effects being very common, though in other respects the season, whilst one of the wettest, has been one of the healthiest ever known in Bengal.

The constitutional disturbance that followed each attempt to dilate the stricture was exactly like malarious fever in a severe form; and, on the second occasion, nearly proved fatal in the state of collapse that rapidly supervened on the rigors.

The resemblance of the rigors in the first attack to convulsions is worthy of note, and it shows how nearly the two conditions are related to each other.

Quinine and opium, which were freely administered on the second occasion, directly after the operation, and in anticipation of mischief, seemed to have but little effect. The rigors were certainly less severe than in the first attack, but the subsequent condition was much worse, and for some time his life was in great peril.

I have not the least doubt in my own mind that, had the same treatment been followed in England, or in the dry climate of the North-west of India, a certain amount of urethral fever, due to the peculiar influence exerted on the nerve-centres by the operation, would have followed; but it would have been of a less severe character than it was here in the damp and malarious atmosphere of Calcutta. How far the internal and external conditions mutually influence and intensify by reaction on each other I cannot say; but that they do exert an influence I feel convinced. And it is not improbable that pathologists may see in such cases something to throw light on the subject of the peculiar perturbation of the nerve-centres, which, in malarious poisoning, whatever that may be, expresses itself sometimes by convulsions in a child, by an ague fit, continuous or intermitting cold sweats, neuralgia, or some other neurotic conditions in the adult.

Calcutta.

ON RHEUMATISM.

ITS NATURAL AFFINITIES.

By J. JAMES RIDGE, B.A., B.Sc., B.S., M.D. Lond.

(Continued from page 247.)

In the last paper we discussed the diseases due to the same cause as most cases of rheumatism. But there are diseases whose origin is quite different from cold-excited rheumatism, in which, nevertheless, acute rheumatism, or symptoms closely resembling it, sometimes occurs; these we must now consider.

II.—DISEASES CONSISTENT WITH RHEUMATIC SYMPTOMS AND OFTEN ASSOCIATED WITH THEM.

It is clear that by seeing what sort of diseases rheumatism associates with, we shall, according to the proverb, be able in some measure to tell what sort of a thing it is itself. For instance, a general disease of peroxidation cannot accompany a general disease of suboxidation; they will be mutually destructive. So, if the chosen associates of rheumatism are found to be diseases in which every oxidisable material is eagerly seized upon and oxidised, it will furnish a strong presumption that no vagrant suboxidised starch will be permitted to exert its baneful influence. We shall see.

a. Scarlatina.—Trousseau asserts that by careful investigation we may discover articular pains in perhaps one-third of the cases; that acute affections of the joints, general

arthritis, peri- and endo-carditis frequently occur during the course of the disease, and that chorea sometimes follows it in children. He regards it as the result of the presence of the rheumatic diathesis. The occurrence of the disease has been accounted for by the interference with the action of the skin. But, as Dr. Fuller has said, the small accumulation of any poison which could arise from long inaction would be rapidly dissipated by a very short rheumatic sweating. If lactic acid be the cause, lactic acid must be continually reproduced. In scarlatina such production is in the highest degree improbable. If lactic acid (as a stable compound), and so rheumatism, was not produced before, when oxidation was only normal and food abundant, *à fortiori* it ought not to be produced now, when oxidation is intensely rapid, the muscles unused, and starchy as well as other food diminished. Dr. Richardson, in consequence of his lactic acid experiments and the association of scarlatina with rheumatism, has expressed his belief that both diseases are produced by similar poisons—acid poisons, like lactic acid. The evidence of the presence of the acid in scarlatina is, therefore, still more slender than in the case of rheumatism, and in both is baseless. I believe the treatment of scarlatina on this ground with real alkalies (potash, soda, and their carbonates) would be most disastrous, as much so as it is acknowledged to be in pyæmia and other diseases with a tendency to suppuration.

b. Pyæmia.—The frequency with which the joints are inflamed in this affection is well known. The inflammation may or may not proceed to suppuration. The similarity of symptoms between this disease and acute rheumatism in many cases has often been remarked. In fact, sometimes a diagnosis of pyæmia has been made only in consequence of the occurrence of suppuration. Many seem to think that if suppuration occurs thus generally it is proof positive in favour of pyæmia. Consequently, acute rheumatism is perhaps credited with a less suppurative tendency than it ought to be. Of course it is very easy to prove that rheumatic inflammation does not tend to suppurate, if all cases in which suppuration does occur are first carefully excluded, and termed pyæmic.

There is no doubt, however, that the reception of a certain poisonous material into the system by inoculation is capable of setting in motion a train of symptoms in which joint-inflammation, in common with that of other serous membranes, holds a prominent place. What is the value of this fact? Is it sufficient to prove or render it probable that the arthritis in rheumatism is due to the presence of a poison? We know it is not the same poison (if any), else the two diseases would be identical. We know, further, that it is an invisible poison. But, on the other hand, if this subtle poison does not provoke suppuration when inflammatory action is set up, it is unlike all the other invisible blood-poisons with which we are acquainted. We can only say, therefore, that while poisoned blood predisposes to and excites inflammation and suppuration, it is possible that a poison of a different nature may excite the rheumatic symptoms. This is not a very important conclusion.

By way of illustration let us take a parallel case. It is well known that the effect of fright upon a nursing mother has sometimes been such that the milk has become endowed with peculiar properties, so as to cause diarrhoea in her infant, convulsions, or even sudden death. Now, we can only imagine that there is some alteration in the composition of the milk—perhaps some poison present—which produces these effects. But the same cause—namely, fright—has operated, times without number, in originating epilepsy. Are we, then, to suppose that the epilepsy is produced by the elaboration of the same poison, or, if not exactly the same, of some similar poison? We know, in the first case, that poisonous material can be elaborated by fright, and next, that fright can cause epilepsy; hence, on the same grounds as in the case of pyæmia and rheumatism—perhaps even surer—we might conclude that epilepsy also was due to a definite blood-poison. But still more, fright can not only cause epilepsy, but chorea. Are we, then, to extend the same explanation to chorea? Further, this fright-occasioned chorea may after a time give place to true articular rheumatism, as in a case related by Trousscau. Some might therefore infer that the causation of rheumatism by a poison in the system is hereby proved. Yet, if so, the conclusion is inevitable that the epilepsy, the chorea, and all the mental and nervous affections which fright can induce, are due to a similar cause. This is manifestly too broad a conclusion. All we can say is, that the fright produces a modification of various parts of the nervous system, and so of the functions of the organs under their control.

As, then, epilepsy may be established by fright, so arthritis

may be set up by influences acting through the nervous system. As the same cause—fright—may occasion other affections under other circumstances, so the same influences acting on the nervous system may set up pleurisy, pericarditis, neuralgia, etc. Lastly, as the modified milk can produce an action on the nervous system similar to that which distant irritation or fright often produces, so the arthritis may be set up by the ichor of pyæmia or indirectly by the influence of the nervous system. The very differences between the two diseases, pyæmia and rheumatism, point to some such different origin, while the resemblances between them are so great that we might expect we should be able to trace some such connexion among their causes as the above considerations indicate.

Dr. Sutton(a) has referred to the difficulty of recognising rheumatism from pyæmia in some cases, and narrates an instance. In this case the symptoms at first exactly resembled those of rheumatism, and it was only eight days before death that abdominal symptoms set in. The autopsy revealed abscesses in the lung and elsewhere, and the *fons et origo* of the septicæmia was supposed to be one of the bronchial glands. No reason can be assigned, however, why the first diagnosis—that of rheumatism—should be regarded as incorrect. Why should not pyæmia be lighted up in the course of rheumatic, as of other, inflammation? Could not the febrile blood of rheumatism irritate the caseous gland so as to render it the source of the septicæmia? Absolute certainty as to the existence of true rheumatism in this case is perhaps impossible; but may not the presence of the herpetic eruption on the lower lip indicate that the primary fever, and so the joint-inflammation, was due to the impression of cold? Such suppurative forms of rheumatism, I repeat, might be considered more common, if another name, on account of the suppuration, were not immediately given them.

c. Gonorrhœa.—At first it might be imagined that in the rheumatism which is attributed to this affection there could be no doubt of the existence of a *materies morbi*. Gonorrhœa is considered a specific disease: even then it does not follow that it is a blood disease. But it can only be called specific in a very diluted sense. We know that the products of other mucous inflammations are capable of exciting similar action when brought into contact with other mucous membranes. In this way purulent conjunctivitis may be excited; so, also, common catarrh. In these cases it is the local contact which is all-important. The influence of the diseased products on a healthy mucous membrane is such that they excite an inflammation having similar tendencies to that by which they were themselves produced. The contagium's power of doing this is greatest, as a rule, when it comes into contact with exactly the same kind of structure as that from which it was itself cast off. But, on the other hand, its specific nature is so natural that the generating inflammation and the generated contagium are both produced every day *de novo* by the simple impression of cold. And, further, the establishment of a similar affection in others by contact depends greatly upon the tendency to that inflammation which they previously possessed; so that we find immunity from some of these affections in some cases, or at some times, while in others, or at other times, they are readily set up. These observations equally hold good in the case of gonorrhœa. This affection can be excited by other irritants than the special pus. Leucorrhœa is by no means an uncommon cause. The passage of instruments has occasioned it, especially in those who have suffered from it before; and I see no reason why cold may not be the cause in some cases, whether or not there may have been exposure to the risk of getting it otherwise. No doubt an explanation of this sort in any particular case would be scouted at once, and most often with justice; but it is very likely that the forgone conclusion as to the cause of purulent urethritis, which we are only too ready to come to, has blinded our eyes to cold as an occasional cause thereof, in the same way as I before remarked in the case of suppurative rheumatism and pyæmia.

The supposition that gonorrhœa is only a local inflammation, as simple as nasal catarrh, is strengthened by the so-called constitutional complications of the disease. Take, for instance, the case of orchitis; epididymitis is, perhaps, rather more frequent, but is more open to the suggestion that there has been an extension of the disease along the *vas deferens*, where orchitis commences first, or is alone produced. This cannot be so. We see, then, that the testis sometimes becomes inflamed thus during gonorrhœa, and that, coincidentally with this, the purulent discharge ceases, or greatly abates. Such a result is said to be due to metastasis.

The cause is often obvious, for the patient has had, now or previously, some blow or injury to the organ, or he has sat upon some damp place, etc. But these causes frequently produce orchitis when there has been no previous gonorrhœa. Another patient with gonorrhœa is exposed to cold and damp, and in a day or two is attacked with rheumatic symptoms, with or without orchitis. Another so exposed suffers from ocular inflammation; sclerotitis and iritis are set up: conjunctivitis is equivocal, as we cannot be quite sure that no pus has come in contact with the mucous membrane. In these cases, also, the urethral discharge often ceases; and they, too, may be established by the impression of cold without gonorrhœa. Now, has the gonorrhœa anything to do with their production? Before we answer this it will be well to note that cases are on record (b) in which rheumatism, which had previously occurred as a consequence of gonorrhœa, was again set up, after some time had elapsed, by passing a bougie, or by attempted coitus on marriage. Here simple irritation was all that was required to establish the train of symptoms, and any special *materies morbi* is out of the question. Ought we not, then, to regard the irritation of the inflamed mucous membrane in purulent urethritis, whatever that is excited by, as simply the predisposing cause of the other symptoms, including the inflammation of joints. There are probably at least two other conditions requisite for its production—(1) constitutional predisposition to the inflammation of fibrous tissues, and (2) the exciting cause, cold or some traumatic influence; for, unless some factors of this kind were required, we should surely see the affection more frequently. The proneness to the arthritis increases after each attack, and at length the irritability caused by the passage of a bougie may be sufficient to set in motion the train of symptoms and appear to act as an exciting cause. Rigors followed by febrile symptoms are also not at all an uncommon result of catheterism.

We have not the slightest reason to imagine that gonorrhœal rheumatism is produced by the elaboration of a suboxidised acid poison, nor any good ground to suppose that there is any specific virus concerned or required.

e. Epidemic Cerebro-spinal Meningitis.—About the nature of this disease there is much difference of opinion. I notice it here because of the not unfrequent association with it of "inflammation of the large joints, marked by swelling and pain, and sometimes ending in sero-purulent effusion." It is possible, as some have suggested, that more than one disease has been included under this name. Its boundaries, in fact, do not seem to be accurately defined. Doubt seems to be generally entertained whether it is contagious; but there seems to be none that it is able to arise sporadically. Mr. J. N. Radcliffe notices the suggestion that the blood-change and the eruptions may be of nervous origin, as well as the symptoms directly due to the meningitis. Dr. Day has referred to this affection, and the association of rheumatism with it, in support of the theory that the latter has a spinal origin. If the meningitis in these cases was certainly the cause of the arthritis, this argument would have great weight. It is not impossible that such a relation should exist between them, but there is no such result in ordinary spinal meningitis. To what, then, is it due? Have we here an instance of acute rheumatism excited by a poison in the blood? It would be very difficult to prove the negative of this, or even the alternative that the blood-poison predisposes the system to the arthritis, just as we may suppose the poison of enteric fever to render the mucous membrane of the lungs specially vulnerable, liable to be inflamed by slighter morbid impressions of cold. At the same time, there are circumstances usually associated with the genesis of epidemic meningitis which justify us in using some hesitation before we dissociate the production of the rheumatism from that influence of cold which can and does usually excite it. The influence of season in the production of this epidemic disease cannot be overlooked, nor has it been. Hirsch, as quoted by Mr. J. N. Radcliffe, even suspects that some influence of this kind is connected with its cause, though other factors are necessary; and some of these are more active in consequence of cold and inclemency of weather. After the first shock of the disease, various complications besides rheumatic inflammation, which we are accustomed to see as the result of cold, often make their appearance. Thus, there are often herpetic eruptions, and also lung inflammations, such as pleurisy, bronchitis, and pneumonia. From the occurrence, therefore, of rheumatism in a disease whose very origin may perhaps be partly due to variations of

temperature and moisture, and which certainly occurs more frequently when such are specially active, no very powerful argument can be derived in support of the blood-origin of the arthritis. On the other hand, we have here another instance of the association of rheumatism with other ordinary inflammations, and also of a modification of the blood, or the cause of that modification, giving a suppurative tendency to the inflammatory process.

f. Erythema Nodosum, and E. Papulatum.—It is doubtful whether we ought to speak of these as diseases associated with rheumatism. The rheumatic symptoms so frequently present, as noticed by Trousseau (c), appear rather to form an integral part of the diseases in question. By some the arthritis has been considered the most important, and the cases have been described as rheumatism complicated by erythema. The joint-affection diminishes from this preponderating importance down to vanishing-point, and this latter especially in cases of *E. nodosum*. The origin of *E. nodosum*, both with and without arthritic pains, is often distinctly traceable to cold; it is often associated, also, with other affections which betray an inflammatory tendency, as conjunctivitis, etc. There is nothing special in this disease; we have all the symptoms of ordinary inflammatory action, which is rarely intense, yet may, but generally does not, end in suppuration or ulceration. There are nearly always present those articular pains which are especially common at the onset of catarrhal affections, and the inflammatory joint symptoms seem rather to be simply a development of the same morbid action to a few degrees further, than of a different nature altogether. The depraved condition of system in which *E. nodosum* occurs is one, also, in which purpura is often developed—so much so, that Professor Schönlein has given to *E. nodosum* the name of "Rheumatic purpura."

With regard to *E. papulatum*, different structures are doubtless affected from those in the above complaint, but that seems to be the chief distinction. The essence of the disease appears to be the same, though the latter seems more intense, for it is attended with severe symptoms more frequently, and with greater arthritis, and cardiac inflammation is more common. In proof of this, we often find the two eruptions together, but *E. nodosum*, the milder, is far more frequently alone than *E. papulatum*, in which the presence of one or two nodes is not at all uncommon.

g. Gout.—I notice this disease, not because some consider rheumatic gout a hybrid of the two diseases, but because there are certain similarities between it and rheumatism, which Dr. Fuller has used as an argument in favour of the existence of a *materies morbi* in rheumatism. Let it be granted that a definite poison has been demonstrated, and that the presence of uric acid or urate of soda in excess in the blood gives rise to paroxysms of gout. The similarity of the symptoms of rheumatism, if it prove the presence of a poison at all, proves too much, for it proves the similarity that must exist between the two poisons in their nature. If that of gout is chemical in its constitution, that of rheumatism must surely be chemical also; and, if so, we ought to be able to discover this as well as the other. This has never yet been done. We may, therefore, without presumption, ask if there is any flaw in Dr. Fuller's argument. Well, it is not quite certain that his premises are correct, that uric acid is really the true cause of gout (*pace*, Dr. Garrod); and even if it be, the general conclusion Dr. Fuller would draw is unwarrantable. Probably the similarities are not dependent upon a single cause; but it should not be forgotten that very similar tissues are involved in the two diseases, and that a predisposition (hereditary or acquired) to inflammation of such tissues is shared by those subject to both; also that the exciting cause is sometimes the same—namely, cold. Such being the case, I would venture to suggest that where this exciting cause acts upon a person whose joints are already irritated by the presence of urates, a local inflammation is set up, which would resemble rheumatism of one joint but for at least two reasons—(1) that the presence of the urates modifies it, and (2) that the inflammation is set up by a less intense exciting influence of the nerves which control that process; hence, that the local condition of the tissues is more influential than in rheumatism. This will account for the inflammation being so localised, especially in first attacks, and for the general freedom of other joints, since less intense impression of cold is required to excite inflammation in the one already predisposed joint than to modify the nerve-influence over many.

(c) "Clinical Medicine," Sydenham Society's *Transactions*, vol. ii., p. 242, etc.

Having now finished the examination of the natural affinities of rheumatism, what conclusions can we draw? I think we may safely say—(1.) That rheumatic inflammation is not specific. By this I do not mean that there is not a group of symptoms frequently associated together which may be usefully designated by the term “rheumatism,” but that the only peculiarity is caused by the greater or less development of one or more symptoms; that the disease tapers off without any change of nature into other diseases which no one considers due to any particular *materies morbi*. (2.) As a corollary of the above, that no special poison is present. For surely a disease which can exist among such various conditions, and is so closely allied in origin and progress with so many simple inflammatory actions, does not require such an explanation. I think I have shown the futility of the arguments in favour of a *materies morbi*, much more of an acid poison, and, *à fortiori*, of the presence of lactic acid. (3.) That the true pathology of the disease is not understood, and that to be successful in the search for this the natural affinities of the disease cannot be neglected as indications of the direction in which we should look. If we trace it thus we shall know as much of the pathology of rheumatism as we have been able to understand of the pathology of inflammation, and know more with every further advance of that knowledge. To endeavour to prove the influence of cold in producing rheumatic fever, and to trace the process as far as we can, are the next steps to which we must address ourselves.

(To be continued.)

ON HÆMOPTYSIS IN CHILDREN, ILLUSTRATED BY TWO CASES.

By Dr. VALD. RASMUSSEN.

(Translated from the *Hospitals-Tidende*, July, 1871, by J. W. MOORE, M.D., M.Ch. Dub., L.K.Q.C.P.I., Ex-Scholar Trinity College, Dublin.)

AMONG the numerous clinical as well as anatomical peculiarities which characterise pulmonary consumption in children as distinguished from this disease in adults, the absence, or, at all events, the very rare occurrence, of hæmoptysis is one of the most important. Nor is it alone as a preliminary symptom that hæmoptysis is so very infrequent, but also, though perhaps to a less degree, during the entire subsequent course of the disease. All children's Physicians are unanimous on this point, which is doubly remarkable when we reflect on the extreme frequency of the occurrence of the symptom in question in every stage of phthisis in adults. An explanation of this peculiar circumstance has not, so far as I have been able to ascertain, been attempted by any author up to the present—very likely because a reliable anatomical basis from which to set out has been wanting. Since, at the close of this *brochure*, I shall attempt to give an explanation of this circumstance, it becomes necessary by way of preface to communicate briefly the experience of others on this subject.

According to Rilliet and Barthez(a) hæmoptysis is nearly always wanting in the commencement of pulmonary phthisis; and in the almost equally rare instances where it occurs in the subsequent course of the disease, it is all but instantaneously fatal. They admit that they have never had absolute proof of an attack of hæmoptysis in the beginning or during the course of tuberculosis, and whatever they have to say on the subject is derived only from the parents of the youthful patients. In private practice they have never observed this symptom, and but five times in Hospital.

The hæmorrhage took place either in the commencement of the disease, or during its course in the second or third month, or sometimes even later. One child suffered from a first attack of hæmoptysis when the disease had continued for two and a quarter years. The hæmorrhage was not considerable. However, in the case of a girl, aged 14, it recurred in the course of eight days. In the remaining instances it either took place on one occasion only, or returned for the first time several months later. When this happened, as also in the fatal cases, the children were not under 7 years of age. In the latter class, however, there was one exception, the child being 3½ years old.

It is, nevertheless, not quite clear how many cases of terminal hæmoptysis the authors alluded to have seen. They state that they have never found the hæmorrhage to proceed from a cavity, which seems to surprise themselves, as they have yet discovered vessels not completely obliterated running through cavities

like trabeculæ.(b) On the other hand, they have in one case seen a suppurating lymphatic gland in the root of the lung perforating the pulmonary artery and causing a fatal hæmorrhage,(c) and in other instances a similar loss of blood occurred with considerable enlargement of the bronchial glands, the pressure of which on the pulmonary artery must, in their opinion, have determined a bronchial hæmorrhage. Still, the cases are not so accurately reported as to enable us to see whether there had been cavities in the lungs or not. And although this appears to have been the case in some instances, yet they seek for the cause of the bleeding in the pressure of the swollen glands. According to West,(d) hæmoptysis is almost without exception wanting in the commencement of the disease. This author observed terminal hæmoptysis in five cases, in only two of which, however, was there a post-mortem examination. Both children were about 5 years old; one was in very advanced phthisis. The author did not succeed in tracing the origin of the bleeding.

Steffen(e) has noticed two rare examples of fatal hæmoptysis in young children. The first of these occurred in a girl, aged 20 months, the clinical diagnosis being set down as pulmonary tuberculosis. The hæmoptysis, which appeared suddenly and with violence, caused death in a few moments. On post-mortem examination there were found a deposition of miliary tubercles, masses of cheesy infiltration, interstitial diffuse pneumonia, and cavities, which, nevertheless, did not communicate directly with the bronchial tubes. These last were in both lungs filled with blood. A closer description of the cavities and their contents is, remarkably enough, deficient in the otherwise very full post-mortem report. The source of the hæmorrhage was not detected, but Steffen supposes that it was situated in the lung, specially in the broken-up tuberculous tissue.

In the second case,(f) the child, a girl, was aged 18 months. She had previously suffered from bronchitis and circumscribed pneumonia. In the beginning of the year 1861, a chronic diffuse pneumonia with tuberculous infiltration became developed, and the morbid process advanced step by step. Late in the evening of March 23, without warning, a considerable hæmoptysis occurred. The blood spurted from the nose and mouth, and the child died a few moments afterwards. An autopsy was not permitted.

Steffen supposes that the hæmorrhage in this instance, as in the former, proceeded from the broken-up pneumonic infiltration.

Hauner(g) has observed hæmoptysis in children on three occasions only, in the Children's Hospital at Munich, since the foundation of that institution. The cases are reported in an abstract form. The children were all over 3 years of age. One suffered from a maculated continued fever (*morbus maculosus*, Werlhof), along with tuberculosis; another expectorated large quantities of pus and blood from an extensive cavity; the third had, off and on, in the course of chronic pulmonary tuberculosis, a “bloody secretion.” The two first-mentioned children died; the third recovered. Reports of the autopsies are wanting.

Bierbaum(h) communicates two cases that appeared in older children, and did not directly produce death. In the one instance, a moderately severe attack of hæmoptysis occurred in a previously healthy boy, 12 years of age, after slight precursive symptoms, and returned two days subsequently. He continued to cough, and was short-winded until six months later, when a severe hæmoptysis set in suddenly while he was at play, returning some hours afterwards. The lung disease now made rapid progress, and he died in the course of two years' time without any recurrence of the hæmorrhage. In the second instance, that of a girl, aged 11, the hæmoptysis appeared at an advanced age of the disease; it was very considerable, and recurred to a less extent three days later, after which the lung disease advanced rapidly, so that the patient died in six weeks' time.

Henoch(i) has never seen hæmoptysis set in throughout the entire course of phthisis in young children less than 6 years old.

Vogel(k) has not observed it either in very young children,

(b) “*Traité des Maladies des Enfants*,” 2me édition, tomo 3me, page 616. Paris, 1854.

(c) This, however, is on the whole an example only of an exceptional form of hæmorrhage. I have never seen it.

and but once in a girl of 10 years of age, when it terminated the disease by death; closer details of the case, however, are not given.

Barrier, Bednar, F. Weber, and Hervieux have never seen phthisis produce hæmoptysis in infancy.

From the above communications, which might in all probability be supplemented by isolated clinical reports, but which, nevertheless, embrace the most important monographical works on the diseases of children, it will be seen—First, that attacks of hæmoptysis are extremely rare in children; and, secondly, that in no case has their point of origin been determined in an anatomical sense.

I have myself had an opportunity of observing two cases, which, at least, merit some attention, partly because they augment the (as yet) rather scanty clinical history of the subject, and partly because the cause of the hæmorrhage was clearly determined in both instances. Moreover, these cases are typical of the two principal forms under which fatal hæmoptysis seems to manifest itself in children during the course of pulmonary phthisis—namely, (1) by the bursting of a small aneurism of a branch of the pulmonary artery running in the wall of a cavity; and (2) by ulceration of that artery from suppuration of a bronchial gland. For the first observation I am indebted to Dr. Hirschsprung, through whose kindness I had an opportunity of making the post-mortem examination.

Case 1.—Pulmonary Phthisis with Cavities (Chronic Interstitial and Caseous Pneumonia, Peribronchitis, Miliary Tubercles)—Aneurism of a Branch of the Pulmonary Artery, bursting into a Cavity—Depositions of Miliary Tubercles in the Pleura, Spleen, Liver, and Kidneys—Caseous Enlargements of the Bronchial Glands—Tuberculous Ulceration of the Ileum.

W. L., 3½ years of age, admitted to the Children's Hospital, February 22, 1870. The child was reported to have tided over several illnesses, about which, however, no more precise information has been obtainable. He is an extremely neglected foster-child, of thin, pale, and relaxed appearance, weighing 10,126 grammes (22.32 lbs.). The cough frequent and troublesome, the respiration tranquil. Percussion less resonant over the entire left half of the thorax. The respiratory murmur somewhat weaker than normal, yet universally audible and vesicular in character; large crepitating moist râles over the whole chest. The patient's state improved somewhat during the first portion of his stay in Hospital; the cough and râles diminished, but he continued pale and weakly in spite of a strengthening course of treatment, and a very good appetite for dry food.

May 1.—Weight 9564 grammes (21.08 lbs.). The cough is again more violent, and the child's appearance, if possible, yet more pallid and emaciated; notwithstanding, he is very lively and remains up all day.

His state grew still worse; he began to suffer from hectic (night sweating—the temperature between 104° and 102° Fahr. in the evening—the pulse about 136), and the respiration over the posterior part of the left side became more and more bronchial in character.

June 12.—Last night he sat up and drank his milk, when, at seven o'clock, he had an attack of coughing, which was not, however, severe; during this, bright-red frothy blood burst out of his nose and mouth, and a moment later he was dead.

Autopsy, twenty hours after death.—Rigor mortis had disappeared. The body moderately thin. The subcutaneous adipose tissue scanty. The muscles pale and flabby. The heart of natural size, its muscular structure pale, the valves healthy; in the cavities only some partially coagulated blood. The left lung universally adherent, but readily detached. From the pressure exerted in taking out the viscera, a large quantity of fluid blood escaped from the primary bronchus. Just in front of the middle of the posterior border of the upper lobe a fluctuating area was felt. On making an incision in this situation, a cavity was discovered, extending right into the root of the lung, and filled with thin fluid blood. It was of irregular shape, and equal in size to a small egg. The wall tolerably firm, partly smooth, partly uneven from the presence of small warty-shaped, irregular prominences, which at the plane of incision showed cheesy infiltrations. Into the cavity bronchial tubes opened in several places—some of them being truncated, others, again, resembling eyelet-holes at their extremities. At the bottom of this cavity, close to the root of the lung, was noticed a little fresh projecting blood-coagulum. On removing this to one side, it was seen to project from an opening in a large, somewhat elongated tumour, about half a centimètre in length, which, when slit up, proved to be a slight sacciform

dilatation on a branch of the pulmonary artery. It was situated on a branch that came off from the main trunk only one centimètre from its origin. The branch in question, when slit up, had a width of five millimètres. The wall was perceptibly thickened at the place where it projected into the cavity. The opening, from which the coagulum protruded, readily permitted a sound to be pressed in at the side. The edges were blood-stained, attenuated, and likewise sharply defined. The coagulum was altogether the size of a pea; it was continuous with a thin layer covering the interior of the aneurism, and was pale yellow or colourless. Immediately behind the aneurism, where the vessel's calibre, slit up, had a breadth of three millimètres, the efferent branch divided into two branches of about the same diameter, one of which ran deep, and the other more superficially, into a pouch lying at the lower portion of the cavity, in the wall of which the vessel ran as a broad string, with an oblique dilatation of its calibre inwards towards the cavity. The remainder of the lung was absolutely void of air. The plane of incision of a pale grey appearance, of firm consistence. It was composed of a comparatively homogeneous, in places whitish, almost cicatricial tissue, with shapeless yellow particles, of various sizes up to large grains of sand, scattered over it (alveoli, filled with detritus). In a few situations there were larger cheesy portions, which formed centres of infiltration, here and there commencing to undergo a process of breaking down. In the thickened pleura were numerous miliary tubercles. In the right lung similar deposits were met with, and on its upper surface were seen some depressed reddish patches, to which the hæmorrhagic infiltrations in the line of incision corresponded. Close beside these were found numerous indurations, isolated or aggregated, with and without any peribronchitic characteristic. On the other hand, no cheesy infiltrations or formations of connective tissue were observed. In the bronchial tubes of this lung blood was also found, but only in small quantity, and mixed with mucus. This was likewise the case as regarded the larynx and trachea, which were healthy in other respects. The spleen of ordinary size. In the centre of its anterior surface an irregular cheesy infiltration was observed, which extended in an imperfectly triangular form inwards into the parenchyma. Beside it were miliary tubercles, and patches of cheesy infiltration up to the size of peas. The liver large, fatty, with thick edges; an abundant miliary deposit in the slightly thickened capsule; a more scanty one in the parenchyma of the organ. The central portions of the acini shrunken, of a pale red tint; their peripheral parts abundantly filled with fat. The line of incision rather dry, in general pale. The kidneys of ordinary size, pale; in other respects unaltered; only in places a miliary tubercle, as well on the surface as in the structure of the organs. The mesenteric glands as large as pigeon's eggs, with cheesy infiltrations, separated by connective tissue. Just above the ilio-cæcal valve a superficial transverse ulcer, with a miliary deposit in its border and on its peritoneal aspect, was found. The brain was not examined.

Although the information which in this case is procurable touching the course of the disease is but imperfect, yet from the state in which the lungs were found we may very well conclude as to the order of progression in the morbid process. This in all probability commenced with a cellular catarrhal pneumonia, which in the badly nourished child, predisposed thereto, has shown a tendency to a cheesy formation—of only a partial prevalence, however, since in other situations the lymph-like (unnucleated) cells in the alveoli have developed into connective tissue, which again has passed more or less into scleroma. These two alterations have gone on side by side, even so close to each other that individual alveoli or very small lobuli lie separately in the newly formed connective tissue. Lastly, the formation of cavities has resulted partly from the decay of the masses of cheesy infiltration, partly from ulceration (fatty degeneration) of the newly formed connective tissue. Now, just because the shrinking of the latter substance has not been homogeneous, but has been interrupted partly by the patches of cheesy infiltration, partly by the more gelatinous soft particles, the obliteration of the vessels has not occurred—a process which may very well have been attended with peculiar difficulties, as the vessel was so large and was situated almost immediately beside one of the chief branches. The artery has consequently been drawn inwards in the process, made fast in a portion of the wall of the cavity, where the formation of connective tissue has been more abundant, and has here dilated as an aneurism in the same way as in adults. A compensatory hypertrophy of the arterial wall has, indeed, taken place, but still it has not been able to withstand the great intra-vascular

pressure. Beside the aneurism, just as in cavities in the adult, a dilatation of a pulmonary branch was observed.

On the whole, some difference is shown in the circumstances under which the aneurismal formation in cavities takes place in adults and in the case here reported, but that formation was yet, in the present instance, also favoured by the anatomical conditions to a greater extent than these are ordinarily wont to accompany phthisical processes in children—a fact which will also appear from what is to follow.

(To be continued.)

SMALL-POX IN CHINA.

By F. PORTER SMITH, M.B. Lond.

THE present epidemic of small-pox in England seems to carry us back to a period in the history of this plague of the human race for which we have had to look hitherto to the contemporaneous condition of countries representing much earlier phases of the history of this disease, and the measures connected with the prevention of the malady as a recurrent pest. For the future, we would suggest that this malady, whatever may have been the grounds of its previous insignificant cognomen, should be promoted to the dignity and style of the "great-pox."

Small-pox is called the "bean disease" in the Chinese language, from the resemblance of the vesicle to a small bean or some other form of pulse, a kind of food very largely grown in China. The disease dates from the reign of the first Emperor of the (Eastern) Han dynasty, Kwang Wu, who reigned A.D. 25—28. It is said to have been imported from some portion of Central Asia, or from some part of South-western China now included in the nominal empire, by some Chinese troops returning from a foreign campaign. This adds another instance to the important list of diseases propagated by armies in ancient and mediæval times. Inoculation has been practised amongst the Chinese for a thousand years or more, showing that the disease must soon have clamoured for some interference, even at the hands of an Eastern people, strong in their belief in fatalism. This latter failing is attested by the facts that the disease is called the *Tien-hwa*, or "heavenly flower," and that the malady has been deified under the name of "Holy Mother of Small-pox." Temples are erected in every part of the empire in honour of this goddess, and every family visited by the disease sends some worshipper with offerings to the shrine of this old hag.

In order to avoid any offence to her, the disease, one of the most horrible of all afflictions, is spoken of as the "felicitous circumstance," or some other periphrastic or propitiating term. The earliest work on the disease is a kind of treatise called the "Wan-jin-shi-tau-chin-lun," first published in 1323. Several other works have been written on the disease; some on inoculation. It is curious that in Chinese the malady is called *Hwa*, "the flower," the equivalent of the word *exanthema*.

The Chinese believe that the small-pox can be diminished in frequency and severity by a judicious system of diet on the part of the expectant parents of children, and by the adoption of a regimen of regulation of the habits, feelings, etc., of those who wish to produce a progeny free from such morbid proclivities. From some of the remarks on this point it is evident that hereditary syphilis must have been confounded with small-pox. The early history, in particular, of this epidemic disease has been much mixed up, as well, with that of plagues and pestilences akin to those of Europe in the middle ages. A later importation of the disease from Europe is said to have occurred, but without much proof. The Chinese inoculate at the spring and winter, but the latter is the time preferred by the general population for undergoing the perils of this mischievous and unsatisfactory substitute for the Jennerian operation of vaccination. The pustule from the small-pox patient is introduced in the dried state into the nostril of the person to be infected with the secondary disease, as one of the methods of inoculation. By the regular practice and repetition for ages of this operation, the small-pox has undoubtedly been robbed of some of its primal virulence. But this has been done at a fearful cost, for now and then the very worst forms of the disease are met with amongst the cases of inoculation, or in the neighbourhood of such carriers of the pestilence. Frightful pitting, horrible cicatrices resulting from loss of tissues by sloughing, and blinded eyes prove the futility of such a compromise with this enemy of the human race. Not until 1805, when Alexander

Pearson, a Surgeon of the Honourable East India Company a Canton and Macao, introduced the practice of vaccination amongst the natives of these two Chinese towns, did the Celestials begin to do battle with the "heavenly flower" at all successfully. Sir George Staunton translated a small work on the practice of vaccination, written by Pearson, and it was published in 1805, with the title of "Tai Si Chung Tau K'i Fah," or "The Wonderful Method of Inoculation from the Great West." This is now a rare tract, but has been the means of extending, very gradually, over the whole Empire of China a knowledge of the subject. More has been done by Cantonese pupils of Pearson, who, having learnt the practice from him, have in turn had their own disciples. The practice is a money-getting one. The origin of the theory and plan as from foreign shores has been carefully suppressed; and as the Cantonese are a roving and enterprising race, the operation is performed everywhere. The temples are often turned into vaccination stations, and a regular announcement is made of the days for attendance. Subscriptions are raised by the people of the tything to pay the expenses, and the whole thing looks well for what is called heathenism. Private Practitioners make a speciality of the operation, just as they do of the small-pox itself and the measles. Four or more punctures are made in the arm with a rude lancet, and the lymph is taken from a fresh arm. The course of the vesicle is somewhat shorter, and much less satisfactory than in European practice; and a large proportion of the cases professed to be vaccinated fail to show any cicatrix at all. A small fee is paid to the Doctor on operating, and the child is seldom brought back to be seen. The virus has evidently become weak, and one of the best modes of helping on the business is to supply the most skilful operators with fresh lymph and copies of Staunton's work.

Any efforts at vaccination by foreign Medical men in China are invariably met with opposition from the native Faculty, whose craft is thus endangered. Idle rumours are spread about the great demand for children's eyes, etc., and the whole scheme collapses. In Shanghai, where cases occur every year amongst the foreign community, the Municipal Council has established vaccination stations; and the native Resident Medical Officer of the London Mission Chinese Hospital attends at a station in the native city provided by the Tantai. Nothing can be learnt by us from the treatment by the Chinese Faculty of the small-pox. They give alkanet root and many other vegetable substances in the form of a decoction to bring out the eruption, an object generally secured.

Now that the telegraphic wire has connected China with England, the news of the spread of small-pox in this country must be breaking upon the Celestial mind. In a short time it may be expected that some benevolent Chinese merchant will send Chinese vaccinators to England, ignorant of the fact that we once possessed a knowledge of this forgotten art!

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

VICTORIA-PARK HOSPITAL.

CASES OF PARACENTESIS THORACIS.

(Under the care of Dr. PEACOCK.)

(Continued from page 248.)

Case 2.—*Empyema and Pneumothorax of Left Side in a Young Man—Paracentesis repeated Three times—Partial Recovery, but Death some time after Discharge from the Hospital.*

G. C. K., aged 22, a clerk, was admitted into the Victoria-park Hospital on November 6, 1866. He stated that his illness commenced with an attack of quinsy at the end of May. At that time, also, he spat some blood, and he had never since been well, continuing to suffer from cough and expectoration at intervals. About a month or three weeks before his admission he suffered from pain at the left side of the chest, which was, however, relieved by the application of a blister. Since that time he had, on several occasions, after fits of severe coughing, expectorated very copiously for a time, not having much cough or expectoration at other periods. When admitted into the Hospital, he was suffering much from shortness of breath, and was greatly prostrated. On examining his chest, the left side was found very much expanded, and there was a marked

fulness in the mammary region towards the sternum. When in the upright position the whole of the left side was remarkably dull on percussion, and the respiratory sounds were entirely absent, except immediately below and above the clavicle, and at the upper part of the chest and to the left of the spine behind. In the latter situation there was a *souffle* heard with the cough, and towards the lower angle of the scapula the voice was markedly ægophonic. When in the recumbent position the sound on percussion in the mammary region was obviously tympanitic, and the relative positions of the clear and dull portions changed with the variations of the position of the patient. The pulsation of the heart was visible to the right of the sternum, at and about the level of the nipple, and the sounds were there loudly audible, while very indistinct in the normal situation. On the right side of the chest the resonance was clear everywhere except beneath the clavicle, where there was some dulness on percussion, but without any rhonchus; the respiratory sounds were elsewhere loud and compensatory. It was evident that the young man had a considerable effusion on the left side, with some air in the pleura; but the precise nature of the case was not clear. From the occurrence at intervals of severe fits of coughing, followed by copious expectoration, it seemed as if the fluid in the pleural cavity might have made its way through the lungs into the bronchi, and the air might have entered the pleural cavity by the opening so produced; but, on the other hand, the history seemed rather to point to a mere chronic affection of the lung, which, leading to a tuberculous abscess, might have been followed by the pneumothorax and empyema. It was evident that the probability of benefit resulting from the evacuation of the fluid would be much influenced as to which of these views was the correct one. As, however, the patient's breathing was very laboured and difficult, and he was suffering from much constitutional disturbance, and was greatly prostrated, it was decided to attempt his relief by evacuating the fluid from the chest. Accordingly the chest was punctured by Mr. Hilton on November 7, and eighty-four ounces of a dark-greenish coloured fluid were evacuated, after which the tube was removed and the opening closed. The first effect of the operation was to afford considerable relief; the breathing became much easier, and there was an improvement in the general symptoms, but the amendment was only of short duration.

The following notes were taken on November 24:—The left side is again fuller than it was, but it is not so large as before the operation. The heart remains displaced to the right side of the sternum. In the upright position there is entire dulness on percussion everywhere except beneath and above the clavicle; but there is a tympanitic sound elicited, when he lies on his back, in the mammary region, and, when lying on the right side, in the axillary region; the respiration being, however, inaudible in the resonant parts. There is scarcely any movement of the left side, and the vocal thrill is there entirely abolished. The right side, on the other hand, moves very freely, and the respiratory sounds are loud and compensatory. He has some cough, but only a little glairy expectoration containing small air-bells. The pulse is quick (120) and feeble; the respirations 24 to 28. He takes his food well, the tongue is clean, and he is in general condition somewhat better since the first puncture.

On the 24th the operation was repeated, and forty ounces of fluid, similar to that before evacuated, were removed.

The following notes were taken on December 2:—The left side of the chest is still somewhat full, but there is more movement than before. The heart's movements are visible over a large space to the right of the sternum. When in the upright position, there is still entire dulness and absence of respiration on the left side everywhere except beneath and above the clavicle, at the cervical and supra-scapular regions, and to the left of the spine. Decided ægophony is heard towards the lower angle of the scapula, and there is occasional slight pleural crackling audible at the end of a forced inspiration. When he lies down the tympanitic sound on percussion is still detected in the mammary region. The vocal thrill is everywhere abolished on the left side. The cardiac sounds are most distinctly heard to the right of the sternum. The breathing on the right side is loud and compensatory. Pulse 120; respiration 28. Not much cough or expectoration.

12th.—The chest is obviously much fuller than before, and the heart is more displaced to the right side. There is entire dulness on percussion over nearly the whole of the left side, though there is some slight resonance immediately below the clavicle and at the lower cervical region. The vocal thrill is also entirely abolished, and there is occasionally a sense of fluctuation on percussing firmly on the side when he is lying

down. The respiratory sounds are inaudible except above and immediately below the clavicle, at the lower cervical region, and to the left of the spine. His general condition has improved since the first operation, but he now only maintains his ground, not gaining flesh or strength. His breathing is better, and his cough is less troublesome; he scarcely expectorates at all; but his pulse remains quick and feeble. On the 14th the operation was repeated for the third time, an effort being made, by exerting pressure on the thoracic parietes, to empty the cavity to the fullest extent possible. In this way ninety-seven ounces of fluid of an opaque sero-purulent character were evacuated, after which the tube was again removed and the wound closed.

14th.—The left side of the chest still continues dull on percussion. It is fuller than the right side, but less so than before the last tapping. The heart can still be seen and felt to beat on the right side of the sternum, but the displacement is less than before. The vocal thrill is everywhere abolished, except above and below the clavicle, at the cervical region, and to the left of the spine. The respiratory sounds are more distinctly audible in these situations, and also in the axillary region, than they were. His general condition has improved. He takes his food well, and, though the pulse remains quick, he has almost lost the cough, and has no expectoration.

January 9, 1867.—He has continued to improve since the last notes were taken. There is some contraction at the lower part of the left side of the chest, but the fulness in the mammary region is still very obvious, though it is partly due to swelling of the integuments. There is more movement on the left side. The heart can still be seen to beat to the right of the sternum, but the sounds are most loudly heard to the left of that bone. The respiratory sounds are heard over much wider spaces on the left side at the upper and posterior parts, though still only feebly. The stomachal sound is also elicited by percussion over a considerable space at the lower part. In other situations the dulness remains much as before. On the right side the respiration is loud and compensatory. Upon the whole, he is improved; his appearance is better; he has no expectoration, and, except slightly in the morning, no cough; his breathing is freer, and he has no pain or uneasiness in the chest; but his pulse continues quick, and he does not gain flesh or strength.

30th.—His chest continues to improve, though still very dull on percussion. There is much greater freedom of motion on the left side. It continues in front fuller than the right side, but some of the fulness is obviously integumental. The space over which the respiration is heard above in front, and in the axillary and spinal regions, has considerably extended, though the sounds are feeble, and accompanied by pleural crepitation. Over the larger portion of the chest no respiration can be heard. The heart is still displaced to the right side, its pulsation being visible between the nipple and sternum, and about the level of that body. His general condition continues better; he has scarcely any cough, no expectoration, and is gaining strength.

February 13.—Left side of the chest dull on percussion everywhere except above, but it moves more freely. There is still considerable fulness, but this is evidently integumental; partly, at least, due to the irritation from the application of iodine, which has been freely used. The extent over which the respiratory sounds can be heard is increasing, though the breathing is still very feeble. The heart occupies the same position as before. He is improving in general condition, and has gained some flesh. When first admitted into the Hospital he weighed 9 st. 6 lbs., his height being 5 ft. 8½ in. During the first portion of his residence he lost weight, so that on December 13 he weighed 10 lbs. less than when admitted. He has since recovered the loss, so that his weight is now very slightly greater than when he was first weighed.

The day after these notes were recorded he was discharged from the Hospital, at his own request, with the intention of going to the seaside. Up to this point he had certainly improved both in his general condition and in the local symptoms. After his discharge the amendment was not, however, of long duration. An abscess formed in the seat of one of the punctures, which burst, and left a fistulous communication with the pleural cavity, from which a copious, and, after a time, an offensive discharge flowed. Under this he became much exhausted, and died in about a year after his discharge.

While in the Hospital he took small and gradually increased doses of iodide of potassium, with spirits of nitric ether, and bark and cod-liver oil, and was allowed a liberal diet, with stimulants. The case was not a favourable one for treatment. There was reason to fear that the left lung was diseased, and

that the empyema and pneumothorax were the result of a tuberculous abscess which had burst into the pleural cavity. The precise nature of the case was not, however, clear, and as it was evident that the patient would not long survive if not relieved, it was decided to have recourse to paracentesis. The first effect of the operation was to afford relief, but never to so great an extent as had been hoped; but it may safely be concluded that the patient's life was very much prolonged by the treatment.

(To be continued.)

THE GENERAL INFIRMARY, LEEDS.

SOME years ago we gave a general account of the Medical charities of Leeds, showing that in the old Infirmary, with all its defects, much good work was done. The names of the various generations of the Heys were familiar to all; that of Teale was also well known as having contributed to the Surgical reputation of the place. We then showed, and have again to show, that the Heys and Teales of the present day are not one whit behind their predecessors, and that, in their hands, and in those of their colleagues, the reputation of Leeds is in no danger of falling away.

Since we last reported on the Leeds Infirmary practice, the institution has changed its quarters into the new and sumptuous building erected some years ago. This has been described in our columns, and we will not weary our readers with repetition. Suffice it to say that the building is on the pavilion system, and consists of five separate portions built on the slope of a hill, so that two point downwards and forwards, three upwards and backwards, these being connected by the administrative buildings, the one set, however, being separated from the other by a covered space for the use of the patients in wet weather. The glass roof of this erection is, however, so high as to seriously interfere with free ventilation, and constitutes one of the prime defects of the existing structure. The only other place for exercise available to the patients is on a terrace level with the roofs of the front portion of the buildings, which in cold weather is bleak and exposed.

Each of the five pavilions contains two wards, one above the other. The four in the front pavilions contain thirty-two beds each, the six in the after pavilions containing twenty-eight. But besides these there are ophthalmic wards, private wards, and accident wards, which bring up the total to over 300 available beds. Two of the twenty-eight-bedded wards are never occupied. These wards are allotted thus:—One of thirty-two beds for male Medical patients; one of twenty-eight for female Medical patients; the remainder of the beds being as evenly as possible divided among the Surgeons to the Hospital. One ward containing twenty-eight beds is devoted to the diseases of children; but the cases are almost all Surgical, smashings and crushings being lamentably frequent among the little things of Leeds. The plan adopted for admitting patients is that each Surgeon takes a week in the course of the month, receiving all who present themselves, and whose cases entitle them to admission, whether they come casually or on recommendation. The great majority are admitted casually; those recommended are received only on Friday, which closes the reception week. From what has been said, it will be noticed that the Hospital is a Surgical rather than a Medical Hospital. This is rendered necessary by the great number of manufactories in the neighbourhood, and the accidents which are constantly happening; but in the Medical wards the cases are carefully selected, and are exceedingly instructive. As a means of education, they are utilised to the utmost, not least by Dr. Clifford Allbutt, who devotes himself most assiduously to the clinical instruction of the pupils in practical Medicine. Under his care were several cases of the highest interest, notes of which we subjoin:—

The first case which seemed deserving of notice was one of a man suffering from mitral regurgitation with dropsy. There was nothing unusual in the symptoms of the case, the point of interest lying rather in the history. The patient (now aged 38) had had rheumatic fever fifteen years previously, and it seems almost certain that the heart-mischief dated from that time, though the dropsical and other symptoms were only of four months' standing. The man had followed a light occupation. Dr. Allbutt said that the interval which elapses in many cases between rheumatic endocarditis and the oncoming of dropsical and such consequences was often a very long one. In 1869 he had a patient under his care who had suffered once from rheumatic fever, in which attack he was informed that his heart had been injured. This single attack had taken

place twenty years previously, and until five months ago he had never felt any ill consequences. He had mitral regurgitation, and died soon afterwards. Another case had been under Dr. Allbutt's care, in which a gentleman had had rheumatic fever eighteen years previously. He had then a murmur with the first sound, heard most loudly at the apex, and this had continued ever since, and had been regarded as regurgitant by eminent London Physicians. He had never suffered from it, however, but had been able to hunt, shoot, and take all kinds of hard exercise up to twelve months ago. He then began to have œdema of the legs, and a little fluid in the left pleura, but the œdema was dependent in great part upon varicose veins, and the pleuritic effusion had been preceded by some pain in the side. A favourable prognosis was given, and the patient is now about again and in good health, but liable to œdema of the ankles after undue fatigue or standing. Dr. Allbutt thinks that a knowledge of these cases should lead us to be careful not to give too absolute a condemnation in instances of mitral regurgitant murmur following rheumatic fever. In many cases a loud murmur may mean very slight regurgitation, or it may even be sometimes, as in the case of the country squire referred to, that there is no regurgitation, but only such a roughening of the valves as may cause an eddy in the blood-stream as it leaves the ventricle. When dropsy finally appears it may be that a slight regurgitation has become larger by hydrostatic pressure, or even by very slow cicatrisation extending over a long period, or, again, the value of the muscular walls may slowly become less. Dr. Allbutt, in the last volume of the St. George's Hospital Reports, has given reasons for fearing that compensatory hypertrophies are essentially unstable tissues, and carry within them their own earlier death; and this supposition ought, he thinks, to be affirmed or denied, as it is probably true, not only of cardiac muscle, but of locomotory muscle, of brain tissue, of kidney tissue, and so on, which is a very grave consideration. However, even if this be true, a large hypertrophy is probably more transient than a small one; and in cases of long life with mitral regurgitation, the regurgitation may have been so slight as to demand only a compensation of extra tissue slight enough to be tolerably stable.

The second and third cases we have to note are two of empyema. When empyema breaks through the lung the prognosis is unfavourable. In one of these cases, however, an out-patient, the empyema had first burst through the lung, and again, some weeks later, through the side, this latter opening taking place while the patient was under treatment. The outer opening seemed to relieve him a good deal, and he gained weight and strength. This opening subsequently closed, and he again fell off, but was once more relieved by its artificial reopening by Mr. Hey. The observation of this case determined Dr. Allbutt to endeavour to make an outer opening in the chest of a man now in the house, and in whom an empyema of the left side has burst through the lung. Mr. Teale will, therefore, first explore the chest with a Weiss's aspirator, and will then make a free incision in the wall. The man is very ill, and will certainly soon die unless the operation relieve him.

The fourth case, Mrs. G., is a young married woman, who has suffered from chronic vomiting for five months. When brought into the house she vomited incessantly, sometimes blood; she was also much wasted. Dr. Allbutt, on the day of admission, remarked that the symptoms resembled ulcer of the stomach, but wished to show the class that absolute rest in bed was one of the best means of checking chronic vomiting. Mrs. G. was therefore confined entirely to bed, and no important medicine was given to her. She gradually improved, and in fourteen days the vomiting had almost ceased. In a month it had altogether disappeared. Of course, the careful Hospital dieting, on very small quantities of milk frequently repeated, had much to do with the relief, but not by any means altogether, for before admission the patient had been compelled to take her food by teaspoonfuls, and often to forego even that amount. Moreover, in other cases Dr. Allbutt has tried this kind of dieting with imperfect results until the recumbent posture was insisted upon.

We also notice a case of chorea, in a young man, of three years' standing. There was no rheumatic history, and the voice was chiefly affected. This was most notable in counting 1, 2, 3, and so on; he would constantly have to fall back, and begin again. Sometimes he would seem to have stopped completely, but with a jerk he would be able to proceed. Dr. Eddison, the Junior Physician to the Hospital, had been trying conium largely in such cases. In five cases so treated three got well, but in the others it did no good. One of the unsuccessful

cases we saw and examined. The patient had a rheumatic history, and a double systolic bruit, basic and apical; so that there may be permanent heart-mischief. As, however, the thyroid is somewhat enlarged, there is probably some interference with the ganglionic or vaso-motor nervous system.

Under the care of Dr. Eddison we also remarked an interesting case of aneurism, apparently innominate, but too large to give any hope of relief by a distal operation. Nevertheless, up to a recent date he had suffered comparatively little inconvenience from its presence. Large doses of iodide of potassium had been given without producing any effect whatever on the aneurism.

In the Surgical wards many cases of interest presented themselves. Under the care of Mr. Hey we saw a girl who for some months had been afflicted with an enormous ranula. This Mr. Hey treated by excision. A small transverse incision was made on the floor of the mouth, when, by pressing upwards, the ranula protruded, and was without any considerable difficulty dissected out completely. Its contents were thick and pulsatious, probably from deposit of the constituents of the saliva, unlike the thick glairy fluid commonly observed.

As a mode of amputating, Mr. Hey is very fond of the circular incision with two slight side slits to give more room. One specimen of this we saw in a railway ticket-collector, who had sustained a compound fracture of the arm, and apparently fracture of the base of the skull. The arm was amputated, and when we saw him he was gradually recovering from both injuries. The amputated arm had received no dressing save a covering of the so-called "tenax."

In the same ward we noticed one of the worst specimens of bad Surgery it has been our fortune to see. A man, aged 53, fell through his foot slipping, and he received a small scalp wound behind and above the ear. He applied to a Surgeon, who fastened up the wound, and although suppuration set in gave no vent to the pus. Ultimately the whole of the posterior portion of the scalp separated, and one day fell down on his neck, completely exposing the back part of the skull. When he came to the Infirmary they tried to replace the scalp, and partially, but only very partially, succeeded. At the date of our visit the surface was gradually cicatrising.

Another curious case, under the care of Mr. Hey, was that of a man who, skylarking with some friends, knocked his knee sharply against the leg of a table, which struck against the patella on the inside. The consequence was a complete dislocation of the patella outwards. On examination the bone was found to be outside the external condyle, and with its inner surface parallel to the length of the limb. It was speedily reduced, and at the date of our visit, a week after the accident, he was walking about.

A sample of conservative Surgery was afforded us by the next case noticed. This was a boy who had suffered a severe injury to his knee, whereby the head of the fibula was exposed, and it was a moot question whether the joint was not opened, and amputation would be necessary. They resolved, however, to try to save the limb, and applied to the wound a mixture of resinous ointment and carbolic acid, under which the limb was doing well when we saw it.

With Mr. Pridgin Teale we saw many cases of interest. As is well known, Mr. Teale is an enthusiastic ophthalmologist, and has invented a curette for the extraction of opaque lenses. A case so treated we saw, as well as one in which both lenses had been removed. These cases of cataract Mr. Teale treats in the open ward. This he thinks advisable, not only on account of the better ventilation of a large ward, but also because he thinks a little light does good by stimulating the iris to contract, and so preventing adhesions. The strength of the light he regulates by layers of cotton-wool bound loosely over the eyes. Another very successful eye case happened to be in the Infirmary at the time of our visit, the patient suffering from the effects of a severe accident. In this case there had been symblepharon with considerable impairment of vision; the eyelids had been separated, and a piece of conjunctiva transplanted with the happiest result.

A plan of treatment recently tried by Mr. Teale is worthy of general attention. He had a female patient who was greatly troubled with irritability of the bladder, and a constant desire to make water. Many things had been tried, but she got no better, so Mr. Teale determined to dilate the urethra, in order to make out whether or no there was any ulceration near its neck. Before this was attained, however, he found that the irritability was gone, and the patient cured. This led him to employ forcible dilatation in a variety of cases of the same kind, some of which were promptly and permanently relieved, whilst others were not at all influenced. He believes that a certain

number of these cases may depend on causes similar to that of fissure of the rectum, and that the same treatment—namely, forcible rupture of the gut or passage—is that best suited for both. Others of the Surgeons here had adopted the same practice, and one of the cases we saw with Mr. Jessop.

A form of disease, happily now somewhat rare, we observed in the children's ward under Mr. Teale. The patient, a little child, was recovering from typhoid fever when a hard nodule appeared in the corner of its mouth. This rapidly increased in size, and presently became gangrenous. Gangrene appeared on the other side of the mouth, and the too well known cancrum oris revealed itself. When we saw the child its condition was well-nigh hopeless. This form of disease is, we were assured, rare in Leeds.

One of the recently introduced modes of treatment has been extensively tried in Leeds; that is by the aspirateur of Dieulafoy. This has been used in a variety of cases, some of which we may here refer to. Under Mr. Teale we saw the case of a man, aged 23, who was suffering from synovitis of the knee of some years' standing. This by some means or other became acute, and he came into Hospital. Two days after admission, the joint was tapped by the aspirator, and four ounces of pus were removed. The temperature was not in any way affected, and ten days after another tapping was required, when four ounces and a half of fluid were removed; but neither did this afford relief, and a week after the joint was laid open on both sides, and it is now a question of excision of the joint or amputation of the limb. It is but right to add that this mode of treatment has been very successful in many cases of a similar kind; but the rule seems to be, that, if good is not done at the first tapping, there is but little hope of subsequent success.

The same treatment has been successfully employed in other kinds of cases. Thus, in Mr. Teale's hands it has been used for tapping the bladder above the pubes in cases of retention of urine, with great success. A patient we saw had been suffering from stricture, when suddenly retention was superinduced. The aspirator was used above the pubes with immediate and permanent relief. Mr. Samuel Hey operated in the same way in a similar case, and took away eighty-four ounces of urine by its means. In both cases the patient did quite well, although, of course, the permanent stricture was not thus relieved; but in both the individual was enabled to pass his water as before the supervention of retention. In yet another case we saw the same instrument used. The patient was a child under the care of Mr. Jessop. It was suffering from hydrocephalus. The fluid had been removed by degrees. A tapping had taken place at the date of our visit, and eighteen ounces and a half of fluid been thus withdrawn. The needle had been introduced at the anterior fontanelle, and occasioned no disturbance. The size of the head had been reduced, but the child seemed very dull and stupid. The same mode of treatment had been unsuccessfully followed in a previous case, but had failed, owing, probably, to the large quantity of fluid withdrawn at once.

Two cases of what might be called elephantiasis were in the Infirmary. One appeared in every respect a case of true elephantiasis of the leg, of nine years' standing; it occurred in a female, and was under the care of Mr. Teale. The patient had come with the intention of having it removed, but Mr. Teale inclined to deferring any operative procedure. The other was a case of false elephantiasis; it was in the charge of Mr. Wheelhouse. The patient was a boy, and at the time of his admission his leg measured nineteen and a half inches in circumference six inches below the patella; by rest and bandaging it had been reduced to twelve inches and three-quarters when we saw him. In this case there was in all probability plugging of the deep veins, causing obstruction to the return of the blood, and so, in course of time, to solid œdema.

An interesting case was under the care of Mr. Jessop. The patient, a bargee, aged 33, had a fall ten or eleven years ago, owing to his foot slipping. His knee came down on a flat board, and the patella was broken clean across. He tied a handkerchief round it, but never laid up, and, in point of fact, received no treatment whatever. Of course the fragments of bone became enormously separated, yet the man was able to do his work, and could walk five-and-twenty miles a day at a good pace without feeling any inconvenience. In July this year he had a second fall on the deck of his barge, and this time his other patella gave way, which completely lamed him, so that after a little time he was obliged to come into Hospital for treatment. His leg was laid on a back splint and bandaged above the knee; nothing else was done. When we saw it the

fragments were about half an inch apart. The great peculiarity of the case was that no other bones seemed to be particularly fragile. The man's constitution was good. In neither instance had he been carrying any weight, and in neither instance had his knee struck against any other than a flat surface. Mr. Teale is inclined to treat fractures of the patella with rest alone. He is strongly inclined to think that ordinary applications do harm, tending to tilt the fragments of bone so as to bring their upper edges together instead of their fractured surfaces. There was no such case under his care at the period of our visit.

We saw an exceedingly interesting case under the care of Mr. Wheelhouse. The patient, a middle-aged man, had double scrotal hernia. That in the right side became inflamed, and a portion of the gut sphacelated and came away, leaving an artificial anus in the right groin. Through this opening everything passed for nine months, when Mr. Wheelhouse resolved on trying Dupuytren's operation for obtaining a passage between the upper and lower portions of the gut. This was had recourse to with entire success, the patient speedily passing a motion *per vias* naturally, and the artificial opening gradually closed. When we saw the case only a small orifice remained, through which hardly any fecal matter passed.

Close by this patient was another, a man aged 53, with a peculiar condition of foot. When we saw him he had on either foot sinuses extending from the under to the upper surface, not apparently connected with dead bone. He had hardly the characters of the perforating ulcer of the foot, and as the main arteries were rigid, insufficient blood-supply had probably something to do with their existence or persistence, although it was clear that they did not depend on this alone.

In a place like Leeds compound fractures are only too common, and we were interested in the mode of treatment adopted here. In some of the last cases we saw this had been absolutely *nil*. In one we saw with Mr. Wheelhouse, a child who had come in with a very bad compound fracture of the leg, the limb was put in a splint; no application whatever was made, and the wound healed admirably. A boy, under the care of Mr. Jessop, had sustained a very bad compound fracture of the arm, inasmuch that the limb was almost detached. Mr. Jessop cut off the ends of the bones, and pegged them together with ivory pegs, thus providing a splint; the limb was lightly covered with oakum, and all went well. When we saw the boy the arm was healed. A case somewhat alike we noted under the care of Mr. Teale. Here the fibula was broken and the joint opened, yet motion was perfect. Many amputations we saw treated in similar fashion.

Unfortunately, it must not be concluded from these statements that Leeds Infirmary is totally free from those plagues of Surgeons, pyæmia, gangrene, erysipelas, and phagedæna. At the time of our visit there were no fewer than six cases of phagedæna in the Hospital, only one of which, however, was said to have originated in it. In one case Mr. Jessop had amputated the thigh by the supra-condyloid method, and the patient was almost well. He was sent to the Convalescent Hospital at Cookeridge, where the stump was speedily attacked with phagedæna, and he had to be brought back to the Infirmary. When we saw him he was recovering rapidly. Many of the cases of phagedæna had originated at this Convalescent Hospital—it was said, owing to the use of sponges in that Institution; in the Infirmary loose cotton-wool alone is used. Other cases were said to have occurred in the town of Leeds itself, and in one instance which we saw the malady had originated in a distant village, in one of the healthiest parts of Yorkshire. It seemed, also, that the infection remained attached to the individual long after he was well himself, for in one instance a patient who had been confined to a private ward, a fortnight after the phagedæna had disappeared, communicated it to a patient in an adjoining bed after being readmitted to the general ward. As a remedy for this troublesome affection, bromine had been tried, but found wanting. That which succeeded best was introduced by Mr. McGill, the Resident Medical Officer. This consisted in free incisions at the edge of the sore, and the promoting of the bleeding. Accidental bleeding has often been known to arrest such morbid processes—as, for instance, when the femoral has been perforated.

A very curious case was in the female ward under Mr. Jessop's care. The patient, an elderly woman, had an ovarian tumour. Removal was proposed, when the swelling burst into the peritoneum. Curiously no disturbance followed, the only thing remarkable being an unusual discharge of urine. After a time the fluid reaccumulated, and she came into the Infirmary, when the same thing happened over again. In neither case did there appear to be any attempt at peritonitis.

Under the care of the same gentleman we saw a clever Surgical case. A man came with an ulcerated bunion, which had burrowed so deeply as to affect the metatarso-phalangeal articulation of the great-toe. On the other foot was a similar sore, but not so far advanced, but its tendency was clear. In either instance Mr. Jessop excised the joint, and at the time of our visit the man was almost well.

The same gentleman pointed out to us a plan he had recently adopted of treating piles—that was, by twisting them off. A similar method had been tried with the pedicle in ovariectomy, in castration, etc., and found very successful.

One of the peculiar lines of practice seen at Leeds is the treatment of crushed hands. The general rule is to remove all it is impossible to save, but to pinch off these all the skin attainable, and to apply it where most wanted on the stump. In two children, however, Mr. Wheelhouse had left nature to take its course, to see how much would come away, before meddling with the mutilated members.

Of amputations we only noted one rectangular stump, which certainly was a beautiful one. It was the work of Mr. Wheelhouse. Supra-condyloid amputation had also been tried very successfully. Mr. Jessop has twice excised the head of the thigh-bone subcutaneously, and has been able to retain motion.

We have but little more to add. We observed that the plaster-of-Paris bandages were made of muslin, and were kept ready for application; that the galvanic apparatus in the Infirmary was good, consisting of Muirhead's constant battery (made by Elliott), Foreaux's continuous current battery (made by Weiss), and the now well-known Stöhrer (the latter Dr. Clifford Allbutt has used with great good effect in the treatment of infantile paralysis); and that in the treatment of secondary syphilis enormous doses of sarsaparilla were given with great good. Finally, we beg leave to return our thanks to all the officers for their courtesy and kindness; in especial these are due to Mr. McGill, the Resident Medical Officer.

LIVERPOOL SOUTHERN HOSPITAL.

IDIOPATHIC TETANUS—RECOVERY—SUBSEQUENT DEATH FROM EXHAUSTION.

(Under the care of Dr. CAMERON.)

[Reported by Mr. LEIGH.]

ELIZABETH L., aged 61, of no occupation, was admitted January 25, 1871, under the care of Dr. Cameron, suffering from trismus.

Previous History.—She first perceived slight stiffness in the muscles of the jaw on the 22nd, which increasing, she applied for treatment as an out-patient on the 24th, but refused to remain then, promising to come in next day, when she was admitted. She had no wound or injury of any kind whatever, and the only cause she could assign for the disease was exposure to cold and want.

On admission, the muscles of the jaw were considerably contracted, and the mouth could only be opened for half an inch. The sardonic grin was present. The rest of the body was unaffected. She had a slight cough. Pulse 88, respirations 32, in the semi-erect (or sitting) posture. She was pale and emaciated.

Treatment.—Two grains of calomel and half a grain of opium were ordered every second hour, and mercurial ointment was rubbed into the armpits and thighs every two hours (this method of treatment having proved very successful here in traumatic tetanus, four recoveries occurring in nine cases). The gums being affected, next day the mercurial treatment was discontinued. Bronchitis (in a moderately mild form) having now supervened, a sinapism was applied to the sternum. Tincture belladonnæ was also given in eleven-minim doses every four hours, which dose was increased to twenty-two minims in two days. As no sleep was obtained, ten grains of pulv. ipec. co. were given every night.

By this time (the 29th) trismus was very complete, and opisthotonos well marked. The left leg was perfectly stiff, the patient not having power to bend it; the right leg was not quite so much affected. The abdominal muscles were also rigid. The bronchitis had now become general, and, owing to the spasmodic contraction of the muscles of the chest, and the consequent difficulty of expectorating, gave rise during the entire illness to considerable aggravation of her sufferings and to great dyspnoea. Pulse 124, respirations 34, semi-erect posture. As much nutriment as could be taken was given in the form of eggs, beef-tea, milk, etc., and eight ounces of whisky in twenty-four hours. Food not being easily taken by the mouth,

nutrient enemata were given, but not being retained were discontinued.

On the 30th slight delirium was present. The belladonna was omitted, and five grains of carbonate of ammonia and twenty-five minims of spirit of sulphuric ether given every two hours. Liq. epispasticus was also applied over the spine for about eight or nine inches in length.

31st.—Trismus less marked; cannot sit forward; great thirst. A febrile attack occurred in the evening (at 6 p.m.) simulating ague, consisting of cold, hot, and sweating stages, the last stage being of some hours' duration.

February 1.—No sleep; febrile attack at 6 o'clock p.m., as yesterday. Spasm very violent, nearly throwing her out of bed. Pulse, 100; respiration, 40.

4th.—Slight stridor from laryngeal spasm; voice weak and hoarse; dyspnoea severe; pulse feeble. The temperature was $101\frac{1}{2}$, and was never very high during the whole course of the disease. She has had the febrile aguish attacks each evening at nearly the same time. Camphor ordered in two-grain doses every two hours.

7th.—Respiration very rapid and spasmodic—62 per minute; pulse 112; trismus and spasm generally diminished.

10th.—Cough troublesome; slight evening febrile exacerbation; pulse 112, and respiration 50.

After this she kept steadily improving. She ate well, slept tolerably, the tongue cleaned, the pulse and respirations fell, and her condition was such as led us to hope for a favourable termination.

On the 28th the spasm had quite left her. A large bed sore had formed on the lower part of the back, and another on the right hip, and the change which subsequently occurred was ascribed principally to the depressing effect of these on the system. The sores slowly improved under treatment, but the appetite diminished, and in spite of quinine, iron, and stimulants, she sank and died from exhaustion nearly three weeks after all cessation of spasm, and more than six weeks after it had commenced to decline.

She was very thin and weak on admission, having suffered hardships and deprivation of food; and this, together with the depressing effect of the disease, the small amount of food capable of being taken while the spasmodic dysphagia lasted, and the bedsores, caused her death.

Post-mortem Examination.—Brain and spinal cord perfectly normal; lungs congested; bronchial tubes containing thick viscid mucus; other organs healthy.

Remarks.—The febrile intermittent evening exacerbation was a peculiar feature in the case, and had no history to account for it. The bronchitic affection of the chest, and the muscular spasm, which rendered expectoration difficult, caused great aggravation of the suffering of the patient.

WHAT BECOMES OF THE DOCTORS.—Terra del Fuego has been traversed by Lieutenant Masters, R.N., who has discovered that the natives believe in devils, and that they are the departed spirits of members of the Medical Profession. The main object of their religious ceremonies is to keep these devils at a distance from them.

THE PREVENTION OF CHOLERA.—At a meeting of representatives of the various districts abutting on the Thames, held on August 25, at the office of the Medical Department of the Privy Council, No. 8, Richmond-terrace, Whitehall, the Mayor of Gravesend in the chair, the following resolutions were unanimously agreed to:—“1. That this meeting of representatives from the various boards and districts abutting on the Thames recognises the advisability of a joint action in appointing a sufficient staff of officers for the inspection of shipping, for the provision of the necessary Hospital accommodation in cases of cholera, and for the disinfection of shipping and infected articles, under the recent Orders of Council. 2. That application be at once made to the Government for the use of one of her Majesty's ships, to be used as a Hospital, below Gravesend, for patients suffering from cholera on board ship. 3. That this meeting forms itself into a conjoint Committee, for taking the necessary action for the inspection of shipping on the River Thames, and to adopt such measures for the treatment of persons affected with cholera and to prevent the spread of the disease, and to take such other measures, as may be deemed needful. 4. That the following gentlemen form a Sub-committee:—Thomas Troughton, Esq.; G. S. Pedler, Esq.; W. P. Jackson, Esq.; J. Lloyd, Esq.; G. L. Shand, Esq.” Dr. C. Meymott Tidy was requested to act as Secretary.

SATURDAY, SEPTEMBER 2, 1871.

SCIENTIFIC WORK, PURE AND PROFESSIONAL.

It may be doubted if in these days scientific work is pursued in precisely the same spirit as formerly, inasmuch as of late years the general public has performed a new and very important part in approving or disapproving the labours of scientific men. Popular applause may be of advantage to some scientific workers. It encourages them to work, and, in some cases, rewards are conferred which are not altogether unsubstantial. The most ardent scientific spirit must feel pleased when he finds that a number of persons are interested in work which has been of most absorbing interest to him.

But the public has its own idea of the sort of science it desires to have, and is as ready to find fault as it is to praise. If the subject is dry or difficult, and more especially if the lecturer or author seems to be dull, the public soon shows its disapproval and dissatisfaction. Nor is there much difficulty in discerning the sort of science the public requires in these days, and probably means to have, whether scientific men assent or oppose. Neither is there any doubt of the opinion the public has formed concerning the duties of a scientific teacher, and the manner in which he ought to teach. The public will listen graciously, but it must not be bored too much with details. Although it is not difficult to please the public in search of scientific information, it is, however, a very grave question how far the meeting of the demand is of advantage to science, or consistent with the sort of life a scientific investigator should lead.

For several years past we have seen one scientific man after another vying with the merely popular lecturer in endeavouring to make his matter palatable to his audience, and in some instances the pabulum has been so highly spiced, that the actual food has been quite lost in the quantity of condiment employed to give it flavour. After attending some of the lectures last year at a highly popular institution, we were constrained to ask ourselves what had been taught. There were overwhelming illustration, flashes of light, beautiful colours, the brightest illumination, and all described in most carefully chosen words and sentences designed to delight the ear and excite the interest; but what was the object of all the charming talk and work? Was it to please, or was it to teach? The eye and the ear had been appealed to with marvellous force, without the attention having been overtaxed or the understanding wearied. Good-natured critics would feel satisfied that they had spent a very pleasant hour, and thankful to Professor — for all the trouble he had taken to provide them with so much amusement and instruction. At

many a dinner-table the discourse would be talked about as an event of the season, and the lecturer spoken of as a distinguished person, whom everyone should hear and see before leaving town. But we cannot help feeling that the matter is serious, for not only have scientific men gone in for popular applause, but they have sought to make the public the judge of the merits of their scientific work. Instead of any new facts discovered being discussed in scientific circles and in societies and in journals devoted to science, the observations and statements have been repeatedly published, and in different forms, in many of the public journals. A word of praise in the *Times* is worth more than all the favours all the scientific journals have to bestow. If two or three leading papers comment favourably, what matters it if half a dozen obscure periodicals carp and find fault, and object to the scientific matter as well as the very taking manner? Nay, what does it signify if the matter was of little real importance provided that the dress which set it off was becoming, and by exciting general admiration gained for its author notoriety and praise. If the matter was the veriest rubbish that could be served up, had it not been the means of gaining for science some public approval, of promoting the diffusion of scientific ideas of some sort? Is it nothing that a fragment science should be brought under the notice of a certain number of persons distinguished for their birth, for influence, for the incomes which they spend, and for the size and situation of the houses in which they live? Is it not well that science should be smiled upon, and is it not meet that hard-working, thoughtful, scientific men should be complimented, and have the advantage of the patronage of the wealthy and the great?

The race after public notoriety has not, however, affected many of the members of the Profession who devote much of their time to scientific research. There have been indications of jealousy on the part of those who prosecute science only, towards those who, besides devoting themselves to scientific investigation, are also engaged in active practice. Purely scientific men have not unfrequently spoken disparagingly of the scientific work conducted by members of the Medical Profession, and in their writings have ignored researches, the results of which it might have been inconvenient to refer to. Not long since we perused several articles in a contemporary, the object of which seemed to be to disparage Medical science and advance what was regarded as pure science; and it is not uncommon to find scientific work praised if it emanates from a scientific man, and ignored or spurned if it comes from a Doctor. For centuries past, however, science has been advanced by members of the Profession, and no men have ever more thoroughly displayed the real scientific spirit, and exhibited greater patience, skill, accuracy, and devotion than Medical Practitioners. Nor, in many instances, has their zeal abated with their years. In their hands the purity of science has been preserved. Independent of popular applause, regardless of public notoriety, a Professional man can pursue his scientific work without ostentation and without anxiety. He need be in no haste to publish, and he can have no object in gilding the facts he discovers so that they shall please the unlearned or amuse the torpid. We trust that the younger members of the Profession who are engaged in teaching, and who are looking forward to practising as Physicians and Surgeons, will see the importance of following the great example of so many of their predecessors, and will zealously prosecute some branch of science in a thoroughly scientific way. Let them not listen to the false arguments of those who seek to restrict natural knowledge to a caste. So far, science has been free to all, and in England, as is well known, some of our most distinguished scientific men are at the same time engaged in some very different calling; and it is most advantageous to British science that this should be so. Without independence, no branch of science can be successfully prosecuted, and independence can be gained only by not having

to live upon science. Though the calls upon the time of a Medical Practitioner are often very serious, we all know that Professional work is very intermittent, sometimes affording ample leisure for scientific pursuits; while, during the early part of our Professional life, there are several hours in each day which can be devoted to steady work, without in any way trenching upon practical Professional studies. In this way it is in our power to further scientific investigation and to promote the diffusion of a knowledge of nature. Being independent, we may work for the work's sake; and there will be little inducement to court the applause of the public, or to waste our energies in dressing up what we have to teach, so as to excite and amuse the listless, and gratify the indolent languishing for phenomena.

THE THIRTEENTH REPORT OF THE MEDICAL OFFICER OF THE PRIVY COUNCIL.

LAST week we drew attention to the new and valuable researches by Dr. Sanderson into the "origin and distribution in water, and the circumstances which determine the existence in the tissues and fluids of the human body," of those infinitesimal living forms which have been supposed, rightly or wrongly, to play at least some part in the production of many of the diseases to which flesh is heir. Dr. Sanderson's paper, it will be remembered, appears as an appendix to Mr. Simon's Thirteenth Report addressed to the Lords of the Privy Council, and we this week invite the attention of our readers to the Report itself, apologising for having treated them as economical schoolmistresses are in the habit of treating their charges—giving them the pudding first, and reserving the—we will not say more weighty, but less attractive—*pièce de résistance*—until afterwards.

Mr. Simon's Report is written with his usual felicity and grace of diction, and contains matter of great public and Professional interest, but it cannot be said to be a cheerful document. It treats chiefly of projects which had either ended in disappointment and disaster, or of others which, since its publication, have also failed. It is divided into sections, several of which deserve some notice. The first contains a statement of the epidemic diseases which prevailed amongst us in 1870—relapsing fever and scarlatina—and notes the rise of the epidemic of small-pox in the early part of the year, which, by its end, had at least in London acquired a severity beyond any recent experience. As our readers have been kept fully informed as to the progress of these epidemics, we pass on to the second section, which relates to the applications made to the Medical Department of the Privy Council by local authorities on questions of common sanitary administration. During the year 1870 there were 200 of these, of which sixty-nine involved inquiry on the spot by a Medical inspector. The communications generally referred to the local prevalence of dangerous infectious diseases, and the inquiries instituted by the Medical inspectors revealed "conditions in no case satisfactory, and very rarely other than of the grossest local neglect." Mr. Simon goes on to notice the inadequacy of the then staff of Medical inspectors for the amount of work devolving on the department, and to urge the necessity of an increase of that staff, for which increase a proposal had been approved by the Lords Commissioners of the Treasury, and has since, we believe, received the sanction of Parliament.

The third section refers to the regulation and superintendence of vaccination during the year, and contains a statement that the awards of money to meritorious public vaccinators amounted altogether to £5685 8s.

Section IV. contains in a few sentences the history of the Government Medical Reform Bill of 1870, the proceedings connected with which the Medical Officer of the Privy Council candidly acknowledges formed a large share of the work of his department. Mr. Simon writes—

"On April 8 the Lord President introduced in the House of

Lords a Bill to provide for the object in view; and on July 7 this Bill, somewhat modified, but with no essential change, as the result of its discussion in the House of Lords, had its first reading in the House of Commons. Here, unfortunately, there was such pressure of other public business that the Bill could not till long afterwards be brought under consideration; and when at last its turn for consideration had arrived, the end of the session was so close that no measure requiring much discussion could be considered. In this state of the case claims were put forward for the introduction of a new and very controversial subject-matter into the Bill; and as the promoters of those claims (which related to the constitution of the General Medical Council) would not consent to postpone them for consideration to the present session of Parliament, the Minister in charge of the Bill was of course obliged to withdraw it."

Now, to the statement that the Bill left the House of Lords "somewhat modified, but with no essential change, as the result of its discussion in the House of Lords," we take grave exception. That the view which we—in common, as we believe, with most moderate but real Medical reformers—took of the effect of Lord De Grey's disastrous weakness in listening to the representations of certain of the universities, and in permitting those universities and other of the examining bodies to grant degrees and diplomas to persons who had not passed the prescribed examinations or been registered under the Act, was no merely sentimental one may be argued on Mr. Simon's own evidence, who, in an official note which appears in the appendix, writes—

"The universities which claimed this exemption had perhaps not duly considered what conflict of law and common sense it might popularly appear, that, in a country where the most illiterate and unskilled persons are not as such prohibited from practice, a man legally holding a Medical degree, given (and perhaps the highest which could be given) after examination by an university of the United Kingdom, might be under penalty for practising his Profession. Nor, perhaps, had they fully seen how difficult it would be for courts of justice in case of need to enforce so paradoxical a law, or how probably this partial exemption, if it were granted, would tend to perpetuate just such by-ways into the Medical Profession as the Bill had for its main object to close."

After this condemnation of "so paradoxical" a law, he proceeds to excuse it on the ground that there was no alternative but to yield to the wishes of the universities, for reasons "which need not here be entered on"—a convenient formula for avoiding the confession of weakness on the part of those who had charge of the Bill. But he goes on to charge persons who represented the change made in the Bill to be a cardinal one with "immeasurably overrating" its importance, although in the same sentence he allows that that change rendered the Bill "logically less complete in its subject matter," "therefore less popularly intelligible, and less susceptible of successful working as law, than it aimed at being." After this confession we think the charge of immeasurably overrating the importance of the change falls to the ground. The fact is that the Bill was degraded from a strong, logical, comprehensive measure to a weak, illogical, and partial one, by striking out the clause which compelled all aspirants for Medical diplomas to pass through one portal into the ranks of the Profession. We believe that nobody at first was more impressed with this fact than the original framers of the Bill, and we can only surmise that the disposition to (in our opinion) immeasurably underrate the effect of the omission of Clause 18 has been a growth fostered by the official atmosphere which surrounds them.

Clause 5 refers to the working of the Pharmacy Act, and here we have the foreshadowing of another Parliamentary failure. Mr. Simon writes—

"I regret to report to your Lordships that the power which, for the public protection, the first section of the Act vests in the Pharmaceutical Society, to prescribe (with consent of the Privy Council) regulations as to the keeping, dispensing, and selling of poisons, is still entirely unexercised. I believe it to have been by an accidental oversight in legislation, that, while all other powers to be exercised for public purposes by

the Society under the Act were vested in the Council of the Society, the language of the first section vested in the Commonalty, and not in the Council, the very important power which that section confers, and to which my present observations relate. It is perhaps not surprising that a large body of tradesmen should be slow to take the initiative in imposing even the most reasonable penal restrictions on themselves. But I have to submit to your Lordships, as a fact which you may deem deserving the consideration of Parliament, that this non-fulfilment of the Society's duty, to make rules against dangerous slovenliness in the keeping, dispensing, and selling of poisons, is a breach of the implied contract under which the Legislature in 1868 gave powers and privileges to the Society."

We all know the fate of the Bill which these sentences were intended to introduce. The combined efforts of the trade proved too strong for Mr. Forster and his colleagues, and dangerous slovenliness in the keeping, selling, and dispensing of poisons is as likely to be rife as ever. For ourselves, we have no great faith in the efficacy of Government inspection of trading operations, and we have always doubted the value of the Pharmacy Act as any bar to an improper sale and use of poisons. But we think that the Pharmaceutical Society, which had special privileges granted to it in order that greater public safety might be insured, is bound, while it enjoys those privileges, to act not merely up to the letter, but to the spirit, of the Act, for the protection of society.

The last clause refers to the labours of Drs. Sanderson and Thudichum in pathological investigation. Of Dr. Sanderson's work we have already spoken. An account of Dr. Thudichum's researches, which would lose by fragmentary publication, is postponed until the results of 1870 can be extended by the present year's work.

The conclusion of the Report sets forth in eloquent terms the evil results which are accruing to the population of this country from the unchecked prevalence of preventible disease and the unamended state of the sanitary laws. Mr. Simon tells the Lords of the Privy Council that the deaths which occur in this country are fully a third more numerous than they would be if our existing knowledge of the chief causes of disease were reasonably well applied throughout the country. The effect of this waste of human life, the train of physical and moral evils which disease and death bring with them—suffering, deterioration of race, poverty, and crime are delineated in striking terms. He urges that—

"At the present time, when popular education (which indeed in itself would be some security for better physical conditions of human life) has its importance fully recognised by the Legislature, it may be opportune to remember that, throughout the large area to which these observations apply, education is little likely to penetrate unless with amended sanitary law, nor human life to be morally raised while physically it is so degraded and squandered.

"The above various considerations, taken together, seem to me to invest the subject which I am bringing under your Lordships' particular notice with a degree of national importance to which very few subjects can pretend. Its relative position among such subjects is not a point on which I would presume to speak. But, considering the trust which is reposed in my office with regard to this great national interest, I cannot in too strong terms express my official knowledge that it most urgently needs the attention of the Legislature. And I venture to hope and believe that your Lordships' full cognisance of the case will lead you to accord to that conclusion your authoritative sanction and furtherance."

With this Report before them, the present Government cannot plead that a necessity for extended sanitary legislation had not been brought prominently under their notice. But the health of the people is of secondary importance when compared with Army Purchase and the Ballot! Cholera is making its way towards us, and may probably get a footing on English soil before honourable members return from their holidays. When it comes, we shall probably hear the epidemic spoken of as another *misfortune* of the Government!

TOBACCO SMOKE.

SOME new researches of a highly interesting nature on tobacco and tobacco smoke have been recently made by Drs. Vohl and Eulenberg (*Vrtljhrsschr. f. gerichtl. Med.*, xiv., p. 249), which will, if confirmed by other observers, tend to revolutionise many of the views held at present as to the influence of smoking on the human economy. The paper, after an elaborate *résumé* of all that was previously known as to the chemical composition of tobacco in its various forms, and of the products generated by smoking it, is divided into three parts, the first of which treats of the chemical composition of commercial tobacco for smoking, for chewing, and snuff; the second contains the results of an investigation of the products generated by the combustion of tobacco during smoking; and the third describes the physiological effects of the bases extracted from tobacco smoke.

Commercial tobacco for smoking purposes was invariably found to contain nicotine, amounting sometimes to 4 per cent. or more, whilst tobacco used for chewing, and snuff, were found to contain only minute traces of that alkaloid; so that nicotine poisoning from chewing or snuffing would appear to be very problematical. The authors state that, as a fact, no such cases are on record.

Among the gaseous products given off during the smoking of good tobacco and cigars there were found oxygen, nitrogen, marsh gas, and carbonic oxide, besides the more readily condensable gases and vapours—sulphuretted hydrogen and hydrocyanic acid; and occasionally sulphocyanic acid, this last being produced at a later stage by the action of sulphuretted hydrogen on hydrocyanic acid. The acid and non-basic products formed are—formic, acetic, metacetic, butyric, valeric, and carbolic acids; creosote; perhaps caprylic and succinic acids also; the latter from fermentation of the malic acid, well known to exist in the green tobacco plant. There were also a solid hydrocarbon of the formula $C_{19}H_{18}$, and a liquid hydrocarbon of the benzol series. The basic products of the distillate were, however, the most interesting. *No nicotine could be detected among them.* Thus the experiments of Zeise are confirmed, and the effects of tobacco-smoking cannot be attributed to nicotine. Besides ammonia, the bases found nearly all belonged to the picolin or pyridin series, well known to be produced during the destructive distillation of wood and many other vegetable products. These bases form a well-defined homologous series. The following were found, and identified by their analysis, the analysis of their platinum salts, and by the determination of their respective boiling-points:—Pyridin, C_5H_5N ; picolin, C_6H_7N ; lutidin, C_7H_9N ; eollidin, $C_8H_{11}N$. In smaller amount—Parvolin, $C_9H_{13}N$; coridin, $C_{10}H_{15}N$; rubidin, $C_{11}H_{17}N$; and others of higher boiling-points—such as viridin, $C_{12}H_{19}N$. Methylamine was not found, and ethylamine in very small quantity only.

In investigating the action of these alkaloids of the pyridin series, the mixed bases boiling below $160^\circ C.$ were first tried on pigeons. These animals succumbed under tetanic spasms, succeeded by convulsions. The bases boiling at 160° — $250^\circ C.$ were next tried on pigeons and guinea-pigs. The results were irregular cardiac action, tonic and clonic spasms, convulsions, and death. Picolin bases from other sources than tobacco were also found to produce similar effects. Pure picolin also had an almost precisely similar result. The only difference appeared to be that this alkaloid caused dilatation of the pupils, whilst the mixed bases from tobacco caused contracted pupils. The effects of tobacco-smoking must hence be referred to pyridin bases, and not to nicotine, the symptoms of which are different. Similarly, no daturin was found among the products of the semi-destructive distillation of stramonium. It is well known, too, that the same pyridin bases are among the products of the distillation of opium, and Drs. Eulenberg and Vohl are inclined to attribute the effects produced by smoking this drug, not to

morphia, but to the picolin series of alkaloids. An interesting line of physiological, toxicological, and chemical study is thus opened up.

THE WEEK.

TOPICS OF THE DAY.

AT Königsberg the cholera is still widely prevalent, and is very fatal; from 50 to 60 cases occur daily, and it is said that the deaths are as many as from 45 to 50 of the attacks. During the week from August 18 to August 25, 329 persons are reported to have died there by cholera; among them were 127 children. A telegram, dated August 25, stated that there had been 12 cases of cholera, and 10 deaths, at Dantzic; but we have no report of any fresh cases since then. At St. Petersburg the epidemic is said to have abated considerably. The mortality in Paris for the week ending August 25 was 823—equal to an annual death-rate of 24 per 1000—79 deaths were referred to diarrhoea, 27 to dysentery, 16 to cholera, and 6 to cholera; but it is not reported that any of the cholera cases were of the Asiatic type. In London the fatal cases of diarrhoea, which in the two previous weeks had been 299 and 425, increased to 487 last week; of these 450 were of infants under 2 years, and 21 of persons aged 60 years or more. The deaths referred to cholera and choleraic diarrhoea declined from 49 in the previous week to 23 last week, and all who died, except 3, were children, mostly infants. The 3 adults who died from "choleraic diarrhoea" were respectively 78, 52, and 51 years of age. The 487 deaths from diarrhoea exceeded by 295 the corrected average number in the corresponding week of the ten years 1861-71, and were equal to an annual death-rate of 8 per 1000 of persons living. In the West and North groups of districts this death-rate was, last week, 7 per 1000, in the Central group 4, and in the East and South groups 9. In many of the provincial towns the deaths from diarrhoea, almost entirely infantile, have considerably increased; most so in Sheffield, which has been suffering very severely from infantile diarrhoea, the annual death-rate from that disease having last week been equal to 18 per 1000 of the population.

The last account of cholera from Berlin states that on the 27-28th inst. there were 100 cases and 29 deaths, on the 28-29th inst. 79 cases and 50 deaths. At Elbing, up to Sunday, 34 persons had been taken ill, of whom 20 died. A telegram from Hamburg states that the first case of cholera occurred at Altona on the 19th inst., from which date up to the 26th inst. 16 deaths from cholera had occurred.

We have heard of three candidates for the vacant post of Officer of Health to the parish of Islington. We are only surprised that there should be such a number of men of high acquirements anxious to obtain such an unenviable position. They are Mr. Haviland, the author of "The Charts illustrating the Geographical Distribution of Disease;" Dr. Meymott Tidy, Lecturer on Chemistry at the London Hospital; and Professor Corfield, of University College. With such a galaxy of talent to choose from, the electors of Islington can scarcely go wrong.

Some serious charges against the management of the Smallpox Hospital at Highgate have been made by three gentlemen who were recently Assistant Medical Officers there. A full inquiry is, we believe, demanded on the part of the Medical and nursing staff.

The cause of the Stowmarket explosion still remains unexplained. Professor Abel supports the spontaneous combustion theory, samples of the gun-cotton produced from Upnor Castle having been found to contain too much acid. Another theory is, that free sulphuric acid had been criminally placed in the cotton sent to Upnor Castle.

Another case of alleged prolonged fasting is reported from the neighbourhood of Preston. A woman is said to have taken nothing but water for sixteen months!

The *Scotsman* of August 29 contains an account of the alleged wrongful confinement of a Manx gentleman in a lunatic asylum in Dumfries. A story of the manner in which the removal of the patient was effected, and the artifices employed to get him into the asylum, is copied into that paper from the *Isle of Man Times*. It is said that three Medical men have since certified the patient to be sane. But the whole story requires verification before it can be accepted or commented on.

THE HAMPSHIRE CAMPAIGN.

We understand that Inspector-General Lawson, the principal Medical officer at Aldershot, will have the general superintendence of the Medical arrangements of the whole force employed in the approaching campaign. The total force of about 30,000 men will be divided into three divisions of nearly equal numbers. Each division will be under the Medical charge of a Surgeon-Major as principal Medical officer, and there will be three field-Hospitals in each. The first division, under the command of Sir Hope Grant, will have Staff Surgeon-Major Rendall, M.D., as principal Medical officer. The first field-Hospital will be in charge of Staff Surgeon-Major F. Holton, M.B.; the second under Staff Surgeon R. Hungerford; and the third under Staff Surgeon J. R. Thomas. In the second division, under the command of Sir John Garvoek, the principal Medical officer will be Surgeon-Major J. Sinclair, 33rd Regiment, and the three field-Hospitals will be respectively under the charge of Staff Surgeons C. M. M. Miller, M.D., R. Watson, and N. Ffolliott. In the third division, under the command of Sir Charles Stavelly, Surgeon-Major J. J. Clifford, of the 9th Lancers, will be the principal Medical officer, and Staff Surgeons E. G. Rellett, W. Grantt, M.B., and G. Palatiano, M.D., will be in charge of the field-Hospitals.

A PANIC ON THE THAMES EMBANKMENT.

A BULL-TERRIER, which had been in the habit of taking freely to the water, having on Wednesday last suddenly displayed extreme unwillingness to do so, and evinced the utmost terror at the sight of the water, followed by a state of excitement in which he flew at and bit several persons on the Thames Embankment, caused a regular panic among the passers-by, until he was secured and removed by the police. The occurrence was sufficiently alarming, no doubt, but it yet remains to be proved that the dog was rabid. Every means should, however, be adopted, in the cases of the bitten persons, to thoroughly cleanse the wounds, and check the absorption of any secretion from the animal's mouth. Mr. Youatt, the celebrated Veterinary Surgeon, was several times bitten by dogs known to be rabid, and he never suffered materially in consequence. The only remedy which he employed was the free application of nitrate of silver, having previously thoroughly washed and sucked the wound. It is well to bear in mind that hydrophobia in the human subject does not inevitably follow the bite of a rabid dog. Several persons may be bitten by the same animal, and hydrophobia may appear only in one or two, and perhaps in none. The popular idea that a dog evincing any unusual irritability or snappishness, or even having bitten his master or other persons without any apparent provocation, should be immediately destroyed, is a great mistake, as by so doing one of the most effectual means of relieving the anxiety and doubt of the person bitten is lost, for the possibility of the dog not having been mad at all can never be established as a fact. The plan to adopt under such circumstances is to tie up the dog, leaving him food and drink within easy reach; if rabies be impending the symptoms will declare themselves within a very few days, but if at the end of

a fortnight or so the dog continue in good health, or be attacked by some disease distinct from rabies, the bitten person may make his mind quite easy on the matter. For this reason we hope that the dog which caused the alarm on Wednesday may not have been destroyed by the police.

THE EAST SURREY ELECTION.

The importance of the Anti-Contagious Diseases Act Association as a political engine has been considerably diminished by the result of the East Surrey election. Notwithstanding the vaticinations of a daily contemporary, that the promised opposition of Mr. Leveson-Gower to these Acts would secure for him a considerable number of votes from the Conservative party, Mr. Watney, who had made no similar pledges, was returned by a very large majority. We are glad to see that the fictitious political value hitherto imputed to opposition to the Contagious Diseases Acts attains its proper level when other questions of more general interest and importance have to be considered. Future and present M.P.'s would do well to consider the result of the East Surrey election as a true index of the state of public feeling on the Contagious Diseases Acts.

MEDICAL RELIEF AT SOUTHAMPTON.—THE WORK OF A UNION SURGEON.

DR. GRIFFIN has resigned his appointment as one of the Medical Officers of the Southampton Union. In taking his leave of the Board he has embodied in a letter some facts which are deserving of notice. He says that Southampton, in the three districts, contains over 47,000 inhabitants. In opposition to Article 159 of the Poor-law Board, which does not allow guardians to assign to a Medical officer a district containing more than 15,000 persons, District No. 2 has 16,000. During the last eight years District No. 2 has attended 16,000 sick paupers—that is, 2000 sick a year—and the average duration of illness has been twenty-six days. Dr. Griffin contends that no man can properly attend to these and his private practice—the salary is £103—consequently he must neglect the one or the other. "To prevent a charge of neglect, he too often is compelled to merely give a momentary look on his visit; and when a visit is impossible, an order for meat and wine has sometimes stopped a disturbance. But the illness lingers, more drugs are consumed, and paupers are made; for it is a well-known fact that 70 per cent. of paupers are made paupers through sickness."

The following graphic account of the working of this "system" at Southampton is doubtless applicable to many other unions. The complaint of the indiscriminate manner in which orders for Medical attendance are given is unfortunately too common. Here is Dr. Griffin's account of the effects of such a lax mode of conduct:—

"Southampton has no right to have an annual sick-pauper population of over 6000. The number is so large because the only real opposition to the manufacture of paupers is on the part of the Medical officer. The guardians take no interest in, know nothing about, have no supervision, and exercise no control over, the granting and management of Medical orders; but whenever a relieving officer does his best to diminish the number of applicants he generally gets into disgrace. It is not uncommon to find two men in the same employ, with similar wages, the one a member of a club which provides Medical attendance for himself and family, the other, although in constant work, not only employing the parish Doctor for his wife or child, but obtaining meat, wine, and other Medical comforts, and when an increase comes to his family circle to have granted almost all he may wish for. (Formerly, when the guardians paid an extra fee for midwifery, they took care to give only eight or ten orders. Now they don't pay, they do not object to grant from fifty to one hundred a year, at an indirect cost to the ratepayers five times greater than when they paid a fee.) Men, too, in constant employment, with wages from £4 to £14 a month, obtain Medical orders for their families. This indiscriminate granting of orders has

been the curse of sick-benefit societies. It has made many an honest man cease to subscribe to clubs when he finds that he has not only to pay the club for his own family, but, as a ratepayer, also for his fellow-workman's, who is as well, perhaps better, off than he. It has done much to pauperise and destroy the self-dependence of the whole labouring population. It, by the number of cases it produces, compels the Medical officer to slur over his work; and, knowing how much he is being imposed upon by the guardians, it too often creates an ill-feeling between the pauper and the Doctor, and destroys that kindness of sentiment and confidence which should exist between them, and which is so essential for the speedy curative of disease; and so the ratepayers suffer."

Dr. Griffin enters into a number of statistics to show the inequality of payment under the present system, and enumerates the various evils to which it gives rise. He says—

"The only plan to rectify these evils is a per case system of payment, and it alone can act honestly to the ratepayer, the poor, and the Medical officer. To the ratepayer, because the guardians will go into the merits of each case, and allow none to have relief who are not entitled to it; to the Medical officer, because he will know he cannot be imposed upon by the guardians; to the poor, because there will be fewer of them, and they will get better attention, while many eventually will carry out the original ideas of the poor-law, and take their order as a loan, to repay it."

It was evident that the letter of Dr. Griffin made a deep impression on the guardians, who accepted his resignation by a small majority. Upon the suggestion of the Deputy President, it was agreed to write to and thank Dr. Griffin for his letter. It should be mentioned, in justice to Dr. Hearne, that Dr. Griffin's letter was written *à propos* to a suggestion by Dr. Hearne to pay the Medical officers of the union by the case.

MEDICAL EXAMINATION OF WOMEN.

MEDICAL Practitioners are occasionally placed in circumstances of great difficulty and danger. They are compelled by law to give evidence on cases involving civil and criminal penalties, and their opinion is frequently of the utmost importance in deciding the fate of a prisoner. If they refuse to act upon the authority of a warrant or summons, issued by a person competent to issue it, they are liable to be fined or imprisoned. It is of the utmost moment, then, that they should be acquainted with the law on the subject of examinations, particularly of women. A Practitioner was proceeded against some two years ago for damages for examining a woman whom it was supposed had given birth to a child. The Surgeon acted upon the simple authority of a police inspector. A verdict was given against him for £200. Now, we cannot complain of this, except on the ground that the Surgeon was unacquainted with the law on the subject, and believed he was merely doing his duty and infringing no law by so doing. Has anyone the power to order an examination of a woman suspected of giving birth to a child, and of concealing the fact—the child being found dead? It appears from Taylor's "Jurisprudence" that a coroner under such circumstances has the power of issuing an order for that purpose, as has also "a person duly qualified to do so." But we presume that the grounds of suspicion must be of a very positive character indeed. There is, we believe, no law to warrant the proceedings lately instituted by a coroner at Kingsland, Hereford. The body of a newly-born child was discovered, the crime of infanticide having been committed most probably by the mother. The coroner held an inquest, and on his own authority ordered a Medical examination of all the women who lived in the house where the crime presumably occurred. All were to be examined, though the state of one only could give ground of suspicion. This case has naturally attracted considerable attention, and, as involving the interests of the Profession, is worthy of especial mention here. The question is, Who is the responsible party in such a case? Is it the coroner who issues an order he is not entitled by law to do, or the Medical Practitioner, who in the performance of his duty acts upon the illegal order? This is a nice question, but one of

grave import to those members of our Profession who are called upon to act under such circumstances.

A NEW HOMŒOPATHIC PROFESSION OF FAITH.

THE *Monthly Homœopathic Review* for August contains a note on its distinctive position as a homœopathic journal, from which we extract the following:—"We believe an important truth to be contained in the system of therapeutics inaugurated by Hahnemann. We regard *specific* medication, wherever it can be had, as a long way the best mode of treating disease; and we believe that the principle '*similia similibus*' is the best guide to the discovery of the specific remedy in each case." This is something new with a vengeance! Homœopathy is no longer the curing of like by like, but the employment of specifics wherever attainable. Now, by a specific we simply mean a remedy which in the majority of instances cures a disease, but of whose principle of action we can give no clear or definite account. But surely this is not homœopathy. If, when we give a dose of colchicum to a gouty subject, a full dose of quinine to an aguish man, thirty grains of iodide of potassium for tertiary syphilis, five minims of liquor arsenicalis for ordinary psoriasis, etc., we are practising homœopathy, it is something new to us, even although we are employing specific medication. From the above passage it is plain that its author places *specific treatment* above the boasted law of similars, which has hitherto been considered the keystone of homœopathic practice, relegating it to the position of a means of finding out drugs possessed of certain specific effects, which may be employed in the treatment of disease. Further on it is said—"We would gladly advocate and practise this creed of ours, undistinguished otherwise among our fellows, but by some strange disorder of vision its maintenance has come to be regarded as a professional crime. To avow adherence to it means to be, so far as established institutions are concerned—ostracised, excluded, silenced. We are forbidden to advocate it in society or journal; to put it in practice at Hospital or Dispensary"—and so on. But surely all this cannot apply to *specific* treatment merely. If so, we must all be in the same boat—which, we trust, we are not. No, it is not specific treatment we reject, it is the monstrous fiction of homœopathy as ordinarily practised; it is the law of similars we deny—the dishonest trifling with inert substances in the 200th or even the 800th dilution (this being a subdivision hardly conceivable, and with regard to which the old joke of a drop in the Thames at Richmond, and a bucket at London-bridge, is a joke no longer). The means to be employed for finding out the physiological action of a drug are plain and simple enough; but we do not accept, and we trust never will accept, the whims and fancies of a hypochondriac as a proof of the action of any drug. The fallacies of a *post hoc ergo propter hoc* logic are too well known to be discussed.

MORTALITY OF PARIS.

It is stated that during last week there were 823 deaths in Paris—seventy-nine from diarrhœa, sixteen from cholera, and six from cholera. Dr. Decaisne, however, in the *France* questions the accuracy of this return. He inquires what the official bulletin means by cholera and diarrhœa. "What can this diarrhœa be that kills seventy-nine persons in six days?" He abjures, as idle, a discussion as to a difference between cholera "nostras" and Asiatic cholera, and is curious to know what is the difference between the fatal recorded cases and the Indian epidemic. He maintains that the cholera may quickly run into cholera, and dwells with much emphasis on the importance of checking at once all the premonitory symptoms of the disease.

WOMEN DOCTORS IN RUSSIA.

IN Russia the "rights of women," so far as the Profession of Medicine is concerned, are fully recognised. The Medical

Faculty of Moscow have decided that it would be of special utility to women to be allowed the privilege of acquiring a thorough Medical knowledge at higher Medical schools, and of afterwards practising without let or hindrance, and that the female sex ought to be authorised to take part, together with the male students, in the classes and lectures of the Medical Faculties, and in the Medical-Chirurgical Academy. It is considered, however, advisable that before entering upon their university career the knowledge to be acquired should be identical with that possessed by the male students. Steps have been taken to carry out the plan. Who shall say, after this, that Russia is behindhand in civilisation and progress?

FROM ABROAD.—DRAINAGE IN GUNSHOT WOUNDS—ALCOHOL AS A CAUSE OF INSANITY IN FRANCE—THE OÏDIUM IN MILITARY BREAD.

DR. CHRISTOT has recently published, in the *Lyon Médical*, a series of interesting papers on "Drainage in Gunshot Wounds," in which he illustrates by many detailed cases the great utility of this means under very unpromising circumstances. His general conclusions are—1. Drainage constitutes a valuable Surgical procedure for warding off the accidents which ensue in gunshot wounds of the soft parts. It furnishes favourable results in those muscular and aponeurotic seton-wounds which are too often complicated by diffuse inflammation and extensive suppuration. By reason of the facilities which it affords for the discharge of pus and all kinds of septic liquids, it constitutes an excellent means of arresting traumatic fever, and of preventing or causing the disappearance of the accidents of septicæmia. Its application seems to be especially necessary in those cases in which the inflammatory action has been induced by the prolonged presence of foreign bodies amidst the tissues, such as projectiles, shreds of clothing, splinters, etc. 2. By the rapid limitation of the extent of the inflammation which drainage puts into force, it acts efficaciously in cases of diffuse suppurative peri-arthritis by protecting the endangered joint. In such cases it should be resorted to as speedily as possible. This, indeed, is one of the most important cases in which it can be employed. 3. In those cases in which gunshot wounds extend more deeply, and in which the bones or joints are implicated, drainage should be employed with more reserve. It would seem to be insufficient to meet the formidable accidents of traumatic arthritis, and it is scarcely more efficacious in the cases in which the diaphyses of the bones are concerned. It is, perhaps, more hurtful than useful wherever the injury implicates a medullary cavity of the first rank (as in the diaphyses of the femur, humerus, and tibia), for the elastic tube which is so well borne by the soft parts becomes an agent of irritation all the more dangerous, as in the osseous system the phenomena of inflammation or absorption present special conditions which only explain too well the serious general complications that result. Drainage resumes all its efficacy in injuries of the skeleton of the extremities (as in the hands and feet, wrist and instep), whatever may be their extent or multiplicity.

The question of the ill-influence of alcoholic drinks is now a principal one among those occupying public attention in France, all kinds of evils, whether political, military, or social, having been explained of late by their abuse. M. Théophile Roussel, who is member alike of the Academy of Medicine and of the Chamber of Deputies, recently read a long communication before the former body, which, it would almost seem, he must have mistaken for the latter, as it related chiefly to the legislative measures necessary to arrest the course of drinking habits. In all this there is doubtless much exaggeration, for no one can believe the evil of drinking can as yet have exerted the immense influence attributed to it. One of the latest papers on the subject is that of M. Lunier, read at the Academy on the 22nd inst., in which he considers the part

which alcoholic drinks have played in the increase of the number of cases of insanity. From the facts which he enumerates, he concludes:—1. In the North-east of France, the departments which do not cultivate the vine are those which have been first invaded by the alcohols derived from beetroot and grain. There the consumption of wine has remained almost stationary, and that of cider is on the decrease, while the consumption of alcohol has doubled or tripled within the last twenty years. 2. The departments of the same region which do cultivate the vine have resorted to alcohols derived from other sources only at a later period, but even in these the consumption has almost everywhere doubled. 3. In this region insanity arising from drinking has considerably increased in frequency, having attained in some parts the proportion of 41 per cent. among the men and 21 per cent. among the women. But while in those departments in which the vine is not grown the increase has occurred chiefly among females, in the others it has scarcely been sensible among them. 4. In the Department of the Orne, which does not produce wine, but where beetroot alcohol is distilled, almost as much spirit as wine is consumed, and almost as much was consumed twenty years since as now. Consequently, the proportion of cases of insanity from drink has for a long time been considerable (13 per cent.), and has not much increased during fifteen years, what increase there has been having taken place exclusively among women. 5. In the East, where more wine is grown than is consumed, and where some years since no brandy was known except that made from the grape in the country itself, the results, in relation to insanity, were nothing alarming; but since the alcohols of the North have penetrated there, the insanity due to drinking has increased in a very strong proportion. 6. In fine, alcoholism plays a very preponderant part in the increase of the number of cases of insanity, and constitutes in this relation, as in so many others, a serious danger for society, and especially in the Northern and North-eastern departments.

M. Poggiale, at the same meeting of the Academy, brought under its notice a curious appearance observed in the bread used for the military (*pain de munition*). The bread affected on examination was found to be extensively damaged by a yellowish-white substance, changing gradually to an orange-red colour, and emitting a nauseous odour. Considerable agglomerations of this substance are formed so as successively to fill all the cavities of the loaf. Examined under the microscope the appearance was found to be due to the presence of the cryptogamic vegetation termed by M. Leveillé *oïdium aurantiacum*, and which had already been observed in bread at Paris in the summer of 1843, and at a later period at Marseilles and in Algeria. The spores of the *oïdium* were found to be adherent to the cortical portion of the corn, and they are probably abundant in proportion as this is in a humid state, badly cleansed, and has undergone alteration from the larvæ of the weevil. It is not found in bread of the best quality which has been carefully prepared. M. Poggiale believes that the high temperature which prevailed during the first fortnight in August has much favoured the development of the *oïdium*. Although no ill-effect has been traced to the employment of bread so affected, he recommends that its use should be interdicted. For its prevention better flour must be employed in the preparation of the bread, while the quantity of water introduced into this should be reduced, and it should be more carefully baked and cooled than is at present the case.

THE DEATH OF RENFORTH.—A suspicion has been raised that the death of the stroke-car in the recent international race was caused by foul play. It is said that the contents of the stomach are to be analysed. The ostensible cause of his death was, it is said, congestion of the lungs.

REPORT OF THE POOR-LAW BOARD.—III.

(Continued from page 261.)

WITH the establishment of dispensaries, says the Report, considerable progress has been made during the past year in the metropolis, fifty-eight dispensaries being either ready, in course of construction, or in contemplation. The Fulham and Lewisham Unions are found to be too thinly populated for the dispensary system, and therefore Medical relief continues to be administered as heretofore; whilst, for a like reason, there has been no change in parts of the parish of Camberwell and of the Wandsworth and Clapham Union. With these exceptions, the system will, before long, be of general adoption throughout the metropolis. Great judgment is, of course, needed in deciding where dispensaries shall be established, how many are needed, and to what number of Medical districts each should be attached. With reference to these heads we quote from the Report—"It will be observed that a dispensary is not merely a place where medicine is given out to the poor, but is the meeting-place of Doctor and patient, at least in the case of those of the sick who are able to leave their homes. If the dispensary is too far from the home of the Medical officer, or from that of the patient, considerable inconvenience may be occasioned to both. At present the dispensaries which have been sanctioned in the metropolis are, with trifling exceptions, within a mile of the homes of the patients, who are supplied with medicines from them, and in the large majority of cases the distance is very much less. While, however, it is important that the area supplied by the dispensary shall not be too large, it is equally necessary that it shall entail a sufficient amount of work to keep the time of a dispenser well occupied. This usually involves the connexion of two, three, or in some cases of even a larger number of Medical districts with the same dispensary."

It is satisfactory to be assured, though hard to reconcile with what we have heard from time to time elsewhere, that "the co-operation of the guardians in the formation of these dispensaries has been in nearly all cases readily obtained, as soon as the objects to be attained by them had been placed clearly before them. The delay which in many cases has taken place in their establishment is due to the difficulties which have so frequently occurred in meeting with suitable sites, and the difficulty has been the greater that the guardians have been in many instances anxious, and not without sufficient grounds, to combine within the same precincts a dispensary and a relief station." To such an arrangement there would appear to be no very obvious objection, provided that it were not, indirectly, the cause of delay in opening the dispensaries. That this has, however, been the result, in some instances, appears to be indicated by the wording of the Report.

Reference is made to the order issued by the Poor-law Board to carry out the dispensary system in those places where it has been adopted. We gave the principal heads of the order at the time of its issue, but we ventured no opinion as to its capabilities for practical use. We now believe that before long it will be found requisite to modify or rescind some portions of it to meet the suggestions which could only result from experience, and which, consequently, the framers of the order could by no means foresee. There is, however, one modification which Medical officers might quite safely get their guardians to adopt without waiting for the issue of any fresh rule. Instead of adhering to the dimensions of the prescription-paper as given in the schedule to the order, there can be no objection to its being so printed as to allow a larger space for entering the prescriptions.

We were aware that, apart from the metropolis, the dispensary system had made but little way, but how little we did not before realise. The Board state—

"We have made inquiries through our inspectors as to the existence of dispensaries under the management of boards of guardians in their districts, exclusive of the metropolis, and we find that the system of providing dispensaries has only been established in about nine unions, in some of which it is merely for the supply of medicines for the workhouse. Where, however, it has been tried it is reported to be working satisfactorily."

This allusion to the question does not seem to foreshadow any very immediate intention of extending the system to the provinces.

With the paragraph above quoted our information on outdoor Medical relief in extra-metropolitan unions and parishes

begins and ends, so far as the Report proper is concerned; but in the Appendix are reports from three Poor-law inspectors on the subject. Of these inspectors, one at least—Mr. R. B. Cane—is certainly somewhat hard upon the Medical officers, and adopts, in parts of his report, a tone which leads to the inference that in the portion of the country under his inspection the Medical men are not up to the general standard. Whether this be so, or whether he views the class with eyes not altogether unprejudiced, we cannot judge, as he gives no list of the places under his care, nor names of officers, as do his colleagues Mr. W. A. Peel and Mr. Farnall. Mr. Cane says—

"One of the most constant representations made to an inspector when attending meetings of boards of guardians relates to what is generally termed the 'Doctors' orders,' meaning the orders given by District Medical Officers for the supply of meat, wine, spirits, beer, and other necessaries for the sick poor under their care.

"The extent and nature of these orders vary in kind and degree not only in different unions but in different districts of the same union, and my attention has not only been drawn to great differences in degree, but in some few instances to the fact that in one district the most liberal if not profuse quantities of stimulants have been ordered, whilst in a neighbouring district, the Medical officer, being, as it was said, a supporter of 'temperance principles,' systematically abstained from ordering stimulants of any kind, even although the patients were afflicted by the same disorders as those for whom such stimulants were so plentifully supplied in the district adjacent to his own.

"These diversities of practice are not confined to the outdoor poor, but, in one instance, certainly, I have found a workhouse wholly unprovided either with wine, spirits, or beer, and I was compelled seriously to remonstrate and point to a case in which life would have been sacrificed unless private resources had supplied what the Medical officer had not required, before even the smallest stock of essentials was provided for occasional use under the most urgent circumstances.

"These contrarieties cannot fail to make a strong impression on the minds, and seriously to embarrass the guardians; and it is in vain that the inspector returns to their inquiries the only general answer in his power—namely, that the so-called 'orders' convey no legal obligation such as either the guardians themselves or their officers are bound to obey; that they are, in fact, no more than representations of what the Medical officer thinks necessary for the health or recovery of his patient, whilst the guardians, being the sole judges of 'means' and of 'destitution,' have to decide whether the patient is able himself to obtain what is Medically thought necessary without help from the poor-rates. The guardians naturally decline to accept the responsibility of withholding what is represented as being essential to life, strength, or recovery from disease, simply because of the cost which the order entails, although in many instances they are fully satisfied that the poorer ratepayers cannot at all times afford themselves what the pauper patient obtains, and although they often feel convinced that Medical aid is sought chiefly in the hope that it will lead to a supply of mutton, beef, and beer. Nor are these suspicions merely. Often it has come under my notice that the Medical officer reports that he has seen the patient, but it was not *medicine* he required, but 'support,' or 'better' or 'larger quantities of food.' Thus, numbers of cases are entered in the Medical officers' reports as suffering from 'debility,' and requiring food alone. Such entries afford guardians who are disposed to avail themselves of their full opportunity for giving relief in aid of wages, since sickness affecting any member of the family brings it within the exceptions to the prohibitory order. On the other hand, those boards of guardians who wish to administer the law on sound and economical principles, find themselves not only embarrassed but absolutely foiled in their endeavours to control relief, and much power and no inconsiderable portion of expenditure virtually passes from their hands into those of the Medical officer, who has no responsibility for money outlay, and whose direct interest it is that the sustenance required shall be supplied from the butcher, the grocer, or the public-house rather than be derived from the Medical effect of the drugs contained in his own dispensary."

The italics in this last paragraph are our own. They contain, in distinct terms, a charge which has been often insinuated—one, however, which on behalf of Medical officers we have always repudiated, and, as we believe, with the entire concurrence of persons, not Medical men, able to form, from local observation, a more reliable opinion than can be arrived at by a non-Professional inspector in a flying visit.

Pursuing the same subject, Mr. Cane adds—

"Another evil, too often apparent, arises from the circumstance that the necessaries, of whatever kind they be, can only be procured by sending long distances for them. Hence a whole week's supply is ordered and procured at one time, and the meat and other articles too frequently form one meal only for the entire family, instead of being consumed at intervals and solely by the sick person for whose exclusive use and benefit they were intended." This evil cannot, surely, be laid at the door of the Medical officer!

"These are the chief evils connected with 'Doctors' orders.' These orders in effect transfer a large portion of out-door relief from responsible to irresponsible hands; they effect a minimum benefit at a maximum expenditure, afford constant opportunities for evading regulations directed against the grossest form of relief in aid of wages, and hold out strong and direct temptation to corrupt practices for private advantage.

"Some attempts have been made to correct these evils, but hitherto with only very partial and limited effect. In some unions, consisting of the parishes composing a populous town, and in some large towns, the guardians have provided a dispensary, a dispenser, and all the necessary medicines and appliances. In many unions bread is baked at the workhouse, and is supplied to the out-door poor.

"In some it is distributed by the relieving officers, who are provided with the means for doing so. In one or two unions and large towns in this district provisions and 'groceries' are contracted for by the guardians, who cause them to be given out on the production of tickets as 'relief in kind,' and in these latter instances the plan is said to be attended with the most satisfactory results.

"But these attempts are few in number, and none of them have, I believe, been so arranged as to combine a dispensary with relief stores, as probably they might with greater advantages still. All that has hitherto been done in my district has arisen from voluntary action on the part of the local authorities."

Mr. Cane adds, referring to the establishment of dispensaries in the provinces—"But little direct official support and encouragement has been afforded, and no action taken, to extend these arrangements to all large towns, where at least they would be comparatively easy of adoption."

Mr. W. A. Peel, whose experience is taken from the unions of Biggleswade, Woburn, Wisbech, St. Albans, Hertford, Hitchin, Huntingdon, Hendon, Brackley, Brixworth, and Oundle, gives more statistics and less of his own views. He finds that in the above eleven unions 6.3 per cent. of the population are paupers, and that, in the sample week which he took, 37.4 per cent. of the 1341 patients under out-door Medical treatment received meat and stimulants on the recommendation of the Medical officers. He is satisfied that, if the returns had been taken for a whole year, no great diversity of practice would have been found in the several districts, a conclusion differing from that of Mr. Cane. On another important point Mr. Peel's opinion is satisfactory. He says—"The guardians are of course able to provide better meat and wine than the poor can purchase for themselves, and in all the cases I have listened to during the last few weeks there has not been one where, in the opinion of the guardians or in my own, medicine would have been a proper substitute."

On the whole, this Inspector seems to have formed a reasonably favourable opinion of Medical officers. He considers that, "in face of some defects which undoubtedly exist in the administration of Medical out-relief, it must be admitted that the present system offers greater advantages to the paupers than the poorer class of ratepayers, when sick, can command. The Medical officer must be duly qualified to practise; it is alike his duty and his interest to cure his patients as quickly as possible, and he is subject to a surveillance from which the private Practitioner is altogether exempt. It is rare that any case of alleged neglect or improper treatment escapes the notice of the relieving officer or the guardians, and if the case be proved against the Medical officer he is either reprimanded or removed."

We must reserve for the present the consideration of Mr. Farnall's report on the same subject.

(To be continued.)

THE CHOLERA PRIZE ESSAY.—A prize of £4000 is yet to be awarded by the Academy of Sciences to the discoverer of an efficient remedy for cholera. More than 150 papers have been sent in on the subject during the last fortnight.

OF THAT DESCRIPTION OF INSANITY WHICH WILL EXCUSE THE COMMISSION OF CRIME.

(From a Legal Correspondent.)

MORAL insanity is not admitted as a bar to responsibility in criminal cases, except so far as it is accompanied by intellectual disturbance; and even intellectual disturbance, if limited to insane delusions, will not relieve from criminal responsibility if the accused, though acting under the influence of the insane delusion, but not in other respects insane, and the act with which he is charged being contrary to the law of the land, had a sufficient degree of reason to know that he was doing an act that was wrong and contrary to law. The accused in that case is assumed to know that the act was contrary to the law of the land, as the law is administered upon the principle that every man must be taken conclusively to know it, without proof that he does know it; but if the accused was labouring under such a defect of reason from disease of the mind as not to know the nature and quality of the act he was doing, or if he did know it, that he did not know he was doing wrong, that is such a degree and quality of insanity as alone will relieve a person from criminal responsibility.

Such are the propositions contained in the answers of the judges to questions propounded to them by the House of Lords in the McNaughten case. The late Mr. Justice Maull took a somewhat different view from the rest of the judges in that case. To use his own words—"To render a person irresponsible for crime on account of unsoundness of mind, the unsoundness should, according to the law as it has long been understood and held, be such as to render him incapable of knowing right from wrong. . . . If the state described be one which involves, or is necessarily connected with, such unsoundness, this is not a matter of law, but of physiology, and not of that obvious and familiar kind to be inferred without proof." It will be observed that this reply greatly modifies the broad propositions propounded, one of which was, "if the accused at the time of the commission of the alleged crime knew he was acting contrary to law." That is something very different from (as Mr. Justice Maull puts it) "knowing right from wrong." The terms used in the question put by the House of Lords "cannot be said," he observes, "to be equivalent to a description of this kind of unsoundness of mind." But yet he cautiously remarks—"There is no law that I am aware of that makes persons in the state described in the question not responsible for their criminal acts." Now, the question was, "What is the law respecting alleged crimes committed by persons affected with insane delusions in respect of one or more particular subjects or persons—as, for instance, where, at the time of the commission of the alleged crime, the accused knew he was acting contrary to law, but did the act complained of with the view, under the influence of insane delusion, of redressing or revenging some supposed grievance or injury, or of producing some supposed public benefit?" It will be observed the question does not deal with the case of supposed moral right or wrong, but merely with a knowledge of the law—i.e., the law of the land—which a person may be acquainted with, and yet think that he is doing right in disregarding it, and that the law of the land is inconsistent with the moral law. It is obvious that, as a rule, a person, though labouring under an insane delusion, would not be permitted to set up a moral standard of his own, and the abstract question of right or wrong must be determined by some acknowledged test. As Chief Justice Tindal, delivering the opinion of all the judges (Mr. Justice Maull excepting), observed—"To establish a defence on the ground of insanity, it must be clearly proved that at the time of the committing of the act the party accused was labouring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing, or, if he did know it, that he did not know he was doing what was wrong. The mode of putting the latter part of the question to the jury on these occasions has generally been, whether the accused at the time of doing the act knew the difference between right and wrong; which mode is not, as we conceive, so accurate when put generally and in the abstract, as when put with reference to the party's knowledge of right and wrong in respect to the very act with which he is charged." His Lordship then goes on to observe—"If the accused was conscious that the act was one which he ought not to do, and if that act was at the same time contrary to the law of the land, he is punishable; and the usual course has been to leave the question to the jury, whether the party accused had a sufficient degree of reason to

know that he was doing an act that was wrong; and this course, we think, is correct.

In answer to the question, "If a person under an insane delusion as to existing facts commits an offence in consequence thereof, is he thereby excused?" the reply was, "If, under the influence of his delusion, he supposes another man to be in the act of attempting to take away his life, and he kills that man, as he supposes, in self-defence, he would be exempt from punishment. If his delusion was that the deceased had inflicted a serious injury on his character and fortune, and he killed him in revenge for such supposed injury, he would be liable to punishment." Here, then, is the *animus* exhibited—the indulgence in malice aforethought. The reason is not so totally obscured as to have obliterated all consciousness of right or wrong, and it is in the intention that the crime consists. For instance, in the case of inebriety, or that partial or temporary mania caused by drink, although drunkenness is no excuse for crime, it is always taken into account in judging of the intent with which an act is done (per Holroyd J., *Rex v. Grindley*, 1 Russ. and Greaves, 8). And where a prisoner was tried for attempting to commit suicide, and it appeared that, at the time of the alleged offence, she was so drunk that she did not know what she was doing, Chief Justice Jervis held that negated the attempt to commit suicide (*Reg. v. Moore*, 3 Car. and Kirwan, 319).

There is, however, a case mentioned in "Paris and Fonblanque" of a prisoner who, after a paroxysm of drunkenness, rose in the middle of the night, and cut the throats of his father and mother, ravished the maidservant in her sleep, and afterwards murdered her, who, notwithstanding the fact of his drunkenness, was executed for these offences (Paris and Fonb. "Med. Juris.," 140 n.).

Wherever the intent is the essence of the crime, as in a charge of cutting and wounding with *intent* to do grievous bodily harm, the drunkenness of the accused is always taken into account in judging of such intent. And if by the long practice of intoxication an habitual or fixed insanity is caused, although this madness was contracted voluntarily, yet the party is in the same situation with regard to crimes as if it had been contracted involuntarily at first, and is not punishable (1 Hale, "Pleas of Crown," 32).

Whether the judges have trespassed beyond the confines of mere law, and have usurped the province of physiologists in the McNaughten case, is not within the province of the present inquiry.

The law remains as laid down on that occasion, and with the law alone the writer of this paper has to do. Further scientific investigation may possibly lead to a modification, in the cause of humanity and justice; but a complete agreement among Medical men of eminence would alone justify the relaxation of rules which the security of society and the repression of evil habits and bad passions require as safeguards, in the absence of a total deprivation of reason through mental alienation. W.

THE EFFECTS OF COMPRESSED AIR ON THE HUMAN BODY.

IN the construction of the great bridge across the Mississippi at St. Louis, (a) it has been found necessary to employ workmen in excavating the rock, at a depth of more than ninety feet

(a) The novel method of constructing this bridge renders it especially worthy of notice. The piers, which are 515 feet apart, and 497 feet each from the nearest abutment, are sunk in the following manner:—The masonry is commenced at the surface of the water, upon an inverted elliptical-shaped caisson, eighty feet long by forty wide—the dimensions of the pier. This caisson is virtually a large diving-bell, closed at the top, open at the bottom, and filled with air. The mass of masonry, which constantly accumulates upon it, is borne up by the confined air, and as the caisson descends the pressure of the water condenses the air, so that the water rises considerably within it, just as when an inverted tumbler is pressed down into a vessel of water. To give greater buoyancy to the mass, air is forced into the caisson through a vertical passage in the masonry, by a powerful steam pump, and it is thus sunk to the river bed. When this is accomplished, the sand within it has to be removed by a current of water, that is forced down through a tube till it finally reaches the surface of the rock. After this surface has been levelled, the caisson and the passages in the pier are filled with concrete, and the whole pier, thus solidified, rests on a sure foundation. During the recent construction of a bridge on similar principles at New York, one of the caissons exploded with appalling violence. Fortunately, there was no one inside, but men on the outside were knocked down by the current of air, while a dense column of water, fog, mud, and stones was thrown up 500 feet into the air, accompanied by a terrific roar. This column was seen a mile off, and the noise was so frightful as to alarm all the neighbourhood.

below the surface of the water. The effects of the highly compressed air on the constitution seem to vary considerably, the great majority of the men (352 in number) being little affected, while there were no less than twelve deaths. For the following details we are indebted to the report of the chief engineer, Captain James B. Eads. As it is intended for general perusal, he enters into a few popular anatomical details, which we are sure our readers will excuse, in consideration of the clearness of the description:—

The first symptom manifesting itself, caused by the pressure of the air, is painfulness in one or both ears. The Eustachian tubes, extending from the back of the mouth to the bony cavities over which the drums of the ears are distended, are so minute as not to allow the compressed air to pass rapidly through them to these cavities, and when the pressure is increased rapidly the external pressure on the drums causes pain. These tubes constitute a provision of nature to relieve the ears of such barometric changes as occur in the atmosphere in which we live. The act of swallowing facilitates the passage of the air through them, and thus equalises the pressure on both sides of the drums, and prevents the pain.

The pressure may be admitted into the air-lock so rapidly that this natural remedy will not in all cases relieve it. By closing the nostrils between the thumb and fingers, shutting the lips tightly, and inflating the cheeks, the Eustachian tubes are opened, and the pressure on the inner and outer surfaces of the tympanum is equalised, and the pain prevented. This method must be used and repeated from time to time, as the pressure is let on, if it be increased rapidly. No inconvenience is felt by the reaction when the pressure is let off, as the compressed air within the drums has a tendency to open the tubes, and thus facilitates its escape through them, whereas increasing the pressure has the effect of collapsing them, and therefore makes it more difficult to admit the compressed air within the cavities of the ears. It frequently occurs, however, from some abnormal condition of these tubes, as when inflamed by a cold in the head, that neither of these remedies will relieve the pain. To continue the admission of compressed air into the lock under such circumstances would intensify the suffering, and possibly rupture the tympanum; therefore the lock tenders were particularly instructed to shut off the compressed air at the moment anyone in the lock experienced pain about the ears; and then, if it could not be relieved by the above means, the lock was opened, and the person was not permitted to go through into the air-chamber. Sometimes fifteen minutes were occupied in passing persons through the first time, after which they usually had no further trouble from this cause.

The fact that the depth penetrated by the air-chamber was considerably greater than that hitherto reached in any similar work, left Captain Eads without any benefit from the experience of others in either guarding against any injurious effects of this great pressure upon the workmen and engineers subjected to it, or of availing himself of any known specific for relieving those affected by it.

When the depth of sixty feet had been attained, some few of the workmen were affected by a muscular paralysis of the lower limbs. This was rarely accompanied with pain, and usually passed off in the course of a day or two. As the penetration of the pier progressed, the paralysis became more difficult to subdue. In some cases the arms were involved, and in a few cases the sphincter muscles and bowels. (b) The patients also suffered much pain in the joints when the symptoms were severe. An average of at least nine out of ten of those affected suffered no pain whatever, but soon recovered, and generally returned to the work.

The duration of the watches in the air-chamber was gradually shortened from four hours to three, and then two, and finally to one hour. The use of galvanic bands or armour seemed, in the opinion of the Superintendent of Construction, the foreman of the chamber, and the men, to give remarkable immunity from these attacks. They were all ultimately provided with them. These bands were made of alternate scales of zinc and silver, and were worn around the wrists; arms, ankles, and waist, and also under the soles of the feet. Sufficient moisture and acidity were supplied by the perspiration to establish galvanic action in the armour, and as the opinion of those most accustomed to the chamber was almost unanimous in favour of this remedy, Captain Eads is very much inclined to believe it valuable.

(b) It must be recollected that this description of the symptoms is written by a civil engineer, and not a Physician.

Immediately on the manifestation of greater severity in the symptoms, a Hospital boat was fitted up at the pier, and one of the ablest Physicians in the city (Dr. A. Jaminet) was engaged to attend those affected, and also to institute such sanitary measures as his judgment should dictate. A careful examination of the health and bodily condition of every workman was daily made, and none were permitted to engage in the work without the approval of Dr. Jaminet. Those most severely affected were sent to the City Hospital, and had the benefit of the advice and treatment of its Resident Physician, Professor E. A. Clark.

The total number of men employed in the air-chamber of this pier was 352. Of this number, about thirty were seriously affected. Notwithstanding the care and skill with which those most severely attacked were treated, twelve of the cases proved fatal. Each one of these, without exception, was made the subject of careful inquest by the coroner, aided by an autopsy conducted usually by some of our most skilful Surgeons and Physicians.

Whilst the exciting cause in all of these cases was doubtless the exposure of the system to the pressure of the condensed air of the chamber, the habits and condition of several of those who died were, at the time they went to work, such as would have excluded them from it if subjected to the examination of Dr. Jaminet, and the verdict in about one-half of the cases gave a totally different cause for the death of the patient. Nearly or quite all of these deaths happened to men unaccustomed to the work; several of them to men who had worked but one watch of two hours. In contrast to this is the fact that a very large number of the men (certainly one-half of those constantly employed) commenced with the work at its inception, and remained throughout its continuance entirely without injury or inconvenience.

The gentlemen composing the engineer corps of the bridge all visited the air-chamber, some of them very often, either in the discharge of their professional duties or from motives of curiosity, and none of them suffered any injury whatever. Much diversity of opinion was expressed by the Medical gentlemen who investigated the symptoms and held autopsies of the deceased. Some of these gentlemen maintained that a slower transition from the abnormal to the natural pressure would have been less injurious; others claimed, on the contrary, that it was from the too rapid application of pressure in passing from the natural into the compressed air. The fact that the air-lock tenders were in no case affected, although subjected many times during a watch of two hours in the air-lock to rapidly alternating conditions of the atmosphere—at one moment in its normal state in the lock, and five minutes later exerting a pressure of fifty pounds per square inch upon every part of the body—would seem to prove both of these theories unsound, and lead us to believe that in the length of time to which the human system is subjected to this extraordinary pressure exists the real source of danger, and not from any rapid alternations of pressure to which it is exposed.

After the caisson reached the rock, Captain Eads has frequently, when passing through the air-lock, admitted the compressed air into it so quickly that none but those well accustomed to it could relieve the pressure upon their ears, and yet he felt no ill-effects whatever from this rapidly increased pressure; and in going out he has let the pressure off so fast that the temperature in the lock has fallen 32° Fahr. in consequence. These transitions occupied but three or four minutes.

Considering that the air-chamber was briefly visited by thousands of persons, including many delicate ladies, even after it had reached the bed-rock, some remaining as long as an hour in it without any of them experiencing the slightest ill-effects from the pressure, and that no cases of any importance whatever occurred among the workmen after the watches were reduced to one hour, Captain Eads feels satisfied that this is the true cause of the paralysis, and that, by lessening still more the duration of the watches, a depth considerably greater can be reached without injury to the workmen. Too long a continuance in the air-chamber was almost invariably followed by symptoms of exhaustion and paralysis. Dr. Jaminet, on one occasion, remained in the chamber two hours and three-quarters when the depth was over ninety feet, and was dangerously attacked soon after reaching home.

NEW WORKSHOPS ACT.—Under the new Workshops Regulation Act, all complaints are now to be addressed to the Factory Inspector of the district, and not to the Officer of Health, as heretofore.

HOSPITAL ACCOMMODATION.

THE following Memorandum on Hospital Accommodation to be given by local authorities has been issued by the Medical Department of the Privy Council:—

A large part of the mortality of England is caused by diseases which spread readily by infection from person to person; such as scarlatina, typhus, small-pox. In order to prevent the extension of such diseases in neighbourhoods where they have begun, it is of the utmost importance that (in addition to whatever other sanitary precautions may be requisite) every endeavour should be made to separate the sick from the healthy. This object is comparatively easy when means to attain it are taken early, while cases of the disease are very few; but any interval of delay allows the cases of sickness to multiply, and perhaps at last to become so numerous that endeavours to isolate them cannot succeed.

These considerations are, most of all, important in regard of the poorer parts of the population, because their usually crowded and ill-ventilated dwellings give extreme facilities for infection. And among these classes the sick, generally speaking, cannot be separated from the healthy, except in proportion as proper Hospital accommodation has been provided for the purpose.

Power is given by the 37th section of the Sanitary Act, 1866, to the Local Board, Improvement Commissioners, or town council, or where there is none of these bodies, to the vestry, to provide "for use of the inhabitant within its district, Hospitals or temporary places for the reception of the sick." When this provision has been made, any justice may order the removal to such place of any person suffering from any dangerous infectious disease, if he is without proper lodging or accommodation, or lodged in a room occupied by more than one family, or is on board any ship or vessel.

The present memorandum is intended for the assistance of health authorities who, having to secure the isolation that is needed for cases of dangerous infectious disease, but not yet having the requisite Hospital accommodation within their districts, would provide such accommodation under the powers of section 37 of the Sanitary Act, 1866, or otherwise.

A condition of the first degree of importance for the usefulness of any such accommodation is that the accommodation shall be ready beforehand. The quantity of accommodation wanted will, of course, be widely different in different cases; and it must be remembered that when two infectious diseases are prevalent in one place at one time, patients having the one infectious disease cannot properly be in the same ward with patients having the other infectious disease. In kind, the accommodation ought in all cases to be as good as the authority can reasonably supply. It is believed, however, that, even under these conditions, the cost of providing Hospital accommodation, whether for villages or for towns, needs not ever be proportionately great.

(a.) As regards villages, each village ought to have the means of accommodating instantly, or at a few hours' notice, say, four cases of infectious disease in at least two separate rooms, without requiring their removal to a distance. A decent four-room or six-room cottage, at the disposal of the authority, would answer the purpose. Or permanent arrangement might be made beforehand with trustworthy cottage holders not having children, to receive and nurse, in case of need, patients requiring such accommodation. Two small adjacent villages (if under the same nuisance authority) might often be regarded as one.

When, in a village, such provision as this has been made by the authority, and cases of disease in excess of the accommodation occur, the sick must not be crowded together, but temporary further provision must be made for them. The most rapid and the cheapest way of obtaining this further accommodation, may often be to hire other neighbouring cottages; or in default of this, tents or huts may be erected upon adjacent ground.

(b.) In towns Hospital accommodation for infectious diseases is wanted more constantly, as well as in larger amount, than in villages; and in towns there is greater probability that room will be wanted at the same time for two or more infectious diseases which ought not to be treated in the same ward. The permanent provision to be made in a town in order to obtain reasonable security against the spread of infectious diseases, should consist of not less than four rooms, in two separated pairs; each pair to receive the sufferers from one infectious disease, the men and women of course separately. The number of permanent beds to be supplied must depend upon various circumstances, chiefly upon the size of the town; but, as no reasonable amount of permanent accommodation could be trusted always to supply the requirements of a place when infectious disease has actually become epidemic, foresight must in the first instance be used, how, in emergency, additional accommodation can be temporarily given, to meet requirements in excess of the permanent provision; otherwise, the authorities may unexpectedly find themselves obliged to leave ill-lodged infectious cases at their homes, much as if no Hospital had been provided. Accordingly, for a town of any importance, the Hospital provision ought to consist of a permanent building, having around it space enough for the erection of temporary structures as occasion may require. Considerations of ultimate economy make it wise to have the permanent building equal to somewhat more than the average necessities of the place, so that recourse to temporary extensions may less often be wanted. In small towns, for instance, if a Hospital consisting of four wards and the necessary administrative offices is to be provided, the original expense of making each ward serve for (say) eight persons, will be far less than double that of making the wards for four. And in any case it is well to make the administrative offices somewhat in excess of the wants of the permanent wards; because thus, at little additional first cost, they will be ready to serve, when occasion comes, for the wants of the temporary extensions, and so to save great inconvenience and outlay.

This memorandum does not propose to deal with the principles on which permanent Hospitals should be built; but, in view of the necessity that they should give the greatest possible assistance for the recovery of the sick, it may be useful to observe that the foremost requisites are the following:—Accessibility of situation, so that the sick may not be exhausted by long journeys, and, as far as consists with accessibility, an open uncrowded neighbourhood; adequate ward-space for each patient, approaching as near as circumstances allow to 2000 cubic feet, with 144 square feet of floor for each bed; thoroughly good provision for ventilation—i.e., for sufficient unceasing entrance of pure air and of exit of ward air, with arrangements also for immediate change of air in the whole ward, when necessary; and with perfect security against the possibility of any

foul air (as from privies and sinks) entering the wards; means of warming the ward in winter to a temperature of 60° Fahrenheit, and of keeping it cool in summer; means for safely disposing of excremental matters and of foul slops, and for cleansing and disinfecting infected linen and bedding; facilities for obtaining, in the use of the Hospital, the very strictest cleanliness of every part.

When the pressure of a particular epidemic requires temporary extension of the accommodation, huts, or, in the summer and autumn, tents, erected on the adjacent ground, will sufficiently answer the purpose; and, if the administrative part of the original building have been thoughtfully devised, these temporary structures may be of very simple construction.

The tents may be either such as the bell tent or Hospital marquee of her Majesty's army, or one of the various forms of tent and marquee used in civil life. Huts may be of wood or iron. Both tents and huts need to be carefully arranged and regulated, especially in the following respects:—

As to Tents.—It is essential to secure the dryness of the ground upon which they are pitched, by trenching around and between them, so as to carry off all rainfall and prevent the lodgment of moisture. The tents should everywhere be distant at least a diameter and a half from each other. The floors should be boarded. The approaches should be paved or otherwise prepared, to prevent them being trodden into mud in wet weather. It is especially requisite that abundant proper means be provided for the reception of refuse matters, and that no casting of slops or other refuse upon the ground in the vicinity of the tents be allowed. In the distribution of patients in active stages of disease, not more than one patient should be assigned to a bell tent of the ordinary regulation size, and not more than three such patients to the regulation Hospital marquee. (a) In other forms of tents the number of patients should be regulated in similar proportions.

As to Huts.—Dryness of site is, as in the case of tents, of the first importance. Each hut should be trenched round. Its floor should be raised a foot or a foot and a half from the earth, so as to permit the free under-passage of air; but care must be taken to prevent the lodgment of moisture or impurities beneath the floor. A distance not less than three times the height of a hut should intervene between any two huts, and each hut should be so placed as not to interfere with free circulation of air round other huts. In huts, as in permanent buildings for the treatment of infectious diseases, not less than 2000 feet cubic space, with 144 square feet of floor, should be given to each patient. The ventilation of huts, also, is of equal importance with that of permanent Hospital buildings. It is best secured by the combination of side-windows with roof-opening, the latter protected from rain, and running the whole length of the ridge of the roof. The windows, capable of being opened top and bottom, should not be fewer than one to each pair of beds, or in large huts one to each bed, nor should be of less size than the sash-window in common use for houses. The ventilating opening beneath the ridge may have flaps, movable from within the tent by ropes and pulleys, so that the opening to windward can be closed, if necessary, in high winds. Double-walled wood huts may have additional ventilation by the admission of air beneath this outer and inner wall, and its passage into the interior of the hut through openings with movable covers at the top of the inner lining. The roof should be covered with waterproof felt; the edges of the felt fastened down by strips of wood, not by nails. The hut should be warmed by open fireplaces, fixed in brick stove-stacks placed in the centre of the floor, the flue being carried through the roof.

The sewerage and scavenging arrangements, both of tents and huts, demand very careful consideration. When the tents or huts are placed within the area of a public system of sewerage and water-supply, no difficulty will arise; for drains may be laid into the public sewer, and water-closets may easily be adopted. But where no system of sewerage exists, the disposal of excremental matters and other refuse will require special provisions. In regard to excrement disposal under such circumstances, the best method to adopt is the dry-earth system, or, failing this, a pail system, with careful arrangements for the disinfection and subsequent disposal of the excrementitious matter (see the Departmental Report, "On Certain Means of Preventing Excrement Nuisances in Towns and Villages"). All slops and other refuse should be deposited in metal pails, and removed from the tents and huts at frequent intervals, and so disposed of as not to become a nuisance. Too much attention cannot be given to the careful scavenging of tents and huts, and to the proper disposal of the refuse from them; and the servant or servants to whom the duty is assigned should be under very vigilant supervision.

If no cottage or other building has been adapted permanently for the administrative purposes, or can be rendered available for them, the kitchen and other necessary offices (larder, washhouse, bedding and fowl linen stores, additional nurses' accommodation, nurses' water-closet or pail-closet, dead-house, etc.) are most readily provided by simply constructed huts or tents, conveniently arranged near the huts or tents which contain the sick.

Medical Department of the Privy Council Office, August, 1871.

REVIEWS.

A Digest of Facts relating to the Treatment and Utilisation of Sewage. By W. H. CORFIELD, M.A., M.B. Oxon, Professor of Hygiene and Public Health at University College, London. Second Edition, corrected and enlarged.

THAT a second edition of Professor Corfield's work on Sewage has been demanded in so short a time proves that the interest of the public in its subject is greater than that excited by most works on sanitary matters. Wealth is of the first consideration in England, health of the second; and as the utilisation of sewage certainly signifies wealth, whilst its treatment has a definite bearing on health, the public in their anxiety for the former probably do not object to obtain with it

(a) *Regulation Bell Tent.*—Diameter, 14 ft.; height, 10 ft.; area of base, 54 square ft.; cubic space, 513 ft. *Regulation Hospital Marquee.*—Length, 29 ft.; width, 14 ft.; side walls, 5 ft. 4 in.; height to ridge, 11 ft. 8 in.; cubic capacity, a little over 3000 ft.

some information on the latter. Dr. Corfield's work is a very elaborate treatise. We can recommend it to our readers as containing a large amount of information and some able reasoning. We cannot, however, attempt an extended review of its contents; but this is less necessary as Dr. Corfield's conclusions have been summed up ready to our hands at the termination of his work. The author lays down the obvious principle "that the method which does, in practice, when it is anything like efficiently carried out, remove at once and completely from the vicinity of habitations the various sorts of refuse in the most expeditious manner, is the one which must be the most conducive to health." From his premises he draws the conclusion that all *dry* methods of treating sewage violate this principle—that they leave the excremental matters in and about the house too long. Even the dry earth system is open to this objection. "Although it has been shown to have a great advantage when it has replaced midden-heaps and cesspools, we maintain, with Dr. Rolleston and with Dr. Parkes, that it has not been shown that the compost is disinfected as well as deodorised." Dr. Corfield urges that the deodorisation alone of a noxious compound only renders it more dangerous. If coal-gas were deodorised, accidents would be more numerous. Carbonic oxide, the most poisonous ingredient of coal-gas, the emanations of typhus fever, are odourless. It is only a presumption that all danger from the noxious emanations of excrementitious matter is removed by mixing it with earth. Then, also, there is the objection that, if the earth were supplied in too small quantity, too moist, or of bad quality, or the air be very damp, or the compost wetted through carelessness or otherwise, danger of infection would at once arise. The author concludes, with Miss Nightingale, that "the true key to sanitary progress in cities is, water-supply and sewerage. No city can be purified sufficiently by mere hand labour in fetching and carrying." The results of the water-carriage system, the author believes, despite of its disadvantages, to be unapproachable by other modes of treatment. He traces it, in conjunction with other sanitary improvements, in certain towns the practical annihilation of cholera, and the extermination of typhoid. "We are sure that it is the speedy removal of the refuse matters that has accomplished this; because, in towns where free exit has not been allowed for the sewage from the sewers, the death-rate of typhoid fever has only very slightly diminished, or has slightly increased, or even (in one case) has very considerably increased." The mortality of phthisis, the author also finds, has been diminished by the construction of deep-drain sewers; in one case the diminution has amounted to nearly half the former number of deaths. A water-logged subsoil is a potent cause of phthisis—a fact which suggests the necessity of impervious pipe sewers. How, then, is the sewage to be disposed of? After discussing the relative advantages of filtration, precipitation, and irrigation, the author finds that irrigative farming alone fulfils the three conditions of purifying the sewage, insuring a profitable agricultural return, and not endangering the health of the neighbourhood. In conclusion, he writes—

"We are, then, reduced to the following simple issue: whenever it is possible, irrigation should be carried out, the sewage having been previously freed, by one or other of the methods described, from the offensive suspended matters, which must be deodorised to prevent the production of a serious nuisance. Wherever, on the other hand, irrigation is practically impossible, intermittent downward filtration, through soil or other suitable material, affords the means of satisfactorily purifying the sewage."

As we have hinted, Professor Corfield's book will well repay the study of all who are interested in the great subject of the increase of national health and national wealth.

Remarks on Diabetes, especially with reference to Treatment. By WILLIAM RICHARDSON, M.A., M.D., Member of the Royal College of Physicians, London. London: Lewis. Pp. 122.

THIS exceedingly interesting little work might, perhaps, have been rendered still more interesting had the writer abstained from that which to most men is too tempting—the endeavour to make the narrative of a case a complete treatise on any particular subject. The case—and it is one of no small interest—is, unfortunately, the author's own. Two years ago he was attacked with severe diabetes mellitus, which unfortunately means, in too many instances, not only loss of Professional position, but loss of life also. The author tells us he was his own Physician. As a rule, the advisability of practising on oneself is something more than questionable, and, in the sister

profession of the law, has given rise to the saying that "he who is his own lawyer has a fool for his client." Even stronger expressions might be used with regard to him who is his own Doctor. However, "all's well that ends well," and Dr. Richardson—it will be noted that this is not the distinguished physiologist—is to be congratulated on his success in obtaining for himself such a measure of health and strength as he now enjoys, and also in having secured by like means something of the same for others.

It can easily be conceived with what avidity a man labouring under such a disease would scan literature, periodic and permanent; and we are certainly not inclined to fall foul of Dr. Richardson's reading.

Our author thinks that diabetes may arise from two causes—1st, an exaggerated natural sugar-formation of the liver; 2nd, a want of power to convert sugar and amylaceous matter into amyloid substance. As to the diagnosis of these, he says the first exists where the appetite is voracious, the patient in tolerably good condition, and the pulse nearly normal; the second is indicated by small appetite or even a loathing of food, weak and quick pulse, and bad general condition. In the former case stimulants are badly borne, in the latter they do good.

In another part he says—"Practically, so far as sugar and starchy substances are concerned, there are three types of diabetes. In the first, by the total suppression of these substances, all sugar disappears from the urine, and this state of things generally continues so long as the diet is restricted. In the second, the sugar is only diminished, and this diminution is often temporary. In the third no effect is produced." In his own case Dr. Richardson at first strictly limited his diet till he came to loathe his food; then he gradually relaxed his system of dieting with benefit. No sugar accumulated in his system. The tests he employed of anything like error committed in his diet were these:—1st, dryness of the mouth, especially at night; 2nd, increased quantity of urine; and 3rd, weight of body. Gradually, emboldened by these, he relaxed his diet, but at the same time increased his walking exercise. His present diet is as follows:—

Breakfast.—Bacon well done, fish or eggs, brown bread or cakes eaten with plenty of good fresh butter; at times, ordinary bread well toasted.

Luncheon.—Eggs or soup, with maccaroni or rice; or cold meat, with a tablespoonful of brandy or two glasses of claret in a tumbler of water.

Dinner.—Soup or fish, meat, green vegetables, potatoes (sparingly), cheese, at times pale ale, and a little dry fruit.

This, it will be noted, is liberal diet for a diabetic, and could not be persevered in were it not for abundant exercise and other precautionary measures. In ordinary cases the author recommends the diet to be gradually reduced to its simplest elements, dropping first one thing, then another; but no sudden change. As soon as anything like loathing occurs, he relaxes; for he says, what is quite true, patients will break through, do what you like, and thus is lost confidence between Physician and patient. Of all things, Dr. Richardson seems to lay greatest stress on walking exercise, which should be persevered in, notwithstanding weakness and total disinclination for exertion. Walks, however, should never be so long that they over-fatigue the patient; that is a great mistake, and even too long journeys in railways are to be avoided.

The third thing in treatment Dr. Richardson insists on is the value of the warm bath, but we are inclined to put the vapour bath far before it. The great object is to promote perspiration, and for this purpose there is no comparison between the two methods. If, however, the bath be alkaline, the disadvantage is more than neutralised, for alkalies seem to exercise an extraordinarily beneficial influence on diabetes. Our readers will remember what was said on this point some time ago in our review of Professor Seegen's work on Diabetes.

To promote free action of the skin warm clothing is strongly recommended. Winter and summer the patient should be enveloped in flannel.

As to medicines, the great remedies advised are iron, nuxvomica, and chlorate of potass, or small quantities of a chalybeate water. If the patient complains of acidity, potass may be given. Cod-liver oil or some other form of fat or oil should be prescribed. As to opium, Dr. Richardson found it do harm. Vichy water he recommends, but says it must be taken with care; not too much except there be acidity. The Carlsbad waters so much recommended by Dr. Seegen resemble those of Vichy, except that they are slightly purgative.

Finally, we again take leave to recommend this as a book well worthy of the attention of the Profession. As the work of a diabetic, it is sure to contain everything of importance

on the subject; as that of a man who has cured himself, it is certain to contain sound rules and axioms which others may follow.

OBITUARY.

DR. THOMAS CASEY,

SON of Thomas Casey, Esq., of Cork, born 1795, M.D. Edin., 1818. Started as Physician in Cork; elected almost immediately Physician to Dispensary; elected Physician to North Infirmity, Cork, 1823; resigned and left Ireland through illness 1840, and elected Consulting Physician; afterwards settled at St. Albans, and at once (1843) helped to found the Dispensary (now Hospital), and served it as Physician for twenty years, till compelled by age to give up work in 1863, when he was appointed Consulting-Physician, and presented by subscribers with handsome testimonial; was also Consulting-Physician to West Herts Infirmity, 1846—1855. Married to daughter of late Major Hawkins, of Indian army, who died three months before him. Died after lingering and painful illness, August 21, 1871.

EDWIN SEPTIMUS GREEN, L.R.C.P. and L.R.C.S. Edin.

THIS promising young Surgeon met with his death, last week, under the following melancholy circumstances. He was superintending some haymakers, and was harnessing a leading horse to a cart. He became entangled in the traces, and the animal, taking fright, started off, dragging him along the road a mile and a half, and causing his death. He was Surgeon to the Settle and Carlisle Railway, Medical Officer to the Settle Union, and had been lately Resident Medical Officer of the York Dispensary. He was educated at Guy's.

DR. EMIL ARENDRUP, OF COPENHAGEN,

DIED at St. Cloud, on August 14, after a short illness, brought on by the great labour and responsibility attending his voluntary services in the Hospital there. The French, Austrian, and Danish Governments had just conferred Orders on him, as a reward for his noble conduct during the siege of Paris. Dr. Arendrup passed some months in London two years ago, and his loss will be deeply felt by many of our readers. A brilliant future was opening before our young friend, but his career has been suddenly cut short. *Bella! horrida bella!*

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentleman passed his Examination in the Science and Practice of Medicine, and received a Certificate to practise, on Thursday, August 24, 1871:—

Newberry, William John, Liverpool-road, Holloway.

The following gentlemen also on the same day passed their first Professional examination:—

Dickinson, William Wood, Guy's Hospital.

Hamlin, William Thorne, St. Mary's Hospital.

Maybury, Aurelius Victor, St. Thomas's Hospital.

APPOINTMENTS.

* * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

ALEXANDER, REGINALD G., M.B. of Caius College, Cambridge—Physician to the Bradford Infirmity and Dispensary, Yorkshire, *vice* Dr. Bourne, resigned.

BOWRING, GEORGE, M.R.C.S.E., L.S.A., Medical Associate King's College—One of the Honorary Surgeons at the Royal Infirmity, Manchester.

HUGHES, Mr. JAMES WILSON, Secretary and Registrar of the Richmond, Whitworth, and Hardwicke House of Industry Government Hospitals, Dublin—to the additional position of Registrar of the Westmoreland Lock Hospital, Dublin, *vice* Surgeon Benjamin F. McDowell, resigned.

MAC EWEN, WILLIAM, M.B., C.M.—Casualty Surgeon to the Board of Police, Glasgow.

MORISON, Mr. R. P.—House-Surgeon to the Hereford Infirmity.

PAYNE, G. S., M.R.C.S.E.—House-Surgeon to St. Bartholomew's Hospital.

RICE, THOMAS DAVID, L.A.H. Dublin, L.M.—Resident Apothecary and Accoucheur to the Westmoreland Lock Hospital, Dublin, *vice* Mr. John Owens, L.R.C.S.I., L.K.Q.C.P.I.

SHIPMAN, GEORGE W., L.R.C.P.L., M.R.C.S.E.—Surgeon to the Grantham District of the Great Northern Railway.
 WATTS, GEORGE H., M.R.C.S.E., L.S.A.—Medical Officer for the Matcham District of the Newbury Union.

NAVAL AND MILITARY APPOINTMENTS.

ADMIRALTY.—Dr. William Hemy Colahan and Mr. Frederick Taylor have been confirmed as Assistant-Surgeons in Her Majesty's Fleet, with seniority of August 15, 1870.

MEDICAL DEPARTMENT.—Surgeon-Major Andrew Leith Adams, M.D., from 22nd Foot, to be Staff Surgeon-Major, *vice* Staff Surgeon Leslie Ogilby Patterson, appointed to the 22nd Foot; Staff Assistant-Surgeon Eugene Francis O'Leary, to be Staff Surgeon, *vice* James Alfred Turner, placed on half-pay; Assistant-Surgeon Thomas Rawlings Mould, M.D., from the Royal Artillery, to be Staff Surgeon, *vice* Staff Surgeon-Major Anthony Dickson Home, C.B., V.C., seconded; Staff Assistant-Surgeon John Norman Davis, M.D., from half-pay, to be Staff Assistant-Surgeon, *vice* Robert de la Cour Corbett, M.D., appointed to the Royal Artillery; Staff Assistant-Surgeon Thomas Alexander Clapperton Macarthur, from half-pay, to be Staff Assistant-Surgeon, *vice* Eugene Francis O'Leary, promoted.

To be Surgeon-Major: Surgeon James Bain, M.D. To be Surgeons: Assistant-Surgeons David Simpson, M.D., Henri Jules Blanc, M.D., John Davies, William Dymock, B.A., Edward Sexton, M.D.

ROYAL ARTILLERY.—Staff Assistant-Surgeon Robert de la Cour Corbett, M.D., to be Assistant-Surgeon, *vice* Thomas Rawlings Mould, M.D., promoted on the Staff.

22ND FOOT.—Staff Surgeon Leslie Ogilby Patterson, to be Surgeon, *vice* Surgeon-Major Andrew Leigh Adams, M.D., appointed to the Staff.

70TH FOOT.—Staff Assistant-Surgeon Humphrey Carden Gillespie, M.D., to be Assistant-Surgeon.

BIRTHS.

CALDWELL.—On August 27, at Richmond, the wife of J. Caldwell, Esq., Surgeon R.N., of a daughter.

CHARLTON.—On August 20, at 7, Eldon-square, Newcastle-on-Tyne, the wife of Edward Charlton, M.D., of a son.

COLLUM.—On August 29, at Croy, Surbiton, Surrey, the wife of Robert Collum, M.D., of a son.

JAMESON.—On August 26, at Grenada-road, Southsea, the wife of Dr. Thos. Jameson, Surgeon R.N., of a son.

MASSY.—On August 29, at Netley, near Southampton, the wife of H. D. Massy, Staff Assistant-Surgeon, of a son.

MARRIAGE.

SIMPSON-SAINSBURY.—On August 22, at the Abbey Church, Romsey, Hants, Spencer H. Simpson, Esq., to Minna, only daughter of Henry Sainsbury, M.D., Linden House, Romsey, Hampshire.

DEATHS.

BARRACK, ALEXANDER, M.D., at Brackley Villa, Bushey-hill-road, Camberwell, on August 21, aged 71.

CARPENTER, W., eldest son of W. Guest Carpenter, F.R.C.S., of Amersham, lost on his passage home from India, on July 12, in his 17th year.

HARGRAVE, WILLIAM, Esq., eldest beloved son of Elizabeth and the late William Henry Hargrave, Surgeon, of Upper Holloway, and Millbrook, Cornwall, at his mother's residence, 5, Lordship-terrace, Stoke Newington, on August 29, aged 47.

KING, LOUISA ADELINE, infant daughter of William Talbot King, Surgeon, 74, Victoria-park-road, Hackney, on August 27.

KNOWLES, EDMUND YALDER, Surgeon, at Farnham, Surrey, on August 26, aged 58.

MCCREA, JOSEPH, R.N., M.R.C.S., late of 37, Compton-terrace, Islington, at Heathlands, Weybridge, on August 25, aged 78.

BOLT, ROBERT ANDREW, Surgeon, of 108, Blackman-street, Borough, at Ramsgate, of consumption, on August 23.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.

BRISTOL LUNATIC ASYLUM.—Assistant Medical Officer. Must be properly qualified and registered. Applications and testimonials to Mr. J. F. Williams, Clerk to the Visitors, Council-house, Bristol, on or before September 13.

BRISTOL ROYAL INFIRMARY.—Dispenser. Must be competent to take entire charge of the Dispensary Department. Applications and testimonials to the Committee, on or before September 9.

CHRISTCHURCH UNION.—Medical Officer for the Eastern District. Candidates must be properly qualified and registered. Applications and testimonials to Mr. Henry Pain, Clerk, on or before September 4. Election the same day.

GOWER UNION (WESTERN DISTRICT).—Medical Officer for this district, including the Workhouse. Candidates must have the qualifications prescribed by the General Orders of the Poor-law Board. Applications and testimonials to the Clerk, Quay-parade, Swansea, on or before September 9. Election on the 12th.

ISLINGTON, VESTRY OF ST. MARY.—Medical Officer of Health and Analyst. Candidates must be duly qualified and registered. Applications and testimonials to Mr. John Layton, Vestry Clerk, on or before September 18. Further particulars may be obtained at the Vestry Office.

KENT AND CANTERBURY HOSPITAL.—House-Surgeon and Dispenser. Must be duly qualified and registered under the Medical Act, 1858. Applications and testimonials to the Secretary, at the Hospital, on or before September 29. Personal attendance is desirable. Further particulars of the Secretary.

LENDEN AND WINSTREE UNION.—Medical Officer for the Eighth District. Candidates must possess the qualifications prescribed by the General Orders of the Poor-law Board. Applications and testimonials to Mr. W. Howard, Clerk to the Board, on or before September 5. Election on the 6th.

MONMOUTH HOSPITAL AND DISPENSARY.—Dispenser. Applications and testimonials to the Committee, on or before September 5.

NORFOLK AND NORWICH HOSPITAL, NORWICH.—House-Surgeon; must have both Medical and Surgical qualifications. Applications and testimonials to Mr. T. R. Tallack, on or before September 8. Election on September 16.

PARISH OF UNST, SHETLAND.—Medical Officer. Applications and testimonials to Mr. White, Inspector of the Poor.

ST. SAVIOUR'S UNION, SURREY.—District Medical Officer for the Third District. Candidates must be duly qualified and registered. Applications and testimonials to Mr. James J. Blake, Union Offices, John-street West, Blackfriars-road, S.E., on or before September 21. Election on the same day.

TOWCESTER UNION.—Medical Officer for the Workhouse and the Towcester District. Candidates must be properly qualified and registered. Applications and testimonials to Mr. W. Whitton, Clerk, on or before September 19.

UNION AND PAROCHIAL MEDICAL SERVICE.

** The area of each district is stated in acres. The population is computed according to the census of 1871.

RESIGNATIONS.

Christchurch Union.—Mr. Watmough has resigned the Eastern District; area 14,311; population 4321; salary £70 per annum.

St. Saviour's Union.—The Third District is vacant; salary £130 per annum.

Tenterden Union.—Dr. Provis has resigned the Biddenden District; area 7207; population 1412; salary £40 per annum.

APPOINTMENTS.

Bridgwater Union.—Mr. Francis J. C. Parsons, L.R.C.P., M.R.C.S., L.S.A., to the Middlezoy District.

Sudbury Union.—George Stevens, L.F.P. & S. Glas., L.S.A., to the Sixth District.

ST. BARTHOLOMEW'S HOSPITAL AND COLLEGE.—PRIZE EXAMINATIONS, 1870-71.—Jeaffreson Exhibition, £20 per annum for two years, E. Crétin. Senior Scholarship in Medicine, Surgery, Materia Medica, and Therapeutics, £75, H. E. Bridgeman, W. Furner, T. Strafford (æq.). Senior Scholarship in Anatomy, Physiology, and Botany: 1, £50, C. Firth; 2, £25, R. W. Leftwich. Junior Scholarships: 1, £50, E. Crétin; 2, £30, P. H. Dicken; 3, £20, A. F. Stevens. Kirkes Medal, D. P. James. Bentley Prize, H. Taylor. Wix Prize, H. E. Bridgeman. Hichens Prize, F. E. Jackson. Practical Anatomy, Sen.: Foster Prize, P. Benson; 2, H. J. Hott; 3, H. A. A. Nicholls, H. Wilcox; 5, E. Milner, F. W. Strugnell, J. L. Whitsed; 8, J. F. Dixon; 9, P. Haig; 10, W. L. Webber. Practical Anatomy, Jun.: Treasurer's Prize, G. Andrew, S. Verco; 3, J. T. Duncan; 4, A. F. Stevens; 5, J. Mills; 6, H. Boulter, P. H. Dicken; 8, S. J. J. Weakley; 9, J. W. Groves; 10, E. J. Burgess.

MEDICAL DEPARTMENT OF THE POST-OFFICE.—Twenty-five additional Medical officers have been appointed in the provinces in connexion with the Post-office, and it is the intention of the Postmaster-General to appoint Surgeons to other post-offices, as well as to some of the suburbs of London just outside the jurisdiction of the present district Medical officers.

THE Local Board of Great Malvern have appointed an Officer of Health for six months.

THE Library of the Obstetrical Society will be closed from Thursday, the 7th, to Wednesday, September 20, both days inclusive.

MR. J. C. SAUNDERS, of Downing College, Cambridge, has recently obtained the Zoology Exhibition at the Preliminary Scientific (M.B.) Examination of London University.

DR. H. ALLEYNE NICHOLSON has resigned his lectureship in the Medical School of Edinburgh, and has settled in Toronto in Canada.

THE second session of the new Medical School of Ceylon, which has been successfully established, has begun.

A NEW Hospital has been opened at Rugely, and is calculated to hold eighteen beds.

SUICIDES.—In London there is one suicide to 175 deaths; in New York one in 172; in Vienna one in 160; in Paris one in 72. In France the number of suicides from drunkenness was, in 1848, 141; in 1866, 401!

THE Committee of the Manchester Auxiliary Fund for the Sick and Wounded in the War has just distributed £1,200 amongst the local Medical charities, that sum being the surplus of the fund.

THE Bombay Government has decided on building two new lunatic asylums—one in the Concan, the other in the Deccan.

A HEALTHY HEALTH-RESORT.—By the Registrar-General's last Quarterly Report, it appears that for ten years past the mortality of Folkestone has averaged 16.4 per 1000.

SMALL-POX IN WIGAN.—Ten deaths from small-pox have been registered in Wigan between the 10th and 14th ult.; of these nine were unvaccinated.

SMALL-POX IN GOSPORT.—In consequence of small-pox of a malignant type having made its appearance at Gosport, the officers and men of her Majesty's ships are prohibited from going into the neighbourhood.

QUARANTINE is enforced in the Italian ports on all vessels from the South and the Baltic.

QUARANTINE POWERS AT LIVERPOOL.—Considerable discussion took place at the last meeting of the Liverpool Health Committee, on a communication received from the Board of Trade, for information as to the extent of the power of the local authorities for restricting immigration from countries in which cholera is rife, when it appeared that no power existed in any local authorities to restrain immigrants from going about the town, or to detain them in quarantine, on suspicion of cholera or choleraic diarrhoea, and a reply representing their present restricted powers has been forwarded to the Board of Trade. The Secretary of the Privy Council Office has informed the Liverpool magistrates that the Lords of the Council have been advised by the law officers of the Crown that a summary jurisdiction exists under the Contagious Diseases (Animals) Act. The objection was taken the other day that the magistrates had no summary jurisdiction under the Act.

THE NEW LOCAL GOVERNMENT BOARD.—One of the difficulties which constantly presented itself in carrying out sanitary reforms and measures, was the difficulty of determining to which authority to appeal in cases of a necessity for enforcing the law. The responsibility was constantly repudiated, and the consequence was, nuisances became perpetuated, and the law was set at defiance. The new Local Government Board Act will do away with some of this uncertainty. The Board will exercise undiminished powers in respect to the administration of the poor-laws. It will be arbiter in all questions connected in any degree with the public health, vaccination, registration, drainage, adulteration of food, sale of poisons, public and town improvements, common lodging-houses, and nuisances of any kind detrimental to health.

STATISTICS OF LUNACY.—The Twenty-fifth Report of the Commissioners in Lunacy bears date March 31, and has just been issued. The number of insane persons of all classes, in England and Wales, on the 1st of January last was 56,755, being an increase of 2,042 over the number in the previous year. Of this increase 1,868 were paupers, and 174 were private patients. The pauper patients have increased in number, in county and borough asylums, by 999; in Broadmoor Criminal Asylum, by 8; in workhouses, 803; and as out-door paupers, 245; while this class has decreased, in registered Hospitals, by 55, and in licensed houses, by 104. The private patients have increased in number in county and borough asylums, by 28; in registered Hospitals, by 76; in naval and military Hospitals, by 156; and as "single patients," in private care, by 36; while they have decreased in licensed houses, by 112, and in the Broadmoor Criminal Asylum, by 10.

NOTES, QUERIES, AND REPLIES.

Be that questioneth much shall learn much.—Bacon.

Dr. W. O., Derby.—We regret that we have not the address of the writer of the letter.

M. A. B. need not have assured us that her remarks were "well meant, if unwelcome." We are fully alive to the interest she takes in, and the ability she often shows in writing on, matters affecting the public health; but we must be allowed to retain our opinions on the subjects of bathing and the use of medicine judiciously prescribed and taken with care. The "indiscriminate" denunciation of the use of mercury as a purgative by our correspondent is as dangerous and as foolish as the "indiscriminate" use of that remedy—powerful for good as well as evil.

George II. employed Mead in his family whilst Prince of Wales, and afterwards appointed him his own Physician on succeeding to the throne in 1727. In practice Mead had been absolutely without a rival. His average receipts had, during several years, amounted to between £6000 and £7000—a very large sum in those days. His treatise on the "Small-pox and Measles" was in Latin, and printed in 1747. He died on February 16, 1754, in his 81st year, and was buried in the Temple Church.

"DREAMS."

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—“M.D.” asks in your journal of this week a remedy for dreaming. After a fair trial I have found nothing so efficacious as the following pill, to be taken each night at bedtime:—℞. gum camph. gr. iij., extract hyoseyam. gr. jss., ft. pil. i., h. sumend. Also a free sponging of the face, neck, and shoulders in cold water, and subsequent rapid drying and friction with a rough towel. I am, &c.,
Maidstone, August 28. L. S. A.

MEDICAL REFORM.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Your correspondent, “An Old University College Man,” draws a very gloomy picture, indeed, of a Doctor's career, and one which, if generally true, would deter anyone from entering the Profession. That a certain number of Doctors are cut off from all cultivated society is, I think, the fault, not of the Profession, but of the men themselves. They are found to be very indifferently educated and mannered, and consequently they cannot occupy the same social position that they naturally would occupy were they not so. I do not think that, if he does his duty, the clergyman is brought less in contact with the poor than his Medical *confrère*; but that, man for man, clergymen occupy a better social position than we do must be admitted; and the remedy is simple. Let our standard of general education be the same as for clergymen, and the disparity will cease; but your correspondent considers this impossible. I must confess my inability to understand the reason of it. Can a man possibly have too good a general education as a preliminary training to a purely scientific career? The sale of drugs in open surgeries and the private dispensing, two evils which greatly lower our Profession, would, I think, entirely disappear were the standard of our general education very much raised. The system of employing unqualified assistants is one which cannot be too strongly condemned, and is, as your correspondent remarks, an evil which, if persevered in, will ruin every plan of reform. I am, &c.,
R. H. L.

THE “MEDICAL DIRECTORY.”

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I have just had to fill up a return for Churchill's “Directory,” and being at a loss concerning certain distinctions of a local nature which have fallen to my lot, as to whether they ought to appear in that book, I turned to its pages to see whether it was customary so to adorn oneself, and to my surprise I found it so. At page 377 may be seen distinctions of the following and local kind, so set forth for the benefit of admiring fellow-townsmen:—

“Member of Council of Yorkshshire Archæological and Topographical Association; Honorary Secretary University of Cambridge Local Examinations; Member of Council of West Yorkshshire Educational Board; Member of the Slocum-Pogis Microscopical Society, of the Slocum-Pogis Society of Industry and Fine Art, and Vice-President of the Slocum-Pogis Mechanics' Institute; author of “On Mural Paintings in St. Judas’, Slocum-Pogis.”

I ask, Sir, is this a way in which the valuable name in Churchill's “Directory” ought to be taken for the purposes of local advertisement? If so, in the next issue I shall fill a column. I am, &c.,
F.R.C.S.

*** Constantly using that excellent work, the “Medical Directory,” we are reminded of the vanity of human nature, which leads many of our brethren to add to their names particulars which can be of no interest to the Profession, and confer no distinction upon themselves.

A REMEDY FOR CHOLERA!

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I am obliged by your giving me an opportunity of stating how I treated a case (one in particular) of cholera and many cases of severe choleraic diarrhoea. I will, therefore, begin by saying that some author (I forget who), in describing the symptoms of cholera and its treatment, terminated his statement by saying that cholera (a redundancy of bile) was a wrong term, and that acolia (without bile) was more correct, as it arose from a total suppression of the action of the liver. On reading this I thought Why not give *fel bovis inspiss.*?—that will restore bile to the system (if of any benefit), and afford time for other remedies! The next case I had I gave it, and it fully realised all my hopes. I had for years previously used it for simple diarrhoea, with nothing else, with great success. I will now give you a statement of all I did for my patient, the only record I possess:—

March 26, 1851.—Visited D. G. at 11 p.m.; found him in a partial state of collapse from Asiatic cholera with the usual symptoms of the stage. My opinion was by no means favourable to his recovery, but I prescribed ox-gall in two-grain doses every four hours, with calomel, opium, and stimulants. I considered the *fel bovis* my sheet anchor. I was not disappointed; my patient recovered. This man was a soldier, discharged for disease of the heart; had cholera in India, and was aware of the nature of his attack. He was living a short time since. Since I was told of the acid draught for diarrhoea I have given—℞. Acid sulph. dil. gr. xx., tr. opii gr. x., aqua ʒxii. ft. haust., s.s., and one hour after *fel bovis inspiss.* gr. ij. This generally succeeds, but occasionally requires three or even four doses of each. So thoroughly am I convinced of the great benefit of the *fel bovis* that nothing should induce me to omit giving it.

The *fel bovis inspiss.* is a most invaluable remedy for very many other disorders, but is little used. But now comes the difficulty. Is it good or bad? The first I procured was good (very fortunately), the second pot villainously bad, made a patient (not with cholera or anything of that description) excessively ill; it purged him furiously; to me quite unaccountable; looked at the extract; not like the first; at once saw it was made of vitiated bile. It was dark green, or as it has just occurred to me, had been kept too long before inspissation, and became decomposed. After this I always personally inspected it before purchasing. The colour of the extract should be of a dull golden bronze, or something like golden syrup when it is poured out—not a tinge of green; if there is it is bad and unfit for use—at least, my experience teaches me so, and I will not use it. I try the colour by spreading a small quantity on white paper.

August 26.

I am, &c.,
AN OLD PUPIL OF JOHN ABERNETHY.

PRIVATE PRACTICE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Staff Assistant-Surgeon Lennox Jenkins, rather a count, and in his own estimation standing high, was asked not long ago to visit patients for a civil Practitioner. So, mounting a pair of spectacles, a frock-coat, and a

frilled shirt, he consequently commenced the rounds. A bronchitic Jew, with a red cap on, suggestive of Daniel in the lions' den, gave very little trouble; but downstairs Mrs. Moses Levy was in ambush to know the real, the candid opinion on the case, and whether or not the regular Medical attendant had done everything, or possibly given the wrong medicine. Next, a nervous publican very condescendingly offered refreshment. A dyspeptic policeman, evidently a patron of questionable Medical literature, gave a diagnosis, even abstrusely beyond Brown-Séguard, of spinal marrow reacting on sciatica of the heart. A phthisical clerk of course was getting better, and if he could only shake off the hacking cough, if he could only put on flesh, soon would he be about again to work for the wife and the chicks. Poor fellow! Sad enough was his condition. Familiarity with such scenes does not make our hearts callous; and the only apology tendered for the frivolous vein pervading this and other communications lies in the attempt temporarily to forget the depression daily to contend with.

But to continue. The next was an interesting case of locomotor ataxy, caused, according to statement, by exposure to rain and thunderstorms on a long march in India. The condition, creeping on gradually, was ushered in by numbness of the soles of the feet as if walking on ice, then working upwards, giving the impression of cords being tied around the joints, together with the feeling as if sitting on indiarubber. Next, pain commencing from the back, ran round the chest, as of a hot iron passing over the ribs, or the skin being torn off with pincers. He had no control over the bladder, a little over the rectum; his wasting legs could be splashed about a little if the eyes were fixed on the ground; yet the memory, the intellect, and the speech remained clear, and his handwriting admirable. He stated that galvanism had been of no service, that he had had syphilis, was temperate (but as to the latter, what man ever confessed the contrary?) Significant enough, his wife lost one husband from typhus, another died of paralysis, and the result of her three marriages consisted of one child, who died of typhus.

Well, as the day wore on, a chronically pregnant lady, who never travels without either a wet-nurse, a goat, or a jackass, propounded puzzling problems on infantile alimentation. An old harpy who let lodgings, and the magnificent wife of a tradesman, equally took the change and the starch out of our friend by rudely declining to believe in the "assistant."

Once, assuming a cavalry swagger before a coroner's jury, he narrowly escaped a verdict of "wilful murder." Instead of gratefully thanking Providence that he was old enough and ugly enough to undertake any case, Lennox Jenkins gladly discovered a convenient bone in his leg when asked to officiate again. The general Practitioner works terribly hard to find, as in Berkshire, his harvest too frequently late.

I am, &c.,
CHUTNEY CURRIE, M.D.

COMMUNICATIONS have been received from—

Mr. LEIGH; Dr. RIDGE; Mr. PAYNE; Mr. BROCKLEHURST; Mr. FOWLER; A BRITON; Mr. JOHN TANNER; Dr. FAYRER; Professor KLEBS; Dr. RUTHERFORD; Miss WOOTTON; Mr. BROWN; AN OLD PUPIL OF JOHN ABERNETHY; Dr. F. R. HOGG; MESSRS. CASSELL; Mr. BRUNTON; Mr. J. CHATTO; Mr. J. SPENCER WELLS; Dr. CAMERON; Dr. CHARLES MAYO; L.S.A.; Mr. BLACKMAN; Dr. HARTSEN; Dr. E. CASEY; Dr. BRAILEY; R. H. L.; Dr. GRIFFITHS; Mr. JOHN THOMAS; Dr. GRAY; Dr. WILTSHIRE; F.R.C.S.; Mr. HUGHES; Mr. W. HUNTER.

BOOKS RECEIVED—

Report of the Sanitary Condition of the Holborn District—Thorley's Farmers' Almanac—Report on the Sanitary Condition of the St. Giles District during the year 1870—Dunglison on the Public Medical Libraries of Philadelphia—Abrath on Small-pox—Le Démon Aécöol, par Dr. Despine.

PERIODICALS AND NEWSPAPERS RECEIVED—

Correio Medico de Lisboa—Nature—Wiener Medicinische Zeitung—Gazette des Hôpitaux—L'Union Médicale—Chloralium Review—La Gazette Hebdomadaire—Pharmaceutical Journal—New Remedies, a Quarterly Retrospect of Therapeutics, etc.—La Tribune Médicale—Southampton Times—Hampstead and Highgate Express—Philadelphia Medical Times—Glasgow Herald—The Dark Blue, September—Medical Press and Circular—The Medical Free Press and Journal of Hygiene, September—Centralblatt für die Medicinischen Wissenschaften, Nos. 31 and 32—Berliner Klinische Wochenschrift, Nos. 31 and 32.

APPOINTMENTS FOR THE WEEK.

September 2. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 9½ a.m.; King's, 2 p.m.; Charing-cross, 2 p.m.; Royal Free, 2 p.m.; Hospital for Women, 9½ a.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

4. Monday.

Operations at the Metropolitan Free Hospital, 2 p.m.; St. Mark's Hospital for Diseases of the Rectum, 2 p.m.; St. Peter's Hospital for Stone, 2½ p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

5. Tuesday.

Operations at Guy's, 1½ p.m.; Westminster, 2 p.m.; National Orthopædic, Great Portland-street, 2 p.m.; Royal Free, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

6. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1¼ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew's, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas's, 1½ p.m.; Samaritan, 2.30 p.m.; King's College Hospital (by Mr. Wood), 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

7. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; Royal Orthopædic, 2 p.m.; West London, 2 p.m.; University College Hospital, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

8. Friday.

Operations at Central London Ophthalmic, 2 p.m.; Royal London Ophthalmic, 11 a.m.; South London Ophthalmic, 2 p.m.; Royal Westminster Ophthalmic, 1½ p.m.

MEDICAL SOCIETY OF LONDON, 8 p.m. Meeting of Council.

VITAL STATISTICS OF LONDON.

Week ending Saturday, August 26, 1871.

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29'83 in. The highest was 30'09 in. at the end of the week, and the lowest was 29'55 in. on Thursday afternoon.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871. As the population of Dublin and its suburbs showed a decline between the Censuses of 1861 and 1871, the enumerated number in April last has been inserted above for that city, the population being assumed to be now stationary.

Continued from Fifth Page of Advertisements.

King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION will be opened on MONDAY, OCTOBER 2nd, with an Introductory Address, at 4 p.m., by Professor Rutherford, M.D.

LECTURERS.

Anatomy—Prof. R. Partridge, F.R.S. Demonst.: J. Curnow & J. B. Perrin.
Physiology—Prof. W. Rutherford, M.D. Demonst.: D. Ferrier, M.A., M.D.
Chemistry—Prof. C. L. Bloxam, F.C.S. Demonst.: W. N. Hartley.
Medicine, Principles and Practice of—Prof. George Johnson, M.D.
Surgery, Principles and Practice of—Prof. John Wood, F.R.S.
Clinical Surgery—Prof. Sir William Fergusson, Bart., F.R.S.
Hygiene—Prof. W. A. Guy, M.B., F.R.S.
Botany—Prof. Robert Bentley, F.L.S.
Materia Medica and Therapeutics—Prof. A. B. Garrod, M.D., F.R.S.
Obstetric Medicine and the Diseases of Women and Children—Prof. W. O. Priestley, M.D.
Forensic Medicine—Prof. W. A. Guy, M.B., F.R.S.
Comparative Anatomy—Prof. T. Rymer Jones, F.R.S.
Pathological Anatomy—Prof. L. S. Beale, M.B., F.R.S.
Dental Surgery—Prof. Samuel Cartwright, F.R.C.S.
Ophthalmology—Prof. J. Soelberg Wells, M.D., M.R.C.S.
Practical Surgery—Prof. John Wood, F.R.S.
Psychological Medicine—Prof. Edgar Sheppard, M.D.
Dean of the Faculty—Prof. Bentley, F.L.S.

KING'S COLLEGE HOSPITAL.

CLINICAL LECTURES are given four times a week by the Physicians and Surgeons. Clinical Instruction is also given in Diseases of the Throat and in Skin Diseases.

Physicians—Dr. G. Johnson, Dr. L. S. Beale, Dr. A. B. Garrod, Dr. Guy, Dr. Duffin. Assistant-Physicians—Dr. Yeo, Dr. Kelly. Physician for Diseases of Women and Children—Dr. W. O. Priestley. Assistant Obstetric Physician—Dr. W. Playfair. Surgeons—Sir W. Fergusson, Bart.; John Wood, F.R.C.S.; H. Smith, F.R.C.S. Surgeon-Dentist—S. Cartwright, F.R.C.S. Ophthalmic Surgeon—J. Soelberg Wells, M.D. Assistant-Surgeon—H. Royes Bell, F.R.C.S. Pathological Registrar—C. Kelly, M.D. Sambrooke Registrars—E. B. Baxter, M.D.; Urban Pritchard, M.D. Vaccinator—W. Dunn, Esq.

An Ophthalmic Department and a Ward for Children are attached to the Hospital. The Physician's Assistant, Physician-Accoucheur's Assistant, and House-Surgeon, as also their Assistants, Clinical Clerks, and Dressers, are selected by examination from amongst the Students, without extra fees.

SCHOLARSHIPS, REGISTRARSHIPS, AND PRIZES.

WARNEFORD SCHOLARSHIPS.—Students entering the Medical Department of this College in October, 1871, will have the exclusive privilege of contending for two Scholarships of £25 each for three years. These Scholarships are given for proficiency in Divinity, Classics, Mathematics, History, and English. The subjects may be ascertained by applying to the Secretary.

Five Medical Scholarships are awarded at the close of each Winter Session for proficiency in Professional subjects—viz., one of £40 for two years; one of £30 for one year; and three of £20 for one year. A WARNEFORD SCHOLARSHIP of £25, for two years, is also annually awarded for proficiency in Divinity and Hospital Practice. SAMBROOKE REGISTRARSHIPS.—Two of £50, tenable for two years, are annually awarded to matriculated Students of this department. DANIELL SCHOLARSHIP.—One of £20, for two years, given for proficiency in Chemistry, is open to Students of the Medical Department. Endowed Prizes, of the value of £25, £15, £10, and £4 4s. each, and College Prizes of the value of £50, are annually awarded.

For further information, apply personally or by letter marked outside "Prospectus," to J. W. Cunningham, Esq., Secretary.

St. George's Hospital Medical School.

—The WINTER SESSION will commence on MONDAY, 2nd OCTOBER, with an Introductory Address by Dr. John Clarke, at 2 p.m., in the Hospital.

The system of clinical teaching has been arranged so as to afford every Student personal instruction in the wards from the Physicians and Surgeons themselves.

Special departments have been organised for practical instruction in Midwifery, Ophthalmic Practice, Orthopædic Surgery, Skin Diseases, Vaccination, and Dentistry. Lectures on Public Health are given by the Lecturer on Medicine.

Pathology (including Morbid Anatomy), Psychological Medicine, and Comparative Anatomy are taught in distinct courses of lectures.

Instruction is given in all the special modes of Medical and Surgical investigation.

The following paid offices are offered for competition annually—viz., Obstetric Assistant, Curator of the Museum, Demonstrator of Anatomy, Medical and Surgical Registrars.

The House-Physicians and House-Surgeons are selected by merit from among the Perpetual Pupils without payment, board and lodging in the Hospital being provided at the expense of the Governors.

Liverpool Royal Infirmary School of

MEDICINE.—The Introductory Address will be delivered on OCTOBER 2nd, at 3 p.m., by Dr. W. Carter.

HOSPITAL PRACTICE.—ROYAL INFIRMARY

Physicians—Dr. Vose, Dr. Turnbull, Dr. Waters.
Surgeons—Mr. Stubbs, Mr. Bickersteth, Mr. Hakes.
Assistant-Surgeon—Mr. Harrison.

Lectures on Clinical Medicine are delivered by the Physicians, and on Clinical Surgery by Mr. Bickersteth.

LECTURES.—WINTER SESSION.

Medicine—Dr. Cameron.
Surgery—Mr. Harrison.
Physiology—Dr. Waters.
Anatomy—Mr. W. Mitchell Banks.
Pathology—Dr. Davidson.
Chemistry—J. C. Brown, D.Sc. Lond.

DEMONSTRATIONS.

Practical Physiology—Dr. Caton.
Dissections—Dr. Glynn and Mr. E. A. Browne.

A Prospectus may be obtained from the Registrar, Mr. Harrison 51, Rodney-street, or School of Medicine, Dover-street, Liverpool.

University College, London.—The

SESSION of the FACULTY of MEDICINE will commence on MONDAY, OCTOBER 2nd, 1871. Introductory Lecture at 3 p.m.

LECTURES IN WINTER SESSION.

Medicine—Prof. J. Russell Reynolds, M.D., F.R.S.
Practical Physiology and Histology—Prof. Burdon-Sanderson, M.D., F.R.S.
Anatomy and Physiology—Prof. Sharpey, M.D., F.R.S.
Chemistry—Prof. Williamson, F.R.S.
Anatomy—Prof. G. V. Ellis.
Comparative Anatomy—Prof. Grant, M.D., F.R.S.
Surgery—Professor Marshall, F.R.S.
Practical Surgery—Mr. Berkeley Hill, M.B., F.R.C.S.; Mr. Christopher Heath, F.R.C.S.; Mr. Marcus Beck, M.S., M.B., F.R.C.S.
Dental Surgery—Mr. Ibbetson, F.R.C.S.

LECTURES IN SUMMER SESSION.

Botany—Prof. Oliver, F.R.S., F.L.S.
Midwifery—Prof. Graily Hewitt, M.D.
Medical Jurisprudence—Prof. Maudsley, M.D.
Practical Chemistry—Prof. Williamson, F.R.S.
Mental Diseases—Lecturer, W. H. O. Sankey, M.D.
Hygiene and Public Health—Prof. Corfield, M.A., M.B.
Materia Medica and Therapeutics—Prof. Ringer, M.D.
Palæozoology—Prof. Grant, M.D., F.R.S.
Operative Surgery—Mr. Christopher Heath, F.R.C.S.
Pathological Anatomy—Prof. H. Charlton Bastian, M.D., F.R.S.
Ophthalmic Medicine and Surgery—Prof. T. W. Jones, F.R.S.
Analytical Chemistry—Professor Williamson, throughout the Session.

UNIVERSITY COLLEGE HOSPITAL.

Physicians—Sir W. Jenner, Bart., M.D., F.R.S.; Dr. Reynolds, F.R.S.; Dr. Wilson Fox, Dr. Ringer, Dr. H. Charlton Bastian, F.R.S.
Obstetric Physician—Dr. Graily Hewitt.
Physician to the Skin Infirmary—Dr. Tilbury Fox.
Assistant-Physician—Dr. F. T. Roberts, B.Sc.
Surgeons—Mr. Erichsen, Mr. Marshall, F.R.S., Sir Henry Thompson, Mr. Berkeley Hill, Mr. Christopher Heath.
Ophthalmic Surgeon—Mr. Wharton Jones, F.R.S.
Dental Surgery—Mr. Ibbetson.

CLINICAL INSTRUCTION.

Medical Clinical Lectures by Prof. Sir Wm. Jenner, Prof. Reynolds, and Prof. Graily Hewitt; also by Dr. Wilson Fox, Holme Professor of Clinical Medicine, whose special duty it is to train the Pupils in the practical study of disease. Dr. Roberts, the Assistant Teacher of Clinical Medicine, also gives special instruction in the methods of physical diagnosis and of clinical observation.

Surgical Clinical Lectures by Mr. Erichsen, Holme Professor of Clinical Surgery, Prof. Marshall, and Sir Henry Thompson.

Lectures on Ophthalmic Cases by Mr. Wharton Jones.

Clinical Lectures on Diseases of the Skin by Dr. Tilbury Fox.

SCHOLARSHIPS, EXHIBITIONS, AND PRIZES.

Three Entrance Exhibitions, of the respective values of £30, £20, and £10 per annum, tenable for two years.

An Atkinson Morley Scholarship for the promotion of the study of Surgery, £45 a year, tenable for three years.

Sharpey Physiological Scholarship, about £95 a year, tenable for three years.

Filliter Exhibition for proficiency in Pathological Anatomy, £30.

Liston Gold Medal for Clinical Surgery.

Dr. Fellowes's Medals for Clinical Medicine, two Gold and two Silver.

Alexander Bruce Gold Medal for Pathology and Surgery.

Cluff Memorial Prize, awarded every other year for proficiency in Anatomy, Physiology, and Chemistry.

The next Examination for the Entrance Exhibitions will be held on the 28th and 29th of September.

Prospectuses and the regulations concerning the Exhibitions and Scholarships may be obtained on application, either personally or by letter, at the Office of the College.

SYDNEY RINGER, M.D., Dean of the Faculty.
JOHN ROBSON, B.A., Secretary to the Council.

Sheffield School of Medicine.—

SESSIONS of 1871-2.—The WINTER SESSION will commence on OCTOBER 1. The Introductory Lecture will be delivered by A. Allen, Esq., F.C.S., and the Prizes distributed in the Anatomical Theatre at 4 p.m.

LIST OF LECTURES.

Anatomy, Descriptive and Surgical—Mr. Skinner and Mr. A. Jackson.
Demonstrations of Anatomy—Mr. E. Skinner, Mr. Clark, Mr. Pearce.
Physiology—Mr. Thos. Leeds and Mr. S. Morton.
Principles and Practice of Medicine—Dr. Frank-Smith.
Principles and Practice of Surgery—Mr. W. F. Favell and Mr. Parker, F.R.C.S.
Chemistry—Mr. Allen.
Dental Mechanics—Mr. G. Mosely.
Clinical Medicine—Dr. Bartolomé, Dr. Law, and Dr. Frank-Smith.
Clinical Surgery—Mr. Barber, Mr. W. Favell, and Mr. Parker, F.R.C.S.
Demonstrators on Practical Surgery and Practical Physiology will be appointed on August 28th.

SUMMER SESSION, commencing MAY 1st, 1872.

Midwifery and Diseases of Women—Dr. Keeling and Dr. Hime.
Materia Medica and Therapeutics—Dr. Young.
Medical Jurisprudence and Toxicology—Mr. Baker and Mr. Harrison.
Botany—Mr. Birks.
Practical Chemistry—Mr. Allen.
Dental Surgery—Dr. Merryweather.
Demonstrations of Pathology and Microscopy—Mr. Hallam (at the Infirmary).
Demonstrations of Operative Surgery—Mr. Favell and Mr. Parker, F.R.C.S.

Perpetual Fee for attendance on all the Lectures required by the Royal College of Surgeons and the Apothecaries' Hall, £40.

Prospectuses and all further information may be obtained upon application to the Hon. Secretaries,

Dr. W. FRANK-SMITH, Norfolk-street.
Mr. A. JACKSON, St. James's-row, Sheffield.

RULES AND REGULATIONS

OF THE

EXAMINING MEDICAL BODIES IN ENGLAND.

SESSION 1871—2.

EXTRACTS FROM THE REGULATIONS OF THE GENERAL MEDICAL COUNCIL ON THE SUBJECTS OF REGISTRATION OF MEDICAL STUDENTS AND PRELIMINARY EXAMINATIONS.

REGISTRATION OF MEDICAL STUDENTS.

THE following Regulations have been adopted by the General Medical Council, in reference to the Registration of Students of Medicine :—

1. Every Medical Student shall be registered in the manner prescribed by the General Medical Council.
2. No Medical Student shall be registered until he has passed a Preliminary Examination, as required by the General Medical Council.
3. The commencement of the course of Professional study recognised by any of the Qualifying Bodies, shall not be reckoned as dating earlier than fifteen days before the date of Registration.
4. The Registration of Medical Students shall be placed under the charge of the Branch Registrars.
5. Each of the Branch Registrars shall keep a Register of Medical Students according to the subjoined form :—

Form for the Registration of Medical Students.

Date of Registration.	Name.	Preliminary Examination and Date.	Place of Medical Study.

6. Every person desirous of being registered as a Medical Student, shall apply to the Branch Registrar of the division of the United Kingdom in which he is residing, according to the annexed form, which may be had on application to the several Qualifying Bodies, Medical Schools, and Hospitals; and shall produce or forward to the Branch Registrar a Certificate of his having passed a Preliminary Examination, as required by the General Medical Council, and a statement of his place of Medical study.

7. The Branch Registrar shall enter the applicant's name and other particulars in the Students' Register, and shall give him a Certificate of such Registration.

8. Each of the Branch Registrars shall supply to the several Qualifying Bodies, Medical Schools, and Hospitals, in that part of the United Kingdom of which he is Registrar, a sufficient number of blank forms of application for the Registration of Medical Students.

9. The several Branch Councils shall have power to admit special exceptions to the foregoing Regulations as to Registration, for reasons which shall appear to them satisfactory.

10. A copy of the Register of Medical Students, prepared by each of the Branch Registrars, shall be transmitted, on or before December 31 in each year, to the Registrar of the General Council, who shall, as soon as possible thereafter, prepare and print, under the direction of the Executive Committee, an Alphabetical List of all Students registered in the preceding year, and supply copies of such authorised List to each of the Bodies enumerated in Schedule (A) to the Medical Acts, and through the Branch Registrars to the several Medical Schools and Hospitals.

11. The several Qualifying Bodies are recommended not to admit, after October, 1871, to the Final Examination for a

Qualification under the Medical Acts, any Candidate (not exempted from Registration) whose name has not been entered in the Medical Students' Register at least four years previously.

In the case of Candidates from other than Schools of the United Kingdom, the Branch Councils shall have power to admit exceptions to this recommendation.

PRELIMINARY EXAMINATIONS IN ARTS RECOGNISED BY THE GENERAL MEDICAL COUNCIL.

"That Testimonials of Proficiency, granted by the National Educational Bodies according to the subjoined List, may be accepted, the Council reserving the right to add to, or take from the List" (A Degree in Arts of any University of the United Kingdom, or of the Colonies, or of such other Universities as may be specially recognised from time to time by the Medical Council, is considered a sufficient Testimonial of Proficiency).

LIST OF EXAMINING BODIES WHOSE EXAMINATIONS FULFIL THE CONDITIONS OF THE MEDICAL COUNCIL, AS REGARDS PRELIMINARY EDUCATION.

I. Universities of the United Kingdom.—Oxford: Examination for a Degree in Arts; Responsions; Moderations; Local Examinations (Senior), Certificate to include Latin and Mathematics. Cambridge: Examination for a Degree in Arts; Previous Examination; Local Examinations (Senior), Certificate to include Latin and Mathematics. Durham: Examination for a Degree in Arts; Examination for Students in their second and first years; Registration Examination for Medical Students; Local Examinations (Senior), Certificate to include Latin and Mathematics. London: Examination for a Degree in Arts; Matriculation Examination. Aberdeen, Edinburgh, Glasgow, St. Andrews: Examination for a Degree in Arts; Preliminary Examination for Graduation in Medicine or Surgery. Edinburgh: Examination of (Senior) Candidates for Honorary Certificates under the Local Examinations of the University of Edinburgh. Dublin: Examination for a Degree in Arts; Entrance Examination. Queen's University (Ireland): Examination for a Degree in Arts; Entrance Examination; Examination for the Diploma of Licentiate in Arts; Previous Examination for B.A. Degree.

II.—Other Bodies named in Schedule (A) to the Medical Act.—Royal College of Surgeons of England: Examination conducted under the superintendence of the College of Surgeons, by the Board of Examiners of the Royal College of Preceptors. The Society of Apothecaries of London: Examination in Arts. Royal College of Physicians, Edinburgh, and Royal College of Surgeons, Edinburgh: Preliminary Examination in General Education, conducted by a Board appointed by these two Colleges combined, Faculty of Physicians and Surgeons of Glasgow: Preliminary Examination in General Literature. Royal College of Surgeons in Ireland: Preliminary Examination, Certificate to include Mathematics. Apothecaries' Hall of Ireland: Preliminary Examination in General Education.

III.—Examining Bodies in the United Kingdom, not included in Schedule (A) to the Medical Act.—Royal College of Preceptors: Examination for a First Class Certificate.

IV.—Colonial and Foreign Universities and Colleges.—Universities of Calcutta, Madras, Bombay: Entrance Examination, Certificate to include Latin. McGill College, Montreal: Matriculation Examination. University of Toronto, King's College, Toronto, Queen's College, Kingston, Victoria College, Upper Canada: Matriculation Examination. King's College, Nova Scotia: Matriculation Examination, Responsions. University of Fredrickton, New Brunswick: Matriculation Examination. University of Melbourne: Matriculation Examination, Certificate to include all the subjects required by the General Medical Council. University of Sydney: Matriculation Examination. Codrington College, Barbadoes: 1. English Certificate for Students of two years' standing, specifying the subjects of Examination; 2. Latin Certificate, or "Testamur." Tasmanian Council of Education: Examination for the Degree of Associate of Arts, Certificate to include Latin and Mathematics. Christ's College, Canterbury, New Zealand: Voluntary Examinations, Certificate to include all the subjects required by the General Medical Council. The Examiners for Commissions in the Military and Naval Services of the United Kingdom: Certificate to include all the subjects required by the General Medical Council. Cape of Good Hope: Third Class Certificate in Literature and Science, granted by the Board of Public Examiners.

FORM OF APPLICATION FOR REGISTRATION AS A MEDICAL STUDENT.

I hereby apply to be Registered as a Student in Medicine, in conformity with the Regulations of the General Council of Medical Education and

Registration of the United Kingdom, for which purpose I submit the following particulars:—

Name of Applicant. (To be written in words at length.)		Preliminary Examina- tion.	Date of Pre- liminary Examina- tion.	Place of Medical Study.
Surname.	Christ'an Name.			

Applicant's Signature, _____

Address, _____

Date of Application, _____

To the Registrar of the
Branch Council for _____

N.B.—The above Form of Application, duly and legibly filled up, must be forwarded to the Registrar, post free, and be accompanied by a Certificate of the Applicant's having passed a Preliminary Examination as required by the General Medical Council, and a statement of his place of Medical Study. The Certificate of Examination must testify that the Student has been examined in—1. English Language, including Grammar and Composition; 2. Arithmetic, including Vulgar and Decimal Fractions; Algebra including Simple Equations; 3. Geometry—First two books of Euclid; 4. Latin, including Translation and Grammar. And in one of the following optional subjects: Greek; French; German; Natural Philosophy, including Mechanics, Hydrostatics, and Pneumatics.

UNIVERSITY OF OXFORD.

DEGREES IN MEDICINE.

EVERY Student in Medicine is required to pass all the Examinations for the degree of B.A., and to reckon the time of his Medical study from the Final Examination for Arts.

1. Candidates for the Degree of B.M. are required to pass two Examinations, each of which is held yearly in full Michaelmas Term, usually at the end of November, due notice being given, in the usual manner, by the Regius Professor of Medicine. Each Examination is conducted by the Regius Professor of Medicine and three persons who have been admitted to Regency either as Masters of Arts or as Doctors, and who are nominated yearly by the Vice-Chancellor, subject to the approval of Convocation. Each Examination is conducted partly in writing, partly *vis à voce*, and part of each is practical. The subjects of the First Examination are Human Anatomy and Physiology, Comparative Anatomy and Physiology to a certain extent, and those parts of Mechanical Philosophy, Botany, and Chemistry which illustrate Medicine. The subjects of the Second Examination are the Theory and Practice of Medicine (including diseases of women and children), the *Materia Medica*, Therapeutics, Pathology, the Principles of Surgery and Midwifery, Medical Jurisprudence, and General Hygiene. Every Candidate at this Second Examination is to be examined in two of the ancient authors, Hippocrates, Aretæus, Galen, and Celsus, or in one of those four, and in some modern author approved by the Regius Professor. (a) His knowledge of disease also is tested at the bedside, and he is required to make observations with the microscope or any other aids to diagnosis with respect to patients submitted to him.

Before a Candidate is admitted to the first of these two Examinations, he must have spent two years in Professional studies after having passed the Examinations required for the Degree of B.A., unless he was placed in the First or Second Class in the School of Natural Science, in which case, if he received from the Public Examiners a special Certificate of his attainments in Mechanical Philosophy, Chemistry, or Botany, he may be admitted to this Examination at once, and need not then be examined again in any science specified in such Certificate. Instruction in Natural Science is carried on at the University Museum, where there is practical instruction in Physics, Chemistry, and Anatomy and Physiology, together with courses of lectures by the Professors in those and other subjects. (b) Large collections illustrate the several subjects;

(a) Such as Morgagni, Sydenham, Boerhaave.

(b) Regius Professor of Medicine, H. W. Acland, M.D., LL.D., F.R.S.; Professor of Geometry, H. J. S. Smith, M.A., F.R.S.; Professor of Natural Philosophy, Rev. B. Price, M.A., F.R.S.; Professor of Experimental Physics, R. B. Clifton, M.A., F.R.S.; Professor of Chemistry, Sir B. C. Brodie, Bart., M.A., F.R.S.; Linacre Professor of Physiology, G. Rolleston,

there is a pathological series, including the collection of Schröder van der Kolk, in the Medical Department, where there is also a Medical laboratory. The Radcliffe Library, containing nearly 20,000 scientific volumes, is open daily to all Students from ten till four, and on certain evenings during Term. Before a Candidate is admitted to the Second Examination, he must have completed sixteen Terms from the date of the same *Testamur* and two years from the date of his *Testamur* in the First Medical Examination, and must deliver to the Regius Professor satisfactory Certificates of his attendance at some first-class Hospital. Everyone intending to be a Candidate at either Examination is required to give the Professor notice of his intention a fortnight at least before the week in which the Examination is to be held.

No one from another University can be incorporated as a Graduate in Medicine without passing these two Examinations.

2. A Bachelor of Medicine wishing to proceed to the Degree of Doctor is required to read publicly within the precinct of the Schools, in the presence of the Regius Professor, a Dissertation composed by himself on some Medical subject approved by the Professor, and to deliver to him a copy of it.

UNIVERSITY OF CAMBRIDGE.

REGULATIONS FOR DEGREES IN MEDICINE AND SURGERY.

Degree of Bachelor of Medicine.—Before a Student can become a Bachelor of Medicine he must have resided nine Terms (three academical years).

Five years of Medical study are required, of which time six Terms (two academical years) shall be spent in the University after the Student has passed the Previous Examination. In the case of those who have graduated with honours as Bachelor of Arts, four years of Medical study are deemed sufficient, and four Terms only of Medical study in the University are required.

The Previous Examination may be passed in the Lent Term (at the latter end of March) by those who declare themselves as Medical Students, and have commenced residence in the University in the previous October. In addition to the Previous Examination, the Student is required to pass an Examination in Algebra at the same time or in some subsequent Term.

There are three Examinations for M.B.

The First Examination is in—1. Mechanics and Hydrostatics; 2. Chemistry, with Heat and Electricity; 3. Botany. Before presenting himself for it the Student must have attended Lectures on Chemistry, including manipulations, and Botany. (Students who have obtained honours in any Tripos or passed the general Examination for B.A. are not required to be examined in Mechanics and Hydrostatics; and those who have passed the special Examination in Botany for B.A. are not required to be again examined in that subject.)

The Second Examination is in—1. Elements of Comparative Anatomy; 2. Human Anatomy and Physiology; 3. Pharmacology. The Student must have completed two years of Medical study, the time of Medical study required to be spent in the University being included in these two years, and must also produce Certificates of attendance on Lectures on the Elements of Comparative Anatomy, Human Anatomy and Physiology, *Materia Medica* and Pharmacy, and Pathology; one year's Hospital Practice, and one season's Dissections.

Students who have obtained honours in the Natural Sciences Tripos, and have passed with credit the Examination in Chemistry, Botany, or Comparative Anatomy, are not required to be again examined in those subjects.

The Third Examination is in—1. Pathology and Practice of Physic (two papers); 2. Clinical Medicine (in the wards of the Hospital); 3. Medical Jurisprudence. The Candidate must have completed the course of Medical study, and must produce Certificates of attendance on one Course of Lectures on each of the following subjects:—Principles and Practice of Physic, Clinical Medicine, Clinical Surgery, Medical Jurisprudence, and Midwifery, and of having attended Hospital Practice during three years.

M.D., F.R.S.; Professor of Zoology, J. O. Westwood, M.A., F.L.S.; Professor of Geology, J. Phillips, D.C.L., F.R.S.; Professor of Mineralogy, N. S. Maskelyne, M.A., F.R.S.; *Lea's* Reader in Anatomy, J. B. Thompson, B.A.; Demonstrator in Anatomy, Charles Robertson, Esq.; Demonstrator of Chemistry, T. H. G. Wyndham, M.A.; Professor of Botany at the Physic Gardens, M. Lawson, M.A., Magdalen College; Lecturer in Natural Science at Magdalen College, E. Chapman, M.A.; *Lea's* Reader in Chemistry at Christ Church, A. G. V. Harcourt, M.A., F.R.S.; *Lea's* Reader in Physics, A. W. Reinold, M.A.; Lecturer in Natural Science at Wadham College, R. Abbay, M.A.

After the Third Examination an Act has to be kept, which consists in reading an original thesis, followed by a *vivâ voce* Examination on the subject of the thesis, as well as on other subjects of the Faculty.

The *Degree of Doctor of Medicine* may be taken three years after M.B. An Act has to be kept with *vivâ voce* Examination, and an essay has to be written extempore. A Master of Arts of four years' standing can proceed direct to M.D., provided he produces the same Certificates and passes the same Examinations as for M.B.

Degree of Master in Surgery.—The Candidate must have passed all the Examinations for the Degree of M.B., and must produce Certificates of having attended a second Course of Lectures on Human Anatomy, one Course of Lectures on the Principles and Practice of Surgery, one year's Clinical Surgical Lectures, ten cases of Midwifery, a second season of Dissections, three years the Surgical Practice of a recognised Hospital, and of having been House-Surgeon or Dresser at such Hospital for six months. The subjects of the Examination are—1. Surgical Anatomy; 2. Pathology and the Principles and Practice of Surgery; 3. Clinical Surgery; and 4. Midwifery.

All the Examinations are partly in writing, partly *vivâ voce*, and take place in the Michaelmas and Easter Terms, an interval of two days being allowed to intervene between the First and Second Examinations for M.B.

Attendance at the Hospital and Lectures in Cambridge is recognised by the Universities of Cambridge and London, and (for one year) by the College of Surgeons and the Society of Apothecaries.

UNIVERSITY OF LONDON.

BACHELOR OF MEDICINE.

Every Candidate for the Degree of Bachelor of Medicine shall be required:—

1. To have passed the Matriculation Examination, or to have taken a Degree in Arts in either of the Universities of Sydney, Melbourne, or Calcutta (provided in the last case that Latin has been one of the subjects in which he has passed).
2. To have passed the Preliminary Scientific Examination.
3. To have been engaged in his Professional Studies during four years subsequently to Matriculation or Graduation in Arts, at one or more of the Medical Institutions or Schools recognised by this University, one year, at least, of the four to have been spent in one or more of the recognised Institutions or Schools in the United Kingdom.
4. To pass Two Examinations in Medicine.

PRELIMINARY SCIENTIFIC (M.B.) EXAMINATION.(a)

The Preliminary Scientific Examination shall take place once in each year, and shall commence on the third Monday in July.

[Candidates for the Degree of M.B. are strongly recommended by the Senate to pass the Preliminary Scientific Examination before commencing their regular Medical Studies; and to devote a Preliminary Year to preparation for it, according to the following programme:—*Winter Session*: Mechanical and Natural Philosophy; Chemistry (especially Inorganic); Zoology. *Summer Session*: Practical Chemistry (Inorganic); Botany.]

No Candidate shall be admitted to this Examination until he shall have completed his 17th year, and shall have either passed the Matriculation Examination or taken a Degree in Arts in either of the Universities of Sydney, Melbourne, or Calcutta (provided, in the last case, that Latin has been one of the subjects in which he has passed); nor unless he have given notice of his intention to the Registrar at least *fourteen days* before the commencement of the Examination.

The Fee for this Examination shall be £5.

Candidates shall be examined in the following subjects of the First B.Sc. Examination(b):—Mechanical and Natural Philosophy, Inorganic Chemistry, Botany and Vegetable Physiology, Zoology.

(a) Candidates who Matriculated previously to January, 1861, will not be required to pass the Preliminary Scientific (M.B.) Examination in any other subjects than Chemistry and Botany; and they will be allowed to pass the Preliminary Scientific Examination and the First M.B. Examination in the same year, if they so prefer.

(b) Candidates who shall pass in all the subjects of the Preliminary Scientific (M.B.) Examination, and also at the same time in the Mathematics of the First B.Sc. Examination, shall be considered as having passed both the Preliminary Scientific Examination, and also the First B.Sc. Examination, without being required to pay an additional Fee; and Candidates who shall pass in all the subjects of the Preliminary Scientific (M.B.) Examination, and who shall have previously passed the First B.A. Examination shall be admissible to the Second B.Sc. Examination.

EXAMINATION FOR HONOURS.

Any Candidate who has passed the Preliminary Scientific (M.B.) Examination in all its subjects may be examined at the Honours Examination next following the Preliminary Scientific (M.B.) Examination at which he has passed, in (1) Experimental Physics, (c) (2) Chemistry, (3) Botany, and (4) Zoology; unless he have previously obtained an Exhibition in either of these subjects at the First B.Sc. Examination, in which case he shall not be admissible to the Examination for Honours in that subject.

If in the opinion of the Examiners any Candidate of not more than 22 years of age at the commencement of the Pass Examination, who shall have passed either the First B.Sc. or the Preliminary Scientific (M.B.) Examination, shall possess sufficient merit, the Candidate who shall distinguish himself the most in Experimental Physics, the Candidate who shall have distinguished himself the most in Chemistry, the Candidate who shall distinguish himself the most in Botany, and the Candidate who shall distinguish himself the most in Zoology, shall each receive an Exhibition of £40 per annum for the next two years, payable in quarterly instalments, provided that on receiving each instalment he shall declare his intention of presenting himself either at the Second B.Sc. Examination within two Academical Years(d) from the time of his passing the First B.Sc. Examination, or at the First M.B. Examination within three Academical Years from the time of his passing the Preliminary Scientific (M.B.) Examination, as the case may be.

Under the same circumstances the First and Second Candidates for Honours in Experimental Physics shall each receive a Neil Arnott Bronze Medal.

Every Candidate for the Degree of D.Sc. shall be examined in some one of the following branches of knowledge, to be selected by himself; and no Candidate shall be approved by the Examiners unless he have shown a thorough practical knowledge(e) of the Principal Subject, and a general acquaintance with the Subsidiary Subject or Subjects, specified as belonging to the Branch so selected.

FIRST M.B. EXAMINATION.

The First M.B. Examination shall take place once in each year, and shall commence on the last Monday in July.

No Candidate shall be admitted to this Examination unless he have produced Certificates to the following effect:—1. Of having completed his 19th year. 2. Of having passed the Preliminary Scientific Examination at least one year previously.(f) 3. Of having, subsequently to having passed the Matriculation Examination, or taken a Degree in Arts in one of the before-named Universities, been a Student during two years at one or more of the Medical Institutions or Schools recognised by this University; and of having attended a Course of Lectures on each of three of the subjects in the following list:—Descriptive and Surgical Anatomy, General Anatomy and Physiology, Comparative Anatomy, Pathological Anatomy, Materia Medica and Pharmacy, General Pathology, General Therapeutics, Forensic Medicine, Hygiene, Obstetric Medicine and Diseases peculiar to Women and Infants, Surgery, Medicine. 4. Of having, subsequently to having passed the Matriculation Examination, or taken a Degree in Arts, Dissected during two Winter Sessions. 5. Of having, subsequently to having passed the Matriculation Examination or taken a Degree in Arts, attended a Course of Practical Che-

(c) This Exhibition having been provided by the liberal endowment of Dr. Arnott, will be entitled "The Neil Arnott Exhibition."

(d) By the term "Academical Year" is ordinarily meant the period intervening between any Examination and an Examination of a higher grade in the following year, which period may be either *more* or *less* than a Calendar Year. Thus the interval between the *First* Examinations in Arts, Science, and Medicine, and the *Second* Examinations of the next year in those Faculties respectively, is about sixteen months; whilst the interval between the Second B.A. Examination and the M.A. Examination of the next year, or between the Second B.Sc. Examination and the D.Sc. Examination of the next year, is less than eight months. Nevertheless, each of these intervals is counted as an "Academical Year." Candidates who had attained the age of 21 years before January 1, 1860, are admissible to the successive Examinations for Degrees in Science without the intervals between them prescribed by the Regulations. Candidates who have been admitted to the First B.Sc. Examination within six months after passing the Matriculation Examination will be required to give evidence of having completed their 18th year.

(e) The Senate desire to make it understood that the Candidate for the Degree of D.Sc. will be expected to be so fully conversant with the Principal Subject he may select, as to be able to go through any examination test (whether theoretical or practical) of his acquirements in it that can be fairly applied.

(f) Candidates who Matriculated previously to January, 1861, will not be required to pass the Preliminary Scientific Examination in any other subjects than Chemistry and Botany; and they will be allowed to pass the Preliminary Scientific Examination and the First M.B. Examination in the same year, if they so prefer.

mistry, comprehending Practical Exercises in conducting the more important processes of General and Pharmaceutical Chemistry; in applying Tests for discovering the Adulteration of articles of the *Materia Medica*, and the presence and nature of Poisons; and in the Examination of Mineral Waters, Animal Secretions, Urinary Deposits, Calculi, etc. 6. Of having attended to Practical Pharmacy, and of having acquired a practical knowledge of the Preparation of Medicines.

These Certificates shall be transmitted to the Registrar at least *fourteen days* before the commencement of the Examination.

The fee for this Examination shall be £5.

Candidates shall be Examined in the following subjects:—Anatomy, Physiology, (g) *Materia Medica* and Pharmaceutical Chemistry, Organic Chemistry.

The Examinations are by printed papers and *viva voce*.

EXAMINATION FOR HONOURS.

Any Candidate who has been placed in the First Division at the First M.B. Examination may be examined at the Honours Examination next following the First M.B. Examination at which he has passed, for Honours in (1) Anatomy, (2) Physiology, Histology, and Comparative Anatomy, and (3) *Materia Medica* and Pharmaceutical Chemistry, and Organic Chemistry. If in the opinion of the Examiners sufficient merit be evinced, the Candidate who shall distinguish himself the most in Anatomy, the Candidate who shall distinguish himself the most in Physiology, Histology, and Comparative Anatomy, and the Candidate who shall distinguish himself the most in *Materia Medica*, Pharmaceutical Chemistry, and Organic Chemistry, shall each receive an Exhibition of £40 per annum for the next Two Years, payable in quarterly instalments; provided that on receiving each instalment he shall declare his intention of presenting himself at the Second M.B. Examination within Three Academical Years (h) from the time of his passing the First M.B. Examination. Under the same circumstances, the First and Second Candidates in each of the preceding subjects shall each receive a Gold Medal of the value of £5.

SECOND M.B. EXAMINATION. (i)

The Second M.B. Examination shall take place once in each year, and shall commence on the first Monday in November. No Candidate shall be admitted to this Examination within Two Academical Years (k) of the time of his passing the First Examination, nor unless he have produced Certificates to the following effect:—1. Of having passed the First M.B. Examination. 2. Of having, subsequently to having passed the First M.B. Examination, attended a Course of Lectures on each of two of the subjects comprehended in the list previously given, (l) and for which the Candidate had not presented Certificates at the First M.B. Examination. 3. Of having conducted at least Twenty Labours. Certificates on this subject will be received from any legally qualified Practitioner in Medicine. 4. Of having attended the Surgical Practice of a recognised Hospital or Hospitals during two years, with Clinical Instruction and Lectures on Clinical Surgery. 5. Of having attended the Medical Practice of a recognised Hospital or Hospitals during two years, with Clinical Instruction and Lectures on Clinical Medicine. N.B.—The Student's attendance on the Surgical and on the Medical Hospital Practice specified in Regulations 4 and 5 may commence at any date after his passing the Preliminary Scientific Examination, and may be comprised either within the same year or within different years; provided that in every case his attendance on Surgical and Medical Hospital Practice be continued for at least eighteen months subsequently to his passing the First M.B. Examination. Attendance during three months in the Wards of a Lunatic Asylum recognised by the University, with Clinical Instruction, may be substituted for a like period of Attendance on Medical Hospital Practice. (m) 6. Of having, subsequently to the completion of his

(g) Any Candidate shall be allowed, if he so prefer, to postpone his Examination in Physiology from the First M.B. Examination at which he presents himself for Examination in the remaining subjects until the First M.B. Examination in the next or any subsequent year; but such Candidate shall not be admitted to compete for Honours on either occasion; and he shall not be admitted as a Candidate at the Second M.B. Examination until after the lapse of at least twelve months from the time of his passing the Examination in Physiology.

(h) See Note (d).

(i) Any Candidate for the Second M.B. Examination who has passed the First M.B. Examination under the former Regulations, will be required to have also passed the Examination in Physiology at some previous First M.B. Examination carried on under the present Regulations; at which Examination he shall not be allowed to compete for Honours.

(k) See Note (d).

(l) See First M.B. Examination, Clause 3.

(m) The Senate regard it as highly desirable that Candidates for the Degree of M.B. should practically acquaint themselves with the different forms of Insanity by attendance in a Lunatic Asylum.

attendance on Surgical and Medical Hospital Practice, attended to Practical Medicine, Surgery, or Obstetric Medicine, with special charge of patients, in a Hospital, Infirmary, Dispensary, or Parochial Union, during six months. 7. Of having acquired Proficiency in Vaccination. Certificates on this subject will be received only from the authorised Vaccinators appointed by the Privy Council. The Candidate shall also produce a Certificate of Moral Character from a Teacher in the last School or Institution at which he has studied, as far as the Teacher's opportunity of knowledge has extended. These Certificates shall be transmitted to the Registrar at least *fourteen days* before the Examination begins.

The fee for this Examination shall be £5.

Candidates shall be examined in the following subjects:—General Pathology, General Therapeutics, and Hygiene; Surgery; Medicine; Obstetric Medicine; Forensic Medicine. The Examinations shall include questions in Surgical and Medical Anatomy, Pathological Anatomy, and Pathological Chemistry. N.B.—Candidates will be expected to write Prescriptions in Latin, without abbreviations.

The Senate desire it to be understood that Bachelors of Medicine of the University of London have no right, as such, to assume the title of Doctor of Medicine.

EXAMINATION FOR HONOURS.

Any Candidate who has been placed in the First Division at the Second M.B. Examination may be Examined for Honours in (1) Medicine, (2) Obstetric Medicine, and (3) Forensic Medicine.

If in the opinion of the Examiners sufficient merit be evinced, the Candidate who shall distinguish himself the most in Medicine shall receive £50 per annum for the next two years, with the style of University Scholar in Medicine.

Under the same circumstances, the Candidate who shall distinguish himself the most in Obstetric Medicine shall receive £30 per annum for the next two years, with the style of University Scholar in Obstetric Medicine.

Under the same circumstances, the Candidate who shall distinguish himself the most in Forensic Medicine shall receive £30 per annum for the next two years, with the style of University Scholar in Forensic Medicine.

Under the same circumstances, the First and Second Candidates in each of the preceding subjects shall each receive a Gold Medal of the value of £5.

BACHELOR OF SURGERY.

The Examination for the Degree of Bachelor of Surgery shall take place once in each year, and shall commence on the Tuesday following the fourth Monday in November.

No Candidate shall be admitted to this Examination unless he have produced Certificates to the following effect:—1. Of having passed the Second Examination for the Degree of Bachelor of Medicine in this University. 2. Of having attended a Course of Instruction in Operative Surgery, and of having operated on the Dead Subject.

These Certificates shall be transmitted to the Registrar at least *fourteen days* before the Examination begins.

The fee for this Examination shall be £5.

The Examinations comprise:—Surgical Anatomy and Surgical Operations, by printed papers; Examination and Report on Cases of Surgical Patients; Performance of Surgical Operations upon the Dead Subject; Application of Surgical Apparatus; *viva voce* Interrogation.

EXAMINATION FOR HONOURS.

Any Candidate who has passed the B.S. Examination may be examined for Honours in Surgery.

If in the opinion of the Examiners sufficient merit be evinced, the Candidate who shall distinguish himself the most shall receive £50 per annum for the next two years, with the style of University Scholar in Surgery.

Under the same circumstances, the First and Second Candidates shall each receive a Gold Medal of the value of £5.

MASTER IN SURGERY.

The Examination for the Degree of Master in Surgery shall take place once in each year, and shall commence on the fourth Monday in November.

No Candidate shall be admitted to this Examination unless he have produced Certificates to the following effect:—1. Of having taken the Degree of Bachelor of Surgery (n) in this

(n) Candidates who have obtained the Degree of Bachelor of Medicine previously to 1866 will be admitted to the Examination for the Degree of Master in Surgery without having taken the Degree of Bachelor of Surgery; and in the case of such Candidates, the attendance on Surgical Practice required by Regulation 2 may commence from the date of the M.B. Degree.

University. 2. Of having attended, subsequently to having taken the degree of Bachelor of Surgery in this University—*a.* To Clinical or Practical Surgery during two years in an Hospital or Medical Institution recognised by this University; *b.* Or to Clinical or Practical Surgery during one year in an Hospital or Medical Institution recognised by this University, and of having been engaged during three years in the Practice of his Profession; *c.* Or of having been engaged during five years in the Practice of his Profession, either before or after taking the Degree of Bachelor of Surgery in this University. One year of attendance on Clinical or Practical Surgery, or two years of Practice, will be dispensed with in the case of those Candidates who at the B.S. Examination have been placed in the First Division. 3. Of Moral Character, signed by two persons of respectability.

These Certificates shall be transmitted to the Registrar at least *fourteen days* before the Examination begins.

The fee for the Degree of Master in Surgery shall be £5.

The Examination shall be conducted by means of printed papers and *viva voce* interrogation, and includes Logic and Moral Philosophy. Any Candidate who has taken the Degree either of B.A., B.Sc., or M.D. in this University is exempted from this part of the Examination; and any Candidate who has passed the Second M.B. Examination may at any subsequent M.S. Examination present himself for Logic and Moral Philosophy alone, if he so prefer; thereby gaining exemption, if he should pass, from Examination in that subject when he presents himself to be examined for the Degree of Master in Surgery.

The Examination is conducted by printed papers and *viva voce* interrogation, and includes the Dissection of a Surgical Region, or performance of Surgical Operations, and Practical Examination in Clinical Surgery.

DOCTOR OF MEDICINE.

The Examination for the Degree of Doctor of Medicine shall take place once in each year, and shall commence on the fourth Monday in November. No Candidate shall be admitted to this Examination unless he have produced Certificates to the following effect:—1. Of having passed the Second Examination for the Degree of Bachelor of Medicine in this University. 2. Of having attended, subsequently to having taken the Degree of Bachelor of Medicine in this University—*a.* To Clinical or Practical Medicine during two years in a Hospital or Medical Institution recognised by this University; *b.* Or to Clinical or Practical Medicine during one year in a Hospital or Medical Institution recognised by this University, and of having been engaged during three years in the Practice of his Profession; *c.* Or of having been engaged during five years in the Practice of his Profession, either before or after taking the Degree of Bachelor of Medicine in this University. One year of attendance on Clinical or Practical Medicine or two years of Practice, will be dispensed with in the case of those Candidates who at the Second M.B. Examination have been placed in the First Division. 3. Of Moral Character, signed by two persons of respectability.

These Certificates shall be transmitted to the Registrar at least *fourteen days* before the Examination begins.

The Fee for the Degree of Doctor of Medicine shall be £5.(o)

The Examination shall be conducted by means of printed papers and *viva voce* interrogation, and includes Logic and Moral Philosophy. (Any Candidate who has taken the Degree either of B.A., B.Sc., or M.S. in this University is exempted from this part of the Examination; and any Candidate who has passed the Second M.B. Examination may at any subsequent M.D. Examination present himself for Logic and Moral Philosophy alone, if he so prefer; thereby gaining exemption, if he should pass, from Examination in that subject when he presents himself to be examined for the Degree of Doctor of Medicine.) Medicine, including Practical Examination in Clinical Medicine.

If in the opinion of the Examiners sufficient merit be evinced, the Candidate who shall distinguish himself the most in Medicine at the Examination for the Degree of Doctor of Medicine shall receive a Gold Medal of the value of £20.

REGULATIONS RELATING TO CANDIDATES WHO COMMENCED THEIR MEDICAL STUDIES IN OR BEFORE JANUARY, 1839.

Bachelor of Medicine.—Candidates who commenced their Professional Studies in or before January, 1839, shall be required to pass the Preliminary Scientific Examination in Chemistry and Botany only, and shall be admitted to the First

Examination for the Degree of Bachelor of Medicine on producing Certificates to the following effect:—1. Of having been engaged during two years in their Professional Studies. 2. Of having attended a Course of Lectures on each of four of the subjects comprehended in the list previously given.(p) 3. Of having Dissected during nine months. 4. Of having attended to Practical Pharmacy during a sufficient length of time to enable them to acquire a practical knowledge in the Preparation of Medicines.

Candidates who commenced their Professional Studies in or before January, 1839, shall be admitted to the Second Examination for the Degree of Bachelor of Medicine on producing Certificates to the following effect:—1. Of having been engaged during four years in their Professional Studies. 2. Of having passed the First M.B. Examination. 3. Of having attended a Course of Lectures on each of two of the subjects comprehended in the list previously given.(p) 4. Of having Dissected during twelve months. 5. Of having attended to Practical Pharmacy during a sufficient length of time to enable them to acquire a practical knowledge in the Preparation of Medicines. 6. Of having conducted at least Six Labours. 7. Of having attended the Surgical Practice of a recognised Hospital or Hospitals during twelve months. 8. Of having attended the Medical Practice of a recognised Hospital or Hospitals during other twelve months. 9. Of Moral Character from a Teacher in the last School or Institution at which they have studied, as far as the Teacher's opportunity of knowledge has extended.

Candidates who have not taken a Degree in Arts, or passed the Matriculation Examination in this University, will be required to translate a portion of *Celsus de Re Medica*.

REGULATIONS RELATING TO PRACTITIONERS IN MEDICINE OR SURGERY DESIROUS OF OBTAINING DEGREES IN MEDICINE.(q)

Bachelor and Doctor of Medicine.—*Bachelor of Medicine.*—Candidates shall be admitted to the two Examinations for the Degree of Bachelor of Medicine on producing Certificates to the following effect:—1. Of having been admitted prior to the year 1840 Members of one of the legally constituted Bodies in the United Kingdom for Licensing Practitioners in Medicine or Surgery; or of having served previously to 1840 as Surgeons or Assistant-Surgeons in her Majesty's Army, Ordnance, or Navy, or in the service of the Honourable the East India Company. 2. Of having received a part of their education at a recognised Institution or School, or required by the Charter of the University. 3. Of Moral Character, signed by two persons of respectability.

Candidates who have not taken a Degree in Arts, or passed the Matriculation Examination in this University, will be required to translate a portion of *Celsus de Re Medica*.

Doctor of Medicine.—Candidates who have been engaged during five years in the Practice of their Profession shall be admitted to the Examination for this Degree on producing Certificates to the following effect:—1. Of having been engaged during five years in the Practice of their Profession. 2. Of having taken the Degree of Bachelor of Medicine in this University.

Candidates who have not taken a Degree in Arts, or passed the Matriculation Examination in this University, will be required to translate a portion of *Celsus de Re Medica*.

Examinations in 1871-72.—The following are the dates at which the several Examinations for the year 1871-72 will commence:—Matriculation: Mouday, January 9, and Monday, June 26, 1871; and Monday, January 8, 1872. Bachelor of Arts: First B.A., Monday, July 17; Second B.A., Monday, October 23. Master of Arts: Branch I., Monday, June 5; Branch II., Monday, June 12; Branch III., Monday, June 19. Doctor of Literature: First D.Lit., Monday, June 5; Second D.Lit., Tuesday, October 10. Scriptural Examinations: Tuesday, November 21. Bachelor of Science: First B.Sc. Monday, July 17; Second B.Sc., Monday, October 23. Doctor of Science: Within the first 21 days of June. Bachelor of Laws: First LL.B. and Second LL.B., Tuesday, January 10, 1871, and within the first 14 days of January 1872. Doctor of Laws: Thursday, January 19, 1871, and in the week following the LL.B. Pass Examinations in January, 1872. Bachelor of Medicine: Preliminary Scientific, Monday, July 17; First M.B., Monday, July 31; Second M.B., Monday, November 6. Bachelor of Surgery: Tuesday, November 28. Master in Surgery: Monday, November 27. Doctor of Medicine: Monday, November 27. Examination for Women: Monday, May 1.

(o) This Fee will continue to be £10 to all such as, having taken their M.B. Degree under the former Regulations, shall not have paid the Fee of £5 at the Preliminary Scientific Examination.

(p) See First M.B. Examination, Clause 3.

(q) All these Regulations are applicable exclusively to Practitioners who obtained their Licences or Commissions prior to 1840.

UNIVERSITY OF DURHAM.

For Registration.—No one shall be held to be a Student in Medicine who has not been registered in a register kept for that purpose. No one shall be so registered unless he has passed one of the preliminary Examinations recommended by the General Medical Council. Every registered Student shall receive from the Registrar a Certificate of his Registration, for which he shall pay the sum of five shillings. The Registration Examination shall be directed to the Rudiments of Religion, Literature, and Science; and shall be conducted by two or more Examiners nominated by the Warden. The registration Examination shall be held twice a year, viz.:—Shortly before the Winter Session, and shortly before the Summer Session, of the College of Medicine, Newcastle-upon-Tyne. The Registration Examination will begin at Durham, on Tuesday, September 19, 1871, and on April 17 and September 18, 1872, at 9 a.m. on each day. Applications to be made to Arthur Beanlands, Esq., Durham, at least one month before the day of Examination, to whom also Candidates must, at the same time, send the Examination fee, £1, and a Certificate of character, and specify the optional subject in which he wishes to be examined.

Subjects of Examination for September 19, 1871.—Necessary Subjects:—The History contained in the Acts of the Apostles; English Grammar and Composition; Arithmetic, including Vulgar and Decimal Fractions; Algebra, including Simple Equations; Euclid, Books I. and II.; Latin Grammar, with Virgil, *Æneid*, Lib. I. and II.; and one of the following optional subjects:—Greek Grammar, with Xenophon's *Memorabilia*; French Grammar, with Voltaire's *Charles XII.*; German Grammar, with Goëthe's *Dichtung und Wahrheit*, Book I.; Elementary Questions in Mechanics, Hydrostatics, and Pneumatics.

Subjects of Examination for April 17, and September 18, 1872.—Necessary Subjects:—The History contained in the Acts of the Apostles; English Grammar and Composition; Arithmetic, including Vulgar and Decimal Fractions; Algebra, including Simple Equations; Euclid, Books I. and II.; Latin Grammar, with—in April, *Cæsar, De Bello Gallico*, Lib. I. and II.; in September, Virgil, *Æneid*, Lib. I. and II.; and one of the following subjects:—Greek Grammar, with Xenophon's *Memorabilia*; French Grammar, with Voltaire's *Charles XII.*; German Grammar, with Goëthe's *Dichtung und Wahrheit*, Book I.; Elementary Questions in Mechanics, Hydrostatics, and Pneumatics. The following Examinations are also accepted as qualifications for Registration:—1. Durham Senior Examination of persons not Members of the University. For this, Candidates are required to satisfy the Examiners in Latin, Algebra (including Simple Equations), Euclid, (Books I. and II.); and one of the four following subjects:—(1) Greek, (2) French, (3) German, (4) Mechanics, Hydrostatics, and Pneumatics. 2. Durham Examinations for Students in Arts in their first year.

The next Senior Examinations of persons not Members of the University, will commence at Durham, on Monday, June 10, 1872, at 2 o'clock.

For Licences and Degrees.—Candidates for the Degrees of M.C., M.B., and M.D., in the University of Durham, are required to reside for three Terms at the University, either in Durham or in Newcastle.

For the Licence in Surgery.—The Regulations are the same as those for the Licence in Medicine, except that the Final Examination is directed more particularly to Surgery, and may or may not be passed at the same time as the Final Examination for the Licence in Medicine.

For the Licence in Medicine.—A Candidate must produce Certificates of Registration as a Student in Medicine, of having, after Registration, spent four years in Medical Study at one or more of the Schools recognised by the Licensing bodies named in Schedule (A) of the Medical Act, 1858, of good moral conduct, and of having attained the age of 21 years. There are two Examinations; one after the second Winter Session, the other after the fourth Winter Session, of Medical Study. The first is directed to Anatomy, Physiology, and Chemistry. The second to the other branches of Medical education, and more particularly to the Practice of Medicine.

For the Degree of Master in Surgery.—A Candidate must be a Licentiate in Surgery, and also a Licentiate in Medicine, of the University, and of the standing of eighteen Terms (six years) at least from the date of his registration at Durham, and of three Terms at least from the date of his admission to the Licence in Surgery. He must be a Bachelor of Arts, or have passed the Final Examination for B.A., or one equivalent

thereto, and must have kept one year's residence in Arts, either at Durham in the University, or at Newcastle-upon-Tyne in the Durham University College of Medicine. He must also have spent one year at least in Medical and Surgical Study at some School of Medicine in connexion with the University. The Examination for this Degree is directed chiefly to the Practice of Surgery.

For the Degree of Bachelor of Medicine.—A Candidate must be of the standing of one year at least as a Licentiate in Medicine, and of six years at least from the date of his Matriculation. He must either be a Bachelor of Arts, or have kept one year's residence in Arts, either at Durham in the University, or at Newcastle-upon-Tyne in the Durham University College of Medicine, and have passed the Final Examination for the Degree of B.A., or an equivalent thereto. He must also have spent one year at least in Medical study at some School of Medicine in connexion with the University. The Examination for this Degree is directed chiefly to the Practice of Medicine.

For the Degree of Doctor in Medicine.—A Candidate must be of the standing of one year at least as a Bachelor in Medicine of the University of Durham, and of the standing of seven years from the date of his Matriculation at Durham, and must perform such exercises as the Warden and Senate require.

The Examinations for the Licences and Degrees in Medicine and Surgery are conducted in Newcastle. Those for the Licences: 1. By Printed Papers of Questions. 2. Practically in Anatomy, Physiology, Chemistry, *Materia Medica*, Pharmacy, Surgery, Medicine, Midwifery, and Medical Jurisprudence. 3. *Vivâ voce* on all the subjects. The Examinations are held, except in special cases, yearly in the month of June, at the close of the Easter Term, and are open to Members of the University. The next Examination will begin on Monday, June 13, 1872, at 9 a.m. The Licences and Degrees are conferred in Convocation at Durham. The Examiners are appointed yearly by the Warden of the University, and approved by Convocation.

Expenses at Durham.—The average annual cost of residence at University College may be estimated at £85 to £90; at Bishop Hatfield's Hall, at £70 to £75. Students may also, with the consent of the authorities, reside in a private house or lodging (approved by the authorities) without becoming Members of any College or Hall. The University fees payable by such Students will amount to about £20 per annum.

Fees for Examination and Degrees: For Senior Middle Class Examination, £1; for Examination at the end of first year, £1; for Registration Examination, £1; for Registration, 5s.; for a Certificate in Chemistry, 10s.; for each Public Examination in Medicine or in Surgery, £1; for a Licence in Medicine, £3; for a Licence in Surgery, £3; for a Degree of Master in Surgery, £6; for a Degree of Bachelor in Medicine, £6; for a Degree of Doctor in Medicine, £6.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.

BY-LAWS RELATING TO MEMBERS.

1. The Members of the College, present and future, are alone eligible to the Fellowship. They have the use of the Library and Museum, and are admitted to all Lectures, but they are not entitled to any share in the government, or to attend or vote at General Meetings of the Corporation. 9. All persons who have been admitted before February 16, 1859, Licentiates of the College, are entitled to be admitted Members of the College under certain conditions. 3. Any Extra-Licentiate who shall have produced Testimonials as to character satisfactory to the Censors, and shall have assured the said Censors that he is not engaged in the practice of Pharmacy, and who shall comply with such other Regulations as are required by the By-laws of the said Corporation, may be proposed to the College to be admitted a Member of the College. 4. Any person who shall have satisfied the College touching his acquirements in General Science and Literature, and his knowledge of Medicine, Surgery, and Midwifery, and who shall comply with the By-laws and Regulations of the College, may be proposed to the College to be admitted a Member of the College. 5. Every Candidate for the Membership of the College, under the last By-law, who shall have commenced his Professional studies after September, 1861, shall satisfy the Censors' Board that previously to the commencement of his Professional studies he has obtained a Degree in Arts from some University of the United Kingdom or of the colonies, or from some other University specially recognised by the Medical Council, or that he has passed Examinations equivalent to

those required for a Degree in Arts. All other Candidates for Membership shall be examined on the subjects of General Education by the President and Censors of the College.

6. Every Candidate for Membership shall furnish proof that he has attained the age of 25 years. 7. Every Candidate shall produce a Testimonial from a Fellow or Member of the College, satisfactory to the Censors' Board, to the effect that, as regards moral character and conduct, he is a fit and proper person to be admitted a Member of the College. 8. Every Candidate (*except such as shall be admissible under the provisions of Sections 15 and 16*) shall produce proof of his having been engaged in Professional studies during a period of five years, of which four years at least shall have been passed at a Medical School or Schools recognised by the College. 9. Every Candidate (*except such as shall be admissible under the provisions of Sections 15 and 16*) shall produce evidence, satisfactory to the Censors' Board, of his having fulfilled the Course of Study prescribed for Licentiates of the College (see below) with the following exceptions:—(1.) The Candidate for Membership must have attended Lectures on Clinical Medicine during three Winter and three Summer Sessions, the attendance not to commence earlier than the second Winter Session, at a recognised Medical School. (2.) He must have attended diligently during three Winter Sessions and three Summer Sessions the Medical Practice, *and during three Winter Sessions and two Summer Sessions the Surgical Practice*, of an Hospital containing at least 100 beds, and have been engaged during six months in the Clinical study of Diseases peculiar to Women, and have served the office of Clinical Clerk in the Medical Wards during at least six months. [The requirements printed in italics apply to Candidates who commenced their Professional education in the United Kingdom on or after October 1, 1867, and to Candidates who commenced their Professional education at a recognised Foreign or Colonial School on or after October 1, 1868.]

10. Every Candidate who has prosecuted his studies abroad, whether in part or to the full extent required by the preceding By-law (*except such as shall be admissible under the provisions of Section 16*), shall, nevertheless, bring proof of his having attended, during at least twelve months, the Medical Practice of an Hospital in the United Kingdom containing at least 100 beds. 11. If the Censors' Board doubt the sufficiency of the Certificates and Testimonials produced by any Candidate, or his fitness, in any respect, for admission to Examination, they may submit the case to a General Meeting of the Fellows. 12. No Candidate shall be admitted to Examination who is engaged in trade; or who dispenses medicine, or makes any engagement with a chemist, or any other person, for the supply of medicines; or who practises Medicine or Surgery in partnership, by deed or otherwise, so long as that partnership continues. 13. No Candidate shall be admitted to Examination who refuses to make known, when required by the President and Censors, the nature and composition of any remedy he uses. 14. Every Candidate (except in cases specially exempted under Sections 15 and 16) shall give proof of his acquirements by written answers to questions placed before him, and shall be examined *vivâ voce* at three separate Examinations, and shall be approved by the President and Censors, or by the major part of them. 15. Any Candidate who has already obtained the Degree of Doctor or Bachelor of Medicine at a University in the United Kingdom, wherein the Courses of Study, and the Examinations to be undergone by the Students previously to graduation, shall have been adjudged by the Censors' Board to be entirely satisfactory, shall be exempt (if the Censors shall think fit) from all or any parts of the Examinations hereinbefore described, except such as relate to the Third or Pass Examination; the nature and extent of which Examination shall, in the case of each Candidate, be determined by the Censors' Board. Every Candidate for the Membership will, however, be required to translate into English a passage from a Latin author, and he will have the opportunity of showing a knowledge of Greek, or of one or more of the modern European languages. 16. If any Candidate who has attained the age of 40 years shall produce Testimonials not merely satisfactory as to his moral character and conduct, and his general and Professional acquirements, but further showing that he has improved the art or extended the science of Medicine, or has at least distinguished himself highly as a Medical Practitioner, the Censors' Board, having well weighed and considered these Testimonials, may, if they see fit, submit them to the Fellows at a General Meeting, and it shall be determined by the votes of the Fellows present, or of the majority of them, taken by ballot, whether the Candidate shall be admitted to Examination, which shall, in every such case, be as full and complete as the Censors may deem sufficient.

17. Any Candidate who shall produce satisfactory evidence of having passed an Examination on Anatomy and Physiology, conducted by any of the Bodies named in Schedule (A) to the Medical Act, and recognised by the College as requiring a Course of Study and an Examination satisfactory to the College, will be exempt from re-examination on the subjects of the Primary Examination. (a) 18. Any Candidate who shall have obtained a Degree in Surgery, at a University in the United Kingdom, after a Course of Study and an Examination satisfactory to the College, will be exempt from re-examination on Surgical Anatomy and the Principles and Practice of Surgery. 19. Any Candidate who shall have passed the Examination on Surgery conducted by the Royal College of Surgeons of England, or the Royal College of Surgeons of Edinburgh, or the Royal College of Surgeons in Ireland, after a Course of Study and an Examination satisfactory to the College, will be exempt from re-examination on Surgical Anatomy, and on the Principles and Practice of Surgery.

The Fee to be paid for admission as a Member of the College shall be 30 guineas.

BY-LAWS AND REGULATIONS RELATING TO THE EXAMINATION FOR THE MEMBERSHIP.

Every Candidate for the Membership of the College (except such as shall be admissible under the provisions of Sections 15 and 16 of the By-laws) will be required to pass the following Examinations:—

The First Examination, on Anatomy and Physiology, will be conducted on successive days, as follows:—On the First day: *Evening*, from Seven to Ten, by written questions. On the Second day: *Evening*, commencing at Seven o'clock, *vivâ voce*, on Dissections and Preparations.

The Second Examination will be conducted on successive days, as follows:—On the First day: *Evening*, from Seven to Ten, by written questions on Surgical Anatomy, and on the Principles and Practice of Surgery. On the Second day: *Morning*, the Candidate's practical knowledge will be tested, either at the College or in the Surgical Wards of an Hospital. *Afternoon*, from One to Four, on *Materia Medica*, and on *Chemistry in its applications to Pathology, Pharmacy, and Toxicology*. This Examination will be conducted partly by written questions and partly in a practical manner. *Evening*, commencing at Seven o'clock, by written questions on Midwifery and the Diseases peculiar to Women.

The Third or Pass Examination will be conducted on successive days, as follows:—On the First Day: *Afternoon*, from Two to Six, by written questions on Medical Anatomy, and on the Principles of Medicine. On the Second day: *Afternoon*, from Two to Six, by written questions on the Practice of Medicine, including the *Principles of Public Health*, and on Psychological Medicine. On the Third day: The Candidate's practical knowledge will be tested, either at the College or in the Medical Wards of an Hospital. On the Fourth day: *Afternoon*, commencing at Three o'clock, *vivâ voce*, on Medical Anatomy, and on the Principles and Practice of Medicine.

(The regulations in italics apply to Candidates who commenced their Professional Education in the United Kingdom on or after October 1, 1865; and to Candidates who commenced their Professional Education at a recognised Foreign or Colonial School on or after October 1, 1866.)

Examinations of Candidates for the Membership of the College will take place during 1871-72, in the months of October, December, February, April, and July.

Candidates will not be admitted to the First Examination until after the termination of the second Winter Session of Professional Study at a recognised Medical School, nor to the Second Examination until after the termination of four years of Professional Study, nor to the Third or Pass Examination until after the completion of the required Course of Professional Study.

Every Candidate must give fourteen days' notice in writing to the Registrar of the College of his intention to present himself for Examination, at the same time transmitting the following Certificates:—*For the Primary Examination*.—Evidence of having passed an Arts Examination; of having been duly registered as a Medical Student; and of having completed the second Winter Session of Professional Study at a recognised Medical School. *For the Second Examination*.—Evidence of having completed four years of Professional Study; of having attained the age of twenty-one years; of Instruction and Proficiency in the Practice of Vaccination; and of having attended not less than twenty labours. *For the Pass Examination*.—Proof of having attained the age of 25

(a) See Regulations relating to the Examinations.

years; a Testimonial from a Fellow or Member of the College; evidence of having completed the required Course of Professional Study.

LICENTIATES.

The College will, under its Charter, grant Licences to practise Physic, including therein the Practice of Medicine, Surgery, and Midwifery (which Licences are not to extend to make the Licentiates Members of the Corporation) to persons who shall conform to the following By-laws:—

Every Candidate for the College Licence (except when otherwise provided by the By-laws) is required to produce satisfactory evidence to the following effect:—1. Of having attained the age of 21 years. 2. Of moral character. 3. Of having passed, before the commencement of Professional Study, an Examination in the subjects of General Education recognised by the College. 4. Of having been registered as a Medical Student in the manner prescribed by the General Medical Council. 5. Of having been engaged in Professional Studies during four years, of which at least three Winter Sessions and two Summer Sessions shall have been passed at a recognised Medical School or Schools, and one Winter Session and two Summer Sessions in one or other of the following ways:—*a.* Attending the practice of an Hospital or other Institution recognised by the College for that purpose; *b.* Receiving instruction as the pupil of a legally qualified Practitioner holding any Public Appointment which affords opportunities, satisfactory to the Examiners, of imparting a practical knowledge of Medicine, Surgery, or Midwifery; *c.* Attending Lectures on any of the required subjects of Professional Study at a recognised place of instruction. (Professional Studies commenced before the Candidate shall have passed an Examination in the subjects of General Education will not be recognised by the College.) 6. Of having attended, during three Winter Sessions and two Summer Sessions, the Medical and Surgical Practice at a recognised Hospital or Hospitals, and of having discharged the duties of Clinical Clerk and Dresser for periods of not less than three months; and of having been engaged during six months in the Clinical Study of Diseases peculiar to Women. 7. Of having studied the following subjects:—Anatomy (with dissections) during two Winter Sessions; (b) Physiology during two Winter Sessions; Chemistry during six months; Practical Chemistry during three months; Materia Medica during three months; Practical Pharmacy during three months (by Practical Pharmacy is meant Instruction in the Laboratory of a Registered Medical Practitioner or of a Member of the Pharmaceutical Society of Great Britain, or of a Public Hospital or Dispensary recognised by the College); Botany during three months (this Course of Lectures may be attended prior to the commencement of Professional Studies; and any candidate producing satisfactory evidence that Botany formed one of the subjects of his Preliminary Examination will be exempt from attendance on this Course); Morbid Anatomy during six months (this includes attendance and instruction in the Post-mortem Room during the period of Clinical Study); Principles and Practice of Medicine during two Winter Sessions (it is required that the Principles of Public Health should be comprised in this Course of Lectures, or in the Course of Lectures on Forensic Medicine. The attendance on these Lectures must not commence earlier than the second Winter Session at a recognised Medical School); Principles and Practice of Surgery during two Winter Sessions (the attendance on these Lectures must not commence earlier than the second Winter Session at a recognised Medical School); Clinical Medicine during two Winter Sessions and two Summer Sessions (b) (the attendance on these Lectures must not commence until after the first Winter Session at a recognised Medical School); Clinical Surgery during two Winter Sessions and two Summer Sessions (the attendance on these Lectures must not commence until after the first Winter Session at a recognised Medical School. By Clinical Medicine and Clinical Surgery are meant special Study and Instruction at the bedside, with Lectures on Cases); Midwifery and the Diseases peculiar to Women during three months (Certificates must also be produced of attendance on not less than twenty Labours and of Instruction and Proficiency in Vaccination); Forensic Medicine during Three Months. 8. Of having passed the Professional Examinations. (The requirements printed in italics apply to Candidates who commenced their Professional education in the United Kingdom on or after October 1, 1867; and to Candidates who commenced their Professional education at a recognised Foreign or Colonial School on or after October 1, 1868.)

(b) The Winter Session comprises a period of six months, and the Summer Session a period of three months.

Any Candidate who shall produce satisfactory evidence of having passed an Examination on Anatomy and Physiology, conducted by any of the Bodies named in Schedule (A) to the Medical Act, and recognised by the College as requiring a Course of Study and an Examination satisfactory to the College, shall be exempt from re-examination on the subjects of the Primary Examination. (c) Any Candidate who shall have obtained a Degree in Medicine at a University recognised by the College, after a Course of Study and an Examination satisfactory to the College, shall be exempt from re-examination on the subjects of the Primary Examination. Any Candidate who shall have obtained a Degree in Surgery at a University in the United Kingdom, after a Course of Study and an Examination satisfactory to the College, shall be exempt from re-examination on Surgical Anatomy, and on the Principles and Practice of Surgery. Any Candidate who shall have passed the Examination on Surgery conducted by the Royal College of Surgeons of England, or the Royal College of Surgeons of Edinburgh, or the Royal College of Surgeons in Ireland, after a Course of Study and an Examination satisfactory to the College, shall be exempt from re-examination on Surgical Anatomy, and on the Principles and Practice of Surgery. Any Candidate, being a "Registered Medical Practitioner," whose Qualification or Qualifications shall have been obtained before the 1st day of January, 1861, having been, with the consent of the College, admitted a Candidate for the Licence, will be examined on the Principles and Practice of Medicine, Surgery, and Midwifery; but he will be exempted from such other parts of the Professional Examinations as his Qualifications may seem to the Examiners to render in his case unnecessary.

Licentiates of this College shall not compound or dispense medicines except for patients under their own care.

BY-LAWS AND REGULATIONS RELATING TO THE EXAMINATION FOR THE LICENCE.

Every Candidate for the College Licence, before he is admitted to Examination, will be required to sign a declaration, stating whether he has or has not been rejected within three months by any of the Examining Boards included in Schedule (A) to the Medical Act.

The First Examination, on Anatomy and Physiology, will be conducted on successive days, as follows:—on the first day: Evening, from 7 to 10, by written questions. On the second day: Evening, commencing at 7 o'clock, *vis à voce*, on Dissections and Preparations. The Second or Pass Examination will be conducted on successive days, as follows:—On the first day: Evening, from 7 to 10, by written questions on Surgical Anatomy, and on the Principles and Practice of Surgery. On the second day: Morning—The Candidate's practical knowledge will be tested, either at the College or in the Surgical Wards of an Hospital. Afternoon, from 1 to 4, on Materia Medica, and on Chemistry in its applications to Pathology, Pharmacy, and Toxicology. (d) This Examination will be conducted partly by written questions and partly in a practical manner. Evening, commencing at 7 o'clock, by written questions on Midwifery and the Diseases peculiar to Women. On the third day: Evening, from 7 to 10, by written questions on Medical Anatomy, and on the Principles and Practice of Medicine, including the Principles of Public Health. On the fourth day: Morning—The Candidate's practical knowledge will be tested, either at the College or in the Medical Wards of an Hospital. Evening, commencing at 7 o'clock, *vis à voce*, on the Principles and Practice of Medicine, Surgery, and Midwifery.

Candidates will not be admitted to the First Examination until after the termination of the second Winter Session of Professional Study at a recognised Medical School, nor to the Second or Pass Examination until after the termination of four years of Professional Study.

After October, 1870, the College will not admit to the Pass Examination any Candidate (not exempted from Registration) whose name had not been entered in the Medical Students' Register at least four years previously.

Any Candidate who shall be rejected at the First Examination will not be readmitted to examination until after the lapse of three months, and will be required to produce a Certificate

(c) See Regulations relating to the Examinations.

(d) Candidates who shall have passed the First Examination for the Licence at this College before October 1, 1867, are exempted from re-examination on Materia Medica and on Chemistry in its application to Pharmacy.

Examinations of Candidates for the College Licence will take place, commencing as follows:—For the First Examination on the first Mondays in the months of February, April, July, October, and December; and for the Second or Pass Examination on the second Mondays of the same months.

of the performance of Dissections or other Professional Study satisfactory to the Examiners during that time.

Any Candidate who shall be rejected at the School or Pass Examination will not be readmitted to examination until after the lapse of six months, and will be required to produce a Certificate of attendance on the Practice of a recognised Hospital during that time, and also of attendance on Clinical Lectures.

Every Candidate intending to present himself for examination is required to give fourteen days' notice in writing to the Registrar of the College, at the same time transmitting the following Certificates:—For the First Examination: Evidence of having passed an Arts Examination; of having been duly registered as a Medical Student; and of having completed the second Winter Session of Professional Study at a recognised Medical School. For the Second or Pass Examination: Evidence of having completed four years of Professional Study; of having attained the age of 21 years; of Instruction and Proficiency in the Practice of Vaccination; and of having attended not less than twenty labours. A testimonial of moral character is required of every Candidate.

Blank forms of the required Certificates of Attendance on Hospital Practice and on Lectures may be obtained on application at the College.

The Fee for the College Licence is Fifteen Guineas, of which Five Guineas are to be paid on admission to the First Examination, which fee will not be returned to any Candidate rejected at this Examination, but will be allowed in the fee for the Licence, and he will be admitted to one subsequent First Examination without the payment of an additional fee.

Any Candidate who shall be rejected at the Second or Pass Examination will have the fee paid on admission to this Examination returned to him, less Three Guineas.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

REGULATIONS RELATING TO THE EDUCATION AND EXAMINATION OF CANDIDATES FOR THE DIPLOMA OF FELLOW.

SECTION I.—*Preliminary Examination.*—I. Candidates will be required to produce one or other of the following Certificates or Testamurs, viz.:—1. Of Graduation in Arts at a University recognised for this purpose. The following are the Universities at present recognized, viz.:—Oxford, Cambridge, Dublin, London, Durham, Queen's University in Ireland, Edinburgh, Glasgow, Aberdeen, and St. Andrews; Calcutta, Madras, and Bombay; Canada—McGill's College, Montreal; and Queen's College, Kingston. A Certificate or Testamur of Graduation in Arts at a Foreign University, on the special recommendation of the Court of Examiners, approved by the Council. 2. Of having passed such Examinations in Arts as shall from time to time be required for Graduation in Medicine by a University recognised for this purpose. The following are the Universities at present recognized, viz.:—Oxford, Cambridge, Dublin, London, and Durham. II. Candidates who shall not be able to produce one or other of the foregoing Certificates will be required to pass an Examination in English, Classics, and Mathematics, conducted by the Board of Examiners of the Royal College of Preceptors, under the direction and supervision of the Council of the College.

The following are the subjects of the Examination referred to in the foregoing paragraph for the year 1870, viz.:—

Part I. Compulsory Subjects.—1. Reading aloud a passage from some English author. 2. Writing from dictation. 3. English Grammar. 4. Writing a short English composition: such as a description of a place, an account of some useful or natural product, or the like. 5. Arithmetic. No Candidate will be passed who does not show a competent knowledge of the first four rules, simile and compound, of Vulgar Fractions and of Decimals. 6. Questions on the Geography of Europe, and particularly of the British Isles. 7. Questions on the outlines of English History—that is, the succession of the Sovereigns and the leading events of each reign. 8. Mathematics: Euclid, Books I. and II. or the subjects thereof; Algebra to Simple Equations inclusive. 9. Translation of a passage from the second book of Caesar's Commentaries "De Bello Gallico." 10. Translation of a passage from the First Book of the Anabasis of Xenophon. 11. Translation of a passage from X. B. Saintine's "Picciola"; or, at the option of the Candidate, translation of a passage from Schiller's "Wilhelm Tell."

Part II. Optional Subjects.—Papers will also be set on the following subjects; and each Candidate will be required to offer himself for Examination on one subject, at his option:—

1. Translation of a passage in French or German, as the case may be, from the before-mentioned works. Besides these Translations into English, the Candidate will be required to answer questions on the grammar of each subject, whether compulsory or selected. 2. Mechanics. The questions will be chiefly of an elementary character. 3. Chemistry. The questions will be on the elementary facts of Chemistry. 4. Botany and Zoology. The questions will be on the classification of plants and animals. The quality of the handwriting and spelling will be taken into account. N.B. Each Candidate (who has not already paid the amount) is required to pay a fee of £2 on the morning of the first day of the Examination, prior to his admission thereto. The next Examinations will be held on or about the third Tuesday or Wednesday in June and December. The exact dates of the Examinations will be duly advertised when fixed in the Medical journals; and Candidates are required to send in the prescribed forms of application not less than three weeks before the commencement of the Examination.

Note.—Candidates who passed, prior to the 1st of January, 1870, an Examination recognised as equivalent to the Preliminary Examination for the Diploma of Member, will be required, in order to qualify for the Fellowship, to pass in Algebra, Greek, and French or German, included in Part I., and in one, at their option, of the four subjects included in Part II. of the foregoing Examination, and those who passed, subsequently to the 1st of January, 1870, an Examination equivalent to that required for the Membership, will have to pass in all the aforesaid subjects excepting Algebra, when the Certificate shall contain evidence that this last subject was included in the first-named Examination.

Special Notice.—In the case of Candidates, natives of India, the Certificates of having passed the Matriculation Examinations of the Universities of Calcutta, Madras, and Bombay will be recognised as equivalent to the foregoing Preliminary Examination, provided that they contain evidence that, in addition to the compulsory subjects thereof, the Candidate passed in Latin, and, in lieu of Greek, in one of the Eastern languages comprised in the lists of subjects issued from time to time by the respective Universities.

SECTION II. *Professional Education.*—I. Except in the cases and instances hereinafter provided for to the contrary, every Candidate for admission to the First or Anatomical and Physiological Examination for the Fellowship is required to produce the following Certificates, viz.:—1. Of having passed the Preliminary Examination appointed by the Council, or such other Examination as the Council may from time to time determine to be equivalent thereto. 2. Of having studied Practical Pharmacy during three months. 3. Of having attended Lectures on Anatomy during two Winter Sessions at a recognised School or Schools. 4. Of having performed Dissections at a recognised School or Schools during three Winter Sessions. 5. Of having attended Lectures on General Anatomy and Physiology during one Winter Session at a recognised School. 6. Of having attended a Practical Course of General Anatomy and Physiology during another Winter or a Summer Session, consisting of not less than thirty meetings of the Class, at a recognised School. Note A.—By the Practical Course referred to in Clause 6, it is meant that the learners themselves shall, individually, be engaged in the necessary experiments, manipulations, &c. 7. Of having attended one Course of Lectures on Comparative Anatomy, one Course of Lectures on Chemistry, and a three months' Course of Practical Chemistry (with Manipulations), in its application to Medical Study, at a recognised School or Schools. Note B.—The Course of Lectures on Chemistry included in Clause 7 will not be required in the case of a Candidate who shall have passed a satisfactory Examination in this subject in his Preliminary Examination. Note C.—The Certificates of attendance on the several Courses of Lectures must include evidence that the Student has attended the Practical Instructions and Examinations of his Teacher in each Course.

II. Except in the cases and instances hereinafter provided for to the contrary, every Candidate before his admission to the second Professional Examination is required to produce the following Certificates, viz.:—1. Of being 25 years of age. 2. Of having been engaged for six years in the acquirement of Professional knowledge in Hospitals or Schools of Anatomy, Surgery, and Medicine recognised by the Council of the College for that purpose; or if the Candidate be already a Member of the College, he shall produce Certificates of having been engaged for two years in the acquirement of Professional knowledge in recognised Hospitals and Schools, in addition to the Certificates required for the Diploma of Member. 3. Of having attended Lectures on Surgery, during one Winter Session, at a recognised School. 4. Of having attended a

Course of Practical Surgery during a period occupying not less than six months prior or subsequent to the Course required by the preceding Clause No. 3, at a recognised School. *Note D.*—The Course of Practical Surgery referred to in Clause 4 is intended to embrace instruction in which each pupil shall be exercised in practical details, such as in the application of Anatomical facts to Surgery, on the living person, or on the dead body; the methods of proceeding and the manipulations necessary in order to detect the effect of diseases and accidents on the living person or on the dead body; the use of Surgical apparatus; the examination of diseased structures, as illustrated in the contents of a museum of Morbid Anatomy and otherwise. 5. Of having attended, at one or more recognised School or Schools, one Course of Lectures on each of the following subjects, viz.:—Materia Medica, Medicine, Forensic Medicine. Midwifery (with practical instruction, and a certificate of having personally conducted not less than ten labours). Pathological Anatomy during not less than three months. *Note E.*—The Certificates of attendance on the several Courses of Lectures, must include evidence that the Student has attended the Practical Instructions and Examinations of his Teacher in each Course. 6. Of having performed operations on the dead body under the superintendence of a recognised Teacher. 7. Of instruction and proficiency in the practice of Vaccination. *Note F.*—In the case of Candidates who commenced their Professional Education on or after October 1, 1868, the Certificate of Instruction in Vaccination will only be received from recognised Vaccine Stations, or from recognised Vaccine Departments in Medical Schools or Hospitals, or other Public Institutions, where the appointed Teacher of Vaccination is not liable to frequent change, and where ample means for study are provided by not less than such a number of cases (eight or ten on an average weekly) as may be found, after due inquiry, to be sufficient for this purpose at each place. 8. Of having attended the Surgical Practice of a recognised Hospital or Hospitals during four Winter and four Summer Sessions, and the Medical Practice of a recognised Hospital or Hospitals during one Winter and one Summer Session. 9. Of having been individually engaged, at least twice in each week, in the observation and examination of Patients at a recognised Hospital or Hospitals, under the direction of a recognised Teacher, during not less than three months. *Note G.*—It is intended that the Candidate should receive the instruction required by Clause 9 at an early period of his attendance at the Hospital. 10. Of having attended Clinical Lectures on Surgery during two Winter and two Summer Sessions, and Clinical Lectures on Medicine during one Winter and one Summer Session at one or more recognised Hospital or Hospitals. 11. Of having attended, during three Winter and two Summer Sessions, Demonstrations in the Post-mortem Rooms of a recognised Hospital. 12. Of having served the office of House-Surgeon or Dresser, for not less than six months, in a recognised Hospital.

Notice.—The alterations in the Regulations, which are applicable to Candidates who commenced their Professional Studies on or after October 1, 1870, are contained in Clauses 3, 5, and 6, paragraph I., in Clauses 3, 4, 5, 9, 10, and 11, paragraph II., and in notes A, B, C, D, E, and G, paragraphs I. and II. of Section II.

III. In the case of a Candidate who shall have taken by Examination the Degree of Bachelor or Master of Arts in any University in the United Kingdom recognised by the Council for this purpose, it shall be sufficient for him to produce a Certificate or Certificates that he has been engaged for five years (instead of six years) in the acquirement of Professional knowledge in Hospitals or Schools of Anatomy, Surgery, and Medicine recognised by the Council of the College for that purpose.

IV. Any Member of the College shall, after the expiration of eight years from the date of his Diploma, be entitled to be admitted to the Professional Examination for the Fellowship upon the production of a Certificate, signed by three Fellows, that he has been for eight years in the practice of the Profession of Surgery, and that he is a fit and proper person to be admitted a Fellow if upon examination he shall be found qualified.

SECTION III.—*Professional Examinations.*—1. The Examinations are held twice in the year, in the months of May and November, and at such other times as the Council may appoint. 2. The Examinations occupy not less than two days, either successive or at such intervals as the Court of Examiners may appoint. 3. The first Examination on Anatomy and Physiology is partly written and partly *viva voce*, on the recently dissected subject and on prepared parts of the Human Body; the second Examination, on Pathology, Therapeutics,

and the Principles and Practice of Surgery and Medicine, (a) is partly written, partly *viva voce*, and partly on the practical use of Surgical Apparatus, and includes the examination of patients, and operations on the dead body. 4. Prior to his admission to the first or Anatomical and Physiological Examination, the Candidate is required to pay—*a.* A fee of Five Guineas, to be allowed on the fee for the Diploma of Fellow, but to be retained in case of rejection. 5. Prior to his admission to the second Professional Examination, the Candidate is required to pay—*a.*(b) A fee of Five Guineas (if a Member) over and above all charges for stamps, to be retained in case of rejection. *b.*(b) A fee of Twenty-five Guineas (if not a Member) over and above all charges for stamps, of which Five Guineas will be retained in case of rejection. 6. A Candidate whose qualifications shall be found insufficient on his Anatomical and Physiological Examination shall be referred, and shall not be allowed to present himself for re-examination until after the expiration of six months from the date of his reference. 7. A Candidate whose qualification shall be found insufficient upon his Pathological and Surgical Examination shall be referred, and shall not be allowed to present himself for re-examination until after the expiration of one year from the date of his reference, unless the Court of Examiners shall otherwise determine.

REGULATIONS RESPECTING THE EDUCATION AND EXAMINATION OF CANDIDATES FOR THE DIPLOMA OF MEMBER OF THIS COLLEGE.

I. *Preliminary General Education and Examination.*—(1.) Candidates who commenced their Professional Education on or after January 1, 1861, will be required to produce one or other of the following Certificates:—1. Of Graduation in Arts at a University recognised for this purpose. The following are the Universities at present recognised, viz.:—Oxford, Cambridge, Dublin, London, Durham, Queen's University in Ireland, Edinburgh, Glasgow, Aberdeen, and St. Andrews; Calcutta, Madras, and Bombay; Canada—M'Gill College, Montreal; and Queen's College, Kingston. 2. Of having passed an Examination for Matriculation, or such other Examination as shall, in either case, from time to time be sanctioned by the Council of this College, at a University in the United Kingdom, or at a Colonial or Foreign University recognised by the Council of this College. The following are the Examinations at present recognised under this Clause (No 2), viz.:—Oxford.—Responsions or Moderations. Middle-Class Examinations, Senior, the Certificates to include Latin and Mathematics. Cambridge.—Previous Examination. Middle-Class Examinations, Senior, the Certificates to include Latin and Mathematics. Dublin.—Entrance Examination. London.—Matriculation Examination. Durham.—Examination of Students in Arts in their second and first years. Middle-Class Examinations, Senior, the Certificates to include Latin and Mathematics. Registration Examination for Medical Students. Queen's University in Ireland.—Two years' Arts Course for Diploma of Licentiate in Arts. Preliminary Examinations at end of B.A. Course. Middle-Class Examinations, the Certificates to include Latin and Mathematics. Matriculation Examinations. Edinburgh, Aberdeen, Glasgow, and St. Andrews.—Preliminary or Extra Professional Examinations for Graduation in Medicine. Calcutta, Madras, and Bombay.—Matriculation Examinations. Canada; Queen's College, Kingston.—Matriculation Examination, Preliminary Examination of Students in Medicine; M'Gill College, Montreal; University College, Toronto; Victoria College, Toronto; University of Laval, Quebec.—Matriculation Examinations. Nova Scotia; King's College, Windsor.—Matriculation Examination. Responsions. New Brunswick; Frederickton.—Matriculation Examination. Australia: Melbourne.—Matriculation Examination, with a Certificate that the Student has passed an Examination in Latin; Sydney.—Matriculation Examination. New York; Bellevue Hospital Medical College.—Matriculation Examination. 3. Of having passed the Preliminary Ex-

(a) Candidates can claim exemption from Examination in Medicine under the following conditions, viz.:—1. The production by the Candidate of a Degree, Diploma, or Licence in Medicine entitling him to register under the Medical Act of 1858, or a Degree, Diploma, or Licence in Medicine of a Colonial or Foreign University approved by the Council of the College. 2. A declaration by the Candidate, prior to his admission to the Final Examination for the Fellowship, that it is his intention to obtain either of the Medical qualifications mentioned in the foregoing paragraph, in which case the Diploma of the College will not be issued to him until he shall produce either the said Medical qualification or proof of having passed the several Examinations entitling him to receive the same. N.B. A Candidate who has passed an Examination in Medicine for the Membership will not be required to pass any further Examination in Medicine for the Fellowship.

(b) The sum of £2 paid on the Preliminary Examination will be allowed against these amounts.

amination for the Fellowship of this College. 4. Of having passed the Preliminary Examinations of the Royal Colleges of Surgeons in Ireland and of Edinburgh, or of the Faculty of Physicians and Surgeons of Glasgow. 5. Of having passed the Examination in Arts of the Society of Apothecaries of London, or of the Apothecaries' Hall of Ireland. 6. Of having passed the First-class Examination of the Royal College of Preceptors. 7. Of having obtained the Testamentur of the Codrington College, Barbadoes. 8. Of having obtained the Degree of Associate of Arts granted by the Tasmanian Council of Education, with a Certificate that the Student has been examined in Latin and Mathematics. 9. Of having passed the Voluntary Examinations of Christ's College, Canterbury, New Zealand, the Certificate to include all the subjects required from time to time in the Preliminary Examination of the College. (2.) Candidates who shall not be able to produce one or other of the foregoing Certificates will be required to pass an Examination in English, Classics, and Mathematics, conducted by the Board of Examiners of the Royal College of Preceptors, under the direction and supervision of this College.

The following are the subjects of the Examination referred to in the foregoing paragraph for the years 1871 and 1872, viz.: Part (1.)—Compulsory Subjects:—1. Reading aloud a passage from some English author. 2. Writing from dictation. 3. English Grammar. 4. Writing a short English composition; such as a description of a place, an account of some useful or natural product, or the like. 5. Arithmetic. No Candidate will be passed who does not show a competent knowledge of the first four rules, simple and compound, of Vulgar Fractions, and of Decimals. 6. Questions on the Geography of Europe, and particularly of the British Isles. 7. Questions on the outlines of English History—that is, the succession of the Sovereigns and the leading events of each reign. 8. Mathematics: Euclid, Books I. and II., or the subjects thereof; Algebra to Simple Equations inclusive. 9. Translation of a passage from the second book of Cæsar's Commentaries, "De Bello Gallico." Part (2.)—Optional Subjects:—Papers will also be set on the following six subjects; and each Candidate will be required to offer himself for examination on one subject at least, at his option; but no Candidate will be allowed to offer himself for examination on more than four subjects:—1. Translation of a passage from the First Book of the Anabasis of Xenophon. 2. Translation of a passage from X. B. Saintine's "Picciola." 3. Translation of a passage from Schiller's "Wilhelm Tell." Besides these Translations into English, the Candidate will be required to answer questions on the grammar of each subject, whether compulsory or optional. 4. Mechanics. The questions will be chiefly of an elementary character. 5. Chemistry. The questions will be on the elementary facts of Chemistry. 6. Botany and Zoology. The questions will be on the classification of Plants and Animals. The quality of the handwriting and the spelling will be taken into account. N.B.—Each Candidate (who has not already paid the amount) is required to pay a Fee of £2 on the morning of the first day of the Examination prior to his admission thereto. The next Examination will be held on or about the third Tuesday or Wednesday in December. The exact dates of the Examination will be duly advertised when fixed in the Medical journals; and Candidates are required to send in the prescribed forms of application not less than three weeks before the commencement of the Examination.

Note.—A Candidate in order to qualify for the Fellowship is required, in addition to the subjects included in Part I., to pass in Greek, French, or German, and in one at his option of the remaining subjects in Part (2).

II. *Professional Education.*—(1.) Professional Studies prior to the date at which the Candidate shall have passed an Examination in General Knowledge in conformity with the Regulation in the preceding Section are not recognised.

(2.) The following will be considered as the commencement of Professional Education:—1. Attendance on the Practice of a Hospital, or other Public Institution recognised by this College for that purpose. 2. Instruction as the Pupil of a legally qualified Surgeon, holding the appointment of Surgeon to a Hospital, General Dispensary, or Union Workhouse, or where such opportunities of practical instruction are afforded as shall be satisfactory to the Council. 3. Attendance on Lectures on Anatomy, Physiology, or Chemistry, by Lecturers recognised by this College. *The commencement of Professional Study, otherwise than by attendance on Lectures in recognised Medical Schools, or by attendance on the Practice of recognised Hospitals, will not be admitted until a Certificate thereof shall be furnished to the Secretary for registration at the College, by the Practitioner*

whose Pupil the Candidate shall have become, or by the Medical Superintendent of the Hospital or other Institution to the practice of which he shall have entered, and will, consequently, date only from the reception of such Certificate by the Secretary; the Certificate to be accompanied by proof of having passed the necessary Preliminary Examination in General Knowledge.

(3.) Candidates will be required to produce the following Certificates, viz.:—1. Of being 21 years of age. 2. Of having been engaged, subsequently to the date of passing the Preliminary Examination, during four years; or during a period extending over not less than four Winter and four Summer Sessions in the acquirement of Professional knowledge. 3. Of having attended Lectures on Anatomy during two Winter Sessions. 4. Of having performed Dissections during not less than two Winter Sessions. 5. Of having attended Lectures on General Anatomy and Physiology during one Winter Session. 6. Of having attended a Practical Course of General Anatomy and Physiology during another Winter or a Summer Session, consisting of not less than thirty meetings of the Class. *Note A.*—By the Practical Course referred to in Clause 6, it is meant that the learners themselves shall, individually, be engaged in the necessary experiments, manipulations, &c. 7. Of having attended Lectures on Surgery during one Winter Session. 8. Of having attended a Course of Practical Surgery during a period occupying not less than six months, prior or subsequent to the Course required by the preceding Clause 7. *Note B.*—The Course of Practical Surgery referred to in Clause 8 is intended to embrace instruction in which each Pupil shall be exercised in practical details, such as in the application of Anatomical facts to Surgery, on the living person, or on the dead body. The methods of proceeding and the manipulations necessary in order to detect the effects of diseases and accidents on the living person or on the dead body. The performance, where practicable, of the operations of Surgery on the dead body. The use of Surgical apparatus. The examination of diseased structures, as illustrated in the contents of a museum of Morbid Anatomy and otherwise. 9. Of having attended one Course of Lectures on each of the following subjects, viz.:—Chemistry, Materia Medica, Medicine, Forensic Medicine, Midwifery (with practical instruction, and a Certificate of having personally conducted not less than ten labours), Pathological Anatomy during not less than three months. *Note C.*—The Course of Lectures on Chemistry included in Clause 9 will not be required in the case of a Candidate who shall have passed a satisfactory examination in this subject in his Preliminary Examination. 10. Of having studied Practical Pharmacy during three months. 11. Of having attended a three months' Course of Practical Chemistry (with Manipulations), in its application to Medical Study. 12. Of Instruction and Proficiency in the practice of Vaccination. *Note D.*—In the case of Candidates who commenced their Professional Education on or after October 1, 1868, the Certificate of Instruction in Vaccination will only be received from recognised Vaccine Stations, or from recognised vaccine departments in Medical Schools or Hospitals, or other public Institutions, where the appointed Teacher of Vaccination is not liable to frequent change, and where ample means for study are provided by not less than such a number of cases (eight or ten on an average weekly) as may be found, after due inquiry, to be sufficient for this purpose at each place. *Note E.*—The Certificates of attendance on the several Courses of Lectures must include evidence that the Student has attended the Practical Instructions and Examinations of his Teacher in each Course. 13. Of having attended, at a recognised Hospital or Hospitals, the Practice of Surgery, during three Winter(c) and two Summer(d) Sessions. 14. Of having been individually engaged, at least twice in each week, in the observation and examination of patients at a recognised Hospital or Hospitals, under the direction of a recognised Teacher, during not less than three months. *Note F.*—It is intended that the Candidate should receive the instruction required by Clause 14 at an early period of his attendance at the Hospital. 15. Of having, subsequently to the first Winter Session of attendance on Surgical Hospital Practice, attended, at a recognised Hospital or Hospitals, Clinical Lectures on Surgery, during two Winter and two Summer Sessions. 16. Of having been a Dresser at a recognised Hospital, or of having, subsequently to the completion of one year's Professional Education, taken charge of patients under the superintendence of a Surgeon, during not less than six months, at a Hospital,

(c) The Winter Session comprises a period of six months, and in England commences on October 1 and terminates on March 31.

(d) The Summer Session comprises a period of three months, and in England commences on May 1 and terminates on July 31.

General Dispensary, or Parochial or Union Infirmary recognised for this purpose, or in such other similar manner as, in the opinion of the Council, shall afford sufficient opportunity for the acquirement of Practical Surgery. 17. Of having attended, during the whole period of attendance on Surgical Hospital Practice (see Clause 13) Demonstrations in the post-mortem rooms of a recognised Hospital. 18. Of having attended, at a recognised Hospital or Hospitals, the Practice of Medicine, and Clinical Lectures on Medicine, during one Winter and one Summer Session.

Notice.—*Clauses 6, 8, 11, 14, and 17, and Notes A, B, C, E, and F, together with the Courses of Lectures on Forensic Medicine and Pathological Anatomy mentioned in Clause 9, are applicable to Candidates who commenced their Professional education on or after October 1, 1870.* N.B. Blank forms of the required Certificates may be obtained on application to the Secretary, and all necessary Certificates will be retained at the College.

III.—1. Certificates will not be received on more than one branch of Science from one and the same Lecturer; but Anatomy and Dissections will be considered as one branch of Science.

2. Certificates will not be recognised from any Hospital in the United Kingdom unless the Surgeons thereto be Members of one of the legally constituted Colleges of Surgeons in the United Kingdom; nor from any School of Anatomy and Physiology or Midwifery, unless the Teachers in such School be Members of some legally constituted College of Physicians or Surgeons in the United Kingdom; nor from any School of Surgery, unless the Teachers in such School be Members of one of the legally constituted Colleges of Surgeons in the United Kingdom.

3. No Metropolitan Hospital will be recognised by this College which contains less than 150, and no Provincial or Colonial Hospital which contains less than 100 Patients.

4. The recognition of Colonial Hospitals and Schools is governed by the same regulations with respect to number of Patients and to Courses of Lectures, as apply to the recognition of Provincial Hospitals and Schools in England.

5. Certificates of attendance upon the practice of a recognised Provincial or Colonial Hospital unconnected with, or not in convenient proximity to, a recognised Medical School, will not be received for more than one Winter and one Summer Session of the Hospital Attendance required by the Regulations of this College; and in such cases Clinical Lectures will not be necessary, but a Certificate of having acted as Dresser for a period of at least six months will be required.

6. Certificates will not be received from Candidates who have studied in London, unless they shall have registered at the College their cards of admission to attendance on Lectures and Hospital Practice within fifteen days from the commencement of the Session; nor from Candidates who have studied in the Provincial Schools in England, unless their names shall be duly returned from their respective Schools. N.B. At their first registration in October, Candidates will be required to produce a Certificate of having passed one or other of the Preliminary Examinations in General Knowledge recognised by this College.

7. Those Candidates who shall have pursued the whole of their studies in Scotland or Ireland will be admitted to Examination upon the production of the several Certificates required respectively by the College of Surgeons of Edinburgh, the Faculty of Physicians and Surgeons of Glasgow, and the College of Surgeons in Ireland from Candidates for their Diploma, together with a Certificate of instruction and proficiency in the practice of Vaccination, and satisfactory evidence of having been occupied, subsequently to the date of passing the Preliminary Examination, at least four years, or during a period extending over four Winter and four Summer Sessions, in the acquirement of Professional knowledge; and in the case of Candidates who shall have pursued the whole of their studies at recognised Foreign or Colonial Universities, upon the production of the several Certificates required for their Degree by the authorities of such Universities, together with a Certificate of instruction and proficiency in the practice of Vaccination, and satisfactory evidence of having been occupied, subsequently to the date of passing the Preliminary Examination, at least four years, or during a period extending over four Winter and four Summer Sessions, in the acquirement of Professional knowledge.

8. Members or Licentiates of any legally constituted College of Surgeons in the United Kingdom, and graduates in Surgery of any University recognised for this purpose by this College, will be admitted to Examination on producing their Diploma, Licence, or Degree, together with proof of being 21 years of

age, a Certificate of instruction and proficiency in the practice of Vaccination, and satisfactory evidence of having been occupied, subsequently to the date of passing the Preliminary Examination, at least four years, or during a period extending over four Winter and four Summer Sessions, in the acquirement of Professional knowledge.

9. Graduates in Medicine of any legally constituted College or University recognised for this purpose by this College will be admitted to Examination on adducing, together with their Diploma or Degree, proof of being 21 years of age, a Certificate of instruction and proficiency in the practice of Vaccination, and satisfactory evidence of having been occupied, subsequently to the date of passing the Preliminary Examination, at least four years, or during a period extending over four Winter and four Summer Sessions, in the acquirement of Professional knowledge.

IV. *Professional Examination.*—This Examination is divided into two parts—1. The First or Primary Examination, on Anatomy and Physiology, is partly written and partly demonstrative, on the recently dissected subject, and on prepared parts of the human body. 2. The Second or Pass Examination, on Surgical Anatomy and the Principles and Practice of Surgery and Medicine, (e) is partly written, partly oral, and partly on the practical use of Surgical apparatus, and the practical Examination of Patients. 3. The Primary Examinations are held in the months of January, April, May, July, and November, and the Pass Examinations generally in the ensuing week respectively. 4. Candidates will not be admitted to the Primary Examination until after the termination of the Second Winter Session of their attendance at a recognised School or Schools; nor to the Pass or Surgical Examination until after the termination of the fourth year of their Professional education. 5. The fee of £5 5s., paid prior to the Primary Examination, and allowed on the whole fee of £22 (f) payable for the Diploma, is retained; and after any two consecutive failures at the Primary Examination, the Candidate is required to pay an *additional* fee of £5 5s. prior to being again admitted to that Examination, which *additional* fee is also retained. 6. £5 5s., part of the sum of £16 15s., the balance of the whole fee due for the Diploma and paid prior to the Pass Examination, is retained; and after any two consecutive failures at the Pass Examination, the Candidate is required to pay an *additional* fee of £5 5s. prior to being again admitted to the said Pass Examination, which *additional* fee is also retained. 7. A Candidate having entered his name for either the Primary or the Pass Examination, who shall fail to attend the meeting of the Court for which he shall have received a card, will not be allowed to present himself for examination within the period of three months from the date at which he shall have so failed to attend. 8. A Candidate referred on the Primary Examination is required, prior to his admission to re-examination, to produce a Certificate of the performance of dissections during not less than three months, subsequently to the date of his reference. 9. A Candidate referred on the Pass Examination is required, prior to his admission to re-examination, to produce a Certificate of at least six months' further attendance on the Surgical Practice of a recognised Hospital, together with Lectures on Clinical Surgery, subsequently to the date of his reference.

QUALIFICATION IN MIDWIFERY.

REGULATIONS RESPECTING THE PROFESSIONAL EDUCATION OF CANDIDATES FOR THIS CERTIFICATE.

1. Persons who were Fellows or Members of the College prior to the 1st day of January, 1853, will be admitted to Examination for the Certificate of Qualification in Midwifery upon producing their Diploma.

2. Persons having become Members of the College subsequently to the 1st of January, 1853, will be admitted to Examination on producing their Diploma, together with a Certificate or Certificates of having attended twenty labours.

3. Members or Licentiates of any legally constituted College of Surgeons in the United Kingdom, and Graduates in Surgery of any University recognised for this purpose by this College, will also be admitted to Examination on producing, together with their Diploma, Licence, or Degree, proof of being 21 years of age—of having been occupied at least four entire years in the acquirement of Professional knowledge—of having attended one Course of Lectures on Midwifery—and of having attended not less than twenty labours.

(e) Candidates can claim exemption from Examination in Medicine under the following conditions, viz.:—1. The production by the Candidate of a Degree, Diploma, or Licence in Medicine entitling him to register under the Medical Act of 1858, or a Degree, Diploma, or Licence in Medicine of a Colonial or Foreign University approved by the Council of the College. 2. A declaration by the Candidate, prior to his admission to the Final Examination for Membership or Fellowship, that it is his intention to obtain either of the Medical qualifications mentioned in the foregoing paragraph, in which case the Diploma of the College will not be issued to him until he shall produce either the said Medical qualification or proof of having passed the several Examinations entitling him to receive the same.

(f) This sum of £22 is exclusive of the fee of £2 paid for the Preliminary Examination.

4. Graduates in Medicine of any legally constituted College or University recognised for this purpose by this College, will also be admitted to Examination on producing, together with their Diploma or Degree, proof of being 21 years of age—of having been occupied at least four entire years in the acquirement of Professional knowledge—of having completed, at recognised Schools, the Anatomical and Surgical education required of Candidates for the Diploma of Member of the College—of having attended one Course of Lectures on Midwifery—and of having attended not less than twenty labours.

5. Person having commenced their Professional education, either by attendance on Hospital Practice, or on Lectures on Anatomy, prior to the 1st of January, 1853, will be admitted to Examination on producing the several Certificates of Professional education required for admission to Examination for the Diploma of Member of this College at the period when such persons shall respectively have, in such manner, commenced their Professional education.

6. Persons having commenced their Professional education, either by attendance on Hospital Practice or on Lectures on Anatomy, after the 31st day of December, 1852, will be admitted to Examination on producing Certificates of being 21 years of age—of having been engaged during at least four entire years in the acquirement of Professional knowledge—of having completed at recognised Schools the Professional education required of Candidates for the Diploma of Member of this College—of having attended one Course of Lectures on Midwifery and the Diseases of Women and Children—and of having personally conducted thirty labours.

Note.—All Candidates who shall commence their Professional education on or after October 1, 1856, will, in addition to the Certificates enumerated in the foregoing clauses, be required to produce a Certificate of having, prior to such commencement, passed a Preliminary Examination in General Knowledge recognised by this College.

N.B.—The fee for the Certificate is as follows; viz.:—1. Persons who were Fellows or Members of this College prior to January 1, 1853, Two Guineas. 2. Persons admitted Fellows or Members of this College subsequently to January 1, 1853, Three Guineas. 3, 4. Persons producing any other Diploma or Certificate or Degree which may be considered by the Council to afford satisfactory proof of sufficient Surgical and Medical education, Three Guineas. 5, 6. All other persons, Ten Guineas.

The Examinations are held in the months of February, May, August, and December.

REGULATIONS RESPECTING THE PROFESSIONAL EDUCATION OF CANDIDATES FOR THE EXAMINATION IN DENTAL SURGERY.

Candidates are required to produce the following Certificates:—

1. Of being 21 years of age.
2. Of having been engaged during four years in the acquirement of Professional knowledge.
3. Of having attended, at a School or Schools recognised by this College, not less than one of each of the following Courses of Lectures, delivered by Lecturers recognised by this College, viz.:—Anatomy, Physiology, Surgery, Medicine, Chemistry, and Materia Medica.
4. Of having attended a second Winter Course of Lectures on Anatomy, or a Course of not less than twenty Lectures on the Anatomy of the Head and Neck, delivered by Lecturers recognised by this College.
5. Of having performed Dissections at a recognised School during not less than nine months.
6. Of having completed a course of Chemical Manipulation, under the superintendence of a Teacher or Lecturer recognised by this College.
7. Of having attended, at a recognised Hospital or Hospitals in the United Kingdom, the Practice of Surgery and Clinical Lectures on Surgery during two Winter Sessions.
8. Of having attended, at a recognised School, two Courses of Lectures upon each of the following subjects, viz.:—Dental Anatomy and Physiology (Human and Comparative), Dental Surgery, Dental Mechanics, and one Course of Lectures on Metallurgy, by Lecturers recognised by this College.
9. Of having been engaged during a period of not less than three years in acquiring a practical familiarity with the details of Mechanical Dentistry, under the instruction of a competent Practitioner.
10. Of having attended at a recognised Dental Hospital, or in the Dental department of a recognised General Hospital, the Practice of Dental Surgery during two Winter and two Summer Sessions.

N.B. The Students of the London Schools are required to register the above Certificates at this College, and special returns will be required from the Provincial Schools.

The fee for the Certificate of fitness to practise as a Dentist is Ten Guineas, over and above any stamp duty.

Members of the College will be examined only by the section of the Board consisting of persons skilled in Dental Surgery.

A Candidate whose qualification shall be found insufficient, will be referred back to his studies, and will not be admitted to re-examination within the period of six months unless the Board shall otherwise determine.

SOCIETY OF APOTHECARIES (ENGLAND).

Every Candidate for a Certificate of Qualification to practise as an Apothecary will be required to produce testimonials—

1. Of having passed a Preliminary Examination in Arts, as a test of general education. (This Examination must be passed before the commencement of Professional Studies, which is defined by the Medical Council to be “the time of commencing studies at a Medical School.”)
2. Of having served an apprenticeship or pupilage of not less than five years to a Practitioner qualified by the Act of 1815. This period may include the time spent in attending Lectures and Hospital Practice.)
3. Of having attained the full age of 21 years, of which satisfactory evidence will be required.
4. Of good moral conduct.
5. Of having pursued a course of Medical study in conformity with the regulations of the Court.

Course of Study.—Every Candidate whose attendance on Lectures shall have commenced on and after October 1, 1863, must attend the following Lectures and Medical Practice during not less than three Winter and two Summer Sessions (each

Winter Session to consist of not less than six months, and to commence not sooner than the 1st nor later than the 15th of October; and each Summer Session to extend from May 1 to July 31):—

First Year.—Winter Session: Chemistry; Anatomy and Physiology; Dissections. Summer Session: Botany; Materia Medica and Therapeutics; Practical Chemistry.

Second Year.—Winter Session: Anatomy and Physiology, including Dissections and Demonstrations; Principles and Practice of Medicine; Clinical Medical Practice. Summer Session: Midwifery and Diseases of Women and Children, and Vaccination; Forensic Medicine and Toxicology; Clinical Medical Practice.

Third Year.—Winter Session: Principles and Practice of Medicine; Clinical Medical Lectures; Morbid Anatomy; Clinical Medical Practice.

N.B.—All Medical Students presenting themselves for the Second Examination shall produce evidence of having served the office of Clinical Clerk at a recognised Hospital during the period of six weeks at least; and also shall produce evidence that they have been examined at the Class Examinations instituted by the various Lecturers and Professors of their respective Medical Schools and Colleges.

No Certificates of Lectures or of Anatomical Instruction delivered in private to particular Students, apart from the ordinary classes of recognised Public Medical Schools, can be received by the Court of Examiners.

All Students are required *personally* to register the several tickets of admission to Lectures and Medical Practice within the first fifteen days of the months of October and May.

Examination in Arts.—Examinations will be held at the Hall of the Society on Friday and Saturday, January 26 and 27, April 26 and 27, September 27 and 28. Candidates will be examined in the following branches; and no Candidate will be approved unless he show a competent knowledge of each branch of the Examination:—1. The English Language; 2. The Latin Language; 3. Mathematics; 4. One of the following subjects, at the option of the Candidate:—(a) Greek, (b) French, (c) German, (d) Natural Philosophy. Candidates applying to be admitted to any Examination must pay the fee (one guinea) at least one week before the Examination, and must sign their names in the Candidates' Book between 11 a.m. and 3 p.m. o'clock, not later than the previous Thursday. If a Candidate fail to pass the Examination, the fee will not be returned to him, but he will be admissible to either or both of the two next following Examinations in Arts without the payment of an additional fee, upon giving the usual notice, and signing the Candidates' Book.

Syllabus of Subjects for Examination, 1872.—I. The English Language: The leading features of its history; its structure and grammar; English composition. [The books recommended for study in this subject are Adams's “Elements of the English Language” and Trench's “English, Past and Present.”] II. The Latin Language: January Examination—Virgil: *Æneid*, Books i. and ii. April Examination—Cicero: *Orat. pro Milone*. September Examination—Horace: *Odes*, Books iii. and iv. Re-translation of easy sentences. Grammatical questions will be introduced into the Latin paper, and each Candidate will be expected to give satisfactory answers to these. III. Mathematics: The ordinary rules of arithmetic; vulgar and decimal fractions; addition, subtraction, multiplication, and division of algebraical quantities; simple equations; the first two Books of Euclid. IV. (a) Greek: Herodotus, Book i.; grammatical questions. (b) French: Molière, *Le Bourgeois Gentilhomme*; translation from English into French; grammatical questions. (c) German: Schiller's poems, *Der Taucher* and *Der Gang nach dem Eisenhammer*; translation of short sentences from English into German; grammatical questions. (d) Natural Philosophy: Mechanics; hydrostatics and pneumatics. [The book recommended for study in this subject is Snowball's “Cambridge Course of Elementary Natural Philosophy.”]

Certificates in Arts granted by any of the bodies whose Certificate is recognised by the Medical Council will be accepted from Candidates who present themselves at the Professional Examination at the Hall as equivalent to their having passed this Examination.

Professional Examinations.—The Court of Examiners meet in the Hall every Thursday, where Candidates are required to attend at 3.45 p.m. Every person intending to offer himself for examination must give notice in writing to the Clerk of the Society on or before the Monday previous to the day of examination, and must at the same time deposit all the required testimonials and the fee at the office of the Beadle, where attendance is given every day, except Sunday, from 10 to 4 o'clock; Saturday, 10 to 2.

The examination of Candidates is divided into two parts, and is conducted partly in writing and partly *vivà voce*.

The First Examination, which may be passed after the second Winter Session, embraces the following subjects:—The British Pharmacopœia; Latin of Physicians' Prescriptions;

Botany, and Physiology; General and Practical Chemistry; Botany, and Materia Medica.

Second or Pass Examination, after the third Winter Session (the five years' pupilage being completed):—Principles and Practice of Medicine; Pathology and Therapeutics; Midwifery, including the Diseases of Women and Children; Forensic Medicine and Toxicology.

All Graduates in Medicine of British Universities will be admitted to a Practical Examination in Medicine and Midwifery only.

Licentiates of the Royal College of Physicians, London; of the Royal College of Physicians, Edinburgh; of the Royal Colleges of Physicians and Surgeons, Edinburgh; of the King and Queen's College of Physicians, Ireland; of the Faculty of Physicians and Surgeons, Glasgow; and of the Apothecaries' Hall of Dublin, will be admitted to a *viva voce* Examination in Medicine, Midwifery, Forensic Medicine, and Toxicology.

Members of the Royal College of Surgeons, England; Licentiates of the Royal College of Surgeons, Edinburgh; and Licentiates of the Royal College of Surgeons, Ireland, possessing a Surgical qualification only, will be admitted to a First and Second Examination on one evening. The First or *viva voce* Examination will include the subjects of Physicians' Prescriptions, Visceral Anatomy, Physiology, Chemistry, Materia Medica, Botany, and Pharmacy; the Second, which is partly written and partly *viva voce*, will include the subjects of Practice of Medicine, Pathology, Therapeutics, Midwifery, Forensic Medicine, and Toxicological Chemistry.

Any Candidate who has passed his First Examination for the Licence of the Royal College of Physicians, London; the Licence of the King and Queen's College of Physicians, Ireland; the joint Licence of the Royal College of Physicians and Surgeons, Edinburgh, or for the single Licence of the College of Physicians, Edinburgh; the Licence of the Faculty of Physicians and Surgeons, Glasgow; the first Professional Examination for the Degree of M.B., or Master in Surgery, in the Universities of Oxford, Cambridge, or London; or the second part of the Professional Examination for the Degree of M.B., or Master in Surgery, in the Universities of Edinburgh, Aberdeen, St. Andrews, and Glasgow; or the First Examination for the Medical and Surgical Degrees in the Irish Universities; or the First Examination for the Licence of the Apothecaries' Company, Dublin, will be admitted to a single Examination in Materia Medica, Therapeutics, Medicine, Pathology, Midwifery, and Toxicology, part of which Examination will be conducted in writing.

The Examination of Candidates for Certificates of qualification to act as Assistant, in compounding and dispensing medicines, is as follows:—In translating Physicians' Prescriptions, in the British Pharmacopœia, in Pharmacy, Pharmaceutical Chemistry, and Materia Medica.

By the 22nd section of the Act of Parliament, no rejected Candidate for the Licence can be re-examined until the expiration of six months from his former Examination. A Candidate rejected on his first Professional Examination can be admitted to re-examination after the expiration of three months. No rejected Candidate as an Assistant can be re-examined until the expiration of three months.

• *Fees*.—For a Certificate of qualification to practise, six guineas, the half to be paid at the First Examination; for an Assistant's Certificate, two guineas.

Students' Prizes.—The Society of Apothecaries annually offer two prizes for proficiency in the knowledge of Botany, and also two prizes for proficiency in the knowledge of Materia Medica and Pharmaceutical Chemistry. The prizes consist of a gold medal awarded to the Candidate who distinguishes himself the most in the Examination; and of a silver medal and a book to the Candidate who does so in the next degree.

The Examination in Botany will be held at the Hall of the Society on the second Wednesday in June, at 10 a.m., and will be conducted by printed papers and *viva voce* questions.

The Examinations in Materia Medica and Pharmaceutical Chemistry will be held at the Hall of the Society on the third Wednesday, and on the following Friday, in October, from ten in the forenoon to one in the afternoon of each day; by printed papers on the Wednesday, and by *viva voce* questions on the Friday.

The Society's Botanic Garden at Chelsea is open daily (except Sunday) from ten till five o'clock p.m., and on Saturdays from ten till two o'clock. Tickets of admission may be had on application at the Beadle's Office, Apothecaries' Hall, Blackfriars, E.C.

ARMY MEDICAL DEPARTMENT,

WHITEHALL-YARD.

QUALIFICATIONS AND EXAMINATION OF CANDIDATES FOR COMMISSIONS IN THE ARMY MEDICAL SERVICE.

1. Every Candidate desirous of presenting himself for admission to the Army Medical Service must be unmarried, and not under 21 nor over 28 years of age. He must produce a Certificate from the District Registrar, in which the date of birth is stated; or, if this cannot be obtained, an affidavit from one of the parents or other near relative, who can attest the date of birth, will be accepted. He must produce a Certificate of moral character from the parochial minister, if possible.

2. The Candidate must make a declaration that he labours under no mental or constitutional disease, nor any imperfection or disability that can interfere with the most efficient discharge of the duties of a Medical officer in any climate. (a) He must also attest his readiness to engage for general service, and to proceed on foreign service when required to do so.

3. The Candidate must be registered under the Medical Act of 1858 as licensed to practise Medicine and Surgery in Great Britain or Ireland.

4. Certificates of registration, character, and age must accompany this Schedule when filled up and returned.

5. Candidates will be examined by the Examining Board in the following subjects:—Anatomy and Physiology, Surgery, Medicine (including Therapeutics), the Diseases of Women and Children, Chemistry and Pharmacy, and a practical knowledge of drugs. (The Examination in Medicine and Surgery will be in part practical, and will include operations on the dead body, the application of Surgical apparatus, and the examination of Medical and Surgical patients at the bedside.) The eligibility of each Candidate for the Army Medical Service will be determined by the result of the Examinations in these subjects only. Candidates who desire it will be examined in Comparative Anatomy, Zoology, Natural Philosophy, Physical Geography, and Botany with special reference to Materia Medica; and the number of marks gained in these subjects will be added to the total number of marks obtained in the obligatory part of the Examination by Candidates who shall have been found qualified for admission, and whose position on the list of successful competitors will thus be improved in proportion to their knowledge of these branches of science. Marks will also be given to Candidates who are willing to pass an Examination in French and German.

6. After passing this Examination, every Candidate will be required to attend one entire course of practical instruction at the Army Medical School on—(1) Hygiene; (2) Clinical and Military Medicine; (3) Clinical and Medical Surgery; (4) Pathology of Diseases and Injuries incident to Military Service.

7. At its conclusion, the Candidate will be required to pass an Examination on the subjects taught in the School. If he give satisfactory evidence of being qualified for the practical duties of an Army Medical Officer, he will be eligible for a Commission as Assistant-Surgeon.

8. During the period of his residence at the Army Medical School each Candidate will receive an allowance of 5s. per diem with quarters, or 7s. per diem without quarters, to cover all costs of maintenance, and he will be required to provide himself with uniform (*viz.*, the regulation undress uniform of an Assistant-Surgeon, but without the sword).

9. All Candidates will be required to conform to such rules of discipline as the Senate may from time to time enact.

EXTRACTS FROM THE ROYAL WARRANT (April 1, 1867) FOR THE PAY AND NON-EFFECTIVE PAY OF MEDICAL OFFICERS.

The daily rates of pay of the Officers of the Medical Branch of the Hospital Department of our Army shall be as follows:—

Medical Staff.—Daily Pay: Director-General, special; Inspector-General, £2, after twenty-five years' service £2 5s., after thirty years' service £2 7s., after thirty-five years' service £2 10s.; Deputy Inspector-General, £1 10s., after twenty-five years' service £1 12s., after thirty years' service £1 15s., after

(a) His physical fitness will be determined by a Board of Medical Officers, who are required to certify that the Candidate's vision is sufficiently good to enable him to perform any Surgical operation without the aid of glasses. A moderate degree of myopia would not be considered a disqualification, provided it did not necessitate the use of glasses during the performance of operations, and that no organic disease of the eyes existed. Every Candidate must also be free from organic disease of other organs, and from constitutional weakness or other disability likely to unfit him for military service in any climate.

thirty-five years' service £1 17s.; Surgeon-Major, £1 4s., after twenty-five years' service £1 7s.; Surgeon, 17s. 6d., after fifteen years' service 20s.; Assistant-Surgeon, on appointment, 10s., after five years' service 12s. 6d., after ten years' service 15s., after fifteen years' service 17s. 6d. Charge Pay: The Officer in Medical charge of an army in the field, of 10,000 men and upwards, £1 daily; of 5000 men and upwards, 15s. daily; of less than 5000, 10s. daily; or, in Medical charge of a colony where the number of commissioned officers and enlisted men is 1500 and upwards, 5s. daily.

Apothecaries' Daily Pay.—Apothecaries, 9s., after five years' service 10s. 6d., ten years' 12s., fifteen years' 13s. 6d., twenty years' 15s., twenty-five years' 16s. 6d., thirty years' 18s.

Medical officers have the right to retire on half-pay after twenty years' service; Medical officers of the rank of Surgeon-Major, Surgeon, or Assistant-Surgeon shall be placed on the retired list at the age of 55, and all Inspectors-General and Deputy Inspectors-General at the age of 65 years.

An Apothecary shall have the right to retire on half-pay after thirty years' good service.

Non-effective Pay: A Medical officer placed on half-pay by reduction of establishment, or on the report of a Medical Board, in consequence of wounds or ill-health caused in and by the discharge of his duties, or on account of age, shall be entitled to half-pay at the following daily rates:—Inspector-General, after thirty years' service £1 17s. 6d., twenty-five years' £1 13s. 6d., twenty years' £1 10s.; Deputy Inspector-General, after thirty years' £1 5s. 6d., twenty-five years' £1 2s. 6d., twenty years' £1 1s.; Surgeon-Major, after twenty-five years' £1, twenty years' 16s. 6d.; Surgeon, after fifteen years' 13s. 6d., ten years' 11s.; Assistant-Surgeon, after ten years' 10s., five years' 8s., under five years' 6s.

The rate of half-pay awarded to officers retiring for their own convenience, after twenty years' service on full-pay, shall not exceed one-half of their full-pay at the time of retirement.

ARMY MEDICAL SCHOOL.

President of the Senate.—Sir T. Galbraith Logan, K.C.B., M.D., Director-General of the Army Medical Department.

Members of the Senate.—Sir Ranald Martin, C.B., Physician to the Indian Council; Inspector-General G. S. Beatson, M.D., C.B., Principal Medical Officer Royal Victoria Hospital; Deputy-Inspector-General T. Longmore, C.B., Professor of Military Surgery; Deputy-Inspector-General W. C. Maclean, Professor of Military Medicine; William Aitkin, M.D., Professor of Pathology; E. A. Parkes, M.D., F.R.S., Professor of Military Hygiene.

Assistant-Professors.—Staff Surgeons-Major W. A. Makinon, C.B., and W. J. Fyffe, M.D.; Staff Surgeon F. S. B. F. De Chaumont, M.D.; and Staff Assistant-Surgeon V. Wearne.

Candidates for Commissions in the Army, and in the Queen's Indian Service, proceed to Netley after passing the Examination in London. At Netley they attend the Medical and Surgical Practice of the Royal Victoria Hospital, and learn the system and arrangements of Military Hospitals. During four months they attend the Lectures given by the Professors and Assistant-Professors, and go through a course of Practical Instruction in the Hygienic Laboratory and Microscopical Room.

NAVAL MEDICAL DEPARTMENT, ADMIRALTY.

QUALIFICATIONS AND EXAMINATION OF CANDIDATES FOR COMMISSIONS IN THE MEDICAL SERVICE OF THE ROYAL NAVY.

The Lords Commissioners of the Admiralty are pleased to direct that the following Regulations, relative to the Examination of Candidates for the Appointment of Assistant-Surgeon in the Royal Navy, shall in future be adopted:—

1. Every Candidate desirous of presenting himself for admission to the Naval Medical Service must be not under 21 nor over 28 years of age. He must produce a Certificate from the District Registrar, in which the date of birth is stated; or, if this cannot be obtained, an affidavit from one of the parents or other near relative, who can attest the date of birth, will be accepted. He must also produce a certificate of moral character.

2. The Candidate must make a declaration that he labours under no mental or constitutional disease, nor any imperfection or disability that can interfere with the most efficient dis-

charge of the duties of a Medical officer in any climate. (a) He must also attest his readiness to engage for general service, and to proceed on foreign service when required to do so.

3. The Candidate must be registered under the Medical Act of 1858, as licensed to practise Medicine and Surgery in Great Britain or Ireland, and he must have performed the Capital and Minor Operations of Surgery under a recognised teacher.

4. Certificates of registration, character, and age must accompany the Schedule when filled up and returned.

5. Candidates will be examined by the Examining Board in the following subjects:—Anatomy and Physiology; Surgery; Medicine, including Therapeutics, the Diseases of Women and Children; Chemistry and Pharmacy, and a practical knowledge of Drugs. (The Examination in Medicine and Surgery will be in part practical, and will include Operations on the Dead Body, the Application of Surgical Apparatus, and the Examination of Medical and Surgical Patients at the Bedside.) The eligibility of each Candidate for the Naval Medical Service will be determined by the result of the Examinations in these subjects only.

Candidates who desire it will be Examined in Comparative Anatomy, Zoology, Natural Philosophy, Physical Geography, and Botany, with special reference to *Materia Medica*; and the number of marks gained in these subjects will be added to the total number of marks obtained in the obligatory part of the Examination by Candidates who shall have been found qualified for admission, and whose position on the list of successful competitors will thus be improved in proportion to their knowledge of these branches of science.

6. After passing this Examination, every Candidate will be required to attend one entire Course of Practical Instruction in the Medical School at Netley, on—(1) Hygiene; (2) Clinical and Naval and Military Medicine; (3) Clinical and Naval and Military Surgery; (4) Pathology of Diseases and Injuries incidental to Naval and Military Service.

7. At its conclusion, the Candidate will be required to pass an Examination on the subjects taught in the School. If he give satisfactory evidence of being qualified for the practical duties of a Naval Medical Officer, he will be eligible for a commission as Assistant-Surgeon.

8. During the period of his residence at the Netley Medical School, each Candidate will receive an allowance of 5s. per diem with quarters, or 7s. per diem without quarters, to cover all costs of maintenance; and he will be required to provide himself with uniform—viz., the regulation undress uniform of an Assistant-Surgeon, but without the sword.

9. All Candidates will be required to conform to such rules of discipline as the Senate may from time to time enact.

10. After completing three years' full-pay service, Assistant-Surgeons will be allowed to be examined for the rank of Surgeon; but no Assistant-Surgeon can be promoted to the rank of Surgeon until he shall have served five years, two of which must have been in a ship actually employed at sea.

REGULATIONS SHOWING RANK, PAY, AND POSITION OF NAVAL MEDICAL OFFICERS.

1. Assistant-Surgeons at home, after completing their time for Examination for the rank of Surgeon, may be granted two months' leave of absence on full-pay, on condition of their resuming their studies at a Medical School or Hospital.

2. Promotion to the rank of Staff Surgeon is open to Officers for distinguished or special service, although twenty years on full-pay may not have been completed; such Staff Surgeons will have 16s. a-day half-pay.

3. Staff Surgeons rank with Commanders, according to date of commission.

4. The whole time served on full-pay as an Assistant-Surgeon to be allowed to Surgeons to qualify for the rank of Staff Surgeon, provided the Examination for Surgeon is passed before the Officer completes ten years service, otherwise only ten years served as Assistant-Surgeon will be allowed to count.

5. Staff Surgeons are appointed to the Flag Ships of Commanders-in-Chief on foreign stations, with an allowance of 5s. a day in addition to their established pay.

6. The Hospital allowances for Naval Medical Officers at home and abroad, in lieu of provisions for themselves and servants, and for fuel and light, are as follows:—

	At Home.	Abroad.
	£	£
Inspector-General of Hospitals	85	130
Deputy Inspectors-General	67	112
Staff Surgeons and Surgeons	53	112
Assistant-Surgeons	39	108

In cases where Medical Officers draw provisions or fuel from public stores, they will be charged for the same at cost price.

7. The travelling allowances, extra pay, lodging money, and compensa-

(a) His physical fitness will be determined by a Board of Medical Officers, who are required to certify that the Candidate's vision is sufficiently good to enable him to perform any Surgical operation without the aid of glasses. Every Candidate must also be free from organic disease of other organs, and from constitutional weakness or other disability likely to unfit him for Naval Service in any climate.

tion for losses, are fixed for Naval Medical Officers according to their relative rank in the Service.

8. Medical Officers have cabins according to their relative rank in the Service, excepting always that the Senior Executive Officer of whatever rank has the one most suitable for his duties.

9. The full- and half-pay of Naval Medical Officers is in accordance with the following scale:—Full pay: Inspector-General of Hospitals and Fleets—On promotion or under twenty-five years' service, £2 5s.; ditto or above twenty-five years' service, £2 6s.; and for each additional year of service 1s. a day more until the maximum is reached—namely, £2 10s. Deputy Inspector-General of Hospitals and Fleets—On promotion or under twenty-two years' service, £1 11s.; ditto or above twenty-two years' service, £1 12s.; and for each additional year of service 1s. a day more until the maximum is reached—namely, £1 18s. Staff Surgeon—On promotion or under twenty years' service, £1 13s.; ditto or above twenty years' service, £1 4s.; and for each additional year of service 1s. a day more until the maximum is reached—namely, £1 10s. Surgeon—On promotion or under fourteen years' service, 18s.; ditto or under seventeen years' service, £1; and for each additional year of service 1s. a day more until the maximum is reached—namely, £1 2s. Assistant-Surgeon—Under five years' service, (b) 11s.; under eight years' service, 12s. 6d.; under eleven years' service, 14s.; under fourteen years' service, provided he passed his Examination for Surgeon while under ten years' service, 15s. 6d.; above fourteen years' service, ditto, 17s. Half-pay: Assistant-Surgeon—Under five years' service, 6s.; under eight years' service, 8s.; under eleven years' service, 10s.; above eleven years' service, provided he passed his Examination for Surgeon while under ten years' service, 11s. Surgeon—On promotion or under fourteen years' service, 11s.; ditto or under seventeen years' service, 13s.; ditto or above seventeen years' service, 14s. Staff Surgeon—On promotion or under twenty years' service, 16s.; ditto or above twenty years' service, 16s. 6d.; and for each additional year of service 6d. a day more until the maximum is reached—namely, 18s. 6d. Deputy Inspector-General of Hospitals and Fleets—On promotion or under twenty-two years' service, £1 1s.; ditto or above twenty-two years' service, £1 2s.; and for each additional year of service 1s. a day more until the maximum is reached—namely, £1 7s. Inspector-General of Hospitals and Fleets—On promotion or under twenty-five years' service, £1 11s.; ditto or above twenty-five years' service, £1 12s.; and for each additional year of service 1s. a day more until the maximum is reached—namely, £1 18s.

10. Retirement is provided for according to age and service, under special regulations.

11. My Lords will consider, and publish hereafter, the manner in which it may be found most advisable to assist Naval Medical Officers in their Professional education after examination and admission into the Navy.

RULES AND REGULATIONS

OF THE

EXAMINING MEDICAL BODIES IN SCOTLAND.

UNIVERSITY OF EDINBURGH.

THE Session 1871-72 will be publicly opened on Wednesday, November 1, 1871, when an address will be delivered by the Principal.

GRADUATION IN MEDICINE—STATUTES OF THE UNIVERSITY OF EDINBURGH RELATIVE TO GRADUATION IN MEDICINE AND SURGERY.

Three Medical Degrees are conferred by the University of Edinburgh—viz., Bachelor of Medicine (M.B.), Master in Surgery (B.M.), and Doctor of Medicine (M.D.). The Degree of Master in Surgery is not conferred on any person who does not also at the same time obtain the Degree of Bachelor of Medicine.

I. The preliminary branches of extra-Professional education are—English, Latin, Arithmetic, the Elements of Mathematics, and the Elements of Mechanics; and the proficiency of Students in these branches is ascertained by examination prior to the commencement of their Medical study.

II. No Candidate is admitted to a Professional Examination who has not passed a satisfactory Examination on at least two of the following subjects (in addition to the subjects mentioned above):—Greek, French, German, Higher Mathematics, Natural Philosophy, Logic, Moral Philosophy; and the Examination on these latter subjects also takes place before the Candidate has entered on his Medical Curriculum.

III. A Degree in Arts (not being an Honorary Degree) in any one of the Universities of England, Scotland, or Ireland, or in any Colonial or Foreign University, specially recognised for this purpose by the University Court, exempts from all preliminary examination; and an Examination in Arts by any corporate body whose Examination has been recognised as qualifying for entrance on Medical study by resolution of the General Medical Council of the United Kingdom, provided the said Examination by the said corporate body shall be also approved by the University Court, shall exempt from preliminary Examination in Arts, on all subjects comprised in the said Examination of the said corporate body.

(b) Except during Session at Netley (see Regulations).

IV. No one is admitted to the Degree of Bachelor of Medicine or Master in Surgery who has not been engaged in Medical and Surgical study for four years—the Medical Session for each year, or *Annus Medicus*, being constituted by at least two Courses of not less than one hundred lectures each, or by one such Course, and two Courses of not less than fifty lectures each; with the exception of the Clinical Courses, in which lectures are to be given at least twice a week during the prescribed periods.

V. Every Candidate for the Degrees of M.B. and C.M. must give sufficient evidence by Certificates—

1. That he has studied each of the following departments of Medical Science—viz., Anatomy, Chemistry, Materia Medica, Institutes of Medicine or Physiology, Practice of Medicine, Surgery, Midwifery and the Diseases peculiar to Women and Children (two Courses of Midwifery of three months each being reckoned equivalent to a six months' Course, provided different departments of Obstetric Medicine be taught in each of the Courses), General Pathology (or, in Schools where there is no such Course, a three months' Course of Lectures on Morbid Anatomy, together with a supplemental Course of Practice of Medicine, or Clinical Medicine), during Courses including not less than one hundred lectures; Practical Anatomy, a Course of the same duration as those of not less than one hundred lectures above prescribed; Practical Chemistry, three months; Practical Midwifery, three months at a Midwifery Hospital, or a Certificate of attendance on six cases from a registered Medical Practitioner; Clinical Medicine, Clinical Surgery, Courses of the same duration as those of not less than one hundred lectures above prescribed, or two Courses of three months, lectures being given at least twice a week; Medical Jurisprudence, Botany, Natural History, including Zoology, during Courses including not less than fifty lectures. (a)

2. That he has attended for at least two years the Medical and Surgical Practice of a General Hospital which accommodates not fewer than eighty patients, and possesses a distinct staff of Physicians and Surgeons.

3. That he has been engaged for at least three months, by apprenticeship or otherwise, in compounding and dispensing drugs at the Laboratory of an Hospital, Dispensary, Member of a Surgical College or Faculty, Licentiate of the London or Dublin Society of Apothecaries, or a Member of the Pharmaceutical Society of Great Britain.

4. That he has attended for at least six months, by apprenticeship or otherwise, the out-practice of an Hospital, or the practice of a Dispensary, Physician, Surgeon, or Member of the London or Dublin Society of Apothecaries. (b)

VI. The studies of Candidates for the Degrees of Bachelor of Medicine and Master in Surgery are subject to the following Regulations:—

1. One of the four years of Medical and Surgical study required by Section IV. must be in the University of Edinburgh.

2. Another of such four years of Medical and Surgical study must be either in the University of Edinburgh or in some other University entitled to give the Degree of Doctor of Medicine.

3. Attendance during at least six winter months on the Medical or Surgical Practice of a General Hospital which accommodates at least eighty patients, and during the same period on a Course of Practical Anatomy, may be reckoned as one of such four years, and to that extent shall be held equivalent to one year's attendance on Courses of Lectures as above prescribed.

4. One year's attendance on the Lectures of Teachers of Medicine in the Hospital Schools of London, or in the School of the College of Surgeons in Dublin, or of such Teachers of Medicine in Edinburgh, or elsewhere, as shall from time to time be recognised by the University Court, may be reckoned as one of such four years, and to that extent shall be held as attendance on Courses of Lectures, as above prescribed.

5. Candidates may, to the extent of four of the Departments of Medical Study required by Section V., Sub-section 1, attend, in such year or years of their Medical and Surgical studies as may be most convenient to them, the Lectures of the Teachers of Medicine specified in the foregoing Sub-section 4.

6. All Candidates, not Students of the University, availing

(a) Certificates of attendance on Practical Anatomy must express not only the number of months engaged in dissection, but the names of the parts dissected, and the carefulness with which the dissections have been made.

(b) See Note as to Vaccination appended to Section XX.

themselves of the permission to attend the Lectures of Extra-Academical Teachers in Edinburgh, must at the commencement of each year of such attendance enrol their names in a book to be kept by the University for that purpose, paying a Fee of the same amount as the Matriculation Fee paid by Students of the University, and having, in respect of such payment, a right to the use of the Library of the University.

7. The Fee for attendance on the Lectures of an Extra-Academical Teacher in Edinburgh, with a view to Graduation, must be of the same amount as that exigible by Medical Professors in the University.(c)

8. No Teacher is recognised who is at the same time a teacher of more than one of the prescribed branches of study, except in those cases where Professors in the University are at liberty to teach two branches.

VII. Every Candidate must deliver, before the 31st day of March of the year in which he proposes to graduate, to the Dean of the Faculty of Medicine—

1. A declaration in his own handwriting, that he has completed his twenty-first year,(d) and that he will not be, on the day of Graduation, under articles of apprenticeship to any Surgeon or other master.

2. A statement of his studies, as well in Literature and Philosophy as in Medicine, accompanied with proper Certificates.

VIII. Each Candidate is examined, both in writing and *vivâ voce*—*First*, on Chemistry, Botany, and Natural History; *Secondly*, on Anatomy, Institutes of Medicine, *Materia Medica*,(e) and Pathology; *Thirdly*, on Surgery, Practice of Medicine, Midwifery, and Medical Jurisprudence; *Fourthly*, Clinically on Medicine and on Surgery in an Hospital. The Examinations on Anatomy, Chemistry, Institutes of Medicine, Botany, and Natural History are conducted, as far as possible, by Demonstrations of objects placed before the Candidates.

IX. Students who profess themselves ready to submit to an Examination on the first division of these subjects, at the end of their second year, may be admitted to Examination at that time.(f)

X. Students who have passed their Examination on the first division of these subjects may be admitted to Examination on the second division at the end of their third year.

XI. The Examination on the third and fourth divisions cannot take place until the Candidate has completed his fourth *Annus Medicus*.

XII. Candidates may, if they choose, be admitted to Examination on the first two of these divisions at the end of their third year, or to the four Examinations at the end of their fourth year.

XIII. If any Candidate at these Examinations be found unqualified, he cannot be again admitted to Examination unless he has studied, during another year, two of the prescribed subjects, either in the University or in some other School of Medicine.

XIV., XV., XVI., * * * * *

XVII. The Degree of Doctor of Medicine may be conferred on any Candidate who has obtained the Degree of Bachelor of Medicine, and is of the age of 24 years, and has been engaged, subsequently to his having received the Degree of Bachelor of Medicine, for at least two years in attendance on an Hospital, or in the Military or Naval Medical Services, or in Medical and Surgical Practice.(g) Provided always that the Degree of Doctor of Medicine shall not be conferred on any person unless he be a Graduate in Arts of one of the Universities of England, Scotland, or Ireland, or of such other Universities as are above specified, or unless he shall, before or at the time of his obtaining the Degree of Bachelor of Medicine, or within three years thereafter, have passed a satisfactory Examination in Greek, and in Logic or Moral Philosophy, and in one at least of the following subjects—namely, French, German, Higher Mathematics, and Natural Philosophy. And provided also that the Candidate for the Degree of Doctor of Medicine shall, on or before the 31st day of March in the year in which he proposes to graduate, submit to the Medical Faculty a Thesis, certified by him to have been composed by himself, and which shall be approved

(c) The Fee must be paid at the commencement of the Course.

(d) Or that he will have done so on or before the day of Graduation.

(e) Including Practical Pharmacy.

(f) Students who commence their Medical Studies in May may appear for this Examination on the second October after the commencement of their studies, provided they have complete Certificates for two qualifying Summer Sessions and one qualifying Winter Session, each Session being constituted by attendance on at least two classes.

(g) Certificates for at least two years' practice must be produced on or before July 15 of the year in which the Candidate proposes to graduate.

by the Faculty, on any branch of knowledge comprised in the Professional Examinations for the Degree of Bachelor of Medicine, which he may have made a subject of study after having received that Degree.(h)

XVIII. The Medical Examiners for all Candidates for Graduation in Medicine are the Professors in the Faculty of Medicine, and, in addition, three persons appointed annually by the University Court.

XIX. The provisions of these Statutes came into operation on the 4th of February, 1861.

XX. Persons who began their Medical studies before the 4th of February, 1861, are entitled to graduate under the system in force before or after that date, according as they may comply with the regulations in force in the University before or after that date.

Note.—In conformity with the desire expressed by the Privy Council, it has been resolved that any Candidate for a Degree in Medicine must produce, at his final Examination, a Certificate from a Dispensary or other Public Institution where Vaccination is practised, attesting that he has been practically instructed in the operation, and is acquainted with the appearances which follow its performance.

Notice to Candidates for Graduation in Medicine.—Candidates who commenced their Medical studies by attendance on qualifying classes before February 4, 1861, are entitled to appear for examination for the Degree of Doctor of Medicine, after four years' study, on completing their twenty-first year, and without having taken the Degree of Bachelor of Medicine. They are also exempted from the Preliminary Examinations mentioned in Sections I. and II., and require only to undergo an Examination in Latin. They are also exempted from attendance on Practical Chemistry and Practical Midwifery, and require only three months of Clinical Surgery, and eighteen months of Hospital attendance.

An *Annus Medicus* is constituted by at least two Winter Courses of one hundred lectures each, or by one such Course, and two Summer Courses, of fifty lectures each, all being duly certified.

Four *Anni Medici* are required for Graduates in Medicine. Two at least of these years must be passed at a University which grants Degrees in Medicine, one of the two being at Edinburgh.

One or two of the *Anni Medici* may be taken at qualified extra-Academical Schools, in the manner stated in the succeeding paragraph:

In University College, in King's College, in the Hospital Schools of London, in the extra-Academical School of Edinburgh, in the School of the College of Surgeons of Dublin, and in certain Medical Schools where at least two lecturers have been qualified by the University Court, a Candidate may make two *Anni Medici*—one of which must be constituted by Hospital attendance and Practical Anatomy, and the other by at least two Courses of one hundred lectures, or one such Course, and two Courses of fifty lectures. The classes at these Schools only qualify to the extent of four, and one of the four must be Practical Anatomy.

In Provincial Schools where there are no lecturers qualified by the University Court, a Candidate can make one *Annus Medicus only*, and this is constituted by attendance on a qualified Hospital, along with a Course of Practical Anatomy.

The Edinburgh extra-Academical Classes only qualify if the fee paid at the commencement of the Session is the same as that paid to the Professors in the University.

All classes must be taken at a University, except four selected by the Candidate. The Classes so selected must be qualifying Courses, as regards the subjects and extent.

Three months' Courses of *Materia Medica*, Pathology, and Midwifery do not qualify. For each of these subjects one Course of one hundred lectures is required.

No teacher is qualified who lectures on more than one of the required subjects, as specified in Section VI. 8.

Every Candidate for a Degree in Medicine must be a Matriculated Student of the University for the year in which he appears for Examination or Graduation.

The dates of the Examinations for 1871-72 have been fixed as follows; and Candidates for each of them are required to assemble in the upper Library Hall a quarter of an hour before the time fixed for examination:—Preliminary Examinations in Arts, October 17 and 18, 1871; March 20 and 21, 1872, at 10.30 a.m. each day. First Professional Examination, October 24, 1871; April 1, 1872, at 11 o'clock each day. Second Professional Examination, April 8 and 9, 1872, at 12 o'clock. Final Professional Examination in June, 1872. Graduation, August 1, 10 o'clock.

The names of Candidates for the foregoing Examinations must be given in, and the fees paid, etc., as follows, viz.:—For the Final Examination in June, 1872, on or before May 20; for Graduation on August 1, on or before July 15; for Second Professional Examination in April, 1872, on or before March 29; for Preliminary Examination in October, 1871, on or before October 7; for Preliminary Examination in March, 1872, on or before March 10; for First Professional Examination in October, 1871, on or before October 14; for First Professional Examination in April, 1872, on or before March 23; Theses for M.D., on or before April 30, 1872. Specimens of the Examination Papers for 1870-71 are given in the Calendar.

The Preliminary Examinations in Arts accepted by the General Council are recognised *pro tanto*—that is to say, they exempt from Examination in Arts on the subjects comprised in them, in so far as the Examinations are of the same extent as those required by this University. Any subjects required by the Statutes, and not included in these Examinations, or not carried out to the requisite extent, must be passed at the University. In all cases Candidates must produce Certificates of having passed such Examinations, with an official notice of the subjects in which they have passed.

The fee for Examination must be deposited with the Registrar at least ten days before the day of Examination. In the event of the Candidate not passing, the fee is not returned, but he may appear at one subsequent Examination without paying an extra fee, and at any future Examination

(h) The Candidate must lodge his Thesis with the Dean on or before April 30 of the year in which he proposes to graduate.

on paying one-half of the fee. The fees are—For the Preliminary Examination, each Non-Matriculated Student pays a fee of 10s. (Candidates who paid the fee in March may obtain admission to the Examination in October without further payment); for the Degree of M.B., three Examinations £5 5s. each, £15 15s.; for the Degree of C.M., £5 5s. additional; or the Degree of M.D., £5 5s. additional to that for M.B., exclusive of £10 Government stamp. The Graduation Fees must all be paid on or before July 15 in the year in which Candidates propose to graduate.

Note.—Total fees and stamp for graduating as M.D. only, by Regulations, for Students who commenced their Medical education before February, 1861, £25.

Candidates, settled for a period of years in foreign parts, who have complied with all the regulations for the Degree of M.D. (under the new Statutes), but who cannot appear personally to receive the Degree, may, on satisfying the Senatus to that effect by production of sufficient official testimonials, have the Degree conferred on them in absence.

Students are recommended to commence their Medical studies by attending a Summer Session.

MEDICAL DEGREES.—PRELIMINARY EXAMINATION IN ARTS, PROGRAMME FOR 1871-72.

I. In conformity with Section I. of the Statutes, Examinations on the Preliminary Branches of extra-Professional Education will take place on Tuesday and Wednesday, October 17 and 18, 1871, and on Tuesday and Wednesday, March 20 and 21, 1872, at 10.30 o'clock a.m. Examination on Tuesdays—English, Arithmetic, Mechanics, Greek, Higher Mathematics, and German. Examination on Wednesdays—Latin, Elements of Mathematics, Natural Philosophy, French, Logic, and Moral Philosophy. 1. English.—A portion of an English author must be written to dictation; the grammatical construction of one or two sentences must be explained; the grammatical errors in a sentence ungrammatically composed must be pointed out and their nature explained, and the derivation and definition of a few English words in common use must be given. (*See* Bain's "English Grammar," and Angus "On the English Language.") 2. Latin.—Ninth Æneid of Virgil, an easy passage from a Latin prose author, and a single passage of English (translated from a Latin author) to be retranslated into Latin, the more difficult Latin words being given. 3. Arithmetic.—The Common Rules, including Vulgar and Decimal Fractions. 4. Elements of Mathematics.—Euclid, Books i., ii., and iii., and the ordinary rules of Algebra, including Simple Equations. A knowledge of Euclid alone will not be sufficient. 5. Elements of Mechanics.—Elementary Mechanics and Hydrostatics.

II. At the same dates, Examinations will take place in conformity with Section II. of the said Statutes, which enacts that no Candidate shall be admitted to a Professional Examination who has not passed a satisfactory Examination on at least two of the following subjects (in addition to the subjects mentioned above):—1. Greek.—Fourth Book of Xenophon's Anabasis. 2. French.—Voltaire's "Henriade," *chauts* i. to vi. inclusive. 3. German.—Schiller's "Death of Wallenstein." 4. Higher Mathematics.—Euclid, Books i. to vi.—Algebra, Trigonometry, and Conic Sections. 5. Natural Philosophy.—Text-book recommended—Balfour Stewart's "Elementary Physics." 6. Logic.—Terms, Propositions, Syllogisms, and Fallacies. Induction. (*See* Fowler's "Elements of Deductive Logic.") 7. Moral Philosophy.—Moral Faculty. Desires and Emotions. The Will. Moral Obligations. Practical Ethics. (*See* Stewart's "Outlines of Moral Philosophy," Part II. (M'Cosh's edition), with M'Cosh's Notes.) As regards Latin, Greek, French, and German, mere translation is not sufficient. Candidates must answer questions in grammar, and must be prepared to translate a passage of English into these languages.

III. In Section XVII. of the said Statutes, it is enacted that the Degree of Doctor of Medicine shall not be conferred on any person unless he be a Graduate in Arts, or unless he shall, before or at the time of his obtaining the Degree of Bachelor of Medicine, or within three years thereafter, have passed a satisfactory Examination on three of the subjects mentioned in Section II. Two of these must be Greek and Logic or Moral Philosophy, and the third may be any one of the following subjects—namely, French, German, Higher Mathematics, Natural Philosophy.

Examinations of the same extent, and on the same subjects, at other British Universities granting the Degree of M.D., will exempt from these Preliminary Examinations. Certificates of having passed such Examinations must be produced, with an official notice of the subjects on which the Candidate has passed an Examination.

Students who come under the old Statutes, in consequence of having commenced their Medical Curriculum by attendance on Classes before February 4, 1861, will be examined in Latin on Wednesday, October 18, 1871, and Wednesday, March 21, 1872, at 10.30 a.m. For nature of Examination, see Section I. of this programme.

UNIVERSITY OF ABERDEEN.

The regulations for granting Medical Degrees are framed in conformity with an Ordinance of the Universities' (Scotland) Commissioners, dated March 16, 1861, and approved by her Majesty in Council.

The following are the Degrees in Medicine granted by this University—namely, Bachelor of Medicine (M.B.), Master in Surgery (C.M.), and Doctor of Medicine (M.D.).

The Preliminary Examination and Professional Curriculum and Examination for the Degrees of M.B., C.M., and M.D., being in conformity with the Ordinances of the Scotch Universities' Commissioners, are nearly the same as those of the Universities of Edinburgh, Glasgow, and St. Andrews.

The studies of Candidates for the Degrees of Bachelor of Medicine and Master in Surgery are subject to these regulations:—

One at least of the four years of Medical and Surgical study must be in the University of Aberdeen.

Another of such four years must be either in this University or in some other University entitled to give the Degree of Doctor of Medicine.

FEES FOR GRADUATION.

1. Each Candidate for the Degree of M.B. shall pay a fee of £5 5s. in respect of each of the three Professional Examinations.

2. If the Candidate desires to be admitted to the Degree of Bachelor of Medicine only, he shall not, on admission thereto, be required to pay any further fee in addition to the £15 15s. so paid by him; but if he desires to be admitted to the Degree of Master in Surgery also, he shall, on being admitted to such Degree, pay a further fee of £5 5s.

3. And every Candidate for the Degree of Doctor of Medicine shall pay, in addition to the fees paid by him for the Degree of Bachelor of Medicine, a fee of £5 5s., exclusive of any stamp duty which may for the time be exigible.

EXEMPTION FROM THE FOREGOING REGULATIONS.

Students who shall have begun their Medical studies before the first Tuesday of November, 1861, are entitled to appear for examination for the Degree of M.D. after four years' study, one of which must have been at the University of Aberdeen.

Further information may be obtained from the Dean of the Medical Faculty, Professor Macrobin, M.D.

UNIVERSITY OF ST. ANDREWS.

The regulations for granting Medical Degrees are framed in conformity with an Ordinance of the Universities' (Scotland) Commissioners; they therefore generally correspond with those of the Universities of Edinburgh, Aberdeen, and Glasgow.

The Degrees in Medicine granted by the University of St. Andrews are those of Bachelor of Medicine (M.B.), Master in Surgery (C.M.), and Doctor of Medicine (M.D.).

The Preliminary Examination and Professional Curriculum and Examinations for these Degrees are generally the same as those of the Universities of Edinburgh, Aberdeen, and Glasgow. The following regulations, however, for Candidates for the Degrees of Bachelor of Medicine and Master in Surgery present some difference:—

No one shall be received as a Candidate for the Degree of Bachelor of Medicine or Master in Surgery unless two years at least of his four years of Medical and Surgical Study shall have been in one or more of the following Universities and Colleges, viz.:—The University of St. Andrews; the University of Glasgow; the University of Aberdeen; the University of Edinburgh; the University of Oxford; the University of Cambridge; Trinity College, Dublin; Queen's College, Belfast; Queen's College, Cork; and Queen's College, Galway.

The remaining years of Medical and Surgical Study may be either in one or more of the Universities and Colleges above specified, or in the Hospital Schools of London, or in the School of the College of Surgeons in Dublin, or under such private teachers of Medicine as may from time to time receive recognition from the University Court.

Attendance on the Lectures of any private teacher in Edinburgh, Glasgow, or Aberdeen shall not be reckoned for graduation in St. Andrews, if the fee for such Lectures be of less amount than is charged for the like Course of Lectures in the University of Edinburgh, of Glasgow, or of Aberdeen, according as the teacher lectures in Edinburgh, Glasgow, or Aberdeen.

Every Candidate for the Degrees of Bachelor of Medicine and Master in Surgery shall be examined both in writing and *vivâ voce*—first, on Chemistry, Botany, Elementary Anatomy, and Materia Medica; secondly, on Advanced Anatomy, Zoology, with Comparative Anatomy, Physiology, and Surgery; and, thirdly, on Practice of Medicine, Clinical Medicine, Clinical Surgery, Midwifery, General Pathology, and Medical Jurisprudence.

FEES FOR GRADUATION.

For the Degree of Bachelor of Medicine five guineas in respect of each of the three divisions of the Examination on Professional subjects; and if the Candidate desires to be admitted to the Degree of Bachelor of Medicine only, he shall not, on admission thereto, be required to pay any further fee in addition to the fifteen guineas so paid by him; but if he desires to be admitted to the Degree of Master in Surgery also, he shall, on being admitted to such Degree, pay a further fee of five guineas; and every Candidate for the Degree of Doctor of Medicine, who has previously obtained the Degree of Bachelor of Medicine, shall pay, in addition to the fees paid by him as a Candidate for the Degree of Bachelor of Medicine, a fee of five guineas, exclusive of any stamp duty which may for the time be exigible.

N.B.—The Degree of Doctor of Medicine may be conferred by the University of St. Andrews on any registered Medical Practitioner above the age of 40 years, whose Professional position and experience are such as, in the estimation of the University, to entitle him to that Degree, and who shall, on examination, satisfy the Medical Examiners of the sufficiency of his Professional knowledge; provided always, that Degrees shall not be conferred under this Section to a greater number than ten in any one year. Fee 52*l.* 10*s.*

REGULATIONS REGARDING THE EXAMINATION OF REGISTERED MEDICAL PRACTITIONERS ABOVE THE AGE OF FORTY YEARS.

Candidates for Graduation are enrolled in order of application, provided they have complied with the undermentioned conditions. Candidates shall lodge with the Professor of Medicine the following Certificates and deposit:—

- I. Certificate of Age.
- II. Certificates from three Medical men, of such acknowledged reputation in the Profession, or of such standing in the Medical Schools, as shall satisfy the Senatus of the Professional position and experience of the Candidate.
- III. A certain portion (viz., £10 10*s.*) of the Graduation Fees; which sum shall be forfeited should the Candidate fail to appear at the time appointed for examination, or should he fail to graduate.

IV. The Examination shall be conducted both in writing and *visà voce*, and shall include the following subjects:—(1) *Materia Medica* and General Therapeutics. (2) Medical Jurisprudence. (3) Practice of Medicine and Pathology. (4) Surgery. (5) Midwifery.

(As regards the last two subjects—viz., Surgery and Midwifery—a minute knowledge shall not be required from those who do not practise these branches of the Profession.)

UNIVERSITY OF GLASGOW.

Three Degrees in Medicine are granted, viz.:—Bachelor of Medicine (M.B.), Master in Surgery (C.M.), and Doctor of Medicine (M.D.). [The Preliminary Examination, Curriculum, and Professional Examinations for these Degrees, being in conformity with the Ordinance of the Scottish University Commissioners, are the same as for the Universities of Edinburgh, St. Andrews, and Aberdeen.]

Of the four years constituting the Curriculum, one at least shall have been passed in the University of Glasgow, and another either in that University or some other University entitled to give Degrees in Medicine.

These Statutes apply to all Candidates who commenced their Medical studies on or after October 1, 1861. Candidates who began their Medical studies before that date are entitled to obtain their Degrees according to the regulations existing at the time when they commenced their studies.

The annual term for conferring Medical and Surgical Degrees is the first day of May.

The fees for the Degrees are as follows:—For the Degree of M.B. (for each of three examinations, £5 5*s.*), £15 15*s.*; for that of C.M. (in addition to the fee for M.B.), £5 5*s.*; for the Degree of M.D. (in addition to the fee for M.B.), £5 5*s.*; and the Government stamp for the Diploma, &c., £10 3*s.*

The Preliminary Examinations of Medical Students in branches of General Education take place at the beginning and at the end of the Winter Session.

The regulations under which the above Degrees are granted, and the notices of the subjects of Examination, will be obtained by application to the Registrar of the University.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH.

ABSTRACT OF REGULATIONS FOR THE LICENCE.

1. No one can obtain the Licence of the College until he has completed the age of 21 years.

2. Every applicant for the Licence must produce satisfactory evidence that he has been engaged in the study of Medicine during a period of at least four years subsequently to his registration as a Medical Student, and that he has attended the following Courses at a University, or at some Medical School recognised by the College:—Anatomy, one Course, six months; Practical Anatomy, six months; Chemistry, one Course, six months; Practical Chemistry, three months; *Materia Medica* and Pharmacy, one Course, three months; Physiology or Institutes of Medicine, one Course, three months; Practice of Medicine, one Course, six months; Clinical Medicine, six months; Principles and Practice of Surgery, one Course, six

months; Clinical Surgery, three months; Midwifery, one Course, three months; Medical Jurisprudence, one Course, three months; Pathological Anatomy, one Course, three months; or General Pathology, one Course, three months; Practical Pharmacy, three months.

The applicant must also produce evidence of having attended the practice of a public Hospital (containing not fewer than 80 beds) during a period of not less than twenty-four months, twelve of which must have been spent in attendance on the Medical wards. He must also have attended for six months the practice of a public Dispensary, or have acted for six months as Clinical Clerk or Dresser in an Hospital, or have been engaged for six months as Visiting Assistant to a Registered Practitioner.

The applicant must also have attended at least six cases of labour under the superintendence of a qualified Medical Practitioner, and must produce a Certificate to that effect.

Every applicant for the Licence, before being admitted to the final Examination, will be required to produce a Certificate that he has studied Vaccination under a competent and recognised teacher; that he has himself performed the operation successfully under the teacher's inspection; that he is familiar with the different stages of the vaccine vesicle, and with the methods of preserving lymph; and that he is thoroughly informed in every necessary part of the subject.

3. Every applicant for the Licence must have passed the Preliminary Examination in Literature and Science before he can be admitted to the Professional Examination.

The Examination will embrace the following subjects:—
1. English: Grammar and Composition. 2. Arithmetic, including Vulgar and Decimal Fractions; Algebra, including Simple Equations. 3. Geometry: First two Books of Euclid. 4. Latin: Translation into English, Cicero de Senectute et de Amicitia, or Horatii Carmina, Lib. II. and III.—Parsing; Translation from English into Latin, the Latin words being supplied. 5. One of the following subjects, at the option of the Candidate:—1. Greek: Herodotus' History, Book I., and Homer's Iliad, Book II. 2. French: Voltaire's *Henriade*. 3. German: Schiller's *Wilhelm Tell*. 4. Natural Philosophy, including Mechanics, Hydrostatics, and Pneumatics.

4. Masters and Bachelors of Arts of any British or Foreign University, whose Course of Study may from time to time be approved of by the College, will be exempted from the Preliminary Examination; also those who have passed the Examination of the National Educational Bodies, or of any of the Licensing Boards recognised by the Medical Act.

5. The Professional Examination will be divided into two parts, according to the following arrangements of subjects:—(1) Anatomy, Physiology, Chemistry; (2) *Materia Medica* and Pharmacy, Pathology, and Pathological Anatomy, Practice of Medicine, Midwifery, Medical Jurisprudence, Clinical Medicine, including the examination of patients, as well as of various morbid products. No Candidate will be admitted to the first examination until he has completed two, or to the second until he has completed four, years of Professional study. The examinations will be conducted partly *visà voce*, partly by written papers.

6. The following will be the periods of Examination up to October, 1872:—(1) Preliminary Examinations in Literature and Science—Saturday, October 21, 1871; Saturday, November 4, 1871; Saturday, April 20, 1872; Saturday, July 20, 1872. (2) First Professional Examinations—Wednesday, October 18, 1871; Wednesday, January 17, 1872; Wednesday, March 27, 1872; Wednesday, May 1, 1872; Wednesday, July 17, 1872; Wednesday, October 16, 1872. (3) The Second Professional Examinations will be held on the Thursdays following the First Professional.

7. Candidates for the Licence of the College, who already possess a qualification from a recognised licensing body, or who have passed the First Professional Examination before a qualifying body (provided it be as extensive as that required by this College), will be at once admitted to the second part of the examination.

8. Meetings for the examination of Candidates who already possess a qualification from a recognised licensing body, will be held on the first Wednesday of every month (with the exception of September and October), and, if necessary, on the following days. Candidates are required to communicate with the Secretary to the College not less than eight days before the date of the examination at which they propose to appear.

9. No Candidate is admissible to examination who has been rejected by any licensing board within three months previous to his examination.

10. The fee payable by a Licentiate is ten guineas. In the

event of a Candidate being unsuccessful at his examination, the sum of two guineas will be retained to defray expenses.

11. Candidates may be admitted to Special Examination, on days other than those appointed above, on bringing forward reasons satisfactory to the Council, and on paying an extra fee of five guineas. Should the Candidate be unsuccessful, the sum of eight guineas will be returned to him.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH.

REGULATIONS TO BE OBSERVED BY CANDIDATES FOR THE DIPLOMA.

These are the same as those given below for the conjoined qualification in Medicine and Surgery conferred by the Colleges of Physicians and Surgeons, with the following exceptions in Professional education:—

No third Course of Medicine and no Course of Pathological Anatomy are required.

A Certificate of three months' instruction in Pathological Anatomy at the post-mortem room of a recognised Hospital will be required from Candidates commencing Professional Study after October 1, 1861.

The Regulations for the Preliminary Examination in General Education generally correspond with those to be observed by Candidates for the joint qualifications of the Royal Colleges of Physicians and Surgeons, Edinburgh.

PROFESSIONAL EXAMINATIONS FOR THE DIPLOMA OF THE COLLEGE.

The Regulations are generally the same as those for the Professional Examinations for the joint Diploma of the two Colleges, with the following exceptions:—

The sum of £4 must be paid to the Treasurer of the College for the First Examination, not later than 10 a.m. of the day preceding it. The sum will be considered as paid to account of the entire fee of £10 payable for the Diploma.

In the case of a Candidate being unsuccessful at this Examination, £2 will be returned to him, the remaining £2 being retained to meet the expenses of the Examination.

Registered Medical Practitioners, whose Degree or Licence in Medicine is dated prior to October 1, 1861, are exempt from the First Professional Examination. The Examinations under this Regulation may take place on the first and third Tuesday of each month.

§ 7. The Second Examination embraces Surgery and Surgical Anatomy; also Medicine, Midwifery, Materia Medica, and Medical Jurisprudence; and shall not take place before the termination of the Winter Session of the last year of Study.

Applications for Examination must be made to the Secretary not later than the Monday previous to the day of the First Examination.

Every Candidate must produce to the Secretary—(1) Satisfactory evidence of his having attained the age of 21 years; (2) the tickets and the Certificates of his classes; (3) the Certificate of his having passed the First Professional Examination; (4) a tabular statement (for which a printed form will be furnished by the officer) exhibiting the full amount of his Professional education, and distinguishing the Classes, Hospitals, and Dispensaries attended during each Session of his studies. If he have been an apprentice, he must also insert the name of his master, the date of his indenture, and the length of time for which he was bound. This statement, accurately filled up, must be attested by his signature, and will be preserved by the College as a record.

If the Candidate have been an Apprentice to a Fellow of the College, he must also produce his discharged indenture.

The remaining fee payable to the College (being £6), together with the receipt for the fee paid for the First Professional Examination, must be lodged not later than 10 a.m. of the day preceding the Examination day, in the hands of the Treasurer, who will certify this upon the Secretary's letter. The sum of £4 will be returned to unsuccessful Candidates.

Periods of Examination for the Diploma of the Royal College of Surgeons of Edinburgh, in the year 1871-72:—I. Preliminary Examinations in General Education; on Saturday, October 21, 1871; on Saturday, November 4, 1871; on Saturday, April 20, 1872; on Saturday, July 20, 1872. II. First Professional Examinations—on Tuesday, October 17, 1872; on Tuesday, January 16, 1872; on Tuesday, March 26, 1872; on Tuesday, April 23, 1872; on Tuesday, July 2, 1872; on Tuesday, July 16, 1872; on Tuesday, October 15, 1872. III. Second Professional Examinations. These will take place immediately after the conclusion of the First Professional Examinations, at each of the above-mentioned periods. They

will generally be begun on the Thursday succeeding to the day of the First Examination, and in no case on any earlier day.

Certificates, etc., to be sent to Dr. Simson, Honorary Secretary, 3, Glenfinlas-street; as follows, viz.:—For First Examination; not later than the Saturday preceding it. For Second Examination; not later than the Tuesday preceding it. Money to be sent to Dr. Gairdner, Treasurer, 45, Northumberland-street; as follows:—For First and for Second Examinations, not later than 10 a.m. of the days preceding these Examinations, respectively. *Note.*—The price of the Diploma is £10; being, for First Examination £4, and for Second Examination, when the first has been paid for, £6.

THE ROYAL COLLEGES OF PHYSICIANS AND SURGEONS OF EDINBURGH.

The Royal College of Physicians of Edinburgh, and the Royal College of Surgeons of Edinburgh, while they still continue to give their Diplomas separately, under separate regulations, have made arrangements by which, after one series of Examinations, the Student may obtain the Diplomas of both Colleges.

The general principle of this joint Examination is, that it shall be conducted by a Board, in which each Body is represented in those branches which are common to both Medicine and Surgery; but that the College of Physicians shall take exclusive charge of the Examination in Medicine, and the College of Surgeons of the Examination in Surgery.

The object of the joint Examination is to give to Students facilities for obtaining from two separate Bodies, and at less expense, a Qualification in Medicine and a Qualification in Surgery.

Students passing that Examination successfully, will be enabled to register two Qualifications under the Medical Act,—Licentiate of the Royal College of Physicians of Edinburgh, and Licentiate of the Royal College of Surgeons of Edinburgh.

The arrangement for thus conferring a Double Qualification by the co-operation of the two Colleges is in conformity with Section XIX. of the Medical Act, and received the special sanction of the General Council of Medical Education and Registration, at a Meeting held on the 7th of August, 1859.

SCHOOLS OF MEDICINE.

1. Every Candidate must have followed his Course of Study in a *University*, or in an *Established School of Medicine*, as defined below, or in a *Provincial School* specially recognised by the Colleges of Physicians and Surgeons of that division of the United Kingdom in which it is situate.

2. Under the title *Established School of Medicine* are comprehended the Medical Schools of those cities of Great Britain and Ireland in which Diplomas in Medicine and Surgery are granted, and such Colonial and Foreign Schools as are similarly circumstanced in the countries in which they exist.

PROFESSIONAL EDUCATION.

1. Candidates commencing Professional Study after September 16, 1866, must have been engaged during four years after the Examination in General Education, in Professional Study, which shall include not less than four Winter Sessions', or three Winter and two Summer Sessions' attendance at a recognised Medical School. (a)

2. The Candidate must produce certificates of having attended the following separate and distinct Courses of Lectures:—

Anatomy, Two Courses, (b) Six Months each; Practical Anatomy, Twelve Months. Or, in the option of the Candidate, Anatomy, One Course, Six Months; Practical Anatomy, Eighteen Months. Chemistry, One Course, Six Months. Practical or Analytical Chemistry, One Course, Three Months. Materia Medica, One Course, Three Months. Physiology, not less than Fifty Lectures. (c) Practice of Medicine, One Course, Six Months. Clinical Medicine, Six Months. (d) Medicine— a Third Course, which may either be Practice of Medicine or Clinical Medicine at the option of the Student, One Course,

(a) Candidates commencing Study prior to the above date, will be admitted to Examination after four Winter Sessions', or three Winter and two Summer Sessions' attendance on Classes at a regular Medical School.

(b) The two Courses must not be attended in the same Session.

(c) In those Schools of England and Ireland in which two separate Courses of Lectures are delivered at separate hours, one on Anatomy, the other on Anatomy and Physiology, the former of these Courses will be received as a Course of Anatomy, and the other as a Course of Physiology.

(d) See Note (d) at foot of next page.

Six months.(d) Principles and Practice of Surgery, One Course, Six Months. Clinical Surgery, One Course, Six Months.(d) Surgery—a Third Course, which may either be Principles and Practice of Surgery or Clinical Surgery at the option of the Student, One Course, Six Months.(d) Midwifery and the Diseases of Women and Children, One Course, Three Months. Medical Jurisprudence, One Course, Three Months. Pathological Anatomy, One Course, Three Months. (e) The Six Months' Courses delivered in Scotland must consist of not fewer than one hundred Lectures, with the exception of Clinical Medicine and Clinical Surgery. The Three Months' Courses must consist of not fewer than fifty Lectures.

3. The Candidate must also produce the following Certificates:—(a.) Of having attended Six Cases of Labour under the superintendence of the Practitioner who signs the Certificate, who must be a Registered Medical Practitioner. (b.) Of having attended, for three months, instruction in Practical Pharmacy. The Certificate to be signed by the Teacher, who must be a member of the Pharmaceutical Society of Great Britain, of a Chemist and Druggist recognised by either College, on special application, or the Superintendent of the Laboratory of a Public Hospital or Dispensary, or a Registered Practitioner who dispenses medicines to his patients. (c.) Of having attended, for twenty-four months, a Public General Hospital containing, on an average, at least eighty patients. (d.) Of having attended, for six months, the Practice of a Public Dispensary specially recognised by either College; or of having been engaged for six months as visiting Assistant to a Registered Practitioner. (e.) Of having been instructed in Vaccination. The Certificate to be signed by the Teacher, who must be a Registered Practitioner. (f)

4. The following Order of Study is recommended as a guide to the Student, though not enjoined:—First Year: Anatomy, Practical Anatomy, Chemistry, Practical or Analytical Chemistry, Hospital. Second Year: Anatomy, Practical Anatomy, Physiology, Surgery, Materia Medica (the last either in this or the Third Year), Hospital. Third Year: Practice of Medicine Clinical Surgery, Practical Anatomy, Practical Pharmacy, Clinical Medicine, Pathological Anatomy, Hospital. Fourth Year: Surgery or Clinical Surgery, Midwifery and the Diseases of Women and Children, Practice of Medicine or Clinical Medicine, Medical Jurisprudence, Practical Midwifery, Hospital.

5. It is strongly recommended to Students to avail themselves of any opportunities which they may possess of attending Lectures on Ophthalmic and Mental Disases, also on Natural History and Comparative Anatomy; and of obtaining practical instruction in the use of the Microscope, in addition to the Courses of Instruction which are absolutely required.

PRELIMINARY EXAMINATION IN GENERAL EDUCATION.

1. All Students who intend becoming Candidates for the Diplomas of the Colleges must have passed the complete Examination in General Education, and have had their names inscribed in the Register of Medical Students instituted by the General Medical Council, at the commencement of their Professional Studies.

2. The following will be the Preliminary Examination in General Education for the Double Qualification in Medicine and in Surgery conferred conjointly by the Royal Colleges of Physicians and Surgeons, and also for the separate diploma of each College, for 1871-72:—1. English Language, including Grammar and Composition. 2. Arithmetic, including Vulgar and Decimal Fractions. 3. Algebra, including simple Equations. 4. Geometry: First Two Books of Euclid. 5. Latin: Translation from one of the two following Books at the option of the Candidate—viz., Cicero de Senectute et de Amicitia, or Horatii Carmina, Lib. II. et III.; and of an easy passage from a Book not prescribed; Exercises in Parsing, and in rendering English correctly into Latin, the Latin words being supplied. 6. One of the following subjects at the option of the Candidate:—(1.) Greek: Herodotus' History, Book I., and Homer's Iliad, Book II. (2.) French: Voltaire's Henriade. (3.) German: Schiller's Wilhelm Tell. (4.) Natural Philosophy, including Mechanics, Hydrostatics, and Pneumatics. N.B.—In Greek, French, and German, parsing of words from the passages given

(d) Two Courses of Clinical Medicine, of three months each, if not simultaneous, will be held equivalent to one Course of six months. They must be attended during the period of attendance at the Hospital where they are delivered. The same rules will apply to Clinical Surgery.

(e) A Certificate of attendance on the Post-mortem Examinations at a General Hospital will be accepted in lieu of this Course

(f) By a Regulation of the Privy Council, of date December 1, 1859, no one can be appointed as a contractor for Vaccination under the English Poor-law who does not produce a certificate of proficiency in Vaccination from a person authorised by the Privy Council to grant the same.

to be translated will be required; also translation of short sentences from English into the respective languages.

3. Testimonials of proficiency granted by certain Educational Bodies will be accepted as sufficient evidence of General Education, and will exempt from the Preliminary Examination.

4. The Preliminary Examinations shall take place at stated periods, and shall be conducted by a special Board of Examiners in Arts, to be chosen from time to time by the Royal College of Physicians of Edinburgh and the Royal College of Surgeons of Edinburgh.

5. Students who intend to undergo the Preliminary Examination shall give in their names, addresses, and places of birth to the Officer of either College, not later than three days before the day of Examination, and shall pay a fee of 10s., not to be returned in case of rejection, but will be admissible to re-examination at a future period without paying another fee.

6. Candidates, the commencement of whose Professional Studies was prior to September 17, 1866, may pass the Preliminary Examination in General Education at any of the periods previous to the first Professional Examination, but are recommended to do so at the earliest possible period. Candidates under this Regulation who have not passed a Preliminary Examination in General Education, will be admitted to a special Examination in General Education previously to their first Professional Examination. For this they shall pay a fee of £1.

PROFESSIONAL EXAMINATIONS.

1. Candidates for the Double Qualifications shall be subjected to two Professional Examinations, to be conducted at separate times, partly in writing and partly orally.

2. Opportunities for both Examinations will be presented six times in each year. On each of these occasions the Candidates shall assemble for the purpose of writing answers to the questions proposed. The oral Examinations will be conducted on the days immediately succeeding.

3. Unsuccessful Candidates at either the First or Second Examination shall be remitted to their Studies for a period to be determined by the judgment of the Examiners, but not in any case less than three months.

4. The First Examination shall embrace Anatomy, Physiology, and Chemistry, and shall take place not sooner than the end of the second Winter Session.

5. Candidates who desire to pass the First Professional Examination must apply to the Inspector of Certificates on or before the Saturday preceding the day of Examination, (g) and must produce Certificates of attendance in regard to all those of the required Courses of Lectures which have reference to the subjects of that Examination. They must also produce a Certificate of having passed the Preliminary Examination.

6. The sum of £6 must be paid to the Inspector of Certificates for this Examination, not later than 10 a.m. of the day preceding it. This sum will be considered as paid to account of the entire fee of £16 payable for the two Diplomas.

7. In the case of a Candidate being unsuccessful at this Examination, £4 will be returned to him; the remaining £2 being retained to meet the expense of Examination.

8. The Second Examination shall embrace Medicine, Surgery and Surgical Anatomy, Midwifery, Pathological Anatomy, Materia Medica and Pharmacy, and Medical Jurisprudence; and shall not take place before the termination of the Winter Session of the last year of study. In the case of Candidates who began their course of study after September 16, 1866, it will not take place till four years after the Examination on General Education.

9. Applications for Examination must be made to the Inspector of Certificates not later than the Tuesday previous to the day of Examination. (g)

10. Every Candidate must produce to the Inspector—1st. Satisfactory evidence of his having attained the age of 21 years; 2nd. A Certificate of his having passed the Preliminary Examination, unless this Certificate have already been seen by the Inspector of the Colleges; 3rd. A Certificate of his registration in the books of the General Medical Council; 4th. A Certificate of his having passed the First Professional Examination; 5th. The Certificates of his classes, and the other Certificates required; and 6th. A tabular statement (for which a printed form will be furnished by the Inspector), exhibiting the full amount of his Professional education, and distinguishing the Classes, Hospitals, and Dispensaries attended

(g) Candidates at a distance are requested to send their Certificates much earlier, so as to give sufficient time for the exchange of one or two explanatory letters; as much disappointment has been occasioned by the discovery of defects in their Course of Study when it was too late to rectify them by the production of documents.

during each Session of his Studies. The tabular statement, accurately filled up, must be attested by his signature, and will be preserved by the Colleges as a record.

11. The fee payable for this Examination, which shall be £10, must be lodged with the Inspector not later than 10 a.m. of the day preceding the Examination day.

12. On the production of the above documents, and after receiving the fees, the Inspector shall give the Candidate a letter authorising the Examiners to take him on trial.

13. In case of a Candidate being unsuccessful at the Second Examination, £8 will be returned to him; the remaining £2 being retained to meet the expense of the Examination.

14. Candidates who have passed the First Professional Examination in Anatomy, Physiology, and Chemistry, at any of the Licensing Boards recognised by the Medical Act, will be admissible to the Second Professional Examination, on producing Certificates of the whole Course of Study prescribed, and of having passed their Preliminary and First Professional Examinations. If any of the three subjects of the First Examination have been omitted, such Candidates will have to undergo an Examination on the omitted subjects; and none of the subjects will be omitted at the Second Examination, even if some of them should have formed part of the First Examination by another Board. The fee payable by such Candidates is £16, and unsuccessful Candidates will receive back £14.

15. In addition to the Written and Oral Examinations, all Candidates shall be subjected to a Practical Clinical Examination in Medicine and Surgery, which shall include the Examination of Patients, Physical Diagnosis, the Use of the Microscope, Surgical Appliances, Bandages, &c.

16. Candidates desirous of Special Examinations on other days than those fixed by the Regulations, must prepare a case to be submitted for the consideration of the authorities of the College, with evidence to show why it was and is impossible for them to avail themselves of the Ordinary Examinations past and future. They must *at the same time* produce Certificates of the whole of the prescribed Course of Study and of the Preliminary Examination, and state the earliest and the latest days within which they can present themselves. It is very desirable that all such Candidates, and especially those who are at a distance from Edinburgh, should present their applications as long beforehand as possible.

The fees for Special Examinations are as follows:—£28 for First and Second Examinations, of which £22 will be returned to Candidates remitted on the First Examination, and £10 to Candidates successful in the First, but unsuccessful in the Second Examination. £25 for Second Examination, when the Candidate has passed the First under the conditions of Section 14. Of this £16 will be returned to the Candidate if unsuccessful. £19 for Second Examination, when the Candidate has passed the First before the Examiners of the Colleges. Of this £10 will be returned to the Candidate if unsuccessful.

17. No Candidate shall be admissible to Examination who has been rejected by any other Licensing Board within the three months preceding his Examination.

I. *Preliminary Examinations in General Education.*—On Saturday, October 21, 1871; on Saturday, November 4, 1871; on Saturday, April 20, 1872; on Saturday, July 20, 1872.

II. *First Professional Examinations.*—On Tuesday, October 24, 1871; on Tuesday, January 23, 1872; on Tuesday, April 2, 1872; on Tuesday, April 30, 1872; on Tuesday, July 9, 1872; on Tuesday, July 23, 1872; on Tuesday, October 22, 1872.

III. *Second Professional Examinations.*—These will take place immediately after the conclusion of the First Professional Examination, at each of the above-mentioned periods. In no case will they be begun on an earlier day than the Thursday of any period, nor will they usually be later than that day.

FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.

ABSTRACT OF REGULATIONS FOR THE LICENCE, 1871-72.

Course of Study.—(1.) Anatomy, two courses, six months each. (2.) Practical Anatomy, twelve months. (3.) Chemistry, one course, six months. (4.) Practical or Analytical Chemistry, one course, three months. (5.) Physiology, not less than fifty Lectures. (6.) Practice of Medicine, one course, six months. (7.) Clinical Medicine, one course, six months. (8.) Principles and Practice of Surgery, one course, six months. (9.) Clinical Surgery, one course, six months. (10.) In addition to the above courses of Surgery and Clinical Surgery, one six months' course of either of these at the option of the Student; *Materia Medica*, one course, three months. (11.) Mid-

wifery and the Diseases of Women and Children, one course, three months. (12.) Medical Jurisprudence, one course, three months. (13.) Practical Midwifery, attendance on at least six cases of labour. (14.) Pathological Anatomy, three months' instruction in the post-mortem room of a recognised Hospital. (15.) Practical Pharmacy, three months' practical instruction. (16.) Hospital and Dispensary Practice, twenty-four months' attendance on the practice of a public General Hospital containing on the average at least eighty patients.

A Certificate of Proficiency in Vaccination, from a Vaccine Institution recognised by the Faculty, will be required of every Candidate. Candidates (not exempted from Registration) must have been engaged in Professional Study during four years from the date of Registration, which shall include not less than four Winter Sessions' or three Winter and two Summer Sessions' attendance at a recognised Medical School.

Candidates are subjected to two Professional Examinations. The First Examination embraces Anatomy, Physiology, and Chemistry, and cannot be undergone before the end of the second Winter Session of Study.

The Second Examination embraces Surgery and Surgical Anatomy, Medicine, *Materia Medica*, Midwifery, and Medical Jurisprudence, and cannot be undergone before the termination of the full period of Study.

Intending Candidates for the Second Examination must produce evidence—1st, of being 21 years of age; and 2nd, of having passed the First Examination. They will also present to the Secretary for inspection their Class and Hospital Certificates, and write out a tabulated statement of their whole course of Study, for which the Secretary, on application, will supply Candidates with printed forms.

The fee for the Diploma is £10—£4 for the First, and £6 for the Second Examination.

First Examinations will be held on the second Tuesday of every month. Second Examinations will take place, the written part on each of the above days, and the oral and clinical parts on the succeeding day. A Candidate, on showing a sufficient reason, may be admitted to Examination on a day specially arranged, by paying an extra fee of £3.

All applicants for the Licence must be registered on the form prescribed by the General Medical Council at the commencement of Professional Study.

Candidates who possess a qualification to practise, or who have passed the Examination in Anatomy, Physiology, and Chemistry before any of the Licensing Boards, will be admitted to the Second Examination on producing evidence of having attended the full Curriculum, and paying the fee of £10.

DOUBLE QUALIFICATION.

The Faculty of Physicians and Surgeons of Glasgow, and the Royal College of Physicians of Edinburgh, while they still continue to give their Diplomas separately, under separate regulations, have made arrangements by which, after one series of Examinations, the Student may obtain two separate Licences—one in Medicine and one in Surgery.

The Fee for the two Diplomas granted conjointly is £16—£6 for the First and £10 for the Second Examination.

The First Examination for the Double Qualification will be held in the Faculty Hall, Glasgow, on October 5, 1871, January 11, April 4, May 2, and July 11, 1872, and on each occasion it will be continued on the succeeding day. The Second Examination will be held, the written part on each of the above days, and the oral part on the succeeding day. Applications to be admitted, either to the First or Second Examination, must be made to the Secretary of the Faculty not later than the Monday preceding the Examination.

PRELIMINARY EXAMINATIONS CONDUCTED BY THE FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW, SESSION 1871-72.

1. Preliminary Examinations in General Literature in accordance with the regulations of the General Medical Council will be held in the Faculty Hall during the Session 1871-72 on the following days, commencing at eleven o'clock, viz.:—Friday, October 20, and Friday, November 3, 1871; Friday, April 26, and Friday, July 19, 1871; and on each occasion the Examination will be continued on the succeeding day.

The Examination will embrace the following subjects:—1. English Language. 2. Latin. 3. Arithmetic; Algebra. 4. Geometry. 5. One of the following subjects at the option of the Candidate:—(1.) Natural Philosophy—Mechanics, Hydrostatics, and Pneumatics. (2.) Greek. (3.) French. (4.) German.

The Fee for the Examination and Certificate is 10s., payable to the Secretary previous to the Examination.

FACULTY OF MEDICINE IN IRELAND.

UNIVERSITIES, COLLEGES, COURSES OF STUDY, DEGREES, AND LICENCES TO PRACTISE.

THE following Bodies grant one or more Degrees or Licences to practise Medicine or Surgery, and provide courses of instruction in the Medical Sciences:—The University of Dublin grants the Degrees of M.B. or Bachelor of Medicine; M.D. or Doctor of Medicine; M.C. or Master of Surgery; also Licences in Medicine (L.M.) and Surgery (L.S.). In connexion with the University, Trinity College gives a Diploma in State Medicine, after Examination, to Doctors of Medicine of Dublin, Oxford, or Cambridge. The Queen's University in Ireland, with its Provincial Colleges at Belfast, Cork, and Galway: This University confers the Degrees of M.D. and M.Ch. The King and Queen's College of Physicians in Ireland, grants a Licence and a Fellowship. This Institution, in connexion with the Medical Faculty of the University of Dublin, constitutes the School of Physic in Ireland. The Royal College of Surgeons in Ireland grants Letters Testimonial qualifying to practise Surgery as a Licentiate, and also confers a Fellowship. Fellows and Licentiates of the Colleges of Physicians and Surgeons may obtain from their respective Colleges a Diploma in Midwifery. The Rotundo and Coombe Lying-in Hospitals grant Diplomas in Midwifery, which are, however, not recognised under the Medical Act. The Governor and Company of the Apothecaries' Hall of Ireland also confer a Diploma.

The Medical Session in Ireland commences about the first week in November.

UNIVERSITY OF DUBLIN.

SCHOOL OF PHYSIC.

The School of Physic in the University of Dublin is under the joint control of the Board of Trinity College and of the President and Fellows of the College of Physicians.

MATRICULATION.

All Students of the School of Physic must be matriculated by the Senior Lecturer of Trinity College, for which a fee of 5s. is payable. No Student can be admitted for the Winter Courses after November 25.

DEGREES AND LICENCES IN MEDICINE AND SURGERY.

The Act 21 and 22 Vic., c. 99, recognises, as qualifications for Medical and Surgical Practitioners, the Degrees and Licences in Medicine and Surgery granted by the University. The Degrees are—1. Bachelor of Medicine. 2. Doctor of Medicine. 3. Master in Surgery.

UNIVERSITY DEGREES.

1. *Bachelor in Medicine*.—A Candidate for the Degree of Bachelor in Medicine must be a Graduate in Arts, and may obtain the Degree of Bachelor in Medicine at the same Commencement as that at which he receives his Degree of B.A., or at any subsequent Commencement, provided the requisite Medical education shall have been completed. The Medical education of a Bachelor in Medicine is of four years' duration, and comprises attendance on the following Courses of Lectures, viz.:—Courses of five months' duration (November to April)—Anatomy, Practical Anatomy (with Dissections), Surgery, Chemistry, Practice of Medicine, Midwifery. Courses of three months' duration (April to July)—Botany, Practical Chemistry, Medical Jurisprudence, Materia Medica and Pharmacy, Institutes of Medicine.

Hospital Attendance.—1. Nine months' attendance on the Clinical Lectures of Sir Patrick Dun's Hospital. 2. Nine months' additional attendance on the Clinical Lectures of any Hospital recognised by the Board. 3. Instruction in Practical Midwifery, including not less than six deliveries. 4. Certificate of personal attendance on Fever Cases, stating name and date of each case.

Any of the above-named six or three months' Courses may be attended at any Medical School in Dublin recognised by the Provost and Senior Fellows (and three of them at the discretion of the Candidate, may be attended in the University of Edinburgh), provided the Candidate have kept an *Annus Medicus* in the School of Physic.

The Schools recognised are—1. The School of the Royal College of Surgeons in Ireland. 2. The Carmichael School. 3. The School of Dr. Steevens' Hospital. 4. The St. Peter-street School. 5. The School of the Catholic University. The recognition of these Schools is conditional on their Students

being furnished with *bona fide* Certificates of an amount of regular attendance equivalent to that required by the University—viz., three-fourths of the entire number of Lectures in each Course.

An *Annus Medicus*, or a year's attendance in the School of Physic, may be kept in three ways:—1. By attending at least two, or not more than three, of the foregoing Courses, which are of six months' duration. 2. By attending one Course of six months' and two of three months' duration. 3. By nine months' attendance on Sir Patrick Dun's Hospital and Clinical Lectures; together with one Course of six months', or, in lieu thereof, two Courses of three months' duration.

The fee for nine months' attendance at Sir Patrick Dun's Hospital is £12 12s. The fee for each Course of Lectures is £3 3s. The fee for the *Licent ad Examinandum* is £5. The fee for the Degree of M.B. is £11.

2. *Doctor in Medicine*.—A Doctor in Medicine must be M.B. of at least three years' standing, or have been qualified to take the Degree of M.B. for three years, and must perform exercises for the Degree before the Regius Professor of Physic in accordance with the rules and statutes of the University. Total amount of fees for this Degree, £13.

3. *Master in Surgery*.—The Degree of Master in Surgery can only be obtained by Students who are Bachelors of Arts, and who have completed the Professional Curriculum and passed the Examinations required. The Curriculum extends over a period of four years, and comprises attendance upon the following Courses of Lectures, viz.:—Anatomy, one Course; Demonstrations, three Courses; Dissections, three Courses; Theory and Practice of Surgery, two Courses; Practice of Medicine, one Course; Chemistry, one Course; Materia Medica, one Course; Midwifery, one Course; Practical Chemistry, one Course; Botany, one Course; Medical Jurisprudence, one Course.

Hospital Attendance.—Three Sessions, each of nine consecutive months' duration, in any recognised Hospital, together with attendance on the Clinical Lectures on Medicine and Surgery there delivered. Any of the above-named Courses may be attended at any of the Medical Schools of Dublin recognised by the Board, provided the Candidate has kept an *Annus Medicus* in the School of Physic. The following Hospitals are recognised by the Board:—1, Sir Patrick Dun's School of Physic Hospital; 2, Meath Hospital; 3, Richmond, Whitworth, and Hardwicke Hospitals; 4, Dr. Steevens' Hospital; 5, Jervis-street Infirmary; 6, City of Dublin Hospital; 7, Mercer's Hospital; 8, St. Vincent's Hospital; 9, Adelaide Hospital; 10, Mater Misericordie Hospital. Of the Courses of Lectures, which are of five months' duration, not more than three can be attended during any one Session. Candidates will also be required to perform Surgical operations on the dead subject. Candidates for the Degree of Master in Surgery, who have already passed the Examination for the Degree of Bachelor of Medicine, will be examined in Anatomy and Surgery only. Fee for the *Licent ad Examinandum*, £5. Fee for the Degree of M.Ch., £11.

UNIVERSITY LICENCES.

Candidates for the Licences in Medicine or Surgery must be matriculated in Medicine, and must have completed four years in Medical studies. Candidates for the Licences in Medicine or Surgery must pass the following Examination in Arts, unless they be Students in the Senior Freshman or some higher class:—Homer's Iliad, Books I., II. (omitting Catalogue of ships), III.; Lucian's Dialogues (Walker's edition); Xenophon's Anabasis, Books I., II., III.; Virgil, Æneid, Books I., II., III.; Sallust; Horace, Satires; Latin Prose Composition; English Prose Composition; English History; Modern Geography; Arithmetic; Algebra to the end of Simple Equations; Euclid, Books I., II., III. In case the Student should wish to continue the Undergraduate Course in Arts, with a view to the Degree of B.A., his answering in the above will be reckoned as equivalent to the Entrance Examination, and the Hilary Examination of the Junior Freshman year. Students who have passed the foregoing Examination will be required to pay the admission fee of £15.

1. *Licentiate in Medicine*.—The Medical Course and Examination necessary for the Licence in Medicine is the same as for the Degree of M.B., with the exception that any General Hospital approved by the Board of Trinity College may be substituted for Sir Patrick Dun's. Candidates who are already Licentiates in Surgery of the Royal College of Surgeons in Ireland, or Members of the College of Surgeons of England, on passing the foregoing Arts Examination, will be admitted to Examination for the Licence in Medicine. Fee for the *Licent ad Examinandum*, £5. Fee for the Licence in Medicine, £5.

2. *Licentiate in Surgery*.—The Surgical Course and Examination necessary for the Licence in Surgery are the same as for the Degree of Master in Surgery. Fee for the *Licentiate ad Examinandum*, £5. Fee for the Licence in Surgery, £5.

Total Expense of obtaining the Degrees of Bachelor in Medicine and Master in Surgery.—I. Lectures: 1. Anatomy (one Course), £3 3s. 2. Practical Anatomy (three Courses), £9 9s. 3. Dissections (three Courses), £12 12s. 4. Surgery (two Courses), £4 4s. 5. Practice of Medicine, £3 3s. 6. Chemistry (two Courses), £4 4s. 7. Materia Medica and Pharmacy, £3 3s. 8. Midwifery, £3 3s. 9. Botany. 10. Medical Jurisprudence, £3 3s. 11. Institutes of Medicine, £3 3s.—II. Hospitals: 1. Sir P. Dun's (first year), £12 12s. 2. Second and third years' attendance, £15 15s. 3. Practical Midwifery, £3 3s.—III. Degrees: 1. *Licentiate ad Examinandum in Medicina*, £5. 2. *Licentiate ad Examinandum in Chirurgia*, £5. 3. M.B. Degree, £11. 4. M.Ch. Degree, £11.—Total Expenses: 1. Lectures, £49 12s. 2. Hospitals, £31 10s. 3. Degrees, £32. 4. Private tuition, £20. Total, £133 2s. N.B.—As no Degrees in Medicine or Surgery are conferred except upon Graduates in Arts, the expense of the Degree of Bachelor in Arts, amounting altogether to £82 4s., should be added to the foregoing, making the total cost something over £200.

THE QUEEN'S UNIVERSITY IN IRELAND,

granting the Degrees of Doctor in Medicine and Master in Surgery, includes three Colleges—the Queen's Colleges of Belfast, Cork, and Galway—each of which possesses a Faculty of Medicine. The Curriculum of Medical Study extends over a period of four years, and is divided into two periods of two years each. The first period comprises attendance on Chemistry, Natural History, Anatomy and Physiology, Practical Anatomy, Materia Medica, and Pharmacy. The second period comprises attendance on Anatomy and Physiology, Practical Anatomy, Theory and Practice of Surgery, Midwifery and Diseases of Women and Children, Theory and Practice of Medicine, Medical Jurisprudence. At least two of the above Courses of Lectures must be attended in some one of the Queen's Colleges; the remainder may be taken, at the option of the Candidate, in any University, College, or School recognised by the Senate of the Queen's University. Candidates are required before graduating to have also attended in one of the Colleges of the Queen's University Lectures on Experimental Physics and on one Modern Language, and to have passed the Matriculation Examination. They are further required to attend, during the first period, Practical Chemistry in a recognised Laboratory, and the Practice during six months of a recognised Medico-Chirurgical Hospital, containing at least sixty beds, together with Clinical Lectures delivered therein; and to attend, during the second period, a recognised Midwifery Hospital, with the Clinical Lectures therein delivered, for a period of three months; or a Midwifery Dispensary for the same period; or ten cases of Labour, under the superintendence of the Medical officer of any Hospital or Dispensary where cases of labour are treated; and eighteen months' Practice of a recognised Medico-Chirurgical Hospital containing at least sixty beds, and in which Clinical Instruction is delivered. There are two University Examinations; one comprising the subjects of study in the first period, the other the subjects of the second period. The University Examinations are held twice in each year—in June and September. Candidates who commence their Medical Studies elsewhere are admitted to the First University Examination before proceeding to College. Further information will be found in the "Queen's University Calendar," or may be obtained by application to the Secretary, Queen's University, Dublin Castle.

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.

REGULATIONS RELATIVE TO THE LICENCE IN MEDICINE.

Examinations for the Licence in Medicine are statedly held on the second Tuesday and Wednesday in each month (except August and September).

The name of every Candidate, together with his Schedule and the documents hereafter mentioned, must first be submitted to the College at one of its meetings. These are held regularly on the first Friday in each month (except August and September).

CURRICULUM.

A Candidate who has not, previous to entering his name, obtained any Medical or Surgical Qualification recognised by the College, must produce—1. Evidence of having been

engaged in the study of Medicine for four years. 2. A Certificate of having passed the Preliminary Examination of one of the recognised Licensing Corporations before the termination of the second year of Medical Study. 3. Certificates of having studied, at a School or Schools recognised by the College, the following subjects, viz.:—Practical Anatomy; Anatomy and Physiology, or Institutes of Medicine; Botany; Chemistry; Practical Chemistry; Materia Medica; Practice of Medicine and Pathology; Surgery; Midwifery; Medical Jurisprudence. 4. Certificates of having attended a Medico-Chirurgical Hospital in which regular Courses of Clinical Lectures are delivered, together with Clinical Instruction, for twenty-seven months. 5. A Certificate of having attended Practical Midwifery for six months at a recognised Lying-in Hospital, or evidence satisfactory to the College in each individual case of having attended Practical Midwifery. 6. Certificates of character from two registered Physicians or Surgeons.

A Candidate who has already obtained a Medical or Surgical Qualification recognised by the College, is required to fill up a Schedule which will be supplied on application, and to lodge it in the same manner as a Candidate not previously qualified; but the only documents he is required to produce are his Diploma or Certificate of Registration, and the Certificate of Practical Midwifery, and Testimonials as to character.

EXAMINATION FOR THE LICENCE IN MEDICINE.

The Examination is conducted—1st, Clinically; 2ndly, by printed questions to be answered in writing; and 3rdly, *viva voce*; and consists of two parts. The subjects of the First Part or Previous Examination are—Anatomy, Physiology, Botany, Chemistry. The subjects of the Second Part or Final Examination are—Materia Medica, Practice of Medicine, Medical Jurisprudence, Midwifery.

All Candidates for the Second or Final Examination (with the exception below specified) are examined in the Practice of Medicine at the bedside in one of the Hospitals of Dublin. The name of the Hospital selected will not be declared to the Candidates until half an hour previous to the time of examination.

Candidates qualified as follows are required to undergo the *second part* of the Professional Examination *only*, viz.:—1. Graduates in Medicine of a University in the United Kingdom, or of any Foreign University approved by the College. 2. Fellows, Members, or Licentiates of the Royal College of Physicians of London or Edinburgh, who have been admitted upon Examination. 3. Graduates or Licentiates in Surgery. 4. Candidates who, having completed the Curriculum above mentioned, have passed the Previous Examination of any of the Licensing Corporations in the United Kingdom.

DIPLOMA IN MIDWIFERY.

Candidates already qualified in Medicine or Surgery may apply for permission to be Examined for the Diploma in Midwifery. The Certificates required to be lodged are the same as those required from *Qualified Candidates* for the Licence to practise Medicine.

Fees.—Fee for the Licence in Medicine, £15 15s. Fee for Licence in Medicine and Diploma in Midwifery (for which latter there is a separate Examination, if taken out within an interval of a month), £16. Fee for the Diploma in Midwifery, £3 3s.

Further information and blank Schedules can be obtained by application, personally or by letter, to the Registrar, College of Physicians, Kildare-street, Dublin.

ROYAL COLLEGE OF SURGEONS IN IRELAND.

I.—REGISTRATION OF PUPILS.

Every person requiring to be registered as a Pupil on the College books shall, if the Council think fit, be so registered if he shall have laid before the Council a receipt showing that he has lodged, to the credit of the President and for the use of the College, in the Bank of Ireland, a registry fee of five guineas.

II.—QUALIFICATIONS OF CANDIDATES FOR LETTERS TESTIMONIAL.

Every Registered Pupil shall be admitted to an Examination for Letters Testimonial if he shall have laid before the Council the following documents:—

a. A receipt showing that he has lodged a sum of twenty guineas in the Bank of Ireland to the credit of the President; and for the use of the College.

(a) Candidates who are Physicians or Surgeons of five years' standing are further exempted from the Clinical and written portions of the Final Examination.

b. A Certificate that he has passed an Examination as to his acquaintance with the Greek and Latin Languages.

c. Certificate showing that he has been engaged in the study of his Profession for not less than four years.

d. Certificates of attendance on an Hospital recognised by the Council, where Clinical Instruction is given during three years.

e. Certificates of attendance on three Courses of Lectures on Anatomy and Physiology; three Courses of Lectures on the Theory and Practice of Surgery, and of the performance of three Courses of Dissections, accompanied by Demonstrations; also, Certificates of attendance on Two Courses of Lectures on Chemistry, or one Course of Lectures on General and one on Practical Chemistry; one Course of Lectures on Materia Medica; one Course of Lectures on the Practice of Medicine; one Course of Lectures on Midwifery; one Course of Lectures on Medical Jurisprudence; and one Course of Lectures on Botany.

QUARTERLY EXAMINATION.

1. Examinations are held Quarterly, on the second Tuesday in February, May, August, and November, at which Candidates shall be divided into two classes—Junior and Senior.

2. The Junior Class shall produce Certificates of having attended three Courses of Lectures on Anatomy and Physiology; three Courses of Lectures on Practical Anatomy, with Dissections; two Courses of Lectures on Chemistry; one Course of Lectures on Materia Medica; one Course of Lectures on Botany; and one Course of Lectures on Forensic Medicine.

3. This Class shall be examined in Anatomy, Physiology, and Materia Medica.

4. The fee for this Examination shall be five guineas; not to be returned in case of rejection, but to be allowed in the fee for the second examination.

5. The Senior Class shall produce Certificates of having attended three Courses of Lectures on the Theory and Practice of Surgery, one Course of Lectures on the Practice of Medicine, and one Course of Lectures on Midwifery; also Certificates of attendance on a recognised Hospital for three Winter and three Summer Sessions.

6. This Class shall be examined in Surgery, Operative Surgery, the Practice of Medicine, and form of Prescription.

7. Both these Examinations shall be partly written and partly oral.

8. The fee for this Examination shall be fifteen guineas.

Fees to be paid by Candidates for Letters Testimonial.

1. The Candidate pays ten shillings for his Preliminary Examination.

2. Five guineas as Registered Pupil of the College.

3. Five guineas for the Junior Class Examination, which is not returned in case of rejection, but is allowed in the fee for his second examination.

6. Fifteen guineas for the Senior Class Examination—total, £26 15s.

5. In addition to the foregoing, a fee of one guinea is to be paid to the Registrar, on handing each Licentiate his Diploma.

6. Every Candidate rejected at the Quarterly Examination shall be required to pay to the College the sum of two guineas on applying for re-examination, so as to recompense the College for the necessary expense.

III.—QUALIFICATIONS OF CANDIDATES FOR THE FELLOWSHIP.

Every Registered Pupil or Licentiate shall be admitted to examination for the Fellowship if he shall have laid before the Council the following documents:—

a. A receipt showing that he has lodged in the Bank of Ireland, for the use of the College, if he be a Licentiate, the sum of twenty guineas, or thirty-five in case he be a Registered Pupil; provided in either case he intends to reside beyond ten miles from Dublin. Should the Candidate intend to reside in Dublin, or within ten miles thereof, he shall lodge, if he is a Licentiate, thirty guineas; or if he be a Registered Pupil, forty-five guineas. Fellows entering on the country list, who may subsequently settle as Practitioners in Dublin, or within ten miles thereof, shall pay ten guineas to the College.

b. A Certificate that he is 25 years of age.

c. A Certificate that he is a Bachelor of Arts of some University, or that he has been examined in such manner as the Council may from time to time direct, with a view to ascertain that he has obtained a liberal preliminary education.

d. A Certificate, signed by two or more Fellows of the College, of good general conduct during his Professional education.

e. Certificates that he has been engaged in the acquisition of Professional knowledge for a period of not less than six

years, during three of which he must have studied in one or more of the Schools or Hospitals recognised by the Council. He may have studied for the other three years in any School or Schools of the United Kingdom which shall be approved by the Council, or in any Foreign School of repute. It is also required that the Candidate shall have had opportunities of practical instruction as House-Surgeon or Dresser in a recognised Hospital.

f. Certificates of attendance on the several Courses of Lectures required to be attended by Candidates for Letters Testimonial, together with one Course of Lectures on Comparative Anatomy and one Course on Natural Philosophy.

g. A Thesis on some Medical subject or Clinical reports, with observations of six or more Medical or Surgical cases taken by himself.

h. Candidates of the required age, who shall have taken the Degree of Bachelor of Arts in a British or Irish University, and have complied with the foregoing regulations in other respects, will be admitted to examination at the end of five-years of Professional Study, of which three years must have been passed in one or more of the recognised Schools or Hospitals.

i. Licentiates of the College, who may not be able to show that they have followed the course of study specified in the preceding regulations, may, at the expiration of ten years from the date of their Diploma, be admitted to the Examination required for the Fellowship, provided they produce such evidence as shall be satisfactory to the Council that they have conducted themselves honourably in the practice of their Profession.

PRELIMINARY EXAMINATION, REGISTRATION, AND MATRICULATION.

Registered Pupils are admitted to answer the Preliminary Examination at any period previous to the final Examination for Letters Testimonial.

Students who are not Registered Pupils are also admitted to answer the Preliminary Examination at any period previous to the Examination for Letters Testimonial, upon payment of a matriculation fee of ten shillings.

The following are the subjects upon which each Candidate for the Preliminary Examination will be examined, viz.—The English Language, including Grammar and Composition. Arithmetic, including Vulgar and Decimal Fractions. Algebra, including Simple Equations. Geometry, first two Books of Euclid. Latin and Greek, including Translations and Grammar. In Greek—the Gospel of St. John, the Menippus of Lucian, or the First Book of Xenophon's Anabasis. In Latin—The First and Second Books of the Æneid of Virgil, the Jugurthine War of Sallust, or the Third Book of Livy. These Examinations are held quarterly, viz.:—On the Third Wednesday in January, April, July, and October in each year. Fee, ten shillings.

Candidates are requested to enter their names, and pay the fee to the Registrar, at least three days previous to the day of Examination.

THE APOTHECARIES' HALL OF IRELAND.

BY-LAWS AND REGULATIONS.

Every Candidate for the Licence to practise is required to undergo a Preliminary and a Professional Education and Examination.

THE PRELIMINARY EDUCATION AND EXAMINATION IN ARTS.

Compulsory.—1. English Grammar, Composition, Writing from Dictation, and the leading events of Roman and English History. 2. Arithmetic and Algebra, to Simple Equations. 3. Geometry: First Two Books of Euclid. 4. Latin: The Twenty-First Book of Livy; the first Three Books of the Æneid of Virgil; the first Two Books of the Odes of Horace (any two of the three named). 5. Greek: The first Two Books of the Anabasis of Xenophon; the Ninth Book of the Iliad of Homer; The Ajax of Sophocles (any two of the three named). 6. French: Charles XII., or "Voyage en Orient" of Lamar-tine, and General Physiology. 7. German: "Wilhelm Tell," or "Die Rauber" of Schiller. Candidates will be examined in French or German, as they may select.

Optional.—1. Natural Philosophy: Mechanics, Hydrostatics, and Pneumatics. 2. Natural History: The Classification, Elementary Structure and General Physiology of Vegetables and Animals.

THE ARTS EXAMINATIONS

will be held at the Hall four times in the year—viz., the third Thursday in the months of January, April, July, and October, at the hour of 12 o'clock noon. It will be conducted by means of printed papers and by Special Examiners (Graduates in Arts of the University of Dublin), with Assessors from the Court-

of the Hall. The answers to the papers will be required in writing.

Unsuccessful Candidates will be remitted to their Studies for a period of six months.

THE PROFESSIONAL EDUCATION AND EXAMINATIONS.

Every Candidate for the Licence to practise must produce Certificates to the following effect:—

1. Of having passed an Examination in Arts previously to entering on Professional Study.
2. Of being at least 21 years of age, and of good moral character.
3. Of Apprenticeship to a qualified Apothecary, or of having been engaged at Practical Pharmacy with an Apothecary for a period of three years subsequent to having passed the Examination in Arts.
4. Of having spent four years in Professional Study.
5. Of having attended the following Courses, viz.:—Chemistry, during one Winter Session; Anatomy and Physiology, during two Winter Sessions; Demonstrations and Dissections, during two Winter Sessions; Botany and Natural History, during one Summer Session; Practical Chemistry (in a recognised Laboratory), during three months; Practical Pharmacy (in a recognised Laboratory), during three months; Principles and Practice of Medicine and Therapeutics, during one Winter Session; Midwifery and Diseases of Women and Children, during six months; Practical Midwifery at a recognised Hospital (attendance upon twenty cases); Surgery, during one Winter Session; Forensic Medicine, during one Summer Session; Instruction in the Practice of Vaccination.
6. Of having attended, at a recognised Hospital or Hospitals, the Practice of Medicine and Clinical Lectures on Medicine, during two Winter and two Summer Sessions; also the Practice of Surgery and Clinical Lectures on Surgery, during one Winter and one Summer Session.
7. Of having performed the operation of Vaccination successfully under a recognised Vaccinator.

The Court of Examiners require Lecturers and Teachers to hold weekly Class Examinations.

The Examination for the Licence to practise is divided into two parts:—The First Part comprehends Chemistry, Botany, Anatomy, Physiology, and Pharmacy. The Second—Medicine, Surgery, Pathology, Therapeutics, Midwifery, Forensic Medicine, and Hygiene. The First Part may be undergone at the close of the Second Winter Session, and after the Candidate has attended the Courses upon the several subjects named for this Examination; and the Second after the completion of his studies at the termination of the fourth Winter Session.

The Professional Examinations will be held quarterly, and will commence on the first and second Mondays in the months of January, April, July, and October.

Candidates for the Licence must lodge their testimonials, and enrol their names and addresses, with the Clerk at the Hall, in Dublin, a week prior to the day of Examination.

TO CORRESPONDENTS.

WE beg to return our best thanks to the Registrars and Secretaries of the various Universities, Colleges, and Schools for their prompt replies to our Circular, and for the trouble they have taken in supplying the latest Regulations of the Institutions with which they are connected.

In order to confine the whole of this week's Number to information specially important to Students, we are compelled to defer answers to several Correspondents, together with all notices of passing events, until next week.

Medical Times and Gazette.

SATURDAY, SEPTEMBER 9, 1871.

TO STUDENTS.

ONCE again the revolving year brings us to the time when with the "Students' Number" of the journal it is, or we think it is, incumbent on us to address a few words of advice and encouragement to Medical Students; and we confess that we cannot honestly say, with the Lake Poet, that—

"Pleasure hath not ceased to wait
On this expected annual round."

—for, in truth, this "Address to Students" is one of the autumnal nightmares of our editorship. In our younger days, when the exercise of the editorial "we" was, perchance, new to us, we were troubled by no doubts either that we could guide Students in the way that they should go, and help them to make the best use of their time, or that they both read and profited by our advice; but Time, devourer of enthusiasm as well as of other things, has rather shaken our confidence in the literary taste and judgment of Students, and in our own knowledge of what is the best course for each and all of them to pursue. Still, we cannot refrain from a few words of greeting to those who are entering one of the noblest and most self-elevating of all professions, and we may point to a few of the broad general principles that none can slight without evil consequences.

Supposing we were to begin at the beginning, and ask what is meant by "a Student," answers might be given of very various kind and tone. It might be said that a Student is a being created by the kind Providence that watches over the interests of lecturers and examiners; or, he is the pabulum of Medical Schools, the sport and victim of the Licensing Bodies and the Medical Council. And many answers of the like kind might doubtless be given, each containing a certain amount of truth. But we want a serious reply—a wider, deeper, and higher definition—and will take that of Vossius, who tells us that the word Student is derived, through the Latin, from a Greek verb meaning "*summâ vi contendere*—to strive with the greatest force, to exert all the power of the mind;" and Howell, speaking of study and of what the Student ought to be, says, "*teneri fideliter, et uti feliciter*: these are two of the happiest properties in a Student." Surely these two quotations may most fittingly and usefully be the text of our brief address.

We present them to our friends, the Students, and say—Take them as mottoes. They contain the very pith and essence of what we would say to you, both as to the spirit in which you should work—*summâ vi*—and as to the grasp and command you should strive to obtain over the subjects at which you work—*teneri fideliter, et uti feliciter*. On beginning your four years' studentship you enter on the studies that are to fit you for your special work in life. It is entering on man's work: quit yourselves like men. Do not for a moment entertain the idea that four years is a long time, and that you can afford to loiter over your work at first; the time is all too short for the variety of subjects you have to work at in order to fit you to undertake the care of human health and life. And, on the other hand, do not be appalled by the number and vastness of the studies marked out for you; by steady, persevering diligence you cannot fail to conquer them. Work thoroughly, when you work, and never in a half-hearted, slipshod fashion; but whatever the subject you are engaged on may be—whether you are to learn much of it or a little only, whether you have to master only the A B C or to go deeply into it—work at it with a will, *summâ vi*, and then you will make it your own so far as you go into it, and you will retain faithfully the knowledge you have acquired. Beware of working merely that you may be able to pass an examination, and of regarding examinations merely as dreadful ordeals that must be "got through." Work that you may know, and use examinations as the best means of trying and testing your work. Especially welcome class examinations for this purpose; honestly met and used, they will prove the best and readiest mode of proving the accuracy, thoroughness, and readiness of your knowledge, and they will, by use and practice, prepare you to face your chief examinations with cool courage and presence of mind.

Make use, as fully as you can, of all the sources of knowledge within your reach—lectures, examinations, the dissecting-room, the post-mortem room, the laboratories and the museum, books (and most continuously, earnestly, and perseveringly the living books in the out-patients' rooms and the wards), note-taking and case-taking, the debating-society, and

any opportunities of earnest discussion—and you will thus take the best means of making your knowledge full, accurate, and ready; you will have acquired the properties—“*teneri fideliter, et uti feliciter.*”

We do not mean, of course, that you are to be for ever, always, and only at work. If you work well and with close attention when working, you will have time for, and will have earned the right of, recreation; and you will need due exercise and amusement. But let your amusements and sports be manly, brave, and healthy. And wherever you are, be observers: “The noblest study of mankind is Man,” and the Medical man needs especially to study man in health as well as in disease. There’s a deal of human nature in patients, and the Medical man should be carefully observant of all its varieties. Readiness of recognition of the kind and manner of the human beings that come to him immensely helps him in the management of their diseases and disorders, and may make the chief difference between the successful and the non-successful Practitioner.

In addition to all this, be honest English Gentlemen, and then, at the end of your four years of studentship, you will be ready to enter on the practice of your Profession with advantage to your fellow-creatures, and with pleasure, as well as profit, to yourselves.

With these few words, we welcome you, and wish you Godspeed in your labours.

THE FUTURE LIFE OF THE MEDICAL STUDENT.

THAT the “boy is father to the man” is an aphorism generally received, and in the main it is true. “As we sow we reap.”

It may be assumed that this axiom may be accepted in respect to the Student of Medicine. The idle and dissipated Student rarely turns out the industrious and painstaking Practitioner. Undoubtedly habits, bad or good, may be got rid of; but it is much easier to dispense with a good for a bad habit, than a bad for a good one. It is method and mental training that are of far more importance to the future Practitioner than great natural abilities or extraordinary acquirements. Habits of observation, the exercise of moderate abilities, and the acquirement of general principles are of far more importance than the occasional display of brilliant parts and the exhibition of knowledge too minute to be practical, and too discursive to be of service at the bedside. The tailors of Laputa were, according to Gulliver, the most learned in the world. They cut their coats by mathematical calculation, and yet were not famous as “fitters.” Indeed, we are told that on one occasion an over-learned “disciple of the shears” made the error of a single figure in his problem, and the result was, the production of a coat large enough to envelop the whole corporation of Laputa in its folds.

Too much refinement, too much fine-spinning in knowledge, is injurious to the culture of a vigorous intellect and of accurate powers of observation. Robert Hall once remarked of a very learned, but a very silly man—“Sir, he has so many books on his head, they compress his brain.” It is too much the fashion of the Medical Student to regard passing his examinations as the grand event of his life—as the entrance, as it were, into a new and happier state of existence; but this is far from being the case. His diplomas are the guarantees to the public that he has fitted himself for practice; but his Student-life continues. “I am still a Student,” said Sir Astley Cooper, before the Parliamentary Committee, when he was 65 years of age, “and should not be satisfied if I did not dissect something daily.” And the fact that they must continue to study and to observe will be more patent to the younger members of our Profession the longer they live. They will gradually become more alive to the “uncertainties” of Medicine; to the necessity for caution and of modesty as to their own abilities. One of the greatest amongst us said, after being

forty years in practice, “I commenced with twenty remedies for every disease, and now I find twenty diseases for which I can find no remedy.” This is, perhaps, a little too decided, but there is unquestionably much of truth in it.

The moral of all that we gather from the above and similar anecdotes is—that Medicine is not an exact science, and never can be; that mere book-knowledge is of little avail; and that, to use the language of Baillie, “the successful practice of Medicine depends mainly on the exercise of common sense and observation, combined with a moderate amount of knowledge.” And this it is which distinguishes one man from another in the “world’s broad field of battle.” The book-learned, the hair-splitter, the *dilletante* Practitioner, is nowhere; whilst the moderately well informed man, who has exercised his senses, and eschewed the “dandyism” of Physic, is successful.” It is true that occasionally the worker for prizes alone may reach distinction if his bodily powers can maintain the strain put upon them; but how many

“By the roadside fell and perished,
Weary with the march of life!”

The successful Practitioner should be a healthy man; should bear a cheerful countenance, and have a word of hope to succour the afflicted. Even if he cannot save, he can alleviate; if he cannot cure, he can cheer. To have good health in after-life, it is unnecessary to say that the habits of the Student should be such as to give a fair amount of time to physical exercise and recreation.

The future life of the Student is neither all cloudy nor all sunshine: like an April day, however, there is enough of both—sometimes to depress, often to enliven. Stripped of the “poetry” with which some are ever anxious to environ it, it is a fact that there is no profession which has more true elements of happiness in it than that of Medicine. The lawyer sees in the main the worse parts of human nature; the clergyman, as a rule, has but limited means of observing mankind; but the Doctor sees humanity in all its phases—from the cradle to the grave. If he sees instances of querulousness, impatience, and repining under suffering, he is witness also to heroism, patience, and fortitude in the hours of pain and tribulation. If he meet with instances of ingratitude—and these he will surely meet with, perhaps out of proportion to what he could reasonably expect—he will be cheered on numberless occasions by grateful thanks and heart-cheering expressions of good-will. If he practise his Profession as a man of honour and prudence, he cannot fail to make it, even “commercially,” a profitable pursuit. It is not for everyone to make a fortune—this, indeed, is quite the exception to the rule; but he will obtain means to live like a gentleman, and put something by for the hour of need.

In conclusion, we will quote the advice of one who knew human nature well, and who, in his Profession, was not only one of the ablest, but one of the most successful, of Surgeons, on the subject of the standing in society to be taken by the Medical Practitioner, and his bearing towards those who employ him. In his address to the Students of St. George’s Hospital in October, 1850, Sir Benjamin Brodie concluded as follows:—“You are entering on a Profession which is good or bad, according to the manner in which it is pursued: let me offer you some suggestions as to your conduct in it. On no occasion allow anything to interfere with the strict performance of your Professional duties. Whatever you undertake to do, that do to the very best of your ability, sparing neither thought nor trouble, whether it be the case of the poor man, to whom you give gratuitous assistance, or of the rich man, who remunerates you liberally for your attentions. Consider yourselves as being engaged, not in a trade, but in the cultivation of a noble and interesting science. Let it be your first object to deserve and obtain the good opinion of all classes of society with whom you come in contact, not only as being skilful Practitioners, but as men of honour and integrity. You will thus be in that

independent situation which will place you above the caprice of the foolish, and also above the necessity of stooping to obtain the favour of any individual. Do justice to others, but do justice to your Profession and yourselves, always bearing in mind that those who are in any way usefully and worthily employed have a much higher place in the scale of existence than those useless and selfish persons who live only for themselves, however high their rank, however large their fortunes."

CHANGES IN THE METROPOLITAN HOSPITALS AND SCHOOLS.

GIVING, as is our wont, an account of the changes in the Hospital Staff and School *personnel* of the various London Hospitals, and taking each in its alphabetical order, we note—first, with regard to St. Bartholomew's Hospital, the irremediable loss of Sir James Paget. It is matter for congratulation that, though he be lost to the Hospital, he is not lost to the Profession, and that his health has now been so far restored as to enable him to resume its practice. Although his retirement has been before this noticed and commented on, we cannot help again referring to his wonderful powers as a teacher, attracting to himself the pupils by the pleasant cheerfulness of his manner as well as by his wonderful diction. As a speaker, especially on Professional subjects, Sir James Paget has few equals, and his loss will long cause a blank at St. Bartholomew's Hospital, the more especially as he has retired in the full maturity of his powers, and before the deadening effects of age were in the slightest degree traceable in him. We also observe that Mr. Holden has retired from the Chair of Anatomy, and that his place has been filled by Mr. Thomas Smith, who, in conjunction with Mr. Callender, now holds the chair in question. By the resignation of Sir James Paget, Mr. Callender became full Surgeon, and Mr. Marrant Baker was appointed Junior Assistant-Surgeon. The Chair of Chemistry, empty by the untimely death of Dr. Matthiessen, has been filled by Dr. Russell, formerly of St. Mary's Hospital; and Dr. Shaw has taken the place of Dr. Thorn, now one of the Privy Council Medical Officers, as Lecturer on Psychological Medicine. Certain minor changes have taken place with regard to the teaching of Operative Surgery and Practical Physiology; but probably the most important change of all is the alteration of the total fees payable to the Hospital to £110 5s.

At Charing-cross Hospital, the grievous death of Dr. Salter occasioned changes in several departments. Thus, Dr. Headland now lectures on Medicine, and Dr. Powell on *Materia Medica*. By the enlargement of the Hospital Staff, too, Dr. Julius Pollock has become full Physician, and Mr. Hird full Surgeon, with charge of in-patients; the two vacancies having been filled by Dr. Powell and Mr. Fairlie Clarke, respectively. Mr. G. A. Canton has become Surgeon-Dentist in the place of Mr. Parkinson; and Mr. John M. Bruce has been appointed Demonstrator of Practical Physiology.

At St. George's, the most important changes are the appointments of Mr. Brudenell Carter in the place of Mr. H. Power, whose services as Ophthalmic Surgeon have been transferred to St. Bartholomew's; and of Dr. Dickinson as Teacher of Morbid Anatomy and Pathology, a post for which he is unusually well qualified.

At Guy's, Mr. Cock, the Senior Surgeon, has retired, and Mr. Bryant has become full Surgeon in his place, Mr. Davies-Colley becoming Junior Assistant-Surgeon. Dr. Fagge is now associated with Dr. Moxon in the teaching of Pathology; Mr. Bryant ceases to teach Operative Surgery; and a newly formed Chair of Psychological Medicine is filled by Dr. Dickson.

At King's College, we observe that the great loss of Professor Miller has, as nearly as possible, been made good by the appointment of Mr. Bloxam to the Chair of Chemistry; that Dr. Ferrier has been appointed Demonstrator of Practical

Physiology; and Dr. E. Sheppard to the Chair of Psychological Medicine.

At the London Hospital the changes are not numerous. Dr. Langdon Down takes a share in the teaching of Medicine; and Dr. Prosser James now fills the Chair of *Materia Medica*, Dr. Tidy taking Medical Jurisprudence.

At St. Mary's, by lapse of years, both Dr. Sibson and Mr. Samuel Lane have come to resign, the new appointments being Dr. Nunneley and Mr. Hayward; Dr. Broadbent and Mr. Gascoyen each taking their step. The Chair of Medicine is shared by Dr. Chambers with Dr. Broadbent; that of Surgery by Mr. J. Lane with Mr. Gascoyen. Mr. T. Norton retains Anatomy alone; and Dr. Lawson does the same with regard to Physiology. Dr. Nunneley takes in hand Practical Physiology; and Dr. Wright lectures on Chemistry in place of Dr. Russell. One of the most important changes is that of Dr. Meadows for Dr. Tyler Smith, in the Chair of Midwifery and the post of Obstetric Physician.

At Middlesex Hospital, the greatest loss sustained is the transfer of Dr. Murchison's services and those of Mr. Henry Arnott to St. Thomas's Hospital. Dr. Greenhow takes the place of Dr. Murchison as Lecturer on Medicine; and Dr. Cayley that of Mr. Arnott in the Chair of Pathology. Dr. Burdon-Sanderson has also given up his connexion with the Hospital; but only two new appointments have been made—viz., Dr. John Murray as Assistant-Physician, and Mr. Morris as Assistant-Surgeon. At this Hospital Mr. Lowne lectures on Physiology, Dr. Murie on Comparative Anatomy, and Dr. Divers on Forensic Medicine.

At St. Thomas's—which, by the way, we may now announce open for receiving patients—almost a new staff has been constructed. The recent appointments to the staff are too well known to require recapitulation. The School is altered as follows:—Drs. Peacock and Murchison lecture on Medicine; Messrs. Le Gros Clark and Sydney Jones on Surgery; Mr. Mason and Mr. Wagstaffe on Anatomy; Mr. Croft and Mr. MacCormac on Practical Surgery; Dr. Bristowe on General Pathology; Dr. Ord and Dr. John Harley on Physiology; and Mr. Liebreich on Ophthalmic Surgery. Mr. Stewart lectures on Comparative Anatomy; and Dr. Payne gives the Demonstration on Pathology.

At University College and Hospital there are not this year many changes. One thing worthy of notice is that there is but one Assistant-Physician—Dr. F. Roberts—about the place, and not one Assistant-Surgeon. Dr. Burdon-Sanderson's Course can hardly be called new. The chief novelty is the division of the teaching of Practical Surgery into three parts, under Messrs. Berkeley Hill, Christopher Heath, and Marcus Beck.

At Westminster, Mr. Mason's services have been transferred to St. Thomas's. Mr. Pearse takes his place in the Chair of Anatomy, Mr. Davy becoming Demonstrator in the place of Mr. Pearse. Dr. Anstie now lectures on Practice of Medicine, Dr. Sturges becoming Lecturer on *Materia Medica*. Thus ends our survey of the many and notable changes which appear in this year's prospectuses.

COMPARATIVE PATHOLOGY AND PATHOLOGICAL HISTOLOGY.—The Laboratory of the Brown Institution will be open for advanced Students and Members of the Profession at Christmas. The Pathological Work of the Laboratory will be under the direction of the Professor; the Histological under that of Dr. E. Klein, formerly Lecturer on Histology in the University of Vienna. For further information apply to Dr. Burdon-Sanderson, or to Dr. E. Klein, 18, Rowland-street, Tottenham-court-road.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, VICTORIA-PARK.—Office, 24, Finsbury-circus, E.C.—Physicians—T. B. Peacock, M.D.; J. R. Bennett, M.D.; E. L. Birkett, M.D.; S. H. Ward, M.D.; J. Andrew, M.D. Consulting Surgeon—J. Hilton, F.R.S. Assistant-Physicians—J. C. Thorowgood, M.D.; H. G. Sutton, M.B.; A. B. Shepherd, M.B.; C. Bäumlér, M.D.; Eustace Smith, M.D.; W. H. Corfield, M.B. Resident Medical Officer—Mr. W. H. Power. The Hospital affords accommodation for 160 in-patients. During the last year 772 cases were under treatment in the wards, and 13,174 were relieved as out-patients. In-patients admitted since the wards were opened in 1855, 7700; out-patients admitted since the establishment of the Institution in 1848, 194,000. Information respecting Medical instruction at the Hospital may be obtained on application to the Physicians.

ADDITIONAL INFORMATION RESPECTING THE METROPOLITAN SCHOOLS, ETC.

ST. BARTHOLOMEW'S HOSPITAL AND COLLEGE.
 This Hospital contains 676 beds.
 Whole fee for attendance on Lectures and Hospital Practice 105 guineas, payable by instalments, or a single payment of 100 guineas. Payment in either of these ways entitles a Student to a perpetual ticket.
 Four House-Physicians and four House-Surgeons are appointed annually, on the payment of a nominal fee, and are provided with rooms by the Hospital authorities. The Senior Midwifery Assistant is appointed for twelve months, and is eligible for re-election for a

second twelvemonth. The Junior Midwifery Assistant is appointed without fee for six months, and is provided with rooms by the Hospital authorities. The Ophthalmic House-Surgeon is appointed for six months, and is eligible for re-election for a second term of six months.

The Clinical Clerks to the Physicians and to the Physician-Accoucheur, the Clerks to the Assistant-Physicians and Assistant-Surgeons, and the Dressers in the Special Departments, are chosen from the diligent Students. Sixteen Ward Dresserships are annually given to the Students of the second year who pass the best examinations in the subjects of Study of the first and second years, or who may be otherwise specially recommended. Other Dresserships may be obtained by payment of the usual fees.

Courses of Practical Surgery and of Practical Physiology have been instituted in accordance with recent regulations of the Royal College of Surgeons.

Special Departments:—Diseases of the Skin (Dr. Duckworth, Friday, at 1.30), Diseases of the Eye (Mr. Power and Mr. Vernon, Tuesday, Thursday, and Saturday, at 1.30), Diseases of the Ear (Mr. Thomas Smith, Friday, at 2.30), Orthopædic Surgery (Mr. Willett, Friday, at 12.30), Dental Surgery (Mr. Coleman, Friday, at 9 a.m.).

The following Scholarships and Prizes are awarded:—Senior Scholarship of the value of £50, Medicine, Surgery, and Midwifery. Senior Scholarship of the value of £50, Anatomy, Physiology, and Botany. Scholarships of the value of £25 each will be awarded to those Students who are placed second in the Examinations for the Senior Scholarships. Junior Scholarships of the value of £50, £30, and £20 are awarded after the General Examination at the end of the Summer and Winter Sessions. The Jeaffreson Exhibition, founded 1868, to the value of £20, and tenable for two years, is awarded at the commencement of each Winter Session to the Student who passes the best Examination in the subjects of Preliminary Education. Wix Prize, founded 1842, is awarded for the best Essay on "The Connexion between Revealed Religion and Medical Science." Hichens Prize, founded 1851. Subject of Examination—Bishop Butler's Analogy. Bentley Prize, founded 1842, for the best Report of Surgical cases occurring in the Wards of the Hospital during the previous year. It is expected that the Reports will comprise the Histories, Progress, Treatment, and Results of not less than Twelve Cases, with observations thereupon. Foster Prize. Subject of Examination—Practical Anatomy; Senior. Treasurer's Prize. Subject of Examination—Practical Anatomy; Junior. The Kirkes Gold Medal. Subject of Examination—Clinical Medicine.

Special Classes are held for the Matriculation, for the Preliminary Scientific, and for other Examinations at the London University. Students preparing for other Examining Boards are arranged in classes and examined by the Lecturers and Demonstrators.

A College for Resident Students exists in connexion with the Hospital. Resident Warden, Mr. Marrant Baker.

All communications to be addressed to the Warden of the College, St. Bartholomew's Hospital.

CHARING-CROSS HOSPITAL.

Gentlemen are received—1st. As Matriculated Students, or those who enter for their entire Medical Education at the Charing-cross Hospital Medical College. 2ndly. As occasional Students, or those who enter to one or more particular classes. Matriculated Students alone have the privilege of filling the offices of Registrar, Pathological Assistant, Assistant-Demonstrator, Clinical Clerks, Dressers, Dentist's Assistant, Resident Medical Officer, Resident Surgical Officer, and Physician-Accoucheur's Assistant, and of becoming Candidates for the Scholarships, Medals, and various general Class Prizes.

The Fee for the Courses of Lectures and Hospital Practice required by the University of London, the Royal College of Physicians, the Royal College of Surgeons, and the Society of Apothecaries, to Non-Matriculated Students, is £80 17s.; for the Hospital Practice alone, £31 10s. The Fee to Matriculated Students for the full period of the Lectures and Hospital Practice required by the Royal College of Physicians, the Royal College of Surgeons, and the Society of Apothecaries, is £74 3s.; for the Hospital Practice alone, £28 19s. 8d. The Fee for Matriculation is £2 2s., to be paid on entering. Payment of Fees may be made in five instalments.

The office of Registrar to the Hospital, and Pathological Registrar to the School, tenable for two or three years, for the efficient performance of the duties appertaining to which the Council award an annual stipend, is open to all Matriculated Students of the Hospital who have obtained their qualifications, as are also the offices of House-Physician, House-Surgeon, and Resident Physician-Accoucheur's Assistant.

Scholarships, Medals, and Prizes.—*Scholarships:* The Llewellyn Scholarship of £25 is open to all Matriculated Students who have just completed their second academical year. The Golding Scholarship of £15 a year is open to all Matriculated Students who have just completed their first academical year. The following Medals are awarded annually:—The Gold Medal for General Proficiency; the Governors' Clinical Silver Medal; Silver Class Medals, on all the subjects of the Lectures; Bronze Class Medals, on all the subjects of the Lectures.

Free Scholarships.—Candidates for Free Scholarships are

required to be sons of Professional men of reduced circumstances and position, or of gentlemen in a corresponding station of society, and are to have had a classical education fitting them for the Medical Profession. They must have already commenced their Medical studies, and, from unforeseen circumstances, be unable to complete their Professional education without such assistance. They are to send in their applications and testimonials before September 1.

ST. GEORGE'S HOSPITAL.

Perpetual pupils pay at the time of entry a compounding fee of £105. They are admitted to the Practice of the Physicians and Surgeons, to all the Lectures (except Practical Chemistry), to compete for all Prizes and Exhibitions, to hold the appointments of House-Physician, House-Surgeon, Assistant House-Physician, Assistant House-Surgeon, Ophthalmic and Orthopædic Assistants, and Clinical Clerk and Dresser for two periods of three months each.

Gentlemen are admitted to the Hospital Practice and Lectures required for the Licence of the College of Physicians, for the Diploma of Member of the College of Surgeons, and for the Licence of the Society of Apothecaries (with the exception of Practical Chemistry), on payment of the following fees—viz., £42 for the first year of study, £42 for the second year of study, and £10 10s. for each succeeding year. By payment of these fees pupils are entitled to hold the office of Clinical Clerk and Dresser, and to become Candidates for the Offices of Medical and Surgical Registrars, Demonstrator of Anatomy and Curator of the Museum, to each of which offices a salary of £50 is attached. An Obstetric Assistant, with a salary of £100 and board and residence, is annually elected from amongst those Students who have obtained a legal qualification to practise. Pupils may also enter to the Hospital Practice and Lectures separately.

The appointments of House-Physician and House-Surgeon are made every six months, are four in number, and are tenable for one year. These appointments are awarded after Examination, and are given without fee or payment, each officer being lodged and boarded at the expense of the Governors of the Hospital. The whole of the patients are under the charge of these Officers in the absence of the Physicians and Surgeons.

Exhibitions and Prizes.—"The William Brown Exhibition," of £40 per annum, tenable for three years: This Exhibition is completed for by perpetual pupils who have commenced their third, but not completed their fourth Winter Session. It will be "bestowed on the Candidate who shall show the best general fitness for the exercise of the Medical Profession, and whose moral conduct shall in all respects be satisfactory." The Treasurer's Clinical Prize of £10 10s., the gift of A. Shaw Stewart, Esq. Sir Charles Clarke's Prize for Good Conduct: The interest of £200 Consols, to be awarded annually to the Student of the Hospital "who, by reason of his general good conduct during the preceding year, should be considered the most deserving." The Thompson Medal: A Silver Medal to be awarded annually for the best Clinical Report of Medical and Surgical Cases observed in the Hospital during the preceding twelve months. Sir Benjamin Brodie's Clinical Prize in Surgery will be awarded to the perpetual pupil of the Hospital who shall have delivered to the Surgeons the best report of not more than twenty Surgical cases which have occurred in the Hospital during the preceding twelve months. Dr. Acland's Clinical Prize in Medicine will be awarded to the perpetual pupil of the Hospital who shall produce the best report of not more than twenty Medical cases which have occurred in the Hospital during the preceding twelve months. The Henry Charles Johnson Memorial Prize in Anatomy will be awarded to that pupil who shall, in the judgment of the Medical School Committee, exhibit the greatest proficiency in Practical Anatomy. General Proficiency Prizes:—To pupils in their first year, £10 10s.; to pupils in their second year, £10 10s.; to pupils in their third year, £10 10s.

The studies of all the Students are superintended by a Medical Tutor specially appointed for that purpose.

For further particulars apply to Dr. Wadham, Dean of the School.

GUY'S HOSPITAL.

This Hospital contains nearly 720 beds.

Voluntary Examinations are held at four periods of the Students' Course, as follows:—1st. At entrance, commencing on October 5, in Elementary Classics, Ancient and Modern History, and Mathematics. The Candidate who most distinguishes himself receives £25; the second Candidate, £20; the third, £15. 2nd. At the end of the first Sessional year, in all the subjects of that year:—one sum of £30, another of

£25, and a third of £10 10s. (presented by one of the Governors). 3rd. At the end of the second Sessional year, in the subjects which form the Course of Study up to that time—£35 and £30. 4th. At the end of the third Sessional year, in all the subjects of the Curriculum—£40 and £35. Honorary Certificates are also given to Candidates who pass creditable Examinations.

Special Examinations.—Two Gold Medals are given annually by the Treasurer to Students who have completed their third, and not exceeded their fourth year—the one for Clinical Medicine, the other for Clinical Surgery.

The Fees for Hospital Practice and Lectures are as follows:—For the First Year, £40; for the Second Year, £20; and £10 for every succeeding year of attendance. The one payment of £100 entitles a Student to a perpetual ticket. Materials used in Practical Courses are charged extra. Payment of 100 guineas entitles to a perpetual ticket.

Students are selected according to merit for the following Appointments:—House-Physicians, House-Surgeons, and Obstetric Residents (Senior and Junior), Surgeon's Dressers, Clinical Assistants, Dressers in the Eye Wards, Post-mortem Clerks, Obstetric Out-patient Clerks, Assistant-Physician's Clerks, Assistant-Surgeon's Dressers, Dressers in the Surgery, Dental Surgeon's Dressers, Aural Surgeon's Dressers, Medical Clinical Clerks, Surgical Clinical Clerks, Extern Obstetric Attendants, Assistant-Surgeon's Clerks, Clerks in the Electrifying Room.

The Registrars and the Demonstrators in Anatomy and Chemistry assist the pupils in their studies.

For further information, apply to Mr. Stocker, Apothecary to the Hospital.

KING'S COLLEGE.

The fees, amounting to £100, may be paid either in one sum on Matriculation or at the commencement of each Winter Session. Students are, however, recommended to add £2 2s. for a second Course of Chemistry, as well as the fee for attendance on the Medical Tutor's class for one year—viz., £3 3s. All resident Students are required to attend the Tutor (Dr. E. B. Baxter) during their first year.

Resident Medical Officers, Clinical Clerks, and Dressers are chosen by examination from Matriculated Students who are Pupils of the Hospital.

Scholarships.—Warneford Scholarships: The sum of £200 is set apart annually for Scholarships in the Medical Department—viz., "For the encouragement of the previous education of Medical Students," two Scholarships of £25 per annum for three years; "For the encouragement of resident Medical Students," one Scholarship of £25 per annum for two years. College Scholarships: The following are given every year to Matriculated Students of this department:—1. One of £40 for two years, open to Students of the third and fourth year; 2. One of £30 for one year, open to Students of the second year; 3. One of £20 for one year, open to Students of the first year. Daniell Scholarship: £20, tenable for two years, is open to every Student of the College who has worked in the Laboratory for at least six months. Sambrooke Registrarships: Two of £30 every year.

Prizes.—Leathes Prizes: Bible and Prayer-book to two Matriculated Medical Students. Warneford Prizes: £40 is expended in the purchase of Medals and Books as Prizes to two Matriculated Medical Students. Class Prizes are awarded annually for proficiency in each subject of Study; these consist of books of the value of £3. Two Medical Clinical Prizes, one of £3 for the Winter Session and the other of £2 for the Summer Session; and two Surgical Clinical Prizes of the same value are given for attendance at the Hospital. Todd Medical Clinical Prize: This Prize was founded in memory of the late Dr. Todd. It consists of a Bronze Medal and Books to the value of £4 4s.

Residence of Students.—A limited number may reside within the College.

For further information apply to Professor Bentley, Dean of the Medical Department.

ST. MARY'S HOSPITAL.

The Hospital contains 170 beds—68 Medical, and 102 Surgical. There are Special Departments for the Diseases of Women and Children; and for Diseases of the Eye, the Ear, the Skin, and the Throat.

Resident Medical Officers, Clinical Clerks, and Dressers.—All these appointments are open to the Pupils without additional fee, and are held in succession, so as to secure a complete system of Clinical training. Five of these appointments exceed in value an equal number of Scholarships of £50 each. All

General Students are required to perform the duties of Clinical Clerks and Dressers for a period of six months during the last two years of their Curriculum. Students of the third year are appointed to assist the Physicians and Surgeons in charge of the out-patients. A Resident Registrarship within the Hospital has been created, with a salary of £100 a year and Dispensary fees, tenable for one year and open to re-election, preference being given to past House-Surgeons and Perpetual Pupils.

Scholarships, Prizes, etc.—A Scholarship in Natural Science, of the annual value of £40, tenable for three years, and an Exhibition in Natural Science of £20, for one year, will be awarded by open competitive Examination immediately before the commencement of each Winter Session. A Scholarship in Anatomy, of the annual value of £20 (the holder of which will be styled Assistant-Demonstrator, and assist in the teaching of Practical Anatomy), will be offered for competition amongst those Students who have completed their second Winter Session; and a Scholarship in Pathology, of the value of £20 (the holder of which will be styled Assistant-Curator), for those Students who have completed their third Winter Session. Examinations for Prizes are held at the termination of each Session in the various Classes for Students of the first, second, and third year. Two Prosectors are appointed annually, who each receive a Certificate and £5 for their services in the Dissecting-room.

The Entrance Fees for General Students may be paid in instalments by arrangement with the Dean of the School. A fee of £1 1s. is required to be paid to the Library and Reading-room. Instruction in Vaccination can be obtained; fee £1 1s.

Further information may be obtained from Dr. Cheadle, Dean of the School, or from Mr. Knott, the Registrar, at the Hospital.

THE LONDON HOSPITAL.

The next Winter Session will commence on Monday, October 2, 1871.

During the Winter Session, Lectures on Anatomy, Physiology, Chemistry, Pathology and Morbid Anatomy, Medicine, Surgery, and Dental Surgery will be given. Clinical Lectures and Clinical Instruction will be regularly and systematically delivered on the Cases occurring both in the Clinical and in the ordinary Medical and Surgical Wards. There will be Clinical Lectures on the Cases in the Wards for Diseases of Women, and Clinical Instruction in the Obstetric Out-patient Rooms, as well as in the Special Departments for Diseases of the Eye, Ear, and Skin.

The Summer Session will begin on Wednesday, May 1, and terminate on Tuesday, July 31, 1872.

During the Summer Session, Lectures on Midwifery and Diseases of Women, Materia Medica, Botany, Comparative Anatomy, Practical Histology and the Use of the Microscope, Pathology and Morbid Anatomy, Practical Chemistry, Forensic Medicine, Syphilis, Diseases of the Eye and Use of the Ophthalmoscope, Diseases of the Skin, Diseases of the Throat and Use of the Laryngoscope, Acoustics, and Diseases of the Ear will be given.

Clinical Lectures and Clinical Instruction will be delivered, as in the Winter Session, in connexion with every branch of Practice.

Table of Fees.—General fee for Perpetual Attendance on all the Lectures, and for attendance on Medical and Surgical Practice, qualifying for Examination at most of the Medical and Surgical Boards, £90; Composition fee for Gentlemen entering at or before the beginning of their Second Winter Session, their first year having been spent elsewhere, £70; Perpetual fee for Lectures and Hospital Practice, £100; Perpetual fees for Lectures alone, £50; Perpetual fee for Hospital Practice alone, £50. Extra Fees:—Practical Chemistry (for Apparatus, &c.), £2 2s.; Subscription to the Library (compulsory), £1 1s. *Note.*—The General fee and the Perpetual fee are payable in two instalments of £45 and £50 each respectively at the commencement of each of the first two years of attendance. If preferred, the *Perpetual* fee can be paid in three instalments—£45 at the commencement of each of the first two years of attendance, and £10 at the commencement of the third year. The Composition fee is payable in two instalments of £35.

Scholarships and Prizes.—Seven Scholarships will be offered for competition during the ensuing Winter Session. The two Buxton Scholarships will be awarded in October to the Students who distinguish themselves most in the subjects appointed by the General Council of Medical Education and Registration as the subjects of the Preliminary Examinations. 1. A Scholarship, value £30, to the Student placed first in the

Examination. 2. A Scholarship, value £20, to the Student placed second in the Examination. 3. A Scholarship, value £20, will be awarded to the First Year Student who shall pass in December, 1871, the best Examination in Human Anatomy. 4. A Scholarship, value £25, will be awarded to the First Year or Second Year Student who shall pass at the end of the Winter Session the best Examination in Anatomy, Physiology, and Chemistry. 5. A Hospital Scholarship, value £20, for proficiency and zeal in Clinical Medicine. 6. A Hospital Scholarship, value £20, for proficiency and zeal in Clinical Surgery. 7. A Hospital Scholarship, value £20, for proficiency and zeal in Clinical Obstetrics. The Duckworth Nelson Prize, value £10, will be awarded by competition at the end of the Winter Session, 1873, and will be open to all Students who have not completed their education. The subjects of Examination will be Practical Medicine and Surgery. Money Prizes to the value of £60 per annum are awarded by the House Committee to the most meritorious of the Dressers in the Out-patient Rooms. The special conditions may be learnt on inquiry. The Offices of Resident Medical Officer, Junior Resident Medical Officer, Four Medical Assistants, Clinical Clerks, Resident Accoucheur, Maternity Pupils, Four House-Surgeons, Surgical Dressing Pupils, Two Medical Clinical Assistants, Two Surgical Clinical Assistants, Medical Registrar, Surgical Registrar, Assistant-Dentist, Post-mortem Clerks, and Two Prosectors of Anatomy are open to the Students.

Communications addressed to the Dean or Vice-Dean of the School, at the London Hospital Medical College, Turner-street, Mile-end, London, E., will receive immediate attention. Information may be obtained from Mr. John Adams, Treasurer, 10, Finsbury-circus, E.C.; Mr. Jonathan Hutchinson, Senior Surgeon, 4, Finsbury-circus, E.C.; Mr. Rivington, Dean of the School, 22, Finsbury-square, E.C.; Mr. Waren Tay, Vice-Dean, 10, Finsbury-pavement, E.C.; Dr. Down, Treasurer, 37, Welbeck-street, W.; Dr. Samuel Fenwick, Harley-street, W.; from any member of the Hospital Staff, and from the Lecturers at the College.

MIDDLESEX HOSPITAL.

This Hospital contains upwards of 300 beds, of which 185 are for Surgical, and 120 for Medical cases. There is a special department for Cancer cases, affording accommodation for thirty-three in-patients, whose period of residence in the Hospital is unlimited. Wards are also appropriated for the reception of cases of Uterine Disease and of Syphilis, and beds are set apart for patients from Diseases of the Eye.

Special attention is bestowed on the Clinical Instruction of the Students, both in the wards and out-patient rooms. Classes, open to all the Students, are held for practical instruction in the microscopic examination of healthy and diseased tissues, and also in the application of bandages and other Surgical apparatus. Students are allowed to take out to read at their own homes books from the Library of the School. Three Clinical Prizes, including the Governors' Prize of twenty guineas, are annually awarded to those Students who pass the most satisfactory Examination at the bedside and in the post-mortem room. Class Prizes are also given, and six resident Clinical Appointments are annually awarded, after competitive examination, to Students who have completed their education, and complied with the Regulations of the School. The officers thus appointed reside and board in the Hospital free of expense.

The College Tutor assists all general Students free of charge, especially those who are preparing for Examination, and his daily instruction is arranged with a view to avoid the necessity of Students obtaining any private teaching apart from that of the Medical School.

The fee for attendance on the Hospital Practice and Lectures required by the Colleges of Physicians and Surgeons and the Society of Apothecaries is £90, which may be paid by instalments.

ST. THOMAS'S HOSPITAL.

The admission fee to Hospital Practice and all the Lectures is £40 for the first year, and a similar sum for the second, £20 for the third, and £10 for each succeeding year; or £105 at one payment for unlimited attendance. Special entries may be made to any Course of Lectures, or to the Hospital Practice.

There are special departments for Diseases of the Eye, Diseases of Women and Children, Vaccination, Diseases of the Skin, Diseases of the Teeth, and Mental Diseases.

Prizes and Appointments.—The William Tite Scholarship, awarded every third year: A Scholarship has been founded by Sir W. Tite, M.P., F.R.S., the proceeds of £1000 Consols,

tenable for three years, on proof of continued residence and good conduct. Preference, in case of equality between Students, to be given to the son of a Medical man, and more particularly of one who has been educated at St. Thomas's Hospital, or is in practice at Bath. To the three most distinguished pupils for general proficiency, the following Prizes are awarded:—First Year's Students—Winter, £20, £15, £10; Summer, £15, £10, £5. Second Year—Winter, £20, £15, £10; Summer, £15, £10, £5. Clinical and Obstetrical Clerks and Dressers are selected according to merit from among Second Year's Students. The Dressers and Obstetrical Clerks are provided with rooms and commons during their period of attendance in the Hospital free of expense. Third year's Students—Winter, £20, £15, £10. The Cheselden Medal, founded by George Vaughan, Esq., is awarded in respect of a Special Examination in Surgery and Surgical Anatomy. The Treasurer's Gold Medal is given annually for general proficiency and good conduct. The Grainger Testimonial Prize, of the value of £20, will be awarded biennially to the Third or Fourth Year's Students for a Physiological Essay, to be illustrated by preparations.

The House-Physicians, the House-Surgeons, and Resident Accoucheur are chosen from gentlemen who have obtained their Professional Diplomas. All are provided with rooms and commons. The two Offices of Medical Registrar and Surgical Registrar are from time to time filled from among gentlemen who have completed their studies in the School. Each Registrar, on completing his Annual Report to the satisfaction of the Physicians and Surgeons, receives a gratuity of £80.

The Tutor in Arts is Mr. S. Hague, LL.B., B.A., Lond.

For further information, apply to Mr. Whitfield, Medical Secretary, St. Thomas's Hospital, London, S.E.

UNIVERSITY COLLEGE, LONDON.

The fees for Lectures and Hospital Practice required by the Colleges of Physicians and Surgeons and the Society of Apothecaries during the Student's entire course amount to £104 14s., which may be paid as follows:—First Winter, £36 5s.; First Summer, £11 11s. Second Winter, £31; Second Summer, £7 7s. Third Winter, £11 4s.; Third Summer, £7 7s.

Entrance Exhibitions.—Three Entrance Exhibitions, of the respective values of £30, £20, and £10 per annum, tenable for two years, are annually awarded, upon examination by printed papers, to gentlemen who are about to commence their first winter's attendance in a Medical School. The subjects of the Examinations are:—Classics, Elementary Mathematics, Natural Philosophy, and either French or German at the option of the Candidate. The next Examination will take place at the College on September 28 and 29. Notice of intention to compete, with a statement of the modern language in which the Candidate wishes to be examined, must be left addressed to the Secretary, not later than 2 p.m. on Saturday, Sept. 23, at the office of the College, where the Regulations may be obtained.

Scholarships and Exhibitions.—The Atkinson Morley Surgical Scholarship, of £45, tenable for three years, is annually awarded to the Student who, upon examination, is found to possess the greatest proficiency in the Theory and Practice of Surgery. The Sharpey Physiological Scholarship, of about £95 per annum, tenable for three years, for proficiency in Biological Science. Filliter Exhibition: A Prize of £30 is awarded annually, in July, to the most proficient Student in the class of Pathological Anatomy.

Medals and Prizes.—Dr. Fellowes's Clinical Medals, one Gold and one Silver, awarded at the end of the Winter and of the Summer Session to Pupils who have most distinguished themselves by reports and observations on the Medical cases in the Hospital. The Liston Gold Medal is awarded at the end of the Summer Session to the Pupil who has most distinguished himself by reports and observations on the Surgical cases in the Hospital. The Alexander Bruce Gold Medal will be awarded for proficiency in Pathology and Surgery. The Cluff Memorial Prize is awarded every other year for proficiency in Anatomy, Physiology, and Chemistry.

Class Medals and Prizes.—Besides the above, Gold and Silver Medals or other Prizes are awarded in each class.

The Appointment of Assistant-Curator to the Museum of Anatomy and Pathology, of Demonstrators of Anatomy, of Resident Medical Officer to the Hospital, and of Surgical Registrar—all of which have emoluments attached to them—are almost invariably conferred upon Students of the College.

Offices in the Hospital tenable by Students.—Physicians' Assistants, House-Surgeons, Midwifery Assistants, Physicians' Clerks, Surgeons' Dressers, Ward Clerks, and Ophthalmic Surgeons' Assistants are selected from the Pupils, without additional fees.

Further information and detailed prospectuses may be obtained at the office of University College, Gower-street, W.C.

WESTMINSTER HOSPITAL.

The entry fee to Lectures and Hospital Practice required by the College of Physicians and Surgeons and the Society of Apothecaries may be paid in one sum of £70, or in three instalments—£35 at the commencement of the first year, and £30 and £10 respectively at the commencement of the second and third years.

In addition to the practice of the Hospital, which contains 191 beds, the pupils of this school are admitted to the practice of the Westminster Ophthalmic Hospital, and to that of the National Hospital for Epilepsy and Paralysis.

Prize Appointments.—A House-Physician and House-Surgeon are appointed annually, by examination, from amongst the senior students, without the payment of any fee; and these officers are provided with board and lodging free of expense. There are Medical and Surgical Registrars, each of whom receives a salary of about £50. A Medical Obstetric Assistant boards and resides at the Hospital without fee.

Prizes.—In addition to the appointments above enumerated, there is a Scholarship of twenty guineas, in Anatomy and Physiology, a Prize of the value of £20 for general proficiency, two Clinical Prizes of the value of five guineas each. Prizes are also awarded to the most meritorious Students of the first and second years.

Full particulars as to courses of lectures and mode of instruction will be found in the Annual Prospectus of this School, and any further information may be obtained by personal application to Dr. Sturges, the Dean of the School.

ENGLISH PROVINCIAL SCHOOLS AND HOSPITALS.

QUEEN'S COLLEGE, BIRMINGHAM.

Professors of the Medical Faculty.—Winter Courses: Medicine, Dr. James Russell. Dr. Balthazar W. Foster; Surgery, Mr. Oliver Pemberton, Mr. Furneaux Jordan; Anatomy, Mr. Charles J. Bracey, M.B. Lond., and William Thomas, M.B., F.R.C.S.; Physiology, Dr. Richard Norris, Mr. T. H. Bartleet, M.B. Lond.; Chemistry, Dr. Alfred Hill, F.C.S.; Demonstrator of Anatomy, Mr. Robert Jolly, M.D., F.R.C.S.E. Summer Courses: Midwifery, Mr. John Clay, Mr. John Bassett; Diseases of Women and Children, Mr. Samuel Berry and Dr. R. C. R. Jordan; Forensic Medicine and Toxicology, Mr. Thomas Swain and Dr. Alfred Hill; Practical Chemistry, Mr. Alfred Anderson, F.C.S.; Botany, Dr. William Hinds; Materia Medica and Therapeutics, Mr. J. St. S. Wilders and Edward Mackey, M.B. Lond.; Ophthalmic Surgery, Mr. J. Vose Solomon; Dental Surgery, Mr. Thomas Howkins; Comparative Anatomy, Dr. Thomas Savage; Medical Tutor and Registrar, vacant.

Hospital Practice may be attended at either the General Hospital or the Queen's Hospital, which are equidistant from the College.

Resident Students.—Students may reside within the College, where they will be provided with rooms and board, and will be under the supervision of the Warden and Resident Tutors. Resident Students are expected to attend the College Chapel, unless specially exempted by the Warden.

Resident Tutors.—The Professor of Classics, the Professor of Mathematics, and the Medical Tutor.

Scholarships and Prizes.—Two Warneford Scholarships, the Sands Cox Prize (value of £20), the Warden's Prize (of the value of five guineas), the Percy Prize (books of the value of five guineas), and Class Prizes, Medals, and Certificates of Honour are awarded annually.

Fees.—Composition fee for all the Lectures required by the University of London, the Royal College of Physicians, the Royal College of Surgeons, and the Apothecaries' Society, fifty guineas, payable by two equal instalments; the first on entrance, and the second at the commencement of the second year. Fees for Anatomy, Physiology, Medicine, and Surgery are £5 5s.; for Demonstration, Chemistry, and Midwifery, £4 4s.; for the other courses £3 3s.; for the Summer (with the exception of Midwifery, £5), £4 or £3 3s. Fees for Resident Students, for rooms and commons, £50 per annum.

The prospectus of the Medical Department, and further information, may be obtained by application to the Rev. the Warden, at the College; or to Professor Foster, M.D., 16, Temple-row, Birmingham; or to Professor Furneaux Jordan, Colmore-row, Birmingham.

THE QUEEN'S HOSPITAL, BIRMINGHAM.

Physicians, Dr. Fleming, Dr. Johnston, Dr. Heslop. Surgeons, Mr. West, Mr. Gamgee, Mr. Furneaux Jordan, Mr. J. St. S. Wilders. Obstetric Surgeon, Mr. John Clay. Dental Surgeon, Mr. Adams Parker. Resident Physician and Medical Tutor, Dr. Underhill. Resident Surgeon and Surgical Tutor, Mr. Gilbert Smith.

Fees for Medical and Surgical Practice, for six months, £10 10s.; for one year, £15 15s.; for three years, £31. Midwifery fee, £2 2s.; Dental fee, £2 2s.; both optional.

Several Clinical Prizes are offered for competition to Students of the second, third, and fourth years. They vary from £2 2s. to £5 5s. in value.

The Hospital has special wards for Diseases of Women and Children and Venereal Diseases. There is a Lying-in department, under the superintendence of Mr. John Clay. Clinical Lectures and Instruction are delivered daily at the Hospital by the Physicians and Surgeons. Special Courses of Lectures and Demonstrations are delivered on Diseases of Women and Children, Diseases of the Skin, Orthopædic Surgery, Bandaging and the Application of Surgical Apparatus, and Venereal Diseases. One of the Honorary Physicians gives special Instruction in Physical Diagnosis, the Use of the Microscope, Laryngoscope, and Ophthalmoscope. The Arts of Prescribing and Case-taking are taught by the Resident Physicians. Fees are to be paid to Mr. H. C. Burdett, Resident Secretary to the Hospital. Special Instruction in Dental Surgery by Mr. Adams Parker. Fee, £2 2s.

GENERAL HOSPITAL, BIRMINGHAM.

Physicians, Dr. Bell Fletcher, Dr. Russell, Dr. Wade, Dr. Foster. Surgeons, Mr. Alfred Baker, Mr. O. Pemberton, Mr. T. H. Bartleet, Mr. W. P. Goodall, Mr. R. Jolly. Resident Physician and Tutor, Dr. Greenway. Resident Surgeon, Mr. Bennett May. Registrar and Pathologist, Mr. Edwin Rickards.

Days and Hours of Clinical Instruction.—Clinical Medicine (Dr. Fletcher): Mondays, at 10 o'clock, Dr. Wade; Wednesdays, at 10 o'clock, Dr. Foster; Thursdays, at 10 o'clock, Dr. Russell. Clinical Surgery (Mr. Baker and Mr. Pemberton): Tuesdays, at 10 o'clock, Mr. Bartleet; Fridays, at 10 o'clock, Mr. Jolly; Saturdays, at 10 o'clock, Mr. Goodall.

Clinical Lectures will be given at stated times by Dr. Fletcher, Mr. Baker, and Mr. Pemberton.

BRISTOL MEDICAL SCHOOL, SESSION 1871-72.

The Winter Session will commence on Monday, October 2, 1871. Medicine, Dr. Martyn and Dr. Fox. Surgery, Mr. Coe and Mr. Tibbits. General Anatomy and Physiology, Messrs. Atchley and Steele. Descriptive and Surgical Anatomy, Mr. Lansdown and Mr. Board. Superintendence of Dissections, Messrs. Ludlow, Dobson, and Chute. Chemistry, Mr. Coomber.

The Summer Session will commence on May 1, 1872. Midwifery and Diseases of Women, Dr. J. G. Swayne. Forensic Medicine, Mr. W. P. Keall. Materia Medica and Therapeutics, Dr. G. F. Burder. Botany, Mr. A. Leipner. Practical Chemistry, Mr. Coomber. Pathological Anatomy, Dr. Martyn and Dr. Fox. Comparative Anatomy, Mr. Atchley.

Fee for perpetual attendance on all the above Courses, except Comparative Anatomy, £57 15s.

Competitive Examinations are held amongst Students of the first, second, and third years respectively; and prizes of money, instruments, and books are annually awarded.

Medical and Surgical Hospital Practice and Clinical Lectures are attended at the Royal Infirmary or at the General Hospital.

Further information may be obtained on application to the Honorary Secretary, Dr. G. F. Burder.

BRISTOL GENERAL HOSPITAL.

The Hospital contains 140 beds. Physicians, Dr. Martyn, Dr. Burder, Dr. Frupp. Surgeons, Mr. Coe, Mr. Lansdown, Dr. H. Marshall, Mr. G. F. Atchley. Physician-Accoucheur, Dr. Swayne. Two Scholarships of £15 each are awarded annually. Also a Scholarship, called the Sanders Scholarship, for the study of Medicine and Surgery, being the interest of £500 (to be given annually), bequeathed to the Hospital by the late J. N. Sanders, Esq.

Fees.—Medical or Surgical Practice, for six months, £6; one year, £10; perpetual, £20. Extra Fee for Clinical Clerk or Dresser, £5 5s. for six months. Library fee, £1 1s. per annum. Dressers reside in the Hospital by rotation and free of expense.

Resident Pupils (including board, lodging, and washing), £100 for the first year, £60 for each subsequent year. Or for five years, with apprenticeship to the Hospital, £260.

Further information will be afforded by Mr. Atchley on application being made to him at the Hospital.

BRISTOL ROYAL INFIRMARY.

The Infirmary contains 242 beds. Physicians, Dr. Brittan, Dr. Fairborough, Dr. Fox, Dr. Beddoe. Surgeons, Mr. Leonard, Mr. Clark, Mr. Tibbits, and Mr. Steele.

Fees.—For one year, Surgeon's pupil, £12 12s.; Dresser (extra fee), £12 12s. For two years (at one payment), Surgeon's pupil, £21; Dresser (extra fee), £21. For three years (at one payment), Surgeon's pupil, £26 5s.; Dresser (extra fee), £26 5s. Dressers reside in the House in weekly rotation. Physician's pupil, for six months, £8; one year, £15; eighteen months, £20; perpetual, £25. Clinical Clerks are appointed without extra fee. A Gold Medal and other Prizes are awarded annually. Patients admitted in 1870—In-patients, 2747; out-patients, 18,816; total, 21,563.

LEEDS SCHOOL OF MEDICINE.

The Winter Session will commence on Monday, October 2, 1871. Anatomy, by Mr. James Seaton, Dr. Robert T. Land, and Mr. John A. Nunneley. Physiology, by Messrs. C. J. Wright and James Walker. Principles and Practice of Medicine, by Dr. Charles Chadwick, Dr. John D. Heaton, and Dr. T. C. Allbutt. Principles and Practice of Surgery, by Messrs. Claudius G. Wheelhouse, T. Pridgin Teale, and T. R. Jessop. Chemistry, by Mr. J. Chapman Wilson. Materia Medica, by Dr. John E. Eddison. Midwifery, by Mr. W. Hall. Forensic Medicine, by Mr. Thomas Scattergood. Botany, by Mr. Edward Atkinson. Comparative Anatomy, by Mr. C. G. Wheelhouse and Dr. T. C. Allbutt. Assistant Demonstrators of Anatomy, Messrs. Robert Parr Oglesby, Charles Richardson, and John Horsfall. Demonstrations in Operative Surgery, by Messrs. S. Hey, C. G. Wheelhouse, and Pridgin Teale. Demonstrations of Skin Diseases, by Dr. Allbutt, at the Infirmary. Ophthalmoscopic Demonstrations, by Mr. T. Pridgin Teale. Total fees, entitling to all the Lectures and Hospital Practice required by the Licensing Boards, £88 4s. These fees may be paid at once, or in two instalments at the commencement of the first and second years. Entrance fee to Library and Reading-room, £1 1s., to be paid by all Students on entrance. Instructions in Vaccination, as required by the College of Surgeons and the Poor-law Board, is given by Mr. Holmes, of Burmantofts, one of the Public Vaccinators. Fee, £1 1s. At the close of each Session, Examinations for Prizes are held, when Silver and Bronze Medals, Books, and Certificates of Honour are presented according to merit. Two Clinical Prizes of £10 each, a Forensic Medicine Prize of £10, and two Chemical Scholarships are awarded to Students. House-Surgeoncies, Clinical Clerkships, and Dresserships are open to the Students.

Honorary Medical Officers of the Hospital.—Consulting Physician: Charles Chadwick, M.D. Consulting Surgeon: William Hey, F.R.C.S. Physicians: John Deakin Heaton, M.D., T. Clifford Allbutt, M.D., and John Edwin Eddison, M.D. Surgeons: Samuel Hey, F.R.C.S.; C. G. Wheelhouse, F.R.C.S.; T. Pridgin Teale, M.A., F.R.C.S.; T. R. Jessop, F.R.C.S.

Terms of Attendance upon the Hospital Practice.—The fees for attendance upon the Medical Practice alone, or upon the Surgical Practice alone, are as follows, being the same in each case:—One Winter Session, £7 7s.; one Summer Session, £6 6s.; Twelve Months, £12 12s.; Eighteen Months, £15 15s.; Three Years, £21. Applications for Medical Practice are to be made to Dr. Heaton, Claremont, between 9 and 10 a.m. Applications for Surgical Practice are to be made to Mr. T. Pridgin Teale, 20, Park-row, between 10 and 12 a.m.

LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE.

The Introductory Address will be delivered on October 2, 1871, at 3 p.m., by Dr. W. Carter.

Hospital Practice, Royal Infirmary.—Physicians, Dr. Vose, Dr. Turnbull, Dr. Waters. Surgeons, Mr. Stubbs, Mr. Bickersteth, Mr. Hakes. Assistant-Surgeon, Mr. Harrison. House-Surgeons, Dr. Cleaver and Mr. Matthews. Pathologist, Mr. Banks. Dental Surgeon, Mr. Snape.

Terms for Hospital Attendance and Clinical Lectures:—For Six Months' Medical or Surgical Practice, £5 5s.; One Year, £6 6s.

Lectures, Winter Session.—Medicine, Dr. Cameron. Surgery, Mr. Harrison. Physiology, Dr. Waters. Anatomy, Mr. W. M. Banks. Dissection, Dr. Glynn and Mr. E. A. Browne. Pathology, Dr. Davidson. Chemistry, Dr. Brown.

Lectures, Summer Session.—Midwifery, Dr. Steele. Diseases

of Children, Dr. Gec. Materia Medica, Dr. Nevins. Medical Jurisprudence, Dr. E. Whittle. Toxicology and Practical Chemistry, Dr. Brown. Botany, Dr. W. Carter. Comparative Anatomy and Zoology, Caton.

Exhibitions.—Royal Infirmary Medical Scholarship (value £42), consisting of Gold Medal, value £10 10s., and Six Months' Free Board and Residence, with Clerkship and Dressership, in the Royal Infirmary. Four Exhibitions (value £31 10s. each), consisting of Six Months' Free Board and Residence in the Royal Infirmary.

The Fee for all the Lectures required by the Colleges of Surgeons and Physicians and the Apothecaries' Hall is forty-five guineas (exclusive of Practical Chemistry).

LIVERPOOL NORTHERN HOSPITAL.

The Winter session will commence on Monday, October 2. Physicians, Dr. Waters and Dr. Glynn. Surgeons, Mr. Manifold, Mr. Lowndes, and Mr. Branston Nash. Junior Surgeon, Mr. John Bradley. Dental Surgeon, Mr. James Lloyd.

The Hospital contains 146 beds, which are mainly devoted to severe Accidents and cases of Acute Disease. There is a special ward for the treatment of the Diseases and Accidents of Children. About 4500 cases are annually treated at the Hospital, of which about 1500 are in-patients. The visits of the Physicians and Surgeons are made between one and two o'clock p.m. daily. Clinical Lectures are regularly delivered by the Physicians and Surgeons during the Winter and Summer Sessions. Clinical Clerkships and Dresserships are open to all the Students, without additional fee. Clinical Prizes will be awarded at the termination of the Winter Session.

Fees for Hospital Practice and Clinical Lectures.—Perpetual, 25 guineas; one year, 10 guineas; six months, 7 guineas; three months, 4 guineas. Students can enter to the Medical or Surgical practice separately, on payment of half the above fees. The Hospital receives one Resident Pupil, fee 60 guineas per annum. Attendance on the Practice of this Hospital qualifies for all the Examining Boards.

For further particulars, apply to the House-Surgeon, Mr. Chalmers.

MANCHESTER ROYAL SCHOOL OF MEDICINE AND SURGERY, FAULKNER-STREET.

The Winter Session will commence October 2, with an Introductory Address by R. T. Hunt, Esq.

Winter Session, 1871-72.—Physiology, Mr. Smith. Descriptive Anatomy, Mr. Lund. Anatomical Demonstrations, Mr. S. M. Bradley. Chemistry, Mr. Stone. Medicine, Dr. Roberts and Dr. Morgan. Surgery, Mr. Southam. The Eye, Mr. Hunt. Practical Physiology, Mr. Smith. Practical Surgery, by the Surgeons of the Hospital.

Summer Session.—Midwifery, Dr. Thorburn. General Pathology and Morbid Anatomy, Dr. Simpson. Materia Medica, Mr. Somers. Forensic Medicine, Mr. Harrison. Botany, Mr. Grindon. Practical Chemistry, Mr. Stone. Comparative Anatomy, Mr. Bradley.

Perpetual fee to the whole of the Lectures required, £42, which may be paid in instalments.

Hospital Practice at the Royal Infirmary, where Clinical Lectures are regularly delivered by the Physicians and Surgeons of the Institution, composition fee £42.

Scholarships.—In addition to Prizes, amounting to 36 guineas, for general proficiency, Three Scholarships for perpetual students will be offered for competition—one of £20 for third year's students; one of £15 for second year's students; one of £10 for first year's students.

Further particulars may be obtained from Mr. Southam; or from the Vice-Registrar, Mr. Stone, at the School, or by letter.

UNIVERSITY OF DURHAM.—COLLEGE OF MEDICINE, NEWCASTLE-UPON-TYNE.

Winter Session, commencing October, 2, 1871.—Physiology, Dr. Murray. Anatomy, Dr. Nesham, Mr. Armstrong, and Mr. Russell. Medicine, Dr. Charlton and Dr. Embleton. Surgery, Dr. Heath. Chemistry, Mr. Marreco, M.A.

Summer Session.—Midwifery, Dr. Gibson. Botany, Mr. Thornhill. Medical Jurisprudence, Dr. Donkin. Materia Medica, Dr. Humble and Dr. Arnison. Practical Chemistry, Mr. Marreco, M.A. Operative Surgery, Dr. Heath. Pathological Anatomy, Dr. Gibb and Dr. Philipson. Pharmacy, Mr. Proctor.

Fees for Lectures.—Composition fee for all the Lectures qualifying for the Licence in Medicine and the Mastership in Surgery of the University of Durham, the Licence and Membership of the Royal College of Physicians, the Diploma of

the College of Surgeons, and the Licence of the Apothecaries' Society, and payable on entering to the first Winter Session, £46 4s. Perpetual Ticket for Pharmacy Curriculum, £12 12s. Separate Courses of Lectures, each £4 4s. The composition fee entitles the holder to attend the Lectures on Botany, Chemistry, Materia Medica, and Pharmacy, and to use the Museum of Materia Medica in the Library of the College.

Hospital Practice.—This can be attended at the Newcastle Infirmary, which contains 230 beds. Midwifery, Diseases of the Eye, Insanity, and Vaccination can be specially studied. The Laboratories, Libraries, and Museums are open daily.

Fees for Hospital Practice.—Twelve Months, £7 7s.; Six Months, £5 5s.; Three Months, £4 4s.; Perpetual fee, £17 17s.; or, if paid by instalments, first year £7 7s., second year £6 6s., third year £5 5s. These fees also are payable in advance.

Medical Scholarships in the University of Durham.—Four Scholarships, of £25 a year each, tenable each for four years. Two resident Clinical Clerkships, four resident Dresserships, and four non-resident Dresserships are conferred for merit. Dickinson Memorial Scholarship, £15, tenable for one year, for general proficiency. By a recent Act of Convocation, Students may now proceed to the Degrees of M.D. and C.M. of the University of Durham by keeping Terms either at Durham or Newcastle.

College Medals.—At the end of each Session a Silver Medal and Certificates of Honour will be awarded in each of the required classes.

Further particulars may be obtained from Mr. Luke Armstrong, Registrar, or of Dr. Arnison, Secretary.

Clinical Clerkships are open to the Students.

T. O. Wood, L.R.C.P., Medical Superintendent of the Dunston Lodge Lunatic Asylum, will deliver a Course of Lectures on Psychological Medicine, illustrated by cases in the Asylum, to Students in their third and fourth years, during the latter half of the Winter Session. Due notice will be given of the time.

Instruction in Vaccination can be obtained of G. C. Gilchrist, M.D. Fee, one guinea.

SHEFFIELD SCHOOL OF MEDICINE.

The Winter Session will commence on October 1. Anatomy, Descriptive and Surgical, Mr. Skinner and Mr. A. Jackson. Demonstrations of Anatomy, Messrs. Pearce, E. Skinner, and Clark. Physiology, Mr. Thos. Leeds and Mr. S. Morton. Principles and Practice of Medicine, Dr. Frank-Smith. Principles and Practice of Surgery, Mr. W. F. Favell and Mr. Parker, F.R.C.S. Chemistry, Mr. Allen. Dental Mechanics, Mr. G. Mosely. Clinical Medicine, Dr. De Bartolomé, Dr. Law, and Dr. Frank-Smith. Clinical Surgery, Mr. Barber, Mr. W. F. Favell, and Mr. Parker, F.R.C.S.

Summer Session, commencing May 1, 1872. Midwifery and Diseases of Women, Dr. Keeling and Dr. Hime. Materia Medica and Therapeutics, Dr. Young. Medical Jurisprudence and Toxicology, Mr. Baker and Mr. Harrison. Botany, Mr. Birks. Practical Chemistry, Mr. Allen. Dental Surgery, Dr. Merryweather. Demonstrations of Pathology and Microscopy, Mr. Hallam (at the Infirmary). Demonstrations of Operative Surgery, Mr. Favell and Mr. Parker, F.R.C.S. Demonstrations of Practical Histology and Physiology and Practical Surgery, vacancies to be filled up August 28.

Medical and Surgical Practice.—*Sheffield General Infirmary.*—Physicians, Dr. De Bartolomé, Dr. Law, Dr. Frank-Smith. Surgeons, Mr. Barber, Mr. Favell, Mr. Parker, F.R.C.S. House-Surgeon, Mr. Hallam.

The Infirmary contains 160 beds for In-patients; shortly to be increased to 200.

The fees for Perpetual Attendance at the Infirmary are £15 15s. for Medical, £21 for Surgical, Practice. For twelve months' Practice: Medical, £10 10s.; Surgical, £6 6s. Six months' : Medical, £6 6s.; Surgical, £6 6s.

Public Hospital and Dispensary.—100 beds. Physicians, Dr. J. Hall, Dr. Law, and Dr. Mitchell. Surgeons, Mr. Chesman, Mr. A. Jackson, and Dr. Keeling.

Sheffield Hospital for Diseases of Women.—Medical Officers: Dr. Jackson, Dr. Keeling, Dr. Hime, Mr. Woolhouse.

For further information apply to the Staff of the Institution.

Table of Fees, including Demonstrations.—Anatomy and Physiology, first Course, £6 6s., second Course, £4 4s.; Practice of Medicine, first Course, £4 4s.; second Course, £2 2s.; Practice of Surgery, first Course, £4 4s., second Course, £2 2s.; Chemistry, first Course, £4 4s.; Midwifery and Diseases of Women, first Course, £3 3s.; Materia Medica, first Course, £3 3s.; Medical Jurisprudence, first Course, £3 3s.; Botany, first Course, £3 3s.; Practical Chemistry, first Course, £3s. 3s.

Perpetual fee for attendance on all the Lectures required by the Royal College of Surgeons and the Apothecaries' Hall, £40.

All further information may be obtained on application to the Hon. Secretaries, Dr. Frank-Smith, 79, Norfolk-street, and Mr. A. Jackson, St. James's-row, Sheffield.

MEDICAL SCHOOLS AND HOSPITALS IN SCOTLAND.

UNIVERSITY OF EDINBURGH.—1870-71.

Principal—Sir Alex. Grant, Bart., LL.D.

THE Session will be publicly opened with an Introductory Address by the Principal, on Wednesday, November 1, 1871. The Classes for the different branches of study will be opened as follows, and will meet daily (Saturdays excepted) unless otherwise stated:—

Faculty of Medicine.—Materia Medica, Professor Christison, M.D.; Chemistry, Professor Crum-Brown, M.D.; Surgery, Professor Spence; Institutes of Medicine or Physiology, Professor Bennett, M.D.; Midwifery and Diseases of Women and Children, Professor Simpson, M.D.; Clinical Surgery, Professor Lister; Clinical Medicine, Professors Bennett, Laycock, MacLagan, and Sanders; Anatomy, Professor Turner, M.B.; Natural History, Professor Wyville Thomson; Practice of Physic, Professor Laycock, M.D.; General Pathology, Professor Sanders, M.D.; Anatomical Demonstrations, Professor Turner; Botany, Professor Balfour, M.A., M.D.; Medical Jurisprudence, Professor MacLagan, M.D. The Lectures on Botany and Medical Jurisprudence are given in the Summer Session.

Royal Infirmary, at noon, daily. Practical Anatomy, Monday, October 3, under the superintendence of Professor Turner. Practical Chemistry, under the superintendence of Professor Crum-Brown. Practical Physiology, under the superintendence of Professor Bennett.

During the Summer Session, Lectures will be given on the following subjects:—Botany, Professor Balfour. Practical Physiology, including Histology, Professor Bennett. Medical Jurisprudence, Professor MacLagan. Clinical Medicine, Professors Bennett, Laycock, MacLagan, and Sanders. Clinical Surgery, Professor Lister. Anatomical Demonstrations, Professor Turner. Practical Chemistry, under the direction of Professor Crum-Brown. Practical Anatomy, under the superintendence of Professor Turner. Natural History, Professor Wyville Thomson. Medical Psychology and Mental Diseases, with practical instruction at an Asylum, Professor Laycock. Operative Surgery, Professor Spence. Practical Pathology, Professor Sanders.

A Table of Fees may be seen in the Matriculation Office and in the Reading-room of the Library.

SCHOOL OF MEDICINE, EDINBURGH.

The Practical Anatomy Rooms and Chemical Laboratories open on Monday, October 2. The Introductory Address will be delivered by Mr. Annandale, on Wednesday, November 1, at Eleven o'clock. Lectures commence on Thursday, November 2.

Winter Session, 1871-2.—Surgery, Dr. P. H. Watson, Dr. Joseph Bell, Mr. Annandale; Chemistry (Lectures, Practical Chemistry, Analytical Chemistry), Dr. Stevenson Macadam; Midwifery and Diseases of Women and Children, Dr. Matthews Duncan; Physiology (Royal Infirmary), Dr. Arthur Gamgee; Clinical Medicine (Royal Infirmary), Drs. Haldane, Balfour, Stewart, and Dr. Matthews Duncan (for Diseases of Women); Clinical Surgery (Royal Infirmary), Mr. Annandale; Anatomy (Lectures, Anatomical Demonstrations, Practical Anatomy), Dr. P. D. Handyside; Medical Jurisprudence, Dr. Littlejohn; Practice of Physic, Dr. Rutherford Haldane; General Pathology, Dr. John Wyllie.

Summer Session, 1872.—Classes open on Wednesday, May 1. —Materia Medica and Therapeutics, Dr. Thomas R. Fraser; Pathological Anatomy and Histology, Dr. John Wyllie; Midwifery and Diseases of Women and Children, Dr. Keiller and Dr. Angus Macdonald; Medical Jurisprudence (Royal Infirmary), Dr. Littlejohn; Clinical Medicine (Royal Infirmary), Drs. Haldane, Balfour, Stewart, and Dr. Matthews Duncan (for Diseases of Women); Clinical Surgery (Royal Infirmary), Mr. Annandale; Anatomy (Practical Anatomy, Anatomical Demonstrations), Dr. P. D. Handyside; Chemistry (Practical Chemistry, Analytical Chemistry), Dr. Stevenson Macadam.

The minimum cost of the Education in the above School for the Double Qualification of Physician and Surgeon from the

Royal Colleges of Physicians and Surgeons, including the fees for the Joint Examination, is £90 4s., which is payable by yearly instalments during the period of study; whilst the minimum cost for the Single Qualification of either Physician or Surgeon, including Fee for Examination, is £80.

ROYAL INFIRMARY, EDINBURGH.

In this Hospital a portion of the beds is set apart for Clinical Instruction by the Professors of the University of Edinburgh. Courses of Clinical Medicine and Surgery are also given by the Ordinary Physicians and Surgeons. Separate Wards are devoted to Fever, Small-pox, Venereal Diseases, Diseases of Women, Diseases of the Eye; also to cases of Incidental Delirium or Insanity. Post-mortem Examinations are conducted in the Anatomical Theatre by the Pathologist, who also gives Practical Instruction in Pathological Anatomy and Histology. Professors of Clinical Medicine, Dr. Bennett, Dr. Laycock, Dr. MacLagan, Dr. Sanders. Extra-Physicians and Lecturers on Diseases peculiar to Women, Dr. J. Matthews Duncan and Dr. Alexander R. Simpson. Ordinary Physicians and Lecturers on Clinical Medicines, Dr. Rutherford Haldane, Dr. Geo. W. Balfour, Dr. T. Grainger Stewart. Assistant-Physicians, Dr. Claud Muirhead, Dr. Thomas R. Fraser. Consulting-Surgeon, Dr. Dunsmure. Professor of Surgery, Mr. Spence. Ordinary Acting-Surgeons, Dr. J. D. Gillespie (Lecturer on Clinical Surgery), Dr. P. H. Watson, Mr. Thos. Annandale. Professor of Clinical Surgery, Mr. Lister. Ophthalmic Surgeons, Mr. Walker, Dr. D. A. Robertson. Extra-Surgeon for Treatment of Ovarian Disease, Dr. Thomas Keith. Assistant-Surgeons, Dr. Joseph Bell, Dr. John Duncan. Dental Surgeon, Dr. John Smith. Pathologist, Dr. James B. Pettigrew. Hospital Tickets.—Perpetual in One Payment, £10; Annual, £5 5s.; Half-yearly, £3 3s.; Quarterly, £1 11s. 6d. Separate payments for Two Years entitle the Student to a Perpetual Ticket. No fees are payable for any Medical or Surgical Appointment in this Hospital.

UNIVERSITY OF ABERDEEN.—FACULTY OF MEDICINE.

Winter Session, commencing on Wednesday, October 26.—Anatomy, Professor Struthers, M.D., £3 3s. Practical Anatomy and Demonstrations, Professor Struthers and the Demonstrator, £2 2s. Chemistry, Professor Brazier, £3 3s. Institutes of Medicine, Professor Ogilvie, £3 3s. Surgery, Professor Pirrie, £3 3s. Practice of Medicine, Professor Macrobin, M.D., £3 3s. Midwifery and Diseases of Women and Children, Professor Inglis, £3 3s. Zoology, with Comparative Anatomy, Professor Nicol, £3 3s. Medical Jurisprudence, Professor Ogston, £3 3s.

Summer Session, commencing on the first Monday in May.—Botany, Professor Dickie, £3 3s. Materia Medica (100 Lectures), Professor Harvey, £3 3s. Practical Anatomy and Histology, Professor Struthers, and the Demonstrator, £2 2s. Practical Chemistry, Professor Brazier, £3 3s. Zoology, with Comparative Anatomy, Professor Nicol, £3 3s.

Matriculation Fee for the Winter and Summer Sessions, £1. For the Summer Session alone, 10s.

Royal Infirmary: Perpetual Fee to Hospital Practice, £6; or First Year, £3 10s.; Second Year, £3. Clinical Medicine, Drs. Harvey, Smith, and Beveridge, £3 3s. Clinical Surgery, Drs. Pirrie, Kerr, and Fiddes, £3 3s. Pathological Anatomy, Dr. Rodger, £2 2s. Practical Ophthalmology, Dr. A. D. Davidson. Dental Surgery, Mr. Williamson.

For further information, apply to Dr. Macrobin, Dean of the Faculty of Medicine.

UNIVERSITY OF GLASGOW.—FACULTY OF MEDICINE.

The Classes open for the Winter Session on Tuesday, October 31, 1871, when an Introductory Lecture will be given by Professor Dickson.

Chemistry, Practical Chemistry, and Chemical Laboratory, Dr. Anderson, £3 3s. Practice of Physic, Dr. Gairdner, £3 3s. Anatomy, Anatomical Demonstrations, and Practical Anatomy, Dr. Allen Thomson and Demonstrator, £8 8s. Materia Medica, Dr. Cowan, £3 3s. Forensic Medicine, Dr. Rainy, £3 3s. Surgery, Dr. Macleod, £3 3s. Midwifery, Dr. Leishman, £3 3s. Institutes of Medicine, Dr. A. Buchanan, £3 3s. Clinical Medicine and Clinical Surgery, Physicians and Surgeons of Royal Infirmary.

Further information may be obtained from the Registrar of the University.

ANDERSON'S UNIVERSITY, GEORGE-STREET, GLASGOW.

The Winter Session 1871 opens October 31. Chemistry,

Practical Chemistry, and Laboratory, Vacant; Surgery, Dr. James Dunlop; Institutes of Medicine (Physiology), Dr. Watson; Anatomy, Anatomical Demonstrations, Practical Anatomy, or Dissection, Dr. G. Buchanan; Practice of Medicine, Dr. McCall Anderson; Materia Medica, Dr. Morton; Hospital Practice in Royal Infirmary; Clinical Lectures in Royal Infirmary.

Summer Session.—Midwifery, Dr. J. G. Wilson; Medical Jurisprudence, Dr. P. A. Simpson; Surgical Anatomy, Practical Anatomy, Osteology for beginners, Dr. George Buchanan; Practical Chemistry, Vacant.

Class Fees: For each of the above Courses of Lectures, First Session, £2 2s.; Second Session, £1 1s.; afterwards free.

Anatomy Class Fees: For both Courses (Lectures and Demonstrations), First Session, £4 4s.; Second Session, £4 4s.; afterwards free.

Practical Anatomy: The Dissecting-room is free for two Sessions to those who attend both Courses of Anatomy. After the second year the fee for Practical Anatomy is £1 1s. per Session.

The fees for all the Lectures and Hospital Practice required of Candidates for the Diplomas of Physician and Surgeon amount to £45.

GLASGOW ROYAL INFIRMARY.

The Winter Session commences on November 1, 1871. Hour of visit and of Lectures at 9 a.m. Physicians, Drs. Steven Perry, McCall Anderson, Scott Orr, W. J. Gairdner, and MacLaren. Surgeons, Drs. Dewar, Macleod, Buchanan, Watson, and Morton. Pathologist, Dr. Joseph Coats.

Beds, 550. Attendance at Dispensary, 2 p.m.

The valuable Pathological Museum is open to all Students who desire to examine the Preparations.

Five Physicians' and five Surgeons' Assistants perform the duties of House-Physicians and House-Surgeons. These offices, held for one year, are open to Students of the fourth year. They are lodged and boarded in the Hospital for £25 per annum. Dressers to the Surgical Wards and Clerks to the Dispensary are appointed without fee.

Fees admitting to the Medical and Surgical Practice of the Hospital and Dispensary:—For the first year, £3 3s.; second year, £3 3s.; third and perpetual, £1 1s.; for six months' attendance, £2 2s.; three months', £1 11s. 6d. Practical Pharmacy, six months, £3 3s.

Fees for Clinical Lectures, on Medicine, £3 3s., on Surgery, £3 3s.

Medical Superintendent, Dr. M. Thomas. Secretary, Mr. H. Lamond, 64, West Regent-street.

SCHOOLS AND HOSPITALS IN IRELAND.

SCHOOL OF PHYSIC, UNIVERSITY OF DUBLIN.

THE School was established by Act of the Irish Parliament 40th George III., cap. 84, and is under the joint government of the Board of Trinity College and the King and Queen's College of Physicians.

Institutes of Medicine, Professor Law. Materia Medica and Pharmacy, Professor A. Smith. Surgery, Professor R. Smith. Anatomy and Surgery, Professor McDowel. Practical Anatomy, Dr. Bennett. Chemistry, Professor Apjohn. Practice of Medicine, Professor Moore. Midwifery, Professor Sinclair. Botany, Dr. E. Perceval Wright. Medical Jurisprudence, Professor Travers. Zoology, Professor Alexander Macalister, M.D. Physics, Professor John Leslie, M.A. Hospital Practice and Clinical Lectures at Sir Patrick Dun's Hospital.

SIR PATRICK DUN'S HOSPITAL.

Consulting Physician, William Stokes, M.D., Regius Professor of Physic. Consulting Surgeon, Robert Adams, M.Ch., Regius Professor of Surgery. The Clinical Lectures in Medicine and Surgery are delivered by Physicians: Robert Law, M.D., King's Professor of the Institutes of Medicine; William Moore, M.D., King's Professor of the Practice of Medicine; Aquilla Smith, M.D., King's Professor of Materia Medica and Pharmacy; Edward B. Sinclair, M.D., King's Professor of Midwifery.—Surgeons: Thomas E. Little, M.D.; Robert W. Smith, M.Ch., Trinity College, Professor of Surgery; Edward H. Bennett, M.Ch., University Anatomist; Richard G. Butcher, M.D., University Lecturer in Practical Surgery. The Physicians and Surgeons attend for Clinical Instruction on alternate days.

Hospital Fee for twelve months, including nine months' Clinical Lectures, nine guineas. Attendance on this Hospital is recognised by all Licensing Bodies.

ST. VINCENT'S HOSPITAL, DUBLIN.

The Winter Session will commence on Wednesday, November 1, 1871. Physicians, Dr. Francis J. B. Quinlan and Dr. Robert Cryan. Surgeons, Dr. Edward D. Mapother and Mr. William H. O'Leary. Surgeon-Dentist, Mr. William J. Doherty. Apothecary, Mr. Boland.

Further particulars may be learned on application to the Secretary, or at the Hospital during the hours of attendance.

THE QUEEN'S UNIVERSITY IN IRELAND.—QUEEN'S COLLEGE, BELFAST, FACULTY OF MEDICINE.

The Lectures will commence on Tuesday, October 3. Anatomy and Physiology, Dr. P. Redfern. Chemistry, Dr. Thomas Andrews. Practice of Medicine, Dr. James Cuming. Practice of Surgery, Dr. A. Gordon. Materia Medica, Dr. J. S. Reid. Midwifery, Dr. R. F. Dill. Medical Jurisprudence, Dr. J. F. Hodges. Natural Philosophy, Dr. Everett. Zoology and Botany, Dr. R. O. Cunningham. The Demonstrations in Anatomy are delivered by Dr. Charles. The Courses of Botany and Practical Chemistry, and a second Course of Experimental Physics will commence in May. After the Session 1871-72 the Lectures in Midwifery and in Medical Jurisprudence will be Summer Courses.

Fees.—Anatomy and Physiology—First Course, £3; each subsequent Course, £2. Anatomical Demonstrations and Practical Anatomy—each Course, £3. Practical Chemistry, £3. Other Medical Lectures—First Course, £2; each subsequent Course, £1.

Two Medical Scholarships are awarded to the Students of each year of the Medical Course. The Examinations commence on October 20.

Belfast General Hospital.—Clinical Instruction—Perpetual fee, payable in one sum of £10 10s., or in two instalments of £5 5s. each on entering for the first and second years. Hospital fee, 10s. 6d. each Session. Four Resident Pupils are appointed each Session.

Belfast Lying-in Hospital.—Fee for the Session, £3 3s.

QUEEN'S COLLEGE, CORK.—FACULTY OF MEDICINE.—SESSION 1871-72.

Anatomy, Physiology, and Practical Anatomy, Dr. J. H. Corbett. Practice of Medicine, Dr. C. O'Connor. Practice of Surgery, Dr. W. Tanner. Materia Medica, Dr. P. O'Leary. Midwifery, Mr. J. R. Harvey. Natural Philosophy, Mr. John England. Chemistry and Practical Chemistry, Dr. J. Blyth. Zoology and Botany, Dr. J. R. Greene. Clinical Medicine and Clinical Surgery, at the North and South Infirmaries, by the Physicians and Surgeons of these Institutions. Clinical Midwifery, at the Lying-in Hospital. The Medical Session will be opened on Thursday, November 2, 1871, and the Lectures will commence on the same day.

Eight Scholarships, value £25 each, are awarded to Students of Medicine.

For further information, apply to Mr. Robert John Kenny, Registrar.

QUEEN'S COLLEGE, GALWAY.—FACULTY OF MEDICINE.

Anatomy and Physiology, and Practical Anatomy, Dr. Cleland. Practice of Medicine, Dr. N. Colahan. Practice of Surgery, Dr. J. V. Brown. Materia Medica and Medical Jurisprudence, Mr. S. M'Coy. Midwifery and Diseases of Women and Children, Dr. R. Doherty. Chemistry, Dr. T. H. Rowney. Natural Philosophy, Dr. A. H. Curtis. Botany and Zoology, Dr. A. G. Melville. Logic and Mental Philosophy, Dr. T. W. Moffett. The County Galway Infirmary, Town, and Fever Hospitals are in the immediate vicinity of the Queen's College. They are visited every morning by Professors of the College, who deliver Clinical Lectures.

Eight Scholarships of the value of £25 each, and Exhibitions varying in value from £10 to £18, are appropriated to Students pursuing the Course for the Degree of M.D.

Fees.—Anatomy and Physiology, £3, first Session; afterwards, £2. Practical Anatomy, £3; Practical Chemistry, £3; Operative Surgery, £3; other Classes, £1 for each Course extending over one Term only—£2 for each Course extending over more than one Term—and £1 for each reattendance on the same. The College Session is divided into three Terms. The first Term commences on October 17, 1871, and ends on December 23, 1871.

For further information, apply to the Registrar, T. W. Moffett, LL.D.

ROYAL COLLEGE OF SURGEONS IN IRELAND.—SCHOOL OF SURGERY.—SESSION 1871-72.

The public Lectures and the usual Winter Course will commence on October 30. Anatomy and Physiology, Dr. Mapother. Descriptive Anatomy, Dr. Bevan and Mr. Morgan. Surgery, Mr. Hargrave and Dr. J. S. Hughes. Practice of Medicine, Dr. Benson. Chemistry, Dr. Barker. Materia Medica, Dr. Macnamara. Midwifery, Dr. Sawyer. Medical Jurisprudence, Dr. Davy. Practical Chemistry, Dr. Barker. Botany, Dr. Minchin. Hygiene, Dr. Cameron. Dissections, under the direction of the Professors of Anatomy and the Demonstrators, Drs. Croly, Stoney, Stoker, Ormsby, Kilgarriff, and Wheeler, commence on October 2.

The Summer Session commences in April and terminates in July, including Materia Medica, Medical Jurisprudence, Botany, Practical Chemistry, Midwifery, and Hygiene.

The fee for each of the above Courses is £3 3s., except Comparative Anatomy, which is free. Practical Instruction in Operative Surgery is given by the Professors of Surgery, separate from the Surgical Lectures. Fee, £5 5s.

For further information, application to be made to the Registrar, John Brennen, Esq., at the College.

DR. STEEVENS' HOSPITAL, DUBLIN,

Contains 250 beds, with distinct Wards for Fever, Syphilis, Diseases of the Eye, and Diseases of Females. There are also in connexion with the Hospital a Maternity Department, and an extensive Dispensary for out-patients. Systematic Courses of Lectures are delivered during the Winter and Summer Sessions on all subjects required by the Colleges, Halls, and the Public Service. Students enjoy the advantages of a Reading-room, Museum, and Lending Library. There is accommodation in the Hospital for two Medical and six Surgical Resident Pupils as Dressers. Fee, £21, including Hospital Certificate. Special Private Classes are held for the preparation of gentlemen for the Licensing Bodies and Competitive Examinations. Senior Middle and Junior Exhibitions will be awarded at the end of the Session to those whose answering exhibits general proficiency in every branch of their Professional studies. There will also be Prizes for the best Reports of Cases which have occurred in the Hospital during the Session. Two Midwifery Assistants are each year (month of November) selected by Competitive Examination, salary £30 per annum. The Dissecting Rooms will be opened on October 1 for Practical Anatomy. The Lecturers and Demonstrators attend throughout the day. The Sessional Courses of Lectures will commence on the 1st Monday in November. Fees—Hospital, £7 7s.; Lectures, £3 3s. each Course; Perpetual, to all Educational Courses required by Colleges, Halls, and Public Service, 75 guineas, payable in two instalments.

Further particulars on application to the Resident Surgeon, at the Hospital; or to E. Hamilton, M.D., Secretary, 120, Stephen's-green.

THE ADELAIDE HOSPITAL, PETER-STREET, DUBLIN.

Physicians, Dr. Henry H. Head and Dr. James Little. Surgeons, Dr. Albert J. Walsh, Dr. John K. Barton, and Mr. Benjamin Wills Richardson. Obstetric Physician, Dr. Lombe Athill. Ophthalmic Surgeon, H. Rosborough Swanzy, M.B. Assistant-Physician, Dr. Walter G. Smith. Assistant-Surgeon, Montgomery A. Ward, M.B., M.Ch.

The central position of this Hospital renders it peculiarly convenient to gentlemen attending Lectures at the University, College of Surgeons, or Ledwich School. The arrangements for Clinical Teaching have been made as complete as possible, and are such as not to interfere with attendance at the Medical Schools. There are Fever Wards apart from the Hospital, and two Wards for Infants and Children. Special hours are devoted to Clinical Instruction in the Diseases peculiar to Women, the Diseases of the Eye, and Cutaneous Diseases, and Students are individually instructed in the Use of the Stethoscope, Ophthalmoscope, Laryngoscope, and Microscope. Two Resident Pupils are selected half-yearly. Prize Examinations are held at the termination of the Session.

Further particulars can be obtained from Dr. Athill, 11, Upper Merrion-street, or any other member of the Medical Staff.

CARMICHAEL (FORMERLY RICHMOND HOSPITAL) SCHOOL OF MEDICINE.

The Winter Courses of Lectures commence November 1. Lecturers: Theory and Practice of Surgery and Operative

Surgery, Mr. W. Stokes. Theory and Practice of Medicine, Dr. Gordon. Anatomy and Physiology, Mr. Curran and Dr. Purser. Anatomy, Descriptive, Practical, and Surgical Dr. Corley and Mr. Mayne. Chemistry, Theoretical and Practical, Dr. Campbell. Midwifery and Diseases of Women and Children, Dr. Jennings. Dissections, which commence in October, are superintended by Messrs. Curran, Corley, Purser, Shaw, Madden, Mayne, Clarke, and Kelly.

Carmichael Premiums.—Premiums to the value of £60, on the foundation of the late Richard Carmichael, Esq., and the "Mayne" Scholarship, value £15, are awarded at the termination of the Session.

Summer Session.—Lecturers: Botany, Dr. Blakely. *Materia Medica* and Pharmacy, Dr. Fraser. Medical Jurisprudence, Dr. O'Reilly. Practical Chemistry, Dr. Campbell.

Fees.—The fee for each Course of Lectures delivered at this School is £3 3s. Fees for all the Courses of Lectures required by the Royal College of Surgeons of London, £43; Edinburgh, £46; and Ireland, £63.

For further information, apply to Dr. Corley, Registrar, 30, Lower Baggot-street, Dublin.

LEDWICH SCHOOL OF ANATOMY, MEDICINE, AND SURGERY, PETER-STREET, DUBLIN.

Anatomy, Physiology, and Pathology, etc., Mr. E. Ledwich, Mr. T. P. Mason, and Mr. W. H. O'Leary. Theory and Practice of Surgery, Messrs. Wharton and Barton. Surgical and Descriptive Anatomy, Demonstrations, and Dissections, Messrs. Mason, Ledwich, Glanville, Robinson, and O'Leary. Theory and Practice of Medicine, Drs. Little and Eames. Midwifery and Diseases of Women and Children, Dr. J. Ringland. *Materia Medica* and Therapeutics, Dr. McDowell. Forensic Medicine and Hygiene, Dr. R. Travers. Theory of Chemistry, Practical Chemistry, and Natural Philosophy, Dr. Cameron. Botany, Dr. Maunsell.

A Course of Operations to be performed by the Students, under the superintendence of the Lecturers (subjects, etc., included), £5 5s.

Certificates of attendance on these Lectures are received by Trinity College, Dublin, and all the Examining Boards.

The Fee for each of the above Courses will be £3 3s.

Further information may be obtained from any of the Lecturers, or from Edward Ledwich, Secretary, 7, Harcourt-street, Dublin.

CITY OF DUBLIN HOSPITAL.

Physicians: Drs. J. Hawtrey Benson and John M. Purser. Surgeons: Messrs. William Hargrave, M.D., Jolliffe Tuffnell, H. G. Croly, and William Thornley Stoker, Esq., M.D., etc. Ophthalmic and Aural Surgeon, Dr. Loftie Stoney. Consulting-Physicians: Professor Apjohn, Charles Benson, M.D., and Thomas E. Beattie, M.D. Clinical Lectures will be delivered by the Physicians and Surgeons, and Special Courses on Diseases of the Eye and Ear will be given by Dr. Stoney. The Certificates of Attendance are received as qualifications by all the Colleges, Halls, and Boards. For further particulars, apply to Dr. Benson, 42, Fitzwilliam-square West, or to Dr. Stoker, 43, Harcourt-street.

HOSPITALS, ETC., FOR SPECIAL INSTRUCTION.

AT DOWNING COLLEGE, CAMBRIDGE, every alternate year an election to a Fellowship takes place, the holder of which must be engaged in the active pursuit of the studies of Law or Medicine. These Fellowships are of the annual value of £200, and are tenable for twelve years. They are not vacated by marriage, and the Fellows are not required to reside. The next election will take place in October, 1871. Foundation Scholarships of £50 per annum (in some cases with rooms and commons) are offered annually for distinction in Natural Science, tenable until the B.A. Degree, and in case of special merit for three years longer. Minor Scholarships of £40 per annum, tenable for two years, are offered each year for competition before entrance, and in awarding one or more of these considerable weight is given to proficiency in Natural Science.

QUEEN CHARLOTTE'S LYING-IN HOSPITAL, MARYLEBONE-ROAD.—Instituted 1752. Rebuilt 1856. Consulting Physician—Dr. Owen Rees. Consulting Surgeon—Henry Lee, Esq. Medical Officers for the In-patients—Dr. Brodie, Dr. Hope. Medical Officer for Out-patients—Dr. Grigg. Secretary—Mr. A. S. Boodle, who attends at the Hospital on Monday from ten to two. Pupils are admitted to reside and board in the Hospital (after having been examined by the Physicians) for periods of not less than six weeks. Terms on application at the Hospital.

ST. LUKE'S HOSPITAL FOR LUNATICS, OLD-STREET, E.C.—Physicians—Dr. Henry Monro and Dr. William Wood. Surgeon—Mr. Alfred Willett. Resident Medical Superintendent—Reginald Eager, M.R.C.S., L.A.S., and M.D. Univ. Lond. The Visiting Physicians are allowed by the Committee to take pupils. For information address the Secretary, Mr. George Seymour.

ROYAL ORTHOPÆDIC HOSPITAL, 315, OXFORD-STREET.—Medical Officers.—Surgeons—R. W. Tamplin, Esq., F.R.C.S., 33, Old Burlington-street; Wm. Adams, Esq., F.R.C.S., 5, Henrietta-street, Cavendish-square. Assistant-Surgeons—Bernard E. Brodhurst, Esq., F.R.C.S., 20, Grosvenor-street; Jno. D. Hill, Esq., F.R.C.S., 17, Guildford-street, Russell-square. Legally qualified Practitioners are free to witness the practice of the Hospital. Pupils on the following terms:—For six months, £3 3s.; for twelve months, £5 5s.; perpetual, £10 10s. Operations, Thursdays, 2 p.m. The Annual Course of Lectures will be duly announced.

THE HOSPITAL FOR SICK CHILDREN, 48, and 49, GREAT ORMOND-STREET, W.C., and CROMWELL HOUSE, HIGHGATE.—Physicians—Dr. West and Dr. Dickiunson. Assistant-Physicians—Dr. Samuel Gee, Dr. W. B. Cheadle, Dr. J. J. Phillips, Dr. F. B. Nunneley, and Dr. John Murray. Surgeon—Mr. Thomas Smith. Assistant-Surgeons—Mr. Howard Marsh, Mr. J. W. Haward. Surgeon-Dentist—Mr. Thomas Edgewood. 127 beds. In-patients, 1870, 691. Out-patients attending, 12,221. The practice of the Hospital, in both In- and Out-patient departments, is open at nine every morning. Fee for Six Months' attendance, £3 3s.; perpetual, £5 5s. Samuel Whitford, Secretary.

LONDON SCHOOL OF DENTAL SURGERY AND DENTAL HOSPITAL OF LONDON, 32, SOHO-SQUARE, W.—The Winter Session will commence on Tuesday, October 3. Mechanical Dentistry, Mr. J. S. Turner, Metallurgy, Mr. G. H. Makins; Dental Surgery and Pathology, Mr. Cartwright; Dental Anatomy and Physiology, Mr. C. S. Tomes. Dental Surgeons to the Hospital—Messrs. Fox, Underwood, Gregson, Coleman, H. Harding, and Hill. Assistant Dental Surgeons—Messrs. Moon, Medwin, C. S. Tomes, Lane, Bartlett, and Scully. Dental House-Surgeon—Mr. Mordaunt Stevens. Treasurer—Mr. Cartwright.

GREAT NORTHERN HOSPITAL, CALEDONIAN-ROAD.—Consulting Surgeon—Mr. Skey. Physicians—Drs. Leared, Hardinge, Cholmcleay, F. C. Webb, Jephson, and Cruicknell. Obstetric Physician—Dr. Gustavus C. P. Murray. Diseases of the Eye—Mr. E. C. Hulme. Surgeons—Messrs. Gay, W. Adams, T. Carr Jackson, Buxton Shillitoe, W. Spencer Watson, and Osman Vincent. Aural Surgeon—Mr. Harvey. Dentists—Messrs. Statham and Chas. J. Fox. Chloroformist—Mr. Coles. House-Surgeon—Mr. Julian Willis. Junior Resident Medical Officer—Mr. J. T. Dempsey. Dispenser—Mr. Ring.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, 23 AND 24, QUEEN-SQUARE, BLOOMSBURY.—The Hospital contains 64 beds; the County Convalescent Branch, at Finchley, 25 beds. The Physicians attend every Monday, Tuesday, Wednesday, and Friday. Physicians—Drs. Ramskill, Radcliffe, Hughlings-Jackson, and Buzzard. Assistant-Physicians—Dr. Charlton Bastian, Dr. Elam, Dr. Maclure. Medical Superintendent—Dr. Tibbits. Medical Registrar—Dr. Gowers. Medical Practitioners and Students will be admitted on showing their cards.

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, BLOOMSBURY-SQUARE, LONDON.—SCHOOL OF PHARMACY.—SESSION 1871-72.—The Session will commence on Monday, October 2, and extend to the end of July, 1872. Lectures on Chemistry and Pharmacy will be delivered by Professor Redwood on Monday, Tuesday, and Wednesday mornings at nine o'clock, commencing on Monday, October 9. Also Lectures on Botany and *Materia Medica* by Professor Bentley. The first and second parts of this course, extending over the winter months, will be delivered at 17, Bloomsbury-square, on Friday and Saturday mornings at nine o'clock, commencing Friday, October 6. The third part of the course, on Systematic Botany, will be delivered at the Royal Botanic Gardens, Regent's-park. Fees: For Registered Apprentices and Associates of the Society, for either of the above courses, One Guinea; for either part separately, Half-a-Guinea. For those not connected with the Society, Two Guineas for either of the above courses; One Guinea for either part separately. Laboratory: The suit of Laboratories for Practical Instruction in General and Pharmaceutical Chemistry will be opened on Monday, October 2, under the direction of Professor Atfield. Fee for the entire Session of ten months, Twenty-five Guineas. The Laboratories are open from half-past nine a.m. till five p.m. Students can enter at any period during the Session. Two Scholarships (the Jacob Bell Memorial Scholarships), of £30 a year each, are open to competition annually in July. The Board of Examiners meet monthly to grant Certificates of Competency. For further information, apply to Mr. Brembridge, Secretary and Registrar.

QUEEN'S COLLEGE, LIVERPOOL.—The Session will commence on Monday, October 2. The College is in connexion with the University of London, and its classes comprise the subjects required for the Matriculation, B.A., B.Sc., and Preliminary Scientific M.B. Examinations of that University. Instruction in Practical Chemistry is given in the College Laboratory by Professor Hamilton. Provincial Examinations of the London University are held at Queen's College. Fees: Separate classes, £2 2s. to £4 4s. per Session; Practical Chemistry, £5 5s.; course, Students, £20 per Session.

SOUTH STAFFORDSHIRE GENERAL HOSPITAL, WOLVERHAMPTON.—One year's attendance recognised by Examining Boards. Pupils resident and non-resident. Fees for Hospital Practice: One year, Ten Guineas; perpetual, Twenty Guineas. Physicians—Dr. Millington and Dr. Miller. Surgeons—Mr. Vincent Jackson, Mr. J. O'Brien Kough, Mr. C. A. Newnham. House-Surgeon—Mr. Burton Ravenhill. Physicians' Assistant—Dr. A. Bottle. Operations are performed in the Theatre every Thursday morning, at eleven o'clock. The fees must be paid to Mr. W. T. Grant, Secretary to the Hospital. The Practice in the Hospital is very extensive, the number of Surgical cases being large and important. Practical Instruction in Surgery to First-year Students, and Dresserships for Students after two years' Professional Education, both in accordance with the Royal College of Surgeons of England, may be obtained at this Hospital; also, Clinical Clerkships. For particulars apply at the Hospital to Vincent Jackson, Honorary Secretary of the Medical Committee.

THE COLLEGE OF CHEMISTRY, DUKE-STREET, LIVERPOOL.—The Certificates of Attendance are acknowledged by the University and Apothecaries' Hall of London, and the Apothecaries' Hall of Ireland, etc. Founder—Sheridan Muspratt, M.D., Ph.D., F.R.S.E., etc., etc. Principal—Martin Murphy, F.C.S., etc., Director of Studies and Analyst of the College during the last twenty-two years. Course of Instruction: The course of instruction given in the College of Chemistry comprises the teaching of Chemistry as a science, and the general application of chemical knowledge; also the teaching of the principles of those branches of Physics which are allied with Chemistry, such as light, heat, electricity, etc. The Students' Laboratories are open throughout the year. Hours of attendance, from 10 a.m. to 5 p.m. daily. Fees: Ten Guineas per quarter of three months, or Thirty-five Guineas per annum, payable in advance. Students are received for a limited period, and for the study of special subjects. Medical Students and Pharmacists entering for one hour per day for three months, fee Three Guineas. Students provide all their own apparatus and books.

NORFOLK AND NORWICH HOSPITAL.—155 beds. One year's attendance recognised by Examining Boards.—Fees: For the Physician's Practice, £10 10s.; for the Surgeon's Practice—one year, £20; two years, £30; perpetual, £40. Pupils resident and non-resident. Physicians—Dr. Cope-man, Dr. Eade, Dr. Bateman. Surgeons—Mr. Nichols, Mr. Firth, Mr. Cadge. Resident Medical Officer—Vacant. Assistant-Surgeons—Mr. Crosse, Mr. Williams.

EDUCATIONAL VACCINATING STATIONS.

In order to provide for the granting of those special Certificates of Proficiency in Vaccination which, under the regulations of the Privy Council, are required to be part of the Medical qualification for entering into contracts for the performance of public vaccination, or for acting as deputy to a contractor, the following arrangements are made:—

1. The vaccinating stations enumerated in the subjoined list are open, under conditions appointed by the Privy Council, for the purposes of teaching and examination.

2. The public vaccinators officiating at the stations are authorised by the Privy Council to give the required Certificates of Proficiency in Vaccination to persons whom they have sufficiently instructed therein; and

3. The Public Vaccinators, whose names in the subjoined list are printed in italic letters, are also authorised to give such Certificates, after satisfactory examination, to persons whom they have not themselves instructed.

LONDON.—Principal Station, Surrey Chapel, Blackfriars-road: *Mr. James Furness Marson*, who attends on Tuesday and Thursday, at 1 p.m. North-west Station, vacant. West Station, 9, St. George's-road, Pimlico, S.W.: Dr. Edward Lowe Webb, on Monday, at 10 a.m. East Station, vacant. North Station, Tottenham-court Chapel, Tottenham-court-road: Mr. William Edwin Grindley Pearse, on Monday and Wednesday, at 1 p.m. South-west Station, 2, Regent-place, Horseferry-road: Mr. William Edwin Grindley Pearse, on Tuesday, at 2 p.m. Strand Station, Charing-cross Hospital: Mr. Robert William Dunn, on Monday, at 10 a.m.

BIRMINGHAM.—The School-rooms, 27, Old Meeting-street, on Monday; the rooms occupied by the Working Men's Mutual Improvement Society, in Barr-street, on Tuesday; St. Mark's School-rooms, St. Mark's-street, on Wednesday; and the Islington Assembly-rooms, 42, Broad-street, on Thursday: *Dr. Edmund Robinson*, at 11 o'clock on the days before-mentioned.

BRISTOL.—The Public Vaccination Station, Peter-street: *Dr. Henry A. P. Robertson*, on Wednesday, at 10 a.m.

EXETER.—Odd Fellows' Hall, Bamfylde-street: *Mr. Charles H. Roper*, on Thursday, at 3 p.m.

LEEDS.—23, Burmantofts-street: *Mr. Frederick Holmes*, on Tuesday, at 3 p.m.

LIVERPOOL.—4, Oldham-street: *Mr. Arthur Browne Steele*, on Thursday, at 2 p.m.

MANCHESTER.—159, Rochdale-road: *Mr. Ellis Southern Guest*, on Monday at 2 p.m.

NEWCASTLE-ON-TYNE.—6, George-street East, Savile-row: *Mr. George Cuthbert Gilchrist*, on Tuesday, at 2 p.m.

EDINBURGH.—The Royal Dispensary: *Dr. William Husband*, on Wednesday and Saturday, at 12.

GLASGOW.—The Hall of the Faculty of Physicians and Surgeons: *Dr. James Dunlop*, on Monday, at 12. The Royal Infirmary: *Dr. Robert Dunlop Tannahill*, on Monday and Thursday, at 12.

. The vacancies in the East and North-west Stations (London) will be shortly filled up.

PRIVATE TEACHERS.

DR. BARRON, Class-rooms, Millikin's Chambers, 7, Southwark-street, Borough, gives Courses of Medical and Surgical Tuition, adapted to Students for Professional Examination.

DR. COALES, M.A., 119, Gower-street, W.C., prepares Candidates for the Prelim. Sc. and Matriculation Examinations of the University of London, and for the Examinations in Arts at the Royal College of Surgeons, Apothecaries' Hall, etc.

DR. W. HANDSEL GRIFFITHS, of Dublin, prepares Students for the Medical and Surgical Professional Examinations.

MR. EDWARD B. GOODWIN (Caius College, Cambridge), 319, Camden-road, N., receives Pupils, resident and otherwise, for the Preliminary Examinations at the College of Surgeons and Apothecaries' Hall, for Matriculation, etc.

MR. HANBURY, M.A., 24, Old-square, Lincoln's-inn, W.C., reads with his Class for the Preliminary Examination in Arts, College of Surgeons, and for the Matriculation Examination of London University. Mr. Hanbury is assisted by efficient Lecturers in French and Chemistry. Resident Pupils are received.

MR. MURRAY, B.A., Arkteon House, Wray-crescent, Tollington-park, N., prepares for the Preliminary Examinations at Royal College of Surgeons and Apothecaries' Hall, and the Matriculation at University of London.

HARTLEY INSTITUTION, SOUTHAMPTON. Principal Dr. F. T. Bond, B.A. Recognised by the Royal College of Surgeons. Students prepared for the regular Curriculum of the Medical Schools.

SOUTH LONDON SCHOOL OF CHEMISTRY AND PHARMACY, 231, Kennington-road, S.E. Director, Dr. Muter. Preparation for Examinations in Classics, Mathematics, Chemistry, Physics, Botany, Materia Medica, and Natural History. Evening Classes for Students engaged during the day.

MR. J. PINCOTT, F.R.G.S., Telham House, Brixton-hill, S., prepares Students for the Preliminary Examination of the Royal College of Surgeons and the Matriculation of the London University.

The Drs. POWER, 8, Red Lion-square, Holborn, W.C., continue daily their Lectures and Examinations, preparatory to the various Competitive and Pass Examinations.

DR. STEGGALL, 2, Southampton-street, Bloomsbury-square, gives instruction to Medical men and Students in all the branches of their studies.

MR. WRIGHTMAN, M.A. Cantab., receives Pupils for the Preliminary Examination and Medical Jurisprudence, at his chambers, 1, Mitre-court, Temple, E.C.

(For fees, etc., see Advertisements.)

DAYS AND HOURS OF INTRODUCTORY LECTURES

TO BE DELIVERED AT THE DIFFERENT MEDICAL SCHOOLS.

	Days and hours, p.m.	No Introductory Lecture announced.
St. Bartholomew's Hospital and Medical School	Oct. 2,	
Charing-cross Hospital and Medical Coll.	" 2, 8	Dr. T. Henry Green.
St. George's Hospital Medical School	" 2, 2	Dr. John Clarke.
Guy's Hospital Medical School	" 2, 2	Dr. Henry Oldham.
King's College Medical Department	" 2	Prof. Rutherford.
London Hospital Medical College	" 2, 3	Dr. W. J. Little.
St. Mary's Hospital Medical School	" 2,	Dr. A. Meadows.
Middlesex Hospital Medical School	" 2, 3	Dr. John Murray.
St. Thomas's Hospital Medical College	" 2, 2	Mr. Le Gros Clark.
University College Faculty of Medicine	" 2, 3	
Westminster Hospital Medical School	" 2, 8	Dr. Basham.

IN THE PROVINCES.

	Days and hours, p.m.	
Leeds School of Medicine	Oct. 2, 12	Dr. T. Clifford Allbutt.
Liverpool Royal Infirmary School of Medicine	" 2, 3	Dr. W. Carter.
Manchester Royal School of Medicine	" 2, 12	Mr. R. T. Hunt.
Newcastle-upon-Tyne Coll. of Medicine	" 2, 2	Dr. G. H. Philipson.
Sheffield School of Medicine	" 2, 4	Mr. Alfred Allen.

The Winter Session of the Bristol Medical School will commence on October 2, and the Queen's College Medical School, Birmingham, on October 2.

TABLE OF FEES CHARGED IN THE MEDICAL SCHOOLS OF ENGLAND

FOR ALL LECTURES AND HOSPITAL PRACTICE REQUIRED FOR THE LICENTIATE EXAMINATIONS OF THE ROYAL COLLEGE OF PHYSICIANS OF LONDON AND THE LONDON SOCIETY OF APOTHECARIES, AND FOR THE MEMBERSHIP EXAMINATION OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

	London.	£ s. d.

ORIGINAL LECTURES.

LECTURE ON OPTIC NEURITIS FROM INTRACRANIAL DISEASE.(a)

DELIVERED AT THE LONDON HOSPITAL.

By J. HUGHLINGS-JACKSON, M.D., F.R.C.P.,

Physician to the London Hospital and to the Hospital for the Epileptic and Paralysed.

(Continued from page 243.)

8. *Rapid and Permanent Failure of Sight in Neuritis.*—Occasionally sight fails rapidly—in a day or two, for instance. I do not know how this is. (Palsy of a cranial nerve will come on suddenly, even when it depends on gross disease—syphilitic disease, for instance.) It is important to note this occurrence for two reasons. 1st. Those who do not use the ophthalmoscope may get a very wrong date for the amaurosis, or, rather, for the changes on which it depends, and may perhaps be misled to suppose that the loss of sight is owing to some such sudden change as hæmorrhage in the retina. Yet, although the onset of blindness or sudden ingravescence in defect of sight in cases of optic neuritis must of necessity imply a change, the ophthalmoscopic appearance may not alter, notably, at all events. 2nd. If we use the ophthalmoscope, or if we use atropine, or if we apply a blister to the head, or adopt any new kind of treatment, the patient may blame us for his blindness if he saw well before such procedures. A patient who reads the smallest print and supposes his sight to be good may, as we have observed (No. 5), have double optic neuritis. The use of atropine affects his sight for near objects gravely, and if, from advance of the neuritic process, what I may call retinal sight fails before the effect of the atropine has passed off, he very naturally blames us for the subsequent permanent affection of his sight. A patient now in the Hospital when asked how long her sight had been bad replied “only since the drops were put in.” She has double optic neuritis. We must, then, when we discover neuritis, sight being good, tell the patient that his eyes are really not good, and that we are anxious about his sight. Whether we give this warning or not we shall be blamed by an unintelligent patient for “tampering with his eyes.” We must, however, act for our patient's good, regardless of selfish considerations. In very many cases we can see enough for diagnostic purposes without using atropine.

9. *The Nature of the Intracranial Disease most often associated with Double Optic Neuritis.*(b)—Contrary to the usual method, it is convenient here to speak of the nature of the intracranial disease which leads to neuritis before we speak of its locality. I have two statements to make as to the nature of the disease. 1. There is usually a gross change, or, as I have called it, “coarse” disease. I have seen double optic neuritis with glioma, hydatid cyst, abscess, syphilitic “deposit,” and with blood-clot. In short, by gross or coarse disease, I mean a “lump of something”—an adventitious product.(c) The second

(a) This lecture was delivered several years ago, and, with modifications, again in June last, in reference to particular cases of cerebral disease. As since 1863 I have published numerous papers on Medical Ophthalmology (Royal London Ophthalmic Hospital Reports), this lecture necessarily involves considerable recapitulation; but there is no impropriety in reproducing in a condensed form the facts stated in former papers, and the opinions therein expressed, now partly modified.

(b) I speak not only of amaurosis from optic neuritis, but of optic neuritis with or without defect of sight. If a patient has optic neuritis and yet sees well, I should think the ophthalmoscopic appearances as good evidence towards the diagnosis of the general nature of the intracranial disease as if there were great defect of sight.

(c) The following list will show the great variety of pathological changes found post-mortem in cases of optic neuritis. I note only those cases which have been under my own observation, and which I have published from time to time during the last eight years. The list could be considerably extended were I to mention unpublished cases and cases I have seen in the practice of other Physicians:—

1. Cancer of the base of skull and middle lobe of brain (Roy. Lond. Ophth. Hosp. Rep., vol. iv., pt. iv., p. 398. Autopsy in the next number).
2. Tumour in the cerebellar fossa, tumour at the sella Turcica and in the left posterior cerebral lobe. Unfortunately there is only a note of atrophy of the optic nerves, and, therefore, it is only an inference that there had been neuritis (*op. cit.*, p. 425).
3. Hæmorrhage in left middle cerebral lobe (*op. cit.*, p. 428).
4. Tumour of the right hemisphere (*op. cit.*, p. 431).
5. Blood-clot (*op. cit.*, p. 435).
6. Syphilitic mass in the right cerebral hemisphere (*op. cit.*, p. 442).
7. Softening of several convolutions of hinder part of anterior lobe (Roy. Lond. Ophth. Hosp. Rep., vol. v., pt. i., p. 68).
8. Tumour of the right corpus striatum and neighbouring convolutions (*op. cit.*, p. 76).
9. Syphilitic disease of each cerebral hemisphere. Autopsy after publication (Lond. Hosp. Rep., vol. iv., p. 335).
10. Abscess of left cerebral hemisphere (*op. cit.*, p. 381).
11. Abscess of left cerebral hemisphere

statement is implied in the first. 2. Double optic neuritis does not point to any particular kind of coarse disease, but simply to coarse disease of some kind. I think this generalisation is most important. You will properly say that the several adventitious products I have named are quite different things. This is obvious enough, but they are all alike in this—each is a “foreign body,” and each may produce just the same kind of optic neuritis.

That some “foreign bodies” are more likely to produce optic neuritis than others, I need not deny. The question is much more difficult than appears at first glance. There is the position to be considered; for certain adventitious products affect particular localities. Thus, the rule is that abscess occurs in the mass of the cerebrum or cerebellum, and blood-clot in the motor tract. Blood-clot is very rarely associated with simple optic neuritis (not very uncommonly with the neuro-retinitis of Bright's disease). I have never seen optic neuritis in recent cases of cerebral hæmorrhage. So rarely does double optic neuritis occur from clot, that if you find it in a patient who is hemiplegic, and whose history seems otherwise to indicate clot, you should, at all events, consider the diagnosis of tumour to be as likely as that of clot; for hemiplegia occasionally comes on suddenly from tumour (probably by hæmorrhage from the tumour). If we know the double optic neuritis to have been present at the time when the hemiplegia came on, we should diagnose tumour. If it come on some weeks after, we should be in doubt; but even then tumour is more probable.

I have spoken above of a Physician's experience, and I hasten to qualify my remarks. I see those patients who have severe cerebral disease. No one ever consults me for defect of sight only, but for such symptoms as severe headache, convulsion, and hemiplegia, with which optic neuritis often occurs. To me defect of sight is but one symptom, and not the most important one, in a series. I admit, then, that my experience is of necessity one-sided. Further, I admit that in a few cases of severe cerebral disease where I have discovered double optic neuritis, I have found no kind of coarse disease post-mortem. I have been wrong several times in the diagnosis of an adventitious product within the skull in cases where there had been found double optic neuritis, but I have far oftener been wrong by neglecting the inferences above stated to be deducible from the presence or absence of optic neuritis—wrong in saying there was an adventitious product when the discs were normal, and wrong in saying there was not when there was double optic neuritis. I feel, therefore, justified in saying that double optic neuritis does point very strongly indeed to coarse disease inside the head. You will not misunderstand me to imply that you are to diagnose tumour or other coarse disease of the brain solely by the ophthalmoscope. You have, in most cases, no need to rely on this one condition. You do not diagnose phthisis by the physical signs alone. You may say that you would be right in most cases if you did trust to physical signs alone. I may go so far as to the ophthalmoscopic signs. You would be right in most cases, I believe, if you diagnosed coarse disease within the skull by the presence of optic neuritis.

There is one important matter to be mentioned under this head. I admitted (No. 4, b) that I cannot always tell by the ophthalmoscope whether there is optic neuritis or the swollen disc, or what is described as the swollen disc; but I am convinced that this matters less than at first glance appears in the diagnosis of the nature of cerebral disease. If you find swelling of the discs, with or without hæmorrhages, with tortuosity of the veins and obscuration of the course of the arteries, you may—whatever you call or however you explain these appearances—infer in the vast majority of cases occurring

(*op. cit.*, p. 387). 12. Large hydatid cyst of left cerebral hemisphere (*op. cit.*, p. 391).

13. Syphilitic disease of right cerebral hemisphere (St. And. Rep., vol. iii., p. 198; also *Lancet*, October 24, 1868). 14. Disease of the surface of right cerebral hemisphere, supposed result of abscess. The patient had been trephined for cerebral symptoms following a blow. (St. And. Rep., vol. iii., p. 199). 15. Brief note of a case in which syphilitic disease of the brain was found (St. And. Rep., vol. i.).

16. Tumour of cerebellum (*Medical Times and Gazette*, June 17, 1865). 17. Syphilitic disease of the left hemisphere. Autopsy after publication of case (*British Medical Journal—Clinical Society—April 30, 1870*). 18. Glioma of left hemisphere—neuritis on right side only (next number of Roy. Lond. Ophth. Hosp. Rep.). 19. Note of case of syphilitic disease of each cerebral hemisphere. Examination of optic nerves and retina by Dr. Hermann Pagenstecher (*op. cit.*).

20. Note of case of tumour of middle lobe of cerebellum (*British Medical Journal*, August 26, 1871). 21. Note of case of glioma of anterior cerebral lobe (*Lancet*, October 29, 1869). 22. Case of glioma of crus cerebri (ditto). 23. Tumour of left cerebral hemisphere and of each cerebellar lobe. Changes in discs slight and doubtful (*Medical Mirror*, September, 1869).

in *Medical* practice that there is an adventitious product within the head. You usually have other evidence. There is severe pain in head, and perhaps urgent vomiting—symptoms I shall more particularly consider in future lectures, when speaking of the diagnosis of tumour of the brain.

In chronic cases you will scarcely ever be wrong; in acute cases there is more difficulty. In some cases of tubercular meningitis and in some cases of pyæmia you may find a swollen disc (d)—or find the disc much swollen, let us say—but, so far as I have observed, only shortly before death. In the cases of pyæmia there is no difficulty, because the diagnosis of that affection by other kinds of evidence is easy. And in most cases of meningitis, tubercular or non-tubercular, I have not seen any considerable alteration of the discs even shortly before death—nothing so marked as any of the stages of optic neuritis I have described. (See No. 4). In a case of universal meningitis, I found no morbid ophthalmoscopic signs (see *Medical Times and Gazette*, Nov. 2, 1867); and recently in another I found, after very careful examination, at the most only enlargement of the large retinal veins, and this was a few hours before the patient's death, when respiration was very much embarrassed. The discs were also examined by Mr. Waren Tay. The meningitis was basal, and there was a cerebral abscess as well.

10. *Conditions under which Double Optic Neuritis scarcely ever occurs.*—Here I must draw your attention expressly to the fact already indirectly implied, that in certain nervous affections optic neuritis scarcely ever occurs. This negative evidence is really most valuable, and yet, so far as I know, little, if any, attention is ever given to it. Optic neuritis very rarely occurs in those cases in which there is no coarse change—no adventitious product. It does not occur, or very rarely occurs, in the neuroses. It is rare in chronic and general convulsions (epilepsy), although not uncommon in partial convulsions—*e.g.*, convulsions beginning in the face, arm, and leg; in the former there rarely is coarse disease (no lump), in the latter there frequently is. I have never seen double optic neuritis in chorea. (e) Now chorea, I think, depends on plugging of small cerebral arteries; but at all events, it does not depend on gross change. (f) I have never seen optic neuritis with hemiplegia from local softening, the result of embolism or thrombosis.

11. *Double Optic Neuritis is not a Localising Symptom.*—Now, we have arrived at the conclusion that in most cases there is coarse disease as a cause—an indirect cause—of the neuritis. We have next to find out where this disease is placed.

Double optic neuritis is of no value in localising, although it depends on local disease. You may suppose I have nothing further to say. I wish to guard you against certain easy inferences which are in most cases fallacious.

Contrary to what you would naturally expect, the coarse disease does not, as a rule, directly involve any known part of the optic (g) nervous system. There may be disease of the base of the skull which squeezes or involves the optic nerves, but double—I say double—optic neuritis does not help you to that diagnosis, and you never can make it unless other symptoms are present which point to disease of the base, such as palsies of cranial nerves. I shall speak of these cases in another lecture. I shall also then speak of the series of symptoms which point to pressure of a tumour on the corpora quadrigemina. I say now two things: that whilst double optic neuritis implies in most cases the existence of an adven-

(d) I have already—Footnote (c), p. 241—quoted Liebreich as to the difficulty there is in saying whether the ophthalmoscopic condition we discover is to be classified as engorged papilla, neuritis descendens, or as neuritis intra-ocularis. Soelberg Wells, who speaks of two principal forms of optic neuritis—the engorged papilla and descending neuritis—after describing their respective peculiarities, says (the italics are mine)—“It must be stated, however, that the distinctive characters of these two forms of neuritis are not often so strongly marked, and also that the one may pass over into the other, and thus give rise to a mixed group of ophthalmoscopic appearances.”

It must never be forgotten that the appearances in cases of optic neuritis in which, post-mortem, we find “coarse” disease vary very much at different stages (see No. 4, p. 241), and, so far as I can judge by the descriptions authors give of the ophthalmoscopic appearances in different “varieties” of optic neuritis, the same case would have to be differently classified according as it was seen early or late. Indeed, my own impression is that there is only one kind of optic neuritis from adventitious products within the cranium. I would reserve the term swollen disc or engorged papilla for what is seen in a rude clinical group of cases—some cases of meningitis and some cases of pyæmia; I surmise that there is in these cases venous thrombosis. On this matter, see Clifford Allbutt's papers in this journal, (vol. i., 1868, p. 575 and p. 629), where he speaks of ischæmia of the discs.

(e) Indeed, I have never seen any morbid ophthalmoscopic appearances in chorea, except in one case, and then they were very trifling. Dr. Clifford Allbutt's experience has led him to the same conclusion.

(f) In some cases of cerebral tumour we have choreiform movements, as Tuckwell points out. He quotes Todd on this matter.

(g) This expression is used as a short term inclusive of the optic nerves, optic tracts, and corpora quadrigemina.

titious product within the cranium, it tells you *by itself* nothing whatever as to the seat of that product. In other words, it is not a *localising symptom*, although, contradictory as it may seem, it depends on local disease.

The disease causing neuritis—never forget that I speak all along of coarse disease, of adventitious products—is rarely limited to the motor tract; perhaps, however, because adventitious products rarely occur in the motor tract. It is rarely found with hemiplegia from clot. Indeed, it is rarely found with any kind or degree of hemiplegia, with the important exception of hemiplegia after a convulsion which begins unilaterally—a hemiplegia in which, when there is coarse disease, the coarse disease is *not* of the motor tract. This is the exception proving the rule.

The disease is mostly of the cerebrum or cerebellum.

12. *Recapitulation.*—Here let us recapitulate. Suppose you discover double optic neuritis, and let us grant that there is severe headache also, you may feel pretty certain that there is coarse disease of some kind within the patient's head; but you have no evidence to show either the nature of the disease (beyond that it is of *some* coarse kind), or to show its position. For either of these points in diagnosis you require other evidence, and, as not unfrequently it is not obtainable, it happens very often in the early history of a case of severe cerebral disease that your diagnosis is incomplete. You can only say that the patient has an adventitious product of *some* kind in *some* part of the intracranium. This is practically the important matter in prognosis.

ORIGINAL COMMUNICATIONS.

ON RHEUMATISM.

ITS NATURE AND ORIGIN.

By J. JAMES RIDGE, B.A., B.Sc., B.S., M.D. Lond.

(Continued from page 275.)

HAVING in previous papers endeavoured to show the baselessness of the theory which ascribes the production of rheumatism to the development and constant presence of an acid *materies morbi*, and having also attempted to show the *prima facie* probability of its simple nature by its affinity with some diseases and association with others, it now remains for me to elucidate the various reasons for accepting this explanation of its pathology, and, as far as possible, to trace the morbid process.

I.—THE ARTHRITIS IS PRODUCED BY AN INFLUENCE WHICH OPERATES THROUGH THE NERVE-SUPPLY OF THE AFFECTED PARTS.

That inflammation can be excited by the influence of nerves is, for the most part, generally admitted. For example—Sir James Paget mentions the inflammation set up in one eye by the long use of the microscope with the other. Brown-Séquard mentions a case in which purulent otorrhœa occurred at every attack of neuralgia of the auriculo-temporal nerve. The phenomena of herpes zoster seem also associated with modification of nerve influence.

The theory of the production of arthritis in a similar manner has not met with such acceptance. Dr. H. Day, in an article on the “Spinal Origin of Rheumatism,” (a) brings forward several facts which point in this direction. They are principally derived from the experience of some army Surgeons during the late American war. I will briefly state them on his authority. In the eighth volume of the *American Journal of Medical Sciences*, p. 55, Professor J. K. Mitchell relates four cases in which a rheumatic condition evidently resulted from spinal nerve lesion. Drs. Weir Mitchell, Morehouse, and Keen, United States army Surgeons in charge of the wards for diseases of the nervous system, Philadelphia, have written a small work on “Gunshot Wounds, and other Injuries of the Nerves;” at p. 83, in speaking of the “alterations in the nutrition of joints” occasioned by spinal nerve injury, they call attention to a subacute inflammation of the joints, which may attack any or all of the articulations of the limb whose nerves are injured, which occurs at any time after the first few days. They have observed, also, the same copious sour-smelling perspirations in some cases. Dr. Day also instances the association of rheumatism with cerebro-spinal meningitis; and this far stronger argument—*viz.*, the remarkable connexion

(a) *Medical Times and Gazette*, August 31, 1867.

of rheumatism with chorea, the latter being almost constantly dependent on spinal irritation. Believing the articular inflammation to be due to spinal irritation, he narrates a case which was successfully treated by the application of blisters and cupping to the spine. With regard to chorea, I have before noticed the case given by Trousseau, in which it was established by fright, and gave place after a time to true articular rheumatism. The possibility of such an origin lets in a flood of light upon the genesis of rheumatism; we see a chain of causation, even if the links of the chain cannot be accurately defined. Dr. Day suggests that this theory does not necessarily interfere with Dr. Prout's idea of the presence of lactic acid in the blood, but may be the cause of its presence. True; but if the cause of the changes which the nervous system undergoes can also excite other simple inflammations, and if, on the other hand, we know no such process as the production of lactic acid in excess under the influence of the nervous system—and, if we did, that no excess of lactic acid has been demonstrated in rheumatism—where is the necessity for supposing such an extra step in the process? If the inflammation can be set up directly, why, without incontestable proof, should we imagine that it is done circuitously?

The following considerations tend to confirm this view:—
(1.) That the arthritis is frequently symmetrical. This is due, I believe, to the fact that the nerve-supply of symmetrical parts is derived from the same segment of the cord, being closely connected by commissural fibres. To me this is much more intelligible as an explanation of all symmetrical diseases than the hypothesis that one part of the body is more like the exact spot on the other side than the immediately adjacent similar tissue. It is the nervous system which is the grand differentiator of similar tissues in each half of the body, while it is the sole connector of distant corresponding parts, and at the same time regulates their actions. (2.) That the various so-called metastases occur. Trousseau(b) has come to the conclusion that the cerebral form of rheumatism is a neurosis. There are cases which present the symptoms of acute meningitis during life, which have not exhibited the usual inflammatory changes after death, even when they have continued for some days. On the other hand, we must recollect that all the physical appearances of meningitis have now and again been discovered, the usual symptoms having been present during life. The absence of the inflammatory changes cannot be ascribed to want of time. How can they, then, be explained? Of course we may say plausibly that the irrepressible lactic acid poisons the encephalic centres; if so, how beneficial is the prevalent dislike of humankind to sour milk! Or we may take Dr. Bazire's view when he says, in reference to cerebral rheumatism—"The reason why such symptoms do not arise in every case of rheumatic fever seems to be that the rheumatic poison can only play the part of the lighted match, and that there must be, in addition, combustible material present. That combustible material is the nervous susceptibility of the patient, his peculiar disposition to the development of cerebro-spinal symptoms, from acquired or hereditary causes." That this virus does not exist it is impossible, as I have before remarked, to prove positively; but I think there is another explanation which is equally consistent, and does not introduce another unknown quantity. No doubt we can speak but vaguely of these engines of the mind; still, we see their normal actions interrupted or distorted—coma, delirium, convulsions, or chorea produced—and we may or may not, at the same time, have meningitic inflammation. Is it not consistent, then, to suppose, until it is proved otherwise, that we have a disturbance of the intellectual and other centres of a similar kind to that which produces inflammation when it affects the centres presiding over nutrition? It would be impossible to reproduce here the whole of Trousseau's lecture on "Cerebral Rheumatism," but it is one of great importance and very suggestive, as well as the notes of Dr. Bazire, and should certainly be read in connexion with this subject. He says(c)—"We are thus led to infer, both from clinical observation and from reasoning, that, in consequence of the cerebral rheumatism, the nerve-substance has probably undergone a modification analogous to that which is believed to occur in tetanus, hysteria, etc., a modification the nature of which is yet obscure and not anatomically demonstrable, but which nevertheless exists, as everything at least seems to indicate, although it cannot be referred to any nosological type."

Trousseau will not admit that when the cerebral form appears during ordinary rheumatism there is true metastasis,

because the joint affection is sometimes unaltered, and does not usually altogether disappear, though it may diminish and there may be oblivion to pain. But he mentions cases in which alternation of cerebral and other symptoms was well marked. A young girl had spinal pain and paraplegia. After three days she was cupped, when all symptoms of paraplegia disappeared; but amaurosis and hemiplegia immediately set in. A few leeches were applied, and, two days afterwards, pains in the joint appeared. In another case, rheumatic arthritis preceded for a few years the symptoms of paralysis; and these symptoms alternated with those of articular rheumatism. "At one time, cephalalgia and sensorial disturbances are present; at another, spinal pain and weakness of the lower limbs; sometimes, again, the cerebral and spinal symptoms are replaced by painful swelling of the joints. This woman, then, had alternately cerebral and spinal rheumatism."(d) I have before mentioned Dr. C. Allbutt's case, in which the symptoms of spinal meningitis were displaced by those of acute articular rheumatism.

Do not these facts go far to prove the central origin of rheumatism? This hypothesis furnishes us with a clue to the cause of the wonderful metastases which occur—so irregular and yet so often methodical. An influence is at work upon the various nerve-centres. Now the nutritional are involved, and the effect is arthritis—the influence flickers about among the various articular nerve-centres, and various joints suffer; then the pericardiac are attacked, or those connected with the meninges, and pericarditis or meningitis results; by-and-bye the intellectual centres suffer, and delirium, coma, etc., result; or the motor centres are affected, and there is paralysis more or less developed, with or without choreic agitation, or, may be, tonic or clonic spasm. All these symptoms I regard as the effect of a similar cause; as it were, the steam is shut off from one engine and turned into another, and according to the function of the engine are various effects produced.

Having thus traced the morbid process backwards to the invisible molecular changes which occur in nerve-ganglia, where from imperfect physiological knowledge it is impossible at present to follow it, we must turn to the causes of the disease, and endeavour to trace these as nearly as we can to the same point, in the hope that some day we may see the connecting link in the now secret mechanism of nerve-influence.

II.—THE ARTHRITIS IS PRODUCED BY A REFLEX INFLUENCE.

The cause most frequently operative in exciting rheumatism is, without doubt, the influence of cold, generally combined with damp. It will be well first to inquire what view is generally entertained as to the rôle which cold plays in the production of this disease. Dr. Fuller tells us that cold locally applied produces none of the symptoms of rheumatism, neither do its primary general effects resemble them; but that it is frequently an efficient cause, "by exercising a depressing influence, interfering with the business of nutrition, and so, through perverted assimilation, giving rise to the formation of the *materies morbi*."(e) That the direct effect on the tissues of the local application of cold is not sufficient to set up rheumatism may be granted, although its influence on a part at all events favours the establishment of the inflammatory action in that region in preference to other parts. Yet it is unreasonable to consider the active production of rheumatic inflammation to be entirely disproved because, indeed, it cannot produce as invariably intense local and persistent effects as a red-hot poker or six inches of cold steel! Dr. Fuller's list of the general effects of cold is incomplete, and he omits just those effects which alone explain the disease. In fact, he himself unconsciously ascribes another general effect to cold, when he says that it has this wonderful power of giving rise to the generation of the lactic acid on which so much depends. The cold, he says, exercises a depressing influence, and causes perverted assimilation. We can easily imagine the production of lactic acid—that is, the deficient oxidation of starchy materials—during this general depression. But is there no state of "reaction" (so-called)—a reaction out of all proportion, both as regards degree and duration, to the stage of depression; a reaction of intense fever, during which oxidisable materials are rapidly consumed, and the amount of water and carbonic acid is largely increased, and thrown off at every outlet? How is it possible for any lactic acid to continue as such, and be the exciting cause of the continued morbid action? If the cold caused the formation of the first lactic acid poison, would not the reaction destroy it, and prevent its further production? And if (in order to be consistent) the advocates of the *materies morbi* theory attribute all the fever and inflammation to the lactic acid or other virus

(b) "Clinical Medicine," Sydenham Society's *Transactions*, vol. i., p. 529.

(c) *Op. cit.*, p. 533.

(d) *Op. cit.*, p. 525.

(e) *Op. cit.*

generated, and not to reaction, what is the reason why cold in causing rheumatism alone is not followed by reaction? And why should we suppose that a poison is the cause here both of febrility and inflammation, when both these are present in common catarrh and numberless other diseases, without a suspicion of its presence?

Yet cold has a most decided influence in the genesis of the disease. It is something more than a most remarkable coincidence that the rheumatism breaks out just after exposure to cold and damp in so many thousands of cases. We cannot reasonably suppose that in all these the lactic acid, or rheumatic virus, had been gradually accumulating up to rheumatism-point, and that the cold acted only by adding just a little more virus than was previously present—just enough to start the whole morbid process, lasting for days or weeks.

Another effect attributed to cold is that of so affecting some joint or other—"lowering its vitality" some call it—as to cause the rheumatic arthritis to occur first there. As a fact, we know that the inflammation generally does attack first any joint which has been specially exposed. Yet even on this supposition, that the vitality has been merely lowered by cold, as well as on that which I advocate, that the inflammation is established solely by nerve-influence, but one explanation will account for the effect. The influence on the affected parts is a reflex one. The actual amount of cold in degrees Fahrenheit is, as a rule, inconsiderable; the effect is most frequently produced by multiple and rapid variations in the degree of cold—a kind of action by which, I need scarcely remark, nerves can most powerfully be affected. In fact, rheumatism is most prevalent, not in countries whose climate is coldest, but where it is damp and variable. When we recollect how long it takes even for intense cold to chill deep textures, we can scarcely think that the interior of even such a comparatively superficial part as the knee-joint can be chilled by the application of the slight cold which usually operates. Yet any doubt which may seem to exist here is quite removed when we consider those other cases in which thick pads intervene to screen the joint. For instance, the shoulder-joint is very commonly attacked, as when it has been exposed in bed with a window open; or the hip-joint from sitting on some damp seat. Here there can be little doubt that the influence is reflected. In the case of the heart, Dr. Fuller imagines that we have conclusive evidence against the direct influence of cold, inasmuch as it is perfectly sheltered. Against all local chill the protection is complete, but not against this reflex influence.

And we cannot too constantly remember that we are dealing with no extraordinary or unusual effect of cold. The establishment of inflammation of serous membranes, mucous membranes, and parenchymatous tissues by its influence is so frequent that it might almost be regarded as an axiom. And this influence is often exerted in such a manner that it is impossible to conceive of it otherwise than as a reflex influence. It is no answer to say that we cannot point out the particular nerves through which that influence is exerted; the facts remain, and no explanation better than this can be given. To me it seems just as reasonable to attribute the inflammatory process to the action of cold as the involuntary inspiration which results from its application to the surface of the skin of the face or chest, or as the sneezing or shivering which it can excite. We know, too, that cold can produce neuralgia and facial paralysis, and can check menstruation. If cold, then, is able to excite inflammatory action in one organ—*e.g.*, a lung—there is a probability that it can do so in others; and if this capability of cold is recognised, there is no unreasonableness in attributing an inflammatory action—rheumatic arthritis—which is generally preceded by exposure to cold, to the action of this, exerted in a reflex manner, through the agency of the nervous system.

But then, it is said, cold does not invariably produce this effect. To some it will act as a muscular and nervine tonic and stimulant; in others it will excite rheumatism; therefore, it has no direct influence, and the previous constitutional state is the all-important condition. The conclusion that, therefore, the disease must have a humoral origin, or that a poison exists in the one set of cases which does not exist in the other, is unwarrantable. The constitutional disposition is, doubtless, a very important factor; but is there no such thing as variation in the degree of susceptibility of the nervous system to receive impressions? Having to refer to this again, I will pass on to notice another objection which has been raised to the view of its purely nervous origin—namely, the variable and often long duration of the disorder, which Dr. Fuller thinks is altogether inexplicable, except it be admitted that a *materies morbi* is generated *de novo* in the system. Is not chorea as long continued, or whooping-cough?—both dependent on

nerve alteration, and largely influenced by habit. Or, to take a simple catarrhal inflammation, does not bronchitis often last as long, have as many exacerbations (often unaccountable), and become just as chronic? While quite agreeing with Dr. Fuller that cold and atmospheric vicissitudes are not essential to the production of rheumatism, I cannot quite see that the arguments he employs establish this so thoroughly as he seems to think. It is true that patients admitted into a Hospital for other diseases, kept in bed in a ward heated to 65° Fahrenheit, nevertheless sometimes fall victims to it. Dr. Fuller says that here cold cannot have been the cause, because they were never exposed to it. Perhaps they may not have been exposed to cold and damp to any such extent as would be necessary to develop rheumatism in a healthy individual, but it does not follow that, under such circumstances, they could not be exposed to quite enough to develop it in persons whose power of resistance to morbid influences is probably at the lowest ebb. The draughts necessary for ventilation in some Hospitals are quite enough to account for rheumatism in anyone, even if patients never did imprudent things which they feel to be the cause of their illness or relapse, and are therefore afraid or ashamed to own. In fact, until the balance of the nervous system has been recovered, and raised to its former level, influences apparently insignificant, and which would be so in health, are quite sufficient to re-establish the morbid process. A too early dinner of meat will thus often seem to be the cause; and like instances will occur to everyone.

(To be continued.)

ON HÆMOPTYSIS IN CHILDREN, ILLUSTRATED BY TWO CASES.

By Dr. VALD. RASMUSSEN.

(Translated from the *Hospitals-Tidende*, July, 1871, by J. W. MOORE, M.D., M.Ch. Dub., L.K.Q.C.P.I., Ex-Scholar Trinity College, Dublin.)

(Continued from page 277.) (a)

Case 2.—*Suppurative Adenitis of the Glands of the Neck and Root of the Lung—Perforation of the Right Bronchus and Pulmonary Artery—Hæmoptysis—Catarrhal Pneumonia and Peribronchitis—Diffuse Interstitial Nephritis—Caseous Swellings of the Mesenteric Glands.*

J. P., AGED 6, admitted September 12, 1870, to Ward No. 5 of the Municipal Hospital. The patient's appearance pale, sickly, and scrofulous. On both sides of his neck were large, partly suppurating, partly firm glandular enlargements, especially on the left side; many rather small, almost circular, openings, through which the sound could be passed in, under the relaxed edges of the sore, in all directions. The urine contained much albumen. The glandular enlargements were treated by incision and carbolic acid dressing, and—after the suppuration had, in a comparatively short period, ceased—by painting with tincture of iodine. Iron was administered internally.

At the end of October he commenced to cough slightly, without the stethoscope as yet revealing anything except some scattered sonorous râles.

November 11.—The cough unceasingly frequent and troublesome, of a ringing character. The expectoration thin, wheyish, with rather transparent yellowish striæ. Percussion sound muffled in the right supra-spinous fossa, and internally in the upper half of the corresponding infra-spinous fossa. The respiration markedly bronchial, with exaggerated vocal resonance. He had lost flesh and strength, and had scarcely any appetite.

14th.—After having been during all the forenoon much as usual, and having had repeated paroxysms of the same hollow, ringing cough, in one of these he brought up about two fluid ounces of light-red frothy blood, which gushed forth in a stream from his nose and mouth. He immediately fell into collapse, and after a few gasps and pulsations, distant from each other about a minute, he died, at half-past one in the afternoon.

The autopsy was performed the following forenoon. The body was much emaciated; rigor mortis had disappeared. The larynx and trachea lay as if buried in a knotty swollen mass, consisting of enlarged glands, some cheesy, and others containing larger or smaller pus foci. The swellings extended downwards to the roots of both lungs, so that the apex of the right viscus in question was very feebly pervious to air, and compressed. On taking out the right lung, there was found in its root a

(a) *Errata*.—In the first part of this paper (page 275, column 2, twenty-fifth line from the bottom), for "a continued maculated fever," read "purpura"; and (seventh line from the bottom) for "age" read "stage."

small cavity, bounded by a glandular mass, except on the external aspect, where its wall was formed by the somewhat thickened pleura. In this cavity, which was filled with slightly coagulated blood, was discovered an opening of tolerably circular form, two millimètres in width, through which it communicated with the primary bronchus. Communicating with the chief branch of the pulmonary artery there was found, a little posterior to the first-named, a slightly larger opening, with attenuated yellow borders, particularly on its outer side. Both openings were almost closed by recent coagula. In the pleura there was no deposit of miliary tubercle. The lowest portion of the superior lobe of the left lung was condensed with fresh and old lobular infiltrations, but without cheesy masses. Elsewhere this lung was pervious to air, except that in places, especially in the superior lobe, tubercles with peribronchitic characters were dispersed. The right lung (if the compression already alluded to as existing in its upper portion be disregarded) was otherwise pervious to air. In the bronchial tubes, even the most minute, there was much aerated, coagulated blood, capable of being drawn out in coherent, branching masses. The heart of ordinary size, very pale. The spleen only slightly enlarged, firm, with very numerous and large follicles. On the surface of the liver strong adhesions, in places very fine; the hepatic structure itself of normal appearance. The kidneys firm, pale; the line of section homogeneous, pale; the pyramids faintly reddish; the uriniferous tubes and the lobular tissue of the cortical substance not recognisable, but the latter had a homogeneous, pale, rather transparent aspect; no amyloid degeneration; the intestinal canal healthy; all the mesenteric glands much swollen, and infiltrated with cheesy matter.

This case belongs to the rarest class. Perforation of the pulmonary artery, with suppuration of the lymphatic glands in the root of the lung, has been, as already stated, indeed, observed before, but extremely seldom and under rather different circumstances than in our case. Rilliet and Barthez are the only authors, so far as I can determine, who mention similar cases. They state (b) that they are aware of only three, one of which was observed by themselves, the remaining two by Berton. In their own and in one of Berton's, as in our case, there existed perforation both of the pulmonary artery and of the primary bronchus. Other authors, as West, indeed, mention this circumstance, but seem merely to have relied on the statement of Rilliet and Barthez.

Apart from the hæmoptysis, our case possesses some interest in a clinical respect also, and although this is somewhat more removed from the reflections which the case most immediately gives rise to, I will, nevertheless, here briefly consider the point in question.

The diagnosis was, during life, set down as tuberculous (cheesy) pneumonia in the superior lobe of the right lung, secondary to the long-continued suppurative adenitis and chronic renal affection. However, on post-mortem examination, it appeared that the right lung was everywhere pervious to air, only a little compressed at its apex by the large glandular swellings round the trachea and in the root of the viscus, and that only in the superior lobe of the left lung downwards were there found scattered recent and chronic lobular pneumonic infiltrations and dispersed peribronchitic deposits. This diagnosis, which, lastly, was necessarily strengthened by the intercurrent hæmoptysis, could, perhaps, scarcely have been made otherwise.

Rilliet and Barthez, who have indeed gained great credit by their study of the so-called bronchial tuberculosis, and especially, too, of the differential diagnosis between that affection and pulmonary tuberculosis, have directed attention to the fact that the percussion sound may be deadened over various parts of the thorax as a consequence of enlarged bronchial glands, but particularly, as in our case, over its upper and posterior portions (in the supra-spinous fossa, and in the superior most internal part of the interscapular region); and that in this immediate neighbourhood, owing to the close relation of parts between the large bronchial tubes and the chest-wall, tubular breathing may be heard, although not at all times. This physical sign it is, however, even with the greatest experience, as also Rilliet and Barthez admit, almost impossible to distinguish from an infiltration of the lung itself, and this especially when, as in our case, there is, or, at all events, there appears to be, a progression in the phenomena.

The perforation of the bronchus probably took place some two weeks before that of the pulmonary artery, whereupon the previously existing slight bronchitis became extremely aug-

mented, the cough more troublesome, and occurring in paroxysms with a ringing sound. The pneumonic infiltrations in the left lung were in all likelihood due to the entrance of pus and masses of detritus from the cavity of the abscess into the most minute bronchial tubes, an assumption that also agrees well with their age. Had the fatal result not occurred so hastily, they would in all probability have become transformed into cheesy masses, and made a starting-point for a general tuberculosis. Such a change had not, however, occurred at the time of death, and in this respect the present case differs from the remaining three on record. The glandular enlargements stood in no relation whatever to the lung affection, but had arisen either primarily, or—as is indeed more likely—by propagation of the inflammation from the cervical glands.

Of initial and so-called idiopathic hæmoptysis I remember to have observed only one instance in my consultation practice. The patient was a boy of 11 years, previously healthy, who in the month of February, after being pelted with snowballs, and having subsequently gone into a warm room, was attacked with hæmoptysis to the amount of one or two tablespoonfuls of blood. The bleeding recurred, according to his parents' account, on the four following days, in about the same quantity. When I saw the lad four months after, he was of a healthy appearance, and physical examination revealed no trace of any alteration in the lungs; while, again, the scanty opaque expectoration, which was brought up by a very trifling cough, contained no elastic filaments.

Hæmoptyses and pulmonary discharges of another origin may also, no doubt, occur in children, but yet generally very seldom, and most frequently the blood is discovered only at the autopsy (apoplexy, lung-infarction), without any actual hæmorrhage having taken place. Thus, they are observed sometimes with gangrene of the lungs, both at the beginning and in the subsequent course of this disease, but only in exceptional cases do they attain any very considerable proportions; sometimes with heart affections, either as infarctions and apoplexies, or as a real hæmoptysis. (c) Attacks of spitting of blood have also been noticed in scorbutis, purpura, and similar diseases.

It still remains to examine what can be the cause of the extreme infrequency of the occurrence of hæmoptysis in children the subjects of pulmonary consumption. This appears to me unquestionably to be an inquiry of great interest, and one which cannot easily be put aside without at the same time renouncing the endeavour, which our science must ever acknowledge, to discover the more or less hidden causes of the morbid phenomena we observe. Setting out from the generally received assumption, first promulgated by Laennec, that the hæmoptysis in phthisis is due to a bronchial hæmorrhage, it will be quite impossible, however much we may set our imagination to work, to find any probable ground whatever why the diminished power of resistance, the defective nourishment of the capillaries, the separation of the mucous membrane, and other similar hypothetical changes in the bronchial mucous membrane, which have been assumed to establish the existence of a bronchial hæmorrhage, should appear less frequently in children than in adults. Nay, more, this becomes quite incomprehensible, if, with Niemeyer, we place a bronchial hæmorrhage of this kind in the same category with epistaxis, which in childhood is so particularly frequent.

The actual state of affairs, however, is, I believe, quite the reverse when we forsake this hypothetical basis and depend on one of a more practical character—namely, the anatomical. There is then greater likelihood of the logical rule *ab esse ad posse* being satisfied, for in assuming a broncho-hæmorrhage in reality a conclusion is drawn *à posse ad esse*.

The burstings of aneurisms or dilatations on branches of the pulmonary artery, running in the walls of cavities, the cause of hæmoptysis in phthisis—as I have repeatedly (d) endeavoured to maintain in opposition to the generally received view—I may perhaps venture to regard as recognised, at all events in their leading characteristics. In each case of fatal hæmoptysis which has since occurred amongst us in our civil Hospitals we have been able to demonstrate this source of the bleeding, (e)

(c) Glass, for example, has ("Upsala Läkareförenings Förhandlingar," vol. i., page 246) communicated three cases in children who suffered from congenital disease of the heart, in which there were found evidences partly of apoplexy, partly of hæmoptysis. In one instance, the patient, a boy aged 4, died of hæmoptysis.

(d) *Hospitals-Tidende*, 1868, Nos. 9—13; 1869, Nos. 11 and 12. *Edinburgh Medical Journal*, 1868, November and December; 1869, August and September. *British and Foreign Med.-Chir. Review*, January, 1869; and elsewhere.

(e) Cases of the kind have been communicated during the past winter, in the *Filiatria*, by Professor Reisz and Lecter Gædeken.

(b) *Loc. cit.*, vol. iii., page 616.

and experiences in England, particularly at Brompton, quite agree with this. Dr. Powell, also, in reference to the works of the present author, has communicated to the Pathological Society of London (f) fifteen cases of fatal hæmoptysis occurring at Brompton. Of these fifteen, in twelve the blood proceeded from bursting of branches of the pulmonary artery, running in the walls of cavities; in eleven of them the vessel was aneurismal (five sacciform aneurisms, six varicose); in one the vessel was simply perforated by ulceration; in three the source of the bleeding could not be discovered.

There may be different opinions as to the extent to which this anatomical discovery should be applied in relation to hæmoptyses which are not accompanied by death, and some may perhaps experience a degree of hesitation in going as far in this respect as I have gone; but to assume for certain from the experiences already to hand that every fatal attack of hæmoptysis occurring in a phthisical patient is due to bursting of a vessel in a cavity, will indeed meet with serious opposition.

In children this source of hæmorrhage has not hitherto been pointed out. We have, however, seen in our first case the bleeding arise in this way, as also it was natural *à priori* to suppose should happen; and in opposition to the other negative observations, the present positive discovery, which so remarkably coincides with the experiences met with in adults, possesses a yet greater degree of importance, and gains a retrospective influence. When the three cases of fatal hæmoptysis, with suppuration of a lymphatic gland in the root of the lung and perforation of the pulmonary artery, are excepted, no positive observation as to the origin of the hæmorrhage in children is forthcoming; for the cause of the hæmoptysis assigned by Rilliet and Barthez—namely, pressure exerted by the swollen bronchial glands—is clearly only a hypothesis, which their recent and meritorious investigations on bronchial tuberculosis—especially in its mechanical aspect—have led them to, but of which they have adduced no proof. It should thus, indeed, also be assumed, as regards children, that at all events fatal hæmoptyses proceed from aneurisms in the walls of cavities; and the question as to the rare occurrence of hæmoptysis in children practically limits itself to this: Whether the peculiar anatomical conditions which favour the development of aneurismal dilatations of a vessel in the wall of a cavity are less frequently present in children than they are in adults? This question may, I believe, be decidedly answered in the affirmative.

We have seen that it is stated by authors that hæmoptysis in very young children, within 6 years of age, is extraordinarily rare, and that it becomes more frequent the nearer the age approaches the adult (Rilliet and Barthez, West, Steffen, and others). This, meanwhile, agrees with the special anatomical changes, which also, in fair accordance with the statements of authors, occur within the two periods of age mentioned.

In early childhood, as is well known, the most frequent form under which phthisis is met with is that of cheesy pneumonia—the “*infiltration jaune*” of Rilliet and Barthez. No doubt in this affection cavities form, although far less commonly than in adults, and especially in the so-called florid phthisis. But these cavities, which arise from necrosis of the central infiltrated portions, are situated within cheesy dry masses in which the vessels have long since become compressed or obliterated, and so could not possibly give rise to hæmoptysis. It is interesting—at least, in this point of view—to note that in the few cases where a post-mortem examination was performed on young children the victims of hæmoptysis, such as Steffen’s above referred to, there was found, as in our case, in immediate proximity to the cheesy pneumonia, a diffuse interstitial inflammation, with the formation of cavities. It should therefore also be assumed that the hæmorrhage in Steffen’s case likewise arose from one of the cavities, and not from the cheesy pneumonia, as we have seen that the author in question himself supposed. If such a breaking down of the infiltrated tissue had been the cause of the violent hæmoptysis, as Steffen supposes it was in the second case, in which no autopsy was obtained, then hæmoptysis in children should be far more frequent than it is in reality. But this view of Steffen seems at best to be but a clinical hypothesis.

In more advanced childhood, on the other hand, cavities occur almost as in adults, and the more especially so the nearer the children have approached the full-grown age. But to this contributes the circumstance that while cavities are found, almost without exception, in all adult individuals the subjects

of chronic pulmonary consumption, they are, on the contrary, rare in children. According to Rilliet and Barthez, they are not discoverable in one-third of the children who have died of phthisis. (g) Among 265 autopsies performed on phthisical children, they met with cavities in seventy-seven only; West, in sixteen out of eighty-one. Further, the frequency of cavities, exactly as that of hæmoptysis, increases with age, a circumstance of particularly great importance in support of the view which has been advanced in this paper as to the origin of the hæmoptysis. According to Rilliet and Barthez, cavities are found on post-mortem examination in about one-third of phthisical children between the ages of 1 and 2 years, in less than one-fifth of those between 3 and 5, in less than one-third of those between 6 and 10, and in less than one-half of those between 11 and 15. But another circumstance also contributes to this, to which these authors have paid no attention, but which still further lessens the frequency of such cavities—a circumstance that touches on the question of the origin of the hæmoptysis—namely, the fact that in this number are included the cavities produced by breaking down of the cheesy tissue; and these, as has been seen, do not cause hæmoptyses. This is certainly, also, the reason why cavities in the first two years of life are comparatively frequent. (h)

It is to be remembered that each cavity in the lung whose wall is formed of condensed pulmonary tissue containing non-obliterated vessels—as is far more frequently the case than is generally supposed—may become the seat of aneurismal dilatations with subsequent rupture, but that most frequently it is cavities whose walls are composed of a condensed tissue, a few millimètres in thickness, which is immediately contiguous to permeable tissue, or, in general, such cavities as have to a greater or less degree, but never completely, retained their original bronchiectatic character, that are liable to this change. But the dilatations of the bronchial tubes, which become developed simultaneously with interstitial pneumonia—in what relation these two processes stand to each other is, as is well known, still a matter of controversy—are rare in children. This holds good pre-eminently as regards primary depositions of miliary tubercles, but also as regards those in which cheesy pneumonia secondarily terminates attacks of peribronchitis; and as in adults cavities are most frequently met with, so, also, in children they, when they do occur (in contrast to those met with in adults), have only a slight tendency to ulcerative processes (Steffen). Most usually, indeed, these so-called interstitial chronic pneumonias with formations of connective tissue in children are not primary or interstitial in the general acceptance of the word, as they are somewhat systematically set forth by Steffen, but are developed from an acute pneumonia, the alveolar cellular contents being metamorphosed into connective tissue—which, indeed, cheesy formations generally resemble, the cells in other alveoli forming a cheesy detritus, which in turn gives rise to miliary deposits, just in the same way as the process, most closely in accordance with the description of the different stages of development of pneumonia given by Key, was described in our first case.

If now it is granted, on the one hand, that bronchiectatic cavities, and, in general, cavities with firm (composed of connective tissue) walls, are rare in children, and, on the other hand, that profuse hæmoptyses in adults arise from bursting of aneurismal vessels in cavities, but at the same time only in a comparatively small percentage of the cavities found in phthisical adults, it is then, even apart from our positive observation, a natural sequence that such hæmoptyses should be rare in children. The unusual occurrence of such is also by no means accidental, but rests deeply grounded on the peculiar anatomical alterations with which phthisis is accompanied in children.

The infrequency of hæmoptysis in children, and the coincidence of this with the rare development of the cavities alluded to, thus appear indirectly to support the view brought forward by the present author on a former occasion: that hæmoptyses in the course of chronic pulmonary consumption, whether fatal or very severe, though not followed by death, always arise from the rupture of aneurismal vessels in the walls of cavities.

DR. HARE, desiring to perpetuate the memory of a legacy of £46,000, left to University College Hospital by one of his patients—the late Mr. Yates—has erected a marble tablet in one of the wards.

PYOCYANINE.

By J. FAYRER, M.D., C.S.I.

It has occasionally been noticed that pus formed on granulating surfaces has a bluish or greenish-blue tinge, and the coloration has generally been attributed to the presence of a modification of the green colouring matter of the bile, or of the bluish ingredients sometimes found in the urine.

Dr. Gibb, in the *British American Journal of Science* (new series, vol. vi., p. 201), relates a case in which a purulent discharge of this colour was observed in a diseased female breast. The colouring matter is said to have been due to cyanide of iron (Holmes's "Surgery," 2nd edition, vol. i., p. 119). M. Fordos, however, says that the colouring matter has no connexion either with the bile or urine. By a chemical process, which consists of soaking the linen stained with the pus in water containing a small quantity of solution of ammonia, a bluish-tinted or green-tinted liquid is obtained. Chloroform added to this, and the blue principle, with a yellowish foreign matter producing the green tint, is extracted from the water. By a further process the blue principle is obtained in prismatic crystals of a beautiful blue colour. This principle M. Fordos calls pyocyanine ("Year-book of Medicine and Surgery," Sydenham Society, 1861, p. 112 and 113).

It has generally, I believe, been observed in cachectic individuals, and examples have occasionally come under my observation in this Hospital.

The following case being a marked one, occurring in an European female in moderately good health, though somewhat anæmic from malarious influences, is worthy of record:—Mrs. W., English, aged 35, stout, of light complexion, and rather anæmic, was admitted on February 6, 1871, into the Medical College Hospital, suffering from two indolent ulcers on the right leg, just above the ankle. The ulcers were of several months' duration, and were ascribed to abrasions. Want of proper care on her part appears to have caused them to assume the indolent condition in which they were found. The surrounding parts were indurated from inflammatory products and textural irritation. Tinct. ferri sesquichlorid. was prescribed, and good diet and wine; water dressing was applied, and the limb placed at rest on a side-splint. After some days the liquor lyttæ was applied, with the view of removing the thickening of the tissues surrounding the ulcers, and of expediting absorption. The water dressing was also continued. Considerable improvement was effected; but again assuming the indolent condition, ol. terebinth. m.xx. was given thrice daily. The result was an increase in action, and it was observed that the pus which now covered the surface of the ulcers stained the dressings of a bluish-green colour. This continued in a most marked manner for several days. The turpentine was discontinued, as her stomach became irritable, and sulphate of zinc lotion was applied like water dressing. Granulation was now proceeding, and the surface contracting, but the progress was slow, and by the middle of March the ulcers were still uncatrised. About this time a cold abscess formed on the outer aspect of the right knee, which resulted in a sore very like those on the leg.

During April her general health was considerably deranged, and, as suspicions of a constitutional taint were entertained, the iodide of potassium was administered. Her general health improved again; but the sores having relapsed into the indolent state, the liquor lyttæ was again applied, with water dressing after it had taken effect. On May 16 the discharge, which had for some time been quite natural, again assumed the bluish-green tinge, and it continued so for a week, when it disappeared, and the natural appearance of laudable pus was assumed. Cicatrisation was soon after this completed, and she was discharged in very fair health.

There was no reason to believe that the coloration was caused by any external application, for the greatest care was taken to prevent any deception.

I would incidentally allude to the benefit that may be derived from the internal administration of small doses—twenty to thirty drops—of ol. terebinth., given at intervals of four or six hours for some days, in the treatment of chronic ulcerations of an indolent character. I have for many years been in the habit of prescribing it in such cases, having first seen it used by the late Dr. Gilbert King, Inspector-General of Hospitals R.N., in the Royal Naval Hospital at Bermuda, so long ago as 1844. The effect on the capillary circulation is most marked, and I have frequently seen it succeed in promoting healthy granulation in most obstinate cases of chronic ulceration. To

prevent strangury, it may be advantageously combined with nitric ether, and occasionally with tinct. opii. In this case the colouring appeared for the first time just after the turpentine was administered, but after a long interval of absence it returned, when that remedy had been discontinued. I do not attribute the coloration to the turpentine, for I have no recollection of ever observing it on any former occasion to follow the use of that drug.

SURGERY IN INDIA.

By A. S. G. JAYAKAR, M.R.C.S.E., etc., etc.

Scrofulous Ulceration of the Palate—Faradisation—Recovery.
M., a scrofulous-looking young man, aged about 30, was admitted into Hutteesingh's Hospital, Ahmedabad, on June 24, 1870, with a perforating ulcer of the soft palate. The hole was situated a quarter of an inch from the uvula, more to the right side, and was (on his admission) about the size of a threepenny-piece. The disease commenced a few months ago, in inflammation; an abscess subsequently followed, which, having burst, gave rise to ulceration and, lastly, to perforation. He denied having ever had syphilis, but admitted having suffered from suppurating buboes about five years ago; never had any symptoms of constitutional syphilis. His voice was mostly nasal, as might be expected under the circumstances. The patient having had a distinct appearance of one suffering from scrofulous diathesis, he was ordered to take cod-liver oil and iron and, locally, astringent gargle.

On July 20, the inflammatory signs about the ulcer having greatly subsided, faradisation was ordered to be applied to the walls of the perforation with a wire every other day.

By September 5, the hole was reduced to one-fourth its original size, the walls showing a great tendency to contract. Glycerine of tannin was also occasionally applied, and it seemed to add to the efficacy of electricity.

He left the Hospital without permission on September 17, the hole being at the time reduced to a size much smaller than that of a pin's head, and his constitution greatly improved. A few more electric shocks, it was hoped, would have completed the cure.

Remarks.—Was this ulceration scrofulous or syphilitic? From the evidence before us, we cannot but presume that the disease was of a scrofulous nature. The history of the case, the absence of any other symptoms of constitutional syphilis, the constitutional diathesis of the patient, and, lastly, the beneficial effects of the treatment adopted, all strongly tend to the belief that the case was one of scrofula, although it must be admitted that scrofula is rarely known to attack the palate alone. The beneficial effect of faradisation is a point of great interest in the above case.

Local Anæsthesia of the Foot from Fracture of the Tibia—Hypodermic Injections of Strychnia—Recovery.

J. W., an anæmic-looking man, aged about 30, was admitted into Hutteesingh's Hospital, Ahmedabad, on February 22, 1871, with necrosis of the left great-toe. The toe was very much swollen and œdematous, and so was also the left foot. The nail of the toe was entirely destroyed, and it was turned downwards. Complained of anæsthesia all over the affected foot, both on its dorsal and plantar surfaces. In walking, which he could not very well do without the aid of a stick, he felt the foot as a dead heavy weight hanging. Patient traced the anæsthesia to a fracture of the left tibia, from which he suffered ten months before his admission, which was evidently simple. The necrosis of the toe was the result of an injury caused by a shoe a few days previous to admission. The treatment consisted in the application of carbolic poultices and the subsequent removal of the necrosed bone about the end of February, since when the toe gradually improved in appearance, and assumed its natural shape.

On March 16, $\frac{1}{2}$ th of a grain of strychnia was injected under the skin, on the dorsal aspect of the foot, for the anæsthesia.

On the 17th the patient felt a great deal better, sensation having returned in the last three toes, and also in the skin of the dorsum, the plantar surface being still numb and heavy.

On March 20 the injection was repeated, and by the 22nd sensation was restored also in the plantar surface and the remaining toes, the foot becoming quite light.

From this date the patient went on rapidly improving, and he was discharged completely cured on April 18, being at the time able to walk and run about without the aid of a stick.

Remarks.—The cause of anæsthesia was evidently in this case

the fracture of the tibia; the broken ends of the bone pressing upon the tibial nerves had caused the action of the peripheral nerves to be suspended for the time being. Was that action restored by the hypodermic injections of strychnia? Undoubtedly it was; but in what physiological manner we cannot at present explain. Perhaps it did so by increasing the irritability of the nerves, as electricity might be supposed to do under similar circumstances. The rapid effects of the drug when administered hypodermically were more than evident in this case, and it deserves a fair trial in all cases of local paralysis or anaesthesia. I have at present a case of total amaurosis, dependent upon nervous exhaustion of the optic apparatus, under treatment, in which the hypodermic injections of strychnia have so far rendered the progress of the case very satisfactory; but, as the case is not yet completed, I must defer its publication to some future time.

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

OPENING OF ST. THOMAS'S HOSPITAL.

FIRST OPERATION.—LATERAL LITHOTOMY BY MR. CROFT.

On Saturday, the 9th, at two o'clock, Mr. Croft performed the first operation in the new operating-theatre of this Hospital.

Lateral lithotomy was performed on a young man of light complexion and pale aspect. Mr. Croft stated that his patient was 26 years of age, and that he began six months ago to complain of frequent micturition, and pain after urination. These symptoms had been more severe lately. On sounding with the lithotrite, the stone appeared to measure about an inch and three-eighths in diameter. By careful examination with a sound the concretion was felt to be rough and tuberculated. The same sounding led to the impression at first that there might be a second stone; but the probability that the calculus consisted of oxalate of lime was inconsistent with the presence of a second formation. Mr. Croft followed the plan of operation inaugurated so successfully at old St. Thomas's Hospital by Cheselden, in the early part of last century. The stone proved to be large, and of the mulberry-like variety. It was slowly and most carefully extracted. The circumference measured five inches and one-eighth, the long diameter being one inch and seven-tenths, the short one an inch and four-tenths. Mr. Croft remarked that it was larger than he had expected, and supposed that in measuring with the lithotrite the stone had been caught somewhere below its equator. The man is going on very well, and there is a good prospect of his making a rapid recovery. Up to the present date everything has gone well with him.

UNIVERSITY COLLEGE HOSPITAL.

At the present time there are several cases in Mr. Marshall's wards (which are now under the charge of Mr. B. Hill) in which the antiseptic treatment of Mr. Lister is being carried out to the fullest extent, and with what advantage some of the cases leave not the slightest doubt.

There is a case of morbus coxae which was admitted when the disease was in its third stage, and for which excision of the head of the femur was performed. The wound was treated on ordinary principles without the antiseptic element, and in a short time profuse suppuration occurred. After a short time pus formed in the knee-joint of the same limb, and this was opened under Lister's plan. In a few weeks the knee-joint had quite recovered, and now the patella is freely movable upon the front of the joint, whereas the child is still prostrated by the abundant discharge from the hip-joint.

Some cases of psoas abscess are also under treatment, which have been opened, and bear good testimony to the advantages of the carbolic dressings. One case is complicated with a lumbar abscess, and on admission very foul discharge was escaping from the opening in the back. A solution of chloride of zinc was syringed into the wound and passed out through the opening in the groin; afterwards the carbolic gauze was used. The opening in the groin has now almost ceased to discharge, while the matter from the lumbar opening is kept

quite inoffensive, and the child has vastly gained in strength and flesh.

Mr. Berkeley Hill also showed us an interesting and somewhat rare case—the absence of the shaft of the fibula in a child between 3 and 4 years old. The two extremities were present, and each was about an inch in length, but no trace of the shaft of the bone existed. The ill-effects of this want were shown in the flattening and eversion of the foot, so that on standing and walking the whole weight was borne on the inner edge of the foot. Mr. Hill pointed out to those around him that there was no absence of the cuboid bone or other portions of the outer side of the foot in this, as had been noticed in a case of absence of the fibula, recorded by Dr. Humphrey in his work on the skeleton.

LONDON HOSPITAL.

STRANGULATED UMBILICAL HERNIA.

(Under the care of Mr. MAUNDER.)

[Reported by Dr. E. FLINT, House-Surgeon.]

W. S., a stout male, aged 52, a very free liver, was admitted on May 30 with a swelling at the umbilicus the size of a large orange. He complained so little that the true nature of the case might easily have been overlooked. When seen by the Surgeon a few hours later, the usual symptoms of strangulated hernia were so slight, and the patient was so determined to make the best of his case, that some fifteen or twenty minutes were expended before the whole truth—and especially a history of irritability of stomach, beginning with vomiting—were obtained. (The man finding that ingesta induced vomiting, had taken nothing for some forty-eight hours.) In the absence of urgent symptoms, Mr. Maunder determined to try the effect of a soporific, with ice to the tumour, and afterwards of a purgative (the patient stated that a few weeks previously a similar state of things, so far as he could judge, had been relieved by purgatives); and in the event of being unable to reduce the tumour, or procuring an alvine evacuation, after the lapse of six hours to explore it. Half a grain of morphia was injected subcutaneously at once, and two hours later one drop of croton oil was administered; but no change for the better occurred, and, taxis under chloroform having failed, the tumour was laid open. It was found to contain some sero-sanguineous fluid and a knuckle of highly congested small intestine, partially adherent by recent lymph. The ring, which embraced the bowel very tightly, was nicked, and the latter having been reduced, the edges of the former were brought together with a wire suture, both to prevent a further protrusion of bowel and also gravitation of secretions. The patient recovered.

Besides other remarks upon the case, Mr. Maunder suggested that freedom from vomiting was due to abstinence; and the total absence of anxiety of countenance resulted from the absence of vomiting—circumstances to be borne in mind when called to a case of suspected strangulation. He also warned the class against the danger of administering opium in cases of suspected strangulated hernia, except under one condition. Opium often makes a patient so comfortable, allays pain and vomiting, that both he and his Medical attendant may be thrown off their guard. A full dose of opium or its equivalent may be administered provided the Surgeon have determined to operate if a satisfactory change shall not have taken place in the physical characters of the tumour after the lapse of a specified short time. Mr. Maunder has operated on three cases of umbilical hernia; one died, two recovered.

UNDER the new Vaccination Act, a penalty not exceeding 10s. can be imposed for preventing a public vaccinator from taking lymph from any child.

STATISTICS OF THE MEDICAL PROFESSION IN THE UNITED STATES.—Dr. Toner, of Washington, publishes the results of the attempt made by the American Medical Association to ascertain the number of Medical Practitioners in the United States. It comprises all Physicians "who have paid the special internal revenue tax of ten dollars on their Profession for the year ending April, 1871. Arranged according to the system or theory practised, the numbers are as follow:—Regular Physicians, 39,070; homœopathic do., 2961; hydro-pathic do., 133; eclectic do., 2860; miscellaneous and unknown, 4774; total, 49,798. Estimating the population of the United States in round numbers at 39,000,000, we have one regular Physician to every 1000."—*Boston Med. and Surg. Journ.*, July 6.

SATURDAY, SEPTEMBER 16, 1871.

MEDICAL EXAMINATION OF WOMEN.

"It is of the utmost moment," as we lately remarked, that Medical Practitioners "should be acquainted with the law on the subject of examinations, particularly of women." The question we then also asked was, "Has anyone the power to order an examination of a woman suspected of giving birth to a child, and of concealing the fact, the child being found dead?" The simple answer appears to be—No one, not even the Lord Chief Justice of England; although not only police inspectors (as in the instance we quoted of the Practitioner who was cast in damages of £200 for acting upon the simple authority of one), but ordinary constables, too often assume functions which no judge would dream of arrogating to himself.

The broad principle upon which the law of England is based is, that every accused is innocent until proved to be guilty; and further, that no amount of mere suspicion will justify a personal outrage—for however delicately an examination may be conducted, it amounts to an outrage in law if effected against the will of the individual, and without lawful authority.

Any evidence connecting an accused with an alleged crime must be obtained *dehors* where nothing but mere suspicion exists. If there is any real evidence, such a link may justify a further step; as, for instance, if there is good ground for believing, not merely for suspecting, that the proceeds of a robbery have been passed to a woman, her person may be searched by a female searcher. Even in this act a delicacy is observed by employing one of her own sex in the examination. But it must be borne in mind that the police authorities are clothed with peculiar powers, and are protected in the exercise of them if they have acted *bonâ fide*, and have used due discretion. They, however, have no power to delegate them, not even to a Medical man. The onus of proving a crime rests with the prosecution; and although, in one sense, the end may justify the means—*i.e.*, a conviction would of itself exonerate all engaged in the prosecution from civil consequences—yet an acquittal might, as in the case mentioned above, result in most disastrous consequences to those who, at least, were not surrounded with that halo of protection enjoyed by the police authorities. In point of fact, the law is the same for both sexes; and in the recent case of Boulton and Park the Lord Chief Justice strongly condemned the examination by a Medical man, although the divisional Surgeon to the force, of the persons of the defendants, upon the bare suspicion that they had been guilty of a felony; and his Lordship added, that even an order of a magistrate would have made no difference; the act was an act of aggression—of trespass—and unjustifiable.

"Taylor's Medical Jurisprudence," it should be observed, is no authority for any legal proposition. So far as Medical science can elucidate the principles of law, that work is most valuable; but as far as abstract principles of law are concerned, it is no acknowledged exponent, and especially when no legal authority is quoted in support of any general statement.

The only safeguard of the Medical Practitioner, when directed to examine the person of an accused, whether male or female, is to take a written assent from the accused to the course proposed, or else to decline the responsibility involved.

If this be said to be frustrating justice, that is no reason why the Medical man should be made the scapegoat of justice. Let the police act upon their own responsibility, if they will, but let not Medical men become their dupes. But of all functionaries, the coroner is perhaps the least justified in ordering a Medical examination of a woman suspected of having given birth to a child, and of concealing the fact—the child being found dead—inasmuch as the coroner's inquiry relates solely to the cause of death, and has nothing whatever to do with the crime of concealment of birth. The mere fact of a woman having been recently delivered of a child since found dead, and having concealed the birth of it, is no proof that she caused its death; and the fact of concealment is expressly forbidden by statute to be received as such proof. Under the 21st Jas. I., c. 27, the bare concealment was evidence of the murder, and the onus of proving the contrary lay upon the party accused, and accordingly this species of offence was formerly within the province of the coroner. But the duty of coroners was in this respect abrogated by 43 Geo. III., c. 58, secs. 4 and 5, and such a course of legislation has been confirmed by all subsequent Acts down to the present time. All that the examination of the woman's person could prove would be a recent delivery, and this of itself would have no necessary connexion with the cause of death, upon which alone is the coroner's jurisdiction founded.

Although an investigation before a magistrate is more comprehensive than that before a coroner, and may include an inquiry into the crime of concealment of birth as well as that of murder, yet the magistrate possesses no power to order an examination of a woman's person. The fact of her recent delivery must be proved from circumstantial evidence, unless she voluntarily submits to a Medical examination, or admits the fact, and thereby furnishes direct proof.

OVER-EDUCATION OR UNDER-EDUCATION—WHICH?

A WORD TO TEACHERS AND STUDENTS.

THERE is a well-known saying to this effect—"A little knowledge is a dangerous thing." That it is so arises chiefly from the fact that many people are prone to give themselves airs, and to presume on their knowledge, all-insufficient though it be. We fear there is an evil tendency to this in modern Medical education, for it would seem that scraps of any number of subjects are taught, but no one thoroughly. We are in danger of forgetting that we are not called upon to educate skilled chemists, expert experimental inquirers—men learned in all that does not relate immediately to their Professional duties. Let us but reflect for a moment. The period of Hospital study practically extends over three years—or, more exactly, twenty-four months. In this space of time the student is expected to make himself master of all that relates to the structure and functions of the human body in health, the changes induced by disease, and the modes of recognising and dealing with these morbid conditions. This is his preparation for the real work of life. And let it be remembered that it is human life he has to deal with, human suffering he is to be called upon to relieve—this is his work, and no other. He is not likely to be called on at a moment's notice to give the exact composition and derivation of methyl-ethyl-amylol-

phenyl-ammonium, but he may be called on to set a broken leg or a broken arm. He may not be capable of exhibiting to an admiring audience the effects of irritation on the nerve-supply of the submaxillary gland, but he may have to perform craniotomy. Now, the former kinds of knowledge are very admirable in their way, and it is good that somebody should be master of them, but do not let us torment the poor hard-working country Practitioner in his embryo days with what will be of not the slightest use to him.

Let us view the matter in another light. The great majority of men study Medicine with the view of earning their bread by its practice. Education to these men means the expenditure of a certain amount of capital, the consumption of a certain amount of time, and so much actual work—all this with a view to subsequent remuneration, perhaps of profit. Most men look forward to being able to lead the life of a gentleman, to bringing up a family respectably, and to making some provision for old age; and yet we question if the average Medical income all over England amounts to £400 a year—certainly in many instances it is much less. Wise men look to laying out their capital to the best advantage. It is surely not to that of the student to devote his time and money to what will never bring him in a farthing, whilst attention to these side-subjects, as well as to those which more strictly concern his future well-being, implies an additional expenditure of time, money, and labour, until—well, *le jeu ne vaut pas la chandelle*—the expenditure of capital is not recouped.

As is well known, we are very far from being advocates for imperfect education—quite the reverse—we desire to see the Medical education as perfect as possible; but we would have during the whole curriculum an eye kept on practical results. Let every department of science studied by the Medical student be taught, not as a pure, but as an applied science. The symmetry of the human frame is a fine thing, but it is more important to know where to pick up an artery, or how to counteract the dragging of a muscle; and so it is all very well to know how to separate a poison from the contents of a stomach, but much more to know how to treat aright a case of poisoning by antidote or otherwise. It is this trifling with high science which annoys and troubles us. Men are led away from that which is to fit them for being sound and wise Practitioners to that which, however admirable in itself, is not to be their calling in life.

But yet again we have seen what amount of time is usually consumed by the student at a school of Medicine; if his time is occupied one way it cannot be so in another—so that he is really prevented from acquiring that knowledge which will be so essential to him in after-life. We do not think that a man should be restricted to the wards and to the post-mortem room for his education; for although he may see many of the graver forms of disease there, he will not see the majority of those encountered in every-day practice. Nay, more, he is hardly likely to acquire there a complete knowledge of the principles he is to act upon when he meets with cases he has not before seen. There are certain Hospitals in London where the system of ward-work is carried out to the exclusion of almost everything else; but the result is not entirely satisfactory. The ex-student at such a Hospital will promptly tell you what to do in such and such a case; but if you ask his reasons, he can only tell you—"Oh! we always treat it thus at ———." Such men, as a rule, are greatly given to routine practice; they recognise a disease, and they promptly order what they have been accustomed to hear prescribed in such cases; but then, unfortunately, the last individual they think of under such circumstances is the patient—disease is to them the entity, not the individual.

We wish greatly to see something between the two extremes—between too much science and too little—and it seems to us that the best way of attaining this is to ask for the student, before he presents himself at the Hospital, as much pure

science as he will require, and thereafter to deal with scientific subjects merely as they apply to Medicine. Teachers are to blame in no small measure for the present condition of affairs. Each man is too apt to extol his office, to tell the student it is the most important of all. It does not, however, follow that he should neglect its duties, or make light of his post. Let him strive to relegate it to its proper place in a sound Medical education—subordinated duly to the great practical subjects—and the result will be a more perfect scheme of education than any to which we have yet attained. It is not by multiplying the "ologies" taught we shall succeed in this, neither by stripping them clean off our system, but by keeping a single eye on the aim and object of all Medical education—the making of good Practitioners. This should be our aim, and to it all our efforts should be directed.

THE WEEK.

TOPICS OF THE DAY.

It is gratifying to be informed that her Majesty's health and strength are improving, slowly as it may be. Her maladies are believed to have had their origin in fatigue and exhaustion, combined with extreme solicitude at the state and progress of political affairs. A sore throat, with considerable debility and malaise, has now been succeeded by an axillary abscess, which is probably a sign of the climax of the illness, and of incipient restoration to health. It is impossible to exaggerate the importance of the Queen's health and strength.

The deaths in London from diarrhoea, which in the week ending Saturday, September 2, declined to 353, last week fell to 293. Of these, 265 were of infants under 2 years of age, and 18 of persons aged 60 and upwards. The deaths referred to cholera and choleraic diarrhoea were 24 last week, 20 in the previous week. Of the 24 last week, 19 were cases of infants, 5 of adults. Of the adult cases, 2 of choleraic diarrhoea proved fatal in twenty-four hours, and one, which occurred in Berwick-street, Westminster, and was certified as cholera, in thirty hours.

Whilst London and Paris continue free from cholera, the disease is said not to have sensibly abated in parts of Germany and Russia. A Berlin telegram, dated September 11, quoting the St. Petersburg *Moniteur*, states that at Kieff, in Russia, there are 150 deaths from it daily. A telegram, dated Königsberg, September 7, informs us, however, that it is diminishing in the Baltic provinces. The Berlin correspondent of the *Times* had represented that cholera was at Coblenz. This, however, has been since denied. It is said, however, that dysentery, bequeathed by the Franco-German war, exists in Coblenz and the neighbourhood. Cardiff has had a narrow escape from the introduction of cholera. An American ship from Hamburg arrived in the Penwith Roads, off Cardiff, on the 11th inst. She left Hamburg on the 30th ult., and had lost four men from cholera. She was visited by the Custom-House authorities, and by Dr. Paine, the Medical Inspector of the port, and was placed immediately in quarantine. Cholera is still rife in Persia. In Tabreez the deaths had been 240 daily, but a letter dated August 11 stated that they had then fallen to 125.

On Wednesday Mr. Stansfeld received a deputation from the City Commissioners of Sewers on the subject of the inspection of shipping between London and Gravesend, and on the difficulties arising from the present condition of our sanitary laws in obtaining conjoint action of the several nuisance authorities having jurisdiction on the river. The deputation urged on Mr. Stansfeld that the Government ought to take this matter into their own hands, and not leave it to the local Board of Health. The Sanitary Acts, it seems, give the City authorities no power to impose rates to meet the expense of inspection beyond their jurisdiction. Mr. Stansfeld promised to give his attention to these points. We should have thought,

considering the nearness of cholera, that it was the duty of Mr. Stansfeld and his colleagues to have given their attention to them a month ago.

The conclusion of the inquiry into the causes of the catastrophe at Stowmarket is equivalent to a charge of manslaughter, if not of murder, against some person or persons unknown. The evidence proved that after the explosion impure gun-cotton was found in the Stowmarket factory; sulphuric acid was present in the gun-cotton—an impurity which would certainly lead to decomposition and explosion. The evidence proved pretty conclusively that the explosion depended upon the impurity of the gun-cotton, and the question then arose whether the impurity were the result of imperfect manufacture or of wilful adulteration. The jury, relying upon the tests to which the gun-cotton when manufactured is subjected by Government, and upon the scientific evidence of Professor Abel and others, which went to prove that pure gun-cotton is “a stable” explosive, came to the conclusion that the gun-cotton had been tampered with by the addition of sulphuric acid “by some person or persons unknown,” after it had passed the Government tests. The object of the adulteration is supposed to have been the discredit of the Stowmarket factory. If this theory be the correct one, the tragedy is another illustration of the danger to society accruing from the possession by criminals of the secrets of modern science. The jury added to their verdict that, from the evidence adduced, there appears to be no danger in the manufacture of gun-cotton in the wet process, but they are of opinion that the drying and storing of gun-cotton should not be allowed near a town. They also consider that gun-cotton works should be subject to constant Government inspection.

The condition of the water in the Parks is one of the “Topics of the Day.” The Serpentine, with its brand new gravel bottom, has degenerated into a stagnant and odoriferous pond half filled with slimy vegetable growths, and the lakes in Victoria-park and Battersea-park rival the waters of the Thames in their deposit of thick, black, offensive mud. “M.D.,” in a letter to the *Times* on the state of the Serpentine, suggests that the lake should be supplied by a six-inch pipe from the natural reservoirs in the chalk hills of Hertfordshire, or from an artesian well sunk in Kensington-gardens.

The accused person in the Brighton poisoning case—Miss Christiana Edmunds—has been committed to take her trial on a charge of murdering by poison a little boy named Barker, and of attempting to poison three other persons. The case is a very remarkable one, and presents questions of great medico-legal interest; but we reserve any commentary until after the trial.

Messrs. William Greaves, Albert E. Kynaston, and John Ackman, the three gentlemen who, having been on the Resident Medical Staff of the Hampstead Small-pox Hospital, have brought serious charges against its management, have written a letter to the *Times* in answer to one written by Mr. Wyatt, which was read before the Metropolitan Asylum District Board, wherein that gentleman brings counter-charges of a somewhat personal nature—such as indulgence in beer, irregularity of hours, and the possession of fighting dogs—charges which, if proved, as the three gentlemen urge, are quite irrelevant to the point at issue. The three Medical officers appeal to the records of the Committee to show that their conduct met with the approval of that body, and they ask for an investigation, conducted by a neutral party, “assisted by some eminent Medical authority, whose character for skill and impartiality may give weight to the decision with the public.”

The lamented death of Dr. Hyde Salter has created a vacancy in the Medical staff of Charing-cross Hospital. Dr. Silver, the Senior Assistant-Physician, becomes full Physician, and a vacancy for an Assistant-Physician will be officially declared at an early date.

THE AUTUMN MANŒUVRES.

NOTWITHSTANDING the severity of the weather and the very considerable exposure to which the troops employed in the various camps have been subjected, and the fatigue which they have undergone, the general health of the men has continued good. Cases of simple diarrhoea, generally of such a mild character as not to require actual admission into Hospital, have, as usual in autumn, been rather prevalent, both among the reserve forces in Aldershot and those actively engaged in the front. Casualties from accidental injuries have neither been numerous nor severe. Great attention having been directed to the early and proper treatment of blisters of the feet, and express instructions issued on the subject by Inspector-General Lawson, footsoreness—that great source of inefficiency among young soldiers—has been infrequent. The plan adopted is the one long known to sportsmen, of passing a worsted thread through the blistered part, cutting off the ends, and leaving the thread to act as a drainage-tube, and soaping foot and sock before putting on the boot. On suitable occasions, a certain number of men per company are caused to fall out and lie on the ground in imitation of wounded, so as to give the bearers of the Army Hospital Corps an opportunity of displaying their efficiency and skill. We believe they have not failed in any respect in the discharge of this and their other duties.

All serious cases of sickness are sent from the field-Hospitals for treatment in the stationary Hospitals. The sick of all arms of the service, including the Household Troops, the Militia, and Volunteers, are sent in the first instance to the field-Hospitals, and those who are likely to require prolonged treatment are sent to Aldershot.

Six sets of a new pattern of field companion, containing medicines, etc., on the valise principle, have been issued to certain regiments for trial, and a report will be sent in by the principal Medical officer as to their suitability for field use. Two hundred and fifty waterproof sheets, constructed with eyelet-holes, so as to be capable of conversion into a *tentes d'abris*, by joining two together, have also been issued for trial.

THAMES SHIPPING INSPECTION COMMITTEE.

A MEETING of the above Committee, called together by Dr. Buchanan, in view of a cholera epidemic, for the more efficient inspection of the shipping of the Thames, was held at Guildhall on September 11, at which representatives were present from most of the Boards or Vestries of districts abutting on the Thames. The chair was taken by G. S. Pedler, Esq., C.C. The Hon. Secretary (Dr. C. Meymott Tidy) stated that he had communicated the resolution of the Committee to the Admiralty, and that they were willing to lend the *Rhin* to the Committee as a Hospital ship for cholera patients in the event of its being required for that purpose. It would be possible to bring her down to Gravesend in about twelve hours. It was agreed to accept the *Rhin*, and the Committee empowered the Mayor of Gravesend to telegraph for the vessel to be sent immediately a case of cholera makes its appearance. The Admiralty requiring that the Committee should insure the *Rhin* against fire in the sum of £2500, a resolution was passed agreeing to these terms. Dr. Tidy reported that he had received a letter from the Secretary of the Metropolitan Asylum District Board to say that patients suffering from cholera for whom immediate provision must be made may be received on board the Hospital ship *Dreadnought*. A letter was read from the Vestry Clerk of Rotherhithe to say that the Vestry declined to name a representative to act on the Committee, inasmuch as they were of opinion that any expense incurred in the more thorough inspection of shipping on the river should be borne by the country at large and not by the riverside authorities only. It was reported to the Committee that as yet no case of cholera had made its appearance on the Thames. A discussion took

place respecting the appointment of a special Medical officer to carry out the inspection of shipping along the whole river and in the docks. It was agreed that such an appointment was most advisable, and that it be referred to the sub-Committee to further such an appointment and to report to the Committee at their next meeting. It has been determined, we believe, that Mr. Harry Leach, Senior Medical Officer of the Seaman's Hospital, Greenwich, should be requested to act as Medical adviser to the Committee. The meeting of the sub-Committee was fixed for next Monday.

THE INCREASE OF FEES AT THE MEDICAL SCHOOLS.

THE authorities of St. Bartholomew's wish us to state that the increase of fees at that School and Hospital is only in proportion to the increase both at Guy's and St. Thomas's—namely, 10 per cent.—and that for students who pass four years at the Hospital the fees at St. Bartholomew's only exceed the fees at Guy's and St. Thomas's by five shillings. If the payment be made in one sum the fees at St. Bartholomew's are exactly the same as at Guy's, St. Thomas's, and St. George's—namely, £105—and are only four or five pounds more than at King's and University Colleges. Payment by instalments at St. Bartholomew's entitles a student to a perpetual ticket. The fees at Guy's are £105 in one sum, or £110 in four yearly instalments of £40 the first year, £40 the second year, £20 the third, and £10 the fourth year. The increase of the fees is, of course, the result of the extra practical classes now required by the Examining Boards.

"PRELIMINARY MEDICAL EDUCATION AT PROVINCIAL HOSPITALS."

THIS is the title of a pamphlet by Mr. Swain, F.R.C.S., Surgeon to the Royal Albert Hospital, Devonport, and it deals with a question which we have long considered worthy of considerable attention. The question is fairly put by Mr. Swain himself: "Do Medical Students, at the present day, obtain that practical knowledge of their Profession which renders them fit and proper persons to be entrusted with the limbs and lives of her Majesty's subjects?" An answer is to be found in this pamphlet, and we are bound to confess that we consider it to be a fair and true one. In substance it amounts to this—that whilst our Students are crammed to repletion with all sorts of theoretical knowledge, the practical part of their Profession is grievously neglected. To supply this defect, Mr. Swain points out that "a great teaching power lies dormant in our provincial Hospitals," and he proceeds to point out, evidently from practical experience, how that power may be used to the advantage of youths about to embrace the Profession of Medicine. He proposes that after a youth has passed his Preliminary Examination, he should spend the first year of Professional study as the pupil of a Surgeon to a provincial Hospital. How that year is to be spent may be learned by reference to Mr. Swain's pamphlet. All we can say is, that we cordially endorse the plan of study which has been there laid down, and we can have no doubt that pupils so trained must be far better prepared to accept advanced theoretical teaching than are those who, as Mr. Swain puts it, "rush from the school to the dissecting-room." Looking, on the one hand, to the acknowledged lack of *practical* teaching, and to the great straits the schools are put to, to provide it, and, on the other hand, to the amount of practical work which is to be done in our provincial Hospitals, under the supervision of men, many of whom stand as ornaments to our Profession, we cannot but enforce the recommendation of the writer of this pamphlet, that students should spend the first year of their Professional study at a provincial Hospital. We commend this pamphlet to the consideration of all provincial Hospital Surgeons, and we trust that it may be the means of inciting them to exertions to obtain that share of teaching students to which we consider them justly entitled.

UNHEALTHY DWELLINGS IN GLASGOW.

EVERYONE is acquainted with the labours of Dr. Gairdner in attempting to remove one of the prominent causes of disease and death in Glasgow. Aided by the Town Council, much has been effected; but much still remains to be done. The changes which are being carried out involve great expense, but there seems no reason to doubt that the funds will be raised by the citizens of Glasgow. At a late conference held in that city on sanitary reform, etc., Dr. Gairdner read an important paper upon the construction of the dwelling-houses in the city of Glasgow. By the last Census, he said, the population of Glasgow as to acreage was more than double that of London and Edinburgh, three times that of Newcastle, and nearly eight times that of Leeds and Sheffield. In fact, there was only one place in the British Empire that exceeded Glasgow in density of population, and that was Liverpool, whose bad sanitary reputation was well known. He was not sure how far the operations of the City Improvements Trustees had affected the statement he was now to make. He knew a short time since it was true within the last few years that in some parts of Glasgow there were nearly 1000 persons living upon an acre of land. There was an entire absence of all those open spaces that were absolutely necessary for the proper accommodation of family life. Poor tenements in Scotland could only be described as warrens, where a large number of the passages were almost as dark as if they were underground; and where there was no individual superintendence to protect the rights and interests of the inhabitants. A high rate of mortality was the necessary consequence. Dr. Gairdner then estimated that, with half-a-million of inhabitants, Glasgow contained about 100,000 households. He did not mean families, because the household often included, besides the family, a great number of lodgers. He then estimated that 25,000 of the households lived in houses of upwards of £10 of rent, 25,000 in houses between £7 and £10, 25,000 in houses even less than £7, and 25,000 in houses below £4 10s. The whole of the lowest 25,000 were, in fact, living below the line even of decency. Then the second 25,000 must also be to a great extent living in houses below the sanitary scale of mere decency, because it was barely possible for a family of five, six, seven, or eight children to be brought up in a single apartment, especially in an apartment forming an individual part of one of those large warrens. There was, therefore, something like one-third of the population of Glasgow living in single apartments. These were the facts, as tested by the Census. The birth-rate in it was 40 or 42, while in London it was about 33 or 34, and in Liverpool about 38. Dr. Gairdner then said that until the style of residences was remedied, they could not reduce the death-rate of Glasgow to any appreciable extent. The above facts show, "trumpet-tongued," the amount and gravity of the evil to be overcome, and should stimulate all interested in the matter to fresh and renewed exertions to mitigate it.

CORONERS IN LANCASHIRE.

CONSIDERABLE dissatisfaction has long prevailed in Lancashire with respect to the performance of the coroners' duties and the salaries which these officers receive. The Financial Committee of the Lancashire Court of Quarter-Sessions have issued a report on the subject, which contains the following significant passage:—"An opinion is gaining ground that the existence of a well-organised and vigilant police and active magistrates, and the further appointment of a public prosecutor, ought to render the office of coroner unnecessary, and that a great pecuniary saving, without disadvantage to the community, would be effected by its abolition." It appears that the salaries now paid to county coroners in Lancashire amount annually to £3325. Looking at the very unsatisfactory manner in which inquests, as a general rule, are held, the opinion of the magistrates in Lancashire will doubtless be endorsed by the country at large.

FATAL SALIVATION FROM BICHLORIDE OF MERCURY.

ONE of those unfortunate cases which occasionally occur even in the best-regulated practices, has just taken place in the neighbourhood of Chippenham. It appears from evidence adduced at the inquest that the following are the facts of the case referred to:—The daughter of Mr. R. N. Fowler, M.P., of Elm Grove, Chippenham, by name Harriet Maria, and aged 9 years, was taken, on Monday, August 21, to Dr. Meeres, of Melksham, to have her head examined. He said she had ring-worm, and prescribed some simple lotion and gave her some medicine. On the following Wednesday Dr. Meeres called, and ordered the head to be shaved, which was done the following day; the lotion and medicine were continued. On Monday morning, the 28th, Dr. Meeres again called, and directed the child's head to be washed, and that she should be brought to his house in the afternoon, when he would apply a lotion which would eradicate the disease at once. The child was accordingly taken, and the lotion was applied to the head by means of a small brush. The application gave the child no pain at the time, and she was taken home in an open dogcart. During the journey the child suffered great pain, which continued after she reached home. Cold water and cold cream were applied until Dr. Meeres saw her again the same evening. So far this is the statement of the nurse. The following letter from Dr. Meeres gives a full account of the case. The straightforward and candid narration will commend itself to the reader:—

“An account has been published in the London and provincial papers of an inquest held on the late Miss Harriet Fowler, whose ‘death,’ the verdict of the coroner’s jury states, ‘was caused by poison from the application of a very strong preparation of bichloride of mercury made to the head and neck by Dr. Meeres;’ and the verdict adds ‘that Dr. Meeres is very greatly to be blamed for having made the application.’ I should be glad to have the opportunity, through your columns, of laying the facts of this very melancholy case briefly before the Profession.

“The child was between 9 and 10 years of age, of a clear complexion, and stoutly built. On August 21 she was brought to me with ringworm of the head (*Tinea tonsurans*). She had also a few spots of *Tinea circinata* about the face. For the latter no local treatment was used. I prescribed steel wine and a lotion of carbolic acid, glycerine and water, and directed that the head should be shaved. This comprises the whole of the treatment for the first week.

“August 28.—The disease seemed to me to be spreading, and I proposed, as a speedy cure, the application of bichloride of mercury, as recommended by Dr. Tilbury Fox. And here let me add that I had on several previous occasions had recourse to the mercurial caustic with success. With a small camel’s-hair brush I applied the solution to each of the patches. In making the application a line of solution accidentally ran in the sulcus behind the left ear. No pain whatever was felt while the child remained in my room.

“Monday Evening.—There had been considerable pain; the painted surfaces were blistered, including the line behind the ear, and the subjacent scalp was tumid. There was sharp diarrhoea and sickness. The vomited matter consisted of pieces of greengage or apricot. Water dressing applied to the head, and no medicine given.

“Tuesday Morning.—The child had passed a restless night, and seemed very prostrate. The bowels had been relaxed, and everything except cold water induced sickness.

“Tuesday Evening.—Mr. Gore saw the patient with me. There were patches of blister on the head. The face had a puffy look, and the eyelids were œdematous. The gums were found to be swollen, and the saliva was running from the mouth. We both saw only too plainly that salivation was coming on.

“Wednesday Morning.—The patient took very little indeed in the way of nourishment, and was very prostrate. The parotid and submaxillary glands were considerably swollen, and saliva ran from the mouth. There was still tendency to sickness and diarrhoea. Pain was complained of in opening the mouth. The blisters had subsided.

“Wednesday Evening.—Further enlargement of the parotid and submaxillary glands. To allay restlessness and procure sleep, ten minims of liq. morphiae acet. were given, and direc-

tions left that the dose should be repeated in three or four hours if sleep was not induced.

“Thursday Morning.—The second dose of morphia had been given, and the patient had passed a quiet night. No further swelling of the face, and no diarrhoea or sickness. The patient was rather drowsy, as if still under the influence of the morphia. I requested that some coffee should be given at once, and the nourishment pressed as much as possible through the day.

“Thursday Evening.—Patient quiet and disposed to be drowsy; had taken some essence of meat, brandy-and-water, and milk. The swelling about the jaws seemed slightly receding. On the whole, I considered the patient better.

“Friday Morning.—The patient got out of bed unassisted and went to the night-stool; she remained out some minutes. In getting into her bed she fainted, and, although assistance was immediately at hand, she did not rally.

“No mercurial medicine was given by me or anyone else throughout the treatment. Throughout the illness there had been no delirium or convulsive movement, and not the least tendency to drowsiness till after the morphia had been given, and then not more drowsiness than was fairly attributable to the drug. It seems to be indisputable that salivation was induced by one single application of the alcoholic solution of mercury, and that the patient was, in fact, poisoned by the mineral.

“This very sad case, I need hardly say, has caused me the deepest sorrow—a sorrow that will never be altogether effaced. The practice of the Profession is always attended with anxiety and uncertainty, but a calamity like the present is enough to crush a man in his work.”

The lotion applied was from a formula of Dr. Tilbury Fox—eighty grains of bichloride of mercury to an ounce of alcohol. Taking all the facts of the case into consideration, we cannot think any blame is attributable to Dr. Meeres. The application was one which has been used, we believe, by Dr. Tilbury Fox in very many instances; and this, as far as we know, is the first in which it has produced any outward symptoms. The case is altogether an exceptional one; and whilst all must regret its melancholy termination, it would be as unjust as ungenerous to attribute that termination to any want of care or skill on the part of Dr. Meeres. At the same time, every right-minded man must sympathise with him and with the parents of the child under the painful circumstances in which they are placed.

A MEDICAL CLERGYMAN.

By the last mail from the West Indies, we find that one of our brethren has been admitted by the Lord Bishop of Jamaica to holy orders. The gentleman in question is Dr. Croskerry, a Dublin Surgeon of 1856. He was formerly in the Royal Navy, but, having resigned his commission, settled as a Medical Practitioner in Jamaica. He is one of the Government Medical Officers in that island, and has been a frequent contributor to the various Medical journals. He was editor of the *West Indian Quarterly Magazine*. It is understood that Dr. Croskerry has no intention whatever of abandoning his Profession. He will be simply a Medical Practitioner in holy orders, doing what good he can for the benefit of the Church, as far as his public and private duties will admit, but taking no cure in it, and no emolument whatever from it.

SMALL-POX IN HACKNEY.

In the month of December last the Guardians of the Hackney Union devoted a house to the treatment of small-pox patients, and subsequently two other houses were occupied for the same purpose. The whole of the patients in these three houses were placed under the care of Dr. G. C. Millar, the Medical officer of the workhouse, with more satisfactory results than could have been expected from the use of private houses as small-pox Hospitals. There have been 200 cases under treatment, and at no time less than 35. The period of detention has been from six to eight weeks, and the death-rate about 11 per cent. For his extra services the guardians have voted Dr. Millar a sum of 100 guineas, and the payment has been assented to by the Local Government Board.

SMALL-POX AT MALTA.

WE are informed that the introduction of this disease into Malta has been clearly traced to the arrival at the island, on September 26, 1870, of an English vessel named the *Fiona*, from Rouen, where the disease was prevalent, having on board an unvaccinated sailor suffering from the disease, who was sent to the Civil Hospital at Malta, and died there on October 1. On October 6 an Italian vessel imported another unvaccinated man suffering from small-pox, who died shortly after being landed and sent to the Civil Hospital. The seed thus imported soon bore fruit. A Greek sailor, a patient in the Civil Hospital, convalescent from diphtheria, on whom no marks of vaccination were observed, was soon afterwards attacked; then a nurse in the Hospital, and several other persons connected with the establishment, became affected. For so far the disease was limited, but within a short period a villager, who had been a patient in the Hospital for some other disease, and had been discharged to his home, was attacked, and the cases among the overcrowded, filthy, badly nourished (and for the most part unvaccinated) native population of the island soon became very numerous, and were attended by great mortality. The insanitary condition of Maltese villages, and the habits of the poorer classes, render them an easy prey to epidemics; and the annual religious celebrations, which commenced about the same time as the small-pox was becoming general, exerted a powerful influence in extending the disease among all classes, in consequence of the constant thronging into the various churches.

The troops, in consequence of their better sanitary condition, and attention to vaccination, enjoyed a comparative immunity; but even among them eighty-two cases and thirteen deaths occurred, those regiments suffering most which were quartered nearest to the civil population, and came most frequently into contact with them in drinking-shops and other places of low character. In one regiment, the 1st Battalion of the 24th, which occupied a position capable of complete isolation, no case of small-pox occurred. The fatal cases among the troops were in many instances of the hæmorrhagic form, in men of dissipated and irregular habits. It is remarkable that of the soldiers who died, one presented distinct and another doubtful marks of previous small-pox; ten presented good, and three doubtful marks of vaccination. Of the eighty-two attacked by the disease, seventy-four presented good marks of vaccination, five none, and three doubtful. Of those who recovered, none bore marks of previous small-pox.

THE CHOLERA AT SECUNDERABAD.

THE outbreak of cholera among the 18th Hussars at Secunderabad, in May last, was remarkable for the suddenness with which it appeared and disappeared, for the intensity of its nature while it lasted, and for the almost complete limitation of its attack to one community. It was only on the evening of the 24th May, that information was received of a few cases of cholera having occurred among natives in the cantonments, and on the Masulipatam-road. Between 3 and 4 a.m., on the morning of the 25th, three cases occurred among the 18th Hussars; these were rapidly followed by others, and within twenty-four hours thirty-four men and one child had been admitted into Hospital, and within twenty-six hours nine men had died. The utmost promptitude was displayed in removing the regiment from cantonments, and early on the morning of the 26th May the whole regiment was on the march to Nagarum, about nine miles to the north-east of Secunderabad. But the disease still clung to it; twenty-four men, three women, and four children, were attacked, and seven men, one woman, and one child died. The movement was then continued to Cherala, three miles further in a north-easterly direction, but without getting rid of the foe. Thirteen men, two women, and three children were attacked, with fatal results to six men, one woman, and one child. A further movement of

about four or five miles was then made to Keesara, and the disease abated; only one fresh case occurred, the patient being a child who died; and one man attacked at Cherala also died. On the 3rd of June, nine days from the occurrence of the first cases, the last case, and on the 4th of June the last death, occurred. On the 18th of June, the regiment being then encamped at Yadagarpully, was declared quite free from cholera. On the 20th it marched to Moul Ali, an extensive plateau, five miles north-east of Secunderabad, and on 23rd June returned to barracks in Secunderabad. During the absence of the regiment the barracks had been thoroughly cleansed and lime-washed, and all remediable sanitary defects rectified. During the month spent under canvas, there was a remarkable immunity from other diseases. Only one death from sunstroke occurred in camp; fever and dysentery were almost unknown; and the general health and appearance of the men were strikingly improved. The total number of cases of cholera was eighty-five, of which thirty-five occurred in Secunderabad, and fifty in the various camps. The deaths at Secunderabad were twenty, and in the camps nineteen. The proportion of deaths to cases was 45.88 per cent.

A thorough investigation and analysis of the circumstances of this limited but very severe outbreak of cholera, especially with respect to the question of the water used by the individuals who suffered from the disease, as well as by those who escaped, would be likely to yield valuable results. The fact of the virulence of the disease expending itself within three or four days, and entirely disappearing in ten days, appears to indicate the possibility of its victims having all, within a certain limited period, been subjected to the same morbid influences, the further extension of which was prevented by the prompt removal of the regiment from cantonments and the adoption of vigorous sanitary measures. Mr. C. Macnamara's theory of the communicability of cholera by water containing cholera excreta, only during the vibronic stage of decomposition—which, according to Mr. Macnamara, in a dilute solution lasts about three days—might meet with an affirmative illustration in such an investigation as we have suggested. In many points the resemblance between the remarkable instance of an outbreak of cholera among a limited community who had used water contaminated by cholera excreta—mentioned by Mr. Macnamara in his work on Cholera, p. 196, and frequently alluded to in other portions of the same work—and the recent epidemic among the 18th Hussars is very striking; but the completeness of the analogy could only be established or disproved by a searching investigation on the spot, and almost at the time of the occurrence of the outbreak.

SANITARY CONDITION OF DUBLIN.

MR. BENSON BAKER's recent visit to Ireland, to investigate the curative and hygienic system in operation, has given rise to a lengthened and instructive correspondence between that gentleman and Drs. Grimshaw and Mapother as to the sanitary condition of Dublin. The correspondence appears in *Saunders's News-Letter*. Of course there are discrepancies of opinion and differences of statements as to "matters of fact"; but all the writers agree that the sanitary condition of the City of Dublin is not so good as it ought to be, and as it might be made. It is asserted by Mr. Baker that there has been much negligence on the part of the Dublin Corporation, as represented in the responsible acts of their Committee of Health. The main result of the correspondence, however, which is too bulky to give even an abstract of, is the evidence it affords of the formidable obstacles which beset any attempts to introduce improvements of a sanitary kind. The people of Dublin experience the same difficulties as we did in this country from the vast number of local jurisdictions which before the passing of the "Local Board of Health Act" existed. If the provisions of that Act were extended to Ireland, the results could not fail of being satisfactory.

EXHIBITION OF SANITARY APPLIANCES.

IMITATING the example of the Obstetrical Society, and that of Sir William Fergusson at the College of Surgeons, in collecting instruments and appliances for use in Obstetrics and Surgery, the Social Science Association have determined to have an exhibition of sanitary appliances at their annual congress, which is to be held at Leeds from October 4 to October 11. The exhibition is intended to bring under the notice of Officers of Health, and others, the latest appliances of science having for their object the improvement of the public health.

HEALTH OF PARIS.

PARIS, with respect to health, contrasts favourably at the present time with the corresponding period of last year. The mortality in the week ending Saturday last rose to 943. Of these 42 were cases of dysentery, and 39 of typhoid fever. Dr. Decaisne reports that the latter disease is considerably increasing, not only in Paris, but in the departments, where it prevails in an epidemic form. There have been 40 deaths from cholera, 87 from diarrhoea, and 2 from cholera.

THE FORTHCOMING "MEDICAL DIRECTORY."

THE editors of the "Medical Directory" announce in our advertising columns that "no qualifications will be inserted in the forthcoming edition of the 'Medical Directory' which cannot be registered under the Medical Act." The editors find that the returns of the past few weeks show a considerable increase of non-registrable foreign degrees obtained without residence, and conferring no right to practise. They have wisely, we think, determined not to insert them. Actual registration is not a condition for insertion in the "Directory," but potential registration is.

DEATH UNDER THE INFLUENCE OF AN ANÆSTHETIC.

A RECENT number of the *Oxford Chronicle* reports a fatal case at Oxford, in the Radcliffe Infirmary. The patient, a married woman, 44 years of age, was about to undergo an operation for cancer of the breast. Bichloride of methylene was administered by the Dispenser of the institution in the presence of the House-Surgeon and one of the Surgeons, on a flannel bag. After two or three convulsive gasps the patient expired. The quantity administered was small. Artificial respiration was practised, as were other means of restoration, but without success.

THE SUEZ MILITARY HOSPITAL.

WE understand that in case of the experiment about to be tried during the ensuing season, of conveying troops to and from India entirely through the Suez canal, proving successful, it is the intention of the India Office no longer to employ the Hospital, established at considerable expense five or six years ago, at Suez, for the reception and treatment of men unfit to undertake the overland transit by rail. The military and Medical staff connected with the Hospital will, therefore, probably be withdrawn in October, 1872.

THE LAST SCIENTIFIC HOAX.

OUR contemporary, *The Philadelphia Medical Times*, has recently admitted into its pages a very marvellous paper on "Microscopic Test-Objects," by a Dr. Neulenz, whose very name might have excited the editor's suspicions. It extends over a page and a half, and is undoubtedly written with great cleverness. The following brief extract may be taken as a fair sample of the whole:—

"Having constructed a one-seventieth immersion objective on a new principle, having 191° aperture—the immersion liquid being fluoric acid—and, for illumination, having invented a new eccentric parallelopiped, to be used with fluorescent rays exclusively, some remarkable results have been obtained. I

take great pleasure in stating that, with regard to test-objects, all previous observers have been totally wrong in every particular, and that *Pleurosigma angulatum* is, in the first place, constructed on the plan of the Nicholson pavement; and, in the second place, that it is not a pleurosigma at all. The most certain test-object is the *Neulensia difficilissima*, a very rare and remarkable diatom, in which my one-seventieth with the parallelopiped shows four kinds of beads and six sets of cross-lines, one of which set contains 147,229,073 lines to the inch: hence, by the well-known formula of Brewster, $\frac{dx}{du} = \sqrt{o \cdot x \cdot p \cdot y}$, it is impossible that the undulations of light should pass without being previously deflagrated, and therefore no other lens can possibly show these lines, nor is it probable that this lens would with any other observer. The immense superiority of this test to Nobert's plate is apparent."

FROM ABROAD.—EXPERIMENTS ON REFRIGERATION—CHOLERA PANICS—ALBUMINURIA IN VARIOLA.

IN a recent number of the *Centralblatt* (xxxiv.), Dr. Horvath, of Kieff, reports upon some interesting results which he has derived from his experiments on the Refrigeration of Warm-blooded Animals. 1. Refrigeration was carried to such a degree in a young dog, that the temperature in the rectum descended to 6·6°, 5·8°, and even to 4·8° C. (44° to 40° F.), and yet the animal, on the reapplication of heat, revived, being then apparently in much the same condition as before the refrigeration. As far as Dr. Horvath is aware, no one had hitherto seen a warm-blooded animal restored to life after such a reduction of temperature. 2. In other experiments he has reduced the temperature (in the rectum) of a rabbit to 7° C. (45° F.), and of a cat to 9·5° C. (49° F.), and found that neither the action of the heart or the respiratory movements could be perceived. Nor did even the strongest electrical current exert the slightest effect either upon the muscles of the skeleton or directly upon exposed nerves. On the restoration of warmth, by pouring warm water over these animals, which had remained for an hour in a state of apparent death, spontaneous contractions of the heart, which had ceased for an hour, were observed. The electrical current, also, applied directly to the muscles, induced energetic contractions in the same muscles which, before the warmth was applied, were insensible to the strongest electrical action. 3. A third interesting and not less important fact is, that in an animal which was first refrigerated and then warmed, it was not possible to excite the action of the muscles of the skeleton by even the strongest electrical stimulus when applied to their nerves, while these same muscles, on the direct application of the current, contracted energetically. The fact that we can separate nervous and muscular energy from each other by this agency, which hitherto it has only been possible to do by the employment of curare, promises to be of good service in future researches concerning the physiology of the muscular and nervous system.

A writer in a recent number of the *Presse Médicale Belge* makes some very appropriate remarks upon the apparent determination of the newspapers in the dull season to get up a cholera panic. Every case, true or not, is watched for, recorded, exaggerated, and, when it has served its purpose, dismissed. To judge from what is passing, it would almost seem that every newspaper has become quite impatient at the unusually slow progress the cholera has made, in spite of so many pens anxious to record its progress. All this would be only foolish and of no consequence did it not tend to act mischievously on the public mind, and to generate among the masses a condition of panic so difficult to deal with and so mischievous in its predisposing influences. Persons under its influence neither eat nor sleep as they should, and are absorbed by their fear of the coming scourge; and such a state of mind is certainly no stranger to the ravages which the cholera usually causes on its first attacking a locality. There can be no doubt that fear invites the cholera, and prepares victims for it. Such panics

prevailed in a remarkable degree on the invasion of Brussels by the cholera in 1848 and 1866. While every sanitary precaution should be most assiduously put into force, care should at the same time be taken not to alarm the public mind by too demonstrative actions, and by the publication of exaggerated and sensational articles in the newspapers. The press has its proper function to fulfil in indicating to the different administrations the means most fitting to be adopted, and in reporting the results of the experience of other countries. Here is a wide field in which its energies can be usefully exerted, while the record of every supposed case as soon as it occurs only spreads terror. An instance of the mischief these reports may cause in a more material point of view has just occurred. A report having got into the newspapers that cholera had broken out in Antwerp, this soon made the tour of Europe, and the Italian Government at once ordered every ship coming from that port to be placed in quarantine; and yet not a case of cholera has as yet been seen in Belgium.

M. Cartaz read, at the Lyons Medical Society, an interesting paper on Albuminuria in Variola, which he terminated with the following conclusions:—1. Albuminuria is met with in confluent variola in about the proportion of one in five cases. 2. It may be—as is, indeed, usually the case—only transitory, and exercise no influence on the progress of the variola; or permanent, and attended with all the consequences inherent in Bright's disease. 3. Even when it is only a passing affection, it may in some cases give rise to serious accidents, as in the eclamptic forms of the disease, etc. 4. In the hæmorrhagic form of variola, albuminuria is of constant occurrence, whether this arise from a lesion of the kidney, from a mixture of blood, or from the two causes united.

M. Perroud, during the discussion which followed, observed that albuminuria may show itself either during the period of eruption or desquamation. In the first case it usually appears during the stage of desiccation, has nothing specific about it, and is probably a result of a nervous reflex action on the kidney, like albuminuria in erysipelas, or in burns, with which it may be classed. In the second case, albuminuria is specific, and truly variolic, recognising for its cause the action of the variolous virus on the kidney, as the pustule of variola results from the action of the virus on the skin. Like this, it is a variolic accident, but less precocious, belonging to the tertiary or visceral period of the disease, while the eruption belongs to the secondary or tegumentary period. In this respect, M. Perroud remarked that the natural history of variola may be compared with that of syphilis. Like this, it has its secondary period, characterised by multiple and successive exhibitions on the integuments (as the cutaneous rash, pustules, angina, conjunctivitis); its tertiary or visceral period, characterised by orchitis, nephritis, or pneumonia; and its intermediate period—deep-seated cutitis, abscess, and iritis. Finally, like syphilis, variola may be inoculated, and then it has its primary accident (the inoculating pustule); or it is developed by infection, and then, as in hereditary syphilis, it is devoid of primary accident. Change in the blood is only the remote cause of variolic albuminuria, the renal lesion being the proximate one. The lesion is not, for the most part, a deep-seated one, and the disease easily yields to general and local tonics, such as quinine, tannin, etc. M. Mayet considered a changed condition of the blood to be the most reasonable hypothesis for explaining the occurrence of the affection, both at an early and a late period of the variola. M. Soulier, on the other hand, regarded the hypothesis of renal lesion as the more preferable one; and, indeed, in an autopsy on a case of variola with albuminuria, he found the Brightian lesion of the kidney. If the albuminuria, indeed, depended on alteration of the blood, it would be more frequent and more fatal. One of the best means of treating this albuminuria is inunction by warm oil, and enveloping the body in a woollen covering. In this way abundant diaphoresis ensues.

ST. THOMAS'S HOSPITAL.

(From a Correspondent.)

ONE day last week St. Thomas's Hospital was quietly opened for the admission of patients; and, after allowing a few days for things to settle down, we took an opportunity of inspecting the arrangements intended for the benefit of the sick poor of London. We had heard rumours that all was not perfectly satisfactory in the new establishment, and that suggestions from those who might be supposed to know best had been consistently set on one side; but we were hardly prepared for the series of blunders we encountered. It was with something of a shock we listened to an appeal from the Treasurer of what was supposed to be one of the richest charities of London, to the outside public, for £22,000, to finish a building which had cost half a million—a sum which, however, without additional help from the public, would have remained useless to all; for bricks and mortar do not alone constitute a Hospital. It is true that out of the sum there had been secured a fine Treasurer's mansion, with a splendid banqueting-hall, together occupying nearly the whole of one pavilion; but these would be of little use to the sick. The heartrending appeal of the Treasurer, though listened to, was not responded to in such fashion as might have been desired by those who had spent their half million; so that now, although the wards are in a manner furnished, the furnishings are of the scantiest. The walls are unadorned, not even relieved with a bit of colour; but to make up for this the floors are of polished oak. It is true that sundry contrivances the uninitiated might take for night-stools, but which are disguised receptacles for clothes and provisions, are of plain deal, unpainted and unvarnished; but these need have nothing to do with propagating disease. Nay, the prime authorities seem enamoured of this dull uniformity; for we have heard outside of a gentleman collecting money from his friends for the purpose of making his ward a little less deadly-lively, but the proposed innovation has been received in a becoming manner, and such waste of money is likely to be promptly checked. Of course we needly hardly say that under such circumstances the ancient Hospital-fittings have been utilised to the utmost.

Up to a certain point, indeed, the expenditure has been lavish. The money represented by abundance of stone urns along the front of the building, which nobody cares to see, is considerable; but along the vast corridors we failed to see anything in the shape of a blind to a window. But again we have compensation. There are two magnificent operating-theatres, should there be at any time a schism in the Surgical staff of the Hospital; and one of these is furnished with three old stools and an elaborate operating-table. Hot water is brought in by the jugful—but there is a fine sun-burner!—true, there is a tap labelled "hot water," but there was none to be got from it.

With the admirable accommodation afforded to the Treasurer, one apt to come to rapid conclusions might have supposed that all the officials are correspondingly well housed; but this is by no means so. It is true the Apothecary has over a dozen rooms, which he is prepared to let out to students at a reasonable rate; but then the unfortunate Resident Accoucheur has been forgotten altogether, and certain of the resident Medical officers have only one room, to serve at once as a sitting- and bed-room. It is true there is a common room in which to take their meals, but no one is supposed to frequent it at other periods; and certainly its present aspect is not inviting. The Resident Assistant-Physician and the Resident Assistant-Surgeon have each been allotted two half-furnished rooms. It seems there is no space elsewhere; so that these gentlemen, if they desire to carry on any original researches, must do so in their bedrooms. Yet these, we should have con-

cluded from their titles, would be on the footing of the honorary officers. To foster habits of activity, and to check lounging, anything in the shape of an easy chair or couch, except at their own private expense, has been denied all residents; although one's experience points to the fact that such things are useful when a man is liable to be called to a ward at any minute, and it is impossible to go to bed.

To facilitate the working of the out-patient department, it is carried on at different parts of the building. A patient presents himself—let us say his case is diagnosed, as far as one can make out, or at all events its severity determined by a porter, and he is conveyed to one or other of some half-dozen rooms, according to the porter's judgment. If he is to be seen as an out-patient, or if he requires any medicine, he has next before him a pleasant walk outside the building, without any protection from the weather, for a distance corresponding to nearly half its length, and to wait again until attended to.

Again, to facilitate intercourse, electric bells have been plentifully dispersed throughout the building; but a code of signals will be necessary to make them useful. The simple speaking-tube exists not. Nay, we are not certain that there is any communication between the accident reception-room and that of the resident dresser, who is perched away near the roof, at a distance from his work.

But then, to compensate for all this, there is a private mortuary, constructed of finely-polished slate, and with appropriate curtains. Who it is intended for, or to what useful ends it exists—for there is another deadhouse convenient enough—we were unable to find out. Doubtless, however, it has a design beyond that of costing money, which might have been better expended elsewhere. Meanwhile, it exists; a fitting memorial of autocratic centralisation.

REPORT OF THE POOR-LAW BOARD.—IV.

(Continued from page 290.)

WITH a glance at the report of Mr. Farnall contained in the Appendix, our review of that portion of the Board's Report which relates to out-door Medical relief finishes. This Inspector bases his conclusions on statistics drawn from eleven places—Aylsham, Blofield, Depwade, East and West Flegg, Forehoe, Guiltcross, Loddon and Clavering, Ongar, Thetford, Witham, and Yarmouth. The tables which he gives show that, for the week ended Lady-day, 1870, there were in the above places 1969 pauper patients under the care of the several District Medical Officers, and that of those, 43·1 per cent. received food and stimulants on the recommendation of the Medical officers. It seems to be with Mr. Farnall, as with Mr. Cane, a grievance that he cannot report that all the Medical officers hold precisely the same views with regard to the number of pounds of meat and the number of ounces of wine requisite for their districts. Mr. Farnall admits that, taking the districts as a whole, none too much in the way of stimulants was ordered. Thus, "there are fifty-two District Medical Officers employed in the above eleven unions, and the tables show that, upon an average, they each had thirty-eight pauper patients during the week ended Lady-day, 1870, of whom an average of sixteen only were supplied with food and stimulants, and this in districts where, as I understand from the best authority, the wages of an agricultural labourer do not exceed 10s. per week." But he complains that "in the Aylsham Union Mr. J. W. Saunders, Medical Officer of the Fourth District, recommended food and stimulants to 5·5 per cent. of his pauper patients only, while Mr. R. K. Morton, Medical Officer of the Sixth District, recommended food and stimulants to all his pauper patients, which is at the rate of 94·5 per cent. in excess of Mr. Saunders's recommendations. Again, in relation to the practice of Medical officers in one union in recommending food and stimulants as compared with a similar practice of Medical officers in another union in the same county, I may instance the Great Yarmouth Union as compared with the Guiltcross Union. In the former union, food and stimulants are recom-

mended to 22·6 per cent. of the pauper patients only, while in the latter union 52·0 per cent. of the pauper patients receive food and stimulants; so that the recommendations in the latter union were 29·4 per cent. in excess of the former. It is, I believe, this diversity of practice on the part of District Medical Officers in the same union, and of one union as compared with another union, which produces a strong impression in the minds of many guardians that their Medical officers abuse the very valuable authority which is given them to recommend food and stimulants to their pauper patients."

But, although Mr. Farnall alludes to the "impression in the minds of many guardians" that Medical officers abuse their privilege, he does not, as does Mr. Cane, affirm the correctness of the impression. Nor does he say that the abuse arises because the Medical officers prefer to work their cures *via* "the butcher's shop," stocked by the guardians, rather than *via* "the Doctor's shop," stocked by the Medical officer. But if he does not accuse the Medical officer of this particular form of meanness—or, at least, refrains from finding him guilty—he lays to his charge another mode of wronging his patients and his employers. As we shall see presently, he charges him with not giving the best drugs. Mr. Farnall advises the Poor-law Board not to disturb existing rules, but suggests that "a remedy might be found which would meet the objections which many of the guardians entertain as to the proceedings of their Medical officers in ordering food and stimulants to some of their pauper patients, and that remedy consists, as it seems to me, in establishing dispensaries in every union, the guardians being legally bound to provide such dispensaries with competent dispensers, and sufficient medicines of the best quality. I am of opinion that these dispensaries would be beneficial both to the ratepayers and the poor, because the supply of cod-liver oil and quinine, and other expensive drugs, would be at the disposal of District Medical Officers for their pauper patients, and should, to a considerable extent, become whole-some substitutes for stimulants and meat, and also because *the sick poor, being supplied with the best medicines*" [which, impliedly, they are not now], "would have, as I believe, a better chance of a speedy recovery than they now obtain through the medium of medicines supplied at the cost of District Medical Officers, whose salaries are generally insufficient to enable them to administer expensive drugs to the sick poor under their care." On reconsideration, however, Mr. Farnall's bolt seems to have "missed the sparrow and killed the crow," since the question naturally arises—By whom are those salaries offered which are generally insufficient to enable the Medical officers "to administer expensive drugs to the sick poor"?

But if Mr. Farnall has failed, even with the aid of very elaborate statistics, to substantiate any very serious charge against the Medical officers as a class, he has wound up his report with some notes on the system in one of his sample unions, which seem to deserve special attention. He says—

"This union adopted what is termed the 'per case' system in administering out-door Medical relief, and the result of that system is shown in the Tables 'A' and 'B,' the first-named table giving the fact that upwards of 50 per cent. of the pauper patients are supplied with food and stimulants, whereas the average number thus supplied in the eleven unions is 43 per cent.; and Table 'B' gives the result that 2·1 per cent. of the population, in 1861, of that union were attended as pauper patients, whereas the average percentage of pauper patients on population in the eleven unions is only 1·1, and, no doubt, these results have led to the conclusion which is expressed in the clerk's letter to me, that the 'per case' system of out-door Medical relief is by no means approved by the present board of guardians; and I may add, for your information, that for the week ended April 9 last the percentage of pauperism on population in the Witham Union was 8·6, which very far exceeds the pauperism of England and Wales."

It will be seen from what we have quoted that Mr. Farnall gives an unqualified approval to the establishment of the dispensary system in the provinces, while Mr. Cane, as mentioned in our last, considers that system practicable, at all events in populous districts. We omitted to quote Mr. Peel's opinion on this point; it is to the following effect:—"It would be certainly practicable to establish dispensaries, not only in the large towns, but in the thinly populated and extensive rural unions. In the large towns, one or two central dispensaries would probably be sufficient; but in some of the large rural unions the Medical stations would necessarily, from the distances at which the population live asunder, require to be much more numerous."

These are the only Inspectors whose judgment appears to have been taken on the matter by Mr. Goschen during the

period embraced by the Report; but it is understood that, as a body, the Poor-law Inspectors are favourable to the adoption of the system. Although this, the final Report of the Poor-law Board, gives no assurance that that Board intended to secure for England and Wales an approximation to the mode of Medical relief which has been found to work so well in Ireland, we may confidently expect that the first Report of the Local Government Board will, while recording the success of the system in the metropolis—if there be such a success to record—announce its speedy extension to the provinces.

ENGLISH HOSPITAL AT METZ.

DECEMBER, 1870; JANUARY AND FEBRUARY, 1871.

(From a Correspondent.)

(Continued from page 262.)

A RATHER remarkable fact in the history of our Hospital was the absence of pyæmia; I do not think a case broke out amongst us, although some patients already pyæmic were sent to us. I cannot attribute this to an unusual amount of ventilation, or to anything peculiar in the quantity or kind of disinfectants used. Whether pyæmia is more prevalent in summer than in winter I do not know, but I cannot help thinking that the exceptionally intense cold which prevailed at the time prevented its development.

Before our taking the Hospital pyæmia had occurred; indeed, we found some cases there when we came in. The cold weather set in about that time, and no fresh cases occurred. The condition of the Hospital was such as is generally considered likely to develop an epidemic of pyæmia. It had been overcrowded for four months with men suffering from profusely suppurating wounds; the wounds had not been dressed sufficiently often or carefully, and there had been great want of attention to the sanitary condition of the wards. Earlier in the war, when the weather was warm, pyæmia was a frightful cause of mortality in many of the temporary Hospitals, showing itself within two or three weeks, or even less, after the establishment of the Hospitals. I am not aware if other military Hospitals were as free from it as we were during that cold weather. Several patients suffered from exhausting night-sweats, the result of long and profuse suppuration. Quinine with sulphuric acid, or with tincture of steel, improved their health and checked the sweating. The quinine was sometimes given in single doses of ten or fifteen grains, sometimes in doses of two or three grains four times a day. I think the repetition of small doses was more useful than the single large ones, though fifteen grains did not cause much headache or discomfort. I have already mentioned that we found a great proportion of our patients suffering from bedsores. This very troublesome complication did not, except in cases of great exhaustion, affect seriously the condition of the patients; air-cushions, and, in the more severe cases, air-beds, with simple dressing to the sores, served to cure them.

The most obstinate and fatal disease with which we had to deal was dysentery. The patients would appear to improve for several days together, leading us to hope that they were through the worst of it, only to relapse into an almost dying condition. These fluctuations occurred in nearly all our cases. The relapses were commonly due to the rations which were served out to the men, consisting often, among other things, of half-cooked peas and beans. At first we had not sufficient control over the diet, but afterwards managed to establish a system of special diet for such cases. Independently of the improper food, the disease was of a very chronic character, and difficult to cure.

Post-mortem examinations were made in many cases. The appearances were in nearly all alike. The intestinal mucous membrane from the anus to the ileo-cæcal valve was almost black, sloughing, and containing extravasated blood. Distinct ulcers were rarely discernible. The muscular and peritoneal coats were softened, the whole thickness of the gut being easily torn. The disease often extended three or four inches above the valve, but not more. As it extended upwards in the small intestine, it became gradually less intense, the colour of the mucous membrane becoming lighter, and its texture more natural, till, at a short distance above the valve, it assumed its normal appearance. No case of hepatic abscess was observed either during life or after death. The patients were treated first by chlorodyne or opium, with occasional doses of castor oil; no permanent relief followed this plan. Opium

allayed pain and gave sleep temporarily, but the disease was not influenced. The ipecacuanha treatment was then tried, and with fair success; doses of five to fifteen grains of the powder were given three or four times a day; it rarely caused vomiting, except at the first dose, sometimes not even then. The spasm and pain were in most cases relieved after a few doses, and the patients greatly improved. Sulphuric acid and opium, with occasional injections of sulphate of copper and opium, appeared to assist in completing the cure.

Among those points which have appeared to me of most interest in our work at Metz I will mention the use of a solution of sulphurous acid as a dressing for wounds; it was our general dressing for wounds in all stages, and was found by us most valuable. I am aware that it is not a new remedy, but I believe that it is by no means so generally used as it deserves to be. The preparation we used was a strong aqueous solution of the gas, of which about half an ounce may be mixed with a pint of water. With this lotion the wounds were first washed by means of an irrigator—that is, a metal can, to which is attached a gutta-percha tube and bone nozzle—the most simple, convenient, and complete way of washing wounds. The mode of dressing was the same as with any other lotion.

Sulphurous acid was used with good results in hospital gangrene, as I have already mentioned. It is also a valuable dressing for fresh wounds, as amputations; but I think its healing effects are most evident in large open sores, whether the direct result of wounds or the result of sloughing or phlegmonous erysipelas—such sores as ulcerate at one point of their circumference while they heal at another, often requiring months to heal, and sometimes exhausting the patient.

I may give one of our cases as an example of many:—A man, who had received a slight wound, had phlegmonous erysipelas of the thigh, leg, and foot. Incisions had been made from the upper part of the thigh down to the dorsum of the foot. We found him with immense indolent sores, the result of the disease. They were dressed first with carbolic water, carbolic oil, and other things, the sores healing at some points and extending in others. After a single dressing with sulphurous acid lotion, they resumed a better appearance; healing went on rapidly, and, when we left him, the man was as nearly as possible well. I have not heard that it was generally used in other military Hospitals. A French Surgeon told me that he had used it, but did not like it, because it healed wounds too rapidly. On inquiring further, I did not find that the rapidity of healing had led to bad results in his practice.

I think it probable that sulphurous acid would be useful in dressing the large granulating surfaces resulting from burns.

I may also mention our results in skin-grafting. We tried it in five cases. The first was a case of several superficial wounds of an indolent appearance: in this case the experiment was repeated several times, but no graft became attached. The second was a case of superficial wound about two inches in diameter, in the upper part of the thigh: the first attempt failed; the second succeeded, but the graft was so long before it began to increase that the sore healed almost independently of it. In the third case the patient had a sore, three inches long by one inch wide, on the back of the thigh. The sore was the remains of a much larger wound; it was healthy in appearance, discharging very little, but healing very slowly: one graft was put on this, which began to increase on the fifth day, and the sore rapidly skinned over. The fourth case resembled the third in character and in result. The fifth was a large ulcer, eight inches long by four wide, left by the separation of a slough: as soon as it began to assume a healthy appearance, a skin-graft as large as a fourpenny-bit was placed on it; the graft united, and, in about nine days, began to increase. In this case I have no doubt the healing of the wound was accelerated by the graft. With regard to our manner of grafting, we took up a small portion of skin with a pair of dissecting-forceps, and cut it off with a pair of scissors. This left a little wound, from which blood oozed slightly; the graft was nearly as large as a barleycorn, and of an oval shape. In the one case mentioned as the fifth a much larger graft was used, with the same result. The grafts were gently laid on the granulations, and secured by a piece of strapping; transparent gelatine strapping is clean and convenient, as the graft can be seen through it. No incision was made in the granulations. The strapping was generally taken off on the second day, sometimes on the third, and a fresh piece put on. By the second day the graft was usually firmly attached; after that it began to dwindle, sometimes disappearing altogether—sometimes beginning to increase on the fifth or sixth day, or

later. In our successful cases the wounds were all healthy, and there was not very profuse discharge—conditions which seem essential to success. Some of the grafts were taken from the patient to be grafted, some from other persons, with the same result.

After grafting, the wounds were dressed with water-dressing or olive oil. I do not think that grafting is of much service except in very large sores; in such cases half a dozen grafts might be put on the sore, and much time saved in the cure. Among our own cases there were very few that could not be cured as quickly by dressing with sulphurous acid lotion alone as with the help of grafts. Snipping off the morsel of skin for the graft is an almost painless operation.

(To be continued.)

REVIEWS.

A Treatise on Diseases of the Nervous System. By WILLIAM A. HAMMOND, M.D., Professor of Diseases of the Mind and Nervous System and of Clinical Medicine in the Bellevue Hospital Medical College, New York, &c. 8vo. Pp. xxv., 774. 1871. New York: D. Appleton and Co.

THIS is unquestionably the most complete treatise on the diseases to which it is devoted that has yet appeared in the English language; and its value is much increased by the fact that Dr. Hammond has mainly based it on his own experience and practice, which we need hardly remind our readers have been very extensive.

The volume commences with an introduction describing "The Instruments and Apparatus employed in the Diagnosis and Treatment of Diseases of the Nervous System;" and this is succeeded by five sections in which the respective diseases of (1) the brain, (2) the spinal cord, (3) the cerebro-spinal axis, (4) the nerve-cells, and (5) the peripheral nerves are considered.

The first of the diseases of the brain in our author's classification is, as might be expected, *cerebral congestion*, in its active and passive forms. Regarding active cerebral congestion in its first stage, he observes that a spontaneous cure is rare, and without proper Medical treatment the symptoms pass, sooner or later, into a more fully developed form—the apoplectic, the epileptic, or the maniacal. Out of 507 cases recorded in Dr. Hammond's note-book, the disease was arrested at the first stage in 478, but in not one of these was there an instance of spontaneous cure. The following is our author's description of the maniacal form of the second stage:—

"This variety, though not so common as either of the others, is yet not infrequent. It is characterised by an accession of mental derangement not materially different from that indicative of acute mania. The delirium is of a very active character, the eyes are suffused, the face is red, the head hot, the motility active, and the whole manner, character, disposition, and mental processes are changed. During the paroxysm the patient may commit some crime of violence, and it almost always happens that his combative proclivities are aroused. He may likewise attempt to injure himself.

"The attack may come on with great suddenness. In the case of a gentleman recently under my charge it was the result of eating a hearty meal in a great hurry at a railway station. A few minutes after his return to the train, he was attacked with furious delirium, during which he attempted to injure himself and all within his reach. He was seized and held, but continued, as far as he was able, to bite, scratch, and kick at those who were near him. The paroxysm lasted about two hours. He then fell into a heavy stupor, from which he did not arouse for two hours longer. For several days his mind was weak, and there was numbness in various parts of his body. Gradually, however, he regained his former powers, but he suffered from occasional confusion of thought and difficulty of speech, with headache and wakefulness for several weeks.

"Paralysis, as in the other two forms, may be one of the phenomena of this variety of cerebral congestion.

"Death may take place during the attack, or from secondary lesions afterwards. Of the twenty-nine fully developed cases, four were of the maniacal form.

"What is called temporary insanity, mania ephemera, or impulsive insanity, generally depends upon cerebral congestion. The subject, therefore, is of vast importance in its Medico-legal relations."—P. 40.

In the treatment of active congestion, Dr. Hammond never finds venesection necessary. A few cups to the nape of the neck, or leeches to the temple or (preferably) just inside the nostrils, often yield the most satisfactory results. After noticing

the value of cold applications to the head or neck, and the importance of attending to the patient's position and dress about the neck, he points out the good effects which frequently follow a few applications of the constant galvanic current in abolishing vertigo and unpleasant feelings in the head, and in restoring mental and physical ability. This agent acts by stimulating the sympathetic nerve; the positive pole being placed over this nerve in the neck, and the negative on the neck as low down as the last cervical vertebra. Care must be taken that the current is not too strong or continued for more than two minutes.

First amongst internal remedies must be placed bromide of potassium or sodium in full doses three times a day, in conjunction (not in combination) with which oxide of zinc, in two-grain doses, may be given after meals. When the symptoms of congestion have disappeared under this treatment, strychnine, phosphorus, and cod-liver oil may be given with advantage as tonics and restoratives. Phosphorus, he tells us, almost always acts well in these cases, and may be given in the form of phosphoretted oil or as phosphide of zinc, a Parisian remedy. Of the latter preparation he thinks very highly. It contains only one-seventh of its weight of phosphorus, and its proper dose is therefore about one-tenth of a grain. His formula is—phosphide of zinc, gr. iij.; extract of nux vomica, gr. x.; conserve of roses, enough to make thirty pills. Dose, one pill three times a day. Under "Hygienic Treatment," he remarks that bathing daily and subsequent friction with a tape-towel are exceedingly useful in determining the blood to the skin, and that the Turkish bath cannot be too highly commended.

There are many points in the chapter on "Cerebral Hæmorrhage" to which we should have liked to have directed our readers' attention, but we must restrict ourselves to one quotation, illustrating the important question whether it is possible or not to determine during life in what part of the brain an extravasation has taken place:—

"As a general rule, hæmorrhage is more liable to take place within the ganglia constituting the motor tract than in any other part of the brain, the reason, doubtless, being that this is the most vascular part of the cerebral substance.

"When the lesion is limited to the corpus striatum of one side, there is loss of the power of voluntary motion on the opposite side, but no abolition of sensibility, except, perhaps, for a few hours.

"The optic thalamus is another common seat of extravasation. In such a case the observed symptoms are especially connected with the organs of the special senses. Thus there are double vision, dilatation or convulsive movements of the pupil, blindness, and anæsthesia or hyperæsthesia of the paralysed parts of the body. As in lesion of the corpus striatum, the paralysis of motion, when it exists, is on the opposite side of the body. The hearing and smell may also be affected.

"It generally happens that an extravasation, originating in either the corpus striatum or optic thalamus, involves both these ganglia. Hence we have, as the most common symptoms of cerebral hæmorrhage, loss or impairment of the power of motion, disturbance of sensibility, dilatation or irregular movements of the pupil, aberrations of vision, etc.

"When the extravasation beginning in the left optic thalamus or corpus striatum extends to the fissure of Sylvius, so as to involve the posterior part of the third frontal convolution, the island of Reil, or other part supplied by the middle cerebral artery, or when it originates in this region, aberrations of speech occur. These are independent of paralysis of the tongue, and are such as are embraced under the term aphasia.

"Hæmorrhage into the crus cerebri produces hemiplegia of the opposite side, more or less extensive according to the size of the clot, with loss of sensibility. The third pair arises in part from the crus, and hence may be paralysed, producing ptosis and external strabismus on the side corresponding to the seat of the lesion, and consequently opposite to the hemiplegia.

"When the pons Varolii is affected, the crossed paralysis is still more marked. The limbs are paralysed on the opposite side, and the face, in whole or in part, on the same side as that in which the hæmorrhage takes place. If the extravasation is in the mesial line, both sides of the body are paralysed.

"The principal symptoms indicating the medulla oblongata as the seat of extravasation are loss of the power of swallowing, from paralysis of the glosso-pharyngeal, difficulty of protruding the tongue, from paralysis of the hypoglossal, and huskiness of the voice, tumultuous action of the heart, dyspnoea, and gastric derangement, from paralysis of the pneumo-gastric nerve.

"In lesions strictly limited to the ganglia cited, there is no aberration of the intellectual faculties. It is only when the

grey substance of the cerebrum or cerebellum is involved that the mind participates."—Pp. 102-4.

The chapter on "Aphasia" occupies upwards of fifty pages, and forms a complete monograph on this mysterious disorder. Dr. Hammond gives tables showing that out of 260 cases of aphasia with hemiplegia (forty-six of which occurred in the New York Hospital), the paralysis was on the right side 243 times, and only seventeen times on the left; and that out of 344 autopsies, 314 supported the left anterior lobe theory, and thirty-one opposed it. He regards the ordinary association of aphasia with right hemiplegia as due to the fact that embolus, which is generally the cause of aphasia, is much more common in the left than in the right middle cerebral artery. (Thus, in forty-two cases of cerebral embolism collected by Meissner, the left hemisphere was affected in thirty-four cases, and of thirty-seven cases in the author's practice thirty-one were on the left side.) Giving full consideration to the facts and arguments that have been urged on all sides of the question, Dr. Hammond, rejecting the locations assigned by MM. Dax and Broca (which are too well known to require to be described), feels constrained to believe—

"1. That the organ of language is situated in both hemispheres, and in that part which is nourished by the middle cerebral artery.

"2. That, whilst the more frequent occurrence of right hemiplegia in connexion with aphasia is in great part the result of the anatomical arrangements of the arteries, which favour embolism on that side, there is strong evidence to show that the left side of the brain is more intimately connected with the faculty of speech than the right."—P. 202.

These cautiously expressed views are supported by a series of fourteen very interesting cases. In one of them the cerebral lesion was due to a blow on the left side of the head some months previously, and the aphasia was at once removed by the operation of trephining, which revealed the fact that a splinter of bone had been pressing on the posterior frontal convolution. In all the cases in which hemiplegia was present the aphasia was of the ataxic form, while when there was no hemiplegia the aphasia was amnesic. In the former, the individual was deprived of speech because he could not co-ordinate the muscles used in articulation; in the latter, because he had lost the memory of words. Dr. Hammond regards these facts as of great value in indicating the seat of the lesion and the physiology of the parts involved. The grey matter of the lobes presides over the *idea* of language, and hence over the memory of words; and when *it* only is involved there is no hemiplegia or difficulty of articulation. Similarly, ataxic aphasia indicates a lesion of the motor tract; while, if amnesic aphasia is also present, the hemisphere is also involved. The chapter concludes with the sound practical advice that "constant efforts should be made to exercise the vocal organs by attempts to speak, and by the application of the galvanic or faradaic currents to the tongue and other muscles concerned in articulation."

The chapters on "Diffused and Multiple Cerebral Sclerosis" (especially the latter) contain a large amount of information which will, we believe, prove new to the great majority of our readers. We must restrict ourselves to a brief abstract of the author's history of "Multiple Cerebral Sclerosis"—a lesion involving several parts of the same ganglion, and consisting of plates or nodules of sclerosed tissue scattered through its substance. In Reynolds's "System of Medicine" there is not the slightest reference to cerebral sclerosis; and many of the cases referred by that Physician to muscular anaesthesia seem to belong to Dr. Hammond's "multiple cerebral sclerosis," which also includes other anomalous forms of disease in which muscular ataxia, chiefly (but not usually) of the upper part of the body, is the most prominent symptom. The progress of a typical case may be thus described:—The first symptom generally is pain occurring in short paroxysms, or occasionally an epileptic attack; numbness of the ends of the fingers or toes is then complained of, and several months may elapse before any indications of tremor appear. This tremor is usually gradual in its development, and may be restricted to narrow limits, as even a single finger, from which it may extend slowly to the extremities and face, the head being usually the last part affected. At first and for a long time the tremor is to some extent under the control of the will, and the shaking ceases during sleep; but eventually the patient ceases to be able to check it, and sleep affords no respite, so that a further cause of exhaustion is introduced by the want of rest. The next symptom of importance is paralysis, and when the sclerosis is limited to the hemispheres or begins in them, it always follows the tremor. The period intervening between the appearance of

the tremor and the accession of the paralysis varies from a few weeks to many months.

The attitude and gait of patients suffering from this disease are peculiar. The body is generally inclined forward, with the head falling toward the chest, the trunk flexed at the pelvis, and the knees slightly bent. In walking, the action is that of a jog-trot, the patient often moving with considerable rapidity. Sometimes the patient cannot stand without help, but on receiving a push will go off at full speed. This symptom, as well as that of being unable to stop without coming, as it were, to an anchor, by seizing a lamp-post or other fixed object, has been observed in the cases which we are in the habit of regarding as pertaining to locomotor ataxy. Sometimes there is a tendency to go backwards. This was the case, to a remarkable extent, in a gentleman who consulted Dr. Hammond. Every time he rose from his chair he was forced to take several steps backward, and it was only by constant mental effort that he was able to go forward at all.

In his remarks on the diagnosis he admits that "multiple cerebral sclerosis has heretofore been confounded with other diseases," and that "its very existence is doubted" by certain Physicians of eminence in this department. Although the prognosis is always unfavourable, he believes that in its early stages the disease may be, at all events, alleviated by treatment. The medicines on which he places most reliance are chloride of barium and tincture of hyoscyamus, simultaneously administered. The former he prescribes in doses of a grain (given in aqueous solution) three times a day; and the latter in doses of from one to two drachms, morning, noon, and night. In six cases out of nine he has given these remedies, either alone or with others, with decided benefit. Electricity is, however (he adds), a powerful adjunct, and should always be employed, if possible. The primary current from fifteen of Smec's cells should be passed through the brain, antero-posteriorly and laterally, and the sympathetic nerve should likewise be acted on. For the muscular tremors he uses a primary current of low tension, whilst for the paralysis the induced current, not too strong, is to be recommended.

There are various points in the chapters on "Tumours of the Brain" and on "Insanity" to which we should have been glad to have directed the attention of our readers, if space had permitted. But our allotted limits are already exceeded; and hence we must defer to a second article our notice of the concluding portion of this thoroughly practical work, in which the diseases of the spinal cord, the cerebro-spinal axis, the nerve-cells, and the peripheral nerves are considered.

NEW BOOKS, WITH SHORT CRITIQUES.

Handy-Book of the Treatment of Women's and Children's Diseases, according to the Vienna School, with Prescriptions. By Dr. EMIL DILLNBERGER. Translated by PATRICK NICOL, M.B. London: J. and A. Churchill. Pp. 208.

*** This little work may be of great use to many of our Practitioners in making known to them some of the modes of treatment pursued in Germany in dealing with the diseases of women and children. These maladies, especially those of women, have received more attention at our hands and those of our American brethren than they have done in most parts; nevertheless, some notice of the modes of prescribing and the fashions of operative procedure adopted in Germany may be of value. For such a purpose the book of Dr. Dillnberger is likely to prove of service, but it might have been rendered more generally useful had another plan been adopted in converting it from the German. The translator seems to have done his work only too faithfully; he has rendered the German words into their English equivalents, but the result is a book certainly not in accord with the ordinary rules of English grammar. It would also have been well to have rendered the prescriptions as far as possible into their English equivalents, instead of leaving them as in the original, for few have the means of ascertaining the composition of any of the Galenic preparations here ordered.

Phrenology, and How to Use it in Analysing Character. By NICHOLAS MORGAN. Longmans.

*** No doubt this is a fair exposition of phrenology as believed in and studied by the more advanced disciples of that so-called "science." But we take exception to books of this kind, from the assumption of their writers that the "principles and practice of phrenology" are founded on fixed data, and according to their authors—at least to the one under notice—"the testimony of God as published in the volume of human nature."

Now, it is pretty evident that the "testimony of God" so "published" is liable to be read in very different ways by different "observers," and those who are not completely initiated will be liable to confound quality with quantity, and bulk with intensity.

Harveian Oration, 1871, and Two Sequels. By Dr. CHAMBERS. Philadelphia: H. Lee.

*** The title chosen by Dr. Chambers is "Restorative Medicine," and on this he dwells with much force and originality. The "Sequels" follow up the same subject, interspersed with others, in a lively conversation between (in the first) the Vicar, Medicus, Chemicus, Psychicus, Chirurgus, Mr. Vain Pumps; and (in the second) between Medicus, Chemicus, Physicus, Orator, and Mrs. Orator, who, in conversation—now "grave," now "gay," now "lively," now "severe"—give us a pleasant half-hour's reading.

Cholera: What it is, and How to Prevent it. By E. LANKESTER. M.D. Routledge.

*** A reissue of a brochure which originally appeared on the approach of cholera in 1866. It is a useful little manual for popular perusal, and contains nine chapters, as follows:—The History of Cholera; Is Cholera Contagious? Symptoms of Cholera; The Poison of Cholera; Causes of the Tendency to take Cholera; How Cholera Poison is Conveyed; How to Prevent Cholera; What to do when Cholera breaks out; On Disinfectants. These various chapters are clearly and simply written.

Notizen und Erinnerungen eines Ambulanz-Chirurgen. Von WILLIAM MACCORMAC, Wundarzt am St. Thomas-Hospitale in London, etc. Aus dem Englischen Uebersetzt und mit Bemerkungen versehen von Dr. LOUIS STROMEYER, Verfasser der "Maximen der Kriegsheil-Kunsthandlung." Hannover: Hahnische Hofbuch.

Notes and Recollections of an Ambulance Surgeon. By W. MACCORMAC, Surgeon to St. Thomas's Hospital. Translated and annotated by Dr. L. STROMEYER, author of the "Maxims of Military Surgery." Pp. 183.

*** This translation of Mr. MacCormac's work has evidently been a labour of love to Dr. Stromeyer, and his remarks, though short, add to the value of the work. The exceedingly complimentary remarks on Mr. MacCormac cannot fail to be gratifying to that gentleman.

COLONIAL CORRESPONDENCE.

AUSTRALIA.

MELBOURNE, VICTORIA, July 15.

DURING the past four or five weeks there has been an epidemic of influenza all over this colony, much more severe, however, in particular parts. It has been principally confined to adults, very young children not suffering at all. The whole track of the mucous membrane lining the air-passages has been affected; but the disease has observed no rule as to the portion in which it commenced, or in which it principally manifested itself. In every instance, however, it appears to have been distinguished by a remarkable prostration and a complete anorexia. The loathing for food has been very marked. Some cases have been further distinguished by the most violent

cephalgia, others by lumbago, and all by more or less of rheumatic pains in the limbs. The suddenness of the attack has also been a peculiarly distinguishing feature. Persons in complete health have felt themselves instantaneously seized with an unaccountable languor and mental depression, accompanied by violent coughing and coryza, so as quite to justify the French designation of a certain form of catarrh—viz., "la grippe." It has not, however, been fatal save in the case of persons previously much debilitated from other causes. During most of the time there has been a steady prevalence of cold north winds of an unusually chilling and discomfort-creating character. In summer, as you are aware, our north winds are hot—corresponding to the simoom of Arabia or the sirocco of South Europe—but in winter they are cold. In either case, however, the wind is very desiccating; perfectly anhydrous and entirely deficient in ozone. There would certainly appear to be some connexion between the continuance of this wind and the prevalence of the influenza.

In the treatment, diffusible stimulants have been found useful; and in the first stage the steady use of tincture of aconite in one-minim doses every hour has appeared considerably to abbreviate the duration of the affection.

There is a good deal of talk just now of a disinfectant, lately introduced to the public by a Mr. Sullivan, who has for some months been experimenting upon it in the laboratory of Mr. Cosmo Newbery, the analytical chemist attached to the Technological Museum. It appears closely to resemble the chloralum now in such general use in England, but it is obtained from kaolin clay, which is found in large quantities a few miles from Melbourne. So far as this disinfectant has been tried, it has indicated a high degree of power in controlling the progress of putrefaction. A putrid body upon which it was well sprinkled ceased to emit any unpleasant odours whatever. Mr. Newbery read a short paper upon it before the Royal Society a few nights ago.

On the subject of antiseptics, too, Dr. Day, of Geelong, whose labours in connexion with ozone and its uses are well known, lately contributed a paper to the Medical Society. Dr. Day, basing his belief upon the ascertained efficacy of solutions of the peroxide of hydrogen in neutralising the activity of pus corpuscles, thinks the peroxide might be employed as a means of arresting the spread of small-pox, both by applying it directly to the pustules and by diffusing it through the atmosphere of wards and rooms in which persons suffering from variola are lying. Happily, we have no means, in this colony, of putting Dr. Day's suggestions into practice, as, so far, we have been fortunate in arresting small-pox before it has become epidemic. But there is so much reason in Dr. Day's conclusions that his theory well deserves a practical testing.

On the 13th, the sixth annual meeting of the Medical Benevolent Association was held. The complete success of this endeavour to provide for the less fortunate members of the Profession in this colony has been thoroughly established. Commencing in the most unpretending manner, and conducting its operations with the most rigid economy, it has well fulfilled the purposes for which it was intended, and has accumulated a fund which will form the basis of a permanent source of relief, thus rendering the society more or less independent of annual subscriptions. The annual meeting appointed a Committee consisting of Dr. Tracy, Dr. Nield, Dr. Martin, and Dr. Cutts, to consider and report as to how best the fund should be invested, and in what manner the interest arising from it should be applied.

The City Council are at present in debate upon the question of recommending to the Government the desirability of introducing to the Legislature a measure similar to the Prevention of Contagious Diseases Act. The necessity of such an Act in this colony is abundantly apparent, and there is a strong feeling in favour of its adoption.

PROVINCIAL CORRESPONDENCE.

IRELAND.

DUBLIN, September 12.

DRS. NUGENT AND HATCHELL, the Inspectors of Lunatic Asylums in Ireland, have just issued their twentieth report. From the statistics contained in this publication, it appears that the number of insane persons in the country was larger in 1870 than it had been in the previous year. The total number of registered lunatics was, in 1869, 10,080; in 1870, 10,266. The numbers at large were 6579 and 6936 in the two years

respectively. There was an apparent increase of 347 persons in public asylums, the totals being, in 1869, 6316; and in 1870, 6663. But one lunatic was confined in gaol at the end of last year. Owing to increased accommodation in the public asylums throughout the country, in which there is now provision for some 7600 patients, a large number of insane persons have been transferred to them from the poorhouses. Unfortunately, under the term "insane" are included the idiotic and demented, many of whom would be even better circumstanced in the wards of the various poorhouses than in institutions for the treatment of the insane. The cost of the district asylums through the different counties for the year 1870 was £10,930 in excess of that for the previous year. The respective amounts were, for 1869, £140,034 10s. 11d.; and for 1870, £150,964 19s. 9d. The actual increase in expenditure is, however, reduced to £2742 when allowance is made for the maintenance of the 347 additional patients above mentioned. In the report are also given full particulars of the conditions of each asylum.

At the recent monthly meeting of the Board of the Coombe Lying-in Hospital, Dr. Arthur Hill Ringland was unanimously elected to the office of Assistant-Physician; and at the same time a resolution, couched in most gratifying terms, was passed, conveying to the out-going Assistant, Dr. William Roe, an expression of the lively sense of his ability, zeal, and kindness entertained by the guardians and directors of the institution. A letter was also read, informing the Board that a bequest of £500 had been left to the charity by the will of the late M. B. Mullins, Esq., of Fitzwilliam-square.

Most of your readers are, doubtless, aware of the strongly nationalistic demonstrations which have recently taken place in our city on the occasion of the visit of some French noblemen and gentlemen, philanthropists in the fullest sense of the word. This is not the place to comment on the taste which led men, who from their station should have known better, to make capital of a visit to our shores of a distinguished party of foreigners, to advance their own peculiar political views. We allude to the demonstrations in question simply because, on Sunday fortnight, an eminent member of our Profession, while standing on his hall-door steps, was assaulted by some of the roughs, who poured forth in multitudes to take a noisy holiday. We are glad to be able to say that no ill-consequences followed in the gentleman's case, and that summary punishment was visited on the assailants.

The near approach of cholera along the Baltic seaboard has naturally attracted considerable attention here, and precautionary measures have been taken by the different local authorities. In some respects such measures are still deplorably incomplete, and hence inefficient. We want an isolated cholera Hospital, and proper means for the conveyance of patients to it. Again, with the River Liffey in its present state, and with extremely deficient sanitary arrangements in the poorer districts of the city, the likelihood of the terrible epidemic gaining ground, should it once obtain an entrance, is much to be dreaded. The authorities seem to depend too exclusively on the purity of the Vartry water, with which all parts of the metropolis are now abundantly provided. An attempt, it is true, has been made to disinfect the Liffey by means of chloralum; but until some contrivance is adopted to keep the bed of the river covered with water, even at ebb tide, by means of sluice-gates, no permanent effect can be looked for. The "main drainage scheme" provides for the difficulty by altogether removing the *fons et origo malorum* from the river; yet against this, too, there are most plausible objections, some of which were advanced in a letter in your impression of May 27 last.

That the subject of the public health is now attracting unusual attention is evident from the fact that a lengthened correspondence on sanitary topics has for some time past been carried on in the columns of our daily papers. This was originated by Mr. Benson Baker, of London, who was lately sent over by the British Medical Association to report on the working of the Irish poor-law system, and has been continued by Drs. Mapother, Grimshaw, Cameron, and others.

On the whole, however, judging from the weekly returns of births and deaths published under the authority of the Registrar-General, the health of Dublin and its suburbs has of late been satisfactory, and the death-rate of the past few weeks contrasts favourably with that of most of the other large cities in the United Kingdom. The annual ratios of mortality per 1000 inhabitants have been each week since the commencement of July, 21, 17, 17, 20, 13, 16, 19, 21, and 18 respectively, or an average of 18 for the nine weeks. The deaths from diarrhoea in the same weeks have been 1, 0, 2, 4, 2, 4, 7, 10, and 8 respectively. Owing to the coincidence of a high temperature and

the fruit season, the prevalence of the last-named complaint has lately assumed considerable proportions, especially among children. Indeed, of the ten deaths from this cause registered in the week ending August 26, nine were those of children under 5 years of age, and the remaining victim was under 10.

It is interesting to note how little Dublin has suffered from the still prevailing epidemic of small-pox. The disease, which was all but unknown in our metropolis during 1870 (no death from it having been registered in the course of that year), began to show itself early in February last in one of the districts of the north side of the city. The first death occurred on March 4, and to September 2 last the total number of fatal cases registered in Dublin and its suburbs amounted to twenty. Of these two took place in the first quarter, nine in the second quarter of the year, and nine in the course of July and August. Five of the patients who died had never been vaccinated; in six others the marks of vaccination were either absent or doubtful; and four had very recently landed from England when they were struck down by the disease.

Latterly, amongst the herds in the neighbourhood of Dublin, epizootic eczema (foot-and-mouth disease) has largely prevailed. It now seems to be decreasing in frequency and severity. A report on the subject was submitted to the Public Health Committee of the Corporation by Dr. Charles Cameron, City Analyst, on the 25th ult. The author alluded to the occurrence of aphthæ in the mouths and on the lips of those who drank the milk of diseased cows; and as a means of obviating such unpleasant consequences, he recommended that for the present all milk used should be previously thoroughly boiled.

GENERAL CORRESPONDENCE.

TREATMENT OF COMPOUND FRACTURE BY COTTON-WOOL.

LETTER FROM DR. JOHN MURRAY.

[To the Editor of the Medical Times and Gazette.]

SIR,—In your edition of August 5 you make mention of a "diseover" (during the siege of Paris) by M. Alphonse Guérin in regard to the dressing of amputations with cotton-wool. With reference to the above allow me to mention a case of compound fracture which was treated in a somewhat similar way:—

B. G., a miner, aged 37 years, while working in a shale pit on August 2 last received a severe injury from a fall of stones from the roof, the weight of the fall being calculated at five tons. On examining the patient I found (independent of several bruises) that he had received a compound fracture of the lower leg, with considerable hæmorrhage from a wound about four inches above the internal malleolus. I adjusted the limb in lateral splints, having previously cut a small window in the inner splint, so as to have easy access to the wound. Hæmorrhage being considerable, I applied (having no lint at hand) several compresses of cotton-wool, and secured them with a bandage. The case went on well, and as the patient never experienced a rigor, nor any symptoms of suppuration, the compresses were allowed to remain. On taking down the splints, for the purpose of putting up the limb in a starch bandage, on August 28, I found the wound completely healed.

The patient is now moving about on crutches, and feels no inconvenience in moving his foot. I am, &c.

West Calder, Sept. 6. JOHN MURRAY, L.R.C.P.&S.E.

USEFUL PRECAUTION FOR TRAVELLING INVALIDS.

LETTER FROM DR. F. A. HARTSEN.

[To the Editor of the Medical Times and Gazette.]

SIR,—From day to day Science and Civilisation continue to discover the means of prolonging life to invalids, and of giving them the blessing even of having a family. This is, I know, in immediate opposition to the repeated warnings of a powerful school. But as Science and Civilisation seem in this matter to be hard of hearing, and even incorrigible, it is best, perhaps, to submit to their obstinacy.

I crave, therefore, a place in your columns for a piece of advice which I hope will be useful to many sufferers in this season. In the present age, the arsenal of therapeutics has been enriched by a very powerful agent—I mean the railway. This agent, however, like many of its kind, has its drawback, which requires correction. Many travellers, those even in good

health, have observed that after a railway journey of some length they felt more particularly tired in the legs, a phenomenon evidently due to the tremulous motion of the ground under their feet. Having suffered considerably from this myself, I tried the experiment of using the well-known air-cushion as a footstool. This answered so satisfactorily that I never travel now without it under my feet, and have not since felt the slightest inconvenience from railway travelling, which formerly fatigued me so dreadfully. In fact, the change is most remarkable. It is scarcely necessary to observe that the air-cushion thus employed would be found equally serviceable in ordinary carriages, and especially for the transport of wounded soldiers, etc. *Prosit Doctors and invalids!*

Pau.

I am, &c.,

F. A. HARTSEN.

OBITUARY.

THE LATE DR. HYDE SALTER.

THE Profession have already learnt with sorrow, through obituary advertisements, that Dr. Salter died on August 30, at the comparatively early age of 47. For some months his condition had caused serious anxiety to his friends, and for many weeks his case had become hopeless.

Dr. Salter's death is on every account a very lamentable event. He combined so much within himself that was admirable and very estimable—intellectual capacity so far above the average of men, associated with such extreme moral rectitude and kindness of nature—that since his death but one sentiment, of deep grief, has pervaded the minds of all who knew him, either socially or Professionally.

Dr. Salter was one of a race of Medical men—grandfather, father, uncle, and all three brothers were members of the Profession. He was the second son of the late Mr. Salter, of Poole, a Fellow of the College of Surgeons, who for half a century held a very extensive practice in the south-east parts of Dorsetshire. Dr. Salter was born on November 2, 1823; and within a few weeks of his birth he was attacked with that malady—asthma, following hooping-cough, which entailed such physical suffering on nearly the whole of his life, and indirectly led to his premature death. During boyhood his education was conducted at a private school in his native town; and, though disabled by his asthma nearly half his time, he was always ahead of boys of his own age. Very early in life he displayed a remarkable genius for drawing and painting, and for some time it was contemplated to educate him for the profession of a painter. But he gradually drifted, as did his three brothers, into his father's Profession.

In 1844 he matriculated at the University of London, and entered the General Literature department of King's College, where he greatly distinguished himself; and in 1846 he took a first-class B.A. degree.

He then entered the Medical department of King's College, and at the end of the first session obtained the first of the junior scholarships of the year. He subsequently obtained other prizes.

In 1850 he was appointed Demonstrator of Anatomy to King's College, and, in 1851, Assistant-Physician to King's College Hospital. During that time he took copious and almost *verbatim* notes of Dr. Todd's clinical lectures, which were published, from his manuscript, in the *Medical Gazette*, and afterwards in a collected form; they constituted the first volumes of those "Lectures on Clinical Medicine" which added so much to Dr. Todd's reputation.

In 1851 Dr. Salter took the M.D. degree of the University of London. In 1852 he succeeded Dr. George Johnson as Physician to the Carey-street Dispensary.

At this time he became assistant-editor (that is, working editor) of the "Encyclopædia of Anatomy and Physiology." The whole of the last two volumes of that work passed through his hands; and he himself contributed to the

Encyclopædia the articles "Tongue" and "Pancreas." Both these articles contain much original matter, and are beautifully illustrated by Dr. Salter's drawings from his own preparations. That on the tongue is the more important, for the first time giving a complete elucidation of the microscopical arrangement of the intrinsic muscles of the organ. Indeed, it was mainly in consideration of the new anatomical observations in this article that he was elected a Fellow of the Royal Society.

He was also largely concerned in the production of the fourth part of Todd and Bowman's "Physiology." He was, at the time it was written, prosector to the Class of Physiology at King's College; and nearly all the physiological experiments and the microscopical preparations illustrative of the subjects in that part of the work ("Digestion" and "Circulation"), as well as the great majority of the original drawings, were by him.

In 1854 he was appointed Lecturer on Physiology and Physiological Anatomy at the Medical School of Charing-cross Hospital, and held that chair for twelve years, when he was transferred to the chair of Medicine. In 1855 Dr. Salter was made Assistant-Physician to Charing-cross Hospital, and in 1866 he became full Physician.

The College of Physicians made him a Fellow of their body in 1856, and he was that year elected a Fellow of the Royal Society. In 1866 he delivered a course of lectures before the College of Physicians on "Dyspnœa."

Only a few months before Dr. Salter's death his *Alma Mater*, King's College, conferred upon him the honorary degree of Fellow of that College.

As an author, Dr. Salter was very happy in the method of expression, lucid in arrangement, and very graphic in description. His Professional writings have consisted of his well-known work on "Asthma" (now in the second edition), and a large number of essays and clinical lectures published in the *Medical Times and Gazette*, the *Lancet*, and the *British Medical Journal*. The volume on "Asthma" is too highly appreciated to require much remark. It was first written in individual papers published in the Medical journals, each paper afterwards forming a chapter of the volume. It contains a painfully accurate description of his own sufferings, and the methods by which he alleviated them; and it has been pronounced to be the best work on the subject in any language.

The numerous clinical lectures were mostly on chest diseases, though by no means exclusively so. It was Dr. Salter's intention to have collected the whole into a volume; and, indeed, he was engaged in this when his illness commenced.

Clinical teaching was one of his greatest pleasures, and he was eminently successful in this method of instruction. He spoke remarkably well, with great perspicuity and facility; and his beautiful chalk drawings improvised on the black board were a great help to himself and his class. But probably Dr. Salter's most remarkable literary production was the Introductory Address delivered by him at Charing-cross Hospital in October, 1855. Reading it again, after a lapse of sixteen years, we are more than ever struck by its singular beauty, the elevated ethics which pervade it, and the eloquent instruction and advice which it gives to students upon Professional study. It is far too important an essay to pass into that obscurity which is the usual fate of introductory addresses; and, indeed, it should be in the hands of every first year's student.

We have reason to know that Dr. Salter had long been engaged on an interesting literary work altogether extra-Professional—namely, a collection of English metrical psalmody, chronologically arranged from the earliest antiquity till now; and the materials are so near completion that we still hope the work may see the light.

In Professional practice, Dr. Salter went through all the usual stages of anxious up-hill toil which is the experience of every young Physician who achieves distinction by legiti-

mate means; but he accomplished the object of his just ambition. In the last few years his practice became more than ample, and he found himself taking rank with the heads of his Profession. His very success, however, probably contributed in no small degree to his premature death. The work was too much for him.

During the last four years that strangely capricious malady, asthma, which had afflicted him in childhood and adolescence, and then left him for many years, returned with terrible force. His nights were passed bolstered up in bed, leaning on his elbow, and getting such snatches of sleep as the asthmatic spasm would allow, and often under the depressing influence of *datura tatula*; while by day he was compelled to forego more than half a proper amount of food. A morning meal and a sandwich about noon, and nothing more, or a sleepless night of asthma would be inevitable. Thus heavily weighted, and with a constant sense of physical exhaustion, he went on with his Hospital duties, his lectures, and his private practice, working bravely and never complaining.

Early in the present year those about him saw him weaker and thinner even than usual, and in the middle of April his strength gave way, and he fairly broke down. He now discovered that he was burning at a high temperature, and in continued fever. He asked Sir William Jenner to see him, and he believed at first that the illness was a mild attack of typhoid fever. But time went on; the fever continued, and that view of the case became impossible. The rest may be briefly told. The patient got weaker and thinner day by day. Nothing local, however, declared itself till the end of June, when one morning he expectorated several ounces of purulent material; and after that it was found that there was a cavity in the extreme apex of the right lung, which, at a subsequent date, was discovered to communicate with a circumscribed emphysematous sac at the back of the neck, external to the chest, and beneath the trapezius muscle. Then onwards the case was one of hectic, of declining strength and progressive emaciation, and on August 30 Dr. Salter peacefully expired from sheer exhaustion.

During his whole illness his mind was perfectly calm and composed. He very early came to the conclusion that he should not recover, and on June 30 he wrote to the authorities of Charing-cross Hospital resigning his appointments on that ground. But though he saw the hopes of his life wrecked just as they were realised, and the prize of success for which he had striven—with how much difficulty and labour!—falling from his hands just as he had grasped it, not one word of murmur or even disappointment escaped his lips. He accepted it as the Divine will, and patiently acquiesced.

We may add that Dr. Salter had many tastes and accomplishments out of his Profession. He never relinquished the classical literature of his academic life; and his knowledge of English *belles lettres* was remarkable. He was a charming pianist; and so accurate and retentive was his musical ear, that upon hearing a new opera for the first time, he would carry away, and at once produce upon the piano, all the salient airs of the composition.

But his greatest accomplishment was pencil drawing, which was of the highest order, and enabled him to illustrate with such accuracy his writings on minute anatomy. Many are the friends whom he has thus assisted by his pencil; and, as we have mentioned, the majority of the illustrations of the fourth part of Todd and Bowman's "Physiology" were from Dr. Salter's drawings; and many plates and figures in the *Philosophical Transactions of the Royal Society*, in the *Transactions of the Linnean Society*, and in those of the Medicico-Chirurgical and Pathological Societies, and in the Guy's Reports, as well as in separate works of his friends, owe their existence to his facile pencil, and the ever-kind and willing help he was so ready to render to others.

During his illness Dr. Salter was treated with the greatest

kindness and devoted attention by his Professional friends. Sir William Jenner gave him any amount of his valuable time, and, when he left town, Dr. Murchison, Dr. Andrew Clark, and Dr. George Johnson attended him with unsparing trouble. A Surgical question arose, and Sir James Paget and Professor Wood came to his aid. It was a great solace and comfort to him long after he had ceased to expect recovery; and he particularly dwelt upon the "almost parental kindness" (as he himself expressed it) of Sir Thomas Watson, who called on him and sat with him, and comforted some of his weary hours.

The devotion of such men to Dr. Salter's closing life may in some sense be taken as a token of how he was appreciated by those who could best take measure of his deserts, and consequently of what his loss entails. The grief of his patients, poor as well as rich, bears another tribute to his character. But it is left to those who knew him in the inner circle of his daily life to fully estimate the blank his death occasions. To those who had his companionship, who shared his charming conversation, who witnessed the simplicity of his habits and knew the elevated motives and sanctions which prompted all he did—to them his death is a sorrow beyond the expression of words, and one which can only cease with memory itself.

CHARLES DUIGAN, L.K.Q.C.P. & L.R.C.S. IREL.

THIS well-known and highly respected Physician died on the 31st ult., after a painful illness of some three months' duration. Mr. Duigan, having studied at the Carmichael School of Medicine, became a Licentiate of the Royal College of Surgeons, Ireland, in 1844, and commenced to practise in Dublin. He subsequently settled at Mullingar, co. Westmeath, where in time he entered into the enjoyment of an extensive and lucrative practice. In 1860 he joined the King and Queen's College of Physicians. Mr. Duigan held the appointment of Honorary Surgeon to the Westmeath County Infirmary. At the time of his death, which was caused by Bright's disease, he was about 45 years of age.

WILLIAM EGGINTON THOMPSON, M.R.C.S. AND L.S.A. LOND.,

DIED from acute enteric and pulmonary inflammation after an illness of three weeks, at his residence, Shepherd's-bush, London, on the 5th inst., aged 54 years. Mr. Thompson was born in the year 1817, at Stanbrook Hall, in Worcester. He received his Medical education at Guy's and St. Thomas's Hospitals. He spent the earlier years of his Professional life in practice near his home, but during the last four years he was engaged in practice in Shepherd's-bush, where he had gained a good and rapidly increasing connexion. Mr. Thompson was possessed of sound Professional experience and judgment, and his character was that of an amiable, unobtrusive gentleman. As such his loss is severely felt by his late patients and friends.

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentlemen passed their Examination in the Science and Practice of Medicine, and received Certificates to practise, on Thursday, August 31, 1871:—

Blok, Moses, New Burlington-street, W.
Day, Gordon Cleghorn, Bridport.
Jessopp, John, Felix Pelham, Herts.
Turner, Horace, Middlesex Hospital.

Also, on September 7:—

Raines, Charles, Hull.
Rendall, William, Maiden Newton, Dorset.

The following gentlemen passed their first Professional examination on August 31:—

Bradbury, John Batley, Leeds School of Medicine.
Eminson, Luther, University College.
Greaves, Frank, Middlesex Hospital.
Palmer, Montagu H. C., St. Thomas's Hospital.
Ward, Joseph, Queen's College, Birmingham.

Also, on September 7:—

Davies, Ambrose Lewis, St. Mary's Hospital.
Northey, Gilbert William, St. Thomas's Hospital.

APPOINTMENTS.

* * * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

- ELLIS, H. VAUSE, M.B. Aberdeen, and C.M.—Medical Officer to the Western District of the Gower Union.
 GREENHOW, Dr. E. H., F.R.S.—Physician to the Middlesex Hospital, in succession to Dr. Murchison, F.R.S.
 JEFFERISS, WALTER ROBERT SPENCE, M.B., C.M., L.R.C.P., L.R.C.S.E.—Assistant-Surgeon to the Landore Siemen's Steel Company's new works.
 KAYE, W. T., M.R.C.S.—Medical Tutor in the University of Durham College of Medicine, Newcastle-on-Tyne.
 MORRIS, H., M.B., M.R.C.S.—Assistant-Surgeon to the Middlesex Hospital, in succession to Mr. H. Arnott, F.R.C.S.
 ORWIN, Mr. ARTHUR W.—Resident Obstetrical Officer to the Charing-cross Hospital, London, W.C., *vice* S. S. Noakes, L.R.C.P. Lond., M.R.C.S. Eng., resigned.
 PALMER, HENRY DRAKE, M.R.C.S.E., L.S.A.—Medical Officer for District No. 8 of the Lexden and Winstree Union.
 TESSIER, WILLIAM HENRY CECIL, L.A.H., Dub., M.D. Univ. St. And., L.S.A., L.R.C.S.E.—Medical Officer to the Biddenden District of the Tenterden Union.
 WALKER, SAMUEL, M.R.C.S.E., L.S.A.—Honorary Medical Officer, North Riding Infirmary, Middlesborough-on-Tees.
 WEAVER, Mr. THEOPHILUS (duly qualified under the Pharmacy Act, 1868)—Dispenser to the out-door sick poor of the Parish of Birmingham.
 WOODWARD, EDWIN, L.R.C.P.E., M.R.C.S.—Inspector of Army Recruits for King's Lynn and District, Medical Inspector of Merchant Seamen for Port of King's Lynn, and Surgeon to the King's Lynn Union House and Infirmary, *vice* T. M. Kendall, F.R.C.S., deceased.

NAVAL AND MILITARY APPOINTMENTS.

- ADMIRALTY.—The following appointments have been made:—Dr. Samuel Haslett Browne has been confirmed as an Assistant-Surgeon in her Majesty's Fleet, with seniority of August 15, 1870; Dr. Christopher K. Ord, Staff Surgeon to the *Sultan*; Robert C. Scott, Staff Surgeon to the *Lord Clyde*; Gerard J. Irvine, Assistant-Surgeon to the *Iron Duke*, for disposal; Edward W. Leet, Assistant-Surgeon to the *Sultan*; George E. Farr, Assistant-Surgeon to the *Lord Clyde*; William Brown, Acting Assistant-Surgeon to the *Lord Clyde*; Thomas Harvey, Acting Assistant-Surgeon to the *Sultan*.
 ROYAL ARTILLERY.—Staff Assistant-Surgeon William Jobson, M.D., to be Assistant-Surgeon, *vice* Robert Lewer, promoted.
 1ST FOOT.—Staff Assistant-Surgeon Henry Comerford, M.D., to be Assistant-Surgeon, *vice* James Davis Gunning, appointed to the Staff.
 6TH FOOT.—Staff Surgeon Eugene Francis O'Leary, to be Surgeon, *vice* Alexander Dudgeon Gulland, M.D., appointed to the Staff.
 54TH FOOT.—Staff Assistant-Surgeon James Hector, M.B., to be Assistant-Surgeon.
 MEDICAL DEPARTMENT.—Surgeon Alexander Dudgeon Gulland, M.D., from 6th Foot, to be Staff Surgeon, *vice* Eugene Francis O'Leary, appointed to the 6th Foot; Staff Surgeon Robert Lewer, from the Royal Artillery, to be Staff Surgeon, *vice* Frederick Tydd Abbott, deceased; Staff Assistant-Surgeon Alexander Neill, from half-pay, to be Staff Assistant-Surgeon, *vice* William Jobson, M.D., appointed to the Royal Artillery; Assistant-Surgeon James Davis Gunning, from 1st Foot, to be Staff Assistant-Surgeon, *vice* Henry Comerford, M.D., appointed to the 1st Foot; Staff Assistant-Surgeon Charles Backhouse has been permitted to resign his commission.
 BREVET.—Deputy Inspector-General of Hospitals William Home, M.D., retired on half-pay, to have the honorary rank of Inspector-General of Hospitals.

BIRTHS.

- ADAM.—On August 31, at Overton House, Avondale, near Hamilton, Scotland, the wife of William Hogarth Adam, Surgeon Royal Navy (*H.M.S. Blanche*, Australia), of a son.
 ARNOLD.—On September 6, the wife of G. J. Arnold, M.D., 17, Hardwicke-place, Commercial-road, of a daughter.
 BLATSON.—On August 30, at Netley, Southampton, the wife of Inspector-General Dr. Blatson, C.B., Honorary Physician to the Queen, of a daughter.
 BLOXAM.—On September 5, at 21, Mount-street, Grosvenor-square, the wife of Wm. Bloxam, M.D., of a son.
 CATES.—On September 2, at No. 4, Sunderland-terrace, Westbourne-park, the wife of William Edward Cates, Civil Surgeon, Dhurwar, Bombay, of a son.
 COLTART.—On August 29, at Beverley, Yorkshire, the wife of W. Wilson Coltart, L.R.C.P. Lond., of a son.
 GARMAN.—On September 5, at Kent House, Bow-road, E., the wife of H. V. Garman, Surgeon, of a daughter.
 GWYNN.—On September 10, at 5, Belgrave-terrace, Upper Holloway, the wife of Edmund Gwynn, M.D., of a daughter.
 HAMILTON.—On September 7, at Magherabuoy, Portrush, county Antrim, the wife of Robert Hamilton, F.R.C.S., Prince's-road, Liverpool, of a son.
 LLOYD.—On September 9, at the Royal Naval Hospital, Haslar, the wife of Dr. William H. Lloyd, R.N., of a daughter.
 LORD.—On September 2, at Portrush, county Antrim, the wife of Surgeon-Major R. G. Lord, M.D., Bombay Army, Civil Surgeon Poona, of a son.
 LYDALL.—On September 9, at 19, Mecklenburgh-square, the wife of Dr. W. H. Lydall, of a son.
 MACGOWAN.—On September 9, at The Park, Kingswood-hill, near Bristol, the wife of Dr. Macgowan, late 52nd Foot, of a son.
 PRINGLE.—On August 9, at Whythank, Mussoorie, N.W.P. India, the wife of Surgeon R. Pringle, M.D., H.M.'s Bengal Army, of a daughter.

ROCH.—On August 2, at Chuckrata, Upper Provinces, Bengal, the wife of Dr. Roch, H.M.'s 55th Regiment, of a son.

MARRIAGES.

- BROWN—HUTCHINSON.—On September 6, at St. Stephen's, Norwich, David Brown, Esq., solicitor, Maybole, to Jane Emily, third daughter of Charles Hutchinson, M.D., Norwich.
 CRANE—PECK.—On August 3, at St. John's Church, Meerut, India, Edward Joseph Crane, Assistant-Surgeon Royal Artillery, to Emma S. O. (Temmie), youngest daughter of the late Leonard William Peck, M.R.C.S., and step-daughter of the late Major Richard Thompson, 51st (King's Own) Light Infantry.
 ELLIS—THOMSON.—On September 6, at Ramsden-street Chapel, Huddersfield, Charles W. Ellis, second son of the late Edwin Ellis, M.R.C.S., of Tulse-hill, Brixton, to Jane, eldest daughter of William Thomson, Esq., of New House, Huddersfield.
 GILMAN—AINSLIE.—On September 5, at Norham parish church, William McDonald, fifth son of Ellis J. Gilman, Esq., of The Boltons, London, to Helen Elizabeth, widow of the late T. A. Ainslie, M.D., of Tien-tsin, China, and eldest daughter of the late John Wilson, Esq., of Bayview, Berwick-on-Tweed.
 HENDERSON—BROCKLEHURST.—On August 30, at St. Mary's Church, Grassendale, near Liverpool, Colin Henderson, M.A., L.R.C.P., L.R.C.S., of Chester, to Mary Jane, only daughter of the late George Brocklehurst, Esq., of Liverpool.
 PALMER—ARMFIELD.—On September 7, at St. George's, Hanover-square, Dr. Frederick White Palmer, Ormonde House, Old Kent-road, to Elizabeth Amy, only daughter of Fred. Armfield, Esq., of South Bermondsey.
 RUSSELL—MANTELL.—On August 29, at St. Mark's Church, Surbiton, Surrey, William Campbell Russell, Esq., of Chislehurst, Kent, third son of the late John James Russell, Esq., of South Lambeth, to Rosetta, daughter of the late George Mantell, M.D., of Farringdon, Berks.
 SEXTON—WALTON.—On August 29, at Brighton, Edward Sexton, M.D., Surgeon Bombay Medical Establishment, to Mary, eldest daughter of the late Rev. W. W. Walton, rector of Waddesdon, Bucks.
 SLADE—CHEESMAN.—On September 2, at St. Pancras Church, Robert Slade, Surgeon, of Puddletown, Dorset, to Eliza, second daughter of the late John Cheesman, Esq., of Brighton.
 SMITH—WEBB.—On September 6, at St. James's Church, Wollaston, Stourbridge, Samuel Wagstaffe Smith, M.D., Pershore, second surviving son of Benjamin Smith, Esq., Tan-y-Graig, Carnarvon, to Sarah Elizabeth, eldest daughter of the late Thomas Webb, Esq., J.P., Stourbridge.
 TAYLOR—PARSON.—On September 5, at the parish church of Stoke-next-Guildford, the Rev. George Taylor, senior curate of Holy Trinity and St. Mary's, Guildford, to Elizabeth Soaper, youngest surviving daughter of the late Charles Alexander Parson, Surgeon, Godalming, and of Mrs. Parson, The Firs, Stoke-next-Guildford.
 WHIDBORNE—GERVIS.—On September 6, at St. Sidwell's, Exeter, George Herbert, eldest son of George Ferris Whidborne, M.D., of Crediton, Devon, to Alice Burne, youngest daughter of the late Henry Gervis, Esq., solicitor, of Thoverton, Devon.
 WOOD—INGRAM.—On August 9, at St. John's Church, Wakefield, William Wood, M.D., of Vincent House, Wakefield, to Christian Susanna, eldest daughter of the late Henry Ingram, Esq., of Wakefield.
 WURBLE—POCOCK.—On September 7, at St. John's, Angell-town, Brixton, Frederick John, eldest son of F. Wurble, Surgeon, of East Malling, Kent, to Annie Florence, eldest daughter of William Pocock, M.D., of Brixton.
 YOUNG—RAYNER.—On September 12, at St. Augustine's, Highbury New-park, Thomas Ernley Young, B.A., to Harriett Maria, second daughter of John Rayner, M.D., of Highbury New-park.

DEATHS.

- BUCHANAN, ROBERT, M.D., of Knoxland, Dumbarton, on September 10, in the 78th year of his age.
 CUTCLIFFE, CHARLES ELWORTHY, Surgeon, at Silverton, Devon, on September 10, aged 59.
 DUNCAN, JANE EMILY, wife of Professor P. Martin Duncan, F.R.S., M.B., etc., at Lee, Kent, on September 2, aged 42.
 DYMOCK, T. GRAHAM W., of the Middle Temple, son of Dr. Archibald Dymock, M.R.C.P.L., at Louth, Lincolnshire, on September 11, aged 19.
 GALLAGHER, ARCHIBALD P., second son of Dr. Gallagher, of Lima, Peru, at Woodside, Esher, the residence of his aunt, on August 31, aged 25.
 HEAD, ELIZABETH UPTON, wife of R. L. B. Head, Surgeon R.N., of Wadebridge, Cornwall, and daughter of Thomas Cleave, Esq., of Trevanion, Cornwall, in London, on August 27, aged 36.
 HUNTER, CHRISTOPHER, M.D., the last remaining son of the late Rev. Christopher Hunter, M.A., formerly rector of Gayton, Northamptonshire, at Ambarrow House, Sandhurst, Berks, on September 6, in his 90th year.
 KNOWLES, EDMUND YALDEN, M.R.C.S., and L.S.A. (Guy's), Medical Officer North District, Hartney Witney School, and several other appointments, and Practitioner in the town of Farnham for upwards of thirty years, at Farnham, on August 26, aged 58.
 LILLIE, MARGARET, the beloved wife of Dr. James Lillie, of Holloway, on September 4.
 PAUL, ELIZABETH CONSTANCE, the infant daughter of John Lister Paul, M.D., Surgeon to the General Hospital, Madras, at Lausanne, Switzerland, on September 8.
 SALTER, HENRY HYDE, B.A., M.D., F.R.S., Fellow of the Royal College of Physicians, lately Senior Physician to, and Lecturer on Medicine at, Charing-cross Hospital, at 14, Harley-street, Cavendish-square, on August 30, aged 47.
 SHEPPARD, MARGARET EDITH, only daughter of Edgar Sheppard, M.D., of Colney-hatch, at 12, Belsize-square, the residence of her aunt, on September 4, aged 23.
 THOMPSON, WILLIAM EGGINTON, Surgeon, at his residence, 6, Boscombe-terrace, Shepherd's-bush, on August 5, aged 54.
 VAUX, JULIA DESBOROUGH, second daughter of the Calvert Vaux, Surgeon, London, at 3, Canterbury-road, Croydon, on September 1, aged 41.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.

DOVER HOSPITAL AND DISPENSARY.—House-Surgeon; must be duly qualified and registered. Applications and testimonials to the Hon. Sec., Mr. E. Elvin, jun., 13, Castle-street, Dover, on or before Sept. 19.

GAINSBOROUGH DISPENSARY.—House-Surgeon. Must be duly qualified and registered. Applications and testimonials to Mr. F. C. Spouncer, on or before October 4. Election on the 19th.

ISLINGTON, VESTRY OF ST. MARY.—Medical Officer of Health and Analyst. Candidates must be duly qualified and registered. Applications and testimonials to Mr. John Layton, Vestry Clerk, on or before September 18. Further particulars may be obtained at the Vestry Office.

KENT AND CANTERBURY HOSPITAL.—House-Surgeon and Dispenser. Must be duly qualified and registered under the Medical Act, 1858. Applications and testimonials to the Secretary, at the Hospital, on or before September 29. Personal attendance is desirable. Further particulars of the Secretary.

LIVERPOOL DISPENSARIES.—Resident House-Surgeon. Must be duly qualified. Applications and testimonials to the Secretary, on or before September 27. Election the following day at 2 o'clock p.m.

MANCHESTER ROYAL INFIRMARY.—Physician's Assistant. Must possess both Medical and Surgical qualifications. Applications and testimonials to the Chairman of the Weekly Board, on or before September 23.

MIDDLESEX HOSPITAL.—Assistant-Surgeon. Candidates to send their applications and testimonials to Mr. Henry N. Custance, on or before September 26. Election on October 3.

NORFOLK AND NORWICH HOSPITAL, NORWICH.—House-Surgeon; must have both Medical and Surgical qualifications. Applications and testimonials to Mr. T. R. Tallack, on or before September 8. Election on September 16.

PARISH OF UNST, SHETLAND.—Medical Officer. Applications and testimonials to Mr. White, Inspector of the Poor.

QUEEN ADELAIDE'S DISPENSARY, POLLARD-ROW, BETHNAL-GREEN.—House-Surgeon. Must be a member of one of the Colleges of Surgeons of London, Edinburgh, or Dublin, and L.S.A. Applications and testimonials to the Rev. T. Peckston, 260, Cambridge-road, London, E., on or before October 3. Election on October 6.

REETH UNION.—Medical Officer for the Muker District. Candidates must be duly qualified and registered. Applications and testimonials to Mr. James R. Tomlin, Clerk, Richmond, Yorks, on or before September 22.

ST. SAVIOUR'S UNION, SURREY.—District Medical Officer for the Third District. Candidates must be duly qualified and registered. Applications and testimonials to Mr. James J. Blake, Union Offices, John-street West, Blackfriars-road, S.E., on or before September 21. Election on the same day.

STOCKPORT INFIRMARY.—House-Surgeon. Must have both Medical and Surgical qualifications. Applications and testimonials to the Hon. Sec., on or before September 27. Election on October 2.

TOWCESTER UNION.—Medical Officer for the Workhouse and the Towcester District. Candidates must be properly qualified and registered. Applications and testimonials to Mr. W. Whitton, Clerk, on or before September 19.

WESTERN GENERAL DISPENSARY, MARYLEBONE-ROAD, W.—Resident Surgeon and Apothecary. Must be M.R.C.S. Eng., Edin., or Dub., and L.S.A., and be registered. Candidates to attend a meeting of the Board of Directors on September 25, at 3 o'clock p.m. Applications and testimonials to be forwarded to the Secretary, on or before September 21.

WORKSOP DISPENSARY.—Resident Surgeon. Must have both Medical and Surgical qualifications. Applications and testimonials to the Committee, on or before September 23. The duties commence November 1.

UNION AND PAROCHIAL MEDICAL SERVICE.

** The area of each district is stated in acres. The population is computed according to the census of 1861.

RESIGNATIONS.

Merthyr Tydfil Union.—Mr. Walter Jefferies has resigned the Penderyn and Rhys District; salary £20.

Monmouth Union.—Dr. Andrews has resigned the Rockfield District; area 17,870; population 2244; salary £31 per annum.

Glanford Brigg Union.—Dr. Wm. Terrewest has resigned the Messingham District; area 12,508; population 2970; salary £38 per annum.

King's Lynn Union.—The office of Medical Officer of the Workhouse is vacant; salary £60 per annum.

Oakham Union.—Mr. T. B. Scott has resigned the Empingham District; area 14,728; population 2536; salary £30 per annum.

Portsea Island Union.—Mr. S. Alford has resigned the Southsea District; salary £70 per annum.

Stov Union.—Dr. Pearson has resigned the Fifth District; area 11,336; population 3493; salary £70 per annum.

Tenterden Union.—Mr. L. R. H. Rouse has resigned the Holden District; area 3700; population 653; salary £15 15s. per annum.

West Derby Union.—The Workhouse for Sick Poor is vacant; salary £120 per annum.

Wimborne and Cranborne Union.—Mr. Wm. Druitt has resigned the Second District; salary £75 per annum. Mr. Druitt has also resigned the Workhouse; salary £20 per annum.

APPOINTMENTS.

Amptill Union.—Arthur Evershed, L.R.C.P., M.R.C.S. Eng., L.S.A., to the Maulden District.

Barnsley Union.—Cleophas W. S. Seaborne, M.D. Univ. St. And., L.F.P. and S. Glasg., to the Wombwell District.

Bishop Stortford Union.—Eustace Arthur Brickwell, M.R.C.S.E., L.S.A., to the Sawbridgeworth District.

Brixworth Union.—Richard L. Wilson, M.R.C.S.E., L.S.A., to the Second District.

Henley Union.—James C. Pritchard, M.R.C.S.E., L.S.A., L.R.C.P. Edin., to the Nettlebed District.

Kington Union.—Henry Horton, M.R.C.S. Eng., L.S.A., to the Eardisley District.

INSPECTOR-GENERAL OF HOSPITALS R. DOWSE has been granted a reward for distinguished service.

THE Corporation of Leicester has decided to erect a fever Hospital in that town.

MR. R. B. STEWART, of Ascot Hall, has sent £1000 to the local authorities of Rothesay, to build a Hospital, in view of an epidemic breaking out.

DR. HENRY LIDDELL, retired Deputy Inspector of Hospitals, has been awarded the Greenwich Hospital pension of £50 for Staff Surgeons.

It is announced that in Czimochow, a village of East Prussia—containing only 479 inhabitants—seventy-nine persons have been attacked with cholera, and forty-six have died.

SMALL-POX has broken out in a virulent form at Sharpness-point, where vast works in connexion with the Gloucester and Berkley Canal are in progress.

THE Lambeth Guardians have awarded Mr. Capel, the Vaccination Inspector, a gratuity of £50, in consideration of services rendered by him during the small-pox epidemic.

DR. FRANKLAND reports that all the waters delivered by the Companies, during the past month, were clear and transparent when delivered from the main.

A **MONTHLY Medical magazine**, in the Bengali language, has been published at Chinsurah. It will be of great service to the numerous class of Medical assistants now scattered throughout Bengal.

MR. GOODSON has been appointed Medical Officer of Health for the Eastern Division, and Mr. Oakman for the Western Division, of the Wandsworth District Board of Works.

PROFESSOR MARSHALL'S scientific examination of the late Mr. Grote's head has revealed the fact that the brain was remarkably small; but it is said to be rich in convolutions.

A **MISS PATMAN** has taken the Doctorate degree of the Paris Faculty.

SMALL-POX is very prevalent in several towns in the West Riding of Yorkshire.

THE Dreadnought Hospital ship will be closed as a convalescent Hospital for small-pox patients on the 14th proximo.

DR. ARCHER, a homœopathic practitioner, has been elected Medical Officer to the Southampton Workhouse by the Board of Guardians.

THE fifth congress of the Italian Medical Society will be held in Rome in October.

THE British Hospital for Diseases of the Skin has received a second donation of £1000 from "V. S. J."

VERDANT.—The *Pastoral Times* of Australia has to its honour found out that brandy is adulterated with alcohol.

MR. J. WICKHAM BARNES is sorry to inform the members of the Poor-law Medical Officers' Association that their President, Dr. Rogers, has been obliged to relinquish for a time all duties connected with the Association and his own practice, on account of temporary indisposition.

THE MEDICAL SERVICE OF INDIA.—For the future there will be a military and civil branch of the Medical Service in India. Army Surgeons must elect in which branch they will serve. The military will be placed under Inspectors-General of the Royal Army; civil Surgeons will have a chief appointed by the Indian Government.

A **LIFEBOAT** called *The Dr. Hatton* has been given, with its equipments and a boathouse (at a cost of £680), to New Romney, by the widow of Dr. John Hatton, formerly of Oxford-road, Manchester. It was Dr. Hatton's wish that his widow should make provision for a lifeboat by will; but she has chosen to carry out his intention at once.

DR. WILLIAM MAC EWEN, having been appointed Casualty Surgeon for the Central Police District, Glasgow, has been presented with a complimentary address, a signet ring, and other articles of jewellery, by the officials of the Belvidere Fever Hospital, London-road, Glasgow, as a mark of their appreciation of his services there.

THE NEW NEWSPAPER LAW IN FRANCE.—The *Union Médicale* of September 2 states that it has just deposited at the Ministry of Finance the sum of 18,000 francs (£720) as security-money required by the new law to be paid by all periodicals appearing more than once a week. It falls rather hard upon our contemporary and upon the *Gazette des Hôpitaux* to have to pay this sum for the circumstance of being published three times a week, while their rivals, the *Gazettes Médicale* and *Hebdomadaire*, treating precisely of the same matters, are exempt.

MORE than 50 per cent. of the deaths in Manchester and Salford last week were of infants under 1 year of age. This great proportion of infantile mortality is from the increase of diarrhoea.

MR. CLEMENTS, the Medical Officer, reported to the Chorlton Board of Guardians that the small-pox was rapidly decreasing. The cases were twenty-three. Since the 29th ult. there had been only one case, and eight had been discharged. Of those in the Hospital three were only active cases.

At the annual general meeting of the Association of Medical Officers of Health, held on July 19 last, the following officers were elected for the year ensuing:—*President*: Dr. Robert Druiitt. *Vice-Presidents*: Dr. W. T. G. Woodforde, Dr. A. W. Barelay, Mr. F. J. Burge. *Treasurer*: Dr. C. J. B. Aldis. *Secretaries*: Dr. J. N. Vinen, Dr. T. Stevenson. *General Purposes Committee*: Dr. E. Ballard, Dr. H. Letheby, Dr. W. Hardwicke, Dr. J. W. Tripe, Mr. J. Liddle, Mr. C. F. J. Lord, Dr. H. G. Sutton, Dr. H. Bateson.

MEDICO-CHIRURGICAL SOCIETY OF GLASGOW.—At the meeting of this Society, held on Friday, September 1, in the Hall of the Faculty of Physicians and Surgeons, the following gentlemen were elected office-bearers for the ensuing session, viz.:—*President*: Dr. James Adams. *Vice-Presidents*: Dr. James Stewart; Dr. Geo. Buchanan. *Council*: Mr. Torrance, Airdrie; Dr. H. Thomson; Dr. James Gray; Mr. Robert Grieve; Mr. J. Pollock, Mearns; Dr. R. Renfrew; Dr. George Miller; Dr. T. D. Buchanan. *Secretaries*: Dr. Robert Perry; Dr. Alex. Robertson. *Treasurer*: Dr. H. R. Howatt.

MORTALITY IN THE EIGHT PRINCIPAL TOWNS OF SCOTLAND.—A comparison of the deaths registered in the eight principal towns shows that during August the annual rate of mortality was 16 deaths per 1000 persons in Perth, 17 in Aberdeen, 23 in Greenock, 25 in Dundee, 26 in Edinburgh and in Paisley, 27 in Leith, and 32 in Glasgow. Of the 2450 deaths, 1233 were of males, and 1217 of females. Of these 1156, or 47 per cent., were of children under 5 years of age. In Perth, 25 per cent. of the persons who died were under 5 years of age; in Aberdeen, 33; in Paisley, 40; in Edinburgh, 41; in Greenock, 43; in Glasgow, 50; in Dundee, 53; and in Leith, 58 per cent.

THE MACCLESFIELD INFIRMARY.—This extensive building stands unoccupied in the midst of its unfinished grounds. By a bequest of the late Mr. Tunnicliff, £30,000 was set aside as an endowment for an infirmary at Macclesfield, the conditions being, that within ten years of the death of Mrs. Tunnicliff a suitable building should be erected, and presented free of debt, for the benefit of the endowment. Mrs. Tunnicliff died in 1865, and only four years, therefore, remain within which to take advantage of the testator's liberality. Nearly £9000 is required to set the building in full operation. It is urged that it will be a great mistake if this important institution be much longer allowed to remain closed.

JAMES DOUGLAS MURRAY.—We regret to record the death, under very melancholy circumstances, of James Douglas Murray, Surgeon, of 26, Hamilton-square, Birkenhead, aged 26. The deceased, according to his usual custom, retired to his bedroom to rest a little on Tuesday afternoon. Patients having arrived, Mrs. Craig, a lady residing in the house, went to call him, but could not arouse him. A Physician was immediately sent for, who at once pronounced him dead. Beside him was a bottle of chloroform, and a bottle in which prussic acid had been. A post-mortem examination was made, which left no doubt that he had partaken of poison. He was the son of Dr. Andrew Murray, of the Royal Navy, and now attached to her Majesty's ship *Eagle*. He succeeded the late Dr. Craig two years ago, and had since been carrying on a successful practice. The motive of the deed appears inexplicable.

IODISED COTTON.—M. Méhu, Pharmacien at the Necker Hospital, describes his mode of impregnating cotton with iodine. The iodine is first reduced to an extremely fine powder by trituration in a porcelain mortar, its pulverisation being greatly facilitated by adding, from time to time, some drops of ether. Very fine and quite dry carded cotton should be chosen, its weight being ten times greater than that of the iodine. This is introduced in small portions, with the proportion of iodine, into a flask capable of containing a litre, and having a wide mouth. Into such a flask, from twenty to twenty-five grammes of the cotton are sufficient to be introduced, in order to secure its thorough permeation by the iodine. The flask is placed in a sand-bath, only slightly corked, until the heated air has escaped, when it should be closely stopped. The iodine disengaged now thoroughly permeates the cotton, and when this has attained the colour of roasted coffee the

process is finished. As much as 10 per cent. of iodine may be thus combined, but for all ordinary purposes 5 per cent. suffices. The cotton may be prepared, also, in a boiling-water bath. To preserve it for use, it must be kept in a bottle stopped with emery or by a cork which has been long kept in melted paraffine. This cotton has been found very useful applied to glandular swellings of the neck, or wherever the local use of iodine is indicated—placing it round the neck, for example, and securing it by a bandage. It requires to be renewed every two or three days.—*Bullet. de Thérapie et de Presse Belge*, August 27.

COMPOSITION AND QUALITY OF THE METROPOLITAN WATERS IN AUGUST, 1871.—The following are Dr. Letheby's returns to the Association of Medical Officers of Health:—

Names of Water Companies.	Total Solid Matter per Gallon.	Oxygen required by Organic Matter, &c.	Nitrogen.		Hardness.	
			As Nitrates &c.	As Ammonia.	Before Boiling.	After Boiling.
<i>Thames Water Companies.</i>	Grains.	Grains.	Grains.	Grains.	Degs.	Degs.
Grand Junction	18.47	0.109	0.125	0.002	14.0	3.5
West Middlesex	17.79	0.044	0.091	0.001	13.9	3.3
Southwark & Vauxhall	18.03	0.096	0.091	0.002	13.8	3.3
Chelsea	18.23	0.121	0.142	0.002	14.0	3.3
Lambeth	18.27	0.091	0.125	0.001	14.0	3.3
<i>Other Companies.</i>						
Kent	27.93	0.004	0.213	0.000	20.0	5.6
New River	16.83	0.030	0.110	0.000	13.4	3.0
East London	17.93	0.057	0.136	0.000	13.8	3.0

Note.—The amount of oxygen required to oxidise the organic matter, nitrites, etc., is determined by a standard solution of permanganate of potash acting for three hours; and in the case of the metropolitan waters the quantity of organic matter is about eight times the amount of oxygen required by it.

The water was found to be clear and nearly colourless in all cases but the following, when it was slightly turbid—viz., in the case of the Chelsea and the Grand Junction Companies.

The average quantity of water supplied daily to the metropolis during the preceding month was, according to the returns of the Water Companies to the Association of Medical Officers of Health, 112,107,697 gallons; and the number of houses supplied was 489,331. This is at the rate of 34.4 gals. per head of the population daily.

NOTES, QUERIES, AND REPLIES.

He that questioneth much shall learn much.—*Bacon*.

A Subscriber.—The F.R.C.S. is the best.

A King's College Man.—Mr. Henry Smith is Surgeon to King's College Hospital with care of out-patients; not Assistant-Surgeon.

He fed Fevers.—In the interesting Autobiographic Recollections of George Pryme, Esq., M.A., M.P., etc., he states that in the winter of 1788 he was attacked by a severe fever, and was attended by Dr. Storer, of Nottingham, the most eminent Physician in that part of the country. After prescribing every medicine he could think of as suitable to the case, he called one evening, declining to see and prescribe for the patient after that, as giving more medicine was only harassing him. He was told that the patient had repeatedly asked for brandy, whereupon some was mixed with water in a wineglass and eagerly drunk, when he asked for more. The next forenoon the Doctor called to inquire if his patient was still alive, and was told that he had had a good night, and was much better. From that time Pryme steadily recovered.

Erratum.—Through a mistake of the printer, Dr. Richardson's diabetic attack (see Review of Richardson on Diabetes) was made to be of two years' standing only, instead of ten.

THE TREATMENT OF PORRIGO DECALVANS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I should feel much obliged if some of your readers would inform me of a successful mode of treating porrigo decalvans. I have used tinct. iodi. (much stronger than the Pharmacopœial strength) and several other local applications, but without any good result. I am, &c.,
Newent, Gloucester, September 9. A YOUNG PRACTITIONER.

"DREAMS."

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Perhaps the following lines may suggest a better remedy for dreaming than any drug in the B.P.:—

"Toil and be glad! let industry inspire
Into your quicken'd limbs her buoyant breath."

"—The toiling swain,
By far the happiest of the sons of men!
Delves in his garden."

"Good Lord! how keen are his sensations all!
At one deep draught of sleep he takes the night."

"Health is the vital principle of bliss,
And exercise of health."

I am, &c.,

J. G.

Beta.—The salaries range, we believe, from five to ten guineas a month; but in all the Lines there are variations in the amounts of payment.

Nemo.—Radcliffe left to St. Bartholomew's Hospital, for ever, the yearly sum of £500 towards mending their diet, and the further yearly sum of £100 for buying of linen.

A Reader.—Linacre was buried in St. Paul's Cathedral, where a monument was afterwards erected to his memory by his admirer and successor in fame, Dr. Caius. He died October 20, 1524.

Gladesville Hospital for the Insane, Sydney.—Dr. F. Norton Manning, in his report on this Hospital for 1870, says—

"This institution is within such a short distance of the Sydney Observatory that I have not thought it necessary to attempt the meteorological observations which are made in some institutions for the insane in Great Britain, but I have carried on through some months a series of observations as to the degree of excitement existing among the patients and the frequency of epileptic paroxysms. These observations were commenced owing to a strong belief, which the results verify, that periods of excitement among the insane are coincident with, if not produced by, meteorological and especially electrical changes. It was not until I had continued these observations for some time that I became aware that the Observatory possessed no electrometer which the Government Astronomer considered sufficiently accurate to warrant scientific tabulation of the result of the observations, and that the occurrence of lightning was the only electrical particular recorded in the Observatory returns. Notwithstanding the want of accurate records, it is interesting to place side by side observations made concurrently at the Observatory and at this institution, and to see how closely periods of excitement among the insane and increased frequency of epileptic fits correspond with periods of electrical disturbance of the atmosphere. A series of records of this character, conducted by means of accurate instruments, on the one hand, and painstaking observation, on the other, would, I believe, be of the greatest interest to both physiologists and Physicians, and might serve to assist in settling some of the at present unsolved problems, both of normal and abnormal cerebral action."

CAMBRIDGE UNIVERSITY MEDICAL SCHOOL.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Observing with surprise in your last week's number, which professes to give some account of the various Medical Schools of the United Kingdom, that no mention is made of the Cambridge University Medical School, I beg to enclose the annual programme issued by the Regius Professor of Physic, from which you will see that regular courses of lectures are delivered by the several Professors, Demonstrators, and Teachers on Zoology and Comparative Anatomy, Anatomy and Physiology, Practical Anatomy, Practical Histology, Heat, Chemistry, Practical Chemistry, Pharmacology, and Pathology; that there is practical teaching in the dissecting-room, regular clinical teaching and clinical lectures at the Hospital, and clinical instruction at the neighbouring County Asylum; that there are museums of Anatomy and Materia Medica, laboratories, etc.; and that the attendance is recognised by the College of Surgeons as well as by the University. I may add that the number of Medical students entering annually at the School has in the last few years been not less than twenty-five.

September 11.

I am, &c.,

CANTAB.

* * The account we published was submitted to the Medical authorities of the University, and returned with approval.

Bibliopole.—The Library and Museum of the Royal College of Surgeons will be re-opened on Monday, October 2.

Effects of Tobacco-smoking.—So much has been written against the use as well as the abuse of smoking tobacco, that it is refreshing to find the subject temperately and carefully treated. In the September number of the *Food Journal*, Dr. E. B. Gray thus sums up a sensible and practical chapter on "The Medical Aspect of Tobacco-smoking":—

"Tobacco should be used as supplementary to food, not as a substitute for it. The season, therefore, for healthy smoking is after a meal. Tobacco should not be taken on an empty stomach (unless to stave off hunger) any more than alcohol. Smoking merely to kill time, or to colour a pipe (!) is a childish abuse of tobacco. Against moderate smoking in a healthy person who enjoys it, not a single argument of any weight has yet been advanced. Perhaps the most plausible of them is this: that every smoker daily imbibes a small quantity of tobacco-oil and nicotine; and as these substances taken by themselves in the pure concentrated state and in large doses are highly poisonous, therefore every habitual smoker is slowly poisoning himself. Just as reasonable is it to condemn all alcoholic drinks, such as wine, beer, etc., as pernicious, because a draught of pure alcohol will nearly or quite kill a man; or to condemn tea and coffee as dangerous drinks, because their active principles, theine and caffeine, taken alone and in large doses, are poisons. One of the best-established truths in Medical science is that the same physiological agent, according to the dose given, may produce effects which differ not merely in degree but in kind. The idea of small doses of tobacco or other such agent slowly accumulating in the system, and at length producing the effect of a single large dose, is *a priori* absurd, and also contradicted by experience.

"So much, and often so much nonsense, is prated about the evils of tobacco, that its virtues rarely get a hearing, and yet the latter are many and great. To quiet nervous unrest, to soothe a ruffled temper, to favour calm and impartial thought, to steady and clear (not to cloud) a confused over-worked brain, to counteract the effects of physical exhaustion—these are just the things which tobacco does; and if it can effect these ends safely and pleasantly, who shall deny it a place among God's good gifts to men?"

THE TREATMENT OF CHOLERA BY OX-GALL.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I regret extremely you stated the treatment I adopted for cholera simply under the head of ox-gall, calomel, opium, and stimulants. Any person reading it would think that the fel bovis had not much to do with the rapid recovery, and that the calomel was the chief agent. The patient took fel bov. gr. xxiv., calomel only gr. xiii., opium gr. ix., and the stimulants were spt. ammon. arom. and spt. æther. arom. every two hours during the six days. Brandy and wine were strictly prohibited.

September 5.

I am, &c.,

AN OLD PUPIL OF JOHN ABERNETHY.

Dr. B., Chelmsford.—The registration at the College of Surgeons will commence on Monday, October 2. Professional studies, however, cannot be recognised until your son has passed the required Preliminary Examination.

M. A. Oxon.—Dr. Glynn died in 1800. He was a Fellow of King's College, and an eminent Physician at Cambridge. He was buried in the chapel by torchlight, as was also Dr. Farmer, of Emmanuel College, in 1797; these were the last. He usually wore a scarlet cloak and three-cornered hat, and carried a gold-headed cane. He also used pattens in rainy weather.

Vaccination in St. Pancras.—In his report for 1870, Dr. T. Stevenson, the Medical Officer of Health, says—

"During the twelve months ending Michaelmas, 1870, the number of children under 1 year of age, successfully vaccinated by the Public Vaccinators, was 2193, as compared with 2497 in 1869, and 2871 in 1868. Such a lamentable falling off in the number of vaccinations speaks volumes as to the laxity of the administration of the law. 179 cases of small-pox were reported, and twenty-one deaths occurred in the parish from the disease. I am unable to supply the omission of the number of deaths in Hospitals, for the information has been refused me at the Highgate Small-pox Hospital. I have applied to the Poor-law officers for information as to the number of deaths among paupers from small-pox in Hospitals, but they are unable to supply me with the requisite information, no record being kept at the Guardians' Office of the results of the disease in the cases sent into Hospital."

HOSPITAL QUACKERY.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I find there may be "questionable practice" indulged in by Hospitals and their authorities as well as by private Practitioners, either legalised or unqualified. The Queen's Hospital here is an instance. Its advertisements now occupying the columns of the local press are headed, "Queen's Hospital, incorporated as a Clinical Hospital by special Act of Parliament," and are evidently for the purpose of making a deluded public think that the Queen's is something that the General Hospital is not. The authorities of the latter evidently think so, for they are heading their advertisements "Clinical Hospital" too, but they have no claim to the Act of Parliament. Now, for any Hospital to be a clinical Hospital there is no need of any Act of Parliament, and I therefore declaim against the action of the Queen's Hospital authorities as a great mistake.

They also suspend, outside the building, a large board with the names of their staff emblazoned thereon, and it is proposed to add their private addresses.

I am, &c.,

PHLEGMON.

Birmingham, September 1.

INFANTILE ECZEMA.

SIR,—Pity the sorrows of parents whose child suffers from eczema: the disgusting appearance, the constant cry, the restless nights, the inclination to tear off the oozing crusts from the inflamed face or the heated scalp all drive the mother, the nurse, and the wretched Practitioner all but frantic. A remedy doing good for a time loses effect. One lady suggests—Try Erasmus Wilson, Startin, or Tilbury Fox; another believes in homeopathy; a third insists on a sea-voyage. The clergyman appearing on the scene produces a tattered prescription, given to him in the Underground Railway by a Dublin celebrity. And last, but not least, the retired Physician thus attempts his share of Job's comfort—"My dear madam, the disease is a safety-valve; to check it might be fatal."

Supposing a wet-nurse is procured, she may be of invaluable service, perhaps the contrary. Of course, a girl without the incumbrance of a husband is preferred; but after a time, to shame grown callous, like Jeshurun she may wax fat and kick. Reckless of erysipelas and expense entailed, the married wet-nurse lives but for one idea—bottled stout; and bottled stout *ad libitum* she must have, otherwise it is discovered that the child at home is neglected. The husband, who is always hanging about the premises, growing jealous, threatens to take his wife away just when the sick child is deriving benefit, or else, in a business-like manner, takes to hard drinking.

Most writers define eczema to be a non-contagious catarrhal inflammation of the skin produced by an accumulation of serum beneath the epidermis, in the form of minute vesicles with inflamed bases. Resembling a joint-stock company, these vesicles combine only to burst; and an alkaline fluid exudes. There may be parental history on either side of phthisis, syphilis, rheumatism, hepatic or renal disease. The mother may have suffered from thread- or tape-worms during pregnancy, inducing a feverish condition after delivery; or else, during pregnancy or lactation, undergone mental anxiety. The disease may be hereditary, yet the strong and weak of light complexions suffer equally—one child only in a family sometimes the victim.

On the look out for faulty food assimilation—in other words, the imperfect absorption of fatty matter—we notice the child's head, the fontanelles, the face, the complexion, the tongue, and the gums, not forgetting the conformation of the chest, the suppleness of the arms, the size of the abdomen, and the appearance of the motions. Criticising the hygiene of the nursery, we wonder if the mother, exercising constant supervision, has common sense; whether the drains are all right; and, above all things, if the nurse, taking an interest in the child, is attentive, or else, when unobserved, neglects her charge to pore over "A Terrible Temptation," or write love-letters to Corporal Spurgeon of the "Blues." Of course, vaccination is blamed (and, to tell the honest truth, recent investigations prove that greater care is required in this particular). An eczematous child, when vaccinated, will often develop healthy-looking vesicles; an attack of measles or varicella will drive away the eruption, but, alas! only temporarily. The heat of the sun, exposure to cold, will induce a fresh blaze; and, as each tooth appears, the gum-lancet is in requisition. Ever on the look out for diarrhoea, congestion of any internal organs, or convulsions, let us enumerate the armoury of remedies found by time and experience of service. Sedatives to allay nerve irritation, steel-wine, beef-tea, cod-liver oil, rhubarb and magnesia, mineral acids, bismuth, iodides, arsenic, strychnine, quinine, alteratives, tonics, diuretics. Locally, poppy fomentations, or marsh-mallow; baths of soda, gelatine, milk, and bran; various soaps; ointments of lead, zinc, sulphur, and nitric oxide of mercury; preparations of tar, creosote, carbolic acid, and oil of juniper. But we require the skill of the specialist who plays on one string to help us in diagnosis. In some cases, the biscuits of the immortal Robb (whose

statue ought to be in Leicester-square) will alone effect a cure. Quinine and arsenic will marvellously benefit one child; the local application of benzoate of zinc ointment, the powder of zinc, starch and camphor, or nitrate of silver will cure another; whereas the third child will get well without any treatment.

Quinine, cod-liver oil, bichloride of mercury, Parrish's food, the local application of black-wash, making the food a matter of study as well as correcting vitiated secretions, and trying sea air, would comprise the treatment in many instances. As to sedatives, chloral hydrate or henbane may be reluctantly given, or opiate suppositories cautiously administered.

Matthew Browne tells a story of a shock-headed, wart-nosed tradesman, brandishing a carving-knife, and holding forth thus:—"What does a man go and be a politician for? His own aggrandisement. What makes me go for to keep a ham-and-beef shop? My own aggrandisement!" Just so. Rich old gentlemen suffering from chronic eczema, pray come to Cheltenham; and to prevent delicate mistakes, please understand that no fee under three guineas will be acceptable at Bangalore Villa.

COMMUNICATIONS have been received from—

APPOINTMENTS FOR THE WEEK.

September 16. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 9½ a.m.; King's, 2 p.m.; Charing-cross, 2 p.m.; Royal Free, 2 p.m.; Hospital for Women, 9½ a.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

18. Monday.

Operations at the Metropolitan Free Hospital, 2 p.m.; St. Mark's Hospital for Diseases of the Rectum, 2 p.m.; St. Peter's Hospital for Stone, 2½ p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

19. Tuesday.

Operations at Guy's, 1½ p.m.; Westminster, 2 p.m.; National Orthopædic, Great Portland-street, 2 p.m.; Royal Free, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

20. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1¼ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew's, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas's, 1½ p.m.; Samaritan, 2.30 p.m.; King's College Hospital (by Mr. Wood), 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

21. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; Royal Orthopædic, 2 p.m.; West London, 2 p.m.; University College Hospital, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

22. Friday.

Operations at Central London Ophthalmic, 2 p.m.; Royal London Ophthalmic, 11 a.m.; South London Ophthalmic, 2 p.m.; Royal Westminster Ophthalmic, 1½ p.m.

QUEKETT MICROSCOPICAL CLUB, 8 p.m. Mr. J. G. Waller, "On the (so-called) Boing or Burrowing Sponge."

VITAL STATISTICS OF LONDON.

Week ending Saturday, September 9, 1871.

BIRTHS.

Births of Boys, 1027; Girls, 1028; Total, 2055.

Average of 10 corresponding weeks, 1861-70, 1925.1.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	727	695	1422
Average of the ten years 1861-70	655.2	640.4	1295.6
Average corrected to increased population	1425
Deaths of people above 90

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29.75 in. The highest was 29.99 in. on Tuesday morning, and the lowest was 29.50 in. on Saturday morning.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871. As the population of Dublin and its suburbs showed a decline between the Censuses of 1861 and 1871, the enumerated number in April last has been inserted above for that city, the population being assumed to be now stationary.

ORIGINAL LECTURES.

LECTURES ON EXPERIMENTAL AND PRACTICAL MEDICINE.

By BENJAMIN W. RICHARDSON, M.D., F.R.S.

LECTURE I.

ON THE PHYSIOLOGICAL ACTION OF THE ORGANIC HYDRIDES. (a)

GENTLEMEN,—I am about to-day to invite your attention to some researches on a class or group of chemical organic substances, which, though of singular physiological interest, have not as yet found their way into Medicine—nay, have not until now been under experimental notice for the attempted advancement of Medicine and Medical art. The substances I would name, called by the chemists hydrides, organic hydrides, constitute a very large group, and in the chemical world have been deemed worthy of the most careful investigation and study. At the risk of seeming too elementary, I must venture to introduce a sentence or two respecting the chemical construction and physical characters of the hydrides—their place in nature.

PHYSICAL NOTES.

The organic hydrides are chemical compounds in which the element hydrogen is combined with an organic radical. Hydrogen, in fact, as Gregory puts it, is “the inorganic starting-point of the organic series” to which the hydrides belong. I may take, in the way of illustration, certain of the series which are to come under our notice to-day physiologically.

When carbon and hydrogen combine as CH₃, they yield by the combination the organic radical methyl or protyl. When to methyl is added hydrogen, a new substance is presented, having for its elementary composition CH₃H. This is hydride of methyl or protyl—sometimes called protylen. It exists naturally, and is formed naturally in some places, and is known as fire-damp and as marsh gas.

When carbon and hydrogen unite in another proportion—namely, as C₂H₅—they form the organic radical ethyl or deutyl; and when to this radical hydrogen is added, the resulting compound, C₂H₅H, is hydride of ethyl or deutyl (deutylen).

When carbon and hydrogen unite in a third proportion—namely, as C₃H₇—they form the organic radical propyl or trityl; and when this is united with hydrogen, it forms the hydride of propyl or trityl (tritylen).

When carbon and hydrogen unite, as C₄H₉, they form the organic radical butyl or tetryl; and when hydrogen is added there is formed the hydride of butyl or tetryl, C₄H₉H (tetrylen).

When carbon and hydrogen combine, as C₄H₁₁, they give the organic radical known as amyl or pentyl; and when to the radical hydrogen is added, there is presented the hydride of amyl or pentyl, C₅H₁₁H (pentylen).

Lastly, when carbon and hydrogen unite, as C₆H₁₃, they form the radical caproyl or hexyl; and when to this hydrogen is added, the resulting compound is the hydride of caproyl or hexyl, C₆H₁₃H (hexylen).

The combinations of carbon and hydrogen do not stop here. The carbon in higher series continues to increase, and to form, with the same proportional increase of hydrogen as in the series we have seen, new radicals, on which hydrides may be constructed. To make the matter of construction a little clearer, and to show the relation of the hydrides to other series, here is a short table, in which five representatives of organic radicals—viz., methyl, ethyl, propyl, butyl, and amyl—are placed in groups, showing how, by their combination with different elements, they produce different series. Thus, it is shown that

with hydrogen they give hydrides; with nitrous acid, nitrites; with oxygen, alcohols; with chlorine, chlorides; and with iodine, iodides. The list might be greatly increased, but it is sufficient for the purpose of illustration:—

Old.	Name.	New.	Chemical composition.
Methyl	. .	Protyl	. . C H ₃
Ethyl	. .	Deutyl	. . C ₂ H ₅
Propyl	. .	Trityl	. . C ₃ H ₇
Butyl	. .	Tetryl	. . C ₄ H ₉
Amyl	. .	Pentyl	. . C ₅ H ₁₁
HYDRIDES of—			
Methyl	. .	Protyl	. . C H ₃ H
Ethyl	. .	Deutyl	. . C ₂ H ₅ H
Propyl	. .	Trityl	. . C ₃ H ₇ H
Butyl	. .	Tetryl	. . C ₄ H ₉ H
Amyl	. .	Pentyl	. . C ₅ H ₁₁ H
NITRITES of—			
Methyl	. .	Protyl	. . C H ₃ NO ₂
Ethyl	. .	Deutyl	. . C ₂ H ₅ NO ₂
Propyl	. .	Trityl	. . C ₃ H ₇ NO ₂
Butyl	. .	Tetryl	. . C ₄ H ₉ NO ₂
Amyl	. .	Pentyl	. . C ₅ H ₁₁ NO ₂
ALCOHOLS—			
Methylic	. .	Protylic	. . C H ₄ O
Ethylic	. .	Deutylic	. . C ₂ H ₆ O
Propylic	. .	Tritylic	. . C ₃ H ₈ O
Butylic	. .	Tetrylic	. . C ₄ H ₁₀ O
Amylic	. .	Pentylic	. . C ₅ H ₁₂ O
CHLORIDES of—			
Methyl	. .	Protyl	. . C H ₃ Cl
Ethyl	. .	Deutyl	. . C ₂ H ₅ Cl
Propyl	. .	Trityl	. . C ₃ H ₇ Cl
Butyl	. .	Tetryl	. . C ₄ H ₉ Cl
Amyl	. .	Pentyl	. . C ₅ H ₁₁ Cl
IODIDES of—			
Methyl	. .	Protyl	. . C H ₃ I
Ethyl	. .	Deutyl	. . C ₂ H ₅ I
Propyl	. .	Trityl	. . C ₃ H ₇ I
Butyl	. .	Tetryl	. . C ₄ H ₉ I
Amyl	. .	Pentyl	. . C ₅ H ₁₁ I

Of the members of this tabulated group we return, then, to the hydrides. I have said that one of them—the first of the series—exists naturally, under the names of “fire-damp” and “marsh gas.” It is no uncommon source of dread and of danger to certain of our hard-working populations. The other hydrides exist, also, freely in nature, but not in so diffused and commonly recognised a form. They exist combined in the American oils called petroleums, and from these they may be separated, in fair conditions of purity, by the process of fractional distillation.

The hydrides can also be made in the laboratory by chemical manipulation. Hydride of methyl can be produced by heating together acetate of soda, caustic potassa, and well-dried lime; and we have on the table a large glass vessel filled with the gas made by this process. Hydride of ethyl can be made by exposing, at a temperature of 300° F., iodide of ethyl to zinc in the presence of water in a closed tube; and from the iodides of the respective series all the hydrides can, in a similar manner, be constructed. On the present occasion we have before us carefully made specimens of all the organic hydrides, from the hydride of methyl up to the hydride of heptyl, C₇H₁₅H (heptylen). They have been prepared with much care and labour by Dr. Versman, who has devoted immense time and work to the study of these organic compounds.

When we examine these hydrides we find that those of the series below the amyl hydride are gases. At the amyl series we arrive at a liquid; but see how light it is! It boils vehemently in my hand, and I can set a glass globe of it into active ebullition by merely applying the surface of my hands to the sides of the globe—it boils, indeed, ten degrees lower than the purest ether. This fluid is thin and bright, like water, and it runs like water; but when we take up some of the higher representatives of the group—the hydride of hexyl, for instance—we find that with the increase of weight there is an oiliness of the fluid. The higher hydrides are, in fact, from this circumstance, commonly called oils.

The hydrides are all insoluble in water; they are soluble in ether more than in any other menstruum. The liquid hydrides dissolve many substances, as iodine, bromine, fats. Of this capacity for dissolving some medicinal agents I have taken advantage, as I will by-and-bye explain. The hydrides all burn in the air, the amount of light they evolve increasing as

(a) Lectures delivered in the session of 1867-68; with an appendix of additional researches on a new anæsthetic compound for producing quick general anæsthesia.

the weight of the carbon increases. Thus, if I pass some of this marsh gas—methyl hydride—through a jet and burn it, I get, as you will see, a faint pale light; but if I drive the gas through one of the fluid hydrides and then burn the compound gas that escapes, I get a good light. Finally, on this part, the hydrides one and all have a peculiar odour—an odour essentially their own, which certainly is not pleasant, and which is not easily removed from them.

PHYSIOLOGICAL AND PRACTICAL.

We will pass now to the consideration of the physiological and practical characters of the hydrides, and that I may be clear I will take them up in order one by one. Certain general notes, applicable to them all, may nevertheless be first supplied, by which much labour of detail will be saved.

I have said that the hydrides are insoluble in water; for this same reason they are insoluble in blood. Nevertheless, they do to a certain extent diffuse through blood freshly drawn, and a certain quantity of them is lost in blood as if it were absorbed. We can, consequently, by exposing the vapour of the hydrides to the blood as it courses over the lung, secure that a certain amount of the vapour shall enter the system and produce a physiological effect; but the absorption is infinitely small compared with the absorption of an oxide or of a chloride formed on the same radicals; we find no other ready method of introducing them.

In parenthesis, let me add a thought on the question of gaseous and liquid diffusion of other substances besides the hydrides through the body. There are some substances so soluble, that in whatever way we introduce them—by the skin, by the mucous membrane, by the veins, by the lungs—they will enter readily and pass readily through the tissues by liquid diffusibility. There are, again, substances which, like the hydrides, are so insoluble they will only act when they are introduced by the lung. These latter diffuse by gaseous diffusion; they pass, if I may so say, into the gaseous or vaporous atmosphere of the blood. Into the blood, as a fluid, they do not enter at all, and yet they may produce transient but profound influences on the organism. On this subject of diffusion we have a great deal to learn, both as Physiologists and Physicians.

The hydrides then, as an insoluble class, pass, I repeat, into the body by diffusion, if, when we have transformed them into gases or vapours, we apply them through the medium of the pulmonary circulation in such a manner that they can be absorbed, as we say commonly, into the blood; but the absorption is by gaseous diffusion.

There is another quality of the lighter hydrides that deserves notice. When brought into the most intimate contact with the tissues they produce no local irritation. We may put a fluid hydride—hydride of amyl, for instance—on the tongue, we may apply it to an open wound or abraded surface, and it will produce no pain, no irritation. You will say that this is owing to the insolubility of the substance in the animal fluids. And so at first it seems to be; but then there is the oil known as turpentine, which is equally insoluble, and which, like the hydrides, is made up of the two elements carbon and hydrogen ($C_{10}H_{16}$), and turpentine, we know, is an extreme local irritant. There is something, therefore, more than insolubility concerned in the fact that the hydrides are not irritants; there is something in the arrangement of the components, in their balance or stability, that must account for the phenomenon. Here, once more, is opened for us a new field of investigation.

METHYL HYDRIDE.

Synonyms: Protyl Hydride—Protylem— CH_3H .

Methyl hydride exists as a gas, the vapour density of which, taking hydrogen as unity, is 8; in other words, it is eight times heavier than hydrogen. It has a faint odour, but it can be breathed in the undiluted form, for a short time, without difficulty or discomfort.

In order to see the action of methyl hydride it is necessary to administer it freely—at least, 35 per cent. of it is required in the air to be breathed before the effects it causes are fully manifested. If it be wished to produce a rapid action, the proportion of gas to air must be greater than that I have named—if it must be 70, or from that to 80, per cent.

There is here a square chamber of glass. I have charged it with seventy-nine parts of methyl hydride and twenty-one of common air. I will now let into this chamber a pigeon and a guinea-pig. You see that without any excitement the animals quickly begin to pass into sleep; they sink down into the most placid sleep, and they seem as if they were dead. I

take them, however, out of the vapour before the respiration has positively stopped, and in the matter of a second or two they return to consciousness, the muscular power also returning as perfectly as ever. Well, this is the action of the gas at all times, and on all animals, as far as I can discover. By diluting the gas more freely with air the period for the production of anæsthetic sleep may be prolonged, but the result is what we have just observed—a deep, brief, anæsthetic sleep; deep because the diffusion of the gas into the body has been free; brief because the gas, owing to its insolubility, has been held in no close physical bondage, has entered into no combination in the organism. If gases were practical agents in the way of administration, the methyl hydride might be employed for the purpose of inducing general anæsthesia for short operations. It would be very effective and very safe. But it would be troublesome to make and keep and transport on a large scale, and it would require a cumbrous apparatus for its administration. We may, consequently, dismiss it from our minds as a narcotic applicable to the daily service of the Physician.

There are, notwithstanding, two or three practical subjects connected with this gas that are most useful to be known. In the mine, when the gas is evolved in large quantities, it becomes sometimes a cause of death. It is fire-damp, and, without explosion, it will kill by the same process of narcotism we witnessed in our experiment a few minutes ago. Of this mode of death we may feel assured that, whenever, unhappily, it occurs, it is one of the most painless of deaths. The death must be as easy as the process of going to sleep, and it is probably completed without so much as a struggle. It thus happens that, after this mode of death in the mine, the spectators who first view the sleeping dead are struck by the placidity of the expression of the dead. The bodies are seen in the position usually assumed during sleep—the trunk and extremities gently flexed, the muscles of the face calm and peaceful, the whole cast that of a sleeper in profound and undisturbed repose. When we read of a body of men having been suffocated with fire-damp, the sorrow arising from the narrative may, therefore, be tempered by the reflection that the death was euthanasia, and was less painful than death is in general amongst humankind.

To this assurance two other encouraging facts may be added. In death from methyl hydride the percentage of the gas in the air inspired must be very large. For this reason it is possible to live for a long time in a moderate mixture of the gas with air without being conscious of any peculiar effect; whilst recovery from even extreme effects of it is nearly instantaneous when air is freely readmitted. In cases, therefore, where a catastrophe from fire-damp has happened, no effort can be too prolonged on behalf of the sufferers. Hope, in such instances, should be sustained beyond hope; for the narcotic air that lays the man in prostrate sleep will kill only by sleep, will not kill with violence, and may fail to kill altogether.

From the negative character of this gas, from its insolubility, it is easily carried out of the body. We have to-day witnessed this truth. It ought thereupon to be remembered, as a sequel and a practice, that the means for promoting recovery from the influence of the gas, when life is not extinct, are simplest of simple. The first and most important measure is artificial respiration. When the breathing has actually stopped for three or four minutes after the seemingly fatal inhalation of the gas by the lower animals, respiration may be restored by artificial inflation of the lungs; and in cases of death from fire-damp, when the human life appears to have been extinguished by the breathing of the gas, the process of artificial respiration ought to be as sedulously sustained as after death by drowning, the result being much more likely to prove a success. Together with artificial respiration, warmth—the warmth of a room filled with fresh-heated air—is of moment as a remedy; and near to every mine there ought to be a receiving-room, ready supplied with warm air, and with a simple double-acting bellows for sustaining artificial respiration.

The day will probably come when some advance will be made in the art of restoring animation at considerable periods of time after what is now called actual death; and when that day arrives there will surely be no form of suspended animation so easy to treat as that from fire-damp. The heart under the influence of this gas outlives the respiration; the lungs are subjected to no extremity of congestion of blood on the one side, nor of exhaustion of blood on the other; the muscles are cast into no spasmodic strain; the nervous centres are oppressed with no extreme tension; the blood is saturated with no soluble poison. Indeed, as an animal killed by this gas lies dead before us—actually dead, so far as we now know about death—it is

hard to believe, either from external or internal evidence, that the death has inexorably taken place.

So much for methyl hydride when it is met with in mines as fire-damp. But we have not yet done with it; it also has an interest to us as marsh gas. In marshes, especially where the soil is of peat, the gas forms in large quantities; and for centuries past, long before the chemical nature and properties of the gas were at all known, it was supposed to be a true malarious poison, the cause of marsh fever.

I wish at once to dispose of this long-sustained and popular theory. It is no doubt correct, that in places where marsh gas is abundant, malarious fever is prevalent and endemic. It may be that the marsh gas is sometimes a carrier of true malarial poison—I mean that the actual poison, with water vapour, may be diffused through the gas; or it may even be that the presence of the gas in the atmospheric air is, after a long time, injurious to those who breathe the air. But, all these admissions made freely, the fact remains that the gas itself is in no sense of itself a malarious poison, and the theory that assigns to it malarious qualities is utter error. From direct observation I know that the gas may be breathed in the proportion of not less than 35 per cent., and although it produces temporary symptoms of drowsiness, sleep, and muscular prostration, it is harmless in other respects, and produces certainly no after-symptoms of a pyrexial character.

ETHYL HYDRIDE.

Synonyms: Deutyl Hydride—Deutylene— C_2H_5H .

Ethyl hydride is, as we see, a gas, at ordinary temperatures. Its composition is C_2H_5H ; its vapour density is 15, as compared with hydrogen; it has the odour peculiar to the hydrides, but in a very faint degree; to some it seems inodorous. I have several times breathed this gas, and find that, like methyl hydride, it is narcotic in action. Animals placed in it, when it is mixed with air in the proportion of 75 per cent. of gas to 25 air, are quickly and safely rendered insensible to pain and consciousness; they also recover rapidly from the narcotism. The action seems to me to be almost negative in its character. When the hydride kills, the death is, I also think, rather to be considered as due to the deprivation of air than to the active agency of a chemical substance on the circulation or on the nervous centres.

In any attempt to utilise ethyl hydride for the purposes of the practising Physician, we must either apply it as a gas or condense it in ether or amyl hydride.

PROPYL HYDRIDE.

Synonyms: Trityl Hydride—Tritylene— C_3H_7H .

Propyl hydride exists at ordinary temperatures as a gas. Its composition is C_3H_7H . Its vapour density, compared with hydrogen, is 22. Its action, physiologically, may be considered as practically identical with the next of the series, to which we now turn—viz., butyl hydride.

BUTYL HYDRIDE.

Synonyms: Tetryl Hydride—Tetrylene— C_4H_9H .

Butyl hydride exists, at ordinary temperatures, as a gas; but it may be condensed to the liquid condition by cold; and in the next representative of the series, amyl hydride (on which I shall have to speak at greatest length), it is always present, unless the amyl hydride is distilled over at the temperature of its own boiling-point. This butyl hydride has for its composition C_4H_9H . The density of its vapour is 29 compared with hydrogen. It is of the same faint odour as ethyl hydride. When butyl hydride is inhaled, it produces sleep and unconsciousness, like as we see produced by the two lighter hydrides; but the quantity of vapour required to produce a decided effect is less by one-fourth. The action of this gas reminds one very closely of the action of nitrous oxide; it asphyxiates if it be long continued, and causes the convulsive movements of asphyxia. This gas is also negative in action, and when it kills, the destruction of life by it is mainly due to simple exclusion of air.

AMYL HYDRIDE.

Synonyms: Pentyl Hydride—Pentylene— $C_5H_{11}H$.

I bring you now to the hydride which, as far as we yet know, is of most importance to us in our practical work—amyl hydride. I believe the day will come when amyl hydride will be as well known in the surgery and in the laboratory of the pharmacien as olive oil, ammonia, alcohol, or ether are now known; and I feel no small pleasure in being the first specially to recognise and point out its usefulness. For though it may seem a little and perhaps a childish thing to lift up

to consideration a bottle of simple fluid like this, yet when a fluid as simple, even, as water itself is found to have everyday applications, it becomes a useful act to have picked it out from a host of other apparently more precious substances, and to have fitted it into its true place and service for mankind.

Amyl hydride is, as you will observe, the first of the organic hydrides of the group we are studying that comes to us in the liquid form. As a liquid it is beautifully clear, mobile, and transparent. It gives no oiliness to the touch, and it is absolutely innocuous when applied to the skin or mucous membrane. If I pour an ounce of it out into a beaker and try to swallow it, it passes into vapour in my mouth with such vehemence that it boils and bubbles over furiously, but it does no harm whatever; and if a little of it be actually swallowed it does no real harm—it distends the stomach, and acts like other gases that produce flatulency, but inflicts no injury on the mucous surface.

The composition of the pure hydride of amyl is $C_5H_{11}H$; for brevity we may write it C_5H_{12} . It boils at a temperature of $30^\circ C.$ (86° Fahr.). It has a specific gravity of .625 (the specific gravity of water being 1.000), and the density of its vapour, taking hydrogen as unity, is 36—that is to say, it is thirty-six times heavier than hydrogen. When very pure it has a very faint odour, so faint that some say it is positively inodorous; but there is a difference of opinion on this point, due obviously to a difference of the olfactory sense in different individuals. Hence I have met with those who say the substance gives a sickly and even unpleasant odour, like that of the lily.

The vapour carries with it the perfumes and odours, mild or pungent, of other substances with singular efficiency. A mixture of ammonia and the hydride, made by passing vapour of ammonia through the hydride, is intolerably pungent—keener than ammonia itself. The sweet-smelling odours of the verbena and rose are carried by it most perfectly, and, to be brief, it might be made the basis of all scents and fragrant essences we use artificially.

Amyl hydride may be derived from two sources: it may be made in the laboratory, and it may be found in a tolerably pure state in nature. I will speak of the artificial product first:—

We have seen that when iodide of ethyl is brought into contact with zinc in the presence of water there is formed ethyl hydride. A similar process is followed in the manufacture of amyl hydride, the difference being that amyl iodide, of which I send round a specimen, is the substance exposed to the zinc in presence of water instead of ethyl iodide. The substances are subjected for several hours to a heat of 288° Fahr., and the products are then very carefully distilled over. There results from the distillation two products—amylene and amyl hydride. They pass over in the fluid state, and in combination with each other.

We are already familiar in Medicine with the substance called amylene. It is the agent introduced by the late Dr. Snow for the production of anæsthesia, and once, as it seemed, was about to take the place of chloroform. Why it failed is not a question before us at the present moment; we have now only to think of separating it from the amyl hydride.

The combined fluids distilled over into the retort are next treated with caustic potassa, and are left in contact with it for a period of twenty-four hours. At the end of that time the retort is placed on a water bath at a temperature of 95° Fahrenheit, and the fluids are distilled over again in combination. The distillate thus obtained is next placed in a flask or retort surrounded by a freezing mixture, and when completely chilled it is treated with anhydrous sulphuric acid, which retains the amylene. Lastly, the hydride of amyl is distilled over as a separate and distinct product. For this elaborate process we are indebted to Dr. Frankland.

To be obliged to obtain amyl hydride for extensive practical purposes by this process would be, good as the process is, to exclude the product from us for general daily use. Fortunately, we find it given to us by nature on a large scale, and are therefore independent of the chemist for its steady supply.

It has been known for some years past that amyl hydride forms part of the oils known as American petroleum oils, and from these it has been separated, as the lightest of the class, by the process of fractional distillation. We have it sent to us in large quantities from this source, but not actually pure. It contains, as we receive it, some lighter hydrides condensed in it, and some heavier mixed with it. By careful distillation it may, however, be cleared of these; and I can send you round for inspection a specimen from our friend Dr.

Versman's laboratory so pure that it serves all the purposes of our research. It answers, too, all the physical qualities that have been assigned to the hydride, and it is most pleasant to inhale. Soon after the introduction of ether spray a light petroleum was brought to me as a fluid that might take the place of absolute ether for the production of intense cold by means of my spray apparatus. The fluid had been used thus, I learned, by Dr. Bigelow, of Boston, United States, and it was called rhigolene. I tried the fluid with the spray apparatus, and found, indeed, that it answered well—I may say, too well, for the freezing was instantaneous, limited, and evanescent. I heard, at the same time, that the vapour of the substance had been tried for the production of general anæsthesia by inhalation, but I was unable to obtain any details on this last-named subject. Sufficient, nevertheless, came before me to make me sure that the agent I had in my hands would prove of service. I found it was an impure but fair natural specimen of amyl hydride, having a specific gravity of .649; and from it I started on the line of research that is now being narrated.

Practical Applications of Amyl Hydride.

Anæsthetic Ether for Local Anæsthesia.—The first application studied had relation to the production of a new fluid compound for local anæsthesia by the spray process. The hydride having been found soluble, in all proportions, in rectified ether, various combinations of the two fluids were made, and the effects registered. In freezing with the spray, it is not the best practice to freeze too rapidly, for if the superficial parts be instantly frozen, the layer of frozen surface acts as a non-conductor, and deeper freezing is rendered impossible. At the same time, the practice is bad that delays the freezing process too long, since delay gives pain in the act of freezing, and pain during reaction. The point to find, therefore, was the correct medium or proportion between ether and the hydride for the end held in view. After many experiments and many applications for operation on the human subject, I find that a mixture of one part of the hydride to four parts of ether is the most effective and ready fluid for spray. I call the mixture "Compound anæsthetic ether for local anæsthesia." As a rule, this compound induces, in the form of spray, perfect insensibility of the skin in from ten to twenty seconds of time. It gives less pain than ether, when applied to a cut or open surface; and in operations upon the teeth it is much better in action than the best ether used alone. It may be diffused into the mouth, as spray, with perfect safety, having no quality that needs to be dreaded. Once or twice during long operations on the mouth, and when the compound vapour given off from the spray was unavoidably inhaled freely, there was produced general insensibility, but this was rather favourable than otherwise to the operative procedure.

Solutions.—I have said that the hydride of amyl is a solvent of many medicinal substances; and this fact has led me to use it in medicine, as a solvent, in various ways. I show you some of the compounds thus formed.

Iodized Hydride.—Iodine dissolves readily in amyl hydride, and produces, in the proportion of twenty grains to the ounce, a solution of great service in practice. When this solution is applied to the skin, the volatile hydride passes off at once as vapour, and leaves the iodine, in considerable quantity, behind, stranded on the part in most equal form of distribution. This application is of singular utility in cases of hard open sores, where it is desired to apply iodine evenly and deeply. Thus, in cases of open strumous glandular disease, the solution plays an important part as a means of cure, and the same in chronic indolent bubo. In bad sloughing fetid ulcerative and suppurative wounds, and in cancer, no solution is so simple, painless, and effective. In these last-named cases the iodine exerts more than a curative influence—it deodorises; it destroys decomposing organic products; it prevents the absorption of decomposed products, and protects against the secondary fever depending on such absorption. In applying the solution in the cases named, it may be gently poured over the part. There is necessity neither for cotton-wool nor for the brush.

From the iodized solution of the hydride, iodine itself may be inhaled with advantage in cases of ulcerated throat, and in cases of cavity of the lung. Indeed, whatever value in the treatment of phthisis and of bronchial phthisis there is in iodine, it is best obtained by the mode of administration now being described. Of course we have amongst us much difference of opinion as to the actual value of iodine inhalation, and I do not suggest this method in support of any one particular opinion. I hold my own view, and in favour of the practice in fitting cases, but I wish, for the moment, merely to describe a ready method of applying the practice, so that all

who wish may adopt it. In using the twenty-grain solution for inhalation it is best to dilute it with more of the hydride until the vapour of the iodine given is scarcely at all irritating to the throat. The patient's own sensations on the matter are here the best guide, and with a very little instruction it is easy to secure that five grains of iodine shall be inhaled at one time. There is not the least occasion for hurry or for causing the slightest constriction of the fauces or pain. I usually administer from a little funnel of parchment paper, holding in it some finely teased cotton-wool, on which I drop the solution. From this funnel the patient breathes, holding it a short distance from the nostrils and mouth, so as to allow the admission of plenty of fresh air.

The solution of iodine in amyl hydride has another application, adapted this time not to the sick person, but to the chamber of the sick. There is no agent at one and the same time so potent for purifying the air of the sick-room as iodine. I introduced it several years back for purifying the air of the room or ward in which sufferers from small-pox are lying; and from all parts of the world, but from India especially, I have received recognitions of the value of the practice. But there has always been some difficulty in carrying out the process. Diffusion by volatilisation of the metalloid itself from a chip-box covered with muslin—a method invented by that able Surgeon, Mr. Hoffman, formerly of Margate—although it is in many cases most effective, is in most cases too slow, and, if I may use such a term, too local; while the plan of driving off the iodine by heat from a porcelain or metal plate is not a plan to be safely entrusted to a nurse. But with the volatile iodide solution all difficulty subsides. We take a packet of ordinary filter paper, the paper being cut into pieces three inches in diameter—in fact, cut as it is sold from the chemical storehouses—and on to a packet of one or two dozen, or more, of such papers we pour the solution until all the pieces are fully saturated with it. Then the papers are allowed to dry; they dry very quickly, and are put into a box ready for use. We give a dozen or so of these papers to the nurse, and tell her to keep some of them exposed to the air in two or three places about the sick-room, so that the odour of iodine may be faintly recognisable through every part of the room; and this done, all is done for ordinary circumstances. To meet any unusual unpleasantness of the air, the nurse may take one or two of the papers and burn them like a taper or spill, when the deodorisation will be the more rapidly and determinately carried out.

In instances where a room or ward has been occupied by infectious cases, and it is required to purify quickly and effectively, the iodized hydride may be used in the form of spray. The spray-producer to be employed must be constructed of glass, as a metal spray-tube is injured by the solution. Siegle's simple tube answers for the purpose well. It is advisable before using the solution to have the room to be disinfected completely stripped of all furniture, the walls rubbed down, and the floors well swept, scrubbed, and dried. Then, from different positions in the room, the iodized hydride should be distributed in spray. The solution containing twenty grains to the ounce is strong enough. The room should have all its windows and doors closed before the iodine is distributed, and the quantity of solution sprayed should be measured. Practically, I find that one ounce of the solution to four square feet of space is a good adjustment of quantity to space. After the iodine has been distributed from the spray-producer, the room should still be kept closed for twenty-four hours at least; during this time the iodine deposited, at first, in the finest layer on the floors, ceiling, and walls slowly volatilises, and, coming into contact with the organic matter, destroys it rapidly. It is prudent not to take a light into the room after the distribution of the solution, until the windows and doors can be reopened, as the amyl hydride vapour easily takes fire.

The most persistent and offensive odours in rooms that have been occupied by the sick may, by this simple method, be more speedily purified than perhaps by any other known method. In asylum practice we get the most difficult of tasks of purification; for, from the bodies of the insane, organic compounds—probably of the sulphur class—diffuse and permeate everything, yielding the most offensive smells. As products of disease, these, perchance, have not a little to do with the unhealthy condition and physical derangement of the bodies from which they are emitted; and when they once fix in an apartment or room, they stay with a perseverance that is wonderful. I was consulted quite recently, at a house I visited, respecting a room of the house in which an epileptic man died, even months ago. This patient, during his fatal illness, suffered from profuse perspirations giving off the most offensive odours,

and still in the room where he had lain, despite all efforts at cleansing it, there was distinct evidence of the odour. To remove this unpleasantness there is nothing approaches iodine, as asylum experience has proved, and the best way of applying the iodine here, again, is by the spray process described. But when the process is being carried out, it must be carried out thoroughly. If the room be opened too quickly, and air be admitted so as to create too speedy a diffusion of the iodine, the cure will only be temporary, and after a lapse of three or four weeks the odour will be once more distinguishable; for these organic odorous products, if they be not absolutely destroyed, release themselves in time from the destroyer, and, being less evanescent, proclaim that the victory over them is incomplete.

In the course of my next lecture I shall consider amyl hydride as a general anæsthetic.

ABSTRACT OF CLINICAL LECTURE ON ACUTE ABSCESS; SINUSES.

DELIVERED JANUARY 26, 1871.

By CHARLES F. MAUNDER, M.R.C.S.,
Surgeon to the London Hospital.

GENTLEMEN,—During my last in-taking week few cases of high-class Surgery were admitted, but many examples of minor Surgery were taken in. Now, although at first sight you may think these latter cases of trifling importance, yet, since they are the kind of case which you will more commonly meet with in private practice, I should advise you to study such with care; and it is to some of these that I shall direct your attention to-day. The first two, of which I have the notes by Mr. Kebbell, are examples of acute abscess.

Case 1.—To avoid being tedious, I may briefly tell you that a child fell upon an iron fender, and struck her cheek violently, a few days ago. Suppuration resulted, both in the cheek and under the jaw. You saw me open one abscess through the mouth, and the other through the skin.

Case 2.—In the case of a young woman the history is negative, but she had been much exposed to cold of late. The notes tell us that she had a pulse of 134; respiration, 38; temperature, 102.4°, on January 3. On January 4 I opened the abscess, and on the following day her temperature had fallen to 98°, showing a rapid improvement. On January 13 she is well.

The first thing we have to determine is—What is an abscess?—A circumscribed inflammatory swelling containing pus. What is the cause?—In the case of the child a blow was received, and we may be readily satisfied with that explanation; but in the instance of the young woman the etiology is not so apparent. You are aware that in instances of suppuration in regions containing lymphatic glands I am in the habit of advising you always to look for the cause of such suppuration to some source of irritation located in parts whence the lymphatic vessels entering those glands proceed. Now, in the large majority of instances, you will find that such source of irritation, and the cause of the suppuration, is evident. How, then, are we to account for this abscess? We must, I think, ascribe it to cold. She is a weakly-looking, anæmic subject, and I must ask you to believe that a current of cold air, impinging upon her neck and followed by great local reaction, was a sufficient cause.

How is an acute abscess generated? A part being sufficiently irritated, great congestion occurs, and with this effusion of inflammatory lymph. On examining a part thus involved (the skin and subcutaneous tissue, for example), it feels hot, somewhat fleshy, reddened and swollen, and the subject of it complains of pain. The child's case was a good illustration. After the lapse of a day or two the swelling is less diffused, and the other symptoms, with one exception, more marked. The fleshy induration is replaced by a soft elastic state of the centre, indicating the presence of matter. Some portion of the inflammatory lymph, instead of being absorbed, has degenerated into pus.

Treatment of this Superficial Abscess.—If the pain be not great, and the constitutional disturbance *nil*, the application of a hot poultice will suffice; and this will relieve pain and promote "pointing." By "pointing" is meant a tendency on the part of the abscess to discharge itself; and this it does by what

is termed "progressive absorption," all the structures between the pus and the surface being disposed of with the exception of the cuticle. This latter having desquamated, the abscess has opened spontaneously. But there are circumstances under which it is not desirable to leave the case to nature, as when there is much constitutional disturbance; when it is situated on the neck or face, especially of the female, whom it is desirable to disfigure as little as possible. You will therefore make your incision small, and, if the abscess be seated on the cheek, try to puncture it within the mouth. The child under consideration has had two abscesses—one below the base of the lower jaw, which I could not reach from within the mouth, and therefore opened by small incision externally; the other, in the cheek, I evacuated by incision through the mucous membrane, the scalpel being guided to its destination by a grooved needle previously inserted.

Treatment of Abscess under a Deep Fascia.—The case of the young woman will contrast with that of the child. We found her with a large painful fluctuating swelling in the left side of the neck, the skin over it being scarcely, if at all, altered; and her temperature was high. I at once proceeded to open the abscess. It did not occur to me to delay for two reasons: she was the subject of traumatic fever; there was no sign of pointing, and, if left, the pus would probably burrow in various directions, and cause great mischief. It appears that fasciæ are slow to yield to progressive absorption, and therefore the knife is often required. I selected, also, the most dependant part of the swelling, and opened it by a small incision just above the clavicle for two reasons—first, to favour the flow of pus in accordance with gravity; and secondly, that the scar might be under cover of her clothes. The notes indicate the success of the treatment, the patient being soon quite well.

There is one other case to which I will allude, and of which the notes are also by Mr. Kebbell.

Case 3.—The patient, a healthy-looking young man, strained his groin some months ago; suppuration followed, and the resulting wounds have persisted. On admission three sinuses, varying from one and a half to three inches in length, existed.

Now, these sinuses are sequæ of abscess, the abscess in this case, as is not infrequent in the groin, being the result of strain, and not of a distant local irritation, as already referred to. Why do they not heal? It is not easy to say, unless, being situated in the flexure of a joint, and the patient being actively employed, repair is interfered with by the movements of the limb, and the granulations at length become indolent.

Treatment of Sinus.—Various methods may be employed—such as the careful dressing by means of compress, strapping, and bandage, so as to keep the walls of the sinus in contact, and thus prevent accumulation of pus; the injection of stimulating lotions, as the nitric acid, the carbolic acid, the iodine, etc., and simple slitting. But the radical and most expeditious means of cure is that which you saw me employ. I slit up these sinuses on a director, and carried my incision at either end of the sinus some half inch into the sound structures, to form a channel for the ready flow of any future secretion, and to prevent bagging at the extremities. Then, with a pair of scissors curved on the flat, I cut away to a level with the healthy skin the thinned and overhanging integuments of either side. In this way an open wound resulted, almost level; and this, as you have seen, has nearly healed by cicatrisation from the edges of the sound skin. It is important for you to know when it is necessary to use the scissors as I have described. It is when the sinuses appear to run close under or in the substance of the skin itself, rather than deeply in the subcutaneous tissue. The roof of the sinus will be found to be very thin, and when slit up each half will have a tendency to curl, and so, if left, to form two sinuses instead of the original one. Sinuses connected with strumous glands of the neck may often be cured by this method of treatment.

THE LATE MR. JACKSON, of Shoreditch and Northumberland-park, Tottenham, has bequeathed the sum of £10,000 to establish in Shoreditch a soup kitchen, and a Cottage Hospital to make up four beds; the housekeeper and Surgeon to be paid.

A BRANCH of the "Association for Promoting the Extension of the Contagious Diseases Acts to the Civil Population," has just been formed in Hereford. The following members of the Profession have given in their names:—Dr. Bull, Messrs. Vevers, Thomason, Lane, Hanbury, Griffiths-Morris, and H. C. Moore. In addition to these are cleric and lay names of considerable influence.

ORIGINAL COMMUNICATIONS.

CASES OF ACUTE CEREBRAL DISEASE,
WITH AUTOPSIES.

By W. H. BROADBENT, M.D.,

Physician to St. Mary's Hospital and the London Fever Hospital.

THE principal object in placing the following cases on record is, that they may contribute to the elucidation of the diagnosis of the various forms of acute cerebral disease. It is not easy when acute head symptoms come on in an adult to form a definite opinion either as to the nature—*i.e.*, whether tubercular or not—or as to the seat of the disease. Much that has been stored in the memory from books is speedily unlearned at the bedside, and a disagreeable uncertainty results. On the one hand, after a train of symptoms superficially similar, different pathological conditions are met with on post-mortem examination; on the other, after differences in clinical history which seem to point to diverse morbid changes, the appearances after death are very similar. What is needed is that by careful observation the characteristic features of any given class of cases should be, if possible, definitely ascertained, so that it may be withdrawn from the general chaos, and to this end an invaluable aid has been found in the ophthalmoscope, for the introduction of which into Physicians' practice we are indebted to Dr. Hughlings-Jackson and Dr. Allbutt.

An indefinite diagnosis is necessarily attended with uncertainty in prognosis. I have seen cases apparently as grave as those here related recover under various methods of treatment; but so long as no clear idea can be formed of the disease which has yielded to one or other remedial procedure, we cannot confidently make our choice when similar cases come before us. It would be much more satisfactory if we could replace the vague suggestions of experience, valuable as these may be, by the definite conclusions of knowledge.

Case 1.—Sero-purulent Effusion into Ventricles of Brain—Obscure Symptoms.

Emma B., aged 25, was admitted into the London Fever Hospital, under my care, April 19, 1871. She had been ill five days, the attack beginning with rigors and pains in the limbs. On admission she was in a state of rather high fever; skin hot; tongue furred, but moist; bowels not loose; pulse 102; herpes on lips and left cheek. On the 21st she perspired freely, and on the 22nd she felt better; the skin was cool, pulse 78, tongue cleaning. So far the case looked very like one of relapsing fever, but on April 23 severe pains came on in the legs, back, and head, heat of surface returned, the pulse rose to 114, and she vomited. These symptoms persisted, the pain in the head gradually becoming the prominent feature of the case. The bowels were rather loose for a few days, but no spots were seen.

May 2.—Acute pain in head, chiefly frontal; no sleep. Bowels quiet; tongue moist, with thick yellow fur; pulse 102. Expression that of suffering; brow contracted; much moaning; efforts to answer questions evidently painful. Blister applied to each temple.

5th.—Less pain in head for the last day or two. Found to be shivering. Extremities cold; face blue; pulse weak; motions liquid, and passed in bed. Hot bottles applied. Brandy (6 oz.) ordered.

6th.—Skin hot; pulse 114, weak; tongue moist, furred. Marked internal strabismus of right eye. Abdomen contracted.

7th.—Vomited this morning. No pain in head. Sleeps more. Takes fluid food well.

8th.—More vomiting. Quite conscious and rational, but very listless; lies on back with eyes half open; sleeps well. Bowels open loosely once a day; urine and fæces passed in bed.

10th.—Sweating freely.

11th.—Expression brighter; strabismus, which had varied in degree, now pronounced; pupils dilated and sluggish; has free use of limbs. Urine and fæces passed involuntarily.

15th.—No strabismus; pupils smaller. Bedsore rapidly forming over sacrum. Patient greatly emaciated.

28th.—Better. Quite sensible and brighter; apparently gaining flesh. Bedsores granulating. Strabismus again.

June 2.—Always says she feels better. Sores healing; less emaciation; convergent strabismus still present. Has been able to take very little of a chop ordered for her some days since.

14th.—Much in same state, but thinner; no appetite for

solid food. Bowels loose; has a little cough; pain in head again complained of.

From this time she gradually became worse. The pain in the head was continuous and severe, so that she cried out on account of it, especially when she was disturbed. The emaciation became extreme, the bedsores worse, and she died worn-out on June 30. Until she sank into unconsciousness at the last, the intelligence was not obviously affected, and there was no paralysis. The eyes were repeatedly examined with the ophthalmoscope, but no morbid change was discovered. The choroid seemed to become anæmic during the last few weeks of her life.

Post-mortem Examination.—Thoracic and abdominal viscera small and anæmic, but free from disease, except that a few tuberculous nodules were found in the apex of the right lung. No affection of Peyer's patches. Brain: Upper surface of hemispheres anæmic. Fine injection of vessels of pia mater on under-surface; opacity about inter-peduncular space, especially over the posterior perforated space, the minute vessels here entering the brain having a pink tinge, and the interspaces containing fluid. In right Sylvian fissure remarkably fine injection of minute vessels; pia mater in left Sylvian fissure anæmic. No tubercles visible to naked eye anywhere. Brain-substance firm; numerous vascular points; a general pinkish tinge. All ventricles—fourth included—large, containing a considerable quantity of turbid fluid; in the posterior cornu of the left lateral ventricle a distinct layer of pus. Lining membrane of ventricles, and especially of the third, thickened and gelatinous-looking. Choroid plexuses large and dark-coloured; vessels on under-surface of corpus callosum and venæ Galeni remarkably injected.

I regret that in this case a persevering mercurial treatment was not tried. My experience leads me to think it might have prevented a fatal termination. It was not adopted partly because the case was looked upon as tubercular and the patient was so greatly emaciated, partly because the temporary amelioration seemed to offer hopes of recovery.

Case 2.—Basal Tubercular Meningitis.

Rachel G., aged 20, a stout, florid young woman, a domestic servant, was admitted July 31, 1871. No definite information could be obtained as to her previous history, or as to the duration of her illness, except that she had been ill at least four or five days. The face was flushed, the expression that of suffering; she complained much of headache; she answered questions, but not readily. Pulse 108, weak; tongue—a dry brown streak down the middle, no rash.

August 1.—Lies on right side, with head thrown back—the head sometimes carried so far back as to overhang the edge of the bed. Face deeply flushed; moans a good deal and tosses. Takes no notice; when urged to do so can answer questions correctly, some requiring exercise of memory, but slowly and with obvious effort; soon fatigued, closes eyes and moans. No history of illness could be got from her. No paralysis; swallows badly; pupils dilated, equal; optic discs small, well defined, not abnormally red; vessels distinct; veins large; tongue furred, dry in centre; sordes on teeth. A dark-coloured loose stool had been passed in the morning.

2nd.—General condition much the same; a deep circumscribed flush on cheeks; ptosis of right eyelid; right limbs apparently more helpless than left, falling more helplessly when raised; no distinct paralysis. Pulse 100, weak; pupils widely dilated, equal. During the night of the 2nd she got upon her hands and knees, and beat the pillow with her hands, as if in agony. Died on the morning of the 3rd.

Treatment.—Chiefly blisters to nape of neck and scalp, and careful feeding.

Post-mortem Examination.—Head: Veins on surface of hemispheres very full; pia mater minutely injected, and of dark-red colour; a little opalescent effusion along some of the sulci. At the base, the optic commissure and tuber cinereum completely hid in firm yellow exudation, which extended for a short distance into the anterior median fissure, near the optic commissure. Both the fissures of Sylvius glued up by exudation, especially the left, in which the vessels were more injected; in both there were numerous minute opaque granulations on the vessels. Over the posterior perforated space the exudation was not quite so abundant or so yellow as about the optic commissure; the origins of both third nerves were involved in it. The exudation extended round the crus cerebri, especially on the right side. On the ridge of the cerebellum, again, was a layer of firm yellow lymph, extending down over the crus cerebri. Granulations and minute injection of vessels in calcarine fissure of both sides. Brain substance firm; much turbid fluid in ventricles; no softening or exudation.

Case 3.—Disease of Temporal Bone—Abscess in Temporo-sphenoidal Lobe of Brain, opening into Ventricle—Prolonged Suppuration in Ventricles.

The patient, a woman, aged 25, six months advanced in pregnancy, was admitted May 26, 1871. For thirteen weeks previously she had suffered from pain in the right ear, from which there was an offensive discharge, and in the back of the head; and she had recently fallen into the condition in which she was found on admission—*i.e.*, semi-conscious, delirious, unable to give an account of herself, or to answer questions. She would put out her tongue when told to do so, and followed people about with her eyes. She vomited frequently; the bowels were confined. Skin hot; pulse 120.

May 29.—Convergent strabismus of right eye, and this pupil larger. Right half of face, including forehead and chin, deeply flushed up to mesial line. Limbs moved freely, and a pinch on either arm felt. Patient lies on back or on left side. Still vomits frequently.

31st.—Lies on back, with head thrown back and face turned to left; screams when turned on right side; moans frequently, and occasionally there is retching or a peculiar hiccough, no actual vomiting; eyelids open, unwinking, and eyes dancing; convergent strabismus of right; this pupil larger than the left. On ophthalmoscopic examination, the optic discs were seen to be more pink, and the fundus of the eye generally more red, than usual; no other abnormal appearance. When drink given the eyes widely opened in peculiar way. Pulse 160; temperature 101° F.

She died at 3.30 a.m., June 2, the temperature at 9 p.m. on the previous evening being 105° F.

On post-mortem examination the upper surface of the cerebral hemispheres presented no abnormal appearance, and the sinuses were free. There was much turbid fluid about the base of the brain, on the right side, and especially beneath the tentorium. As the right temporo-sphenoidal lobe was raised from the middle fossa of the cranium, an abscess in its substance was opened by the adhesion of the surface and membranes to the outer part of the anterior aspect of the petrous bone at the situation of the tympanum. Here the bone was extensively carious, and the tympanic cavity was opened. The bone, dura mater, and surface of brain were blackened. The convolutions below the parallel sulcus were flattened by distension occasioned by the abscess, from which much thick yellow pus escaped. The pons and medulla were completely enveloped and concealed by a thick layer of yellowish-white consistent pus, which was not removed by a forcible stream of water. It extended as far forwards as the posterior perforated space, and downwards into the spinal canal; over the back of the medulla it was continued into the fourth ventricle, from which, in fact, the pus had issued. When the layer of pus was scraped off, the subjacent parts did not appear to be altered. The lateral ventricles and their cornua, the third and fourth ventricles, with the aqueduct of Sylvius, were enormously distended, and full of thick yellow pus. They were lined with a thick false membrane, and the ependyma, which was distinct from this, was thickened and tough. The septum lucidum was entire, and covered by a tough false membrane. Right corpus striatum of greenish-purple colour, nearly black, covered by thickened ependyma, superficially softened and discoloured, but not down to the fibres. Left corpus striatum discoloured on the surface, but not softened. Thalami not softened; covered by purulent false membrane lining third ventricle. Ventricular aspect of corpus callosum thickened, and rendered tough by false membrane; vessels large. Anteriorly in and near bend of Genu it presented for one-third of its thickness or more a close aggregation of deep-red dots, about the size of a pin-point, which formed a distinct layer. Scattered red points extended into the adjacent layers of fibres for a little distance. The abscess in the right temporo-sphenoidal lobe was situate near the junction of the posterior and middle cornua with the ventricle. It was about the size of a small walnut, and was lined by a thin, tough, black false membrane. It communicated with the descending cornu at about one-third of its length from the ventricle.

The history of the case was evidently disease of temporal bone, abscess in adjacent temporo-sphenoidal lobe of brain, opening of abscess into descending cornu of lateral ventricle, inflammation of the lining membrane of the ventricles, and suppuration leading to the accumulation in these cavities of an enormous amount of pus, which made its way out between the medulla and cerebellum, and enveloped the pons and medulla. What is most remarkable is the time during which the ventricles had been the seat of suppurative inflammation before death occurred. This must have been considerable from

the amount of thick consistent pus they contained, and from the state of the walls of these cavities. We are accustomed to see the ventricles largely distended by an excess of cerebro-spinal fluid; but it is rare to find pus in such quantity, or to have such extensive inflammatory changes in their walls. The fact that these could occur without implicating more deeply the adjacent nervous substance is also worthy of note. Diagnosis and prognosis were here obvious, but no attempt was made to say beforehand where the abscess would be found. A blister seemed to give relief; but there was little room for treatment.

Case 4.—Enteric Fever, with Cerebral Complications.

A young woman, aged 20, was admitted May 17, 1871. No distinct history could be obtained of her previous symptoms, but it was understood that she had been at work as a domestic servant up to within a few days of her admission. She was extremely restless, and in a state of maniacal delirium, violent, threatening, and attempting to bite or strike, abusive and cajoling by turns, like an insane person; expression fierce and maniacal. Skin not hot; pulse 120; pupils equal, and acting naturally; no dulness over lungs; sibilant râles heard over entire front of chest.

May 18.—Still delirious, and had had a violent outburst in the night. Face sallow and chlorotic-looking, but conjunctivæ clear. Refused to put out tongue. Bowels not open. Castor oil $\mathfrak{z}\mathfrak{i}\mathfrak{i}\mathfrak{j}$. given, a simple enema administered, and blistering fluid applied to nape of neck.

19th.—More quiet; face flushed; a little sordes on teeth; tongue dry and brown; bowels open freely; coughs a little at times, and sibilant râles heard over entire chest. Poullice applied.

20th.—Still delirious, talking nonsense in a busy, active manner, but not violent; bowels not open. Chloral given, as she did not sleep.

22nd.—More rational; tongue dry and black; bowels loose, and motions dark; very little sleep; taking fluid food well. At 6 p.m., lying on back, taking no notice; eyes closed; face pale; expression distressed; respiration 48, variable; pulse 130. She resisted with an impatient movement when eyes opened or hand moved. Abdomen full, not moving much in respiration; no red marks when nail drawn across skin. She died soon after midnight.

On post-mortem examination the small intestine presented the appearances characteristic of an advanced stage of enteric fever. Peyer's patches enlarged, prominent, and ulcerated, and some apparently entering on stage of repair; solitary glands large and numerous, some with ulcerated, worm-eaten appearance. Lungs congested. Other viscera of chest and abdomen healthy. Brain: Surface injected, but not to a remarkable degree. No opacity of membranes, no effusion, no visible tubercles. At various parts were seen patches of a bright-red colour, irregular in shape and size, but on the average about the size of a finger-nail; some had a dark-red point in the centre. The redness of these patches was not removable by washing or pressure; it was very superficial, not involving the brain substance. The patches were most numerous over the parietal and occipital lobes above, very few being seen in front of the sulcus of Rolando; they were numerous on the temporo-sphenoidal lobes, and present on the orbital convolutions. Brain-substance pale, with greyish tint of normal consistence; no effusion into ventricles. Surface of cerebellum paler than that of cerebrum.

The characteristic typhoid affection of the small intestine was quite unexpected in this case. The early head-symptoms were totally unlike those of enteric fever, and it is probable had a different mode of causation, being due to the vascular changes which had given rise to the superficial hæmorrhage seen on the surface of the convolutions after death.

CASE OF FOREIGN BODY IN LEFT BRONCHUS.

By HENRY BULLOCK, F.R.C.S.

On April 15, 1871, I was sent for to see E. D., a boy, aged 5, who, on the previous day, was supposed to have swallowed the bone top of a lead pencil. There were no symptoms at the time, his mother being only aware of it from the fact of the child having run in and said "he had swallowed the top of the pencil." The reason of my being sent for was that he had begun to breathe badly.

On examination, I found the respiration somewhat hurried;

there was a short cough, with slightly accelerated pulse. On percussing the chest there was little or no difference in the two sides, but to the eye the movements of the right side were exaggerated, of the left lessened, and on listening the respiratory sound was increased on the right, and nearly inaudible on the upper half of the left side. There was no urgent dyspnoea, and there was not, nor had there been, any spasmodic respiration or cough. Next day, there being no amelioration of the symptoms, my partner and self (having tracheotomy instruments in readiness) held the patient up by the legs with the head downwards without effect; snuff was also administered. We then determined not to interfere actively in the case. Gradually the child became feverish, and the cough increased in frequency, but did not become urgent, and never became spasmodic. As time went on the appetite became capricious and the fever increased, the pulse becoming rapid and the respirations frequent, accompanied by sibilant rhonchus on the left side, the right remaining free and normal. On some days he was tolerably well, and, except that the physical signs remained, it was hoped that there was some error in the diagnosis. After a time, however, the symptoms increased in severity, and assumed more or less of a hectic character—that is to say, he became emaciated, had night-perspirations and flushed face. Diarrhoea came on, and purulent expectoration. There was some bronchial breathing, and dullness on percussion, with mucous râles. All these symptoms went on until there seemed but little hope of a favourable termination to the case, when suddenly, on August 31, he was seized with a violent fit of coughing, and expectorated nearly a pint of muco-purulent fluid, followed by the foreign body. Since, there has been a rapid diminution of all the unfavourable symptoms, and except that there is still less distinct breath-sound on the left than on the right side, and slight cough with some emaciation, the child is, to all intents and purposes, well.

The case is perhaps worthy of record from the fact of the foreign body having entered the left instead of the right bronchus, and from its having caused at first so little local or constitutional disturbance. The question as to the advisability of performing tracheotomy, and searching for the foreign body by means of various instruments, arose, and was rejected for the following reasons—viz., that the shape of the substance was against its lodging in the larynx if expectorated, which also, with the physical signs, led to the belief that it was tolerably firmly impacted in a bronchial tube; and that, even if its exact situation were ascertained, it would be extracted with extreme difficulty, if at all, the balance of probability being in favour of doing serious injury to structure rather than of removing the foreign body. Another interesting feature of the case was the near approach of the general symptoms to those of pulmonary phthisis, the history of the case and the absence of certain physical signs alone negating such a view of the case, which, on the other hand, was upheld by the child's previous delicate state of health, and his present strumous appearance. The case, on the whole, shows that where there is no great urgency of symptoms it may be—nay, is—justifiable to abstain from active interference.

OPHTHALMIC PRACTICE IN BOMBAY.

By GEORGE WATERS,
Assistant-Surgeon, Bombay Army.

THE following brief summary of the work done in the Cowasjee Jehanghir Hospital during the year ending December 31, 1870, with occasional remarks, may not be altogether devoid of interest to those who turn their attention to the study and practice of ophthalmology. In point of the number of patients treated and operations performed, this Hospital stands unequalled by most others of its class; indeed, so far as we are aware, the Royal London Ophthalmic Hospital, Moorfields, is the only one that has a greater attendance of patients—the number of operations performed in the former being exactly 600, and the entire number of cases under treatment during the above year close upon 6000, including those seen in both the in- and out-door departments. No less than 2150 cases are classed under "diseases of the conjunctiva." Amongst these 2150 is to be found almost every affection to which the conjunctiva is liable, simple conjunctivitis being by far the most common. The predominant sources of this class of ocular lesions in Bombay are chiefly found to be bad ventilation, want of cleanliness, insufficient protection from the sun's rays, and contagion, in the order mentioned. In many instances

before the patient comes to Hospital the disease has gone on to granular conjunctivitis, chiefly affecting the palpebral surface of the upper lid, commencing in hyperæmia of the papillæ. For the reduction of these granulations, solid sulphate of copper is our most reliable weapon. In very severe or obstinate cases we use sulphate of copper, mitigated nitrate of silver points, and ten-grains-to-the-ounce solutions of silver (applied with a camel-hair brush), interchangeably avoiding the latter, however, where weakness or irritability of the cornea is detected, as its application in such circumstances would most probably incur ulceration of the corneal tissue.

Next in point of numbers come diseases of the cornea—1110 in all, including keratitis and its consequences—viz., opacity, staphyloma, etc. This class of diseases affects people of all ages pretty equally; and defective nutrition of the corneal tissue, owing to general debility, brought on in most instances by poverty and consequent inability to procure sufficient nourishment, appears to be its predominant source in Western India. We also not unfrequently meet with the chronic interstitial keratitis arising from syphilis, the vascular keratitis following conjunctivitis, and, lastly, the traumatic keratitis the result of injury.

Although we vary the constitutional treatment of this class of diseases according to the exigencies of individual cases, our great sheet-anchor is concentrated nourishment in some form or other, the choice of which must be regulated by the taste and actual requirements of a certain proportion of patients; and, unfortunately, owing to caste and other influences, the prejudices of the remainder. The local treatment in the acute stage, being what is usually adopted in Europe, calls for no remark. The feature in the treatment peculiar to the practice of ophthalmology in the East is the frequent necessity for making artificial pupil; and this is accounted for by the fact that in many up-country districts Medical aid is either not procurable or, through ignorance, not solicited until the disease has run on to ulceration, the necessary result of which is opacity; and those opacities we meet with, curiously enough, almost invariably obscure the pupil, thus involving the necessity of making an opening in the iris behind a clear portion of cornea, in order to procure vision. We usually perform iridodesis when there is sufficient pupillary margin adjacent to where we wish to make the breach in the iris; but when we have reason to suspect the iris has undergone degenerative change, or when it is adherent to the lens capsule by synechia, we make artificial pupil by excision.

Under the heading "diseases of the lens and capsule," 517 cases are classed. One hundred and one cataracts were extracted. Of the remaining 416, the majority were cataracts in course of formation only; others were cases of opaque capsule, the lenses having been previously removed; and a few patients, though possessing maturely formed cataracts, were discharged as unsuitable for operation, their eyes being otherwise in a pathological condition. Of the extractions, twelve were by suction by Bowman's syringe, the subjects of operation being chiefly young, and the disease in most instances traumatic in origin. Six cataracts were removed by ordinary linear extraction. The operation for solution of cataract was performed nine times, and although all the cataracts thus treated were soft in character, the best result could only be called indifferently good.

This mode of dealing with cataract has quite recently been highly recommended by an ophthalmologist of much repute in England. It seems to us, nevertheless, with regard to natives of India, to be inferior to any of the other methods at present had recourse to, for although every detail in the operation has been carefully attended to by Dr. Sylvester, the results have seldom been anything but meagre; whereas 95 per cent. of the cataracts extracted by him in the same year by Von Graefe's method were successful, and the same when scoop extraction was performed. For the extraction of the remaining seventy-four cataracts, Von Graefe's modification of the linear method and scoop extraction were had recourse to, the latter operation more frequently than the former.

Although the ratio of success following each of the methods last referred to was exactly the same, post-extraction operations for dealing with opaque capsule occluding the pupillary area were most frequently necessitated where scoop extraction had been performed. Probably this is accounted for by the fact that the incision made for the exit of the lens is as a rule much smaller in the scoop than in Von Graefe's operation; probably, also, by the fact that the insertion of the scoop behind the lens occasionally causes detachment of more or less posterior capsule, which, not being removed with the lens, and being highly transparent at the time, escapes observation, and

remains unnoticed until subsequent shrivelling renders it opaque; whereas, if Von Graefe's operation be performed with ordinary dexterity, no scoop is required. Regarding the comparative merits of the two operations, we refrain from expressing an opinion until further experience shall have given us data sufficient to justify us in doing so.

Touching the use of chloroform for cataract extraction, we unhesitatingly endorse Mr. Dixon's views on the subject as stated in his article on diseases of the eye in "Holmes's System of Surgery." In the Cowasjee Jehanghir Ophthalmic Hospital anæsthesia is very rarely required for the removal of cataract; and, contrary to the rule amongst Europeans, natives of India rarely ask for "medicine to make them sleep." Whether it be from a less highly organised nervous system, or a more energetic exercise of the will in Asiatics than in Europeans, we are not prepared to say; but we have no hesitation in saying the former afford many more facilities for operating without chloroform than the latter. We look upon this as another feature peculiar to ophthalmic Surgery in India, and one which gives us all the advantages gained by the exhibition of chloroform, while it enables us to avoid the ill-effects which the use of that anæsthetic frequently entails.

Four hundred and fourteen patients were treated for disease of the choroid and retina. The ratio the acute cases bore to the chronic was as one to three, and the symptoms of the former were frequently concomitant with those of cerebral disease or syphilis, or both, while a few cases could not be traced to their origin; in the subacute and chronic cases less difficulty was met in discovering the cause of disease. Finding that the great majority of persons suffering either from chronic choroiditis, chronic retinitis, or progressive atrophy of the optic nerve were students, or they belonged to some occupation requiring the constant and close use of the eye, we naturally regarded the prolonged examination of minute objects as the most fertile source of these diseases, and concluded these affections must as a rule commence insidiously and almost painlessly, as otherwise we should have seen a greater number of cases at an earlier stage.

Two hundred and twenty were under treatment for various injuries of the eye. Little can be said of this class in general terms, and, although many cases were interesting, anything like an account of each would occupy too much space.

Diseases of the iris, in all 314. Syphilis is by far the most frequent cause of iritis amongst natives of India, especially of Bombay, and of the above number not a few are classed sequelæ of iritis that had a syphilitic history. The treatment of sequelæ of iritis, it may be here stated, aids considerably to swell the number of operations performed in this Hospital, artificial pupil being so often necessitated in order to procure vision where the original pupil has become occluded by organised lymph, such patients not having presented themselves for treatment sufficiently early. It also gives additional grounds for regarding the frequency with which artificial pupil requires to be performed as particularly characteristic of ophthalmic practice in the East.

Diseases of the eyelids, 394 in all. Trichiasis, ophthalmia tarsi, and cysts of the lid, in the order mentioned, embrace more than two-thirds of the wholenumber. With us the treatment of trichiasis pretty generally resolves itself into an operation, and for this purpose we are most in favour of Von Graefe's plan of splitting the tarsal margin, and taking means permanently to elevate the outer portion with the peccant cilia, which are thus retained, and the disfigurement which would result from their removal avoided. We seldom or never have recourse to scalping of the lids. We find Haynes Walton's operation useful where there is superfluous skin on the lid; also, in cases where the cilia are only slightly and generally peccant, with a mild degree of entropium as a complication. In cases of long-standing trichiasis we often perform canthoplasty as a preliminary step in the treatment, as it relieves the irritability of the cornea due to pressure of the contracted lids. We find the operation of canthoplasty much facilitated by inserting the armed needles, and pulling them through, leaving the threads ready for ligature prior to using the knife, the difficulty of engaging the mucous membrane with the needle when much bleeding is present being thus obviated.

Epilation of the peccant cilia as a means of curing trichiasis has, in our experience, proved utterly futile, the hairs invariably reappearing in or near the site of the extracted ones; and even when the bulbs are previously inoculated with solution of caustic potash, unless the trichiasis be very limited, much benefit seldom results.

Ophthalmia tarsi, we find, is more materially and rapidly benefited by exhibiting cod-liver oil internally, and applying a

weak mercurial wash locally, than by any other means. This may easily be understood, from the fact that most of those who come under our observation so suffering are ill-fed, and frequently scrofulous, whilst not a few are hereditarily syphilitic.

Fifty-five cases of lachrymal obstruction were treated during the year 1870, and almost as frequently Bowman's operation was performed with complete success.

In order not to occupy too much space, I have merely noticed in general terms those diseases which form the great bulk of our work in this Hospital, my object being chiefly to afford data to those desirous of obtaining information regarding the relative frequency of the most common affections of the eye, and the causes of their occurrence.

Bombay.

HYDROPHOBIA IN DOMINICA.

By JOHN IMRAY, M.D.

THE circumstances under which a disease first makes its appearance in any country cannot but present points of interest, and may fairly claim to be placed on record. The interest is certainly not lessened when so frightful a disease as hydrophobia is in question. This terrible malady has hitherto been of rare occurrence in the West Indies. So far as this island is concerned, during a lengthened residence I have never seen or heard of an instance of the disease, nor is there even a tradition of its having been met with at any time.

I give the details of the following case that I have had charge of in the Roseau Infirmary, being remarkable as the first that has come under Professional observation in the island, and also as to the uncertainty that remains in regard to the source from whence the morbid poison was derived, which doubtless gave rise to the attack.

The history of the case previous to admission into the Infirmary, as nearly as possible in the language of the wife of the unfortunate man, is as follows:—

"On Friday, July 28, 1871, M. N. went to work in his provision garden. When he had finished putting out some guano, he felt something itching his right hand, and he began scratching it; but when he had done with the guano he went and cut a bundle of wattles. When he got home he said to me (his wife), 'My hand pains me; I do not know what is the matter. Nothing hurt me, only I scratched it; but now it begins to pain me.' He complained during the night of the arm, and felt as if there was something running up the arm to the shoulder.

"All Saturday he stayed at home, complaining of his arm. When I (his wife) came home from the market in the evening, he complained of headache and fever; he ate a little pounded plantain and fish. During the night the pain of the arm increased, and on the Sunday morning I applied some leeches. All Sunday he complained of the pain of the arm and of the head, chiefly on one side (that of the affected arm), and of fever, and a trembling came over him. In the morning I gave him a cup of coffee; he carried it trembling to his mouth, drank a little, and said he could not take any more. He ate a little bit of bread. During the day he said his hand trembled when he took water, and he did not know what was the matter with him; it seemed as if there was something inside afraid of the water; he felt as if there was a bar across his throat and chest, and his heart jumped up whenever he tried to drink.

"On Sunday night he was very restless; called for water often, and when brought ordered it to be taken away. 'The thing inside,' he said, 'don't want to see water.' Said he was thirsty and hungry, but could not drink or eat. A blister was applied to the arm.

"On Monday morning some panada was made for him. He twice took some, and 'fought with it' in his mouth, and a little went down. He put a little sugared water in his mouth, gargled for some time, and a little was swallowed. He was in bed all day, or changing about from place to place. He complained of weakness and faintness. He then said he could take no more water from a cup, but asked me to fill a small phial, and let him try. Then he said, 'Don't give it to me to my face, but bring it behind my back and give it to me.' He took the phial quickly from me, made a run, and then, struggling with himself, carried it to his mouth, poured out the water hastily, and swallowed it with great difficulty. On Monday night he was restless, and did not sleep, always crying out he had a 'faintness.'

"On Tuesday he said he could not take anything more. The same day he was sent to the Infirmary. He never said he had

been bitten by a dog, but spoke about some ants having crawled on his hand."

Tuesday, August 1,—M. N., admitted into the Roseau Infirmary; a tall, spare, strong-looking black man, apparently between 40 and 50 years of age. He is extremely agitated and frightened; his eyes wild and staring. He speaks rapidly and eagerly; says he is very ill, but does not know what is the matter with him; describes minutely his sufferings, and hopes I shall be able to do something for him. Surface cool; free perspiration; tongue moist, with yellowish coating; pulse quick. His great restlessness and agitation were quieted somewhat by speaking encouragingly and soothingly to him. He stated that while putting out some manure in his grounds ants crawled upon his hand; he brushed them off, but his hand and arm hurt him afterwards. He does not remember being bitten by a dog, or any other animal. Some thin arrowroot ordered; part taken with great difficulty. Any attempt to swallow is accompanied with most distressing agitation; he rises from his bed with terror in his countenance, calls for people to hold him, and unless there are two or three persons to take hold of his arms and body he will not make the effort. With the left hand he suddenly grasps the cup or glass with a great effort, and, assisted by someone also holding the vessel, it is brought to his mouth, the head is thrown back, a quick gulp of the liquid is taken, and with a most painful struggle it is swallowed. This is repeated two or three times, and he sinks down in a state of utter exhaustion, and bathed in perspiration. On admission an enema containing liq. opii sedativ. ʒjss., æther sulphur. ʒij. was administered, and he remained quiet after this for a short time. In the evening he was able to swallow a draught with half a grain of muriate of morphia. He slept for several hours after this draught. Towards morning he awoke, sprang from his bed, rushed out of the Infirmary, and ran to his house at the outskirts of the town, wading through a stream to reach it. Soon after he was brought back by his wife. He was then in a state of great agitation and terror. He swallowed a draught containing a quarter of a grain of morphia, which had a slightly quieting effect. The bowels had not been acted on. An enema with castor oil, turpentine, and sulph. magnes. was ordered, which had no effect. Towards evening he became very violent, and from time to time required to be restrained by several men holding him. Every attempt to swallow was accompanied by the phenomena already described, only with augmented violence. About 11 o'clock p.m. I administered to him a small glass of sangaree (wine, water, sugar, and nutmeg), which he thought he would try. In this was dissolved forty grains of hydrate of chloral. I held the glass to his lips while the fluid was swallowed in repeated portions. The unfortunate patient took the draught mouthful by mouthful with great resolution, but with pain, horror, and agitation very distressing to witness, the whole surface being almost washed with perspiration. He would not even look at the glass until he had been firmly held by several persons. The only effect of the chloral hydrate was to make him a little drowsy. The same violent paroxysms recurring at short intervals, another dose of fifteen grains of the chloral hydrate was given, but with no good effect; the paroxysms still continued, and he died exhausted about eight o'clock on the morning of August 3.

The nurse stated that at one time, when he appeared "dozing," she poured a spoonful of water into his mouth unknown to him, and he instantly jumped up in great alarm.

There was no post-mortem examination. We have here presented a group of symptoms, passing on rapidly to a fatal termination, that are seen in no other disease but hydrophobia; and yet the patient, although repeatedly questioned, denied that he had ever been bitten by a dog or any other animal that he could remember. The ants that he spoke of as crawling on his hand, causing at the time itching, followed afterwards by pain, can only be considered a coincidence, and not a cause. But a feeling of pain being experienced in the hand, then running up the arm to the shoulder and neck, with the subsequent train of morbid phenomena, clearly point to the probability of the virus having found its way into the system from the infliction of some slight injury by a rabid animal at a former time, which may have escaped the man's attention, or have gone from his memory. No cicatrix or mark could be detected on any part of the hand or arm. It is, at all events, vastly more probable that the disease was contracted in this manner than that it originated spontaneously in the system. This supposition (of inoculation by specific virus) is greatly strengthened, if it may not be assumed as true, by the undeniable fact, as will presently be seen, that rabies did exist in the island for at least six months previous to the unfortunate man's

death, and doubtless many months before. That some morbid agency very fatal in its results had been at work among the canine race during the last twelve or eighteen months, was very distinctly proved by the great number of dogs that either died or were destroyed in the town of Roseau and other parts of the country. Rabies among dogs, being unknown in the island, was not suspected at first by anyone to be the cause of the mortality; but afterwards the symptoms were so suspicious that serious misgivings were entertained by many persons, who destroyed their dogs as soon as they became affected with the prevailing distemper. It is unnecessary to detail the symptoms; they were in several instances that have been brought to my notice simply those of rabies canina. There can be no question now that this horrible disorder did really exist to an alarming extent in the colony; and it is surprising that more deaths from hydrophobia have not been the consequence.

Although the case of hydrophobia above described is the first that has come under Professional notice, it is not the first that has occurred in the island of late. About two months ago it was reported that two children had died of the disease on the windward side of the island. The locality being remote, no Medical assistance could be obtained; but the symptoms were of such a character that no doubt was left as to the nature of the malady.

A dog bit four children on the same day (some time in April last). Six weeks after, one of the children was taken ill, and died in two or three days with all the symptoms of hydrophobia. A week after this another of the children was attacked, and died in a similar manner. The other children have as yet escaped. On application to the manager of the property to windward, where hydrophobia first made its appearance, I obtained a clear and intelligent statement of the facts. It appears, in the first place, that the disease (rabies) did not originate in the quarter, but was introduced. About the beginning of the year a dog was taken from an estate close to the town of Roseau, on the leeward side of the island to the windward locality where the disorder first broke out. This animal showed symptoms of rabies about a week after its removal to the district, though not recognised at the time. It was seen snapping and biting furiously at other dogs, and subsequently made its way to the place near the town from whence it had come, where it died. The distemper now spread among the dogs in the quarter. Cattle in the pasture, sheep, and pigs were attacked by the rabid dogs. Mr. Robinson states that about twenty dogs died on the estate that he manages, and that many were killed as soon as the symptoms of the disease were observed. He describes the symptoms very clearly, thus:—"I noticed carefully four of my dogs on the first appearance of the disease. They refused food; showed great restlessness and seeming anxiousness; then spasms of the throat; a hoarse cough. They attacked everything in their way—man or beast. The eyes are unusually bright on the first appearance of the disease, but after two days or more a thick veil seems to come over them. I noticed this particularly in two dogs—that I had chained." Mr. Robinson gives a very good account of the two children that died in the quarter; both well-marked cases of hydrophobia. The details need not be repeated.

This dreadful disease has not been confined to Dominica, it seems, for I observe in the island newspapers that two deaths have lately taken place in Barbadoes from hydrophobia, and one death from the same cause in Trinidad, and there may be other instances among the neighbouring colonies that I am not aware of.

Is rabies always the result of the inoculation or absorption of a specific animal poison, or does it originate *de novo*, from time to time, among the canine or feline races? This is a question of much importance, and may still be considered *sub judice*, although the weight of authority, so far as I know, preponderates on the side of propagation in all cases by absorption of a morbid virus. The first instances of hydrophobia in this colony appeared in a remote and rather inaccessible part of the island, and it might not unfairly have been concluded that the disease originated in the locality, had it not been possible to trace its introduction into the quarter. In like manner I believe it to be more than probable that, had all the facts and circumstances been observed, its introduction into the island would have been made equally clear. But it was not suspected at first that rabies could be brought to, or even exist in, the country.

The question of origin has much interest in a scientific point of view, but it has also a very important practical aspect. If we accept the opinion that rabies can only be propagated by a specific virus conveyed from animal to animal by inoculation or imbibition, then the inquiry naturally arises—Is it possible

to find means for effectually excluding the disease? or, if it has appeared, can it be quickly extinguished?

In large and populous countries it would, perhaps, be difficult, if not impossible, to prevent the introduction of rabies by any restrictive measures; nevertheless, the success attending the stamping-out process in arresting the spread of cattle disease shows what can be done in this direction. In these West Indian colonies, however, the disorder might be almost with certainty excluded, or at once extinguished, by rigidly enforcing proper precautionary measures to prevent its introduction, and stringent internal regulations to arrest its extension. Unless the various governing bodies of these colonies consider the matter of such importance as to demand legislative action, but little in the way of prevention can be effected. The case may be thus put. A certain amount of trouble and a small expenditure of money are to be balanced against the probability of a certain number of human beings perishing by a horrible death. Taking it, then, on the lowest ground—that of probability—it does certainly appear that ample reasons exist for prompt and decided legislative intervention on the subject.

I am glad to find that an Act for the protection of the inhabitants from rabid dogs has already passed the Legislative Chamber of this colony.

Dominica, West Indies.

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

UNIVERSITY COLLEGE HOSPITAL.

As stated last week in a short notice of the Surgical practice in some of the wards of this Hospital, the carbolic acid treatment of wounds is having fair and extended trial. The following cases, for notes of which we are indebted to Mr. E. J. Ramsay, House-Surgeon, have been all treated throughout antiseptically:—

CHRONIC DISEASE OF KNEE-JOINT—DIVISION OF HAMSTRING TENDONS—SUBSEQUENT AMPUTATION OF THIGH—ANTISEPTIC TREATMENT.

(Under the care of Mr. BERKELEY HILL.)

Robert S., aged 33, a labourer, the son of healthy parents, and of good family history, was admitted on June 28. About sixteen years ago he first noticed his left knee a little swollen; this slowly became larger and soft to the touch, and was painful and tender on pressure. For two years he continued to follow his occupation, but then went to Hastings Infirmary for several weeks; after this he resumed his work, and continued at it up to six years ago, when the knee became contracted, and for the last five years he has not walked upon it at all. On admission he could not bear the slightest pressure upon the joint; the muscles of the thigh and leg were much wasted, and the tendons behind the knee much contracted. When lying on his abdomen the right buttock was very prominent and tense, and the left buttock flattened and ill-defined. On standing the left knee was projected forwards, the toes of the left foot scarcely touched the ground, and were close to the heel of the right foot. The swelling of the left knee was nodulated here and there, very hard, and fourteen inches in circumference, the middle of the thigh measuring twelve inches, and the leg nine and a half inches. The patella was somewhat external to its usual position, and not distinctly felt. The inner side of the head of the tibia was enlarged, as also the inner condyle of the femur, and between the two was felt a slight groove.

July 7.—The patient being under chloroform, Mr. B. Hill proceeded to straighten the leg, and for this purpose performed tenotomy of the hamstring muscles. This allowed the limb to be brought nearly into the straight line, though the head of the tibia was somewhat posterior. The leg and thigh were then enveloped in cotton-wool, and placed on a back-splint.

August 1.—Limb put up in McIntyre splint.

15th.—There is now some ulceration at the back of the knee-joint; and another spot on the outer side of the upper part of the leg in the situation of a blister is also ulcerating.

30th.—The joint is not at all improving, and the patient is rapidly losing strength; so that Mr. Hill recommended amputation. This was performed by a long anterior flap (from which

the patella was afterwards dissected out) and a short posterior one, and the femur sawn through immediately above the condyles. As some hæmorrhage was taking place from the smaller vessels the stump was wrapped in carbolic gauze, and the flap not stitched together until four or five hours afterwards. Previous to cutting the flaps, the lower part of the thigh and upper part of the leg were rubbed with carbolic oil, the instruments washed in carbolic water, and the carbolic spray made to follow the knife throughout.

31st.—Wound dressed antiseptically in the evening. Pulse 128.

September 2.—A little thin but non-offensive discharge from the stump. Spoon diet. Pulse 112; temperature 99.8°.

4th.—Sutures giving way, and the edges of the wound a little gaping; some ordinary strapping was used to pull the edges together, and the carbolic dressing, as usual, afterwards applied. Discharge very free, but non-offensive. Temperature 100.4°; pulse 108; is feeling very well.

5th.—Wound still gaping, owing to giving way of fresh sutures; discharge much less; is doing well. Temperature 100°; pulse 100. Antiseptic dressing and spray used in the treatment.

10th.—The wound is now granulating rapidly; his general health is very good, and he takes food well.

RECURRENT CANCER IN CICATRIX OF BREAST—REMOVAL—ANTISEPTIC TREATMENT.

(Under the care of Mr. BERKELEY HILL.)

Caroline H., aged 51, was admitted into University College Hospital on August 29. She had led a sedentary life, but always enjoyed good health till two years ago, when she had the left breast removed for a cancer of slow growth. She rapidly recovered from the operation, and remained well till three or four months ago, when she noticed a small lump in the old cicatrix. On admission there was, near the sternal extremity of the cicatrix, a small tumour, to which the skin was adherent, and of a deep-red colour, which occasionally was the seat of severe shooting pain; below the old cicatrix were two or three smaller lumps, free, however, from adhesions to skin or deeper structures; and in the left axilla was a solitary enlarged and hardened gland, which moved up and down with the arm.

August 31.—Mr. B. Hill, by two incisions, removed a large oval-shaped piece of the integument and subcutaneous tissues, thereby excising together all the cancerous nodules in the pectoral region; then subsequently removed the enlarged axillary gland. This was done under a spray of carbolic acid and water (one to forty parts), supplied by means of Richardson's apparatus for local anæsthesia. The edges of the wound were then brought together by sutures, previously steeped in carbolic acid, and the whole covered by several layers of Lister's carbolic gauze, and a piece of protective oil-silk over this.

September 1.—Wound dressed under a spray of carbolic acid. A quantity of sanious fluid and a large black clot were found beneath the dressing; all, however, being quite free from odour. Fresh carbolic gauze was applied.

4th.—The same mode of dressing resorted to. A small quantity of discharge free from odour had escaped from the inner half of the wound, the edges of which were gaping nearly to the extent of one inch.

6th.—The wound healing rapidly.

STRANGULATED FEMORAL HERNIA—OPERATION—SAC NOT OPENED—ANTISEPTIC TREATMENT OF WOUND.

(Under the care of Mr. BERKELEY HILL.)

Ann W., aged 44, a married woman, was admitted on August 31. She stated that her employment has required her to stand a great deal and to lift heavy weights. She is the mother of four children, and has always enjoyed good health. About 11 p.m. on August 28 she was seized with severe pain across her abdomen, and within half an hour afterwards she began to vomit, and during the next day the vomited matter was very offensive, smelling "like her motions." This continued up to the time she was operated on, sixty-seven hours after the first symptom of strangulation commenced. Her bowels had acted about an hour after the first seizure, but since then had passed neither flatus nor fæces. The nature of the case had not been diagnosed before her admission, though she had been treated for intestinal obstruction; the aid of ʒjss. of castor oil, four pills, three bottles of medicine, and about twenty enemata having been employed in her treatment.

On admission there was a small tumour, about the size of a walnut, in the left femoral region, which she was not aware of herself. She was vomiting stercoraceous matter.

Chloroform having been administered, Mr. Hill made a vertical incision, about an inch long, at the upper part of the

tumour, and reached the hernia as it projected through the saphenous opening, at which point was the constriction. This he divided, and then, by gentle taxis, the contained bowel was readily returned into the abdomen. The operation was performed under the carbolic spray, the edges of the wound united by carbolised sutures, and afterwards dressed with the carbolic gauze.

After the operation the patient was sick, but the vomiting soon ceased, and within six hours of the operation the bowels operated, flatus having a few hours previously escaped.

September 5.—The bowels had not acted since the evening of the day of operation. A dose of castor oil was therefore given, and this morning the bowels have been moved three times. She has been fed on spoon diet, eggs, and four ounces of brandy. The wound has been all along treated strictly antiseptically.

8th.—The wound is quite healed, and the patient has permission to leave the Hospital.

MIDDLESEX HOSPITAL.

VESICO-VAGINAL FISTULA—FAILURE OF ACTUAL CAUTERY—CLOSURE BY OPERATION.

(Under the care of Mr. HULKE.)

The diagnosis of vesico-vaginal fistula is usually simple, but when the opening is a very small one, and high in the vagina, it may, as this case would appear to show, be overlooked, even by competent observers, and the stillicidium assigned to some other cause.

For the notes of this case we are indebted to Mr. Davidson, House-Surgeon:—

In the beginning of July, a healthy-looking countrywoman, aged 35 years, sought relief at the Middlesex Hospital for stillicidium urinæ, dating from her first and only labour eight years before. She said that the labour was a difficult one, that instruments were used, and that she was first aware of the stillicidium three days after her confinement. Three weeks later she went into a metropolitan Hospital, where she stayed for three months. Subsequently she attended a public Dispensary for a long time, and went into another Hospital for seven weeks. She failed to obtain any relief, and in none of these institutions was any operative measure proposed to her, or, so far as she knew, practised.

When up, the urine dribbled away continuously, but when lying down she was able to retain it for some minutes. Dr. Hall Davis discovered a very small opening communicating between the vagina and bladder, which with difficulty admitted a probe, and was some distance from the outlet. She was transferred, therefore, to the Surgical wards for operation.

On July 18, the fistula having been brought well into view with a Bozeman's speculum, Mr. Hulke touched it with the actual cautery, hoping that, as the opening was so very small, this might suffice for its closure.

After this the stillicidium ceased entirely until July 22, when it recurred, and, as after ten days it still continued, Mr. Hulke pared the edges, and closed it with three fine sutures of fishing-gut—a material which Mr. Hulke considers has all the advantages possessed by wire, without its drawbacks. Twelve days later the stitches were removed, and the fistula thoroughly healed.

BENIGN FUNGUS OF TESTIS REPLACED WITHIN THE SCROTUM.

(Under the care of Mr. HULKE.)

[From notes taken by Mr. DAVIDSON, House-Surgeon.]

A boy, aged 6, was admitted into the Hospital in July with a fungous protrusion from the left testis through a V-shaped aperture in the skin of the scrotum. It was a granulating button, with broad top and narrow neck, about the size of a small nut.

On August 16 he came under the care of Mr. Hulke, who, as other measures had failed, detached the skin from the body of the testis, replaced the fungus, and closed the wound over it with wire sutures. The incision healed almost by first intention, and at the end of the month the boy left the Hospital with an apparently healthy scrotum.

CASE OF POISONING BY CORROSIVE SUBLIMATE—DEATH FROM COLLAPSE.

The following notes have been communicated by Mr. R. H. Lucas, the Resident Medical Officer:—

S. D., aged 39, a whitesmith, admitted September 5, 1871.

Half-an-hour before admission patient swallowed a large quantity of corrosive sublimate dissolved in vinegar.

11.30 a.m.—State on admission: Complains of considerable tightness and burning sensation in the throat and gullet, and of a burning pain at epigastrium. Countenance pale and anxious, and features pinched. The surface of body is cold and covered with a clammy sweat. Vomits freely a large quantity of dark muddy-looking material mixed with half-digested food. Pulse small and rapid; respirations quick and catching. Ordered the whites of several eggs to be given immediately.

2 p.m.—Continues to vomit freely; the vomited matter consisting now mainly of the white of egg mixed with white curdy material. Has now considerable difficulty in swallowing. Pain has extended all over abdomen, which is somewhat tympanitic on percussion and exquisitely tender to touch. Pulse very rapid and weak. Extremities quite cold, and perspiration profuse. Has passed about one ounce and a half of urine. Brandy and beef-tea injection, to be repeated in half an hour.

3 p.m.—Patient is rather drowsy. Has vomited a little mucus mixed with blood. Considerable purging of fluid matter containing a large quantity of blood.

4 p.m.—Continues to get more drowsy. Purging of bloody matter continues. Pulse cannot be felt; face livid; and surface of body quite cold. The patient died at 4.30.

Autopsy.—The whole of the intestinal canal presented a truly characteristic appearance of the action of a powerful corrosive irritant. In the mouth, soft palate, and commencement of œsophagus, the mucous membrane was merely whitened, softened, and to a great extent denuded of its epithelium. Lower down, however, and extending to the cardiac orifice of the stomach, the entire mucous lining was peeled off and hung in shreds, so completely disintegrated as scarcely to bear the slightest touch. The stomach contained a few ounces of thick grumous blood. Its mucous membrane presented a dark mottled appearance, produced by effusion of dark blood in patches beneath its surface, usually on the rugæ, the sulci between which being of a pale colour, but still intensely injected and much softened. The intestines throughout were acutely inflamed, and contained a large quantity of grumous material, chiefly consisting of blood. Nowhere was there any perforation. The bladder was firmly contracted. Kidneys and lungs much congested.

The principal points of interest in this case appear to be, the rapid supervention of death from collapse before salivation set in, the almost entire suppression of urine, and the acutely inflamed condition of the whole intestinal tract.

DANGEROUS THERAPEUTICS.

EXAMPLES are not wanting to warn us from time to time of the sharp-edged nature of the tools which we nowadays habitually handle. It has been asserted with some degree of truth that therapeutics have not kept pace with pathology in the advance

of Medicine as an art and science; and yet those who remember the series of articles on Therapeutic Advance published some time ago in these columns, must admit that therapeutics, if slow in onward and upward progress, have neither been retrograde nor at rest. It is not, perhaps, so much in the discovery of new remedies as in the revision of the old that progress has been made, although something has been done in that way, too. It is, above all, in fixing on remedies of known efficacy, in using these singly and in a form sure to take effect, that we have made headway. But the very power which has been entrusted into our hands necessitates an amount of care which it is not everyone who is willing to employ, or, indeed, in all instances knows how to take it.

But the other day the public were shocked with the death of Mr. Fowler's child, as the result of an external application prescribed by Dr. Meeres. The jury returned a censuring verdict, and Dr. Meeres's peace of mind is destroyed. Yet the same prescription has been used hundreds of times, not only without harm, but with positive advantage. Nevertheless, the one fatal case shows that its safe use depends not merely on careful diagnosis of the appropriate condition in which to use the remedy, but also on the necessity of carefully inquiring after any idiosyncrasy in the patient before using drugs of such potency.

Again, the other day we happened to hear how a Medical Practitioner, whose skill is undoubted, being called to a patient troubled with restless nights, promised her one good night's sleep, gave her a small quantity of morphia subcutaneously, and in the morning she was dead—not, perhaps, as the direct result of the morphia injection, although that undoubtedly would have a certain influence in determining the fatal result.

Accidents by chloroform are too notorious to require more than reference, but the fatal effects of chloral are not so well known; and yet we question whether, in the long run, chloroform will count as many victims as chloral. The dangers of the former are known and dreaded, those of the latter are yet a mystery to many; and whereas chloroform is rarely, if ever, applied except by the skilled Physician, chloral has come into what might almost be called domestic consumption. It is but the other day it came into use, and yet if anyone will compare the cost of the first samples with that now in use, he will see what a vast difference there must be in the consumption to enable it to be made so cheaply, for the price of materials remains unaltered. Its use has spread abroad over all the earth, but from Australia, America, the Continent, and our own country we hear of fatal results following its inordinate or unauthorised use. On this very point we would refer our readers to our columns from abroad, where certain fatal cases are detailed.

And this leads us to consider one prime cause of accidents with narcotics. People are suffering agonies of pain, and they know that a prick with a pin or a mouthful of badly tasted stuff will give them relief, and they are clamorous for this Elysium of ease. In the olden time, when a man had at his disposal only crude opium or its tincture, and he knew of but one way to administer it, he was checked in the giving of it by the knowledge that thereby he was doing so much to disturb nutrition that the bad might more than counterbalance the good. Nowadays, with the exceedingly minute quantity requisite subcutaneously, the damage done to digestion is small; and while the patient is clamorous, the Doctor, though but half acquiescent, gives way. This he would not always do were the danger present to his mind; but impunity in the doing—we cannot say of evil—has wrought its customary effects, and he consents to give morphia for what perhaps his better judgment condemns. But it is perfectly well known to Medical men that the subcutaneous use of morphia is not without its dangers. In the records of the Committee of the Royal Medical and Chirurgical Society, not a few cases are related where most threatening symptoms followed comparatively speaking small

doses, alarming syncope being among their number. Since that time fatal cases have occurred. This danger is so well known to many who habitually employ hypodermic medication that they combine together opium and belladonna, in order that the latter may ward off the ill-effects of the former—an end which, in truth, seems thereby to be attained, though a larger dose than ordinary of the morphia is requisite. Nevertheless, with all such precautions, when morphia is given subcutaneously in almost all affections of a painful kind, whether the patient is fit or unfit, accidents are sure to happen, and then arises the question—Was anyone to blame? We be no vain *laudatores temporis acti*, nor have we the slightest desire to return to Alexipharmic or Theriac medication; but it must be confessed that these messes, if they had little power of doing good, had still less of doing harm, which is more than can be said for many of our modern remedies. A wise old Practitioner told a young one setting out in the world—as the choicest piece of wisdom he himself possessed—that the Practitioner's first duty was to see he did his patient no harm. Well, undoubtedly we have it in our power to do much good; it must also be conceded that we may do much harm. Nay, sometimes in practice it would almost seem that we must do evil that good may come—must destroy that we may build up again. And if it be true that fools and children should never see half-finished work, it is equally true that the same class should be precluded from the use of edged tools.

Our desire is this: to impress upon the mind of the Practitioner the dangerous character of many of the remedies he uses, and of the modes in which he uses them; not to deter him from their use on all proper occasions, but that he may take all proper precaution that they are employed on the right patient, at the right time, in the right place, and in the right manner.

PUS AND PUS CORPUSCLES.

Two highly interesting memoirs on the chemical composition of pus corpuseles, and on the chemical composition of pus, by Drs. Miescher and Hoppe-Seyler respectively, have recently been published (Hoppe-Seyler's *Med.-Chem. Untersuch.*, 1871, pp. 441-486); indeed, Professor Hoppe-Seyler—no mean authority—regards Miescher's researches as the most important contribution that has been made of late years to the chemistry of pus. We propose to briefly summarise the results arrived at, for the benefit of our readers.

Miescher, in order to obtain pus corpuseles free from serum, treated pus and fabrics impregnated by it with saline solutions of appropriate density. In these liquids the pus corpuseles sink to the bottom of the fluid, and may be obtained tolerably pure by repeated washings. Attention was first directed to the albuminoids of the protoplasm. Pus corpuseles are mainly composed of albuminoids, and, when treated with a solution of common salt, they are converted into a viscid gelatinous mass—a change dependent, as Rovida has shown, on the formation of a ring of hyaline substance around each corpusele; but this is not due to myosin, for Miescher could obtain no reaction for this body. Five albuminoids were obtained, agreeing (in number, at least) with the five different albuminoids found by Kühne in muscle. These were—alkaline albuminate, undetermined whether kept in solution by alkaline phosphate or not; an albuminoid coagulable at 118° to 120° Fahr., which was not merely albumen dissolved in alkaline phosphate; an albuminoid coagulable at the temperature at which ordinary serum-albumen coagulates; Rovida's hyaline substance; and a fifth albuminoid, the reactions of which need not be described here. Miescher was unable to detect paralbumen, though he does not deny its presence. The alcoholic extract of the globules was only investigated for lecithin and cerebrin, both of which were found to be present, the former in abundance. No gluten or chondrin was found in the watery extract, nor in the serum of pus. It must be understood that a mixture of lecithin and cerebrin forms the

substance to which Liebreich assigned the name "protagon" — a highly phosphorised material; for lecithin leaves on incineration an ash very rich in phosphoric acid. But Miescher has also demonstrated the presence of another phosphorised substance in the nuclei of pus corpuscles, to which he has assigned the name *nuclein*; and he surmises that this body, on account of its phosphorus, plays an important part in cell-growth and in the genesis of the cell albuminoids and their derivatives. Nuclein closely resembles mucin, but is richer in phosphorus, and it appears to exist preformed in the corpuscles.

With reference to the questions of the origin of pus corpuscles, their identity with the white blood globules and lymph corpuscles, and their ultimate fate, Hoppe-Seyler's results are remarkably interesting. Since living white blood corpuscles cannot be obtained from the blood in quantity sufficient for chemical analysis, and the spleen, although furnishing them abundantly, contains cerebrin and glycogen (both of which it is necessary to exclude), a novel expedient was adopted. Fresh crystalline lenses from the ox were introduced into the abdominal cavity of dogs, and, as was expected, the lenses became infiltrated with lymph corpuscles. The presence of glycogen was proved most clearly in the lenses at the period corresponding to the greatest number of active lymph cells; hence the conclusion that the glycogen comes from these. If, however, the lenses were allowed to stand till the corpuscles became rigid, sugar was found, but no glycogen. Since no glycogen was detected in the pus from inflammatory abscesses and wounds, its occurrence is a means of distinguishing lymph cells from pus corpuscles, although these have their origin in the former. With regard to the fatty degeneration of pus, it is stated that lymph cells by their transformation into non-contractile pus corpuscles lose their glycogenic properties, and with excess of oxygen may produce fat; whilst by maceration in water many changes take place, which changes are favoured by access of oxygen. Further, yeast cells and pus corpuscles seem to be in many respects very closely allied, and the former seem to contain a substance identical with the nuclein of pus.

THE WEEK.

TOPICS OF THE DAY.

CHOLERA seems to be increasing rather than diminishing in intensity in the North of Europe. A telegram from Berlin, dated September 19, announces that in the Baltic Provinces up to the 10th inst. the number of persons attacked by the disease has been 2517 civilians and 84 soldiers. Of these, 1273 (or nearly 50 per cent.) have died, 620 have recovered, and 708 remain under treatment. A telegram of the same date from Königsberg tells of a still higher mortality. During the week ending the 17th inst. the fatal cases exceeded in number those of all previous weeks. "Over 300 deaths occurred, the usual proportion of 50 to 60 per cent. of deaths having risen to 70 or 80 per cent." A telegram from Constantinople states that cholera has appeared at Pera and in the neighbouring villages, and a few cases are reported from Smyrna. But we are sorry to notice that the pestilence is still threatening our own coasts. The steamer *Alster*, a trader from Hamburg to Hartlepool, arrived in the Roads off Hartlepool early in the week, having lost a man from Asiatic cholera. The body was thrown overboard immediately after death. The ship, on her arrival, was boarded by Dr. R. Oldham, the official Medical Officer, who arranged for her immediate disinfection; and as no one on board appeared sick, he allowed her to enter the tidal basin on condition that none of the crew were permitted to land. Soon after, however, another of the crew was seized with choleraic symptoms, and Dr. Oldham having been again summoned, the man has been removed to the cholera Hospital, where he is still under treatment.

With cholera thus near to us, we are glad to notice that the deaths referred to diarrhœa, choleraic diarrhœa, and cholera diminished last week. The deaths in London from diarrhœa, which in the three previous weeks had been 487, 353, and 293, fell last week to 268. This number, however, exceeds by 149 the corrected average number in the corresponding week of the last ten years. Of the 268 deaths last week, 244 were of infants under 2 years of age, 13 of persons aged 60 years and upwards. The Registrar-General attributes — no doubt correctly — this comparatively large mortality to the neglect of early Medical treatment. The deaths from "cholera" and choleraic diarrhœa, which in the four previous weeks had ranged from 40 to 20, fell last week to 15, only 5 of these being deaths of adults. Of these, 4 were certified as having died from choleraic diarrhœa, and 1 from English cholera. The deaths from small-pox, which during the six previous weeks had averaged 84, and had been nearly stationary, fell last week to 57. The decline of this disease, we hope, will not prove the precursor of a cholera epidemic. But it is clear that the danger is by no means passed.

The Hampstead Small-pox Hospital is just now attracting a large amount of that righteous indignation of which the British public has always a large stock on hand. Pending the full investigation which is promised, we are not disposed to pronounce any sweeping verdict on the management and staff of the Hospital. But there are two sides to every question, and we can at least state what is acknowledged to be true on each. The charges brought against the management of the Hospital by the three Medical officers have yet to be proved; but it is undoubtedly true that the managers of the Hospital have in several instances neglected to preserve evidence of the personal identity of the patients committed to their charge, and from this neglect grave consequences have arisen. Deaths have been certified to have taken place which have never occurred, and families have been plunged in sorrow which has been suddenly removed by the appearance of a relative whom the Hospital authorities had reported to be dead and buried. But even worse than this, a child of 6 years of age—Elizabeth Bellue—has disappeared entirely, and no trace of her can be found. The Hospital authorities endeavoured to persuade her parents that another child was their missing daughter, and this statement was persevered in for some days. At last, however, the parents remaining unconvinced, the Hospital authorities reconsidered the matter, and came to the conclusion that the father and mother were right; but up to the time of our writing, although Elizabeth Bellue was received at the Hospital as early as May 17, and on May 23 or 24 is believed to have been in the convalescent establishment at Islington, she has never been seen by any relative, and it is utterly uncertain whether she be alive or dead. These facts have been proved before Mr. Justice Brett, and they are not denied by the Hospital authorities. Looked at as a naked statement, they certainly furnish ground for the most serious charge that has been of late years brought against a public institution for the treatment of the sick in this country; but in justice we are bound to say that it is not difficult to see how these misadventures occurred. The Hampstead Small-pox Hospital was the creation of necessity—there was little or no time to give it a perfect organisation. The East Grinstead sisterhood, who undertook the nursing department, had probably but little experience in the organisation of a Hospital staff on a large scale, and would be dependent on hired subordinates. The Hospital became rapidly full, and large numbers were taken in daily. The friends of the patients were on no account allowed to visit them, for fear of spreading the contagion; and we need not say that small-pox is a disease which, when it attacks badly, obliterates every feature by which identity may be recognised. Under these circumstances, the card at the bed-head would be the only guide; and with faulty organisation, and scores of fresh patients admitted weekly, mistakes

would almost certainly occur. Of course, the supposition that the child has been carried off and concealed in an Anglican convent is simply absurd. It would appear far more likely that she has died, and been buried under a wrong name. It is true that such an accident would not have been possible if the organisation had been good; but the Hospital was opened in a panic, the organisation was improvised at a moment's notice, and the moral of the whole story is, that a community such as that of the British metropolis ought to be better prepared with Hospital accommodation to meet an epidemic visitation.

A wretched child, of between 12 and 13, has been taken before the magistrate at Wandsworth to complain of the conduct of certain men to her, and is stated to be pregnant.

Several cases of accidental poisoning by carbolic acid have taken place lately, and metropolitan coroners and others have been addressing the public on the superior safety of other disinfectants, particularly of chloralum. A letter, dated from St. Thomas's Hospital, and signed "A. J. B.," in the *Times* of Thursday, draws the following distinction between carbolic acid and chloralum:—

"In conclusion, carbolic acid is readily diffused through air; chloralum is not. Both are good in their place, but the latter can no more pretend to take the place of carbolic acid than carbolic acid that of chloralum. Carbolic acid may coagulate germs and render them harmless; chloralum could do nothing of the kind."

MEDICAL HONOURS.

The names of Peter Eade, M.D., and of G. W. W. Firth, Esq., have been added to the Commission of the Peace for the city of Norwich.

A MEDICAL CONGRESS AT ROME.

This is the age of congresses, Medical as well as political. In the main nothing is more favourable to the development of science and the amity of nations than these *réunions*. The late meeting in London of the ambulance officers was a decided success, so we believe will be one that it is proposed to hold at Rome in May next. MM. Nélaton and Ricord, many of our German *confrères*, and visitors from England and America are expected to be present.

HEALTH OF HARROW.

ANOTHER cry of "mad dog!" Harrow is now the victim. It has been roundly asserted that disease to a very grave extent, and of an infectious character, is prevalent in this beautiful village and famous seminary. The report, however it originated, has been proved to be absolutely false, and letters have appeared in the *Times* from residents and from Dr. Butler, Head Master of the School, who says he has made inquiries of the proper authorities, and is able to state that there is no ground whatever for any apprehension. The health of the parish during the summer has been peculiarly good.

OPHTHALMIC DISEASE IN THE PLASKET SCHOOLS OF ST. GEORGE'S-IN-THE-EAST.

THE amount of serious disease arising from preventible causes has been exemplified in a remarkable manner in the above schools. It was discovered that the children in these schools were affected with ophthalmia, and Mr. Adams, of the London Ophthalmic Hospital, on examining them, found twenty-seven children suffering from purulent ophthalmia, which might in some cases destroy the sight in a very short space of time. He recommended the employment of additional nurses; and, in order to secure ventilation and to prevent the annoyance to the children caused by swarms of flies, that the windows should be fitted with patent blinds. The guardians have acted on the suggestions of Mr. Adams.

NAVAL MEDICAL EDUCATION.

It has long been felt that the practical knowledge of Assistant-Surgeons entering the Royal Navy has been defective. Since the Hospital at Netley has been open to the Naval Assistant-Surgeons, improvement in that particular has taken place. With the view, however, of still further improvement, it has been decided that an additional Naval Staff Surgeon should be appointed to the *Duke of Wellington*, at Portsmouth, to superintend the studies of the numerous naval Assistant-Surgeons now attached to Netley Hospital. It is also proposed to establish a Naval Medical Professorship at the Hospital, and seventeen additional students nominated by the Admiralty will shortly join the School in Southampton Water.

MEDICAL CERTIFICATES UNDER THE NEW FACTORY ACT.

It is satisfactory to state that the provisions of the new Act to regulate factories are being carried out with vigour. One of the greatest evils under the old system was the laxity which prevailed with respect to Medical certificates. Mr. Thornhill, Factory Inspector, of Huddersfield, on Tuesday last preferred several charges of breach of the Act, to which all the defendants pleaded guilty, and were fined. The charges were for employing children uncertified by a Surgeon or schoolmaster. It is difficult to understand how the employers of factory labour could willingly and knowingly infringe so wholesome and useful a statute as the Factory Act.

WESTMINSTER HOSPITAL.

THE following is an extract from a letter addressed to the Editor of the *Times* by the authorities of Westminster Hospital:

"It having been stated in some of the journals that the site of the Westminster Hospital has been claimed by the Government, we are desirous, in the interest of that institution and of the Medical school attached to it, to make it known that such statement is entirely unfounded."

It is true the value and importance of the Hospital are now materially lessened by the new St. Thomas's Hospital, and it had been suggested that Chelsea Hospital might be a convenient site for Westminster were it removed, but of that there seems no immediate prospect. It is a thing not generally known that at the time the Hospital was built the ground on which it stands was so marshy that £5000 had to be spent in driving piles to secure a good foundation for it. Perhaps it was for this reason that erysipelas was at one time prevalent in the Hospital, and that, too, in its worst form. The building itself, though tolerably well suited for its precincts and neighbours (it was built by Sir Charles Barry), has never been particularly well adapted for Hospital purposes. On the whole, the patients would benefit by removal.

NEGLECT OF SANITARY PRECAUTIONS AT CORK.

AT the present time it is of the greatest importance that sanitary regulations should be carried out with the utmost vigour. This is more particularly the case with respect to vessels arriving at our various sea-ports. We know how cholera is propagated by infected passengers on shipboard, and how vitally essential it is to strictly examine all vessels arriving from infected ports. Any negligence on this point is worthy of more than a passing notice, and calls for severe remonstrance, if not for punishment. We regret to say that an instance of this negligence occurred only last week at Cork. It was reported to the Corporation of that city that two vessels from infected ports in Russia had arrived in the harbour, and been permitted to come to anchor, without having been inspected by any of the four sanitary authorities; that no Medical inspection of the vessels had then been made, but it had been *unofficially* ascertained that there was no sickness on board. The Corporation expressed great surprise at the negligence of the several sanitary authorities, and directed that

special attention should be called to the omission to furnish the Custom-house officers with lists of the infected ports, as they may be inspecting and passing infected vessels in every port in Ireland. How much of the negligence to which the above facts refer is due to the circumstance that four sanitary authorities exist in the port of Cork? If there were one only, and this efficiently worked, it would be far more effective, and we should know where to fix the responsibility.

SMALL-POX HOSPITALS AND HEALTH IN THEIR NEIGHBOURHOOD.

Does a Hospital for infectious diseases, if properly situated and properly managed, render the neighbourhood in which it is placed in any way insalubrious? We think we may safely answer in the negative. The affirmative, however, is the prevalent opinion, and it would be difficult to convince the majority of people to the contrary. At all events, the establishment of the Small-pox Hospitals at Homerton and Stockwell has deteriorated the house property to so great an extent that a petition from the inhabitants of the latter place has been presented to the Lambeth Vestry, urging them to reduce the assessment of their property. It would seem unjust that the few should suffer for the convenience of the many; but it would be a great mistake for the Vestry to grant the prayer of the petitioners on the ground that the Hospital was in any way detrimental to the inhabitants in its neighbourhood, however convinced they may be that it is so.

PROCURATION OF ABORTION.

AMERICA has long had an unenviable notoriety for the frequency and facility with which abortion can be procured, both by legitimate and illegitimate Practitioners. The evil has become so serious, that a judge in a late case in which conviction was obtained made some very strong remarks on the subject. He asserted that the "abortionists" had become so numerous that they were a pest to society, and that means must be taken to stop their nefarious and dangerous practices. He had made up his mind to punish with the utmost rigour of the law all offenders who came before him. There is too much reason to believe that the practice is becoming alarmingly common in our own country. The annals of our police-courts and our sessions and assizes bring to light only a few cases; but these are sufficient to indicate what is taking place on an extended scale. Happily for us, the offenders are rarely, if ever, members of our own Profession, but consist of "prescribing druggists," old women, and so-called "midwives." A coroner's jury at Southgate, near Rotherham, has returned a verdict of manslaughter against a chemist at Rotherham for causing the death of a young woman "by an operation performed for a criminal purpose." It cannot be too generally known that the attempt to procure abortion, either by the means of powerful drugs or by manipulative proceedings, is attended with the utmost danger to health and life. Even when "successful," the effects of such proceedings are often most disastrous, and the victim, though she may escape disgrace, lingers on in the utmost wretchedness and misery.

HEALTH OF BUENOS AYRES.

THE terrible calamity which has lately befallen this important city, by which it was nearly depopulated, arose in a great measure from preventible causes. With the desire to prevent for the future any such fearful epidemic, the Government has determined to adopt means of a very extensive character. They have appointed Dr. Scrivener special Commissioner for the purpose of procuring in Europe such reports or information as he may deem of value for the sanitary improvement of the city.

FROM ABROAD.—TOXICAL EFFECTS OF HYDRATE OF CHLORAL—TEMPERATURE OF THE WOUNDED—LYONS *versus* NANCY.

PROFESSOR N. R. SMITH, of Baltimore, has recently communicated a paper to the *Boston Medical and Surgical Journal*, on

the "Toxical Effects of Hydrate of Chloral," an account of which will prove of interest to our readers. His attention was first called to the subject on his being consulted by an old retired Medical man on account of a singular affection of his fingers, attended with desquamation of the cuticle and superficial ulceration, especially about the borders of the nails. It was attended with pain and much morbid sensibility to touch, and was associated with some acceleration of pulse and general malaise. He stated that he had been taking chloral in liberal doses as a hypnotic for some months, and was convinced that it was the cause of the ailment. This was soon relieved by local astringents, but in about three weeks afterwards Professor Smith was called to him on account of severe bronchitis, with a pulse of 140, and extremely feeble action of the heart. Of this he died; and as it is nothing uncommon for aged persons to die of bronchitis, the author did not suspect the use of the chloral as being connected with the event. Some weeks after, however, he met with the case of a lady, 22 years of age, who was suffering from a precisely similar affection of the fingers, and who had been taking chloral as a hypnotic during a month previously. She was not then suffering from any general affection, but about ten days later she became the subject of general anasarca, the action of her heart being exceedingly feeble, and her pulse counting 140. Respiration was excessively embarrassed, and the urine was found to contain albumen. Under stimulants and diuretics she recovered. Two other cases have come under Dr. Smith's notice, in which the same affection of the fingers followed the use of chloral. He has also recently met with two cases of death from overdoses of this substance. In the one the person took it in doses of half a drachm, for a neuralgic affection, and it was supposed that he had died almost suddenly after taking three drachms. In the other case, the patient not receiving relief from a painful affection of the head from a hypodermic injection of morphia, took chloral, and fell into what was supposed to be only a deep sleep, but which proved to be a fatal one. The amount of the dose is not known, but is supposed not to have been larger than has been often recommended. In the case of a lady who was suffering from pain and restlessness after a severe Surgical operation, a drachm and a half was thrown into the rectum, and she sank at once into a state of insensibility, and died in about three hours.

"These cases are, it appears to me, amply sufficient to establish the toxical effects of this powerful agent. It is probable that its poisonous effects are exerted in two ways. 1. When given in a large dose, and especially where the system may have been charged with it by its previous administration, it at once overwhelms the powers of life, and causes immediate death. 2. It appears, when given in small doses, and continuously for some time, to induce a form of toxæmia similar to that caused by the continued administration of ergot. . . . Another very interesting and important inquiry is certainly suggested by the foregoing observations, crude as they are. If chloroform, developed in the blood from chloral, is productive of such disastrous effects, primary and secondary, can the direct inspiration of chloroform be as innocuous as it is thought to be? The Profession are aware of the fatal primary effects of chloroform in numerous instances. It has undoubtedly caused death in many cases in which it had been given with every caution in regard to quantity and mode of administration—in cases, too, in which there existed no malady of brain or heart to forbid its use. In some instances it has been administered fatally in which it had been previously given with a good result. But I would more especially call attention to the chronic poisoning of the blood which I believe results from its free and repeated use. I have administered chloroform as often as any other Surgeon in America, both in Hospital and in private practice—indeed, I have been constrained to use it in many cases in which my judgment was adverse to its use; for such is the overweening confidence in its effects that many patients refuse operations unless under its influence—but the more I have used chloroform, the less has my confidence become in its innocuousness. When I compare the results of my operations performed before anaesthetics were employed with those performed during the last twenty years with the aid of chloroform, I am satisfied that unpleasant secondary results

were less frequent during the past period than they have been under the use of that agent. I allude to secondary hæmorrhage, pyæmia, erysipelas, and hospital gangrene. Whoever will take the trouble to look over the Medical journals and retrospects of the last two years, will discover that pyæmia or septicæmia occupies far more space in Surgical records than it did before anæsthetics were so generally employed.

"When chloroform is administered during the period of an hour or more, as it frequently is, it undoubtedly enters copiously into the circulation, not only powerfully impressing the brain and the heart, but modifying the constitution of the blood and functions of the capillaries. If the effect of chloroform, developed from chloral in the blood, be such as I have shown on the functions of the minute vessels, causing erythema and ulceration in the extreme parts, may we not suppose that the introduction of chloroform more directly into the circulation may produce the occurrence of those results not uncommon before its use. These suggestions, I trust, will not be regarded as impertinent from one who has practised Surgery for more than half a century without and with anæsthetic agents. I doubt not that, if they are deemed worthy of any notice at all, they will be rejected by the majority of the Profession; but I have an abiding confidence that their truth will be ultimately acknowledged."

M. Demarquay, at one of the recent sittings of the Academy of Sciences, read a paper on the "Modifications of the Temperature caused by Severe Wounds." It is founded upon thermometrical observations carefully made on forty-eight persons suffering from severe wounds in Paris during April and May. The first category of these relates to thirty-eight cases in which the wounds were caused by fragments of shells or by balls, there being always a more or less severe lesion of the bones or joints, sometimes a portion of one or of both limbs being carried away. In all these cases there was found a diminution of temperature from one to several degrees Centigrade. The lowest points reached were from 35° to 34° C., death usually occurring before the thermometer had descended to 35°. The subjects were between 20—50 years of age; but, all things being otherwise alike, the same results were not always observed in wounds apparently of a similar gravity. The diminution of temperature was more considerable in men of 40 than in those of 20 years of age. The wounded men in which the lowest temperatures were recognised were those who had been accustomed to the immoderate use of alcohol. All those in whom the thermometer descended to 35° died, whether they were operated upon or not, no reaction following the operation in these cases.

A second category related to six cases of penetrating wounds of the abdomen; and in these death took place rapidly, the thermometer quickly descending to 35° or 34° C. In a paper formerly read to the Academy, M. Demarquay, describing the fall of temperature which was produced by ligature of a noose of intestine, attributed this to the strangulation of the noose by the wound. But in the present cases the depression of temperature occurred independently of any compression of the intestines whatever, and was entirely due to the severity of the wound.

In a third category of cases, M. Demarquay demonstrated the truth of a fact which he, as well as Professor Billroth, had already made known—that severe and somewhat extensive burns are attended, as a general rule, with a considerable diminution of temperature.

The struggle between Lyons and Nancy for the translation of the Strasburg Faculty of Medicine has not yet been decided. Petitions from the latter city gave rise to an incident which may be almost called amusing. They were referred to a committee to report upon—M. Bouisson, who is both Dean of the Medical Faculty of Montpellier and Member of the National Assembly, being charged with its preparation. This he soon effected; and in his report he at once disposes of the claim urged by Nancy—that by reason of its vicinity to the German frontier it was the natural heir of Strasburg, and most likely to support

the honour of French Medicine in that quarter—as the piece of sentimental nonsense which it is. But he found the opportunity of throwing a little cold water on other candidates too tempting to be resisted, although somewhat out of his sphere of duty. He therefore suggests that Lyons, also, had better remain as it is; for, in fact, Montpellier and Paris could supply all that is wanted, Lyons being, moreover, a very restless as well as populous place, quite unfitted for the residence of studious young men.

BEN RHYDDING.

(By a Holiday Contributor.)

IT has been our fate, as we doubt not it has been that of many others, to be not unfrequently consulted in cases of absolute break down from over-work, bodily or mental, or where a lingering illness made a change imperative, or yet again, where a long course of treatment, with proper hygienic conditions, was deemed necessary for a return to health and strength. In most instances we were met with the question—Where are we to go? and we confess to having experienced no little difficulty in answering it. The sanitary condition of our watering-places is bad; the ways of the watering-place landladies are not agreeable; pests of various descriptions are not infrequent; in short, for an invalid such as we describe, such a change is not always a desirable one.

We had heard of a place in the North which we thought might be turned into account this way, and resolved to make it the subject of experiment in our own vile body; so, when holiday time came round, not with any particularly shattered constitution, but tired enough thoroughly to appreciate the change, we packed our portmanteau. Next morning we were up betimes, took our seat in the Northern express, and soon were on our way to Leeds. There we arrived a little after midday, and found there was time to look at the place before our next train started. There is not much to be seen in Leeds beyond the new Infirmary—with the exception of the Town Hall, everything else is ugly; but soon we were on our way again, and presently emerged into the charming scenery of Wharfedale. In about an hour we reached Ben Rhydding Station, mounted the trap in waiting for the train, and while ascending the hill—for Ben Rhydding lies high—we had time to have a peep about us. A goodly way above us, and close to the margin of the heathery hills, rose what one might be readily pardoned for esteeming a nobleman's castellated mansion, but which we were informed was our destination; and soon making our way through the surrounding trees, we reached its entrance. The building we found situated on a plateau on the south side of the valley of the Wharfe, but rising far above the bed of the river, fronting towards the east, one wing facing almost due north. Round about it were the grounds, carefully and trimly kept, and from those stretching away behind the house could be had a view of the pleasant village of Ilkley, at a distance of about a mile; and beyond that, again, the valley, away on towards the woods surrounding Bolton Abbey. The situation was pleasant; the air felt bracing; there was enough sun to make everything enjoyable; the change from London made us feel buoyant; and everything looked *couleur de rose*. What it might have been had we arrived in the middle of a snowstorm we will not pretend to say.

The house, though large, accommodating nearly 150 people, was about as full as possible; but not more than half of these, perhaps, were undergoing active Medical treatment. The others had come to enjoy the rest, the scenery, the fresh air, the regular hours, the plain food, the cold bath in the morning, and what not. Altogether, one would have said they were a "motley crew," but with this grand advantage over ordinary dull, bored humanity—they had a never-failing subject of conversation (the weather was rarely mentioned, except with

reference to out-door exercise)—each others complaints, the baths to be taken, and the walks to be done.

It is perhaps time, however, we informed the uninitiated that Ben Rhydding is what is commonly called a hydropathic establishment—a place for the water-cure; but let us promptly assure the horrified reader that it is not a place where the doctrine that cold water cures everything is either preached or practised. The practice is such as is or may be adopted by any orthodox Hospital Physician in London: and with their doings we happen to be tolerably familiar. Dr. Macleod, the Resident Physician, is a man who knows how to use the system without abusing it, and is at all times prompt to apply the appropriate remedy to the prevailing disease, be that what it may.

The means relied upon for the cure of such maladies as we referred to first of all are mostly hygienic—rest, quiet, good air, good food, and exercise; but should a line of treatment be indicated by any gentleman sending a patient there, it is faithfully carried out until its efficacy or its uselessness is fairly shown; or should any addition to it be deemed advisable by Dr. Macleod himself, it is promptly supplied, modified, or improved on, as the case may require.

But it will be best to give some idea of the day's routine in the case of an invalid such as we have figured, thereby perhaps best describing the ways of the place. Early in the morning—that is, by six or seven—the bath-man knocks at the door with a pair of large rough sheets on his arm, and tells you he has come to make ready your bath. In many instances the bath is in the individual's own room, but sometimes he has to make his way to one or other of the bath-rooms scattered through the building. These baths are merely shallow zinc tubs, in which one can sit down with his legs extended in front of him. They are partly filled with water pure and cold from the hills, and so filled the stranger is invited to get out of his warm bed and get into the cold water, having previously wetted his head and face. The instant he is seated he is saluted with a pail of cold water over his back and shoulders, the bath-man rubs the back and limbs; but about two minutes of this is enough for anybody, and the bather is speedily on the floor, where he is enveloped, first in one, then in the other, of the sheets, and quickly rubbed dry. With a good circulation the reaction is wonderful, and one feels all over in a healthy glow; but this would be too much for the more weakly, and in their instance the cold water is duly tempered with warm before its application.

The next thing to be done after dressing is a run up on to the hills or a turn through the grounds, to get an appetite for breakfast. Many take advantage of this early excursion to procure their morning draught of pure clear water from a fountain high up above the houses. We think we can pronounce it healthier than the rum-and-milk of some valetudinarians, or the even more questionable beverages of others. But with the cold bath, the morning mountain air, and what not, by eight o'clock most portentous appetites are produced, and the first breakfast-bell is the signal for trooping back to house. Most visitors breakfast in the great dining-hall, where all meals are served, but some do so in their private apartments. The meal itself consists of tea or coffee, bread-and-butter, eggs, and cold meat, varied from time to time with fish; and the rapidity with which the solids disappear vouch for the efficacy of this "treatment" in recovering an appetite.

After breakfast there is a general dispersal—some to read the morning papers, others to write letters for the early post to town, and so on. The stronger most likely betake themselves to the moors, or are off on some of the many excursions to be made in the neighbourhood. Those undergoing treatment probably remain behind, as for them, in the middle of the day, there is another bath, perhaps the rain-bath—a contrivance whereby a multitude of little jets of cold water are made to play at all sorts of angles on the surface of the body. This can be withstood but for a short time, but the reaction is fine. Or, again, there may be, in the case of ladies with uterine troubles, the sitz-bath; or, yet again, if the skin acts badly, the Roman or hot-air bath, or the pack. This last form of cold-water application seems to be singularly useful, and might with great propriety be employed more generally for reducing temperature. The patient's bed is prepared for the pack by having all the bed-clothes turned down, and a thick blanket spread on the mattress; over this is laid a cold dripping sheet, and in this the patient is carefully and tightly enveloped. Next, the blanket is folded round the patient, a light feather-bed is placed over him, Continental fashion, and the bed-clothes over all. Thus he is left for half an hour or so, in most cases speedily becoming warm from bodily reaction. If this be insufficient, hot-water bottles are used

till the surface feels as if enclosed in a gigantic poultice. The result is free transpiration, and in most cases an irresistible tendency to go to sleep, inexpressibly soothing to one who for some time past has been restless from irritating skin complaints, or such like. At the end of half an hour the patient is uncased and soused in cold water, the result being a feeling of lightness hardly to be otherwise attained.

A walk or stroll in the grounds brings one to dinner-time—that is, two o'clock—when the plain, substantial fare is attacked even more vigorously than in the morning. At this meal wine or beer is generally partaken of—those undergoing treatment at the discretion of the Physician; those as visitors merely at their own. Claret and bottled beer seemed to be the two liquors mostly consumed. It is in this respect, almost as much as any other, that Dr. Macleod's method of dealing with patients differs from that in vogue at most other establishments of the kind, in which everything but water is strictly forbidden. He knows the value of wine, and is only anxious that it should be used aright, in this way doing much to promote the comfort of those under his care.

Dinner over, there is a second dispersal, this time more general than before. Ladies who, up to this time, have been confined to their rooms, make their appearance on the lawn or in the croquet ground, or there is some little excursion to be made to the village; at all events, in good weather the time is chiefly passed in the open air—some, however, being drawn to the reading-room by the arrival of the London papers; and so the time passes until tea, at seven. This, to a great extent, is a repetition of the morning meal, but is more generally partaken of in the hall. About eight o'clock the majority of the visitors make their way to the drawing-room, where whist-tables abound, the younger members of the company indulging in games, or dancing, varied with music, according to the capabilities they can muster. At ten, retirement begins; some of the lights are turned out; one by one the company move off, some to smoke a final cigar or pipe outside (for tobacco-smoke is forbidden in-doors); but presently all are a-bed, and at eleven lights are turned out. Thus ends the day—not a very exciting one, truly; but its pleasures, if simple, are innocent; and, with a quiet head on a spotless pillow, the stranger may dream of the toil and turmoil he has left behind him.

This quiet, even life has its charms to many, and year after year the same visitors return; some, indeed, make the place their residence the year through. One would have thought, from the situation and aspect of the house, that it would not be a pleasant residence in winter; but all the halls and corridors are warmed by hot-water pipes, and so an even temperature is tolerably well maintained. Some, indeed, seem to prefer a residence at Ben Rhydding in winter to its attractions in summer; the visitors are less numerous, stay longer, and thus get more domesticated together; but, for our own part, we should not then care to expose a *poitrine* to the tender mercies of a northern blast. It nevertheless seems just the place, even then, for patients in what has been termed the first stage of phthisis, as indicated by a certain delicacy of appearance and appetite, when the patient cannot digest fat, and when he is inclined to rely for warmth on outward rather than inward resources. For diabetes, too, where bathing and exercise are of such vital importance, we should strongly recommend Ben Rhydding as a residence presenting in both respects admirable facilities for treatment. There is another class of patients still who seem to derive benefit from a residence here; not so much, however, from the situation or climate as from one of the appliances introduced by Dr. Macleod—these are chronic bronchitis, especially such as have emphysema and labour from occasional fits of asthma. For their use a compressed air bath has been constructed, and has been found to be wonderfully beneficial. By pumping air into an air-tight chamber, and limiting its means of escape, a pressure equivalent to two atmospheres may be attained, and it is surprising to see the effect of this on poor men and women who have passed the night panting in bed. Their breathing becomes quieter and easier, and many of them drop off to sleep. On a healthy individual the influence of the increased pressure is indicated by a slight oppression about the ears and temples; but by opening the Eustachian tubes, either by swallowing or by forced expiration, the mouth and nose being closed, the inequality of pressure is removed, and comfort is restored. It is only while the pressure is increasing or decreasing that the oppression is noticed. Whilst the pressure is stationary no uneasiness is felt.

Yet another class who may be benefited, and we have done. We have already alluded to the facilities for treating skin

diseases; the same means will be found available and useful for chronic subacute rheumatism. For this troublesome complaint the Roman or Turkish bath, the wet pack, etc., will be found exceedingly serviceable.

Nevertheless, of all these, we still think the place most beneficial for men who have broken down from over-work or are convalescent, rather than suffering from any acute disease. These, provided they can get out of doors, will doubtless find themselves highly benefited by a residence at Ben Rhydding.

There is but one point more to be alluded to—that is, the over-expectation of good to be derived from such a change. It is more than likely that many may feel themselves worse than usual for some days after their arrival. The sudden and complete change in one's mode of life is quite enough to account for this, but its effects speedily wear off, and before long the hygienic conditions begin to tell. Nevertheless, let no one be disappointed if for a day or two after his arrival he does not feel as well as usual; that will soon be changed.

PHYSIOLOGICAL NOTES FROM PARIS.

I. *The gases of the blood*, and the proportions in which they vary under certain conditions, have formed the subject of a recent experimental investigation by MM. Matbieu and Urbain.

(1) The influence of losses of blood on the proportion of the gases in arterial blood is first considered. Blood was taken from the crural arteries of fasting dogs, with the following results [Bs represents bloodlettings] :—

	Successive Bs of 20 c.c., at one day's interval.		Successive Bs of 20 c.c., at one hour's interval.					Successive Bs of 40 c.c., at one hour's interval.		
	Resp. 22.	Resp. 15.	Resp. 18.	Resp. 16.	Resp. 16.	Resp. 14.	Resp. 12.	Resp. 17.	Resp. 15.	Resp. 12.
	c.c.	c.c.	c.c.	c.c.	c.c.	c.c.	c.c.	c.c.	c.c.	c.c.
O.....	21.50	20.25	20.00	18.75	17.75	16.50	15.65	20.75	17.25	14.80
CO ² ...	47.50	54.50	52.75	49.25	49.25	48.25	47.35	67.25	54.50	48.40

Hence we see that for a loss of blood of 20 c.c. there is the following series of diminutions in the oxygen:—2nd B, 1.25 c.c., 3rd B, 2.25 c.c.; 4th B, 3 c.c.; 5th B, 3.50. If this influence of bloodletting were not fully recognised, it would injure the accuracy of experiments on this subject, and a correction must always be made for it. It does not last for more than from fifteen to twenty days.

(2) The proportion of the gases contained in the blood of different arteries is then considered, and the results are shown in the following table :—

	I.				II.				III.	
	Carotid.	Branch of crural.	Carotid.	Crural branch.	Right lingual.	Right carotid.	Right lingual.	Right carotid.	Crural.	Branch of crural.
	c.c.	c.c.	c.c.	c.c.	c.c.	c.c.	c.c.	c.c.	c.c.	c.c.
O.....	23.00	22.00	23.50	21.25	19.00	20.75	18.75	19.00	12.67	10.16
CO ² ...	54.50	44.00	46.50	37.50	44.00	51.75	60.75	43.50	62.50	52.10

In this table the results under I. were obtained immediately after the blood was drawn; those under II., after it had stood protected from the air for one hour; and those under III., after it had similarly stood for two hours. As a general rule, it is seen that the blood of the larger arteries is richer both in oxygen and carbonic acid than that of the smaller trunks.

(3) In another set of experiments, the influence of external temperature on the gases of the blood is investigated; and it is shown that the arterial blood of animals at a constant temperature contains most oxygen in winter. Thus, to take the most striking case, the temperatures being 0.7° and 24° C., the relative volumes of oxygen were 22.10 c.c. and 11.56 c.c. The experiments generally show that the quantity of oxygen fixed by the arterial blood varies directly with the degree of cold. The authors explain this phenomenon by a reference to the fact that the pulmonary endosmosis is more active at a low than at a high temperature, and they illustrate it by an ingenious experiment. Again, the introduction into the economy of an excess of oxygen when the temperature is low is in accordance with the fact that in winter organic

combustion is at its maximum. In demonstration of this fact, they ascertained the difference of the oxygen in equal volumes of arterial and venous blood, when the inspired air was 10°, 22°, and 40° C. At 10°, 9.00 c.c. of oxygen had disappeared; at 22°, 7.75 c.c.; and at 40°, only 5.50 c.c.

(4) The influence of atmospheric pressure is the last point they investigated. The following are their results :—

Pressure of inspired air	734 mm.	764 mm.	794 mm.
O	20.50 c.c.	22.50 c.c.	24.00 c.c.
CO ²	49.75 c.c.	51.50 c.c.	56.50 c.c.

Hence we see that in arterial blood both the oxygen and the carbonic acid increase directly with the atmospheric pressure, which is a necessary consequence of the laws of endosmosis of gases traversing moist membranes.

II. *Crystallised Aconitine* has been studied chemically by M. Duquesnil, and physiologically by that gentleman and M. Gréhant. This alkaloid must be distinguished from the various substances previously known as aconitine, which, according to M. Duquesnel, differ in their energy according to the mode in which they are obtained. He obtains his crystalloid body from the powdered root of aconitum napellus, by exhausting it with very concentrated alcohol, after adding a little tartaric acid. The alcoholic solution, protected from the air, is distilled at a temperature not exceeding 60° C., and an extract is thus obtained, from which fatty and resinous matters are separated by the addition of water, which contains the alkaloid in the state of a tartrate. Any colouring matter is separated by ether, and the aconitine is then liberated from the acid by the addition of an alkaline bicarbonate. It is then redissolved in ether containing a little "ether of petroleum," and obtained on evaporation in rhombic or hexagonal colourless tablets, whose composition is represented by the formula, C₃₄H₄₀NO₂ (where C=6).

Its chemical composition seems to approximate it to the glucosides, which have the property, under the influence of certain agents—as, for example, ferments—to split up into glucose and some other substance. This view may explain why it is that certain preparations of aconite are so liable to undergo alterations which modify their properties.

It is almost insoluble in water, but dissolves readily if a drop of an acid is added. It is, moreover, soluble in alcohol, ether, benzene, and especially chloroform. It is not volatile; it turns the plane of polarisation to the left, and it is faintly alkaline. The most sensitive tests for it in solution are phosphoric acid, tannin, iodide of potassium, and biniodide of mercury and potassium; but the physiological experiment of applying the most minute quantity to the tongue is more certain than any of them, the characteristic sensation being at once produced.

It is one of the most active of the vegetable poisons. To detect it in a Medico-legal case we should employ dialysis, and then the method of Stas.

The physiological experiments were made in the laboratory of Claude Bernard, and under his superintendence. From three experiments on frogs (which they fully describe) it appears that small doses of this alkaloid possess the same physiological action as is induced by curarine—that is to say, the first action of the aconitine is to destroy the motor power of the nerves.

They were much astonished to find, in another case in which a comparatively large quantity of aconitine was injected into a frog, that the excitability of its motor nerves remained for a long time unaffected; but on opening its thorax it was seen that the action of the ventricle was completely arrested, and that the auricles alone contracted feebly. This observation led to the idea that the poison in a large dose primarily arrested the action of the heart, and that the result was the stoppage of the process of absorption. This hypothesis was thoroughly confirmed by the following experiment :—A frog's foot being extended under the microscope, a milligramme of aconitine was injected under the skin. In a minute and a half the circulation became slower, and in three minutes it had stopped. On the thorax being opened the ventricle was found motionless. The nerves of the brachial plexus were less excitable than the lumbar nerves, which were scarcely affected. The heart's action having been arrested, poisoning could only have taken place by imbibition.

In mammals the phenomena of poisoning occur with such rapidity that it is far from easy to analyse them. In a rabbit, however, into which they injected a milligramme of the alkaloid, and in which they kept up artificial respiration, the sciatic nerve, after a lapse of half an hour, could no longer give rise to muscular contractions. The contractility of the muscles was, however, unaffected.

III. M. Bert, one of the most distinguished experimental physiologists of the present day, has instituted a series of valuable observations on "The Influence that *Changes of Atmospheric Pressure* exert on the Phenomena of Life"—a subject to which we recently directed the attention of our readers in connexion with the human subject. He finds that when we rapidly diminish the pressure to which a warm-blooded animal is submitted down to 15 or 18 centimètres (of the barometer), it springs about, is seized with convulsions, and dies rapidly, with a bloody froth in the bronchial tubes. Death takes place with equal rapidity, whether the animal is enclosed in a bell-jar or is exposed to a continuous current of the attenuated air. In the former case the ambient air is scarcely altered; in both the blood is black in the cavities of the left side of the heart.

If, however, the pressure is gradually diminished, the animals may, with due precautions, be kept alive for a considerable time at very weak pressure, but finally die of asphyxia. The composition of the air in which they die varies very much with the degree of pressure. M. Bert gives a number of observations on this point made on sparrows, owls, cats, kittens, and guinea-pigs. We will quote the results afforded by the cats, as showing a fair average:—

	c.	c.	c.	c.	c.
Pressure of	75	51	29.5	21	16
CO ² . . .	13.2	10.1	9.6	6.4	5.5
O . . .	4.4	8.5	10.3	13.5	16.6

Birds could not be kept alive at a pressure lower than 18 centimètres, while mammals could live at a pressure of only 12; but under these conditions their temperature sank several degrees. Cold-blooded animals and certain newly born mammals were able to bear a far lower pressure. Some anomalous results were obtained—thus, the hawk, a high-flying bird, was more susceptible than the sparrow; and a hedgehog showed itself as susceptible as other mammals, and could not be thrown into a state of hibernation.

From the tabulated results, which we have only quoted in the case of the cat, it appears that till the pressure sinks to about 55 centimètres the functions are not materially affected; and this corresponds to about an elevation of 2000 metres. From that point the alterations in the exhaled air follow a uniform course to 30 centimètres, when they become more marked.

IV. M. Gréhant has made a series of experiments "On the Arrest of the Circulation of the Blood consequent on the *Introduction of Compressed Air* into the Lungs." As long ago as 1855 Poiseulle established the fact that inspiration impedes the pulmonary circulation, while expiration favours it, and that in inflated lungs the injected capillaries are of smaller diameter than in those organs when non-inflated. Recently M. Gréhant, while measuring the pressure of the blood of the femoral artery of a dog poisoned with curari, and in which artificial respiration was kept up, observed that if he worked the bellows with extra force the arterial pressure was diminished by one-half. This rough experiment, together with his knowledge of what Poiseulle had previously ascertained, led him to a further investigation of the subject.

In a dog in its natural condition, the pressure of the blood of the femoral artery was registered on M. Marey's revolving cylinder as equal to 12 centimètres of mercury. Through a tube fixed on its trachea, air at a pressure of 15 centimètres was forced into the lungs, when the arterial pressure fell to 3 centimètres, and the tracing showed that the blood-waves gradually diminished and finally disappeared. In a second experiment the inflated air was submitted to a pressure of 6 centimètres of mercury, and the arterial pressure fell from 12 to 5 centimètres.

Similar experiments, with analogous results, were made on rabbits. In one case, when the inflated air was at a pressure of 4.2 centimètres of mercury the carotid pressure fell from 13.8 centimètres to 2.6 centimètres. Division of the pneumogastric nerves did not exercise any influence on these phenomena.

M. Gréhant describes two perfectly distinct experiments by which he directly proves that the compressed air arrests the pulmonary circulation. We give the second, as being the one capable of being most briefly described. The blood yielded by an animal dying from hæmorrhage is defibrinated, and the thorax being opened and two glass canulas inserted into the pulmonary artery and the left auricle respectively, the circulation is artificially maintained through the lungs under a constant pressure of 5 centimètres of mercury. As soon as the lungs are inflated the blood ceases to flow into the left auricle, but comes again abundantly when the insufflation ceases.

These experiments may yield some useful hints as to the

dangers that might ensue in cases of artificial respiration. It is needless to add that the subject treated of by M. Gréhant is quite distinct from the effects of compressed air on the body generally.

RECOLLECTIONS OF DR. JOHN DAVY.

JOHN DAVY was the illustrious brother of a still more illustrious man; and if we have hitherto given no sufficient notice of this excellent Physician and Physiologist, it was not from the want of a due esteem for his merits, but because we hoped that a fitting opportunity would soon occur in a review of a biography of him. But nothing of the kind has yet appeared worthy of the subject; and, though we cannot pretend to supply this want, we deem it due to his memory, and a just tribute of our respect to the Medical Profession, to give a brief notice of such points concerning him and his works as we can glean from some of his intimate friends, before they, too, are silenced in the grave.

The short obituary notices of him that have been published seemed to us scantily appreciative, as rather hinting at his faults than generous to his merits. His virtues were assigned chiefly to his sympathy with and veneration for his elder brother's reputation; as if such a mind as John Davy's could avoid a noble respect for his most eminent and true friend and near relation. And as to his defects, it was said that Dr. Davy's "main deficiencies were deficiencies affecting his power of imagination and his faculty of exposition;" as if, in physiological science, the imaginative and expository faculties were not too often in want of him, or men like him—that is to say, of inquirers judiciously diligent in experimental observation and scrupulously precise in the record and application of the results.

He was an original and profound observer, not a compiler or sciolist, always explaining his experiments with didactic and instructive perspicuity suitable to the occasion; while his "Piscatory Colloquies" are a good example of the imaginative faculty in its proper place. He never indulged in the ordinary roads to temporary fame by advertisement or dissertation; but pursued the noiseless and even tenor of his way in the investigation of difficult and obscure problems of physiology, and obtained his results by the experimental method. Happy would it be for this science had it more men thus working and fewer merely writing and talking.

He graduated in Medicine at Edinburgh, in 1814, when his inaugural dissertation on the blood gave earnest of his taste for a branch of physiology to the cultivation of which much of his attention was happily devoted in after years. Most of these were spent in the Medical Department of the Army, generally in chief Medical charge at the several stations where he served; and he has left very valuable, though never very current, records of the different colonies in which his duties placed him. Thus, we have his "Account of the Interior of Ceylon," quarto; "Observations on the Ionian Islands and Malta," two vols. octavo; "The West Indies before and after Slave Emancipation," octavo; to which may be added his "Lectures on Chemistry and Discourses on Agriculture," a small octavo volume, dedicated to the "Managers of the Reid School of Practical Chemistry of Barbadoes," at whose solicitation they were delivered and published.

His "Physiological and Anatomical Researches," two vols. octavo, 1839, and his "Physiological Researches," octavo, 1863, contain a wealthy mine on the subjects; while his work on the "Diseases of the Army," octavo, 1862, affords the most extensive series of the pathological history of soldiers, as explored by dissection, that has ever been published, and is indeed a sort of modern Morgagni. Of the researches at Fort Pitt, which had resulted in the discovery of the softening of fibrin, many years before this important pathological element figured as a great and new fact, under the name of "thrombosis," on the Continent, Dr. Davy has left interesting notes in his work on "Army Diseases," chap. viii., pp. 267 and 288. He was the discoverer of phosgene (chloro-carbonic acid), and his early contributions to chemical science have been well recorded in Thomas Thomson's "History of Chemistry."

But to Dr. Davy physiology is still more indebted. Here his patient research was rewarded with many important dis-

coveries. Among them are the bilocular auricle of the heart and the cutaneous branch of the pulmonary artery of batrachians; the chemical constitution of the urine in them and in fish, and of the excrements of insects; the temperature of man under several conditions, and of many other animals, including the regular warmth of certain fishes; important points in the anatomy and physiology of the torpedo, and in the structure of the generative organs of other plagiostomes; phenomena connected with the blood, respiration, and animal heat of higher vertebrates, and with the impregnation and development of the ova of the salmonidæ. These are only some points that at present occur to us without a critical examination of his extensive works.

Of such men, with their minds mostly devoted to the abstract or higher branches of our Profession, it has often been remarked that they are "not practical"; which seems to us only one of the many modes, in the present commercial age, of hinting a dislike to or ignorance of these pursuits. But it is easy to show, even in the single instance of John Davy, how groundless and idle such opinions may be. He proved the true structure of the central organ of vegetative life in a class of vertebrates; how far the two commonly received primary divisions—hot-blooded and cold-blooded—of the whole of that sub-kingdom are at variance with physiological truths; how the temperature of the human species may, as is now well known, afford important guidance in the practice of Medicine; how the myriad swarms of gnats are useful, by converting vegetable matter into nitrogenous compounds, for the fertilisation of plants; and how the ova of fish may be transported to, and hatched at, any distance, even as far off as the Antipodes. Surely these are practical facts. And several ichthyologists, especially Dr. J. E. Gray, the worthy head of the Zoological Department of the British Museum, had the commendable perspicacity to recognise immediately this last as a great practical fact, and to promote the results of it accordingly. Hence the present well-established and interesting addition to the economic resources of our country, now that the eggs of the salmonidæ for the purpose of breeding, at home and abroad, have become a regular article of commerce. And the waters of Ireland should afford peculiar facilities for the development of this practical fact.

Something like a practical fact, too, was the good example of Dr. Davy's generous pursuits to Army Medical Officers. But, so far from such an example having met with due reward, he was injudiciously, if not ungratefully, displaced or passed over in favour of servile mediocrity or convenient inferiority—and this not only in the department which he had adorned in the public service, but to some extent in civil life also, when men by no means his equals received honorary degrees from universities, while those learned bodies might have honoured themselves, and done a graceful act of justice to physiological science, by a suitably grateful recognition of the merits of John Davy.

Never was a Medical officer more active and sincere, more zealous and intelligent, in the execution of his public duties. These were always so paramount with him that he neither would nor could endure negligence or incompetence in his subordinates, much less such shams as were then, if not now, too common in the public service. And in this respect his conduct was alike to superiors and inferiors; so that, as is often the fate of officers conscientiously devoted to their duties, he was not generally very popular. Though in private few men were more capable of the most cordial and generous friendship, in his public capacity he was too particular, too just, to be always quite pleasant and convenient. Accordingly, when he was judiciously pointed out as the most proper man for the highest office in his department, the significant question came, "Would he be likely to give trouble?"—and thenceforth he was shelved, ignobly banished to the Westmoreland lake district, much to the satisfaction of the gentle dulness of more pliant and fortunate Medical officers. But his quiet mind was not in the least soured by this treatment. He enjoyed in that beautiful seclusion his pure love of nature, and his friendship with nature's own poet—Wordsworth—and never dropped his favourite physiological pursuits.

He continued, besides, the practice of angling, having been throughout the greater part of his life an ardent and excellent fly-fisher. Of his devotion at proper seasons to this sport he has left pleasing evidence in his "Angler in the Lake District," and the "Angler and his Friend," two small octavo volumes published during his retirement. His angling tours extended far and wide—to the Hebrides, the borders of Wales, Ireland, and elsewhere. In these excursions he was often accompanied by a congenial friend, such as Mr. Gulliver, who is the

"Amicus" to whom the prefatory note of "The Angler and his Friend" is addressed; and in that note the circumstances which had led to their retirement from the army, after vainly offering their services for the then looming war, are intimated. In the same note it will be seen that Dr. Davy carried to his retirement his wonted equanimity of mind, undisturbed by any alloy of discontent. And, indeed, his piscatory friends often noted the fulness of the enjoyment which they shared with him. Among these was Dr. Maunsell, a worthy brother of the angle, at whose house, near Dublin, Dr. Davy received agreeable entertainment on his way to or from the Irish fishing quarters.

Indeed, he was not only a good friend, but a most excellent husband and father. Of his tenderness in this last relation his nearest friends had painful evidence when some of his little ones sickened and died of scarlet fever; and so durable was his feeling of this sorrow, that it was ever ready to be excited in sympathy with other parents in like affliction. So, no wonder that he was wont to say that children may be sent as much to teach us as we them. His person was rather small and spare, and he had one leg somewhat bent from a fracture in early life. With a fair complexion, his hair was dark and plentiful, though kept short, and he had bright hazel eyes. But his mind was his fairest possession. In its guileless simplicity dwelt the love of natural science and its cultivators, without the slightest debasement of envy, jealousy, or rivalry. Nay, he was ever ready, and in the most friendly way, to give his valuable aid and encouragement to the physiological inquiries of all sincere students; and his profound chemical knowledge was often thus signally useful. In short, his life was passed in noble and innocent pursuits, until somewhat suddenly cut off, at the ripe age of 78, in his house at Lesketh How, near Ambleside, on January 24, 1868. He was buried hard by, amid those scenes which in life he loved so well.

"Study to be like him."

ENGLISH HOSPITAL AT METZ.

DECEMBER, 1870; JANUARY AND FEBRUARY, 1871.

(From a Correspondent.)

(Concluded from page 359.)

HAVING noticed very roughly some points which seem to me to have interest, I will conclude by giving notes of a few of the cases which have been under our care:—

Case 1.—V., aged 33, a soldier of the line, was wounded on August 14. When he first came under our charge he was in an exhausted condition, and complaining of constant pain. A bullet had passed through the right upper arm, in the neighbourhood of the shoulder-joint; its aperture of entrance was immediately below the coracoid process, and it passed out behind a little lower down. The humerus had been fractured close to its head, but had united with a certain degree of firmness; several pieces of bone had come away, abscesses had formed around the fracture, and the skin on the inside of the arm was quite undermined. There was no movement in the shoulder-joint, and it seemed probable that the scapula, as well as the humerus, was diseased. Another bullet had passed close to the elbow-joint without fracturing the bones, but intense pain was felt in the joint, and the wounds had not closed; any attempt to flex the forearm on the arm caused intense pain. The forearm and hand were very œdematous. As he was becoming more exhausted every day, we urged him to have his arm amputated, but he refused for some time.

December 27, 1870.—Superficial gangrene appeared on the back of the hand and fingers. The patient was now willing to submit to an operation, but his condition did not admit of it; his pulse was imperceptible at the wrist. He was ordered a good quantity of stimulants, and plenty of strong soup, etc., and it was decided to amputate as soon as there was any reasonable hope of success.

30th.—The gangrene had not extended, and the patient's condition had so far improved that it was decided to seize the opportunity. Chloroform was administered, and the arm removed at the shoulder-joint. A long flap, including the deltoid, was dissected up, and a short flap on the inside containing the vessels was made by passing the knife behind the head of the bone, and cutting from within outwards. In

attempting to rotate the arm during the operation, it broke again, rendering the division of the muscular attachments rather difficult. The artery was compressed above the clavicle, a very slight quantity of blood being lost. The vessels were ligatured, and the flaps brought together with metallic sutures. The patient appeared to be dying more than once during the operation, but was restored by brandy. The head of the humerus was soft and carious, and its cartilage was gone. The cartilage lining the glenoid cavity was ulcerating, but we could not find any disease of the scapula. The cartilage of the elbow-joint was diseased.

31st.—Patient passed a fair night, after taking an opiate. No bleeding has occurred this evening. He is a little feverish.

January 7, 1871.—Has gone on very well; wound suppurating freely. No sutures taken out at present. The stump is dressed with carbolic oil, after being thoroughly washed out with carbolic water. The man eats well, and takes about a bottle of sherry a day.

11th.—Is gaining strength. Nearly the whole line of incision has healed. All the sutures but three have been taken out. To-day he has no appetite, and complains of pain referred to the elbow and hand.

14th.—Still improving. All the ligatures and sutures have been taken away. Pain comes on towards evening. He takes fifty minims or a drachm of laudanum every night.

23rd.—Has been gradually gaining strength, and now walks pretty well. He still complains of pain, and has had a tolerably regular alternation of good and bad days. Has taken quinine three times a day, and lately has been taking chloral instead of opium at night. Laudanum, in doses of a drachm, has not latterly procured him any sleep. I have given him chloral in doses of twenty increased to forty grains; this always sent him to sleep immediately, and he never suffered any ill effect from it. I usually gave it dissolved in a little brandy-and-water, and it seemed to me to act more surely and quickly when so given. Some syrup of chloral which I tried was far inferior in its effects to the solid hydrate dissolved immediately before it was taken—in fact, I saw no result whatever from the syrup of chloral that I used.

February 7.—The patient left us to-day for the house of a French lady in Metz, who is taking care of a number of soldiers who have lost limbs and are without friends until the Government is sufficiently settled to give pensions. The wound is not quite healed, one point in the line of incision still discharging slightly.

15th.—I saw him for the last time to day. There is no longer any discharge; the stump is quite sound, and the man is out of doors all day. Although this patient was much reduced by his wounds, and by being confined to his bed for four months with a short allowance of food, he did very well. At that distance of time from the date of the injury, the patient was suffering from diseased bone or diseased joint, and one may expect as good results as are met with in operations for disease. The effect on the system of the original injury has long passed off, and he is suffering merely from the irritation caused by a diseased limb.

The operations which prove most fatal are those which are not performed within a few hours of the receipt of the injury, but which are performed within two or three weeks of it.

Case 2.—G., aged 38, soldier of the line, was wounded on August 16, at the battle of Gravelotte. A piece of shell had struck him on the left ankle, and before he was taken from the field a horse trod on the same foot. When he came under our care, several sinuses around the ankle-joint led to dead bone: it was evident that the astragalus and tarsal bones, as well as, perhaps, the lower end of the tibia, were severely damaged. He complained of much pain, but his general health was fair.

December 19, 1870.—I performed Syme's amputation of the foot. On opening the ankle-joint it was found quite disorganised; the articular cartilage of the lower end of the tibia was gone, and the surface of the bone carious. After sawing off a slice of the tibia and fibula, the section was so soft and vascular that it was thought best to take off another slice. This was done; the resulting section was more vascular than normal, but still much less so than the first. The lower end of the tibia was so much enlarged that the flap was barely large enough to cover it. Metallic sutures were used, and the stump was dressed with carbolic oil. On examining the foot, the astragalus and scaphoid were found smashed and the articular tissues spoilt.

22nd.—The flaps rather tense and red, so that it was necessary to loosen some of the sutures. Patient rather feverish. Morning temperature 102°.

23rd.—Stump red; does not suppurate freely. Temperature 102.3°.

25th.—Stump suppurating more freely; less red. Temperature 99.8°.

28th.—The edge of the flap is sloughing a little, and the whole flap has fallen back to some extent, though the bone is not exposed. The flap is kept up by strapping.

January 3, 1871.—The angles of the wound are uniting. General health improved. Temperature 99°.

7th.—Stump healing rapidly.

From this time the patient went on perfectly well, and when I last saw him, on February 22, the stump was quite sound, and not tender; the pad of the heel made a thick and firm covering for the ends of the bones. I have no doubt that by this time, with a suitable boot, he can walk on it. With so much injury, and with the implication of the bones of the leg, it seemed doubtful that this case would succeed; but as the stump resulting from Syme's operation is so much more satisfactory than that from amputation in the lower third of the leg, we resolved to try it.

Case 3.—A man, whose name I did not get, was brought to us from another Hospital on December 11. His left thigh was enormously swollen, the skin tense and shining. The man's face was pale and anxious; his breath had a sweetish, pyæmic odour; and he had a good deal of diarrhoea. The pulse was small and quick. His account was that he had not received any hurt, but that his thigh had been getting gradually larger for two months; he could give no cause for its coming. The pain was most severe. I made an incision at once, and let out an enormous quantity of dark-coloured pus. When the abscess was emptied I was much surprised to find that the femur was fractured. I questioned the patient about it, and he assured me that he could not in any way account for it, never having met with any accident; indeed, he did not know that it was broken until I told him. The lower end of the upper fragment could be felt on the outside of the thigh about three inches above the knee-joint; it was very sharp, as if it had been broken obliquely. The man was much relieved when the abscess had been opened, but never rallied. He died three days after admission. I was so pressed for time that I could not examine the bone after death. It seems possible that the bone had been gradually thinned by the pressure of the growing abscess.

Case 4.—A chasseur had been hit on August 16 by a piece of shell in the right groin, fracturing the pubic bone. When I first saw him two or three fragments of bone had been already extracted. I took away several other pieces, and, when they were all put together, it was evident that nearly the whole of the horizontal ramus of the right pubic bone and some of the portion forming the symphysis had come away. When we left him the patient could get about very well with crutches, and could bear with some weight on his right leg. In such cases it is well to examine the interior of the wound with the finger every two or three days. Fragments of bone become detached frequently, and when detached cause great irritation, and lead to troublesome abscesses.

REMARKABLE CASE OF IMPALEMENT.

OUR readers will peruse with great interest the following case of impalement which occurred in the practice of Mr. Reynolds, of Thame, Oxon. Through the kindness of Mr. Reynolds, we have been enabled to examine the patient, whose present condition fully bears out the account kindly furnished by his partner, Mr. Humphreys, who, seeing the case at first, had the chief management of it. Mr. Humphreys states—

“Last Good Friday (April 7), George W., aged 11 years, was on a rick of straw, playing at soldiers with another boy, who, being on the ground, charged at him with a rick-stake, on which he fell, and which was driven into him. The stake, which was slightly curved at the upper part, was forty-three inches long and three inches in circumference, being very sharp-pointed at its extremity. As much as seventeen and a half inches of it entered his body. It struck him just in front of the right spermatic cord, and passed beneath Poupart's ligament into the cavity of the abdomen, traversing the whole of the cavity across to the left side, and then entered the thorax through the diaphragm, displacing the heart and pushing it to the right side of the sternum, piercing the left lung, and then passing out between the seventh and eighth ribs, and then under the muscles and integuments in the axillary space,

and along the upper third of the humerus, which it kept extended above the boy's head, the external skin not being ruptured.

"The accident occurred at 2.30 p.m., at a village five miles from Thame. Dr. Lawson, my assistant, went to attend the case, but, finding it a very serious one, sent for me to help him. I found the boy sensible, and not in much pain, and expressing a wish to have the stake removed. I determined not to give chloroform, on account of the injury to the heart and lung, and at once proceeded to remove the stake, it having been in the boy now four hours. He was held down by four strong men, whilst Dr. Lawson and I used our whole strength to remove it, taking care to have the course of the stake followed by the fingers of a gentleman present, to prevent the admission of air into the cavities. After the removal there was not more than a teaspoonful of blood lost. The heart still remained displaced. On the boy moving, a lump of the small intestines protruded from the wound, as large as an orange, which, after ascertaining that it was not torn, we replaced, and then ligatured the wound in the abdomen, and applied a cold wet compress along the whole course of the passage of the stake, and having given the boy a dose of opium, put him to bed.

"8th.—Found the boy depressed, but not in much pain. Pulse 120. Breathing difficult, and with emphysema extending over the whole body, the cellular tissue crackling on passing the hand over the surface, a great quantity of air escaping from the wound in the groin. Ordered beef-tea and weak brandy-and-water, with some diaphoretic mixture and grey powder and opium.

"9th.—The same symptoms, only with more pain. Pulse small, quick, and thready.

"10th.—Emphysema better, but symptoms of peritonitis showing themselves; bowels tympanitic and very tender; legs drawn up; great anxiety of countenance; wound dry, and not discharging; pulse 160, and very wiry. Slight spitting of reddish mucus, with severe cough and dyspnoea, and pain over left side of chest. Crepitus to be heard over the left lung. The heart still beating an inch to the right of sternum. Ordered a mustard poultice to the left side of chest, and a linseed poultice all over the bowels. Removed the sutures and pressed out about half a teacupful of bloody matter. Gave calomel gr. j., opii gr. $\frac{1}{4}$, 4tis horis. To take nothing but gruel and barley-water.

"12th.—Decidedly better. Emphysema and dyspnoea better, but crepitus still to be heard over the left lung. Not so much pain and anxiety. Pulse 130. Bowels have acted, but abdomen tympanitic and very tender. Right testicle, showing signs of severe inflammation, to be poulticed. Treatment to be continued, but the calomel and opium not quite so often, the gums being slightly sore.

"16th.—The symptoms have been gradually diminishing for the last four days. The emphysema has not quite gone, and the crepitus in left lung is much better. The wound in the groin, which was from two to three inches long, shows signs of healing, but the right testicle is sloughing out. The bowels less tender, and are acting naturally every day. Ordered beef-tea and a little wine; calomel and opium twice a day only.

"Three weeks after, the boy continuing to progress well, all treatment was discontinued; but next day all the symptoms of inflammation returned with violence. Ordered the calomel and opium again, and poultices, and to go back to the gruel, etc. Under this treatment for a few days the symptoms again abated.

"Six weeks after, the boy was able to sit up and play, and eat his ordinary food, but showed signs of an abscess in the axilla. The testicle has sloughed, and the wounds in the groin and scrotum healed. The heart is still beating an inch to the right side of the sternum. The left lung is consolidated up to the fourth rib. Ordered poultice to axilla; to take quinine and steel, cod-liver oil, and wine.

"I consider that the principal points in the case are—1st, the stake having been left in so many hours, the injured vessels in its course were sealed by the formation of coagula, and thus hæmorrhage was prevented; and 2ndly, the calomel and opium seemed to act as a charm in staying the extensive serous inflammation—for whenever we discontinued their use the symptoms returned. I have made these few remarks on the case, as so severe a stake-injury with recovery is seldom seen."

When we examined the boy, five months after the accident, he was able to walk about, and was perfectly free from pain, even on pressure. There was slight enlargement of the abdomen, with the cicatrix of the wound in the left groin; the right testicle absent. There was also a flatness of the left side of the chest, the left lung being perfectly consolidated from the fourth

rib downwards, and the breathing puerile all over the right side in consequence. The apex of the heart was still beating an inch out of its right place.

REVIEWS.

A Treatise on Diseases of the Nervous System. By WILLIAM A. HAMMOND, M.D., Professor of Diseases of the Mind and Nervous System and of Clinical Medicine in the Bellevue Hospital Medical College, New York, &c. 8vo. Pp. xxv., 774. 1871. New York: D. Appleton and Co.

[SECOND NOTICE.]

WE commence our reconsideration of Dr. Hammond's volume at the point at which he takes up "Diseases of the Spinal Cord." In the second chapter of this section we find a very complete essay on "Spinal Irritation," or (as he terms it from its pathology), "Anæmia of the Posterior Columns of the Spinal Cord." In his history of this affection he gives full credit, not only to the brothers Griffin, but to several earlier British Physicians with whose names the present generation are not familiar—as, for example, Player, Brown of Glasgow (1828), Darwall of Birmingham (1829), Tate (1830), and Whatton (1831). While Dr. and Mr. Griffin based their admirable monograph on 148 well-analysed cases, Dr. Hammond tells us that his observations are based upon a careful study of 127 cases occurring in private practice during the last six years, and of which he has full notes, and 29 of which he has less complete data—in all, 156 cases. The views of a trustworthy Physician who has enjoyed so extensive an experience of a somewhat mysterious disease are worthy of all consideration, and we shall therefore endeavour to lay them before our readers. The author divides the symptoms into the *centric* and the *eccentric*. In the former he places (1) *Tenderness at some one or more points over the spinal column, increased by pressure*; and (2) *Pain in the spinal cord*. The tenderness is the essential symptom of spinal irritation. Its seat is generally in the dorsal region of the spine. Of his own cases, twenty-five had cervical tenderness only, thirty-seven cervical and dorsal, forty-five dorsal only, nineteen dorsal and lumbar, fifteen lumbar only, and in fifteen the whole spine was tender. One hundred and sixteen cases, therefore, of one hundred and fifty-six, were characterised by dorsal tenderness, and in forty-five it was limited to this region. The degree and character of the tenderness are subject to great variation, and in some cases strong pressure is required to develop it, while in others the least touch is insupportable. Sometimes there are radiating pains from the tender spot to distant points. In a gentleman now under Dr. Hammond's care, with well-marked spinal irritation in the region of the third lumbar vertebra, pressure not only causes intense suffering at that point, but develops pain along the whole course of the crural nerves and their branches, as far as their terminations on the inner sides of the feet; while a lady, who has spinal tenderness over the eighth cervical and first dorsal vertebrae, experiences, from pressure, intense pain along the course of the first intercostal, the internal anterior thoracic, and all the nerves of the left upper extremity.

"The fact," says Dr. Hammond, "that the patient denies the existence of tenderness should have no weight with the Physician. Only a few days ago a young lady consulted me for severe infra-mammary pain, headache, and nausea. I at once suspected spinal irritation, but she declared, in answer to my inquiries, that there was no sign of tenderness anywhere over the spinal column. I insisted, however, on a manual examination, and to her great surprise found three spots that were exceedingly painful to slight pressure. This young lady had been treated for dyspepsia for several years, without deriving any benefit from the measures used, but was cured by the treatment which I shall presently fully consider. Occasionally it happens that the tenderness is not perceived for some time after the pressure is made. In a recent case I found the interval to be over a minute, and then acute pain, following the course of the nerves, was experienced."—P. 411.

Passing over his remarks on the second of the centric symptoms, we come to the consideration of the *eccentric symptoms*, which he arranges, after the example of the Griffins, according to the part of the spinal cord with which they are connected. His experience of this disease is so extensive, and his remarks are so judicious, that we shall offer no apology for a somewhat long extract, embodying his chief conclusions:—

"(a) *The Cervical Region*.—As has been already observed, in twenty-five of the cases the irritation existed in the cervical

region only of the spinal cord, in thirty-seven the cervical tenderness was conjoined with dorsal tenderness, and in fifteen with tenderness of the whole spine. Taking the uncomplicated cases as presenting the clearest features, the following would appear to be the more prominent symptoms of cervical spinal irritation:—

"Vertigo was an accompaniment in eleven cases, and headache in fifteen; noises in the ears in eight, and disturbances of vision in four. Fulness and a sense of constriction across the forehead were complained of in several cases, as was also tenderness of the scalp. In addition, the mind was more or less affected in every case, and in seven the aberration was of such a character as almost to amount to insanity. In one of these, a married lady, aged 30, there were several paroxysms of maniacal excitement every day; and in another, that of a young lady, aged 23, so furious were the exacerbations that, for fear she would injure herself or others, she had to be restrained by two strong nurses, who held her while the fits lasted. The predominant type, however, was melancholia.

"Sleep was deranged in every case, generally in the form of insomnia, though in three cases the tendency to somnolence was excessive. In every case the dreams were of an unpleasant character; in two there was nightmare, and in one somnambulism.

"Neuralgic pains were present in seventeen of the twenty-five cases. If the upper part of the cervical region was the seat of the irritation, these pains were experienced in the scalp and face; if the lower, they were seated in the neck, the shoulders, upper part of the chest, and the upper extremities.

"Motility was interfered with in eighteen cases. Sometimes there were fibrillary twitchings; in five cases there were clonic spasms of the muscles of the face and neck; in three, general chorea; in two, contractions of the flexors of the arm on one side, so that the elbow was rigidly bent; in two, the contractions were in the flexors of the hands, and in four, of the fingers. In one case there was complete loss of power over the hand; in four, aphonia; and in one, almost constant hiccup while the patient was awake.

"Nausea was present more or less in fifteen cases, and, in one, part of everything taken into the stomach was almost immediately rejected. Pain in the stomach was not met with in any case.

"(b) The Dorsal Region.—I found the dorsal region of the spine tender in one hundred and sixteen cases. In thirty-seven of these it was conjoined with cervical, in nineteen with lumbar tenderness, and in fifteen it was affected with the whole spine, leaving forty-five uncomplicated cases.

"The most prominent symptoms in these cases were connected with the viscera, the stomach being the organ commonly involved. Thus, gastralgia was present in every case, nausea and vomiting in nine cases, pyrosis in three, gastric flatulence in forty, and acidity, as evidenced by heartburn, in twenty-six.

"Next in order came the heart. There were palpitations in twenty-six cases, fits of oppression, during which the heart beat with irregularity as regarded force and rhythm, in ten cases, and attacks of syncope in five.

"There was difficulty of breathing in fifteen cases, and cough in fifteen. Intercostal neuralgia existed in ten, and infra-mammary pain in thirty-one cases.

"There were no muscular spasms, contractions, or paralysis.

"In the thirty-seven cases in which the dorsal tenderness was conjoined with cervical tenderness, the symptoms characteristic of each region were more or less intermingled. In two cases there was epilepsy, and in three chorea paralytica.

"(c) The Lumbar Region.—This portion of the spine exhibited tenderness in forty-nine cases. In nineteen of these it was accompanied by dorsal tenderness, in fifteen the whole spine was affected, and in fifteen the tenderness was confined to the lumbar region alone. Of these latter all were characterised by neuralgic pains in the lower extremities, and in three of them there were similar pains in the muscles of the back and abdomen. In six there was spasm of the neck of the bladder, accompanied with severe pain, and causing great difficulty of urinating; in one there was incontinence of urine; in five pain in the uterus and ovaries, and in one neuralgia of the rectum.

"Motility was affected in eight cases. In four of these there were strong tonic contractions of the muscles of the lower extremities, and in four paralysis. In all of these there were occasional clonic spasms simulating chorea. Of the nineteen cases in which there was also dorsal tenderness, the symptoms were in general those characteristic of spinal irritation of both regions.

"(d) The whole spine was tender in fifteen cases, and so extensive was the hyperæsthesia that it was scarcely possible to press

upon the most limited spot without producing pain. Of these cases the most prominent symptom in three was epilepsy, in one paralysis, sometimes of the upper and sometimes of the lower extremities, and in three contractions of the limbs. Neuralgic pains, either in the scalp, face, neck, chest, upper extremities, abdomen, or lower extremities, were present in every case, according to the part most severely affected for the time being. The heart was disordered in five cases, the stomach in ten, in three there was difficulty of swallowing, from alternating paralysis and spasm of the muscles of the larynx, and in two aphonia."—Pp. 413-415.

From this valuable analysis of the symptoms we pass on to the consideration of sex and age as causes. Of the 156 cases, 140 were females, and of 137 cases of which Dr. Hammond noted the ages, seventy-two were between 15 and 25, thirty-two between 25 and 35, fifteen under 15, and eighteen over 35.

We should not refer to the subject of treatment if he did not speak so decisively on a point regarding which just now there is much discussion—namely, the administration of alcohol. In his remarks on improving the general tone of the system he writes as follows:—"I am as well convinced of the general applicability of alcohol in some form, in the treatment of spinal irritation, as I am of anything. Whisky, brandy, and rum are to be preferred on account of their less liability to disagree with the stomach, and as containing a greater percentage of alcohol than vinous or malt liquors." We may add, that to improve the nutrition of the spinal cord he recommends a combination of strychnia and phosphorus in the form of a pill, containing half a grain of extract of nux vomica and the tenth of a grain of the phosphide of zinc, which may be given thrice a day. The application of hot water to the spine in Dr. Chapman's indiarubber bags is "an admirable adjunct," but the most efficacious remedy with which our author is acquainted is the direct galvanic current, the negative pole being placed at some point above the seat of pain and the positive pole at an equal distance below it. No single application should last longer than three or four minutes, but the process may be repeated two or three times at the same séance with short intervals.

In the chapter on "Spinal Meningitis" we find some valuable remarks on the treatment of the bedsores that so frequently accompany the chronic form of that disease. Although not presenting anything positively new, they contain descriptions of methods of treatment that are not so generally known as they deserve to be.

"For the cure of the bedsores the method recommended by Dr. Brown-Séguard may be used. It consists in the alternate application of sponges, one of which is saturated with hot water, and the other with cold water. This should be done for five or ten minutes every day, and the effect is to increase the activity of the circulation of the part, and to promote the formation of granulations.

"But I have generally preferred the method by galvanism first suggested and employed by Crussel, of St. Petersburg, and which I used for the treatment of indolent ulcers with almost invariable success in 1859, when Surgeon to the Baltimore Infirmary. The method was also recommended by Mr. Spencer Wells. During the last six years I have employed it to a great extent in the treatment of bedsores caused by diseases of the spinal cord, and with scarcely a failure; indeed, I may say without any failure, except in two cases where deep sinuses had formed, which could not be reached by the apparatus.

"A thin silver plate—no thicker than a sheet of paper—is cut to the exact size and shape of the bed sore; a zinc plate of about the same size is connected with the silver plate by a fine silver or copper wire six or eight inches in length. The silver plate is then placed in immediate contact with the bed sore, and the zinc plate on some part of the skin above, a piece of chamois-skin soaked in vinegar intervening. This must be kept moist, or there is little or no action of the battery. Within a few hours the effect is perceptible, and in a day or two the cure is complete in the great majority of cases. In a few instances a longer time is required. I have frequently seen bedsores three or four inches in diameter, and half an inch deep, heal entirely over in forty-eight hours. Mr. Spencer Wells states that he has often witnessed large ulcers covered with granulations within twenty-four hours, and completely filled up and cicatrised in forty-eight hours. During his recent visit to this country I informed him of my experience, and he reiterated his opinion that it was the best of all methods for treating ulcers of indolent character and bedsores."—P. 454.

Passing over chapters devoted to "Acute Myelitis" and

"Spinal Softening," we arrive at the consideration of "Sclerosis of the Antero-Lateral" and "of the Posterior Columns of the Spinal Cord," the latter being the title under which "Locomotor Ataxia" is considered. The former is a disease of a somewhat vague nature, that can hardly be regarded as fully established, although Dr. Hammond says that "there is rarely much difficulty in recognising it." The gait is stated to be characteristic, although it presents considerable variations. In one of his patients it was "similar to that of a duck," whilst in another "the motion of the body was almost serpentine." The subject of locomotor ataxia, as we now usually call it, is fully discussed; and a chapter of upwards of forty pages on it abounds in sound practical matter. After describing the ordinary symptoms of this disease, as lessened sensibility, difficulties in standing and walking, and the incapacity for prolonged muscular effort, he gives the following less generally recognised and very curious symptom:—"A phenomenon is often noticed as regards the upper extremities, which also exists with the lower, but which cannot be so readily manifested; and that is, that the patient loses the ability to distinguish even considerable differences between weights. In the normal condition, if two weights, differing in the ratio of thirty-nine to forty, are put one in one hand and one in the other, the difference is perceived without difficulty. The lower extremities, according to Jaccoud, are not so sensitive, and cannot distinguish a less difference than from about fifty to seventy grammes.

"A person affected with posterior spinal sclerosis may have an ounce-weight put into his hand, and if in a few seconds it be removed, and one of half an ounce substituted, he will not be able to tell correctly which is the heavier. Or both hands may be extended, and the two weights placed simultaneously in them. The eyes should, of course, be closed. Sometimes less differences can be perceived, but ordinarily greater ones are not distinguished. In the case of a gentleman now under my charge, there is an impossibility of telling which of the two pieces of lead, the one weighing one ounce, and the other a pound, is the heavier. Späth states that, in a case under his charge, the patient could not distinguish between two weights, which differed as one to one hundred.

"No means for measuring the extent to which the patient is able to determine the state of muscular contraction is at all comparable to the dynamograph. The range of its usefulness is, however, limited, owing to the fact that posterior spinal sclerosis is not very frequently seated high enough in the cord to affect the muscles of the upper extremities."—P. 491.

When the lesion is not above the origin of the nerves which go to form the brachial plexus, the line is straight, but when it lies between the fifth cervical and the first dorsal vertebrae, it resembles the coast-line of a country abounding in projecting headlands and deeply indented bays.

From an experience of ninety-one patients affected with this disease who have been under the author's care during the last six years, he is not led to speak hopefully of treatment. Of the many remedies that have been tried, the only ones which he has found to produce any amelioration of the symptoms are ergot of rye (in the early stages) and bromide of potassium, which may be combined with it. A drachm of the fluid extract of the former with from thirty grains to a drachm of the latter may be given three times a day. "Cod-liver oil," he adds, "is always advantageous, and the primary galvanic current is a main feature of the treatment." In eight cases chloride of barium was given with decided benefit.

Although the prognosis must generally be unfavourable, the patient may live for many years. Of the ninety-one patients referred to as under his own care, three only (so far as he knows) have died; and he mentions two cases of persons still alive who have suffered for over twelve and twenty years respectively. Five of his patients were cured, and in a considerable number there was a marked amelioration of the symptoms.

Amongst "Cerebro-spinal Diseases" our author places hydrophobia, epilepsy, catalepsy, ecstasy, chorea, hysteria, multiple cerebro-spinal sclerosis, and athetosis, the latter being a new form of disease, to which we shall direct the attention of our readers on a future occasion.

We must pass over these diseases very briefly. Dr. Hammond describes a very remarkable case of hydrophobia occurring in a boy, aged only 3 years, who had been bitten three months previously by a bitch in heat, but not stated to be rabid. During his illness he talked incessantly about dogs, and invented marvellous stories regarding them, all having a tragic ending. Dr. Hammond has no faith in the efficacy of any remedy when the disease is once fully developed. In two cases reported by Dr. Schivardi, of Milan, the primary current from the soles of

the feet to the forehead caused great temporary improvement. Of the chapter on "Epilepsy" we need only state that it is based on 286 cases which have come under the author's notice, in order to recommend it to the careful study of our readers; while that on "Chorea," based on 82 cases, is equally deserving of commendation. The chapter on "Multiple Cerebro-spinal Sclerosis," like the previous ones on "Sclerosis," is mainly based on the observations of the present school of French pathologists—Jaccoud, Charcot, Vulpian, Bourneville, Guérard, etc.—but additionally contains details of eleven cases that have fallen under the writer's personal observation.

The section on "Diseases of the Nerve-cells" treats of progressive muscular atrophy under the title of "Atrophy and Disappearance of Trophic Nerve-cells;" of glosso-labio-laryngeal paralysis under that of "Atrophy and Disappearance of Motor Nerve-cells;" and of organic infantile paralysis under that of "Atrophy and Disappearance" of both kinds of cells; while under "Functional Derangements of Motor Nerve-cells" are described paralysis agitans, writer's spasm, and lead paralysis.

If space had permitted it, we should have made various quotations both from this section and from the concluding one on "Diseases of Peripheral Nerves;" but under existing circumstances we must content ourselves with the remark that the latter portion of the work is fully as valuable and original as the earlier parts. We cannot conclude without a word of commendation on the extreme beauty of the numerous illustrations that are freely scattered over this admirably got-up volume.

GENERAL CORRESPONDENCE.

UNION OF TENDONS.

LETTER FROM MR. SIDNEY PARSONS.

[To the Editor of the Medical Times and Gazette.]

SIR,—The following case being illustrative of rapid union of a severed tendon, I thought perhaps you would like to insert it in your widely circulated journal:—

A. H., a farm labourer, aged 19 years, whilst cutting turnips in a machine, accidentally let his hand slip between the knives on May 26. He first came under my notice on May 31, and on examining the wound I found, by the escape of the synovial fluid, that the phalangeal joint of the thumb had been opened; and on further examination that the tendon of the extensor secundi internodii pollicis muscle had been severed. I put the thumb into a gutta-percha splint, so constructed as to keep it at perfect rest, and ordered the patient to use cold water dressing for a few days, after which the "red wash" was substituted. On June 14 the wound had closed over, and a healthy granulating surface had formed, and on June 17 this was covered with a fine cuticular layer. A week after this he possessed some power of extension as well as flexion over the terminal phalanx of the wounded thumb, thus showing the tendon of the extensor secundi internodii pollicis to have become united.

He is now able to follow his employment, and can extend and flex his thumb almost as well as before.

I am, &c., SIDNEY PARSONS, M.R.C.S., L.S.A.
Romsey, Hampshire, September 5.

OBITUARY.

JOHN WILLIAM IRVINE, M.D., L.R.C.S., L.S.A.

THIS gentleman was the eldest son of Dr. James Pearson Irvine, who for a quarter of a century practised his Profession in Lancaster. He was educated in the Lancaster Royal Grammar School, and afterwards at the University of Glasgow, where his distinguished career, in anatomy especially, led to his appointment as Curator of the Museum in the Leeds School of Medicine, at which place he finished his Medical studies. He obtained his diploma of L.R.C.S. Edin. and L.S.A. Lond. in 1859, and in 1862 became a Doctor of Medicine at St. Andrews, passing his examination with high honours. His success in Liverpool, where he commenced practice, was rapid. He was at once appointed Honorary Surgeon to the Liverpool Caledonian School, and subsequently Honorary Surgeon to the Liverpool Dispensaries. In 1864 he was elected Visiting Surgeon to the West Derby Union Hospital, where he had excellent opportunities for pursuing the Surgical branch of his Profession, to

which he had always a strong inclination. All these appointments he held up to the time of his death, doing his duty diligently, and winning the esteem of all—patients or others—with whom his position brought him in contact. He was also an Assistant-Surgeon to the First Lancashire Rifle Volunteers, where his loss is particularly felt by officers and men. By gentlemanly bearing and scholarly attainments Dr. Irvine had won the confidence of all who knew him, and had gained that position which great qualities in those practising Medicine deserve. His affable and genial manners attracted the suffering poor in his wards, and his visits were like gleams of sunshine to them. With a kind word and a willing ear for all, he won from suffering humanity a love which is better than any stone that man can raise over the grave, and left on the hearts of his fellows a better epitaph than pen can write—a character which, at the time when sea as well as earth shall give up its dead, will indeed prove a monument more telling than brass. As regards his more immediate connexion with his brother Practitioners, it may truly be said that there is none who knew him but will be sorry, and truly sorry, to hear of his untimely death. He shone chiefly as a Surgeon; and as a Surgeon, operative or otherwise, he gave unmistakable signs of becoming one of the leaders in the town in which he practised. He has contributed several essays to the Medical papers: one on "Fever in Liverpool," in the *Medical Times and Gazette*, and another on "Resection of the Clavicle, with Formation of the Entire Bone," in the pages of the *Lancet*. At the time when his illness overtook him he was engaged on a paper for the "Liverpool Medical and Surgical Reports" on amputation at the hip-joint, that paper being the result of three successful hip-joint amputations, after failure of resection of the knee-joint and disease of the femur. The unfortunate gentleman last spring suffered from relapsing fever, an attack which was probably favoured by his unremitting labours in the fever wards of the West Derby Hospital during the late fever and small-pox epidemic. He never thoroughly recovered his strength after this attack, though he still supervised the wards of his Hospital with but short intermissions. In the beginning of August, by the strong advice of his Medical friends, he was induced to undertake a voyage to Canada onboard the steamship *Germany*. He suffered on the second day from severe sickness, which prostrated him so much that on the fourth day after leaving Liverpool he died quietly and painlessly of exhaustion, at the early age of 33. Owing to some unfortunate mistake in the offices of the company to whom the ship belonged, the telegram announcing his death was delayed, and thus we are only at this late hour able to announce his melancholy death.

RICHARD FILKIN, M.D.,

Was born on November 25, 1775. His father was a Lieutenant in the Royal Navy. His family afterwards resided at Chiswick, Middlesex, where he went to school at Dr. Rose's. In July, 1790, he commenced his Medical education under Mr. Dundas (afterwards Sir David Dundas, Bart.), Sergeant Surgeon to King George the Third. Seven years later he entered on his Medical and Surgical studies at St. George's Hospital, and finally passed as Member of the Royal College of Surgeons. Richard Filkin then entered the army, and ultimately became Surgeon of the North Gloucester Militia. In 1815, the regiment being disembodied, he was placed on half-pay, which he retained to the time of his death. Being relieved from military duty, he settled in private practice at Tetbury, in Gloucestershire, where he resided about fourteen years, and at which place he is now to be interred. After he had left Tetbury, he went to Glasgow University, kept his terms, and took his M.D. He never practised after this, but occupied his leisure by travelling on the Continent of Europe. Subsequently he was much in London, and eventually settled at Richmond, where he had many old friends, and where he died on the 15th inst. Dr. Filkin was a man of considerable intelligence and of agreeable conversation, and as a Medical officer of the army, his zeal and energy occasioned him to be well thought of at the Army Medical Board, especially for his "Code of Diet for the Army."

GEORGE B. NEWTON, M.R.C.S.,

Was attached to her Majesty's ship *Ocean*, having previously served in the *Rodney*. Whilst serving in Japan, he died suddenly from sunstroke. Mr. Newton had lately received promotion on account of his Professional acquirements, and in recognition of his having induced the Japanese authorities to

adopt the principles of our own Contagious Diseases Act. He did not live to know of this promotion. He was a man of remarkable energy and suggestiveness. Under his superintendence, the Lock Hospitals in China and Japan were established in connexion with both services.

CHARLES ELWORTHY CUTCLIFFE, SURGEON, ETC., OF SILVERTON, DEVON,

DIED on September 10, 1871. He was in practice for thirty-five years, and having been for twenty years Medical Officer to the Tiverton Union for the parishes of Silverton and Bickleigh, was eligible for superannuation. Once during his period of service he was presented by "the poor" with a present of plate—humble in itself, but highly appreciated by him. During twenty years' service under the guardians of the poor no complaint was ever made against him.

JAMES E. MALE, M.R.C.S.,

DIED on Sunday last, at his residence, Euston-place, Leamington. Up to the preceding day he had been in his usual health, but was then seized with very severe abdominal pains, which resisted all treatment, and he died at the end of twenty-four hours. The symptoms seemed to indicate the existence of perforation of the stomach or intestines; but a post-mortem examination showed that death was the result of fatty degeneration of the heart. Mr. Male was one of the oldest Practitioners in the town of Leamington, and many years Surgeon to the Warneford Hospital and to the Great Western Railway. He was educated at University College.

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentlemen passed their Examination in the Science and Practice of Medicine, and received Certificates to practise, on Thursday, September 14, 1871:—

Popham, Francis William Home, Gowler, South Australia.
Thomas, John Howell, Carmarthen.

The following gentleman also on the same day passed his first Professional examination:—

Meredith, William Henry, Queen's Hospital, Birmingham.

The autumnal registration at the Hall commences on Monday, October 2, and terminates on Saturday, the 14th.

APPOINTMENTS.

* * * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

ADDISON, CHARLES E., L.K.Q.C.P., M.R.C.S.E., and L.M.—Certifying Factory Surgeon for the Colchester District.

BAUMGARTNER, JOHN RICHARD, M.R.C.S. Eng., L.S.A. Lond.—House-Surgeon to the Norfolk and Norwich Hospital, *vice* Dr. Beverley, resigned.

HARPER, JOHN WILLIAM, M.R.C.S.L. and L.S.A.—Medical Officer to the Fifth District of the Stow Union.

NAVAL AND MILITARY APPOINTMENTS.

ADMIRALTY.—In accordance with the provisions of Her Majesty's Order in Council of February 22, 1870, Assistant-Surgeon Thomas St. J. Clerke, M.D., has been placed on the retired list of his rank, from October 5, 1870.

8TH HUSSARS.—Staff Assistant-Surgeon David Arno Smet Thorburn, M.D., to be Assistant-Surgeon, *vice* Edmund M'Grath, promoted on the Staff.

17TH FOOT.—Staff Assistant-Surgeon John Ruxton, M.B., to be Assistant-Surgeon, *vice* George Wellington L'Estrange, appointed to the Staff.

70TH FOOT.—Staff Surgeon Samuel Fuller, to be Surgeon, *vice* Surgeon-Major Vere Webb, appointed to the Staff.

MEDICAL DEPARTMENT.—Surgeon-Major Vere Webb, from 70th Foot, to be Staff Surgeon-Major, *vice* Staff Surgeon Samuel Fuller, appointed to 70th Foot; Assistant-Surgeon Edmund M'Grath, from 8th Hussars, to be Staff Surgeon, *vice* Staff Surgeon-Major Francis Reynolds, who retires upon half-pay. To be Staff Assistant-Surgeons: Assistant-Surgeon George Wellington L'Estrange, from the 17th Foot; Alexander Crombie, M.B.; George Ballingall Stuart, M.B.; Lewis Allen Irving, gentleman; John Alexander M'Cracken, M.D.; James Maybury Beamish, M.D.; James Albert Clery, M.B.; Brodie Cruikshank, M.B.; James Coats, M.B.; John Gover Williamson, gentleman; Henry Bradford, gentleman; William James Fawcett, M.B.; Henry William Joynt, gentleman; William Egerton Saunders, gentleman; David Leckie, M.B.; William Johnston Charlton, gentleman; John Ruxton, M.B.; Alfred Henry Anthonisz, M.B.; William Tobin, gentleman; Oscar Frederick Molloy, gentleman; William Joseph Moylan, gentleman; Richard Exham, gentleman; William Leavens White, M.B.; James McNamara, M.D.; Rodolph Harman, M.B.; John Bower Wilson, M.D.; George Dalton

Nugent Leake, gentleman; Joseph Walter O'Malley Martin, M.B.; Robert Henry Robinson, gentlemen; Poole Robert Gabbett, gentlemen; Matthew Daniel O'Connell, M.D.; Charles de Montmorency Palmer, M.B.; Espine Charles Robert Ward, gentleman; William Finlay, gentleman; William Price Sullivan, gentleman; John R. Dickson, gentleman; Edward Hearne Joynt, M.D.

BIRTHS.

DAVIS.—On September 12, at the Laurels, Mortimer, Berks, the wife of G. H. Davis, L.R.C.P. Edin., of a son.
 HILL.—On September 15, at 5, Bedford-terrace, Upper Holloway, the wife of James Robert Hill, L.R.C.P., of a daughter.
 HUNTER.—On September 14, at Bridge House, Dartford, the wife of R. H. Hunter, M.R.C.S., of a daughter.
 JEFFERISS.—On September 13, at Plas Marl, Landore, the wife of Walter Robert Spence Jefferiss, M.B., C.M., of a daughter.
 MACKINNON.—On July 30, at Kussowlie, East Indies, the wife of Assistant-Surgeon Charles Mackinnon, 20th Hussars, in Medical charge of Convalescent Depôt, of a son.
 MENZIES.—On August 18, at Sorrento, the wife of James A. Menzies, M.D. Edin., F.R.C.S. Edin., of Naples, of a daughter.
 RAYNER.—On September 13, at Teviotdale, Stockport, the wife of Edwin Rayner, M.D., of a daughter.
 SKEGG.—On September 14, at 23, Northumberland-street, Trafalgar-square, the wife of John J. Skegg, L.R.C.P. Edin., of a son.

MARRIAGES.

CLARK—VINK.—On September 14, at the parish church of South Hackney, Andrew Neal, third son of R. W. Clark, M.D., late of Whitby, Canada, to Rosa Isabella, second daughter of F. Vink, Esq., Terrace-road, South Hackney.
 DODSWORTH—DANIELL.—On September 7, at Christ Church, Turnham-green, Chiswick, Frederic Charles Dodsworth, L.R.C.P.L., of Oxford Villa, Turnham-green, eldest son of F. C. Dodsworth, Esq., The Lawn, Turnham-green, to Fanny, daughter of the late Neville Daniell, Esq., and niece of Fern Edwards, Esq., of Woodbine House, Turnham-green, and Hong-kong.
 DUSTAN—HARTNELL.—On September 14, at Trinity Church, Valetta, John Dustan, Staff Assistant-Surgeon, to Mary Ann Elizabeth, only daughter of the late Rev. M. A. Hartnell, M.A., of Tresco, Sicily.
 EAGER—FURNIVALL.—On September 19, at Shere, Cawley Eager, M.D., M.R.C.S., son of John King Eager, M.R.C.S., of Ripley, Surrey, to Grace Isabella, daughter of William Henry Furnivall, Esq., of 16, Grafton-square, Clapham.
 GRIFFITH—BOULTON.—On September 14, at St. Mary's, Bryanston-square, Captain V. S. Griffith, Adjutant of the East York Royal Volunteers, son of the Rev V. Pole Griffith, rector of Tullaghobeghy, diocese of Raphoe, to Fanny, youngest daughter of Robert George Boulton, M.D., and J.P. of Beverley, East Yorkshire.
 MCSHEEHY—HIRST.—On September 13, at St. Ann's Church, Leeds, Louis McSheehy, F.R.C.S.I., Surgeon 12th Regiment, to Theresa Mary, only daughter of Joseph Hirst, Esq., Mount Cross, Bramley, Leeds.
 MORGAN—BIRD.—On September 14, at St. Mary's, Melcombe Regis, Weymouth, Herbert, only son of the late M. Morgan, M.D., of Charlotte-street, Bedford-square, London, to Mary Amelia Anne, second daughter of William Salter Bird, Esq., of Semington, Wilts.
 WHITE—PRICHARD.—On September 9, Dr. William White, Surgeon-Major (Artillery Brigade), of the Bengal Presidency, M.D. and F.R.C.S., of 3, Inverness-terrace, and of Court Lees, near Canterbury, Kent, to Selina Taylor Prichard, of 49, Westbourne-park, second daughter of the late William Taylor Prichard, Esq.

DEATHS.

CAMERON, HELEN GRANT, on August 21, aged five years; also, on the 22nd, Alan Martin, aged ten months, children of A. G. M. Cameron, M.D., at Lundavra, Essequibo, British Guiana.
 FILKIN, RICHARD, M.D., only son of the late Lieutenant Richard Filkin, R.N., at his residence, Ormond-terrace, Richmond, Surrey, on September 15, in the 96th year of his age.
 KING, LOUISA, the wife of Dr. William Grimwood King, at Parkfield-villas, King Edward's-road, South Hackney, on September 18.
 MACLEAN, MILDRED, eldest daughter of the late William Maclean, Surgeon, Chatham, at 3, Edwardes-place, Kensington, W., on September 12.
 MALE, JAMES EDWARD, M.R.C.S.E., at his residence, Euston-place, Leamington, suddenly, from heart disease, on September 17, aged 56.
 MITTON, JOHN, M.R.C.S.E., at Wildbad, Germany, on September 4, aged 31.
 NEWBOLD, EDWARD, Surgeon, of Macclesfield, at Worthing, on September 18.
 ROBINSON.—At Newbury, Berks, on September 15, the dearly loved wife of R. P. Robinson, Surgeon, aged 78.
 TRAVERS, MARY CAROLINE, daughter of Dr. Travers, at Kensington, on September 17, aged 9 months and 12 days.
 TROSH, ANNE ELIZABETH, widow of Frederick Charles Trosh, M.D., late of Bombay Medical Staff, at Torquay, on September 9, aged 63.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.
 DUDLEY GUEST HOSPITAL.—Resident Medical Officer. Must have both Medical and Surgical qualifications, and be registered. Applications and testimonials to the Rev. G. Y. Osborne, St. Edmund's Vicarage, Dudley, on or before October 14.
 GAINSBOROUGH DISPENSARY.—House-Surgeon. Must be duly qualified and registered. Applications and testimonials to Mr. F. C. Spouncer, on or before October 4. Election on the 19th.

KENT AND CANTERBURY HOSPITAL.—House-Surgeon and Dispenser. Must be duly qualified and registered under the Medical Act, 1858. Applications and testimonials to the Secretary, at the Hospital, on or before September 29. Personal attendance is desirable. Further particulars of the Secretary.
 LIVERPOOL DISPENSARIES.—Resident House-Surgeon. Must be duly qualified. Applications and testimonials to the Secretary, on or before September 27. Election the following day at 2 o'clock p.m.
 MANCHESTER ROYAL INFIRMARY.—Physician's Assistant. Must possess both Medical and Surgical qualifications. Applications and testimonials to the Chairman of the Weekly Board, on or before September 23.
 MIDDLESEX HOSPITAL.—Assistant-Surgeon. Candidates to send their applications and testimonials to Mr. Henry N. Custance, on or before September 26. Election on October 3.
 NARBERTH UNION.—Medical Officer for District No. 3. Candidates must have the qualifications prescribed by the Local Government Board, and must have a knowledge of the Welsh language. Applications and testimonials to Mr. John Thomas, Clerk, on or before September 23. Election September 25.
 PARISH OF UNST, SHETLAND.—Medical Officer. Applications and testimonials to Mr. White, Inspector of the Poor.
 QUEEN ADELAIDE'S DISPENSARY, POLLARD-ROW, BETHNAL-GREEN.—House-Surgeon. Must be a member of one of the Colleges of Surgeons of London, Edinburgh, or Dublin, and L.S.A. Applications and testimonials to the Rev. T. Peckston, 260, Cambridge-road, London, E., on or before October 3. Election on October 6.
 ROYAL ORTHOPÆDIC HOSPITAL.—House-Surgeon and Apothecary. Must be M.R.C.S. and L.A.C., or possess the certificates of Medical and Surgical qualifications of some British University, College, or Corporation by charter. Applications and testimonials to the Secretary, 315, Oxford-street.
 STOCKPORT INFIRMARY.—House-Surgeon. Must have both Medical and Surgical qualifications. Applications and testimonials to the Hon. Sec., on or before September 27. Election on October 2.
 WARRINGTON DISPENSARY.—Resident Surgeon-Apothecary. Must have the qualifications which are required of candidates for appointments in the Poor-law Medical Service. Applications and testimonials to the Honorary Secretary, on or before October 2.
 WESTMINSTER HOSPITAL.—House-Physician. Must be qualified to practise under the Medical Registration Act of 1858. Applications and testimonials to the Secretary, on or before October 1. Election on October 10.
 WHITCHURCH UNION.—Medical Officer wanted for the Overton District. Candidates must have the qualifications prescribed by the Orders of the Local Government Board. Applications and testimonials to Mr. Spencer Clarke, Clerk, on or before September 25, at 9 a.m. Election the same day.
 WORKSOP DISPENSARY.—Resident Surgeon. Must have both Medical and Surgical qualifications. Applications and testimonials to the Committee, on or before September 23. The duties commence November 1.

UNION AND PAROCHIAL MEDICAL SERVICE.

** The area of each district is stated in acres. The population is computed according to the census of 1861.

RESIGNATIONS.

Warminster Union.—Mr. Philip Grubb has resigned the Warminster District; area 7103; population 6263; salary £95 per annum—the Corsley District; area 5066; population 1616; salary £50 per annum—and the Workhouse; salary £35 per annum.

APPOINTMENTS.

Lexden and Winstree Union.—Henry D. Palmer, M.R.C.S. Eng., L.S.A., to the Eighth District.
 Macclesfield Union.—James Allen, M.R.C.S. Eng., L.S.A., to the Adlington and Bollington District. John L. Rushton, M.D. St. And., M.R.C.S. Eng., L.S.A., to the Sutton and Rainow District.
 Rugby Union.—Fred. Wm. Wimberley, M.R.C.S. Eng., L.S.A., to the Brinklow District.
 Tenterden Union.—Wm. H. C. Tessier, M.D. St. And., L.R.C.S. Edin., L.S.A. Lond., L.A.H. Dub., to the Biddenden District.

UNIVERSITY OF TORONTO.—Dr. Alleyne Nicholson, lately Lecturer on Natural History in the Medical School of Edinburgh, has been appointed to the Chair of Natural History in the University of Toronto, Canada West.

VETERINARY COLLEGE, EDINBURGH.—Dr. G. W. Davidson, of Edinburgh, has been elected to the Chair of Zootomy or Comparative Anatomy, and Mr. Thomas Walley, M.R.C.V.S., of Manchester, to that of Cattle Pathology.

THERE was a small diminution in the deaths in Paris last week, the number being 827, against 945 the previous week.

MAX LOEWENSTEIN, in the Berlin *Centralblatt*, maintains, contrary to the statements contained in most anatomical text-books, that the vaginal mucous membrane is supplied with lymph glands. These vary in number in different individuals, and are most abundant on the upper surface of the canal. In structure they resemble the solitary glands of the small intestine.

SMALL-POX is alarmingly increasing at Brentford. In a few days nineteen persons have died of the epidemic at Old Brentford. Nine new cases are reported in New Brentford, and seven deaths in Bull-lane; and numerous other cases are reported in the immediate neighbourhood.

THE Mauritius papers state that a fever almost similar to that which so long devastated the Mauritius has appeared in a very bad form in Madagascar.

NOTES, QUERIES, AND REPLIES.

So that questioners much shall learn much.—*Bacon.*

C. W. S., Adlington, near Chorley.—Yes, man is an animal. Not necessarily a brute by nature; only sometimes.

Nemo is correct in his opinion.

N. is exempt. The Secretary of the College of Surgeons will furnish him, on application, with the papers he requires.

Fork can register the diplomas referred to by the payment of 5s. by application to Dr. Francis Hawkins, 32, Soho-square, London, W.

Candidate.—Under the peculiar circumstances of the case, we think you would be admitted for examination. Our correspondent should address a memorial stating the whole facts of the case to the Clerk of the Apothecaries' Company, Blackfriars.

A Partner is bound both by law and equity to the covenants of the agreement. It is not only necessary that he should not reside within three miles, but that he should attend no patient residing within that distance.

Purens.—We do not recommend any particular school. In our "Students' Number" all particulars will be found to enable our correspondent to choose a place of study for his son.

Studens had better consult his teachers as to the books he should use to assist him in his studies.

A. B. must pass the Preliminary Examination. The term "Professional studies" has reference to his entering a Medical school, and has no relation to his apprenticeship.

Anxious (Bath).—The case is one quite amenable to treatment. Our correspondent should place himself under the care of any respectable Surgeon in his own town, and should avoid as a pestilence advertising adventurers, who will not only rob him of his money but ruin his health. The person to whom reference is made is an arrant quack.

A Provincial Student.—The Primary and Pass Examinations for the diploma of Membership of the Royal College of Surgeons will take place about the middle of November. The exact dates will be duly advertised in the *Medical Times and Gazette*.

Dr. M., Fowey, Cornwall.—Sir Humphry Davy is to have a statue, which will be erected in Penzance, the place in which Dr. Beddoes found him serving his apprenticeship to a Surgeon. £500 has already been subscribed. Sir Christopher Wren, the architect, and Locke were Medical men.

Pharmacy.—It is true that at a meeting of the Pharmaceutical Council, on the 6th instant, the election of two homœopathic "registered chemists and druggists" was defeated by a majority of one!

Decrease of Small-pox.—In the year 1865 the deaths from small-pox in England and Wales, when the estimated population was 20,990,946, numbered 6411, and in 1869, when the population was 21,869,607, only 1565. The deaths in that year were 494,828, and in 1865 the number was 490,909.

E. R., Stockwell.—Professor Pryme, M.P., who died in 1868, states in his autobiography that when he first saw Lincoln's-inn-fields, the centre was a mere grass field with sheep feeding on it. Many of the great lawyers of the time had houses there—as Lords Kenyon, Erskine, and Sir F. M. Eden—who proposed converting it into an ornamental garden; whereupon Erskine said, "If so, it must be called the *Garden of Eden*."

"Incomes."—It is recorded of Radcliffe, that in 1691, when his fame was so great that everybody flocked to him for advice, that his neighbour, Dr. Gibbons, received £1000 a year—a large sum in relation to the value of money at that period—from the overflow of patients who were not able to get admission to the great Physician of the day. In 1707—seven years before his death—his fortune amounted to £80,000.

Progress of Growth in the various Provinces of France.—Dr. Chéron, "On Medical Art in relation to Military Organisation," gives some curious details with regard to the period of growth in the human being. The average number of Frenchmen liable each year to military service having attained the age of 20 is 325,000, but about 61,000 are exempt from various causes, of which deficient height is one of the most frequent. This, Dr. Chéron thinks, is not a sufficient ground for exemption, as the time required to reach the full development of the stature varies considerably in different races. The population of France, being composed of mixed races, presents great differences as regards height, and the duration of growth greatly varies from one region to another, according to the origin of the inhabitants. The descendants of the aboriginal Gauls, occupying the central zone of France, from the Alps to the Atlantic, scarcely reached their full height before the age of 23. The inhabitants of the South, springing from Greeks, Romans, and Gauls, attain their complete stature at 23 years of age. In the North-east of France the descendants of Belgians, Northmen, Flemings, and Germans are not fully grown till they reach the age of 26. Dr. Chéron quotes the opinion of Dr. Larry, a great authority in such matters, to the effect that a low stature is more often coincident with a strong constitution than a very high one.

The Correspondent who complains that the communication sent to us was not inserted seems to labour under a strange mistake respecting the duties of an editor. It remains for him to determine the value of contributions sent him with the view of being published. The authors of such communications are not always the best judges of their own productions, though generally they have a very exalted opinion respecting them. We cannot admit that the dictum of a "layman" with respect to the action of medicines, and their value in certain disorders or diseases, can be fairly put in competition with that of a Physician of extensive practice.

A Middlesex Hospital Student.—Yes; the session was opened by an introductory address by Sir Charles Bell. We cannot recommend that address as a truthful exposition of the "hopes and fears" of a Medical life. With all his unquestionable genius, vast acquirements, and brilliant discoveries, Sir Charles was really a "disappointed man." He never succeeded in practice in London. There were causes for this, to which it is not necessary to allude. But he felt his failure most poignantly, and expressed his dissatisfaction in unmeasured terms. Late in life the Government found out his merits, and appointed him to a chair in the University of Edinburgh. This was a paltry reward for eminent services to mankind; but it must be remembered that it is not without a "precedent." Government showed their appreciation of Burns by making him an Exciseman. "They manage these things better in France."

Prussian Army Medical Department in the late War.—Sir Randal H. Roberts, Bart., in his recently published book, "Modern War, or the Campaigns of the First Prussian Army, 1870-71," says, "Perfect, however, as the organisation of the Prussian Army is in most respects, one portion seems to require a most thorough remodelling. I refer to the Medical Department. As it was in our service, so it is here: many an officer would rather endure pain and suffering than send for his regimental persecutor." The passage concludes thus:—"It is true that during the war many eminent Medical men from Berlin, and all the German towns, flocked to assist their country; but I am sorry to say that the want of good and efficient Medical men was deeply and fearfully felt." Sir R. Roberts went out at the commencement of the war as special military correspondent to the *Daily Telegraph*, and followed the fortunes of the 1st Prussian Army from the beginning to the end. His book, therefore, contains an eye-witness's account.

Spes.—The appointments referred to rest with the Secretary to the Colonies. The emoluments are not always in a ratio to the duties to be performed, but an energetic Surgeon may derive great advantage from such an appointment. It is a mistake to suppose that his practice is limited to his official duties. We could give several instances in which a colonial appointment has given the possessor the means of obtaining distinction and fortune. The case to which our correspondent refers is quite an exceptional one. There can be no doubt that Dr. A. was a man of great talents and acquirements, but he had the misfortune to be possessed of a very irritable temper and a brusqueness of manner which interfered seriously with his success as a private Practitioner in the colony to which he was appointed. He contributed largely to our knowledge of the natural history of the district in which he officiated. We quite agree with the opinion of our correspondent, that his labours in the cause of science gave him a just claim on the Government for some peculiar recognition. This he did not obtain, and we believe his family are at the present moment in a state of all but destitution.

Quackery at the Time of the Plague.—The following extract from Defoe's "Memoirs of the Plague" (new edition, Wm. Tegg) may not be without interest at the present time:—

"As for quackery and mountebanks, of which the town was so full, I listened to none of them, and observed often since, with some wonder, that for two years after the Plague I scarcely heard or saw one of them about the town. Some fancied they were all swept away in the infection to a man, and were for calling it a particular mark of God's vengeance upon them, for leading the poor people into the pit of destruction merely for the lucre of a little money they got by them; but I cannot go that length neither. That abundance of them died is certain, many of whom come within the reach of my own knowledge; but that all of them were swept off I much question. I believe rather they fled into the country and tried their practices upon the people there, who were in apprehension of the infection before it came to them. This, however, is certain: not a man of them appeared for a great while in or about London. There were, indeed, several Doctors who published bills recommending their several physical preparations for cleansing the body, as they call it, after the Plague, and needful, as they said, for such people to take who had been visited and had been cured; whereas, I must own, I believe that it was the opinion of the most eminent Physicians at that time that the Plague was itself a sufficient purge, and that those who escaped the infection needed no physic to cleanse their bodies of any other things—the running sores, the tumours, etc., which were broken and kept open by the directions of the Physicians, having sufficiently cleansed them—and that all other distempers and causes of distempers were effectually carried off that way; and as the Physicians gave this as their opinion wherever they came, the quacks got little business."

REST.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In this age of gigantic enterprise the poor human brain, stimulated beyond allotted capacity, too frequently gives way. The metal and the earthenware crock float but a short time together down the stream. The majority must fail in the race for wealth, fame, and position—*Vae victis!* Want of sleep, want of rest, all busy men suffer from. This letter is written on a calm Sabbath morning—the sun, as well as the sky, all but

Italian; the shops closed; the hum of business pleasantly changed into the melodious chimes of the village church bells, inviting us to come and find rest in public worship, inviting us to thank Providence for all mercies bestowed, and to pray for help and comfort in the trials of the future. Last night a welcome shower of rain has improved the green velvet turf of the little garden. The sweet simple roses are gone, tolerably replaced by hollyhocks, China asters, dahlias, and double geraniums; and the hardy chrysanthemums promise a variegated blaze later on.

Lord Shaftesbury, speaking of Sunday—the “pearl of days,” the period for repairing all the wear and tear of the mind and the body during the week—looks upon it as a day which may be devoted to many family duties, to social intercourse, and to innocent enjoyments. Some people could afford to pay double fees, or, at all events, frequently be more considerate. Instead of a day of rest, jaded and tired, we shall find it hot and oppressive in the sick-rooms about to be visited. On the list are cases of choleraic diarrhoea, scarlet and typhoid fevers. Unavoidably we must run the risk of conveying infection to other patients, or, more likely, to our own families. A pretty winning child—the only one after many longing years of married life, and heir to property—is rapidly sinking. The spring flowers will mark poor little Jack’s early grave. The grief of the parents will only die with them.

Sufferers only can appreciate the mental agony of battling with work after a sleepless night. Opium, henbane, chlorodyne, chloral, bromides, hypodermic injections, purgatives, tonics, alcohol, electricity, baths, etc., will temporarily stupify into narcotism, followed by depression—*par après!* London Physicians, as well as patients! never work after dinner; mix in society; take a holiday whenever practicable; rest on Sundays; and if these remedies fail, go to the play. Depend upon it, the “play’s the thing:” we are shaken out of ourselves temporarily; or, as Rousseau puts it, “go to theatres, there weep at misfortune, and, returning home, imagine ourselves happy and virtuous.” The Prince of Wales, Mr. Gladstone, Sir William Fergusson—indeed, most busy men (editors especially)—are great dramatic patrons. Austere clerical dignitaries have innocently enjoyed Sothorn in *David Garrick*, Mrs. Rousby (a Doctor’s daughter) in *Jean of Arc*, and Toole in *Aladdin*. The Bishop of Manchester, complaining that courting hours were short and fleeting, and the days of wedlock long (and sometimes dreary), ought to go to the Strand to see the *Heir-at-Law*.

Major Magnum Bonum, a martinet on parade, a lamb at home, meanly taking advantage of his wife’s absence (“Dolly Vardening” at Ryde), insists on a full-dress inspection of the kitchen utensils, including the blacking brushes—all on the Prussian system. The Tichborne claimant suggested a dose of physic would do the Solicitor-General a deal of good. Ah! these are not the times “when weariness can snore upon the flint, and restive sloth find the down pillow hard.”

To all fussy, nervous, restless mortals let a portly Practitioner recommend Dr. Pangloss, LL.D., and recently elected (more judiciously than some of the others) F.R.C.P.

COMMUNICATIONS have been received from—

DR. LITTLETON; MR. STOTHARD; DR. RIDGE; MR. J. E. CUTCLIFFE; DR. EADE; F.R.C.P.; C. W. S.; DR. FAYRER; MR. C. F. MAUNDER; MR. S. TURNER; DR. J. J. SKEGG; DR. COUSINS; MR. T. R. TALLACK; DR. W. H. BROADBENT; DR. B. W. RICHARDSON; MR. H. MORRIS; DR. J. J. RIDGE; DR. DAY; MR. J. CHATTO; MR. HENRY BULLOCK; DR. F. R. HOGG; DR. E. HUGHES; MR. SHIRLEY DEAKIN; J. S.; MR. LE GROS CLARK; MESSRS. BLACKWOOD AND SONS.

BOOKS RECEIVED—

Epidemic Cholera, by Edward Ambrose Fitzgerald, Surgeon Bengal Medical Service—Report of the Reigate and Redhill Cottage Hospital, 1870-71—Carbolic Acid from a Septic Point of View, by J. Milner Fothergill—Green on Morbid Anatomy—Mortality Experience of the Prudential Assurance Company.

PERIODICALS AND NEWSPAPERS RECEIVED—

Gazette des Hôpitaux—L’Union Médicale—Pharmaceutical Journal—Dublin Evening Telegraph—Medical Press and Circular—Dublin Freeman’s Journal.

APPOINTMENTS FOR THE WEEK.

September 23. Saturday (this day).

Operations at St. Bartholomew’s, 1½ p.m.; St. Thomas’s, 9½ a.m.; King’s, 2 p.m.; Charing-cross, 2 p.m.; Royal Free, 2 p.m.; Hospital for Women, 5½ a.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

25. Monday.

Operations at the Metropolitan Free Hospital, 2 p.m.; St. Mark’s Hospital for Diseases of the Rectum, 2 p.m.; St. Peter’s Hospital for Stone, 2½ p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

26. Tuesday.

Operations at Guy’s, 1½ p.m.; Westminster, 2 p.m.; National Orthopædic, Great Portland-street, 2 p.m.; Royal Free, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

27. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary’s, 1¼ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew’s, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas’s, 1½ p.m.; Samaritan, 2.30 p.m.; King’s College Hospital (by Mr. Wood), 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

28. Thursday.

Operations at St. George’s, 1 p.m.; Central London Ophthalmic, 1 p.m.; Royal Orthopædic, 2 p.m.; West London, 2 p.m.; University College Hospital, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

29. Friday.

Operations at Central London Ophthalmic, 2 p.m.; Royal London Ophthalmic, 11 a.m.; South London Ophthalmic, 2 p.m.; Royal Westminster Ophthalmic, 1½ p.m.

VITAL STATISTICS OF LONDON.

Week ending Saturday, September 16, 1871.

BIRTHS.

Births of Boys, 1111; Girls, 1100; Total, 2211.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.966 in.
Mean temperature	62.6°
Highest point of thermometer	78.6°
Lowest point of thermometer	52.5°
Mean dew-point temperature	52.9°
General direction of wind	N.E.
Whole amount of rain in the week	0.00 in.

BIRTHS and DEATHS Registered and METEOROLOGY during the Week ending Saturday, September 16, 1871, in the following large Towns:—

Boroughs, etc. (Municipal boundaries for all except London.)	Estimated Population to middle of the year 1871.*	Persons to an Acre. (1871.)	Births Registered during the week ending Sept. 16. At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29.97 in. The highest was 30.12 in. on Thursday morning, and the lowest was 29.70 in. on Sunday night.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871. As the population of Dublin and its suburbs showed a decline between the Censuses of 1861 and 1871, the enumerated number in April last has been inserted above for that city, the population being assumed to be now stationary.

St. George's Hospital Medical School.

—The WINTER SESSION will commence on MONDAY, 2nd OCTOBER, with an Introductory Address by Dr. John Clarke, at 2 p.m., in the Hospital.

The system of clinical teaching has been arranged so as to afford every Student personal instruction in the wards from the Physicians and Surgeons themselves.

Special departments have been organised for practical instruction in Midwifery, Ophthalmic Practice, Orthopædic Surgery, Skin Diseases, Vaccination, and Dentistry. Lectures on Public Health are given by the Lecturer on Medicine.

Pathology (including Morbid Anatomy), Psychological Medicine, and Comparative Anatomy are taught in distinct courses of lectures.

Instruction is given in all the special modes of Medical and Surgical investigation.

The following paid offices are offered for competition annually—viz., Obstetric Assistant, Curator of the Museum, Demonstrator of Anatomy, Medical and Surgical Registrars.

The House-Physicians and House-Surgeons are selected by merit from among the Perpetual Pupils without payment, board and lodging in the Hospital being provided at the expense of the Governors.

The London Hospital and Medical

COLLEGE.—The next WINTER SESSION will commence on MONDAY, OCT. 2nd, 1871, when the Introductory Lecture will be given, at 3 p.m., by Dr. W. J. Little, formerly Physician to the London Hospital. After the Introductory Lecture, the Prizes will be distributed by John Adams, Esq., Consulting-Surgeon to the London Hospital.

The BIENNIAL FESTIVAL will be held at the LONDON TAVERN, at 6 p.m.—T. B. CURLING, Esq., F.R.S., Consulting-Surgeon to the Hospital, in the Chair.

General Fee to Lectures and Hospital Practice, £90, payable in two instalments of £45 each. Library fee, £1 1s. Special entries can be made to Lectures or Practice.

The Hospital contains 570 beds. There are Medical and Surgical Wards for Children, Wards for Syphilis, Special Departments for Diseases of Women, Diseases of the Eye, Diseases of the Ear, Diseases of the Skin, and Special Arrangement for Diseases of the Throat. A Maternity Department exists for the delivery of lying-in women at their own homes. 835 cases were attended last year by the Students of the Hospital.

For Instruction in Mental Diseases, Students can attend, without further fee, the Practice of Dr. John Millar, Medical Superintendent of Bethnal House Asylum, a few minutes' walk from the Hospital. Clinical Lectures, both Medical and Surgical, will be given every week, and Practical Instruction imparted in all the Departments.

The In-patients during 1870 were 5213, and the Out-patients 63,736; total, 68,949.

At the Medical College, which has been enlarged, Lectures will be given on all subjects required by the Examining Boards.

MEMBERS OF THE STAFF AND LECTURERS AT THE COLLEGE.—Mr. James Luke, F.R.S., Mr. John Adams, Mr. Curling, F.R.S., Dr. Herbert Davies, Dr. Andrew Clark, Dr. Ramskill, Dr. Langdon Down, Dr. Hughlings-Jackson, Dr. Morell-Mackenzie, Dr. Sutton, Dr. Fenwick, Dr. Woodman, Mr. Jonathan Hutchinson, Mr. Maunder, Mr. Cooper, Mr. Walter Rivington, Mr. Jas. Adams, Mr. Wareu Tay, Mr. McCarthy, Mr. Reeves, Dr. Head, Dr. Palfrey, Mr. Barrett, Dr. Letheby, Dr. Meymott Tidy, Dr. Frosser James, Mr. J. E. D. Rodgers, and Mr. Gilbert Baker.

The following Prizes and Appointments are open without further payment to Students paying the general fee of £90:—

Seven Scholarships to be offered for competition in the Winter Session.

1. A Scholarship of £30 to the Student of less than three months' standing who passes in October the best examination in the subjects required at the Preliminary Examinations.

2. A Scholarship of £20 to the Student of less than three months' standing placed second in the above examination.

3. A Scholarship, value £20, in Human Anatomy for first year Students, to be awarded in April, 1872.

4. A Scholarship, value £25, in Anatomy, Physiology, and Chemistry for first year and second year Students, to be awarded in April, 1872.

5. A Hospital Scholarship, value £20, for Clinical Medicine, to be awarded in April, 1872.

6. A Hospital Scholarship, value £20, for Clinical Surgery, to be awarded in April, 1872.

7. A Hospital Scholarship, value £20, for Clinical Obstetrics, to be awarded in April, 1872.

The Duckworth-Nelson Prize, value £10 10s., for Practical Medicine and Surgery (biennial).

Money Prizes to the value of £60, given annually by the House-Committee for zeal in Dressing Out-patients and Knowledge of Minor Surgery.

Certificates of Honour in all the Classes, according to the results of the general examinations at the end of the session, and Special Certificates to those who have fulfilled with credit the duties of Hospital appointments.

Four House-Surgeoncies, tenable for three or six months, and Dresserships to In-Patients, open to all.

Dressership to Out-Patients, with the privilege of competency for the Prizes above mentioned.

The office of Resident Medical Officer, tenable for two years, with a salary of £75 for the first year and £100 for the second year. The office of Junior Resident Medical Officer, tenable for six months.

Four Medical Assistantships, held for three months, with residence and board in the Hospital for three weeks.

The office of Resident Accoucheur, tenable for six months.

N.B.—The holders of all the resident offices are provided with rooms and board free of expense.

Two offices of Clinical Assistant in the Medical Out-Patients' Department, each at a salary of £40.

Two offices of Clinical Assistant in the Surgical Out-Patients' Department, each at a salary of £40.

The office of Medical Registrar; salary, 25 guineas.

The office of Surgical Registrar; salary, 35 guineas.

Prosecutors of Anatomy, Ward Clerks, and Post-mortem Clerks.

A prospectus, giving details, will be forwarded on application to the Bedell of the London Hospital Medical College, Turner-street, E. Further information may also be obtained from Mr. J. Adams, Treasurer, 10, Finsbury-circus, E.C.; Mr. Rivington, Dean, or Mr. Wareu Tay Vice-Dean, at the Medical College.

St. Thomas's Hospital.—The Medical

SESSION for 1871 and 1872 will commence at the New Hospital, on the Albert Embankment, Westminster-bridge, S.E., on MONDAY, the 2nd OCTOBER, 1871, on which occasion an Inaugural Address will be delivered by Mr. Le Gros Clark, at Two o'clock, after which the Distribution of Prizes will be made by Sir Francis Hicks, Treasurer.

Gentlemen entering have the option of paying £40 for the first year, a similar sum for the second, £20 for the third, and £10 for each succeeding year; or, by paying £105 at once, of becoming perpetual Students.

PRIZES AND APPOINTMENTS FOR THE SESSION.

First Year's Students—Winter Prizes, £20, £15, and £10; Summer Prizes £15, £10, and £5.

The Wm. Tite Scholarship, founded by Sir Wm. Tite, C.B., M.P., F.R.S., the proceeds of £1000 Consols, tenable for three years, is awarded every third year.

Second Year's Students—Winter Prizes, £20, £15, and £10; Summer Prizes, £15, £10, £5; the Dresserships and the Clinical and Obstetric Clerkships.

Third Year's Students—Winter Prizes, £20, £15, and £10; Mr. George Vaughan's Cheselden Medal, the Treasurer's Gold Medal, the Grainger Testimonial Prize, the Two House-Physicianships, the Two House-Surgeoncies, the Resident Accoucheurships; Two Medical Registrarships, at a salary of £40 each, or one at £80, are awarded to 3rd and 4th year's Students, according to merit.

MEDICAL OFFICERS.

Honorary Consulting-Physicians—Dr. Barker and Dr. J. Risdon Bennett.

Dr. Peacock, Dr. Bristowe, Dr. Clapton, Dr. Murchison, Dr. Barnes, Mr. Le Gros Clark, Mr. Simon, Mr. Sydney Jones, Mr. Croft, Mr. Liebreich, Dr. Stone, Dr. Ord, Dr. John Harley, Dr. Payne, Dr. Gervis, Mr. MacCormac, Mr. Francis Mason, Mr. Hy. Arnott, Mr. J. W. Elliott.

Medicine—Dr. Peacock and Dr. Murchison. Surgery—Mr. Le Gros Clark and Mr. Sydney Jones. General Pathology—Dr. Bristowe. Physiology and Practical Physiology—Dr. Ord and Dr. John Harley. Descriptive Anatomy—Mr. Francis Mason and Mr. W. W. Wagstaffe. Anatomy in the Dissecting-room: Anatomical Lecturers—Mr. Rainey and Mr. Wm. Anderson. Chemistry and Practical Chemistry—Dr. A. J. Bernays. Midwifery—Dr. Barnes. Practical and Manipulative Surgery—Mr. Croft and Mr. MacCormac. Physics and Natural Philosophy—Dr. Stoue. Materia Medica—Dr. Clapton. Forensic Medicine and Hygiene—Dr. Stone and Dr. Gervis. Comparative Anatomy—Mr. C. Stewart. Ophthalmic Surgery—Mr. Liebreich. Botany—Dr. Wale Hicks. Dental Surgery—Mr. J. W. Elliott. Demonstrations Morbid Anatomy—Dr. Payne. Mental Diseases—Dr. Wm. Rhys Williams. Geographical Distribution of Diseases in England and Wales—Mr. A. Haviland.

T. B. PEACOCK, M.D., Dean.

R. G. WHITFIELD, Medical Secretary.

For entrance or Prospectuses, and for information relating to Prizes and all other matters, apply to Mr. Whitfield, Medical Secretary, The Manor House, St. Thomas's Hospital, Newington, Surrey, S.E.

Middlesex Hospital.—The Winter

SESSION for 1871-72 will be opened on MONDAY, OCTOBER 2nd, at Three o'clock, with an Introductory Address by Dr. John Murray.

LECTURES FOR WINTER TERM.

Medicine—Dr. Greenhow, F.R.S. Surgery—Mr. De Morgan, F.R.S. Practical Surgery—Mr. Hulke, F.R.S.; Mr. Lawson; Mr. Henry Morris. Diseases of the Eye—Mr. Hulke, F.R.S. Physiology—Mr. Lowne. Anatomy—Dr. R. Liveing, M.A. Cantab. Chemistry—Mr. Heisch. Pathological Anatomy—Dr. Cayley. Anatomical Demonstrations—Dr. Liveing. College Tutor—Dr. Liveing.

Consulting-Physicians—Dr. F. Hawkins, Dr. A. P. Stewart.

Physicians—Dr. Goodfellow, Dr. Thompson, Dr. Greenhow, F.R.S.

Obstetric Physician—Dr. J. Hall Davis.

Assistant-Physicians—Dr. R. Liveing, M.A. Cantab., Dr. Cayley, Dr. John Murray.

Consulting-Surgeon—Mr. Shaw.

Surgeons—Mr. De Morgan, F.R.S., Mr. Nunn, Mr. Hulke, F.R.S.

Assistant-Surgeon—Mr. Lawson, Mr. Henry Morris.

Dental Surgeon—Mr. Tomes, F.R.S.

Assistant Dental Surgeon—Mr. Turner.

The Hospital contains 305 beds; there are special departments for Cancer (36 beds), for Diseases of the Eye, Diseases of Women and Children, and Syphilis. Demonstrations are given during the Summer Session on Diseases of the Skin and the Use of the Laryngoscope. Three Clinical Prizes, including the Governors' Prize of Twenty Guineas, are awarded to those Students who pass the most satisfactory examination at the bedside and in the Post-mortem Room. Class Prizes are also given. There are likewise valuable rewards in the form of Six Resident Clinical Appointments. Students can avail themselves, free of charge, of the assistance of the College Tutor, and thus avoid, when preparing for the examinations of the Licensing Boards, the necessity of any private teaching apart from that of the Medical School.

General Fee for attendance on the Hospital Practice and Lectures required by the Colleges of Physicians and Surgeons and the Society of Apothecaries, £90, which may be paid by instalments.

Fee for Dental Students, £25 guineas for the first year, and 15 guineas for the second.

Some of the members of the staff receive Students to board with them.

Further information may be obtained on application to the Treasurer, Dr. Greenhow; the Dean, Dr. Cayley; or to Mr. Lucas, the Resident Medical Officer, at the Hospital.

The Middlesex Hospital College

DINNER.—The ANNUAL DINNER of the Past and Present Students and Friends of the Middlesex Hospital Medical College will take place at the FREEMASON'S TAVERN on MONDAY, OCTOBER 2nd, at 6.30 p.m.—THOMAS TAYLOR, Esq., F.R.C.S., in the Chair.

Gentlemen intending to be present are requested to send in their names as early as possible to the Dean, Dr. Cayley.

Tickets, 7s. 6d. each (not including wine), to be paid for at the door.

ORIGINAL LECTURES.

LECTURES ON EXPERIMENTAL AND PRACTICAL MEDICINE.

By BENJAMIN W. RICHARDSON, M.D., F.R.S.

ON THE ORGANIC HYDRIDES; WITH AN APPENDIX ON HYDRAMYL AS AN ANÆSTHETIC.

LECTURE II.

GENTLEMEN,—At the close of the last lecture we had before us a solution of iodine in hydride of amyl, and the practical applications of this solution were described at some length. I have still to notice two other simple solutions in which the hydride of amyl is the solvent.

Solution of Oils and Fats in the Hydride.—Common oil mixes in the hydride of amyl freely, and stearine, spermaceti, and other similar fatty substances readily go into solution in it. When a solution thus made is exposed to the air, the volatile hydride evaporates, and leaves the oily or fatty matter behind. By this simple means we are able to leave upon the skin an even layer of substances which effectually exclude the air, and which, if required, may act also as means for diluting more active remedies. There is here in the hydride a solution of spermaceti and olive oil; the spermaceti, cut into fine shavings, is added until the fluid is saturated, then a sixth part of oil is added. This solution is most useful in the treatment of burns. It is gently poured over the burnt surface, and as the evaporation of the hydride proceeds, the cooling that occurs is an immediate source of relief from pain. In time, the part is left covered with a pellicle or false skin of fatty substance, and the air is entirely excluded. If, when the surface of the body is freshly covered with the solution, a little cotton-wool is lightly placed upon it, the rapidity of evaporation is subdued, and the dressing is more effective. I met, myself, with the accident of a severe burn this winter, and treated the injured part precisely as I have stated, and with the best success. The relief from pain was all but instantaneous, and by reapplying the solution over the cotton-wool I kept the pain entirely in abeyance until the balance of the circulation was restored. I left the dressing on the abraded surface, retaining it with a light bandage, and when, a few days afterwards, I removed the cotton-wool and the layer of fatty matter, I found the healing perfected. It is important in using this solution to avoid bringing the flame of a candle or other light near to the part, the vapour that goes off being very inflammable.

The advantage of the hydride over ether and the other volatile solvents of fats is, that by its presence it excites no pain. The oxides and the chlorides themselves create local pain on sensitive surfaces; this fluid does not. In some forms of skin affection where there are symptoms of extreme vascularity, heat, and irritation, the application of a mixture of the hydride and olive oil is very soothing and useful, and I should think it might be of service in some ophthalmic cases; but on this point I have as yet had no experience.

A solution of wax or of spermaceti in the hydride may be turned to much good account in bandaging. The bandage is well saturated with the solution, and is applied while in the moist condition. In a short time the bandage is left quite dry, and the part encircled by it is encased in a firm but flexible structure, which effectually excludes the air.

Ammoniated Hydride.—When a solution of ammonia is placed in contact with amyl hydride, bubbles of gas rise freely from the ammonia, and diffuse into the light hydride. After a time the hydride may be decanted off, when it will be found strongly impregnated with ammonia. The mixture, I think, is merely mechanical; at the same time it is very useful for several purposes.

The solution may be diluted with more hydride, until the pungency of the ammonia is reduced, and then the vapour may be inhaled: a method of administering ammonia which in many cases would prove of advantage. In scarlet fever, for which disease ammonia is so excellent a remedy (I had almost said an antidote), we are often embarrassed, in cases where the patients are very young, because we cannot get the sufferers to swallow ammonia in solution. In such cases, then, we could with little difficulty introduce the remedy by the lungs, and so sustain the fluidity of the blood and keep up the action of the heart.

A solution of camphor in this ammoniated solution of the hydride is useful as a preservative of animal substances, and may be applied for the preservation of specimens of natural history. The specimen to be preserved is dipped in the solution, and is allowed to remain in it until it is quite saturated. Then it is removed, and the hydride is permitted to evaporate, when the structure is left charged with the camphor, and is retained in good condition for a long period of time. Half an ounce of camphor in sixteen ounces of the hydride forms a good compound for the purpose named.

Lastly, on this point, the simple ammoniated hydride serves well for keeping pathological preparations during considerable periods of time. A good many years ago I discovered that if a little common ammonia be put into a closed jar with a pathological specimen, the specimen retains its freshness for many weeks. I now use the solution before us in preference to the simple ammonia, and with still better results. Into a pint jar I place, with the specimen to be preserved, half an ounce of the ammoniated solution of the hydride, and after the vapour is well diffused I close the jar closely with a tightly fitting stopper. The jar being placed in a cool place, there is not the least occasion to hurry over an examination, for the specimen will keep (even for microscopical research) three or four days in excellent condition.

AMYL HYDRIDE AS A GENERAL ANÆSTHETIC.

To complete the research instituted as to the physiological action of amyl hydride, I have experimented with it as a general anæsthetic. There are many points in common between this substance and amylene (the anæsthetic introduced by the late Dr. Snow), as the following outline will indicate:—

	Composition.	Fluid density.		Boiling-point		Vapour density. $H_2=1$	Solubility in water.
		Water=1000		Cent.	Fahr.		
AMYLENE	$C_5 H_{10}$	·659		35°	95°	35	1 part in 9319.
AMYL HYDRIDE	$C_5 H_{12}$	·625		30°	86°	36	Insoluble.

To test the properties of the hydride, its effects were first tested on pigeons, guinea-pigs, rabbits, and frogs. In all these researches the same plan was adopted. The animal in each case was placed in this glass chamber, which has a capacity of 1000 cubic inches. The arrangements here are such that every condition of a practical kind is at hand. A measured quantity of the vapour is gently diffused through the air of the chamber with hand-bellows: an aneroid barometer within the chamber gives the atmospheric pressure, a thermometer registers the temperature, while, by means of a warming apparatus beneath, the air can be sustained at a fixed temperature at all seasons of the year. The amount of vapour yielded at the temperature that exists during the time at which the experiment is carried out is calculated, and by a simple contrivance the animal is so introduced that no air is let in to interfere with the charge of vapour within the chamber at the moment of the introduction. Thus we have means for obtaining the facts we require to learn, in a steady and systematic manner.

In order to produce a decisive effect with the vapour of amyl hydride, the air in the chamber was charged with different percentages of the vapour at 65° Fahr., and some preliminary experiments were made in which the special symptoms induced were not noticed in detail, the production of decided anæsthesia being only sought. After this the particular phenomena presented were carefully noted.

It may be of service to those who are anxious to study the action of anæsthetic substances with rapidity and precision, to give in this place a sketch of the manner in which the phenomena observed are noted down. The facts to be registered are tabulated in a special book, on a plan devised in consultation with Dr. Sedgwick, to whom I am constantly indebted for the most useful suggestions. The table is arranged under the following heads, the facts of one experiment being added for clearness of illustration:—

Anæsthetic used.	Date of expt.	CONDITIONS OF ATMOSPHERE.			CONDITIONS OF SUBJECT.			CONDITIONS OF INHALATION.						CONDITIONS OF NARCOTISM.					Result.				
		Bar.	Therm. (dry bulb).	Therm. (wet bulb).	Animal.	Age.	Temp.	Physical.			Duration.			Duration of				Symptoms.					
								Method.	Cubic space of chamber.	Quantity of agent.	Beginning.	End.	Removal from vapour.	1st stage.	2nd stage.	3rd stage.	4th stage.	Circul.		Resp.	Nerv.	Vomit.	Temp.
Amyl hydride	July 8	29.75	65° Fahr.	63	Pigeon	15 mnths	108.8° Fahr.	Diffusion of vapour in chamber	1000 cubic inches	60 per cent. of vapour in air	3 p.m.	3.1 p.m.	3.1 p.m.	0	0	50 secs	0	Not appreciably changed	Respirations fell 23 during anæsthetic sleep.	0	108.6° during narcotism	Recovery in one minute.	

Remarks.—The anæsthesia was complete for thirty seconds.

The research with hydride of amyl was commenced by narcotising pigeons. Observations on these animals are specially important, for, as they are extremely susceptible to the dangers of anæsthesia, it may be safely inferred that an anæsthetic which proves safe to them will prove safe to the human subject. Moreover, in the pigeon, even more than in man, vomiting and muscular excitability during the action of the narcotic are easily induced; and again, in them, modification of the animal temperature is always strikingly marked. In a word, so close is the analogy of symptoms caused by an anæsthetic in a pigeon and in the human subject, the value of any anæsthetic may be safely determined by the effect produced on the pigeon; and no new anæsthetic agent ought ever to be administered to the human subject until the inferior animal named has been found in several instances to pass through the ordeal with perfect safety.

When, then, in the case of amyl hydride, a pigeon is exposed to an atmosphere containing from thirty-five to forty per cent. of the vapour, the period required for the production of decided symptoms is under a minute, and within two minutes the insensibility is so profound that the animal must be removed into pure air. The insensibility is accompanied with slight muscular movement, and sometimes with a drawing back of the head; but the muscles speedily relax, and the sleep is calm and attended with the deepest insensibility. On removal of the animal from the vapour, and on placing it in pure air, the recovery is very rapid—from one and a half to two minutes being sufficient to insure entire restoration to consciousness. The specific lightness of the vapour, and its insolubility in the blood, account for the briefness of the insensible condition it produces. The temperature of the body of the animal is but slightly modified; there is a reduction of temperature, but it amounts barely to the fourth of a degree on Fahrenheit's scale. In this particular the amyl hydride differs materially from chloroform and ether. Chloroform administered to the third degree of narcotism causes a reduction of from 6.5 to 6 degrees of temperature in pigeons, and ether causes a reduction of 4 degrees. Perhaps the shorter period of administration required to produce the deep insensibility when the hydride is the agent employed may account for the difference observed. On guinea-pigs and rabbits the vapour of amyl hydride acts with the same rapidity as on pigeons. Recovery from the effects is also equally rapid, while the animal temperature in these animals undergoes no appreciable decline. In these animals the muscular excitement is not developed, but in the rabbit there is noticed a rapidity of breathing during recovery which instantly ceases if a little of the vapour be readministered.

In order to see the extreme effects of the amyl hydride, the vapour of it was made to kill;—the animal after being narcotised was, I mean, retained in the vapour until the evidences of life had ceased. Animals of the three classes named above were thus allowed to sleep to death. The process of death is gentle—a continuance, as it seems, of the deep sleep. The circulation and the respiration appear to cease simultaneously; but in one case I could hear the heart in motion a few seconds after the cessation of respiration. Towards the close of the life the temperature falls suddenly from 1° to 1½° Fahr., and the pupils dilate.

After death the heart is found fully charged with blood on both sides and in all the cavities. The arterial colour of the blood on the left side is decidedly darker than is natural, but the coagulation is not interfered with, and the corpuscles show no evidence of change.

The lungs after death are not found congested with blood, as in death from agents which kill simply by causing asphyxia, neither are they found bloodless and blanched, as is so common after death by chloroform and some other volatile chlorides. They are left retaining a natural colour and character. The brain shows no visible sign of injury.

For a long time after death from amyl hydride the muscles of the body retain their irritability, and may be called into vigorous action by electrical excitation. I recollect no agent that destroys life and interferes at the same time so little with the muscular irritability. Let it be understood, however, that this retention of condition for muscular motion under stimulus extends only to the voluntary and the semi-voluntary muscles. In the midst of the life of the other muscles the involuntary heart is dead, and makes effective response to no stimulus, not even to electricity.

The influence of the vapour is slower on frogs than it is on warm-blooded animals; but after a little time frogs become so profoundly narcotised, it is hard to determine they are alive, and if the temperature be lowered they will lie in the vapour for two and three hours, and still, on removal, will recover. Thus, if a strong, healthy frog, narcotised deeply, be placed in a shallow glass basin, with a little of the liquid hydride around the body, the evaporation of the liquid will keep up such a degree of cold that change into fatal death is suspended; and when the liquid has evaporated altogether, if the temperature of the air be kept at from 65° to 70° Fahr., and a little water of the temperature of 70° be occasionally supplied to the animal, it will recover when every indication of life is, to the naked eye, absent. In plain fact, it is difficult to say when death has actually occurred. The muscular irritability may positively be so suspended that it cannot be called forth by stimulus, and yet recovery may be the ultimate result.

After I had conducted these experiments, I ventured to inhale the vapour of amyl hydride myself to the production of unconsciousness. I placed four drachms, by measure, of the fluid in this vulcanite inhaler, pouring the liquid upon a double layer of domette, with which the inhaler is loosely lined. The vapour was to me agreeable to breathe; it caused none of the suffocating sensation experienced from the inhalation of vapour of ether, and none of the irritation produced by the vapour of chloroform; but it induced a sensation of gentle glow or warmth in the chest. After six deep inspirations of the vapour, I felt evidence of change in the cerebral circulation—viz., giddiness and inability to stand firmly, with the swaying movement, or sense of movement, common to the first stage of narcotism. Then, for a few seconds, I lost consciousness, but, the inhaler being removed, I recovered very quickly, and in three minutes was perfectly well. Neither nausea, chilliness, nor headache followed the administration.

On the whole, of the facts thus gleaned by experiment, I infer that the amyl hydride, in addition to its other useful applications, might be employed as a general anæsthetic for the prevention of pain in certain Surgical operations, such as extraction of teeth, where the operative proceedings are short—not exceeding, that is to say, two or three minutes in duration.

There is one other application of amyl hydride, interesting in a physiological as well as practical point of view, to which reference should be made. It becomes of service in studying the question of restoration of life after death by extreme cold. In some animals of cold blood—fishes and frogs—if their bodies be suddenly frozen, it matters not how extreme, how absolutely through the mass of the animal body, the freezing may be, there will still often be recovery on thawing their bodies, if the process of thawing be not too rapidly carried out. We may therefore, taking one of these frozen animals with the intention of restoring it, so utilise the fluid as to moderate the thawing at will. We place the frozen animal in a tall glass jar, and over it we pour some hydride of amyl. Then we warm gently the lower part of the jar; and as the liquid can never be made to exceed the temperature of 86° Fahr., if the evaporation be perfectly free, the animal thaws in it without any danger of what is called reaction, and recovery is the general fact.

I cannot do better in closing this part of the lecture than

demonstrate the fact just named by an experiment. Here are some frozen fish that have by the frost been frozen in an aquarium; they have been retained in the frozen state in this room by a surrounding of ice and salt; and here, also, are some frogs frozen so completely that they are, you will say, of stony hardness. I will pass some of these frozen animals round, but one of them—a frog—I will retain. I take this glass jar, an anatomical-preparation jar, fourteen inches long and two and a half inches in diameter; I place the animal in the jar, pour over it five or six fluid ounces of the light hydride, and apply a gentle warmth so as to raise the fluid to its maximum of 86° Fahr. There is not the least occasion now to do more than wait and watch. In a short time, as the muscles of the animal relax, there will be a sign of renewed respiratory action, in the escape of a bubble of gas from the mouth of the animal. As I am speaking of it the phenomenon occurs, although there is no apparent breathing movement. That escape of gas is of itself quite sufficient. I turn the fluid, together with the animal, into a large glass funnel, having a narrow escape-tube, so that the fluid can run away into a receiver below it, and the animal be left in the air. Soon the animal recommences to breathe, and, as you see, in the freshness of its renewed life, it leaps out of the vessel. It has recovered without sustaining a trace of injury.

(To be continued.)

THE
DISCUSSION ON PURULENT INFECTION
AT THE
PARIS ACADEMY OF MEDICINE.

By Professor VERNEUIL.

GENTLEMEN,—When in 1869 I took part in the discussion on purulent infection, I had two points in view: I wanted to be brief, in order not to fatigue your attention, and clear, so as to convince your minds. My rôle, moreover, was a modest one, for I came neither as a reformer nor an innovator; I merely desired to be the propounder of a doctrine slowly prepared during the last fifty years, ten times foreseen, and almost reduced to a formula even in our own country, but which at last owed its quasi-completion to a new series of exact researches especially undertaken on the other side of the Rhine.

Finding it impossible at that time to lay before you all the arguments—all the proofs drawn from history, from clinical observation, from pathological anatomy, and from experimental physiology—I had to limit myself by reviewing, in a few condensed propositions, the principal points which I then considered as nearly demonstrated. I also indicated the gap which was yet left to be filled.

The theory has been variously judged. M. Bouillaud accuses it of not being new. M. Chassaignac considers that it creates an inextricable confusion, and, moreover, that it resembles that of M. Guérin, with the exception of a different name and the addition of an entity. M. Legouest thinks it altogether useless. M. Alphonse Guérin attacked it with a severity which at first pained me; but, considering our old and sincere friendship, I soon became reconciled. MM. Bouley and Gosselin alone gave me their support by admitting, without hesitation, an infection of the blood previous to the invasion of pyæmia.

The opposition offered me by my honourable colleagues has not changed my convictions. I merely perceive that I have missed my aim; that, desirous of being concise, I wound up by being obscure; that my doctrine has not been understood, because I presented it badly; that I did wrong in forming premature aphorisms. In order to defend myself to-day, I shall be obliged to enter into fuller details, which may almost seem prolix.

But I am quite at ease in this debate. The theory which I uphold is not my own. I have nothing to claim, not having written anything on the subject prior to 1869; and, free from all preconceived notions, I must naturally be impartial. I have acquired my opinions by reading a good deal, which at first only led me to doubt; by observing at the bedside, which began to open my eyes; lastly, by carefully taking up the pathological anatomy and physiology of traumatic lesions. Starting from this principle—that the accidents following wounds have their cause in the perturbations of the reparative process—I have looked for these causes in the local disposition

of the primary lesion, in the organic state of the subject, and in the composition of the surroundings of the patient.

In following this rule, I scarcely ran any risk of going astray. However, when the theory took its hold, I returned to my books in order to submit it to a dissolving and decisive action of criticism; I definitively adopted it when I found it resist and render a sufficient account of all the facts. In order to make the demonstration more clear, allow me, first of all, to define certain terms, so as to avoid any logomachy, and to remove a misunderstanding which has already taken root.

I shall commence by this latter. The discussion at first started on the curability of purulent infection. Soon afterwards the pathogeny came into play; and, lastly, the different theories proposed up to this day were also to be examined: thus the field gradually grew larger. I have thought best to enlarge the same still more, for the following reason.

The greater number of my colleagues consider purulent infection a special disease, having an origin, an etiology, a regular march, and symptomatology all distinct, and, consequently, a definite place in the nosological list. I am of a different opinion. I regard, with Virchow, Weber, and others, purulent infection as the accidental complication of a general and pre-existing malady—septicæmia. The difference is, therefore, quite marked. MM. Guérin, Legouest, Chassaignac, in order to remain logical, have, from the beginning, described the causes of pyohæmia. As to myself, before studying the complication, I began with an examination of the primary disease which must necessarily serve as its prologue. I therefore, first of all, drew an outline of the history of pyohæmia.

If my views are correct, I was right to proceed in that manner; if I am wrong, I beg my honourable opponents to have the kindness to follow me in my digression, to occupy themselves for a few moments with septicæmia, that I may show in the end that it has no necessary connexion with pyohæmia, no relation of cause to effect. If they do not accede to my demand, we might discuss a long time without understanding one another, and contend without coming together; for we should not be placed upon the same territory. I now pass to the question of words, about which it is so necessary to agree.

Of the Traumatic Poison, or Sepsine.—This virus is produced under different circumstances, but especially on the surface of exposed wounds. It is a particular substance, the principal characters of which I indicated in my last communication, and of which I now merely wish to recall the properties that interest the practical Surgeon. This substance introduced into the circulation, no matter how, alters the blood and develops a general disease called septicæmia.

I had several terms by which to designate this deleterious substance. I chose the one of *traumatic virus*, without, however, paying too much attention to the name. My choice was violently criticised, and to defend the same I have no idea of entering into a physiological discussion on the different viruses; but I must remark that the substance in question possesses the principal attributes of the so-called virulent matters. In fact, it is spontaneously developed from the decomposition of organic matter; it is inoculable in infinitesimal doses, and seems to act like ferments. Lastly, it communicates its toxic properties to the blood of the infected subject; so that this blood, if transferred to another healthy subject, produces septicæmia, as in direct inoculation.

I invoked for this purpose the conclusive experiments of Otto Weber, which date since 1864. I should have said that similar experiments had already been made by Hamont in 1827. I must also add that the recent researches of MM. Coze and Feltz, Raimbert and Davaine leave no doubt on this point. I avow, nevertheless, that the above-mentioned substance differs from virus in one essential character; that is, it does not necessarily infect the subject that generates or supports it. In other words, a wound may furnish the deleterious product in large quantity without altering the blood of the wounded, or without producing a change in his general state. Such a patient would be, so to speak, rather venomous than virulent.

M. Alph. Guérin tells us that the term "virus" had already been thought of by Trousseau, who, with his vivid imagination, thought to have found in the quantity of the poison the explanation of its effects. M. Guérin thinks that I, too, have been seduced in the same way. I do not defend myself for having borrowed an idea from the teachings of one of the most eminent men of our age. I find that Trousseau did well to specify materially the vague idea of *encombrement*, and to admit, in order to explain the epidemicity, the presence of virulent germs in the air. But, in truth, I do not see that it is neces-

sary to have a vivid imagination, or that one must yield to seduction, in order to admit an analogy so striking.

I shall not prolong this discussion any farther: it can be taken up some other day, and furnish material for a desirable revision in the yet imperfect classification of infectant, inoculable, and morbigenous substances. I hope that these explanations will satisfy M. Chauffard, and also M. Bouley, who, though admitting the toxic substance, refuses it the quality of a virus, and assimilates it to ferments; which, by-the-bye, but little advances the question, and might even be an error—for the putrid poison, unlike other ferments, resists heat and alcohol.

After all, I am ready to accept any name, and, among others, the one much used, of *septic poison*, though I think it preferable to give to the active principles of putrid matter the name of *septicine* or *sepsine*. The latter term, employed by Bergmann, has the advantage of possessing an excellent radical, sanctioned by usage, and could easily enter into combination with other words. Sepsine is, moreover, a sort of animal poison to be classed among the alkaloids. (a)

Whatever may be the chemical nature of sepsine, this substance, introduced into the economy, produces a general disease to which M. Piorry, in 1847, gave the very appropriate name of *septicæmia*, in order to replace the one of *typho hæmia*, at first adopted.

Septicæmia (also called *septicohæmia*, *septhæmia*, *septicæmic fever*) is therefore synonymous to alteration of the blood by septic matters, to putrid fever, putrid infection, and putrid resorption, so often met with in the old authors. Thus, in fact, if the word was at that time new, the idea had been known long ago, having always found a place in the humoral theories. However, it was only at the beginning of this century that it was experimentally demonstrated. Haller had paved the way, and gave in conclusion of his researches the following very explicit phrase:—“*Nihil potentius humores nostros corrumpit quam ipsa putrilago.*”

In 1815, Orfila announced to have poisoned dogs in a few hours by the introduction of fragments of putrid matter into the cellular tissue. Gaspard, at last, in 1822, founded a dogma which gave great promise for the future. His numerous experiments, intelligently practical, were repeated in France for a period of twenty-five years, then left off, but again taken up with a fresh ardour in Germany since 1846, and continued up to this day.

One would think that the Surgeons who every moment had occasion to observe putrid poisoning would be the first to profit by these experiments, and to understand their importance. But not at all; the Medical pathologists alone knew how to be benefited by them. Whereas, MM. Bouillaud and Piorry, in twenty short phrases, but very clearly expressed, described the principal characters of acute or chronic, sporadic or epidemic Surgical septicæmia, our Surgeons were either completely silent, or else took part at the restoration of the humoral doctrines in quite another direction.

Pierre Bérard, in his celebrated article on pus, makes no allusion to acute putrid infection; and, in his description of chronic putrid infection, he still attributes the essential rôle to pus. Sédillot, it is true, in 1847, spoke of septicopyhæmia, but did not describe simple septicæmia apart, of which his experiments, as though in spite of himself, furnished him such conclusive examples. In vain did obstetricians point to the dangerous effects of the retention of putrid matter in the uterus, and describe the rapid poisoning resulting therefrom. Our Surgeons were working alongside of traumatic septicæmia, but never remarked or described the disease.

This scarcely excusable negligence must, however, be explained. The Surgeons of that day had taken up the history of phlebitis, the outlines of which had been drawn by Hémmler and his disciples. On the other hand, convinced as they were that the mixture of the pus with the blood was the true cause of the serious traumatic accidents, they paid all their attention to discovering the mechanism of this mixture; so that, absorbed by this twofold research, they always confounded, in the description of pyohæmia, the part due to putrid infection, to purulent infection, and to phlebitis. It is only in the last few years that the distinction was thought of, and afterwards affirmed in France by MM. Gosselin, Batailhé, Maisonneuve, and others.

En résumé, and, as far as France is concerned, the word septicæmia, created twenty-three years ago, has thus far not been described in any Surgical work of importance, including

(a) Bergmann and Schmicdeberg have succeeded in isolating a sulphate of sepsine in the form of needle-shaped crystals, of which an aqueous solution at the dose of ten milligrammes is said to poison a dog.

the collection of theses at the School—the faithful echo of our every-day scientific tendencies.

The German school, during all this time, did not remain inactive. Virchow, in 1846, repeated Gaspard's experiments, and adopted the term created by Piorry. Otto, Weber, and Billroth followed, and introduced the use of the thermometer in the study of traumatic fevers; Bergmann, Panum, and Stich studied carefully the chemical properties of the putrid poison; and thus became established the formal distinction between septicæmia and pyohæmia. As to myself, I believe that the reaction has been rather excessive, and the separation too radical. Consequently, I shall try and re-establish the unity of Surgical fevers, which, in spite of the multiplicity of their forms, the variable degree of their gravity, the different period of their apparition, form, none the less, an uninterrupted chain from the traumatic fever, which lasts four or five days; pyohæmia, which lasts from one to several weeks; and the hectic fever, which may prolong itself for several months.

(To be continued.)

ORIGINAL COMMUNICATIONS.

CASE OF SELF-INFLICTED GUNSHOT WOUND OF THE THROAT.—RECOVERY.

By J. FAYRER, M.D., C.S.I.

A HINDOO carpenter, aged about 25 to 28 years, attempted to commit suicide at 5 p.m. on October 19, 1870, by shooting himself in the throat with a pistol, purchased at a native gun-maker's, and carrying a bullet of about twenty to the pound.

It appears that he placed the pistol against or near the right side of his throat, about the upper margin of the wing of the thyroid cartilage, over the thyro-hyoid space. The ball passed through and emerged on the left side, a little below the angle of the lower jaw. He fell, and there must have been considerable effusion of blood. After some hours he says he applied a portion of his dress to the wound, and then, having crossed the river in a boat, walked about four miles to the Hooghly Hospital, where he was admitted on October 19, at about 7 p.m. He absconded on the 24th, and presented himself at the Medical College Hospital on October 26, having, as he said, walked all the way. From his statement it appears that many hours elapsed before he received Medical aid, and even his own rough dressings were not applied until about four hours after the wound was inflicted, during which time a considerable quantity of blood was lost by oozing. Soon after shooting himself he tried to drink, but the water came through the wounds on either side of his throat. These wounds, he says, were about the size of a two-anna piece, the left being rather larger than the right; that immediately after inflicting them, he grasped his throat with his left hand, placing the thumb on the left and the index finger on the right aperture, not with the view of stopping hæmorrhage, but of tearing open the wounds. This idea he appears to have abandoned, and to have tried to staunch the bleeding with a portion of his clothing.

For a few days he had paroxysms of coughing, every attempt to swallow being thus frustrated; fluids were rejected and came through the wounds in the neck. The whole throat swelled, inflamed, and became very painful, and soon the tissues about the pomum Adami sloughed and became fetid. It appears that gangrene began in the right side, on October 26.

When admitted into the Medical College Hospital he was much reduced, and miserably weak; the neck was swollen and infiltrated. There was a sloughing wound on the right side and anterior surface of the pomum Adami; a second on the left side, near the angle of the lower-jaw, in a similar condition. These were separated by a bridge of integument about a quarter of an inch in width. The sloughs separated soon after admission, laying bare great part of the right ala of the thyroid, and a smaller portion of the left. The os hyoides appear to have already separated; it was probably comminuted by the bullet; the carotid artery could be distinctly felt beating in the left wound. Through the large gaping wounds, now converted into one, an elongated, irregular opening, an inch in length, in the pharynx and œsophagus, was perceptible; through this the vertebral column could be felt with a probe. Efforts to speak produced a faint husky sound. The vocal cords had apparently escaped when the thyroid cartilages were injured; indeed, portions of their upper margins perished. When he

recovered and left the Hospital he could speak, with still a husky but quite audible voice. On admission, any attempt to swallow was followed by rejection of the fluid through the wounds. The tube of the stomach-pump was introduced with some difficulty, and some beef-tea passed through it into the stomach. He seemed anxious to feed himself, and as he appeared to swallow a small portion he was allowed to take milk and beef-tea frequently. It was observed that when all sloughing had ceased, and the clean granulating surfaces allowed the deeper parts to be quite distinctly seen, he managed to swallow more of the fluid, a considerable portion running down the open channel.

By November 2, with a view of expediting the healing of the wound by placing the parts at rest, all feeding by the mouth was discontinued. The head was bandaged forward to facilitate contraction, and nutrient enemata of beef-tea, wine, and milk were trusted to, being given at frequent intervals. He existed entirely on this mode of sustenance until November 7 (the sixth day), when the craving for food became intense. The wound during this rest had contracted considerably. Milk and beef-tea were again carefully introduced into the stomach through the tube, which now passed easily.

The enemata were also resumed until November 9. About this time contraction of the healing œsophagus began to be apparent, and the tube was introduced daily, through which he was fed with milk morning and evening.

On November 11 arrowroot was added to the milk, the enemata of beef-tea and port wine being still continued.

The wound in the neck was all this time granulating healthily, and rapidly closing, and he was beginning to speak in an audible voice. This progress continued, and by the end of the month the wound was reduced to a fistulous opening.

On December 5 he began to feed himself with milk, arrowroot, and beef-tea, and now has only a few drops passed through the wounds. He began to take solid food, and found he could swallow it easily. He rapidly improved in health, became fat and strong, and was able to give us an account of his accident and all that followed it. The cause, he said, was jealousy. A tube was passed occasionally down the œsophagus, to obviate the contraction caused by cicatrization of the wound, and it appeared to do so satisfactorily.

It was not until May 23 that he was discharged, as we had kept him in the hope that a small fistulous opening communicating with the larynx (the remains of the wound) would close. It had nearly done so when he was discharged. As he was in good health and impatient to return home, we let him go.

The wound, with the exception of the narrow fistulous opening above mentioned, had contracted to a linear though irregular cicatrix, and I believe it would have been impossible for anyone to have imagined that it was due to a perforating gunshot wound; though, of course, when the nature of the wound and its subsequent progress is explained, it is intelligible. We verified the fact of its being a gunshot wound by inquiry from the police, at the Hooghly Hospital, and from the native gunmaker from whom he had purchased the pistol. His own statements, too, though very wild and vague at first, were so clear and consistent afterwards that there was no reason to doubt their truth. It is not difficult to imagine how important Medico-legal questions might arise out of such cases, and it is therefore not uninteresting that such a case as this should be placed on record.

ON RHEUMATISM.

ITS NATURE AND ORIGIN.

By J. JAMES RIDGE, B.A., B.Sc., B.S., M.D. Lond.

(Continued from page 344.)

WE have seen that there is good reason to reckon among the capabilities of cold the power of exciting inflammatory action in distant organs by reflex influence. For my present purpose it is not essential that the exact mode in which this is done should be explained, though, of course, if it were possible to do so, the proof would be complete. Is the inflammation true "reaction"? If so, does it occur centrally, being a reaction of the central ganglia against the impression of the afferent nerves, and is that reacting impulse transmitted along the efferent trophic nerves so as to excite inflammation; or is it peripheral, a reaction of the tissues in consequence of the cold-induced modification of the efferent nerves? We cannot at present decide. But we know that cold is able to affect distant parts through the medium of the sympathetic, as when the vessels of one hand contract, and its temperature falls, on

plunging the other into ice-cold water. It seems probable, then, that the altered nutrition of distant parts, and the occurrence of inflammation in them, is determined by the influence of cold upon their central trophic centres. But this is not its only possible influence, nor does it account for all the symptoms of rheumatism. There is febrile action before there is any arthritis, and sometimes febrility occurs without any local inflammation at all, or only some such insignificant accompaniment as a few herpetic vesicles. Dr. C. F. Oldham(a) has recently endeavoured to prove that the intermittent fever which has been ascribed to the influence of a specific miasm is really due to "chill, or, in other words, the sudden abstraction of heat," and adduces some good arguments in support of this view. It seems not at all unlikely; for in hot climates the difference between the day and night temperatures is often very great. Further, the influence of the excessive heat is such as to relax the tone of the nervous system, to weaken the power of inhibitory nerves which would repel morbid impressions of cold; hence the great frequency of fever. At the same time, the periodicity of the diurnal changes probably accounts to a great extent for the intermittency of the febrile phenomena.

It seems, then, as if in intermittent fever the heat-regulating centre is alone affected, and the reaction of sweating, or rather, I think, the transference of action to secretory nerves, terminates the febrile process for a time. In the recognised catarrhal affections there is more than this. We have implication of other centres—namely, those which control some mucous membrane or other; yet the preliminary general fever is here also usually much relieved by a critical perspiration. The occurrence of the local catarrh may also sometimes be averted by the same process. But the greater the extent or intensity of the local inflammation, so much the less likely is the sweating to prevent it, or a continuance of perspiration to remove either the local action or all general febrile action; because we have then a focus of inflammatory fever, and this secondary fever in turn renders the nerve-fibres of all kinds more sensitive to fresh impressions. When the articular serous membranes are similarly attacked, we have first the same general febrile action, and subsequently a very intense form of secondary fever—very intense, as is usual in most serous inflammations, but often also because of the extensive total surface inflamed, and partly, perhaps, on account of the intensity of the exciting cause. The severity of the process can to some extent be gathered from the large amount of fibrin present in the blood, surpassing in this particular almost all other diseases. Yet the amount of pyrexia as measured by the thermometer, though often great, is not generally so much as we should expect. Is not this because the fever is maintained against and in spite of the abundant sweating which is such a remarkable characteristic of the disease, though not peculiar to it? The inflammatory fever evinces its presence partly as heat, partly as work done in the process of perspiration and the evaporation of water. For it ought not to be forgotten that this sweating is not mere transpiration, since the vessels are often distended to their utmost for a long time before it occurs. Hence we see the danger which arises from checking this cooling process, unless artificial cooling agents supply the deficiency; for, in consequence of its arrest, the heat accumulates, and the phenomena of heat-stroke may result. I do not assert, however, that the fever is all secondary, for there are generally exacerbations, especially at night; and though we speak of the heat-regulating centre in the singular number, it seems capable of different actions or states simultaneously in different parts—for the process of perspiration is not always general, but the alternative febrile action may continue in various nerve-territories at the same time that sweating occurs in others.

At present the molecular changes of nerve and cell by which the chill influences the textures are very obscure; but so, also, are those which are the admitted cause of simple inflammation. That inflammation can be excited by nervous influence is nearly all that we can positively assert; the *modus operandi* remains to be discovered. The ultimate cause of rheumatic inflammation is in no deeper darkness. Some facts with regard to the causes of inflammation are apparently emerging from the gloom, but it would be unwise to be very dogmatic upon such scanty materials, and most certainly would it be improper to deny the possible neurotic origin of rheumatic inflammation if we cannot make it fit in with an imperfect theory.

We have now to gather together the various considerations which will enable us to reply to the question, What, on this supposition, are the conditions required for the production of rheumatism? They are of two kinds.

(a) "What is Malaria."

1. *General Conditions.*—The principal of these is, that there must be a susceptibility of the nervous system to inflammation-exciting influences. In the highest states of health this impressibility is slightest; the tone of the system is good. In consequence of this, influences which affect others are submitted to with impunity. But that this is only a matter of degree is proved by the fact that the more powerful the influence the more numerous will be the sufferers and the greater will be the proportion of severe cases. A slight shower may suffice to establish the morbid process in the very susceptible; a drenching rain will infallibly increase the number of patients—patients, too, suffering from all manner of inflammatory affections—according to the special weakness of each. There may be some in whom no amount of exposure will establish rheumatism; there are few in whom more or less will not set up inflammation of one kind or another.

There is one very important element which greatly affects the liability to morbid action under the influence of cold; that element is *habit*. This scarcely needs illustration; but the effect of daily cold-sponging in checking the susceptibility to catarrh will thoroughly illustrate it. We must observe, however, that the influence on the nervous system thus exerted is only gradually developed, and is so at all only so long as the effect is restrained within certain limits. The application of cold, the first and every time, if we would obtain beneficial results, must be of an intensity such as is within the amount required to establish catarrh, etc. If a cold be set up every time, harm, and not good, will result. And if, after a while, such an exposure is endured as to establish severe morbid action, the stability gradually built up during much time will disappear, and we must begin again from the beginning. It is on this principle that we are obliged to commence with baths less cold and prolonged, and proceed gradually to the longer and the colder. The power we wish to encourage and strengthen is the recoverability of the nervous system, the stability of its equilibrium, by which its resistance to depressing influences will be more firm and decided. It is possible that there are inhibitory trophic, as well as inhibitory motor, nerves. If such is the case, it follows that a greater resistance to inflammation-exciting influences may be conferred by either a more powerful condition of the inhibitory nerves or a diminished impressibility of the excitatory nerves. So long as the balance is maintained on the right side, the actual degree of health (in some directions) may be very different, but immunity from inflammation the same.

Here, then, I believe, we find the explanation of the influence of constitution, hereditary or acquired, in predisposing to an attack of rheumatism. As Dr. Fuller remarks, (b) "some are peculiarly sensitive, others under precisely the same circumstances remain perfectly free from it. Others, having long been perfectly free from it, become very subject to it on changing their mode of living, or from some less obvious cause; others get rid of it in the same way. The disease generally makes its appearance in those subject to its invasion, whenever the system is lowered or deranged. It is frequently an attendant upon disordered conditions of the uterine system.

. . . M. Chomel has been struck with the frequency of its occurrence after excessive lactation, after much venery, and during tedious recoveries from fevers." These are circumstances which Dr. Fuller thinks strongly show that the disease is due to the production of the acid poison, through the derangement of normal digestion and assimilation associated therewith. The argument, however, that rheumatism must have a humoral origin, because it is constitutionally disposed to and inherited, and because it is modified and developed by external conditions of climate, food, and habit, only holds good if it were also true that diseases of the nervous system are never influenced or produced by the very same circumstances. But this is notoriously incorrect, and therefore Dr. Fuller's argument is quite inadequate to prove the conclusion he desires.

This power the system has of adapting itself to external conditions is just that power of habit which I before mentioned. A balance, as it were, is struck among the nerves regulating nutrition at different degrees of intensity, by which the normal processes of nutrition are carried on healthily under exposure to the average climatic influences. The maximum amount of morbid influence which it is possible for anyone to suffer without harm is thus, *ceteris paribus*, determined by the average of his ordinary exposure, and it therefore varies with each individual, and in the same individual at different periods; but under the same external conditions there will of course still be differences among men in this respect—differences to be

accounted for by the hereditary or acquired constitution, the age, the previous state of health, the diet, etc.

Notwithstanding these particular differences, however, an average resistance-power to climatic influences will exist in every body of men exposed to the same circumstances, and, if these are altered, we might expect the average of rheumatic and other inflammatory affections due to cold to vary also. If this body of men continue exposed to an average of deleterious influences higher than before, then the same law will operate, habit will again be formed; they will adapt themselves to the new circumstances. On this principle it is that we can account for Sir J. Pringle's observation, quoted by Dr. Fuller, that rheumatism is more prevalent at the commencement of a campaign, and shortly after return to garrison, than at any other period of a soldier's life. At each of these periods a new balance has to be struck among the trophic nerves, the more luxurious habits and self-indulgences of garrison life after the hardships of a campaign unsettling the system as much as the previous increased exposure.

2. *Particular Conditions.*—These determine the kind of disease—that is, what tissues the inflammation shall attack, and the character it shall assume. They include—(a) Hereditary or acquired predisposition to inflammation of fibrous and serous tissues. This notoriously varies to a very great extent. The nature of hereditary influence I need not discuss. That weak points, organs and tissues more susceptible than others to morbid action of different kinds, do exist in most men, if not in all, and that such coigns of vantage are hereditary, is unquestionable. Further, the occurrence, from whatever cause, of rheumatic inflammation renders the system more liable to a second attack, and the joint or joints previously affected more obnoxious to the morbid process. The wherefore of these conditions we cannot yet explain. (b) Exposure to a sufficient exciting cause. The frequency of exposure to chill, and its severity, will of course increase the risk. But though cold is the most common cause of rheumatism, it is not essential to its production. It follows from my theory that anything which can disturb the balance of the nerve-forces in the direction of inflammation is able, in those disposed to inflammation of fibrous tissues, to set up rheumatism. Such has occurred in many of those cases where mental excitement, grief, anxiety, fright, or over-fatigue have appeared to excite it; so, also, it is possible to conceive of morbid blood thus affecting the nerve-ganglia controlling the inflammatory process—an explanation to be received when no better is forthcoming. In some cases, however, it is not improbable that such causes as these have only depressed inhibitory nerves, or so affected the nervous system that other (slighter than usually necessary) causes have been able to excite the disease. As examples, also, of such central causes are those cases of arthritis from injury to the spine quoted by Dr. Day, and before noticed. While, therefore, we need not be surprised that anything capable of exciting inflammation by its direct action on the nervous system may excite rheumatism in the predisposed, we must attribute a reflex action to the most common of all causes—the influence of cold.

I have said that any peculiarity in the inflammation can be easily accounted for. The principal peculiarities are the fugitiveness of the inflammation, and the rarity with which suppuration occurs. Bearing in mind that cases of cold-excited arthritis which do proceed to suppuration are quite as truly rheumatic as those which do not, although usually excluded from the category, any real disinclination to suppurate is probably due (1) to the nature of the tissues affected; (2) to the nervous origin of the disease; (3) to the constitutional predisposition.

The condition of the blood has recently been shown to have a marked influence upon the tendency to suppuration, especially in commencing the process. We can therefore easily understand how a general tendency to suppuration will be to a great extent dependent upon the condition of this fluid and the original construction of the white corpuscles, so that, if these are normally formed and thoroughly endowed with their proper physiological disposition (which, perhaps, is to develop into red globules), the tendency for them to degenerate into pus-corpuscles will be at its minimum; and to accomplish this result a more powerful stimulus will be necessary. Of course the tissues themselves, if sufficiently irritated, also suppurate; but I speak rather of a general pyopoietic tendency, which influences greatly the degree of local irritation required to produce pus. If any joint has been exposed to a traumatic influence or a previous attack we know that the inflammation is more readily set up there. But the tissues, as a rule, are not locally irritated at first, and the rest enforced by the pain

(b) "What is Malaria."

preserves them from it afterwards. Since, also, the exciting cold acts solely by its influence on the nervous system without any blood-infection, and if sufficiently powerful is able to establish the inflammatory action thus without any great preparatory alteration of vital processes, it follows that the attacks generally occur when there is no special proneness of the blood to favour suppuration. There is sometimes, however; and when so altered, by scarlatina, pyæmia, the puerperal state, etc., then it is that suppuration most often occurs, tending to prove that there was some necessary factor absent in the former case. The intensity of the nerve-influence, however, may be great enough to induce tissue-suppurative, although a concomitant influence of the tissues or blood is probably present in most cases in which it occurs. To put these circumstances concisely, I would suggest that the general termination of the arthritis in rheumatism is to be accounted for by the inflammation being excited by the influence of the nerves alone in tissues little prone to suppurate, and in individuals whose blood has no general pyopoietic tendency.

In connexion with the constitutional influence there is one point which should be mentioned, and that is that every now and then we meet with a run of cases of some special type, which indicate the existence of a wave of epidemic influence upon the population at large, evincing its presence when individuals are attacked by disease, and modifying in various ways the symptoms of rheumatism. At one time the cases of acute and severe rheumatic inflammation are very common; at another they are few and far between, while subacute cases abound; while at yet another time the general symptoms are low and asthenic, and typhoid symptoms are more frequent; or there may be such a modification of the blood that purpura complicates nearly every case. A tendency to the supervention of peri- and endo-carditis seems also sometimes to be prevalent. These are evidently accidents of the disease, although the nature of the causes of such epidemic constitutional states is seldom clearly defined.

If the simple nature of rheumatic inflammation is established or rendered probable by the above considerations, I might consistently say in a word that the rational treatment to be adopted must be that of simple catarrhal fever and local inflammation. While this is perfectly true, the appreciation of its real nature will enable us to use our weapons more intelligently and with greater precision, and will enable us to understand more clearly the methods by which they can affect the disease, and the value of their influence.

(To be continued.)

ON THE COCA LEAF, AND ITS USES IN DIET AND MEDICINE.

By J. H. SCRIVENER, M.D., Lima.

THE two most valuable vegetable productions of Bolivia are the Cascarilla (*i.e.*, the Cinchona, or Peruvian Bark), and the Coca; the former is well known to fame, the latter comes next in importance for its services to mankind.

The Coca (*Erythroxylon Coca*) is a shrub which grows to about six feet in height. Its leaves are about one inch in length, and of a light-green colour; its flowers are white, and produce a red berry. In its cultivation the soil is well prepared previous to the sowing of the seeds, and then divided into different compartments. After the sprout has come out, which takes place in a few weeks, and when they have grown to two or three feet in height, they are transplanted to other grounds, within two or three feet of each other, which are called *cocales*. These plantations are formed in the most shady places, for the purpose of protecting them from the heat of the sun, which is very powerful in the deep valleys of these regions. Indian corn is also sown between them, the broad shady leaf of which serves as an additional protection to them.

The Coca plant grows luxuriantly in all the valleys, and arrives at perfection in about two years; the time is known by the height of its branches and the brittleness of its leaves, which break or fall on touching them. The Indians are careful in gathering the leaves, as they are delicate and easily broken from their stems. As soon as they are gathered they are laid upon the ground for the purpose of being dried by the sun, which, as this process gradually takes place, changes the colour of the leaf from a light to a dark green. The leaves, when perfectly dried, are wrapped up in palm-leaves and covered with flannel. Packages are then made of them of fifty pounds each, which are called *cestos*; others of 100 pounds are called

tambors. They are then conveyed on the backs of llamas to the Custom-house of La Paz, and sold to the miners for the Indians of their establishments. The duties on the Coca form an important revenue to the nation, amounting to 400,000 dollars a year—£80,000.

It is not known when the Coca was first discovered, but it must have been at an early period, probably under the Incas. Its production was very great during the Spanish sway, for it then became an article of importance to the Indians. Previous to that period, according to Prescott, it was reserved for the Incas and nobles of the country.

There are many estate-holders in the city of La Paz who have large plantations of Coca, from which they derive a large revenue; they are not exposed, like other plantations, to local causes or atmospheric changes which might injure or destroy them.

According to an article published in *La Tribuna*, August 5, 1863, "the Indians of Peru refer to mystic traditions for the origin of this plant. They say that Manco Capac, the divine Son of the Sun, descended in the primitive epoch from the rocks of the Lake Titicaca, and bestowed the light of his father upon the poor inhabitants of the country; that he gave them a knowledge of the gods, taught them the useful arts and agriculture, and presented them with the Coca, that divine plant which satisfies the hungry, gives strength to the weak, and makes them forget their misfortunes."

In the splendid and sumptuous city of Cuzco (the capital of the Incas) the Coca-leaf was used as an article of luxury; the Incas and the nobles masticated it in their palaces and temples, which were richly adorned with gold and silver.

There are different opinions of the properties of the Coca, for, according to some writers, it contains a small quantity of some narcotic, which intoxicates those who masticate it; whilst others affirm, as cited by Prescott, that its effects are similar and equally injurious to the mastication of tobacco.

The properties of the Coca are variable, according to the quantity employed. It is a stimulant, a tonic, slightly narcotic, and very nourishing. It possesses an agreeable aroma, and a flavour similar to that of tea, and, like that plant, is frequently employed in the form of an infusion in slight disorders of the stomach.

There are certain signs in the physiognomy of a Coca chewer which manifest the influence of the plant; they are characterised by a paleness of the lips, a slight yellow tinge about the angles of the mouth, and the teeth are stained with a bright yellow. With its use the countenance, which usually presents an afflicted aspect, becomes more animated; the eyes assume a brilliant appearance; the pulse is strong and frequent, and there is a desire for physical exertion. These are, undoubtedly, signs of the stimulating and tonic effects of this plant.

Abuse of the Coca occasions, according to some authors, signs of premature old age, which are marked by an unsteady step, a yellow skin, a want of brilliancy in the eye, and a general indifference or apathy. I have seen hundreds of Indians, during my residence in Bolivia, who have chewed the Coca-leaf from youth upwards, many of whom had attained their 80th year, and who showed no signs of having been affected by the plant. I have only seen the signs above mentioned in very advanced age, for the Indians are proverbial for longevity.

There can be no doubt that the Coca is both salutary and nutritious, and, we may add, the best gift that the Creator could have bestowed on the unfortunate Indians. It is of inestimable value to them, for without it they would do nothing with spirit or goodwill. They are always supplied with a quantity of its leaves, which nourish and strengthen them; and it is their great resource in their trials and afflictions. They always carry a bag of the leaves hanging from their neck, and a small flask by their side filled with ashes or lime. The manner of employing them is very singular, and is as follows:—The Indian takes a handful of Coca-leaves out of the bag, and withdraws the filaments from them. He then puts them into his mouth, and chews them into the form of a ball. He then wets a piece of thin stick, which he introduces into the flask; and on withdrawing it, it is covered with the lime or ashes. He then pierces the ball in his mouth with it till it has acquired a strong and pungent taste, which is naturally followed by a copious salivation: part of this salivation is ejected from the mouth, and part of it is swallowed. The ball is retained in the mouth for about an hour, and is then renewed with another handful of leaves.

The proprietors of the mining establishments in Potosi and other districts are abundantly supplied with Coca, which they daily distribute to the Indian workmen. The quantity which they give to each Indian is an ounce and a half, with the

exception of holy days, when it is increased to three ounces. Groups of Indians may be seen on those days, and at the hours of rest from their labours in the mines, chewing the Coca with as much pleasure and delight as a connoisseur in tobacco smokes a rich havana.

The effects of Coca on the Indian are very visible; they are strongly marked in his countenance by a greater brilliancy in his eye, more agility in his step, and he is animated and contented; he appears as if he had partaken of a rich repast. There can exist no doubt, in view of these beneficial effects, of the erroneous opinions of authors who have written on the noxious effects of this plant; and to prove still further their little knowledge of its properties, I shall bring forward the effect it produces upon travellers.

The Indians of Bolivia are very remarkable for the rapidity of their journeys on foot, and are probably without rivals as postillions. There are some who are called *andadores* (swift travellers), who are employed by the Government on critical occasions to convey dispatches to distant parts, for the swiftness of their journeys and their well-known fidelity. They travel from sixty to seventy miles a day—from the rising to the setting of the sun—and for several successive days. Their road generally lies over passes in the mountains only known to them, and they are without any other food than a few Coca-leaves, or a small quantity of powdered Indian corn. But, what is still more surprising, and will appear almost incredible, is, that they travel these long distances without being weary, or at least without signs of fatigue.

I heard from good authority that, during the war for the independence of the country, a battalion of infantry, composed principally of Indians, made forced marches of sixty miles a day, notwithstanding the weight of their knapsacks and their arms, and without any other food than the Coca, and occasionally a small quantity of Indian corn. This was found sufficient to sustain their strength, to keep them lively and contented, and ready and disposed to continue their journeys, which invariably terminated without signs of fatigue.

There was at that period a battalion of infantry, under the command of General Valdes, which travelled 108 miles on foot in three days, and without any other food than the Coca-leaves.

The Indians, according to Tschudi, looked upon the Coca plant as sacred and mysterious. It formed a principal part in their religious ceremonies, and they burnt it upon their altars as a pious offering to their deity. The priests chewed it at their prayers to conciliate the benevolence of their gods, and blessed it to obtain every worldly advantage. The Indians, according to the same author, filled the mouths of the dead with Coca-leaves for the purpose of securing their salvation; and some have affirmed that this custom still exists among them, and that when an Indian meets with a mummy he kneels down with devotion, and places around it a quantity of Coca-leaves.

There are few plants that can be compared to the Coca for its varied and inestimable qualities. Besides its admirable effects in nourishing the system, it is employed with advantage, in a Medical point of view, as an excellent tonic in weakness of the stomach, and other affections of that organ. It is to be hoped that the day is not distant when that plant will become generally known to the Medical Faculty, and placed beside those in our pharmacopœias as one of the most important of the kind.

I cannot admit the opinion of the Jesuit Julian, who states that the Coca would lose the strength of its properties by exporting it to Europe, and that Medical men would not employ it as a tonic. There can be no difficulty, in my opinion, in preserving the properties of the plant, as the leaves might be packed up in cases lined with tin, as the tea is from China, which would prevent it from becoming impaired in the voyage.

It would have been interesting to have known when this plant was discovered, but this was a task we could not accomplish, and will probably remain a mystery. The information we have acquired of it is from the period of the Conquest, when the Coca was employed in the manner we have described; and, from the knowledge we possess of its valuable qualities, we firmly believe that when they become known in Europe it will be employed with advantage for complaints of the stomach, and as a solace and powerful auxiliary unequalled in the history of plants to the poor and afflicted when suffering from hunger and grief.

The Coca was introduced into Salta, a province in the Argentine Republic, about a century ago, and is frequently employed by its inhabitants. The peasants in the valleys of San Carlos, Molinos, and Rinconado chew it with the same

pleasure and advantage as the Indians of Bolivia. It is not unknown in Buenos Ayres, the capital of that State, where it is gradually coming into use, and can be obtained at several chemists' shops. The natives employ it, in the form of an infusion, in disorders of the stomach.

It is to be regretted that we have no further details of the Coca, which is attributed to the conquerors of Peru, who were indifferent to everything save gold and silver, and who destroyed everything that tended to a knowledge of the country. It is well known that the Incas transmitted to their descendants an account of their laws, arts, and sciences—in fact, everything relating to the welfare of the country. These accounts were made of cords of different colours, called *quipos*, which, according to Prince San Severo, served them as an alphabet. It would have been an easy task to the Indians, who had acquired a knowledge of the Spanish language, and who served as interpreters to their conquerors, to have deciphered the *quipos*; but the indifference of the latter to all that was scientific had no bounds; they were satisfied with amassing gold, silver, and precious stones, and cared nothing about the history and customs of the country.

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

KING'S COLLEGE HOSPITAL.

NECROSIS FOLLOWING INJURY—REMOVAL OF DEAD BONE.

(Under the care of Mr. WOOD.)

[Reported by Mr. E. B. Roche, House-Surgeon.]

S. W., aged 8 years, was admitted on June 7. A fortnight before he had fallen from a height of four or five feet on to a heap of rough stones, and hurt his right leg, so that it soon became very painful, and he had to keep his bed. The pain continued, and the leg gradually increased in circumference up to the time of his admission, when there was considerable swelling over nearly the whole length of the tibia, which pitted on pressure, and gave an indistinct feeling of fluctuation. There was, too, intense pain caused by the gentlest manipulation, and considerable febrile disturbance, with a temperature of 105°.

Mr. Wood made a free incision in the most prominent part of the swelling, carrying his knife down to the bone, and let out a quantity of very offensive pus.

On June 18 another incision was made, about four inches above the first, and from this also much pus escaped. The soft parts around the knee-joint now commenced to swell, the swelling extending some distance up the thigh, and any attempt at movement caused excessive pain. A drainage-tube was passed through the openings already made.

On July 5, Mr. Wood made two incisions—one on each side—about four inches above the joint, and a drainage-tube was passed. About ten ounces of very fetid pus were thus evacuated.

On the 7th the patient was seized with a slight rigor; there was, however, no recurrence of shivering, and from this time the child rapidly improved, his temperature fell, and his appetite and strength increased.

Two other small incisions had to be made, which soon healed, and the upper opening in the leg closed; those in the thigh continued discharging for some time, but no dead bone could be felt through them. The surface of the tibia at the lower opening on the leg is seen to be necrosed.

On September 12 a thin plate of the tibia was removed by the dressing forceps through the opening in the leg, which has now healed over. The leg is quite straight, and the knee at the present time stiff, and the limb still kept upon a long back-splint.

(Under the care of Sir WM. FERGUSSON.)

O. K., aged 6 years, was admitted for disease of his right humerus on January 19, 1871. About six months previously his arm was jammed by a door being closed upon it suddenly, causing at the time much bruising of the soft parts, which soon became red and swollen. Abscesses soon formed and discharged themselves, giving rise to sinuses, two of which were discharging at the time of admission. One of these was situated in front of the arm, about an inch and a half below the coracoid process, and the other about the same distance above the external condyle; through both these sinuses dead bone

could be distinctly felt. The general health of the child was very bad. Sixteen days after admission, the condition of the boy being much improved, Sir Wm. Fergusson opened up the sinuses, and attempted to remove the sequestrum, first through one, then through the other. It resisted these efforts for some time, but at last yielded, when Sir William with a powerful pair of forceps seized the bone through the upper opening, and pulled well in the axis of the arm. By these means the whole shaft of the humerus was dislodged in a state of necrosis. The head and lower extremity of the bone remained intact, but the arm itself bent easily, as the new bone was too soft and yielding to allow it to preserve the straight position. It was placed upon a splint, and the wounds dressed with water dressing, and gradually closed.

The result of this case is an arm of the same length and firmness as the other; but the mobility at the elbow-joint is considerably diminished.

(Under the care of Sir WM. FERGUSSON.)

Jane P., aged 20; admitted for necrosis of the lower jaw. She states that about twelve months ago, while loading a cart at a market-garden, she slipped and fell, striking the right side of her face, and cutting her cheek. A few days afterwards the jaw became very painful, and the cheek swelled considerably. The pain and swelling continued, and after nine months two openings formed, leaving sinuses, one of which is below and anterior to the angle of the inferior maxilla on the right side, and the other an inch and a half anterior to this. Through each dead bone could be felt. Sir William Fergusson enlarged the posterior sinus, and through it extracted a piece of necrosed bone about one inch and a half long, consisting of a portion of the angle and the bone anterior to it. The third molar tooth was dislodged with it. Oiled lint was applied to the wound, and the patient fed on spoon diet for a few days. The opening rapidly closed, and in ten days after the operation solid food was easily masticated.

SATURDAY, SEPTEMBER 30, 1871.

THE INDIAN MEDICAL SERVICE.

THE members of the Indian Medical Service have good reason to complain of the state of uncertainty in which they have latterly been placed. The two facts of no admissions to the junior ranks having taken place during the last three years, and of the steadily increasing disproportion between the numbers of Surgeons and Assistant-Surgeons in the three Presidencies, indicate an abnormal condition of affairs in the covenanted branch of the Service; while the increase of uncovenanted Medical officers—many of whom are of native or mixed extraction—and their nomination in many instances to appointments formerly held by commissioned Surgeons or Assistant-Surgeons, justifies the suspicion that there is being brought about a gradual and insidious change, the ultimate result of which

will be the extinction of the Indian Medical establishment. It appears, in fact, that the Indian Government is now effecting, in an underhand manner, changes in the constitution of the Medical Service of that country similar to those proposed some years ago, but which it was found impossible to carry out without a special Act of Parliament, altering entirely the terms of admission to the Service. By conferring the "local rank" of Surgeon and Assistant-Surgeon on senior members of the subordinate Medical Department [who may have attained the necessary Professional standard, a mode was hit upon of getting round the barriers raised by unrepealed Acts of Parliament, and of at the same time gradually introducing into the Indian Medical Service a new element, the disturbing influence of which was at first barely perceptible; but now, from the increasing numbers of this class of Medical officers, and their selection at considerably lower salaries for posts formerly held by Medical officers of the superior grade, the tendency of the change is every day becoming more obvious.

In order duly to appreciate the nature of this change, we must not limit ourselves to the merely Professional aspect of the question. From the earliest days of our presence in India, down to the present time, Medical science has been the one and sole branch of European learning which has thoroughly recommended itself to the native mind. Our system of law has been accepted and submitted to, but is still, in many instances, felt to be harshly dissonant from, and inconsistent with, native prejudices and feelings. Our theology in all its varied and contradictory phases has never yet gained such a hold upon the convictions and opinions of Brahmin or Mussulman as would enable it to continue its existence beyond a single generation, supposing the English population to be withdrawn from India. Not much more can be said for general literature. It must, however, be admitted that the engineering skill of the English occupiers has, in roads, canals, and railways, left indelible traces of the presence of a race possessing superior knowledge and energy. Politically, therefore, any change likely to result in a deterioration of the class of Medical officers in India possesses an importance over and above that attaching to it as a matter of simply Professional interest.

We are quite ready to admit that many, or even all, of the Medical officers virtually admitted into the Indian Service by the back-stairs of local rank may be men of ability and skill—some, indeed, we believe possess very high attainments as Physicians and operative Surgeons—but they have been appointed by selection from a population infinitesimally small compared with that composed of students who have gone through a systematic Professional training in the United Kingdom, and from among whom candidates for admission to the Service must further submit to a strictly competitive examination. Although some men of exceptional skill and acquirements may no doubt have passed into the "local ranks" of the Indian Medical Service, it must be admitted that competition among the members of a larger class, who have enjoyed superior Professional opportunities, is more likely to supply the sort of men required, than is selection from the subordinate Medical Department, or the organisation of an uncovenanted Medical service, the admission to which is by nomination instead of by competition. These, however, appear to be the means most in favour at present with the Indian Government of keeping up its stock of Medical officers. The discontent and suspicions of the members of the Indian Medical Service have been thoroughly aroused, and, we must say, not without cause. Rumour succeeds rumour as to impending changes. The latest is, that the Indian Medical establishment is to be divided into two branches—civil and military; that the latter will be placed under the superintendence of the Inspectors-General of Hospitals of the British Medical Service in India, and thereby virtually transferred to the Medical Department of the home army, and liable to removal from

India in their regular turn; while the former will be under the supervision of Inspectors-General of the Indian Service, and will remain in India till the completion of their terms of service. The liberty of choice between the two Services is to be given to the officers already in the Indian Medical Service. The result would, of course, be the transfer of the Medical charge of the native portion of the Indian army to the British Medical Service, and the abolition of all the military duties now performed by members of the Indian Medical Service.

Such a scheme would involve many difficulties and instances of individual hardship to members of both Medical Services, unless it be complemented by an extension of the system of retirement by which Medical officers might obtain credit for the longer periods of service entitling them to the higher rates of pension. There can be no doubt that the Indian Government could have the Medical duties of the native army performed much more cheaply by the Army Medical Department than by its own, as it would thereby free itself from the higher rates of retirement which it has hitherto paid to its Medical officers. The Medical officers who might elect for the Indian Civil Medical Service would, of course, continue on the old terms of pay and retirement; and if the standard of admission to the Service be kept up to the high mark at present attainable by competitive examination, and if the terms offered by the Government be sufficiently good to induce highly educated young men from this country to compete, the Civil Medical Service of India would probably afford one of the most attractive and remunerative fields for Professional labour. On the other hand, if the standard of admission be virtually lowered by the selection of men unwilling or unfit to encounter the test of competitive examination, direct injury will be inflicted not only upon the Profession, but upon the political position of the whole British population of India.

THE METROPOLIS WATER ACT, 1871.

A FEW weeks ago, on the eve of its becoming law, we expressed no very favourable opinion of the above measure; now that the Bill has passed into an Act we shall be rejoiced to find that we were mistaken in our surmises, yet we have our misgivings. We repeat that the Act is a Water Companies' measure, and our assertion is confirmed by the statement of the Companies' organ (the *Journal of Gas Lighting, Water Supply, and Sanitary Improvement*), which states that "the Act just passed is the result of earnest conferences between the Companies . . . and the Government," and adds that, *if cautiously acted upon*, it (the Act) is calculated to effect much good. The article we have just quoted insists upon time being given for the gradual introduction of the constant system of supply, together with cautious preparation for this desirable boon. It is a pity that any rupture should have occurred between the Water Companies and the Metropolitan Board of Works—that the former should have imbibed the idea that Bill No. 1 was conceived in a spirit of gross antagonism to the Companies, and that the strongest opposition of these was consequently excited. Fears are entertained lest the Metropolitan Board, in a fit of petulance at the rejection of their own Bill, should prefer to leave the Act as much a dead letter as the Act of 1852. The securing of a constant supply in the metropolis and adjacent districts practically rests with the Metropolitan Board and the Water Companies; for, putting aside the outlying districts, a constant supply for the metropolis is to be obtained in one of three ways:—Either a Company may now (as no doubt the Companies will) take the initiative, and propose to furnish such supply in any district; secondly, if in the City, the Corporation may demand it, or, outside, the Metropolitan Board of Works; or, lastly, the Board of Trade (now the Local Government Board) may, under certain conditions, insist on a constant supply in any district. These conditions are, that certain regulations as to prevention of

waste, etc., be complied with by the consumers. These regulations are to be made by the Companies, and, if not complied with by four-fifths of the householders in a district, the obligation on the Companies to furnish a constant supply ceases. If neither the Metropolitan Board nor the Companies elect to enforce compliance with the regulations, the Act becomes a dead letter. We regret that the enforcement of the regulations has not been made compulsory on someone; and earnestly do we counsel the Companies to put the statute in force, give a constant supply, and thus forestall that future legislation which must necessarily speedily ensue should the Act prove nugatory.

No doubt the evils attending the present system of intermittent supply have been much exaggerated; for we confidently assert that in the larger class of houses contamination in cisterns seldom occurs, whilst in the poorer class of houses, in consequence of the smallness of the cisterns and butts, a daily almost complete removal of the supply takes place. Nevertheless, a constant supply may, and no doubt will, prove a great boon to the population; for not only, with reasonable care, will all risk of poisoning by impure water be avoided, but a cool and refreshing beverage will be so constantly at hand, that habits of temperance may be expected to be introduced, such as can scarcely be looked for when drinking-water is too often a nauseous lukewarm beverage.

THE WEEK.

TOPICS OF THE DAY.

WE regret to say that the health of her Majesty, although partially recovered, is still not re-established. The Queen has not been able to attend divine service, as has been her wont, or to take her usual amount of air and exercise. We fear there is too much reason for apprehending with Mr. Disraeli that a long-time must elapse before her Majesty will be able to resume the performance of public and active duties.

We are glad to see that the last speech of the Prime Minister, at Aberdeen, affords evidence that the quiet time of the recess has given opportunity for recollection that there are subjects of as real importance to the well-being and happiness of the people as Ballot Bills and Extension of the Suffrage. It is true that the general tone of the latter part of his address at Aberdeen seemed to indicate that Parliament had enough to do without legislating on such matters; but he acknowledges that "legislation upon health, legislation upon atmosphere, legislation upon water, legislation upon drainage, legislation upon labour in all its relations," are subjects which Parliament must attend to, although to do it he thinks the machinery of Parliament must be improved, in order to give greater facility and expedition to the transaction of non-political business. But whilst Mr. Gladstone and his colleagues are improving the machinery of Parliament, another session may slip away, and cholera may be in our midst.

It is worthy of remark, considering the popularity of the cry for a National Parliament and for Home Rule in Ireland, that if we descend from Imperial to Medical politics, we find our Irish friends by no means so enamoured with isolation. The proposal of the Government last year to create a separate Examining Board for each division of the United Kingdom was, we believe, very unpalatable to the Irish Medical authorities. We know that it was opposed by some of the most distinguished of the Medical Profession in Ireland, on the ground that there might be an inequality in the eyes of the public between the English and Irish qualifications; and this, we fancy, was the view taken in some quarters where the idea of Irish political independence is by no means unwelcome.

The vacancy for the Assistant-Surgeoncy to the Middlesex Hospital is still unfilled. There are several candidates for the post, but we hear there is to be no canvassing.

The deaths from diarrhœa in London last week declined to 205, of which 186 were of infants under 2 years of age. The deaths in the previous week were 268. Only 2 deaths were referred to cholera and choleraic diarrhœa; in the eight previous weeks these deaths had averaged 22. The fatal cases of small-pox in London last week rose to 89; in the previous week the number was 57. The fatality showed an increase in St. Pancras district, Bethnal-green, Walworth, Battersea, and Camberwell.

The inquiry into the management of the Temporary Small-pox Hospital at Hampstead is undoubtedly at present the chief matter of Medical interest amongst us. The inquiry promises to be a long one, and we do not intend to express any opinion on the main points at issue between the complainants and the defence until we have the evidence of both sides before us; but enough, we think, has transpired to verify the remarks we recently made. The Hospital was got up in a hurry for the indiscriminate reception of paupers and of people of a higher station who could not be nursed at home. The East Grinstead Sisterhood, which generously and heroically undertook the nursing, was quite inadequate to the task. The Sisters had to rely upon hired nurses, who were procured on the spur of the moment, and even these were largely supplemented by the aid of convalescents, who, whatever might have been their previous station or condition, were set to work in a rate-supported Hospital. The Hospital seems to have been conducted on the principle of a workhouse Hospital; and as thirty patients were received per diem, many of them in a most filthy condition, and the nursing staff was most inadequate, there can be no wonder that scandals got abroad. With regard to the questions at issue between the Medical Superintendent and his assistants, as we have said, we must reserve all comment.

THE HEALTH OF THE TROOPS DURING THE MANŒUVRE CAMPAIGN.

So far as concerns the health of the troops engaged during the fortnight's campaign, the experiment has met with an almost unanticipated success. The general health of the troops is reported to have been highly satisfactory. The number of admissions into the permanent Hospitals at Aldershot from all the camps was actually below the average, and the men who remained at Aldershot furnished a greater proportion of cases to strength than did the men on active service. This, of course, is to be accounted for by the fact of all the weakly men and recruits likely to break down under hard work or exposure having been left behind; but it nevertheless affords a satisfactory proof that the health and condition of the men on field service had been maintained. Many Medical officers, indeed, expressed to us the opinion that their men had actually derived considerable benefit from the complete change of scene and employment. And judging ourselves from the appearance of many of the regiments marching into camp after the heavy work of Thursday, the 21st inst., the last day of the operations, we were struck by the generally healthy appearance of the men, dust-begrimed and travel-stained as they were. With the exception of one case of small-pox there was no serious form of fever. Rheumatism, bronchial attacks, slight bowel derangements, and accidents were the chief causes of admission into Hospital. One man of the 7th Hussars was so severely injured on Thursday by the falling of his horse that he was reported to have been killed; but this, we believe, was not the case. A man of the 42nd Regiment received a very severe injury of the wrist, from a pick-axe having been driven through the joint while he was engaged at trench-work.

During our hurried visit to the camp we had an opportunity, through the courtesy of the quartermaster of one of the regiments just returned from the campaign, of seeing the Broad-arrow camp-kitchen in full work. It certainly appeared to answer the purpose admirably, and has both cheapness and

simplicity of construction to recommend it. It consists of four sets of ranges, each composed of three flues dug in the ground, in a shape resembling the Ordnance broad-arrow, and converging in one common flue leading into a spacious wattle and daub chimney. The depth of the flues is about two feet, and at regular intervals along the upper surface are openings of a kidney shape, into which block-tin cooking-pans accurately fit, the intervening spaces being filled in with adhesive baked clay. A good wood fire is lighted at the open end of the flue, and the draft through the narrow and nearly air-tight channel towards the chimney is so powerful that there is almost a complete consumption of the smoke, and the heat is carried along the whole length. The flues, of course, work more efficiently when the wind is in a favourable direction, but even when such is not the case they do their work very tolerably. The set of ranges which we saw had been in operation some three or four months, and the soldier-cooks in charge appeared perfectly satisfied with them. The peculiar shape of the cooking-pots is for the sake of portability on the march, as the hollow part of the pot fits on the back; and as each pot cooks for five men, every fifth man on the march carries one, containing the other necessary cooking utensils for the same number of men. The kitchen, we believe, was devised by a sergeant of the Army Service Corps, who, as we were informed by one of the soldiers employed at the one which we visited, received from the Government a honorarium of £5 for his invention.

ROYAL COLLEGE OF SURGEONS.

THE Calendar of this institution has just been published, and, as heretofore, contains a large amount of valuable information for the members of the Profession generally. In addition to the regulations to be observed by candidates for the Fellowship and Membership of the College, the questions submitted during the past year, whether primary or pass, for both distinctions, are published, and will be found of great assistance to those about to offer themselves for examination.

The following analysis of this useful publication will, perhaps, be read with some interest:—It appears that there are now 1334 Fellows of the College—viz., 192 honorary, or those on whom the distinction was conferred in December, 1843, and August, 1846. Of these gentlemen the senior appears to be Mr. Joseph Swan, of Tavistock-square, admitted a Member so long ago as October, 1813; the youngest is Dr. G. M. Humphry, F.R.S., of Cambridge. There are 434 Fellows by examination, of whom the senior appears to be Mr. Robert Martin, of Ipswich, who passed for Membership in April, 1813; the youngest is Mr. Thomas Cooke, admitted a Member and Fellow in the present year. By election there are 706 Fellows, the oldest being Mr. George Burt, the last elected Mr. James Gleadall. For the first time there appear in the present Calendar two gentlemen who have been elected *ad eundem*—viz., Dr. M. Kelburne King and Mr. William McCormac. There are nearly 15,000 Members of the College. The Licentiates in Midwifery have increased to 1014, and those in Dental Surgery to 314.

The following gentlemen are members of the Council, viz.:—*Mr. George Busk, F.R.S., President; *Mr. Henry Hancock and *Mr. T. Blizard Curling, F.R.S., Vice-Presidents; Mr. J. Flint South, *Mr. John Hilton, F.R.S., Mr. Richard Quain, F.R.S., Sir William Fergusson, Bart., F.R.S., *Mr. F. Le Gros Clarke, Mr. Thomas Turner, Sir James Paget, Bart., F.R.S., Mr. Charles Hawkins, Mr. Prescott G. Hewett, Mr. H. Spencer Smith, Mr. John Birkett, Mr. John Simon, F.R.S., Dr. G. M. Humphry, F.R.S., Mr. Luther Holden, Mr. John Gay, Mr. J. E. Erichsen, Mr. W. J. Erasmus Wilson, F.R.S., Mr. Henry Lee, Mr. T. Spencer Wells, and Mr. George Critchett. Those gentlemen to whose names an * is prefixed are also members of the Court of Examiners with the following:—Messrs. R. Partridge, F.R.S., Edward Cock, John Adams, S. A. Lane, and W. Scovell Savory, F.R.S.

The following recognised metropolitan Hospitals appear to be represented on the Council:—St. Bartholomew's, by Sir James Paget, Bart., and Mr. Holden; St. Thomas's, by Messrs. South, Clark, and Simon; Guy's, by Messrs. Hilton and Birkett; the London, by Messrs. Curling (Vice-President) and Critchett; University College, by Messrs. Quain and Erichsen; the Charing-cross, by Mr. Hancock (Senior Vice-President); King's College, by Sir William Fergusson, Bart.; St. George's, by Messrs. Hewett and Lee; and St. Mary's, by Mr. Spencer Smith. The only Hospitals not at present represented on the Council are the Westminster and Middlesex. A vacancy has just been created in the Council by the death of Mr. Solly, which will be filled at the annual election in July next. The Examiners in Medicine are Drs. Peacock and Wilks, F.R.S.; those in Midwifery, Mr. Hancock (Chairman), and Drs. Farre, Barnes, and Priestley; in Dental Surgery, Messrs. Partridge, Hilton, Cock, Cartwright, Ibbetson, and Salter. The Professors are Mr. Timothy Holmes (Surgery and Pathology), Mr. W. H. Flower, F.R.S. (Comparative Anatomy and Physiology), Mr. Erasmus Wilson, F.R.S. (Dermatology), and Dr. G. M. Humphry (Lecturer on Anatomy and Physiology). Two new officers appear as Assistants in the Museum—viz., Dr. Goodhart and Mr. Lidderdale.

Turning to the financial department, we find that this year the disbursements exceeded the receipts by £7 11s. 10d. The following is a summary of the receipts and expenditure for the former:—College income, £11,461 19s. 1d.; from trust funds, £290 3s. 2d.; total, £11,752 2s. 3d. Disbursements for College purposes, £11,433 12s. 2d.

Under the head "Receipts," the largest amount, as might be expected, is derived from fees paid on examination for the several diplomas, amounting to £9279 11s.; the next largest amount is derived from rent of chambers and dividends on stock (£36,000), producing £1907 1s. Elections to the Fellowship, Council, and Court of Examiners yielded £262 10s. The dividends received on trust funds were £290 3s. 2d. The smallest amount was received from Sir Charles Blicke's bequest of £300 to the Library—viz., £8 17s.; the largest on Mr. Erasmus Wilson's liberal donation of £5000—viz., £147 10s.

The expenditure, which amounted to £11,759 14s. 1d., was chiefly on account of fees paid to members of the Council, Courts of Examiners, etc., and salaries and wages to the large staff of officers and servants of the College. The Councils and Courts received £4377 18s. 6d.; for this amount the former attended fourteen meetings, and the latter during the past collegiate year held six meetings for the examinations for the Fellowship, forty-seven meetings for the primary and pass examinations for the Membership, two meetings for examinations in Midwifery, and one for the Licence in Dental Surgery. The amount paid for salaries and wages was £3387 8s. 10d.—not an extravagant sum when the large number employed is taken into consideration, as we find there are eight officers and fifteen servants, exclusive of extra assistance. For taxes, rates, and stamps (not including postage), the large sum of £974 17s. 7d. was required. Pensions are put down at £457 3s. Law expenses, £146 10s. 10d. Subjects, patients, bandaging, and refreshments at examinations, £158 3s. 11d.

The following analysis of the examinations may be interesting:—At the primary examination for the Fellowship during the past year 93 candidates offered themselves; of this number 54 passed, and 39 were referred for six months. At the pass examination for the same distinction 29 candidates went up, of which number 18 passed, and 11 were referred for one year. For the *primary* examination in Anatomy and Physiology for the Membership there were 603 candidates, 424 of whom passed, and 179 were referred for three months. For the *pass* examination in Surgical Anatomy and the Principles and Practice of Surgery and Medicine there were 382 candidates; 247 passed, 59 were approved in Surgery but were required to

qualify in Medicine, 44 were approved in Surgery and afterwards qualified in Medicine, and 291 diplomas were granted; the rejections for six months amounted to 76. For the Licence in Midwifery 12 were examined, 7 passed, 2 were referred for a written examination, and 3 were altogether referred. For the diploma in Dental Surgery 10 candidates were examined, of whom 8 passed to the satisfaction of the Board, and two were referred to their studies for six months.

The gentlemen who have filled the office of President, taking them in seniority, are: Messrs. South (twice—viz., in 1851 and 1860), Hilton, Quain, and Sir William Fergusson, Bart. There have been four representatives of the College in the General Council of Education and Registration—viz., Messrs. Green, Arnott, Hawkins, and Quain. The Honorary Medal of the College has been presented to Messrs. Wilson (1800), Parkinson (1822), Swan (1825), Bennett (1834), and Crowther (1869).

The Collegial-Triennial Prize has only been awarded on six occasions—viz., in 1822 and 1825 to Mr. Joseph Swan, in 1840 to Mr. Thomas Williams, in 1843 to Mr. Holmes Coote, in 1846 to Mr. Henry Gray, and in 1858 to Mr. George Harley. For the Jacksonian Prize a long list of prizemen appears. The following is the subject for the Collegial-Triennial Prize: "The Structure and Functions of the Medulla Oblongata, including the Connexions of the Central Nerve Roots." The prize consists of the John Hunter medal, executed in gold, to the value of fifty guineas, or, at the option of the successful author of the dissertation, of the said medal executed in bronze, with an honorarium of £50. The subject of the Jacksonian prize for the present year is, "The Treatment of Wounds after Operations, including the Arrest of Hæmorrhage, Primary and Secondary." The subject of the prize for the ensuing year (1872) is, "The Diseases of the Nose, including those of the Sinuses connected with it, and their Treatment."

It only remains to add that the compilation of the Calendar reflects credit on all engaged in it. Were we disposed to be hypercritical, it would be to inquire why only one Fellow is allowed to place "M.D." after his name when there are amongst them and the Members so many graduates in Medicine of Universities in the United Kingdom.

THE FIVE PAST PRESIDENTS OF THE NEW SYDENHAM SOCIETY.

THE Council of the New Sydenham Society has presented to each of its unpaid officers a handsome portfolio, containing photographic portraits of the five gentlemen who have held the office of President of the Society—viz., Sir James Paget, Sir Thomas Watson, Dr. Williams, Mr. Hilton, and Dr. Stokes. The Society owes its prosperity in great measure to the activity of the local secretaries, and it was felt, at the general meeting of 1869, that some acknowledgment was due to those gentlemen beyond an annual vote of thanks. The Council were empowered to devise some method of discharging this obligation, and that which they have chosen will be, doubtless, accepted as graceful and appropriate. The portraits have been taken expressly for the purpose, and are of great excellence.

A GOOD AND SENSIBLE EXAMPLE.

So great an alarm was lately caused at Ruthin, North Wales, in consequence of several deaths having occurred from typhus fever, that the people began to desert the village, and a complete exodus was threatened. Mr. Watkin Williams, M.P., hearing of the terror which prevailed, went at once to Ruthin, visiting the fever-stricken patients, and trying to allay the fears of the inhabitants. His efforts were successful. There was, we believe, no occasion for the great alarm which existed. The example set by Mr. Williams is, however, highly commendable. Nothing is more depressing than fear, and more likely to predispose to fever, whilst a bold faith and hope have a contrary effect—

"Thus drew Marseilles' good Bishop purer breath,
When the air sickened and each breeze was death."

A MEMORIAL TO HARVEY.

A MOVEMENT has been set on foot for the erection of a memorial to our distinguished fellow-countryman Harvey, on the occasion of his 300th birthday. The memory of John Hunter is best perpetuated by the museum which he did so much to establish; but for Harvey there is no such memorial—for though his great discovery has now become part and parcel of our everyday knowledge, and is within the circle of the most limited education—nay, though now Harvey's proofs seem so childishly simple that his discovery appears as though it were no discovery—we have but to look back to the opposition he himself encountered, and to the obloquy showered upon him, to understand something of his position when nearly 300 years ago he proclaimed abroad what he had long before established in his closet. It is fitting there should be a memorial of such a man above and beyond what has been done by the College of Physicians to keep his memory green. Their efforts may do thus much within a certain circle, but it is right that something should be done beyond these to perpetuate the name of the great discoverer. To this end a movement has been commenced in Folkestone, Harvey's native town, to procure for him some memorial on the occasion of the 300th anniversary of his birthday, which falls in 1878. A public meeting has been held in Folkestone, and the proposition has been well received; but it is desirable that any memorial should have a national rather than a local character. It is proposed that the memorial should take the form of a statue; and for that no better place than Folkestone could be chosen—better, far, than having it erected in London, and, when some new military hero is voted a statue, seeing it displaced and hidden, as has been that of Jenner. Meanwhile, subscriptions are wanted—not from Medical men alone, but from all interested in the advance of sound scientific knowledge; and Dr. Bence Jones, Honorary Secretary to the Royal Institution, has consented to act as treasurer. The honorary secretaries are—Dr. George Eastes, Albion-place, Hyde-park-square; and W. G. S. Harrison, Esq., Town Clerk's Office, Folkestone. We would strongly advise the gentlemen immediately concerned in getting up the memorial to extend its basis as widely as possible; for, though a local memorial to Harvey would be a great thing, a national one would be far greater. Probably their best course would be to call a meeting, gathering together the heads of the Profession, so as to obtain their sanction and countenance—individual enterprise might then be left to do the rest. But to give the scheme a proper *locus standi* these men ought to be invited to take part in the movement.

CHOLERA AND COPPER.

It is well known that during the epidemics of cholera which have occurred in this country, Birmingham suffered little or nothing in comparison with other large towns. The cause of this immunity from the disease was variously accounted for. One of the most prevalent opinions was, that it was dependent mainly on the extent of the workings in copper carried on in the town and neighbourhood. It would appear from a late publication of Dr. Burg's that there is some ground for believing that that opinion is the correct one. Dr. Burg, in revising the different statistics of deaths from cholera during its last outbreak in Paris in 1864 and 1865, finds that, out of 26,332 artisans in brass and copper, there were only 16 deaths—viz., 6 per 1000. In other statistics he finds, among 5650 coppersmiths, founders of bronze, and manufacturers of brass instruments, not a single death is recorded from cholera. In the Society of the "Bon Accord," formed in Paris in 1819, and composed only of workers in bronze, there has not been a single member attacked by cholera since the foundation of the Society; and we may add to these curious and interesting facts that the city of Mio-Tinto, protected as it is by the surrounding copper mines, has never been visited by the epidemic, although it ravages all the surrounding provinces.

THE BLOOD IN CHYLURIA.

PROFESSOR HOPPE-SEYLER (*Med. Chem. Unters.*, 1871, p. 551) has recently been fortunate enough to obtain and analyse, simultaneously, specimens of both the blood and urine of a female patient of the late Professor Niemeyer's, suffering from chyluria, and thus to contribute to our scanty knowledge of the pathology of this obscure disease. The urine had a milky-white appearance, and contained 7.2 parts per 1000 of fat. The blood yielded 41.3 per cent. of serum, of a yellowish colour, barely turbid, and not in the least milky. Indeed, there was perfect coagulation of the blood, and the serum was not of the same fatty nature as the urine. The analytical results exhibit a smaller proportion of albuminoids than is usual. This, Hoppe-Seyler suggests, may be owing to loss through the urine, to dilution with lymph in consequence of the manner in which the blood was drawn (by cupping), or to both these causes. The serum contained a high percentage of fat, whilst the blood corpuscles did not appear to contain fat in larger proportion than normal corpuscles; nor were the red corpuscles and the colouring matter of the blood (hæmoglobin) diminished. Since the whole blood contained 1.7 per 1000 fat, the serum 35.9 per 1000, and the urine 7.2 per 1000, Hoppe-Seyler thinks it is evident that transudation is not the sole source of fat in the urine, but that a certain amount of the transuded fluid, deprived of or poorer in fat, passes back either into the lymph or into the bloodvessels. We may add a third, but less probable, alternative—that fat actually formed in the kidneys.

SMALL-POX AT BERKELEY.

It is probable that the town of Berkeley is indebted for the small-pox epidemic, with which it has been rather severely visited this season, to the first instalment of "navvies" from some very important public works which are now beginning to be carried out by the Bristol and Berkeley Canal Company. The works will last about three years, and give employment to about 1000 labourers. There has, however, been an energy shown in meeting the disease which might advantageously be imitated in other communities. Three new Hospitals were constructed, roughly indeed, but of such a kind as to meet the requirements of the case. We are glad to say that the present accounts are highly favourable, and it is expected that the epidemic will soon entirely disappear. It seems a desecration to the memory of Jenner that small-pox should be epidemic at the very spot where he discovered the beneficent powers of vaccination.

THE WAY TO STAMP OUT SMALL-POX.

It is now all but universally admitted that revaccination is requisite for proper protection against small-pox, after a certain period has elapsed since the first vaccination. If this system were generally carried out, this frightful disease might be, at no distant time, completely eradicated. We are glad to announce that the Vice-Chancellor of the University of Oxford has just issued the following notice to the undergraduates who will come up next term:—

"There has been small-pox in Oxford during the long vacation, not of a very serious character, and the disease is now much abated. Still, for security, I think it right to require that every young man who has not been properly revaccinated within the last seven years, or since he attained the age of 17, should submit to the operation before his return on the 13th."

Why could not such a wise regulation be carried out in all our schools and colleges?

OPHTHALMIA AT PLASNET SCHOOLS.

It is satisfactory to state that the children suffering from ophthalmia in these schools are progressing favourably under the care of the Medical Officer. It is not creditable to the authorities that the causes producing this formidable disease

should have been so long in existence. It is to be hoped that the late epidemic will have given them a lesson in hygiene, or, at all events, will induce them to seek Medical aid for their charges the moment disease of any kind presents itself. The amount of suffering that may be prevented in such cases by prompt attention can scarcely be conceived.

EFFECTS OF THE WAR ON MEDICINE.

ONE of the most striking effects of the late war on our Profession has been manifested in the University of Strasburg. Last year only eleven Medical students presented themselves for examination, whilst in the previous year no less than 1014 received their degrees. One cause of this extraordinary falling off is the awkward position in which graduates of this University are placed, their degrees being acknowledged neither by France nor Prussia.

FROM ABROAD.—RELATION OF OSTEO-MYEELITIS TO PURULENT INFECTION—CUNDURANGO IN CANCER—THE GERMAN MEMBERS OF FRENCH SCIENTIFIC SOCIETIES.

DURING the debate at the Paris Academy of Medicine, which, after having dragged with tedious monotony through months and almost years, but which is now happily, if not satisfactorily, terminated, one of the very few practical contributions was made by M. Gosselin, who called attention to the very considerable part which osteo-myelitis plays in purulent infection. He brought out the fact prominently that septicæmia and pyæmia are of far more frequent occurrence when there is simultaneous suppuration of the large bones and of the soft parts than when there is suppuration of the soft parts alone. At the last meeting of the Academy, M. Demarquay read a paper confirmatory of this view, founded upon a large number of cases of severe wounds that came under his care during the recent events. From the autopsies which he has made, it results that, whenever he has observed during life symptoms of purulent infection, and after death the pathological conditions characteristic of that affection, he has also constantly seen well marked osteo-myelitis affecting the bones of the broken limbs; and anticipating the objection that this osteo-myelitis is in the same position as numerous other manifestations of purulent infection—*e.g.*, visceral abscesses—he states that the osteo-myelitis, in all the cases in which he has observed it, affected the fractured or contused bones only, and not those which had not been exposed to violence. On several occasions he had met with men who seemed to have sustained but slight injury—the ball, arrested by the femur or tibia, or having coursed around the bone, producing apparently only a slight contusion. Nevertheless, at the end of twelve or fifteen days the wounded men became the subjects of purulent infection, and on sawing through the bone affected a fine specimen of osteo-myelitis would be discerned.

It is, indeed, already well known that in spontaneous osteo-myelitis, which has been so well described by M. Chassaignac, death occurs just as in the traumatic form; and, nevertheless, in such cases there has been no contact of air to change the liquids contained in the medullary cavity, and impart to these the fetidity so familiar to anatomists. In order that these liquids should remain inoffensive, the internal surface of the bones must have remained impermeable to the liquids contained in the medullary canal. But the experiments of M. Cruveilhier, and more recently those of M. Ollier, have shown that absorption may take place in the medullary canal. M. Demarquay has himself repeated these experiments, and in the present paper gives some account of the results which he has obtained. In a series of rabbits he opened the medullary canal of all the bones of the limbs, and then, by means of a Pravaz syringe, injected a solution of strychnine into the interior of the bones. In a few instants, when the operation has been well executed, the animal dies, with all the symptoms of poisoning by strychnine. To avoid all sources of error, the parts in the vicinity

must be well protected; and in order that the absorption may take place rapidly, great care must be taken in fixing the animal, and the injection must be made gently, so that the small vessels of the medulla of the bones do not undergo laceration, which would give rise to a hæmorrhage that might interfere with the experiment. It might be objected that, although the thin and delicate vessels of the medulla may allow of the penetration of an aqueous solution of strychnine, this does not prove that an albuminous fluid like diluted pus can pass in the same manner. To meet this objection, other experiments were performed, in which diluted pus was injected into the medullary cavity, and rabbits so treated died with the symptoms of purulent infection, and exhibited after death the pathognomonic elements of this affection. M. Demarquay adds that he has, while engaged in investigating the subject of callus, frequently produced traumatic injuries in rabbits in every respect similar to those required for the performance of the above experiments, and that these rabbits, when they have been well dressed and well fed, have never died in consequence of similar lesions. This may be regarded as a kind of preliminary communication, as M. Demarquay intends continuing his experimental investigation of the subject.

Ministering to the desperate hopes of the victims of incurable disease is by far too profitable a mine for its working to be readily abandoned by charlatans, whether within or without the ranks of the Profession. Of course these are not to be confounded with the mere sanguine enthusiasts who honestly believe that they have hit upon discoveries which shall benefit mankind, and who naturally look for their reward. The large prize offered every year by the French Academy of Medicine for the discovery of cures for incurable diseases always produces its crop of candidates, and, although the claims of these prove worthless on examination, no one can blame their being proffered in order that they might receive the sanction of Medical science. It is always possible that out of efforts of this kind some good may result; and without effort of some sort we are likely to remain stationary. But this is not the line of procedure of the regular charlatan. He wants no academical sanction, which is much too circuitous a route for him to pursue, involving as it does all the bother of legitimate observation and inductive proof. He appeals directly to the hopes and fears of the victims themselves; and as long as men love life as they do, if he only promise boldly enough he will always meet with willing auditors. The last promiser of the impossible who has appeared on the scene is a Dr. Bliss, of New York, who declares cundurango to be a cure for cancer, without apparently any legitimate ground for making any such statement. We believe him to be a respectable member of the Profession; but at the very least his conduct must be regarded as highly questionable in circulating all over the country statements of the curative powers of this drug, without being able to adduce a single case that can be regarded as satisfactory. In the Profession his statements have soon been disposed of; for of the numerous trials of his remedy, made by independent and competent persons, none have proved successful. But the harm done by exciting false hopes, impairing the dignity of the Profession, and encouraging empiricism and quackery in imitating their modes of procedure, remains.

We had hoped that with the advent of peace the irascible feelings which at first prevailed in some of the French scientific societies against their German members would have subsided; and, in fact, that it has done so in part appears by the very sensible and temperate report respecting the conduct to be held towards them which has just been presented to the Biological Society by M. Bouchard. The subject was brought before the Society by M. Paul Bert, the distinguished and rising physiologist, from whom we should have expected better things than the following resolutions which he proposed:—

“1. That the *savants*, whether natives or inhabitants of

Germany, recently at war with France, who are, under any title whatever, members of the Biological Society do cease to form part of the said Society. 2. No *savant* having such origin or residence shall in future be nominated a member. 3. The Society will not receive as a communication, nor receive in *concours* for its prizes, any memoir emanating from a *savant* belonging to either of these categories. 4. That they shall be interdicted attending the meetings of the Society."

The Society might well pause before committing itself to such an extreme and narrow-minded declaration as this, and accordingly it handed over the proposition for the consideration of a committee composed of MM. Robin, Giraldès, Ollivier, Ranvier, and Bouchard, and in which anti-German views were certainly not unrepresented. The report produced by M. Bouchard is a very sensible and creditable document, in which he points out forcibly the indiscriminate character of M. Bert's accusations and proposals, and indicates the losses which would accrue to France from this breaking up of her scientific relationships with so progressive a country. He protests against chaining down the future to present animosities, and asks what those who are now only learning or may not yet have come into existence can have to do with the alleged delinquencies of the present race of *savants*. "We cannot," says the reporter, "approve an attitude the tendency, if not the effect, of which would be to create an obstacle, however slight this might be, to the expansion of ideas. Learned societies, above all, should avoid placing any hindrance to the relations between peoples. We are well aware that by the force of circumstances such relationships have been compromised. But if we seek less than heretofore the hospitality of those to whom we do not refuse it, and if Germany ceases to be for us the land of studious pilgrimage, we shall do wrong. It is by science especially that we have been vanquished, and it would show little sense if we shun those who, after having received much from us, may, in their turn, communicate to us the secret of their strength." One of the statements upon which M. Bert based his proposal was, that certain of the German Surgeons knowingly committed acts of cruelty, while others engaged in systematic pillage of scientific objects, whether public or private. "Such odious conduct," M. Bouchard observes, "indeed constitutes a crying grievance; and if any of the twenty-one members of the Society have been guilty of it, let him be stigmatised as he deserves, and expelled."

Another society—the Société Médico-Pratique de Paris—has pursued a less reasonable course. At its meeting on June 28, 1871, it confirmed the following resolutions which had been brought before it three months before—so that it had had ample time for reflexion—while some of its members cautioned it against acting thus *ab irato* :—

"This Society," say the resolutions, "loudly proclaims that one of the greatest conquests of modern civilisation is, beyond all contradiction, scientific neutrality; but it does not hesitate to declare that any nation that shelters espionage and pillage behind science voluntarily places itself without the laws of civilised peoples—and, in consequence, this Society decrees the definitive expulsion of all German Physicians who have the honour of belonging to it, whether as Titular or Corresponding Members. Moreover, it expresses the wish that all French Faculties and Scientific Societies may in future be closed against German subjects, remaining, however, widely open to the French students and Practitioners of Alsace and Lorraine."

During the discussion much effect was naturally produced by the statements made by some of the members of the Society, that several German Physicians had, both prior to and during the occupation, acted as spies, while others had stolen instruments, books, manuscripts, etc., from the houses of their French *confrères* in which they had been quartered. One member—M. Bourdin—declared that a Prussian Physician who had inhabited his house at Choisy-le-Roi for several months abstracted from his library of rare books an entire collection of works and memoirs on suicide, which he had been years in accumulating and annotating. The Prussian *savant* characterised it as a "precious collection," and exhibited the sincerity of his appreciation by appropriating it.

BROADMOOR CRIMINAL LUNATIC ASYLUM.

SOME years ago, when benevolence seemed to be the moving spring of our treatment of criminals, it was resolved to collect together in one building all those criminals who, while undergoing any sentence, became insane, or who had been acquitted after the perpetration of crime on the ground of insanity. A site was selected among the heathery hills of Berkshire, where now may be seen the imposing-looking building called Broadmoor Lunatic Asylum. The Asylum is situated on the brow of a hill, looking south over Aldershot in the distance, within two miles of Wellington College on the South-Eastern, and four miles of Bracknell on the Waterloo, Staines, and Reading line. It is not, therefore, very convenient of access, which tends to foster the development of internal resources; so that, though when the Asylum was built nothing was to be seen around it but heather, it is now surrounded by well-cultivated fields and gardens. The Asylum was opened in 1863 for female patients, and in the succeeding year for males; but large as is the accommodation, it is already too small, and will doubtless have to be increased.

The building itself, which is of red brick, is built on the block system, the male division consisting of six blocks, the female of two. The two divisions are completely disconnected, and between the two lies the house of the Medical Superintendent, Dr. Orange. The six male blocks are situated three on either side of the central administration department, which also contains the chapel, amusement-room, etc. On either side of the chapel, and at right angles to it, projects one of the blocks referred to, and these, again, are faced at right angles by other two, so that the whole of the male division has an arrangement something like this—

The staff consists of three Medical officers—the Superintendent, Dr. Orange; his deputy, Dr. Cassidy; and an Assistant Medical Officer, Dr. Gray. The duties are thus divided :—Dr. Orange takes charge of the female blocks, and fulfils the general duties of superintendent, which are of a most onerous nature; Dr. Cassidy takes three male blocks, including the Infirmary or No. 3 block; and Dr. Gray takes the others. Of course there are many other matters to be attended to besides mere ward visitation. Roughly, however, the work is distributed as indicated. The work itself is wearing in its character, the patients being in many instances utterly intractable. As far as possible the wards are divided into day rooms and dormitories, but a very large proportion of the patients require to be confined separately, at all events at night. None of the patients we saw, however, had other means of restraint applied than seclusion or careful supervision. Strait-jackets are not employed. Of course this would not be possible with such a class of cases were not abundant help always at hand, so that the number of attendants is greatly above the average of other asylums; yet even with this number accidents are not unfrequent, attendants being struck or otherwise injured in a considerable number of instances during the year.

The exercising grounds are situated on the face of the hill in front of the building, and there is a distinct piece of ground for each block. It should further be said that the whole

building is supplied with earth-closets, which are found to act admirably with a little care. The night soil is removed day by day, and is never allowed to accumulate; so that the wards and dormitories are kept clean and sweet.

But it is time we saw something of the inhabitants of Broadmoor. They ordinarily number between 400 and 500, and are of two distinct classes. All are alike in that they have committed crime, and more than 100 of them have committed that greatest of all crimes—murder; but they differ in this respect: some have been guilty of but one crime, committed, it may be, under maniacal impulse, whilst others may have spent their lives in crime—that is to say, what of their time was not spent in prison. The former group, then, consists of men and women, who have never been tried, being proved insane when the time of their trial came on, or who have been acquitted on the ground of insanity, or who, having been found guilty by the jury, are afterwards sent to the Asylum by the Home Secretary for the time being, to be detained during her Majesty's pleasure. This group comprehends not a few men of good position, whose brain having been turned, have rushed into crime; and let it be said that these are the most manageable class—far different from the other group, which consists of men who have been trained and educated in crime, and who have graduated in half the gaols and prisons in the country. During their confinement in one of these, signs of insanity, which may long have existed undetected, are observed, and they are sent to Broadmoor, where they are detained until their period of sentence has expired, and sometimes much longer. Some of the members of this group are gifted with every evil quality it is possible for them to possess. Steeped to the lips in crime, they add to the evil training of the convict class the fell purpose and maniacal impulse of the madman. The ordinary madman is seldom capable of combining with others in order to effect his purpose; but with these it is not so—they enter into conspiracies for effecting their escape or murdering their keepers, and it is often only by the merest accident they are discovered in time to save life and limb. Not unfrequently they succeed in intimidating the attendants by threats of violence, which would be carried out were there the slightest opportunity. These seem also to be able to mature a resolution and to persist in its execution in a way quite unlike the ordinary lunatic. Perhaps some of the lowest types are to be found among those who have been guilty of arson, for in these natures destruction is an aim and object for itself, and burning is at once one of the easiest and most effectual means of gratifying this impulse; but, besides, they are given to inordinate revenge for slight offences, and this propensity they readily gratify in the same way.

Let it be added that there are in the Asylum a considerable number of whose insanity there are more than doubts, but who have made themselves so obnoxious to their officers in convict prisons as to be sent to a madhouse as insane. Of course the discipline and diet of an asylum are very different from those of a convict prison, so that they have every reason for persevering in their shamming, if such it be.

In the infirmary we noted some interesting types of cerebral disease. Some of the most common were cases of general paralysis of the insane. The periods during which these patients survive are very various—in some instances, Dr. Orange says, extending over ten years, though the majority die much more quickly; usually within two years. Most of those we saw were in bed, some in an advanced stage of the disease. Their condition was very peculiar. Some seemed as fat as possible; but this speedily gives way to emaciation, and they become thin, and troubled with bedsores. One man we noticed in a condition something like melancholia attonita, with a peculiar rigidity in all his limbs, so that if his hands or arms were moved into any position, they would persist in it, apparently without any volition on his part, only gradually resuming their

former condition. He could walk when roused, but when allowed to sit down seemed at once to recover his old position.

A case struck us as we entered a ward. The patient had much of the aspect of a general paralytic, and his hands and limbs were hanging down uselessly. His history, however, as pointed out by Dr. Orange, promptly refuted any such notion, for he had suffered first from hemiplegia on one side, the other also becoming affected after a time in like manner. There was also in his look something altogether different from a general paralytic when closely scanned, especially more brightness and intelligence in the eye. Altogether, this case was an exceedingly instructive one, which would have been welcomed in our schools.

Among the patients in the Asylum we noted what seemed to us an unusual proportion afflicted with what has been called the "madman's ear." The organ first of all gets swollen and thickened (most likely in the concha), or there may be an effusion of blood constituting a hæmatoma; but after a time contraction takes place, causing alterations in shape—very often a tendency to curl up, or to become otherwise distorted.

Any account, Medically, of Broadmoor Asylum would be incomplete without reference to the local fever. This does not seem so prevalent now as when the Asylum was first opened; still it prevails. In its type it is more continued than intermittent, and is generally accompanied with diarrhoea. It is not dangerous, though it often proves lingering. We are not aware that it has in any instance caused death.

Finally, we beg leave to return thanks to the authorities for their courtesy and consideration. Their admirably kept case-books and post-mortem books were placed freely at our disposal, and every opportunity afforded us in inspecting the institution.

AUTOBIOGRAPHICAL RECOLLECTIONS OF THE PROFESSION.

No. XVI.

By J. F. CLARKE, M.R.C.S.,

For nearly forty years on the Editorial Staff of the "Lancet."

Mesmerism as a Physical and Remedial Agent—Clairvoyance—The Spirit of Prophecy—Were the O'Keys Impostors?—Action of the Committee of the Hospital—Resignation of Dr. Elliotson—Meeting of Students, etc.

So long as the inquiries into the physical and remedial powers of mesmerism were carried on with calmness and carefulness, the experiments on the O'Keys were watched with intense interest by Medical and other observers. There were, as there always are in such inquiries, two parties, one on the side of the experimenters, the other against them; but it may be stated with perfect truth that fair-play was observed. The chief cause of discontent, however, was on the part of the clinical clerks, who were occupied for hours together in "pawing" the in- and out-patients. Some of the young gentlemen so engaged were worn out by this really very serious labour. In the midst of all this, Dr. Elliotson continued to superintend the manoeuvres for many hours a day, always earnest, always energetic, and, as I believe, actuated by the most disinterested and praiseworthy motives.

It was only when the inquiry was assuming a totally different character that most persons engaged in it began to assume an offensive attitude. Elliotson and the ultra-believers were carried away, by the partial success of their efforts to show the real influence of mesmerism, into experiments on *clairvoyance*. O'Key was consulted, when in the mesmeric state, as to the remedies which were to be employed in her own case, and in that of others. Her dicta were assumed to be reliable, and were acted upon. It is scarcely necessary to say that the results were not satisfactory. It is necessary to state, in defence of Elliotson's proceedings, however, that Dr. Maccreight, one of the Physicians of the Middlesex Hospital, had made him acquainted with "a fact" which had a considerable influence on his conduct. Dr. Maccreight had informed him that a girl under his care had been placed under the influence of mesmerism in order that she might prescribe for her ailment—hysterical mania.

This girl was in the habit of visiting Dr. Maccreight at his house in Queen Anne-street. On one occasion, whilst under the mesmeric influence, she was asked what drug would relieve her. According to Dr. Maccreight's account, she said, "There is only one medicine that will be of service to me; it is contained in a bottle on the third shelf in your private chest—the second bottle from the right." Curiously enough, this was the ammoniated tincture of iron. This was administered, and the patient recovered. Dr. Maccreight was a man of intelligence, and of the strictest probity; and I well remember, at a meeting of the Royal Medico-Botanical Society, of which he was a member, the graphic and minute account he gave of the circumstances. The late Lord Stanhope was in the chair, and expressed his firm belief in the prophetic powers of the patient. I mention this, not to prove the "fact," but rather with the object of saying that the late Lord Stanhope was a firm believer in the ultra-powers of mesmerism. But he disbelieved the beneficial powers of all medicines except those of a vegetable origin, and lent his name and authority to systems of botanic treatment and to certain quackeries which the experience of mankind could not endorse. (a)

After a variety of experiments to test in every conceivable way her powers of prophecy, and her ability to see without eyes, etc., O'Key's career was cut short in the Hospital in the following manner:—It had been noticed that on some occasions, when passing by the bedside of persons dangerously ill, she shuddered. This was observed particularly by one of Dr. Elliotson's clinical clerks, and this gentleman, with the aid of others, determined to carry out experiments on the subject. Accordingly, one night late, the lights being all but extinguished, O'Key was led into Ward 1, occupied by men. The wards of the Hospital were of an oblong shape, and the beds of the patients ranged round the four sides. O'Key was led carefully and slowly round the room. Nothing particular was noticed in her until she arrived opposite the bed of a man who was *in extremis*. O'Key was then felt to shiver violently, and on being brought some distance from the bed was asked why she shuddered; she exclaimed, evidently with emotion, "Great Jacky is on the bed!" When nearly reaching the door, and having got opposite the last bed in the ward, she slightly shivered. "What's the matter, O'Key?" "Little Jacky is on the bed!" Childish and absurd as these incidents appeared at first sight, they were followed by events which caused extreme excitement in the Hospital. The first man mentioned died before the morning, the second escaped scarcely with his life. It may readily be imagined what alarm these

(a) The experiments on mesmerism, and other "heresies" of the time, brought me into close communion with this able but eccentric nobleman. A thorough aristocrat in appearance and bearing, he was always "condescending" in matters relating to "science." A more thorough gentleman never existed. His views on scientific subjects, however, were much contracted, and it is not doing an injustice to his memory to state that his prejudices were stronger than his judgment. I had many conversations with him on various subjects, and always found him communicative and kind. On one occasion I spoke to him respecting the appearance of the great Lord Erskine at the memorable trial of Queen Caroline. It was well known that the veteran orator was to speak in her defence. Intense interest was occasioned by the announcement. A brilliant display of eloquence was anticipated. Lord Erskine rose, and, having made a few introductory remarks, suddenly sank into the arms of Lord Stanhope, who was next him. Lord Stanhope remarked to me, in speaking of this circumstance—"Yes, it is quite true; the old man sank into my arms. He had prepared himself for a great speech, and he rose to speak almost like one from the dead. The house was in a breathless state of suspense and attention; but he had taken an overdose of opium, to the use of which drug he had become the victim, and he dropped down, as many thought, from emotion, but in reality from being over-dosed." Many years after, I mentioned to the venerable ex-Lord Chancellor Lyndhurst the anecdote I had heard from Lord Stanhope. Lord Lyndhurst, at the time referred to, was Sir John Copley, the Solicitor-General to the King, and took a prominent part in the impeachment of Queen Caroline. He said: "I remember the circumstance to which you allude perfectly. The Government had been informed that Erskine would address the House. The excitement was intense. We were not without apprehension that the address of the renowned orator might have a seriously damaging effect on the prosecution. The Attorney-General said to me, 'Copley, you must watch him.' I prepared to take notes, and did so. After the utterance of a few sentences Erskine broke down, fell into the arms of Lord Stanhope, and I was saved a 'forensic display,' which I was too happy not to have made against a man whom I regarded with affection and admiration." Whilst upon this point, I may be pardoned for referring to Erskine's first appearance in Parliament. Pitt was then Prime Minister. Erskine entered Parliament shortly after his great and successful defence of Horne Tooko, Thelwall, and Hardy. He had made his magnificent appeals to English juries on the Stockdale prosecution, on the prosecution against Thomas Paine, and on the still more memorable trial against Captain Hardy. His entrance into the House of Commons was regarded by the Ministry as a serious blow to their existence. "I will answer the great orator," said Pitt; and accordingly he took means for doing so. The great advocate—certainly the greatest advocate of our modern times—addressed the House as if he were speaking to a jury at *Nisi Prius*. Pitt, early in the address of Erskine, suddenly, and in the face of his great opponent, stopped taking notes; Erskine was confused, and literally broke down. His vanity was wounded.

incidents caused amongst the patients, and what scandal was engendered, particularly amongst the enemies of Elliotson. I well remember, on going to the Hospital the following morning, finding the students in a state of the wildest excitement, and numbers of persons waiting to see the "inspired girl." Elliotson arrived earlier than usual that day, and immediately repaired to the theatre, to which he was followed by a great crowd. He seemed somewhat oppressed, but not daunted, and at once proceeded to give an explanation of what some "might regard as prophecy," but which he said was explicable on physical grounds. He then remarked that it was well known that when a person was near death his body gave out a peculiar effluvia. This was not always to be detected, except by persons with a strong sense of smell. Now, O'Key's senses were preternaturally acute, and she could and did detect the effluvia even at some distance from the dying person. After entering into some other points respecting mesmerism, he commenced his round of the wards.

Notwithstanding the explanation he had vouchsafed, the agitation amongst the patients and students continued, and the public mind was much excited. Under these circumstances the Council of University College met on December 27, 1838, and passed the following resolution:—"That the Hospital Committee be instructed to take such steps as they shall deem most advisable to prevent the practice of mesmerism or animal magnetism in future within the Hospital." A copy of this resolution was forwarded to Dr. Elliotson, who, almost immediately, and without, I think, sufficient reflection, resigned his appointment of Lecturer on Medicine at University College, and as Senior Physician to the Hospital. He considered the resolution personally offensive to him, and was exceedingly angry with respect to it. At this time there were two parties in the Medical staff of the University. One might be said to be headed by Elliotson, the other by Liston. A strong personal dislike had long existed between these two remarkable men, and each of them lost no opportunity of annoying the other. The scenes in the Medical Committee-room of the Hospital were often of a very exciting character. Remarks of a very offensive kind were frequently made, and on one occasion Liston was so much annoyed that he declared to me, on our ride home, that he would never enter the Hospital again. The fact was, Liston's party were in the minority, and had to suffer much at the hands of their opponents. Elliotson's experiments had very much weakened his power at the Board, and he was obliged to submit to "indignities" which galled him. (b) The culminating point came with the passing of the resolution by the Council of the College; and this, probably, with his changed position, in the Committee, materially influenced him in the step he took. But he soon, I think, regretted it. At all events, before his resignation was accepted by the Council, he made efforts to rally the students in his favour. Always a favourite with the majority of them, always kind and attentive—a most able teacher—it is scarcely necessary to say that he soon enlisted a great number of them in his favour.

But the opponents of Dr. Elliotson were equally vigilant as himself, and when, on Friday, January 5, 1839, the students held a great meeting in the Anatomical Theatre of University College, the opposing forces marshalled nearly equal. The discussion was altogether above the common of such meetings, and eloquent speeches were delivered on both sides. The principal speaker in favour of the Council was the late Mr. Durance George; in favour of Dr. Elliotson, Dr. W. Wood. The proceedings were occasionally stormy and somewhat personal,

(b) It is necessary here to state that Dr. Elliotson had sufficient warning of the dissatisfaction which his proceedings with respect to mesmerism had engendered in the minds of his colleagues at the Hospital. Early in June the Medical Committee of the Hospital held a meeting to take into consideration some "published statements" respecting animal magnetism which had appeared in the *Lancet*. Dr. Elliotson did not attend this meeting, at which resolutions were carried requesting the Doctor to refrain from further "public exhibitions" of mesmerism, at the same time stating that they did not wish to interfere with its employment as a remedial agent when he chose to employ it. In answer to these resolutions Dr. Elliotson said that "no consideration" should prevent his pursuing the investigation of animal magnetism; that he had never made a "public exhibition" of it, but had only employed it remedially; and, as it was a subject in which many new facts were likely to be developed, had simply given clinical lectures and demonstrations upon it to the pupils, when a great number of scientific and eminent men had attended, but only on special invitation after their urgent requests to be present. However, he would refrain from further exhibitions of these in the theatre, though he should forward to the Committee the names of such gentlemen as might in future apply for permission to witness the experiments, leaving it to the Committee to sanction the admission to the theatre of such persons as they chose to approve of. A list of applicants was forwarded to the Committee, who would not sanction their admission. The public exhibitions in the theatre were discontinued, but mesmerism was still practised in the theatre, and numerous small parties assembled to witness its effects on the O'Keys through the medium of mesmerised gold, water, etc.

but, taken altogether, they were not discreditable to the students. Motions, amendments, and counter-amendments were proposed. Eventually the following resolution was carried by a majority of three or four in a room containing about 300, one-third of them not voting:—"That the students of University College, duly appreciating the high Professional acquirements of Dr. Elliotson, and the inestimable value of his services here, do most sincerely regret the circumstances which necessarily led to his resignation as Professor of the Principles and Practice of Medicine in the College, and as Physician to the Hospital." The numbers voting appearing to be nearly equal on both sides, it was eventually determined to take them by ballot the following day. There then appeared to be 124 in favour of the resolution, 111 against it. Both parties appeared to think the result a victory, and united in cheers. The Council had to meet at four o'clock, and the resolution had yet to be forwarded to them. Before that could be effected the Council had accepted the resignation of Dr. Elliotson.

From this time mesmerism, except by occasional fits and starts, ceased to occupy the minds of the Profession. It was "scotched," if not "killed," and if experiments were carried on, they were in private houses, or by charlatans in the lecture-rooms of "literary" and "scientific" institutions. Dr. Elliotson gradually lost his practice; but he retained for some years a respectable position as a consultant. It is remarkable with what tenacity he held to the opinions he had formed respecting the influence of mesmerism; we believe he retained them to the last.

What a marvellous career was that of Elliotson! His father was a druggist in the Borough, where he amassed a considerable fortune. He had two sons, John and Thomas, who were sent to the University of Cambridge, where they graduated. John Elliotson was elected Physician to St. Thomas's Hospital at a comparatively early age, and did not seem at first destined to make a prominent figure in the Profession. In the years 1827-28, etc., he commenced publishing in the *Lancet* short reports of cases under his treatment in the Hospital. To each of these were appended a few clinical remarks, always to the purpose, always terse and epigrammatic. The result was, the unknown Physician became in twelve months the talk of the town, and the recipient of £5000 in one year, his income the previous year being only £500. He was chosen to fill the Chair of Medicine at the University of London (as it was then called), and was made Senior Physician to the North London Hospital. He acquitted himself in these appointments admirably, and was one of the most popular teachers that ever existed. In the zenith of his fame, in the prime of life, in full usefulness, he unfortunately took up with mesmerism. Honest himself, he believed all others were equally honest, and hence the result—Elliotson and mesmerism stood and fell together.

It is somewhat curious that the journal which in 1828 had laid the foundation of his fame and fortune should just ten years afterwards do so much to effect his ruin; but it was so. Nothing could have been more bitter or telling than the leading articles in the *Lancet* on "The Mesmeric Humbug." These and the exposure of the O'Keys in Bedford-square brought matters to an issue.

Stripped of all nonsense and all supernatural attributes, it must be acknowledged that the subject of animal magnetism is one of intense and fascinating interest. Sceptics have been puzzled, believers bewildered by the phenomena displayed. The subject is intricate and confusing; but should it be a prohibited one for investigation? Perhaps the following quotation from "The Correlation of Physical Forces," by Mr. Grove, is not an irrelevant answer to the question:—"Without pretending to know what, probably, we shall never know—the actual *modus agendi* of the brain, nerves, muscles, etc.—we may study vital as we do inorganic phenomena, both by observation and experiment. The effort to establish one observation leads to the imperfect perception of new and wider fields of research, and, instead of approaching finality, the more we discover, the more infinite appears the range of the undiscovered."

Popular indignation against the practice of mesmerism had been excited by leading articles in the *Lancet*, on its absurdity and immorality. These articles were written by Mr. Wakley, in his most forcible and trenchant style. Moreover, a series of experiments to prove that the O'Keys were impostors had been instituted and carried out by Mr. Wakley, at his private house in Bedford-square. I was present at these experiments; and though it is true that the O'Keys failed to "prove their full powers," much was brought before the notice of the gentlemen assembled that was surprising and puzzling. After a lapse of three and thirty years, reference to these experiments

and some account of them may not be without its interest at the present day. Now that the subject may be calmly discussed, "without fear and without malevolence," I propose to devote my next article to what I hope may be an impartial *résumé* of these memorable proceedings.

THE HAMPSTEAD HOSPITAL INQUIRY.

THE charges brought against the management of the Temporary Small-pox Hospital, at Hampstead, by Messrs. W. Greaves, A. E. Kynaston, and John Aikman, recently Assistant Medical Officers in the Hospital, are now being investigated by Mr. Henley and Dr. George Buchanan, two Special Commissioners appointed by the Local Government Board. The inquiry, which is a public one, is being held at the offices of the Metropolitan Asylums Board, Norfolk-street, Strand. Besides the charges brought by the three Assistant Medical Officers, the case of the missing child is to be made matter of separate investigation. On the first day of the inquiry the Committee of the Hospital were represented by Mr. Hammond, and afterwards by Mr. Montague Williams; the three Assistant Medical Officers by Mr. Collins and Bucknill; and the father of the lost child by Mr. W. Wright. The following are the charges originally brought by the three Medical Officers in a letter published in the *Times*. The official inquiry was demanded by the authorities of the Hospital. As the inquiry is one of special Medical interest, we propose giving a *résumé* of the evidence:—

The charges were (1), that delirious patients, more particularly children, were tied down to keep them in their beds at a time when their bodies were covered with the small-pox eruption; (2) that strait-waistcoats were used for the same purpose; (3) that patients in an acute ward, in the height of the disease, had been provided with a most inadequate supply of milk and fluid during the night; (4) that patients on low diet were kept without food from 7 a.m. until 3 p.m.; (5) that complaints were continual regarding the unfitness of the food supplied; (6) that through the totally inadequate number of nurses, children had been found dead in bed, and the nurse ignorant of the fact; and (7) that the body of a patient who died at midnight had been removed into the bath-room, where it remained all night in a most offensive condition. There were other charges, including that of the lost child, and these were the chief; and the Medical Superintendent, Dr. Grieve, was pointed at as being responsible for this alleged condition of things.

The inquiry commenced on Thursday, September 21.

Mr. Henley, the Commissioner presiding, on opening the proceedings, stated that he and Dr. Buchanan had been instructed by the Local Government Board to inquire relative to the specific charges made in the *Times*, and they proposed to go into those seven charges first, before doing anything else.

After some discussion as to the mode in which the inquiry was to be conducted, and its limits,

Mr. Collins opened the case of the seven charges made in the letter in the *Times*, and he stated that complaints of these matters had been made to Dr. Grieve, but had been disregarded. The complainants had made no complaints to Mr. Wyatt (the chairman of the Hospital Committee) and the other gentlemen who came to the Hospital, for Dr. Grieve was the complainants' superior, and to him they looked for a remedy.

The first witness called was James Henry Wills, of Dorset-place, Pall-mall, described as a clerk. He stated—I was ill with the small-pox, and was taken to the Hampstead Hospital on February 28 last. At first, at the Hospital, they would insist upon calling me "Wells" instead of Wills. When I was taken in I was run in on a trolley, in my own shirt and guernsey, instead of having Hospital clothes. Soon after my admittance I was tied down in the iron bedstead, and I have the marks on my ankle now where I was tied down. The persons who tied me down were a convalescent patient, who was acting as a nurse, and a nurse, a paid one, who gave me an "extra screw," which extra screw, I believe, caused the mark on my ankle. The nurse who gave me the "extra screw" was a day nurse, for the night nurse would not have been able to do it, she being old and generally "screwy." I suppose the nurse came to give me the "extra screw" because I got loose; but that is as far as my memory serves me, for I was rather delirious at

the time. I don't remember how long I was tied down. It may have been for twenty-four or forty-eight hours for all I know. I think sheets were used in tying down, and I never saw anything else used for this purpose. I think Dr. Greaves untied me, and he said he did not agree with the tying down. After being thus tied down, I was in a most fearful state, for I had not been moved, and then I was changed. I was not washed, but my things changed; Hospital clothes were served to me. I was wiped, not washed, and put in the bed. I saw several persons tied down while in the ward—during four or six weeks. There were only two nurses in this (No. 9) ward, but I have seen convalescent patients acting as assistants. After I had been in No. 9 Ward for some time, I had an attack of erysipelas, and I was transferred from No. 9 to No. 12, which was a fever ward. There the nurse used to lower the gas, bid us "good night," and we had no attendance all night, except that someone used to come in to keep the fire going. One night a poor fellow was taken very ill, and I got one of the patients who could get up to go off for assistance, but he was gone a long time, and I had to sit up in bed and see the man die. This must have been about the beginning of April, and the hour was between twelve and one o'clock in the morning. About five minutes after the man was dead, the patient whom I had sent to obtain assistance came back, and the Sister Frances came ten minutes afterwards. She asked my brother patient to assist her to lay the body out; but it was in such an offensive condition that he refused. The body was not removed until five o'clock in the morning. I cannot give the name or date. I do not know the name of the patient who refused to lay out the body.

The Commissioner said it was rather a vague charge for the Hospital authorities to answer, for there was no name or date.

The witness's evidence was then read over, and he added to his former evidence that the food-cooking in the Hospital was vile, and the food "not fit for paupers."

Questioned by the Commissioner presiding, the witness said that he was never kept the whole night without drink, but he could not get it so often as he wished. Sometimes they were kept two or three hours without drink. In answer to other questions, he said he had what was called boiled mutton handed to him on an ice-cold plate, and potatoes not fit for a pig.

The Commissioner requested the witness not to give his evidence sensationally, but to state the facts as they were.

The witness allowed that the potatoes were not all bad, and he knew this, as being engaged at Covent-garden Market he knew good potatoes, and the quality of the potatoes was better than that of the meat. The bread was good, but insufficient in quantity. The nurses used to obtain some "youngsters" from the convalescent wards to help, but they used to be youngsters, for the old ones would not come.

Questioned by Dr. Buchanan, the witness said, in addition to the nurses he had mentioned, there were the Sisters. The night nurse, when she went away on the night when the man died, directed his attention to that man's bed, and said she did not think he would last out the night.

Cross-examined by Mr. Hammond, the witness said:—I had no Medical attendant when I was taken ill with the small-pox, but I was sent to the Hospital on an order of the relieving officer of the Strand Union. Mr. Greaves was the Medical officer of the ward I was in, and I might have mentioned some complaints to him. I know Dr. Grieve, too, and saw him often, but I did not mention to him anything about these things. I knew the position he held from others, but still I did not tell him either before or since I have left the Hospital. I should be surprised to hear that Sister Frances is the matron, but I never complained to her or to anyone. The day nurse went out of No. 9 Ward about nine or ten o'clock, and then the gas was lowered. Mr. Greaves used to come round after that to see that all was well. In the fever ward we seldom had more than one Medical attendant in the twenty-four hours. I don't know the name of the nurse in the fever ward, but she told me that she came from the Fever Hospital in the Liverpool-road. She certainly told me that the man would not live till morning, and in the morning she said, "There, you know I told you I thought he would not live." She, of course, would not come in the night, for she was in bed. I said nothing to her about what she had said. I adhere to the statement that it was Sister Frances who came into the room when the man died. I have sworn to it. (Question repeated.) I have sworn to it. I was in the Hospital two months to a day.

In the course of his further examination by Dr. Buchanan, the witness said the erysipelas he had was not in his leg and ankle to cause the marks of which he complained, and which he attributed to being tied down. He allowed that he had

since been under treatment at Charing-cross Hospital, and that his ankle was now swollen beyond its normal state. There was also a numbness in his legs. He believed he was lamed for life, but he had had no Medical opinion upon this. He had been in communication with a patient living in Wellington-street, Strand.

The next witness was a publican's assistant, named John Hunter. He was taken into the Hospital, being ill with small-pox, on March 16, and was discharged on April 27. He deposed that he was tied down with sheets "all over his body, wound round and round;" that he saw many other patients tied down. He said: "I could not see the manner adopted in tying the patients down, because I could not leave my bed. The convalescent patients usually tied the others down. I saw a man named Gee, an officer, tie a patient down. There were two day nurses and one night nurse in charge of the ward, but the latter was assisted by a convalescent patient. I might have heard half-a-dozen patients complain of being tied down. They complained to the other patients, to one another. The nurses were at times in the room when patients were tied down, and sometimes not. In the latter cases the convalescent patients tied them down in the absence of the nurses. It was the men who came from the convalescent ward to assist the night nurse who usually tied the patients down. Sometimes the patients remained tied down for forty-eight hours; sometimes longer. I never saw Mr. Greaves untie any patients. I don't know whether the tying of the patients was ever loosened. I know that they remained in the same position until they were untied.

The witness made the same complaints of want of milk and food which the previous witness had made, and went into nearly the same details, and he held that the meat supplied was unfit for sick men. Then, too, he said, he had seen a boy in the Hospital with scurvy in the hands, and he had seen the maggots crawling out of the sores on the boy's hands. He had also seen patients with their heads covered with vermin.

This witness said he never complained to Dr. Grieve about the food. He once did complain to him about some stamps, and Dr. Grieve made a note of it. He said that after he went into the Hospital he was informed that he was there as a pauper, and, therefore, he thought it of no use to complain. It was proved that all the patients, of whatever grade, were admitted on relieving officers' orders.

The next witness was Mr. Edwin James Barter, a clerk in the Ottoman Bank. He was received into the Hospital on May 24, and left on June 19. He deposed that he saw several persons tied down, and one in particular, who would get out of bed. He was tied down by a nurse. She said he could have drink by asking for it. The quality of the meat was bad, and the quantity insufficient. He did not complain to the officials, for it was no use to complain. When he first went into the Hospital he was put into sheets which had been slept in before. "They were not changed all the time I was there, and I saw a patient get into the sheets I left." There were only four or five towels for the use of 113 patients. They were changed every day. The water the patients washed in was thrown into the bath. Those who wanted to have a bath had to ladle it out and so clear it. "The bath-room was used for dirty linen, and the stench was fearful." In cross-examination by Mr. Hammond, this witness said he had stopped in the Hospital for some days longer after he had been pronounced fit to go out, and had thanked Dr. Grieve for permitting him to do so.

The next witness was Thomas Hatcher, a waiter. This witness deposed to the tying down of patients. When convalescent he had acted as cook. He deposed to the toughness of the meat—"It took the edge off the knife in four strokes." He described the insufficient washing accommodation: one sink, with three bowls, for eighty-four people; two or three towels, changed only once a week, and full of vermin. This patient, in cross-examination, stated that a short distance off there was another lavatory, to which the patients might have gone. He had not complained to Dr. Grieve. Dr. Grieve had permitted him to stop longer than was necessary, at his request, and he was very much obliged to him for it.

Before adjourning, Mr. Henley said that he and his colleague had received authority to inquire respecting the missing child, and that matter would be taken after these charges had been dealt with.

The inquiry was adjourned until Friday, September 22.

SECOND DAY.

Mr. Montague Williams appeared for the Asylums Board, Mr. Bucknill for the three Assistant Medical Officers.

The first witness was Onario Grandy, a market gardener's porter. He deposed to seeing patients tied down, when—

Mr. M. Williams rose and said the managers did not at all deny that persons who were delirious were tied down, and the only question to be raised was—though he did not wish to narrow the inquiry—whether persons had been improperly tied down, or had been injured by being thus restrained.

This witness spoke of the milk and beef-tea being short in the night and the beef being hard. In answer to the Chief Commissioner, he said: I have seen my ward without nurses at all, the night nurse having gone off before the others came on. This has happened on several occasions, and I have heard the patients calling out for the nurse. The ward has thus been left for as long as half an hour, which was about the outside time. The night nurse went off duty about eight o'clock in the morning. Regarding the sheets, within an hour after I first got up my bed was filled by another patient without the sheets being changed. I had slept in it for eight days without a change of sheets. After I had been up for an hour I wanted to lie down again, and Nurse Sullivan told me to lie down outside another patient's bed, he not being in it, and she would find me another to sleep in. Just before she left duty she went to the convalescent ward and found it was full; but she said, "There's a patient who won't last above half an hour, and you may have his bed." The patient only "lasted" about a quarter of an hour. The body, bed, sheets, and pillow were taken away, and sheets quite wet were brought me. The nurse told me not to get into them without airing them, and doing this took me until about two in the morning, for they wanted drying, and not airing. I only had one fire to dry them by, and it took me from nine at night to do this. The next day my bed was filled again, and I was sent into the convalescent ward, No. 4, where I got into a bed which a patient had left. My bed was a few feet from a closet door, and there was a great smell from the closet being out of order. (A plan of the Hospital was produced, and the witness pointed out the position he occupied in No. 4 ward). He continued: The bed I went into was the same another had got out of. The sheets were certainly dirty from use, nothing more—nothing offensive about them, except before I left I found vermin on me. On the bottom sheet of the bed in which I was first put there were small stains of blood. In the double ward there were eighty-four or eighty-eight patients, and there were two jack-towels for the whole, and there were so many vermin on them that I could not use them. Several of us complained to Mr. Gee, the wardsman, who asked what we "could expect where there was sickness." I never had a bath because I was sore with boils. I heard there was no bath in the ward. A bath was put in some days before I left. He also deposed to hearing the Medical superintendent order one obstreperous patient to be tied down.

This witness was cross-examined by Mr. Montagu Williams, but nothing fresh was elicited. He said he had been in communication with Mr. Kynaston, and had met him at Mr. Hunter's, a beershop in Wellington-street, Strand (the patient previously examined), and that Mr. Kynaston had taken down what he had to say.

The other witnesses examined on Friday were—Charles M'Laren, bricklayer; Ross Smith, photographer; Frank Barrett, pianoforte-maker; and a woman named Grainger. M'Laren deposed to the bad quality of the beef, to seeing people tied down when delirious, to the fact that the towels had vermin on them, and to the bad state of the water-closet and bath. He said he had made no complaint to the visitors or to anyone else. He said he had plenty of bread in the Hospital, and that he could not complain of the treatment of his child, who had died in the Hospital of small-pox. Ross Smith stated that he saw persons tied down when delirious. He did not complain of the quantity or quality of the milk, beef-tea, or food while in the sick ward No. 11; but he said that he was twice ordered poultices, which he did not have, nor did he have whisky Mr. Greaves had ordered him. In the convalescent ward the meat was unfit for food; but he did not complain, because he was told by the wardsman that while he was there he was only a pauper. When he was convalescent he had to work and assist.

Examined by Dr. Buchanan, he said the patients got what they wanted to drink in the night. The Sisters came round at night at irregular hours.

Frank Barrett gave similar evidence as to the tying down of patients, the bad food, and dirty linen. He stated that a petition was got up among twenty-nine patients to Dr. Grieve, complaining of various matters, and that immediately the grievances were redressed, in the way of the tea and coffee being vastly improved, the dinners better, and other matters

seen to. He also deposed to the dirty condition of towels, and the presence of vermin on some patients and on towels.

In cross-examination he said he was permitted by Dr. Grieve to stay beyond his time. When convalescent he had acted as assistant in the receiving-ward, and had seen many come in a very filthy condition, both as regards vermin and clothing. About thirty a day were admitted, and there were 400 or 500 patients in the Hospital.

The woman Grainger deposed to a dead body lying all night in one of the wards at Hampstead, and complained of the treatment of an epileptic and idiotic girl by one of the nurses, who had called her a dirty beast, and pushed her about.

The Court then adjourned until the next day.

THIRD DAY.

On Saturday, the mother of the idiotic girl (Letitia Gibbs) referred to by the last witness was examined. She deposed to having found vermin in her child's head after leaving the Hospital. She saw Dr. Grieve in reference to the treatment her daughter had received. Dr. Grieve instituted an investigation into the charges, which, after hearing both sides, he said he did not believe.

The sister of the girl, who had been in the Hospital with her, deposed to having seen a nurse strike her idiotic sister with a towel. She did not complain to Sister Frances of the way in which her sister was treated.

The next case investigated was that of the child of James Stokes, a music agent, a little girl of 7 years. The child's father said when the child went in she was a fine fleshy little girl. She was in the Hospital forty-six days. Mr. Charles Watkin, a Surgeon, knew her before she went into the Hospital. Witness continued: I inquired for her every day at the Hospital, and she was reported to have the small-pox sharply for the fortnight, then better for three days, and then weakly until June 20, when we brought her out. I went on that day, accompanied by my wife and brother-in-law. I had written inquiring about the child, and I received an answer, signed by Sister Agnes, saying that the child was very bad, but by the aid of God it would recover. On the day I went to fetch my child she was brought out in a blanket, doubled up. My brother-in-law lifted the blanket from the face of the child and failed to recognise her as my child; but I did. The child had a swelling over the eye, and a poultice on. I asked what was the matter, and the nurse said she thought that the clothes would never be put on the child again. The Sister said the child had been very bad, and had had sores, which had been treated with cold water dressings. The eye, the Sister said, would come all right if the poulticing were continued. The child was not dressed, but she was given to us in the blanket and a dirty nightgown, with her head full of vermin. The child was a mere bag of bones when she was given to me. She did not have vermin in her head before she went, and since she has been out she has not walked. The child had the right leg twisted inward, and the left leg was curled over it and contracted. The left arm was twisted behind the back, and I had trouble in extricating it. The nails of the left hand, which were very long, look petrified, for she had so placed her hand under her legs that what had passed from her had gone over the hand and nails. She had sores on her body. A large one was at the bottom of her back, one large one on each hip, also on the ankles and legs. We sent for a Surgeon, Mr. Watkin, and a fortnight after she left Hampstead she was sent to Charing-cross Hospital, where she has been ever since, eleven weeks to-day.

In cross-examination it was elicited that the particulars of this case had been published in the *Echo*, and that Mr. Aikman, one of the three complaining Medical Officers, had sworn before Sir Thomas Henry that the child had every care and attention, that she was in a reduced state when she went into the Hospital, that everything had been done to save her sight, and that she had had water-pillows.

Mr. Charles S. Watkin, a Surgeon, of King William-street, Strand, was then called, and he corroborated the previous witness as to the condition of the child when she was brought to her father's house. He thought the condition of the child might be caused by inadequate nursing or want of food. He would leave the "might" out, and say he thought it was likely that the emaciated condition of the child was owing to want of food. If the child had been properly nursed, means might have been taken to prevent the knees coming into contact, and so the sores there have been prevented. Asked regarding the number of nurses he should think necessary for a ward containing forty-eight children suffering from small-pox, he said, after much consideration, not less than six for the day for

merely attending on the patients. Half that number would suffice for the night. The witness said he had not been particularly connected with Hospitals, but he had once been House-Surgeon, and had not been a small-pox Hospital Medical officer. He went on to say that six day-nurses would be required for a ward with thirty-four adult patients. He considered that strait-waistcoats and tying down of delirious patients were to be avoided, if possible. These should be the last resource. It was the duty of the nurse in the Hospital to try and straighten the limbs of the child.

By Dr. Buchanan: The nature of the small-pox in the child was, I thought, severe. I saw the child on the day following the appearance of the eruption, and one cannot say, at such a time, whether a case is or is not going to be severe. When I saw the child on her return, the whole eye seemed to be suppurated—that is, there was matter in the eyeball. I have seen in the course of my practice the limbs drawn up, both in children and adults. I have not seen them after fevers or diseases of that kind. Where I have seen these contractions they have commenced during my attendance, but I have not attributed them to bad nursing, and certainly not to bad Medical treatment. We know contractions will occur, but they may be ameliorated. I have never visited any other small-pox Hospital that I recollect, except a small village temporary Hospital attached to a workhouse or a union. It is my opinion that children would require fewer nurses than adults.

Questioned by Mr. Williams, the witness denied the truth of what Mr. Aikman had sworn regarding the appearance of the child when it went to the Hospital as “having been ill for some time prior to admission, and altogether in a very reduced condition.”

Dr. Charles Chittenden said he was, until lately, the House-Physician to the Charing-cross Hospital, and was now a Surgeon in the Royal Navy. He spoke of seeing the child when it came out of the Hospital, of its emaciated condition, and of the contraction of the limbs as spoken to before, as well as of the sores. The sores on the knees could not occur, he said, without gross negligence on the part of the nurses. The sloughing in the eye was sometimes due to small-pox; but in this case he thought it was from malnutrition. The emaciated condition might arise from one of three causes—from want of food, or because the food did not assimilate in the stomach, or from the loss by the sores. The child lost five ounces of blood on the Sunday after it was brought home, and it was then not fit to have left the Hospital. It was not admitted to Charing-cross Hospital at once for want of room for one thing, and for another the fear of contagion. He had been connected with the Charing-cross Hospital for twelve months, and he had other Hospital experience. He thought the ward with forty-eight children at Hampstead should have had seven nurses, including the Sister, and at night about one nurse to twelve patients. In a case of thirty-four adults in an acute ward, one nurse to six or seven patients would be required of a day, and about one in twelve at night. These nurses were required, he said, altogether, for attending on the patients, scrubbers apart. He visited the Hampstead Hospital about June, and he was struck with the insufficiency of nurses to attend to one large ward where Mr. Aikman was, and Mr. Aikman told him that the one nurse and the one Sister attended to the forty patients in the ward. In his opinion, no person should be tied down, and no strait-jacket should be used without the order of a Medical man. It was not proper to tie a person down with sheets in the form of a rope, and the effect would be probably to leave marks. In small-pox it would be improper to tie down when the patient was in delirium, because tying down would be likely to cause sloughing from the eruption. The tying down would relieve the nurses of duty.

By Dr. Buchanan: To confine the legs of delirious patients I would tie a sheet of jean with laces so as to prevent their legs moving about, and these laces would be tied to the bedstead. This is a special apparatus designed for the purpose. The objection to the use of a bed-sheet is that it was twisted as a rope and would be likely to cut. Children, in my opinion, require more nurses than adults, other conditions being alike.

From his further answers to the Medical Commissioner, it appeared that the witness held that it would not be the duty of the Medical man to look after bedsores, especially if he had much to do, but would leave that duty to the nurse, especially in the case of an unconscious patient.

Cross-examined by Mr. Williams, the witness said he went to see Mr. Aikman when that gentleman was Medical assistant at Hampstead, as a friend, and took the statements made by him regarding the number of nurses there as being true, and

made on his word of honour. He should believe Mr. Aikman's word, but if Mr. Aikman had sworn that every possible care had been taken of the child while at Hampstead (the affidavit read to this effect) he should not believe him on oath. He thought the child should not have been removed, and it certainly was not in a fit condition to be removed. If Mr. Aikman had sworn it was in a fit condition—well, it was a matter of opinion. He thought the child had not had proper food and nursing, but if Mr. Aikman had sworn that everything was done that could be done, he would believe it was done. He thought 100 patients too many for one Medical man to attend to. He would not set his opinion against Mr. Aikman's oath that everything which could be devised had been done for the child, and he applied that to all his statements. He further stated that he had been a qualified Practitioner for one year, that though he had described himself of the Royal Navy his commission as Assistant-Surgeon would not be signed before the 1st proximo, and that he had had no experience of any small-pox Hospital beyond what he had gained by the visit to see his friend Mr. Aikman.

Re-examined by Mr. Collins, the witness said that Mr. Aikman told him there were 136 beds under his attention, and this was far too great a number, for University College Hospital had only 30 beds to each Medical officer.

By Dr. Buchanan: I know that University College is a large Medical school with a small Hospital, and I know that there are not sufficient appointments for all the students, and on this account the number of beds to each officer is made as small as possible. I know that the Medical men in charge may employ themselves otherwise—in teaching students—to occupy their time. Hampstead is not comparable in these respects with University College or any Hospital I know. I have no special knowledge of small-pox or fever Hospitals.

By the Chief Commissioner: I have never been in any small-pox Hospital beyond visiting Hampstead.

The case was then adjourned until Monday.

FOURTH DAY.

The witnesses examined on Monday were—John Channon, a gold and silver plater; the Rev. H. M. Turton, the chaplain; Thomas Owen, a butcher; and Albert Emerson Denton, clerk to a solicitor. Channon, Owen, and Denton had been patients in the Hospital. The first deposed to the fact of the nurses tying down delirious patients at night, to the badness of the food, and to the difficulty of getting a bath. He said that by seven o'clock the towels were as full of vermin as they could be, and that he and another patient used to get up at half-past five to have the first wash. He saw strait-waistcoats put on patients twice.

The Rev. M. Turton said that he had seen a strait-jacket used, and twice had seen patients tied down. He said many complaints of badness of food, of vermin in the towels, etc., had been made to him, but he always recommended the patients to go to the Medical Superintendent. Owen, the butcher, deposed to the insufficiency and badness of the food, and dirtiness of the linen.

Mr. Denton said he had seen several patients tied down with twisted sheets. He had tied down some himself, under the direction of a nurse. He gave strong evidence as to the filthy state of the linen and the clothes given to convalescents. He said the patients did not have the stimulants ordered by the Medical men, and they did not complain for fear of being “served out” in some way by the nurse. “One patient had complained, and the nurse got the stimulant struck off altogether, for she told the Doctor that the patient did not require it.” He gave instances of neglect. One patient, who died, was ordered eight ounces of whisky and four eggs daily five or six days before he died; the stimulant was only obtained twice. He was ordered poultices in the morning, and did not have them until the evening.

At the conclusion of the day's proceedings, Mr. Williams asked the opposite side to say to what length they were going to bring evidence about such undisputed points as the tying down of delirious patients, and said that the managers were anxious to go into the whole question of their management as early as possible.

Mr. Collins said that he could not answer the question, as his side were desirous of showing the extent to which this had been done.

The inquiry was then adjourned until Tuesday.

FIFTH DAY.

On Tuesday, the witnesses examined were—Michael Croake a lad of 15; George Donaldson, an apprentice to a printer; William Charles Peters, a wine and commission agent;

Thomas Johnstone, a machine-maker; and Elizabeth Haynes, who had been first a patient, and afterwards a nurse in the Hospital. The first-named witness deposed to having been tied down, and to having seen others tied down; to having wanted milk, and having asked "until it was of no use of asking;" to having been denied a bath when he was filthy and had vermin on him, and to having been intimidated by the nurses.

Donaldson gave confirmatory evidence. "It appeared to him that the patients were handled very roughly, and they were tied down by the nurses' orders." The sheets he was put in at first were dirty, and looked as if they had been used before. One was changed after five days, but the other was not changed at all. When he was changed to another ward he was again put in dirty sheets, and he slept between the blankets because of the dirty sheets. The towels of No. 4 were dirty and covered with vermin. There were two towels for eighty or ninety patients, and these two were not changed while he was there. The bath was full of dirty stinking water, and he neither bathed nor washed while he was in the convalescent ward nor in Ward 10. While he was in No. 10 Ward a patient died four beds from him at five o'clock in the morning, and was not removed until ten. A nurse was there at the time, and put a screen round the bed where the dead body was five minutes before his death. He did not ask to be washed, for other patients were not washed, and he thought there was no convenience for washing. He often heard complaints, mostly of a day, as to not getting milk, but sometimes they got it. He got only about three ounces of meat. The Medical gentlemen used to come round twice a day—once in the morning, and he used to look in for about ten minutes at night. Dr. Grieve used to come in at times. He remembered the night before the man died, and he was certain the Medical officer, Mr. Grey, visited the man. The body was removed before the Doctor came in the morning, but no one visited the man between the Doctor's night visit and his death.

The witness Peters gave evidence as to the inferior quality and insufficient quantity of food supplied. The milk, to his taste, was good; but the beef-tea he could not "make out," and he was told it was Liebig's, which might account for its bad taste. The Sister of his ward had cut down the food-supply. A boy had died in his ward in the early morning, and his body, which was in an offensive condition, had not been removed until the next day. When he was sent into the convalescent ward, the bed allotted to him was in such a disgusting condition, from the sheets being defiled with "gore, matter, and lice," that he preferred walking about all night to sleeping in it.

Johnstone gave similar evidence. He had known a patient drink his medicine, because he could not get anything else to allay thirst. He deposed to the insufficiency and badness of the food, and to the vermin and filth.

Elizabeth Haynes said: During the seven weeks witness was nurse she was often short of milk, and then she mixed water with her supply—very often half as much water as milk. The patients often complained. She then went as under day nurse to the children's ward, and was under Sister Clara and nurse Dick. There were forty-nine patients in the ward, and the three could not properly manage the forty-nine patients, for the children were neglected, and some of them were often tied in the beds. The nurses had to scrub the wards themselves, and as the nurses had to scrub the wards they tied the children down instead of giving them drink. They tied the children down instead of attending upon them because they got out of bed, but these were not always delirious. A child named Ricketts was reported convalescent on Saturday and was dead on Wednesday. Six weeks after the mother came to see another child, and was told that the dead one was sent to Islington. The mother went there, and when she came back said that at Islington they told her the child was sent from there to the workhouse. She remembered a child named Sarah Smith, whom she took out to play one afternoon at four o'clock by the order of Sister Agnes, and the child died at twelve o'clock the same night, and the corpse was in the ward the next morning, and was removed at eleven.

A conversation arose upon the subject of how this case came within the seven charges, and Mr. Collins said he would show that it dealt with the charge of the shortness of nurses.

The witness went on to say that she knew a child who had a bath one morning and was put back to bed, and on next being seen the child was dead. Mr. Aikman once found a dead child in bed, but the child had been seen by witness ten minutes before, when she saw it die. She went on to speak of further experiences in other wards, which were somewhat of

like character, and she declared that there were not sufficient nurses and milk.

The inquiry was again adjourned.

SIXTH DAY.

At the opening of the Court on Wednesday, the further examination of the witness Haynes was postponed, as she was not present.

Mr. John Aikman, one of the late Assistant Medical Officers of Hampstead, was then sworn. He described himself as a Master of Surgery and Bachelor of Medicine of Glasgow. He had acted as House-Surgeon and House-Physician in the Glasgow Royal Maternity Hospital and the Royal Infirmary, in each six months respectively. He proceeded to say (examined by Mr. Collins): When in Glasgow I saw about 300 cases of small-pox, and more than 2000 cases of fever passed through my hands while in Glasgow Royal Infirmary. In April last I applied to Dr. Grieve for the position of Assistant Medical Officer, and was engaged. After relating some conversation with Dr. Grieve, which showed that differences existed between him and the Assistant Medical Officers, he said: There were eleven large wards and two isolated (fever) wards. I was given in charge No. 3 (the female) Ward, in which there were thirty-four patients, No. 7 (children's) Ward, in which there were fifty-six beds, and a fever ward (isolated), No. 12 (male), in which there were six beds. These were the numbers when I first went, though the wards were changed afterwards. I was told that I had charge of these patients, and was to attend to them Medically, which I did. Instructions were all given to me verbally by Dr. Grieve, and I never saw written or printed instructions. I frequently saw children tied down in their beds. I really could not say what number; almost innumerable, I should say. I saw this from the very first, and they were delirious more or less. They were tied down with sheets by the nurses, I believe; but never, on a single occasion, did I give orders for this to be done. In my judgment, this is not a proper treatment. The ages of the children in the Hospital varied from a few days to 12 years. I either myself untied the children I saw thus tied, or ordered the nurse to untie them. That did not stop the practice, for though I did not find them tied so frequently I still found some. I remember, during my first fortnight at the Hospital, untying four on one evening visit. They were tied in various ways, sometimes with the sheet over the body, at other times with the sheet drawn under the bed, and tied over the child's body and arms, and at other times the sheet was passed merely over the chest. I think four is the greatest number at one visit that I untied. The general condition of these tied children was, before the crisis, restless, and they would tumble out of bed. To the ward of fifty-six children there were by day a Sister Agnes, a nurse named Simpson, and a convalescent patient as helper, and they had the ward work to do as well as the nursing. I believe the convalescent was a paid nurse. At night there was one nurse. The Sister went round with me on my morning visit, and was responsible for giving the medicine and stimulants. I never saw strait-jackets used in that ward. Regarding the milk given to children, the milk I know was scarce in the ward. Sometimes there was none in the ward, sometimes a few pints, and sometimes more. I found none about four times, and very frequently there was an insufficient quantity. Complaints were often made to me by the nurses; it was a general thing to hear complaints about this. I mentioned to Dr. Grieve frequently about the tying down. I used to see Dr. Grieve with the other Medical officers every morning at a quarter to ten o'clock, for the purpose of telling him about the wards and hearing his instructions. When I told Dr. Grieve he promised me an extra nurse for No. 7 Ward, and also for No. 6 Ward, also a children's ward, which was added to my duties afterwards. I never got the extra nurse. I used, at first, to order extra quantities of beef-tea and milk for the patients, and initialed the order. I used thus to order so many pints for that particular night, and Dr. Grieve told us there must be no "extras" ordered. This was when a new dietary came into working—June 18. He would not recognise these orders after June 18. We complained of insufficient quantities of things by writing an order for more, and then, when spoken to by Dr. Grieve, we said we had ordered them because there were none. He used to say that there were sufficient; but that they had been injudiciously given by the nurses. The children's diet was short. It would have been very difficult to have made a regular diet for the children, owing to their varying ages. About the 18th Dr. Grieve told us we had been ordering among us eighty or ninety pints of milk a night, and that it could not go on. We told

him we were obliged to do it, as there was nothing in the wards of a night, and would not be unless some alterations were made in the diet. He said that the diet was perfectly sufficient, and it would not be altered. Mr. Kynaston then said that if the dietary—the milk principally—were doubled, the mortality would be halved. I cannot say what occurred after in conversation, but there were high words, and two hours after the change in the diet was made. I can say that the mortality was very high in the week before June 18, for I saw it was seventy-one in the *Times*. [This was afterwards shown to be the mortality for two weeks. The number who died in that week was forty-six.] In No. 3 Ward there were thirty-four patients, with, as day nurses, Sister Caroline and Catherine Jenkins, and no assistance except from convalescent patients. I have seen the strait-waistcoat used as well. Sometimes a sheet was used to a strait-waistcoated patient, as it was necessary usually to restrain the feet as well as the body and hands. The strait-waistcoat was properly put on, and the hands were properly fastened; but there should have been an apparatus for the purpose of fastening the feet. I used to release the patients thus restrained, and told the nurse, Sister Caroline, that they should not be thus put under restraint. On May 31 I took a strait-waistcoat off a girl named Mackey, and told the girl Haynes (the witness of the previous day), who was then acting as night nurse, that it would increase the delirium. I told Dr. Grieve of it the next morning, and he said he was perfectly aware that it should not be done without our orders, and that was the correct view. I found other cases, and when I spoke to the nurses they said they could not get on without it. Sometimes it was utterly impossible to conduct the ward properly with the number of nurses. I told Dr. Grieve so; but I did on one particular day tell Dr. Grieve that in the then condition of the ward, which had a reduced number of patients, the nurses and assistance were sufficient. On making complaint once of insufficient nurses, I got one assistant, Nurse Fisk being sent, and that was for a special case. In No. 3 Ward I used frequently to find an insufficient supply of milk—that is, up to June 18, under the first diet table. Sometimes there used to be almost none, at others at most a few pints. There was usually more beef-tea than milk. The nurses used to complain to me very frequently of the short supply of milk—I have seen the short supply every night in succession for nearly a week. I also complained to Dr. Grieve about this ward up to June 18, when Dr. Grieve told us—the three of us, Assistant Medical Officers—that our power of ordering food was gone, and that the nurse must make all complaints for the future. I think a supply of milk was essential to the patients' treatment, and was better than the beef-tea. The milk was not very good; sometimes it was sour or "on the turn," and at other times it had been scalded, which gave it an unpleasant taste. The milk was poor, too, and it was at night that I found it more particularly sour, though I sometimes found it curdled in the morning. This was in June and July, especially in the very hot weather, and it then occurred almost daily. The beef-tea was such that I could not have taken it, and I don't think it was proper beef-tea for patients suffering from small-pox. It was fearfully salt, and had a really abominable taste. The patients said they could not drink it. The patients complained of the beef-tea the whole time I was there, but I only tasted it once. I believe it was made from an "extract" of beef. I remember asking Mr. Kynaston to look after the ward in my absence. Mr. Kynaston told me, and told Dr. Grieve, if I remember correctly, something about the children's ward, and Dr. Grieve replied that he had no right to be in the wards, that his being there was interfering. This was in reference to Mr. Kynaston going round the wards after I had made my evening visit, and it occurred after Mr. Kynaston had made a complaint regarding the nurses. This was in July, the middle or end of the month. Dr. Grieve used to take the duty of discharging patients, he seeing those who were going straight away to their homes (not to a convalescent Hospital); he took the duty of deciding if a case was small-pox, and he also took the charge of everything in the wards except the Medical treatment of the patients. This was during the main part of the time; but an alteration was made in these duties just before we left—some ten days. I mean by "Medical treatment" visiting and prescribing for patients, and the ordering of stimulants under reserve, for Dr. Grieve took the right of refusing stimulants. We had the ordering of low and ordinary diet—this was part of the Medical treatment; but I had no power of ordering full diet, for there was no such thing in the acute part of the Hospital; that was what Dr. Grieve told me.

There was only one "extra"—eggs—as far as I know, and we had great trouble in getting them. Dr. Grieve said he would not sanction an order for eggs unless he saw the patients for whom they were ordered. When he made that rule I went to the Board-room and told him I could never submit to such a rule, as I considered it an insult to my University, and resigned on the spot. In the course of a long conversation he consented to forego the rule to a certain extent—that is, that he was to countersign the orders—and I withdrew the resignation. During the last ten or twelve days we were there, Dr. Grieve took the Medical charge of the patients completely out of our hands. With reference to charge 4 in the *Times*, that on making the visit we had been informed by the nurse in charge that the patients of the ward had been without food from seven a.m. until three p.m., that referred to Ward No. 1 (acute), and I heard a complaint to that effect from nurse Meredith, who distinctly said in July that the Ward was without food from 7 o'clock a.m. till 3 o'clock p.m., and that the meat for the convalescents was so bad that she had not served it out. I often saw the meat served up in the isolated ward to the adult patients, and I can say that meat was coarse, and on more than one occasion when I saw it it was distinctly decomposing. This was in the beginning of July, and once a patient kept a piece and showed it to me. On July 10 I visited Ward 7, when Nurse Simpson was off duty. No nurse was there, and I saw a child about 6 or 7 years old lying across its bed, with its head over one side, and its legs over the other, and the bed-clothes thrown off. I found the child to be dead. There was not an adult person in the ward at all at the time, only the children-patients and myself. No one came in for ten or fifteen minutes. The child had certainly been dead more than a few minutes when I first saw it. Nurse Simpson when she came in did not know of the death, and I told her it was the most disgraceful thing I had seen in an Hospital in my life. She said she could not possibly help it, for Sister Agnes was off duty, and she had herself to go for the dinners. At that time there were at least forty children in the ward. I went straight to Dr. Grieve and reported to him what I had seen and said. He replied that he would attend to it and see the nurse, and he was then on a visit through the wards.

The witness, in answer to Dr. Buchanan, said that the position in which the child was found might have hastened death. He was examined as to the truth of the allegation that an offensive corpse was left in the bath-room. He said Mr. Greaves took me to see the dead body, which was that of a man who had died with the small-pox, and it was in a fearful state. It was shown to me naked, and I saw it was covered with an eruption, which was still moist, and the stench from it was horrible—it could be felt all the way from the bath-room through a long passage. The body was lying on the ground without anything between it and the ground, unless there was a sheet or mat under it, and it was naked under the sheet when I saw it. It was not a fit thing that the body should have remained where it was a moment longer than was absolutely necessary. The offensiveness was, I think, due to the small-pox itself, and the disease must have been offensive when the man was alive.

The examination of the witness was continued to still greater length, and he deposed to the dirty condition of the sheets, which, he said, were not changed often enough. He then spoke of the condition of the children's heads, and said that he had given instructions to have the "crusts" in their heads anointed with carbolic acid and oil, and he gave a particular case in which a child, who died, was terribly afflicted with maggots in the head, through, he believed, this anointing not being done at an earlier date than it was. The vermin in the children's heads, he said, were brought into the Hospital by the patients. The nurses, he said, could not attend to all the patients, and he gave his orders verbally for things to be done.

In answer to Dr. Buchanan, he acknowledged that the nurse had not neglected any obvious duty. He was asked why he did not stop and see his verbal order carried out as to putting on carbolic acid and oil, and he said that the nurse (Sister Agnes), when he spoke to her on his morning visits, said she had not time.

SEVENTH DAY.

On Thursday Mr. Aikman was recalled and, examined by Mr. Collins, said: In such an Hospital as Hampstead provision should certainly have been made for such cases as bedsores. Under the system of the Hospital everything was done that could be done, but the system was not sufficient. He mentioned the particular case of the girl Stokes to Dr. Grieve, and

told him that as the Assistant-Surgeons could not give it sufficient attention it ought to be removed. That was at a comparatively early period of the case, and he recommended that the child, after it was getting better, should be removed to some little country Hospital. He told that to Dr. Grieve every time he saw him in the ward, and at last he consented that the child should be removed. The wards were very full at that time. He believed that Dr. Grieve ordered the child to be removed home. There was a sloughing of the child's eye, which sometimes took place on recovery from small-pox, caused by low condition, in consequence of the cutting off of nourishment. Dr. Grieve, the Medical Superintendent, was perfectly cognisant of the state of the child until it left the Hospital. At this time he (witness) had 136 patients under his charge, all in acute stages of disease. At his morning visits the beds were in such an abominable state in the children's ward that he had to leave them for a time, and to go back to them afterwards. The sheets were not washed, but cleaned by some process. He pointed that out as being one of the great predisposing causes of bedsores. What were called "draw-sheets" were not used, even in cases where he told the nurse or the Sister that they ought to be used. The children's hands in the Hospital were "muffled." He did not like the practice although he had tried it, because he thought it made them rub themselves more. He did not continue the practice. On one evening in June four children tumbled out of bed, being unattended to. He thought the nurse was Blomfield (the lame woman), who had been a patient. On July 20 he found a child nearly dead lying outside its bed. It was suffering from a very severe attack of small-pox, and was about 6 years of age. It had only a nightgown on. He called the attention of the nurse to it, and she said that was nothing, as the child had been out on the floor several times during the night, and she could not help it. The child died during the night. A complaint was made by Mr. Kynaston to Dr. Grieve, the Medical Superintendent, about cording the beds, a patient having fallen out, and Dr. Grieve replied that it was no business of his (Mr. Kynaston's) if the patients dropped out and died on the floor. Mr. Kynaston was at that time the Medical officer of that ward, and Dr. Grieve told him that it was the duty of the nurses to attend to such things. Mr. Kynaston told Dr. Grieve that this state of matters had existed for some days. Dr. Grieve told the Assistant Medical Officers that they had no right to complain about food, or any other matters which were not absolutely Medical. Dr. Grieve generally made light of complaints, and generally said the complaints were beyond his (witness's) province, or were absurd, and that it was the duty of the nurses to report such cases. On one day in August he sent a written remonstrance to Dr. Grieve, that the patients in the children's ward had not received their customary supply of eggs, and that they had thus been deprived of the food on which their existence mainly depended. The remonstrance was returned to him with the word "bosh" written upon it. He reported that a patient was suffering from erysipelas caused by want of eggs, which the steward of the Hospital had refused to supply. That was on June 27. He told Dr. Grieve of that case, and he said the steward was right; but he gave no reason. Eggs were subsequently given, on his remonstrance, but were again suddenly stopped.

[The inquiry was proceeding when we went to press.]

REVIEWS.

De l'Ovariectomie. Par Dr. G. BODDAERT. Bruxelles. 1871. 8vo. Pp. 16.

On Ovariectomy. By Dr. BODDAERT. Brussels. 1871.

La Sedicesima Ovariectomia in Italia. Storia Chirurgica del Professore F. MARZOLO. Padova. 1871. 8vo. Pp. 31.

The Sixteenth Ovariectomy in Italy. Surgical History by Professor MARZOLO. Padua. 1871.

WHEN we find that the case related by Dr. Boddaert is the first in which ovariectomy has proved successful in Belgium, and Dr. Marzolo tells us that his case is the sixteenth in Italy, and only the third which has proved successful, we are forcibly reminded of the progress which this operation has made here within the last few years, and regard with pride and satisfaction the acknowledged influence of British Surgery upon Continental opinion and practice.

We need say little about the two cases detailed in the pamphlets before us, except that they are extremely creditable to the operators, serious difficulties having been ably overcome, and the patients restored from a very deplorable condition to

good health. But, for the credit of London Surgery, we have great pleasure in translating the remarks with which Dr. Boddaert concludes his *brochure* :—

"With regard to the proceedings followed in the operation, they are those which I have seen practised in London by my honoured teacher, Spencer Wells. I have religiously observed in my operation the precepts recommended by this eminent Surgeon, and I have endeavoured to exactly imitate his method of operating. During my visit to London I was present at fourteen ovariectomies, eleven of which were performed by Mr. Spencer Wells. I was able to observe closely the proceedings employed by this remarkable Surgeon; for, besides the operations which he performed at the Samaritan Hospital, at which I was present, Mr. S. Wells also kindly invited me to assist him in some cases in his private practice. Not being able to sufficiently thank Mr. Spencer Wells for the kindness he showed me during my visit to London, I only pay a debt in now publicly expressing my gratitude."

Such "international courtesy"—to use the popular phrase—is far more gratifying than even visits of our volunteers to Brussels or the reception of the Belgian riflemen at Wimbledon.

FOREIGN CORRESPONDENCE.

HOLLAND.

(From our own Correspondent.)

ROTTERDAM, September 19.

SMALL-POX IN HOLLAND.

The following are the official monthly returns for July :—

Towns.	Population Jan. 1, 1871.	Deaths from all causes, with still-born, in 10,000 inhabitants.	Deaths from small-pox.	Deaths from scarlet fever.	Deaths from measles.	Deaths from angina diphtherica.
Amsterdam	281803	22.4	299	2	6	—
Rotterdam	123097	28	14	1	—	—
The Hague	93083	21	30	—	—	—
Utrecht	60587	21	5	—	—	—

In August the small-pox mortality in Amsterdam was 196.

Here I will end my communications on small-pox, because the epidemic is ended in most places. Till now we have not had, that I know, one case of Asiatic cholera.

PROVINCIAL CORRESPONDENCE.

BIRMINGHAM.

September 27.

THE NEW PAROCHIAL DISPENSARY.

I HAVE just had an opportunity of inspecting the arrangements made at the Parish Offices in this town for the Dispensary established by the Guardians and approved by the Local Government Board, for the treatment of the out-door sick poor of the parish. The Dispensary is to be in full operation on September 30, and I cannot speak too highly of the complete and liberal manner in which the Guardians have made preparations for the comfort and convenience of the Medical officers; everything that is required for the proper treatment of the patients is provided for them. Some particulars of what I observed may not be uninteresting to your readers.

A spacious, well-warmed and ventilated waiting-hall is provided, capable of accommodating about sixty persons; from this hall there are entrances into two conveniently situated, well-lighted consulting-rooms, the walls of which are covered with varnished oak paper. There is a couch of original design for the examination of patients, also washstand, table, chairs, etc. There is a nicely fitted, well-lighted store-room, placed, with a view of economising space, between the consulting-rooms. There is a communication with the dispensary from each of these rooms by means of a passage, and also with each consulting-room; so that, in case of a consultation being desired, or a necessity ensuing of seeing the dispenser, there is no necessity of passing the patients waiting in the hall. Another entrance, also from the hall, into the dispensary, permits the patients to obtain the medicines prescribed for them. The dispensary is located in one corner of a large room, and is

similar in design to the ticket-office of a railway station. The open space is provided with benches capable of seating twenty-five persons, for the accommodation of the patients waiting whilst their medicines are being prepared. There are two windows in the partition, one for receiving the prescriptions, and the other for delivering the medicines, a rail being provided at the latter to prevent overcrowding. The shelves of the dispensary are stained and varnished, the tops of the counters being of solid oak. There is a cabinet for keeping poisons, a label-box of almost unique design (a patent, it should be stated, of Mr. Clay's), engraved bottles for keeping acids, percolators, evaporating-pans, elaborate weighing apparatus, and almost every convenience which the science of modern dispensing can require. In the centre of the dispensary there is a cabinet which struck me as being useful for dispensing. A stove, which will allow of seven or eight vessels being used at the same time for the purpose of making infusions, decoctions, and extracts, will likewise afford warmth to the department. On inspecting the stock of drugs, I found that there was an ample supply of everything that might be required, even most of the new and expensive medicines being amongst them. A dispenser has been appointed, who will have the assistance of a porter and a youth from the workhouse.

I understand that two of the District Medical Officers will attend at the Dispensary daily (excepting Sundays) for the purpose of seeing the out-patients; and from the regulations shown to me, I have no hesitation in saying that they are most complete.

The establishment of the Parochial Dispensary must be a great boon to the district Medical officers, who will be thus liberated about fifteen days in the month from attending to the out-patients, except urgent cases. The visiting, etc., of course, will go on as before. They will also be relieved of all dispensing, which generally takes place in the afternoon. This will be an additional relief to them. At a first glance the clerical work seems heavy; but on more careful examination it is not so, but is easily performed, and may be done chiefly in the office whilst seeing the patients. A calculation has been made as compared with the present amount of clerical work, which shows that thirteen days in the year are saved, of ten hours' duration each. A pharmacopœia has been specially prepared, and contains some useful simple formulæ; but, where practicable, the forms of the British Pharmacopœia are adhered to. There is every inducement, therefore, for the district Medical Officers to be satisfied with the new arrangements; and it is hoped that they will do their utmost to carry out the scheme in such a manner as shall make the Guardians and the public satisfied with the new order of things.

The whole of the arrangements have been effected under the advice and instruction of Mr. John Clay, who has been ably assisted by the Clerk to the Guardians, together with the cordial support of the whole body of Guardians. Mr. Clay richly deserves the thanks of the Profession.

GENERAL CORRESPONDENCE.

APPLICATION OF MERCURIAL LOTION TO THE SCALP.

LETTER FROM DR. THOMAS S. DOWSE.

[To the Editor of the Medical Times and Gazette.]

SIR,—One can but agree with the good sound advice embodied in your leader on "Dangerous Therapeutics." It is not, however, such an easy matter to employ remedies on the right patient, at the right time, in the right place, and in the right manner. If these several conditions could always be diagnosed, therapeutics would take a far higher place than they at present occupy in what might be termed the modern treatment of disease. The dissimilarity of opinions respecting the action and properties of medicines tends more to render this branch of our Medical art conflicting than it otherwise would be; and I fear, however perfect our knowledge might become as to the direct action of drugs, we shall never be able to lay down orthodox and absolute rules for our perfect guidance in their administration. The Physician who can so estimate the idiosyncrasy of his patient's nervous system as to say "Opium will (or will not) agree with you," might fairly be called clever; so also might he be who can determine beforehand whether iodide of potassium will produce iodism. But I do not think it requires a *savant* to determine whether a highly concentrated solution of bichloride of mercury might be *freely* applied to the delicate scalp of a young child without expecting serious

ulterior consequences. I have often used a solution of similar strength to that published by Dr. Fox, omitting the hydrochloric acid, using equal parts of glycerine and spirit to dissolve the mercury (glycerine dissolves it readily), and I take the same precaution in its application that I would do were I using strong nitric acid. My plan is to free the skin from fatty matter, if need be, by washing with Castile soap and water, thoroughly drying it with a hot cloth, then, by means of a piece of lint tied to the end of a penholder, forming a compact pad, I apply the solution, using firm pressure for a few seconds until it becomes absorbed. I should hope that Dr. Fox would give in the next edition of his valuable little work on "Diseases of the Skin" some instructions as to the manner of applying solution No. 164, especially to infants.

I am, &c., THOMAS S. DOWSE.

Highgate Infirmary, Sept. 23.

AN OVERLOOKED CHAPTER OF THERAPEUTICS.

LETTER FROM DR. F. A. HARTSEN.

[To the Editor of the Medical Times and Gazette.]

SIR,—In almost all eras of history we meet with narrations of recoveries said to be due to supernatural agencies. And the source of those narrations, far from being exhausted, goes on flowing every day. This fact, however unpleasant for many investigators, is undeniable, and requires scientific inquiry.

It would be easy to declare such narrations to be altogether the product of imposture or illusion; but there are some cases in which this manner of proceeding would fail to satisfy even minds of a very sceptic nature. (a)

But, allowing some of the facts narrated to be true, there still arises the question—Is it necessary to appeal to supernatural agencies for their explanation? Some say, "No; for there are no supernatural agencies." This, however, is setting aside the question, and not solving it. It is what is called in logic a *petitio principii*, for it is not proved that there are no supernatural agencies, neither is it an axiom.

Now, if a fact of the kind be not supernatural, there is only one explanation for it—namely, that which is based upon the *curative power of the imagination*, or of *lively trust*. And, in order to decide how far this mode of explanation is reasonable or not, we ought to determine in cases of a simple character the limit to which the curative power of the imagination is likely to go. In consequence, we wish to collect a number of morbid cases where recovery was *evidently* due—at least, for the most part—to the effect of *trust*, and afterwards to criticise them and draw our conclusions.

Should any intelligent Medical man have met, in the course of his practice, striking cases of the kind, or be acquainted with trustworthy accounts of them by others, he would render *good service by giving us the benefit of them*.

At all events, the curative power of the imagination is a fact. This ought to be studied like that of every other therapeutical agent, and deserves that a special chapter should be consecrated to it in our manuals of general Medical science.

I am, &c., F. A. HARTSEN.

7, Rue Bayard, Pau (Basses Pyrénées).

DR. LAVIES AND THE "O. W." RELIEF FUND.

[To the Editor of the Medical Times and Gazette.]

SIR,—It is only within a few days, since my return from France, that I have learnt that it was in the *Medical Times and Gazette* that my dear friend, Dr. Lavies, invited my Professional brethren to aid him in relieving my family and myself from a most painful position caused by the late war. The Profession most generously responded to the appeal, and I have endeavoured, by letter and in person, to express my grateful thanks to each of the contributors; but as there may still be some whose names and addresses I do not know, I trust you will allow me to take the same means of showing my gratitude that Dr. Lavies did in promoting its cause.

September 26.

I am, &c.,

O. W.

A SHEFFIELD colliery contractor was fined on the 21st inst., under the Factory Act, for employing a boy not certified by the Surgeon.

(a) See, for example, the account of the origin of the Chapel and Statue at Lourdes, by M. Henri Lasserre, in his well-written book, "Notre Dame de Lourdes," and the extracts from this book by the same author.

OBITUARY.

SAMUEL SOLLY, F.R.C.S., F.R.S.,

DIED on Sunday last, somewhat suddenly; but he had been ailing for some considerable period, and had been unfitted for following his Profession for some months past. Mr. Solly was an apprentice of Mr. Benj. Travers, sen., at the united Hospitals of St. Thomas's and Guy's, at which school and at Paris he was educated. He was admitted a Member of the Royal College of Surgeons in 1828, and Fellow in 1843. He was appointed Professor of Human Anatomy and Surgery to the College in 1862, and in 1867 a member of the Court of Examiners and senior Vice-president. He had been a member of the Council since 1856. At the election of President in 1870 it was generally anticipated that Mr. Solly would be elected to that office, but the choice of the Council fell on Sir William Fergusson, Bart., Serjeant-Surgeon to the Queen. He felt this "slight" very acutely, and this, combined with another disappointment respecting the career of one of his family, had a marked effect upon his health and spirits. Naturally vivacious and full of animation, he sank into a somewhat listless state, and showed marks of fading intellectual power. Under these circumstances he resigned his seat at the Examining Board of the College, and, in fact, retired from all active duties in his Profession. Mr. Solly was all his Professional life connected with St. Thomas's Hospital, and was Senior Surgeon and Lecturer on Surgery to that institution until a short time before his death. He held several honorary and other appointments. He contributed several works of some merit to the Profession. The chief of these were "On the Human Brain," a large volume entitled "Surgical Experiences," and "An Analysis of Muller on the Glands." Mr. Solly was a good but not a great Surgeon. He was scarcely in the category of the "giants of the Borough Hospitals," but was on an average of Hospital Surgeons in general. He was a fair operator, a florid lecturer, and a good clinical teacher. He was somewhat below the middle height, a rather small head, bald, with sagacious blue eyes, a nose inclined to the aquiline, a florid complexion, and an animated expression of countenance. He was a man of untiring industry, and one of the few Hospital Medical officers who saw their patients early in the morning. He was in his 66th year.

DR. GEORGE CURSHAM

DIED on Saturday last in his 77th year. He was an M.D. of Paris, and Fellow of the Royal College of Physicians of England. He was Physician to two life offices, Provincial Inspector of Anatomy, and late Physician to the Hospital for Consumption, Brompton. He was better known to the Profession, however, as having been for some time one of the honorary secretaries of the Royal Medical and Chirurgical Society, the duties of which office he fulfilled with great ability and urbanity. On his retirement he was presented by the Fellows with a very handsome silver inkstand. We are not aware that Dr. Cursham made any contributions to the literature of Medicine, with the exception of a paper to the Royal Medical and Chirurgical Society, entitled "Cases of Obstruction of the Veins in the Lower Extremities of Phthisical Patients." He never had a large practice. He was a most amiable man, and of a retiring disposition.

JAMES ALFRED TURNER, STAFF SURGEON,

DIED on the 18th instant, at Chyngton-house, Seaford, Sussex, aged 40. He entered the service July, 1855, and became Surgeon November, 1869. He was present at the capture of Canton, on December 29, 1857; skirmish at White Cloud Mountains, June 3; and capture of Nantow, August 11, 1858; also the campaign of 1860 in North China, including the affairs of Sinho and Tangku, capture of the Taku Forts, and surrender of Pekin—medal and three clasps.

WILLIAM HENRY WRIGHT,

ONE of the Surgeons of the Metropolitan Police, and of No. 1, Clapton-square, met with a melancholy death on the 22nd instant, in the Welsh mountains, near Dolgelly. He ventured upon a narrow ledge of rock, in order to obtain a good view of a waterfall, and was precipitated to the bottom of a cliff seventy feet in height.

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentleman passed his Examination in the Science and Practice of Medicine, and received his Certificate to practise, on Thursday, September 21, 1871:—

Tims, Thomas Lamb, Warwick.

As an Assistant in Compounding and Dispensing Medicines:
Culf, John Carrington, East Suffolk Hospital, Ipswich.

The following gentleman also on the same day passed his first Professional examination:—

English, Thomas Johnson, St. George's Hospital.

APPOINTMENTS.

* * * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

CARLESS, EDWARD NICOLS, M.B., C.M., L.F.P.S.—Medical Officer and Public Vaccinator to the First District of Devizes Union, *vice* Robert Samuel Thornley, M.R.C.S., L.S.A., deceased.

CLARK, ROBERT OKE, M.R.C.S.E. and L.S.A.—Medical Officer for the North District of the Farnham Union.

FERNIE, HENRY MORTLOCK, M.R.C.S.E. and L.S.A.—Certifying Factory Surgeon to the Macclesfield District.

HAYWARD, SIDNEY, M.D., M.R.C.S., L.S.A.—Medical Officer of the Overton District of the Whitchurch Union.

HENRY, RICHARD, A.B., M.D. Queen's University, Ireland, L.R.C.S.I., and L.M.R. of Dublin—Medical Officer, Public Vaccinator, and Registrar of Births, etc., for the Aghnacloy Dispensary District of the Clogher Union, counties of Tyrone and Monaghan, *vice* Dr. John Watson Mulligan, resigned.

JOHNSTON, WILLIAM, M.D. Edin., L.R.C.S. Edin., Retired Assistant-Surgeon, Royal Navy—Medical Officer for the Southsea District of the Portsea Island Union.

LORIMER, J. A., L.R.C.P.L., M.R.C.S.E.—Public Vaccinator for the town of Farnham.

PINDER, GEORGE HOLTBY, M.R.C.S. and L.S.A.—Physician's Assistant at the Royal Infirmary, Manchester.

ROBERTS, ARTHUR COPLESTON, M.R.C.S. Eng., L.S.A.—Surgeon to the Exeter Dispensary, *vice* John Shirley Steele Perkins, L.R.C.P. Edin., M.R.C.S. Eng., deceased.

WADDY, H. E., L.R.C.P. Lond., M.R.C.S. Eng.—Surgeon to the Children's Hospital, St. Lucy's Home, Gloucester, *vice* Caleb Barrett, F.R.C.S. Eng., resigned.

MILITARY APPOINTMENTS.

MEDICAL DEPARTMENT.—Staff Surgeon William Arthur Thomson, M.B., having completed twenty years' full-pay service, to be Staff Surgeon-Major, under the provisions of the Royal Warrant of December 27, 1870.

BOMBAY ARMY.—MEDICAL DEPARTMENT.—To be Surgeon-Major: Surgeon Thomas Berkeley Beatty, M.D.

BIRTHS.

BRACE.—On August 28, at Nagpur, India, the wife of Dr. John Brake, Inspector-General of Prisons, Central Provinces, of a son.

CRAWFORD.—On September 24, in London, the wife of Thomas Crawford, M.D., Deputy Inspector-General of Hospitals, of a daughter.

DUCKWORTH.—On September 21, at 11, Grafton-street, Bond-street, W., the wife of Dyce Duckworth, M.D., of a daughter.

GRABHAM.—On September 22, at Pontefract, the wife of Charles Grabham, M.B., of a son.

HAIRLAND.—On September 23, at Northwold, Cheltenham, the wife of H. J. Hairland, M.D., of a daughter, stillborn.

LLOYD.—On September 23, at Spring-hill, Birmingham-heath, Birmingham, the wife of Dr. Lloyd, of a son.

NORTON.—On September 20, at Rye House, Putney-hill, the wife of Selby Norton, M.D., of a son.

ROSS.—On August 16, at Gulmurg, Cashmere, the wife of J. Halyburton Ross, Surgeon H.M.'s 39th Regiment, of a daughter.

WHITE.—On September 21, at Myrtle Villa, Victoria-road, Aldershot, the wife of Staff Assistant-Surgeon M. L. White, of a son.

MARRIAGES.

BATESON—TOWNSON.—On September 20, at St. Paul's Church, Caton, near Lancaster, Robert S. Bateson, Surgeon Bengal Army, to Catherine A. (Kate), elder daughter of Robert Townson, Esq., Ash House, Caton.

CLARKE—WALKER.—On September 21, at St. Giles's Church, Camberwell, Frederick Howard Clarke, Surgeon, of Chillington, Devon, to Martha, youngest daughter of the late Miller Walker, Esq., Long Sutton, Lincolnshire.

DIVER—SKINNER.—On September 16, at St. Martin's-in-the-Fields, Thomas Diver, M.D., M.R.C.S. Eng., etc., of Bombay, to Mrs. Charlotte Lisle, second daughter of the late Joseph Skinner, Esq., of Exeter, Devon.

GREENHOW—TAYLOR.—On September 27, at Starston, Norfolk, Henry M. Greenhow, F.R.C.S., Surgeon H.M.'s Bengal Army, to Jessie, youngest daughter of T. Lombe Taylor, Esq., of Starston.

GRIFFIN—BUXTON.—On September 20, at the parish church, Fazeley, Edwin Perrins Griffin, of Kidderminster, to Margaret Taylor Young Waddell, elder daughter of T. Buxton, M.R.C.S., of Fazeley, Tamworth.

HUSSEY—ARMSTRONG.—On September 21, at the parish church, Brighton, Edward L. Hussey, F.R.C.S. Eng., of Oxford, to Lucy, eldest daughter of the Rev. H. W. Gleed Armstrong, M.A., vicar of Bierton, Aylesbury.

LOWE — GRAHAME.—On August 17, at St. Andrew's Kirk, Bangalore, Thomas Lowe, Surgeon Madras Sappers and Miners, to Margaret Macdonald (Maggie), eldest daughter of George Grahame, Esq., 1st Battalion 21st Royal Scots Fusiliers.

ROY — HAIRBY.—On September 26, at the parish church, Hundley, Lincolnshire, the Rev. Robert Evelyn Roy, M.A., rector of Skirbeck, Lincolnshire, to Anne Susanna, eldest daughter of the late James Hairby, M.D., of Northbeck House, Hundley, and granddaughter of the late Thomas Garfit, Esq., formerly of Hundley.

DEATHS.

ALEXANDER, GERVASE, M.D., eldest son of the late Gervase Alexander, M.D., of Halifax, Yorkshire, at his residence in the Haymarket, London, on September 23, aged 68.

COOKE, ELLEN, daughter, and only child, of George R. Cooke, Surgeon, at Greenhithe, on September 25, aged 2 years and 2 months.

CORNISH, SAMUEL HENRY, Surgeon, late of 32, New-cross-road, after a lingering illness, on September 20, in the 40th year of his age.

CURSHAM, GEORGE, M.D., F.R.C.P.L., Government Inspector Anatomical Schools, at Victoria-street, Westminster, on September 23, aged 76.

EVANS, JOHN OWEN, M.D., at Fratton, Portsmouth, on September 18, aged 48.

FORD, JAMES H., M.R.C.S., L.S.A., at Grays, Essex, on September 5, aged 67.

FOULDS, FRANCES, the beloved wife of Samuel Foulds, Surgeon, at Chesterfield, after a short illness, on September 18, aged 37.

GOODACRE, THOMAS BERNARD, infant son of Dr. Goodacre, at The Rectory Wilby, Norfolk, on September 24, aged 2 months.

HARRIES, CHARLES ALEXANDER, M.R.C.S.E. and L.S.A., at Bath, for forty years a Practitioner in that city, on September 22, aged 63.

MILBANKE, MARY, the beloved wife of R. T. Milbanke, M.D., and relict of the late Evan Jones Cruchley, R.N., at Brighton, on September 24.

PLAYNE, FRANCES MARIA, the beloved wife of Alfred Playne, M.B., of Maidenhead, and Box House, Minchinhampton, Gloucestershire, at Maidenhead, on September 21.

STAMPER, PRISCILLA, the wife of J. Fenton Stamper, M.D., at Pembroke Dock, on September 15, aged 41. Interred at Highgate Cemetery.

STOTT, JANETTE COTTEREL, widow of Hugh Stott, Surgeon, formerly of Lewisham, on August 21, in the 43rd year of her age.

TURNER, JAMES ALFRED, Surgeon to Her Majesty's Forces, at Chyngton House, Seaford, Sussex, on September 18, aged 40.

VALLANCE, JAMES THOMAS, M.D., F.R.C.S.E., of Vilette, Broadstairs, at Stratford, Essex, on September 22, aged 63.

WEBSTER, EDWARD, Surgeon, at Oundle, on September 20, aged 56.

WRIGHT, WILLIAM HENRY, M.R.C.S. and L.S.A., of 1, Clapton-square, London, younger son of the late R. J. P. Wright, Esq., of Clapton, at Festiniog Falls, accidentally drowned, on September 22.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.

DUDLEY GUEST HOSPITAL.—Resident Medical Officer. Must have both Medical and Surgical qualifications, and be registered. Applications and testimonials to the Rev. G. Y. Osborne, St. Edmund's Vicarage, Dudley, on or before October 14.

GAINSBOROUGH DISPENSARY.—House-Surgeon. Must be duly qualified and registered. Applications and testimonials to Mr. F. C. Spouncer, on or before October 4. Election on the 19th.

PARISH OF UNST, SHETLAND.—Medical Officer. Applications and testimonials to Mr. White, Inspector of the Poor.

QUEEN ADELAIDE'S DISPENSARY, POLLARD-ROW, BETHNAL-GREEN.—House-Surgeon. Must be a member of one of the Colleges of Surgeons of London, Edinburgh, or Dublin, and L.S.A. Applications and testimonials to the Rev. T. Peckston, 260, Cambridge-road, London, E., on or before October 3. Election on October 6.

ROYAL ORTHOPÆDIC HOSPITAL.—House-Surgeon and Apothecary. Must be M.R.C.S. and L.A.C., or possess the certificates of Medical and Surgical qualifications of some British University, College, or Corporation by charter. Applications and testimonials to the Secretary, 315, Oxford-street.

WARMINSTER UNION.—Medical Officers for the Warminster District and Union Workhouse, and for the Corsley District. Candidates must possess the qualifications prescribed by the Local Government Board. Applications and testimonials to Mr. J. Merrick, Clerk to the Guardians, Warminster, on or before October 16. Election the same day.

WARRINGTON DISPENSARY.—Resident Surgeon-Apothecary. Must have the qualifications which are required of candidates for appointments in the Poor-law Medical Service. Applications and testimonials to the Honorary Secretary, on or before October 2.

WESTMINSTER HOSPITAL.—House-Physician. Must be qualified to practise under the Medical Registration Act of 1858. Applications and testimonials to the Secretary, on or before October 1. Election on October 10.

UNION AND PAROCHIAL MEDICAL SERVICE.

* * The area of each district is stated in acres. The population is computed according to the census of 1861.

RESIGNATIONS.

Pocklington Union.—The First Pocklington District is vacant; area 17,367; population 4783; salary £40 per annum.

Tiverton Union.—The Silvertown District is vacant; area 6549; population 1514; salary £32 per annum.

West Derby Union.—Mr. Richard B. Reid has resigned the Bootle-cum-Linacre District; area 1050; population 6405; salary £100 per annum—and the Workhouse; salary £70 per annum.

Westhampnett Union.—Mr. George C. Carter has resigned the Rumbolds-whyke District; area 11,452; population 2908; salary £100 per annum.

APPOINTMENTS.

Saint Saviour's Union.—James R. Turner, M.R.C.S.E., L.S.A., to the Third District.

Tenterden Union.—Wm. H. C. Tessier, M.D. St. And., L.R.C.S. Edin., L.S.A. Lond., L.A.H. Dub., to the Halden District.

DR. HUNTER is to be the first Director-General of the new department in India, to be called the "Statistical Department."

THE general condition of the health of Paris is good. Last week there were 832 deaths. Of these 55 were from diarrhoea, 45 from bronchitis, 35 from dysentery, 17 from infantile cholera, and 2 from cholera.

THE Guardians of Islington, on Thursday week, voted a gratuity of £20 to the Medical Officer for extra services rendered during the transfer of the inmates of the Workhouse to the new building at Upper Holloway.

AT the instance of the Local Government Board, the Guardians of Camberwell have taken steps to build a new infirmary, at a cost of £17,000.

WE are requested to announce that a *conversazione* will be held in the Board-room of St. Mary's Hospital, after the delivery of the Introductory Address by Dr. Alfred Meadows, at 8 p.m. on Monday next, October 2.

A MEETING of working-men has been held at Stepney, in aid of the funds of the London Hospital. Resolutions approving of the objects of the meeting were submitted and carried.

THE Liverpool charities have just been enriched by £9296 6s. 4d., the residue of the estate of Mr. James Dunlop, tailor and draper, which he directed by will to be thus applied. The four principal Medical charities each receive £929 12s. 7d., and others sums proportionate to their size and usefulness.

DR. R. FOWLER, late Medical Officer to the dissolved East London Union, has been awarded an annuity of £60 by the Local Government Board, in consideration of the loss of his office. *Little enough, too!* considering the long term of office, and the admirable manner in which Dr. Fowler performed the important duties entrusted to him.

THE last advices from Bahia report some yellow fever cases in that port. The health of the city of Buenos Ayres is good, notwithstanding that the weather had been most trying, and rain much wanted. All that can be done will be done to combat the disease this summer; and it is to be hoped that the city of Buenos Ayres will escape the revisitation of the plague of 1871.

WILLIAM COLLINSON, chemist and druggist, of Rotherham, was on Monday committed for trial for the wilful murder of Eliza Utley, aged 27 years, by using an instrument with a felonious intent.

DR. FRESSENTIUS publishes in the *Zeitschrift für Analytische Chemie*, for 1871, a somewhat severe reflection on modern chemists for their almost entire neglect of analytical investigation.

SMALL-POX is still on the increase in Chester.

THE small-pox return to the Chorlton Board of Guardians, last week, showed that there were 14 in the Hospital; 4 had been admitted during the week, and 4 had been discharged; 1 had died, unvaccinated; 13 remained under treatment, of whom 7 were convalescent.

ACCORDING to Drs. Davis and Moreton, the average cranial capacity of man in the Teutonic family is 94 cubic inches; in the Esquimaux, 91; in Negroes, 85; in Australians, 81; in Asiatics, 87; and in the Bushmen, 77. It is argued that size of brain stands in direct relation to high intellectual powers, since Cuvier, Humboldt, Napoleon, and other great men, possessed large brains.

A FEVER SPOT.—**Dr. T. Thorne**, reporting on the condition of Dudley, says that the mortality from fevers was enormously high—double that of the large towns of England and Wales, exceeding even Liverpool; that typhus had been epidemic; and that he considered it was largely owing to the overcrowding and destitution among the poor.

PARISH OF LIVERPOOL.—The vacancy caused by Dr. De Zouche's resignation has been filled by the appointment of Mr. James Ridley, L.R.C.S. Ire., L.K. & Q.C.P., and L.M. Dub., to a district. The following changes of districts, however, will take place:—Dr. Paterson removes from No. 6 District to No. 7 (Dr. De Zouche's); Dr. Lowndes removes to No. 6 from No. 5; Dr. Anderson to No. 5 from No. 1; Dr. Fisher to No. 1 from No. 2; Mr. Ridley takes No. 2. Mr. Ridley was formerly Resident Medical Officer to the Workhouse.

NEW HOSPITAL AT LANARK.—The foundation-stone of a public Hospital for the district of Lanark was laid on the 14th inst. by Mr. Robert Monteith Carstairs.

DEATH OF M. BLACHE.—M. Blache, one of the most distinguished of the Paris Physicians, and quite recently President of the Academy of Medicine, died last week. His loss is felt the more severely by the Profession as he was a great favourite among them as an attendant upon their own families. He had a large consultation practice, in town and country, in children's diseases. He was son-in-law of M. Guersant.

ROYAL COLLEGES OF PHYSICIANS AND SURGEONS OF EDINBURGH.—The following are the subjects of preliminary examination for the diplomas during the year 1871-72:—In Latin, the books prescribed to be translated from are, for October 21 and November 4, 1871, as formerly, the 1st Oration of Cicero against Catiline, and the 2nd book of the *Aeneid* of Virgil; the candidate, besides selecting one of these at his option, will be required to translate a passage from an unprescribed author. For April 20 and July 20, 1872, the candidate must select one of the two following authors and subjects, viz.:—Cicero de Senectute et de Amicitia; Horatii Carmina, Lib. II. et III., the other subjects of examination being the same as above. In Greek, the books required are, for October 21 and November 4, 1871, *Xenophon's Anabasis*, Book III., and *Homer's Iliad*, Book I.; for April 20 and July 20, 1872, Herodotus' History, Book I., and Homer's Iliad, Book II. On each occasion, translation from both the books prescribed is required, also parsing from the passages translated, and derivations of English words from the Greek. In French, the books required are, for October 21 and November 4, 1871, *La Fontaine's Fables*; and for April 20 and July 20, 1872, Voltaire's *Henriade*. Parsing, and translation of short sentences from English into French are also required. In German, the books required are, for October 21 and November 4, 1871, *Schiller's Wallensteins-Tod*; and for April 20 and July 20, 1872, *Schiller's Wilhelm Tell*. Parsing, and translation of short sentences from English into German are also required.

LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE.—The session 1871-72 will be opened on Tuesday, October 3, at 3 p.m. (instead of Monday, the 2nd, as previously arranged), with an introductory address by Dr. W. Carter, Lecturer on Botany, and Physician to the Southern Hospital; after which the prizes and certificates of honour gained during the past year will be distributed. The following is the prize-list for the winter session:—*Exhibitors*: Mr. J. L. Johnstone, Mr. W. Kelly, Mr. J. B. Lyth, Mr. T. F. Young. *Surgery*: Mr. J. B. Lyth, Silver Medal. *Physiology (Seniors)*: Mr. E. Riding, Silver Medal; Mr. G. W. Joseph and Mr. D. L. Parry (*æq.*), First Hon. Certificate; Mr. W. T. Hayward, Second ditto. *Anatomy (Seniors)*: Mr. G. W. Joseph, Silver Medal; Mr. E. Riding, First Hon. Certificate. *Anatomy and Physiology (Juniors)*: Mr. R. N. Pughe, Silver Medal; Mr. D. D. Stewart, First Hon. Certificate; Mr. G. G. S. Taylor, Second ditto. *Chemistry*: Mr. R. N. Pughe, Silver Medal; Mr. E. A. Morgan, First Hon. Certificate; Mr. R. M. Craven and Mr. F. C. Gresham (*æq.*), Second ditto. Summer Session:—*Midwifery*: Mr. D. L. Parry, Silver Medal; Mr. T. R. Jones and Mr. G. H. Wilson (*æq.*), First Hon. Certificate; Mr. J. H. Harricks, Second ditto. *Diseases of Children*: Mr. D. L. Parry, Silver Medal; Mr. J. H. Harricks and Mr. R. Whiteside (*æq.*), Hon. Certificate. *Materia Medica*: Mr. E. Riding, Silver Medal; Mr. J. Bark, First Hon. Certificate; Mr. G. W. Joseph, Second ditto. *Medical Jurisprudence, etc.*: Mr. G. W. Joseph, Prize; Mr. E. Riding, Hon. Certificate. *Botany*: Mr. R. M. Craven, Prize; Mr. E. Marmon, Hon. Certificate. *Practical Chemistry*: Mr. J. Bark, Prize; Mr. F. C. Gresham, Hon. Certificate. *Comparative Anatomy*: Mr. T. F. Parry, Prize; Mr. F. C. Gresham, Hon. Certificate.

ABSORPTION OF WATER BY LEAVES.—M. Cailletet, in a recent communication to the Académie des Sciences, states his solution of the problem whether leaves absorb water. Various experimenters have reported contradictorily on the matter, and M. Duchartre, in his latest works, answers the question in the negative. M. Cailletet proves that both sets of observers are right, by showing that absorption differs according to the conditions of the plant. If it grows in a well-watered soil, its leaves never absorb water; but if it receive by its roots an insufficient quantity of water for its vegetation, the leaves, if they are moistened, will supply this. Thus, a faded branch will recover all its freshness if its summit, or even only some leaves, be soaked in water, while plants may be thus made to live without being in contact with the soil, and quite isolated from all assimilable matter.—*Union Médicale*.

CITRATE OF CAFEIN IN NEURALGIA.—Dr. Arnett states that he has had great success in the treatment of neuralgia, nervous headache, hysteria, and similar affections, by means of cafein and sulphate of morphia. His formula is—sulph. morph., gr. $\frac{1}{2}$; cafein, citric acid $\bar{a}\bar{a}$ gr. iij.; to be given in warm coffee, or, what is better, a decoction of race ginger. It acts powerfully on the skin, equalises the circulation, thereby removing local congestion. In the majority of cases the nervous irritation may be reduced without the sulphate of morphia.—*Boston Journal*, August 17.

NOTES, QUERIES, AND REPLIES.

Be that questioneth much shall learn much.—Bacon.

Mr. T. W. Patterson, Morar.—Your letter, with enclosure, received with thanks.

In Nubibus.—The clouds will soon be dispelled by the sun of hope.

Formula.—It was in 1824 that the formula for prussic acid was withdrawn from the new edition of the Pharmacopœia, then in course of preparation.

Plympton.—We are acquainted with all the circumstances, but we agree with the chairman of the Board of Guardians, that it would not be fair to discuss the matter in the absence of Dr. Miles.

A Twelve Years' Subscriber.—There can be no doubt that the words "shall have been" have a retrospective effect, and influence all contracts held previous to the passing of the Act.

Discoverer.—Dr. Groenvelt, in 1693, discovered the curative power of cantharides in dropsy; and no sooner did his cures begin to be known than he was at once committed to Newgate, by warrant of the President of the College of Physicians, for prescribing cantharides internally.

TREATMENT OF ALOPECIA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

Sir,—In answer to a "Young Practitioner" I have to advise him to apply repeatedly some preparation of cantharides to the form of porrigio named decalvans by Bateman, and, by Celsus, alopecia. Dupuytren, I believe, was the first who employed cantharides in this obstinate complaint, in which I have long used a cantharidine ointment with almost invariable success, whilst the use of it has never been attended with any deleterious effects. My formula requires very careful manipulation in mixing the ingredients, and has been regularly made up at the Liverpool Apothecaries' Hall, 4, Colquitt-street.

Liverpool, September 25.

I am, &c.,
AN OLD PRACTITIONER.

THE QUEEN'S HOSPITAL, BIRMINGHAM.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

Sir,—“Phlegmon” possibly is personally annoyed that the Queen's Hospital is incorporated as a clinical Hospital by special Act of Parliament. The advantages of such an Act no doubt vex him. The Hospital was founded for clinical purposes. Clinical instruction is the first duty of every officer, and for all time to come every Physician and Surgeon must give regular and efficient tuition, or by Act of Parliament must retire. Only a very few years ago the Committee of the General Hospital refused to admit pupils beyond a few dressers. At any moment this may recur. At any moment, also, the Physicians or Surgeons may refuse to teach, and thus put an end to the clinical qualification of the Hospital. As regards the not very conspicuous black boards within the railing, they are the legacy of an old régime, and were better removed. It is simply untrue to say that it is proposed to affix private addresses. Of course “Phlegmon” gives no credit to the Queen's Hospital officers for refusing to have their names published each week in the newspapers. What of the “note” and “beam,” etc.?

I am, &c.,
CARBUNCLE.

INFANTILE DIARRHŒA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

Sir,—Just as the bugle is sounding for mess, or in the middle of a pleasant dream that the examination as to fitness for promotion from the subordinate grade of Assistant-Surgeon had been passed (*en passant*, there's no harm in remarking that this Professional test requires time and leisure for special reading and cramming, that some Medical officers cannot afford), a banging is heard at the door, and a voice exclaims—“Sorry to disturb you, but please, Sir, will you come and see the baby, who is very ill, suffering awful from purging and vomiting, which has been going on more than a week. My husband is on guard; I have no one to help me. The landlady said it was no matter, merely the teeth; we gave a Stedman's powder; consulted Mr. Abel, the chemist, who ordered a draught; and on the advice of Mr. Boxer, the baker, the child has had plenty of brandy.” The poor soul, with four other children, finding it difficult to cook her husband's food, to keep the room tidy, let alone attending to the sick infant, dirt and discomfort reign paramount. To culminate trouble, pregnancy prevents her increasing income by taking in soldiers' washing.

In this horrible atmosphere the accomplished Physician—through inclination and opportunity familiar with microscopical, chemical, and pathological accessory aids to diagnosis, besides depending on good food, cleanliness, and judicious nursing—would wring his hands in dismay at the hopeless task before him. As on service the soldier depends on rough-and-ready expedients, so general Practitioners (as Army Medical Officers are in times of peace), adapting matters to circumstances, trade on experience and common sense, of course reading up and consulting in occasional puzzling cases. Lately 2000 deaths in London in six weeks naturally excite alarm; and the Registrar-General, recording 19,903 deaths in 1869, considers diarrhœa one of the most fatal of zymotic diseases. As a rule soldiers' children suffer from diarrhœa during detention in the proportion of 28 per cent. Of soldiers' wives 9 per cent. menstruate regularly during lactation, but this condition (through hot weather) unexpectedly occurring, infantile digestion becomes deranged. Many women nurse during pregnancy, are very careless as to diet, often giving children the same food as themselves. In that interesting disease, puerperal peritonitis, when we

notice abdominal distension, raw beefy tongue, tready pulse, a wandering eye, yet the patient professing to feel much better, we throw down the cards—the game is lost; the grim destroyer calls “Domino.”

So in thrush and infantile diarrhoea, after a little time the alimentary canal has no more power of appreciating food than if it were placed in the gloved hand. Each drop of wine, milk, or beef-tea greedily swallowed simply increases irritation; so do nutritive enemata. Blistering the stomach, then applying poultices of beef-tea or cod-liver oil, will occasionally prolong life. In my own practice, a child, now well and strong, thus lived fourteen days, taking nothing by the mouth—all a chance; we must not despair. Thirteen years’ experience recommend the following treatment in certain cases:—Put the infant in a hot bath; give a powder containing hyd. c. creta, pulv. ipecac. co., pulv. rhei—(remedies none the worse for being as old as the hills). After the bath the patient to be wrapped in hot blankets, with hot bottles around; apply mustard over the stomach. Interdict for hours any food, solid or liquid, even to touch the lips. Very weak black tea, containing milk and lime-water, may next be given, hot or cold, according to judgment. In other cases quinine and carbonate of soda may be prescribed, or dilute nitro-hydrochloric acid and bark, as circumstances dictate. The nursing mother at the outset should take castor oil, chloroform, and laudanum, should rest, and be most rigid as to diet.

Having neither shares in pearlina, Horniman’s tea, revalenta arabica, even chloralum, or any other remedy considered valuable by Medical senators, I should at present pin my faith on chlorodyne, or, still better, hypodermic injections of morphia, if suffering from CHOLERA.

COMMUNICATIONS have been received from—
 Dr. STAMPER; Mr. NORRIS; An Old Practitioner; Dr. P. S. O’REILLY; Mr. HAGGER; Mr. A. INGLIS; Dr. RUSSELL; Mr. WADDY; Dr. LITTLE; Dr. FAYRE; Mr. P. BELL; Mr. COLLETTE; Mr. MAUNDER; Dr. ARCHER FARR; A TWELVE YEARS’ SUBSCRIBER; Dr. MEDD; Dr. EDDISON; Mr. FURNEAUX JORDAN; Mr. WALTER RIVINGTON; Dr. T. S. DOWSE; M. A. B.; Mr. R. BOOKS RECEIVED—
 Miscellanies, by Dr. J. A. Symonds—Dr. Doherty’s Organic Philosophy volume III., Biology—Western-super-Mare Hospital and Dispensary, Report 1871—Professor Zerffi on Spiritualism and Animal Magnetism—Darwinism: being an Examination of Mr. St. George Mivart’s “Genesis of Species” by Chauncey Wright, Esq.—Allbutt on the Use of the Ophthalmoscope in Diseases of the Nervous System and of the Kidneys—Williams on Pulmonary Consumption—De l’Ovariectomie, par le Docteur G. Boddart.

PERIODICALS AND NEWSPAPERS RECEIVED—
 Nature—Pharmaceutical Journal—Medical Temperance Journal, October—The Preston Herald—Journal of the Gynæcological Society of Boston, September—Medical Press and Circular—Journal of the Scottish Meteorological Society, July—The Anti-Vaccinator.

APPOINTMENTS FOR THE WEEK.

September 30. Saturday (this day).

Operations at St. Bartholomew’s, 1½ p.m.; St. Thomas’s, 9½ a.m.; King’s, 2 p.m.; Charing-cross, 2 p.m.; Royal Free, 2 p.m.; Hospital for Women, 9½ a.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

October 2. Monday.

Operations at the Metropolitan Free Hospital, 2 p.m.; St. Mark’s Hospital for Diseases of the Rectum, 2 p.m.; St. Peter’s Hospital for Stone, 2½ p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

3. Tuesday.

Operations at Guy’s, 1½ p.m.; Westminster, 2 p.m.; National Orthopædic, Great Portland-street, 2 p.m.; Royal Free, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

4. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary’s, 1½ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew’s, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas’s, 1½ p.m.; Samaritan, 2.30 p.m.; King’s College Hospital (by Mr. Wood), 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

OBSTETRICAL SOCIETY (Council Meeting, 7½ p.m.), 8 p.m. Dr. Copeman, “On Cases in Practice.” Dr. Braxton Hicks, “On the Contractions of the Uterus throughout Pregnancy: their Physiological Effects, and their Value in the Diagnosis of Pregnancy.” And other Papers.

5. Thursday.

Operations at St. George’s, 1 p.m.; Central London Ophthalmic, 1 p.m.; Royal Orthopædic, 2 p.m.; West London, 2 p.m.; University College Hospital, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

6. Friday.

Operations at Central London Ophthalmic, 2 p.m.; Royal London Ophthalmic, 11 a.m.; South London Ophthalmic, 2 p.m.; Royal Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

London Hospital.—The following Operations will be performed on Wednesday, at 2 p.m.:—
 By Mr. Maunder—Removal of Tumour occupying the Nostril, Orbit, Temporal, and Zygomatic Regions of the Left Side.
 By Mr. Couper—Removal of Naso-pharyngeal Polypus; Operations for Ununited Fracture of Femur.

VITAL STATISTICS OF LONDON.

Week ending Saturday, September 23, 1871.

BIRTHS.

Births of Boys, 1049; Girls, 1052; Total, 2101.

Average of 10 corresponding weeks, 1861-70, 2018.9.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	707	704	1411
Average of the ten years 1861-70	624.6	590.5	1215.1
Average corrected to increased population	1337
Deaths of people aged 90 and upwards	6

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1871.	Small-pox.	Measles.	Scarlet Fever.	Diphtheria.	Whooping-cough.	Typhus.	Enteric (or Typhoid) Fever.	Simple continued Fever.	Diarrhoea.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.745 in.
Mean temperature	53.6°
Highest point of thermometer	67.6°
Lowest point of thermometer	39.0°
Mean dew-point temperature	43.7°
General direction of wind	N.E.
Whole amount of rain in the week	0.10 in.

BIRTHS and DEATHS Registered and METEOROLOGY during the Week ending Saturday, September 23, 1871, in the following large Towns:—

	Estimated Population to middle of the year 1871.*	Persons to an Acre. (1871.)	Births Registered during the week ending Sept. 23.		Deaths Registered during the week ending Sept. 23.		Temperature of Air (Fahr.)		Temp. of Air (Cent.)	Rain Fall.	
			Highest during the Week.	Lowest during the Week.	Weekly Mean of Mean Daily Values.	Weekly Mean of Mean Daily Values.	In Inches.	In Centimetres.

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29.75 in. The highest was 30.09 in. at the beginning, and the lowest was 29.33 in. at the end of the week.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871. As the population of Dublin and its suburbs showed a decline between the Censuses of 1861 and 1871, the enumerated number in April last has been inserted above for that city, the population being assumed to be now stationary.

Continued from the Fifth Page of Advertisements.

St. Thomas's Hospital.—The Medical

SESSION for 1871 and 1872 will commence at the New Hospital, on the Albert Embankment, Westminster-bridge, S.E., on MONDAY, the 2nd OCTOBER, 1871, on which occasion an Inaugural Address will be delivered by Mr. Le Gros Clark, at Two o'clock, after which the Distribution of Prizes will be made by Sir Francis Hicks, Treasurer.

Gentlemen entering have the option of paying £40 for the first year, a similar sum for the second, £20 for the third, and £10 for each succeeding year; or, by paying £105 at once, of becoming perpetual Students.

PRIZES AND APPOINTMENTS FOR THE SESSION.

First Year's Students—Winter Prizes, £20, £15, and £10; Summer Prizes £15, £10, and £5.

The Wm. Tite Scholarship, founded by Sir Wm. Tite, C.B., M.P., F.R.S., the proceeds of £1000 Consols, tenable for three years, is awarded every third year.

Second Year's Students—Winter Prizes, £20, £15, and £10; Summer Prizes, £15, £10, £5; the Dresserships and the Clinical and Obstetric Clerkships.

Third Year's Students—Winter Prizes, £20, £15, and £10; Mr. George Vaughan's Cheselden Medal, the Treasurer's Gold Medal, the Grainger Testimonial Prize, the Two House-Physicianships, the Two House-Surgeons, the Resident Accoucheurs; Two Medical Registrarships, at a salary of £40 each, or one at £80, are awarded to 3rd and 4th year's Students, according to merit.

MEDICAL OFFICERS.

Honorary Consulting-Physicians—Dr. Barker and Dr. J. Risdon Bennett. Dr. Peacock, Dr. Bristowe, Dr. Clapton, Dr. Murchison, Dr. Barnes, Mr. Le Gros Clark, Mr. Simon, Mr. Sydney Jones, Mr. Croft, Mr. Liebreich, Dr. Stone, Dr. Ord, Dr. John Harley, Dr. Payne, Dr. Gervis, Mr. MacCormac, Mr. Francis Mason, Mr. Hy. Arnott, Mr. J. W. Elliott.

Medicine—Dr. Peacock and Dr. Murchison. Surgery—Mr. Le Gros Clark and Mr. Sydney Jones. General Pathology—Dr. Bristowe. Physiology and Practical Physiology—Dr. Ord and Dr. John Harley. Descriptive Anatomy—Mr. Francis Mason and Mr. W. W. Wagstaffe. Anatomy in the Dissecting-room: Anatomical Lecturers—Mr. Rainey and Mr. Wm. Anderson. Chemistry and Practical Chemistry—Dr. A. J. Bernays. Midwifery—Dr. Barnes. Practical and Manipulative Surgery—Mr. Croft and Mr. MacCormac. Physics and Natural Philosophy—Dr. Stone. Materia Medica—Dr. Clapton. Forensic Medicine and Hygiene—Dr. Stone and Dr. Gervis. Comparative Anatomy—Mr. C. Stewart. Ophthalmic Surgery—Mr. Liebreich. Botany—Dr. Wale Hicks. Dental Surgery—Mr. J. W. Elliott. Demonstrations Morbid Anatomy—Dr. Payne. Mental Diseases—Dr. Wm. Rhys Williams. Geographical Distribution of Diseases in England and Wales—Mr. A. Haviland.

T. B. PEACOCK, M.D., Dean.

R. G. WHITFIELD, Medical Secretary.

For entrance or Prospectuses, and for information relating to Prizes and all other matters, apply to Mr. Whitfield, Medical Secretary, St. Thomas's Hospital, Albert-embankment, Westminster-bridge, S.E.

St. Thomas's Hospital, Albert-

EMBANKMENT, WESTMINSTER-BRIDGE, S.E.

The ACADEMICAL SESSION for 1871-72 will commence on MONDAY, the 2nd of OCTOBER, on which occasion an Inaugural Address will be delivered by F. Le Gros Clark, Esq., at Two o'clock p.m. The Prizes for the past Session will afterwards be distributed by the Treasurer, Sir Francis Hicks.

Old Students of St. Thomas's (with their friends), on presenting their cards, will be immediately admitted.

Leeds School of Medicine.—The

WINTER SESSION will commence on Monday, 2nd OCTOBER. The Introductory Address will be delivered by T. Clifford Allbutt, Esq., M.A., M.D., at twelve noon.

LECTURES AT THE SCHOOL.

Anatomy—Mr. James Seaton, Dr. R. T. Land, Mr. J. A. Nunneley. Physiology (including the Practical Course)—Messrs. C. J. Wright and James Walker.

Medicine—Dr. Chadwick, Dr. Heaton, and Dr. Allbutt. Surgery (including the Practical Course)—Messrs. Claudius G. Wheelhouse, F.R.C.S., T. Pridgin Teale, F.R.C.S., and T. R. Jessop, F.R.C.S.

Chemistry—Mr. J. Chapman Wilson.

Materia Medica—Dr. John Edwin Eddison.

Midwifery—Mr. William Hall.

Forensic Medicine—Mr. Thomas Scattergood.

Botany—Mr. Edward Atkinson.

Comparative Anatomy—Mr. C. G. Wheelhouse, F.R.C.S., and Dr. Allbutt. Demonstrators of Anatomy—Messrs. R. P. Oglesby, Charles Richardson, and John Horsfall, F.R.C.S.

Clinical Lectures are given by the Physicians and Surgeons to the Infirmary.

Ophthalmoscopic Demonstrations are given by Mr. T. P. Teale.

Demonstrations in Operative Surgery are given by Mr. Wheelhouse and Mr. Teale.

Demonstrations of Skin Diseases are given by Dr. Allbutt in the Infirmary.

Instruction in Vaccination is given by Mr. Holmes, one of the Public Vaccinators.

Besides the Infirmary, there is a large Dispensary and a Fever Hospital, both of which are open to Students of the School.

Special Prizes of the value of £10 each are given in the classes of Clinical Medicine, Clinical Surgery, and Forensic Medicine.

Silver and Bronze Medals are given in the Class Examinations.

Composition Fee, entitling to attendance upon all the required courses of School Lectures, forty-four guineas. The Fees for attendance upon the Medical and Surgical Practice of the Hospital are twenty guineas each for three years, and proportionally less for single sessions.

All applications for Tickets should be made to the Treasurer, Dr. Heaton, Claremont, Leeds. The Prospectus, and any further information about the School, may be obtained from the Secretary, Dr. Eddison, 19, Park-square, Leeds.

St. Bartholomew's Hospital and College.

—The WINTER SESSION will commence on MONDAY, OCT. 2nd. Students can reside within the Hospital walls subject to the College regulations. For all particulars concerning either the Hospital or College, application may be made, personally or by letter, to the Resident Warden of the College, or at the Museum or Library. A handbook will be forwarded on application.

St. Bartholomew's Hospital and COLLEGE.

CLASSES FOR THE UNIVERSITY OF LONDON.

MATRICULATION EXAMINATION.

There will be two Classes held at St. Bartholomew's Hospital in each year, for the convenience of gentlemen who are preparing for the Matriculation Examination at the London University, from October to January, and from March to June. Provision will be made for teaching all the subjects required, as follows:—

1. Classics, French, English, Modern Geography, and English History—Malcolm Laing, M.A., Trin. Coll., Cambridge.
2. Mathematics and Natural Philosophy—Rev. E. S. Carlos, B.A. Trin. Coll., Cambridge.
3. Chemistry—H. E. Armstrong, Ph.D.

Fee for the Course of Three Months ..	10 Guineas.
Fee for 1 or 2 ..	5 Guineas.
Fee for 3 ..	2 Guineas.

PRELIMINARY SCIENTIFIC EXAMINATION.

A Class in the subjects required for the Preliminary Scientific Examination will be held from January to July, and will include all the subjects required, as follows:—

Chemistry—H. E. Armstrong, Ph.D.
Botany—Rev. G. Henslow, M.A. Cantab., F.L.S., Lecturer on Botany to the Hospital.

Zoology and Comparative Anatomy—W. S. Church, M.D. Oxon., Lecturer on Comparative Anatomy to the Hospital; late Lee's Reader in Anatomy at Christchurch, Oxford.

Mechanical and Natural Philosophy—P. J. Hensley, M.D. Cantab., Fellow of Christ Coll., Cambridge.

Fee to Students of the Hospital ..	6 guineas.
Fee to others ..	10 guineas.
Fee for any single subject ..	3 guineas.

Further information may be obtained on application, personally or by letter, to the Resident Warden of the College, St. Bartholomew's Hospital.

Middlesex Hospital.—The Winter

SESSION for 1871-72 will be opened on MONDAY, OCTOBER 2nd, at Three o'clock, with an Introductory Address by Dr. John Murray.

LECTURES FOR WINTER TERM.

Medicine—Dr. Greenhow, F.R.S. Surgery—Mr. De Morgan, F.R.S. Practical Surgery—Mr. Hulke, F.R.S.; Mr. Lawson; Mr. Henry Morris. Diseases of the Eye—Mr. Hulke, F.R.S. Physiology—Mr. Lowrie. Anatomy—Dr. R. Liveing, M.A. Cantab. Chemistry—Mr. Heisch. Pathological Anatomy—Dr. Cayley. Anatomical Demonstrations—Dr. Liveing. College Tutor—Dr. Liveing.

Consulting-Physicians—Dr. F. Hawkins, Dr. A. P. Stewart.

Physicians—Dr. Goodfellow, Dr. Thompson, Dr. Greenhow, F.R.S.

Obstetric Physician—Dr. J. Hall Davis.

Assistant-Physicians—Dr. R. Liveing, M.A. Cantab., Dr. Cayley, Dr. John Murray.

Consulting-Surgeon—Mr. Shaw.

Surgeons—Mr. De Morgan, F.R.S., Mr. Nunn, Mr. Hulke, F.R.S.

Assistant-Surgeons—Mr. Lawson, Mr. Henry Morris.

Dental Surgeon—Mr. Tomes, F.R.S.

Assistant Dental Surgeon—Mr. Turner.

The Hospital contains 305 beds; there are special departments for Cancer (36 beds), for Diseases of the Eye, Diseases of Women and Children, and Syphilis. Demonstrations are given during the Summer Session on Diseases of the Skin and the Use of the Laryngoscope. Three Clinical Prizes, including the Governors' Prize of Twenty Guineas, are awarded to those Students who pass the most satisfactory examination at the bedside and in the Post-mortem Room. Class Prizes are also given. There are likewise valuable rewards in the form of Six Resident Clinical Appointments. Students can avail themselves, free of charge, of the assistance of the College Tutor, and thus avoid, when preparing for the examinations of the Licensing Boards, the necessity of any private teaching apart from that of the Medical School.

General Fee for attendance on the Hospital Practice and Lectures required by the Colleges of Physicians and Surgeons and the Society of Apothecaries, £90, which may be paid by instalments.

Fee for Dental Students, £25 guineas for the first year, and 15 guineas for the second.

Some of the members of the staff receive Students to board with them.

Further information may be obtained on application to the Treasurer, Dr. Greenhow; the Dean, Dr. Cayley; or to Mr. Lucas, the Resident Medical Officer, at the Hospital.

Middlesex Hospital Medical College.

—WINTER SESSION, 1871-72.—The SESSION will be opened on MONDAY, OCTOBER 2nd, with an Introductory Address, at 3 p.m., by Dr. John Murray, after which the prizes awarded during the past year will be distributed. The Lectures and Clinical Instruction in the Wards will begin the following day. For the College prospectus and information respecting residence of Pupils and other details apply to the Dean, Dr. Cayley.

The Middlesex Hospital College

DINNER.—The ANNUAL DINNER of the Past and Present Students and Friends of the Middlesex Hospital Medical College will take place at the FREEMASON'S TAVERN on MONDAY, OCTOBER 2nd, at 6.30 p.m.—THOMAS TAYLOR, Esq., F.R.C.S., in the Chair.

Gentlemen intending to be present are requested to send in their names as early as possible to the Dean, Dr. Cayley.

Tickets, 7s. 6d. each (not including wine), to be paid for at the door.

INTRODUCTORY LECTURE

DELIVERED AT THE

OPENING OF THE MEDICAL SCHOOL OF
ST. THOMAS'S HOSPITAL,

OCTOBER 2, 1871.

By FREDERICK LE GROS CLARK, F.R.C.S.,
Senior Surgeon to the Hospital.

THE lecturer said: Mr. Treasurer,—It is now many years—I do not care to say how many—since I exchanged my school-days for an artied student's life within the walls of our venerable Hospital. I may even then have indulged in the fond anticipation that, at some long distant future, I might realise the promotion which every Hospital apprentice of my time hoped for, but few attained. Yet I knew that unremitting exertion was needed in this competitive race, and I sought, with others, the mental relaxation and physical bracing which exercise on our river afforded. We used to come to Stangate; and many a time have I tripped, in the lightness of heart which the young and unwarped spirit alone knows, over the long shelving shore at low water, to launch my boat. Even the ready credulity of boyhood would have rejected as absurdly improbable the suggestion that each flood-tide was then flowing over the site of the Hospital of future ages. Yet so it is; and I stand, with mingled feelings of deep emotion, on this spot, to inaugurate the first session of a new era in the history of our old and honoured School.

It would ill become me, on an occasion like the present, to yield to those reflections which naturally claim their influence over the mind of one who has passed the meridian of his days. It is the penalty of survivors to lament over the graves of those who are gone before; and how few of the number who began their career with me still remain, whilst all my honoured teachers have departed. How distant the prospect of the future was long years ago, yet how brief in retrospect. It scarcely needs an effort to carry me back to the time and scenes when, with buoyant hope and earnest purpose, I listened to the words which fell from the lips, and watched the hand-skill, of those I revered—ambitious to tread in their footsteps. Their place knows them no more; and in paying a passing tribute to their memory, I am reminded that I am now the oldest teacher in this School, and the oldest officer or servant of the Institution; and I am sensible how closely the next generation is pressing on—how soon I must give place to others; happy if, perchance, I linger still in the memory of some whose early promise I have hailed, and whose future career I shall continue to watch with abiding interest.

I have been led into this train of reflection by a consciousness that lapse of time has gained for me the privilege of addressing you on this interesting occasion. I shall not, however, indulge myself by giving further expression to meditations in which my younger hearers cannot be expected to sympathise. We are met together to celebrate a new birth; to inaugurate a new era; to renew our association with the familiar waters of our old river, from whose banks we have been divorced so long. He will not resent our presence; for, though we have encroached upon his bed, he flows by us with increased vigour, and in a purer and more wholesome current than of yore. All hail to our noble river, which secures to us immunity from encroachments, and an animated scene and health-giving breezes for our patients.

We have a noble Hospital, and the local habitation of its fitting accompaniment—a great Medical school. To you, Sir Francis, I offer, on behalf of my colleagues, our congratulations on the completion of this great work, which owes so much to your unflagging energy and devotion; and to express, at the same time, our appreciation of the enlightened spirit which has prompted the governors to make such admirable arrangements for the Medical school. I believe, sir—nay, I have no misgiving—that our success will be commensurate with these preparatory advantages, and will leave no room for regret that this impulse has been acted on so liberally.

Although deputed to inaugurate a new era in the history of our Hospital school, I cannot be unmindful that there are

many present on this occasion who sympathise with me in the memories of the past; and I may be excused if I devote a few moments to the retrospect. Such indulgence—sentimental if you please so to call it—may not be without its apology, and even its useful application, in this utilitarian age.

The dawning history of St. Thomas's Hospital was not such as to promise the vigorous adolescence which it has since attained. It was early in the thirteenth century—viz., in 1207—that an accidental circumstance gave birth to it. The canons of St. Mary Ovary were burnt out of house and home, and took refuge in a building, which they erected near at hand, till their monastery was rebuilt; and the subsequent appropriation of this building for charitable purposes is the origin of our Hospital. A few years later, when under the patronage of the Bishop of Winchester, the ruins of whose palace still survive by the riverside in Southwark, it was scantily endowed by him.

The derivation of our name is somewhat obscure. It would appear, however, from the careful researches of Dr. Stone, who has contributed a "Short History of Old St. Thomas's Hospital" to our *Reports*, that the Spital was first dedicated to St. Thomas the Martyr of Canterbury, and afterwards, with more orthodoxy, to St. Thomas the Apostle. The annual income of the Hospital towards the close of the fifteenth century was £343; and this was dispensed by a president, a master, and brethren, the foundation being limited in its usefulness, and employed as an alms-house for the needy and infirm to die in, rather than as a refuge wherein the sick and wounded could be made whole. Nurtured thus through a prolonged infancy of more than three centuries, the institution was at last claimed by our orthodox and excommunicated King Henry VIII., as church property, and was subsequently adopted and endowed by his youthful son Edward, who, shortly before his death, appointed the Lord Mayor and commonalty of the City for the time being as governors in perpetuity of the four royal foundations of St. Thomas, St. Bartholomew, Bridewell, and the Blue-coat School. Under their sheltering wing our Hospital has flourished and been enriched during the succeeding reigns. The old structure survived the great fire of London in 1666, and likewise a succeeding conflagration, ten years later, in Southwark; but towards the close of that century it was replaced by a new building, nearly £40,000 being subscribed for that purpose, and the statue of Sir Robert Clayton, which still graces our grounds, was then erected in commemoration of his liberal benefactions.

My own early memory of our Hospital dates back to a period prior to the erection of the two noble piles of building which flanked the new front square, in the midst of which the beautiful statue of our Sixth Edward stood; and I used to traverse the old London-bridge from my City home, and listen by night, on my way from lecture, to the mysterious music of the water-works, as the tide rushed through them with deafening noise; and little, indeed, did we then ween of the possibility that any power could arise of such influence as to compel our removal to another site.

The interval of our abode in our late temporary refuge has been one of partial suspension of animation, and will, doubtless, ere long be regarded as a blank in our existence, when the life we now renew shall be fully established and developed.

In the chronicles of our Hospital there are recorded many curious and interesting facts and events, as well as the names of both Physicians and Surgeons who were not only famous in their own day, but whose reputation has survived to the present time. Amongst the records—for which I am much indebted to our Medical Secretary, Mr. Whitfield—I find references to some singular customs and circumstances, which mark the changes that time has wrought in us and in our establishments. Thus, towards the close of the sixteenth century, inmates of the Hospital of notoriously bad character were ordered to be punished at the cross erected within its walls before they were discharged; and we have an actual recital of punishment by whipping at the said cross being inflicted, for misdemeanour, in 1567. We also find that, in 1573, the morals of the patients were further cared for, by a hand-mill being provided for them wherein to grind corn, that they might thus "be kept from idleness." In 1698, Mr. Elton, one of the Surgeons, was suspended from his office for assaulting and beating one of his colleagues; and in consequence thereof an order of the Court of Governors was passed—which, I presume, is still in force—that in future, if any officer strike or beat another officer, he should be expelled.

This was certainly a vulgar way of resenting an offence, and is suggestive of the hybrid character of the barber-chirurgeon of that epoch. But it is recorded traditionally that the more

polished Physician, whose status in society permitted him to carry a rapier by his side, was also guilty of Professional squabbling, ending in deadly feud; for Mr. Whitfield has in his possession a gold-headed cane which was presented by one of our Medical staff to his grandfather, in recognition of his services in arresting a mortal combat across his table by two Physicians of this establishment.

I find the practice of specialities is recognised in the register of events of 1638, when 207. a year was voted to a Surgeon—I suppose the Wilson of his time—for the special care and cure of scald-head. But the governors of that period showed a wise discretion in another allied act. It is well known that, before the great Cheselden lived, and adorned alike the Profession and our Hospital, one of the most terrible diseases to which the human frame is subject was rarely cured, because of the ignorance and incapacity of those who undertook the only means of affording effectual relief by operation. Now, it appears that in the year 1700 a certain Dr. Cypriano, a native of Amsterdam, and educated at Utrecht, had acquired a reputation for lithotomy; and the General Court of the Hospital, prompted by a humane feeling, and careful also of the honour of their officers, requested the President to treat with this gentleman, with the view to his instructing two of their Surgeons in his special operation. It is recorded that on several occasions he performed the operation in question at our Hospital with great success, and without fee or reward; but we do not learn whether his instructions were serviceable to his two pupils. I should think it doubtful; for little is learned in a complex operation, almost every step of which is out of sight, and in which an appreciation of all the attendant difficulties can be acquired only from an accurate acquaintance with the anatomy of the parts concerned. But anatomy was not then studied as it now is, and the benevolent object of the governors would have been more effectually attained had they reseeded an order of the Court issued a short time previously, that “no dead corpse should be dismembered.”

The first impulse in the right direction, in the performance of lithotomy, was given by a French priest, Frère Jacques, in 1697, who acquired an European fame; but it remained for Cheselden to place it on the sure foundation which I have indicated; and it is much to say of our great Surgeon, that his work on the subject, published in 1723, deserves to be a textbook still, and that in every essential particular this operation remains what he left it a century and a half ago. What worthier subject, then, could be found for the sculptor's chisel, or to be held in cherished remembrance by the old St. Thomas's students? and beautiful, as a work of art, is the marble effigy of this fine old English Surgeon which now graces our entrance-hall—the gift of those who delight to honour the great and good associated with their Hospital and school.

At this period of our history a regular registry of the Surgical pupils was kept by the Apothecary, and the useful order of dressers existed. It may not be uninteresting to the gentlemen now holding that responsible office to learn that they were then called “Cubbs” in our establishment.

I have said that we can boast of many names of celebrity in the annals of our Hospital. Thus, one of our Physicians, Sir F. Prujean, received special marks of honour at the Court of Charles II., whose queen he attended in a severe attack of fever.

Dr. Richard Mead, whose courtly bust (also the gift of our old students) presents an interesting contrast to the artless and almost rude attire of his great Surgical colleague, was an accomplished Physician and a man of letters; and whilst an officer of our Hospital he condescended to read lectures on Anatomy to the Company of Barber-Surgeons. Engaged in a large and lucrative practice, the Medical attendant of Queen Anne in her last illness, and the Court Physician of George II., we learn that he was “highly respected, and as the patron and friend of the learned universally admired.”

It is recorded that Cheselden gave lectures on Anatomy and Surgery at the Hospital, but it was not until later—viz., in 1768, that Joseph Else, one of the Surgeons, was officially appointed to lecture; and it may be said of him that he was the founder of the systematic teaching of Anatomy in St. Thomas's Hospital.

Dr. Mark Akenside was likewise an accomplished Physician, and, in addition to being one of the officers of our Hospital, held the highest Court appointment at the commencement of the reign of George III. But his reputation as a poet has survived his Professional fame, and there is much of elegance and rhythm in his verses, and his language is choice and classical; but few can read his “Pleasures of Imagination” without some sense of weariness at the pompous and somewhat pedantic diction in which his really beautiful imagery is clothed.

In 1770, Dr. Fordyce, whose portrait we possess, set us an example of diligence which I think few of my colleagues would be disposed to follow. He used to lecture daily on three subjects—viz., Chemistry, *Materia Medica*, and the Practice of Physic—and these lectures, given at his own house, were delivered in three successive hours, commencing at seven o'clock in the morning.

The names of the first Lister (whose aged, benevolent face I can just recall) and of Wells (the author of the elegant and conclusive monograph on the “Formation of Dew”), of Currey, Chandler, and the Clines, bring me to the period of my own personal recollections, when my honoured master, Mr. Travers, with Mr. Green and Mr. Tyrrell, were the Surgeons, and Dr. Williams, Dr. Elliotson, and Dr. Roots were the Physicians of our Hospital. They are all gone, and I cannot but record the great esteem in which they were held by all who knew them, as men of high scientific attainments, whose teaching and example have left their impress on the minds of many scattered throughout the length and breadth of this land. Of my own more immediate contemporaries, some are gone and some still survive, though they have withdrawn from amongst us. The grave has scarcely closed over one; and many will have learned with grief, but scarcely with surprise, of the death, one short week since, of Samuel Solly. I have known him since my boyhood, and we have been allies and colleagues throughout life; and I cannot recall a single hour during which the harmony of our intercourse has been interrupted. His compulsory retirement from Professional duties, in consequence of ill-health, occasioned our premature loss of his services here; and he carried with him the sympathy and kindly feeling of all his colleagues.

I may, perhaps, be permitted to express the excusable pride I feel in having now associated with me many of my former pupils, who have already made a name for themselves in the world of science; and even in the rising generation, St. Thomas's has no need to be ashamed of her children; and we both hope and expect she will rear many worthy successors to those I have named.

The last few words I have spoken remind me of the change which has come over the guiding principle of election to the offices of this Hospital since I was an articulated student. Then an apprenticeship to one of the Surgeons was deemed a necessary first step towards obtaining the appointment of Surgeon to the Hospital; and I have, naturally, a vivid recollection of all my contemporaries, who were competitors at the early start. Just as on the racecourse, one by one fell away from various causes, and speculation as to the future was often falsified by unredeemed promise or inability to stay. He who had the good fortune, as it was mine, to get an early start might hope to win; but the necessary exertion was arduous and unremitting, for since the age of twenty I have not ceased to take part in the teaching, though not the less a learner, in our Hospital school. I mention this circumstance to exemplify the trying nature of the long probation and deferred promotion which attended this arrangement.

The principle of free choice which now prevails, partly the cause, and in part the consequence, of the comparatively obsolete usage of apprenticeship, carries its own recommendation with it; yet I am free to admit that my conservatism does not allow me to dismiss this custom of other days without a word of apology for it. If we may judge by results, certainly the names of my immediate predecessors and teachers, and their contemporaries at the sister Hospital, where the same usage prevailed, is some justification of that system. The training of the young men who claimed their privileges from an apprenticeship of six years at the Hospital, was such as to constitute a special preparation for their future duties, if they were naturally qualified to avail themselves of their peculiar advantages. Living for a lengthened period in the dissecting-room and wards of the Hospital, they could not fail to acquire that familiarity with their after-engagements which no other training could so well supply. Indeed, the change in the practical working of the old system of apprenticeship is not, to my mind, an unmixed advantage. When Practitioners in the country conscientiously performed their duty towards their apprentices during their more protracted sojourn with them, our students used to come to London already in possession of preliminary information, and what I may term conventional details, in their Profession, which are not so well acquired in our schools.

But times are changed, and with them the rising generation; and I neither expect nor desire to see a recurrence to the bygone system to which I have referred. Yet I would venture to plead on behalf of the students whom we educate at our

school;—other things being equal, their prior claim to preferment is just and natural, and should never be ignored. In reputation, a Hospital and its school are essentially linked together. The indirect advantages to the public derived from the latter are scarcely subordinate to the benefits directly flowing from the former; and the fame of a Hospital must ever be commensurate with the reputation of its officers, as trustworthy teachers of the scientific practice of their Profession.

But both teachers and pupils have their special responsibilities, and by their reciprocal fulfilment only can successful teaching be secured. I believe that the public generally have but a very imperfect appreciation of the complex and extended course of instruction which Medical education now embraces; and it is this increasing complexity which continually enhances the difficulty of the problem that is presented by the necessity of having some definite limit to the acquirements which a qualification to practise demands. It is not given even to the most gifted to become proficient in all the required subjects within the limit of time which is assigned to study; and, therefore, it is obvious that a standard must be adopted which shall supply a numerical sufficiency of qualified Practitioners. Whilst it is my sincere conviction that the College of Surgeons has honestly and faithfully fulfilled its functions, I have hailed with satisfaction, as I have sought to forward by my feeble influence, that scheme of conjoint examination which offers to the candidate one common portal by which he may enter the Profession with a qualification to practise, whilst it leaves to our English colleges and universities the special privilege of conferring honorary degrees, after exacting proof of more advanced attainments.

I said that teachers have their responsibilities; and, without presuming to dogmatise on this subject, I will briefly indicate the method which my own experience has taught me to regard as the most profitable, if not the most acceptable, mode of imparting Professional knowledge. Teaching may be either exhaustive or suggestive. The former method, even if well and fully accomplished, can but instruct the student in facts, and supply him with reasons—good or bad—for the conclusions from these facts. But this is not education, which consists less in supplying the learner with thoughts than in stimulating him to think for himself; for

“—Knowledge dwells
In heads replete with thoughts of other men;
Wisdom in minds attentive to their own.”

Bishop Butler has remarked that the best writer—and, *à fortiori*, I should say the best *viva voce* teacher—is he who simply states his premises, and leaves his readers to work out the conclusions for themselves. It is true that much of our teaching relates to facts; but these facts are, or ought to be, associated with principles, and the business of the teacher should be, in my apprehension, to exercise the mind of his pupil to work out for himself the relation between a principle enunciated and the facts by which it is supported. Trituration and digestion are as essential to healthy assimilation by the brain as by the stomach; and I am disposed fully to concur with an apologist of Coleridge's disjointed style of writing, when he eulogises its highly suggestive character, as contrasted with such exhaustive teaching as alone will satisfy him “who thinks that the epithets *teres atque rotundus* are the highest that can be applied to a scientific work, or who expects an author to furnish him with a complete system, which he can carry away in his memory, and, after it has received a few improvements from himself, may be hawked about to the public or to a set of admiring disciples.” I cannot help lamenting that there is much in the present method of teaching which is subversive of this suggestive principle for which I plead. Circumstances have, no doubt, conduced to this result, and chiefly the multitude of subjects crowding upon the attention of the student, which create a demand for the supply of information in such a form that it can be appropriated by an exercise of memory, without the invigorating effort which suggestive teaching stimulates. The results of such mechanical learning are not satisfactory, and the stereotyped acquirements of our students have induced the examining bodies wisely to modify their examinations, by rendering them as practical as possible, in order that the possession and exercise of a retentive memory may not be the chief qualification on which a student can rely for obtaining his diploma.

If, then, it be the duty of the teacher to stimulate the student to think for himself, it is no less incumbent on the latter to cultivate a spirit of self-reliance in learning his Profession. He must, in short, educate himself, with the assistance and direction he will obtain from his teachers; and he will find that an infusion of enthusiasm into his work will

impart a pleasurable life and activity to the laborious details of his scientific pursuits, and render attractive that which would be otherwise irksome or repulsive in his studies.

I would now address a few words especially to those who are about to commence their Hospital career. Your sojourn amongst us is fraught with momentous consequences to you, both moral and intellectual. The new life you enter upon and the new scenes you become conversant with must leave their lasting impress on you for good or evil. Familiarity with suffering and death in all their varieties and forms constitutes a school of moral training which cannot fail to refine or to debase the moral sense, to strengthen or to enervate the character. Your future career will afford ample opportunity for applying the lessons of sympathy here inculcated, and of patient forbearance and gentleness in your relation with the sick and sorrowing, with whom so much of your life will necessarily be spent. These are grave responsibilities which will be yours, the importance of which you cannot too soon realise—confidence of the most sacred character entrusted to your keeping, and opportunities for good beside and beyond your mere Professional duties—from availing yourselves of which, no false humility, no mistaken apprehension, should tempt you to shrink; and which you cannot evade without a compromise of truth, if you indulge the restless hope of restored health or of prolonged life when you know that hope is vain. It is unnecessary I should pursue this subject further. If you obey the promptings of your better nature, and speak the truth with gentleness and candour, you will have your reward in peace of conscience; whilst it is beyond your ability to estimate the consequences to the dying sufferer who hangs upon your lips.

If I have paused to point out these as some of the moral lessons to be studied here, it is scarcely requisite that I should dwell on the necessity of improving every opportunity of mental culture now placed within your reach. The book of nature is spread out before you in the dissecting-room, the laboratory, the wards, the museum; its pages are to be supplemented—not superseded—by the teaching and recorded opinions of other interpreters of the great original. Drink deeply at the fountain-head, and gradually each new phenomenon or insulated fact will assume its true relation to others, as you view them, blending harmoniously, and acting under laws alike grand in their conception and simple and uniform in their operation, and thus bearing the impress of the Infinite intelligence and goodness which planned them. It is thus, I venture to believe, that you will best cultivate the self-reliance and freedom from the slavery of authority which are such essential qualifications for philosophical inquiry, and which are quite consistent with—indeed, ought to be the offspring of—true humility; for that independence of character which has taught its possessor to scorn servile imitation, and to bow obsequiously to no man's dictum, should prompt him likewise to follow meekly the steady light of Truth, and to be the ever-ready servant and interpreter of nature. I do not say your path is easy; but you may make it pleasant by opening wide your heart in sympathy with your fellow-men, and by cultivating your Profession in an enlarged and philosophic spirit, instead of resting satisfied with the minimum of knowledge as your trading capital, acquired only for the pecuniary return it promises. You owe this to the noble calling you are about to follow; for, though I am aware that it has been said—and, I fear, with some truth in its application to the present time—that the “age of chivalry is gone, and that of sophisters, economists, and calculators has succeeded,” yet is my faith unshaken in the elevating tone and influence of scientific pursuits, and in the full, though tardy recognition of their claims, at length forced on the promoters of public education—unshaken, also, in the manly sentiment and independent principle which pervade the mass of my Profession.

A few words more of personal application I am constrained to speak to my younger hearers, who will bear with me if their triteness deprives them of their relish. Most of you must be aware that your sojourn amongst us entails sacrifices on those who have sent you here—sacrifice in the anxiety consequent on your being thrown alone amid all the temptations, frivolities, and dissipation of this great city, and a pecuniary sacrifice for your best and permanent interest. Confidence is placed in your redeeming the tacit or spoken pledge of honest and upright conduct. Will you abuse and betray that trust? Yet wasted time and misemployed talents, and the indulgence of low tastes and vicious habits, will be such betrayal, and bring grief and disappointment in return for self-denying love.

In fulfilling your obligations I would simply ask you to be manly; and I will tell you briefly my interpretation of that

comprehensive word. I should be untrue to my own instincts and to the position I occupy as President of the United Hospital Athletic Club, if I did not bid you cultivate manly exercise and sport. I admire the strong arm, the swift foot, and the bold bearing of the athlete; yet these pastimes must be your recreation, not your occupation. But there is a higher phase of manliness to which I especially refer. It is manly to be severe with yourself, and to deal lightly with the failings of your fellow-men. It is manly to admit rather than to justify either ignorance or error. Self-sacrifice is manly; but there is no element of manliness in the untruthful, the selfish, and the impure mind. It is both gentle and manly to esteem others better than yourselves, and to claim the respect which is your due, by that courteous consideration for all around you which never fails to characterise the true gentleman. Above and beyond all, if you value your Bible, it is manly to avow it, and, by patient endurance of contradiction and consistency of conduct, to prove that your faith is a real and living principle, regulating primarily your own deportment, and thus influencing your relations to all around you.

"To thine own self be true,
And it will follow as the night the day,
Thou canst not then be false to any man."

But it is time that I bring to a close my brief tribute to the memory of the past, and the vindication of my confident hope in the future, of our ancient and royal foundation.

Once the refuge of a few obscure monks; now reopened amid the pomp and glittering pageantry of State officials, and graced by the presence of the noble and gentle in the land, and of our beloved Queen who sympathises in the early interest the good Prince Albert took in our future home—nurtured erst in poverty, and restricted in usefulness; now possessed of a princely income, and folding within her wide-spread arms the destitute sick and maimed, whose only passport is suffering and want—yielding formerly her pittance of empirical skill and nursing to the few who sought it; now rich in the memory of so many whose labours within her walls have indelibly allied their names with some of the most enduring achievements of Medical science; and, shall I not add, proud of association with the imperishable name and work of the self-denying and gentle Nightingale.

Such, in brief, is the history of this noble institution, and such are the children she has nurtured, who have repaid her fostering care by shedding a lasting lustre on our Profession.

And what is the moral to be laid to heart from this history and these names? Shall we shrink in timid indolence from sustaining the weight of reputation thus transmitted to us? Shall we plead, with deprecating humility, that "there were giants in those days," and sit down in listless indifference beneath the laurels they planted? Nay; not so. Let each and every associate in the work, with unselfish and untiring energy, devote himself to his allotted task. Let the substantial token of our affection for our *Alma Mater*, placed within her chapel walls, be the pledge and symbol of that harmony of action for the common weal, which no jarring note of discord shall disturb. Let private advantage and individual preferment ever yield, as in truth and honesty they should, to the fulfilment of the sacred trust to which every officer of this establishment is pledged when he takes office here. Let this be done earnestly, heartily;—I speak, Sir, as one who has journeyed through weary years of discouragement, and is permitted, by grace and not by right, to tread a few steps within the boundary of the Promised Land;—let this, I say, be done earnestly and heartily, and who shall gainsay the confident anticipation which it may be, perchance, my happiness to witness, though not to share in, that our ancient foundation, both Hospital and School, shall emerge from its temporary eclipse, to shine with more than pristine brightness?

And, standing thus on this border-land, once more, beside the old, familiar river, from whose slimy bed this stately edifice has risen as if by magic—surrounded, too, by my trusted colleagues, and many familiar faces which remind me of our earlier and happy association as pupil and teacher—imagination portrays for me, without an effort, the expanding vista of an illustrious future, worthy of such a history and such a habitation.

THE new Hospital for Women at Birmingham was opened on Monday last, with a crowded waiting-room, and a number of most interesting cases presented themselves.

THE introductory meeting of King's College Medical Society will be held on Thursday, October 12, in the library, King's College, Dr. Rutherford, President, in the chair, when Dr. Cotterill will read the address.

ABSTRACTS OF

THE INTRODUCTORY ADDRESSES DELIVERED AT THE OPENING OF THE MEDICAL SCHOOLS.

CHARING-CROSS HOSPITAL.

THE Introductory Address at this Hospital was delivered by Dr. Green. The lecturer, in the first place, alluded to the irreparable loss the Hospital and School had sustained in the death of the late Dr. Hyde Salter. He then proceeded to review the great improvements which during the past year had been made in the Hospital and School premises—the new wards and the increase in the number of beds, the new dissecting-room, library, post-mortem room, and physiological laboratory; and the valuable additions which had been made to the staff. In seeking for a special subject upon which to address his audience at the commencement of another Medical session, Dr. Green said that that which appeared to him to be the most deserving of attention was the necessity which existed at the present time for a more *practical* study of Medicine and Surgery. The time was gone by when a few hours spent in the dissecting- and lecture-room, and the commission to memory of a small volume of multifarious facts, were all that was required of the Medical student. The Medical Profession was essentially a practical one, and Medicine, no less than Surgery, demanded a practical education. The lecturer then proceeded—

It has been argued, and students have left their Medical schools with the impression, that a practical knowledge of our Profession is readily to be acquired after going into practice—that the engagement in the attempt to treat disease brings with it the knowledge which it is necessary to possess. I do assure you, gentlemen, that nothing can be more erroneous. I do not mean to deny that an educated student—a man well grounded in what we may call the *elements* of Medicine and Surgery—may, and does, derive very much additional knowledge from the practice of his Profession; on the contrary, an educated man engaged in practice is in the most favourable position for acquiring an increasing store of knowledge. He starts upon a firm basis, and one upon which he can, year by year, continuously and successfully build. But I do maintain that if a man, upon leaving his Hospital studies, does not possess a large amount of practical knowledge—knowledge, remember, which can only be obtained by systematic work in the wards and in the out-patient room—the chances are very much against his acquiring this knowledge after he has once commenced to practise. If he does not acquire such essential elementary accomplishments, for example, as how to put up a fracture, how to palpate the abdomen, how to distinguish between systolic and diastolic cardiac sounds, or how to recognise urinary deposits under the microscope whilst he is a student, the probabilities are that he will never do so at all. It is to prevent the possibility of the student finding himself in such an unenviable condition, that the examining bodies have recently made changes in the curriculum and in the character of the examinations; and it is in order to stimulate you to do your best—to prepare yourselves for all that will be required of you—that I have ventured to bring this subject before you on the present occasion.

After alluding briefly to the nature of examinations, Dr. Green continued—Be assured, then, gentlemen, that what will be required of you is, such a knowledge of your Profession as is not to be obtained from the attendance upon lectures or from the perusal of books, but can be acquired only by the *practical* study of disease. This will be required of you not only by your examiners, but also by the public. The time, we believe, is rapidly passing away when mere Professional tact will suffice to insure success in the practice of our Profession. Tact must always be an important element in the acquirement of success; but as education advances, and as Medicine and Surgery continue to approach that high position which they so justly deserve, we shall find that there is an increasing demand for real knowledge, and that tact without this will no longer be accepted.

In order to obtain this knowledge, the lecturer impressed upon the students the necessity of availing themselves of all those opportunities which, in consequence of the regulations passed by the examining boards, were presented to them; of holding clerkships and dresserships with the determination to acquire from them all the practical knowledge which the

filling of such offices is so eminently calculated to convey; that the various means provided for practical instruction should be utilised, and that these should no longer be regarded as optional, but as *necessary* parts of education.

He then pointed out the importance of students studying disease *for themselves*; and said—If I mistake not, the knowledge we derive from even one half-hour devoted to the careful and painstaking study of a single patient will be more valuable to us than many hours spent in listening to the teaching of others. It is this kind of clinical work which appears to me to be the great want in our education at the present day. We do not, I think, sufficiently recognise its importance, and hence, except in the case of those comparatively few students who are fortunate enough to secure resident Hospital appointments, and of some of the more studious clerks and dressers, it is almost unknown. We do not mind going round the wards or into the out-patient room and listening to the clinical remarks of our teachers, but we do not consider it at all necessary to examine the patients for ourselves, and, even if we are asked to do so, we perhaps hardly take the trouble to do it in anything like a thorough manner. And yet surely it is from such study as this that we are most likely to derive that practical knowledge which we shall stand in need of when we are thrown upon our own resources. How many hours of our student-life do we spend in the dissecting-room, studying the dead body? Ought we not to spend a more proportionate amount of time in the wards, studying the living body?

The lecturer then remarked upon the insufficiency in the amount of time set apart in the curriculum for systematic clinical work; and continued—Examine the patients for yourselves; form your own conclusions as to the nature of their diseases; decide upon the plan of treatment you would adopt, and make your own prognosis. And by all means be very thorough in what you do. Spare no pains and grudge no time in learning all that you possibly can of the ease you are observing. Remember that more mistakes are made from want of care than from want of knowledge. Do not attempt to observe too many cases at a time; one done well is far better than a dozen done incompletely. Watch the same case carefully from day to day; note the natural course of the disease, and the way in which it is influenced by remedies; and if it should terminate fatally, let nothing prevent you being present at the post-mortem examination.

The lecturer concluded by an allusion to the rapid advances which are being made in the knowledge of pathology and therapeutics, and by an exhortation to the students to use all diligence to acquire during their student-life what in the present age would be required at their hands.

GUY'S HOSPITAL.

THE Introductory Address was delivered by Dr. Oldham, of which the following is an abstract:—The last thing which a student will lack at Guy's is opportunity. But he has to apply his mind to the acquisition of a large section of knowledge; and, above the industry it demands, there is that higher knowledge—the government of his own mind. To train, refine, and discipline the intellect, and to keep it in alliance with the moral sense, is what a student is urged to do, and he must do it for himself. Two elemental faculties of the mind—by which he can question its operations and control them by his will—enable him to comprehend the power he possesses of self-culture; but to bring these faculties into constant play, so as to know the pursuits and progress of the mind, and to judge impartially of them, needs vigilance and resolution. The fact of a student being placed here without restraint, increases the importance of this self-protective habit. The mind is never at a standstill, and it cannot be neglected for any time and then be found the same pliant instrument it was before. We must recognise innate differences in mental capacity; and Medical science and practice gain by variety of power. Sometimes a student is discouraged in being distanced by the rapid successes of a brilliant intellect; but experience shows that, taking the resources of the whole man, the ultimate success of those who have striven their utmost to discipline their minds, enlighten their moral nature, and learn their Profession is remarkably equalised.

The study and practice of Medicine afford scope for mental culture and urgent motives for its exercise. How imposing is the portal through which you first enter, and how unlike the drudgery of a reiterating act! Your minds are at once engaged

in the study of the physical sciences, or a series of facts of infinite variety and absorbing interest—one set leading on to others—and then their order and rule of law. You require to know them, where they touch and expound Medical science. Their study is a leading element in a liberal education, teaching the mind to lay well hold of fact, storing it with ideas, imparting intellectual tone and a high discipline.

There is an obligation on us all to help to raise the social status of our Profession; but all other expedients are superficial compared with the great one of a more extended and elaborated preliminary education. It is from the highly cultivated men among us that our position—such as it is—is maintained; and when from this rank we see one conspicuous as Surgeon, teacher, author, for high-mindedness and a polished courtesy, we may indeed rejoice, as in the instance of Sir James Paget, that the highest honour which in this country is awarded to a practising Surgeon or Physician should have been conferred on him.

The number and diversity of the subjects which are included in the study of Medicine are favourable to mental activity, and diligence is essential to master the details. The senses, too, are quickened by them, and the training they go through, not only by direct and combined exercise, but by the aid of various instruments, is hourly exemplified. You are required, in a great measure, to work out by your own observation your knowledge of disease, and there is no man so hopelessly bewildered as he who, when he is called upon to treat disease, has to turn from his patient to a description in a book. You are not, however, to be devoted to an unrelenting toil. We who know the laws of health proclaim that to keep the mind in a jaded state is to enfeeble it, and recreative pursuits, well selected and subordinated to your main pursuits, strengthen the body and refine the mind.

It is in clinical study that all you have acquired is to be condensed; and you cannot exaggerate the importance of carefully reporting cases. It brings you, also, into close relation with your teachers, who soon see what of earnestness there is in you. In searching into the causes of disease you first see how character is unmasked; and in this respect the Hospital is a large confessional, in which you are invited to observe the promptings of conduct and the deepest recesses of the heart. You here, also, learn something of the lot and condition of the poor, who, as a rule, will command your respect. It is in the lying-in charity that we see the poor in their worst attire but their truest aspect; and there in times past I have often witnessed the greatest suffering with the least complaint, the purest affections in the lowest hovels, the deepest gratitude for the smallest benefit, and abject poverty with the generosity which gives the most of what it least can spare.

A powerful motive for Professional culture ought to arise from your anxiety to repay the expectations of those who send you here; and another, to enable you to meet those momentous incidents of practice where death and life are trembling in the balance; and, lastly, you are urged as a supreme duty to adore and magnify the Giver in the cultivation of His highest gifts.

KING'S COLLEGE.

THE Introductory Address was delivered by Professor Rutherford. After stating that the chief objects sought for by those who profess Medicine are to preserve health and to cure disease, Dr. Rutherford pointed out that a knowledge of the healthy state and of the conditions necessary for its preservation must necessarily precede a knowledge of the diseased state and the means required to rescue an individual from it. After referring to some of the attractive features of biological science, he stated that, although Medical studies deal to some extent with metaphysics, they nevertheless chiefly concern the two great factors of the physical world—to wit, matter and energy. "The first great idea which those who enter upon the study of living beings should lay hold of is, that the matter and energy which are found in them are derived from the dead world around them. Things that live, although they can transform matter and energy in the most marvellous ways, can neither create nor destroy them. A continual stream of matter and energy flows from the dead into the living world, serves its time there, and returns to the dead world again. . . . Seeing that the matter and energy found in the organic come from the inorganic world, it might be anticipated that the changes through which they pass in the world of life are subject to the same laws which govern them in the world that is lifeless. Such appears to be the case. The law that

rules the chemical changes taking place in a muscle does not differ from that which regulates the chemical changes that go on in a steam-engine. The laws that preside over the movements of the blood are just those which control the movement of any other liquid. The metamorphoses which matter and energy undergo in the living world are many of them infinitely more complex and difficult to follow than those through which they pass in the inorganic world. It is therefore necessary that one should be acquainted with the character of the phenomena found in the inorganic ere we attempt to follow or comprehend the more intricate nature of those found in the organic kingdom. In short, the chemistry and physics which immediately concern lifeless things must be studied before the chemistry and physics which immediately apply to things that live can be comprehended. In other words, a knowledge of inorganic chemistry and physics must be acquired before organic chemistry and physics can be understood."

He then, with the aid of some familiar illustrations, explained the methods of observation and experimentation by which facts in natural science are ascertained, and pointed out the disastrous results that follow hasty observation, careless experimentation, too rapid digestion of facts, and the substitution of fiction for truth. The truly scientific method of investigating the events of life was begun three-and-twenty centuries ago by Hippocrates, and fortunate would it have been had the path which he opened up been pursued; but the dark ages enveloped it in obscurity, and it was not fairly reopened until our immortal countryman Harvey found his way into it, and Bacon shed the light of his genius upon it.

In indicating the present position of Medicine, the lecturer stated that in inquiries regarding living things in a state of health or disease, students should particularly attend to—
1. Their physical or structural composition. 2. Their chemical composition. 3. The functions or actions which they perform. He stated that the four great essential subjects in Medicine are physiology, pathology, hygiene, and therapeutics, and proceeded to explain what was meant by these subjects, and to give an account of their present position. "The most advanced part of physiology and pathology is that which refers to the structural composition of the body. Our knowledge of the chemical composition of the body is not so advanced, because of the excessively difficult nature of the inquiry. Very much has been learned regarding the actions of the body in health and disease; but although we know a great deal regarding these actions, we are far from having ascertained all about them. No stone, however, is being left unturned. The secrets are being sought out with the aid of the most refined physico-chemical instruments and processes.

"The causes that give rise to the phenomena of life have, ever since the first glimmerings of science, formed a deeply engrossing subject for inquiry; and assuredly, as time runs on, the interest and importance that attach to such a question, so far from diminishing, continue if possible to increase. For centuries there has been a keen controversy between the vitalists and physicists. The vitalists first took up the ground, and ascribed the operations of the body to spirits—good during health, and evil during disease. Hippocrates, some three-and-twenty centuries ago, started the hypothesis that the actions of the body are presided over and directed by a spirit termed Nature. Aristotle called this spirit Vegetative Soul; and said that it is common to all plants and animals. In modern times this spirit, or principle, has received various names, and its existence is still believed in by some physiologists. By them it is looked upon as directing the various operations necessary for the life of plants and animals. In opposition to this idea, many physiologists have come to the conclusion that the existence of such a spirit is a myth; and they believe that the ordinary vital operations of plants and animals are due to the ordinary attributes of matter and energy. There has been some extravagance on both sides. Some vitalists have called the holders of the physical view materialists, even if they refuse to believe that a cabbage is possessed of a vegetative soul; alleging that if we deny the existence of such a soul in a cabbage, we must deny the existence of a man's rational soul, and even the existence of a God. On the other hand, some upholders of the physico-chemical views have absurdly maintained that the properties of matter and energy may be regarded as sufficient to explain all mental phenomena. The controversy is still unsettled."

In alluding to the spiritualists of the present day, the lecturer said—"We have been informed by a noble lord that a certain Mr. Home is able to defy the law of gravitation to an extent which is, to say the least, *very* remarkable. We have been seriously told that he can fly through the air by a mere effort

of his will. The number of those who possess this marvellous power would seem to be *very* limited; and it is fortunate for cab proprietors and railway shareholders that the number is likely to remain a small one. As yet Mr. Home and his disciples do not seem disposed to make a public exhibition of their marvellous powers. Probably they still continue to ride in omnibuses, cabs, and railway carriages, and find it safer to trust themselves to such modes of conveyance rather than to their newly discovered mode of aerial flight. Spiritualism of the sort now fashionable is not so very novel as the spiritualistic media would fain have us believe. Within the memory of most people miracle-workers have been ever and again starting up. The tricks of the mesmerists, spirit-rappers, and table-turners made dupes of a great many simple-minded persons. Possibly the media have now become so dexterous that they can make dupes of persons whose minds cannot be exactly charged with simplicity; but, nevertheless, it is probable that ere long their tricks will be exposed, just as all similar tricks have been."

Hygiene, the lecturer said, is in a state of considerable advancement. We know well the ordinary conditions necessary for preserving health; but we have yet much to learn regarding measures sufficient to protect man from the malignant agencies that produce disease. Nevertheless, the great success of vaccination leads us to expect great achievements in this direction.

He explained many of the reasons why therapeutics are in a state which, though rapidly improving, is still far from being satisfactory. "The mechanical appliances adopted by the Surgeon are, on the whole, eminently satisfactory. Nothing can surpass the cunning and dexterity with which he uses his knife to remove a diseased member. Still, in the majority of cases, the use of the knife in disease implies the confession that the Surgeon has failed to arrest the diseased condition of the part. Both Surgeons and Physicians experience extreme difficulty in exercising a really curative influence over disease. Patronius Arbeter was wrong, however, when he said that 'a Physician is nothing but a satisfaction to the mind.' Happily, there are many diseases which can be completely cured, and a great many more that can be influenced for good, by the use of remedial measures; but still the achievements of Medical men are circumscribed by a circle which, though ever widening, is yet a narrow one. The chief reasons for this limited success are, that we are still unacquainted with many of the healthy actions that take place in the body. The causes of many diseases are as yet unknown. It is not yet possible to ascertain precisely what parts of the body are affected by some diseases. Obscurity still hangs over the significance of many of the altered bodily actions that are observed in disease. Some of these actions have a fatal, others have a beneficial, tendency, and the difficulty is to know which to favour and which to repress. The actions of many drugs, and other remedial agents, are only partially known, and even where these actions have been ascertained there remains the difficulty that the precise influence of the drug differs in different individuals, and even in the same individual at different periods of his life. But we are not possessed of the power of ascertaining beforehand what are all the respects in which one man differs from another, and, therefore, we are not by any means always able to predict what will be the precise influence of the remedial measures which we adopt. Hence it is that Medicine does not present the characters of an exact science. We cannot, in many instances, say what is or what will be, nor can we always with precision wield those powers which we already possess for influencing the constitution of the body and its actions. We have, for the present, to weigh probabilities, and to hit the mark as nearly as we can. This fact need not, however, dismay those who are entering upon the study of Medicine. She is daily becoming more exact, and the pleasure and satisfaction which result from an honest and earnest attempt to render her more scientific quite outweigh any disappointment one may be inclined to feel at finding that she lacks much of that precision which gives such charm to physics, chemistry, and mathematics. The great fact to be remembered is, that Medicine must be pursued in a scientific spirit. Only by cautiously comparing and weighing all the facts of any case, and coming to just conclusions from these, can we hope to advance Medicine. We have to bear in mind that whenever we give a man a dose of Medicine we really perform an experiment—an experiment which is important to the person and important to the science of Medicine." The lecturer said: "Observe all the conditions of the experiment, and write them in a book, so that they may never be forgotten by your memories, which are treacherous at the best. Old Hippocrates showed us a splendid example. He wisely saw that to get at accurate facts is the backbone of all

science. He did not content himself with remembering his facts: he wrote them on tablets, so that they might never be forgotten or altered. If you will adopt the Hippocratic plan—if you will be careful in ascertaining the facts of a case, and cautious in the inferences you draw from them, you will in due time add many a stone (perhaps many a precious stone) to the as yet unfinished temple whose portal you are now entering. The temple is, indeed, far from being complete. Many niches are still empty; many stones lie strewn about; many foundations have yet to be laid; yet all is activity. The stones are getting into their places, the walls are surely rising; here and there, indeed, a gilded pinnacle crowns a wing. Your ears may be at first somewhat dinned by the noise, your eyes a little distracted by the hurrying to-and-fro of the workmen and their machinery; but you will soon forget the noise and the hubbub when you earnestly join in helping to rear an edifice so truly noble as that of Medicine.

"A great and attractive feature connected with the prosecution of Medicine is the open-handedness that everywhere prevails with regard to discoveries. The moment a Medical man makes a discovery, however valuable, he tells it to all the world, so that everyone may have the advantage of any good contained in it. In consequence of this absence of secrecy, it is in the power of everyone to acquaint himself with and to adopt any measure that is proposed for the treatment of disease. Nevertheless, although there is free intercourse between Medical men in every part of the world, Medical science presents somewhat different aspects in different countries. Diseases which are rare in this are sometimes common in other lands. The type of a disease which may be rare here may prevail elsewhere. The mode of treating some diseases differs in different schools. The methods adopted in the tuition of Medicine are not everywhere the same. It often happens that certain schools are famed for the facilities with which certain subjects can be studied; for example, although the Surgery of England is in many respects decidedly superior to the Surgery of France, nevertheless students have greater facilities for the practice of operative Surgery in France than they have in England. Although physiology and pathology are in many respects just as advanced in England as they are in Germany, nevertheless many inquiries connected with these subjects can be prosecuted in Germany with less expense and greater facility than in this country; for in Germany the Imperial powers liberally support physiological and pathological laboratories, and happily in that country physiologists and pathologists are not pursued by a herd of anonymous scribblers, who, while they wink at all manner of sports, however cruel and meaningless, are ready to thrust their waspish stings into anyone who dares to decapitate a frog in the interests of the healing art. Seeing that the aspects of Medicine are not everywhere alike, it is very important that you should visit different schools of Medicine in order to get an education as comprehensive as possible. It is well to visit the chief schools of France and Germany. The Germans and the French have much to learn from us, but at the same time we have not a little to learn from them."

The lecturer concluded with some practical remarks concerning the mode of study which should be adopted by the students.

THE LONDON HOSPITAL.

THE Introductory Address was delivered by Dr. J. W. Little, who said:—Revolving in the mind the relationship of the past and the present stirs the thought as to the future of the Hospital, and of its youngest members in particular, and of the Medical Profession itself as it may be influenced by them. We are tempted—"Laudator temporis acti"—to look back to the moment when, forty-three years ago, we for the first time sat upon the benches of the old anatomical theatre, listening to the introductory lecture of that day, delivered by Mr. Headington, at the commencement of his annual course of anatomical lectures. We were then freshly entered, like so many of you, gentlemen, this day. The first thought, and that a painful one, is of how few of the then young faces, soon to become familiar ones, which glowed with intelligent emotion at the eloquence of a Headington, are now to be seen. One at least is here—Mr. Curling, who by his persistent exertions in the cause of practical and scientific Surgery, his researches in pathology, by his readiness to adopt all novelties that promise to be beneficial to humanity, has shown the present generation of students how the advantages of the London Hospital can best be utilised. He can recall, we doubt not, the glories

of the discoveries and improvements of the previous forty years, as related to us in language unsurpassed for accuracy and for freedom from exaggeration; in language pure in diction, noted for clearness, quietness, and perspicuity—language, indeed, to which we, unhappily, can make no approach. Mr. Headington was an accomplished and sound Surgeon, who had more the appearance of the learned and well-bred Physician of that day. He early handed over the operating-knife to the able hands of Mr. Luke, then his Assistant-Surgeon. The greater number of my hearers may never have heard the name of Headington: in fact, he lived, he practised, and died in a part of London—Spitalfields—then wealthy and of comparatively fashionable resort. It has been a loss to Surgery that he was not addicted to spreading his fame by any writings; but it is a sufficient proof of the distinguished hold he possessed of the respect and affection of his colleagues and pupils, that he was one of the few whose bust and portrait adorn the building in which we are now assembled.

Headington made known to us the triumphs of Hunter, Pott, Jenner, Baillie, Haller and Bichât, Cavendish and Lavoisier, Dalton and Davy. The theories of Stâhl, Cullen, Brown, and Broussais were then first brought to our knowledge; we learnt then how great had been the progress of the Medical art during the previous forty years.

It may on this occasion be not merely a matter of personal interest to ourselves and any contemporaries—Medical antiquaries as it were—to note briefly some of the men whose merits were eulogised by Headington, and who almost constituted in themselves standpoints in Medicine and Surgery, and the allied branches of knowledge, during the forty years preceding Mr. Headington's address. It is too easy, perhaps, to fall into the historic vein.

The beginning of the period we are considering may be roughly stated as having been ushered in by two important events in the world's history, the American War of Independence and the great French Revolution. The consequent agitation of men's minds, as well as the acquisition of a new power supplementary to man's individual physical force, in the application of steam to the purposes of mankind in branches of the arts into which it had not been previously introduced, were probably all momenta aiding the progress of man in the departments of science and learning embraced by the cultivator of Medicine. In this country eminent Medical men worked on in our thoroughly English way, little aided by State assistance, except in the happy circumstance of the purchase by Government of Hunter's museum. Hunter's fame needed not even the preservation of his museum to render it "*ære perennius*." It cannot be doubted that Hunter's career had exercised considerable influence on the progress both of English and foreign Medicine during the first thirty years of this century. But in France in particular, at the beginning of the present century, a great impulse was given to Medical studies by the appointment of a Government commission on the reorganisation of the Medical schools of Paris, Montpellier, and Strasburg. The names of many of the ablest Physicians and philosophers of that country appeared upon that commission. In Germany, also, the younger University of Berlin, fostered by the wide confidence in the future of German science, was beginning to emulate the reputation of Leyden, Göttingen, Upsal, Halle, and Vienna.

The beneficial influence of a man's labours, and especially of so great a man as John Hunter, being often greatest after his disappearance from the scene of his labours, was illustrated in this instance. Anatomy, Surgery, and Physiology were all powerfully impelled onwards during the epoch we are considering—say from 1790 to 1830—by his unexampled successful career. Headington in his lecture laid great stress upon Hunter's operation of ligaturing the artery above the aneurism as even then one of the greatest practical improvements of his age.

Mr. Headington might well expatiate on the merits of Jenner as a man of science, and as one having a higher claim to profound admiration as a benefactor to mankind in general. Bacon has said, "There are short methods for men of genius," but it might perhaps with propriety be also said that there are *new* methods for men of genius; their characteristic is that they do not walk in beaten roads, and are not deterred from following it through unfrequented paths. The originality of Jenner's mind, and his accuracy of observation, are shown by the universal reception and practice of vaccination by the brightest luminaries of our Profession in all the civilised parts of the earth.

The fair way of judging of the merits of an invention is, as Sir Humphry Davy said, "by the operation of the discovery upon civilised and social life; and in this respect Jenner"—a pupil of

John Hunter, be it remembered—"stands almost alone, having discovered the means of subduing a positive evil, and having secured a benefit, not only for all the inhabitants of the earth that have existed since his time, but for their most remote posterity, gaining for his name the most enviable kind of immortality—that arising from the gratitude and blessing of the reflecting portion of his fellow-creatures in all countries, and which will be more estimated in proportion as men estimate more correctly the nature of the truest glory—that of saving the lives of myriads of mankind.

We cannot let pass this occasion of stigmatising the conduct of Government, which, after a statue (the first erected in this country to the memory of this great man and Physician) was inaugurated with considerable ceremony in Trafalgar-square—the ceremony being graced by the presence of one of the most benevolent and enlightened men of the time, the late Prince Consort, and other distinguished personages, as well as by the authorities of the Royal College of Physicians—caused it to be removed from its public and noteworthy position from amongst the statues of men famed for their military glory to a comparatively obscure walk in Kensington-gardens. Surely even the shades of Sir John Franklyn and Lord Clyde in Waterloo-place must blush at the injustice inflicted on the memory and services of Jenner. However much we may all admire military virtues, the discredit done to the memory of Jenner and to the Medical Profession, by the removal of his statue from a prominent and unrivalled situation in the metropolis to a subordinate one, indicates a preference for the glory attendant on the destruction of human life rather than for that attendant on its preservation.

This was the period, also, when the names of Black, Cavendish, Priestly, Dalton, Scheele and Berzelius, Lavoisier and Gay-Lussac, Berthollet, and Davy were in men's minds. You will learn from your excellent teacher, Dr. Letheby, and his coadjutor Dr. Tidy, to how great an extent the atomic theory, morphology, and chemistry in general, have since been modified by Davy, Mitscherlich, Faraday, Tyndall, and others. Perhaps one of the proudest things ever said of a great chemist has been said of Berthollet, who died in 1825—"He was remarkable for a high degree of candour, renouncing his opinions with the greatest readiness whenever the progress of science was opposed to them, and this even in old age;" a point of character worthy of all imitation.

Headington did not leave untouched the researches of Cuvier and his assistants, of whom Brogniart was the principal. To Cuvier's genius, belonging entirely to the period we are considering, we owe the great elucidation of the then mysterious subject of extinct animals. Hunter had been one of the earliest, if not the earliest, who showed how many thousands of years appeared necessary to account for the terrestrial changes associated with fossil remains. And yet in Headington's time geology was only in the condition of sturdy youth. A generation of able men, most prominent among whom has been a fellow member of our Profession—Owen—has been successfully employed in its advancement.

Headington overflowed with admiration of two most notable physiologists who are now rarely mentioned, but whose works, together with those of Hunter, formed the foundation of English physiology of the period we are considering—Haller and Bichât. Of the sterling worth of Von Haller's Physiology I cannot do better than quote a *naïve* remark made half a century after Haller's death, by Rudolphi, in the introduction to his own work on physiology—viz., "That if any author of a book on physiology were asked whose work on that subject was the best, the inquirer could not complain if the author named his own. But if inquiries were made whose was the second best, all would reply 'Haller's.'" That work, however, on physiology which appears to all authors on the same subject the second best, is doubtless, as Rudolphi remarks, the best.

Some modern pathologists do scant justice to the Physicians of the last century. We may be permitted to say a word of commendation for another of Headington's great men—we allude to Cullen. It is doubtful whether any better *vade mecum* in nosology than that of Cullen has since been published, although needing adaptation to the present time.

Of the remaining Physicians lauded by Headington, Baillie's works show the accuracy and coolness of his judgment, his minuteness of observation, and his acuteness in referring effects to their true causes.

Brown and his speculations, in an attempt to supplant the theory and practice of Cullen, produced a profound sensation at the beginning of this century. Brunonianism, as they were called, since justly reviled, may after all, by its intense opposition to the antiphlogistic treatment of the period, have con-

tributed to the reaction of later years in favour of the use of supporting treatment in disease.

On the other hand, Broussais' researches, which in Headington's day were on the tongue of every Physician, referred all forms of pathological disturbance to gastro-enteritis. His severe antiphlogistic regimen and medicinal treatment contributed much to prolong the reign of most extensive blood-letting by leeches, and even of venesection. The student of to-day would be aghast at the application of fifty leeches daily for many days until the patient risked dying, or did die from loss of blood, and at the string of twenty patients waiting their turns to be bled in the arm—a weekly event in some Practitioners' surgeries.

Bichât—"This was a man!" as Shakespeare says—Bichât, one of Headington's worthies, who has been named the Physiological Physician *par excellence*, has left an imperishable name in anatomy and pathology. He wrote his celebrated works, "Researches on Life and Death," and his "General Anatomy," before the age of 30—"Devies repetita placet"—an encouragement to you who are about to become engaged in the arduous pursuits of Medicine. His career shows that it is not merely the inspired genius and power of observation of the poet, the artist, or the orator that may distinguish its possessor at an age when the majority of men are only beginning to find their position in the world, but that natural gifts, employed with industry and energy in the wards of a large Hospital, in the deadhouse, and in the laboratory, may yield one or more of you an undying reputation before others have awoke to the consciousness of a laudable career being really open to them.

Bichât was the first to study thoroughly the relations of the membranes and structures of the body to one another, and to subject them to such an analysis and generalisation as the state of chemistry and microscopy then permitted. He rendered a great service to pathology and practical Medicine in first distinctly showing that the closest similarity existed between the phenomena of disease in each particular membrane or structure, wherever situated; that, for example, given the knowledge of certain changes which occur in and upon a serous membrane when inflamed—say, the peritoneum—the Physician was first taught by Bichât that similar changes in, and other situations where a serous surface is found, the phenomena being modified only by the peculiarities of each organ which is invested by a serous membrane. With similar results he investigated the cellular and mucous membranes, the fibrous and other structures; and, whilst shedding a new effulgent light upon a minuter anatomy than had yet been taught, he prepared the way for much of the progress of morbid anatomy and the improved diagnosis of disease, and even for the minute-microscopical investigation of the tissues, which has characterised French, German, and English Medicine in later years.

We cannot forbear mentioning at this moment a former distinguished Physician and Professor here, Dr. Pereira, whose bust also adorns this museum. He became attached to the London Hospital several years after our pupil days, but we had the good fortune to be attracted by his reputation as a teacher of *Materia Medica* and chemistry to his lecture-room at the then existing Aldersgate Dispensary. Pereira was a warm expounder of many of the memorable discoveries of Bichât. We confess, however, to not having taken in the best part his persistent efforts to make us understand the differences between Bichât's animal sensibility, Bichât's animal contractility, organic sensibility, insensible contractility, and, lastly, his sensible organic contractility—terms now, happily for you, relegated for the most part to the realm where there is neither pleasure nor pain; whither also have gone the vitalistic theories of Stâhl, the theories which constituted Brunonianism, and many other theories and hypotheses:

"All these, up-whirl'd aloft,
Fly o'er the backside of the world far off
Into a *limbo* large and broad, since call'd
The Paradise of Fools."

We all owe much to Pereira for the thoroughness and excellence with which he taught and the example he instilled. He was the first lecturer whom we saw who was accustomed to use diagrams to illustrate his lectures.

Mr. Headington did ample justice to contemporary Surgeons in the persons of Dupuytren, Larrey, Cline, Cooper, and others.

Another notable circumstance, creditable alike to Dr. Billing and to the London Hospital, which it is permissible on this occasion to mention, is, that the first course of clinical lectures on Medicine delivered in this metropolis was delivered at the London Hospital by him. Previously to his time, isolated irregular bedside observations, both in Surgery and Medicine, will naturally have flowed from the lips of able men, such as

Cheselden, Baillie, Abernethy, the Blizards, and others whose names have already been mentioned to-day; anyone, however, who witnessed the monotonous silent Hospital round of the old-fashioned Physician of Headington's time will bear us out that the example of thorough clinical teaching was sorely needed in those days. It may now be truly said of Dr. Billing, as was said of Morgagni, in the language of Virgil—

Nec tarda senectus
Debilitat vires animi, mutatque vigorem.

An important addition to our resources, that of systematic thermometry as a means of diagnosis in inflammations and fevers, has been made during the period of which we are speaking, and may be mentioned here. We owe to a member of our staff, Dr. Woodman, an able translation of Wunderlich's treatise on this subject. It is due to a former senior Physician of this Hospital, Dr. Cobb, under whom we had the pleasure to officiate on occasion of the first invasion of cholera in 1831, at Newcastle-on-Tyne, to state that he, and others besides ourself, employed at that time the thermometer to measure the fatal tendency to death. Esmarch, who is as well known for his accuracy of observation as for his skill and boldness as an operator, has recently favoured us with his latest observation on ice-application to joints and acute inflammation of bone. He states that he can demonstrate the therapeutic propagation of cold to the interior of the living bone, and a reduction thereby of temperature in the internal part amounting to 10° Cent.—a fact which, when considered in connexion with the daily palpable beneficial effect of ice to external parts, enables the Physician to understand the efficacy of cold applications to the trunk in inflammations and hæmorrhage. Truly Æsop might have said of the Physicians that we blow hot and cold with one breath, for as a Profession we still think highly of warm applications in similar cases. You, gentlemen, will have to watch the practice of your Physicians and Surgeons, and learn how and when to employ either one or the other.

In 1830 auscultation and percussion were just struggling into notice in this country. In this Hospital Dr. T. Davies, fresh from the schools of Montpellier and Paris, laboured most effectively to disseminate a correct knowledge of heart and lung disease. It is pleasant to add, that our former pupil and colleague, Dr. Herbert Davies, has since worthily represented his excellent father in the branch of inquiry and practice he had made his own.

THE MIDDLESEX HOSPITAL.

DR. JOHN MURRAY delivered the Inaugural Address at this Hospital. The lecturer commenced by urging the new students of Medicine to inquire of themselves whether they were adopting a profession for which they were naturally fitted. According to the comparative vivacity and force of a young man's intellect, his fitness for a profession should be gauged. If a youth afforded no evidence of predominant interest in literary study and the delights of scholastic ambition, he ought not to be encouraged to adopt a profession requiring that considerable amount of application to such pursuits demanded by Medicine. He referred to the unhappy instances daily to be seen, of men possessed of excellent abilities engaged in the half-hearted pursuit of occupations wholly unsuited to their natural turn of mind—abilities which, if they had been directed into the proper channels, would have placed the possessors in positions in which they would not only have excelled, but would have increased their enjoyment of life—perhaps also the depths of their pockets, and certainly their value to the public. Most young men's minds, he believed, afforded a clue, if properly scrutinised, to their natural fitness, to ascertain which was the duty of parents and guardians; and this was becoming daily more and more imperative as free trade, the correlative of natural selection, was, in this country at least, in the ascendant. To make the most of this natural fitness, the preliminary education of the young man should be of a most liberal character. The great acuteness in the observation and treatment of disease displayed by men of the present day distinguished in Medicine does not, he believed, rest on the possession of Medical facts alone, but on a sound general education aided by natural ability for the practice of their Profession. He decried the growing tendency amongst the advocates of the real or modern or so-called useful studies to underrate the value of classics, by the study of which we are made acquainted with the spirit and power of Greek and Roman antiquity, learned from its original works. A liberal education should make a man know himself and the world, not

in a narrow sense—as Matthew Arnold expresses it, “to make a man a good citizen, or a good Christian, or a gentleman, or to fit himself to get on in the world, or to enable him to do his duty in that state of life to which he is called. There is a wider and a more noble sphere—to do good to mankind, and to advance his fellow-creatures.”

After offering a few words of advice as to the manner in which the student of Medicine should proceed in surmounting the mass of work before him, Dr. Murray continued:—To assist and guide the student in his studies, Medical schools have been formed, in which more or less compulsory attendance is required, the different subjects taught being arranged in such a manner as to afford a very considerable amount of assistance to the pupil. Our metropolitan system of Medical schools, as it at present exists, has found many able opponents—men whose opinions carry with them great authority, and in whose views I am prepared largely to sympathise. But, while we should look sanguinely forward to a future still greater than the present in the Medical education of the metropolis, there still can be no doubt that even now, with its disadvantages, London affords many unrivalled opportunities for the study of Medicine unattainable elsewhere.

The mission of a Medical school, it seems to me, should be not alone to cram the student with facts, but to effect as far as possible the total Medical cultivation of the student in his strictly Medical studies. What is to be avoided is, that the instruction degenerate into a preparation for examination, instead of providing that the pupil may have the requisite time to come steadily and without hurrying to the fulness of the measure of his powers and character; that he may be securely and thoroughly formed, instead of being bewildered and oppressed by a mass of information hastily heaped together. Do the Medical schools of London effect this? That there is much room for improvement in their teaching, that the tutorial system might be with advantage grafted more largely into them, less stress laid upon certain subjects, and other compulsory courses instituted, I am very strongly of opinion; but that they do much to develop the total Medical cultivation I most certainly assert. If this desirable object is not attained, it is not entirely the fault of the schools. What faults they do possess are in a great measure due to the baneful influences of certain of our licensing bodies, which do not demand a sufficiently high standard for qualification, and do not allow the schools time to develop the student. That systematic teaching is, as asserted, carried to an excess in them I do not believe; in fact, the very reverse. That students should be allowed to study wheresoever and howsoever they please, as recommended by not a few, is a doctrine which I think should be resisted, as opposed to reason, and a retrograde step in education. Were it possible, as is proposed, to render the examinations all-sufficient as tests, which I deny they can be made to be, the more or less want of system in the preparation for these examinations would entail a waste of time and strength, and, by reaction, tend to reduce the standard of examinations. It is this absence of system which I believe is the bane of education in this country. In everything we lean upon our energy and wealth to overcome the drawbacks necessarily dependent on our want of gradual training and method. We forget that “if the iron be blunt and a man do not whet the edge, then must he put forth the more strength; but wisdom is profitable to direct.”

How are students, I ask, to be guided in their studies unless in a systematic school? where are they to learn exact habits of mind? Not in books, certainly. They must be brought to the water, and taught systematically and gradually how to drink. But they must be compelled to do so; and I believe, in spite of all that has been said to the contrary, this can be done if properly tried. Most students are willing and anxious to learn if intelligently managed; and if the teacher fail, it is, in the majority of cases, as much the fault of the teacher as of the pupil. If there are those indisposed to apply themselves to their work, much can be done to make them learn if taught methodically and under a compulsory system. I never saw the man yet, unless he were an incorrigible dunce, who could not be made to learn. Were it not for our compulsory system, however, what would become of such men? One would stay at home and cram; another would go from place to place, “taking tithe of musk, of anise, and cummin,” but neglecting the principles and more important matters of his Profession, picking up crumbs which he would mould together into some crude idea representing his peculiar notions of the theory and practice of Medicine, while only a comparatively small number would pass their examinations, and that chiefly through their inherent natural good qualities, possessed of a comprehensive

Medical education. A considerable number would probably be able to pass the examinations, however strict and searching they might be; but their minds would not have been gradually formed, and taught that exactness of reasoning which is likely to be engendered by a proper system of teaching, such as is aimed at in some, at least, of our Medical schools. I would have you, therefore, to bear in mind that system and regularity in your work are all-important.

The remaining portions of Dr. Murray's address were chiefly directed to detailed advice in reading, in attending lectures, and in clinical work—in the last of which he pointed out that our metropolitan system is deficient. He earnestly urged upon students the desirability of going abroad for a time, and extending their term of student-work beyond that required by the licensing corporations, and advised them to obtain the highest qualifications possible; and alluded to the shameful state of ignorance in which some young men commence practice, possessed though they be of one or more British qualifications.

The lecturer concluded his address by reminding his hearers that beneficence forms Medicine's highest title to respect; that their duty, their real pleasure, would be found in allaying misery, in assuaging suffering, and advancing the physical wellbeing of man. He pointed out that *succurrere miseris* was the first lesson of their Profession; and in carrying out their great and noble object they should do it as best they could.

ORIGINAL COMMUNICATIONS.

CONVOLUTIONS OF FRONTAL LOBE OF THE BRAIN.

By METCALFE JOHNSON, M.R.C.S.E., L.S.A.

DR. TURNER, of Edinburgh, has, in a concise little pamphlet, drawn attention to the map of the convolutions of the brain. In accordance with his observations I have here ventured to delineate in the accompanying sketches some markings in healthy and diseased brains which I have examined.

Fig. 1 is an ideal map of the brain, in which the following parts are represented:—

- a, a.* Longitudinal fissure.
- b, b.* Superior frontal fissure.
- c, c.* Inferior " "
- d, d.* Fissure of Rolando.
- e, e.* Horizontal limb of fissure of Sylvius, leading to intra-parietal fissure.
- f, f.* Parallel fissure.
- g, g.* Parieto-occipital fissure.
- 1, 1. Superior frontal gyrus.
- 2, 2. Middle " "
- 3, 3. Inferior " "
- 4, 4. Ascending " "
- 5, 5. Ascending parietal gyrus.
- 6, 6. Angular gyrus.

In the following seven figures, taken from post-mortem examinations of various brains whose peculiarities will be pointed out in due course, the letters and figures point to the parts corresponding with those of the ideal map.

Fig. 2 represents the brain of a man who died insane, having been picked up as a tramp, but who, for some reason or another, probably due to insanity, refused to give his name or history. In this brain the parts are well marked, and easily recognised as being in the anterior or frontal lobes almost identical with the map.

In Fig. 3, an epileptic of a very severe kind for many years before death, the same parts are recognised, but the superior frontal gyrus is further convoluted, especially on the right side. The convolutions, or sulci, extend more into the space occupied by the ascending frontal gyrus.

Fig. 4 is the brain of a very intelligent but eccentric man, who died of rupture of the heart from fatty degeneration, after a somewhat dissolute and immoral life. The frontal lobes are well marked into the separate gyri, the right being more regular than the left. This will be remarked in all the specimens.

Fig. 5 is especially remarkable in having had the left lateral ventricle distended to an enormous size, containing a space equal to twenty square inches of surface. By this means the fissure of Rolando has been forced back into an abnormal posi-

tion, and the space occupied by the superior frontal gyrus, larger than natural. The effect upon the left caloso-marginal fissure is shown in Fig. 9, *B*, as compared with the right (Fig. 9, *A*). Here, again, the irregularity of left side is remarkable. He was a man of very curious habits—one of the people who belong to the "borderland" between sanity and insanity.

Fig. 6 is the brain of an old woman who was always a strange Irish character; not quite sane, but still sufficiently so to have married and given birth to several sane children. In the left frontal lobe was discovered a large bony tumour, weighing two ounces and three drachms, and displacing two fluid ounces and three fluid drachms of water. It was very slightly attached to the base of the skull, about the region of the sella Turcica. Here, again, it is the left side.

Fig. 7 represents the brain of a man who had always passed for a sane man, but who was found dead in bed, the cause of death being, apparently, abscess in the frontal sinus. Here the general arrangement is very normal, but more so on the right side.

Fig. 8 represents the fore half of the brain of a microcephalous idiot, drawn during the earlier part of my researches, and therefore the posterior half was not accorded. The parts are just so far formed as to be recognisable, but only by a slight stretch of the imagination. Had we no better clue than this brain, we could see no sure indication of the division into gyri. Here we have an interesting case of arrest of development (intra-uterine), probably at about the seventh month; and when compared with Fig. 5, where the brain injury was extra-uterine (probably hydrocephalus as a child), shows us two distinct causes of cerebral insanity; and when compared with Fig. 6, in which the injury to the brain was the growth of later years, shows us how the convolutions of the brain may be perfect or imperfect, and the class of mentation effected equally distinct in either case. The case of Fig. 6 was characterised by periodical attacks of apoplectiform epilepsy for several years before death.

So far as I am able to record, the characters associated with these separate brains were of various shades of mental power. Of Fig. 2 I have no history, except that he died insane, but there was no evidence of brain disease. As shown in my paper on "Cerebral and Ganglionic Insanity," a large proportion of insane persons show on post-mortem examination no appreciable signs of diseased brain-structure to account for their disordered mentation.

In the case of No. 3, he was an agricultural labourer of ordinary mental calibre, being neither more stupid nor less intelligent than his class. He was subject to epilepsy; was a good-tempered man, who had supported himself by his own exertions until prevented by losing the use of his right hand.

No. 4 was a clever man of dirty habits, fond of drink and immoral habits in respect to women. His eccentricity was not such as is at all accounted for by the development or disease of his brain. Indeed, it seems to be a very fair sample of an average development, the only abnormality being a tendency to a reduplication of convolution in the superior frontal gyrus.

No. 5 was always very eccentric from boyhood till death, and this was very satisfactorily accounted for by the enlarged state of the left lateral ventricle. How far this throws any light upon the relation of mentation to secondary automasis may be a question. It would seem as though the seat of control in secondary automasis is in the parts concerned in the centre of the brain, corpus striatum, and thalamus opticus. In this case I see in my notes the following remark—"Thalamus opticus rough on surface. Grey matter very distinct." This man's power of acting through secondary automasis was perfect, but his general function of mentation was very imperfectly performed. There is reason to think that his perception of *res ab extra* was abnormal; at any rate, he spoke and acted as if it were so. His manner was brutish, his habits dirty, and his appearance at times almost ferocious. He was very cunning, and fond of drink. Never took care of money, but always spent it in drink. He was a man of ungainly gait—a sort of flat-footed waddle. His family of brothers and sisters were all rather clever; and I am inclined to the opinion that this brain, minus the enlarged ventricle, might have become that of a clever man.

Of No. 6 it may be said that, being Irish, her strange and foolish manner was not so perceptible, as the frequent association of that strangeness with very fine wit in the Irish nation renders it difficult to distinguish folly from wit; the more so, since the speech is so often nowadays used to obscure the meaning of the mind. Here, however, we have the abnormal direction of the fissure of Rolando, as well as the interruption of the superior frontal fissure, the oblique direction of the

FIG. 6.

FIG. 7.

FIG. 8.

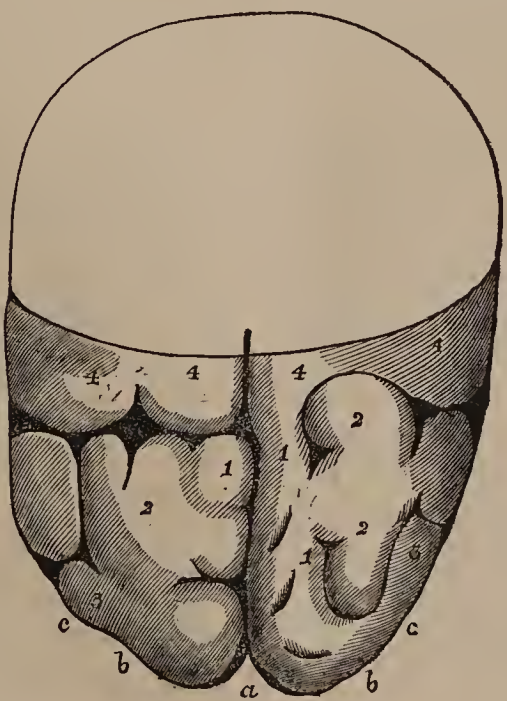

FIG. 9.

inferior frontal fissure, which together alter by their surroundings the shape, size, and relation of the whole of the gyri. Moreover, the depth of fibres beneath these layers of grey matter was so much altered, as well as the constitution of the subjacent substance, that it was impossible to expect healthy mentation on that side of the brain for some years past.

Of No. 7, I have no history of anything abnormal in his mental development. I therefore conclude that he was a man of ordinary mental capacity.

The interest of the whole centres itself in No. 8, a remarkable case of intelligent microcephaly. The brain by itself only weighed fourteen ounces and six drachms, while the cerebellum and appendages weighed four ounces and six drachms. Her powers of mentation consisted of an ability to learn words, for speech, and understanding; she could never be taught her letters or figures; could not count ten. I have referred to her case more at length in my paper on "Cerebral and Ganglionic Insanity."

The few general conclusions that follow naturally on the consideration of these brain-markings seem to consist chiefly of the recognition of the necessity for a close analytical mental history in cases of brain disorder. If the Surgeons of our lunatic and idiot asylums would make close analyses of the mental properties of their patients in life, our post-mortem examinations would then present much more of interest, and we should then have a firmer grasp of the clue to this labyrinth or Rosamond's bower, which the brain, as at present laid before us, seems to resemble. It may further be remarked that the facts here related, in respect to the general resemblance of these brains and the particular dissimilarity of each, lends fresh and additional colour to the opinions which I have advanced respecting mentation, both in my paper on "The Relation of the Ganglionic System to Mentation," in the *Lancet*, and my paper on "Hedonism" in the *Medical Times and Gazette*—that the grey matter plays a part independent of the mere tubular message-passing through the nerve-fibres from periphery to centre.

At present I have only been enabled to devote attention to the anterior or frontal lobes, and this from only one aspect. In course of time I shall hope to be able to supply more matter on lateral aspects, which will throw more light upon the arrangement of gyri, which in the present aspect are out of sight.

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

MEDICAL COLLEGE HOSPITAL, CALCUTTA.

INTRACRANIAL SUPPURATION—TREPHINING—PARTIAL RECOVERY—RECURRENCE OF SUPPURATION—DEATH.

(Under the care of J. FAYRER, M.D., Senior Surgeon of the Medical College Hospital, Calcutta.)

WE are indebted to Mr. Sanders, our Resident Surgeon, for this account of a very interesting case of injury, followed by intracranial suppuration, that has recently occurred in Dr. Fayrer's wards of the Medical College Hospital.

At one time the operation of trephining appeared likely to prove successful, for the worst symptoms passed away. He regained—having been completely aphasic—the power of speech; consciousness, which was all but obliterated, returned; hemiplegia, which was complete, passed away; he was able to read; to get up from his bed and walk; and there was every appearance of the wound closing in by healthy granulations, except at one side of the trephine aperture, where the bone was evidently dead. The improvement was only transient—fresh indications of mischief appeared, paralysis and aphasia returned, and he relapsed into a state as bad as that from which he had just been relieved.

The trephine was again applied, more pus evacuated, and, to a certain extent, relief conferred; but the mischief had spread to the interior, and a cerebral abscess had formed.

The case illustrates the danger that may attend any scalp-wound, however slight; and it proves that in such cases, where intracranial suppuration results, perforation of the skull offers the only hope of safety. The patient was completely relieved by the first operation, and had the mischief not extended to the brain substance, there is every reason to believe that he would have recovered.

The patient was a man prematurely old, broken in constitution by climate and excesses, and who met with the accident in the very worst season of the year—a time in Calcutta when, owing to the malarious, hot, and humid state of the atmosphere, suppuration, even in the most healthy, is only too prone to occur.

The condition commonly known as "Pott's puffy tumour" was well seen in this case, and the welling out of pus from within the cavity as the trephine pierced the cranium was very satisfactory proof that the diagnosis was correct and the operation needed.

The dura mater was not opened until the following day, as it looked perfectly healthy, and evinced no signs of suppuration between it and the brain. The symptoms of cerebral pressure not yielding to the first operation, the membrane was carefully punctured, and a small quantity of pus evacuated. This was soon followed by an amelioration in the symptoms; gradually one by one they cleared away. Consciousness and speech returned, paralysis passed away, and he had assumed all the aspects of complete convalescence, when a return of the symptoms showed that intracranial mischief was again insidiously invading. The trephine was again applied, and more pus evacuated, but this time without success; a cerebral abscess had formed, and he sank.

The post-mortem examination revealed the presence of a large abscess, the gradual formation and pressure of which accounted for all the recurring symptoms. The forward pressure in the first instance accounted for the aphasia, as it pressed directly over the island of Reil, and that on the cerebral ganglia explained the hemiplegia. The necrosis of bone was limited almost to the area removed by the trephine; those portions which escaped that instrument were in rapid process of exfoliation, a deep groove having already formed, and the dura mater became adherent just beyond the groove. It proved that the suppuration between the bone and dura mater was of limited extent, the adherent state of the dura mater to the cerebral lobe showing that it was also limited there. It was by extending deeply into the substance of the brain that suppuration proved fatal.

Case of W. J. S., aged 43, formerly an Indigo Planter; Admitted July 18; Died August 22, 1870. Disease—Intracranial Suppuration following a comparatively Slight Injury.

(Reported by Assistant-Surgeon E. SANDERS, B.M.S., Resident Surgeon of the Medical College Hospital, Calcutta.)

July 18.—The patient states that three days ago a piece of brick was thrown at his head, and caused a slight wound, which was dressed, and thought no more of at the time. On admission, was slightly intoxicated, and was found to have a slight wound on left side of head one inch and a quarter in length, situated posterior to the parietal eminence, reaching down to the bone. The pericranium was slightly denuded; margins of wound somewhat inflamed. Bowels costive; tongue foul. *R.* Cathartic pills *ij.*, stat. *R.* Ol. ricini *ʒij.*, ol. terebinth. *ʒij.*, aq. menth. pip. *ʒj.* in four hours. The patient is a tall thin man, much broken in constitution by excess and exposure to the debilitating influence of a tropical climate.

21st.—Patient doing well—in fact, wanted to be discharged from Hospital—till 6 p.m., when some bleeding occurred from the wound, which was easily controlled by pressure. Is slightly feverish. *R.* Fever mixture and purgative draught.

22nd.—Water dressing to wound. *R.* Quin. sulph. grs. v., ter die.

24th.—Everything went on well till 6 p.m. to-day, when he complained of a slight aching pain over left eye.

27th.—Bowels moved every day by means of purgatives. Has slight hemicrania of left side. 6 p.m.: Is feverish and restless. *R.* Magnes. sulph. *ʒij.*, dec. sennæ *ʒiv.*, stat.

28th.—Bowels freely opened. Still feverish, and complains of a feeling of nausea. Head to be shaved, and an ice-bladder applied. *R.* Calomel grs. vj., pulv. jalapæ *ʒj.*, stat. 6 p.m.: Temperature 101.4°; pulse 88, full. Has had four scanty stools. Tongue foul. Pupils contracted.

29th.—Temperature 100°; pulse 72. Nausea has now ceased. He feels weak, and complains of a feeling of heaviness in his head; not at any particular part, but all over. 5 p.m.: Temperature 101°; pulse 72, full and hard. Great uneasiness in head. Complains of weakness in right arm and leg, with sudden startings, and a sensation as of pins and needles. *R.* Repeat calomel and jalap.

30th.—Much the same as yesterday. Wound not looking so clean. Eyelids slightly drooping.

31st.—Tongue very foul. Bowels costive. Right arm very weak; can only raise it by a series of jerks. Loss of sensation

in right side of face. Slight difficulty of speaking. Mind clear. The granulating wound is dry, flabby, and glazed; a puffy swelling around it. A crucial incision was now made down to the bone, and a small quantity of pus evacuated. Bone found bare and roughened over a small area. 6 p.m.: The power of articulating (or rather the memory of) certain words is lost, and he uses words wrongly. 9 p.m.: Has vomited once.

August 1.—9 a.m.: Temperature 101.3°; pulse 80. Aphasia very complete. Complete paralysis of right arm; right leg very nearly the same. Endeavoured to express what he wants in writing with his left hand, but could only trace the initials of his name. Mind seems clear. A trephine was now applied over the seat of injury, and a teaspoonful of thick pus evacuated from between the skull and dura mater. Skull naturally very thick (one-third of an inch), and without diploë. Some plastic matter formed on the inner surface. No bulging of dura mater, which was carefully examined. 1.15 p.m.: Had a mild convulsive fit, which began in right arm, and extended over the whole body, lasting two minutes. When the fit was over, breathed in puffs, the air escaping from right side of mouth. 11 p.m.: Has had several fits. Pulse 110, and rather hard. Examined the dura mater, but could detect no bulging. ℞. Cathartic enema, stat.

2nd.—7 a.m.: Passed a stool in bedclothes. During the night slept for a very short time; convulsive fits occurring at short intervals. Very restless. Can only utter sounds like "ai cairna," which he repeats incessantly. 9 a.m.: Dura mater punctured, and a small quantity of pus let out. Seems to be sensible, and expresses his wants by signs. 3 p.m.: Fits becoming violent.

3rd.—Temperature 101°; pulse 76, small; respiration 18, regular. Has passed a very restless night. Stools and urine are passed involuntarily, or without an effort to express that he wishes assistance. In one instance in which I watched him, he did not seem to be conscious of having passed anything. Occasional convulsions throughout the day.

4th.—2.30 a.m.: Had a very mild fit. 6 a.m.: Since last report has been sleeping quietly. 9 a.m.: Temperature 98°; pulse 72; respiration 16. Is conscious, and asks by signs for food, drink, etc. Stools and urine passed in bedclothes. A curious frothy appearance of eyelids. 4 p.m.: Tongue very foul. Ordered a fetid enema. Begins to articulate. 5.30: Said "pipe," which was given to him, and he had a short smoke.

5th.—Temperature 98°; pulse 68; respiration 16. 9 a.m.: Is able to say a few words, which he repeats over and over again, without seeming to have any very definite idea of their meaning. Head easy. Wound granulating healthily. Brain seen at the bottom of the wound rising and falling healthily. Can move the right leg, but the effort to do so causes him a good deal of pain. Hyperæsthesia of the right leg, reflex movements very powerful; right arm not improved at all. Answers questions very sensibly by signs. 10 a.m.: Woke from a light sleep, and called out for his breakfast. Helped himself with left hand; seemed to enjoy it a good deal; then went to sleep again. 11.30 a.m.: Woke up and called for the nurse. Moves his right leg pretty freely. Endeavoured to talk, and seemed much distressed at being unable to find words for his ideas. Became very low-spirited and depressed. 6 p.m.: Had a slight spasm in left side, which he expressed by saying, "I had padsum." Sensation returning in right arm.

6th.—4.30 a.m.: Has slept since last report till now, when he woke up and said, "Nurse, port wine." 9 a.m.: Sensation in right arm nearly perfect. Tingling in right eyelid. Can now move his right arm slightly, and can lift it up with his left, but a good deal of pain is thereby experienced. Temperature in right axilla 97.4°; temperature in left axilla 98.1°. Can read print and can articulate, though slowly, most of the words in an easy sentence. Wound doing well.

7th.—Temperature 98°; pulse 68; respiration 16. Small slough removed from dura mater. Brain seen below, but it seems at some depth. Right leg has nearly recovered; right arm doing very well. Bowels still only moved by enema.

8th.—Temperature, pulse, and respiration normal. Wound suppurating freely and looking very healthy. Sensation and motion are now quite restored to right leg. Right arm can be raised to his head, though the motion is somewhat jerky. Says that the hand is very weak, and that he cannot hold anything in it. Speech is now very fair, though slow, as if it were an effort of memory to find the words, or that the tongue requires schooling to articulate them. Occasionally hesitates at a word, and failing to pronounce it, substitutes another, not always, however, relevant. The tingling of right eyelid has now entirely ceased. Appearance natural. 10 p.m.: Pulse 80, and full. Complains of an uneasy feeling across brow; articu-

lation not quite so clear as it was in the morning. Has been exercising his newly recovered power of speech too freely, and has evidently fatigued himself. Directed him to keep quite quiet, and not to talk.

9th.—7 a.m.: Had an attack of bleeding from the granulations. This, he says, has done him a deal of good, and he certainly does look better.

10th.—Is doing very well, though he had some slight startings of right side during the night.

On the 11th he walked several paces. Quinine and nitro-muriatic acid ordered.

13th.—Doing well since last report. Wound very healthy and closing up rapidly. Bone, except at one side, nearly covered by granulation. Hole in dura mater would admit a pin. Very little discharge from wound. 7.30 p.m.: Had a mild convulsive fit, beginning as the others in the right side. He was conscious while it lasted, but could not restrain the movements of his limbs. 8.45 p.m.: Had another fit.

14th.—Had two more fits during the night, chiefly affecting the right side. Complains of a dull throbbing pain in the head, and a feeling of heaviness. Hole in the dura mater dilated with a probe, and a drop or two of pus evacuated. Pus has all along come more copiously from behind dura mater and brain than from between bone and dura mater.

15th.—Feels all right again this morning. Wound very healthy, rapidly closing; free discharge of laudable pus. Bone concealed by granulations, except at one point, where it is evidently dead.

17th.—Not doing so well. Wound looking unhealthy about the aperture in dura mater. Right arm very much diminished in power.

18th.—Patient weak and low. Right side completely paralysed. Again trephined over the place where the bone is dead, and slit up the dura mater on a director. Free evacuation of pus, and a long shreddy piece of slough from between dura mater and brain.

19th.—Much the same as yesterday, only weaker. 10 a.m.: Had a mild convulsive fit, which only affected the paralysed limbs.

20th.—4 a.m.: Speech becoming affected. 9 a.m.: Weak and very irritable; seems sensible. 7 p.m.: During the day has gradually lost the power of articulation. Now howls when he wants anything.

21st.—9 a.m.: Cannot utter the slightest sound. Wound nearly filled up with tough insensible granulations. Opened the wound in dura mater in several places on a director, and evacuated a small quantity of yellow pus which had become pent up. No appearance of sensation during this. No pulsation of brain apparent, but remote pulsation is felt on pressing the finger into the spot where the skull was originally trephined. This causes slight pain and a jerky motion of the right arm from elbow downwards. Countenance dull and heavy; intelligence much affected, though he can still be made to understand some questions. Tongue foul; pulse slow and weak; temperature normal. Patient is gradually sinking; endeavoured to write with left hand, but failed. 11 a.m.: Began to be drowsy; stupor gradually set in. 7.30 p.m.: Patient has been sinking all day. Breathing is now difficult and stertorous. Gurgling in throat. 8 p.m.: Is quite comatose.

22nd.—4 a.m.: Died.

Autopsy, Ten Hours after Death.—Body considerably emaciated. Head: Externally on left side is a large trephine wound, situated between the left parietal protuberance and the mesial line, and somewhat posterior to that eminence. On removing the skull, the dura mater found somewhat adherent to the bone. Inner surface of skull with a large hole, formed by the application of trephine. Some portion of the margins healthy, the rest necrosed, and in process of removal. Between the apertures and the groove for longitudinal sinus is a patch (the size of a shilling) of commencing necrosis, beautifully circumscribed by a very narrow groove. Dura mater adherent to brain in a circle about three inches in diameter, and corresponding in situation with the wound in the skull. Arachnoid surface otherwise free from any trace of inflammation. Brain much congested; large veins over the pia mater filled with very dark blood. A thin clot about the size of a crown-piece over the upper surface of the left anterior lobe. At the seat of injury, protruding through the dura mater, and filling up the hole in the bone caused by the first application of the trephine, is a fungus cerebri. Round the adherent dura mater is a circle, an inch wide, of discoloured and softened brain-substance, which gives to the finger a feeling of fluctuation. On making an incision through this, the contents of an abscess were evacuated, consisting of very offensive pus, sloughs, and

softened brain-substance. The brain on this side was found much softened, in many parts nearly broken down. On making a section and exposing the third ventricle, the left thalamus opticus was found softened, the corpus striatum seemingly healthy, and the ventricle separated from the abscess only by a thin layer of softened tissue. Very little fluid in the ventricles, not opaque, but slightly sanguinolent. The abscess is about the size of a hen's egg, and extends forwards over the island of Reil, which is darker in colour and more softened than normal. A thin layer of softened brain-substance separates it from the floor of the abscess. Right side fairly healthy, but congested. Posterior cornu of third ventricle filled with slightly sanguinolent serum. Lungs healthy. Heart healthy, contained blood, fluid. Liver very large, congested—in a condition between myristicate and hobnail. Spleen very large; capsule much thickened in places. Kidneys: Capsules easily separable, large, coarse in structure, and highly congested. Intestines healthy.

SATURDAY, OCTOBER 7, 1871.

THE INTRODUCTORY LECTURES.

IN these days of feverish desire and agitation for change, when for any ceremony or custom to be old seems almost to insure its being swept away, or at any rate "reformed," and newness has become, as it were, synonymous with improvement; so that the creed of great numbers appears to be, "All change is good; whatever is, is wrong"—lighting upon such days as these, we say, it is remarkable and refreshing to observe that the vast majority of our Medical Schools still adhere to the time-honoured habit of opening the Winter Session by a General Introductory Lecture. Indeed, we know of only one School—in London, at least—which has given up this old custom; and we will not inquire into the reason why the authorities of the Medical School of St. Bartholemew's Hospital have dropped the Introductory Lecture. We will not pretend to know whether they think the ceremony foolish, or superfluous, or inconvenient, or what other cogent argument they may have found against it. Doubtless—as was, we think, observed in one of the Lectures given this year—while much may be said for, much may also be said against, Introductory Lectures, and we are content to note that none was given at St. Bartholemew's Hospital Medical School. In most instances, also, the custom of delivering the Lecture, as a separate ceremony, in the afternoon of the first working-day in this month, was adhered to, though in one or two cases the more modern plan of making it introductory also to an evening entertainment or *conversazione* was adopted.

In style and scope the Introductory lectures naturally varied: some

consisting, more or less entirely, of information to the students on the variety and extent of the subjects they will have to study, of advice as to the necessity of strenuous, steady work, and on the best ways of truly educating themselves, instead of only, parrot-like, learning by rote all that may be set before them, and of warnings against the snares and pitfalls that will beset their path; while others were of a more ambitious character, entering into the history, to a greater or less degree, of the rise and fall of Medical theories and systems. We cannot note the special characteristics of each and all of the Lectures, and must beg that it may not be supposed that any we do not especially mention were not worthy of notice, but only that some have come more directly under our notice than the rest.

The Introductory Address at Guy's Hospital was delivered by Dr. Oldham, who spoke of the necessity laid on the student of training, refining, and disciplining his intellect, and of keeping it in alliance with the moral sense. He pointed out how favourable the number and variety of the subjects included in the study of Medicine are to mental activity, and to the training and quickening of the senses; and urged on the students the importance of *educating* themselves thoroughly while they learned from their teachers. To such students as may feel at times "discouraged by being distanced by the rapid successes of a brilliant intellect," he offered the consolation,—“experience shows that, taking the resources of the whole man, the ultimate success of those who have striven their utmost to discipline their minds, enlighten their moral nature, and learn their Profession is remarkably equalised.”

At St. Thomas's Hospital the fact that the lecturers and students met together for the first time in their new buildings, naturally led Mr. Le Gros Clark to dwell chiefly on the history of the Hospital and School, and of their past worthies. His lecture struck us as being a particularly interesting and elegant discourse, full of graceful allusions and somewhat touching memories. Referring back to his own student days, he told how he used to come to Stangate, and "trip over the long shelving shore at low-water to launch his boat," and remarked that "even the ready credulity of boyhood would have rejected as absurdly improbable the suggestion that each flood-tide was then flowing over the site of the Hospital of future ages"; and naturally, also, he could not but indulge in some reflections on how few of those who began their career with him still remain, while all his honoured teachers had departed. To all this he added some truly wise and high-toned advice to those commencing their Hospital career, and in most eloquent and feeling language depicted the real manliness of character which every student should strive to attain to. It is not easy to refrain from quoting some of this part of his discourse; but as, happily, we are able to give his lecture in full elsewhere in our pages, it would be superfluous to repeat it here.

At the London Hospital Medical College, an innovation on established custom was made by the appointment of a past member of the staff—Dr. Little—to deliver the Introductory Address. Remembering that the first Introductory Lecture he had heard, as a new student at the London Hospital, forty-three years ago, was an eloquent address from Mr. Headington, "On the Glories of the Discoveries and Improvements of the previous forty years," Dr. Little felt desirous to give to the present students the same stimulus and encouragement that he had then derived from Mr. Headington's description of the triumphs of the great workers in Medicine, Surgery, Physiology, Pathology, and Chemistry, of his time. He went, accordingly, over the same period as Mr. Headington did, and then very briefly described the chief additions to our knowledge, and spoke of the most eminent workers, at home and abroad, since 1830, and finally ventured on a forecast of some of the triumphs we may hope to win in our battle with disease and death, in the years to come, and concluded his interesting address with some sound advice to the students on the right

method of working, recommending them above all things to be thorough in all their doings.

Dr. Little's brief reference to the germ theory and Mr. Lister's antiseptic treatment of wounds is worthy of note. After complimenting Mr. Lister on "the zeal and ability with which he has propagated his ideas," Dr. Little observed—"Si parva licet componere magnis." The knife used in tenotomy is, it is true, a very small one. We are unable to reconcile the danger announced by Mr. Lister, of carrying germs of disease into the body, say with a new cutting instrument, or one perfectly clean in the ordinary sense in which the operator speaks of his instrument, with the fact that we ourselves have performed thousands of divisions of tendons subcutaneously, without in a single instance witnessing a particle of pus secreted from the puncture, even when subcutaneous incisions of considerable depth and range have been made. Surely, if the danger of introducing pus germs or putrefaction germs into the living structures with the knife existed, some one instance of suppuration after subcutaneous tenotomy should have occurred in our experience."

The text of Dr. Rutherford's Address at King's College may, we think, be said to have been the same as that of Dr. Clifford Allbutt's address at the Leeds School of Medicine, which we hope to publish next week—viz., "What is Disease, and Can we Cure it?" Both of the lectures are very good; but it may fairly be said, perhaps, that Dr. Rutherford handles his subject chiefly as a physiologist, while Dr. Clifford Allbutt treats it more from the Clinical Professor's point of view.

Want of space forbids our making any further remarks on the Introductory now, but we shall return to the subject next week, when we shall notice some more of the Lectures, especially those of Dr. Meadows, of St. Mary's Hospital, and Dr. Russell, of Queen's College, Birmingham.

THE PUBLIC SERVICES.

THE commencement of a new Medical Session appears to afford a favourable opportunity for the consideration of the relative advantages and disadvantages presented to junior members of the Profession by the Naval and Military Medical Services, and for the examination of the reasons which have rendered at least one of these services so unpopular that many vacancies still exist in it. The Army does not at present suffer from any dearth of candidates for its Medical appointments, while the Navy is constrained to recruit its Medical ranks from the superfluous aspirants for admission into the sister service, as so few directly offer themselves for it.

The reason cannot be assigned to inferiority of pay or comparative slowness of promotion in the Navy, as in both respects the Medical service of the Navy is superior to that of the Army. A Naval Assistant-Surgeon commences at 11s. per diem, which rate continues for the first five years; from six to eight years' completed service he draws 12s. 6d., and from nine till eleven, 14s.; under fourteen years' service, provided he shall have passed his examination for Surgeon while under ten years' service, 15s. 6d.; and above fourteen years', 17s. A Naval Surgeon on promotion, or under fourteen years' service, draws 18s. per diem; under seventeen years' service, £1; and for each additional year of service 1s. a day more until the maximum is reached—namely, £1 2s.

An Assistant-Surgeon in the Army commences at 10s. per diem; after five years' service he gets 12s. 6d.; after ten years' service, 15s.; and after fifteen years' service, 17s. 6d.; and, should he have the luck to be promoted in less than fifteen years, his pay will be 17s. 6d., and on the completion of fifteen years' service, 20s. per diem. So that in the Navy, after the first five years, pay is increased every three years, while in the Army the interval is five years, and the total amounts in twenty years' full-pay service are less than in the Navy, as may be seen from the following tables:—

		Navy.										
		Per diem.		Per annum.

Average annual pay							£262			6	10½	

The Naval Medical Officer, therefore, during twenty years of full-pay, after first entering the service, receives in cash £428 17s. 6d., or an average annual amount of £21 8s. 10½d., more than his Professional brother in the Army. Similar differences might be traced out in the pay of the higher ranks.

As regards promotion, also, the position of the Naval Medical Officer for several years past has been better than that of the Military, and continues so. The Navy List for the present month contains the names of only three Assistant-Surgeons of 1859 qualified for promotion, and sixteen of 1860, and none of either year who have not passed the examination for promotion; while in the Army List of same date we find not only that there are fifty-two Assistant-Surgeons of 1859, but that above them stand ninety-nine of 1858, and forty-one of 1857, while below them are thirty-two of 1860. So that under the present condition of affairs the period for promotion in the Navy may be said to be under twelve years, and in the Army over fourteen. Half-pay is also better in the Navy than in the Army. In the former service an Assistant-Surgeon under five years gets 6s.; under eight years, 8s.; under eleven years, 10s.; above eleven years, provided he passed his examination for Surgeon while under ten years' service, 11s. In the latter, the half-pay of an Assistant-Surgeon under five years is 6s.; after five years, 8s.; and after ten years, 10s., without further increase. It must, however, be borne in mind that in the Army half-pay to Medical officers is only given during unfitness for service in consequence of bad health, while in the Navy it may occur on the completion of each tour of foreign service. But practically such is not the case, as, in consequence of the limited number of Medical officers in that service, no one, except at his own wish, is placed on temporary half-pay on return from foreign service, the rule being that six weeks' leave on full-pay is granted on return, and on its expiration the Medical officer is appointed to one of the Naval Hospitals or to a ship on the home station, where he would probably serve eighteen months or, perhaps, two years before again going abroad. The result is, that, except in case of bad health, there being no compulsory loss of service, a Medical officer can put in twenty years' actual full-pay service almost continuously. Cases, of course, occur in which this cannot be done, but we believe them to be exceptional. In this matter, also, of half-pay in consequence of bad health, the Naval Medical Officer does not occupy the same invidious position compared with that of officers of the military branch as does his Professional brother in the Army. In the Navy, all officers, on becoming ineffective on a foreign station, and passing a Medical board, are sent home on half-pay, which

(a) As Surgeon under fourteen years' service.
 (b) As Surgeon over fifteen years' service.

commences from the date of the Medical board. In the Army, military officers, under the same circumstances, having appeared before a Medical board at home, can obtain leave by successive extensions on Medical certificate for eighteen months or two years before being placed on half-pay; but Medical officers can only obtain six months' leave for the recovery of their health, and if still inefficient at the expiration of that time, they must go on half-pay, to their great loss, both pecuniarily and departmentally.

We have thus shown some of the points in which "My Lords of the Admiralty" hold out higher inducements for young Medical men to enter their service than are presented by the War Office. For their want of success in procuring the requisite number they have themselves entirely to blame. Their want of faith in carrying out in individual instances the specific provisions which the wording of their warrants obviously suggests, their readiness either to limit in subsequent minutes privileges apparently accorded to Medical officers in others of earlier date, and to extend to members of the "civil branch" similar or even greater advantages by the levelling-up process, have produced in the minds of all Naval Medical Officers such disappointment and irritation as, reflected by their influence on the several Medical schools, and in their letters to the public journals, have generated an amount of distrust in the minds of students which it will take the Admiralty years of better policy to eradicate.

Naval officers of the executive ranks, while tenaciously and very naturally holding the necessary relative precedence of their own branch of the service—and to this no Medical officer can reasonably object—are, we believe, always ready to admit that outside their own executive circle the Medical service in practical importance takes the next rank, and is entitled to all the privileges of the executive branch, except, of course, that of command. They do not, however—whether reasonably or not does not come within our scope for consideration—look upon the other civil departments with the same favourable eye, and are less inclined to support the position of the Medical officers than they otherwise would be, as experience has taught them that every privilege gained by the Medical Department is either simultaneously or ultimately accorded to the other—more correctly styled—civil branches.

The Admiralty must therefore adopt a more consistent course as regards their Medical officers if they wish to fill up their vacancies and have a contented Medical Department. Content and efficiency are as inseparable as any other cause and effect. We have been at some pains to show that it is not the mere money consideration which prevents young Medical men from entering the Naval Service. We also feel assured that we have accurately stated the case between the Admiralty, their Medical Officers, and the Schools; and we cannot hold out any hope of amendment in the feelings of students towards the Naval Medical Service until the Admiralty prove by a steady course of well-doing, as regards their Medical officers, their regret for former shortcomings and the sincerity of their good intentions for the future.
