RADFORD LIBRARY,

Saint Mary's Hospital, Manchester.

No.

~~P. 24~~ Q. 158

This Book to be returned in _____ days.

Fine for overtime _____ per day.

Note.—No book can be renewed if wanted by another reader, nor unless brought to the Library for that purpose.

It is requested that the leaves of books may not be turned down,—that no person will write in them,—and that the greatest possible care may be taken of them.

EXTRACTS FROM THE RULES.

That each Medical Officer shall be allowed not more than two works out of the Library at one time, and not more than two volumes of each work.

That Registered Medical Students shall be allowed to take out books every Tuesday and Saturday, from eleven till one, or at such hours as may be ordered from time to time by the Board.

That each Registered Medical Student shall be allowed to have not more than one book out of the Library at the same time, unless the work consists of two or more volumes, and in no case more than two volumes.

ORIGINAL LECTURES.

ON THE INFLUENCE OF THE
NERVOUS SYSTEM ON DISEASES OF THE
ORGANS AND TISSUES.

By THOMAS LAYCOCK, M.D., etc.

Professor of the Practice of Medicine, of Clinical Medicine, and of Medical Psychology and Mental Diseases, in the University of Edinburgh.

(These lectures have been revised, and somewhat extended, by Dr. Laycock.)

LECTURE IV.

THE TROPHIC CLINICAL ANATOMY OF THE CEREBELLUM AND MEDULLA OBLONGATA.

ALTHOUGH the subject is full of difficulties, I will endeavour to give you an outline of a trophic clinical anatomy, being satisfied that even an imperfect anatomical basis will both give more precision to your observations and render them less difficult, while at the same time it will tend to counteract that mischievous vagueness which hangs about all observations of this class. Such anatomy should enable us to determine both the seats and the causes of the changes in the nervous system which influence morbid states of organs and tissues, and which consequently regulate chemical and vaso-motor action. It should also include the seat of those appetites by which the kind and quantity of nutritious materials supplied to the body are regulated, the nervous apparatus by and through which bodily feelings and mental states influence corporeal conditions, and the seats of the processes by which both mental and corporeal tendencies are transmitted hereditarily. This as to anatomy. As to causes which influence the functions of the nerve-centres, there are two kinds—namely, changes in the supply of blood and in its qualities, and changes in the properties of the nerve-tissue itself. The latter I shall not touch on at all; as to the former, I shall give you a new scheme of study. In the first instance, however, I will endeavour to specialise these trophic centres clinically.

There is a numerous class of sensations and feelings well known as "corporeal," which are, in fact, trophic. Such are the feelings of hunger and thirst, and their various modifications, and the feelings of bodily comfort and discomfort, of strength and of weakness, and the like, to which I referred in a previous lecture. These states of consciousness, whether normal or abnormal, indicate that there is a special *sensorium commune*, in which the conditions of organs and tissues as a whole, and the morbid changes therein, are so represented to the consciousness as to induce these feelings, to the end that a proper supply of nutrient materials and a due accumulation of energy for the purposes of life may take place. There is so much unity of function of diverse organs in the actions necessary to these trophic ends, that it is difficult to avoid the conclusion that there is a trophic centre, or series of centres—a sort of corporeal *sensorium commune*—corresponding to the mental or intellectual. In particular, there must be a point where the feelings of bodily strength and health, and those of weakness and illness are felt. The hypothesis that the seat of these is diffused over the whole body is so contrary to facts, as well as to all analogy, that we need not consider it. Where, then, are the nerve-centres which subserve to the feelings of ease and pain, of health and strength and weakness, and which regulate trophic and vaso-motor changes? I fix them in the medulla oblongata, pons, and cerebellum, and I look upon the cerebellum as more especially the reservoir and source of motor or executive vis nervosa, and the great sympathetic vaso-motor and trophic centre of the body, including the brains. The arguments in favour of these views are detailed in my Psychological Course, and are to be found in the text-book. (a)

Unfortunately, in the study of the functions of the cerebellum we derive little direct knowledge from the states of consciousness, simply because, as the centre of organic life, it has no

direct relations to special conscious states, although it has close functional relations with the brain along the *processus è cerebello ad testes*. Nor is it easy to mark out the line of physiological activity along its three bilateral sets of commissures—viz., the spinal or inferior, the cerebral or superior, and the unifying or middle commissures—the crura cerebelli, and pons. I think there are grounds for concluding that in many cases of general nervous debility, as distinguished from the weakness due to imperfect supply of food, drink, and nutrient materials, and to loss of blood and the like, there is defective functional activity of the cerebellum, and therewith defective evolution of vis nervosa, of which it is, as it were, the storehouse; just as muscular fibre stores up muscular energy. It is, I think, exhaustion of this store that causes the feelings of languor, the desire for rest after much labour (not the aches of weariness, which are derived from the exhausted muscle), and the need for sleep and rest, so as to reaccumulate energy, and replace exhausted materials. It is through the connexions of the cerebellum with the genito-spinal centre that nervous debility is so often associated with exhausting sexual excesses, and with renal and utero-ovarian disorders. The results are very various because of the multitudinous relations of the cerebellum: while in some persons local diathetic diseases like gout, rheumatism, and syphilis may be induced, in others there may be central neuroses like epilepsy, catalepsy, hysteria, insanity. It is probable, too, that various trophic drugs—the so-called stimulants—act through the cerebellum, and more especially opium, alcohol, and "bitters."

This view does not exclude the fact that the brain and spinal cord and the special nerves and nerve-centres have each their own stores of vis nervosa; for when any one of them, whether motor or sensory, is subjected to exhausting conditions, the results of nervous debility follow. Snow-blindness is an example of local sensory exhaustion from excess in use, as "writer's spasm" is of motor exhaustion. Tissue-changes, wholly local, thus arise from nervous debility of special trophic nerves and spinal nerve-centres; as illustrations may be mentioned sympathetic ophthalmia, herpes zoster, local œdemas, and local pigmentations. It is, indeed, as to the diagnosis of these local affections that a clinical trophic anatomy is so important; for even when the nervous debility is general, the morbid results are not manifested locally as disease or disorder of nutrition until either an exciting or predisposing local cause takes effect. In injury of one eye, for example, there may be no morbid diastaltic action on the other eye as a result until a general morbid state is induced; when that comes on the local predisposition takes effect, and inflammation of the sound eye follows. In this way many latent causes of local disease become manifest when either trophic debility is induced generally or of a particular nerve-centre. Now it is impossible with our present knowledge to allot particular functions to particular lobes of the cerebellum; all we can affirm is that it is as highly evolved and apparently as complex a structure as the cerebrum, including the hemispheres.

If we endeavour to determine whether the cerebellum belongs specially to the corporeal or the intellectual system, we at once solve that question by its embryological anatomy. It is plainly a differentiation of the medulla oblongata, and the medulla oblongata is as plainly an aggregate of corporeal centres in relation with it, with the pons, and with the brain and hemispheres above. The medulla oblongata is in the line of physiological activity of all the sensory nerves from the body below, and of all the fibrils coming from the mental region above. It is equally the seat of all those centres which regulate the functions of the heart, lungs, stomach, and their appendages; so that in this, as a group of co-ordinated centres, we can fix the merely bodily feelings as distinct from ideas or notions of things, and of some, at least, of the corresponding movements. Cut off communication with the mental region above by complete division of the crura cerebri, and there remains a group of corporeal centres intimately connected with each other, which I term the occipito-spinal area. Of this group the cerebellum is the chief, having its own proper connexions with the brain proper or cerebrum.

Now, as to the body generally, after including the viscera of the thorax and the stomach and liver, we can limit our attention of the trophic relations of the medulla oblongata to the skin and limbs. From the skin come the afferent trophic nerves of temperature, of corporeal pain, and of the chemical condition of the tissue and glands. As I previously remarked, it is necessary to distinguish the nerves of sense proper going along the medulla oblongata to the hemispheres from the afferent trophic nerves—such, for an example, as the nerves of touch, and of sense of resistance or weight. These latter, arising in the muscular

(a) We may therefore conclude:—1. That the cerebellum, in virtue of the decussation of all its commissural fibrils, is a central unifying organ. 2. That it is not the unifying organ of thought and will, and must therefore be the unifier of organic or vegetative life. 3. That it is in the same relation to the anterior and antero-lateral column of the cord as the lateral and posterior grey matter. 4. That, having probably similar functions, it influences all the motor functions of the cord, and through these all the vital activities of the body, including temperature, secretion and excretion, nutrition of muscular and other tissues, and co-ordination of cardiac, vaso-motor and muscular activity.—"Mind and Brain," second edition. Vol. II., p. 43.

system, have probably a wholly different centre than the sense of muscular ache or such pain as is felt in muscular rheumatism. But even as to the cerebral sensory nerves, we must distinguish between those fibrils which go to motor centres like the cerebellum, so as to regulate and co-ordinate the action of muscles, and those which go to the hemispheres and subserve to perception and thought. These distinctions will enable you to understand how and why the æsthesiometer helps us to determine the condition of trophic centres, and why we should distinguish thermal and algic insensibility from touch-palsies. (b)

Let us now take up the clinical anatomy of the trophic appetites and the chemical centres. The appetites are desires for things which supply energy—such as heat, chemical affinity, and vis nervosa—and as to the supply of which, organs and tissues are regulated chemically. Are there, then, special nerves and nerve-centres in the medulla oblongata with the function of regulating the supply? The discovery of Claude Bernard that injury to the medulla oblongata at the point corresponding to the floor of the fourth ventricle caused sugar-production, threw an entirely new light on organic chemistry; and this became greater when it was ascertained that the sugar was produced in the liver. Until these discoveries, the Profession was wholly in the dark as to the true nature of diabetes mellitus, so that the treatment was founded on wholly diverse and contradictory hypotheses. The sugar (or something sweet), produced neurotically, is found in the blood as well as in the urine; but it is most readily observed as glycosuria, and the urine has, therefore, been examined, and found to contain something sweet in numerous disorders in which the trophic centres are involved, as, for example, "nervous" attacks, hooping-cough, ague, injuries to the head, and diseases of the crura cerebri, optic thalami, and medulla oblongata. I might add the glycosuria caused by curare, carbonic oxide, and chloroform. (c)

Water is an essential constituent of all living tissues, whether vegetal or animal. In neurotic disorders of nutrition (or trophies), what are termed the animal appetites for food and drink are often modified—eminently so in fever, in dropsies, and in diabetes, as to the water appetite or thirst. The theories of thirst in fever have been invented without any relation to the thirst of dropsy, and the thirst of diabetes, whether as to insipidus (polyuria) or mellitus (glycosuria), discussed independently of both. That of diabetes mellitus has had various explanations, all having, chiefly, reference to the glycosuria as a cause. An experiment made by Claude Bernard helps us to a simple explanation. He caused polyuria (hydruria) by puncturing the medulla oblongata a little below the point where injury causes glycosuria. Schmiedeberg produced it (as well as glycosuria) by the inhalation of carbonic oxide. It is to this class of phenomena that we can refer the copious flow of limpid urine in hysteric convulsions and in various neuroses in which the genital or urinary system is a starting-point. The thirst caused by corporeal injury, with or without pain, and which distresses the wounded so much on the field of battle, seems to belong also to this class. To understand the practical bearings of these experiments, it is necessary to remember that, like heat, the water in the organism is a fixed quantity, and that there is probably, therefore, a regulative apparatus to maintain it at the healthy or normal amount. If there be too much, it is excreted by the skin or the kidneys, or both; if too little, the desire for it occurs as thirst. When I come to speak of dropsies, I shall show you that the thirst is diastaltic, and probably due to a renal hyperæsthesia, just as experiments show that the condition of the splanchnic nerves influences the production of glycosuria and hydruria. At present, I would only remark that the thirst in both kinds of diabetes (which in other cases, when there is no sugar or urea in excess in the urine, is termed polydipsia) is probably a neurosis of this water-centre; so that one reason why patients in dropsies, as well as in diabetes, pass much urine is that they drink much. Further, a neurosis of this regulative centre may induce the abnormal production of water from the tissues themselves; for I can confirm the observation made by numerous observers, that more water is excreted in some cases of diabetes mellitus than is imbibed. Something analogous seems to occur in fevers, for Dr. Parkes found more water to be used up in fever than is taken. The production of water in the tissues of plants has not, so far as I know, been investigated; but we know it is stored up in them

under circumstances which render it difficult to explain its origin *ab extra*. The appetite for food is so frequently modified in numerous diseases, that it requires special notice. Anorexia is so common, that I cannot enter upon the theories of its origin; the rarer neurosis of this kind is *bulimia*.

The ravenous appetite of the diabetic patient is obviously explained most easily by the loss of nutriment through the kidneys; so, also, the atrophy, the too frequent concurrent tuberculosis, and the low temperature. I must, however, express my doubts as to the validity of these explanations, for there are reasons for the opinion that, like the thirst, they are neurotic—at least, in part. When we remember that if, in fevers, in diabetes, and perhaps in phthisis, water be produced at the expense of the tissues from neurosis of the water-regulating centre, we can easily understand that, as the hydrogen of the water must be taken from the hydrocarbons or fats, and the oxygen diverted from its proper uses, there may be a general atrophy as the result of a trophic chemical neurosis, independently of manifest cause of wasting disease. From this point of view, phthisis, malignant disease, and chronic suppurative and exudative inflammations are to be classed together as wasting diseases having a common cause of waste. We can also see how cases of diabetes mellitus may—as, indeed, they do—differ according as there is waste of food and tissue in the abnormal production of water, or there is not.

(To be continued.)

CLINICAL REVIEW.

By GEORGE W. CALLENDER, F.R.S.,
Surgeon to St. Bartholomew's Hospital.

GENTLEMEN,—By using the term clinical review I wish to indicate the precise character of the matter we shall consider together during the present session. Whilst visiting the wards we can see our patients under treatment, observe the progress which they make, and in the end take note of the results. Here, in this theatre, I shall pass these cases in review, in order that we may criticise their management, consider how (if possible) better results might have been attained, examine the difficulties which occasionally interpose to thwart the best-reputed plan of treatment, and inquire into those matters of detail which arise in well-nigh every case, and which, whilst they are unavoidably passed by in systematic lectures on injuries and Surgical diseases, call for particular notice in relating the history of individual cases. To-day we will review the cases which are at present, or quite recently have been, in the back ward of Harley.

The first patient, on the left-hand side on entering the ward, is a male aged 62, who fell, and, besides other severe injuries, dislocated the sternal end of the left clavicle forwards. Mr. Young was able, the day after the accident, to reduce the dislocated bone by manipulation—that is, by pressing the shoulders back, and thus drawing the sternal end of the clavicle off the breast-bone; but, on the remission of pressure, the clavicle started forward, though to a less extent than before. As soon as the patient could bear the confinement, an old-fashioned apparatus (Brasdor's) was applied for the purpose of keeping up continuously the back-drawing of the shoulders; but our patient could not tolerate its use, and so we were obliged to be content with the partial reduction which had been from the first effected. If you now examine him, you will easily recognise the furcula or inter-clavicular notch, and then, to the left side of this you will feel and see the end of the collar-bone projecting forwards of its natural position, and the immediate surroundings thickened so as to make the displacement appear greater than it really is. This patient will have a thoroughly useful arm, so far as this hurt is concerned, and when the induration about the sterno-clavicular joint subsides, as it probably will, there will be no notable disfigurement.

But could we have done more towards completely reducing and holding reduced the dislocated bone? In this instance we could not, by reason of the patient's inability to bear restraint, or even slight pressure against the displaced clavicle. Nor, indeed, is it in any case easy to ensure permanent reduction of such a dislocation as this, of a joint of which the entire holdfast lies in the strength and integrity of its ligaments. You cannot look at any specimen of the joint such as the one before us without seeing at a glance how little support it has from apposition of its surfaces, which, separated by this fibro-cartilage, easily glide backwards or slip forwards after tearing of the supporting ligaments. By keeping the patient on his

(b) Dr. Laycock has had an æsthesiometer made which helps to distinguish these three kinds of sensibility of the skin.

(c) The most recent and valuable contribution of this kind is a paper, read on February 8, 1870, to the Royal Medical and Chirurgical Society of London, by Dr. W. H. Dickinson, "On certain Morbid Changes in the Nervous System associated with Diabetes."

back, and so allowing the weight of the arm to drag upon the clavicle, it is possible some help towards retaining the bone in position might have been gained; but with our patient this was out of the question, as his other troubles hindered him from lying down.

This man displaced his clavicle through falling on the front of his left shoulder. Some few of the instances of this displacement which I have seen have followed blows upon the sternum. One man had this bone shattered by a kick from a horse, and both clavicles were thrust forward, and could not be replaced. And this, too, is the direction which the displacement usually takes when following any such injury as in the case before us. Here is a specimen from our museum, (a) in which the bone is dislocated forward and downwards from the sternum, the luxation being complete; and in Guy's museum (b) there is a specimen in which the displacement is forward and upwards. When the dislocation is complete the bone is usually displaced downwards; when it is incomplete, the clavicle is most often thrown up towards the neck. I need scarcely remind you that in the rarer form of displacement of the sternal end of the clavicle backwards, an instructive example of which has been narrated by Mr. De Morgan, (c) serious symptoms may arise from pressure of the bone upon important structures at the root of the neck.

It of course more frequently happens that, from a fall on the shoulder, the clavicle breaks about its middle third; and a few beds from our first patient there lies a man who has suffered this amongst other hurts. He is a fireman, who, whilst on duty, fell through a skylight. Mr. Young tells me that well-nigh the half of his scalp was torn off, from the forehead to the occiput, and that the wound extended below the mastoid process into the neck, where a good deal of blood was extravasated. This great flap, hanging by its base, was replaced after being cleansed, and was secured by wire sutures. We fully expected some after-trouble, but the man was young (19) and healthy, and this large wound healed throughout, so that its fastenings have remained undisturbed to this day—three weeks after the injury.

His broken clavicle could not be well set, the acromial end standing forward with a sharply-pointed extremity, and for some days we were unable to get him to lie down, as he was troubled with bronchitis, whilst his other hurts were such that he could not bear the restraint of bandages. Now that he is recumbent, the weight of the arm and shoulder is drawing out the acromial end of the clavicle, and eventually the malplacement will be inconsiderable. Here is a case in which we were quite unable to follow out the prescribed method of treatment for an injured clavicle, because of the grave hurts with which it was complicated, amongst which may be mentioned, besides those already referred to, a comminuted fracture of the left patella.

Amongst other examples of broken bones, there are in the ward two cases of delayed union very unlike, but both instructive.

This term "delayed union" is, I believe, the only one admissible in the vast majority of cases in which a fracture is reputed to have failed in its repair. There are some few cases in which union is prevented by portions of muscles, or by fragments of bone, detached and becoming necrosed, which interpose between the broken ends; and there are cases in which osseous union is forbidden by the distance which separates the broken pieces, as in certain transverse fractures of the patella. But in all cases in which the bone-ends of the fracture are fairly brought together, their union, if they are left at rest, is only a question of time; but if they are moved occasionally, or incautiously handled, then their union is retarded, or, if such bad treatment is persisted in, may even be altogether prevented.

There are some fractures which, more than others, require care in their management, lest union be interfered with. Amongst such, very oblique fractures of the tibia and fibula occur to me. A long time must elapse—perhaps seven or eight weeks—before union is sufficiently firm to resist the tendency to gliding when the weight of the body comes to press on the slanting surfaces. I have seen several instances in which repair has been undone by too early a use of the limb under such circumstances, although time enough had been allowed for the repair had the cases been examples of transverse, or less oblique, fracture of the bones. Amongst such, too, may be counted fractures of the lower third of the humerus, which, it is known, are liable to be unset by the attempts made, often prematurely, to restore elbow-joint movements. The fracture

must be very firmly united before we try to set to rights any stiffness of the elbow.

The first of the two cases is that of a man, aged 21, who broke the bones of his right leg just above the ankle, and the tibia again in its upper third. At the end of five weeks union was imperfect. The fracture was again put up, and some phosphate of iron was prescribed for the patient; but it was ten weeks before repair was sufficiently good to allow of his going to his home. We were not surprised at this slow recovery; it always follows when the blood-supply in a limb is interfered with—for instance, when, from bruising of the tissues and plugging of veins with clots, the venous system is so obstructed that the limb becomes and remains oedematous or hard and brawny. But in the case before us the fracture in the upper part of the tibia had, no doubt, involved the great nutrient artery, which you may see, in this bone, passing near the popliteal line, through this large medullary foramen, directly downwards into the cancellous tissue; and we conclude that, despite the reparative power of the periosteum and in the shaft above, firm union was not attained until the circulation had been restored in the lower portion of the shaft, so that this part of the broken bone could bear its share in the process of reunion.

The second patient occupies the last bed in the ward on the left-hand side, and I will read you the notes of his case, which have been drawn up for us by Mr. Payne. He is 52 years of age, and on February 20 was admitted into Kenton Ward with a fracture of the lower third of the leg, both bones being broken, and the fracture extending into the ankle-joint. The internal lateral ligament was also torn, carrying with it the internal malleolus, and thus the foot was easily displaced either inwards or outwards. It was found necessary to divide the achilles tendon before the foot could be brought into good position. One week after the accident he became violent and delirious, and during the night displaced his leg from the splints, and so gave rise to a severe attack of phlegmonous erysipelas, causing great sloughing of the skin, and converting the simple into a compound fracture. On March 25, his pulse, which had been at 120, with a temperature of 104°, fell to 92, and the next morning to 84, the temperature ranging from 99° to 99.6°; and I then decided, in consultation with some of my colleagues, to amputate the limb. The patient, however, refused to submit to the operation, and from this time he very gradually sank, so that now (three months after the receipt of the injury) he is in a most feeble condition, the injury to the limb unrepaired, and with effusion, probably of a pyæmic character, into the opposite (right) knee- and ankle-joints. The time for an amputation has now passed by.

Let me refer to the reasons which led to our advising amputation of the limb on March 26. The damage to the tissues, including the sloughing of a large tract of skin and the converting of the fracture into a compound one with the ankle-joint laid open, seemed to be greater than the patient at his time of life could possibly repair. We watched him until he rallied out of his delirium. He seemed to steady himself, his temperature dropped nearly 5°, his pulse became not only less frequent but was natural in volume, and his digestion and other functions fell into fair working order. Then the time most favourable for the operation seemed to have arrived. Later on, the exhaustion consequent upon suppuration and upon the endeavour to repair so great a local injury has been such that no opportunity for again raising the question of amputation has been given us; but, from the great effort nature has made in this case to effect a cure, I feel satisfied the patient would have made a good recovery after the operation. Firm union of the broken bones could scarcely be hoped for in the exhausted state of this poor man—with suppuration, too, in progress about the site of the fracture, to say nothing of the extreme difficulty we have experienced in keeping the parts at rest and in good position—and I need scarcely again remind you that without rest it is hopeless to expect osseous union of fracture of the tibia and fibula.

Opposite to this patient is a man, aged 53, with compound fracture of the bones of the left leg. Although I anticipate for him a good recovery, yet you will observe for yourselves that the condition of the limb six weeks after the hurt is not altogether satisfactory; there is some discharge from the wound, and there is a blush of redness around it which extends for some distance over the limb. The fracture was comminuted, and possibly some fragment of bone has necrosed, and is causing the irritation. Could we feel any such piece of bone we should remove it, provided that the operation did not necessitate any great disturbance of the parts; as it is, it seems best to leave the parts at rest, and to allow the necrosed bone,

(a) Series iii., 97.

(b) Specimen No. 1292, 90.

(c) "System of Surgery," vol. ii., p. 805.

if there be any, to work its way out. It is possible, however, that there may have been some suppuration extending along the course of the extensor tendons, and the irritation thence arising may have retarded repair. However this may be, here is another example of delayed union, for at the end of the sixth week the bones are not fairly joined together; so we have put up the fracture for another three weeks, and at the end of this time the bones will, without doubt, have firmly united.

ORIGINAL COMMUNICATIONS.

NOTES

ON THE PATHOLOGY OF MALIGNANT NEW GROWTHS.

By HENRY ARNOTT, F.R.C.S.,

Assistant-Surgeon to the Middlesex Hospital, and Lecturer on Surgical Pathology in the School.

III.

CARCINOMA—(continued.)

Microscopic Appearances modified by Tissue affected, as Muscle, Bone, etc.—Villous Cancer—Hæmatoid Cancer, or Fungus Hæmatodes—Melanotic Carcinoma—Colloid.

BEFORE entering upon the brief consideration of the varieties of carcinoma to which have been assigned special names, some notice should be given to the modifications caused by the locality or tissue affected by the growth. It has been already said that the secondary growths met with in the liver or lungs are, as a rule, more richly cellular than the primary tumour, but, excepting that the stroma is less obvious, there is very little other difference discernible, either in the form or size of the cells, or in their arrangement. Sometimes, when the development of these secondary tumours is exceedingly rapid, an unusual preponderance of the small cells before described may be met with. I have seen, for instance, a very rapidly growing carcinoma recurrent near the scar of an amputated breast, in which the cells were so uniform in shape and so small in size, that it would have been very difficult to name the growth at all without the aid afforded by the examination of the primary tumour. In the outlying pea-like nodules which occasionally occur in the pectoral muscles beneath a scirrhus breast, and which afford such beautiful opportunities for the study of the infiltrating characters of carcinoma, it often happens that the bulk of the tiny mass is made up of these small "indifferent cells," and there is merely a trace of the alveolar fibrous stroma so characteristic in mature carcinoma.

Carcinoma affects bone either in the form of distinct tumours or as an infiltration of the bone with cancer elements, so as to affect its consistence rather than the shape of the bone. In such cases of bone-softening in connexion with cancer elsewhere as I have had the opportunity of examining, I have seldom been able to detect any cancerous elements, but occasionally one meets with instances of considerable deformity of the flat and long bones occurring either as primary or as secondary carcinoma. In such cases, there is an abundant milky juice to be scraped from the section of softened bone, and in this juice are just such cell-forms as are commonly met with in the juice of a scirrhus tumour. Very thin sections of bone so diseased show groups of such cells enclosed in spaces corresponding to the Haversian spaces of the original bone; but, besides this, the osseous lamellæ are occasionally found to be divested of calcareous matter, and to form a fibrous stroma very like that of ordinary carcinoma, the lacunæ being swollen into groups of new cells in some parts as though these cells resulted from the proliferation of the original lacunal cell. To follow up in detail the modified appearances of carcinoma as they are altered by the tissue affected, however, would lead us beyond the scope of these notes. With the brief suggestion that the statement of Virchow, as to the absence of any visible intercellular material being an essential condition of true carcinoma, is probably not to be received without exception, since one occasionally meets with instances of undoubted scirrhus of the breast in some parts of which a certain amount of granular material separates the cells, we may pass on to the notice of those named varieties of cancer whose distinguishing characteristics are really caused by degenerative processes or other accidental conditions.

Villous Carcinoma has been described, but is, I fancy, an

extremely rare variety. Malignant villous tumours are almost invariably associated with epithelioma rather than with carcinoma, and are met with on such mucous surfaces as are normally villous—the villi, owing to the disturbed nutrition of the part, becoming greatly hypertrophied. Certainly many tumours which are called villous cancers are simply due to a more or less active overgrowth of the healthy villi of the part, which may give rise in the bladder or rectum to large masses of velvety substance, forming beautiful objects when floated out in water, but having no trace of malignancy about them, either in their anatomical structure or clinical history.

At the same time it must be mentioned that villous tumours of the bladder and elsewhere have been described by Prof. A. Luecke and others, in which groups of carcinoma cells were imbedded in the fibrous matrix of the papillæ; and such growths would be quite rightly named villous carcinoma.

Hæmatoid Carcinoma or Fungus Hæmatodes may be dismissed with a very few words. Very soft and rapidly growing tumours, whether carcinomatous or sarcomatous in type, are supplied with very delicate capillary networks, and these fine vessels, when separated by careful washing from the cell-elements of the growth, are seen to be variously dilated, the vessel wall yielding in the direction of least pressure. This is particularly the case where fatty degeneration advances as rapidly as the cell-proliferation, and it is specially in such instances that, the vessels bursting, large quantities of blood are poured out, and by their subsequent changes diversify with such rich colours the cut surfaces of these growths. It is obvious that this accidental hæmorrhage is an insufficient ground for according a special name to tumours exhibiting it, for precisely the same thing happens in a greater or less degree with every soft new growth.

But I will take this opportunity of directing attention to those growths occasionally met with, in which the blood so poured out plays so important a part amongst the various characters of the tumour that the elements of the new growth are in danger of being overlooked. I have twice seen tumours of this kind, each time in the ham or lower part of the thigh, and both times with similar symptoms. A swelling had been present for some weeks or months, and latterly had rapidly increased. It presented all the signs of a cystic growth or large abscess, but on making an exploratory incision a stream of pure blood flowed forth, and the Surgeon thought that he had opened an aneurism. On pressing upon the artery in the groin and enlarging the opening, a large sac of blood was discovered, with clot-layers enclosing it, and in one case the Surgeon was with difficulty induced to believe in the true nature of the disease, and amputate the limb. In both cases, however, a comparatively insignificant basis of spindle-cell sarcoma was found infiltrating the muscular tissue, and it was from the new vessels of this growth that the blood had evidently been poured.

Melanotic Carcinoma.—This form of disease is exceedingly rare. The great majority of cases of "black cancer" are really instances of sarcoma, and will be referred to with the other sarcomata. When a true carcinoma is melanotic, the black tint is due to a certain proportion of the cells containing granules of pigment; but almost all the dark nodules in carcinomatous growths which have come under my own observation have derived their colour from the changes resulting in blood extravasated into the part, and could not be strictly classed with melanotic growths at all.

Colloid Carcinoma.—This very interesting variety is probably much less common than is usually affirmed, for most English Surgeons have unquestionably been in the habit of placing in this class those purer forms of mucous tumour or myxoma which bear to the naked eye a close resemblance to jelly, in the clear flickering masses in which these growths are sometimes met with. True colloid also owes its characters to the presence of mucus, but in the form of a degeneration; and a colloid tumour bears to a myxoma the same relation that a fattily degenerated fibrous tumour does to a lipoma.

Thus it is that, besides such very characteristic examples of colloid cancer as have been best described by Mr. Sibley, in his well-known paper in the *Medico-Chirurgical Transactions*, we meet with colloid nodules in many examples of carcinoma, and also in cases of epithelioma; and even occasional single cells are sometimes the seat of this change, appearing amongst the polymorphous carcinoma cells, with large refracting clear-spaces within them, distending the whole cell, or giving the impression of a greatly dilated nucleolus. Where this change is general, a peculiar jelly-like aspect is imparted to the growth, which can yet be seen to be a genuine infiltration. Thus, I have seen a portion of a very extensive colloid carcinoma in the abdomen (its usual seat) distinctly infiltrating

the muscular tissue of the uterus, growing from the peritoneal surface, and invading the organ to a depth of some lines. The effect of this accumulation of mucus within and between the cells is to alter the microscopic appearances as greatly as the coarser characters. Single oval cells become enormously distended, the nucleus remaining near the periphery, and the rest of the swollen cell being marked with faint concentric lines (possibly indicating successive stages in the mucous accumulation), and in this way a figure resembling an oyster-shell is produced (Fig. 10.). When a multi-nucleated cell is affected,

FIG. 10.

FIG. 10.—Colloid carcinoma. The two detached cells exhibit in a marked degree the change which has affected to a less extent those still grouped in an alveolus. From a colloid of the stomach. Magnified 220 times.

the group of nuclei is surrounded by the same crease-like lines, and when, from the over-distension of many cells, a distribution of the contained mucus through the stretched alveoli takes place, large spherical spaces are formed, in which the remains of cells and nuclei in the centre are surrounded by these singular concentric faint lines, so that a microscopic portion of carcinoma so affected reminds one strongly of a sheet of still water, into which a few pebbles have been tossed, throwing the calm surface into a series of circling ripples, which gradually fade into one another, and are lost (Fig. 10). The fibrous stroma, however, may remain comparatively unaffected, although much stretched, and broad tracts of waving fibres with oat-shaped nuclei may be traced mapping out the growth into round or oval alveoli of various dimensions (Fig. 11).

FIG. 11.

FIG. 11.—Colloid carcinoma, showing the fibrous stroma, whose spaces are filled with clear mucus. At one point, a few cells undergoing the colloid degeneration are shown. Magnified 220 times.

This appearance has gained for the tumour the name "alveolar cancer"; but it has been shown in a former "Note" that all carcinoma is essentially alveolar. It is only that here, the alveoli being distended with a clear fluid, their arrangement is more clearly discernible.

CLINICAL REMARKS
ON THE SEVERAL FORMS OF PULMONARY PHTHISIS.

By R. DOUGLAS POWELL, M.D., M.R.C.P.,

Senior Assistant-Physician to the Hospital for Consumption and Diseases of the Chest, Brompton;
Assistant-Physician to the Charing-cross Hospital.

(Continued from page 658.)

Alveolar Catarrh—May advance to Catarrhal-Pneumonic, or Tuberculo-Pneumonic, or Tuberculo-Fibroid Phthisis, very amenable to treatment—Diagnosis—Illustrative Case of Catarrhal-pneumonic Phthisis in an Early Stage—Comments on Etiology, Prognosis, and Treatment.

It would hardly be instructive to give an illustrative case of Alveolar Catarrh in the first and slightest degree, that condition which forms the connecting link between the prodromal catarrh of Niemeyer and catarrhal pneumonia. This condition is, however, an extremely common one, and may be very readily overlooked, for the signs by which it is recognised are only faintly marked. It must be considered as really the first stage of phthisis—that stage through which, at least, all cases of catarrhal-pneumonic phthisis (and therefore the majority of cases of pulmonary consumption) passes. The pathology of this disease consists, as has been before intimated, in the proliferation of the epithelium of the air cells by a catarrhal process of the most superficial kind affecting them. Tubercle has nothing whatever to do with this process, which may, indeed, pass on to catarrhal pneumonia and destruction of the lung without tubercle taking any conspicuous part in it. But an irritative hyper-growth of the minutely dispersed adenoid or gland tissue of the lung, which has been before referred to, may be set up secondarily by the catarrh, and then the disease in its further stages assumes the characters of that described by Addison as tuberculo-pneumonic phthisis. Further, the adenoid growth, accompanied, as it always is, by more or less increase of fibrous tissue, may, having once been set going by the irritation of a simple catarrh, take so prominent a part in the future progress of the disease as to eclipse altogether the catarrhal process, and we get a somewhat rare, insidiously progressive and very destructive disease, which, I think, has not been fully described in its entirety, but which closely corresponds anatomically with the iron-grey induration of Addison, and invades the lung by substitution of a fibroid tissue, inch by inch, from apex to base. These may be said to be the three directions in which alveolar catarrh, when it runs in an unfavourable course, may lead, and its tendency to develop into such formidable morbid processes is a sufficient reason for its being rationally regarded as the first stage of phthisis. Hereditary predisposition, existing cachexia, and the special nature of the influences which have produced the disease play an important part in determining its future characters—*i.e.*, whether it shall be pneumonic, tuberculo-pneumonic, or tuberculo-fibroid; also, whether its course shall be rapid, or insidious, or intermittent. But I must hasten to observe that if alveolar catarrh be early recognised and rationally treated its progress may be in a large number of cases entirely checked, and the more adverse the circumstances which have led to the development of the disease, the more hope is there, on their removal, of convalescence.

How, then, can this condition be recognised in its earliest stage? Professor Niemeyer, who has more than any other author urged the importance of its early detection and treatment, regards the presence of pyrexia as the one symptom above all others indicating the extension of the catarrh to the alveoli, and he attaches some weight to streaky hæmoptysis as a sign of the alveoli having become involved in the catarrhal process. The significance of these symptoms, when present, is beyond question; indeed, I think, when there is elevation of temperature, we always have some pneumonia present, and have, therefore, arrived at a stage beyond mere catarrh. The patient who is the subject of alveolar catarrh has always been depressed in health, through tardy convalescence from some other disease, or bad living, or mental anxiety; he has had a persistent, though, it may be, a slight cough, for a longer or shorter time, and has during that time been getting thinner. At this stage, the physical signs are very slight, but sufficient for diagnosis in conjunction with the symptoms and history. There is no dulness or impaired movement, but the respiration is weaker at one apex, the inspiration being wavy, or even jerking. There are usually a few sonorous râles present, which, if limited to that apex, are

very significant; and, in addition, one hears at the extreme summit of the lung (supra-clavicular or supra-spinous region) a peculiar crumpling sound at the moment of cough, which differs both in time and degree from the crepitant sound audible at a somewhat later stage with the first inspiration following a cough. Not to refine too much, though we have to deal with very slight physical signs—which, the slighter they are the more important are they to be recognised—we may say that physical signs of bronchial catarrh limited to one apex, and associated with a decided imperfection in the respiratory murmur at that apex, afford, when taken in conjunction with the symptoms—more particularly emaciation—unmistakable evidence of incipient phthisical disease, upon which we must advise most decidedly, if we do not wish to see the patient pass beyond our control, so far as positive cure is concerned.

There is no clinical line of demarcation to be drawn between this condition and the prodromal catarrh which precedes it, or the catarrhal pneumonia into which it is apt to pass; they shade imperceptibly into one another. I only specially refer to this stage as the earliest recognisable stage of phthisis. I now pass on to give a case illustrative of catarrhal pneumonia in an early stage, which also bears out some of the above remarks respecting the most common etiology of this form of consumption.

S. S., aged 29, a married woman engaged in domestic duties and suckling a child aged 7 weeks, came under my notice as an out-patient in April last. Her mother had died of consumption within two years of the patient's birth, and an elder sister had been affected with the disease in an early stage. She had enjoyed fair health until her first confinement, when she was with difficulty delivered of twins, only one of whom survived the birth, which was stated to have been a "cross one." This child she suckled for eleven months, when she again became pregnant with her present child. Ever since her last confinement (seven weeks) she had suffered from increasing debility, emaciation, and cough, and shortly before her confinement she had had slight hæmoptysis. She was a tall, thin, anæmic woman, with the worn look so characteristic of over-lactation or rapid childbearing; her large, heavy, pendulous breasts, marbled with large veins, increased by contrast the apparent general flatness and narrowed antero-posterior diameter of the chest. There was no local flattening, however, at either apex, and the respiratory movements, though generally deficient, were not more so at one apex than at the other. On percussion over the summit of the left lung the resonance was somewhat less than on the opposite side; the respiratory sounds were harsh and accompanied by some moist crepitation, which extended to the second rib. The respiratory murmur elsewhere was of fairly good quality, but somewhat feeble. The main symptoms complained of were troublesome cough and yellow expectoration, shortness of breath, general weakness, and giddiness in the head. The pulse was quick and weak, the appetite indifferent, but digestion fairly good.

The case was regarded as one of Catarrhal-pneumonic Phthisis in an early stage, the disease being limited to the left apex, and supervening upon the exhausting effects of more than thirty months' continuance alternately of gestation and lactation. She was directed immediately and completely to wean the child, to take abundance of appropriate food, with a moderate amount of beer. Some counter-irritation was applied at the left apex, and cod-liver oil and steel wine administered, with some morphia and ipecacuanha lozenges for the cough. On again examining the chest a month later the moist sounds were no longer audible with ordinary respiration, but a few crackles were heard after cough. There was slight flattening at the left apex, which became more obvious on deep inspiration; the respiratory sounds were feeble there, while on the opposite side they were more developed, and on percussion the line of resonance of the right lung extended a little to the left of the mid-sternal line. There was no evidence of a cavity at the left apex, and no extension of the disease below. The health of the woman was, though improved, by no means restored; she was still anæmic and thin. Her cough was troublesome, especially in the morning, and expectoration difficult, the effects of coughing often causing vomiting at that time. She had neglected to completely wean her child, and continued to "give it the breast now and then." The pulse was quiet but weak; the appetite improved. She had been unable to take a stronger preparation of iron ordered a fortnight previously, and was obliged to fall back upon the steel wine. Three weeks later she had very greatly improved in health and strength; some colour had returned to the cheeks, and she was gaining flesh rapidly.

This case, though not complete, illustrates so many points

in the clinical history of catarrhal-pneumonic phthisis(a) in its earlier stages that I have related it in preference to others.

I use the term "catarrhal-pneumonic phthisis" because the term pneumonic phthisis is often used to signify cases which have commenced as simple basic pneumonia which have not undergone complete resolution. It may be true that we sometimes meet with genuine croupous pneumonia at one apex. I believe such cases are, however, exceedingly rare. The case now under consideration could not be confounded with such; the dulness was never absolute, the respiration was not decidedly bronchial,(b) and the crepitation was not that of typical pneumonia. But in other cases, which do not essentially differ from this save in degree, the dulness may be complete and the crepitation undistinguishable from that of true-exudative or croupous pneumonia, the respiration being also tubular, but, I think, never so intensely so as that of basic pneumonia. This, of course, might be readily accounted for by the seat of the disease; but the subsequent course of such cases is very rarely indeed that of simple pneumonia. They do not undergo complete resolution. The most common course is for the consolidation subsequently to soften and break up into cavities; and on post-mortem inspection of such apex consolidations, we find the alveoli stuffed with large catarrhal cells, instead of being occupied by the fibrinous exudate with entangled corpuscles characteristic of true-exudative pneumonia. We must not, however, draw the line too absolutely between these two forms of pneumonia, for they are certainly not unfrequently mingled together; but it is the catarrhal pneumonia which is the important disease, the natural tendency of which is to break down into cavities, while any croupous pneumonia with which it may be complicated readily undergoes resolution. We thus, from clinical and post-mortem experience, know that an apex pneumonia is of a much more serious kind than a basic one—it should be always regarded as probably a phthisical pneumonia, and, though we cannot agree with those observers who say that the inflammation has been determined to that part by the presence of tubercles, yet, clinically and in their acceptance of the term tubercle—as including both the miliary granulation and nodules of catarrhal pneumonia—this view will, I think, generally hold good.

The main points of the case before us may be summed up as follows:—A woman with a tolerably strong hereditary tendency to consumption (her mother was probably phthisical when she was conceived), enjoys fair health until she is 27, but in the course of the succeeding two years and a half she gives birth to three children in two confinements, two of whom live and are suckled by her. Shortly before the birth of her last child her health breaks down altogether, and she becomes the subject of phthisis. It is to be remarked that there is no history in this case of any exposure to cold.

Now, I think it is fair to assume that, had this patient been in happier circumstances, had her health not been depressed by the development at her expense of three infants and the maintenance of two of them, while she herself was doubtless not in the enjoyment of nutritious food in any great abundance, had she sought advice earlier (and taken it), she would never have become phthisical—her hereditary proneness to consumption might have remained a mere latent tendency. Had there been any family tendency to insanity, it is extremely probable that she would have been, under the same circumstances, afflicted with puerperal mania. "It is true that privation, excess, errors in habits of life, the sedentary occupations, the pernicious influence of certain trades, grief, anxiety, and the other wasters of vital powers, will not suffice to induce consumption in all, or even in the greater proportion of, individuals; for these agents, so universally prevalent, are part of the daily lot or of the daily errors of many more than fall victims to consumption. But it is also true that if to any or all of these conditions that of inherited tendency to phthisis be superadded, very few indeed escape the disease."(c) The truth of this remark is well borne

(a) This case would be grouped under one of the following headings by the authors named:—Pneumonic phthisis, Addison; catarrhal pneumonia, Niemeyer, Hérard, and Cornil; epithelial pneumonia, Andrew Clark.

(b) The breath-sound which is audible over a portion of lung when the consolidation is not uniform, but in scattered nodules, is variable within certain limits; sometimes it is simply harsh, sometimes bronchial, but with some vesicular murmur superadded. I find the term "broncho-vesicular" a convenient one briefly to describe this sound. It also very well describes the sound frequently heard over a small cicatrising cavity with compensatory vesicular enlargement around it. When the nodules are large enough to be mapped out by percussion, of course the bronchial breath-sound will be correspondingly isolated.

(c) Dr. Pollock, "Elements of Prognosis in Consumption," p. 340.

out by the above, amid hundreds of other cases which must be familiar to Physicians.

The points about the case which rendered the prognosis a favourable one, with certain reservations, were:—1. The obvious and very sufficient determining cause. 2. The limitation of the disease to one apex. 3. The presence of considerable crepitation and some dullness, without any local flattening or marked difference in expansion. 4. The absence of fever.

1. If the circumstances of the patient admitted of complete rest from the cares and anxieties of her position of life, and a change to a purer air, there would scarcely be a doubt as to the prognosis; and although she has had no advantages of this kind, and with the common dread of her class of becoming again pregnant, she could not be persuaded completely to wean her child, she has yet greatly improved; the disease has not extended, the physical signs show drying up of secretion sounds and pulmonary collapse. The encroachment of the margin of the opposite lung, and the gradual appearance subsequently of some flattening, show that the lung beneath is cicatrising. This encroachment of the margin of the opposite lung towards the diseased side should always be anxiously looked for; it can be readily made out by percussion, and when the disease is one-sided, it precedes, often by a long interval, any decided apex flattening.

3. The late appearance of flattening—coincidentally, that is to say, with the lessening and disappearance of moist sounds, which were considerable—is an important sign of arrest of the disease, in contradistinction to flattening which comes on coincidentally with an advance in the other physical signs, and which may be due, therefore, to sheer loss of lung substance, or to the presence of the indurative (tuberculo-fibroid) form of disease, which, though of chronic course, yet is one of the most intractable of lung diseases. Flattening must, then, only be considered in conjunction with other signs, and with especial regard to the period of its appearance. In the case before us, it, together with the other signs, signifies pulmonary collapse, with, perhaps, a few shrunken nodules, pleural adhesion, and some pleural thickening.

With regard to the management of such cases as this, there is little comment needed. It is unnecessary to point out the great importance of complete removal, for a time, at least, from the adverse circumstances which in the first place induced the disease. In the case of women who are suckling, a partial weaning of the child is of very little use; the irritation and vascularity of the breasts is kept up by the occasional sucking of the child, and the nutrition is diverted from its natural objects almost as completely as before. Iron and cod-liver oil are the necessary remedies. One of the best forms of iron to begin with is the ammonio-citrate, to which a little aromatic ammonia is added. The sesquichloride will often not agree at first.

There is one symptom in the above-related case which deserves a special comment: the cough remained troublesome while the pulmonary signs were greatly improving and all secretion sounds rapidly drying up. Dr. Thorowgood(d) has drawn attention to the irritable dry cough which is so frequently attendant upon the subsidence of pulmonary disease, and truly observes that the patients should be encouraged to check the cough themselves as much as possible. This they can do to a great extent, and may be assisted by some sedative cough mixture, if necessary, to secure rest at night. The morning cough in these cases—and, indeed, in many others—is the most troublesome. It is, however, the natural consequence of a good night's rest, and should never be checked by a sedative, since the retained matters suitable only for expectoration considerably impede respiration, become highly irritating, and much increase the future trouble from cough. A cup of warm cocoa, or tea, or milk, taken before rising, will greatly facilitate expectoration. If this does not suffice, a simple steam inhalation is useful.

(To be continued.)

At the recent examination for the newly established diploma in State Medicine, given by the University of Dublin, the first place was taken by Dr. J. W. Moore, ex-scholar, Trinity College, Dublin; the second by Mr. A. W. Foot, Junior Physician to the Meath Hospital and County of Dublin Infirmary; the third by Mr. Yeo, who obtained the Junior Medical Exhibition in 1864 and the senior Medical Exhibition in 1866; and the fourth by Mr. Todhunter, a gentleman already well-known in certain circles for his literary abilities.

PREGNANT SICKNESS.

By METCALFE JOHNSON, M.R.C.S.E.

IN considering the effects of remedies upon the human body, the possibility of error in some form or another presents itself so frequently as to induce great hesitation to accept coincident results as necessary consequents. There are, however, some drugs, such as opium, whose effect in sleep is seldom doubted. The point to which I desire to direct attention is one which is beset with difficulties. My object now in writing is to invite consideration for the phosphate of lime as a means of relieving the sickness consequent on the pregnant condition. But when we consider the double relation of mind and body, through the ganglionic nerves and the disturbed state of their functions, in all cases in which the control of the ganglionic nerves, or the great sympathetic, is interfered with by an abnormal condition of organ or organs under its especial rule, we shall see that it requires especial watchfulness to be sure that we do not mistake a "*post hoc*" for a "*propter hoc*" in those instances where relief of symptoms has followed the exhibition of the remedy. Before proceeding to remark on the theory of *modus operandi*, etc., the simple use of the drug may be described. For some years past I have been in the habit of prescribing the simple hydrated phosphate of lime of the Pharmacopœia in doses of from three to ten grains each, three times a day, suspended in water, and flavoured according to the taste of the patient. I have tried the remedy dissolved in hydrochloric acid, as also the powder in the dry state, besides having had it made up into biscuits; but in none of these forms have the same agreeable results followed so frequently as when the simple hydrated phosphate has been used suspended in water.

One remark may here be made respecting disorders of the great sympathetic and its subjected organs, that they are generally characterised by a dislike of all sweet flavours. This has been noticed in the case of persons whose ganglionic system is disordered through the stomach by the abuse of alcohol; for I think it is Coleridge who says there is always hope for a man so long as he is fond of his pudding. But in those other forms of female ganglionism which, for want of a proper diagnosis, we designate under the generic term hysteria (though in many cases the *ὑστερον* has nothing to do with it), the taste not only takes an aversion to sweet things, but has, apparently, a depraved tolerance of the flavour of fetid preparations and the alkalies, together with an ability to receive the stimulus of both alcohol and the carminatives, such as lavender, ammonia, cardamoms, etc., with advantage. The relation of this sympathetic nerve to certain conditions of the circulation is a subject worthy of more attention than it has at present received; more especially since the *Saturday Review* has, with a one-sided view of the matter, taken up such a raid against "alcoholism."

With these complex considerations we approach the subject of pregnant sickness or vomiting. Here we have, of course, an enlarged uterus, which physically bears a relation to the various organs of the body, such as the stomach, large and small intestines, liver, gall-bladder, kidneys, etc., different from that in health, pressing upon each, and producing a state of things with reference to each organ which, if brought about by traumatic means, would in any case bring on nausea and vomiting. But, in addition to this, the very relation to the nerve is altered, and in many cases this great change is attended with not only bodily suffering but temporary mental aberration. I have not unfrequently seen temporary insanity of a few hours' duration attend both the act of conception and the act of quickening. Everyone is of course familiar with the puerperal insanity as well as the frequent insanity which is associated more or less directly with ovarian or uterine disease.

A short time since, Mrs. A. B., aged 24, second pregnancy, during the last month has had violent spasms all over the body, with strabismus. Mouth and hands clenched. Says she has pain all through the womb. Has great sensibility in the nipples of the breast. Bowels generally confined. Has had bleeding at the nose for the last few days. Her mother is a very excitable, clever woman, and one other close relative a somnambulist. The spasm was relieved by subcutaneous injection of morphia. I emptied the bowels by an aloetic enema, and gave her the phosphate of lime, which she took for three weeks, after which she was delivered of a very small child, the parietal bones of whose head consisted simply of two centres of ossification. Since her confinement she has been well. The spasm

never returned after using the phosphates. I have often had this proof of the efficacy of the phosphates in arresting the sickness: that patients have been sent to me for "some of that medicine that relieves the sickness."

I had a patient a few weeks ago, who had been complaining for some weeks of an irresistible vomiting after every meal, who no sooner took the phosphates than all sickness ceased. This of course might be the effect of expecting to be relieved; but the cases have occurred too frequently for me to think other than that relief has been most frequently the result of the use of the phosphates. As such, I trust that some of your readers will be induced to give the remedy a trial, for which I now proceed to give a physiological reason or *ratio medendi*.

As we have seen, the altered shape of the uterus, the altered nerve relations, the control of the ganglionic nerve to supply the new arterial system to be established, make a demand upon nervous influence which is very unusual. Nervous power cannot be expended without harm, unless the supply of new neuric elements makes up the deficiency. Neuric force derives much of its nutrition and source from phosphates. Moreover, the child in its formation requires more phosphates for its new bones, and if these are supplied at the expense of brain and ganglionic nerve, it follows, as a matter of course, that debility, nervousness, and all the concurrent train of symptoms must inevitably be brought about; and hence arise those feelings of depression, peevishness, and irritability so frequently associated with the pregnant state. Nor is it to be wondered at, if we consider that we take no steps to supply the new demand made upon the blood.

This view of the case is again supported by pathological evidence, when we see how that fractures in pregnant females are more frequently liable to non-union. These considerations induce me to believe that the remedy is really the cause of the relief so constantly expressed by the patient after its use for a few days. I have also for some years been in the habit of using this form of phosphates for the relief of rickety children with great success, which further confirms me in the belief that phosphates administered through the stomach do become used by the blood. I have used for children the saccharated wheat phosphates supplied by the druggists, but in the case of pregnant females I have not found these so useful, and chiefly, I suspect, owing to the sugar which they contain.

Lancaster.

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

THE LONDON HOSPITAL.

MR. JONATHAN HUTCHINSON'S CLINIQUE.

Syphilitic Caries—Obscure Cases of Paraplegia following Slight Spinal Injury—Hatter's Felt for Splints—Stricture of the Rectum—Recovery from Traumatic Tetanus—Syphilitic Eruptions.

We had the pleasure of accompanying Mr. Jonathan Hutchinson round the wards on Thursday, June 8, and of seeing with the students many cases of interest, brief notes of some of which we append.

The first case which particularly attracted us was that of a young man with a form of bone disease which Mr. Hutchinson believes to be peculiar to the victims of hereditary syphilis. For four years this youth had suffered from caries of the tibia, for which two operations had been performed without avail, the bone slowly softening away at the bottom of a deep ulcer. The bone did not necrose, but was rather eaten steadily away by an obstinate caries. Some tolerably characteristic malformation of the teeth was the only other syphilitic symptom presented, and careful examination into the patient's history failed to elicit any more. It was pointed out to the students that, after examining the patients in such cases of suspected hereditary taint, the brothers and sisters should be inspected if possible, and it would be necessary to bear in mind that it was not always the eldest children who were specially affected, the taint sometimes skipping these, and falling with excessive severity upon the younger members.

In another ward was a case of extreme interest in its bearing upon the subject of railway injuries, and the applications for compensation which so frequently result from such accidents. A young woman, not much over 20 years of age, fell down

some two and a half years ago, but felt no ill effects of her fall, and married a few months later. A year or more after her marriage, however, weakness of the legs came on, and at present she is unable to walk. Mr. Hutchinson, to awaken the students' interest in the case, imagined it to be one of railway injury, in which a Medical opinion was required as to the reality or not of the symptoms complained of, and he then went carefully through the several salient points of the case. The woman had suffered from constipation, and the value of this symptom was pointed out, some patients passing a week without any relief of the bowels, and anything like incontinence of fæces being rare in cases of fractured spine, unless the bowels be very loose. Attention was drawn to the well-nourished condition of the limbs, and the considerable muscular resistance offered to the pressure of the Surgeon's hand against the sole of the foot. Mr. Hutchinson candidly stated that he had been formerly used to regard this symptom as of much value, as setting aside the diagnosis of true paralysis, but many late cases had induced him to reconsider his opinion. A boy with angular curvature of the spine and paraplegia, who had lately been in the Hospital, and who had showed to a marked degree this muscular resistance of the supposed paralysed limbs, had subsequently suffered from paralysis of the sphincters, proving the reality of the former symptom. On pressing the hand firmly against the sole of this present woman's foot, her limb was thrown into spasmodic twitchings which she could not control. There was fair sensation of the limbs to make the case more doubtful, and there was no conceivable motive for feigning, so that, in fact, it was as difficult to decide upon the nature of the malady as to suggest its appropriate treatment.

There was another very similar case also in the wards—a blacksmith, also young, and not long married, to whom, therefore, the symptoms gave the keenest distress, but who might not unreasonably, under different circumstances, be suspected of shamming; for, besides the spasmodic twitching of the limbs, there was a certain amount of voluntary movement associated with the resistance to pressure, and in his history he spoke of diarrhoea for some time as one of the earliest symptoms, which is contrary to the rule. The loss of power here followed a kick on the buttock from a horse, three months previously. The man showed the characteristic dragging of the toes in walking, and when standing on his heels, could not raise the toes at all when bidden to do so.

A case of excision of the knee brought up the subject of appropriate splints for use after such operations. At the London Hospital, for some time past, stout hatter's felt (as used for the hats of the Cornish miners) has been largely employed for these splints. It is a substance very readily cut and moulded to the limb after soaking in hot water, and capable of easy adjustment with iron brackets, etc., where such appliances are required. We saw several such splints in the wards, and they seemed to be excellently adapted for their purposes, being quite firm and yet light, and comfortably moulded to the joints supported by them. Mr. Hutchinson mentioned that in his last three cases of knee-excision he had modified the operation somewhat by peeling up a skin flap after making the customary horse-shoe incision, and so getting into the joint above the patella, and removing all the synovial membrane and ligamentous tissues in front of the bones; and in these cases the wounds had healed very favourably.

A case of stricture of the rectum called forth the remark that, speaking roughly, it was sufficient to ask the sex of the patient to ascertain the nature of the stricture, whether malignant or innocent; malignant stricture being almost limited to men, whilst in women the disease was as frequently innocent, syphilitic, gonorrhoeal, or following parturition.

We saw a capital case of recovery from traumatic tetanus in a lad who had been admitted some weeks previously with all the symptoms of a severe attack of tetanus, following a wound of the ball of the thumb. These symptoms had not come on until fifteen days after the injury (in itself a hopeful sign), but had then been very severe. The treatment had consisted of absolute rest and quiet, abstention from all narcotics, and the exhibition of quinine during some weeks. There was still some trace of the peculiar contortion of the forehead, but in other respects the boy seemed perfectly recovered.

A curious case of syphilitic disease of the brain was called into service to demonstrate a syphilitic eruption on the body. This eruption was very abundant, serpiginous, and multiple, and hence resembling rupia. It was stated to be not rupia, however, because (1) it was a tertiary, and not a secondary symptom; (2) the ulcer healed in its centre, whilst it spread at its edges; and (3) it was not symmetrical. The patient was taking twenty-five grains of iodide of potassium daily, and

Mr. Hutchinson pointed out the necessity of commencing with small doses of this drug, but steadily pushing it on to get the best effect, there seeming really no limit in some cases to the advantageous pushing.

The last case we noted was one in which the usual operation for ordinary fissure of the anus had been followed by a spreading sore, which reached the size of a shilling, and was long in healing. It was thought possible that there might be a syphilitic explanation of so unusual a result, but there seemed to be nothing to support the view.

ST. MARY'S HOSPITAL.

CASES OF POISONING BY SEWER EFFLUVIA, WITH CLINICAL REMARKS.

(Under the care of Mr. C. HANDFIELD JONES, M.B. Cantab., F.R.S.)

Case 1.—J. F., aged 49, admitted July 10, 1865, states that he was ailing eight days ago, but has been ill actually since the 6th. He was taken at first with giddiness and shortness of breath while at work in a sewer, which stunk very badly. He finished his day's work, and continued doing a little work up to the 8th, when his feet swelled. His bowels have been much acted on by castor oil yesterday and the day before. He complains now of feeling numb all over, but has no paralysis. There is some œdema of feet and legs. The abdomen is rather tense, especially at the upper part; is dull in the left flank, resonant in the right. A few doubtful rose spots on abdomen; no gurgling or tenderness in iliac fossa. Good breathing in all right back and front; good, also, in left, but attended with some moist râles at lower part. Heart's sounds normal; pulse quiet, rather weak; tongue coated; skin cold. Broth diet; brandy ʒij., acid. nitrici mʒij., creosote mj., spt. chlorof. mx., and aq. ʒj., 4tis hōris.

12th.—Feels much better. Tongue clean; pulse quiet; urine clear, bright-coloured, not albuminous, acid, specific gravity 1010; abdomen much blown up, but not tender, some doubtful spots. Less numbness in hands and feet; right foot more numb than left; says he could not feel the skin of his face when he came in. Has still the taste of the sewer air.

15th.—Urine pale, not albuminous; bowels regular; abdomen distended; feet œdematous. Ad. mist. strychniæ gr. $\frac{1}{16}$ th ad. ʒj.

19th.—Pulse of good size and force. Legs and scrotum and penis œdematous. Urine: Specific gravity 1015, notably albuminous, depositing casts and renal epithelium. Abdominal distension continues. Pot. nitras gr. xv., hydr. bichloridi gr. $\frac{1}{16}$ th, and aq. ʒj. ter die. At this date or before he was ordered charcoal ʒss. ter die.

On the 22nd the urine was much less albuminous, and the abdomen much less swollen.

On the 29th the urine was quite free from albumen; the legs still pitted. Tinct. ferri muriat. mx. ter die.

August 2.—He had some diarrhœa. Legs were almost natural. On August 4 he went out.

Case 2.—W. W., aged 49, admitted August 23, 1867. Yesterday morning, as he was passing by a gullyhole in the Edgware-road, he perceived an extremely bad smell. In half an hour after this, about 9 a.m., he was taken with severe vomiting; he fell down in a shop, and the sweat ran off his face. The vomiting lasted all day, in spite of two doses of brandy. In the evening the vomiting seems to have subsided, but he was greatly exhausted, and came to the Hospital. He was suffering, when he came in, with cramp in his calves and feet, and in his loins. After admission he had a turpentine stupe to the abdomen, which relieved him very much. He was ordered acid. hydrocy. dil. mv., and infus. gent. co. ʒj. 4tis horis. He denies having eaten anything unwholesome, but admits that he had pork the day before, which he does not usually take. Urine pale, not acid, not albuminous; sp. gr. 1019. No diarrhœa. Epigastrium feels sore. Says he could not see when he came in from the straining of the vomiting, and even now his sight is dim; he cannot make out the large figures over the beds on the opposite side of the ward. He had good diet and tonics, and went out well August 28.

Case 3.—This is taken from a foreign source, and will be found in the "Sydenham Society Year-book," 1860, p. 485:—"A ground-labourer, aged 40, after working about three hours in a sewer, was compelled to leave off on account of the horribly stinking atmosphere. Next morning, after a sleepless night, he resumed his employment, but was at once obliged to discontinue and go home to bed. At first he suffered from languor, anorexia, and sleeplessness, with slight nocturnal delirium. There was no fever and thirst, and the tongue was

clean. Pulse 80 to 90. Bowels confined. After these symptoms had continued four days, an icteric tinge of the sclerotics, of the face and general surface became perceptible. This did not become intense, and there was no corresponding alteration of the urine or excrements. On the eighth day there was hæmorrhage from the nares and pharynx. Extreme prostration followed, but was very promptly succeeded by an improvement in all the symptoms, which led to convalescence. The treatment consisted in fresh air, support, and stimulants."

The above histories undoubtedly describe the operation of a poison, or several poisons, on the human frame. There is a good deal of difference in the symptoms—dependent, perhaps, on idiosyncrasy—but the general character of all is the same, and points evidently to prostration, expressing itself in various ways. In the first we have giddiness, dyspnœa, numbness, meteorism, œdema of the lower limbs, and after a while temporary albuminuria. The numbness, a sensory paralysis, was very considerable, and probably, like the giddiness, was produced by change in some of the encephalic centres. The meteorism may be referred to paralysis of the nerves and muscular coat of the intestines. The anasarca and albuminuria I ascribe similarly to vaso-motor nerve paralysis. In the second case, the morbid impression made on the system seems to have provoked, probably through its operation on the vagi nerves, intense vomiting, which possibly may have had a remedial influence. The duration of the symptoms in this case was much shorter than in the others, but the same is true in even a greater degree of the exposure to the morbid agency. In the third case there was languor, sleeplessness, some delirium, followed by some blood-change producing an icteric tint, then hæmorrhage and great prostration. The blood-change was probably of the same kind as that which takes place when jaundice is produced by mental emotions, the nervous system in both cases being the medium through which the cause operates. The hæmorrhage was occasioned, like the œdema in the first case, by paralysis of vaso-motor nerves affecting the capillaries, but the loss of retentive power must have gone further than in that instance. Unfortunately, the thermometer was not used in any of these cases, so that the absence of fever cannot be held proved, but pyrexia was certainly not a marked symptom. Fever is so common an attendant on blood-poisoning and prostration, that its absence would be rather surprising. The occurrence in the first case of spots much resembling those constituting the eruption of typhoid is a very interesting matter, as it bears on the question of the pythogenic origin of that fever. I do not think it would be safe to lay much stress on the appearance of these spots, unless they came out in successive crops, and were associated with some of the other usual symptoms. Nevertheless, as ground seems to exist for doubt whether typhoid is as truly a specific fever as small-pox (for instance) is, and whether the typical cases do not shade off by various modifications into other forms of disease, I think it is worth considering whether this eruption may not indicate, at the least, the presence of a certain amount of typhoid element.

However, having regard to the absence of marked diarrhœa, of evident fever, of prolonged duration of illness, of incubation, and of general similarity of symptoms, the above histories seem to me to make rather against the origin of enteric fever from emanations from mere filth.

In conclusion, let me observe that, as these were cases of acute poisoning by sewer emanations, so, undoubtedly, cases of chronic and slight poisoning by the same agent are vastly frequent. We ventilate our sewers into the streets, and the amount of contamination thereby occasioned to the atmosphere may be sorrowfully appreciated by any Londoner who passes incautiously near a gullyhole during a spell of dry weather. We think of our ancestors as dirty people; what will our posterity, in more enlightened ages, think of us who were content to breathe such a polluted air without an effort to amend it? Well may Doctors have to send their patients out of London, and well may we erect convalescent asylums in the country.

ST. PETER'S HOSPITAL.

LARGE CALCULUS VESICÆ—LITHOTOMY—RAPID RECOVERY.

(Under the care of Mr. TEEVAN.)

ON June 10, 1868, James B., a powerfully-built man, aged 74, was sent up to the Hospital from Eton Union, Bucks, suffering from stone in the bladder. Patient was born at Eton; was formerly a seaman, but his complaint has for some years ast

rendered him an inmate of the Union. No history of stone in his family. Past state: Six years ago first began to pass some yellow gravel, which lasted for about four years, when he commenced to suffer much pain after urinating, chiefly at the end of the penis. Has only passed blood three times, and then only after riding in a cart. Stream of urine has never suddenly stopped. Water only occasionally thick. Present state: Looks healthy; but little pus or albumen in urine, which is usually clear. At night he is frequently called out of bed, but holds his water for several hours in the day-time. Is calm and self-possessed, and has not lost flesh.

June 11.—Mr. Teevan examined the patient's bladder with a lithotrite, and found the stone of such a size as to entirely preclude lithotripsy.

June 15.—Patient's bowels were opened with an enema this morning. At 3 p.m. he was put under chloroform by Dr. Aspray, and then placed on the operating table. A large rectangular staff was introduced, without any difficulty, by Mr. Teevan, and then given to Mr. Coulson to hold. As the man had a deep fat perineum, Mr. Teevan commenced the lateral operation lower down than usual, and struck the staff at the first cut. The second cut opened the bladder very freely, from which a large quantity of urine escaped, and the open polypus forceps being then introduced, and suddenly opened, at once grasped the stone, which had fallen between its blades. On account of the great size of the calculus, Mr. Teevan had to introduce a probe-pointed bistoury four successive times, cutting outwards and downwards, that the stone might glide out without the slightest traction being exerted. The calculus was smooth, of oval shape, composed of uric acid, and weighed four ounces and a quarter. Much bleeding took place during the operation, but it ceased a few minutes after the stone was extracted.

16th.—Patient slept well last night; tongue clean and moist; pulse 84; urine passes freely by the wound.

18th.—Not the slightest hypogastric tenderness; pulse 76.

20th.—Patient going on very well; wound looks healthy and is fast contracting.

27th.—Urine passes per urethram.

29th.—Patient sits up for two hours daily.

July 5.—Wound nearly healed; all urine comes per urethram.

16th.—Wound quite healed.

Discharged cured on the 25th; not suffering from incontinence of urine.

Remarks.—The calculus, although of great size, produced but little disturbance, as it was smooth, rested behind the prostate, and the patient led a sedentary life; these facts accounted for the little amount of pus or albumen present in the urine. No difficulty was experienced in the operation, which was rapidly performed, as the bladder was freely laid open and the stone extracted without the slightest violence being used. The absolute immunity from any constitutional disturbance, hypogastric tenderness, or secondary hæmorrhage, coupled with the fact of a rapid recovery and freedom from incontinence of urine, show the great advantages of extracting a calculus by gentleness, which implies cutting, rather than by forcible tearing it out by the so-called process of dilatation, which is absolute laceration of the prostate, its capsule, and the surrounding connective tissues.

YORK COUNTY HOSPITAL.

DISLOCATION OF FOOT FORWARDS.

(Under the care of Mr. HORNBY.)

[Communicated by OSWALD BAKER, Esq., House-Surgeon.]

J. D., a farmer, aged 42, admitted March 21, 1871. The accident was met with in the following manner:—The man was following the York and Ainstie hounds, when his horse refused a hedge, and, raising itself on its hind legs, fell over backwards. The patient got himself clear of the animal, with the exception of his left leg, which was on the ground, with the anterior aspect upwards, the heel resting on the soil. On this leg the body of the horse came, and so caused the above injury.

Three hours after the accident, although there was then considerable swelling about the ankle, its nature was clearly visible. The malleoli were in their respective positions, but the foot was markedly forwards, the posterior surface of the os calcis being in the same straight line as the posterior margin of the external malleolus.

The patient was placed fully under chloroform, and Mr. Hornby, grasping the foot, and applying forcible traction with

extension, the House-Surgeon at the same time holding the leg, as well as pressing with his thumbs on the astragalus, the dislocation was reduced. The foot was kept between splints for a month; the patient was then allowed to try to walk.

April 27.—On leaving the Hospital, the full use of his limb was rapidly returning.

SIMPLE FRACTURE OF FEMUR—DEATH.

(Under the care of Mr. HORNBY.)

David H., aged 50, a labourer from Elvington, was admitted into the County Hospital, on January 14, with a fracture of the right femur. The fracture presented no special characters. It was diagnosed to be just above the condyles. There was some swelling and effusion into the knee-joint. Extension was applied by means of the ordinary long splint, the leg being bandaged to the splint as high as the knee.

January 16.—The effusion into the knee-joint has increased, and there is more swelling at the seat of the fracture; but the patient had been fairly easy until last night, and he says that the pain in his thigh was so great that he could get no sleep. 9 p.m.—Has had great pain in his thigh throughout the day. Bandage removed from leg as low as ankle, and all extension abandoned for the present.

17th.—Pulse, 112; temperature, 103°. Passed another sleepless night, in spite of tinct. opii and chloral. The thigh is considerably more swollen, the calf having become now involved, although on removal of bandage it was quite normal. Some slight discoloration at seat of injury. 9 p.m.—Pulse, 120; temperature, 103°. Tongue clean; skin cool, moist. Has not suffered much pain in the limb, which appears more swollen. The dusky discoloration extends throughout the limb, and partakes somewhat of a tallowy colour. The swelling does not pit on pressure, like erysipelas or simple œdema, although there is slight pitting which is not very persistent. The discoloration is not defined at its margins, and there is no vesication. The anterior and posterior tibial arteries can be distinctly felt at the ankle strongly pulsating. The patient has refused solid food throughout the day, and has vomited several times. Has had no action of the bowels since admission, although several doses of aperients have been administered. Ordered an enema, which freely relieved him.

18th.—Pulse, 112; temperature, 101°. Has again been vomiting; the discoloration of the skin is now more marked, and partakes of that from effusion of blood. The swelling does not appear to have increased since yesterday. 9 p.m.—His stomach rejects everything; he is delirious; his extremities are cold; and he is almost pulseless.

Died at 5 a.m. the following morning.

Autopsy.—Body healthy; no internal lesions. The lungs are very emphysematous, and contain but little blood. The kidneys are pale, and the remaining organs more or less bloodless. On cutting into the thigh or leg, blood poured out from the cellular tissue. There is no large collection of blood in any one place—it seems generally diffused throughout the whole length of the limb. The fracture is an ordinary one, at the junction of the upper three-fourths with the lower fourth of the bone, and as transverse as a fracture can be. Unfortunately, there is not time to seek, by dissection, the vessel from which the hæmorrhage took place.

THE CONCOURS REVIVED AT THE PARIS FACULTY OF MEDICINE.—At its adjourned meeting on June 15, the Faculty of Medicine resumed its discussion on the Report of M. Gavarret on the project for the re-establishment of the *concours*. As the result, it adopted unanimously, with the exception of one vote, the employment of the *concours* in the nomination of future Professors.

THE OSSUAIRE OF ST. LAURENT.—The *Gazette Hebdomadaire* (June 16) publishes the report which, at the request of the Communist authorities, "Citoyen Docteur" Piorry drew up concerning the eighteen skeletons found in the St. Laurent Church, or, to use the words of the Commissary of Police, "*sur les cadavres découverts récemment par mes soins.*" M. Piorry shows that all the hubbub which was raised by this supposed "discovery" was a mere mare's nest, as the *cadavres* were in fact skeletons of aged women, more or less wanting in their teeth, and which had been so long interred that the bones had undergone considerable decomposition. They were, in fact, the bodies of women interred before the sepulture in churches had been prohibited in France. As this report did not corroborate the suspicion of a recent "crime" having been committed, the Commune did not think it necessary to make it public.

Medical Times and Gazette.

SATURDAY, JULY 1, 1871.

THE GENERAL MEDICAL COUNCIL.

THE session of the General Medical Council, which commences on Tuesday next, does not promise to be a very long or a very animated one. The expectations raised by the Medical Reform Bill of last year have not been realised, and although attempts have been made by the licensing bodies in England to carry out without legislation the chief reform which is necessary, those attempts, however successful they may ultimately prove, will not have effected the desired amalgamation of examinations before the meeting of the Council. Still, remembering as we do the elements of which the Council is composed, we do not despair of an average amount of talk, and of a corresponding scantiness of performance. It would belie the history of the General Medical Council if it were argued that because there is not much for the Council to do there cannot be much for the Council to say.

The personal changes in the Council will not be numerous. We shall miss Dr. Rumsey, whose vacant place has not as yet been filled up by the Crown, and Mr. Quain will appear as the representative of the Royal College of Surgeons of England. There will be the usual routine business to be gone through. Committees will have to be appointed; the cases of certain alleged offenders against social and Professional morality will have to be investigated; and we believe that a requisition from the Board of Public Examiners of the Cape of Good Hope asking that their Examination in Arts may be recognised, and from Sydney in reference to the formation of a Medical school there, and a communication from the undaunted Dr. Edwards Crisp will be brought under the notice of the Council, and will afford occupation for speakers and reporters.

The *pièce de résistance* provided for the Council, however, will be the report of the Committee on Medical Education, of which Dr. Parkes is the chairman. It is said, and we hear it on good authority, that this report is a very important one, inasmuch as it recommends that the Council should again seek an interview with the Lord President of the Privy Council, with the view of obtaining the assistance of Government in framing and carrying a Medical Amendment Act in 1872. We cannot but think that this recommendation, before it be adopted, should be most carefully considered. The great reform which the Medical Profession needs is the co-operation of the examining bodies to institute a national examining board in each division of the kingdom. If this cannot be obtained without fresh legislation, an appeal to Parliament, with the attendant evils of State interference in the affairs of the

Medical Profession, the probable formation of a new order of licentiates unaffiliated to any of the existing institutions, and the tolerably certain lowering of the standard of Medical education and examination, seems inevitable. But we maintain that the General Medical Council ought to bring its influence so strongly to bear on the examining bodies that such a train of evils shall be avoided. If the Medical licensing bodies choose to unite for the formation of Conjoint Examining Boards, the Act of 1858 gives them the power to do so under the sanction of the General Medical Council, and public opinion will support them in the step they take. We are glad to hear that the report of Dr. Parkes's committee contains a recommendation that the General Medical Council should send another letter to the examining and licensing bodies, urging on them the necessity of co-operation. It may be also hoped that the Council will issue some well-defined and considered scheme, in the form of a recommendation—for more than this they cannot do—for the guidance and consideration of the educational and examining bodies. If the General Medical Council will bring about, without appeal to Parliament, a fair one-portal system, erected on the basis of the present examining bodies, and utilising the present excellent machinery for Medical examination, it will for ever and triumphantly rebut the charges of inefficiency and incompetency which have been brought against it. If, on the contrary, it becomes itself the mere appendage of a Government department, and places Medical examination and education under the direction of a Minister of the Crown, it will have irreparably injured the Medical Profession, and have published to the world its own failure.

PERSECUTED PHILOSOPHERS.

NEARLY a whole column of the *Times* of June 23 is devoted to magisterial investigations, which, we regret to say, have terminated, even as in the days of Galileo, in the victory of legal intolerance over applied science. The Galileos on the present occasion are—Professor Zendanester, represented by his managing partner, John D. Bryant; Professor Cicero, *alias* George Shepherd; Professor Thalaba, *alias* William Henry; and Charles and Sarah De Baddeley.

These illustrious personages, although their studies and pursuits mainly tend in one common direction, differ slightly from one another in the branches of science to which they devote themselves. Professor Zendanester's agent calls himself "a botanist," but is charged by the police "with professing to tell fortunes," and "a case of medicine bottles and several boxes of pills" were found in his room. Hence we may infer that this gentleman is also engaged in the practice of Medicine, and that he is probably a specialist of a certain nature. Professor Cicero describes himself as "the great and true physiognomist and phrenologist," and, in accordance with the universally recognised view that the world's greatest men belong to no special nation, he announces himself as "of Rome, Palestine, Jerusalem, and the Holy Land." He has lately returned from the East—which, we presume, means Palestine and the Holy Land—to England, and, with the modesty that characterises true genius, has selected for his dwelling-place a quiet by-street near the Edgware-road. Although he informed Mr. Mansfield, at their late interview at the Marylebone Police-court, that, "so far from being a gainer by the undertaking, he had been a loser," he tells us—or rather his "fair inquirers"—in his prospectus, "that he still continues to practise the ancient art of physiognomy with phrenology," and that "characters and dispositions are faithfully described from the features, thus rendering the exact age of the inquirer unnecessary." If we had known last week that "the Professor can be consulted, *free of charge*, upon any matter appertaining to the affairs of life, past, present, and future," we should have liked to have inquired where he was—whether in Palestine or the Holy Land—six months ago, and where he would be at the present time. We learn

from extrinsic sources that the true answer to the first question would have been "in prison for two months for the illegal possession of certain goods," while the unsympathising reporter for the *Times* tells us that he is now enjoying "imprisonment for three months, with hard labour." We are sorry to find that so scientific a practitioner as Professor Cicero adopts—or, reflecting on his present unfortunate position, we should rather say adopted—the pernicious practice of allowing himself to be "consulted *medicinally*, free of charge, daily from 10 a.m. to 10 p.m."

Of Professor Thalaba and Professor Baretta we know little, except that the former is an astrologer, and that they are both fortune-tellers, and that they have retired from the cares of the outer world for three months, the latter being prescribed a course of strong personal exercise.

Charles De Baddeley, and Sarah, his wife, are charged with "selling noxious drugs with intent to procure abortion." The former is described as a Medical botanist and a mesmeriser. A Mrs. H., who was in the pay of the detective police, gave evidence before the magistrate to the effect that she had "three times visited the female prisoner, and that the male prisoner put her in a state of clairvoyance, and she told her what to do, and supplied her with herbs, etc., to procure the miscarriage of her niece." The "she's" and "her's" are rather confusing, but we presume that Charles mesmerised his wife Sarah. The herbs given to Mrs. H. were found to be ergot of rye and safin, and a book has been found in the house by the police, containing, among other entries, the following:—"Ergot of rye for forcing childbirth." As the case is not yet tried, and the prisoners are out on heavy bail, it would be unfair to express any opinion on it.

But if such persons as these Professors and De Baddeleys crop up so abundantly in the metropolis of the most civilised nation on the face of the earth, what are we to think of the mental condition of the vulgar throng who unceasingly, and after repeated warnings, flock to these false prophets? When policeman Webb, in company with two others, invaded the sacred temple of Professor Zandanaster in Homer-street, this is what he saw and what happened:—

"In the front room on the ground-floor he found thirty or forty young women seated. Witness held the door, and another officer went into the inner room, a detective named M'Maith remaining outside. The women wanted to know what was the matter. He told them that he must have their names and addresses. They immediately began to scream, and rushed in a body through the door, overturning M'Maith. Witness succeeded in obtaining the names of five, and then went into the inner room, where he found the prisoner. On the walls were pictures (now produced in court) of various planets personified, and designed to show the influence which the heavenly bodies exercise upon the fate of mortals. One was illustrative of 'astral-physiognomy,' the signs of the zodiac being painted on different parts of the face in a woman's portrait. There were, besides, schemes of the nativity of the Queen, the Prince of Wales, the Empress of the French, Constance Kent, and others. Upon a table lay a large 'Book of Fate,' bound in morocco leather, stamped with mystic signs in gold. On opening it at a place marked by a satin book-marker witness found a blank scheme for nativity on one page, and on the opposite page some large cabalistic symbols. These two pages were much soiled, but the rest of the book had evidently not been used. John Carter, who accompanied the last witness, found the prisoner sitting at a table with the 'Book of Fate' open before him, and turning a machine called the magic mirror, into which a girl was looking, in order to see her future husband."

This magic mirror was likewise used—or, at all events, exhibited—by Professors Cicero and Baretta. Mr. Pain, who defended one of the party, argued that while the magic mirror at the Crystal Palace was tolerated, it was unjust to prevent these unfortunate philosophers from exhibiting the same toy; but the ruthless magistrate declined to discuss the point, and sarcastically remarked that "the Crystal Palace was not in his district." Happy Crystal Palace!

Would any course of education, even if it had been devised by Professor Huxley, have prevented these silly "thirty or forty young women" from throwing away their sixpences or (if they wished their nativities cast) their additional half-crowns? We doubt it. Among this class, everything that is printed is regarded as necessarily true, and they do not believe that a Professor can abuse their confidence. Men comparatively seldom fall a prey to these impostors, and the reason is sufficiently obvious. That it is not their common sense that keeps them safe from being cheated in this manner is well illustrated by a case that was tried at the Thames Police-court on the same day that the Professors were engaged in the Marylebone Court. Mr. J. W., the captain of a merchant ship, and about 40 years of age, *was* (alas! we cannot say *is*) the proud possessor of a handsome watch and gold Albert chain. Knowing the wickedness of London, he concealed these valuables in his boot—a Wellington boot, which he exhibited to the magistrate. In Radcliffe-highway he met a fair lady, whom he treated with wine, and afterwards accompanied home. After a time the woman left him "very hastily," which excited his suspicions, and he looked in his boot for his watch and chain, when he found that they, like his fair companion, were gone. He did not believe the woman would have abused the confidence reposed in her! "What confidence?" said the magistrate. The prosecutor said that he had told her *in confidence* where he had hidden his valuables. Alas! poor confiding human nature!

THE SMALL-POX EPIDEMIC.

ANOTHER trifling decline in the deaths from small-pox was recorded last week—namely, from 240 to 232. The distribution of the deaths gives as results—West districts, 30 deaths; North, 53; Central, 20; East, 38; and South 91 deaths. These numbers show an increase in the West and South of London, and a decrease in other districts. The greatest fatality was in Battersea, Clapham, and Southwark. In Liverpool the small-pox is subsiding more rapidly than it is in London, and it is also giving way in Southampton. In the North-Eastern ports—Grimsby, Newcastle, and Sunderland—it is five or six times as severe as we have had it in London. During the fortnight ending last Saturday 89 deaths from small-pox were registered in Sunderland alone—equal to an annual death-rate of 22 to 23 per 1000 persons living. The deaths in Newcastle in the same period were 49. Looking back to the Continent, we learn that no epidemic is now prevailing in Paris; but in Berlin, where small-pox has been epidemic for the last three months, 164 deaths were recorded last week from this disease—equal to an annual death-rate of 12 per 1000.

At this season of the year, when not only Londoners, but the well-to-do population of other large towns, are usually contemplating a migration to one of their customary health-resorts, it would be, by a great many people, regarded as a boon if the Registrar-General added to his weekly statements a paragraph giving the facts as to the prevalence of small-pox or scarlet fever in the most important of these places. Of course we know that everyone can protect himself and his family against any danger from the former; but against the latter there is no safeguard whatever for visitors, except a previous attack of the disease. But even in the instance of small-pox, it is not a pleasant idea for a timid or nervous person to harbour, that he or she is likely at all, when taking a summer holiday, to be jumping from the frying-pan into the fire. In illustration: We were informed about two months ago that the small-pox mortality of Weymouth was at an annual rate of 32 per 1000 living. What is it now? Weymouth is a favourite resort of some people, and many persons break a long journey there, as on their way to the Channel Islands.

It is to be regretted that the National Association for the Promotion of Social Science does not know its own mind. It will be recollected that about a month ago Dr. Lankester

delivered an address before the Association, in which he urged that it was desirable that immediate steps should be taken for the suppression of small-pox. Thereupon the Committee of the Association determined to send up a deputation to the Lord President of the Privy Council, and (we suppose after mature deliberation) it was determined that the special object of the deputation should be the urging upon the Government to put in force the Diseases Prevention Act, 1855. We do not quarrel with this, but with the way in which the whole affair was muddled by the Association. They have lost a good opportunity of pointing out the fact that, although probably all necessary powers for the suppression of small-pox are given by the Sanitary and Vaccination Acts, the local authorities will not use them, except under direct order from the Privy Council; and that the main advantage of putting in force the Diseases Prevention Act would be the pressure it would impose upon negligent boards of guardians and sanitary authorities in invaded districts. To give them advice is one thing; to order them distinctly to do certain acts is quite another thing. They treat advice with contempt, resting on their own all-sufficient wisdom; but to disobey an order from the central sanitary authority of the nation, in the presence of an epidemic severe enough to call it forth, would be to raise a storm of popular indignation which they would be little disposed to face.

SYPHILIS AND VACCINATION.

THE Committee appointed by the Royal Medical and Chirurgical Society upon the cases of vaccino-syphilis referred to in Mr. Hutchinson's papers, made their report on Tuesday evening. They state that they saw three of the cases in each series, and also the two vaccinifers. We are sorry to say that the Committee confirm the inferences of Mr. Hutchinson. They have seen no reason to doubt the fact that syphilis was in each series conveyed in vaccination, but whether through the medium of the lymph, or of blood, or both, they are not prepared to state. At the same meeting it was announced that Mr. Hutchinson had forwarded an appendix to his former papers, but it was not read in consequence of the meeting being the last for the session. We are far from wishing to throw undeserved obloquy upon the practice of arm-to-arm vaccination; but it cannot reasonably be expected that the public, who are always more open to unfavourable than to favourable reports, will ignore the facts now established. There is a danger—infinitesimal indeed, but still a danger—and they will demand to be protected from it. No one who knows what syphilis is, and how it impresses its stamp upon a whole lifetime, will say that such a demand is unreasonable. At the present moment no one can tell how often a similar accident has occurred before; for these cases can scarcely be believed to be unique. And the question which now presents itself to us is, what steps the Government intends to take to provide that the population shall not plead danger as a bar to the vaccination of their children. Much has been written about the non-success of heifer vaccination, and much which is of questionable authenticity; but, after all, it is due to the public that the alternative should be offered of vaccination from the child's arm or of vaccination from the calf. In London, Manchester, Liverpool, and other large towns, we certainly think that, at definite and short intervals, an animal vaccinifer should be provided by the State for the use of persons who object to arm-to-arm vaccination. A few calves thus provided at large centres of population would suffice for the exigencies of the case, since it has been shown that the lymph can be preserved for several days upon thoroughly charged points, and, if then used by the method of scarification, is nearly as efficient as humanised lymph.

The donations at the annual dinner of King's College, on Thursday fortnight, amounted to £4500.

THE WEEK.

TOPICS OF THE DAY.

THE General Medical Council holds its meeting this year at its miserable apartments in Soho-square. Surely, with the large funds accumulated in the hands of the Council, a more suitable place of meeting might be provided.

The Lunacy Regulation Amendment Bill, which has been sent from the Lords to the House of Commons, seems likely to be a useful piece of legislation. The main clauses in the Bill recognise a variety of mental affection which our law has failed to recognise before. "Persons of weak mind" are defined by the third clause of the Bill to be those "whose mental capacity is so affected by sickness or any other temporary cause as to render them incapable of managing themselves or their affairs." The Lord Chancellor under the Bill has power, on the presentation of a petition and the establishment to his satisfaction of the fact that a person is of weak mind, to appoint a guardian of the person and his property, who shall direct his affairs. The "person alleged to be of weak mind" is to have personal notice of the application to the Lord Chancellor served upon him; the order made by the Lord Chancellor is not to be in force more than six months, and is not to be renewed more than once; the patient is to be visited by the Visitors in Lunacy as frequently as the Lord Chancellor may think necessary, who are to report on his condition. It strikes us that the Bill does not define on what evidence the weakness of mind is to be considered by the Lord Chancellor satisfactorily established. There is not a word said about Medical certificates or Medical evidence, and no inquiry under a commission of lunacy is to be issued. The law carefully provides that Medical evidence alone shall establish lunacy. Why it should not be judged to be equally necessary to establish temporary incapacity seems difficult to be understood.

The Vaccination Amendment Bill introduced by Mr. Forster makes the appointment of vaccination officers obligatory on boards of guardians, and gives a greater share of the supervision of the machinery of public vaccination to the Poor-law Board. But the Government have adopted the illogical and useless recommendation of the recent Vaccination Committee. Under the new Bill, if it become law, no person can be fined more than once in the full penalty of twenty shillings for refusing to have his child vaccinated, or more than twice in a mitigated penalty. It is not necessary again to expose the absurdity of this; it is most illogical. There is not another punishment the infliction of which frees the offender from all future penalties. It is certain to be perfectly useless, for anti-vaccination associations will be got up to pay all fines and to hold the subscribers harmless. If the Government intend to impose a tax on the non-vaccinated, Mr. Lowe had better embody it in his next Budget; but to call the tax a penalty for a public offence, and at the same time to tell the offender that, having paid it, he may persist in his evil course for ever unmolested, is the way to bring, not only vaccination, but the law into contempt.

The chemists and druggists are getting up a strong agitation against the Pharmacy Amendment Act, the chief provisions of which are to compel the Council of the Pharmaceutical Society to frame and enforce regulations for the storing of poisons in shops and warehouses, or, in default of the Society so doing, to vest the power in the Privy Council. The Metropolitan Chemists' Defence Association has published the following list of reasons upon which the Association opposes the Bill:—

"1. That the Pharmacy Act, 1868, does *not* demand the enactment of any such compulsory regulations, but merely gives permissive power to frame such, should circumstances arise rendering them absolutely necessary.

"2. That precautions of the most ample nature are already voluntarily adopted by chemists, both for their own protection as well as for the safety of the public; the occurrence of an accident making them amenable, under Lord Campbell's Act,

to heavy pecuniary penalties, in addition to the utter ruin of their business in the event of a fatal mistake being made.

"3. That cases of death by error in dispensing or retailing poisons are of the rarest occurrence. The records of such during the last ten years, giving an average below two per annum, proving the entire absence of any grounds upon which compulsory regulations can with justice be demanded.

"4. The great difficulty in framing regulations of such general and broad character as shall be of practical utility, and at the same time applicable to the various classes of the business, which differ widely according to locality.

"5. The exemption of Medical men, many of whom keep open shops in every respect identical with those of chemists, and by whom, in some districts, the larger proportion of dispensing and retailing of poisons is conducted, as also the exemption of Hospitals and Dispensaries, would render the supposed security illusory, and exhibit an arbitrary act of partial legislation."

On this subject we have only to say that the reason urged in its favour by the supporters of the original Pharmacy Act was, that it was to protect the public from accidental poisoning, and from the indiscriminate sale of poisons. This was the public advantage set forth as the reason for giving the Pharmaceutical Society the monopoly it at present enjoys. Nevertheless, accidental poisoning and criminal poisoning do not seem greatly to have been diminished by the Act. Under these circumstances it does not seem unreasonable to call on the Pharmaceutical Society to use all the powers given it by the Pharmacy Act to prevent loss of life from poisoning. Having said this, however, we are not prepared to add that power of superintending the sale of poisons is to be transferred from the Pharmaceutical Society to the Privy Council. If the Pharmaceutical Society fail in their duty, rescind their privileges, but do not subject a respectable trade to minute and vexatious interference from Government officials.

The President's Chair at University College, vacant by the death of Mr. Grote, is to be filled by Lord Belper.

The Committees of the Royal Colleges on the subject of the Conjoint Examination Board hold another meeting on Friday, June 30, at the Royal College of Physicians.

Hydramyle, the anæsthetic to which we referred last week, has been again administered during the present week by Dr. Richardson for short operations, and with continued favourable results. The vapour is so rapid in its action that, in a case of extraction of a molar tooth, by Mr. Peter Matthews, on Monday, the patient was rendered insensible, the operation was performed, and recovery was completed in fifty seconds. For tooth-extraction, Dr. Richardson lets the patient inhale for twenty or twenty-five seconds, and then, although there is still consciousness, he withdraws the vapour. After this, a deep but brief stage of unconsciousness comes on, during which the operation is carried out. The delay in the production of anæsthesia is due to the insolubility of the hydramyle—that is to say, after the lungs are charged with the vapour, time is required for the blood to take up the narcotic and carry it to the nervous centres. The same phenomena may be observed, in a lesser degree, from bichloride of methylene and from methylic ether. For short operations, such as tooth-extraction, the occurrence of deeper insensibility after the inhalation has been stopped is an advantage, and the fact that the insensibility intensifies for a short time, as stated, will have to be specially remembered by administrators.

THE ELECTIONS AT THE COLLEGE OF SURGEONS.

It may be well to remind the Fellows of the College of Surgeons that there are *four* vacancies to be filled up at the election of Members of Council next Thursday, and that there are *six* candidates. Three are retiring members, who offer themselves for re-election, and three are candidates who have not yet been on the Council. The three retiring members are Messrs. Cock, Busk, and Le Gros Clarke. We have repeatedly

argued that re-election of retiring members should not be the rule, but should be the exceptional reward of unusually good service. We believe all three of the candidates who retire this year have done good service; but as Mr. Cock has been President, and still remains an examiner, we think he may well be satisfied with the share he has attained of College honours, and ought not to be displeased if the Fellows consider that he may now gracefully make way for some successor whose Professional work has not yet been rewarded by collegiate dignity of any kind. Guy's influence is strong, but English love of fair-play may prove to be stronger still. Of Mr. Busk and Mr. Clarke, we hear on all sides strong opinions in favour of their re-election. Mr. Spencer Wells is the senior of the three new candidates, and it is hardly possible that the Fellows would elect a junior over his head; but his strict determination not to canvass should lead his friends to exert all their influence in his favour, as a good deal of canvassing for other candidates is being carried on, and Fellows are very apt to give a vote to those who ask them for one, without much consideration for the claims of candidates who do not. We have expressed our opinion before, and now repeat it, that Messrs. Critchett and Holt are in every way well fitted to be elected to the Council, and we hope to see them there in their turn; but we should be sorry if any system of canvassing should succeed in placing either of these gentlemen above a senior fellow who is, at least, equally deserving of the good-will of his brethren.

FROM ABROAD.—M. LINAS ON THE PARIS COMMUNISTS—PROPOSED * CONVERSION OF THE HÔTEL-DIEU INTO GOVERNMENT BUREAUX
—LES AMBULANCES DE LA PRESSE.

M. LINAS, after recounting the dreadful scenes amidst which he figured during the last struggle in Paris, adds (*Gazette Hebdomadaire*, June 23) some interesting reflections:—

"Such are the facts, and I now have to appreciate them, as well as their authors, regarding them, as far as the subject admits of it, from a psychological point of view. To this I am indeed led, and even anticipated, by the good sense of the public. All, in fact, who speak or write of the events which were accomplished in Paris between March 18 and May 28, employ, with one common accord, such qualifying words as moral disease, mental aberration, dementia, convulsions, epilepsy, alcoholism, delirium, frenzy, madness, furious mania, monomania, etc. The London *Times* uses the term delirium tremens, and the Germans speak of morbus democraticus. These expressions, borrowed from the Medical vocabulary, are on every lip, and at the end of every pen; and I observe that most of those who employ them take them in their proper signification, and in no figurative sense. For, in truth, the acts of the Commune, and especially the last ones, are so strange and extraordinary, attain so high a degree of violence and monstrosity, and so surpass, by their odious attempts and horrible crimes, preceding insurrections, that they seem to have entirely passed beyond the limits of sound reason to enter within the domain of maniacal fury. In the eyes of the Physician, still more than in those of the vulgar, these acts look like an immense phenomenon of collective insanity; and his thoughts naturally recur to those great madresses of the middle ages, which, bursting on entire populations, spread on every side terror, desolation, fire, and murder. He calls to mind, also, those transports of savage fury provoked by epilepsy and alcoholism, only to be quenched in blood, carnage, and destruction.

"Alcoholism! This is truly one of the worst of the social diseases of the present times. Who can describe the great part that has been played, first in our disasters and later in our civil strife, by this redoubtable poison, which overturns reason, slays conscience, extinguishes all noble sentiment, stimulates the worst instincts, and converts man into an ignoble brute or a wild beast of prey. We have not forgotten the severe orders of the day by which the unfortunate general Clément Thomas stigmatised during the siege the shocking scenes of debauchery, drunkenness, indiscipline, and cowardly defection which some of the battalions of the National Guard exhibited in the trenches in the very face of the enemy. It is also notorious that drunkenness was one of the most efficacious of the stimuli resorted to by the Commune to maintain the zeal of its adepts, to exalt the enthusiasm of its followers, and

to spur on the ardour of its combatants. It will be remembered in what a piteous state the Versailles troops found the defenders of the forts Issy and Vanves, while all testimony agrees in recognising that the majority of the incendiaries were such a prey to alcoholic excitement as to become deaf to the voice of humanity and inaccessible to all ideas of compassion. Is it meant, then, that we are to charge to the account of alcoholism all the frightful excesses which have sown so much ruin and mourning throughout Paris? Certainly not. Perversity, rage, hatred, vengeance, wickedness, and vice of all kinds, and the worst passions, have also largely contributed to the accomplishment of these terrible crimes.

What, then, have been the motives for actions so abominable as these? What aims have their authors pursued? Social regeneration and proletarian emancipation? The extinction of pauperism? The elevation of the working classes? Universal happiness? Well, we can believe that among the *ecoryphei* of the Commune and the abettors of insurrection there were certain misguided minds sincerely carried away by communistic Utopias who believed in good faith that they were engaged in realising these chimeras. But side by side with these theorists, these dreamers and sophists, there was a large majority of demoniacs (*energumènes*), monomaniacs, and dangerous fanatics, individuals of cruel temperament and ferocious disposition. A not less formidable category was made up of libertines, idlers, limited intellects, incapables, persons who had lost their position, and the refuse (*fruits secs*) of all Professions. To speak only of our own, there were on the Commune some three or four equivocal or interloping Doctors of low position, whose names would be sought for in vain in any Medical directory, and who we are well entitled to deny as belonging to ourselves.

“Without wishing to exaggerate the importance of the system of Lavater, we cannot help recognising that on this occasion it receives a somewhat exact application. If we stop to look at the photographs of the members of the Commune which crowd the shop windows, or, better still, if we have seen these personages themselves at the Red clubs, where they were the habitual orators and favourite dignitaries, we cannot but be struck by their strange and forbidding physiognomy. With some rare exceptions, it is no intellectual reflection, but the type of instinct and passion which prevails. No nobility, elevation, or dignity can be traced in features which, for the most part, are wrinkled, withered, and deeply ravaged by the indelible traces of ardent passions. Some bear the inoffensive and sanctified expression of mystics and *illuminati*, while others exhibit that peculiar disorder of the head, and that inexpressible vacuity of the physiognomy, which are usually only met with in lunatic asylums. Finally, what is very characteristic in most of them is, the utter absence of all expansive and benevolent sentiment, and the predominance of perverse and depraved instincts, as shown in the strong impress of violence and hardness in the features, and the forcible expression of distrust, hatred, envy, and ferocity. Place side by side with some of these portraits those of persons upon whom great crimes have conferred a sad celebrity, and the resemblance is at once seen to be most striking. To sum up, it results from this short Medico-psychological sketch, that the Paris insurrection had, among its leaders, adepts and heroes, many men misled by dangerous sophisms or carried away by detestable propensities, a certain number of monomaniacs and *illuminati*, plenty of fierce and cruel beings, and a weak minority of sincere and convinced minds, but devoid of rectitude and good sense.”

At the time of the construction of the Hôtel-Dieu, commenced some few years since, the Medical Profession offered the most vehement opposition to the enormous scale upon which this was contemplated, demonstrating, as far as history and probability could avail, that the proposed agglomeration of nearly a thousand patients in a lofty edifice insufficiently provided with means of ventilation, could only be the most disastrous of undertakings. The embellishment of the capital, however, required a grand edifice on a time-honoured site, and the protest was utterly disregarded. The building is now completed, and a hope has sprung up in the minds of some of the Profession that the great want of accommodation for some of the municipal and government offices consequent on the late conflagration may induce the Government to appropriate this vast edifice for the supplying a portion of its necessities. M. Hénocque, calling attention to the subject, points out that, unfitted as is the Hôtel-Dieu for the purposes of

a Hospital, it might easily be converted into a means of accommodating numerous *bureaux*. There is good light, while the warmth and ventilation, however defective they might prove for an agglomeration of sick inmates, would amply suffice for working purposes. The three stories of which the edifice consists may be calculated to furnish 20,000 square mètres of surface, and, supposing each *employé* to have, upon an average, six square mètres, there would be found ample space for 3000 *employés*. It is heartily to be hoped that this vast building, which, according to the universal prognosis of the Profession, was destined, sooner or later, to become, as its predecessor so often had been, the home of erysipelas, purulent infection, and puerperal fever, may, under the pressure of economical necessities, be diverted to a more innocuous purpose.

M. Ricord, who, as Director of the Ambulances de la Presse, by his untiring devotion and courageous personal exposure to risks of every kind, from the commencement of the first to the end of the second siege, earned for himself the esteem and enthusiastic admiration of the Profession in Paris, has just published a summary of the report which he sent in to the Intendance. It is only a brief statement, preliminary to an elaborate memoir, on the operations of these ambulances which he is engaged in preparing. In this report he states that these ambulances were founded by means of voluntary subscriptions of a liberal character made by the French press at the time of the declaration of war; and that the sum subscribed, added to donations received from England, amounted to more than a million francs. Thanks to the remarkable activity of the *ambulances mobiles* of the Society, and the amount of the *matériel* which they had at their disposal, 22,199 sick or wounded were treated in them during the Prussian war, and 1924 during the civil war. Of course attention to the wounded formed only a portion of the duties which were performed. The sick and fever-stricken had to be sought for at the advanced posts and in the trenches, tended, and then transported either to the fixed ambulances or to the Hospitals. Five great ambulances, having several others at the advanced posts, in this way succoured 14,057 fever patients. The fixed ambulances, or temporary Hospitals, supplied with all they wanted, were nineteen in number, and these were brought into communication with forty-three small convalescent ambulances set up by private charity, and each only accommodating a few of the wounded. There was no want of Medical aid, 140 Doctors or Medical students, and fifty-two *pharmaciens* having cheerfully rendered their services, while the devotion of these was rivalled by that of from 250 to 300 *Frères des Ecoles Chrésiennes* who accompanied the ambulances to the field of battle, while from 225 to 250 of their number officiated as *infirmiers*. The whole community of the Sisterhood of Esperance also joined the ambulance, as did numerous volunteers, who officiated as carriers of the wounded, and often exhibited great bravery and devotion in their dangerous task. The number of wounded collected from battle-fields cannot be exactly stated, but at least they may be put down at 5000, who, added to 22,199 other wounded and fever patients, and 1924 Communists, furnish an important total of 24,123. M. Ricord finishes his report by stating his desire that these facts and figures should be brought under the notice of the Minister of War; for, by some unaccountable omission, these services have received none of the “well-merited recompenses” which it seems is the all-devouring ambition of Frenchmen to be decorated with.

PARLIAMENTARY.—THE VACCINATION ACT.

In the House of Commons, on Friday, June 23,

Dr. Brady asked the Secretary of State for the Home Department whether his attention had been directed to an announcement in the *Pall-mall Gazette* and the *Times* newspapers, that a public meeting was to be held at St. James's Vestry-hall, to protest against the Vaccination Act, in which the following appeal was made:—“Parents, attend and protest

against the tyrannical law which compels you to poison your children's blood in infancy;" and further announcing that members of the Vestry were to speak at said meeting; and, if so, whether he had made, or intended to make, inquiry into the circumstances of the hall having been appropriated to a purpose wholly opposed to the sanitary conditions of the metropolis.

Mr. Bruce said he had received from the Vestry Clerk an explanation, which he thought was satisfactory, of the circumstances of the case. The Vestry Clerk stated that a member of the Vestry applied for the use of the hall for a meeting to take into consideration the unsatisfactory state of the vaccination law. The vestry accordingly granted the use of the hall for that purpose, but the use of it would have been refused by a large majority if the Vestry had been aware that such advertisements as the hon. gentleman referred to were intended to be published.

THE APPLICATIONS OF ELECTRICITY TO MEDICINE.

II.

ELECTRICITY, as used in Medicine, is either static (derived from the friction of a glass-plate or cylinder), or dynamic (the direct product of chemical action), or induced from the contact-current by an induction-coil. Static electricity is not much employed. Contact-electricity or constant-current galvanism is of much greater importance; but its value is only now becoming fully understood.

In a former article on this subject (a) (*vide* p. 611, vol. i. 1871), we discussed these two varieties of electricity—viz., Frictional, or Franklinic Electricity, and Current, or Galvanic Electricity—and we considered them with special reference to the modern doctrines of force or energy. Putting on one side all further consideration of electricity as related to other forces, we shall next proceed to discuss that form of electric action which was discovered by our countryman Faraday, and which is commonly known as Induced, or Faradic Electricity.

The induced electricity (the interrupted current, or faradisation) is that most commonly employed, and is derived either from electro-voltaic or electro-magnetic instruments. In the former, the electricity is primarily developed by chemical action; in the second, by the rotation of a kind of wheel.

Suppose we construct a coil of copper wire, covered with silk to insulate it. This wire had better be rather thick, and the number of turns need not be great, especially if wound round a core composed of soft-iron wires. If now we construct another, also of copper wire, finer in character, and made up of a great number of coils, but built so as to constitute a cylinder, into which the former may be introduced, we have an induction apparatus. All that is now necessary is to connect the extremities of the thick wire with a battery, and the extremities of the thin wire with some object capable of testing the existence of electrical effects, when it will be found that the moment the circuit through the thick wire is closed the poles of the thin wire also give evidence of a galvanic current, stronger than that produced by the battery and passing in the opposite direction—this, too, without any direct communication between the contained and containing coils, the former of which is called the primary, the other the secondary. But when the current has been fairly established in the primary coil, its effects on the secondary cease until the former is arrested, when signs of a current, this time in the direction of the primary one, are again manifested by the secondary coil. Thus, in induced electricity the current is to and fro, and can only be produced by breaking or

closing the primary current. To keep up its effects, therefore, some apparatus must be introduced, constantly opening and constantly closing this current. This is commonly known as the *trembler*.

But there is another form of induced electricity still more frequently employed. It is called electro-magnetism. Thus, if a bar of soft iron, shaped like a horse-shoe, be surrounded by either extremity of a coil of protected wire, wound in opposite directions, and if through this wire is passed an electric current, the iron bar is converted into a magnet. But suppose something quite the reverse of this—that is to say, a magnet, horseshoe-shaped and powerful—is the origin of the energy instead of a battery. If, then, we have two bobbins made of copper wire covered with silk, and surrounding soft-iron centres, the two being connected on an axis by a soft-iron plate; if, further, we have the means of causing these to rotate rapidly on this axis, either iron core coming close to both poles of the magnet in the course of its revolution, we have the well-known magneto-electric machine. Here magnetism is transferred with each approximation from the magnet to the soft-iron core; the soft-iron core in its turn induces an electric current in the copper-wire coils, whence by appropriate mechanism it is conveyed to the galvanometer or human body, as the case may be.

These are the two forms of electric force most generally employed in Medicine, chiefly on account of the ease with which they may be produced and applied.

A word next as to the means commonly employed of giving rise to current electricity, whether for applying it directly to the human system, or for producing an induced current for that purpose. This is attained usually by constructing a series of couples, forming what is known as a galvanic battery. The electricity so produced is, of course, current electricity, and this current is *continuous*. The current in the case of induced electricity, on the other hand, is to and fro, or, as it is also termed, *interrupted*. Now, in batteries constructed on the principles we have laid down—that is to say, made up of electro-positive and electro-negative plates, with a liquid intervening—there is great difficulty to be faced in rendering the current equable. Hence these have now generally fallen into disuse, and batteries with two liquids instead of one are commonly employed. The reason why the galvanic action of the two elements becomes enfeebled is twofold. Thus, in the zinc-copper combination, the sulphuric acid combines with the zinc, rapidly at first, more and more slowly afterwards, as the acid comes nearer and nearer to neutralisation. But this is not the principal difficulty; for, as sulphate of zinc forms, hydrogen is set free, and this elings most pertinaciously to the inactive copper plate, interfering with the circuit of the current; and not only so, but, by reducing some of the sulphate of zinc, it coats the copper plate with a layer of zinc, and so gradually approximates the character of the two plates.

To remedy this last difficulty a second liquid is introduced, and so placed that the hydrogen set free in forming the sulphate of zinc shall attack it rather than the inactive plate, which in this way is untouched, and thus the strength of the current remains unimpaired, so that the current so produced is known as the *constant* current. One of the best forms of constant-current battery was invented by the late Professor Daniell, and is known by his name. This is a zinc-copper battery, but the copper is immersed in a solution of sulphate of copper. Between this and the dilute sulphuric acid a diaphragm of glazed porcelain is interposed. By this means the two liquids are kept from uniting too speedily, without interfering with the passage of the electric current. When in action the hydrogen attacks the sulphate of copper, reducing the metallic copper which is deposited on the copper plate. The sulphuric acid passing in the opposite direction tends to renew the acid attacking the zinc. Provision is easily made to keep up the supply of sulphate of copper, and so the current remains constant for a very long time.

Some form of this battery is that most useful in Medicine, provided a constant current be desired, but only if the battery is to be stationary. The bulk of the elements and the mass of sulphate of copper crystals requisite, if it is to be used for any length of time, interfere with its portability. One of the best for the Practitioner, or rather, we should say, for Hospital practice, is constructed by Messrs. Elliott and Co., Strand. This will continue to act steadily for a very long time, but it is bulky, and cannot be readily transferred from place to place. As copper and zinc are not very far removed from each other in the electro-motive series, inventors have sought to increase the electro-motive power of a battery, by selecting as the negative element platinum or carbon. The former is the prin-

(a) A Treatise on Localised Electrification, and its Applications to Pathology and Therapeutics. By Dr G. B. Duchenne (de Boulogne). Translated from the Third Edition of the Original by Herbert Tibbits, M.D., Medical Superintendent of the National Hospital for the Paralyzed and Epileptic. Part I. London: Hardwicke. Pp. 322.

Electricity in its Relations to Practical Medicine. By Dr. Moritz Meyer, Royal Councillor of Health, etc. From the Third German Edition, by W. A. Hammond, M.D., Professor of Diseases of the Mind and Nervous System, and of Clinical Medicine in the Bellevue Hospital Medical College, etc. New York: Appleton and Co. Pp. 497.

A Practical Treatise on the Medical and Surgical Uses of Electricity, including Localised and General Electrification. By George M. Beard, A.M., M.D., etc., and A. D. Rockwell, A.M., M.D., etc. New York: William Wood and Co. Pp. 698.

eiple of Grove's, the latter of Bunsen's battery. In either case, nitric acid is used instead of sulphate of copper. This, being attacked by the hydrogen, produces nitrous acid, and so protects the platinum or carbon. These batteries are exceedingly powerful, but the nitrous acid fumes, evolved after a time, are extremely objectionable, and so chromic acid is frequently used as the reducing agent. The battery in most common use nowadays for Medical purposes is constructed on this principle. It is made by Stöhrer, of Dresden, and consists of zinc-carbon elements, with chromic acid as the reducing agent. Two forms are in use—one where one or two of these elements are employed to give rise to an induced current; another where fifteen or twenty are combined, for the purpose of producing a constant continuous current.

In all these batteries two liquids are used, but in Smee's battery a nearly constant current is obtained with one liquid by mechanical means. The elements are zinc-platinum, but the platinum plate is roughened by covering it with spongy platinum, whereby the disengagement of the hydrogen is greatly facilitated, and the resistance is reduced to a minimum. The most useful Medical battery for producing a constant current and, at the same time, retaining portability, is a modification of this, made by Weiss and Son, the well-known instrument makers.

SMALL-POX RETURNS OF THE ASSOCIATION OF MEDICAL OFFICERS OF HEALTH.

New Cases of Small-pox occurring in the Public Practice of the undermentioned Districts.

Districts.	No. of Cases week ending						June 24. Sent to Hospital.

INFANTICIDE IN LONDON.—Dr. Lankester remarked, at an inquest a few days ago, on the body of a newly-born child which was found inside the gate of a lady's residence at Paddington, that over 300 bodies of children were found in the streets of London every year.

An official report states the German loss of military Surgeons to have been 101—viz., seventy-two killed in battle, twenty-five died of disease, the rest by accidents. The loss is considered very slight, compared with other campaigns, especially with the Crimean war.

At his request, the skull of the late Mr. Grote has been opened by Mr. Marshall, who has taken a cast of the brain.

NATIONAL ASSOCIATION FOR THE PROMOTION OF SOCIAL SCIENCE.

ON Tuesday last the Marquis of Ripon, as Lord President of the Privy Council, received a deputation from this Association, the reputed purpose of which was to urge upon the Government the putting into force the Diseases Prevention Act, 1855, with a view to the suppression of small-pox. The deputation was introduced by Dr. Brewer.

Dr. Lankester stated that the deputation had proceeded out of a paper which he had read before the Association, in which he maintained that the measures now being adopted for the suppression of small-pox were not efficient, inasmuch as the epidemic was running on severely still, and, in fact, we were not suppressing it. In the first place, no efficient attempts were being made to vaccinate the endangered population in the infected districts. In his capacity as coroner, he had considered it his duty to hold inquests in cases where deaths of unvaccinated persons arose from small-pox, and everyday instances were coming under his notice in which whole families of children were unvaccinated, and he had found that no one had ever called upon the parents to obtain vaccination for their children. He urged that such instances should be sought out, and that there should be in force an imperial system, by which the vaccination of unprotected children should be insisted upon, not in ordinary seasons, but as soon as ever small-pox breaks out in any district. The present plan of leaving the matter at such times in the hands of parish guardians has simply resulted in failure, since one parish may be active, while another is indolent, and the whole city suffers from the apathy of a portion of it. Secondly, he referred to the practice of concealing the occurrence of small-pox in families and houses, and mentioned an instance in which a case was thus concealed for three weeks, with the result of spreading the disease certainly to at least thirteen individuals. He considered that there should be some power of compelling the occupiers of houses to declare the existence of small-pox upon their premises to the local authority, or the Medical Officer of Health, so that an opportunity might be afforded of taking the necessary measures for preventing its spread. Thirdly, he urged that where there is no Medical Officer of Health, a special officer should be appointed to suppress small-pox. It should be his special business to take the necessary measures, or to see that they were taken. When cattle plague broke out special cattle plague suppression officers were appointed, and it is believed that great good resulted. If in any district the first case were properly taken in hand by such an officer, the extension of the disease might be stopped. He estimated the probable expense of the small-pox epidemic to the nation at not less than five millions, and it might have been stopped for a quarter of a million.

Dr. Mouatt dwelt upon the importance of a compulsory vaccination of a population invaded by small-pox, illustrating his remarks by his own experience for many years in the gaols in Bengal, and by the fact that on one occasion, when small-pox broke out in Java, the Dutch put a stop to it quickly by the compulsory vaccination of the entire population.

Mr. Liddle considered that the Government should put some pressure upon the local boards, with a view to compelling them to put in force the powers they possess, and should call upon them from time to time to report as to the Acts they were enforcing. There was power now to require the owners of lodging-houses to declare the presence of infectious disease in them, and he thought that this power should be extended to ordinary dwelling-houses. Now, there was one law for the poor and another for the rich. At the present time many parishes were without disinfecting chambers, mortuary and post-mortem rooms, on account of the difficulty of obtaining a site, and he considered that the parishes should have powers of compulsory purchase for these purposes. Referring to the Diseases Prevention Act he stated that, from its not being in force, there was often a difficulty in getting people who had died of small-pox speedily buried, and cited an instance under his own knowledge in which, on account of the poverty of the parents and their inability to pay for the coffin, the undertaker had detained the certificate for burial, and the body had lain unburied for nine days.

Mr. Pears, the general Secretary of the Association, stated that the objects that it was desired to attain were—1. Isolation by the compulsory removal of any small-pox case when there was more than one family in a house, or where several people

lived in the same room. 2. Powers of compulsory vaccination and revaccination where a neighbourhood was invaded, and systematic visitation for such purpose. 3. That Medical men should be required to report all cases of small-pox within their cognisance; and 4. That burials should be effected as speedily as possible.

After some further observations by Dr. Sarvis, in which he complained of the difficulty of obtaining the removal of patients to the Hospital under the existing law,

Lord Ripon remarked that he was under the impression that the object sought by the deputation was to obtain the enforcement of the Diseases Prevention Act, whereas it appeared to him that the observations of the several speakers pointed rather to the amendments which they considered ought to be made in the existing laws. With respect to the compulsory appointment of a vaccination officer, they were probably aware that this was included in a Bill now before Parliament. As to the suggestions with regard to other matters put forward, the Government must proceed deliberately—they must not be in advance of public opinion, but must carry it with them in anything they do; and he referred to the delicacy of interfering with such private matters as were alluded to by the deputation. With respect to the Diseases Prevention Act, he thought that under subsequent Acts local authorities possessed all the powers which that Act conferred—viz., of house-to-house visitation, for erection of mortuaries, etc.; and specially as respects small-pox, the putting in force the Diseases Prevention Act would only lead to a conflict of authority. Still, he promised to give his best consideration to the statements made to him, after which the deputation withdrew.

RATTRAY ON THE EFFECTS OF CHANGE OF CLIMATE ON THE HUMAN ECONOMY.

(Concluded from page 613, vol. i., 1871.)

EFFECTS ON THE URINE AND PERSPIRATION—EFFECTS ON THE WEIGHT AND STRENGTH.

WE now proceed to consider the concluding portion of Dr. Rattray's memoir.

4. None of the secretions are more visibly affected by great changes of climate than *the urine and perspiration*. The following experiments were made by the author upon himself (aged 39) during the voyage to Bahia between June and September. During twenty-four days from Plymouth to the equator, drink (tea or coffee) being limited to thirty-nine ounces daily, the urine gradually decreased from thirty-nine to thirty ounces. On the two following days, when the heat was excessive, and he drank 88 ounces daily, he secreted thirty-six and a half and thirty-seven and a half ounces of urine, leaving fifty-one ounces of drink to be accounted for. From Dalton's well-known observations, he calculates that the skin exuded 27.02 ounces, and that the lungs exhaled 19.58 ounces, while 4.4 ounces were carried off by the bowels.

Contrasting the relative excretion of free fluid in the temperate and tropical latitudes, he finds that in the former, as compared with the latter, the free fluid excreted by the kidneys is as 59.54 to 42.04 per cent., that secreted by the lungs is as 26.97 to 22.25 per cent., and that secreted by the skin is as 8.55 to 30.7 per cent., while the excretion by the bowels is almost unaffected by climate.

On his return voyage, he took daily 88 oz. of free fluid, and was much struck with the oscillations both in the quantity of the urine and in the amount of its solid constituents, even in adjacent days. Thus, on three consecutive days taken at random, the urine amounted to 49, 71, and 52 fluid ounces, with 494, 290, and 266 grains of solids. The smallest quantity was forty-three and a half, and the largest eighty-two ounces. He gives a curious rule for enabling us to moderate our drink according to the temperature of the air. At 30° Fahr., five ounces of free fluid are required; at 40°, fifteen ounces; at 50°, twenty-five ounces; at 60°, thirty-five ounces; at 70°, forty-five ounces; at 80°, fifty-five ounces; and at 90°, sixty-five ounces. This fact, as he ventures to call it, "was proved by an experiment made in the Pacific in 1860-61, during his passage from Valparaiso (latitude 33° S.) to Vancouver (latitude 48° N.), when the drink was increased or decreased, with the desire."

The functionally-excited skin in hot climates acts as a safety-valve for the kidneys, just as the latter do for the former in cold ones. We cannot, however, accept our author's views

that frequent changes of climate tend to develop the range of action in both organs.

5. Upwards of fifteen pages, containing eighteen elaborate tables, are devoted to the *Influence of Tropical Climates on the Weight and Strength*. The experiments illustrating this department of the subject "were made in H.M.S. *Salamander* during a voyage of five months to, and a subsequent stay of three years on, the east coast of Australia, while making triennial trips between Sydney (latitude 34° S.) and Cape York, Torres Strait (latitude 10½° S.), a distance of 1700 miles in a nearly north and south direction." The crew consisted of 209 men, of whom 129 were between 15 and 25 years of age, sixty-three between 25 and 35, sixteen between 35 and 45, and one between 45 and 55, and all were in good health.

The first table, illustrating the effect of tropical weather alone on the weight, is based on eighty-five weighings, and shows the effect of three and a half months' exposure to an average temperature of 82° F. Of the eighty-five cases, 64½ per cent. had lost flesh (the average loss being five pounds). Though greatest among the adults (71 per cent.), and especially the higher ages (77½ per cent.), it was large even among the juniors, of whom 54 per cent., instead of growing, lost considerably. During the 100 days that elapsed between the two weighings. (made as they entered and quitted the tropics), salt meat was issued on thirty-six days, and fresh (preserved) meat on seventy-two, while lime-juice was given out on sixty-one days. Of fifteen officers and men subsequently tested after seventeen days' more prolonged and direct solar exposure, but with a larger allowance of fresh meat, eleven had lost from one to nine pounds (average three and three-elevenths pounds), one being unchanged, while three had gained weight. "This," says the author, "shows that the wasting effect of tropical weather on the adult white is not preventible, even by judicious regimen." Considering the mawkish, unsavoury taste of many of the preserved meats supplied to the Royal Navy, we cannot help feeling that "judicious regimen" is rather a strong expression. Had the persons thus experimented on been fed on such fare as our great passenger steamers issue, the weighing might have given a different result.

The second table shows that the loss of weight is considerably increased on an almost purely salt meat diet. The season being the same, though the exposure was only for thirty-two days (eighty less than in the previous observation), no less than 81 per cent. of the seventy-six persons weighed lost on an average four pounds. The more prolonged the time of exposure is, the greater apparently is the loss of weight. After a stay of a year at Cape York, eleven marines, fed on a mixed fresh and salt meat diet, lost weight to the average extent of eleven and nine-elevenths pounds.

The third table shows that if a third injurious influence—namely, hard subsolar work—is added to the preceding ones, the body is still further affected. In an experiment based on 103 cases, and extending over 104 days, of which sixty-two were spent in the tropics and forty-two in the temperate zone, the average loss of weight was seven pounds, the seniors suffering the most.

The next two tables show that season materially influences the reduction in weight. While the number who lost flesh in the dry season was 44 per cent., it was 76 per cent. during the wet monsoon. The sixth table is very instructive in showing "how much and rapidly the system rebounds under an opposite change of climate, and when removed from excessive warmth, into a healthy temperate climate, with a fresh meat and vegetable diet, light work, frequent leave."

After a fifty-four days' stay at Sydney in spring, no fewer than 90 per cent. of eighty-three sailors who were weighed had either gained flesh or lost nothing, the average gain being as much as six pounds. The loss of weight in the small remainder occurred among the juniors, and was probably due to causes which might be readily explained.

During the three years over which the triennial trips from Sydney to Cape York extended, the weight of the crews was continually oscillating, increasing at Sydney and decreasing on the return to the tropics. The seventh table shows that, notwithstanding the invigorating influence of the periodic returns to cool weather, 44 per cent. of the original crew, in a year and a half, had lost flesh, while the health and strength of all had declined. During the next year and a half the crew had more fresh meat in their northward trips, the beneficial influence of which is shown (in the eighth table) by reducing the percentage of those who lost flesh to 28½, as well as by a diminution in the percentage of loss.

The ninth table shows that after a fifty-five days' passage from the cool climate of England across the equator to the

south temperate zone, 63 per cent. of the crew had lost flesh to an average of nearly seven pounds, the seniors suffering more than the juniors. These results were not due to a decrease in the food, as the daily consumption during the last week averaged six ounces more than during the first. The cause was, therefore, partly climatic and partly dietetic, salt meat being issued on fifty of the days. The effect of a forty-four days' voyage from the Cape of Good Hope to Sydney, along the fortieth parallel of south latitude, and after a health-infusing stay of fifteen days at Simon's Bay, was, as is shown in the tenth table, very different; only 19.7 per cent., or twenty-six out of 132 sailors, lost flesh, and the loss was very trifling in these cases. These were all seniors, all the boys and younger men actually gaining in weight.

The eleventh and twelfth tables show the effects of voyages of 144 and 230 days on the weight. From the latter we learn that "though fifty-five days in all were spent at Madeira, Simon's Bay, Sydney, and Brisbane, on a health-giving fresh meat and vegetable diet, and lime-juice was freely given, the monotony and confinement of 175 days at sea, with 156 salt-meat days, a double exposure to the tropics and frequent changes of temperature, had increased the number who had lost weight since leaving England to 65 per cent.—a decided index of failing health and near approach to disease."

Passing without remark over the thirteenth, we shall consider the conclusions that may be deduced from the fourteenth table, which contrasts the variations in weight during a long voyage (of eighty-eight days from England to Bahia) of the men, boys, and naval cadets. During the first fifty-seven days 85 per cent. of men (of whom 425 had been weighed), but only 56 per cent. of the boys (64 in number), and 58 per cent. of the cadets (60 in number), lost flesh. During the first eighty-eight days (when 296 men, 40 boys, and 58 cadets were weighed) the percentages were—men 88, boys 60, cadets 65. Further, while 53 per cent. of the men (310) began to recover weight during the last thirty-one days of the voyage, when a cooler atmosphere was entered, 73 per cent. of the boys (41) and 58 per cent. of the cadets (59) did the same. Subsequently, after twenty-eight days' stay in harbour in England, while 89 per cent. of the men (391) gained flesh, the percentage was 90.5 among the boys (34) and 100 among the cadets (28). The greater age and strength and the rougher early life of the boys enabled them to bear the voyage better and recover sooner under favourable agencies than the delicately-trained cadets; while, on the other hand, a generous diet and better regulated life caused the latter to increase more in England. The cadets during the month in harbour gained, on an average, 1½ lbs. per week, which Dr. Rattray regards as about the healthy rate of growth at their age (viz. from 14 to 17).

In a subsequent table the author compares the effects of a tropical climate and other influences on the weight. The results are compiled from a combination of several preceding tables, and show that while under general conditions only 9.6 per cent. lose flesh, an injurious diet raises this to 19.7 per cent. Under a tropical climate the percentage rises to 64.7, while under the latter and salt meat combined it ascends to 65.2, and in the rainy season to 76.3. If to these influences hard work be added, the percentage rises to 91.3 per cent. Hence a tropical climate is more deleterious by far than any of the other agents.

"The cause of this reduction in weight in the tropics (says Dr. Rattray) is threefold: first, a diminished necessity for surplus fat, which becomes absorbed; secondly, that peculiar and not easily explained physiological effect of heat, which causes the tissues to decay faster than in cold latitudes; thirdly, diminished lung-work and blood-oxygenation, and thereby an imperfect renewal of tissue."

From the preceding facts, and others of a similar nature which we have passed over from want of space, the writer draws the following "important hygienic and therapeutic indications":—

1st. That the tropics, especially during the rainy season, should be avoided by natives of colder latitudes.

2nd. That the young, the debilitated, and the diseased should especially shun warm regions.

3rd. That none but full-grown, healthy adults should go there.

4th. That with all, even the latter, a speedy exit should be made therefrom when great loss of flesh and strength gives warning of approaching disease.

5th. That such injurious agencies as may increase the weakening and disease-inducing influences of tropical climates, of themselves irremediable, should be avoided—e.g., faulty diet, over-fatigue, impure air, etc.

6th. That, to preserve health, a tropical climate should be frequently changed for the more temperate ones of higher altitudes or latitudes.

Since this paper was in type we have received a Blue-book containing a "Summary of the Cruise round the World of the Detached Squadron, 1869 and 1870." The squadron, consisting of nine ships, under the command of Admiral Hornby, started from Plymouth on June 19, 1869, and returned to that port on November 15, 1870, having been absent from England 515 days, and actually at sea for 409 days. The route was as follows:—Madeira, Bahia, Rio Janeiro, Monte Video, the Cape, Melbourne, Sydney, Hobart Town, New Zealand, Japan, Vancouver's Island, Honolulu, Valparaiso, Bahia, home. We extract the following paragraph, as it contains an independent confirmation of Dr. Rattray's views:—

"The health of the crews was remarkably good throughout; the number of sick seldom exceeding, on any passage, a mean of 4 per cent. of the number of persons borne, and generally below that; on some passages little over 2 per cent.; and the loss to the squadron by deaths (including accidents), persons invalided, and those left behind in Hospital, not invalided, but unable to proceed with the squadron, was only 3.4 per cent. Doubtless much of this result is owing to the excellence of the provisions which were sent out to meet the squadron at different places, more especially the salt beef, preserved meat, and biscuit, which were specially the subject of comment in the squadron, and to the following measures which were taken to preserve health:—Fresh meat, vegetables, and soft bread were issued to the crews during the stay of the ships in harbour; and, when the weather would permit of its keeping good, two days' allowance of meat and vegetables was taken to sea. At Yokohama, Honolulu, and Bahia, live bullocks, equal to four or five days' consumption, with a larger quantity of vegetables, were also taken to sea, and issued after a few days' salt meat rationing. In the *Liverpool*, which may be taken as an example of the squadron generally, fresh meat was issued on 133 days, preserved meat on 94, and salt meat on 289 days; lime-juice was also issued on 344 days. In severe weather, chocolate was issued to men of the middle and morning watches, and was much appreciated by them—in, fact, some men, who did not care for their daily allowance of grog, asked for, and were allowed to take up, chocolate instead. Yet, in face of the apparent healthiness of the cruise above shown, and the precautions taken to preserve health, the following statistics, which were collected in the *Liverpool*, from actual weighing and measurement, would appear to show that the effect of the cruise has been to stunt the physical development of the boys, and to reduce the stamina of the men:—Soon after leaving England, 25 grown officers, 70 marines, and 269 seamen were weighed, and found to average 151.79 lbs., and the same persons, as nearly as possible, were again weighed when close to England on the return voyage, and found to average only 145.94 lbs; 98 growing youths (comprising 29 officers and 69 boys), were found to average 123.14 lbs. at starting, and the same persons, as nearly as possible, 130.82 lbs. on returning. The average height of the boys had only increased from 63.79 in. to 65.07 in., and their average chest measurement from 33.91 in. after full inspiration, and 32.22 in. after full expiration, to 34.26 in. after full inspiration, and 32.78 in. after full expiration. Their average age at starting was 16 years 10 months."

LOSS OF FRENCH AUTOGRAPHS.—M. Amédée Latour, in No. 10 of the *Union Médicale*, describes the devastation committed at his house at Chatillon during the first siege of Paris, and stigmatises in the severest terms the brutal and disgusting conduct on the part of the Prussians who occupied the village, and of which he was an ocular witness. His ravaged house, burnt or looted furniture, his pillaged cellar, his devastated garden, and even his well poisoned with the *débris* cast into it, were, however, not his greatest calamities. Besides these, he has to lament the irreparable loss of an invaluable and unique collection of Medical autographs, which he has been collecting for more than forty years, and which were all arranged and labelled. They comprised many thousand specimens, among which were notes or letters (some of great importance) of almost every Medical man of eminence, living or dead, of the present half century. He fears that they have been purloined, for other papers of no consequence, which were in the same cupboard, have been found intact or torn up. He fears his manuscripts have only been too carefully examined, and hints suspicions of two German *confrères* attached to a neighbouring ambulance.

WRITERS ON SCIENCE.

At the recent dinner of the Literary Fund, when the Bishop of Winchester presided, Dr. B. W. Richardson was asked to return thanks for the toast of "The Writers on Science." He said:—

"If you, my Lord Bishop, with so full a measure of choice thoughts and current of eloquent words always at your command, should express yourself embarrassed with so old a toast as "the toast of the evening," what shall I do in responding, on an hour's notice, to a toast so new to me that I doubt if I ever before heard it proposed in a public assembly. As I have sat here listening to the many excellent speeches, and especially to the hearty speech of Sir Henry Anderson, a broken dream of the men classed as writers of science has passed before me. Who are the writers on science? Are they as well known as other great writers? They are not. They are less fortunate, and, therefore, the more worthy of the exceptional honour you would bestow on them. Excuse me a moment or two while I indicate the peculiarities of the position of the writer on science. He is a man communicating to the world that which is, by comparison, new to the world. The poet can cast back for his models to a time when the Greeks had not so much as the figment of an alphabet. The theologian may go back for his lesson to the earliest manifestations of the life of intellect on the planet. The historian finds subject and matter ready for his hand from the oldest and remotest, as well as the newest, writings and traditions of races and peoples. The story-teller is embarrassed with the richness of the past, and troubled by the greed of his admirers for more of his work. These all, indeed, are but the continuing interpreters of things, events, thoughts, which every man who claims to read claims also to understand. The writer on science has none of these advantages; he is but newly born into an old world of thought, and is not simply telling of new wonders, but is often himself learning at the same time as he is instructing an audience unlearned in his knowledge. Thus he comes slowly into the recognised brotherhood of men of letters; at the best he speaks to but a small audience, amuses rarely, excites, sometimes, without intention, hopes that are delusive, and requires always, in order that he may be fairly understood, a degree of patience it is vain to expect from the multitude. To these difficulties others are added belonging to the work he accomplishes. The most original writers on science are destroyed, constantly, by the magnitude and overpowering character of the work they have written, and by the practical results that spring from the work. In other literature the book produced lives as the book, and the learner from it, age after age, must go back to the fountain-head to drink and drink; in science-literature the book sinks into the fact it proclaims, and the fact remains the exclusive master of the field. A striking example of this flashes across my mind at the present moment. Every reading man and woman knows that in the reign of Queen Elizabeth the book of Shakspeare's plays had its origin, and nearly everyone who has read that book (and who has not?) remembers the curious saying in it, 'I'll put a girdle round the world in forty minutes.' But how many are there who have read another great book of that same reign, entitled 'De Magnete,' or are aware that at the time when Shakspeare was writing his now familiar phrases, the author of the book on the magnet, the Queen's Physician, one William Gilbert, when his daily toils of waiting upon the sick were over, was working with his smith in the laboratory at his furnace, needle, and compass, was writing up for the first time the word 'Electricity,' and was actually forging the beginnings of the very instruments that now, in less than forty seconds, put the girdle round the globe? Again, writers on science are lost sometimes in the blaze of their own success. They raise wonder by what they do, and fall beneath it. All knowledge newly born is miracle, but by-and-bye, as the knowledge becomes familiar, the miracle ceases. In this way advances in science become part of our lives, while the men who write them down cease to us. When the Leyden jar was first described, Europe was mentally as well as physically convulsed with the thing; now a Leyden jar is a common object—we all know it; but how few know of Mr. Cuneus, who first described this instrument of science. The whole civilised world is cognizant in this day that communication from one part of the world to the other, by telegraph, is almost child's play; but how many have seen or heard of Mr. Cavallo's original essay on 'Electricity' as a means of communicating intelligence to places distant from each other? There is nothing more

commonplace in our day than to know that a living human being can be placed in gentle sleep, and, while in blissful oblivion, can have performed on him what were once the tortures of the Surgeon's art; but how few have heard or seen Sir Humphry Davy's paper announcing to mankind this grand beneficence. These are some of the difficulties of writers on science; and yet there is another I must name, be it ever so lightly. I refer to the desperate struggles of the man of science who has nothing but science to carry him on in life. None but such as are placed as I am, practising as Physicians in this metropolis of the world, and admitted at the same time, as men of science, into some knowledge of the subject upon which I now speak, can form a conception of the almost hopelessness of the position of the pure scholar in science. On this I say no more. I would awaken, but not weary, your sympathy. Ladies and gentlemen, in speaking of writers on science, you will say, perhaps, I have spoken in sadness. It is not so; much of the difficulty these writers have had to bear I recognise with admiration as their truest glory; and I see that hope for better worldly prospects is near. A profession of science is, no doubt, organising. The world is at last asking men of science to employ themselves in teaching the world; and the teachers, bending to the labour, are, in their turn, willing to suspect that they are but as children, or, at best, youths in the race after knowledge. This is most hopeful; and it is hopeful also to find that men like you, my Lord Bishop, who claim to be the conservators of a knowledge that was matured when science was unborn, are listening now to our scholars with an attentive ear, and are beginning to accept that the Lord of Nature, whether He reveal Himself to the ancient law-giver in the burning bush that was not consumed, or to the modern astronomer in the burning glory of the omnipotent sun, is one and the same Lord. Thus there is hope, I may say certainly, in the future for the literature of science; for its poetry, its parables, its facts, nay, even for its religion. I might bring proof of this belief from many sides. I am content to find it here; that in an assembly so distinguished writers on science should have been so enthusiastically remembered, and my poor attempt at reply so generously received. For both kindnesses from my heart I thank you.

GENERAL CORRESPONDENCE.

CHLORIDE OF ALUMINIUM AS AN ANTISEPTIC.

LETTER FROM DR. A. ERNEST SANSOM.

[To the Editor of the Medical Times and Gazette.]

SIR,—I am sorry that any statements in my book on "The Antiseptic System" have given offence to Mr. John Gamgee. In your correspondent's letter these are cited as comments "on himself and chloralum," from which, and other expressions, it might be inferred that they were calculated to give rise to personal irritation. I am at a loss to discover how it is possible for them to bear such an interpretation; but if they may be so construed, I beg to express my apologies, and to assure Mr. Gamgee that nothing could be farther from my intention.

I have said that chloride of aluminium is not a novel antiseptic application; that experiments have formerly been made with it in this country and in France. It was noted as an antiseptic by Dr. Angus Smith, and its comparative efficacy was investigated when it was mingled with blood and with sewage matters. ("Appendix to Third Report of Cattle Plague Commissioners, 1865," pp. 165, 172, 181; "Disinfectants and Disinfection," Edinburgh, 1869, p. 88, etc.) In France it was employed before 1862. M. Lévy, in his "Traité d'Hygiène" (editions 1862 and 1869), records that the "Compagnie Maritime" of Paris proposed a plan for disinfecting all dead animals which might become centres of putrefaction; the antiseptic agent to be employed was either the chloride of aluminium or perchloride of iron. ("On exploierait pour la conservation le chlorure d'aluminium ou le bichlorure de fer." Lemaire, "De l'Acide Phénique," p. 321.) The animal substances to be disinfecting were soaked in the antiseptic solution, or the latter was injected into the arteries of the dead animals. M. Lévy says:—"My colleagues—Trebachet, Chevallier, Fourvel, Jobert (de Lamballe)—and myself have examined, in the laboratory of Aubervilliers, muscular and other structures, which, after an immersion of six hours in these liquids, had been preserved in a state of remarkable suppleness and freshness." ("Traité d'Hygiène," etc., vol. ii., p. 455.) Surely, in

face of these facts, I could arrive only at the conclusion that chloride of aluminium was not an antiseptic novelty, and it was only just that I should say so.

It can scarcely be urged that I have been unfair to chloride of aluminium when I have distinctly recommended it (in page 203 of my book) as a most efficient agent for the disinfection of sewage in the presence of water—a wide field of usefulness. And as a Surgical antiseptic I have not condemned it, but have said that its position must be as yet *sub judice*. My opportunities of judging concerning it can only be from published records; and I contend that it was impossible for me, from the evidence which I observed, to arrive at any other conclusion than that I expressed. If my statement is "bald," it is because the evidence is not luxuriant.

I am, &c., A. ERNEST SANSOM, M.D.
Duncan-terrace, June 26.

BRITISH MEDICAL ASSOCIATION.

LETTER FROM MR. SAMPSON GAMGEE.

[To the Editor of the Medical Times and Gazette.]

SIR,—I have the honour to request publication of the accompanying correspondence, and to subscribe myself

Yours, &c., SAMPSON GAMGEE.
18, Broad-street, Birmingham, June 26, 1871.

"18, Broad-street, Birmingham,
June 24, 1871.

"William D. Husband, Esq., F.R.C.S., J.P., President of the Council of the British Medical Association.

"My Dear Sir,—The more carefully I consider the notices of motion for the next annual meeting of the Association, published in your name in the *British Medical Journal*, the more deeply am I impressed with the sense of their great importance.

"The laws of the Association are, I believe, twenty-seven in number, and of these no less than twelve are affected, several radically, by your notices or motion. I think our associates might be assisted in forming a correct estimate of the changes you propose to effect, if you deemed it advisable to direct the publication in an early number of the journal of the laws as they are now in force, and as they would be if your notices of motion became law.

"It appears that you propose that the Secretary shall no longer be a member of the Council, or of the Committee of Council, but that such officer shall henceforth reside in London, and devote the whole of his time in the business management of the Association, and of the journal-office. Without venturing to express any opinion on the advisability of effecting such a change, I submit that it is not merely an administrative alteration, but deeply affecting the fundamental principles on which the Association was founded.

"When it was deemed advisable to change the name of our body from the Provincial to the British Medical Association, it was generally felt to be in the interest of the Profession to maintain the independence of the Association from those metropolitan influences which have hitherto centred so powerfully in the Medical corporations, and have militated in favour of the few against the general interest of the great body of Practitioners throughout the country.

"The events of late years have not detracted from the cogency of arguments formerly held to be valid in favour of an independent organisation of the Profession.

"It has been stated that, as at present administered, the British Medical Association has become practically a great joint-stock enterprise for the publication of a weekly journal, which absorbs nearly the whole of the Association's income. Hitherto the independent action of the Secretary, a Medical Practitioner, residing in the provinces, and having a seat on the Council and the Committee of Council, has secured to the great body of Practitioners an official representative not under the control of the journal; but if the Secretary is to be reduced practically to the position of a paid clerk residing in London, and charged with the business management of the journal-office as well as of the Association, he must be subordinate to the editor, or in business matters co-ordinate with him, in authority. The latter alternative would be incompatible with good government, while the former would inevitably lead to such a centralisation of power in the editor of the journal, as to render him practically for the time being the master of the Association.

"I do not observe that you contemplate making any alteration in Law 32, concerning the audit of accounts. Hitherto it has been held, though by no means unanimously, that the independent position of the Secretary and the editor acted to some extent as a check on the financial arrangements. If, however, you purpose to make the Secretary a clerk in great part subordinate to the editor of the journal, an official public auditor of the accounts could scarcely fail to give general satisfaction, the more so since no official denial has been given to the rumour current, on very good authority, that the funds of the Association have lately suffered materially from the action, which I do not attempt to characterise, of one of its subordinate servants.

"The British Medical Association has adopted a policy with the avowed intention of influencing the Legislature in the reform of the Medical Acts. Five of our most distinguished associates amongst the leaders of the Medical Profession in the three kingdoms have recently resigned all connexion with the Association on questions vitally affecting its management. Is it too much to presume that you have taken these facts into full consideration with your colleagues on the Committee of Council, before giving notices of motion to which I refer? If the assumption be correct, is it not reasonable to look to you for a statement of the reasons which have led you, at so critical a period in its history, to propose so extensive organic changes in the management of the Association?

"Since your proposals open up the whole question of the government of our body, it is essential that full opportunity be given for discussion, and I suggest that you give notice of a special meeting during the approaching

annual meeting for the discussion of your notices of motion. I intend forwarding copies of this communication to the Medical journals, but shall not do so before the 27th inst., so that I may transmit with it a copy of any reply with which you may favour me.

"I am, Dear Sir, faithfully yours,
"SAMPSON GAMGEE."

"36, Bootham, York, June 26, 1871.

"My Dear Sir,—The most important alteration in the laws of which I have, at the request of the Committee of Council, given notice in the journal, will only be proposed at Plymouth, if the members agree to the proposal which will be submitted to them, to improve the business working of the Association and journal-office.

"The Committee of Council will fully submit to the Council, and, if the Council approve, to the meeting, the reasons which have induced it to recommend the proposed changes in the working of the Association. These changes can in no way lead, as you fear, to metropolitan or editorial supremacy, as the election of the governing body by the members generally (so vast a proportion of which reside in the provinces) will not be affected.

"The meeting must decide when the discussion on the report of the Council shall take place.

"I had, before receiving your note, taken steps to have the proposed alterations in the laws printed in the journal in a form which renders them more intelligible to the members."

"I am yours very truly, "W. D. HUSBAND.
"Sampson Gamgee, F.R.S. Edin."

"18, Broad-street, Birmingham,
June 26, 1871.

"W. D. Husband, Esq.,

"My Dear Sir,—I lose no time in thanking you for your prompt and courteous acknowledgment of mine of 24th inst.

"I regret that I cannot attach the importance which I generally do to your opinions to the statement that the changes you propose 'can in no way lead to metropolitan or editorial supremacy, as the election of the governing body by the members generally (so vast a proportion of which reside in the provinces) will not be affected.'

"The government of the Association, professedly based on representative principles, has, so far as I am informed, no parallel in any representative assembly or society in the world. The nominally supreme Council has no control over the Association (as a distinguished associate once cogently put it) during a recess of 361 days in the year. Whatever be the theory of our constitution—a most legitimate matter for difference of opinion—the practical effect is scarcely open to question. Take, for instance, the ensuing year, hopefully looked forward to by Medical reformers—who will wield the power of the Association, when its President resides at Plymouth, the President of the Committee at York, the Treasurer at Bath, and the members of the Council be scattered in units over the three kingdoms, while 37, Great Queen-street, or some such central office in the metropolis, will be the head-quarters of the editor, and of his subordinate officer, who will combine the functions of business manager of the journal, and of Secretary of the Association? A fact not to be forgotten is, that no provision is made in the laws, or in the notices of motion, either for a public audit or for substantial security being given, by paid servants, who may have the handling of the whole income of the Association.

"I am happy to think that this discussion is not with yourself personally, for whom I have always entertained most sincere respect. You have confirmed my anticipations, that the notices of motion of the most important alterations of laws have been given at the request of the Committee of Council, and I therefore hold myself at liberty to promote or take part in such measures as may be deemed necessary for bringing to an issue, on public grounds, questions which, however solved, cannot fail to exercise an important influence on the future of the Association, and on the best interests of the Medical Profession.

"According to previous intimation, I forward copies of our correspondence to all the Medical journals.

"I remain, very faithfully yours,
"SAMPSON GAMGEE."

BEAUPERTHUY'S TREATMENT OF LEPROSY.

LETTER FROM DR. DALTON.

[To the Editor of the Medical Times and Gazette.]

SIR,—As the subject of leprosy is occupying some Professional attention in England at present, it may possibly interest some of your readers to know that Dr. Beauperthuy, the discoverer of a new mode of treatment, which has been attended with considerable success, is at present engaged by the government of this colony in carrying out his valuable researches and mode of cure of that hitherto formidable and intractable disease. He is likely to remain here until the middle of next year, and the results of his specific treatment of the patients intrusted to his care will probably be embodied in a report, which, no doubt, will be published. In the meantime it may be as well to describe how he has set about his work.

Before his arrival no serious attempts had been made by the local Medical Practitioners to combat a disease which was generally considered incurable. Here, as elsewhere throughout the West Indies, this loathsome malady was very prevalent, and evidently on the increase.

A certain number of the worst cases were to be found in an asylum about twenty miles from this city, under the charge of a resident superintendent, a visiting Surgeon, and a visiting commissioner. There were usually about 230 inmates, of both sexes and of a great variety of races. Many more lepers, however, were and are at large, and scattered through the colony

Dr. Beauperthuy arrived here on January 6 this year, and on January 12 I accompanied him (as visiting commissioner) to the colonial Leper Asylum to inspect the cases, and to make a selection to be subjected to his treatment. On examination he candidly pronounced the greater part of them hopelessly incurable, but made a careful selection of sixteen cases, naturally the mildest in character, and more likely to prove amenable to his mode of cure. Some of the cases were severe enough to test the efficacy of his mode of treatment. Of the number chosen, eight were East Indian coolies, and the other eight either negroes or mulattos, except one, a Mustee youth. Notes and photographs were taken of these cases before they were removed from the Asylum.

A wooded island, about three-quarters of a mile long and half a mile broad, was partially cleared and fitted with wooden huts for their reception. This island is about forty miles up the river Essequibo, a magnificent stream nearly as large as the river Orinoco, and about thirty miles from Georgetown. The land is low, but has been partially drained, and it is considered healthy. The patients reached this secluded spot about January 18, and Dr. Beauperthuy, having installed himself in a modest wooden cottage, situated on the bank of the river opposite, and having made ready for their reception, commenced his treatment soon afterwards.

On May 2 of this year I visited Kuow Island—the name of the place—in company with Dr. Beauperthuy, who wished me to see the cases. On landing I found the land partially cleared of trees, and about sixteen huts, together with a building for the dispenser, a kitchen, and other wooden edifices in process of building. The huts were small, but well adapted for the purpose. Each hut contained two patients, who each had a mosquito netting over his small bed. The floor was of earth, well rammed, and of course dry. There were, in addition to the single chamber, a sort of antechamber open on the leeward side, and a kind of attic above the apartment, which might serve for a sleeping-place, and was reached by a ladder. The patients had chairs and tables, with books, papers, and games to amuse themselves with, whilst around the huts were plots of ground laid out with provisions and flowers, and occasionally a few fowls were noticed. The Doctor visits his patients daily, and makes minute notes and frequent official reports to the government. The lepers are also visited three times a week by the resident Surgeon of the penal settlement a few miles off, up the river Mazarouni, a tributary of the river Essequibo. He has nothing to do with the treatment of the cases, but merely watches the result, and in company with Dr. Beauperthuy makes his notes and remarks. At the time of my visit there were about twenty-three patients under gratuitous treatment, the expenses being paid by the colony; whilst a few private patients were lodged in a small building close to the Doctor's house.

As I had seen most of the patients before they were subjected to the specific treatment, I was in a position to judge if the results so far were satisfactory. In justice to Dr. Beauperthuy I must admit that, after about three months of his treatment, the change for the better in most of the patients was very striking. Tubercles had in some instances been considerably reduced, if not obliterated, thickening of the skin abated, and blotches disappeared, even in that short time.

It is difficult to describe, but the general aspect of the face and body in particular instances indicated a marked general improvement. The altered and disfigured features were rendered more human-looking. In some cases of ulcerations about the feet of the coolies, there had been little or no improvement. With scarcely an exception the patients were profoundly impressed with the marked benefits of the treatment, and evinced the most unbounded confidence in the Doctor. Indeed, their eagerness and anxiety to undergo the full penalty of the treatment were remarkable. Several of them exhibited with pride long blistered and abraded surfaces where tubercles had once deformed the skin.

This is not the time to enter upon the *rationale* of the treatment, or to attempt to decide the result even in these cases. Dr. Beauperthuy considers himself only in the light of a pioneer in the march of improvement in the treatment of leprosy. He is yet dissatisfied with the means at his command, and is still engaged in more experimental researches on the subject, which he hopes soon to develop. Meanwhile, he has been of use in his generation, and has grappled with a disease which ancients and moderns have equally considered incurable.

I am, &c.,

H. G. DALTON, M.D., F.R.C.S. Eng., F.L.S., etc.
Georgetown, Demerara, June 5.

REPORTS OF SOCIETIES.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, JUNE 7.

Dr. BRAXTON HICKS, F.R.S., President, in the Chair.

THE following gentlemen were elected Fellows of the Society:—F. H. Anderson, M.R.C.S. (Hammersmith); Frank Argles, L.R.C.P. (Wanstead); Alfred Armstrong, M.D. (Lower Norwood); Arthur Beadles, M.R.C.S. (Forest Hill); F. R. Hogg, M.D. (Woolwich); and William McBeath, M.D. (Atherstone).

Mr. C. R. CARTER exhibited a Large Uterine Fibroid Tumour, removed after death from a patient who was known to have suffered from it for forty years. It was eight inches long and six inches broad, and had undergone degeneration and calcification, whilst in its interior were contained about three pints of pus.

Dr. ROUTH said the chief interest of the case was the formation of pus in the fibroid, as purulent disintegration of such a growth was not common.

Mr. SCOTT exhibited two Ovarian Tumours, removed from a patient aged 35. The one, a multilocular cyst of the right ovary, the other a fibroid tumour of the left ovary. The operation had been performed on May 3, and the patient was progressing favourably. The chief points of interest in the case were—the slight adhesions met with, notwithstanding the history of preceding attacks of peritonitis; the co-existence of an ovarian tumour with two pregnancies, both terminating safely; the apparently rapid growth of the fibroid tumour of the left ovary; and the twisted state in which the pedicle of the right ovary was found.

Dr. PHILLIPS expressed a doubt from the appearance of the specimen whether the fibroid growth was strictly ovarian in its origin; and

Mr. SPENCER WELLS believed it to be an outgrowth from the uterus. (Referred to a committee.)

Dr. GREENHALGH exhibited his new Metrometer Sound for measuring any part of the cavity and neck of the uterus from side to side, and from back to front, as well as in its long axis. In shape, length, and termination it closely resembles the ordinary Simpson's sound, and consists of a small canula, through the centre of which runs a movable shaft. To the upper extremity of this shaft are attached two watch-springs, and to its lower extremity a graduated scale fixed by a screw. The instrument being introduced the required distance into the uterus, the screw is then loosened, which permits the escape and divergence of the watch-springs, and these, on being arrested by the uterine walls, register on the graduated shaft the amount of divergence.

Dr. MEADOWS read a paper on Pelvic Hæmatocele, with special reference to its diagnosis and treatment. The author expressed his conviction that this affection, though not common, is not so rare as is generally supposed; nor in many cases is the diagnosis a matter of much difficulty, though in some, and especially in the less severe forms, or when seen long after the attack, the diagnosis is extremely puzzling. Allusion was made to a paper by Dr. Barnes on Intra-peritoneal Hæmorrhage, published in the last number of the St. Thomas's Reports, the author criticising some of the cases in regard to their diagnosis, and expressing some doubt as to their accuracy in this respect, judged solely by the details given. An examination of these cases, in their results, when compared with others of the same kind, collected from the works of MM. Bernutz and Goupil, showed a very startling contrast; for of forty cases of the former, three only died, whereas in sixty-two cases of the latter only eighteen recovered. In regard to diagnosis, the author remarked that the difficulties were greatly lessened in cases where the attendant happened to know the exact condition of the parts before the occurrence of the attack, because, as swelling necessarily results from the hæmorrhage, its absence before the attack, and its immediate discovery afterwards, together with the attendant symptoms, pointed at once to the nature of the case, inasmuch as no other swelling occurs thus suddenly. The differential diagnosis of uterine displacements, of tumours, either of the uterus or ovaries, becoming suddenly impacted in one or other *cul de sac*, of pelvic cellulitis, and of pelvic peritonitis, was dwelt upon at some length, and their distinctive features pointed out. The author recommended the division of the cases into two groups; the first to include all those which originated in the performance

of the functions of menstruation or parturition, and the second those of distinctly organic origin, not connected directly with the uterine functions. He advocated more frequent resort to puncture, grounding his recommendation on the fact that of Bernutz' eighteen cases which recovered, nine were operated upon, seven ruptured spontaneously, and only two were left alone; while out of twelve fatal cases, two only were tapped, one ruptured spontaneously, and nine were left alone. The author related two cases in which he had tapped successfully, and the paper ended with some directions as to the conditions, mode, and time of operating.

Dr. BARNES said that Dr. Meadows doubted his cases because they were so many; but was his experience so exceptional? Olshausen said that in 1867 Scanzoni had only seen two cases, but that he ought to have seen 200. Olshausen himself had seen 34 cases of hæmatocele in 1145 gynecological cases. Seyfert had seen 66 cases out of 1272. In fact, it was only necessary to look for these cases with intelligence in order to find them. He had expressly stated in his paper that some of the cases were no doubt open to criticism as to diagnosis. In some this had been drawn from the history and general symptoms, and was not established by local exploration. He would, however, premise that every one had been seen either in consultation or Hospital practice, and that there was a presumption that the symptoms were severe enough to cause anxiety. The facility of diagnosis depended upon the extent of one's experience. Hæmatocele was most liable to be confounded with pelvic peritonitis. Now, he had been familiar with pelvic peritonitis for thirty years. The history and physical signs of pelvic peritonitis from other causes than effusion of blood into the peritoneum differed materially. Dr. Meadows was astonished that eight of his cases attended abortion. The possibility of this occurrence should not be questioned because others had not yet noticed a similar connexion. Again, Dr. Meadows doubted because so many of his cases recovered. It would have been easy to produce a more convincing mortality if he (Dr. Barnes) had punctured the cysts and given purgatives. In reference to the division of the cases, Dr. Meadows failed to see that his design was simply to illustrate the matter from a clinical point of view, not to classify. He could not accept any responsibility for the freaks of statisticians. Lastly came the question of treatment. He considered it most important not to disturb parts recently the seat of severe injury. Rest was necessary to allow of the conservative process of encapsulation. Puncture was only necessary when urgent symptoms, as of toxæmia, arose. Dr. Meadows, by dealing with the statistics of Bernutz' cases, had come to a conclusion strictly the opposite of that which Bernutz himself had formed. He (Dr. Barnes) very much preferred the deliberate judgment of Bernutz upon his own cases, arrived at by a process of clinical reasoning and comparison, to Dr. Meadows' statistical deduction.

Dr. SNOW BECK said his experience led to the conclusion that retro-uterine hæmatocele was a comparatively rare affection. He did not think that rupture of the gravid uterus, or extra-uterine gestation cysts, or ovarian cysts with large effusion of blood into the peritoneum ought to be included under this term, which was properly restricted to effusions of blood encysted in the pelvic peritoneum, or extravasated into the loose cellular tissue in the pelvis. With these restrictions Dr. Barnes's cases were reduced from fifty-three to three cases of hæmatocele from rupture of diseased ovaries, and eight cases attending abortion, some of which were of a very doubtful nature. When blood became encysted in the pelvic peritoneum or neighbouring cellular tissue, it was desirable to remove it if possible, and to prevent the cyst from refilling. The danger of allowing it to remain was shown by the cyst sometimes bursting into the peritoneum, or the woman being worn out by constant suffering. However, when it formed an inert mass, causing little inconvenience except from its presence, it would not be desirable to interfere with it.

Dr. MADGE, in reply to Dr. Beck, said that, in the case published by him, death did not take place from rupture of the cyst into the peritoneal cavity. There were repeated hæmorrhages from the cyst, the blood passing per rectum, and some of the contents of the hæmatocele seemed to undergo changes of an unhealthy character, which induced a pyæmic condition, the patient dying of exhaustion. He was the first to bring the subject before the Society, his paper on the subject having been read about ten years ago.

Dr. PHILLIPS believed that small effusions of blood into the retro-uterine pouch were of common occurrence. Instances of large effusion extending above the pelvic brim he considered comparatively rare. Excluding those severe cases where the

effused blood resulted from some grave lesion, as the rupture of an extra-uterine foetal cyst, or a gravid uterus, he thought the mortality was not nearly so great as Dr. Meadows implied. There existed but few specimens of retro-uterine hæmatocele in any of the museums. He considered that the peritoneal symptoms described in some monographs on the subject were exaggerated. They were not necessarily very severe, as pure blood did not set up much peritonitis. He stated that in many cases the retro-uterine pouch descended much lower than represented in diagrams, and that the depth in the pelvis to which the effusion extended should not be used as an argument against its intra-peritoneal seat. He asked for some indications to distinguish between a small inflamed ovarian cyst, surrounded by inflammatory adhesions, and a blood effusion. The physical signs in many cases afforded but little assistance, and the preceding history might mislead, as urgent symptoms occasionally supervened suddenly from impaction of an ovarian tumour in the pelvis. Generally, however, an ovarian cyst displaced the uterus more to the opposite side of the pelvis; a hæmatocele pushed it forwards. Probably no one would doubt the advisability of emptying the cyst by puncture if pyæmic symptoms threatened from absorption of putrid contents (which he believed rarely happened if the patients were left alone); but the cases in which tapping was applicable seemed to him to be few. It was certainly not safe to tap before the effusion became encysted, while, at a later period, the serous part had in most cases already undergone absorption, and it was almost useless to puncture the remaining mass. He had seen cases where the blood extended as high as, or above, the umbilicus do perfectly well without Surgical interference.

Dr. GERVIS said it appeared to him that some of Dr. Beck's remarks were founded on a misapprehension of Dr. Barnes's views. Dr. Barnes never asserted that certain symptoms referred to by Dr. Beck were the symptoms of peri-uterine hæmatocele, but that in the cases quoted from his paper there was pelvi-peritonitis plus more or less intra-peritoneal effusion of blood, standing to one another in the relation of cause and effect. Again, Dr. Beck said, if purulent accumulation be present, what will rest do for the patient? whereas Dr. Barnes distinctly stated that the indication for puncture was the presence of irritative fever, pointing to the occurrence of local suppuration. On the general question of the comparative frequency of slight effusions of blood into the peritoneum, he (Dr. Gervis) entirely coincided in the opinions expressed by Dr. Barnes and Dr. Phillips.

Dr. GRAILY HEWITT stated that during the last five years he had observed in University College Hospital altogether, he believed, twelve or fifteen cases. They had all recovered, and in no case had puncture been resorted to.

Dr. TILT remarked that if the German pathologists had found hæmatocele common, the French writers considered it to be very rare. Since he first drew the attention of the British pathologist to hæmatocele in 1853, Dr. Tilt had only met with twelve cases. Pelvi-peritonitis was often mistaken for hæmatocele. The majority of cases required no surgical treatment, but when the collection of blood was considerable, and the tension of the sac very great, he had repeatedly punctured it through the vagina, and allowed the blood to drain away of its own accord, thereby greatly relieving the patient's suffering and shortening the duration of the disease.

Dr. GREENHALGH agreed with Dr. Meadows, that pelvic hæmatocele was by no means so frequent nor so harmless an affection as Dr. Barnes would lead the Profession to believe. On a rough estimate he (Dr. Greenhalgh) did not think that he had seen more than twenty-five indubitable cases of that affection, notwithstanding he had had extensive opportunities of meeting with such cases. He observed that many of the cases of pelvic hæmatocele which had fallen under his notice were of a far graver character than those recorded by Dr. Barnes; three cases having died speedily after the attack, and several others requiring much more treatment than the rest-and-do-nothing system advocated by Dr. Barnes. In three cases puncture and evacuation of the effused blood had been necessitated by the severity of the constitutional symptoms, followed by satisfactory results, and he (Dr. Greenhalgh) had little doubt that, had puncture been had recourse to in some of the other cases, the patients would have made a far more rapid and satisfactory recovery. He inferred that Dr. Meadows attached due importance to rest.

Mr. SPENCER WELLS said his personal experience of pelvic hæmatocele was chiefly as a sequel of ovariectomy. He believed the less severe forms, where only small quantities of blood were effused and afterwards absorbed, were very common. When

the tied or cauterised pedicle was in the pelvis, a good deal of trouble was sometimes observed at each menstrual period for some months, with all the signs of hæmatocele. In the slighter cases he considered rest and opiates constituted the best treatment. But there were other cases where a high temperature, rapid pulse, loss of flesh, dry tongue and skin, with a painful distended abdomen, and scanty concentrated urine, showed that the patients were being poisoned by absorption, and here not only puncture but drainage was necessary to save life. Puncture alone might only give temporary relief, or do harm by hastening decomposition of blood or pus; but when a canula or drainage-tube maintained a free escape for fluid and gas, cases apparently hopeless did well.

The PRESIDENT stated that his experience coincided with those observers who considered slight cases of hæmatocele as of common occurrence.

Dr. MEADOWS said that he had referred to Dr. Barnes's paper, on the ground that, if unchallenged, these cases might hereafter be used for statistical purposes in a way which their real importance did not warrant. Dr. Meadows agreed with the speakers who had preceded him as to the comparative rarity of hæmatocele. He entirely concurred in the value of rest in the treatment of these cases, but thought that the facts which he had brought forward in his paper made it necessary that we should review our practice in this respect, at least in regard to those cases where the quantity of effused blood was more or less considerable. The frequency of spontaneous rupture, either by the vagina or rectum, and the escape of the effused blood, seemed to be nature's method of pointing out the treatment we ought to adopt. He found, moreover, that the period of convalescence was greatly shortened by the tapping or rupture.

OBITUARY.

LIONEL JOHN BEALE, M.R.C.S.

WE have this week to record the death of Lionel John Beale, M.R.C.S., a late Member of the Royal Society of Literature, the Ethnological Society, the Zoological and the Royal Botanical Society, and Medical Officer of Health to St. Martin-in-the-Fields since the establishment of that function in 1856. Born in October, 1796, at Falmouth, Cornwall, he was taken to Jamaica, where his father held an appointment in the dockyard. At the age of 6 he was sent to England, and never again saw his father, who died before he was 40 years of age. Thrown about in the world at various schools—where, as he used to say, he was badly taught and worse fed—he chose the Medical Profession, and in due time became a pupil of Anthony White, Surgeon to the Westminster Hospital, with whom he worked and from whose instruction he acquired the sound judgment he was conspicuous for through life. Medical students in those days picked up knowledge how they could, and attended what lectures they pleased. At Mr. Carpue's he was for some time the only student. In 1815 he passed the College of Surgeons, and in the same year went to Brussels and Paris as Hospital mate with several students (of whom he was the only one who could speak a word of French) to attend the wounded after Waterloo, and the following year brought home several sick soldiers. Soon afterwards he purchased a practice in Burford, Gloucestershire, but, disliking country practice, settled in Bedford-street, Covent-garden. His tastes were literary, and he never desired extensive practice. He soon afterwards removed to Long-acre, where he remained upwards of thirty-five years, and on Friday, June 23, died of debility and failure of brain power, at the age of 74, after an illness of only four days.

In early life he was the friend and executor of Mr. Belsham, the eminent Unitarian minister, whose character and teaching he greatly valued, though he did not belong to that religious sect. The simplicity of his life and the tenderness of his nature made him rather the friend of the poor than of the rich, and amongst the poor he spent the greater part of his energies. He leaves one son, Lionel Smith Beale, M.B., F.R.S., Physician to King's College Hospital, and three daughters.

His published works are—"On Spinal Diseases," published about 1830; "The Laws of Health in relation to Mind and Body," 1851; "Health and Longevity," 1854; "On Personal and Domestic Hygiene," 1855.

Mr. Beale was a man of most pleasing and refined manners; of great acquirements in the subjects of art, language, and ethnology; and of entire liberality and breadth, without a particle of vulgar scepticism. In his Medical works he preferred common sense and experience to the newest refinements

of science as the basis of practice. He made the most of a rational hygiene, and was not fond of too energetic medication. We doubt not but that, had he in early life been more systematically educated in the science of the day, and compelled to keep in the front ranks of the Profession, he would have made himself the position which he had the next gratification of seeing filled by the inheritor of his name.

DR. ROBERT DAUN, DEPUTY INSPECTOR OF HOSPITALS.

Dr. Robert Daun died on the 14th ult. at 6, Picardy-place, Edinburgh. He was born at Inch, Aberdeenshire, on April 16, 1785, and was the eldest son of the clergyman of that parish. He received his early education at the Grammar School of Elgin, and pursued his Medical studies at the University of Aberdeen. He passed his examination in London, and entered the Army, as Assistant-Surgeon, at the age of 19, almost his first service being in India, when he was attached to the 22nd Light Dragoons, and afterwards to the 59th Foot. On his return to England, in 1814, he exchanged into the Scots Greys, and, with them, was present at the battle of Waterloo, and afterwards with the army of occupation in France. He went to India a second time about 1820, and served there for some years, returning finally to Europe in 1825. His great experience in the treatment of cholera caused his selection as Government Inspector, in which capacity he was sent to Sunderland and the other infected districts on the occurrence of the first great epidemic of cholera in 1831 and 1832, for his services on which occasion he received the thanks of Government, and sundry other honorary distinctions. He was frequently called into consultation on cases apparently hopeless, and on two instances, at least, succeeded in restoring the sufferer by the use of saline injections. He then retired into private life, residing successively in London, St. Andrews, Aberdeen, and, latterly, in Edinburgh. In private life his conduct and character were of the most amiable type. His reasoning powers were of a high order, his favourite pursuits being the higher mathematics and theology. He was, we believe, at the time of his death, senior Member of the Royal College of Physicians in London, Fellow of the Royal Society of Edinburgh, and a member of various other learned societies.

DR. HILL, OF PORTOBELLO.

WE regret to record the death of Dr. William Hill, who died at his residence, 1, Union-place, Portobello, on the 10th ultimo. The deceased, who was born on November 1, 1802, in Loanhead, was the son of Mr. David Hill, supervisor of inland revenue. He studied at the University of Edinburgh, and having obtained his qualification from the College of Surgeons, went to Portobello when he was 23 years of age, and commenced practice as a Surgeon. The only other Medical Practitioners there then were Drs. Kerr and Thomson; the death of the former a few years afterwards and the removal of the latter left the whole field open to Dr. Hill. From his genial disposition, obliging manner, and sympathetic feeling for the sufferings of even the poorest of his patients, Dr. Hill very soon won the confidence of the community. On September 30, 1842, Dr. Hill was presented by his friends in Portobello and its vicinity with a valuable gold watch and a purse of forty-five sovereigns, the whole of the money having been collected in penny subscriptions. In 1826 he was appointed Medical Officer to the parochial board of the parish. About fifteen months ago he placed his resignation in the hands of the board, which was accepted with regret, and at that meeting he was granted a retiring allowance of £50 a year during his life. Several other valuable presents were made to him, evincing the high respect in which he was held amongst the townsmen. Dr. Hill was never married. It has been determined to perpetuate the memory of Dr. Hill in a suitable and permanent form, as a mark of the high esteem in which he was held by all classes of the inhabitants of Portobello. A meeting was held in the Town-hall buildings on Monday last for the purpose of considering this.

DR. ALLAN E. MAHOOD.

Allen E. Mahood, M.D. and Surgeon, Glasgow, and L.S.A. Ireland, commenced practice in Dublin in 1832, a year memorable on account of the ravages of cholera in that city. During his unremitting attendance on the sufferers, as Medical Officer of Health for St. Audeon's parish, he twice contracted that disease, and nearly lost his life. Acting on the advice of his friend and master, the late Dr. Graves, he removed to Kingstown in 1844, and established himself as a general

Practitioner. His thorough Medical education and promptitude of action soon won for him the love and esteem of a large circle of patients, which he retained to the period of his death. Although living in the simplest manner, his health gradually became impaired during the last four years from periodical attacks of gout, which for six months had become almost unremitting, and confined him entirely to the house. He died at the age of 66 years, at his residence in Kingstown, on June 24, of gouty dyspepsia, lamented not only by his family and immediate relations, but also by a large circle of friends.

LEGAL INTELLIGENCE.

PUBLIC HEALTH ACT—LOCAL GOVERNMENT ACT—JURISDICTION OF MAGISTRATES—REMEDIES OF PERSONS AGGRIEVED.

THE following is a summary of a case decided very recently by the Court of Queen's Bench upon appeal from a decision of the Ipswich bench of magistrates—Cook (appellant) v. the Ipswich Local Board of Health (respondents):—

The Section 69 of the Public Health Act, 1848, after empowering the local board to give notice to the owners or occupiers of premises in streets not sewered, etc., to their satisfaction, requiring them to sewer, etc., the same, and, on the default of the owners and occupiers, to execute the works themselves, proceeds to enact as follows:—"And the expenses incurred by them in so doing shall be paid by the owners in default, according to the frontage of their respective premises, and in such proportion as shall be settled by the surveyor, or, in case of dispute, as shall be settled by arbitration (having regard to all the circumstances of the case) in the manner provided by this Act, and such expenses may be recovered from the last-mentioned owner in a summary manner."

Section 64 of the Local Government Act, 1858, provides that "all questions referable to arbitration under the Public Health Act, 1848, may, when the amount in dispute is less than £20, be determined by two justices in a summary manner." Held, that the justices are not empowered to inquire into the question of the actual expenditure by the board, either as arbitrators under the latter Act or as the justices to enforce the payment; that their duty in this respect is simply ministerial, and not judicial, the remedy of a person aggrieved being by addressing a memorial to the Secretary of State, as provided by 11 and 12 Vict., c. 63, s. 120, and 21 and 22 Vict., c. 98, s. 65.

The justices cannot take upon themselves the double capacity of arbitrators to settle the disputed proportion and of justices to make the order for enforcing payment. The 24 and 25 Vict., c. 61, s. 16, requiring the deposit of the plans, etc., in the office of the local board, is directory merely, and the remedy of any person aggrieved by the non-compliance is by addressing a memorial to the Secretary of State.

However dry and uninteresting such legal details may be to the general reader, it is very desirable that both the local commissioners, the magistrates, and the owners of property should understand their respective duties and liabilities before rushing headlong into law, alike disastrous to the public weal and to private interests. Costs must be paid by one party or the other, or by both.

AN UNQUALIFIED PRACTITIONER.

On Tuesday evening Dr. Hardwicke concluded an adjourned inquest at the "College Arms," Camden Town, on the body of Theodore Gordon Rowe, aged 17, a clerk to Mr. Herbert Clarke, the coal merchant.

It appears that the mother of the deceased, soon after he was taken ill, went to Mr. Halket, herbalist, of High-street, Camden-town, and he gave her a draught, the tincture of "podophyllum," for the deceased, which he took. The mother also paid Mr. Halket half-a-crown for a visit. After taking more medicine deceased vomited blood, and passed blood in his urine, and died about ten minutes after.

Mr. Halket admitted that he was not a qualified Medical Practitioner, but said he vended vegetable medicines. He sent to the deceased two mixtures; the first was a fever medicine, and the second a purgative containing two drachms of podophyllum, and two drachms of tincture of senna, made up in an eight-ounce bottle, one-eighth of a drachm being taken as a dose. He had known of much larger quantities of podophyllum being taken. Mr. Halket did not improve his position by further stating, in reply to the jury, that he was a chemist, and

a member of the Medical Reform Society. He had often visited patients who were his customers, and in this instance did so at the request of deceased's mother.

Mr. William Turnbull, M.R.C.S., 257, Hampstead-road, was called in after the death by Mr. Halket to see the body, and was of opinion that the deceased had died from malignant scarlet or typhus fever. A post-mortem examination confirmed that opinion. He certainly should not have given such a medicine as "podophyllum," and thought if a qualified Practitioner had been called in deceased might have survived. Deceased might probably have died from the effects of the disease, but he considered the mixture containing the podophyllum accelerated the death.

The following verdict was returned:—"That the death of the deceased was caused by blood-poisoning from scarlet or typhus fever, and that such death was accelerated by unskilful treatment." The jury also censured Mr. Halket for putting in his shop-window a notice that he might be consulted.

MEDICAL NEWS.

UNIVERSITY OF DUBLIN.—At the Summer Commencements, held on Wednesday, June 28, in the Examination Hall of Trinity College, the following Licences and Degrees in Medicine and Surgery were conferred by the Right Hon. Sir Joseph Napier, Bart., LL.D., Vice-Chancellor of the University:—

<i>Licentiates in Medicine.</i>	
Browne, Thomas John.	Purefoy, Richard Dancer.
<i>Licentiate in Surgery.</i>	
Purefoy, Richard Dancer.	
<i>Bachelors in Medicine.</i>	
Per cent.	Per cent.
1. O'Connor, Jacob ... 84	11. Moorhead, Thos. Hamilton 64
2. Rogers, John G. ... 79	12. Armstrong, James ... 62
3. Kennedy, David ... 77	13. Comyn, Henry ... 56
4. { Drapes, Thomas ... 72	14. Dobson, Andrew F. ... 54
{ Molony, Patrick J. ... 72	{ White, Richard D. ... 52
5. { Worthington, Thomas B. 71	15. { Gibson, George ... 52
{ Whittaker, William M. ... 71	{ Browne, Thomas J. ... 52
6. { Quill, Richard ... 71	18. Elliott, Christopher ... 50
{ Tweedy, Henry J. ... 68	19. Browne, Otway P. ... 49
9. Blunden, Maurice ... 66	20. Waugh, John ... 47
<i>Masters in Surgery.</i>	
Per cent.	Per cent.
1. Molony, Patrick J. ... 74	6. Courtenay, Edward M. ... 51

<i>Doctors in Medicine.</i>	
Collins, Edward Wolfenden.	Todhunter, John.
Moore, John William.	Tomkins, Arthur Wellesley.
Morgan, John.	Yeo, Gerald Francis.

Previous Examination in Medicine.—The following candidates, having passed in all the subjects, have been recommended as entitled to compete for the Medical Scholarships founded by the Board of Trinity College:—

Per cent.	Per cent.
1. Clarke, Andrew ... 86½	5. Tuthill, Phineas B. ... 50
2. Pearce, George A. ... 73	6. McNeill, John P. ... 47½
3. Cooper, Charles A. ... 54½	7. Bluett, George A. ... 45½
4. Fleetwood, Thomas F. ... 53	

The Medical Travelling Prize, value £50, has been awarded to Mr. Jacob O'Connor.

At the same time Mr. Charles Lever, the eminent novelist, received the degree of LL.D., *honoris causa*. Mr. Lever graduated in Medicine in 1831, in which year he had conferred on him the degree of Bachelor in Medicine of the University.

APOTHECARIES' HALL.—The following gentleman passed his Examination in the Science and Practice of Medicine, and received his Certificate to practise, on Thursday, June 22, 1871:—

Ellis, Edward Thomas Charles, Bexley-heath, Kent.

As Assistants in Compounding and Dispensing Medicines:—

Dunn, Henry, Shipley, near Leeds.
Tomlin, Albert Roberts, Barnsley.
Williams, Jabez Vivian, St. Ives, Cornwall.

APPOINTMENTS.

* * * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new appointments that take place.

DARCH, Mr. AUGUSTUS.—Dispenser to the Lambeth Dispensary.
DRYSDALE, Dr. C. R.—Physician to the Metropolitan Free Hospital, *vice* James Jones, M.D. Univ. Lond., M.R.C.P. Lond., deceased.

DUDLEY, Dr. J. G.—Physician to the Metropolitan Free Hospital, *vice* Dr. W. Lomas, resigned.

LEE, SAMUEL EDWARD, M.R.C.S., etc. (of the West London Hospital).—House-Surgeon and Apothecary to the Leicester Infirmary.

TORRY, Dr. J. COOPER.—Assistant-Physician to the Metropolitan Free Hospital, *vice* Dr. C. R. Drysdale, appointed Physician; also as Physician to the Infirmary for Consumption and Diseases of the Chest, Margaret-street, Cavendish-square, *vice* Dr. James Jones, deceased.

NAVAL AND MILITARY APPOINTMENTS.

John Black Nicoll, M.D., has been promoted to the rank of Surgeon in H.M.'s Fleet, with seniority of May 15, 1871 (confirming a commission given by Vice-Admiral Edward G. Fanshawe, C.B., Commander-in-Chief of H.M.'s Ships and Vessels on the North-American and West-Indian Station, *vice* Martin, deceased).

1ST REGT. OF LIFE GUARDS.—Surgeon Owen William George, M.D., having completed twenty years' full-pay service, to be Surgeon-Major, under the provisions of the Royal Warrant of December 27, 1870.

102ND FOOT.—Staff Assistant-Surgeon Edward Litton Low, M.B., to be Assistant-Surgeon, *vice* William James Tyrrell, who exchanges.

BIRTHS.

COLLINS.—On June 26, at Euston-place, Leamington, the wife of Dr. C. P. Collins of a daughter.

FYFE.—On June 18, at 42, Montpelier-square, the wife of Andrew Fyfe, M.D., of a daughter.

PRICHARD.—On June 22, at Wonastow Court, near Monmouth, the wife of W. G. Prichard, M.D., late of H.E.I.C.S., Madras, of a daughter.

TUKE.—On June 22, at the Manor House, Chiswick, the wife of Harrington Tuke, M.D., of a daughter.

MARRIAGES.

DYER—COLES.—On June 27, at Holy Trinity Church, Weston-super-Mare, Arthur Edwin Dyer, to Jessie Louisa, youngest daughter of the late James Coles, F.R.C.S.

HARDY—WILL.—On June 21, at St. Andrew's Church, Aberdeen, George Simpson Hardy, Esq., Ramsey Hall, Essex, eldest son of James Hardy, Esq., of Jacques Hall, Essex, to Mary Christian, second daughter of James Will, M.D., Aberdeen.

HIRSCH—COLQUHOUN.—On June 27, at Glasgow, Samuel Hirsch, Esq., merchant, Nottingham, to Mary, youngest daughter of Hugh Colquhoun, M.D., The Anchorage, Bothwell.

PARTRIDGE—SMITH.—On June 22, at St. Paul's, Onslow-square, South Kensington, Henry Francis Partridge, to Mary, eldest daughter of Robert Smith, M.R.C.S., of Kensington.

TAIT—STEWART.—On June 28, at All Saints', Wakefield, Lawson Tait, F.R.C.S. Edin. and Eng., of Waterloo-street, Birmingham, to Sybil Anne, eldest surviving daughter of William Stewart, Esq., of York House, Wakefield.

WALKER—HETHERINGTON.—On June 22, at Christ Church, Bootle, George Charles Walker, M.D., Stanley-road, to Louisa Ann, eldest daughter of Walter F. S. Hetherington, Esq., Sandon House, Merton-road, Bootle.

WALLIS—PRITCHETT.—On June 24, at Bromley St. Leonard, Middlesex, Percy, second son of the late William Wallis, to Alice, younger daughter of the late Charles Pritchett, M.R.C.S., etc.

WILSON—POWYS.—On June 22, at St. Paul's Church, Dorking, Surrey, James Arthur Wilson, M.D., of Rose-hill, Dorking, to Eleanor Powys, second daughter of the late Hon. and Rev. Littleton Powys, rector Titchmarsh, Northamptonshire.

DEATHS.

ASBURY, JACOB VALE, M.R.C.S., L.S.A., at his residence, Enfield, on June 21, in his 80th year.

BEALE, LIONEL JOHN, M.R.C.S., at 108, Long-acre, on June 23, aged 74.

DUNDAS, ROBERT, M.D., formerly Assistant-Surgeon in H.M.'s 60th Regt., for many years Physician in the British Hospital at Bahia, and afterwards Physician to the Northern Hospital, Liverpool, at his residence, 14, Gloucester-place, Hyde-park, on June 25, deeply regretted by his numerous friends.

IRVINE, ALASTAIR, eldest son of W. S. Irvine, M.D., at Craigatin, Pitlochry, on June 20, aged 19.

MACEGAN, B. C., M.R.C.S.E., Surgeon *City of Durham* steamer, Inman Line, by drowning at Halifax, Nova Scotia, on May 29.

PECHEY, WILLIAM CRISP, M.D., at West Grove House, Walthamstow, on June 22, aged 32.

SMITH, MARIA, widow of the late J. Smith, M.R.C.S., of Wheatley, Oxon, at Eton, on June 23, aged 77.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.

BROADMOOR CRIMINAL LUNATIC ASYLUM.—Assistant Medical Officer; must be legally qualified in Medicine and Surgery. Applications to the Superintendent, on or before July 5.

GUISBOROUGH UNION.—Medical Officer; must be duly qualified according to the General Orders of the Poor-law Board. Applications, with diplomas and testimonials, to William Weatherill, Clerk, on or before July 10.

HOLSWORTHY UNION, DEVON.—Medical Officer. Applications, with testimonials, to be sent to George Braund, Clerk, on or before July 4.

HOSPITAL FOR SICK CHILDREN, 49, GREAT ORMOND-STREET.—Assistant-Physician; candidates must be Fellows or Members of the Royal College of Physicians of London. Applications and testimonials to be sent in on or before Wednesday, July 19.

Huddersfield Infirmary.—Physician; must be a Graduate in Medicine of one of the Universities of the United Kingdom, or a Fellow or Member of one of the Colleges of Physicians, and be duly registered. Applications and testimonials to John Marsden, Esq., Hon. Sec., on or before July 28.

Infirmary for Consumption and Diseases of the Chest, 26, Margaret-street, Cavendish-square.—Visiting-Physician. Candidates must be Members of the Royal College of Physicians, London. Testimonials to be forwarded on or before July 10.

Leeds Public Dispensary.—Junior Resident Medical Officer. Candidates must be unmarried, and possess at least one legal qualification. Applications, with testimonials, to be sent to Mr. John Horsfall, 31, Albion-street, Leeds, on or before July 15.

Metropolitan Free Hospital, Devonshire-square, City.—Assistant-Physician. Candidates must be Members of the Royal College of Physicians of England, or pledged to become such within twelve months if elected. Applications, with testimonials, diplomas, etc., to the Committee, on or before July 10.

Middlesex Hospital Medical College.—Lecturer on Physiology. Applications to the Dean on or before July 22.

Parish of Great Yarmouth.—Medical Officer for the North District; must be registered under the Medical Act, and possess the qualifications prescribed by the Order of the Poor-law Board. Applications, with testimonials, to John L. Cufaude, Clerk, on or before Monday, July 10.

St. Mary's Hospital Medical School.—Medical Tutor and Pathologist. Applications and testimonials to be sent to Dr. Cheadle, the Dean of the Medical School, on or before Monday, July 3.

St. Thomas's Hospital.—Resident Assistant Physician. Candidates must be Members of the Royal College of Physicians, or Medical Graduates of a University of the United Kingdom, not less than 25 years of age. Applications to the Treasurer, at the Office, 13, St. Thomas's-street, S.E.

POOR-LAW MEDICAL SERVICE.

** The area of each district is stated in acres. The population is computed according to the census of 1861.

RESIGNATIONS.

Bridgnorth Union.—Mr. William Thursfield has resigned the Third District; area, 26,591; population, 6501; salary £77 per annum. Also the Workhouse; salary, £20 per annum. Dr. Thursfield has resigned the Fourth District; area, 10,192; population, 4550; salary, £40 per annum.

Hunslet Union.—The Templenewsam District is vacant; salary £15 per annum.

APPOINTMENTS.

Banbury Union.—Frederick W. Fowke, L.R.C.P. Edin., M.R.C.S. Eng., L.S.A., to the Chipping Warden District.

Bicester Union.—William Drinkwater, M.R.C.S. Eng., L.S.A., L.R.C.P. Edin., to the Bicester District and the Workhouse.

Dolgelley Union.—Edward Jones, M.D. St. And., M.R.C.S. Eng., to the Dolgelley District.

Gateshead Union.—Philip Brown, M.D. King's Coll. Aber., L.S.A., to the Ryton District.

MESSRS. H. ADRIAN, H. Durham, G. Martineau, and G. Neison have been elected Fellows of the Chemical Society.

SIR JOHN PAKINGTON will preside at the Social Science Congress at Leeds on October 4.

THE National Hospital for Consumption, Ventnor, has now extended its benefits to women patients.

DR. R. H. LLOYD, of London, has been appointed House-Surgeon to Salford Dispensary, in room of Dr. Veitsch, resigned.

MESSRS. N. M. ROTHSCHILD AND SONS have sent a donation of £200, and P. Hambro, Esq., £25, to the St. George's Hospital.

DR. BARRINGER, Surgeon of St. George's Lodge of Odd Fellows, Clerkenwell, has been presented with an elegant silver inkstand, as a recognition of his meritorious services to the Lodge.

THE attaching naval Medical officers to Netley for a course of instruction prior to their appointment to either ships or Hospitals, has been found to work so satisfactorily that it is likely to be repeated next year.

THE Professor of Chemistry at the Conservatoire des Arts et Metiers, M. Payen, died suddenly of apoplexy, in the 76th year of his age, having been a member of the Academy for twenty-nine years.

MR. JOHN FREELAND, of Nice, has, in addition to former large donations to the scientific and charitable institutions of his native city—Glasgow—just given the following handsome donations:—To the University of Glasgow, £3000; Anderson's University, £5000; Royal Infirmary, £5000.

DR. ALEXANDER CAMPBELL has been appointed Attending Surgeon to the Royal Infirmary, Dundee. He is the son of Mr. Campbell, of Blairton, who was Assistant-Physician at the Aberdeen Royal Infirmary.

THE following have been elected honorary members of Cambridge Philosophical Society:—Sir B. C. Brodie, Dr. W. B. Carpenter, Professor Huxley, Professor Bartholomew Price, Professor Argelander (Bonn), Professor Clebsch (Göttingen), Professor Des Cloiseaux (Paris), Professor Helmholtz (Berlin), Professor Wohler (Göttingen).

THE Select Committee on Baby-farming closed the evidence on Monday, and the next meeting of the Committee will be held on Thursday week, for the consideration of their report.

At a public meeting at Brighton, held last week, it was unanimously resolved to raise a sum of not less than £1500 to defray expenses for receiving worthily the British Association in 1872.

AN important addition has just been made to the Worcester County and City Lunatic Asylum by the erection of a new ward for the reception of 134 male patients. The entire establishment will now accommodate between 700 and 800 patients.

At the Westminster Police-court, last week, a woman named Allen was fined £5 for having let a room in which a person had been suffering from the small-pox, without having previously disinfected the apartment. In default the defendant was sent to prison for six weeks.

At Bridgwater Sessions, on Saturday, Mr. Bovett, a veterinary Surgeon, and Mr. Roberts, a coach-builder, were each fined £5 for contempt of court, in disobeying summonses requiring them to produce their children before a magistrate, when charged with breaches of the Vaccination Act.

THE College of Physical Science at Newcastle advances. Upwards of £22,000 has been subscribed towards the £35,000 which it is estimated will be required. The appointment of the professors was to be made yesterday. The North of England Institute of Mining Engineers have placed their hall at the disposal of the new College. At present it is proposed to open the College on October 7.

WITHIN the last few days, a ship from Shanghai arrived in the docks with 5000 chests of spurious tea. The City Commissioners of Sewers, finding the law powerless to reach those who offer this compound for sale, have laid the matter before the President of the Board of Trade, suggesting that the Customs officials be empowered to seize and destroy all spurious tea on the production of a certificate that it is unfit for human food.

THE Children's Hospital, Brighton, has just been removed from the temporary premises in the Western-road to the new establishment in Dyke-road, Church-hill, formerly known as Church-hill School, and more recently as Dr. Foreman's private asylum, which has been purchased by the governors for its present purpose. Every attention has been paid to rendering the establishment in every way worthy of the benevolent purpose to which it is intended, and to fit it to become, what it worthily may, a country Hospital for Sick Children.

THE report of the directors of the "Metropolitan Association for Improving Dwellings" states that the deaths upon the entire property of the Association had this year been sixty-six, out of an average population of 3934, of which forty-one were children under 10 years of age. The average rate of mortality in the eleven separate buildings of the Association had been under 17 per 1000, while that of the metropolis generally had been 24 per 1000.

IN an action against a chemist and druggist, carrying on business in Devonshire-street, Sheffield, for damages alleged to have been sustained through the administration of improper medicine, it appeared the plaintiff was passing along the street, when the defendant, who was near his shop door, asked him how he was. Plaintiff replied that he was not very well, upon which the defendant recommended him to have a pennyworth of his pills. He took the pills, as advised, but received no benefit from them. Afterwards, the defendant sold him a box of mercurial pills, instructing him to take six per day. This he did for three days, and on the fourth he took the remaining two. He then was taken very ill while at work. He became very weak; his tongue was swollen, his teeth loose, and salivation set in. Mr. Harrison, Surgeon, then attended him for nearly a fortnight, and gave it as his opinion that his illness was the effect of extreme salivation. His Honour said that the law now was, that every person who held himself out as following any skilful employment was bound to bring to the exercise of it a reasonable amount of skill. This applied to Medical men, but not to chemists and druggists, who were simply sellers of drugs. If a man would be so great a fool as to go to a chemist, and take any pills that he might give him, it was his own fault. The matter having been argued at some length, his Honour decided that there was no case for the jury, so that, unless the plaintiff elected to be non-suited, he should direct the jury to find a verdict for the defendant. The

plaintiff preferred a verdict for the defendant, in order that he might be in a position to appeal. Verdict accordingly.

BRITISH MEDICAL BENEVOLENT FUND.—At the usual monthly meeting, held on Tuesday last at 11, New Burlington-street, grants to the amount of £90 were made to nine applicants for assistance, and an annuity of £10 was voted to a disabled member of the Profession, to qualify him for a vacant residence at Providence-place. A warm vote of thanks was passed to Dr. Gull, for an additional and liberal donation of £50 to the funds of the charity.

THE HORTON HOSPITAL, BANBURY.—This Hospital, now completed, was commenced in June, 1869, by the late Miss Horton, of Highbury, London, and was intended by her to be a gift to the town of Banbury. Her death, in July, 1869, caused a stoppage of the works for some months. They were, however, resumed in February, 1870, by her great-nephew, Mr. J. H. Horton, and have cost upwards of £6000.

SMALL-POX IN ECCLES.—At the monthly meeting of the Barton, Warton, Monton, and Eccles Local Board, held on Monday, the clerk reported that the guardians of the Barton-on-Irwell Union, having declined to allow the use of their Hospital for the small-pox patients of the district, the board had printed and published directions to the inhabitants for the prevention of the epidemic, also offering a free gift of disinfectants for infected places, and for nuisances generally, and that these had been largely applied, and generally used with good effect. The General Purposes Committee had appointed Mr. E. Roe, the Medical officer, to attend the small-pox cases, and also an assistant inspector to aid in the use of disinfectants. The disease had spread from the street where it first broke out to other parts of the hamlet. There had been sixteen deaths since the last meeting. Young and old had alike fallen victims to it. In three cases the board had felt it necessary to order the interments the day following the death.

SMALL-POX has appeared in one of the poorer districts of Halifax, and several cases of typhoid fever have occurred.

At the meeting on Monday of the Parochial Sanitary Committee of St. Pancras, attention was called to the practice of patients being discharged from the Small-pox Hospital at Hampstead before they were well, and left to find their way home in any way they could. Omnibuses and cabs refused to take them, and those who had homes to go to had to reach them by dragging themselves along the road while they could scarcely walk. The chairman said when a patient was discharged from a Hospital the responsibilities of the Hospital authorities ceased.

FACTORY INSPECTION.—The physical degeneration of our factory population—including all trades carried on upon a large scale—is one of the questions incidentally raised by Mr. Baker in his last half-yearly report to the Home Office. He is anxious to give us a timely warning that a certain degree of physical deterioration is observable amongst our working-classes. In dealing with what he terms the vexed question of certifying Surgeons, he asks whether there are such evidences of sanitary improvement in workshops as will enable us to say with confidence that every danger to the physique of the workers has been removed. He then instances the absorption of lead, of arsenical gases, or other forms of inhalation of this mineral; of the dangerous nature to life of various dusts, and of the almost equally evil effects of overcrowding in ill-ventilated workshops. In the case of children, also, there is a constant disposition on the part of improvident parents to get them to work before the legal age, by means of a Surgeon's certificate fraudulently obtained. Without going into details, it may be admitted that all these are evils requiring as much as ever active and intelligent supervision for their detection.

MEDICAL EDUCATION AT BERLIN.—Professor Gairdner has recently delivered two lectures at the University of Glasgow, entitled "Recollections of a recent Visit to Berlin, with special reference to the methods pursued in teaching clinical Medicine, etc." In his first lecture Dr. Gairdner gave an account in considerable detail of what he had witnessed in the clinical wards of Professor Traube, who conducts with great efficiency and success the "Pro-paedeutische," or elementary clinical instruction at the Charité Hospital. In his second lecture he spoke of the production, as a rule, of Medical Students, "who begin upon a higher platform than ours, trained even in the gymnasia and *Real-schaber* into habits of accurate thought, and informed, not only with several languages, ancient and modern, but with something more than the rudiments of those sciences on which all Medical education has to be grounded. From all I could see around me in Berlin, from the exact and scientific spirit in which every kind of Medical inquiry is pursued, from the

evident care for scientific training in the universities, from the facilities given to researches in the anatomical, physiological, chemical, and pathological departments, under the direction of the various Professors, with the aid of liberal grants for rooms, apparatus, and materials, I came away convinced that Medical science and scientific training, which are, unhappily, in danger of being starved in England and Scotland, thereby cutting away from the practical departments the staff on which they ought to lean, are fostered in the German Universities as the very life and light of the Medical art."

TELEGRAMS from Buenos Ayres, *viâ* Lisbon, state that the epidemic of yellow fever had disappeared.

WE learn by the last West Indian mail that meetings had been held in Chili to discuss the question "Is cattle disease transmissible to the human species through the digestive organs?" The Chilian Medical Faculty had advised carefully abstaining from eating the flesh and drinking the unboiled milk of infected cattle.

A CASE of snake poisoning is recorded in the *Australian Medical Journal*, which terminated fatally, in spite of repeated injections of ammonia into the veins, after the plan of Professor Halford. After the first injection there was some improvement, but the patient soon relapsed. A second injection produced less effect, and a third and fourth none. The treatment was carefully carried out by Drs. W. Scott and Thomas Wyly. The patient, who retained his faculties to the last, and presented the usual symptoms, died about twenty-four hours after being bitten, and twelve after the commencement of the ammonia treatment.

WE are glad to be able to again record the success of Professor Halford's treatment of snake-bite by injection of ammonia into the veins. In Tasmania, a woman, having been bitten six hours previously, was insensible, cold, and apparently sinking. Dr. Appleyard injected thirty drops of liq. ammonia, B.P., sp. gr. 959, into a vein of the arm. The effect was magical—she roused up directly, and very soon afterwards was perfectly recovered. Again, a man was bitten the other day at Schnapper Point, and when the Doctor arrived, one hour and a half after the bite, the man was perfectly insensible, the limbs paralysed, the pupils of the eyes dilated, the countenance dusky, and the skin covered with a profuse clammy perspiration. Within twenty seconds of Dr. Dimock injecting the ammonia into a vein of the arm, the man jumped suddenly up, as if electrified, and stared about him; his pupils began to act, and his skin to get warm, and in two hours he was removed home. Dr. Dimock has since expressed himself as follows:—"I have no hesitation in saying that the preservation of this man's life was entirely owing to the ammoniacal injection."

THE TRANSLATION OF THE STRASBURG UNIVERSITY.—The project of translating this University to Lyons, which is so anxiously desired by the Medical Profession of that city, is likely to be strongly opposed in the Chambers. A Bill has been brought in for conferring this boon on Nancy, which has already an imperfectly constituted university body; for it is argued that it would be an act of great injustice to remove such a body from the eastern portion of France, where it is so much wanted. At Nancy the University will be able to perform the same useful function which Strasburg executed so well, of acting as a bond of union between French science and German science, "so remarkable during the last thirty years for its initiative spirit, its progress, and its discoveries." It will there stand face to face with the celebrated Heidelberg, and the new German University at Strasburg, while it will furnish a living source whence the youth of Alsace and Lorraine, of Metz, Strasburg, Colmar, and Mulhouse may derive renewed inspirations of love for its French fatherland.

A PHYSICIAN, passing by a stonemason's, called out to him, "Good morning, Mr. Wilson. Hard at work, I see. You finish your gravestones as far as 'In memory of,' and then you wait—I suppose, to see who wants a monument next." "Why, yes," replied the mason, resting for a moment on his mallet, "unless somebody's ill, and you are doctoring him, and then I keep right on."

NOTES, QUERIES, AND REPLIES.

Be that questioneth much shall learn much.—Bacon.

J. W. will oblige by forwarding the information he is possessed of.
R. T. should make his request to the Secretary of the College.

Dr. P. S., Bath.—The printer would be greatly obliged if you would write on paper of uniform size, and on one side only.

A Subscriber for Twenty-nine Years.—It is matter of arrangement, but usually the costs are paid equally by the parties to the covenant.

An Old Pupil of Dr. Ryan's.—It is true that Dr. Ryan published a "Manual of Midwifery," which possessed considerable merit. The other work referred to was not written by him.

Mr. Jones.—The result of the Arts examination at the Whittington Club cannot be known for some weeks.

CHLORIDE OF AMMONIUM IN PNEUMONIA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In reply to the letter of "Tenax" in this day's *Medical Times and Gazette*, I may state that I have used chloride of ammonium with success in a large number of cases of pneumonia, in which, from great depression of the vital forces or for other reasons, the ordinary active practice in vogue a quarter of a century ago seemed inexpedient.

A reference to my mode of using it will be found in the chapter on "pneumonia" in my "Practical Treatise on the Diseases of Advanced Life," published in 1848. I am, &c. GEORGE E. DAY, M.D.
Andersey, June 24.

An Indian Surgeon, Cheltenham.—You cannot be allowed to vote at the election on Thursday next, not having been admitted a Fellow. The dinner takes place the same day, to which you will be admissible. Mr. H. D. Carden, of Worcester, will preside. Write at once to Mr. T. Carr Jackson, the Honorary Secretary, 3, Weymouth-street, W.

A Provincial Fellow.—At the last meeting of Fellows for election into the Council, 234 voted, about seventy less than the previous year; on that occasion Mr Spencer Wells had eighty votes recorded in his favour, with nine plumpers. The proceedings commence at two o'clock. To vote you should attend early, with your friend, who will be allowed to vote, notwithstanding he has not received any notice from the College, the fault resting with himself for not furnishing the Secretary with his address.

CONTRIBUTIONS TO MEDICAL LITERARY HISTORY.

(From the Brit. and For. Med. Chir. Review.)

Διαβήτης, a siphon; hence the disease diabetes, because "the fluid does not remain in the body, but uses the man's body as [a siphon] whereby to leave it." (a) The disease received various other names, all more or less referring to its most prominent symptoms, as far as they had been observed by the old Physicians—e.g., from the excessive thirst of the patient it was called δίψακος, (b) and from the great flow of urine ὕδρος (or ὑδρῶν) εἰς ἀμίδα, *urinal dropsy*, and διάρροια εἰς οὐρα, *urine diarrhoea*. (c) The word was adopted by the Arabic Physicians, and written *diābētis*. (d) The disease was probably rare in old times, for it is not noticed at all in the Hippocratic collection, and Galen says that he had only met with two cases in his own practice. (e) It is not therefore remarkable that its special peculiarity—viz., the saccharine quality of the urine—should have escaped detection (at least in Europe) until the time of Willis, who says that, in the seventeenth century, when there was much drinking of undiluted wine (*vinum meracius*), cases of diabetes were of very frequent occurrence. (f) He then goes on to mention (as if he were the first, or almost the first, to make the observation) (g) that the urine of diabetic patients had a wonderfully sweet taste, as if imbued with honey or sugar. This fact has never since been lost sight of; and it was no doubt in consequence of its having been first prominently brought before the public by Willis that this species of diabetes was at first called "diabetes Anglicus." Probably, however, it is not generally known that among the Hindus, several hundred years before Willis's time, it had been distinctly mentioned (and not at all as if there were anything new in the statement) that the urine occasionally assumed a saccharine character, and the serious nature of the disease in which this occurs had also been pointed out. The words of Susruta (who cannot have lived later than the ninth or tenth century of our era, and who probably lived in the fifth or sixth (h), are as follows:—"Mellita urina laborantem quem medicus indicat, ille etiam incurabilis dictus est. . . . Omnes urinales affectiones tempore incurabiles fiunt; ad mellitum urinae statum perveniunt, et tunc insanabiles fiunt." (i) This passage is, of course, very fragmentary and incomplete, but it is worthy of being brought forward (almost for the first time), and perhaps of being noticed in all future historical accounts of the disease.

(a) Aretæus, "Caus. Morb. Chron.," ii., 2, p. 97, l. 7, ed. Adams. In the text Adams has retained the common reading διαβάθη, a ship's ladder, which hardly makes sense; but in the notes to his translation (p. 339) he proposes to read διαβήτη, a siphon, a conjecture which has been adopted above.

(b) Galen, "De Loecis Affect.," vi., 3, tom. viii., p. 394, l. 12; Alexander Trall., ix., 8, p. 552, l. 29, ed. Basil; Paulus Ægin., iii., 45, p. 47, l. 46, ed. Ald.

(c) Alexander Trall., *ibid.*; Galen, *ibid.*, and "De Sympt. Differ.," e. 6, tom. vii., p. 81, l. 2; and "De Cris.," i., 12, tom. ix., p. 597, l. 4.

(d) Avicenna, iii., 19, sect. 2, vol. i., p. 549, l. 18.

(e) "De Loecis Affect.," vi., 3, tom. viii., p. 394, l. 14.

(f) "Pharmaceutice Rationalis," pt. i., sect. 4, cap. 3, first published in 1674.

(g) His words are, "Quod autem plerique orthores potum aut parum aut nihil immutatum reddi asserunt, a vero longissime distat; quoniam urina in omnibus (quos unquam me novisse contigit, et credo ita in universis habere), tum a potu ingesto, tum a quovis humore in corpore nostro gigni solito, plurimum differens, quasi melle aut saccharo imbuta, mire dulcescebat."

(h) See the "Imperial Dictionary of Universal Biography," art. *Susruta*.

(i) Taken from Hessler's translation, tom. i., p. 184. His note on the passage is as follows (Fasc. ii., p. 39):—"Mellitus urinæ status (*mad'hu-mēhatva*) hoc loco nihil aliud esse videtur, nisi urinæ dulcedo, quam in diabete mellito animadvertimus; ad quem statum morbosum omnes affectiones urinarias suo tempore pervenire Susrutas sua auctoritate affirmat." (See "Susrutas, Ayurvēdas, id est Medicinæ Systema," &c. Erlang. 1844, &c.) See also Wise's "History of Medicine," vol. ii., pp. 328, 330.

Dr. M., Barnstaple.—The next recognised examination in Arts, etc., will take place at Apothecaries' Hall in September, which, if your son passes, he could commence his Hospital studies the ensuing October.

HINTS ON ARMY MEDICAL UNIFICATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—If, as is likely, the unification of the Army Medical Corps be carried out, let us hope that, while the interests of the service are duly provided for, points of minor importance will not be neglected. It is customary to assume that a scientific corps should have a soul above buttons, yet it will be found that the most complete dress regulations in the service are those of the Royal Engineers, seen to by one of themselves. The occasion will be a favourable one to relieve us from our funereal trappings. When it was sought to popularise the Commissariat and to attract into it officers from the line, the first step was to give the corps a becoming dress. Belts of some shade of brown, with a *lépi*, would be neat, workmanlike, and distinctive. The cocked hat might be retained in the administrative grades. It is, when the wearer is on horseback, a becoming head-dress, but no one in their senses would choose it to perform any duty in.

Servant's allowance should be granted to all officers of the corps. Attached as they will be to regiments for short periods, they cannot expect anything but the refuse of the regimental servants. The allowance will enable them to provide themselves with good servants, who will follow them from unattached to attached service, and *vice versa*.

Quarters should, of course, be again chosen by date of commission, and not of appointment to regiments, as at present. Officers should be exempted from subscription to the band fund of regiments to which they will no longer belong. By attention to these points, apparently trifling, the comfort of Medical officers will be promoted, and the new corps will gain a popularity which it will be found to stand much in need of.

I am, &c., ARMY SURGEON.

COMMUNICATIONS have been received from—

H. R.; Mr. METCALFE JOHNSON; Dr. H. KENNEDY; Dr. H. G. DALTON; Mr. G. HARRISON; Dr. C. B. KER; Mr. G. CROXTON; Mr. SUTHERLAND; Dr. R. DOUGLAS POWELL; Mr. HENRY ARNOTT; Mr. J. CHATTO; Dr. HANDFIELD JONES; Dr. J. R. HARDIE; Dr. SANSOM; Dr. PLAYFAIR; Mr. J. SAMPSON GAMGEE; Dr. WAKE; Dr. FELCE; Dr. C. P. COLLINS; A SUBSCRIBER FOR TWENTY-NINE YEARS; Dr. J. C. TORRY; Mr. F. P. STAPLES; Dr. ABBOTTS SMITH; ARMY SURGEON; Mr. S. LUCAS; Mr. W. J. B. RICHARDS; Mr. WYKES.

BOOKS RECEIVED—

Curran's Lithotomy in India—Growths in the Larynx, by Dr. Morell-Mackenzie—Report of the Aboo-Lawrence School—Part II. of Deschanel's Natural Philosophy, edited by Professor Everett—How to Stamp out Small-pox, by Dr. Mordey Douglas—Selected Obstetrical Works of Sir J. Y. Simpson, Bart., edited by Dr. J. Watt Black—Rapport sur l'Ambulance de l'Ambassade D'Autriche-Hongrie à Paris—Braithwaite's Retrospect, vol. lxiii.

PERIODICALS AND NEWSPAPERS RECEIVED—

Pharmaceutical Journal—New York Medical Journal—Mechanic's Magazine—Chemist and Druggist—Bulletin Général de Thérapeutique—North British Daily Mail—Brighton Examiner.

APPOINTMENTS FOR THE WEEK.

July 1. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 9½ a.m.; King's, 2 p.m.; Charing-cross, 2 p.m.; Royal Free, 2 p.m.; Hospital for Women, 9½ a.m.; Royal London Ophthalmic, 11 a.m.

3. Monday.

Operations at the Metropolitan Free Hospital, 2 p.m.; St. Mark's Hospital for Diseases of the Rectum, 2 p.m.; St. Peter's Hospital for Stone, 2½ p.m.; Royal London Ophthalmic, 11 a.m.

ROYAL INSTITUTION, 2 p.m. General Monthly Meeting.

4. Tuesday.

Operations at Guy's, 1½ p.m.; Westminster, 2 p.m.; National Orthopædic, Great Portland-street, 2 p.m.; Royal Free, 2 p.m.; Royal London Ophthalmic, 11 a.m.

ETHNOLOGICAL SOCIETY, 8 p.m. Meeting.

5. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1½ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew's, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas's, 1½ p.m.; Samaritan, 2.30 p.m.; King's College Hospital (by Mr. Wood), 2 p.m.; Royal London Ophthalmic, 11 a.m.

OBSTETRICAL SOCIETY (Council Meeting, 7½ p.m.), 8 p.m. Dr. Tilt, "On the Diagnosis of the least known Varieties of Uterine Inflammation." Dr. Copeman, "Notes of Cases of Interest." And other Papers.

6. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; Royal Orthopædic, 2 p.m.; West London, 2 p.m.; University College Hospital, 2 p.m.; Royal London Ophthalmic, 11 a.m.

7. Friday.

Operations at Westminster Ophthalmic, 1½ p.m.; Central London Ophthalmic, 2 p.m.; Royal London Ophthalmic, 11 a.m.; South London Ophthalmic, 2 p.m.

VITAL STATISTICS OF LONDON.

Week ending Saturday, June 24, 1871.

BIRTHS.

Births of Boys, 1008; Girls, 930; Total, 1938.
Average of 10 corresponding weeks, 1861-70, 1976.2.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	662	634	1296
Average of the ten years 1861-70	637.5	585.6	1223.1
Average corrected to increased population	1345
Deaths of people above 90

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1861.	Small-pox.	Measles.	Scarlet Fever.	Diphtheria.	Whooping- cough.	Typhus.	Enteric (or Typhoid) Fever.	Simple continued Fever.	Diarrhoea.
West	458125	14	6	4	1	7	...	1	1	4
North	618210	97	...	5	2	5	2	1	2	6

Total	2803989	232	27	24	3	33	6	9	7	20

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.631 in.
Mean temperature	56.2°
Highest point of thermometer	72.9°
Lowest point of thermometer	47.5°
Mean dew-point temperature	51.5°
General direction of wind	Variable.
Whole amount of rain in the week	1.50 in.

BIRTHS and DEATHS Registered and METEOROLOGY during the Week ending Saturday, June 24, 1871, in the following large Towns:—

Boroughs, etc. (Municipal bound- aries for all except London.)	Estimated Population in middle of the year 1871.*	Persons to an Acre. (1871.)	Births Registered during the week ending June 24.	Deaths Registered during the week ending June 24.	Temperature of Air (Fahr.)			Temp. of Air (Cent.)	Rain Fall.	
					Highest during the Week.	Lowest during the Week.	Weekly Mean of Mean Daily Values.		Weekly Mean of Mean Daily Values.	In Inches.
London	3258469	41.8	1938	1296	72.9	47.5	56.2	13.44	1.50	3.81
Portsmouth	125464	13.2	61	31	71.2	47.0	58.2	14.55	0.95	2.41
Norwich	81787	10.9	55	29	70.0	42.0	53.9	12.17	1.42	3.61
Bristol	173364	37.0	112	64
Wolverhampton	74438	22.0	65	31	67.7	40.9	53.1	11.73	2.11	5.36
Birmingham	378574	48.3	238	128	68.8	44.3	53.9	12.17	1.74	4.42
Leicester	101367	31.7	79	44	71.7	44.7	54.4	12.44	1.06	2.69
Nottingham	90480	45.3	49	32	70.7	44.5	55.1	12.83	0.98	2.49
Liverpool	526225	103.0	345	259	65.2	44.4	53.0	11.67	1.48	3.76
Manchester	379140	84.5	318	188	68.0	45.2	54.2	12.33	1.25	3.17

Bradford	148030	22.5	183	64	70.0	44.0	53.3	11.84	1.27	3.23
Leeds	266108	12.3	275	110	65.0	45.0	52.6	11.44	1.35	3.43
Sheffield	255247	11.2	196	112	66.0	43.6	52.1	11.17	1.39	3.53
Hull	135195	38.0	92	50	70.0	38.0	55.3	12.94	0.90	2.29
Sunderland	103037	31.2	81	76
Newcastle-on-Tyne	136293	25.5	111	76
Edinburgh	179944	40.6	147	127	66.7	39.0	51.8	11.00	0.60	1.52
Glasgow	477627	94.3	401	302	69.0	43.0	54.7	12.61	0.76	1.93
Dublin (City, etc.)	322321	33.1	178	109	68.9	37.0	54.9	12.72	1.35	3.43
Total of 20 Towns in United Kingd'm	7336961	34.4	5017	3189	72.9	37.0	54.1	12.28	1.29	3.28

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29.63 in. The highest was 29.98 in. at the end, and the lowest was 29.34 in. at the beginning, of the week.

Note.—The population of Cities and Boroughs for 1871 is estimated on the assumption that the increase since 1861 has been at the same annual rate as between the censuses 1851 and 1861; at this distant period, however, from the last of these two censuses, it is probable that the estimate may in some instances be erroneous. The estimates for Leicester, Nottingham, Leeds, Bradford, and Hull are based upon a local enumeration of the inhabited houses.

* The actual numbers of the population of these cities and boroughs, as enumerated at the Census on April 3 last, will shortly be available; new estimates based upon these enumerated numbers will then be substituted for the above numbers.

GROSSMITH'S (PRIZE MEDAL) ARTIFICIAL LEGS,

With PATENT ACTION KNEE- and ANKLE-JOINTS, enable the patient to walk, sit, or ride, with ease and comfort, wherever amputated. They are lighter in weight, less expensive, and more durable than any hitherto introduced, and are worn by Ladies and Children with perfect safety. They were awarded PRIZE MEDALS at the Great International Exhibitions of London, Paris, Dublin, and wherever they have been exhibited, and pronounced by the Surgical Juries to be "Excellent in manufacture," "well constructed," and "on a system superior to all others."

GROSSMITH'S (PRIZE MEDAL) ARTIFICIAL EYES

Can be worn in every case where the Sight has been lost, and are recommended by the Surgeons of the London Ophthalmic and General Hospitals, as affording the best protection to the cavity, preventing the wasting and closing of the lids, and all unpleasant appearances. They are fitted in a few minutes, without pain or operation, the colours perfectly matched, and a movement obtained precisely in accordance with the action of the Natural Eye. They have been awarded PRIZE MEDALS at the Great International Exhibitions of London, Paris, and Dublin.

"Mr. Grossmith's house has been highly reputed, for upwards of a century, for the manufacture of well-devised and useful Artificial Limbs, and they are in every way worthy of commendation."—*Lancet*.

"Mr. Grossmith's Artificial Legs, Hands, and Eyes are most beautiful and perfect imitations of the natural."—*Medical Times and Gazette*.

For Price-lists and full information, apply to Messrs. GROSSMITH'S LEG, HAND, and EYE FACTORY, 175, FLEET-STREET, LONDON.—Established 1760.—Paris: CHARRIERE & SON.

SYR. FERRI PHOSPH. CO. (AMERICAN).

PARRISH'S CHEMICAL FOOD,

PREPARED BY PARRISH, OF PHILADELPHIA,

and imported by his SOLE AGENTS,

P. AND P. W. SQUIRE, 277, OXFORD-STREET, LONDON, W.

For convenience and security, this preparation is supplied in 4 oz., 8 oz., and 1 lb. bottles.

Each Bottle bears the name SQUIRE on the Seal and Label.

FOX'S

"PALATABLE" COD-LIVER OIL, "PALATABLE" CASTOR OIL,
AND "PALATABLE" COD-LIVER OIL WITH QUININE

ARE THE FINEST OILS,

So prepared as to be really pleasant to the taste, whilst their medicinal properties are not in the least impaired. They can be assimilated when other kinds have been rejected.

From the MEDICAL TIMES AND GAZETTE, June 4th, 1870.

"In these preparations the Patentees have succeeded in making the Oils not only palatable, but easily retained upon the stomach without rising. We have tried them in several cases with marked benefit, and in some instances in which the Oil in its natural state could not be retained. The mode of preparation is such that the medicinal properties of the Oil are unimpaired. To children in particular the Oils as prepared by Fox and Co. will be highly advantageous." See also "The Lancet," June 18th, 1870, and Jan. 28th, 1871; "Medical Press and Circular," May 4th, 1870, and Dec. 28th, 1870; "British Medical Journal," Nov. 12th, 1870.

GEORGE W. FOX & CO.'S London Depot, 8, Bury-court, St. Mary-Axe, E.C.

MANUFACTORY, CITY-ROAD, MANCHESTER; and through all leading Wholesale and Retail Chemists.

Palatable Cod-liver Oil, 1s., 2s., 3s. 9d.; with Quinine, 2s. 6d., 4s. 9d. Palatable Castor Oil, 6d., 1s.

NEPENTHE.

PREPARED EXCLUSIVELY FROM OPIUM. (Dose the same as Tinctura Opii.) Price 8s. per lb.

From the "Lancet," Dec. 18, 1869.

NEPENTHE, OR ANODYNE TINCTURE (PREPARED BY MESSRS. FERRIS AND CO., BRISTOL).

This preparation really consists, as stated, solely of opium, resembling somewhat the liquid extract of the British Pharmacopoeia. It is claimed for it that it does not produce headache, stupor, giddiness, depression of spirits, diminution of nervous energy, prostration of strength, nor constipation; it is doubtless less stimulating than those preparations of opium made with the solid and crude drug; and a further commendation of Nepenthe is its uniformity of strength. The Nepenthe intended for subcutaneous injection is of double the ordinary strength; and that it is really so we have verified by analysis.

May be procured direct from the Sole Manufacturers,

FERRIS, BOORNE, TOWNSEND, and BOUCHER,
Wholesale Druggists, Bristol,

And through all leading Wholesale and Retail Chemists in Great Britain and the Colonies.

NOTICE.—Notwithstanding the enormous and increasing advance in Opium, the price of Nepenthe remains the same, and it is now the cheapest as well as the best preparation of this important drug.

N.B. Two Pounds NEPENTHE, or One Pound NEPENTHE and Two Pounds Ferris and Co.'s SYRUP of CHLORAL, will be sent, Carriage Paid, to any Railway-station on receipt of P.O.O. for 16s.

ORIGINAL LECTURES.

LECTURES ON FORCE AND ENERGY

DELIVERED AT THE ROYAL INSTITUTION, ON MAY 9 AND 16,

By CHARLES BROOKE, M.A., F.R.S.,
Consulting Surgeon of the Westminster Hospital.

LECTURE II.

THIS lecture was commenced with an explanation of the various forms of wave-motion. In longitudinal vibrations, the motion of each disturbed particle is in a line coinciding with the direction of the wave; and as the disturbance is communicated from particle to particle in succession, each will be in a slightly different phase of its vibration from its predecessor; hence, not the particles themselves, but an accumulation of them, will travel onwards, followed at the interval of a period of vibration by a second accumulation, and so on. This was illustrated by an appropriate apparatus, but may be more familiarly illustrated by the wave that is observed to travel across a cornfield in a breeze. Sonorous vibrations are entirely of this character. In transverse vibrations the motion of each disturbed particle is in a plane perpendicular to the direction of the wave; and, as in this case, also, the particles are disturbed in succession, the juxtaposition of these in successive phases constitutes the wave. This was shown in an apparatus by a row of white balls, but a more familiar illustration is found in dropping a stone on the surface of still water; the wave only travels onwards, which may be shown by light floating bodies, as small scraps of paper, which are lifted only, and not carried onward by the crest of the wave. The phenomena of diffraction, and more especially those of polarisation, require that the vibrations which constitute light and heat must be of the latter kind.

If electricity, and therefore magnetism, consist also of vibratory motion (an assumption which the obvious interchange of the former with other forms of energy necessitates), then the probable form of electric and magnetic wave-motion becomes an interesting subject of inquiry. It must be observed that both electricity and magnetism possess a dual character not common to other forms of energy; there is *positive* and *negative* electricity, *austral* and *boreal* magnetism, but there is no analogous *a* and *b* condition in light or heat. Now, is there any conceivable kind of wave-motion that would present this duality of character? Undoubtedly there is—namely, a helical wave, in which the motion of each disturbed particle is in a circle, the plane of which is perpendicular to the direction of the wave. [A helix of this kind was then shown by the wave apparatus.] If a helix be called *positive* when it turns from left to right, and *negative* when it turns the contrary way, from right to left, then a progressive motion in the same helix will appear positive or negative, according to the end at which it is viewed; also, opposite motions in the same helix may be conceived to interfere, and to give rise to repulsion, while opposite motions in opposite helices would progress without interference—like two series of waves on the surface of the water crossing each other—and this may, perhaps, be the source of electrical attraction.

The intimate relation—it may be said the identity—of electricity and magnetism was shown by means of De la Rive's floating battery, consisting of a small Smee's element, floating in a vessel of water, the electrodes of which were connected with the ends of a small cylindrical coil of insulated copper wire resting horizontally on the element. This coil manifested all the properties of a floating magnetic needle, taking its position in the magnetic meridian, and one end being attracted, and the other repelled, by either of the poles of a bar-magnet. Since magnetic effects are ordinarily exhibited by steel or iron, it might be supposed by some that this metal is essential to the development of magnetic energy; it is, however, merely the ordinary and most susceptible vehicle of magnetism. Since magnetic energy is manifested in a direction at right angles to the electric current that produces it, the dynamic difficulty of resolving one helical wave into another at right angles to the former must not be lost sight of, but it is probably not insuperable. There is, however, some valid experimental confirmation of the helical character of the magnetic wave. The energy or, as it has sometimes been termed, the inertia of rotation—*i.e.*, the resistance which a

rotating body offers to any change in the direction of its axis of rotation—is well exemplified by the gyroscope, and a more familiar illustration is found in the undeviating path of the rifle-ball. Now, if a mass of copper be suspended by a string between the poles of a powerful electro-magnet, and be put in rapid rotation by twisting the string, the instant that the magnet is excited, the rotation is arrested; and if the mass be now forcibly rotated, so much heat is developed by molecular friction, that fusible metal contained in a copper tube similarly placed may be actually melted and poured out. This arrest of the motion of the rotating mass would be a necessary dynamical sequence of the helical wave-motion assumed to constitute magnetic energy; for in that case each disturbed molecule would be describing a circular orbit in a plane at right angles to the lines of magnetic energy, and would by its own energy resist any displacement of its axis of revolution; and this view was further confirmed by another experiment. A ball of copper with a small pulley on its axis was placed at the end of a frame, so as to be capable of being rapidly rotated by a wheel and band, when placed between the poles of the electro-magnet; its axis of rotation either coinciding with, or being placed at right angles to, the lines of magnetic energy. When the axis of rotation of the ball coincides with the magnetic lines, there would be obviously no change in the direction of the planes of the assumed molecular revolution, and consequently no heat ought to be developed; and that was shown to be the case by means of a thermopile connected with a galvanometer and brought near the rotating ball. When, however, the axis of rotation of the ball was placed at right angles to the magnetic lines, it was equally evident that heat was immediately developed.

The gyratory nature of the magnetic wave is further confirmed by a fact first observed by Faraday—namely, that if a beam of polarised light be transmitted through a piece of heavy glass placed between the poles of an electro-magnet, so that the axis of the beam may correspond with the lines of magnetic energy, then, if the magnet be excited, the plane of polarisation is twisted a little, either to the right or left, according to the direction of magnetic polarity—a result by no means inconsistent with the hypothesis of molecular orbitation.

The lecturer then referred to some of the physiological bearings of the subject. He remarked that *wave-motion* is probably the universal medium of communication between mind and matter; the means by which objective impressions are rendered cognisable to the senses. If light and sound consist in the perception of their respective vibrations, this must be obviously true in regard to the functions of the eye and ear. Nor is the dependence of the cognate senses of taste and smell on heat-vibrations less evident. Very cold substances are notoriously tasted and smelt with difficulty. They are then less volatile—*i.e.*, less capable of assuming the gaseous form in which vibrations of their own special periods are readily excited; and just as different substances in the state of incandescent vapour emit luminous rays of different definite periods of vibration, and thus produce their special bright lines in the spectrum, so the odours and savours of substances may not improbably depend on the different periods of vibration of which their vapours are specially susceptible. The organs of common sensation are certainly amenable to the impressions of heat and electricity, but they are also susceptible of various other impressions not so readily referable to vibratory motion; but in all cases, whether in the nerves of common or special sensation, the existence of a due amount of thermic energy is essential to the exercise of their functions, which are impaired by its diminution, even to the production of complete local anæsthesia. No doubt can be entertained of the close relationship, if not actual identity, of electric and nervous energy. If, then, electricity be admitted into the category of wave-motions, the transmission to the sensorium of all impressions received by the special organs of sense, is obviously comprised in the above mentioned generalisation.

Another important physiological point for consideration is the nature of the existing relations between electric energy and muscular action. The opinion usually entertained on this subject is that a muscle contracts in obedience to some "stimulus" dependent on electricity, and transmitted to it by a nerve from a nerve-centre; but the view entertained by Dr. Radcliffe,^(a) that contraction ensues on the negation of electrical charge, appears more in accordance with observed phenomena; and notably with that of *rigor mortis*, the universal contraction of the muscles which ensues immediately on the cessation of nervous action, when unquestionably no "stimulus" can be transmitted. It is well known that the interior and exterior

(a) "Dynamics of Nerve and Muscle." Macmillan, 1871.

of the fibres of nerve and muscle are in opposite electrical states, so long as they are in a state of activity; and this implies some quasi-insulating power in the sarcolemma and neurilemma. The necessary limits of a lecture forbid entering into any detail of the relation of these views to the state of a connected nerve and muscle, known as "electrotonus," but they are entitled to careful consideration, and are fully detailed in the work already mentioned. That the contractile force of a muscle is maintained in a potential condition by the ordinary state of electrical charge, and is brought into action only at the moment of discharge, when electrical tension ceases, is further rendered probable by the demonstrable fact that if a muscle which has not lost its vitality be *surcharged* with electricity, it becomes abnormally elongated. With the apparatus designed to show this fact, an experiment bearing some analogy was shown. A thin band of vulcanised caoutchouc, coated on both sides with a metallic varnish, was fixed at one end, and stretched by a cord passing over a pulley, and having a weight at the end of it; any alteration in the length of the band was rendered evident by the movement of a long index connected with the pulley. The metallic coating of one side of the band is insulated; that of the other side is connected with the earth. If, now, the insulated side be charged by an electrical machine, the other side becomes oppositely charged by induction, and the consequent attraction of the charged coatings causes a visible elongation of the band, which, however, disappears at the moment of discharge.

A further point remaining to be considered in this lecture is the means by which the various kinds of energy are transmitted. Sonorous vibrations are freely transmitted by all kinds of homogeneous matter, whether in the gaseous, fluid, or solid state; in solid matter not homogeneous the amount of transmission depends upon structure. Thus, the transmission of sound through wood is much less perfect in the transverse than in the longitudinal direction; it is much more impeded by cork, and almost intercepted by cotton-wool and similar substances. Electric energy is more or less freely transmitted by most kinds of matter, except glass, silk, and the resinous products of the vegetable kingdom. Since the transmission of the vibrations of light and heat through an absolute vacuum is obviously impossible, because the transmission of motion implies the presence of matter to be moved, it becomes a necessity that infinite space must be pervaded by some highly elastic and attenuated kind of matter, as the medium of the transmission of light and heat from the central luminaries of all existing solar systems to their attendant satellites. This, in entire and probably unavoidable ignorance of its nature, has been termed "ether," and the existence of ether has been assumed to be demonstrated by the periodic retardation of Encke's comet. But it has been further assumed that ether *alone* is capable of transmitting the vibrations of light and heat, and must therefore exist interstitially in all kinds of translucent and transcalent matter.

The only basis on which this *interstitial ether* hypothesis rests is the assumed incapacity of ordinary matter, whether in the solid, liquid, or gaseous state, to transmit the extremely rapid vibrations of light and heat, for no more valid reason than this: that the only vibrations of ordinary matter of which any actual knowledge exists—namely, those of sound—are almost immeasurably slower than those of light and heat, the former being numbered by at most a few thousands, the latter by hundreds of millions of millions in one second of time. But it must be borne in mind that sonorous vibrations are always *longitudinal*, in the production of which repulsive forces are *alone* concerned; whilst, on the contrary, light and heat vibrations are necessarily *transverse*, and the production of these is solely due to *attractive* forces. Now, these respective forces obey very different laws, for whilst attractive forces obey generally, and probably universally, the law of the inverse *square* of the distance between the attracting particles, molecular repulsion must obviously—at all events, in gaseous matter—obey the law of the inverse *cube* of the distance, as a corollary to Boyle's law of the constant ratio (within wide limits) of gaseous pressure to density; therefore, from the rates of transmission of longitudinal vibrations, nothing can be predicated respecting the possible rates of transmission of transverse waves. It has been asserted that molecular repulsion is a dynamic resultant effect of molecular vibration, and therefore incapable of expression by a statical law; but it is very doubtful whether molecular attraction is not equally a dynamic sequence, and therefore not a whit more entitled to claim a statical law than the former. This view was illustrated by an experiment, in which a disc of card at the end of a light suspended rod of wood, and placed near a tuning-fork, is attracted

or drawn towards the latter when thrown into vibration by means of a violin-bow.(b)

Sir C. Wheatstone has long since shown that electricity traverses a copper wire at a velocity considerably greater than that of light, and probably not less than 250,000 miles in a second. Whether electricity be matter or motion, this result shows that the capability of matter to transmit the vibrations of light is by no means improbable. Moreover, it is now generally admitted that when a body becomes heated its own molecules, and not merely those of the supposed interstitial ether, are thrown into a state of vibratory motion, the amount of heat corresponding, probably, to the amplitude of the vibrations. If, then, ordinary matter be assumed to be susceptible of heat-vibrations, can any valid reason be assigned for its insusceptibility of light-vibrations, when the close relationship, if not the absolute identity, of these two forms of energy is manifested by so many phenomena common to both, such as those of reflection and refraction, polarisation, and the reciprocal properties of emission and absorption, whether general or selective.

The reciprocity between the powers of radiating and absorbing both light and heat which exists in all substances, so far as experiment has shown, presents a cogent argument in favour of the hypothesis that the energies of both light and heat are exerted on the molecules of sensible matter, and not on any supposed interstitial medium. It is a well-established fact that those surfaces of bodies which radiate heat most freely also absorb most readily—that is to say, that molecular condition which is more or less favourable for imparting to adjacent matter the wave-motion of heat is also more or less favourable to its reception; and the same holds good with respect to the selective absorption of heat—namely, that any substance absorbs more freely the special kind of heat which it radiates. Thus, while a plate of rock-salt absorbs little more than 3 per cent. of the heat radiated by heated black platinum, it absorbs 30 per cent. of the heat radiated by a piece of its own substance, heated to the same temperature. Precisely the same phenomena are observed with respect to light: for example, the scoriae floating on the surface of a pot of molten metal glow more brightly than the clean surface of the metal; and if an encaustic tile with a pattern on it—say of black and white—be heated red hot, and placed in a dark room, the black portion will be observed to glow much more brightly than the white. In these instances the molecular conditions that facilitate absorption equally facilitate emission; and the case is the same with regard to selective absorption. Thus, a piece of red glass, when heated, emits a greenish light—that is, the absorbed correspond with the emitted rays. And a still more striking instance has been observed by Professor Balfour Stewart—namely, that a tourmaline, heated to incandescence, emits light polarised in a plane perpendicular to that which it transmits. Here the structure, that enables the crystal to take up wave-motion in one direction only, compels it to impart motion exclusively in the same direction. If, then, it be admitted that the molecules of all kinds of matter are susceptible of thermic energy, how can it be denied that they are equally susceptible of the energy of light, when the varied phenomena are shown to be in all cases precisely analogous.

All substances in the state of incandescent vapour are found to originate or emit rays of definite refrangibility, and to form an interrupted spectrum, consisting of bright lines only; moreover, the vapour of every substance is capable of absorbing the rays that itself emits when incandescent—that is to say, of responding to and appropriating those special vibrations of which it is most susceptible. This is readily demonstrated by means of sodium. If burnt in a spirit-lamp it emits only the double D line in the spectrum, and if interposed in a state of vapour, it absorbs the vibrations of the same period, and cuts out the same line from a continuous spectrum. A similar reciprocity of emission and absorption exists in sonorous vibrations. If two harps tuned exactly in unison be placed at the opposite sides of a room, a note struck on one will excite vibrations in the corresponding string, and in that only, of the other; is it less reasonable to attribute the former phenomena to the special susceptibility of the molecules, than to ascribe the latter to the special tension of the reciprocating strings? It is quite true that incandescent bodies in the solid or fluid state emit rays constituting a continuous, not an interrupted, spectrum. This is no doubt due to the interference of aggregation with the motion to which the molecules are most prone; for it has been observed that the bright lines in the spectrum

(b) This experiment, though perfectly successful in the quiescent atmosphere of the empty theatre, was much interfered with by the convection-currents due to the presence of the audience.

become more sharply defined by attenuation of the emitting vapour or gas, and that they become broader and less defined by its condensation.

It has appeared, from the investigations of Mr. Norman Lockyer, that the periodic time of vibrations emitted by incandescent hydrogen in the vicinity of the sun is sometimes slightly modified by the proper motion of the emitting gas; in this case some portion of the bright line will be slightly deflected towards the violet or red end of the spectrum, accordingly as the wave-length is diminished or increased by the proper motion of the gas; occasionally deflections in both directions simultaneously have been observed, showing the existence of a solar cyclone. A precisely analogous acoustical phenomenon was demonstrated by placing a free reed at one end of a long hollow rod, and a small pair of bellows at the other end: if the rod were briskly waved to and fro while the sound of the reed continued, its pitch appeared to be sharpened to those whom it approached, and flattened to those from whom it was receding. It follows from these facts, as an irresistible conclusion, that the molecules of ordinary matter are susceptible of the vibrations both of light and heat, and are therefore equally capable of transmitting them; and, if so, the hypothesis of the necessity of interstitial ether becomes absolutely groundless. If it were asked how, since ether is admitted to occupy infinite space, it can be imagined to be excluded from the spaces occupied by ordinary matter, the lecturer would reply, by means of a very simple hypothesis which he ventured to put forward in the introduction to the last edition of his "Elements of Natural Philosophy"—namely, that ether (like its liquid namesake with water) is immiscible with ordinary gaseous matter, and therefore floats above the attenuated confines of the atmosphere; it would thus be not less capable of fulfilling its beneficent mission of supplying organic life with the indispensable energies of light and heat; for, as no limit can be assigned to the possible amount of molecular displacement in a medium so attenuated as ether must necessarily be, an amount of energy is conceivable in its molecules, which would be sufficient to impart effective motion to the indefinitely denser forms of cognisable matter.

ORIGINAL COMMUNICATIONS.

CRIES OF ATLAS AND AXIS.

By THOMAS STRETCH DOWSE, M.D.,
Medical Superintendent, Highgate Infirmary.

M. R., aged 31, a woman of dissolute habits, and much given to drink, was admitted into the Highgate Infirmary on March 24, 1871. For a week previous to this, she had scarcely been sober for an hour together, and after drinking a large quantity of rum, she fell upon the ground perfectly intoxicated. How long she remained in this position seems uncertain; when, however, consciousness returned, she felt pain, and a sensation of stiffness at the back of the neck and head. This was two days previous to her admission. When first seen, she appeared weak and prostrate, and, whenever she moved, supported the head with her hands. She was able to walk without help, but the changing of the body from the vertical to the sitting or lying posture gave her increased pain, and unless the head was supported it appeared perfectly distressing. To move the head, either to the right or left, was an act of great difficulty, and at times quite impossible. She experienced some inconvenience upon swallowing, and complained that the effort gave her pain at the back of the head. There were no symptoms of paralysis, either motor or sensory. Her appetite was tolerably good, and she masticated with perfect freedom.

Upon examining the seat of pain, which was centred at the back of the neck, in the occipito-atloid region, she appeared much discomfited, and complained bitterly. No sign was manifested at this time of any grave lesion. She continued much in this state for a week, when the shoulders and neck were fixed, and the head rotated upon the spine; but this did not appear to give her so much pain as when the head was moved suddenly, or when it was raised from the pillow by its own weight. At this time no crepitation was felt, neither did any temporary form of paralysis ensue, as it would have done had pressure been made upon the cord. She kept to bed from the first, resting on her back, with the head and neck carefully adjusted, and retained in position by pillows, for the reason that, although no fracture nor dislocation was diagnosed, it was thought extremely probable that the joint and its sur-

roundings were seriously injured. In order that the parts might be kept at perfect rest in the most favourable posture, a gutta-percha collar was made to fit the neck, overlapping the shoulders and supporting the chin. This appliance she bore for some short time only, as it gave her great discomfort. She continued much in this way for a month, presenting no other symptom or sign than those stated. After this, however, she grew weaker, and the pains increased in severity; so much so, that the slightest effort she made to move or turn increased them to such a degree that she was compelled to abandon all such attempts, unless assistance was rendered. Six weeks after admission, chloroform was given to her, and whilst insensible the head and cervical spine were carefully manipulated. It was observed that the movements of the former upon the latter were abnormally free, and a slight grating was thought to be appreciable. From this time, which was about a fortnight previous to her death, she was supported chiefly by fluids, which she took in considerable quantities, without any great difficulty, up to within two days of her decease. No form whatever of paralysis, either temporary or otherwise, took place. There was no incontinence of urine or feces; no squint, vomiting, nor intolerance of light. For some days prior to her death, exhaustion set in, arising from constant pain and inanition. Her face became puffy; the eyelids were agglutinated with muco-purulent matter. She appeared insensible to pain, and spoke in a low muttering tone. Hæmorrhagic purpura appeared over the buttocks and lower extremities; and she sank on June 5.

Autopsy, made twenty-four hours after death, revealed, in relation to the brain—the dura mater perfectly healthy; the arachnoid membrane was raised by fluid over the surface between the convolutions like so many distended bullæ; the pia mater was greatly congested, and the capillary vessels were mapped out, even to the most minute ramifications; the brain-substance was of healthy consistence and free from disease; the medulla oblongata, spinal cord, and pons varolii were healthy, but the membranes in the immediate neighbourhood of the injury were diseased. The three joints—namely, occipito-atloid, atlo-axoid, and odonto-atloid—presented the following condition:—The occipito-atloid, with the synovial membranes, were highly congested and of a purplish-black colour. The cartilages were nearly destroyed by ulceration, leaving the articular surfaces rough and friable. The odonto-atloid was nearly destroyed. The transverse ligament was completely ulcerated through, leaving the odontoid process free to move in any direction. This process of bone was partially destroyed by carious ulceration, and what remained was for the most part soft and friable. The cartilages of the lateral atlo-axoid joints had commenced to ulcerate at the edges, which were carious, and the articular surfaces roughened. The check ligaments were quite healthy.

This case presents some points of manifest interest:—1st. Its rarity is worthy of note. 2ndly. The lesion itself, commencing, as it probably did, primarily in the transverse ligament or in the synovial membrane in connexion with it, doubtless from the excessive strain brought to bear thereon at the time of the fall. 3rdly. The extensive mischief that existed in this important region, not producing any pressure upon, or injury to, the medulla oblongata; but it is well known, anatomically, that this part of the spinal canal allows of considerable displacement between the atlas and axis without serious symptoms supervening, and the integrity of the check ligaments greatly helped to retain the odontoid process in its natural position. The treatment adopted was perfect rest, counter-irritation, the internal administration of belladonna, bromide and iodide of potassium, and hydrate of chloral, also nocturnal injections hypodermically of morphine and atropine.

THE RULING PASSION.—During his stirring recital of the sufferings and destruction endured at Chatillon by the useless cross-fire of the insurgents (*e.g.*, 2400 shells putting only six men *hors de combat*) and Versailles, M. Amédée Latour thus deplures one of his grievances:—"What a suffering for a lover of the garden like I am! Here I have under my eyes my magnificent pear-tree covered with blossom and devoured by caterpillars. I can count sixteen frightful clusters of them. To destroy them the tree must be climbed, and that is an impossibility; for, being in sight of the forts at Issy and Vanves, the instant the artillerymen perceive any object in the garden or at the windows, they throw a shell. Woe to anyone who ventures to light a candle in any of the upper rooms."

TWO FATAL CASES OF GUNSHOT WOUND OF HEAD, WITH REMARKS.

By FRANCIS H. WELCH,
Assistant-Surgeon 1st, 22nd Regiment.

Case 1.—T. L. was maliciously shot by J. B.—the motive, “a feeling of being unfairly used by T. L., his non-commissioned officer, and inability to get any redress;” the instrument, an Enfield rifle and cylindro-conoidal bullet. The victim was asleep at midday in a reclining position on his cot, his back resting upon the rolled-up bedclothes and mattress, his head on one side, the face away from the murderer and towards the wall, a distance of two feet; the murderer stood about six feet off, which would bring the muzzle to about one foot from the body. The bullet entered the neck on the right side, emerged at the left temple, and struck against the wall. Death was instantaneous, and the amount of venous blood from the opening of exit excessive. He was seen by me within ten minutes. The countenance was very pallid and perfectly composed, but so altered in expression that many of his comrades were unable to recognise him; the muscles flaccid, and the body apparently in exactly the same position as before death, no movement or spasmodic action having followed the sudden lesion to the cerebral substance. The aperture of entrance was situated one inch and a half below the angle of the lower jaw, right side, and one-third of an inch outside the inner edge of the sterno-mastoid; the size of it was somewhat larger than the diameter of the bullet, round, with edges slightly ragged, the lower half inverted, the upper half everted (this evidently due to the obliquity of course of bullet to the surface of skin); there was scorching and blackening of surrounding tissue. The aperture of exit was one inch and a half behind the left external angular process of frontal bone, and the same distance above the zygomatic arch, sufficiently large to admit all the fingers; the scalp very lacerated, bloody, and everted, with much disorganised cerebral substance and many bone fragments scattered around. Venous oozing ensued for some time after death, and blood flowed from the nostrils and mouth.

Section cadaveris was performed twenty-two hours afterwards, and revealed the course of the bullet as follows:—It lacerated the fibres of the sterno-mastoid, and punched out a segment from the external jugular vein, leaving it empty, with an oval, clean-cut lateral aperture, involving about one-third of an inch of its calibre; it passed between the great vessels of the neck, dissecting them completely from each other and from the accompanying nerve, for the distance of one inch and a half, causing ecchymosis of the sheath, but no external laceration of the coats; entering the pharynx, it crossed in front of the vertebræ, fractured the posterior part of left superior maxillary and palate bones, penetrated the skull through the great wing of the sphenoid, and emerged at the left temple, shattering the parietal and frontal bones to a fearful extent where forming part of the temporal fossa, and sending fissures as far as the surrounding sutures. The brain-matter of the left anterior lobe was reduced to a pulp, and numerous spicula were scattered around in its substance. The edges of the cranial bones at the point of exit were levelled off in a direction outwards, the inner table being less carried away than the outer; the opposite condition prevailing at the entrance. The periosteum was completely detached from the whole left parietal and half of frontal bones, the dura mater to a much lessened extent. The course of the bullet was direct, a probe traversing it without impediment. The heart was empty and flaccid; the veins comparatively bloodless. The external coat of the carotid artery was ecchymosed, and on opening it a transverse laceration and incurving of the inner and middle tunics had occurred (probably at the point of direct impingement of bullet); above which, occupying the whole calibre of the vessel and occluding it, a firm, pale red, uniform, fibrinous clot, very devoid of red corpuscles, and strongly adherent to the inner coat, had formed, extending from the laceration for the distance of three inches along the external carotid and superior thyroid arteries, and convex at each free extremity; the vein was not lacerated, nor any deposition of fibrine in its interior.

The main features in this case were—the position of the limbs and body unaltered in the transition from sleep to death by the sudden injury to the cerebral mass; the progressive increase of distribution of lesion to the parts adjacent to the track of the bullet from entrance to exit; the eversion of upper part of entrance-wound, the inversion of the lower; the clean-cut partial section of the external jugular vein; the

absence of appreciable lesion to the internal jugular; the dissection of the deeper vessels and nerve, and the rupture and incurving of the middle and inner coats of the artery, with the formation of the firm, uniform, fibrinous coagulum, so instantaneous in production; the great extent of injury to the flat bones entering into the formation of a cavity with the direction of the bevilting, corresponding to loss of impetus of missile, and the comparative limited fracture of cancellated bones, such as the tuberosity of superior maxillary; and the non-contracted state of heart, rigor mortis being present, probably dependent on the injury to the pneumogastric nerve.

Case 2.—Suicide by Enfield rifle; bullet cylindro-conoidal. Private D. was an habitual tippler, and always extremely nervous and tremulous from alcoholism; had lately been in Hospital with ebrietas, and within a fortnight of his death had had a thorough debauch. It was not noted that he was more depressed or nervous than usual for the two or three preceding days; it was proved that he was in his ordinary state the evening previous. Twelve months prior he had re-enlisted, and often expressed his regret for so doing, on account of his ability to have earned good wages as an artisan; the sole ascribed cause for the act of suicide. Early in the morning at “rouse parade,” while lying in bed, he was warned by the corporal for fatigue duty; he replied “All right.” Within a few seconds, those who were around him (within ten yards) “heard a noise like to the explosion of a very loose blank cartridge in the fire, in the direction of his bed,” but wholly “insufficient to cause alarm.” One (his comrade *par excellence*) stepping forward, said, “D., you have loose powder about you,” and obtaining no answer, drew the bedclothes (which covered the head completely) down, when he saw the blood streaming around, and found that the man had shot himself. The bed upon which the body lay was upon the floor (usual custom), a form standing transversely at the head, about one foot and a half in height. The clothes covered completely the body, warm and flaccid. On turning them down, the corpse was observed lying on the back, with the face turned towards the right side, legs straight down; the right arm across the abdomen, with the hand on the left thigh; the left with the elbow away from the body, flexed nearly at right angle, the hand lying by the side. The rifle was in the bed, with the stock outside the right foot, nipple outwards; the barrel across the chest, with the muzzle on the neck, directed towards the left ear; the ramrod on the right side of the bed. The bullet, after emerging from the cranium, had perforated the form (deal board one inch thick), indented the wooden wall of room posterior to it, on exactly the same level and in a line with the bed, and then fallen on the floor not much damaged. The amount of blood in the bed was excessive, and death instantaneous.

The post-mortem, thirty hours after death, revealed as follows:—Excessive rigidity of muscles; countenance very pallid and composed, but usual expression entirely altered; slight ecchymosis of conjunctivæ; skin behind the left ear blackened, and hair singed; aperture of entrance over left mastoid process smooth, round, with edges inverted, slightly exceeding the diameter of bullet. A large, ragged wound, about three inches in diameter, with scalp very lacerated, and clots of blood, brain-matter, and pieces of bone adherent, situated above and behind the right ear, formed the point of exit. The course of the bullet was directly across the skull, obliquely upwards. It had separated the left temporal bone at its squamous suture, and broken into fragments its petrous portion, passed directly through the posterior lobes of the cerebrum, reducing them to a pulp with the cerebellum, and fracturing the posterior portion of the right parietal with the upper half of occipital bones, emerged as before stated. At the entrance the inner table of the skull was more fractured than the outer, and the dura mater more stripped off than the pericranium; at the exit the opposite condition prevailed, both as to bones and to membranes. The left hand, on its palm, was blackened by exploded gunpowder, and a round patch of the same, one inch in diameter, was situated upon the inner side of the dorsum of the left foot, two inches behind the great-toe.

The theory was that the man, while lying in bed, had placed the stock of the charged rifle between his feet, the barrel over his chest and towards the left shoulder, the nipple resting against the inner side of the dorsum of the left foot, as proved by the mark of explosion, the knees bent (from the fact that the Enfield from the muzzle to the trigger is only three feet five inches long, and the man being five feet six inches and a half high, it would have required more twisting round of the body to bring the ear into contact with the muzzle than the circumstances warranted), and with the right hand, grasping midway

the barrel and the left the muzzle, the head well bent round to the left side, he had pressed the trigger with the right great-toe, the body falling into the position above stated; and, the rifle lying somewhat lower, with the nipple outwards on the outer side of the right foot, from the recoil and the outward direction given it at the time of firing, the bullet emerging from the head passed through the form, about six inches in height from pillow, the line coinciding with that of a rifle afterwards placed in the position stated.

Apart from the local results of the missile, and the method adopted for the suicidal purpose, the main interest in this case is centred in the character of the explosion, and, Medico-legally, is of great importance, substantiating strongly many of the statements advanced on the trial of Risk Allah, at Brussels, for the murder of his ward, Ready, detailed in the *Medical Times and Gazette*, November 3, 1866. The facts narrated were personally obtained within half an hour of the disaster. The head and body were completely covered by the bedclothes. The ramrod, lying by the bed, out of its groove, indicated a probable charging of the weapon within a short time of the infliction of the injury; while the care bestowed on the replacing of the remaining cartridges (a) attested the absence of all hurry over the act. That the whole charge of powder was used is proved by the effects produced. Those within ten yards of the man, engaged in dressing, were in accord that the noise produced "sounded merely like the ordinary puff made by throwing a loose cartridge in the fire," and was not of sufficient intensity to call forth alarm, the majority taking no heed of it. Those in the room below (a thin board floor separating them) described what they heard "like to the shutting of a door;" while those "on guard," about fifty yards' distance, and separated by two compartments, discerned nothing. The barrack-room was one of a series of compartments in a large wooden building, and accommodated about thirty-five men, with beds rather closely arranged on the floor; the partitions of thin planking. Sounds were very freely transmitted from one part to the other. The bedclothes may have been partially accountable for the extreme muffling of the explosion, but the main cause would apparently be due to the placing of the muzzle of the rifle in direct or close contact with the body. At the trial referred to, M. Charrins stated, "A gun fired near the object makes only a dead report, nearly like the noise produced by a bale of goods dropping from a pulley. I had proof of it at Namur, on the occasion of the death of a corporal, who killed himself by firing his gun with the muzzle near the body in a room where his comrades were playing; they heard nothing." (b) In Ready's case, "no report of a gun was heard in the hotel, although a maidservant was cleaning down the stairs at the time the catastrophe must have taken place." In the present instance the muzzle was probably a few inches from the skin, as the wound was round, smooth, and but slightly larger than the diameter of the bullet, and in the position of the body under the bedclothes, the course of the missile, and the attendant circumstances, strangely coincides with the facts adduced at the trial of Risk Allah, and strongly corroborates the educed verdict.

From these instances, it is unquestionable that death may be caused by the discharge of an explosive weapon, either on the part of the individual himself or by another, the muzzle applied close to or within two or three inches of the skin, with such a complete muffling of the usual accompanying report, as to cause no apprehension of the occurrence to individuals placed within six or ten feet of the injured person.

METROPOLITAN CONVALESCENT INSTITUTION.—The half-yearly court of the above Institution was held on Tuesday, at the offices, Piccadilly. The report stated that the admissions of patients during the half-year had been—at the Walton Asylum, 1219; at Mitcham, 140; and at Hendon, 169. In January last, in consequence of the prevalence of small-pox in the metropolis, it was determined that no patients should be admitted who were not under the protection of recent revaccination, and the Board is now happy to report that no case of that disease has appeared in either of the Asylums. The Walton Asylum is now complete in all its details, and affords accommodation for 280 patients.

(a) After taking one from the usual packet of ten, the rest were so carefully tied up as at first sight to deceive one as to their having ever been disturbed, and subsequently restored to their proper ammunition-pouch.

(b) From experiments made by M. Charrins, as reported in the *Medical Times and Gazette* already quoted, "When a gun is discharged close to the body, the wound is large and blackened; but if at a little distance, the wound was large and clean."

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

MIDDLESEX HOSPITAL.

PULSATING CAVERNOUS ANGIOMA IN LEG AND IN FOREARM—SUBCUTANEOUS LIGATURE OF THE TUMOUR IN THE LEG.

(Under the care of Mr. J. W. HULKE.)

MARY C., a housemaid, aged 27, was sent up from Surrey on April 24, 1871, to consult Mr. Hulke about a swelling in her leg. There was found, on admission, a semi-globular swelling above the inner ankle, overlying the inner surface of the tibia, disappearing almost completely on pressure, refilling when this was removed, most quickly when the limb was circularly compressed above the swelling, and more slowly when similarly compressed below. The swelling also pulsated distinctly and rhythmically, its diastole occurring a little behind that of the radial artery. The swelling was lobulated, two inches in diameter, and the skin was slightly thinned over the summit, where some large bluish veins were visible beneath it. There was also a slightly varicose condition of the right internal saphena. The tumour at the ankle had been first noticed in the patient's fourteenth year, when she said that it was quite small. In its present condition it increased temporarily, and became painful when she stood. There was also noticed—what the woman herself had paid but little attention to—considerable swelling of the front and inner side of the left forearm for about five inches downwards from the inner condyle, its girth at two inches below the condyle being ten inches and a quarter, that of the right arm being eight inches and three-quarters at the same point. The cutaneous group of ulnar veins was unusually distinct. The swelling was greatly reducible by pressure, and returned at once on this being removed. It had a soft, doughy feel, and communicated to the hand a purring thrill and rhythmical pulsation, which latter was even visible when the arm lay relaxed on the bed. Both thrill and pulse were arrested when the brachial artery was compressed, but this did not obviously lessen the bulk of the swelling. Her attention had been first directed to this swelling when she was about 20, by some pain in the part after unusual exertion. On the forefinger of the same arm there was an oval, elastic swelling, at the outer side of the first phalanx, the size of a bean, and a similar larger tumour above the right wrist; but neither of these pulsated, and they were clearly bursæ connected with the flexor tendons.

On April 26 chloroform was administered, and Mr. Hulke tied the tumour at the ankle in halves, subcutaneously, with the immediate effect of rendering it very tense and pulseless.

The operation was followed by some painful swelling of the part, and two days later the anterior and lower border was observed to pulsate feebly. By May 1 there was a free blood-stained puriform discharge, and carbolic acid lotion dressings were applied. Some discharge has been escaping since, but the pulsation quite stopped by May 3, and the tumour began to contract and harden. The tumour in the forearm has not as yet been interfered with.

EPITHELIOMA OF FOREARM SPRINGING UP IN AN OLD SCAR—AMPUTATION—RECOVERY.

(Under the care of Mr. J. W. HULKE.)

Henry R., a healthy-looking farm-labourer, aged 64, came up from Sussex on April 25, and was admitted into Forbes Ward with an exuberant warty condition of an old scar left by a lacerated wound of the forearm. Many years previously a waggon-wheel had crushed his arm, grinding away the soft tissues from the bones, and so severely injuring the limb that the man said that the wound had taken three years in healing. After this it continued soundly healed for thirty years, but ten years ago the thinnest point of the scar broke open, and gradually a warty excrescence formed, which slowly attained its present dimensions. When he had considered it becoming inconveniently large, he had been in the habit of paring it with a knife.

On admission the affected forearm was found to be in all respects less developed than the opposite limb, and both elbow and wrist were partly flexed from the contraction and cicatrization of the flexor muscles. On the inner and under surface of the forearm, from near the elbow downwards, was a pro-

minent, tuberos, warty, cauliflower-like mass sprouting from the old scar, measuring four inches by five, and exuding a scanty, thin, offensive discharge. There was no enlargement of the axillary lymphatic glands. There was no family history of cancer. The man had only lately begun to complain of gnawing pain in the part, which hindered sleep, and up to a recent period he had been able to perform his usual farm-work, ploughing, mowing, etc., using the arm freely.

On April 26 chloroform was given, and Mr. Hulke amputated the arm just above the elbow by the circular method. There was free bleeding, and many vessels were tied. Three hours later, however, arterial hæmorrhage recurred, the nurse having given the man a cup of warm tea. A tourniquet was applied, and Mr. Hulke sent for, and several more spouting vessels were ligatured. One vessel in the bone spouting freely after continued pressure, Mr. Hulke plugged it with a small peg of wood, and then closed the wound and applied carbolic acid dressings. The bleeding did not again recur, and the man rapidly recovered from the operation. He was allowed to get up, the stump being nearly healed, on May 13, but he has not yet left the Hospital. The microscopic examination confirmed the naked-eye appearances of epithelioma, the cells being of a large, coarse, squamous type.

EPITHELIOMA SPRINGING UP IN SCAR OF A BURN—REMOVAL—RECOVERY.

(Under the care of Mr. J. W. HULKE.)

Caroline D., a nurse, age 47, was admitted into Regent Ward on February 14, 1871, with an oval nodulated mass on the right side of the spine and over the lower part of the scapula. The surface was ulcerated and coarsely granulated, and discharged a very offensive sanguineo-purulent fluid. It was very painful, preventing her from sleep and from lying in comfort on the back or left side. In childhood she had been severely burnt on the back, and the wound had been three years in healing. Four months ago she received a severe blow upon the scar, breaking its skin and causing it to bleed very profusely. From that time a warty growth had appeared in the injured spot, and spread with great rapidity, in spite of caustics which had been applied to check its growth; and of late her general health had suffered. After she had passed several restless nights, from pain, on February 22 Mr. Hulke caused chloroform to be administered, and removed the mass with about an inch of scar tissue all round, and, as soon as the free bleeding was arrested, dressed the surface and edges of the wound with Vienna paste spread on small strips of lint, and covered all with carbolic oil dressing and cotton-wool. There was some troublesome oozing of blood for some time after her return to bed, necessitating the dressings being removed, but subsequently, as the eschar began to separate (March 2), a clean granulating surface was exposed, with healthy discharge. On March 20 the following note was made:—"The entire wound is now covered with small florid granulations. The discharge is moderate, inodorous, and creamy. The edges are thin, and from them a thin bluish pellicle of new skin is advancing on all sides. She is much freer from pain, and stronger." By May 5 the wound had cicatrised completely, save for a vertical stripe about half an inch wide, and the scar seemed perfectly healthy.

BIRMINGHAM GENERAL HOSPITAL.

A CASE OF FACTITIOUS URTICARIA (GULL).—A CASE OF PROTRACTED INTENSE MENTAL ANXIETY, CULMINATING IN AN ATTEMPT AT SUICIDE.

(Under the care of Dr. RUSSELL.)

Case 1.—The following case may not be uninteresting as an addition to two instances of factitious urticaria briefly related by Dr. Broadbent and Dr. Savage in the *British Medical Journal*, March 6 and 13:—It occurred in a woman of highly nervous temperament, aged 38. She had suffered from epileptic attacks with delirium for four months, and she assured me that the peculiar condition of skin to be noticed had only shown itself since the occurrence of fits. She also suffered from well-marked "spinal irritation," and it was whilst examining her spinal column, and drawing my finger over the spinous processes, that I was struck with the broad line of intense injection which followed. I then found that the pressure of pleats in the clothes was indicated by the production of similar vascularity, so that the lower part of the trunk, where the clothes were bound round the body, presented a curious patchy state of

white and deep-red. Her skin had always been "tender," so that a fleabite would cause a blister. She has also had some tendency to bruising and to hæmorrhage from slight wounds. The abnormal state of her skin has now become so troublesome that she is obliged to wash her face without soap, and to use only tepid water; after washing, her face looks and feels for half an hour as if scalded. If she carries her baby she bears marks on her arm for an hour. On drawing a blunt instrument along her skin, sometimes instantly or in a few seconds, but generally in a minute and a half, the several follicles started into prominence. Where their development was rapidly effected, the appearance they presented, as they followed the course of the instrument, was very remarkable; they had the appearance of minute vesicles. They then appeared to spread themselves as the contraction of the cutaneous fibres extended from each as a centre, and in two minutes or two minutes and a half they were lost in a broad flat wheal, with perfectly straight, sharply-defined margins, a quarter of an inch broad, and of the thickness of thickest cardboard. At the same time a bright crimson blush extended itself in all directions; and when the wheal was fully formed it stood forward of a faint pinkish-white colour, surrounded by a bright crimson areola an inch in breadth. I drew the name Mary on the back in large letters, and it could be easily read at the end of a long room. She stated that an hour usually elapsed before the wheals subsided, and from our observation this was probably correct. The wheals were best seen on the chest, back, and face; less so on the forearm, and, as remarked by Dr. Gull, were not produced on the thenar and hypothenar eminences, where the cutaneous contractile fibres are few. I repeatedly measured the distances between two marked points upon the skin, but I did not find that they at all approached one another after the production of the wheals, whether the interspace were narrow and occupied by a single broad wheal, or whether it was broader. The interrupted current, primary and secondary, from Stöhrer's battery, whether feeble or powerful, did not produce any effect in raising wheals; nor did the persevering application of chloroform reduce them after they had been produced. A wheal was frozen by ether spray. After thawing, the wheal remained unchanged at first, but the entire surrounding district, previously bright red, became covered with elevated follicles, and by degrees the original wheal was lost in a broad wheal which spread from it, and finally occupied the entire space which had been frozen. Another district was frozen, and then scratched, after having thawed. Bright vascularity and goose-skin resulted, and in ten minutes the space was occupied by a wheal, the vascularity having previously subsided. The skin on one trial was found decidedly hyperæsthetic to the battery, and a hair drawn over it excited a "dither." On another occasion the hyperæsthesia was less marked. She had no itching in the skin, but a sense of heat attended the production of the congestion. My friend Dr. Denne was kind enough to examine the optic discs on two occasions. He found a varying tendency to anæmia, the arteries being small. The site of the anæmia was different at each examination. Dr. Gull notices that the susceptibility of the skin, which is the cause of these phenomena, may be hereditary. There was no evidence of it being so in my patient, though her sister had had some epileptic attacks, and her two children exhibited only a doubtful tendency to vascularity of the skin. I should add, that she had suffered from the spinal irritation for two years. I may just say that belladonna and bromide of potassium both failed in relieving this troublesome tendency.

It is curious to note the different ways in which a morbid sensibility of the skin may manifest itself in different individuals. My friend Dr. Denne has at this time a case of factitious urticaria in which a wheal alone is developed, without any congestion of the surrounding skin. Trousseau's cerebral maculæ in "cerebral fever" are well known. I produced the same phenomenon the other day in a case of deep jaundice with intense itching, but no wheals; and also in a patient suffering from a severe form of hypochondriasis, in whom profuse perspiration is a prominent symptom of her attacks. In a case of mild urticaria, when the itching was absent, scratching scarcely produced any result; and finally, in a child now in the Hospital, the subject of very chronic pemphigus, in whom the disappearance of the bullæ has left the skin covered with a dull mottling, slowly reproducing itself after pressure, a scratch with the nail left a white line, from which a belt of pure whiteness gradually spread itself on either side, just as the redness in the case detailed above, and subsided again in five minutes, leaving the original scratch very distinctly marked by its colourless line for a quarter of

an hour or twenty minutes. The other day, in a lady of nervous temperament about to submit to an operation, an experimental use of ether spray to a small patch in the arm was followed immediately after thawing by a bright red patch, as in my patient, covered with prominent follicles; but the whole speedily subsided without any wheal having been produced. It is, of course, needless to remark that the "spinal irritation" in my patient had no necessary connexion with the irritable state of the skin. Were the statement required, I could support it by the fact that, by a curious coincidence, I had at the same time in the Hospital a man suffering from epilepsy with delirium and from very severe spinal irritation—precisely the combination which existed in the preceding case—but no effect whatever resulted from scratching the skin.

Case 2.—I have thought the following graphic description worth transcribing, from the illustration it affords of the influence exerted by protracted intense anxiety upon mental and bodily health. It powerfully exemplifies a condition of complete self-absorption, resulting from the mind having been habitually turned in upon itself by some predominating impression, and the effect in destroying the capability for sleep and withdrawing nerve power from the full performance of the bodily functions:—A respectable man, aged 54, whose brother had been insane, but who had been himself free from any mental infirmity, had been exceedingly harassed for fifteen months by anxieties in business, occasioned by his having rendered himself responsible for goods procured for one of his principal employers, who, by dishonest practices, gradually fell into a state of bankruptcy. My patient got remittances from time to time, with great impotunity, through other hands than those of his employer, whilst he still allowed himself to be persuaded to increase his liabilities. He was repeatedly reassured by fair promises, but three months ago he lost faith, and with loss of faith his mental health gave way. "He had always been a very particular man about his payments, had always paid his way, and had never been in no trouble at all." His sleep, which had been disturbed for the preceding twelve months, was now almost lost. He positively affirmed that for five weeks prior to his admission he had not slept at all, and his wife, who watched him closely, asserts that this hardly amounts to an exaggeration. If he fell asleep he "got to dream, and fought and choked so that it was necessary to awake him." "He was always in a lot of trouble in his sleep, and was perpetually falling down high places." He would get up and go downstairs, taking his pillow with him, and doze for a few minutes at a time with his head on the kitchen table. Then he saw phantoms; he told his wife that there was something on the mantel-piece with two faces and no body. He can't describe what he saw in his sleep, but he fervently hopes he shall never see the like again. With all this he grew strange and desponding by day, so much so as to be remarked by his neighbours. He preferred sitting for an hour at a time in a neighbour's shop, doing nothing and never speaking. Then he wandered about the roads, and one day he lost himself so completely in a place he was in the habit of passing daily, that he was obliged to apply to a passenger, who brought him home, when he told his wife that he had lived in Birmingham all these years, and now had to ask his way to his own house. He took little food. His wife tells me that for a week together he had hardly anything but a cup of tea and a bit of bread-and-butter in the morning. Then he would have a glass of something to drink, and that made him worse. He does not suppose he had a good meal for an entire month. He lost flesh rapidly. A month ago he lost nearly a stone weight in the course of a fortnight, but subsequently partially recovered his flesh. He had no dyspeptic symptoms, but suffered from occipital headache, and from so much vertigo that he fell more than once. At last his misery culminated in an attempt at self-destruction. He left his house at five o'clock one morning, and returned with his clothes saturated with rain; went upstairs, and, there is no doubt, mixed some powder containing strychnine with some egg and tea which his wife carried up to him. He has not the least recollection where he purchased the dose, nor does he even remember having done so; but soon afterwards he called up his wife, and wished her good-bye, telling her that he had taken poison. The symptoms of strychnism were sufficiently pronounced to indicate the truth of his assertion, though it was evident that a fatal dose had not been given. When brought into the Hospital he manifested so much excitement that the nurse believed he was about to have a fit. He did not attract any special notice for several days when I received the preceding history. He was then partially recovered, though he remained exceedingly restless, disturbed, and anxious. His pulse was 60. His pupils con-

tracted to a pin's point, and refused to dilate. He was still entirely sleepless. A combination of chloral and bromide of potassium has succeeded in gradually restoring sleep and in effecting a surprising change in his whole demeanour. He has regained his cheerfulness, has lost his restlessness, and recovered his appetite, though to the present time, a fortnight after the beginning of amendment, his pupils are as minutely contracted as ever.

SATURDAY, JULY 8, 1871.

THE GENERAL MEDICAL COUNCIL.

THE Government has not followed the precedent set by the nomination of Mr. Teale and of Dr. Rumsey, and again returned a provincial Practitioner of eminence as one of the representatives of the Crown in the General Medical Council; but by nominating a leading London Physician has clearly given colour to the suspicion that they desire to narrow rather than to widen the representation of the Profession in the Council. Personally, Dr. Gull would be most warmly welcomed in any Professional assembly, and we have no doubt that his practical sagacity and wisdom will prove of the highest value in the deliberations of the Medical Parliament. But we cannot but feel that it is a pity the opportunity has been lost of returning some provincial general Practitioner of eminence. With the exception of one gentleman, the whole of the English members of the Council are in the ranks of pure Physicians and Surgeons. Practically, we believe there may be no harm in this, but yet we doubt the policy of such an arrangement. Hitherto it has been said, in answer to the outcry for direct representation, that the Crown representatives are really the representatives of the Profession. If this be so, it seems to us a mistake that one of them, at least, has not been selected from the ranks of the great mass of the Profession. In saying this we would disclaim in the strongest terms any feelings except those of high satisfaction in seeing Dr. Gull a member of the Medical Council. As we have said, his counsel and assistance there cannot fail to contribute greatly to the value of its decisions. But we would rather that a place which has been hitherto filled by a provincial Medical man should not have been occupied by a metropolitan Practitioner, even of the highest rank.

The opening address of the President was marked by a feeling of regret, in which, when we place ourselves in the position of the members of the Medical Council as they met in 1870, to discuss the Medical Act Amendment Bill of the Lord President of the Privy Council, we frankly own we share. That we regret the fate of the Lord President's Bill, when, after being altered and spoiled in the House of Lords, it was turned out of the

House of Commons, we utterly deny; but we shared the hopes which the Bill as originally drafted raised; and if, with some few alterations, which at the time we pointed out as necessary, it had been passed by both Houses of the Legislature, we entirely agree with Dr. Paget that "it would have removed the chief obstacles to the further improvement of the education of the Medical Profession, the real obstacles to the advancement of its social status, and the more general attainment of Professional excellence." The mischief, however, was done when the Lord President of the Privy Council, by the omission of Clause xviii., omitted everything that made the Bill valuable, and converted it into a measure for adding three more to the existing Medical qualifications in the United Kingdom. We, however, can sympathise with the President of the Council when he recounts the sacrifices of interest made by the representatives of the various Corporations and Licensing Bodies as they swelled the majority in the Council in favour of the Bill. We would only observe, from the opposition which the Bill met with in the House of Lords from various of the Licensing Bodies, it was clear that those Bodies did not share the self-sacrificing heroism of the majority of the Council in which they were represented.

In replying to the questions put by Dr. Acland and by Dr. Stokes as to the causes of the failure of the Bill of last year, and as to the chances of fresh legislation, the President of the Council added nothing to the information which we have heretofore given our readers on these subjects. The last point on which the Bill struck, and on which it went finally to pieces, was that of "direct representation" raised by the British Medical Association. Dr. Paget could only repeat Mr. Forster's statement that it was "the wish and anxiety of the Government" to bring in a new Medical Bill next year, but really, with the number of questions pressing upon them, they could not pledge themselves to do so; but they would throw no difficulties in the way of private members who might attempt the task. We are happy to believe that it would not be necessary for the Government to throw difficulties in the way of any member who might attempt, without the consent of the governing bodies of the Profession, to induce Parliament to alter its constitution.

A short debate on the Conjoint Board scheme took place incidentally on the first day of the session, which was chiefly remarkable on account of imputations thrown on the College of Surgeons of England by the new member nominated by the Crown, and indignantly repelled by the new member who represents that body. We cannot but think that this passage of arms, although it certainly enlivened the rather gloomy character of the first day's proceedings, was somewhat premature, inasmuch as we believe at present very sincere efforts are being made by all the Corporations to come to a mutual understanding on the subject, whatever Dr. Gull's experience of the last fifteen years may portend.

The report of the Committee of Professional Education, which, on the motion of Dr. Parkes, was received and entered on the minutes, is a document of great importance and value. It chronicles some very important improvements made in the system of education and examination by the Royal College of Physicians of London, the Royal College of Surgeons of England, and by the London Apothecaries' Society. These improvements—the requirement of the evidence of practical and clinical study by the production of proof on the part of the student of his having filled the offices of dresser and clinical clerk, and by submitting him to the test of practical examinations—are thus commented on by the Committee:—

"It is impossible to overrate the effect which the regulations of these great Licensing Bodies (to whom the majority of English students go for their licences) will have on Medical teaching in England. A great part of what was desired by the Committee of Education has been thus obtained, and it seems only just that the Council should fully recognise the improvements which have been made."

Some of the Scottish and Irish bodies have also instituted clinical and practical examinations; and the Committee adds:—

"It cannot be for a moment supposed that these alterations are made in the letter only, and are illusory. We believe they are what they profess to be, and believing this, we must allow that the Licensing Bodies have shown a determination to improve their curricula and examinations, and that in several cases both are now much more efficient than formerly."

With this praise, which all must allow to be high, the Committee proceed to point out that there are certain suggestions in the Education Report which have yet to be carried out, and they specify four:—First, the separation of the teaching of pharmacy and therapeutics; secondly, the lengthening of the period assigned to the study of midwifery; thirdly, they call attention to the non-adoption by several bodies of the recommendation that pathological anatomy shall be made a separate course; and, fourthly, the Committee strongly advise the enforcement of more regular class examinations. They state that the Society of Apothecaries of London has ordered that all students should produce evidence of having undergone these examinations, and they advise the Council to urge on all the Licensing Bodies to issue regulations requiring that written class examinations should be frequent. The Committee then pass on to the question of legislation and of conjoint boards. They remind the Council of their resolution of February 26, 1870, which decided in favour of the formation of a joint Examining Board in each division of the Kingdom, and they conclude by recommending the Council to again send a copy of that resolution to each Licensing Body, and that the Council should send a deputation to the Lord President of the Privy Council, to urge the desirability of such legislation as may carry out the object the Council proposed in passing the resolution of February, 1870, and which Lord De Grey had in view when he introduced his Medical Bill of 1870.

As the principal of these points will successively be discussed by the Council, we reserve our comment on them until next week; merely now observing that, whilst we hold Conjoint Examination Boards to be a most necessary reform, we cannot but think that fresh legislation is unnecessary as it will certainly be dangerous. The 19th clause of the Act of 1858 states that—"Any two or more of the Colleges and Bodies in the United Kingdom mentioned in schedule (A) to this Act may, with the sanction and *under the directions* of the General Council, unite or co-operate in conducting the examinations required for qualifications to be registered under this Act." We believe that all legal powers necessary for the formation of a Conjoint Board in each division of the kingdom are contained in this clause. Its only defect is that it is permissive, and we believe that it is the fault of the Licensing Bodies, or of the General Medical Council, or of both, if this great and needed reform be not at once inaugurated.

The proceedings of the first day terminated with a short debate on the present objectionable tabular form of returns made by the Army and Navy Examining Board, which, in a curious way, lumps together in an aggregate number the candidates who have not obtained a sufficient number of marks to obtain appointments, and the candidates who, although they have passed the necessary examinations, have not received appointments from the fact of there being no vacancies. The numbers have been quoted in Parliament and elsewhere as if all these persons had been rejected for incompetency, and thus an erroneous impression has been left on the public mind. A committee was appointed to consider and report on this subject. Here we must stop. Next week we shall continue our commentary on the proceedings of the session.

At Eccles and Patricroft a society for the relief of families afflicted with the prevailing epidemic—small-pox—has been formed.

THE ARMY BILL AND THE MEDICAL SERVICE.

THE proposed transfer of the power of appointment of officers of militia from Lords-Lieutenant of counties to the Crown will afford the opportunity of carrying out one of the many suggestions for the acceleration of promotion in the Medical Department of the Army. During the interchange which will be constantly taking place between the active and the reserve portions of the army, it will be impossible to keep up a continuous Medical history of individual soldiers and, *à fortiori*, of the whole army, unless a uniform system of observation and record be maintained from the first enlistment till the final discharge of each soldier. As a matter of State Medicine it would be a very grave error of omission if the constantly accumulating facts respecting the health and sanitary condition of the army, which under the present system are so fully recorded in the annual reports of the Army Medical Department, should be permitted to lose any of their value from the incomplete character which they would assume if they referred only to the period passed on service in the regular army. In order to effect this necessary continuity of record, to train the young soldier in the habits conducive to individual and aggregate health, and to enable the old soldier on joining the home army to continue in the practice of such habits, not only for his own advantage, but as an example to the younger men, it is evident that a trained staff of Medical officers, whose whole time can be devoted to the work, must form a very important part of the militia and reserve forces of the future. It is also evident that the material for such a staff, both in the administrative and executive ranks, already exists among the present Medical officers of the army on full or half-pay; and that the introduction of a system of optional retirement from the general service at twenty years, instead of twenty-five, on £1 per diem, so frequently advocated by ourselves and our contemporaries, and again advanced by "X. Y. Z.," conditional on enrolment in the Medical Reserve, with liability to being called out for active service at home or abroad, would place at the disposal of the authorities a number of experienced military Surgeons, from whom selections could be made for service in the militia. Officers so employed should, of course, have their retired pay brought up to the full-pay rates of their respective ranks in the Militia Medical Service.

There would thus be established two distinct currents of relief to the now nearly stagnant stream of promotion in the Medical service of the army, composed respectively of Medical officers retiring completely on the £1 per diem, taking the remote chance of being called on again to serve, and of those partially retiring into the Medical service of the militia.

If to some such scheme as we have slightly sketched were added a provision for compulsory retirement from the inspectorial ranks after, say, fifteen years, or on reaching 60 years of age—the period at which retirement from the administrative ranks of the control department becomes compulsory—we should, as demonstrated by "X. Y. Z.," have the Medical Department of the Army composed of men of shorter service, on rates of pay so much lower as to counterbalance the expenditure caused by the retirement of Surgeons of twenty years' service on £1 per diem.

THE PRESSURE MEAT-PRESERVING PROCESS.

WE have recently drawn attention to the fact that, in the preparation of extract of meat by Liebig's process, the stimulating and not the nutritive parts are preserved. A process has been recently patented by Mr. T. F. Henley, an engineer of great experience, the aim of which is to extract, by simple pressure, a large portion of the juice from the fibres of meat, and to leave the latter in an available condition as food if preserved simply by moderate desiccation. Thus, there is a twofold product—meat-juice and meat dried. The meat-juice, rich in

extractive matters, and containing over 50 per cent. of albumen, is evaporated in vacuum pans, so as to retain its solubility, flavour, and unchanged alimentary process. The method of preservation relied on is the oldest and the safest—that of abstracting moisture at low temperatures—and the mechanical means adopted do away with the use of water, much heat, and the coagulation and separation of albuminoid matters, which, in Liebig's process, lead to unnecessary expense and wastefulness.

The apparatus used by Mr. Henley consists in powerful presses and evaporating pans. There is no complication in the process, and it does not call for scientific experts to superintend its application. This may be seen by anyone visiting the experimental laboratory at 3, Great Winchester-street-buildings, where, under Professor Wanklyn's directions, some interesting researches are being prosecuted on the subject. Prange's Estancia Company have undertaken to afford all facilities for the meat-juice and pressed meat on their estate in Uruguay; and, anticipating a successful solution of the long vexed question of meat preservation, they have for some years been rearing and fattening cattle, so as to take advantage of any opportunities that might be afforded them.

Meat-preserving establishments are starting up in all directions in the River Plate, Australia, and other cheap-meat-producing countries. Annual reports have recently been very favourable, and an ever-increasing amount of capital is sure to be directed towards providing the food we so much need. It is not one, but many, processes whereby a great result is to be obtained, and meat supplied in various forms suited to different tastes. Mr. Henley has the merit of introducing a cheap plan, which does away with tins and other expensive methods of packing, and gives us raw produce fit for the cook, without foreign admixtures. It may be regarded as a great advance in the art of economising waste material; for what can be more wasteful than turning a bullock (all but its flesh-juice) into manure? and by Henley's process not a particle of nutriment is lost. Mr. Wanklyn reports that the meat-fibre, after having lost the amount of fluid essential to its complete preservation, is twice as rich as the best salt meat. In salting, however, not only is juice extracted, but a large amount of salt is added to the meat, and to this we have to attribute scurvy when sailors are fed on it exclusively.

The time has arrived for a supreme effort to feed the people of Western Europe. France is still rich, but not in meat; and whereas the French have taken more readily than ourselves to using Liebig's extract, they will greedily utilise anything tending to give them a cheap and abundant meal. The *pot au feu* must be kept boiling; and how much more will they appreciate it with a savoury meat-juice than a stimulating *entremet*, the cost of which places it beyond the reach of many.

THE SMALL-POX EPIDEMIC.

JUDGING from the mortuary tables, small-pox in the metropolis would be regarded as having been nearly stationary for the last two or three weeks. The deaths registered last week were 235, against 232 the week before. There was an increase in the deaths of small-pox patients in the North districts and a considerable increase in the East, but there was a diminution in all the rest. The numbers were: West districts 23, North 66, Central 11, East 60, and South 75. But it is certain that the epidemic is attacking fewer people now than it did three or four weeks ago. Although the returns made by the Health Officers are necessarily very imperfect, yet, so far as they go (and they represent the progress of the disease in certain parishes in all parts of London), the reduction in the number of fresh cases last week is shown to be very marked. A few weeks of steady summer weather would make a still more decided impression. The City Small-pox Hospital has been closed. We are sorry to observe that the epidemic continues to spread in Sunderland, where last week 54 deaths were

registered, equivalent to an annual death-rate of 29 per 1000 persons living. This death-rate from small-pox was last week equal to that from all causes in Edinburgh. At Newcastle, 25 deaths from small-pox were recorded, equivalent to an annual death-rate of 10 per 1000. The disease continues to abate in Liverpool, but it has broken out with epidemic proportions in Manchester and Salford, where 23 deaths were registered as due to this cause last week.

It is curious and interesting to notice how the epidemic breaks out in succession in different towns; and when it has come to an end it will be an important subject for comment. At about this time last year it was raging with violence in Paris, and we were congratulating ourselves, although tremblingly, upon our own exemption. There were not wanting those who attributed this to our superior vaccination arrangements, and who took the opportunity of throwing discredit upon the practice of heifer vaccination so largely resorted to in that city. But by the time that Paris was invested by the German armies the epidemic there had undergone a marked decline, and within a very few weeks an outbreak happened in London which, taken altogether in its duration and severity, has certainly been no less remarkable. It broke out in Liverpool about the same time, but, while for a period more severe than with us here, it has subsided much more quickly. It attained its maximum there in the fourth week of February; but in London the maximum deaths were recorded in the first week of May. As it was declining in Liverpool it broke out in Southampton—namely, in the last weeks of March—and about the same time we began to hear of a severe epidemic at Grimsby and a threatened outbreak in Newcastle. A little latter—namely, about the time of the highest small-pox mortality in London—the neighbouring town of Sunderland became seriously invaded. In this town the rapidity of the progress of the epidemic has been unparalleled by any town of which the Registrar-General gives us information. During the last weeks of April he recorded 2 deaths per week from small-pox; but from the first week in May onwards the weekly deaths recorded have been 4, 9, 9, 12, 18, 26, 46, 43, and 54. And now we hear of 23 deaths in Manchester and Salford, against 6, 17, 9, and 11 in the four previous weeks. And all this might have been prevented! but warnings and threatenings fall upon deaf ears and preoccupied minds. There is yet time granted to our other large towns and cities; to Hull, only separated from Grimsby by a few miles of an arm of the sea; to the seething manufacturing population of Leeds and Bradford, Birmingham and Sheffield; and to the maritime population of Bristol and Portsmouth. Should it reach these towns, as it probably will before long, and find them still unprepared by an universal vaccination of the infants and the revaccination of all the young persons and adults, even the outbreak in Sunderland may be thrown into the shade by the severity of the disaster that would follow.

THE WEEK.

TOPICS OF THE DAY.

AN important, although at present a partial step only, has been taken to the formation of a Conjoint Examination Board for England. We understand that a scheme has been all but arranged between the Royal Colleges of Surgeons and Physicians for the formation of a Conjoint Board, the basis of which is to vest the nomination of examiners in a committee chosen by the four Universities and two Colleges. It will be seen that the Society of Apothecaries has not as yet given in its adhesion to this scheme. It is clear, however, that no satisfactory Conjoint Board of Examiners can be formed without that Society being represented in it. But it is understood that there are legal questions relating to the Act of 1815 at present under the consideration of counsel, which must be decided before the desired combination can be effected.

We regret much to hear that Dr. Hyde Salter has been obliged by indisposition to resign the Physiciancy to Charing-cross Hospital. Dr. Silver, the senior Assistant-Physician, will be promoted, and there will be a vacancy for an Assistant-Physician.

The last phase of the case of Edward Cunningham Craig against Miss Jex Blake seems to have ended somewhat disastrously for that lady. A bill of exceptions was taken by Miss Jex Blake's counsel to the decision of the judge who tried the case (Lord Mure), as to the admissibility of certain portions of evidence, and to his ruling in addressing the jury. The Court unanimously disallowed all the exceptions, and gave Mr. Craig expenses.

Professor Agassiz has started on an expedition to do for the Pacific what Dr. Carpenter has been accomplishing for the seas of Europe. He has had a coast-survey steamer placed at his control, and he will examine by deep-sea soundings the waters of the Pacific Ocean along the coast of North America. It may be expected that not only natural history, but geology, will be advanced by this expedition, and by the practised acumen and powers of research of the great Transatlantic naturalist.

A report that Weymouth was devastated by small-pox, which appeared in the *Times*, has been contradicted by the Mayor of the town, who, quoting Dr. W. J. Smith, states that, "in the three weeks ending last Thursday, only seven deaths from small-pox occurred, all of unvaccinated persons." The question, however, which people would like to have answered before going to Weymouth, is, What number of cases of small-pox do these deaths represent?

One William Jack, of 11, Macclesfield-street North, City-road, was fined last week, at the Clerkenwell Police-court, in the sum of £3, for "unlawfully selling poisonous substances by retail, without a cover bearing the name of the article, the word 'Poison,' and the name and address of the seller." The summons was taken in consequence of a case of suicide investigated by Dr. Lankester. Might not this law be put in force against herbalists and other quacks who vend poisonous plants and drugs?

The *Court Circular* of July 3 contains an account of the investiture by the Queen of Inspector-General Sir David Dunbree, M.D., and Director-General of the Medical Department of the Navy Sir Alexander Armstrong, M.D., with the insignia of Knights Commanders of the Bath.

ELECTION OF MEMBERS OF COUNCIL AT THE ROYAL COLLEGE OF SURGEONS.

THE annual election of Fellows into the Council of the Royal College of Surgeons took place on Thursday, the 6th inst., in the library of the College. There were four vacancies to be filled up, caused by the retirement, in the order prescribed by the charter, of Messrs. Edward Cock, the late President of the College; George Busk and Frederick Le Gros Clark, who offered themselves for re-election; and of Mr. Lane, who declined being put in nomination for re-election; these gentlemen are all members of the Court of Examiners. The other candidates, who offered themselves for the first time, were—Mr. T. Spencer Wells, of the Samaritan Hospital; and Messrs. George Critchett, of the London Hospital, and Barnard W. Holt, of the Westminster Hospital, Fellows by examination.

Punctually to the time appointed—viz., two o'clock—Sir William Fergusson, Bart., the President of the College, accompanied by Messrs. Busk and Hancock, the Vice-Presidents, entered the large library where the elections are conducted, and shortly addressed the Fellows, pointing out the mode of conducting the election, which is by ballot. On the present occasion a novelty was introduced: boxes or compartments were fitted up, where the voting papers could be filled up in secrecy, without attracting the attention of a curious or inquisitive

person, on the plan recently adopted for taking the votes for members of the School Board. The voting then commenced, and was not brought to a close until five o'clock, when the President invited any Fellow so inclined to check the account taken, as usual, by Mr. Stone. On the conclusion of this ceremony, the President declared that the choice of the Fellows had fallen on Messrs. Wells, Critchett, Le Gros Clark, and Busk.

The numbers for each candidate were as follows, viz. :—

Mr. Wells . . .	131, including 4 plumpers.
Mr. Critchett . . .	130, „ 7 „
Mr. Clark . . .	127, „ 9 „
Mr. Busk . . .	117, „ 1 „
Mr. Holt . . .	104, „ 7 „
Mr. Cock . . .	74, „ 10 „

In the evening a large party assembled at the annual festival held at the Albion Tavern, under the chairmanship of Mr. Carden, of Worcester. We defer until next week an account of the proceedings.

UNIVERSITY COLLEGE AND HOSPITAL.

MR. BERKELEY HILL and Mr. Christopher Heath have been promoted Surgeons to University College Hospital, and Dr. F. T. Roberts has been appointed Assistant Teacher of Clinical Medicine. A scheme for the distribution of a Sharpey Physiological Scholarship in the College has been adopted. It is expected that the annual value of the scholarship will be about £100.

THE NEW POOR-LAW SANITARY INSPECTORS.

WE understand that Surgeon-Major A. D. Home, C.B., V.C., of the Army Medical Service, has been nominated for one of the recently established Sanitary Inspectorships under the Poor-law Board. Mr. Home has for some time past, with the sanction of the military authorities, been employed probationally in his new office, to enable him to complete his period of twenty-five years' service in the army. His permanent appointment has, we believe, been somewhat expedited by the fact of his having again come near the top of the roster for foreign service. We are glad to see that the first selection to such appointments has fallen upon an army Medical officer of distinguished service and acknowledged abilities, and we have no doubt that this recognition of the claims of their brother officer to fill such a responsible and lucrative post will create much pleasure among the Medical officers of the army, and encourage many of them to persevere hopefully in pursuit of the necessary qualifications, for the acquirement of which their duties both at home and abroad afford peculiar advantages.

THE MORTALITY AT BUENOS AYRES.

THE latest advices from Buenos Ayres put us in possession of some ghastly statistics of the late yellow fever plague. During January, February, March, April, and May the epidemic raged, and during the nine days from April 3 to 12, 3985 are said to have died out of a population of about 70,000. On the 11th the Board of Health ordered all who could do so to leave the city. During the visitation 23,000 appeared to have perished. From a list of poor patients attended on behalf of the British Legation, it appears that during an interval of a month, out of a total of 67, 50 were cured, and 17 died. These deaths were all males of the average age of 35 years. Out of 4000 victims whose ages have been ascertained, 1800 died before the age of 30, 1600 between the age of 30 and 50, and 600 between 50 and 90. That is, out of every 20, 9 died under 30, 8 between 30 and 50, and 3 between 50 and 90. Considering the relative ages of the population, the greatest mortality had been amongst those who had passed the prime of life. This mortality had been the greatest amongst the males, especially between the ages of 30 and 50.

DR. GULL AND THE GENERAL MEDICAL COUNCIL.

DR. GULL has been appointed to succeed Mr. Rumsey as a Government member of the General Medical Council.

WOMEN DOCTORS IN RUSSIA.

THE Emperor of Russia is favourable to the admission of women to the Medical classes of the University of Helsingfors. He has given public intimation of this fact. It is understood that he was memorialised on the subject by his Finnish subjects.

ARMY MEDICAL DEPARTMENT.

It has been decided that the office of Director-General shall for the future be tenable for seven years. This decision has been arrived at in consequence of the results of a return laid before Parliament showing the dates at which the Medical officers employed in the Director-General's department entered on their duties.

INSANITY IN FRANCE.

THE number of cases of mental alienation produced by the excesses of the Commune, amounts, according to official report, to more than 500. The victims are, for the most part, mothers, wives, sisters, or intended brides, who saw the objects of their affection violently torn from them, either on a suspicion of reaction or on a charge of non-compliance with the military law. Very few of the latter category have returned, for the Federal chiefs always took care to place them at the points most exposed to danger.

INDIAN MEDICAL SERVICE.

WE learn by the last *Homeward Mail* that the following commissions have been granted by the Secretary of State to the subscribers to the Madras Medical Fund, and their families, with effect from April 1, 1870:—Annuity Branch: A grant equal to the value of ten large annuities. The grant, from 1870, of five large annuities, and one small annuity every year, and one small extra annuity every other year. Charity Branch: An increase of 23 per cent. per annum, on the rates of pension which existed in 1868, to widows and to daughters over age, and of 28 per cent. per annum, on the same rates, to sons and daughters under age. The pensions of widows and of daughters over age were increased by the Service 5 per cent. from January 1, 1869. All the pensions from the Charity Branch will therefore be 28 per cent. higher, from April 1, 1870, than they were in 1868.

THE SOPHIA NURSES.

UNDER this title it is proposed to found an institution at St. John's House, North-end-road, Fulham. In consequence of the immense mortality from "baby-farming" it was considered desirable to establish a home for infants, where they would be carefully nursed and fed. The nursery would be to some extent self-supporting. It was deemed advisable to charge such of the mothers as are able to pay a certain sum for the maintenance of their children, so as to avoid the risk of giving any encouragement to immorality. A complete staff has been formed, and an influential list of patrons and patronesses obtained. Dr. W. S. Playfair is Consulting-Physician, and Sir W. Fergusson is Consulting-Surgeon. The following is extracted from the prospectus:—

"A large and commodious house, in a healthy situation in the suburbs of London, has been secured; a suitable staff has been engaged, and arrangements have been made which will ensure the bringing up of the children according to the strictest hygienic laws. As a safeguard against the abuse of this charity, only the *first* children of unmarried women will be received, and after a proper investigation of the case. Although the institution will be, to a certain extent, self-supporting, it is evident that the expenditure will greatly exceed the receipts, and, therefore, contributions in aid of this scheme will be absolutely necessary. In addition to the good results hoped

for as regards the children, it is intended to assist the mothers to obtain suitable employment, and thus aid them to regain the respectable positions from which they have fallen."

NEW HOSPITAL FOR WOMEN, BIRMINGHAM.

ON Tuesday the Election Committee met for the purpose of appointing four acting Honorary Surgeons. There were eleven candidates for the four vacancies, and all the gentlemen, with one exception, were local Practitioners, and of good standing in the town. The election was conducted by means of voting-papers, and resulted in the return of the following gentlemen:—Mr. J. C. Bracy, Mr. Thomas Savage, Mr. Ross Jordan, and Mr. Lawson Tait. It would be impossible for the authorities of this young Hospital to have a more able staff of Medical officers. The appointments have given general satisfaction.

ROYAL COLLEGE OF SURGEONS.

IN his annual report to the Museum Committee, which has just been published, Professor Flower, F.R.S., the indefatigable Conservator, states that the additions to the pathological series rather exceed those of last year, and adds that the recent modification of the staff will be the means of effecting in future a still larger and more systematic annual development of this series than has hitherto been the case. Dr. Thurnam, of the Wilts County Asylum, has recently presented a collection of nearly fifty specimens, many of which are of considerable interest.

One of the principal novelties in the Osteological Collection is the skull of a very large sturgeon, in which all the cartilaginous portions—constituting, in fact, the greater part—which cannot be preserved by any known method in a condition suitable for ready examination, have been carefully modelled in *soft wood*, and the ossified portions fitted to them in their natural relations. The form of the brain cavity, and the position, course, and size of the various nerve-apertures excavated through the great central mass of cartilage of which the skull is composed, have been carefully reproduced by the ingenuity of Mr. James Flower, the articulator to the College.

The skeleton of the horse which has stood for many years in the Eastern Museum, and so often and erroneously stated to be that of "Eclipse," has been replaced by a finer and more characteristic specimen, being that of the celebrated racer "Orlando," who died at the Royal Paddocks, Bushey-park, at the great age of 28, and whose remains were obtained for the Museum with the permission of her Majesty, through the kind intervention of Mr. Sudlow Roots, of Kingston, a Fellow of the College. Another noteworthy skeleton is that of the little hippopotamus born in the Zoological Gardens in February last, and which lived but two days. It excited some interest, as being the first of these animals produced in this country, and affords an exceedingly good skeleton, valuable as showing the condition of development of the bones at that early period of life.

Mr. Crowther, of Hobart Town, a valuable contributor to the Museum on previous occasions, has sent home the skeleton of a fine sea leopard, and several skeletons and fœtuses in spirits of cetaceous animals.

The art of preparing mounted skeletons is one which has made great advances in recent years. Not only is much more care bestowed than was generally the case in former times, on preserving all the smaller bones, as the sesamoids, hyoids, etc., and in retaining them in their proper relation to the more conspicuous elements of the skeleton, but numerous mechanical arrangements have been invented, by which the various surfaces of the bones can be examined separately without interfering with the remainder of the skeleton.

The continuation of the revision of the great Hunterian series of specimens of physiology and comparative anatomy by Professor Flower has resulted in some fine and interesting additions to the Museum. The whole of the division appropriated to

the nervous system and organs of the senses, which was formerly in an extremely unsatisfactory condition, has now been put into perfect order. A number of brains which had been accumulating for several years have now been catalogued, and form a very instructive and important series; 206 of the old preparations have been remounted during the year, and 119 new ones added.

The Dermatological Collection has been arranged in systematic order. A descriptive catalogue of 513 models, drawings, etc., has been completed and published by Professor Wilson at his sole expense, and presented by him to the College.

Catalogues of the Teratological and Calculi Collections are in progress. The Collection of Surgical Instruments and Appliances is also making progress. Amongst the contributors to this novel addition to the Museum are—Messrs. Swan, Erasmus Wilson, Birkett, Holden, Taylor, Kempthorne, White Cooper, Barker, C. Edwards, Bond, and Mrs. Hatton. Amongst the contributors to the general collection are—The Royal Institution, the Zoological Society, Sir William Fergusson, Messrs. Cook, J. E. Adams, Gay, Spencer Wells, Hilton, Lee, Quain, Partridge, Hancock, Curling, Hutchinson, Hickman, Sclater; Bennett, of Sydney; Professor Gervais, of Paris; Professor Peters, of Berlin, etc.

These additions are now displayed in the Theatre of the College, where they will remain for a few days for the inspection of the Members preparatory to being dispersed throughout the Museum.

FROM ABROAD.—THE AMERICAN MEDICAL ASSOCIATION AND MEDICAL WOMEN—DISCUSSION ON CHLORAL—LYONS *versus* NANCY.

THE American Medical Association has recently held its twenty-second annual meeting at San Francisco, and, considering the vast distance, the attendance was numerous. Dr. Stout, of that city, delivering the "Address of Welcome," forcibly demonstrated the rapidity of progress by exhibiting a map of New York city bearing the date 1776. "Through the centre of the city could be traced the road to Boston—a road which then occupied as much attention as the great trans-continental railroad over which the visitors had just passed." We are not yet in possession of sufficient details of the meeting to judge of the amount of scientific work performed, but it is evident from the report which we have perused in the *New York Medical Record* that the consideration of the "woman question" occupied a good deal of the attention of the Association, and gave rise to some lively discussions. The *élite* of the Profession in the United States seems as little disposed to admit the reasonableness of the claims advanced as with ourselves. It is true that Professor Alfred Stillé, the President of the Association, is Consulting Physician to the Philadelphia Medical College, but one of the speakers observed that he would never have been elected to the presidency if he had held that office when he was proposed. Indeed, he has put his colleagues into a position of some difficulty; for, according to the ethical code of the Association, no member can consult with any person so attached to a Female Medical College. The Philadelphia members of the Association, as on former occasions, have made a push to get the claims of the ladies recognised (although the President himself thought the question had better stand over), but with very ill success. The first battle arose on the question whether Dr. Thomas, who had been sent as a delegate from the Women's Medical College, should be received as a member, it being admitted that, were his claim allowed, it would be optional in future for women's colleges to send lady representatives. A warm discussion ensued, in which the usual arguments, *pro* and *con*, upon the Medical women question (with which we are now so familiar) were reproduced. A sensible suggestion by Dr. Johnson, of Missouri, "that women should organise their own associations and manage their own affairs," was loudly cheered, and will certainly meet with many adherents in this country, who, while not objecting to their doctorial proclivities if they see fit to indulge in them, enter-

tain a strong aversion to their thrusting themselves into male organisations. The question was disposed of on this occasion by being "indefinitely postponed." Another branch of it was next day opened by Dr. Atlee, of Philadelphia, who proposed the resolution, "That the American Medical Association acknowledges the right of its members to meet in consultation the graduates and teachers of women's Medical colleges, provided that the code of ethics of the Association be observed." As we just observed, by the present laws of the Association none of the members of the Association can consult with its own president. A somewhat hasty discussion followed, as the members were eager to partake of a pleasant excursion in the bay, and when they met again in the evening they ordered the resolution to be laid on the table, to await the decision of some future meeting.

It will be thus seen that our Transatlantic colleagues have more ballast, and less of the go-ahead propensity, than we sometimes give them credit for, the Medical Association exercising an influence, in the absence of official bodies of authority, very much more considerable than any similar body could do here. The Association is also laudably strict with regard to homœopathy. It has displaced a Dr. Martin from the chairmanship of the Vaccine Committee because he sent a communication to a homœopathic journal, and has referred the question of his expulsion from the Association to the Committee on Ethics—declining to refer the case of the "erring disciple" to the Massachusetts Medical Society, to which he belongs, on the ground that the regular Practitioners in that State are far too much addicted to consort with homœopaths to be trusted with its decision. As a statistical fact, it was stated that in the United States there are about 60,000 licensed Practitioners, of which number 3000 are homœopaths. The Association agreed to co-operate in raising the proposed memorial to Sir James Simpson, "as an evidence of their appreciation of the deceased."

At a recent meeting of the New York Academy of Medicine, several of the members gave some account of the results of their employment of chloral. Dr. Foster said that he had given as much as ninety grains in a case of delirium tremens. Dr. Jenkins was in the habit of giving only small doses, and had found seven and a half grains produce twelve hours' sleep in an habitual opium-eater, five grains afterwards securing quiet sleep. Dr. Hart reported a case of neuralgia in which one dose of twenty grains caused death in thirty minutes. Dr. Peaslee stated that he had been in the daily habit of administering it, and had observed no ill-effects result. His dose at first is generally from ten to fifteen grains. In an habitual opium-eater chloral was substituted, sleep being procured by thirty grains at night, and the opium reduced by a fourth. Dr. Adams mentioned a case of hay-asthma cured by a single dose of chloral. Dr. Caro referred to a case of strangulated hernia in which chloral seemed to have exerted an almost magical effect after chloroform and tobacco had failed. He had also used it, in doses of fifteen or twenty grains, with happy results, in cases of rigidity of the os uteri. Dr. Pooley said that he had ordered thirty grains every night for a patient who had a weak and irritable heart, without any ill-result being produced. He was much struck with the efficacy of small doses, and while at first he used to give sixty grains or more, his ordinary dose was now thirty, in tolu. He had noticed intermittent pulse under its use, but not to any alarming extent. In some cases his attention had been called to itching of the eyelids. Dr. Bell observed that chloral acts much better when combined with bromide of potassium. In delirium tremens he gives fifteen grains of chloral every three hours, stopping after the third dose. He has never met with any ill-effect from its use; and it has this peculiarity: that if it is to act well, it will do so quickly, as within twenty minutes of the first dose. Dr. Peyers spoke of its advantageous use in a case of enlarged heart and angina pectoris. Dr. Van Kleek

reminded the members of the Academy that Dr. Squibb, who is an excellent authority, had announced that chloral became decomposed when suspended in syrup.

The thirty Deputies of the North-Eastern Departments having presented their Bill for the erection of an University at Nancy—or, rather, for adding a Medical Faculty to the already existing University—the Profession at Lyons are bestirring themselves in order to get a Medical Faculty established in their city, which, indeed, they demanded long before the present crisis had arrived. They point out that the resources of Nancy for supplying the wants of a Medical school are utterly inadequate, since it, together with the towns surrounding it, possesses a more scanty population whence patients can be drawn than does even Montpellier, which, partly on this account, has proved notoriously defective as a Medical institution. Lyons, on the contrary, the second city in France, offers facilities even rivalling for clinical purposes Paris itself, nearly 25,000 patients being annually treated in well-organised Hospital establishments. Another argument is derived from the events of the late war. Every Frenchman is, at all events at present, convinced that war will sooner or later be renewed, but there is by no means the same confidence felt as heretofore that this must necessarily be a successful one. At all events, on its occurrence, Nancy, and even Paris, will again have to run the risk of siege and investment, and consequent stoppage of all educational communication with the rest of France for perhaps an indefinite period. By the late siege, and especially by the subsequent insurrection, all Medical studies were brought to a temporary end in Paris, and Strasburg being now in alien hands, no other centre of instruction existed; and it is said that the interests of many of the students have been most seriously compromised by this state of things, Montpellier being utterly unable to supply the deficiencies thus suddenly created.

For this, among other reasons, M. de Ranse, in the *Gazette Médicale*, advocates the formation of several centres of Medical instruction. In the first place, however, he admits the claim of Nancy to be converted into a complete State university, liberally endowed, in order to enable it to enter worthily into competition with that of Strasburg, for which Prince Bismarck has announced that a far more liberal provision will be made than when it was a French institution. This will be more easily accomplished, as it seems a legacy of 5,000,000 frs. has been left for public purposes to the city of Nancy, which is desirous of devoting it in this manner. Lyons, it seems, although so much wealthier a city, is at present in far from a flourishing financial position; but, believing this only to be a temporary condition, M. de Ranse suggests that there should be established in it a "free university," independent of State control, and in imitation of similar establishments, which have proved so successful at Brussels, Liège, and Louvain, in Belgium. The example, once set, would doubtless soon be followed in such large cities as Marseilles, Bordeaux, Lille, etc. These institutions, embracing the entire circle of human knowledge, and officered by examiners independent of the teaching body, would enter into a wholesome competition with the State universities and with each other, and might eventually give rise to something like the scientific emulation which has proved so advantageous in the German universities, and certainly would prevent the higher education being brought to a standstill by any of the revolutions which yet may be in store for Paris.

PARLIAMENTARY.—LUNATICS (SCOTLAND) BILL—LIFE ASSURANCE—REGISTRATION OF BIRTHS AND DEATHS—THE PHARMACY BILL—THE VACCINATION AMENDMENT BILL—LUNATICS (IRELAND).

In the House of Lords on Thursday, June 29, on the Lunatics (Scotland) Bill being reported,

The Marquis of Huntley proposed an amendment excluding from its operation chartered and licensed asylums, but he withdrew this on its being conceded by the Earl of Morley that

criminal lunatics should not be sent to such asylums without the consent of their managers.

The Life Assurance Companies Act Amendment Bill was reported.

In the House of Commons,

Mr. Campbell, for Dr. Playfair, asked the Secretary of State for the Home Department whether it was the intention of her Majesty's Government to introduce a Bill early next session to make the registration of births and deaths compulsory, and to improve the modes of granting certificates of death.

Mr. Bruce said he was in communication with the Registrar-General on the subject, and he found it was in his opinion desirable that several improvements of the law should be made with respect to the registration of births and deaths. Under those circumstances, he proposed to introduce a Bill with that object next session.

On Monday, in the House of Lords,

The Lunatics (Scotland) Bill was read a third time and passed.

In the House of Commons,

In answer to Mr. T. Cave,

Mr. W. E. Forster said the Government intended to proceed with the Pharmacy Bill during the present session, its object being mainly to insure that the first clause of the Pharmacy Act, passed in 1868, which said there should be regulations for the keeping, dispensing, and selling of poisons, should be complied with. He was aware that several petitions had been presented against the Bill from chemists and druggists throughout the country, but he hoped to be allowed to take the second reading on Thursday, with a view afterwards to go into committee *pro forma*, and reprint the Bill with amendments, which he believed would meet the wishes of many persons connected with the trade.

In answer to Sir Massey Lopes,

Mr. W. E. Forster said he could not admit that the working of the Vaccination Act, 1867, would make a large increase in the expenditure of the poor-law guardians. As to the recommendation of the Select Committee—namely, "that a considerable proportion of the expenses of working the Act should be contributed from moneys to be voted by Parliament"—it had not been included in the Vaccination Bill, which was merely a Bill for the practical amendment of the Act to secure better provisions against the increase of small-pox. The recommendations of the Committee would require the serious attention of the Government; but the question of these expenses could not be considered by itself, it must be considered along with other subjects, as between local rates and imperial taxation.

Sir D. Corrigan obtained leave to bring in a Bill to amend the law relating to dangerous lunatics and dangerous idiots in Ireland, and to make more effectual provision for the superannuation of the officers of district lunatic asylums in Ireland.

The Bill was introduced and read a first time.

THE PARIS ASSISTANCE PUBLIQUE.—After the revolution of September, 1870, the post of Director-General was abolished, on the supposition that his autocratic and initiative power was too great, while the control of the Conseil de Surveillance, being a mere advising body, was quite insufficient. Moreover, on this Conseil, consisting of some twenty members, only one Hospital Surgeon, one Physician, and one Professor of the Faculty had a seat. By a decree of September, 1870, all initiative power in regard to measures concerning Hospital administration was confided to a Conseil Supérieur, in which the Medical element was sufficiently represented. The execution of the measures resolved upon devolved upon a general agent, who thus occupied an intermediate position between the Conseil and the Hospital *personnel*. So matters continued during the siege; but it seems there was a constant struggle for the increase of the powers of the agency, and an endeavour to restore the old state of things. And, in fact, a decree of February, 1871, conferred on the general agent the powers formerly possessed by the Director-General, and deprived the Conseil of its initiative power. Finally, by a decree issued on June 25, the modifications of 1870 and 1871 are suspended, and the *status quo* restored. The Medical officers have formed themselves into a Hospital Medico-Chirurgical Society, with the view of impressing upon the Government the importance of giving a due share of authority to the Medical element of the Conseil.

A HINT.—A reception-house has been opened in Greenock for persons in whose homes fever may have broken out, and who may themselves have escaped contagion.

MEETING OF THE GENERAL MEDICAL COUNCIL.

HELD AT 32, SOHO-SQUARE.

FIRST DAY.—TUESDAY, JULY 4.

THE fourteenth session of the Council was opened on Tuesday last at Soho-square, at 2 p.m., the President, Dr. Paget, in the chair. In addition to the President, there were present:—Dr. Bennett, Dr. Acland, Dr. Humphry, Dr. Embleton, Dr. Storrar, Dr. Alexander Wood, Dr. Andrew Wood, Dr. Fleming, Dr. Macrobin, Dr. Thomson, Dr. A. Smith, Mr. Hargrave, Dr. Leet, Dr. Apjohn, Sir D. Corrigan, Bart., Dr. Sharpey, Dr. Parkes, Dr. Quain, Dr. Christison, Dr. Stokes, and Dr. Francis Hawkins (Registrar). Mr. Cooper was prevented by indisposition from attending at the first meeting of the session.

Mr. Quain was formally introduced to the Council as member for the Royal College of Surgeons, *vice* Mr. Caesar Hawkins, and Dr. Gull as member for the Crown, *vice* Dr. Rumsey.

The PRESIDENT delivered his annual address, which was as follows:—On the two former occasions on which I had the honour of opening a session of the Council, I did it in the fewest words. I spared your time, knowing its value, and could well spare it, because the business of the session was plainly and unmistakably before us, and any introductory remarks of mine would have been at least superfluous. On the present occasion the circumstances are different, and in one respect peculiar. What has happened since our last meeting might seem to demand comment—perhaps lengthened comment; but I will not detain you long. We meet for business, not for talk, except such talk as may be in itself business. But one word for two friends of ours who have retired from the Council since our last meeting. We should be ungrateful if we omitted to acknowledge what we owe to Mr. Caesar Hawkins—to his diligence in business, his conscientious accuracy, on which we could always rely, and the clear judgment and honourable spirit which he brought to the consideration of every question; and to Dr. Rumsey it is due that we should remember his great and willing sacrifice of time and labour while aiding us in the large and complicated subject of State Medicine, of which he is so perfect a master. The services rendered by these two gentlemen to the Medical Council were, in fact, rendered to the general public. The public may overlook them, or fail duly to acknowledge them—we cannot, and ought not. Our last meeting was wholly occupied in considering the Medical Amendment Bill of the Lord President of the Council. I regret that it was necessary to withdraw it. I believe that it would have accomplished a vast amount of good. I believe that it would have removed the chief obstacles to the further improvement of the education of the Medical Profession, the real obstacles to the advancement of its social status, and the more general attainment of Professional excellence. It would thus have conferred great, very great, benefits on the public. I therefore regret its loss. But I have satisfaction in remembering that this Council, after long and careful consideration, expressed an approval of it, and a wish that it might speedily become law. It has been sometimes said, or insinuated, that this Council has more regard for the interests of the Medical Corporations and Universities than it has for the interests of the public. If there be any candid man who thinks thus, I would ask his attention to the vote of the Council on the Bill of Lord De Grey. That Bill proposed in its chief and leading provision to deprive all the Universities and Medical Corporations of their ancient privilege of granting licences to practise Medicine—a privilege which, in the case of the Corporations, is the most important they possess. The Council, early in their discussion of the Bill, expressed a doubt of the necessity or expediency of this sacrifice of ancient privileges—a sacrifice which might, not improbably, be injurious to all the Corporations, and might even endanger the existence of some of them; yet, after careful consideration of the whole Bill, this Council approved of it by a majority of fifteen to three. Perfect unanimity, of course, could not be expected on a measure involving so great a number and variety of details; but to any person who finds fault with the constitution of the Council because he believes it to represent unduly the interests of the Corporations, I would commend that vote of fifteen to three as a fact worthy of consideration. It is not necessary for me to enter upon the causes which led to the withdrawal of Lord De Grey's Bill.

Neither is it necessary for me to discuss the merits of the two Medical Bills which were introduced into the House of Commons by private members in the present Session. They have been withdrawn; yet they have not been without use, if their discussion has diffused more knowledge on a subject of which the general public is so profoundly ignorant, and many members, even, of the Medical Profession, are still so imperfectly informed. Among the business of our present session will be an inquiry into the conduct of a qualified Medical Practitioner. We shall have to inquire, under the provisions of the 29th section of the Medical Act, whether he has been guilty of infamous conduct in a Professional respect. The charge against him is that he has authorised another person to affix his name to false certificates of death—false in this respect: that they stated him to have been in Professional attendance on the deceased—which, it is said, was contrary to the fact. Charges of this kind have been made against two Practitioners. The complaints were made originally to the Registrar-General of Deaths and the Secretary of State for the Home Department, and by them the complaints were referred to this Council. In accordance with the standing orders, a preliminary inquiry has been made by the English Branch Council. In one of the cases it was found that the evidence was scanty and the circumstances such as, in the opinion of our solicitor and that of the Branch Council, would not fairly warrant a charge of infamous Professional conduct. In the other case it was thought proper that the charge, and the evidence in support of it, should be submitted to your judgment. I have mentioned this case, not merely because it is the first in which charges of this kind have been brought under your notice, but because I desire your opinion as to whether one part of the procedure—namely, our deliberation on the merits of the case—should be public or private. Of course, the hearing of the case will be public; the decision will be public; but it has appeared to us worth consideration whether there should be a short intervening time, in which our deliberations should be private. The deliberations of juries are private; so are those of magistrates at sessions, and those of judges when they sit in a body; in all these cases the deliberations are private, though the decisions are given publicly. Whatever differences of opinion there may be in the Council on this suggestion of mine, I am satisfied we shall all be agreed on taking that course which appears to us the most likely to lead to a just conclusion—just towards the person whose conduct is impugned, and just towards the Profession and the public, who would have good reason to blame us if we shrank from exercising aright the powers conferred on us by the Medical Act.

Committees were then appointed on the following subjects:—Business, Finance, and the Registration of Medical Students, and the Returns from the Bodies in Schedule (A) of Professional Examinations and their Results.

The next matter on the programme was the following statements from the Medical Department of the Army and the Military Department of the India Office:—

Statement of the Degrees, Diplomas, and Licences of the Candidates for Commissions in the Medical Department of the Army, who, in February, 1871, presented themselves for Examination, showing the number that passed, and did not pass, distinguishing the Qualifications, both Medical and Surgical, under the Heads of the several Licensing Bodies.

* 2 deficient in all subjects. † 1 deficient in all subjects.

REMARKS.—Candidates—Successful, 10; failed, 13: total, 23. Diplomas and Degrees—Successful, 21; failed, 26: total, 47. N.B.—Of the 13 candidates returned as unsuccessful, 9 were qualified, but were not accepted, as only 10 appointments were made.

The PRESIDENT pointed out that the manner in which these tables were drawn up was calculated to mislead, and had misled, the public with reference to the number of candidates who failed. In the first table occurred this statement in small type:—"Of the unsuccessful, seventeen would have been accepted had there been vacancies for them;" and in the second, "N.B.—Of the thirteen candidates returned as unsuccessful, nine were qualified, but were not accepted, as only ten appointments were made." So that it was not that they had failed to satisfy the examiners, but to obtain commissions—which was an entirely different thing.

Dr. PARKES asked that the debate upon this point might be adjourned until Dr. Alexander Wood returned to the council-room, as that gentleman had taken an active part in bringing the matter unsuccessfully under the notice of the Army and Navy Medical Board.

Sir DOMINIC CORRIGAN then moved, and Dr. ANDREW WOOD seconded, the following resolution:—"That the returns from the Medical Departments of the Army and of the Indian Army be entered on the minutes."

It was carried unanimously.

THE BILL OF LAST SESSION.

Dr. ACLAND: When we broke up last session we parted with the expectation that we should meet again with further powers and fresh duties, and a Committee of the Council was appointed to confer with the Lord President on the subject of the Bill then about to be introduced. The result was the passing of the Bill through the House of Lords. It, however, was afterwards dropped, and it therefore seemed to me expedient, for our own sakes and for the sake of the public, to put a formal question to the President, in order that he might officially tell us if he have the knowledge how it was that the legislation which we expected has fallen through. I would only add, before putting the formal question, that we are now, as I understand, *in statu quo*—that is to say, after a great deal of deliberation which, in one form or another, has gone through two or three sessions, we have to begin again to carry on our work with the same powers as before, and with an utter uncertainty as to whether we are to have new powers or new duties assigned to us. Dr. Acland concluded by putting the formal question of which he had given notice.

The PRESIDENT: Gentlemen, I have no special or official information on the subject, but, as most of you know, an answer to this question was included in some remarks made by the Vice-President of the Council, Mr. Forster, in the debate on the two Medical Bills on June 14. I have sent for a copy of Hansard, but Hansard for that night it is an impossibility to

obtain. However, I will read to you the words which have been reported—and I have no reason to doubt their accuracy—which Mr. Foster used on that occasion,—“That legislation had failed last year; because, although the Bill which had been introduced into the House of Lords had been most carefully considered, it had been thought desirable when that Bill came down from that House to add to the questions they were then attempting to settle, another question—namely, the constitution of the Medical Council, and it was then too late in the session to deal with that subject.” Of course, I have the same information that most other persons have as to some of the details or causes of the withdrawal of that Bill. I do not know that I should enlighten many of you by mentioning them, but I should wish to give as complete an answer as I can to the question that has been put. It was known that the Bill was opposed, that some of the Medical Corporations had petitioned against it, and that it was energetically opposed by a Committee of the British Medical Association. It was known, also, quite well that the session was drawing to a close. I believe that not much more than a fortnight of it remained, and that little time which did remain was shortened unexpectedly by one or two debates incidental to the outbreak of the great war between France and Germany; and, therefore, it was quite clear that the time which would be occupied by any serious opposition or obstruction to the Bill would necessarily be fatal to it. Some members of the House of Commons, in concert with and helping the Committee of the British Medical Association, expressed their intention to oppose it, and they insisted upon its being enacted that a certain proportion of the Council should be elected by the direct votes of all registered Medical Practitioners, stating that they would obstruct the Bill in every way if that were not granted either immediately or by promise of the Government for the following year. The Government objected to that, because it was obvious, from the divided state of opinion, that discussion would be necessary, and there was no time for discussion. Under these circumstances, Mr. Forster offered, on the part of the Government, that, if the Bill passed unobstructed, should any private members introduce another Bill in the following session—that is, this session of 1871—to enact this direct representation, the Government would assent to the Bill being referred to a fairly constituted select committee, so as to consider the question without prejudice. This offer of the Government was refused by some members of the House acting for the Committee of the British Medical Association; and, as there was no time to discuss it, Mr. Forster was under the necessity of withdrawing it. That is all I know of the matter, and I believe it is substantially what took place.

Dr. STOKES then asked the President, pursuant to notice, “if he were aware whether the Government proposes to bring forward the same or any other Medical Bill either in this or any subsequent session, and, if so, whether he would inform the Council.”

The PRESIDENT said his information upon this latter question was precisely similar to that which he possessed with regard to the first. In the same debate from which he had before quoted, Mr. Forster gave a statement on the very point, and, consequently, he had not thought it proper or advisable to ask the Government more directly what their intentions were. The Vice-President of the Council in that debate had said, “from the number of questions pressing on the Government for legislation, he could not pledge them to bring in a Bill next year, but it was their wish and anxiety to do so. If they were unable to deal with the subject next year, and if any private member, such as his honourable friend the member for Salisbury, or any other, took up the subject, no obstacle would be thrown in the way of the fullest consideration of it by the House; and if it was thought desirable, the Bill might be referred to a committee upstairs.”

LIST OF EXAMINING BODIES.

The next subject on the agenda was the list of Examining Bodies, whose examinations fulfil the conditions of the Medical Council. It was the same as last year, with one addition:—“The Examiners for Commissions in the Military and Naval Services of the United Kingdom: Certificate to include all the subjects required by the General Medical Council.”

REPORT OF COMMITTEE ON PROFESSIONAL EDUCATION.

Dr. PARKES then moved that the report of the Committee of the Council on Professional Education be received and entered on the minutes.

The motion was seconded by Dr. STORRAR, and carried unanimously.

REPORT OF THE COMMITTEE OF THE COUNCIL ON PROFESSIONAL EDUCATION.
The Report of the Committee of 1869 on Professional Education, and the replies to the letter of the Chairman from Teachers on Medical Education, were forwarded to the Licensing Bodies, and answers were received from them in 1870.

All the answers did not arrive in time to be presented at the meetings of Council in 1870, and accordingly an interim report only was then laid before the Council (Minutes, vol. viii., p. 11). By a resolution of Council (Minutes, vol. viii., p. 105), the Committee on Education was re-appointed, and directed to report at a future meeting of the Council.

Subsequently, replies to the first Education Report having been received from all the Licensing Bodies, they were printed and distributed, last autumn, to the Members of Council, and are contained in the Appendix to the 8th volume of the Minutes of the Meetings of the Council.

The probability that an Act to regulate Medical education would be passed in 1870, rendered it inexpedient to discuss last year many of the suggestions contained in the Education Report, and in the replies sent in by the Licensing Bodies, for if the Medical Bill of 1870 had been passed, it would have necessitated a revision of the whole subject of Medical education and examination, and would have rendered any previous decisions null and void.

During the last two years very important alterations have been made in the system of education and examination by some of the Licensing Bodies, and several of the suggestions of the Education Committee have been met.

The Royal College of Physicians of London, by a rule passed in April, 1871, requires from every candidate for its Licence, evidence that he has discharged the duties of clinical clerk, and of dresser, for periods of three months respectively, and thus one important recommendation of the Education Report has been carried out.

The Royal College of Surgeons of England, on the reception of the report, appointed a Committee to consider it, and eventually determined to act on the opinion of their Court of Examiners of December 16, 1869, that “every part of the knowledge included in, or accessory to, the education of candidates for the diplomas of the College ought to be taught and learnt practically.” The College has, therefore, introduced into its curriculum clauses which ensure practical instruction in chemistry, pharmacy, general anatomy, and physiology and Surgery, and has ordered that every candidate at an early period of his Hospital attendance shall be individually engaged at least twice a week in the observation and examination of patients, under the direction of a recognised teacher during not less than three months—this is for the purpose of enabling him fully to profit by the Hospital instruction; and in addition to this, every candidate is ordered, as formerly, to be also a dresser, or to have charge of patients equivalent to the work of a dresser, for six months, and is also to attend demonstrations in the post-mortem rooms of a recognised Hospital during the whole period of Surgical Hospital practice. And to ensure that these regulations shall be carried out, the College has now instituted for the diploma of Membership (as it had previously done for its Fellowship) a practical clinical Surgical examination in addition to the examination in bandaging, etc., formerly instituted.

The Society of Apothecaries of London has also made some important changes. Since June, 1870, all candidates have been required to produce evidence of having served the office of clinical clerk for at least six weeks, and of having been examined at the class examinations conducted by the teachers of the respective subjects. The clinical examinations which were instituted by the Society on June 13, 1867, have been made an integral and invariable portion of the final examination. Students attending for their first or primary Professional examination have been required, since December, 1870, to undergo an examination on Medical regional anatomy on the healthy subject; and in various other parts of the examinations increased practical work has been demanded.

It is impossible to overrate the effect which the regulations of these great Licensing Bodies (to whom the majority of English students go for their licences) will have on Medical teaching in England. A great part of what was desired by the Committee of Education has been thus obtained, and it seems only just that the Council should fully recognise the improvements which have been made.

The four English Universities have made no change in their systems of examination, which were considered satisfactory by the Council.

In Scotland, the Royal College of Physicians of Edinburgh now requires all candidates for the licence, without exception, to undergo a clinical examination in Medicine in the Royal Infirmary of Edinburgh. Previous to July, 1869, students only underwent this test.

The Royal College of Surgeons of Edinburgh had previously to July, 1869, instituted practical clinical examinations, which are carried on in a Surgical Hospital, and they have since made no change in their regulations.

The Faculty of Physicians and Surgeons of Glasgow has not essentially altered the mode of conducting the examinations, but in some points the examination has been more systematised, especially as regards the clinical part. All candidates, whether previously qualified or not, are subjected to an examination at the bedside, both in Medicine and Surgery. The written part of the examination has also been extended.

The University of Edinburgh has made no alteration.

The University of Aberdeen has annulled the regulation which exempted the candidates who obtained the highest place in the written examination from being examined orally, and, in accordance with the wish of the visitors from the Medical Council, enforces the oral examination on all.

The University of Glasgow has made the clinical examination more efficient, but, otherwise, has made no change.

The University of St. Andrews has made no alteration.

In Ireland, the University of Dublin has improved the clinical examination, and now systematically enforces it on all candidates. The previous Medical examination—viz., in physics, chemistry, botany, Materia Medica, and descriptive anatomy—is now compulsory.

The Queen's University in Ireland has instituted clinical examinations in Medicine and Surgery in the final examination for the M.D. and Master in Surgery.

The Royal College of Surgeons of Ireland has introduced a practical examination in bandaging, etc., and the Council is now engaged in the consideration of how best to introduce clinical examinations in Surgery.

The King's and Queen's College of Physicians has instituted a clinical examination, which is carried on in the wards of an Hospital for the second or final part of the examination.

The Apothecaries' Hall of Ireland has extended the period of examination from two to six days, so as to more practically test the candidates' knowledge, and they have instituted a clinical examination of patients, which is enforced on all candidates.

It cannot be doubted from the previous statements, which have been

drawn from official communications received from each Licensing Body, that great progress has been made in the path indicated in the various reports of the visitors of the Medical Council, and of the Committee on Education.

It cannot be for a moment supposed that these alterations are made in the letter only, and are illusory. We believe that they are what they profess to be, and, believing this, we must allow that the Licensing Bodies have shown a determination to improve their curricula and examinations, and that in several cases both are now much more efficient than formerly.

There are, however, some suggestions in the Education Report which have not yet been carried out, and on which it seems desirable the Council should express an opinion, while there are other suggestions which it will be better to keep in abeyance until the Medical Legislation, which cannot long be delayed, has been concluded.

Of the former kind, there are some of considerable importance:—

1. The separation of the teaching of pharmacy and therapeutics, the former being made an early, and the latter a late, course in the curriculum.

The opinion of the Committee on Education, which included Dr. Christison and Dr. Aquilla Smith, and the views of all the best teachers of *Materia Medica*, were in favour of this separation. But some licensing bodies consider that therapeutics should not form the subject of a separate course of study, but should be considered an essential part of the courses on practical Medicine and Surgery.

It must be admitted to be so; but still there is a necessity for special instruction, and without it, it may be confidently asserted that the progress in therapeutics will be slow.

It seems desirable that a definite opinion should be come to on this point, and we propose to move a resolution to take the sense of the Council on this matter.

So, also, it will be for consideration how far practical instruction in drugs and pharmaceutical preparations might not be substituted for formal lectures. For the last two sessions a plan of the kind has been carried on by Dr. Harvey, at Aberdeen, and is said to have been highly successful.

2. The length of time assigned to midwifery in most of the present curricula is too short, and the Committee on Education recommended that one entire winter session should be assigned to this subject, and that the amount of practical instruction should be increased. This opinion was shared by all the experienced teachers in midwifery, whose replies are given in the appendix to the Education Report of 1869.

We therefore advise that the Council shall recommend that the systematic lectures on midwifery shall be given in the third or fourth winter course, and that the candidates shall be required to attend not less than twenty labours, in addition to practical instruction in the diseases of women.

3. The recommendation that pathological anatomy shall be made a separate course has not been carried out, but several of the licensing bodies have endeavoured to meet it by requiring a certificate of attendance, and of practical instruction, in the dead-house.

We think that a certain number of systematic lectures should be added to this practical instruction.

4. The Committee on Education strongly advised the enforcement of more regular class examinations. The Society of Apothecaries of London has ordered that all Students shall produce evidence of having undergone these examinations, and we advise the Council to urge on all the Licensing Bodies to issue regulations requiring that written class examinations shall be frequent.

The other points raised in the Education Report, and which we advise should not be discussed at present, are—the length of the sessions, the method of teaching chemistry, and the application of chemistry to physiology and pathology, the teaching of minute anatomy, and the definition of the areas of instruction and of examination.

The new curricula, especially that of the College of Surgeons of England, will gradually introduce changes in some of these matters, and the probability of Parliamentary legislation on Medical examinations renders it now inexpedient to deal with the remaining questions.

The allusion to possible legislation leads us to the last part of the Report of the Education Committee of 1869. The Council will doubtless remember that the Committee strongly recommended the formation of conjoint examining boards, so as to reduce the numbers of licences to practice from nineteen to three, and to make each licence a qualification in both Medicine and Surgery; that the Council authorised circulars to the licensing bodies in this sense; and that in the autumn of 1869 various conferences took place between some of the Licensing Bodies, and replies were received from many of them favourable to the proposed combinations. Subsequently, the action of the Government in introducing a Bill to carry out the same object suspended all negotiations of the kind.

The withdrawal of the Government measure, in consequence of the opposition raised on another ground, has replaced matters on the old basis.

It might indeed be argued that the willingness of the Licensing Bodies to improve their examinations, and the fact that they really have improved them, renders it less necessary to revive the plan of a single uniform licence to practise for each division of the kingdom. But a moment's reflection will show that the proposal is still necessary. The independent licences and their several examinations still remain as numerous as ever. The competition between different bodies, therefore, still exists, and must produce its fruits, and the inequality of the examinations in different parts of the kingdom remains.

Any Licensing Body raising its standard beyond a certain point will certainly drive some students, who otherwise would take its licence, to more lenient bodies. The rigour of an examination may, then, exist only on paper, and all the efforts of the Council may be spent in making ropes out of sand.

The only effectual remedy, unless the Council is prepared to be constantly inspecting and visiting the examinations of the Licensing Bodies on a more systematic plan than heretofore, is to urge on the system of a single portal for each division of the kingdom.

The discussions of the last two years have shown that there are no insurmountable difficulties. In England the three great Licensing Bodies have, at the instance of the Royal College of Physicians, almost arranged a scheme, and it seems to require only a little more aid to form a single Board for England. In the other divisions of the kingdom enough has been done to show that combination can be carried out if men will earnestly try for it.

It is impossible that the Government, after introducing a Bill, should let the matter entirely drop. If it did so, the present session has shown that there are persons ready to take the matter up; and if the Licensing Bodies do not themselves carry out a measure of the kind, they will give great discouragement to those who desire to see them continue the representatives and guides of the Profession, but who consider the thorough

examination of those on whose skill the lives of men are to depend must be provided for at all costs.

The Council can hardly, without inconsistency, leave the resolution of February 26, 1870, to remain a dead letter.

In this resolution, which was carried by 15 votes against 3, the Council decided that it was of opinion a joint Examining Board should be formed in each division of the kingdom. Subsequently, also, the Council passed a resolution approving of the principles of the Medical Bill which was at that time being prepared by Lord De Grey.

Accordingly, we beg to recommend that the Council shall address a letter to each Licensing Body, transmitting a copy of the resolution of February 26, 1870, and urging that arrangements for the formation of the Boards shall be undertaken without delay, so that the Council may be in a position to communicate them before the close of the year to the Government.

And we advise, in addition, that the Council shall authorise the Executive Committee to seek an interview with the Lord President of the Council, and to urge upon him the desirability of such Medical Legislation in the session of 1872 as may carry out the object the Council proposed in passing the resolution of February, 1870, and which Lord De Grey had in view when he introduced his Medical Bill of 1870.

(Signed) E. A. PARKES, Chairman.

Dr. PARKES, in accordance with the desire of several members of the Council, read the resolutions which it was his intention to move in reference to the above report, in order that the Council might have them brought under their attention before the debate took place.

THE CONJOINT BOARD.

At this stage of the proceedings a long discussion occurred, in consequence of some members of the Council, who stated that they had to attend a meeting of the College of Physicians on the subject of the Conjoint Board on the morrow, at four o'clock, requesting that the consideration of these important resolutions of Dr. Parkes might be postponed until they could be present at the Council.

Dr. A. SMITH objected to such a precedent being established. It was the first duty of every member of the Council to attend to the business of the session, and the consideration of important subjects should not be put off to meet the convenience of gentlemen who wished to absent themselves.

Dr. BENNETT pointed out that the discussion upon the Conjoint Board had a material bearing upon one of the resolutions, and it would be more convenient that the debate should take place after the meeting at the College of Physicians.

Dr. GULL said he was acquainted with the business which was about to take place at the University of London, and also at the College of Physicians, and he thought it very doubtful whether any action to be taken by those bodies to-morrow would facilitate the discussion of this matter by the Council. The subject of conjoint examinations had been under consideration for the last fifteen years, and he felt almost certain that to-morrow things would be left just as they were before. The College of Surgeons either is, or fancies it is, tied up to a certain line of action—opposed in all true principles (in his humble opinion) to any useful conjoint examination. The scheme was proposed last year, and accepted, but rejected by the College of Surgeons as not practicable. He quite agreed that nothing should interfere with the deliberations of the Medical Council; and although his duty might call him to the Senate of the University of London, he would be content with having attended the Committee, which would report to the Senate his views. He hoped Dr. Storrar, Dr. Quain, Dr. Sharpey, and Dr. Parkes would feel with him upon the subject, that they would be better serving the purpose which they all had in view by sitting at the Council, and assisting to determine upon its course of action; thus giving it as great prominence and force as possible, instead of trusting to the College of Surgeons, who, no doubt, had very good intentions upon the matter, but very little more. They always had had good intentions, from the time when he was junior censor of the College of Physicians, fifteen years ago. But the fact was, really, the College of Surgeons either could not or would not agree to the measure. Under these circumstances, he hoped that the Council would not delay their deliberations in view of what was going to take place out of doors.

Mr. QUAIN was sorry, on the first occasion of addressing the Council, to be obliged in some degree to play the part of advocate for the body he represented; but he felt bound to protest against some of the statements made by Dr. Gull. The College of Surgeons did not deserve the character which he had given it. He (Mr. Quain) believed that both the College of Surgeons and the College of Physicians were now in a very fair way to come to an agreement on the matter of the Conjoint Boards. He was not at liberty to say more, things being now in progress; but he desired individually, and for the Council of the College of Surgeons, to repudiate as unjust the observations which had fallen from Dr. Gull.

Mr. HUMPHRY thought it a serious matter that the business

of the Council should be interfered with, and that from want of subjects they might have to adjourn at 4 o'clock. In any view it was only the last resolution upon which the meetings out of doors could have any bearing. He would, therefore, propose that, at all events, the Council should be at liberty to proceed with the debate on the others.

This course was ultimately agreed to.

REMOVAL OF NAMES FROM THE REGISTER.

Mr. QUAIN moved, and Mr. HARGRAVE seconded, a motion for the removal of the name of Edwin Lowe from the Register, a conviction having been obtained against him for felony. The motion was carried unanimously.

The REGISTRAR then read a certificate of the conviction of Frederick Henry Morris, of Swindon, a Member of the College of Surgeons, of a misdemeanour, and it was proposed to strike his name off the Register.

Mr. QUAIN, however, pointed out that there had been no proper identification of the man convicted with the man whose name was on the Register. After some discussion the matter was referred to the Solicitor to ascertain this point before putting in force the powers of the Council.

ANOTHER PETITION FROM DR. PATTISON.

The REGISTRAR read a petition addressed to the Council by Dr. John Pattison, praying that his name might be reinstated on the Medical Register, with letters from C. H. Frewen, Esq. The petition set forth the qualifications of Dr. Pattison; alleged that, from having followed a special mode of treatment, and practising under a foreign diploma, he could not disguise from himself that a certain prejudice would be created against him in the minds of the Council; that he, therefore, desired to be heard by counsel; but this was refused. It admitted the impropriety of the letter written to Mr. Frewen, but urged in extenuation—first, that it was written under a natural irritation caused by Mr. Frewen's refusal to pay fees justly due; and, secondly, that it was merely an idle threat which he never intended to carry out, and never did carry out, when his book on cancer was actually published. It urged that for the offence committed he has been sufficiently punished, and that he is advised that, under all the circumstances, he has not been guilty of misconduct within the meaning of the Medical Act; and it humbly prayed that his name may be reinstated on the Register. A characteristic letter of Mr. Frewen's accompanied this; and, after a short discussion, in which the President, Dr. Bennett, Dr. Stokes, Dr. Apjohn, Dr. A. Smith, Dr. Fleming, and Dr. Andrew Wood took part,

The Registrar was directed to reply to Dr. Pattison's communication by enclosing the resolution of the Council moved by Dr. Stokes, and seconded by Dr. A. Smith—"That, having heard the petition that Dr. Pattison be replaced on the Register, and, having fully considered the said petition, the Council see no reason for altering the decision at which they formerly arrived after full and careful consideration of the whole case."

A communication from Dr. Edwards-Crisp, addressed to the President, and enclosing resolutions of a meeting of Medical Practitioners on the subject of the Medical Bill of last session, was then read before the Council, and the Registrar was ordered to acknowledge the receipt thereof.

COLONIAL CERTIFICATES.

Dr. STORRAR produced a letter from the Board of Public Examiners, Cape of Good Hope, praying that the Medical Council will be pleased to recognise their third-class certificate in literature and science, which has been assimilated to the Matriculation Examination of the London University, as fulfilling the conditions of the Council with respect to preliminary examination. He said if the Council had any curiosity to see them he was prepared to produce the questions put to candidates in January last.

Dr. BENNETT: Have you the answers? (Laughter.)

Dr. STORRAR: I hope the President will not think it desirable that any of us should furnish them. (Laughter.)

On the motion of Dr. BENNETT, seconded by Dr. ALEXANDER WOOD, this matter was referred to a committee.

The REGISTRAR then read a letter addressed to the President and Medical Council, from the Honorary Secretaries of the Sydney Infirmary and Dispensary, requesting advice on the subject of founding a Medical School at Sydney.

Dr. STORRAR suggested that this should be referred to a committee composed of representatives of the three kingdoms.

Several other members of the Council felt grave doubts whether it was within the province of their body to give advice as to founding schools.

After some further discussion, Dr. FLEMING moved, and Dr. HUMPHRY seconded, the following resolution:—"That a letter

be addressed to the Honorary Secretaries of the Sydney Infirmary and Dispensary, in reply to their request for advice on the subject of founding a Medical School in Sydney, informing them that it is not within the province of the Medical Council to give advice on the subject; but that the Council will forward to them copies of their reports on Medical education."

THE ARMY AND NAVY MEDICAL RETURNS.

Dr. ALEXANDER WOOD, having now returned to the council-room, reopened the discussion upon this subject. He said that he with others had been deputed by the Medical Council some years ago to bring this matter under the notice of the Army and Navy Board. They had explained the difficulty which the Council felt about the tables, and the incorrect ideas which got abroad in consequence of the way in which they were drawn up. They were informed that, with all their anxiety to do what would be satisfactory to the Medical Council, the authorities of the Army and Navy Board could not alter the form of the tables. There was no doubt that in Parliament and elsewhere they produced a very bad and very unfair effect in connexion with the public appreciation of Medical education. The apparent rejection of a number of candidates brought great discredit on the Examining Bodies who sent them up, and altogether he trusted that, before they appeared again on the Minutes of the Council, a committee would be appointed to consider the whole subject, for he felt sure the Council would not wish to continue to publish returns which were such an evident source of injustice. He therefore moved that these returns be referred to a committee to report upon them at a subsequent meeting of the Council. He was empowered to state that Sir D. Corrigan would have supported the motion had he not been obliged to go to his duties in another place.

Dr. APJOHN seconded the resolution. He could not believe that the Medical authorities would object to a proper modification in the form of the tables, in some way which should not lead to mystification or false impression.

Dr. ALEXANDER WOOD confirmed Dr. Parkes in his statement that the authorities of the Army and Navy Board, while in the most courteous manner acknowledging that they saw the difficulty by which the Council was met, yet stated that there were reasons of the most imperative character why they could not alter the form of the tables.

Mr. QUAIN hoped nothing would be said or done which would prevent the Council receiving these most valuable returns from the Army and Navy Board.

Dr. ALEXANDER WOOD said nothing would be done by the Committee without the Council.

Mr. QUAIN said he felt sure the Army and Navy Board would not be unwilling to correct what was evidently an inaccurate statement in the returns; and he pointed out two respects in which they were not only obscure but absolutely incorrect; the columns, instead of being headed "successful" or "unsuccessful," or "passed" and "failed," should be headed "passed" and "not passed;" then the fact of some out of the number passed obtaining commissions would not throw a slur upon those who had succeeded in satisfying the examiners, although they might not obtain commissions because there were not enough for all.

Dr. PARKES quoted from vol. iv., page 6, a letter from the Army Medical Department, dated February 21, 1865, in which the following passage occurred:—"You must bear in mind the Medical Department, and I presume the Naval Department also, will not give [the tables] in any form in which the unsuccessful candidates can be identified."

Dr. ANDREW WOOD pointed out that, in their anxiety to avoid casting a stigma upon unsuccessful candidates, the Army Board seemed to forget that they were casting a stigma by their present system—an undeserved and unfair stigma—upon the Examining Bodies, who were constantly having the fact of these supposed rejections of their students by the Government cast in their teeth.

Dr. ALEXANDER WOOD pointed out another matter in which the tables worked very unfairly—namely, that the Examining Body whose diplomas the unsuccessful candidates possessed was often rendered accountable for deficiency in preliminary education, over which they had had no control.

Dr. PARKES said this no longer existed, as the Board did not exact preliminary subjects.

Dr. ALEXANDER WOOD said, with all his respect for Dr. Parkes and his colleagues, the Army Examining Board was not in any way entitled (and he believed he was expressing Dr. Parkes's own opinion in saying this) to be used as a test of the other Examining Bodies of the country. He quoted an instance in which a student had presented himself for examination

before the Board which he (Dr. Wood) represented, and was rejected; but a few days afterwards the secretary received a letter from him, saying that he had gone to the Army and Navy Medical Board, had passed their examination, and now hoped there would be no objection to give him his diploma.

Mr. QUAIN said it was quite clear the Council ought not to publish any returns which were calculated to convey an erroneous impression. On the other hand, they were much indebted to the Army and Navy Medical Board for supplying them with those documents, but it was the duty of the Council to publish them in such a way that they could not be mistaken by the public. The tables must be quoted accurately, but also distinctly, so that no mistake could arise.

The PRESIDENT valued the returns very much, because when properly understood they afforded clear and conclusive evidence of a steady improvement in Medical education, and they afforded a test which the Council would be very slow to give up.

Dr. ANDREW WOOD: But let them be a true test.

The PRESIDENT said no doubt they were published in such a form that a person not very well acquainted with the matter might be deceived by them, and the extent to which they were exaggerated at the present time by public men to prove inefficiency of Medical attainments was preposterous. It was only right to remind the Council that it was not the Army and Navy Board, but the Council itself, which had desired to have these returns as a test. He believed they had been a matter of considerable trouble and annoyance to the Board, but, out of deference to the Council, they had been continued.

After some further discussion, the Chairman put the motion, and it was carried unanimously.

SECOND DAY.—WEDNESDAY, JULY 5.

CHARGE AGAINST MR. WM. HENRY KEMPSTER.

The PRESIDENT read the section of the Medical Act under which the proceedings against Mr. Kempster were taken:—
“If any registered Medical Practitioner shall be convicted in England or Ireland of any felony or misdemeanour, or in Scotland of any crime or offence, or shall, after due inquiry, be adjudged by the General Council to have been guilty of infamous conduct in any Professional respect, the General Council may, if they see fit, direct the Registrar to erase the name of such Medical Practitioner from the Register.”

Mr. OUVRY, the solicitor to the Council, stated the nature of the charge, which was that of having allowed Mr. William Goodson, an unqualified Practitioner, to practise under colour of his name, and of having signed certificates of the death of patients whom he had not personally attended. The cases were those of Stephen Henry Manley, who died on May 13, 1870; of Frederick Witt, the child of a railway porter; and of a man of the name of Anderson, who died on March 17, 1867, of consumption. Various declarations were read in support of the charge. Mr. Ouvry then stated that he wished to ask Mr. Kempster whether he produced the agreement between himself and Mr. Goodson?

Mr. KEMPSTER: Certainly; that is part of my defence.

The agreement was then read.

Mr. KEMPSTER: I beg respectfully to submit that that agreement cuts the ground from under the first charge altogether. It really shows that Mr. Goodson is an ordinary assistant. I wish to raise that point first, and ask you whether there is anything to answer now. That agreement was the second one between Mr. Goodson and myself, and I believe that it is the usage of the Profession for Medical men to sign certificates in cases where their assistants have attended patients. I should like to have an expression of opinion upon that point first.

The PRESIDENT: Have you the former agreement?

Mr. KEMPSTER: No; my solicitor kept it, and I believe he cannot find it. I have one here [handing it to the President] which is a copy of it, and it was made with another assistant.

The PRESIDENT: I would ask you, first of all, whether the facts deposed to in these declarations are contested as to their accuracy by you at all.

Mr. KEMPSTER: Not at all. I admit the bare facts, but I object to the manner in which they are put.

The PRESIDENT: I observe that one of these cases occurred in 1867, and the date of the bond that you produce is October 15, 1869. You have mentioned that there was a previous bond, which cannot be found. Now, as you cannot produce that bond, and you rightly consider it a point of importance, I think you might substitute some evidence for that. If Mr. Goodson is himself present, you can, of course, call him as a witness to depose to that bond, because otherwise your bond, being dated October 15, 1869, would not cover a case which occurred in the year 1867.

Mr. KEMPSTER: I do not rest my defence entirely upon the bond; but I may say with regard to that case that it was a parish case, and it is entered in my parish book regularly.

Mr. WM. GOODSON, L.S.A. (examined by Mr. Kempster), said: I am now a registered Medical Practitioner, and have been your assistant for nine years. During the whole of that time, with the exception of a few weeks, I have been under bond not to practise in the locality. There was a former bond which expired before that was entered into. I have never represented myself to be in business on my own account. About six or seven years ago, in consequence of the great increase of population in the neighbourhood, you opened a branch surgery, and I have resided in the house as your assistant. I have always paid over to you the moneys received, except small sums for petty cash and the amount of my weekly salary. Any further payment which you have made to me has been by cheque. I have had your authority for filling up certificates, and have generally consulted you about them. In some few cases it has happened that persons have died without your having professionally seen them, but they have been the exceptions, and not the rule. In such cases I have described the symptoms to you. You have signed the certificates, and left me to fill up the particulars. I have been assistant to other Surgeons, and certificates have been signed by them under similar circumstances—ordinary elub certificates. Whatever I have done has been done only as your assistant.

In answer to the President: I have not signed death certificates in Mr. Kempster's name.

The PRESIDENT then called the witness's attention to the declaration of Fanny Milton, stating that she had called twice on Mr. Goodson for a certificate of the death of Frederick Witt.

The WITNESS said that in that case he was not able to give the certificate to Fanny Milton in the first instance, for the simple reason that at that time Mr. Kempster had not signed it. The particulars were filled in by the witness, and Mr. Kempster signed his own name.

Mr. KEMPSTER: I have abundant evidence that there is a conspiracy against myself and other Medical men in the neighbourhood. I have a friend here who has half-a-dozen actions against him pending at present. Am I now to consider the case before the Council?

The PRESIDENT: You are at liberty to say anything more that you wish to do, either in the way of addressing the Council or of calling any friends of yours as witnesses.

Mr. KEMPSTER: It seems to me that I am charged with a variety of offences. I am charged with permitting an unqualified person to practise under colour of my name, and that I share in the profits of such practice. Now, I have not shared the profits, but have taken the whole of the proceeds of that practice. If the Council would give me an opinion on each matter as it arose, it would be much easier for me to deal with the charges; but I think I have shown, on the first point, that Mr. Goodson has only practised as my assistant. As to permitting an unqualified assistant to practise, I must direct your attention to one of the regulations of the Royal College of Surgeons, Edinburgh. The candidate for admission to membership must produce a certificate of having been engaged for six months as visiting assistant to a registered Practitioner. You require students to bring a certificate of this kind in order that they may become qualified assistants; yet, if a death occurs during that period in which he has been acting as assistant, the Practitioner is liable to be tried before you for unprofessional conduct. Besides that, a second charge appears to be that I have issued certificates of death, signed or purporting to be signed by myself, when such has not been the case. I have only to say that, during the last four years covered by these charges, I have examined the counterfoils of my certificate-books for death. I am the parish Surgeon, and have a large practice. I hold many appointments, and probably the majority of deaths in the district have to be certified by me. The party who is at the bottom of these proceedings has been endeavouring to get up a case for the last four years against me, yet he can discover only three cases in which the evidence asserts that I have not seen the persons whose deaths are certified. In the case of Anderson, I most emphatically deny what is alleged. It is true I did not see him for some little time before his death, but I have seen him on many occasions. He suffered from chronic phthisis. I left him in the care of Mr. Goodson. And, with regard to these other cases, they are pretty nearly the only cases which I have not seen prior to death. It is a very hard thing that I should be brought up to answer such a charge when the foundation of it is so slight. I am prepared now to show

that what I have done is the usage of the Profession, and therefore I contend that my conduct cannot be considered as "infamous."

Mr. JAMES J. JOSEPH, L.R.C.S. and K.Q.C.P.I., examined by Mr. Kempster. He said: I am a registered Medical Practitioner, residing in Battersea, and have known you for four or five years. I have known Mr. Goodson for some time, and feel assured that he is your assistant, and has not been and is not in business for himself. I have seen your surgery in Arthur-street, and your name on the door-plate. Mr. Goodson's name is not upon the plate. I have been seven or eight years in the Profession as an assistant as well as principal, and I attended cases before I was qualified. The practice in case of the death of a patient whom I attended was to sign the certificate. I have known many cases of Medical Practitioners employing unqualified assistants, and I believe that is the usage of the Profession under the circumstances. It is within my knowledge that almost every Practitioner in our neighbourhood has at some time had an unqualified assistant, and has signed certificates in the same way.

The PRESIDENT: You mention that you signed certificates of death when you were attending the case, not for yourself, but for your principal whose assistant you were. I wish to ask you whether you signed those certificates in his name or in your own?

A. I filled up the certificate signed by my principal.

Q. Did those certificates state that the patient or the deceased had been attended by your principal?

A. By him. He had seen the case along with me.

Q. Then in that respect they were quite true?

A. Yes.

Q. But did you sign his name to any certificates where he had not been in attendance on the deceased?

A. No.

Mr. KEMPSTER: There is some misunderstanding. I asked whether you had ever, as an assistant, attended a patient who had died before he or she had been seen by your principal—whilst you were an unqualified assistant?

A. Yes.

The PRESIDENT: In that case did you sign the certificate in the form representing that that patient had been attended by the principal?

A. By the principal.

Q. I think you have not clearly understood the question. The question put both by Mr. Kempster and myself was to this purport: In the case of a patient who died while you were attending, and who had not been seen by your principal, did the certificate run in the form that that patient had been seen by your principal?

A. Yes; and it was signed by him.

Q. Although he had not seen the case?

A. Although he had not seen the case. It is common in parish cases.

In answer to Dr. Quain, the Witness stated that the certificates were in the usual form that "the patient was last seen by me" on such a date.

Mr. W. GREENWOOD SUTCLIFFE, M.R.C.S., examined by Mr. Kempster. He said: I am a resident Medical Practitioner, residing at Nine Elms, and have known you for nine years, and your assistant, Mr. Goodson, for seven years. Of my own knowledge I am assured that he is your assistant, and that he is not in independent business for himself. I have seen your name on the surgery where Mr. Goodson resides. I have been seven years in the Medical Profession, and was an assistant for twelve or fourteen years previously. During that time cases have occurred of my attending patients who have died before they were seen by my principal, and I always signed the certificates myself by the authority of my principal.

The PRESIDENT: In your principal's name or your own?

A. In his name. Of course, what I did he was responsible for. That practice is very general in the country. The certificates run in the usual form—"The patient was last seen by me" on such a date. I certainly signed the certificates, although my principal had never seen the patients. I have been in all parts of England, and I have always found that has been the custom.

In answer to Dr. Acland, the WITNESS stated that the Registrar would not take a certificate signed by an assistant "for" his principal. In such a case they would register the death as uncertified. He also added that in general practice it was utterly impossible for many Practitioners to attend every patient personally.

Dr. CHRISTISON asked whether the practice was for an assistant to be supplied with blank forms signed by his prin-

cipal, which he had authority to fill up without communicating with his principal at all.

Mr. KEMPSTER said that one of the depositions which had been read almost answered that question. Mrs. Milton said that she had to wait two days for the certificate; whereas if the forms had been already signed she would have obtained the certificate on her first application. But Mr. Goodson had to tell her to wait until he had obtained the signature. In some districts it was usual for assistants to be provided with forms signed by their principals, but that was never his practice.

Mr. W. BAXTER LANGLEY, M.R.C.S., in answer to Mr. Kempster, said: I am a registered Medical Practitioner, and have been in practice both as principal and assistant. I am now a Medical agent in Lincoln's-inn-fields. One department of my business is to provide Medical men with assistants. I have written a work on the Laws and Customs of the Medical Profession, which has gone through four editions very rapidly, and has been accepted, I believe, as a standard authority. Questions of that kind are referred to me sometimes from the courts of Westminster. Mr. Justice Hannen referred one to me last week. I believe that about 500 appointments pass through my hands every year, and I am besides in constant communication with a very large number of principals and assistants who eventually make arrangements through other channels. As to the proportions of unqualified and qualified assistants, there has been a very remarkable change within the last few years. Formerly the great demand was for unqualified assistants, because the principals thought that they could not compete with them; but the tendency to have qualified assistants has very much increased, and principals tie them down with the ordinary bond not to practise in the locality. Ten years ago the proportion of unqualified assistants was five to one, and probably the number now is only three to one. It is frequently the case that a patient dies before he can be seen by the principal, especially when there is a branch establishment. I know of a case where an assistant resides eight miles away from the principal, and there is a range of mountains between them, so that such cases must constantly occur. With regard to such cases, the principle recognised by the Profession is something of this kind: *qui facit per alium facit per se*; the principal, employing a man whom he believes to be tolerably competent, allows him to fill up these documents, subject to a communication with himself, as a general rule, but in exceptional cases the assistant uses a document that has been signed by the principal, though the principal has never seen the patient. There are cases of that sort in which a Medical man would feel himself justified in adopting that course rather than to horrify the relations by allowing them to suppose that the child was buried without a certificate. I do not mean to say that that is the best custom, but I am sure it is a wide-spread custom, arising out of the necessities of the case, particularly where the assistant is resident at a long distance from the principal. I heard you read the regulation as to applicants producing a certificate of having attended for six months as visiting assistants, and I certainly do not understand by that that the assistant is always to be attended by his principal. In cases where the assistant resides five or six or more miles from the principal it is quite impossible for the principal to see a large proportion of the patients. In the East-end of London it has been a general custom for the certificates to be signed by the parish officer; the assistant really attends the case, and sends out the documents from time to time, consulting the principal when he is able, but in some urgent cases, no doubt, he uses the certificate without doing so. In that case the agent is supposed to be acting for the principal, just as the managing clerk of a solicitor would represent the firm and act on their account. He would appear in court just as if he were the principal.

In answer to Dr. Allen Thomson: I know of instances where the assistant signs the name of the principal by his authority, in cases where the latter has not seen the patient. That must be so in a large number of cases.

In answer to Dr. Bennett: In all those cases I am quite sure the principal's name is signed by a general authority of the principal, and there is no indication on the face of the certificate that it is not signed by the principal. It goes to the registrar as a *bonâ-fide* signature of the principal.

In answer to Dr. Sharpey: I am afraid it has been the custom for the signature of the principal to be used when he has not himself seen the patient. We are all too apt to use forms rather loosely.

The PRESIDENT: May I ask you why the assistant could not sign "J. Smith, for J. Brown"?

A. Because the registrar would not receive it. He would at

once object to it. He might say, "This is not the signature of the parish Surgeon."

Q. Can you tell me what would be the consequence of the Medical Practitioner giving no certificate? Would there be any serious consequence resulting from his declining to give a certificate?

A. Your legal adviser would answer that question better than I. The popular impression is that when a person is buried without a proper certificate, there is something dishonourable attaching to the funeral—that the person did not die a natural death, in fact.

Dr. PARKES: Is it consistent with your knowledge that the Poor-law Board require that the parish officer shall have qualified assistants?

A. I was communicated with as to the possibility of that being carried out, and I replied that it was quite possible, provided the Board of Guardians would allow a sufficient salary to the Medical officer.

Q. Do not a large majority of parish Surgeons employ qualified assistants?

A. There has been a very great change in that direction; but a large proportion, I am sorry to say, have not arrived at that condition yet.

Dr. STOKES: Is there any charge for these certificates?

A. I believe not; but your legal adviser would be better able to inform you.

Dr. APJOHN: Is it the practice at present for the principal to issue a bundle of these certificates, signed by him, to be filled up by his assistants?

A. Certainly not in that miscellaneous way. I do not think he would be guilty of such lax conduct as that; but when an assistant lives seven or eight miles off, sometimes three or four of these certificates are signed by the principal, on the distinct understanding that they are to be used only in cases of great emergency.

Mr. KEMPSTER then addressed the Council. He said that the present was a most malicious proceeding on the part of Dr. Leslie, and was one of a long series to which he and other Medical men were being subjected. A memorial was sent a year ago to the Registrar-General begging him to prosecute; but, after consultation with legal advisers, the Registrar-General said that no offence had been committed, and that what was done was usual. Subsequently he was summoned before Mr. Ingham, at Wandsworth Police-court, under the 6th and 7th William IV., c. 86, for making a false statement to be inserted in a register of death. Mr. Ingham at once said that it was an attempt on the part of the prosecutor to invent a new offence. A memorial was then sent to the Home Secretary, who consulted the Registrar-General, and decided that there was no offence.

The PRESIDENT informed Mr. Kempster that it was at the instance of the Registrar-General and the Home Secretary that the matter was referred to the Council.

Mr. KEMPSTER inquired whether the fact really was that it was at the instance of the Home Secretary and the Registrar-General, or whether those officials had not simply referred the memorialists to the Medical Council.

The PRESIDENT replied that the latter was the case.

Mr. KEMPSTER contended that that was a very different thing from proceeding against him. The charge made resolved itself into one of "infamous" conduct. That was a very strong word to use with reference to a comparatively small matter. Dr. Leslie had laid a regular trap for him—he managed to see a patient, and got him to go to Mr. Goodson. What had been done was done by Medical men every day. If he had unwittingly done anything wrong he expressed his sorrow for it, and assured the Council that it should not be repeated. For the future he would not sign a certificate unless he saw the patient himself.

Mr. OUVRY (at the request of Dr. Acland) stated that the charge was brought before the Council by Dr. Leslie, who had forwarded a correspondence between himself and the Home Secretary and the Registrar-General, in which they declined to interfere, but suggested that he should bring the case before the Medical Council.

The room was then cleared, and the Council deliberated for more than an hour.

Upon the readmission of the reporters,

The PRESIDENT, addressing Mr. Kempster, said: The Council wish me to mention that the delay has been due rather to the form in which they wish their conclusion to be recorded than to anything else, and I have the pleasure of telling you that the Council acquit you of the charge preferred against you; and I have great pleasure in adding that they do so unanimously.

Mr. KEMPSTER (with emotion): I have nothing to say but to thank you for the impartial hearing I have had.

Sir D. CORRIGAN then proposed the following resolution:—
"That the facts which have come to the knowledge of the General Medical Council in the investigation of the case of Mr. William Henry Kempster, have impressed this Council with the conviction that an amendment of the laws in force in regard to death registry is most urgently required; and that a copy of this resolution be forwarded to the Secretary of State for the Home Department."

Dr. CHRISTISON, in seconding this, stated that it appeared to him, from information which had been communicated in the course of the investigation, that a change was absolutely necessary, to render it possible for a Medical man to obey the law, and that there ought to be a certain latitude allowed with respect to assistants signing certificates of death.

Dr. ACLAND observed that a more unsatisfactory and tortuous state of the law, more perplexing and unjust to Medical men, could not be conceived. It was connected with many other evils bearing very hardly on the Medical Profession and on the public, and was an evil of such magnitude that Mr. Goschen, in his Local Taxation Bill, had proposed the construction of an entirely new Public Health Department, with a special Minister who would have under his surveillance the whole of these questions; but unfortunately that Bill was withdrawn. Mr. Stansfeld, however, as President of the Poor-law Board, had given notice of a Bill which would come before the House to-morrow; and it was the bounden duty of every member of the Council who had heard the evidence to-day to exercise all his influence in promoting any scheme which affected the happiness, health, and well-being of the public as that Bill would. When the public read the remarkably straightforward evidence which had been given, they would be taken by surprise to learn that the registration of deaths should be in such a state of confusion.

Dr. ALEXANDER WOOD said that in Scotland the Registrar-General and Sub-Registrars were extremely anxious that there should be a better mode of giving certificates. He remembered a case where strong suspicions existed as to the death of a child. The regular Medical Practitioner had been dismissed, and a person had been called in who had no licence at all. The child died, and a gentleman who had never seen the child before its death was brought to sign the certificate. This was represented to the Registrar-General, and eventually it was put into the hands of the public prosecutor, who, after making certain inquiries, gave up the prosecution on the ground that the individual who had committed this gross breach of propriety was sorry for it, and had apologised. But there was nothing to prevent such a state of things continuing, and he was of opinion that the only remedy was that the person signing the certificate of death should, *bonâ fide*, state that he attended the patient during life, and that where death had taken place without Medical attendance the death should not be certified by a Medical man.

Dr. STOKES expressed his conviction that the form of the certificate of death was entirely faulty, as it contained a number of particulars, such as the age of the patient, the length of his illness, the place of his death, as to which a Medical man ought not to be expected to certify. In some cases a certificate was applied for when death had not taken place, an instance of which he had heard of in Dublin, where the Doctor took the precaution of calling at the house, and found the man alive and kicking. (A laugh.) Then, as to the cause of death; it seemed a simple question to ask, but it was a most difficult one to answer.

After a few words from Dr. SMITH, the resolution was carried unanimously.

Dr. ACLAND moved that the questions relating to the Medical Bill and the President's answer yesterday should be inserted in the minutes.

Dr. GULL seconded this; but as there was a strong feeling that such a course would be inconvenient, as well as against the Standing Orders, the resolution was withdrawn.

The minutes of yesterday's proceedings were then confirmed, and the Council adjourned to to-morrow at two o'clock.

THIRD DAY.—THURSDAY, JULY 6.

MEDICAL EDUCATION.

The Council proceeded to consider the motions proposed by Dr. Parkes on the Educational Report, which was taken as read.

INSTRUCTION IN PHARMACY AND THERAPEUTICS.

Dr. PARKES moved—"That it is desirable that the instruction in pharmacy should be separated from that in therapeutics,

and that the former should be obtained at an early, and the latter at a later, period of the Professional curriculum." He said that he considered it most necessary to teach students to make up their own prescriptions and to understand the nature of drugs; and as to the science of therapeutics, there could be no question that it was one to which much greater attention ought to be paid.

Dr. CHRISTISON seconded this, and observed that the universities of Scotland had for a long time followed the practice of Continental universities, where distinct instruction was given in therapeutics.

Dr. MACROBIN also spoke in support of the motion.

Dr. HUMPHRY did not think it was necessary to have separate courses of lectures on therapeutics, because he thought that science could be best taught in connexion with Medicine and Surgery, and it was a science only in its infancy. He was of opinion that the Licensing Bodies should not be confined to any particular mode of imparting instruction. He moved the following amendment:—"That the practical instruction in pharmacy may with advantage be substituted for formal lectures on the subject, and should be attended at an early period of the Professional curriculum, and that instruction in therapeutics should be conducted at a later period of the Professional curriculum, either by a special course of lectures, or as an essential part of the courses of lectures on Medicine and Surgery."

Dr. APJOHN seconded the amendment.

A discussion then followed, in which Drs. ALEXANDER WOOD, AQUILA SMITH, THOMSON, Mr. HARGRAVE, and Sir DOMINIC CORRIGAN took part.

The amendment was put to the meeting and rejected, there being only three votes in favour of it.

The original motion was then put, and carried.

INSTRUCTION IN MIDWIFERY.

Dr. PARKES proposed, "That it is desirable that the Professional instruction in midwifery should be extended, and that every candidate for a licence shall be required to attend not less than twenty labours." He said that the lectures on midwifery were supposed to include instruction in the diseases of women and children, but he believed that the students of the present day were far less trained on those matters which concerned their every-day practice than were the students of former days. The authorities of the College of Surgeons of England and of the Apothecaries' Hall were of opinion that the course of midwifery should be extended. The Committee were not by any means agreed as to the number of labours, and twenty was fixed upon as a sort of suggestion or compromise, but of course the Council could substitute any other number.

Mr. HARGRAVE seconded this.

Dr. HUMPHRY was of opinion that it was much better to leave the subject to the licensing bodies. He thought the time spent in attending labours beyond the first few was not compensated by the additional amount of information gained, and it would be a great hardship to Medical students, especially in London, to require them to attend so many as twenty labours.

Mr. MACROBIN stated that he would vote for the motion if ten were inserted for twenty.

Sir DOMINIC CORRIGAN opposed strongly, and said that it looked very like a scheme for the sale of certificates.

Dr. ALEXANDER WOOD suggested that the motion should be, that the instruction on midwifery should include lectures on the diseases of women and children.

Drs. Stokes, Bennett, Quain, Fleming, and Mr. Quain, and others, expressed opinions generally against the adoption of the motion.

Dr. MACROBIN moved, and Dr. ANDREW WOOD seconded, the following amendment:—"That it is desirable that instruction in midwifery should be extended beyond three months, so as to embrace instruction in the diseases of women and children, and that every candidate for a licence be required to attend not less than ten cases of labour."

This amendment was lost, as also was an amendment proposing simply to substitute ten for twenty cases of labour.

The original motion was then put and lost.

PATHOLOGICAL ANATOMY.

Dr. PARKES then moved the resolution No. 3:—"That it is desirable that a course of systematic lectures on pathological anatomy should be introduced into the Medical curriculum."

Dr. ANDREW WOOD seconded it.

Mr. HARGRAVE moved an amendment to the effect that the word "lectures" should be omitted, because he was against tying down the Licensing Bodies to any particular mode of imparting instruction.

Dr. STOKES seconded this.

The debate was continued by Sir Dominic Corrigan, Drs. Christison, Sharpey, and Gull; and upon being put to the vote, the amendment, which was in these terms—"That it is desirable that systematic instruction in pathological anatomy should form part of Professional education"—was adopted.

COMPULSORY CLASS EXAMINATIONS.

The fourth resolution was then proceeded with—"That it is desirable that class examinations should be compulsory, and that the Licensing Bodies should require them in all cases."

Dr. HUMPHRY said that, having on all former occasions raised objections to Dr. Parkes' resolutions upon this subject, he had great pleasure now in seconding this motion. He was satisfied that class examinations were beneficial, not only to the students, who took a great interest in them, but also to the masters themselves, who learnt by them the weak points in their teaching.

Dr. STOKES objected to the word "compulsory," which he thought dangerous and doubtful in its operation.

Dr. ALEXANDER WOOD supported the motion.

Sir D. CORRIGAN moved the following amendment:—"That it is desirable that class examinations should form a part of every course of lectures, whether systematic or clinical." He agreed with Dr. Stokes that the word "compulsory" was objectionable. It would only lead to the sale of false certificates, which is the curse of the rising generation of Medical men.

Dr. A. SMITH seconded the amendment, and Drs. Andrew Wood, Sharpey, and Gull supported the original motion, the latter proposing to insert the words "on students" after the word "compulsory."

Sir Dominic Corrigan's amendment, having been put to the vote, was lost.

Dr. ACLAND then moved, and Mr. QUAIN seconded, the following amendment to the original motion:—"That it is desirable that class examinations should be compulsory on students"; but, on being put to the vote, it was lost.

Mr. QUAIN then moved an amendment in the following terms:—"That it is desirable that class examinations should form a necessary part of class instruction."

The amendment was seconded by Dr. A. SMITH, and, upon a division, was carried by the casting vote of the Chairman.

FINANCIAL POSITION OF GOVERNMENT
IN RELATION TO
ARMY MEDICAL DEPARTMENT.

*** The following has been forwarded to us for publication:—

Number of Medical Officers in each Rank, with Pay thereof, on May 1, 1871.

No.	Rank.	Pay per Annum.
101	Surgeon-Majors	£43,329 0 0
235	Surgeons	85,775 0 0
1	Assistant-Surgeon over 15 years	319 7 6
231	Assistant-Surgeons „ 10 „	63,236 5 0
241	Assistant-Surgeons „ 6 „	54,978 2 6
137	Assistant-Surgeons under 6 years.	25,002 10 0
		£272,640 5 0

Number of Medical Officers in each Rank, with Pay thereof, as will be on May 1, 1876.

No.	Rank.	Pay per Annum.
212	Surgeon-Majors	£92,856 0 0
124	Surgeons	44,895 0 0
117	Assistant-Surgeons over 15 years.	37,366 17 6
229	Assistant-Surgeons „ 10 „	62,688 15 0
137	Assistant-Surgeons „ 6 „	31,253 2 6
127	Assistant-Surgeons under 6 years.	23,177 10 0
		£292,237 5 0

Excess £19,597 0 0

The foregoing figures distinctly prove that, at the present rate of promotion, the position of the component members of the department must, at the expiration of five years, be so altered by length of service as to cause the gradually increasing outlay to have then reached an additional cost of nearly £20,000 per annum.

In this calculation no count has been taken of the number of Surgeon-Majors over twenty-five years' service, whose pay is consequently augmented by 3s. a day (viz., 27s.), as this sum is allowed to be a set-off against the probability of any deaths amongst the senior Assistant-Surgeons, whose places would then be supplied by those on a lower rate of income.

The calculation is thus rendered perfectly incontestable, and a continuance of the investigation will also show that each succeeding year must, by a process of reduplication, add immensely to the increasing price of the Medical Service.

It is therefore evident that on this day five years (May 1, 1876) the country will possess an army Medical staff of the exact numerical strength of to-day, but costing £20,000 more; and that for this augmented outlay nothing but discontent and dissatisfaction amongst those who are growing old in the subordinate grades will be purchased, without even adding a single man to a projected Medical reserve.

That those now in office will have retired ere then is a strong incentive to avoid the question; but, minor though the consideration is in comparison with the greater military questions of the day, it cannot thus be shelved.

The solution of the difficulty is not only feasible, but possesses the rare qualification of being beneficial alike to the State and to the Service—viz.: Optional retirement at twenty years' service, instead of twenty-five, on £1 a day, conditional on enrolment, up to the age of 55 years, in the Medical Reserve, from which the militia could be provided with experienced military Surgeons, on the additional allowance to each officer, when so employed, of quarters, fuel, servants, and forage.

Paradoxical as the statement may seem, it is nevertheless a fact that the retirement of a Surgeon-Major on £1 a day costs the State only 8s. 6d.; since, by his removal, 24s. being saved, while the promotion of an Assistant-Surgeon over fifteen years' service to the rank of Surgeon costs only 2s. 6d., and the appointment of an Assistant-Surgeon to fill the place of the latter 10s. a day, this sum, 12s. 6d., with the 20s. given as pension to the Surgeon-Major, represents a total loss of 32s. 6d., against a gain of 24s., leaving a balance loss of 8s. 6d., at which rate, for the increased outlay of £20,000, 129 Surgeon-Majors might be pensioned yearly.

It is therefore incredible that the excess of expenditure should still continue to be dispensed to the hardship of the recipients, when a proper utilisation of a far less amount would reproduce a normal rate of promotion, establish a Medical reserve, supply Medical officers for the Militia, and give rise to contentment in a department where despair and stagnation

now reign. That the members of the House of Commons interested in collateral military affairs will, when the press of business lessens, demand an investigation of this subject cannot be doubted.

May 1.

REVIEWS.

Lectures on Surgery. By JAMES SPENCE, F.R.S.E., Surgeon to the Queen in Scotland, Professor of Surgery in the University of Edinburgh, etc. Parts III. and IV. Edinburgh: Adam and Charles Black.

THOSE who looked forward to these concluding volumes of Mr. Spence's work as likely to contain the most valuable results of his large Surgical experience, will not be disappointed. We greatly prefer the portions on Operative and Regional Surgery to the earlier sections of the book, of which we could not speak quite so highly. After thirty-five years' Surgical practice, twenty-two of them spent as a Lecturer on Surgery and a Hospital Surgeon, Mr. Spence considers justly that he may claim some right to state decidedly the opinions which he holds, and the practice which he has found from experience to be most successful; and accordingly, these last volumes, which treat so largely of practical subjects, teem with valuable suggestions and rules for practice, which acquire great force from the writer's very high position in the Profession and widely recognised reputation as an able operator. Not the least important feature in these lectures is the prominence given to such anatomical facts as are of special importance in diagnosis and operative Surgery, but which the ordinary student of anatomy is too apt to forget when he comes to apply his knowledge to the practice of Surgery. Ophthalmic Surgery has been wisely omitted altogether from the course, it having been felt that due justice could not be done to so important a subject within the limits of a series of lectures on general Surgery. The only part of the book to which we must still venture to take exception is the manner in which chromolithography has been adopted, "as preferable," to use the writer's own words, "to the ordinary woodcuts, both in respect to the perspicuity afforded by colour, as well as enabling me to give faithful transcripts from photographs, or from original sketches made by various artistic friends, of actual cases or dissections, and used by me as class illustrations in my lectures at the University." The coloured plates are much fewer in the later parts of the book, and they are perhaps clearer than those in the former volumes, but they nowhere approach in distinctness the outline sketches or woodcuts, and we cannot help regarding a slightly diagrammatic clearness as more valuable than too rigid faithfulness in a student's text-book; not that even the outline sketches are always all that could be desired in this respect. For instance, Plate lvi., representing, as we are told, the parts involved in lithotomy in a child, is to us absolutely unintelligible from any point of view, and would certainly not help a student, however closely it may resemble a spirit preparation. We think that many of the drawings illustrating the work do but scant justice to the text, and certainly fail to clear up such few points as are not very fully described in writing.

Dipping at random into those parts of the book which have interested us most, we may draw attention to an admirable chapter on the mode of arranging for operations when all the skilled assistance and paraphernalia used in the Hospital are not at hand. Mr. Spence is a zealous advocate for chloroform, which he has used in almost all operations, small or great, since 1847, and he has had the rare good fortune to lose only one patient by its employment. The treatment of cases of danger attending its administration is fully laid down, and it is recommended to bring the patient rapidly under the influence of the drug rather than commence with small doses gradually increased. "Measurement of the chloroform used is merely to give an appearance of precaution, and, I presume, to enable the Surgeon to be prepared for a coroner's inquest." Mr. Spence is opposed to the notion that the mortality after operations has increased since the employment of chloroform has become general. He ignores the statistics upon the point, and declares that such statements are mere assertions without any distinct proof; and he meets them with the counter-assertion, that chloroform "has greatly advanced the successful results of operations." This is a question doubtless very difficult to settle, although of no small importance, and its difficulty has been increased by the conflicting statistics published. Did not Sir James Simpson himself put forth statistics, not

many years since, showing how small was the mortality in Hospitals since the introduction of chloroform? And when the like figures were needed, not many months back, to show the great mortality in large Hospitals as compared with private practice, had not the same operations become very much more fatal in their results? We may therefore comfort ourselves with Mr. Spence's conviction, that the increased mortality which some statistics have seemed to indicate is no real bar to the use of a drug which saves both patient and Surgeon so much.

Exceedingly useful chapters follow on the ligature of the principal arteries and on excision of joints. In the sections on Amputation Mr. Spence compares the circular with the flap method, and refers to a series of experiments undertaken by him many years ago, with the view of discovering the best form of operation for producing a good stump. He gives the decided preference to the flap operation, but of late years he has chiefly practised in the thigh and leg a modification of Teale's method, making a single long anterior flap, which he finds offers many advantages in the formation of a good stump, whilst it saves the Surgeon the troublesome details of measurement, etc., required by Teale's method. That Mr. Spence is well qualified to speak with authority, is evident from the statistics furnished by his own practice, in which 403 cases of amputation are variously tabulated and compared. Here, as in former portions of the work, the subject is enriched with clinical cases and practical notes.

Injuries and diseases of the head and spine usher in the important section on Regional Surgery, which occupies the remainder of the book, and is abundantly illustrated by clinical cases. We have no space to follow up the various portions of the subject, but we would specially direct attention to the chapters on hernia, and on the treatment of stone and stricture, as showing the thoroughly practical character of these lectures. This series of lectures will no doubt be warmly welcomed by many an old pupil of the author, whilst the work cannot but contribute largely to sustain Mr. Spence's high reputation as a Surgeon of unusual ability and experience.

COLONIAL CORRESPONDENCE.

AUSTRALIA.

(From a Correspondent.)

MELBOURNE, VICTORIA, April 22.

THERE is a general impression in this part of the world that our friends in the old country do not know much about us, either socially or politically, and I am sure that, so far as the Medical Profession here is concerned, this ignorance of us is at home supreme. There seems to be a general belief that, in some way or other, we are unpleasantly associated with convictism. To this feeling was to be traced, I presume, the reluctance on the part of the Medical Council, when framing the amended Medical Bill, to register Medical degrees of the Melbourne University unless the applicant holding them should first have resided twelve months in England, so as to purge himself from all suspicion of being an ex-prisoner of the Crown. Caution, however, is indicated quite in a contrary direction, for there is much more likelihood of new arrivals here being open to the suspicion of unfavourable antecedents than of those returning to England.

Taking the Profession in this colony altogether—and there are 468 of us, as *vide* the last "Register" issued by the Medical Board—I think we are a tolerably reputable body. There are among us, unfortunately, some very frightful examples of the black-sheep variety. These are, happily, not numerous, but they are eminently mischievous, and by their malignant activity they have brought the Profession a good deal into disrepute; for the public, as we know, judge on the *ex pede Herculem* principle. Others there are who, without being actually disreputable, are so strongly imbued with the trading instinct that they sacrifice every consideration for the sake of material gain. It is to these gentlemen we owe the great extension of the club-Doctor system. There was a time, and that comparatively recently, when club Doctors did not exist in this colony, but now they are numerous, and the injury they have quite unnecessarily inflicted upon the Profession constitutes one of our most crying grievances. If I remember rightly, it is the rule in the old country for only the head of a family to be attended by the club Doctor, and the collateral practice, represented by the attendance upon the wives and families of the men, makes up, in some measure, for the loss in taking, at a nominal fee, the head of the household; but

here the whole family is included, and, as we are a prolific race, the work of attending patients of this kind is something to deter all but those who are either insatiable in their appetite for ill-requited occupation, or whose needs compel them to accept such appointments. The sum paid for a year's attendance upon a family averages about 11s.; in some instances I have known it to be as low as 7s. 6d., and I have heard of 4s. 6d. being received. Until lately, this munificent fee has included medicines, but now the clubs are establishing Dispensaries, where the prescriptions of the Medical officer are made up. The rate of payment of the Doctor, however, has been proportionately lessened. The most degrading part of this club attendance arises from the fact of the Medical officer being chosen according to the "tenders" sent in. A lodge issues an advertisement that tenders will be received from duly qualified Medical Practitioners willing to supply Medical attendance and medicines during a given period. I am sorry to say these advertisements are numerous responded to, as the following extract from one of the daily newspapers will show:—

"The following elections of Medical officers in the Bendigo district are announced:—At a meeting of the Loyal Catherine Lodge, Eaglehawk, held a few days ago, for the purpose of electing two Medical officers, three tenders were received, and Drs. Atkinson and Thom were duly elected. At a meeting of the Rechabite Society, held on Tuesday evening last, for the same purpose, Dr. J. J. Thom was elected. Tenders were received by the Court Pride of the Forest, Golden-square, on Monday evening last, from Drs. Eadie, Boyd, and Tovell, for Medical attendance, when Dr. James Eadie was elected by a majority of sixty votes."

From time to time an endeavour has been made to check this growing evil; but as those whom the abolition of the system would temporarily affect are actively antagonistic, and as those whose position renders them independent of clubs are indifferent, the opponents of the club system have only got pooh-poohed on the one hand, and denounced on the other. So the evil grows, and is likely to grow still more, until it reaches such proportions that its own monstrosity will prove its destruction.

We have lately built a new Hospital in Melbourne. It is a handsome structure, and combines the last improvements in architectural hygiene, but it is in a bad, low-lying situation, the only reason for selecting the site being that the ground was given by the borough council of one of the suburban townships. There was a strong effort made to have it erected near the Medical School of the University, both for the obvious reason that a Hospital is a necessary part of a Medical school, and because the University is surrounded with comparatively poor localities, where the greatest number of Hospital patients might be expected to be found. But it happened that the promoters of the Alfred Hospital—for that is its title—belonged to the vulgar-rich class, and they had predetermined to have it in their own quasi-aristocratic suburb; and they carried their point, and so put up the building in a swamp, from which drainage is impossible. Moreover, it is two miles out of town, and all the patients have to come from long distances; as most of the Medical staff have to come long distances too, a good many people are inconvenienced who need not be. Speaking of the staff, I must mention that a new principle has been adopted, both in defining the qualification and in the mode of election of the staff. Strictly speaking, the staff is not divided into Physicians and Surgeons, although the practice in the Hospital is divided into Medical and Surgical. The acceptance of Medical or Surgical duties, however, depends upon the taste or inclination of the officer. The rule defines a general qualification—that is to say, the candidate must hold a recognised degree or licence, and be on the register of the colony; but he can take either Medical or Surgical duties. The election, moreover, is in the hands of the committee—or, as they are called, the Court of Management; and this is so far an advantage, that the discreditable canvassing of subscribers is avoided. Some little confusion has arisen out of the circumstance that among those accepting Surgical duties are some Doctors of Medicine, and among those doing Medical work are Surgeons having no university degree. All the quasi-Physicians, I hear, insist upon being styled "Dr.," and as this involves the styling of some of the M.D. Surgeons "Mr.," the Committee of Management are puzzled a little how to act. This confusion of titles is very common in this colony. It is the rule for the public to address every Medical man as "Dr.," and those who have not even a colourable right to this designation—such, for example, as being M.B. or M.R.C.P.—frequently so style themselves, and resent being reminded of the breach of etiquette such assumption infers.

You will have heard something of the controversy which has arisen out of the proposition, by Professor Halford, to employ liq. ammonia, by injection into the veins, as a remedy in cases of snake-bite and other kinds of poisoning in which neuro-paralysis occurs. The Profession generally have accepted Professor Halford's method as a valuable contribution to toxicological therapeutics, and, as about twenty-five cases of recovery from snake-bite have occurred after its use, they claim that its efficacy has been demonstrated. But the small unpleasant section of the Profession—who, though small, like mosquitoes, are very troublesome—deny its efficacy, for no reason, as it would seem, but that they refuse to believe it to be of use. The question has recently been revived by Dr. Neild, who, at the last meeting of the Medical Society of Victoria, read a paper on a case of poisoning by chloroform (swallowed), in which the ammonia injection had been of marked benefit.

GENERAL CORRESPONDENCE.

EFFECTS OF BRITISH CLIMATE ON THE INDIAN CONSTITUTION.

LETTER FROM DR. R. L. DUTT.

[To the Editor of the Medical Times and Gazette.]

SIR,—I shall feel extremely obliged if you will kindly insert the following in your valuable columns. There is a popular belief, even amongst Medical men, that the natives of tropical countries cannot bear the severe climate of colder regions. It is asserted that they fall an easy prey to diseases of the lungs, especially consumption. As is always the case, theory steps forward with a reason to maintain that the lungs of those thus transferred to colder latitudes are called upon to discharge an unaccustomed and undue amount of function as a decarboniser, from the lessened activity of the skin and the liver, as well as from the inhalation of cold and irritating atmosphere; the great onus thus thrown on the lungs serves as a prolific source of disease, aided by any existing or new cause of irritation.

How far this is true cannot be sufficiently ascertained. It is stated on some good authorities that the West Indians and the Africans are very prone to lung diseases by transference to colder countries, such as this; but even if this be true, it does not imply that all tropical nations are so liable. The natives of India now residing in this country enjoy perfect immunity in this respect. There are now more than fifty gentlemen in the United Kingdom; most of them have resided three or four years, and some longer. So far as I am able to judge from what I know of my acquaintances among them, who exceed half the number, and from other sources, I hardly find, excepting occasional cases of cold or catarrh, any serious complaints, much less of diseases of the lungs. There is an increase of muscle, improvement of tone, and energy of circulation, in place of laxity and weakness of fibre, want of tone, and pallidity of skin, the inevitable concomitant of tropical constitution. The processes of digestion and assimilation are found, as a matter of course, equally improved. Dyspepsia, with its train of miserable symptoms, and bowel complaints, such as dysentery and diarrhoea, are rarely to be met with among them. It is remarkable that there is in some of them a marked alteration in colour; it looks much lighter, especially in those of a very dark complexion, where the change is easily discernible.

It does not admit of doubt that the climate takes the chief part in the improvement, though the adoption of English diet and habits appears to have no inconsiderable share in it. What share the climate has, apart from the influence of education, in invigorating their minds, is not so easy to understand; yet it seems not improbable that it serves to check the flow of that vagrant imagination, the peculiar endowment of an Eastern mind, which revels in subjective pleasures, and pictures with vividness the palaces of Aladdin or the diamond-bearing trees of Heaven. And, further, it develops a practical turn of mind, conducive alike to the material prosperity and welfare of the individual and society at large.

In conclusion, the highly beneficial effects of the climate of Great Britain on the health of the natives of India are undeniable, and the prevailing notion of their being deleterious is an error based on no reasonable grounds. Let not those numerous Indian gentlemen who are anxious to see the West be deterred from coming over to England by this imaginary obstacle. I am, &c., R. L. DUTT, M.D., M.R.C.S.E.

97, Camden-street, London, N.W.

THE POLICY OF GARRISONING INDIA AND OUR OTHER TROPICAL POSSESSIONS BY LOCAL ARMIES.

[To the Editor of the Medical Times and Gazette.]

SIR,—Some time ago I wrote a letter to your journal on the policy of garrisoning India and our other foreign possessions by men enlisted specially for the purpose, instead of by imperial troops as at present; that letter you kindly inserted. I see that you remark, in an article headed "Mr Cardwell's Recruits," in the *Medical Times and Gazette* for April 29, that young lads are not suitable for service in India; and that is brought forward as one reason against the policy of raising local armies for India and our other tropical possessions. Now, it seems to me, that if we raised local armies for India, etc., there would be fewer lads in proportion to old soldiers than if we continue to garrison our foreign possessions by imperial troops, and for the simple reason that if we ever did raise local armies for foreign service they would be composed of long-service men; whereas the idea with regard to the future of the imperial army is, that it shall be composed of short-service men. To keep men for only a very few years in the first line, and then pass them on to the reserves, seems to be almost, if not absolutely, decided upon. The proportion of recruits in a short-service army must, in the nature of things, be very much greater than in a long-service army; and even if it be determined to raise six years' service battalions, composed of men who have already served three years in the first line, and employ these battalions in garrisoning India and other places, relieving them at the end of six years, we should be met by that curious fact in statistics, published in the *Medical Times and Gazette* for April 15, 1871, showing that the death-rate for the first six years of service in India is 43·31, while for the first twelve years the ratio of deaths is only 31·93. Consequently, if we relieved our Indian garrison every six years, we should do so at an unnecessary loss of life, amounting to 11 or 12 per 1000—we should keep men in India during the years of their maximum mortality, and relieve during the years when, if they had remained, their mortality would have been at its minimum. If men were enlisted for Indian and tropical service specially, it seems to me that they could be enlisted as to age and with regard to their special fitness for tropical service. When we consider in addition the vast sum each recruit for India costs, as lately published, the enlisting of men for twelve, fifteen, or twenty years for Indian service, and Indian service only, would be a very economical policy. It is, no doubt, a very important question in the future of our country how she should garrison her vast foreign empire; and different people will hold different opinions, and free discussion will bring out, probably, in time, most of the advantages and disadvantages of local and imperial troops for our foreign garrisons. Perhaps, if you consider this letter worth inserting, you will kindly afford me a little corner in your journal.

I am, &c.,

X. X.

OBITUARY.

DR. ROBERT DUNDAS.

ON June 25 the Medical Profession lost a distinguished member, and his numerous friends a respected and beloved companion, by the death of Dr. Robert Dundas. Born in Ireland at the latter end of the last century, he entered the Medical service of the army at an early age, served in the Peninsula, and was present at the siege of New Orleans in 1815. He subsequently settled at Bahia, in Brazil, where he was entrusted with the Medical superintendence of the British Hospital. This post he filled for twenty-three years with great credit to himself and benefit to others, rapidly attaining great Professional eminence at Bahia and in Brazil generally. His health giving way, he resigned his Hospital appointment and practice, and returned to Europe with ample means, the product of his skill and industry. He was, however, much too active-minded to accept the leisure so well earned by twenty-eight years' service in tropical climates, and, as soon as his health began to recover, he settled in practice at Liverpool, the residence of many of his old Bahia friends. Here he was appointed Physician to the Northern Hospital, and again did good work for several years. In 1852 he published, under the title of "Sketches of Brazil," a valuable contribution to Medical literature. In this work he advocated strenuously the doctrine that intermittent fever is not necessarily the result of so-called malaria, but may be generated in the human economy

by electrical, thermometric, and morbid hygienic conditions quite apart from the action of marsh miasmata. He also brought forward a considerable mass of evidence to prove the possibility of arresting the course of continued fever by quinine. This work was well received by the Medical public, and the edition was rapidly exhausted; but it was never reprinted. The period for calm and repose had arrived, and Dr. Dundas, partly influenced by the ties of friendship, gave up his Liverpool position, and settled in London, at Gloucester-place, Hyde-park, in the year 1854. Here, in the bosom of his family, and surrounded by many attached and devoted friends, old and new, he spent the last years of an eventful life. He died of exhaustion following a severe and continued attack of sciatica, in his 80th year. He was an upright, conscientious, intellectual man, of firm will and unflinching resolve. He combined with a certain sternness of character so much warmth of affection and sympathy for those whom he esteemed and loved, that he exercised over them great and universal influence. He retained, also, until the end, a most extraordinary power of attaching to him those whom he honoured with his regard.

HENRY CURRAN, M.D., OF DUBLIN.

HE was one of the Surgeons of the Mater Misericordiae Hospital, and one of the Physicians of the North City Dispensary district. He died of malignant typhus, caught in the performance of his duties among the stricken and destitute. Two of his brothers had but just recovered from typhus.

NEW INVENTIONS.

ISINGLASS AND COLLODION STICKING-PLASTER.

WE have received from Messrs. Ferris and Co., wholesale druggists, of Bristol, two samples of a plaster composed of isinglass and collodion—one black and opaque, and the other white and transparent. These plasters seem to us admirably adapted for their purpose. They are much thinner and lighter than any ordinary plaster, they adhere well and effectually, and are clean and elegant. We recommend our readers to try them.

MEDICAL NEWS.

UNIVERSITY OF DUBLIN.—In the degree lists of last week the following names were omitted:—

<i>Bachelors of Medicine.</i>	
Courtenay, Edward Maziere.	Floyd, Thomas Sargent.
Morgan, John.	

Mr. Comyn, though having passed the respective Examinations, has not yet graduated in Medicine and Surgery.

APOTHECARIES' HALL.—The following gentlemen passed their Examination in the Science and Practice of Medicine, and received Certificates to practise, on Thursday, June 29, 1871:—

Clay, Charles, Childs'-place, Temple.
 Goodson, William, Battersea-park.
 Lithgow, Robert Alexander, Downpatrick, Ireland.
 Maybury, Horace Mansell, Trimley, Surrey.
 Morgan, Edward Rice, Llansamlet, Swansea.
 Pinder, George Holtby, Ardwick and Ancoats Dispensary, Manchester.
 Skaife, Frederic, Easingwold, Yorkshire.

The following gentleman also on the same day passed his first Professional examination:—

Scott, John Walter, Guy's Hospital.

At the recent competitive examination for the Prizes in Botany, given annually by the Society of Apothecaries to Medical Students who are in attendance on the second summer session of their Medical studies, the successful Candidates were—

First: Vines, Sydney Howard, of Guy's Hospital.—A Gold Medal.
 Second: Skerritt, Edward Markham, of University College.—A Silver Medal and a Book.

APPOINTMENTS.

* * * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new appointments that take place.

Her Majesty in Council was this day pleased, by and with the advice of her Privy Council, in pursuance of the provisions contained in the 4th section of the 21st and 22nd Victoria, cap. 90, to appoint William Withey Gull, M.D., to be, for five years, a member of the General Council

of Medical Education and Registration of the United Kingdom, in the place of Henry Wyldbore Runsey, M.D., resigned.

BLOXAM, JOHN ASTLEY, F.R.C.S. Eng.—Junior Surgeon to the West London Hospital.

JONES, TALFOURD, M.B. Lond.—Physician to the Brecon County and Borough General Infirmary, *vice* Prestwood Lucas, M.D., M.R.C.P., deceased.

MARRECO, ALGERNON FREIRE, M.A., F.C.S., Lecturer on Chemistry in the University of Durham College of Medicine, Newcastle-on-Tyne.—Chair of Chemistry in the College of Physical Science, Newcastle-on-Tyne, in connexion with the University of Durham.

MURRAY, Mr. JARDINE, F.R.C.S.E.—President of the Sussex and Brighton Medico-Chirurgical Society.

ROBERTS, Dr. F. T.—Assistant Teacher of Clinical Medicine at University College Hospital.

TATHAM, Mr. GEORGE, M.R.C.S., J.P.—Vice-President of the Sussex and Brighton Medico-Chirurgical Society.

VERNON, BOWATER JOHN, L.R.C.P. Lond., F.R.C.S. Eng.—Ophthalmic Surgeon to the West London Hospital.

WILTSHIRE, ALFRED, M.D., M.R.C.P. Lond.—Physician for the Diseases of Women to the West London Hospital.

MILITARY APPOINTMENTS.

1ST FOOT.—Staff Surgeon Henry Kelsall, to be Surgeon, *vice* William Grantt, M.B., appointed to the Staff.

MEDICAL DEPARTMENT.—Surgeon William Grantt, M.B., from 1st Foot, to be Staff Surgeon, *vice* Henry Kelsall, appointed to 1st Foot.

BIRTHS.

MILLER.—On July 3, at Gloucester House, Southsea, the wife of J. W. Moore Miller, M.D., J.P., of a daughter.

RHODES.—On June 26, at 5, Royal-terrace, Weymouth, the wife of Charles Rhodes, M.D., of a son.

SAVERY.—On June 27, at 12, York-buildings, Hastings, the wife of John Charles Savery, M.R.C.S., of a daughter.

SEQUEIRA.—On July 2, at 34, Leman-street, E., the wife of James Scott Sequeira, M.R.C.S., etc., of a daughter.

WADD.—On July 1, at Beaconsfield, Bucks, the wife of Dr. F. J. Wadd, of a daughter.

MARRIAGES.

BOULGER—DENHAM.—On June 23, at the residence of Dr. Denham, 30, Merrion-square, Dublin, Edward Vaughan Boulger, B.A., only son of the late Percy Nihill Boulger, Esq., of Dublin, and grandson of the late Major Pierce Boulger, to Lizzie, second daughter of John Denham, M.D.

CREAGH—O'DONNELL.—On June 21, at St. Anne's, Edge-hill, Symon Pierce Creagh, of Bryan's Castle, county Clare, to Helena, eldest daughter of John O'Donnell, M.D.

DONALDSON—MACKIE.—On June 27, at St. Margaret's Chapel, Craig Ellachie, Banffshire, N.B., the Rev. Augustus Blair Donaldson, M.A., to Joanna Maria, younger daughter of the late Wm. Mackie, M.D., formerly of Bombay and Elgin.

GREEN—SYMONDS.—On July 1, at the parish church, Clifton, Bristol, Thomas Hill Green, Fellow of Balliol College, Oxford, to Charlotte Byron, youngest daughter of the late John Addington Symonds, M.D.

KERR—GIBSON.—On June 29, at St. Peter's, Onslow-gardens, South Kensington, Norman S. Kerr, M.D., Markyate-street, Beds, to Eleanor Georgina, only daughter of Edward Gibson, Esq., Ballinderry, county Antrim.

KLAMBOROWSKI—SMITH.—On June 29, at Clare, Suffolk, the Rev. L. Klamborowski, curate of Tilbury, to Frances Elizabeth, youngest daughter of R. T. Smith, F.R.C.S., of Clare, Suffolk.

PATERSON—ANDSON.—On June 6, at Bahia, Brazil, Alexander Paterson, A.M., M.D., F.R.C.S.E., to Margaret Ann, only daughter of the late James Andson, Esq., of Arbroath.

ROBINSON—SMITH.—On June 28, at St. Mary's, Hemel Hempstead, Nathaniel Wishart, eldest son of Dr. Robinson, Kennington-road, London, to Lucretia Ellen, second daughter of George Alexander Smith, of The Marlowes, Hemel Hempstead, Herts.

SOUTHBY—WOODCOCK.—On June 29, at Holy Trinity, Westminster, Anthony Gapper, younger son of Anthony Southby, M.D., of Bulford House, Wilts, to Eliza Cowdell, younger daughter of William Woodcock, Esq., of 67, Bessborough-street, Belgravia.

SWANSBOROUGH—DUCHESNE.—On June 29, at St. Giles-in-the-Fields, William Swansborough, of 8, Versailles-road, Upper Norwood, to Eliza Maria, widow of Robert Duchesne, M.D., of Woodford, and youngest daughter of Joseph Gullich, Esq., of Guernsey.

DEATHS.

BARLOW, MARY GEORGINA FLORENCE, the fourth and only surviving child of Robert Barlow, M.R.C.S. Eng., at Norfolk House, Albion-road, Dalston, on July 2, aged 14 months.

HUNTER, WILLIAM, M.D., of Woodbank, late Surgeon-Major Coldstream Guards, at Largs, Ayrshire, N.B., in his 78th year.

LEAHY, JAMES W., Surgeon R.N., at Southsea, on July 3.

VANCE, JOHN EPWORTH, of the Middle Temple, eldest surviving son of the late George Vance, M.D., at 37, Westbourne-terrace, on July 1.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.

BLACKBURN AND EAST LANCASHIRE INFIRMARY.—House-Surgeon; must be duly qualified. Applications and testimonials to the Secretary (marked "House-Surgeon") on or before July 18. The duties commence on July 28.

BRIXTON DISPENSARY.—Resident Dispenser. Applications and testimonials to Mr. Hollamby, 29, Branksome-road, West Brixton, S.W., on or before July 18.

GENERAL HOSPITAL AND DISPENSARY FOR SICK CHILDREN, BRIDGE-STREET, MANCHESTER.—Resident Medical Officer; must have a Medical qualification and be registered. Applications and testimonials to the Secretary, on or before July 22.

GUISBOROUGH UNION.—Medical Officer; must be duly qualified according to the General Orders of the Poor-law Board. Applications, with diplomas and testimonials, to William Weatherill, Clerk, on or before July 10.

HOSPITAL FOR SICK CHILDREN, 49, GREAT ORMOND-STREET.—Assistant-Physician; candidates must be Fellows or Members of the Royal College of Physicians of London. Applications and testimonials to be sent in on or before Wednesday, July 19.

HUDDESFIELD INFIRMARY.—Physician; must be a Graduate in Medicine of one of the Universities of the United Kingdom, or a Fellow or Member of one of the Colleges of Physicians, and be duly registered. Applications and testimonials to John Marsden, Esq., Hon. Sec., on or before July 28.

INFIRMARY FOR CONSUMPTION AND DISEASES OF THE CHEST, 26, MARGARET-STREET, CAVENDISH-SQUARE.—Visiting-Physician. Candidates must be Members of the Royal College of Physicians, London. Testimonials to be forwarded on or before July 10.

INFIRMARY FOR EPILEPSY AND PARALYSIS, CHARLES-STREET, PORTMAN-SQUARE, W.—Physician; must be a Member or Fellow of the Royal College of Physicians, London. Applications and testimonials to Mr. E. Watherston, Hon. Sec., on or before July 31.

LEEDS PUBLIC DISPENSARY.—Junior Resident Medical Officer. Candidates must be unmarried, and possess at least one legal qualification. Applications, with testimonials, to be sent to Mr. John Horsfall, 31, Albion-street, Leeds, on or before July 15.

METROPOLITAN FREE HOSPITAL, DEVONSHIRE-SQUARE, CITY.—Assistant-Physician. Candidates must be Members of the Royal College of Physicians of England, or pledged to become such within twelve months if elected. Applications, with testimonials, diplomas, etc., to the Committee, on or before July 10.

MIDDLESEX HOSPITAL MEDICAL COLLEGE.—Lecturer on Physiology. Applications to the Dean on or before July 22.

PARISH OF GREAT YARMOUTH.—Medical Officer for the North District; must be registered under the Medical Act, and possess the qualifications prescribed by the Order of the Poor-law Board. Applications, with testimonials, to John L. Cufaude, Clerk, on or before Monday, July 10.

ST. THOMAS'S HOSPITAL.—Resident Assistant-Physician. Candidates must be Members of the Royal College of Physicians, or Medical Graduates of a University of the United Kingdom, not less than 25 years of age. Applications to the Treasurer, at the Office, 13, St. Thomas's-street, S.E., on or before July 19.

SUFFOLK GENERAL HOSPITAL, BURY ST. EDMUNDS.—Physician. Applications and testimonials to the Committee, on or before July 17.

WARWICK COUNTY LUNATIC ASYLUM.—Assistant Medical Officer; must have both Medical and Surgical qualifications. Applications and testimonials to Dr. Parsey, at the Asylum.

WIRRAL UNION.—Medical Officer for the Upton District. Candidates must have the qualifications prescribed by the General Orders of the Poor-law Board, and will be required to attend a Board meeting on the day of election, bringing their testimonials and diplomas. Residence within the district required. Election on July 12. Further particulars may be obtained of Mr. P. Gregory, 33, Hamilton-square, Birkenhead.

POOR-LAW MEDICAL SERVICE.

. The area of each district is stated in acres. The population is computed according to the census of 1861.

RESIGNATIONS.

Lewes Union.—Mr. Richard Turner has resigned the Lower District; salary, £45 per annum. He has also resigned the Workhouse; salary, £35 per annum—and the Workhouse for Children; salary, £10 per annum.

APPOINTMENTS.

Aysgarth Union.—Alfred Baker, M.R.C.S. Eng., L.R.C.P. Edin., to the Askrigg District.

Brackley Union.—John Farmer, M.R.C.S. Eng., L.S.A., to the Workhouse. Robert B. Hocter, M.B. and M.C. Univ. Dub., to the Brackley District.

Brighton Parish.—David Richards, M.R.C.S. Eng., L.S.A., to the Workhouse.

Tavistock Union.—Newbegin Kent, M.R.C.S. Eng., to the Beerferris District.

MR. GROTE bequeathed his valuable library to the London University.

THE Prevention of Adulteration Bill has shared the fate of many other innocents, and has been withdrawn.

DR. GAVIN MILROY is about to leave this country for the West India Islands, being sent out by Government to undertake further investigations regarding leprosy.

THE collections at Worcester on the 25th ult. ("Hospital Sunday")—the first adopted in that city—amounted to £439 6s. 8d.

MR. C. COWEN, Deputy Inspector-General of Hospitals, is to succeed the late Dr. Telfer in Medical charge of the Military Prison at Gosport.

THERE was a rise in the mortality of Paris last week, which, however, is attributed to the large return of persons who had left during the rule of the Commune, and not to the prevalence of any epidemic.

THE foot-and-mouth disease has broken out in East Cornwall. In Stoke Clemsland it has made its appearance on four farms.

JOHN SINGLETON, a barman, of Liverpool, was fined 10s. and costs, at the Lancaster Police-court, on Saturday, for wilfully exposing himself in a public conveyance whilst suffering from small-pox.

CHOLERA has broken out among the regiments at Secunderabad. The 18th Hussars have suffered most, and have been moved into camp away from cantonments.

In a note upon the manner in which the death-rate is computed, the Registrar-General points out that the true interpretation of the diminished rate at which population has increased on the areas of towns within their ancient boundaries is the abolition of cellar and other dwellings, the erection of warehouses, factories, and offices, in the place of houses, the removal of families, and the increase of population taking place in the districts beyond the town limits.

A MODE OF PROPAGATING SMALL-POX.—At the last meeting of the Belfast Town Council, a discussion took place respecting the high death-rate of the town. Mr. Boag called attention to the evils resulting from the habit of "waking" the dead, and mentioned that small-pox had been very extensively propagated by this means.

LEGION OF HONOUR.—The Chief of the Executive Power, on the recommendation of the Minister of War, has just promoted M. Ricord to the grade of Grand Officer, M. Demarquay to that of Commander, and MM. Lunier-Ladger and Cusco to that of Officer, for their services during the siege of Paris. For similar services fourteen other Medical men have had the grade of Chevalier conferred upon them.

THE general meeting of the Benevolent Medical Society for the county of Kent, will be held at the "Ship" Tavern, Greenwich, on Wednesday, July 12 next, at two o'clock. Dr. William Carr, of Blackheath, is President; and Mr. John Moulden Burton, of Lee-park, the Vice-President of this Society. £1 ls. a year offers all the advantages of a life insurance, in addition to probable aid in sickness or disability. After the meeting the members will dine together at four o'clock.

ONE of the Medical officers of the ——— Union having received a circular with reference to the non-production of the Medical officers' books, forwarded his to the last meeting of the Board of Guardians, with a long entry in the column for observations, from which the following is an extract:—"The last time I had the honour of attending at the Board I took my book carefully filled up. Not a soul would take the trouble to look at it. I proposed to an intelligent guardian, well developed in the frontal region, that I should put a good-looking dummy in your possession, and leave the thing, and he thought I could not do better." A little further on he stated that "Mrs. Brooks has been suffering from one shilling and sixpence a week and old age combined." The facetiousness of the Medical officer roused the ire of one of the Board, who stigmatised it as "nonsense," but the others appear to have taken no notice of the effusion, except to laugh at it.

PROFESSOR CLAPARÈDE.—This eminent Genevese zoologist died at Sienna on June 2, at the early age of 40, having long suffered from an affection of the chest. A pupil of John Müller, at his recommendation he undertook the investigation of the lower aquatic animal life, in which, like Sars, he acquired so distinguished a reputation. From these he has drawn many facts in support of Darwinism, of which he was an enthusiastic supporter. Fortified with all the learning of Germany, he wrote with the lucidity of an accomplished French scholar, and, in spite of his weakly state of health, he displayed remarkable energy in the pursuit of science. Even during the last two years, his works have been multiplied in a surprising manner, as if he were aware of his approaching end. Writing in French and German with equal facility, his communications have appeared in the most important serials of France, Switzerland, and Germany.—*Revue Scientifique*, July 1.

A LITERARY LOSS AT THE HÔTEL DE VILLE.—M. le Dr. Chereau, the distinguished Medical archæologist, has sustained a great loss at the recent conflagration. One of the projects of Baron Haussman, which he intended to carry on on the same colossal scale employed on his less laudable undertakings, was the production of a new "History of Paris, furnishing a detailed account of all its ramifications, institutions, professions, monuments, streets, and their transformation, etc." For this end he (furnished as usual with an unlimited command of funds) assembled around him a numerous body of *savants*, historians, archæologists, and artists; and at the time of the outbreak, this grand historical monument, which was to consist of many expensively illustrated volumes, was under

active execution. To M. Chereau was assigned the production of the "Histoire de l'Ancienne Faculté de Médecine de Paris," and he had entirely completed his manuscript, which, with more than 100 illustrations, was in the press. This interesting document has been entirely destroyed, although, fortunately, the illustrations, consisting of portraits, autographs, chromolithographs, etc., lying at the photograph establishment in another part of the town, were preserved. Of this laborious undertaking, which has occupied M. Chereau some years in its compilation, he has no copy; but with a courage which cannot be sufficiently admired, he states his determination to rewrite it from his notes.

NOTES, QUERIES, AND REPLIES.

He that questioneth much shall learn much.—Bacon.

Dr. A. S. Jayakar.—Your letter, with inclosure, has come safely to hand.

A Poor Patient.—No letter of recommendation is required.

Perplexed.—Avoid advertisers. The case is amenable to treatment. Any respectable Surgeon may be consulted.

An Indian.—Write to the Naval Medical Department, Somerset House, Strand, W.C.

Dublin.—We have no intention of entering on a discussion of the theological question with Dr. McCabe. We will only say that craniotomy is justified by the opinion of divines and theologians of the highest standing, by the Christian obligation of saving life, by the common sense of mankind, and by the law of the land. It is a great pity that religious differences should be allowed to influence elections to Medical offices.

HORSE ALLOWANCE IN INDIA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Can any reader of the *Medical Times and Gazette* inform me whether Medical officers serving in India and entitled to draw horse allowance are obliged to muster their chargers before that allowance can be obtained? I cannot help thinking that surely some order is in existence, or ought to be, allowing Medical officers in India, when they are entitled to allowance for several horses, to draw that allowance for horses which are not passed chargers. A Doctor has other duties to perform besides mere parade duties, and it seems to me very hard that he should not be allowed to draw a rupee of allowance for horses kept by him and employed in visiting the sick, simply because the animals so kept and used are not quite of the stamp that a colonel could certify to be passed chargers. Take the case of a Medical officer attached to royal horse artillery or cavalry. In all probability, one horse is sufficient for all his parade work. He will be entitled to allowance for two or three horses, according to his service. Why should he not be allowed to keep one or two strong ponies for going to Hospital and performing his other Medical duties, and be entitled to draw allowance for them? Surely visiting the sick is quite as important a duty as sitting on horseback on parade; and for the former purpose an expensive charger is quite unnecessary. A pony is, indeed, a great deal more suitable to hammer over the hard high road at any hour of the day or night than a valuable horse probably costing from £60 to £100. Many cavalry and royal horse artillery Medical officers can ill afford to buy three, or even two, horses at such a figure. If anyone knows of any order allowing Medical officers entitled to horse allowance to draw it for horses which are not passed chargers, I should be much obliged if he would kindly refer me to number and date, as nowadays the Indian pay department will not pay a rupee that they can dodge anyone out of.

I am, &c.,

TATTÚ.

P.S.—Tattú is the Urdu for pony. Thirty rupees (equal to £3) is the allowance per month for a passed charger.

Mesmer.—Baron Dupotet gave his first experiments in London on animal magnetism at the North London Hospital, in the autumn of 1837. A full account of these remarkable *séances* will appear amongst the "Reminiscences" at the proper time.

The late Dr. Epps.—The *Homœopathic Monthly Review*, quotes the sketch of the late Dr. Epps which appeared in one of Mr. Clarke's "Reminiscences." In some remarks upon it, the editor says the phrase "took to the practice of homœopathy" is one apt to suggest sinister motives. "This was not the intention of the writer of the sketch; and it is only due to the memory of Dr. Epps to say that he was a thoroughly upright and conscientious man, however mistaken, and would not have practised homœopathy if he had not fully believed in it.

Professorship of Chemistry in the Royal Academy.—At the last dinner of the Royal Academy the President alluded to the steadily advancing deterioration of colour in many modern paintings, in consequence of which their value has been much impaired. This failure of colour is the more remarkable when contrasted with the perfect state of preservation of the paintings of the older masters, and is to be attributed chiefly to the knack of selection of materials and of mixing the colours in due proportions not having been handed down among the traditions of the art. To remedy this defect as far as possible, Sir F. Grant stated that it is the intention of the Council of the Royal Academy to appoint a Professor of Chemistry, whose duty it will be to lecture to the students on the properties of the mineral and organic materials used in the preparation of artists' colours. The idea is good, and, if efficiently carried out, it may be hoped that eventually the secret of mixing colours "with brains" may be restored to the world of art.

A Reader.—The second volume of Dr. Arnott's "Elements of Physics" was published nearly forty years after the appearance of the first. Nearly the same period occurred between the publication of the first and last numbers of Dr. Copland's "Medical Dictionary."

•• The following letter has been sent us for publication. It is addressed by Dr. Rogers, the President of the Poor-law Medical Officers' Association of England and Wales, to the Honorary Secretary of the Poor-law Medical Officers' Association of Ireland:—

33, Dean-street, Soho, July 1, 1871.

DEAR SIR,—I am directed by the Council of this Association to write and inform you that Mr. Corrance, M.P. for East Suffolk, who has recently been making a tour in Ireland, for the purpose of investigating your system of general and Medical poor-relief, will, in the course of the present month, bring the question of the laws relating to the poor of England and Wales before the House of Commons, and (*inter alia*) propose a resolution—"That the Dispensary system, subject to certain modifications as to the abuse in the issue of tickets to persons capable of paying for Medical attendance, etc., shall be generally adopted in this country."

It has always been one of the cardinal objects of this Association to secure that all medicines and appliances needed for the sick poor should be supplied either from the rates, or from funds furnished from Imperial sources; and as, by the provisions of the Medical Charities Act, the Medical officers in Ireland are spared the degradation of finding such drugs from their stipends, which stipends in this country are oftentimes obviously insufficient to pay even the cost of such drugs, and from which cause, as well as from the fact that the importance of rendering Medical relief in England and Wales efficient has, ever since the enactment of the new Poor-law of 1834, been almost wholly disregarded, whereby the service was discredited, and discontent exists so strongly that 10 per cent. of the Medical officers annually resign their appointments, and large numbers of the remainder originally seek for, and subsequently retain, such appointments solely on account of its bearing on either their obtaining, or on the preservation of, their private practice.

The great extent to which expenditure on pauperism in England, Wales, and Scotland has expanded during the last twenty years has caused public attention to be directed to this subject, and since that time an opportunity has been afforded of contrasting the system of Medical relief in the United Kingdom with that which has existed in Ireland since the enactment of the Medical Charities Act, whereby it has been shown conclusively that whilst such expansion of expenditure has been with us almost continuous, yours has materially diminished; and whereas it has also been clearly exhibited that such lessened outlay is traceable, if not wholly, certainly in great part, to the improvement in the health of the poor, as proved by the marked diminution of epidemic disease and the lowering of your general rate of mortality.

The importance of a more efficient system of Medical relief is beginning to dawn on the English public, and we look forward with much confidence to the impetus which will be given to the question by the discussion about to take place in Parliament; but our Council feel that it would be matter of much regret if this opportunity should be lost of putting on record the opinions of such representatives as Sir Dominic Corrigan, Sir John Grey, Messrs. Brady, Gregory, Mitchell, Henry, and others who may be known to you; and I am respectfully, but earnestly, to request that the kind offices of the members of your Association may be exerted in urging on these gentlemen the advisability of not only being present, but supporting Mr. Corrance's motion.

In conclusion, I may be permitted to observe that, should your system be hereafter introduced into this country, it would tend to our mutual benefit if some of your representatives were to point out the blots of the Dispensary system, whilst enlarging on the social and economic advantages which have sprung from the efficiency of your Poor-law Medical relief arrangements.

I have the honour to be yours truly,

J. ROGERS,

President of the Poor-law Medical Officers' Association of England and Wales.

Dr. Maunsell, Hon. Sec. Poor-law Medical Officers' Association, Ireland.

BRITISH MEDICAL ASSOCIATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I shall feel obliged by your publishing the inclosed letters, supplemental to those which, by your courtesy, appeared in these columns last week.

I am, &c.,

SAMPSON GAMGEE.

18, Broad-street, Birmingham, July 4.

"To William D. Husband, Esq., F.R.C.S., J.P., President of the Council of the British Medical Association.

"My Dear Sir,—As President of the Committee of Council by whom the editor of the *British Medical Journal* is appointed, I beg to call your attention to an article which he has appended to my correspondence with you, published in this day's journal. I am referred to in that article as 'representing locally other journalistic interests,' and further on allusion is made to my 'journalistic clients' and to the 'journal I represent.'

"In so far as the expressions quoted tend to convey that I am the representative of, or in any way connected with, any Medical or other journal or newspaper, they are positively and wholly untrue.

"You have raised an issue in your official capacity, as the chief executive officer of the British Medical Association, by proposing alterations in nearly one-half of its laws. As a member of its Council, I addressed you officially, on the broadest public grounds, on that issue, and, so far as I am concerned, the discussion shall be conducted with the most faithful observance of those rules which make a free expression of difference of opinion possible amongst gentlemen.

"I abstain from expressing any opinion on the judgment, taste, and discretion displayed by your subordinate officer in commenting on our correspondence in the terms quoted; but I submit for your consideration whether the editorial article in question does not furnish additional evidence against the expediency of further centralisation of power in the British Medical Association.

"I am, Dear Sir, faithfully yours,

"SAMPSON GAMGEE.

"18, Broad-street, Birmingham, July 1, 1871."

"36, Bortham, York, July 3, 1871.

"My Dear Sir,—I beg to acknowledge the receipt of your letter in which you complain of the article appended to our correspondence in the *British Medical Journal*, and to assure you that the Committee of Council have no

intention of giving increased power or influence to the editor of the journal in the management of the Association.

"Believe me very truly yours,
W. D. HUSBAND.
"S. Gamgee, Esq., F.R.C.S."

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—If you indulge Mr. Gamgee with the publication of his further correspondence with the President of Council, I must ask you to insert this letter, and thus to allow me, on my part, to throw a little further light on the facts. The comment, of which Mr. Gamgee now warmly impeaches the accuracy, was forwarded to him in proof for his observations. If it contain any error of fact, he is directly responsible, for he had an express and unusual opportunity afforded to him by my courtesy of correcting such error. I accept the responsibility of the discretion and good taste of what I wrote; and of these points Mr. Gamgee will hardly, after this explanation, appear to be a perfect judge; but it may be right to state that the comments were also forwarded to the President of Council before they appeared, and have been approved by him. I find a difficulty in believing in the reality of an indignation, of which it lays so easily in Mr. Gamgee's power to avert the occasion.

I am, &c.,
THE EDITOR OF THE "BRITISH MEDICAL JOURNAL."

•• We have published these letters at the request of their respective writers, but we can insert nothing more on the subject.

COMMUNICATIONS have been received from—

DR. RUSSELL; X. X.; DR. F. R. HOGG; MR. ARNISON; DR. WOODWARD; MR. W. STANYER; MR. S. T. KNAGGS; DR. NAVRATIL; DR. LETHEBY; DR. VINEN; DR. TALFOURD JONES; MR. SEQUEIRA; MR. WILSON; MR. SAMPSON GAMGEE; DR. PARSEY; DR. T. GIBSON; DR. WILTSHIRE; MR. C. BROOKE; DR. DOWSE; MR. J. CHATTO; DR. J. W. MOORE; DR. F. PORTER SMITH; DR. DAY; MR. T. MURPHY; AN INDIAN; MR. JARDINE MURRAY.

BOOKS RECEIVED—

Hunt on the Skin, ninth edition—Dr. Hammond's Treatise on Diseases of the Nervous System—Die Uebertragung der Syphilis durch die Vaccination, by Dr. Heinrich Kübner—The Medical Jurisprudence of Insanity, by Balfour Browne—Half-yearly Abstract, vol. liii.—Women and Doctors; or, Medical Despotism in England—Report on the Sanitary Condition of Birkenhead—Preliminary Report and Tables of the Population and Houses enumerated in England and Wales and in the Islands in the British Seas.

PERIODICALS AND NEWSPAPERS RECEIVED—

Quarterly Journal of Microscopical Science, No. 43—British and Foreign Medico-Chirurgical Review, No. 95—Medical Temperance Journal, No. 8—The Milk Journal—Science Gossip—Worcestershire Chronicle—Philadelphia Medical Times—Gazette Hebdomadaire—Pharmaceutical Journal—Mechanics' Magazine—Dark Blue—Monthly Microscopical Journal—Mental Journal—Edinburgh Medical Practitioner—Birmingham Morning News—Camden and Kentish Towns Gazette—The Porcupine—Quarterly Journal of Science, No. 31—Medical Press and Circular—Brighton Examiner—Popular Science Review, July—Westminster Review, July.

APPOINTMENTS FOR THE WEEK.

July 8. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 9½ a.m.; King's, 2 p.m.; Charing-cross, 2 p.m.; Royal Free, 2 p.m.; Hospital for Women, 9½ a.m.; Royal London Ophthalmic, 11 a.m.

10. Monday.

Operations at the Metropolitan Free Hospital, 2 p.m.; St. Mark's Hospital for Diseases of the Rectum, 2 p.m.; St. Peter's Hospital for Stone, 2½ p.m.; Royal London Ophthalmic, 11 a.m.

11. Tuesday.

Operations at Guy's, 1½ p.m.; Westminster, 2 p.m.; National Orthopædic, Great Portland-street, 2 p.m.; Royal Free, 2 p.m.; Royal London Ophthalmic, 11 a.m.

12. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1½ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew's, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas's, 1½ p.m.; Samaritan, 2.30 p.m.; King's College Hospital (by Mr. Wood), 2 p.m.; Royal London Ophthalmic, 11 a.m.

13. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; Royal Orthopædic, 2 p.m.; West London, 2 p.m.; University College Hospital, 2 p.m.; Royal London Ophthalmic, 11 a.m.

14. Friday.

Operations at Westminster Ophthalmic, 1½ p.m.; Central London Ophthalmic, 2 p.m.; Royal London Ophthalmic, 11 a.m.; South London Ophthalmic, 2 p.m.

VITAL STATISTICS OF LONDON.

Week ending Saturday, July, 1 1871.

BIRTHS.

Births of Boys, 1099; Girls, 1061; Total, 2160.
Average of 10 corresponding weeks, 1861-70, 2011'8.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	678	650	1328
Average of the ten years 1861-70	657'4	605'6	1263'0
Average corrected to increased population	1389
Deaths of people above 90

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1861.	Small-pox.	Measles.	Scarlet Fever.	Diphtheria.	Whooping- cough.	Typhus.	Enteric (or Typhoid) Fever.	Simple continued Fever.	Diarrhoea.

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29'80 in. The highest was 30'10 in. on Monday at 9 a.m., and the lowest was 29'51 in. on Wednesday at 9 a.m.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871; the numbers for Edinburgh and Glasgow have been furnished by the Registrar-General of Scotland, while those for Dublin are still the estimated numbers recently used.

† No return has been received from Dublin this week; an average of the numbers in the three previous weeks have been inserted to make up a total for the twenty towns of the United Kingdom.

HOOPER'S PATENT ELEVATING BED & WATER MATTRESS,

Combining the advantages of the Water Mattress with a ready method of lifting an Invalid, for the use of the Bed Pan, Ablutions, Elevating the Back and Head, Ventilation and Adjustment of the Bedding, &c., &c.

The principle of this Elevating Bed being the simple lever, without pulleys, cranks, or wheels, the invalid is raised from the Water Mattress, or again replaced with great facility.

Much pain and exhaustion are thus spared to the invalid, and the attendant's labour is materially lightened

7, PALL-MALL EAST, LONDON.

CHLORODYNE SPECIAL NOTICE.

The absurd statements that have recently appeared in Medical and other Journals respecting the constituents of CHLORODYNE (each analysis differing widely), J. T. DAVENPORT is compelled to further CAUTION the Profession against using any Compound under the name of Chlorodyne but the genuine, which alone has gained such extraordinary celebrity.

J. T. DAVENPORT appends Medical testimony in confirmation of the above.

The wonderful efficacy of Chlorodyne being universally acknowledged, it must be evident to all that the assumption of the name to any other Compound than the Genuine is not only improper, but unprincipled, as it is liable to injure the health of the Patient and cause discredit to the Physician. Even death has resulted from the use of spurious Chlorodyne when benefit had been previously experienced from the genuine; and this melancholy circumstance has no effect in restraining these heartless proceedings.

From Dr. J. WILSON, Castleton, Yorkshire.

"I require to use a considerable quantity of Chlorodyne in cases where no other medicine is of the least avail; and my object in wishing a supply from your own establishment is that I am frequently deceived by getting a *Spurious* article from other places, although I never order anything but the genuine Browne's Chlorodyne."

From JAS. ATKIN, M.D., Medical Officer, Fever Hospital, Oldcastle, Co. Meath.

"Having ordered from our Druggists 'Chlorodyne,' I was not only *disappointed in its effects*, but annoyed when I received a spurious compound. I have been in the habit of using your Chlorodyne with great advantage to my patients and satisfaction to myself."

From F. E. BARTON, Esq., Surgeon, Dover.

"I have now used your Chlorodyne in numerous cases, and have much pleasure in adding my testimony to its very great efficacy as an Antispasmodic and Anodyne, having found it especially valuable in those cases in which Opium does not agree well with the patient."

From Thomas F. Hale, Esq., Surgeon, Saundersfoot, Pembrokeshire.

"Sir,—I should be much obliged by your forwarding three bottles of Dr. J. COLLIS BROWNE'S CHLORODYNE, which I have found most useful in allaying pain. I have used twelve ounces of it, and, in nearly every case in which I have employed it, have every reason to be satisfied with the result; and although I object, as a rule, to use any preparation of a secret nature, and whose composition I am not fully acquainted with, still, having once tried the Chlorodyne, and found that it really did produce the effects stated, I do not think I should be justified in withholding such a preparation from my patients, when I see the value of the remedy."

From Lord FRANCIS CONYNGHAM, Mount Charles, Donegal, December 11th, 1868.

"Lord Francis Conyngham, who, this time last year, bought some of Dr. J. Collis Browne's Chlorodyne from Mr. Davenport, and has found it a most wonderful medicine, will be glad to have half a dozen bottles sent at once to the above address."

"Earl Russell communicated to the College of Physicians that he received a despatch from Her Majesty's Consul at Manilla, to the effect that Cholera has been raging fearfully, and that the ONLY remedy of any service was CHLORODYNE."—See "The Lancet," 1st December, 1864.

CAUTION.—Vice-Chancellor Sir W. Page Wood stated that Dr. J. Collis Browne was undoubtedly the Inventor of CHLORODYNE, that the whole story of the Defendant was deliberately untrue, which, he regretted to say, had been sworn to.—See "Times," 13th July, 1864.

The Sole Manufacturer of Dr. COLLIS BROWNE'S Chlorodyne is

J. T. DAVENPORT, 33, Great Russell-street, Bloomsbury-square,

Who alone received the Recipe, and who is the Only Authorised Maker.

MEETING OF THE GENERAL MEDICAL COUNCIL.

HELD AT 32, SOHO-SQUARE.

THIRD DAY.—THURSDAY, JULY 6.

We furnished last week a brief outline of this day's proceedings, of which we now give a fuller report.

Dr. PARKES moved a resolution, which in the course of the debate was modified in its terms, and finally put as follows:—"That it is desirable that the instruction in pharmacy should be separated from that in therapeutics, and that the former should be obtained at an early, and the latter at a later period of the Professional curriculum." He said that probably there was no teacher in Europe to whose opinion the Council would attach greater importance than it would to that of Dr. Christison, who, in his treatise on Medical education, strongly advised the separation of the teaching of pharmacy from the teaching of therapeutics; and another authority of great weight, in support of the same system, was also present in the Council, Dr. Aquilla Smith. With regard to pharmacy, there was a point in the report of some importance—viz., that instruction should be made more tutorial, so to speak. The Council did not wish to go too much into details, and therefore it was thought sufficient to bring the subject in a general way before the educational bodies. The course of instruction followed in Aberdeen was alluded to in the report for the purpose of showing that the theory could be carried out in practice. Dr. Harvey had furnished him privately with a report on the subject, which he hoped would be printed; therefore, he would not attempt to describe that professor's scheme for fear of doing it injustice. The result of it was that in the most simple manner, and in a mode which was very agreeable, the students had been taught, not only the character of drugs, but how to make up their own prescriptions, and had acquired a knowledge far superior to that which is ordinarily obtained in shops, to which heretofore they had been sent by the University.

Dr. CHRISTISON, in seconding the resolution, said that *Materia Medica* in its ancient signification included both the outward history and character of medicines, the mode of preparing them for use, and also their action, so far as these things were known in ancient times. To this was afterwards added the subject of dietetics; and for a long time *Materia Medica* was understood in that extended sense. The universities of Scotland had taken their system very much from the Dutch school, in which many of the most illustrious Physicians of this country were formerly educated, in part at least; and the students of those universities had always taken a very great interest in the subject now before the Council. He was very much surprised when he entered the Profession to find that the London Society of Apothecaries gave instruction in what was now understood as therapeutics to the students in their first year. Now, it was quite clear that a very important part of therapeutics could not be understood until a very advanced period—in fact, not until the last portion of the Professional course. It being now understood that *Materia Medica* embraces the two great branches of pharmacy and therapeutics, and that under therapeutics the professor would deal with diet and regimen, as well as Medicine, he would say a word or two with regard to each of those branches. Some Surgeons and Physicians of high authority contended that pharmacy had attained such perfection in the hands of pharmaceutical chemists that Practitioners might leave it unstudied; but those who held that opinion seemed to forget that many Practitioners, not only in country places, but in the army and navy and the East Indian services, had no alternative but to practise pharmacy. A great responsibility in this respect was attached to them, and therefore it was necessary that they should know something of the mode of distinguishing the characters of drugs, and also how to administer them. It was of great importance that pharmacy should be taught practically; and, if so, increased accommodation would be required. His view was that the lectures should not be very numerous, but should be interspersed now and then with practical illustrations by an able dispenser. With regard to therapeutics, some men of ability held the opinion that it need not be a separate subject of study. They had no faith in therapeutics; and no wonder, when the way in which they had been taught that science was considered! He declined to say anything specific upon the subject of defective teaching in this respect; but he was quite certain that the subject was greatly neglected in many schools, and to that neglect was to be

ascribed, to a great extent, the contempt for the science expressed in some quarters. Those who would enter properly into the subject would find it most attractive; and it was a science in which research would be rewarded by valuable discoveries. Pathology, to which so much attention had been paid during the last fifty years, was now in a very great measure worked out, and there was not the same room for inquirers to make discoveries; therefore, let men of ability, who were anxious to make valuable additions to Professional knowledge, turn their attention to therapeutics. As to its place in the course, certainly it should be about the last study in which a student should be engaged, because no one could study it to advantage until he was well acquainted with chemistry, pathology, and the treatment of diseases; and as it was the most advanced, so it was the most important, of all branches for the Physician and the Surgeon so far as regarded Medical treatment; for what would be the use of the most brilliant inventions in pathology, and the most accurate diagnoses of disease, unless they had effectual remedies to apply? (Cheers.)

Dr. MACROBIN observed that very often a man who entered a Hospital knew nothing of drugs, and was consequently placed at a great disadvantage, as he could not understand what was going on in the wards. It was therefore necessary that pharmacy should be taught very early in the course—as soon as the student had gone through a course of chemistry—and therapeutics should come after a systematic course on the practice of Medicine. Dr. Harvey had the advantages of ample accommodation for the working of his scheme, and of scientific assistants, so that their students were not likely to introduce incompatibles into their prescriptions, as was too often the case with men who did not understand practical pharmacy. Dr. Harvey was quite enthusiastic about his scheme, and found that it worked admirably. He (Dr. Macrobin) had to teach the science of therapeutics, and he gave a systematic course of lectures teaching the action of drugs which he prescribed. He entirely approved of the resolution.

Dr. HUMPHRY moved as an amendment:—"That practical instruction in pharmacy may with advantage be substituted for formal lectures on the subject, and should be attended at an early period of the Medical curriculum; and that instruction in therapeutics should be conducted at a later period of the Professional curriculum, either by a special course of lectures, or as an essential part of the courses of lectures on Medicine and Surgery." Whilst he was in favour of separating pharmacy from therapeutics, he feared that the course proposed by the resolution would add to the burdens of the students, as it seemed to contemplate the establishment of a separate course of lectures on these subjects as obligatory upon the Licensing Bodies. No more grievous alteration could be made in the Professional curriculum than an addition to the number of courses of lectures. When he was a student, although the course was more limited, he was obliged regularly and systematically to neglect certain courses in order that he might study to the best advantage; and he strongly felt that, to increase the number of lectures, would be to interfere seriously with the success of the examinations, upon which the Council justly laid such stress. The science of therapeutics was confessedly the most difficult of all the sciences with which they had to deal, based as it necessarily was upon reconditte physiological observations which were at present in their infancy; therefore, he could not think it advisable to make a special course on therapeutics compulsory. In reality, the study of that subject would be better pursued in connexion with Medicine and Surgery in the wards and in the practical lectures; therefore, he could not vote for a measure which would so unnecessarily add to the burdens of the students.

Dr. APJOHN seconded the amendment. He was strongly opposed to the scheme of separate lectures on therapeutics. It would require an addition to the staff of professors, which was altogether impracticable.

Dr. ANDREW WOOD said that whilst the Council did not wish to add unnecessarily to the burdens of the students, it should be remembered that one of their great duties was to diminish the burdens of the patients, and unless the *summum bonum* of all their instructions were obtained, that of curing and preventing diseases, they would fail in accomplishing the object for which they existed as a Council. But, in truth, the fear was groundless; for the burdens of the student would be diminished instead of increased by the plan proposed; because, at present, they were required for a long period to attend a laboratory or dispensary for the purpose of learning pharmacy, and if this scientific and systematic instruction in practical pharmacy were introduced at an early period, the future course would be much more easy. At the present time the examinations upon *Materia Medica*,

which included therapeutics, were conducted at a period of the course when it was utterly impossible that any professor could put proper questions, or that a student could give proper answers. In his opinion, pharmacy should be one of the earliest studies after chemistry, and therapeutics should be the coping-stone to be put on the whole. (Hear, hear.)

Dr. AQUILLA SMITH thought the amendment had the great advantage over the resolution of leaving perfectly free the means of carrying out the great reformation they all desired. As a teacher, he had found that it was a great waste of time to be trying to make students understand therapeutics in their first year, before they could possibly have acquired a knowledge of diseases, or even of the character and constitution of drugs, so as to fit them to prescribe the most ordinary remedies in the Pharmacopœia. As an examiner in *Materia Medica* in Dublin, he was necessarily debarred from examining the students in therapeutics, because the examination took place before the students could thoroughly recognise the diseases which it was their business to cure. At present he believed it to be almost impossible for a Medical student in Ireland to acquire a practical knowledge of pharmacy except by entering himself as a pupil for six months to the Apothecaries' Hospital, or by engaging himself for one or more sessions as assistant to a Medical Practitioner who kept a shop for the compounding of drugs; but even then he was not taught the character of drugs or the means of detecting spurious drugs, which was so important a branch of knowledge. As to the scheme of separate lectures, it was impossible that practical pharmacy could be taught in the usual course of lectures on *Materia Medica*, and it would involve much less labour on the part of the student himself if he attended for three or four months a school of pharmacy. At the present time some students thought they were doing wisely by committing the Pharmacopœia to memory—(laughter)—and to perfect themselves in *Materia Medica* they tried to commit to memory the characters of drugs, instead of going into the museums and there studying them.

Mr. HARGRAVE opposed the motion, principally on the ground that it was not desirable or practicable to increase the staff of professors.

Dr. ALLEN THOMSON said that they should be cautious in introducing alterations. There was some uncertainty as to the meaning of the word "therapeutics," but as used in the resolution he understood it to apply to the general principle of the action of the remedies. He regarded therapeutics as a whole as the principles and practice of Medicine—the principle on which remedies were applied to diseases in general or to special diseases. He quite approved of the separation of practical pharmacy from therapeutics, and of the respective periods at which it was proposed to teach them; but he felt strongly that the mode of instruction should be left perfectly open to the schools. The way in which the Council could best carry out its object would be by the examinations.

Dr. SHARPEY, in support of the resolution, expressed his belief that the contemplated scheme would not increase the number of lectures.

Sir DOMINIC CORRIGAN inquired what was meant by "instruction in pharmacy." If it meant that pharmacy was to be taught by a course of lectures, he would oppose the resolution, because it was downright nonsense to suppose that a man could be taught to make up a pill or a draught by walking into a lecture-room.

Dr. PARKES was sorry that Sir Dominic was not in the room when the meaning of "instruction in pharmacy" was explained by preceding speakers. What had been said would meet the views of Sir Dominic; and, as there was really nothing that called for a reply in the observations that had been made, he would now propose that the opinion of the Council should be taken.

The amendment was put and negatived, and the resolution was then carried by a large majority.

MIDWIFERY.

Dr. PARKES moved—"That it is desirable that the course on midwifery should be extended, and that every candidate for a licence shall be required to attend not less than twenty labours." He said that the evidence brought before the Council made it clear that the course should be extended. Answers had been received from twenty of the most experienced teachers in the kingdom, and, with only one or two exceptions, all stated that it was absolutely impossible to do justice to the subject in the limited time devoted to it. It was a subject which included to a considerable extent the practice of Medicine, because the course on midwifery had always comprehended instruction in the peculiar diseases of women and children, as to which

students of the present day were less trained than used to be the case. In answer to the question of how many lectures were necessary to make the student fully acquainted with the subject, most of the lecturers had said that it could not be done in less than a five or six months' course or a two summers' course; and none of them put it at less than eighty lectures. Twelve London teachers of midwifery jointly signed a paper, in which they remarked very strongly indeed upon the very small number of lectures now assigned to this subject. As to the number of labours mentioned in the latter part of the motion, it was right to say that the Committee (after some dissension) put in that figure as a sort of compromise, in reality leaving the Council to settle the number. A professor in Dublin had recommended thirty, an Edinburgh teacher said ten were sufficient; and Dr. Farre and the whole of the London teachers were of opinion that a student should attend not less than twenty. The College of Physicians of London also required attendance on twenty labours before they give their licence. It was hardly to be supposed that the desire of teachers of midwifery to extend the course was prompted simply by the wish to teach the subject thoroughly; but it must have arisen from the feeling that the time now devoted is not sufficient for the purpose.

Mr. HARGRAVE seconded this.

Dr. HUMPHRY was of opinion that it would be better to leave this subject to the licensing bodies. He felt the same objection to this as he did to the former resolution—viz., that it would add to the number of lectures, which was *prima facie* a great evil, and sure to result in superficial instruction. As to the number of labours, he thought it was a most unwise proposal to make twenty the minimum. Without undervaluing the experience obtained in midwifery by attending cases, he believed that the amount of information gained after the first few cases was by no means proportionate to the time spent. Then in London, especially, it would be very serious to require a student to pay as many as twenty visits to the dens where they have to go, subjecting themselves to all kinds of annoyance and inconveniences.

Dr. ALEXANDER WOOD inquired whether this proposal had been sent down to the Licensing Boards for their opinion?

Dr. PARKES referred to page 215 of the Report of the Committee on Professional Education (1869), where the paper signed by twelve London lecturers on midwifery stated—"At present, one summer course of three months only is required. It is found to be impossible in such a course to treat adequately of the subject of midwifery proper; whilst the extensive and important subjects of the diseases of women and children must be left untouched." That was the opinion of those best qualified to speak on the subject; and the Court of Examiners for the Apothecaries' Society said—"The Court are thoroughly of opinion that the period allotted to the study of midwifery should be extended." Then the report from the Royal College of Surgeons said—"In the opinion of the Council, the period for the study of midwifery may be extended with advantage."

Dr. ALEXANDER WOOD said that the whole tendency of the Committee's report was to substitute the teaching by lecture for that kind of practical teaching which formerly was more common, and was in many respects a much better system. He thought that midwifery was quite sufficiently attended to in the schools at present, and he agreed with Dr. Humphry that the time consumed in attending labour cases, after the first few, might be better employed, because a student might have to attend a great many more than twenty labours before he met with any case that presented any extraordinary features; and for all ordinary cases as much might be learnt from ten visits as from twenty. Intelligent students already complained of the amount of time they had to spend listening often to very dreary lectures, and the Council ought not to increase the number without very good cause.

Dr. MACROBIN moved as an amendment—"That it is desirable that instruction in midwifery should be extended beyond three months, so as to embrace instruction in the diseases of women and children, and that every candidate for a licence should be required to attend not less than ten cases of labour."

Dr. CHRISTISON said that the Universities of Scotland required five months' attendance on lectures on midwifery. He did not know whether attendance on any particular number of labour cases was also specified, but he quite agreed that twenty were not necessary.

Sir D. CORRIGAN thought that the regulations should be left altogether to the Licensing Bodies. Circumstances differed very much. In some cities there were large lying-in Hospitals, in others there were none, and the same regulations could not be applied with advantage to all places. Another

objection to the scheme was that ten pupils might be brought round the same woman when she was in labour, so that there would be two hundred certificates for twenty cases. What guarantee had they that that would not be done? It was the direct interest of the midwifery teacher to sell as many certificates as he could, and he did not see what there was to prevent one case giving out twenty or even fifty certificates. He did not care much about the recommendations of these lecturers in a matter where their pecuniary profit was so largely concerned. The only way of satisfactorily testing a man's knowledge was to examine him, and certificates were often not worth the paper they were written upon.

Dr. ANDREW WOOD, in seconding Dr. Macrobin's amendment, said that the College of Surgeons in Edinburgh required attendance on six labours. Perhaps that was too small a number, but he did not see how it was possible to supply a student in Edinburgh with the opportunity of attending twenty labours. Since the course of Midwifery had been reduced to three months it was impossible to include instruction in the diseases of women and children. Some said that those peculiar diseases might be taught by the Professor of Medicine, but that Professor turned round and said he had no time for it. The consequence was that many men went into practice without being properly trained in that important subject, and he would ask whether such a man was fit for the position of a parochial Surgeon?

Dr. STOKES thought that some of the preceding speakers forgot that there were books which, to a large extent, had taken the place of lectures. He believed that all these resolutions were in the wrong direction. It mattered little how many cases of labour a student attended. Ten might give him as much knowledge as fifty.

Dr. BENNETT objected to allocate the diseases of women and children to special professors. In all the Hospitals and large schools there was abundant opportunity for students learning in the wards all that was peculiar in these cases. The fact was that the midwifery teachers wanted to absorb into their own department every Surgical operation on the female body, and the treatment of every disease that occurred in the female constitution, and also the diseases of children.

Dr. QUAIN said that it seemed absurd to prescribe the length of any course of lectures, as so much depended on the teacher. One man could communicate as much knowledge in three months as another could in three years. He would mention that a student took very high honours in the University of London who never attended a midwifery course in his life, and had not visited six cases.

Dr. FLEMING advocated practical instruction in preference to lectures. Attendance on labours was worthless unless the student was accompanied by a skilled Accoucheur.

Mr. QUAIN knew one of the most experienced teachers of anatomy, who held that his lectures on anatomy were of very little value. One fallacy lying at the bottom of the scheme proposed was that it trusted too much to lectures, and another was that it put too little confidence in the student. He believed that the young men of the present day were as zealous as the students of former days. In France and Germany attendance was not obligatory on any one course; all lectures were open to the student, who attended which he thought proper, and the lectures of men who really could teach were always crowded, whilst those of professors who could not teach were almost deserted. Another objection he felt to the proposition was that nearly every Hospital now had wards in which the peculiar diseases of women and children were studied, and it would not be right to ignore that fact by assigning the subject to a professor of midwifery exclusively.

Dr. PARKES, in reply, observed that what had been objected by Sir D. Corrigan would apply to certificates of every kind. If a teacher took 100 pupils to a case of labour and gave each one a certificate, such certificate would be a false one; and the same sort of thing might be done under any system. As to the objection raised on the ground of adding to the lectures, he believed there was hardly a member of the Council who had not both spoken and written against the practice of over-lecturing; and he did not think that such a result would follow. A rearrangement in other particulars would take place. The evil now was that subjects were supposed to be taught which were not taught—namely, the diseases of women and children. He was quite willing to alter the twenty into ten, and to add words relating to the peculiar diseases he had mentioned.

The PRESIDENT thought it better that Dr. Macrobin's amendment should be put.

This was done, and the amendment was lost.

Dr. ANDREW WOOD then moved, and Dr. MACROBIN seconded—“That it is desirable that the instruction in midwifery should be extended, and that every candidate for a licence should be required to attend not less than ten labours.”

This was also lost.

The original motion was then put, and shared the same fate as the two amendments.

PATHOLOGICAL ANATOMY.

Dr. PARKES moved—“That it is desirable that instruction in pathological anatomy should include a certain number of systematic lectures.” It would surprise the Council, he said, if they knew how very ignorant men were on this point. The object of the Committee in proposing this was to ensure that pathological anatomy should be carefully taught; and, so far from adding to the burdens of the student, this would enable him to comprehend what was taught.

Dr. ANDREW WOOD seconded this.

Dr. HUMPHRY moved, as an amendment—“That it is desirable that systematic instruction in pathological anatomy should form a part of Professional education.” His chief objection was to the word “lectures” in the resolution. It was most important that the instruction in pathological anatomy should be systematised, and that might be done without occupying any more time, because the time now spent was spent in a very unsatisfactory manner. There were some subjects in which the student in his after-life would be able to gain much instruction and experience—*e. g.*, midwifery; but there would be no opportunity for instruction in pathological anatomy after he had completed his course. It should be the foundation-stone of their science in the treatment of disease, and unless a man obtained a fair knowledge of the subject as a student, there was little or no chance of his obtaining it as a Practitioner. Of all the things he (Dr. Humphry) learnt as a student, none had stood him in such good stead as the information on pathological anatomy gained at St. Bartholomew's under the most admirable guidance of Mr. Paget. That knowledge had been the basis of all his subsequent work. Therefore, he was most anxious that more systematic instruction should be given upon this science, but that the way in which it should be done should be left open.

Dr. STOKES seconded this.

Sir D. CORRIGAN said he should object to see an ordinance issue from the Council that pathological anatomy or the study of the appearances presented after death should be separated from the study of disease before death. You might as well bring a parcel of broken bones into a lecture-room for the purpose of teaching that branch of practical Surgery which dealt with the treatment of broken bones. What was important to teach students was to recognise the effects upon the system during life. He recollected attending a course of pathological lectures in which preparations were put up in jars; and he declared that if the labels had been removed no one would have known what those preparations were from looking at them; or if the labels had been shifted the preparations would have been just as good for the purpose of study. (Laughter.) He objected altogether to the resolution.

Dr. CHRISTISON would be ready to vote either for the motion or for the amendment, but upon the whole preferred the amendment. The learned gentleman detailed the history of the study of pathology in Edinburgh, and stated that at the present time it had resulted in this, that Dr. Saunders now taught pathology practically and by lectures in the manner pointed at by Dr. Parkes's motion, and the result was that his chair had become one of the most popular in the University. Teachers should always look to what the students were inclined to adopt, and not to require subjects compulsorily until they were pretty generally taken up by the students.

After some remarks from Dr. Thomson, Dr. SHARPEY said that the propositions now before the Council had for their object to secure a more systematic study in pathological anatomy, instead of that desultory study which had hitherto prevailed. He was of opinion that young men would profit more by the cases which came under their notice in Hospital practice if they had the advantage of a systematic course of instruction in this subject. Dr. Christison had alluded to the teaching of pathological anatomy in Edinburgh; but it would be known to several members of the Council that for many years it had been systematically taught in London. He was disposed to leave the details of the arrangements to the Licensing Bodies, for he thought in all these cases it was wise of the Council merely to express a general opinion upon these matters. He intended to vote for the motion, but at the same time he would not be at all disappointed if Dr. Humphry's amendment was carried, because he believed it met the case.

Dr. GULL said: Sir Dominic Corrigan had remarked that there was very little advantage in studying pathological specimens unless the student was acquainted with the history of the disease. He would ask the learned baronet to take the proposition the other way. He believed that, upon a heart or a lung or other morbid specimen being given to a man, he ought to be able to tell very much the clinical history of the case. He had written the following remarks upon this matter some time ago:—"That morbid anatomy, as a part of clinical Medicine, requires much more time to be spent upon it than at present; so that, instead of a hasty evisceration of the dead, exact dissections of morbid parts might be made, thereby affording them a closer acquaintance with the mechanical effects of disease;"—(applause)—"that a clinical laboratory should exist in every Hospital, in which might be carried out more complete examination of excretions and other matters than is practised at the bedside." He believed, for example, that students ought, in many cases, to be required to give an outline of the clinical history of a case from even an evacuation. Every day mistakes came under his notice simply from a non-acquaintance with this subject in detail. There was not one man in a hundred who would take the trouble to look into it, whereas it should be well understood and known as a part of Professional education; therefore, he thought the Council would miss a good opportunity if it did not express a distinct opinion as to the advantage of more systematic study of this important branch of science. He would either vote for Dr. Parkes's motion or Dr. Humphry's amendment, which was, perhaps, a little better, because it was less explicit. He believed Sir Dominic Corrigan agreed with most of what he was saying now.

Sir D. CORRIGAN: With a good deal of it.

Dr. PARKES would be glad to vote for either the motion or the amendment, although he thought (perhaps naturally) that the motion was a little the best, because it would more surely advance the object which the Council unanimously had in view.

The PRESIDENT put the amendment to the meeting, and it was adopted.

CLASS EXAMINATIONS.

Dr. PARKES then moved the fourth of the resolutions:—"That it is desirable that class examinations should be compulsory, and that the Licensing Bodies should require them in all cases." He said that as the motion was so worded as to be as little explicit as possible, retaining any definite meaning, it would probably not meet with any opposition calling for argument. These class examinations were admitted by all teachers to be the best means of ascertaining satisfactorily that they were teaching efficiently, and the labour which they entailed was always well bestowed. The motion left the question whether they should be oral or written entirely in the discretion of the teacher.

Dr. HUMPHRY said that, having on all former occasions moved amendments or made objections to Dr. Parkes's resolutions upon the subject, he had great pleasure in seconding the motion. He had always been of opinion that class examinations were most important adjuncts of Medical instruction. In this instance, drawing out of the students was the best mode of putting into them knowledge. He had been sometimes utterly astonished and quite disheartened to find the little amount of knowledge that he had imparted; but he had learned from that partly that he had not been sufficiently explicit in his teaching. There was no doubt that the students liked it, and it was most improving to the teachers themselves.

Dr. STOKES: I quite agree with Dr. Parkes's motion; but what does he mean by compulsory—compulsory on the students or on the teachers?

Dr. ANDREW WOOD: Both.

Dr. STOKES: I think the word "compulsory" is a dangerous word, and that compulsion is of doubtful advantage.

Dr. ALEXANDER WOOD cordially supported the motion, principally on the ground that it brought the mind of the teacher in contact with the mind of the student. He was opposed to enforcing the lecture system to the extent to which it was done; but here was a proposition which enabled the teacher to know what the student is learning, and also in what respects he himself is deficient as a teacher. When he was a teacher he had been in the habit of taking a text-book and telling the students to prepare a few pages, and then they had a conversation together about it, rather than a lecture. Thus he got to know where the weak points in the students' knowledge were, which never could be done without examination. Then, why not make this compulsory, if at the end of the students' curriculum you made it compulsory that he shall have shown that he has undergone examinations by certain examiners? He knew no means of mental discipline upon a subject equal to undergoing exami-

nation upon it, nor any better mode of teaching a man to arrange his knowledge than by having to prepare for such examinations.

Sir DOMINIC CORRIGAN moved as an amendment—"That it is desirable that the class examinations form a part of every course of lectures, whether systematical or clinical." That would carry out fully the principle which Dr. Parkes advocated, and which the Council was unanimously agreed upon—namely, the utility of class examinations—and that they should form an integral part of every course of lectures. He cordially agreed with Dr. Stokes's objection to the word "compulsory." It was dangerous and useless, and would only lead to a system of the sale of false certificates, which was the curse of the rising generation of Medical men.

Dr. A. SMITH seconded the amendment, and was much opposed to the word "compulsory" forming part of the resolution.

Dr. ANDREW WOOD said it was quite evident that the last two speakers agreed with Sir John Falstaff that they would do nothing on compulsion. Sir Dominic Corrigan's objection to compulsion on the ground that it would lead to false certificates would apply equally to all certificates. He contrasted the system which was pursued when he was a young man, when students were allowed to fritter away their time just as they liked during their curriculum of study, and then were obliged to go to men called "grinders," who crammed them up like a lot of parrots. He objected to emasculating the resolution by removing the compulsory portion of it.

Dr. SHARPEY said, in his experience compulsory attendance was necessary; otherwise only the most zealous students would attend, and the very men who required the greatest amount of instruction would absent themselves.

Dr. GULL proposed that after the word "compulsory" the words "on students" should be inserted.

The PRESIDENT then put the amendment to the meeting, which was lost.

Dr. ACLAND then moved the following amendment—"To omit all words after the word 'compulsory.'" He entirely agreed with the general principle contained in the motion, but he thought that for the Council to endeavour to enforce details of this sort was unwise. Speaking for his own university, it was so alien to the system of freedom of thought and dependence upon examinations adopted there that many of the most learned teachers would receive it as an undue interference with their province by the Medical Council.

Mr. QUAIN seconded the amendment, which was lost by a small majority.

Mr. QUAIN then moved as a further amendment—"That it is desirable that class examination should form a necessary part of class instructions." He wished the vote of the Council to be unanimous, and he thought that this change of words might meet the views of all parties.

Dr. A. SMITH seconded the amendment, which was carried upon a division by the casting vote of the Chairman.

It was then put as a substantive motion, and carried *nem dis.*
Adjourned to to-morrow at two o'clock.

FOURTH DAY.—FRIDAY, JULY 7.

The Council reassembled at two o'clock.

CONJOINT EXAMINING BOARD FOR ENGLAND.

Dr. BENNETT (by permission of the Council, and on the understanding that no discussion was to follow) made a statement with regard to the arrangements agreed to on this subject by a conjoint Committee of the Royal Colleges of Physicians and Surgeons of England. He said that it was only with a desire to facilitate the discussion on the Education Report that he wished to say anything at this stage. At the close of the session of 1870, prior to the introduction of the last Medical Bill, efforts were made to form a Conjoint Board for this part of the kingdom, and those arrangements had gone to such an extent that there was a well-founded hope of their ultimate success. Those efforts fell into abeyance when there was a prospect of legislation. As soon, however, as the Bill failed, it was thought desirable to resume those efforts, inasmuch as the recommendation of the Council was still before them, and the College of Physicians had taken very great pains in their endeavours to bring about such a junction as was thought desirable. They had met with considerable difficulties. Scheme after scheme had been discussed and abandoned, in consequence of the objections to it, sometimes coming from the universities, but more frequently from the Apothecaries' Company, who were so bound by their Act of Parliament as to make it very difficult for them to accede to propositions to which otherwise there

was reason to believe they would gladly assent. The result was that the College of Physicians had determined to form a board between themselves and the College of Surgeons, and they had drawn up their scheme in such a way as to offer the greatest possible facilities for the junction of other bodies. They had been in communication with the various universities, and they had reason, at all events, to hope that when the scheme as now completed was before the universities, they would concur in it; but whether they did or not, the arrangements between the two Colleges were such as to leave no moral doubt that their junction in examinations would be effected. The conjoint Committee appointed by the two Colleges had passed certain resolutions, of which he would read the substance. It should be observed that the scheme had been only completed so recently that there had been no opportunity for obtaining the official consent of the Colleges themselves, but the feelings and wishes of those two bodies were, he believed, represented on the Committee; there could, therefore, be no doubt that the scheme would be officially approved. The Committee had agreed upon a scheme for a Conjoint Board before which all candidates applying for licences would be obliged to appear, in order to obtain the qualification of either body. Parts of the scheme were introduced for the express purpose of facilitating the co-operation of the universities, and there was reason to believe that they would meet with the approval of the universities, though, of course, he had no authority to speak on behalf of those universities. Their representatives were present, and would have an opportunity of saying how far it was likely that the universities would co-operate. The scheme consisted essentially in the formation of a board of examiners appointed by the co-operation of the College of Physicians of London, the College of Surgeons of England, and such other authorities mentioned in Schedule A of the Medical Act as were willing to join them, it being understood that liberty should be left to them still to confer their honorary distinctions and degrees, whilst each will abstain from independent action in giving admission to the Medical Register. Then the examiners were to be appointed by the several co-operating Medical authorities on the nomination of a committee (this was the important part of the scheme), to be called the Committee of Reference; but no member of the Committee of Reference was to be eligible for nomination as an examiner. The Committee of Reference was to consist of an equal number of representatives of Medicine and Surgery, to be appointed as follows:—One representative of Medicine and one of Surgery, to be appointed by each of those universities in England which joined with them; four of Medicine, appointed by the College of Physicians of England; four of Surgery, appointed by the College of Surgeons. Then there was a special provision with reference to matriculated students of English universities to this effect: that students of English universities who shall have completed their Professional study and passed such examinations of their university as shall comply with the requirements of the final examinations conducted by the board, will be eligible for admission to the final examinations, and after such examinations they will be required only to pay a fee of five guineas. The principle of the scheme, therefore, was this: in the first place, a combined Board of the two Colleges, with provisions to facilitate the co-operation of other bodies who might join with them. The two bodies would no longer directly appoint their examiners, but they would agree to the formation of an intermediate body, called the Committee of Reference, which Committee would look out for the best examiners that are to be obtained, and submit those names to the several co-operating bodies for approval. The examinations would be conducted by the examiners thus brought together, and the qualification received by successful candidates would be a conjoint qualification of the two Colleges—a qualification in Medicine and a qualification in Surgery—as the result of one examination. If the plan succeeded, the views and action of the Council with reference to future legislation would be very much modified, because all that was proposed to be accomplished by a Bill in Parliament would be done by their own voluntary efforts.

Mr. QUAIN said that although he was precluded by the understanding that had been come to from entering into any discussion, he should like to say, as representing the College of Surgeons, that he did not dissent from anything said by Dr. Bennett.

CLINICAL INSTRUCTION.

Dr. FLEMING moved—"That it is desirable that clinical instruction in Medicine and in Surgery should not be conducted so much by formal lectures in class-rooms as appears

from the evidence before the Council to be the case at present; but that Hospital students should be divided into classes of limited numbers, so as to enable them individually to observe cases of disease, and to be examined upon them conversationally at the bedside or in proximity to it. Further, that it is desirable that, where possible, all students should serve as clinical assistants or dressers." He looked upon clinical teaching as the most important part of the student's career, and he was not satisfied with its state generally in this country. Very little progress had been made during the last twenty or thirty years. The immense advantages afforded by the large Hospitals were not utilised as they ought to be, and it was too much the custom for the students literally to "walk" the Hospital wards without learning what they ought to learn from the Physicians and Surgeons. The clinical lectures in periodicals which he occasionally read were very often admirable prelections on forms of disease of an anomalous or rare character, which a man might not meet with in a lifetime, and the lectures were evidently prepared not so much for the student as for publication, and they by no means came up to his idea of what clinical instruction (between which and clinical lectures there was a great distinction) ought to be. The College of Surgeons of England, very much to their credit, now required that a student should be engaged for three months in wards examining cases, and being examined as to them. Some valuable opinions on the importance of this were collected in the report of the Committee on Professional Education. Dr. Sieveking said: "I would remark that in teaching clinical Medicine the individual student requires to be more constantly appealed to. He should be called up to report upon the pulse, tongue, temperature, secretions, and various physical symptoms; he should be examined by the bedside about treatment, diet, and doses of medicine." That plan had been adopted in Glasgow and some other schools, but it was not general. Sir Thomas Watson said: "By clinical instruction, I mean the explanation of what the student thus sees by a teacher properly qualified to give it, who would point out to him in each case how the diagnosis of the disease is best made, what are the symptoms which should guide its treatment, what treatment he adopts, and why he adopts it, the apparent effects of that treatment, and, in cases that prove fatal, the comparison between the actual and the anticipated morbid conditions of the interior of the body." Then Sir William Fergusson said: "The Medical Council would do well, in my opinion, to define what should be called a clinical lecture. No so-called lecture should be recognised as such, unless it be essentially clinical—i.e., delivered at the bedside, or within reasonable distance from the patients whose cases are to be commented on. Lectures on one subject, or more, which have no reference to subjects or cases immediately or recently under observation, should not be recognised, and lectures on the principles and practice of Medicine or Surgery should be refused as clinical lectures. It is worth consideration whether the words 'clinical lectures' should not be given up, and 'clinical instruction' substituted. No written or read clinical lectures should be recognised. If a man cannot give clinical lectures and instructions without reading, he should not be recognised as a clinical teacher. Something of a formal lecture may occasionally be permitted or enjoined, but teaching by brief remarks and demonstrations during visits, or on seeing patients and prescribing for them, should be represented and required as the essential quality of this kind of instruction." After reading remarks made by Mr. Hamilton Labatt, Mr. Simon, and Mr. Teale, Dr. Fleming concluded by expressing his hope that the opinions of such eminent authorities would prevail with the Council.

Dr. MACROBIN, in seconding this, remarked that in Aberdeen clinical instruction in Surgery was given at one time, and in Medicine at another time.

Sir D. CORRIGAN believed the system proposed to be perfectly impracticable, and that the Licensing Bodies of the United Kingdom must be allowed to adapt their arrangements to their necessities and to the size of their Hospitals. It was absurd for the Council to tell every Hospital to divide the students into classes of limited numbers. Supposing there were sixty pupils in a school, was a Physician who could not teach properly to keep ten of these students, and were those ten to be compelled to remain with an inefficient teacher for six or three months? Was it right to force a student to attend a man whose teaching he could not respect?

Dr. MACROBIN: They are all qualified men.

Sir D. CORRIGAN replied that there were many qualified men who could neither teach nor learn. He himself had found that pupils left him either because his brains were wearing out, or

because from some other cause he failed to interest them. (A laugh.) Then why should not a man study a Surgical case whilst he was specially studying Clinical Medicine? Was the door to be shut upon him when he might not have another opportunity of seeing such a case again? He should like to know how many Hospitals there were in Aberdeen.

Dr. MACROBIN: One.

Sir DOMINIC CORRIGAN: Then, of course, they could do what they liked with the students; but in London, Dublin, or Manchester the students would not submit to such a restriction. They would go where they could learn the most, and they would not tolerate the idea of being forbidden to learn Surgery because they were learning Medicine, and *vice versa*, of being compelled to follow a particular Physician or Surgeon. He remembered the case of a most respectable man connected with a Hospital, to whom a particular ward was assigned. It became a joke when the statistical returns were made that there was never a fatal case in that ward, whereas in his (Sir D. Corrigan's) ward the deaths were 15 per cent. The Government official called him up, and said—"I don't like to publish these returns, because they seem like a slur on your Professional skill. Here is that respectable old gentleman, who does not lose a case." He replied—"You can publish it if you like on a Morrison's pill-box, but I will tell you the fact. This gentleman particularly dislikes trouble, and we put into his ward all the worn-out cooks and people suffering under rheumatic arthritis; he was very much obliged to us, and such patients never die!" (A laugh.) He objected altogether to laying down this minute code of regulations. (Cheers.)

Dr. GULL proposed as an amendment—"That the Council express their sense of the importance of making clinical instruction year by year more practical and more consonant with the phenomena of disease, and less dependent upon formal clinical lectures." He thought that the study of Medicine must be made more and more practical. He had heard of a celebrated London professor who gave three weeks' lectures on pericarditis, whereas one hour's investigation at the bedside of some patient suffering from pericarditis would have taught the students a great deal more. The bedside in Medicine was what the dissecting-room was in anatomy. (Cheers.) He would, however, be sorry that the lecture-room should be shut, because there was a great advantage in bringing a student into contact with the mind of his teacher, but the formal lectures should be rare. When a man had something to say, let him say it.

Dr. STOKES seconded the amendment. He did not know of any formal or prepared clinical lectures in his city. Clinical lectures were given out of the mind of the Surgeon or Physician upon cases as they arose. As to clinical lectures in wards, they were a cruel and barbarous institution, and a man who told the students everything about a case there must be very indifferent to the feelings of his patients. What was done in the Meath Hospital was this: there was a conversation at the bedside of the patient, in which all painful topics were avoided, and after the visits the students assembled in the theatre, and were examined upon the cases. In a class of eighty or ninety men, the number who availed themselves of all the possible advantages of a Hospital was not more than a fourth, and it was better for a teacher to produce a small number of good and willing men than a large number of indifferent and unwilling men. (Cheers.) He would conclude by observing that multiplied coercive regulations were utterly beneath the dignity of the Council, and they would only prove to be nugatory if passed.

Dr. CHRISTISON said that if he were disposed to suggest any change in Dr. Gull's amendment, it would be that the Council should say that they had observed with pleasure that great improvements had been going on in the mode of clinical instruction. He agreed with most of the objections made to Dr. Fleming's proposition, and also with the opinion that an occasional clinical lecture of a more formal character than the demonstrations in the wards would be of great service. He was the first to introduce, in 1831, examinations on clinical subjects in his university, and he had repeatedly referred to the propriety of paying attention to what the students found most appropriate for their instruction. Supposing there was a great accumulation of cases of partial paralysis of the nerves of the face, what could be more useful than for the professor to bring the students into his class-room, and give them an account of those various cases, of the different symptoms, of the probability of recovery, and the different varieties of treatment? It once fell to his lot to do so, and, in deference to the request of the students, he had published his lectures on that subject. He hoped that it would go forth that the Council attached the greatest possible importance to observations made

by professors in their visits and in their examinations of the students. He did not approve of the practice of some teachers who examined their pupils in a loud voice by the bedsides of the patients. If it was desirable for the Council to say anything, he thought Dr. Gull's proposition amply sufficient.

Dr. HUMPHREY thought the Council ought not to interfere at all with such details, because by doing so they would very much diminish the value of the opinions that emanated from them. He found, from personal inquiry, that the regulations of the College of Surgeons as to close clinical instruction were carried out far more than could have been expected. At the Hospital in Cambridge that particular work was carried on most patiently and laboriously.

Mr. HARGRAVE opposed the motion.

Dr. ANDREW WOOD, in support of the amendment, referred to the method of a Dublin professor as his beautiful of what clinical instruction should be. That professor took the students with him round the wards, and he would say to one, "What is your diagnosis?" and as soon as the visit was over he took them into the operating theatre, and made such comments on the case as he could not have made at the bedside. Sir D. Corrigan had alluded to the fact of professors having different qualifications, and that some would draw 100 or 150 after them, and others only two or three. That was a grievous evil, because there would always be a great deal of squeezing and pushing, which would be very inconvenient to the patients as well as to everyone else. It was on that ground he supposed that Dr. Fleming proposed limited classes. He could not agree with the opinion of those who seemed to think that the Council should lay down no regulations. What was their business but to counsel the Profession? Dr. Parkes's excellent report showed that the recommendations of the Council, which had been issued from year to year, had been followed almost in their entirety by nearly every Licensing Body, and he believed that those bodies looked upon it as a privilege to receive such recommendations.

Dr. ALEXANDER WOOD said that when he began to study midwifery, the first axiom he learned was that a meddling midwifery was a bad midwifery; and applying that to the subject before them, he thought it would be dangerous, seeing how satisfactorily this department was going on, to interfere by laying down too precise regulations. Dr. Christison and himself had once to sit on a board to hear a charge made against one of the most distinguished clinical teachers in the country, that he was not properly instructing his class; and the wise and sound deliverance that the University Court made upon that case was, that when a professor was attracting students from all quarters to his lectures, it was not for the Court to lay down rules for his guidance—that much must depend on the individual character and genius of the professor.

Dr. AQUILLA SMITH supported the amendment.

Dr. QUAIN thought that no two members of the Council would agree on the best mode of clinical teaching, and it was not desirable that they should. The Council could exercise its influence most effectively on the clinical examinations; therefore, nothing more was necessary for them to do than to express a general opinion on the value of clinical instruction.

Dr. PARKES agreed that the great test of the nature of clinical instruction was in the examination, and he was against any resolution on the subject being passed, because at the present time every Licensing Body had instituted a clinical examination.

The PRESIDENT said that all the opinions expressed agreed substantially with what Dr. Fleming really wished to secure by his motion; but they differed as to the advisability of minute legislation. For his own part, he was against the Council going into details on the subject of teaching. They could not be too precise upon matters relating to the examinations, upon which the licence and the diplomas depended; but there was great advantage in allowing considerable latitude and freedom in matters of teaching. The kind of instruction which was the best for England might not be the best for Scotland or Ireland, and what was the best for one man was not necessarily the best for another.

Dr. FLEMING, in reply, said that he did not want to dictate at all to the Licensing Bodies; all he wished to secure was that a certain amount of real clinical instruction should be given. Neither did he contemplate the introduction of painful topics at the bedside, but only such things as the feeling of a patient's pulse, an examination of his tongue, or of an evacuation of urine. Surely, that might easily be done.

The amendment was then negatived by a majority of 8 against 7.

The original motion was also lost, only three voting for it.

PRELIMINARY STUDY OF CHEMISTRY.

Dr. STORRAR moved—"That it is desirable that students should have the option of acquiring an adequate knowledge of chemistry, and of passing an examination in it, before they enter upon the period recognised by the Licensing Bodies as the course of Professional study." He said that this was in the interest of the student and of the patient. It was agreed that four years was the utmost limit that could be prescribed for Professional study, and yet that period was still overcrowded with subjects. The proposition he had brought before the Council would reduce the pressure on the student by making an examination in chemistry precedent to the course of Professional study optional with the student. A wonderful revolution was in progress in grammar schools by the introduction of physical science. Masters of high repute in this branch were appointed in Eton, Harrow, Rugby, Marlborough, Clifton, and many other schools, and the time might shortly come when lads of 16 or 17 years of age would proceed from school with an amount of knowledge in chemistry which would enable them to pass a very good examination for the purposes of Medical study. The Council was not asked to make this compulsory, but only to express an opinion that it was desirable that students should have the option. Schools for science were springing up in many of the provincial towns. There was an advertisement in the *Times* of this morning of an institution which was nothing less than a college of science in Newcastle-upon-Tyne, and hundreds of youths would there acquire a knowledge of chemistry which would amply qualify them for Medical studies. Some parents in England postponed sending their sons to a Medical school too early. He remembered the case of a clergyman's son who had taken honours and was intended for the Medical Profession. The father did not like the idea of sending him into a dissecting-room when he was not 17 years old, and he asked what should be done. He (Dr. Storrar) answered—"Send him to University College, where you propose that he should study; enter him in the classes of natural philosophy and chemistry, and let him defer entering upon the study of anatomy till the following year." This was done, and the young man took the gold medal in anatomy last year in the University College examinations. There was no doubt that he was assisted in that by his having studied natural philosophy and chemistry before he began the study of anatomy. Teachers of anatomy often complained that the students had great difficulty in getting in two years that amount of knowledge which they held to be indispensable in consequence of the crowd of subjects; and if they had the option of being examined in chemistry at the outset it would be extremely useful.

Mr. QUAIN, in seconding the motion, observed that it was strange that chemistry should be considered by many as nothing else but a Medical science, whereas it ought to be universally considered as a part of general education. It was marvellous to find so many highly educated men ignorant of some of the simplest laws of nature. He had known a man of the highest ability, and very much distinguished in his university, who could not tell why the stirring of a fire caused it to blaze. Lately, he had been reading some of the evidence given before the Royal Commission on Education, and he noticed that the master of the City of London School stated that his boys began Latin three years later than was ordinarily the case in schools, but they made much greater progress, because meanwhile they were learning arithmetic and chemistry. The teacher of chemistry in that school had become so well known that he was mentioned, in flattering terms, in a report by M. Duruy, the head of the Educational Department under the late régime in France. And as this study was becoming more general in schools, there was good cause to believe that the labours of Medical students would be considerably lightened if they were allowed to begin their Professional course after they had passed an examination in chemistry.

Dr. THOMSON suggested that the resolution should be altered so as to be limited to "the general principles of chemistry." As a teacher, he was strongly impressed with the propriety of some such measure as the one now before the Council. The junior students of anatomy were quite unprepared for the reception of scientific knowledge at the commencement of their Professional studies; and he could conceive no measure which would contribute more to fit them for the due reception of the knowledge which had to be communicated to them than a preliminary scientific year, which should include the principles of chemistry, physics, and other kindred subjects.

Dr. APJOHN did not know what was meant by the word "adequate." It was impossible that boys of 15 or 16 could acquire a sufficient knowledge of chemistry, and he should be

very sorry if the smattering which was all they could obtain at that age was to be the only knowledge they possessed during the Professional curriculum. He said this as the result of a very extended experience in the teaching of chemistry. He, therefore, would move as an amendment—"That chemistry is a most important branch of Medical education, and that the Council does not think it desirable to adopt any resolution which, if it had any practical effect, would tend to discourage the efficient study of the subject by Medical students."

Dr. ANDREW WOOD seconded this on the ground that it was not calculated to relieve the student, but its certain effect would be to prevent many from extending their knowledge of chemistry. The subjects of study at first were nothing but anatomy and chemistry, and to restrict a student to one subject would not be a boon, because the study of chemistry was a kind of relief to that of anatomy, and it could scarcely be suggested that a man at the beginning of his career could study any other strictly Professional subject with anatomy so as to get much benefit from it. Did Dr. Storrar think that a youth of 16 would be able to cope with the immense difficulties of such a science as chemistry? Surely they did not mean that the knowledge of chemistry was to be that sort which was given to young misses in boarding-schools, but that it should be such a thorough knowledge of it as was required in Medicine, therapeutics, and physiology. A young man would be more likely to get the requisite amount of knowledge in this science by taking it in the course as he does now, than if he were allowed to disembarass himself of it; for they all knew that a student frequently applied himself very hard to a subject till he was examined upon it, and then threw it to the winds. (Cheers.)

Dr. BENNETT drew attention to the fact that the Council had already passed a resolution moved by Dr. Storrar, which was very much more comprehensive than the present one—and which had been acted upon by the Licensing Bodies. The resolution was in vol. iii., page 234, of the Minutes, and sufficiently expressed the view of this Council, which was that if students could learn chemistry, botany, and other natural sciences before they commenced their special Professional studies the Council approved of it, and it was perfectly competent for the Council to sanction an examination in them before the Professional studies were entered upon. It appeared, therefore, much better to be satisfied with having expressed an opinion of that sort with regard to natural science generally than to mention chemistry specially.

Dr. STORRAR (in reply) said that, in using the word "adequate," he had in view the examination in chemistry at the College of Physicians, which was an exceedingly good one. Did any member of the Council really contemplate that a Medical student for general practice should be conversant with the whole range of chemical subjects? What he really meant was that, if a student obtained such an amount of knowledge of chemistry as is obtained in an ordinary Medical school by general Practitioners, he might be examined upon it before commencing Professional study. It was not likely that he would lose that knowledge, as one of the speakers thought, because there were other studies in which he would be engaged which must keep it up—namely, practical physiology, toxicology, and also pathology. Pathology, properly studied, involved the question of testing animal fluids, and in that and other ways there would be abundant opportunities of keeping up that knowledge of chemistry which Dr. Andrew Wood supposed must necessarily be scattered to the winds the instant the first examination was passed upon it. Dr. Thomson suggested the words "principles of chemistry," but he (Dr. Storrar) objected to that because the principles of chemistry might be so limited that a very young person might have some idea of them. Dr. Apjohn thought it was impossible to give more than a smattering of chemistry to boys of 14, 15, and 16 years of age. It was just this smattering which he wished to avoid; he had always set himself against fireworks and explosions, which were very interesting, but useless as educational means. Dr. Apjohn would be surprised to know the extent to which schools were going in appointing natural science masters. At Clifton College the salary of that master is £300 a year, proving that they were going in for something like serious work in this matter. Then it was not to be supposed that only boys of 15 or 16 were contemplated in the motion; he had mentioned the case of a young man whose father objected to introducing him too early to the dissecting-room. There were many such cases, and it was perfectly possible that a young man 17 years old should be able to acquire an adequate knowledge of chemistry up to the standard required by the College of Physicians. Dr. Andrew Wood seemed

to take a very easy view of the work of the student during the first year—that he had nothing to do but to study anatomy, and that he might lighten it with chemistry. Whatever was the case in Edinburgh, in this country it was certain that the student was pretty hard strained in getting a sufficient knowledge of anatomy and physiology with chemistry in two years' time. The resolution now before the Council was a decided advance upon the one referred to by Dr. Bennett, and it was from a feeling that they might now go a step further that he proposed this definite resolution.

The amendment was put to the vote and negatived.

The original motion also was lost.

CONJOINT EXAMINING BOARDS.

Dr. PARKES moved:—"That a letter be addressed to each Licensing Body transmitting a copy of the resolution of the Council of February 26, 1870 (*see* vol. viii., pp. 32-4), on the formation of Conjoint Examining Boards, and urging that arrangements for the formation of such boards shall be undertaken without delay, and shall be communicated to the President of this Council before the close of the present year." He reviewed the history of the proceedings of the Council upon this subject, by which it appeared that an almost unanimous decision had been come to that such Conjoint Boards were desirable, which opinion of the Council was transmitted to the Lord President, and formed the basis of legislation last year. The Licensing Bodies were now in a better position for the consideration of this subject, and any recommendation of the Council would have more weight than it had previously. Nor did he think that the statement made by Dr. Bennett would in any way affect this question, because that statement must necessarily be considered as of an informal character. When the College of Physicians or the College of Surgeons informed the Council that a Conjoint Board was formed that would be very pleasing intelligence; but there was no reason why the Council should alter its verdict of 1870 and not press the subject on the attention of the Licensing Bodies.

Dr. STORRAR seconded this.

Sir DOMINIC CORRIGAN opposed. He said that on the former occasion when the matter was before the Council, he had to deal with some of the most obstinate men he ever met, for he stood alone against seventeen. (Laughter.) He had not changed his opinion. The result in Scotland had not been to send out any better men, and he did not think that the plan could be carried out in Ireland.

Dr. GULL said that it was the dream of his life that there should be a conjoint examination for men who entered the ordinary departments of the Profession, because it was a very grave weight for a young man to be examined by some half-dozen bodies. As for the universities, he would only speak for the University of London. The Council and Senate had always expressed the greatest willingness to put aside all their privileges, and make every sacrifice for the good of the Profession in order that there should be a Conjoint Examining Board. That was also the feeling of the College of Physicians. During the last fifteen years, since he had been junior censor of the College, it had been the constant effort of the most advancing men to bring about this result. He was very sorry that on a former occasion during the present sittings of the Council he had said that the College of Surgeons were obstructive, because he now found that it was not so. It was a most disgraceful thing that there should be nineteen Examining Bodies, all of different views, buying and selling the unfortunate Medical student before he could enter the Profession; and it would be a disgrace to the Council if they did not arrive at some means of solving this question. Let the universities give the same honours which they give now, let the men who want those high honours go to the universities for them, but do let there be for the Medical Profession one uniform standard of qualification for those who seek, not the honours, but the necessities of the Profession. He hoped that Sir Dominic Corrigan in his cooler moments would find that the thing was not impossible in Ireland. Why should it be? No university or body had more distinguished itself than the University of London, and yet that university was willing to put all its privileges aside, and make its students submit to the examination of this Conjoint Board. (Cheers.)

Dr. ALEXANDER WOOD complained that Government was obstructive, and it was the duty of the Council to endeavour to effect for the Profession this much needed reform. They would stand in a more independent position, and do more good, if they accomplished it with the machinery which was at their command, rather than if they laid themselves down at the foot of any Government and asked for a Bill.

Dr. HUMPHRY said that the University of Cambridge entered heartily into this scheme, and appointed a syndicate for its consideration, which syndicate had expressed itself favourable to the appointment of the Conjoint Board, on the ground that it was desirable for the Profession; and they were quite willing that their students should be subjected to such examination, provided they could insure that the board was a sufficient one, and that the examiners were appointed in a proper manner. He had reason also to believe that that was the feeling of the University of Oxford, though, unfortunately, Dr. Acland was not present to express it.

Dr. ANDREW WOOD hoped that a joint Examining Board would be formed for each of the three divisions of the kingdom.

Dr. APJOHN stated that the University of Dublin were prepared to co-operate.

Dr. EMBLETON said the same on behalf of the University of Durham.

Mr. QUAIN thought it would be discreditable to the Profession if what was so generally desired was not attained without Government interference. Dr. Gull had alluded to the discredit of having nineteen competing Boards. It should be remembered that those Boards were made to compete, not by the Profession, but by the Government, and he had, therefore, a great distrust of Government interference.

Dr. QUAIN expressed his hope that Sir Dominic Corrigan had not given utterance to his real feeling. The Colleges of Physicians and Surgeons in England had been straining every point to accomplish that which was now apparently so near completion; and if their brethren in Ireland would undertake the same duty in the same spirit, the result could not be doubtful.

Dr. CHRISTISON said that he saw no difficulties in the way on the part of the Universities of Scotland which could not be overcome.

The PRESIDENT expressed himself as entirely in favour of the resolution. He observed that the Council possessed no power itself to form the Conjoint Board. It might do its best to promote it, but it could not force the Licensing Bodies to unite. If the union could not be effected without legislation, they must have legislation; but he would rather try voluntary effort first. The thing that most weighed with him was that, notwithstanding all their care and the great improvement which had been made, statistical returns showed that some examinations were occasionally too easy; and, inasmuch as it was the chief duty of the Council to prevent any men whatever entering the Medical Profession whose patients would not be fairly safe, he felt that they ought to do all in their power to effect their object.

The resolution was then put, and carried *nem. dis.*

Dr. STORRAR required the names and numbers of those who voted for the motion, and of those who declined to vote.

It was ascertained that all the members present, except Sir Dominic Corrigan, voted in favour of the motion.

The following is the resolution of February 26, 1870, mentioned in the previous motion:—"That this Council is of opinion that a joint Examining Board should be formed in each of the three divisions of the kingdom, and that every person who desires to be registered under any of the qualifications recognised in schedule A to the Medical Act shall be required, previously to such registration, to appear before one of these boards, and be examined on all the subjects which may be deemed advisable by the Medical Council; the rights and privileges of the universities and corporations being left, in all other respects, the same as at present."

Dr. PARKES moved, and Dr. ANDREW WOOD seconded—"That the first resolution of February 28, 1870 (*see* vol. viii., p. 37), be also transmitted to the Licensing Bodies at the same time as the previous resolution." This was also carried.

The following is the resolution referred to—"That, in accordance with the foregoing resolution (*see* vol. viii., p. 32, sect. II.), the universities and Medical corporations established in each division of the United Kingdom shall be requested to concert a scheme for the constitution and regulation of a conjoint Examining Board for that part of the kingdom to which they belong, and shall, on or before June 1, 1870, transmit such scheme to the consideration of the General Medical Council."

Dr. ANDREW WOOD moved, and Mr. HARGRAVE seconded—"That the report of the Committee on Education be recommended, and brought up to-morrow in a form adapted to the resolutions of the Council," which was carried.

Adjourned to to-morrow at one o'clock.

FIFTH DAY.—SATURDAY, JULY 8.

The Council reassembled at 2 o'clock.

After the reading of the minutes of yesterday's proceedings, evidence establishing the identity of Mr. Frederick Henry Morris as the person who was convicted at Devizes on March 27, 1871, of a misdemeanour, was heard, and the Registrar was directed to remove the name from the Register.

CERTIFICATES FROM THE BOARD OF PUBLIC EXAMINERS IN LITERATURE AND SCIENCE, CAPE OF GOOD HOPE.

The following report was read:—

The Committee find that the Board of Public Examiners in Literature and Science, Cape of Good Hope, is constituted under an Act of the Legislature of the Colony.

The Examination Papers for the Third Class Certificates referred to show that the examinations, as stated, correspond generally with the Matriculation Examination at the University of London. The Committee therefore advise the Council to recognise these certificates as fulfilling the conditions of the Preliminary Examination.

Dr. STORRAR moved—"That the report of the Committee on the application from the Board of Public Examiners of the Cape of Good Hope be received and adopted."

Dr. PARKES seconded this.

Dr. STORRAR, in answer to Mr. Quain, explained that the Cape of Good Hope Board had three grades of certificates, and the third-rate certificate seemed to be generally correspondent with the Matriculation Examination at the University of London. Of course, it was impossible in a matter of that kind to get the answers to the questions. The Committee had dealt with the general complexion of the case, as had been the practice with regard to other colonial colleges, and the *prima facie* aspect of things in the Blue Book before them was very satisfactory.

The resolution was carried *nem. dis.*

THE EXECUTIVE COMMITTEE

was then elected by ballot, and the following members were appointed—Drs. Bennett, Acland, Sharpey, Quain, Andrew Wood, and Aquilla Smith, the names being arranged according to the number of votes received.

ACTION OF THE COUNCIL IN PENAL MATTERS.

Mr. QUAIN moved a resolution to the effect that when it was necessary to inflict any penal measure upon a registered Practitioner, it should not be necessary that such proceeding should be moved and seconded. He thought it was not the duty of any two members of the Council to promote the punishment of any person who was accused of any offence. It was imperative on the Council, as a Council, to take questions of that kind into its consideration; and even if it happened that no members proposed and seconded a motion for that purpose, the Council would still be bound by the 28th and 29th clauses of their Act to decide the matter. When he came into the Council last Tuesday, he heard the memorial of a member of the Medical Profession of New York (Dr. Pattison) read, and on it were the various motions which had been carried by the Council, with the names of the proposers and seconders. No individual members of the Council ought to appear to the public to be the especial promoters of the punishment of a Practitioner; personal feeling of any kind ought not even to be suspected by the public, and there could be no doubt that the public would suppose that the men who proposed and seconded such a motion were specially active parties in the matter.

Dr. STORRAR seconded this. No doubt in the case of the graduate of the University of New York there was a disposition to fix upon the mover and seconder of the resolution as the persons against whom he felt specially aggrieved. Other cases might arise, which made it very expedient that the gentleman occupying the position of President, and therefore representing the whole Council, should be the person to make such a motion from the chair. Why should not their business generally be done without movers and seconders? That was the case in the body to which he belonged, and the results were satisfactory. But certainly, in special cases of the kind mentioned, no member of the Council ought to be required to put himself forward as, what might be described in extreme language, the hangman.

Sir DOMINIC CORRIGAN did not think that any inconvenience had arisen from the usual practice; but if it were so, the resolution was defective in not telling what was to be done in order to bring the case before the Council. It was suggested that the President should do it, but that would be to throw on the President the burden—if such a thing could be called a burden, which he did not believe.

Dr. GULL said that, as a new member of the Council, it had struck him as one of the faults of their proceedings that members should have to propose questions of this kind. As to the course to be adopted in such cases, the matter would be

on the *Agenda*, without any names attached, and the President would bring it forward as a matter of form.

Sir DOMINIC CORRIGAN: What would be the next step?

Dr. GULL: Then the Council would vote. In the London University the Vice-Chancellor would bring the matter before the Synod, and the Synod would vote on it without a motion. That is the most natural course.

Dr. ANDREW WOOD suggested that a difficulty would arise if one member thought that one method of procedure ought to take place, and another was in favour of a different procedure.

Dr. ALEXANDER WOOD said that those members who had felt it their duty to propose and second such motions had hitherto felt it to be their duty to make themselves particularly acquainted with the case. They informed themselves of the particular circumstances of the case, and took charge of it, so to speak. There had been no lack of moral courage on the part of the Council in doing its duty up to the present time, and it was rather peculiar that this deviation from the ordinary course should have been proposed by a gentleman whose experience was the least.

Dr. BENNETT would not express any strong opinion, but it struck him as objectionable that his name should have been cited by Dr. Pattison as having moved a particular resolution. He now moved "that it be referred to the Executive Committee to report on the most desirable mode of procedure in the case of motions having reference to any penal measures."

Dr. THOMSON seconded this.

The PRESIDENT thought that on the whole the best mode was to put such motions from the chair, so that it could not be said of any member of the Council, however unjustly, that he was vindictive.

Mr. QUAIN had no objection to withdraw his motion, so that Dr. Bennett's could be substituted. It had been said that no inconvenience had arisen; but were they to wait till they were attacked and vilified?

Sir D. CORRIGAN: Yes.

Mr. QUAIN: I should think not. Our laws should be such as to prevent anything of the sort. Supposing it occurred in Ireland, and we waited till somebody was shot.

Sir D. CORRIGAN: We always do. (Laughter.)

Dr. BENNETT's motion was then put and carried.

RETURNS FROM THE ARMY AND INDIAN MEDICAL BOARDS.

The following report was read:—

The Committee appointed July 4 to consider and report on the returns from the Army and Indian Medical Boards, recommend that the following communications be addressed to the Director-General of the Army Medical Department, and to the Major-General, Military Secretary, India Office:—

To the Director-General, Army Medical Department.

"Sir,—I am directed by the General Medical Council to thank you for the statement with which you have favoured them, 'of the degrees, diplomas, and licences of the candidates for commissions in the Medical Department of the army, who, in February last, presented themselves for examination;' and to ask you, should you see no objection, to make a slight alteration in the last column, which, although sufficiently intelligible to a careful reader, might be misunderstood by some.

"The alteration I am directed to suggest is, that in future returns the last column headed 'Candidates' should stand thus, as may be illustrated by applying it to the present return—

"Total number of candidates	57
Succeeded in obtaining appointments	36
Succeeded in examination, but not in obtaining appointments, there being only thirty-six vacancies	17
Failed in examination	4
Total	57"

To the Major-General, Military Secretary, India Office.

"Sir,—I am directed by the General Medical Council to thank you for the statement with which you have favoured them, 'of the degrees, diplomas, and licences of the candidates in the Medical Department of the Indian Army, who, in February, 1870, presented themselves for examination at Chelsea Hospital;' and to ask you, should you see no objection, to make a slight alteration in the last column, which, although sufficiently intelligible to a careful reader, might be misunderstood by some.

"The alteration I am directed to suggest is, that in future returns, the last column, headed 'Candidates,' should stand thus; as may be illustrated by applying it to the present return—

"Total number of candidates	23
Succeeded in obtaining appointments	10
Succeeded in examination but not in obtaining appointments, there being only ten vacancies	9
Failed in examination	4
Total	23"

Sir DOMINIC CORRIGAN moved—"That the report be received and adopted, and that the letters drafted therein be signed by the registrar, and forwarded by him as directed." He explained that the reason of the proposed change was that, in the form at present followed, a person who did not carefully scrutinise it would conclude that a much greater number failed in the

examinations than was the case; and by the change, the real state of facts would be seen at a glance.

Dr. PARKES seconded this, and it was carried.

FINANCE COMMITTEE.

The following report was read:—

The Finance Committee beg leave to present, in the table subjoined, a statement of the income and expenditure of the year 1870, compared with the income and expenditure of the preceding year, also an estimate for 1871. It will be seen that there has been an increase of income in 1870, and

that this is partly due to an increase in the number of registration fees; but it includes also the balance of the Pharmacopœia account and the proceeds of sales, making together £607 6s., which, by direction of the Council, is now included in the ordinary income. The debt still owing to the Council on account of the Pharmacopœia was reduced in January last to £104 14s.

The expenditure of 1870 is less by £302 13s. 8d. than that of 1869. The reduction is to a considerable extent due to a diminished charge for printing, especially for printing reports of committees. It is expected that a considerable permanent saving under this head of expense will be effected by an arrangement that has been entered into for printing and binding the *Medical Register* at a reduced cost through the agency of her Majesty's Stationery Office.

This report was received and adopted on the motion of Dr. Sharpey, seconded by Dr. Storrar.

Dr. SHARPEY then said that after due consideration, he had come to the determination of resigning his office as one of the Treasurers. He had now served for ten years, and although it could not be said that the duties were in any way a burden, yet he felt that the time had come at which it was expedient that he should resign his share of those duties into other hands. He considered it to be an honourable distinction to have been appointed to the Treasurership in succession to the late Mr. Green. Since then he had had the satisfaction of having had as colleagues Dr. Burrows and Dr. Quain, and they had always acted together in perfect harmony. He could not now withdraw from his office without expressing to the President and the Council his sense of the constant kindness, consideration, and indulgence with which he had been treated, and the satisfaction he felt that there would be no difficulty in appointing an abler and better successor.

The PRESIDENT proposed, and the Council at once carried by acclamation: "That the hearty thanks of the Council be returned to Dr. Sharpey for his long and valuable services as Treasurer."

Dr. SMITH then moved, and Dr. PARKES seconded, "That Dr. Bennett be elected Treasurer of the General Medical Council."

This was agreed to, and Dr. Bennett briefly acknowledged his appointment.

THE PHARMACOPŒIA COMMITTEE.

The following report was read:—

The Pharmacopœia Committee appointed by minute of the Council, July 12, 1869, beg to report that, owing to the pressure of important business during the sessions of the Council last year, no meeting of the Committee was held, and no report was prepared for their consideration by Dr. Redwood.

The Committee met on the 7th instant, and received a report from Dr. Redwood on the progress of pharmacy since the date of his last report. Some points of importance in connexion with pharmaceutical preparations were discussed, and Dr. Redwood was requested to continue his services. It was also resolved that Dr. Christison, Dr. Quain, and Dr. Aquilla Smith be requested to continue their inquiries as regards additions or other changes in the Pharmacopœia, and that Dr. Redwood be requested, in addition to his duty of reporting on the progress of pharmacy, to investigate, from time to time, the composition of articles in the Pharmacopœia, concerning which questions have been raised.

As the sum of £75 remains as balance in the hands of the Committee, it will be unnecessary to ask the Council to place any further sum at the disposal of the Committee for use during the ensuing year.

Dr. CHRISTISON moved that the above report be received and adopted. He said that, even if the Committee had met last

year, there would have been but little to report upon; but subsequently some useful information had been derived from various quarters, and all parties concerned in the Pharmacopœia should be stimulated to look after matters with care during the approaching year. He would remind the Council that they were not entitled to make what was commonly understood as a profit out of the Pharmacopœia, but that the estimate should be made on a plan which would leave a moderate surplus.

Dr. QUAIN seconded the motion.

Dr. A. SMITH said he was no party to that report, which he had not seen till it appeared on the programme. The Committee met yesterday, and Dr. Redwood was summoned to meet them. Dr. Quain, Dr. Christison, Dr. Sharpey, and himself engaged in desultory conversation up to the time of the meeting of the Council, and there was no resolution passed at that meeting.

Dr. CHRISTISON reminded Dr. Smith that after he left the Committee continued to sit.

Dr. SMITH observed that he would not continue sitting in a committee when they were summoned to the Council-room. He asserted that what was called Dr. Redwood's "Report on the Progress of Pharmacy" was only a report of discussions which took place at a meeting of the Pharmaceutical Society; and he regarded the report now before the Council as waste-paper, and would suggest that it be amended.

Dr. APJOHN thought it very desirable that the Committee should furnish the Council with a summary of the researches made by them, because, from the remarks made by Dr. Smith, he was disposed to think that no researches had been made. If he was wrong, Dr. Christison could contradict him; but if he was right, then he agreed with Dr. Smith that the report was so much waste-paper, and would tend to mislead people who were not conversant with such questions. He wanted the Committee to be an efficient one, but he could not see that they had been doing anything.

Dr. QUAIN observed that the Council had assigned a duty to the Committee, and he believed that they had discharged it as faithfully and efficiently as any Committee.

Dr. A. SMITH: No, no. I say we have not. (Order, order.)

Dr. QUAIN (in continuation): That duty was to take care that an accurate record of what was done in pharmacy was kept, and they had engaged the gentleman under whose care the last Pharmacopœia (which was admitted to be a great success) was constructed, to devote himself to the work of

securing that the next edition should be as perfect as possible. He had greater faith in that gentleman's opinion than he had in the opinion of those who last addressed the Council—(Sir D. CORRIGAN: Order)—for he knew the value of Dr. Redwood's work in relation to the Pharmacopœia.

Dr. A. SMITH wished to explain that he did not insinuate a word against Dr. Redwood. He was perfectly willing to admit his capacity, and he regretted that this allusion to that gentleman should have been made. What he stated, and what he adhered to, was that the report presented to the Committee by Dr. Redwood was not a report on the progress of pharmacy.

Sir D. CORRIGAN said he rose to present a humble petition to the Pharmacopœia Committee that they would insert after each article its degree of solubility in water. At present they only put the fact that such an article was soluble in water.

Dr. QUAIN thought the suggestion very proper.

Dr. CHRISTISON: I must support Dr. Quain's statement with regard to Dr. Redwood, so far as to say that I have more reliance in Dr. Redwood in directing what should be in the Pharmacopœia than I have either in Dr. Smith, Dr. Apjohn, Dr. Quain, or myself. (Cheers.)

The resolution was carried, and, on the motion of Dr. BENNETT, seconded by Dr. PARKES, the Committee was re-appointed, the names of the members being—Drs. Christison, Quain, Sharpey, and Aquilla Smith.

VISITATION COMMITTEE.

Dr. ALEXANDER WOOD moved—"That it is desirable that the visitation of the preliminary examinations and those of the Licensing Boards be recommenced, and that a Committee be appointed to consider the best means of doing so." The Committee to consist of Dr. Alexander Wood (Chairman), Dr. Humphry, Dr. Thomson, Mr. Quain, Dr. A. Smith, Dr. Sharpey, Dr. Storrar. He said that the visitations had been suspended last year on account of the progress of the Medical Bill, which required so many attendances in the Council that they could not be carried out. It was desirable, however, before they were resumed that a Committee should report upon a scheme, because objections had been made to the mode of carrying them out.

Dr. HUMPHRY seconded this, and it was carried.

The Council adjourned to Monday, the 10th.

SIXTH DAY.—MONDAY, JULY 10.

The Council reassembled at 2 o'clock.

The amended report of the Committee on Professional Education was read.

Dr. PARKES said that the Council had confirmed all the more important parts of it, so far as the matter of it was concerned; but, with regard to the manner in which certain things should be expressed, criticism must be of advantage. The report had been circulated amongst the members, and had received many alterations in language; and having gone through that ordeal, it would be wasting time to have any debate upon the greater portion of it. The first two pages were simply matters of fact of which the evidence was at hand, and he could not conceive that any objection could be made to that part.

Dr. THOMSON suggested that the report might be conveniently divided for the purpose of discussion into three parts, which he pointed out.

The PRESIDENT suggested that they should proceed page by page, observing the divisions mentioned by Dr. Thomson.

This was agreed to, and a long discussion took place, which, however, presented very few features of public interest, until the clauses relating to the establishment of a Conjoint Board were reached.

Dr. ALEXANDER WOOD then said that there were statements in that part of the report with which he could not agree. The first was: "It is impossible that the Government after introducing a Bill should let the matter entirely drop." How did they know the mind of Government? Would they take up the match-tax again? (Laughter.) For his part he thought they would not, and he hoped that they would also let the idea of passing a Medical Bill drop. At all events, holding the opinion that it was not desirable that the Government should interfere, he thought it would be foolish to send down to the Licensing Bodies anything in the nature of a threat that Government interference would bring the matter about if it was not done voluntarily. Again, he did not like the reference in the same paragraph to "other persons" as being "ready to take the matter up," and he would move the omission of the whole paragraph.

Sir DOMINIC CORRIGAN seconded this on the ground that the paragraph was not only a threat against those who might not

see their way to a combination, but it contained an insinuation that such bodies were careless of the lives of people.

After some further discussion the omission of the paragraph was agreed to.

Some further amendments having been made, the following resolution was agreed to on the motion of Dr. PARKES, seconded by Dr. ANDREW WOOD:—"That the report of the Committee on Professional Education, as now amended, be received and adopted, and that copies be sent to the several Licensing Bodies for their consideration."

Dr. BENNETT called the attention of the Council to the fact that the unamended report had been published in the papers. He thought it was extremely undesirable that any reports of committees should go forth to the public until they were finally received and adopted by the Council.

The following is the report of the Committee on Professional Education, as finally amended and accepted by the Council:—

The Report of the Committee of 1869 on Professional Education, and the replies to the letter of the Chairman from Teachers on Medical Education, were forwarded to the Licensing Bodies, and answers were received from them in 1870.

All the answers did not arrive in time to be presented at the meetings of Council in 1870, and accordingly an interim report only was then laid before the Council (Minutes, vol. viii., p. 11). By a resolution of Council (Minutes, vol. viii., p. 105), the Committee on Education was re-appointed, and directed to report at a future meeting of the Council.

Subsequently, replies to the first Education Report having been received from all the Licensing Bodies, they were printed and distributed, last autumn, to the Members of Council, and are contained in the Appendix to the 8th volume of the Minutes of the Meetings of the Council.

The probability that an Act to regulate Medical education would be passed in 1870, rendered it inexpedient to discuss last year many of the suggestions contained in the Education Report, and in the replies sent in by the Licensing Bodies, for if the Medical Bill of 1870 had been passed, it would have necessitated a revision of the whole subject of Medical education and examination, and would have rendered any previous decisions null and void.

During the last two years very important alterations have been made in the system of education and examination by some of the Licensing Bodies, and several of the suggestions of the Education Committee have been met.

The Royal College of Physicians of London, by a rule passed in April, 1871, requires from every candidate for its Licence, evidence that he has discharged the duties of clinical clerk, and of dresser, for periods of three months respectively, and thus one important recommendation of the Education Report has been carried out.

The Royal College of Surgeons of England, on the reception of the report, appointed a Committee to consider it, and eventually determined to act on the opinion of their Court of Examiners of December 16, 1869, that "every part of the knowledge included in, or accessory to, the education of candidates for the diplomas of the College ought to be taught and learnt practically." The College has, therefore, introduced into its curriculum clauses which ensure practical instruction in chemistry, pharmacy, general anatomy, and physiology and Surgery, and has ordered that every candidate at an early period of his Hospital attendance shall be individually engaged at least twice a week in the observation and examination of patients, under the direction of a recognised teacher during not less than three months—this is for the purpose of enabling him fully to profit by the Hospital instruction; and in addition to this, every candidate is ordered, as formerly, to be also a dresser, or to have charge of patients equivalent to the work of a dresser, for six months, and is also to attend demonstrations in the post-mortem rooms of a recognised Hospital during the whole period of Surgical Hospital practice. And to ensure that these regulations shall be carried out, the College has now instituted for the diploma of Membership (as it had previously done for its Fellowship) a practical clinical Surgical examination in addition to the examination in bandaging, etc., formerly instituted.

The Society of Apothecaries of London has also made some important changes. Since June, 1870, all candidates have been required to produce evidence of having served the office of clinical clerk for at least six weeks, and of having been examined at the class examinations conducted by the teachers of the respective subjects. The clinical examinations which were instituted by the Society on June 13, 1867, have been made an integral and invariable portion of the final examination. Students attending for their first or primary Professional examination have been required, since December, 1870, to undergo an examination on Medical regional anatomy on the healthy subject; and in various other parts of the examinations increased practical work has been demanded.

It is impossible to overrate the effect which the regulations of these great Licensing Bodies (to whom the majority of English students go for their licences) will have on Medical teaching in England. A great part of what was desired by the Committee of Education has been thus obtained, and it seems only just that the Council should fully recognise the improvements which have been made.

The four English Universities have made no change in their systems of examination.

In Scotland, the Royal College of Physicians of Edinburgh now requires all candidates for the licence, without exception, to undergo a clinical examination in Medicine in the Royal Infirmary of Edinburgh.

The Royal College of Surgeons of Edinburgh had previously to July, 1869, instituted practical clinical examinations, which are carried on in a Surgical Hospital, and they have since made no change in their regulations.

The Faculty of Physicians and Surgeons of Glasgow has not essentially altered the mode of conducting the examinations, but in some points the examination has been more systematised, especially as regards the clinical part. All candidates, whether previously qualified or not, are subjected to an examination at the bedside, both in Medicine and Surgery. The written part of the examination has also been extended.

The University of Edinburgh has made no alteration. Practical study, and class examinations in all branches of Medical education, clinical examinations of the students in Medicine, clinical examinations of candidates both in Surgery and Medicine, were in force for some time previous to the report of this Committee in 1869; and the University contemplates

the requirement of study as clinical clerks and dressers, so soon as the General Council report in favour of that measure.

The University of Aberdeen has annulled the regulation which exempted the candidates who obtained the highest place in the written examination from being examined orally, and, in accordance with the wish of the visitors from the Medical Council, enforce the oral examination on all.

The University of Glasgow has made the clinical examination more efficient, but, otherwise, has made no change.

The University of St. Andrews has made no alteration.

In Ireland, the University of Dublin has improved the clinical examination, and now systematically enforces it on all candidates. The previous Medical examination—viz., in physics, chemistry, botany, *Materia Medica*, and descriptive anatomy—is now compulsory.

The Queen's University in Ireland has instituted clinical examinations in Medicine and Surgery in the final examinations for the M.D. and Master in Surgery.

The Royal College of Surgeons of Ireland had formerly instituted a practical examination in bandaging, etc., and the Council has now ordered clinical examinations in Surgery and in Medicine for the final examination.

The King's and Queen's College of Physicians has instituted a clinical examination, which is carried on in the wards of an Hospital for the second or final part of the examination.

The Apothecaries' Hall of Ireland has extended the period of examination from two to six days, so as to more practically test the candidate's knowledge, and they have instituted a clinical examination of patients, which is enforced on all candidates.

It cannot be doubted from the previous statements, which have been drawn from official communications received from each Licensing Body, that great progress has been made in the path indicated in the various reports of the visitors of the Medical Council, and of the Committee on Education.

There are, however, some suggestions in the Education Report which have not yet been carried out, and on which it seems desirable the Council should express an opinion, while there are other suggestions which it will be better to keep in abeyance.

Of the former kind, there are some of considerable importance:—

1st. The separation of the teaching of pharmacy and therapeutics, the former being made an early, and the latter a late, course in the curriculum.

It seems desirable that the instruction in pharmacy should be separated from that in therapeutics, and that the former should be obtained at an early, and the latter at a later period of the Professional curriculum.

So, also, it will be for consideration how far practical instruction in drugs and pharmaceutical preparations might be substituted for formal lectures. In the last two sessions a plan of this kind has been carried on in Aberdeen.

2nd. The recommendation that pathological anatomy should be made a separate course has not been carried out in all cases, but several of the Licensing Bodies have endeavoured to meet it by requiring a certificate of attendance, and of practical instruction in the dead house.

It is desirable that systematic instruction in pathological anatomy should form a part of Professional education.

3rd. The Committee on Education strongly advised the enforcement of more regular class examinations. Certain of the Licensing Bodies have ordered that all students shall produce evidence of having undergone these examinations, and it is desirable that all the Licensing Bodies should issue regulations that class examinations shall form a necessary part of every course of instruction.

The other points raised in the Education Report of 1869, and which we advise should not be discussed at present, are—the length of the sessions, the method of teaching chemistry, and the application of chemistry to physiology and pathology, the teaching of minute anatomy, and the definition of the areas of instruction and of examination.

The Council will doubtless remember that the Education Report of 1869 strongly recommended the formation of Conjoint Examining Boards, so as to reduce the number of licences to practise from nineteen to three, and to make each licence a qualification in both Medicine and Surgery; that the Council authorised circulars to the Licensing Bodies in this sense, and that in the autumn of 1869 various conferences took place between some of the Licensing Bodies, and replies were received from many of them favourable to the proposed combinations. Subsequently the action of the Government in introducing a Bill suspended all negotiations of the kind.

The withdrawal of that Bill makes it desirable that these negotiations be resumed.

It might indeed be argued that the willingness of the Licensing Bodies to improve their examinations, and the fact that they really have improved them, renders it less necessary to revive the plan of an uniform examination for each division of the kingdom. But a moment's reflection will show that the proposal is still necessary.

The independent examinations for licences being as numerous as ever, the risk of inequality of standard in different parts of the kingdom still obtains.

This inequality may doubtless be to a certain degree corrected by more constant and systematic visitations, but the only effectual remedy in the opinion of the Council is the consolidation of examinations.

In a resolution, which was carried by 17 votes against 1 on February 26, 1870, the Council decided that it was of opinion a joint examining board should be formed in each division of the kingdom. It is, therefore, desirable that the Council should address a letter to each licensing body, transmitting a copy of the resolution of February 26, 1870, and urging that arrangements for the formation of the boards shall be undertaken without delay.

CONJOINT EXAMINING BOARDS.

Dr. PARKES moved: "That in case the arrangements for Conjoint Examining Boards are not complete in each division of the Kingdom by the close of the year, in accordance with the recommendations of the Council on the subject, the Executive Committee shall be authorised to seek an interview with the Lord President of the Privy Council, and to urge upon him the desirability of such Medical Legislation in the Session of 1872 as may carry out the object the General Medical Council had in view in passing the resolutions of February 26 and 28, 1870, and of July 7, 1871." It was his opinion that the resolution already passed upon this subject would be entirely nugatory, and that there would be no Conjoint Boards formed

in the several divisions of the Kingdom. The arrangements for a Conjoint Board had made the greatest progress in England. The scheme agreed to by the Joint Committee of the two Colleges was an admirable one, and in some form or other he thought it would be carried; but it was impossible to deny that a great difficulty still existed. The assent of the Universities would only be obtained on certain conditions being fulfilled. If the Society of Apothecaries still continued giving its licences the Universities might say—"Until this Board is completely formed in all its parts we will not agree to give up the privileges we possess of giving licences to practise, and we must wait till a further arrangement takes place." Unless the Apothecaries Society decided to go to Parliament for a fresh Act it would continue to issue its licence; and in that case not only would there be two Boards, but the Apothecaries Society would possess the power of putting their men on the Register, and the Council could not prevent that being done. That Society might also compel the Royal College of Surgeons to admit their licentiates; but if they did not insist upon that they would get some other body to do so. The difficulty, therefore, was very great, and for that reason he did not believe that the arrangement would be made in England. Then, with regard to Scotland, Dr. Christison thought there would be no difficulty in the amalgamation of the bodies in that country. The greatest weight was due to the opinion of one who so thoroughly knew the condition of the Scottish schools.

Dr. ALEXANDER WOOD: I think Dr. Christison's words were that there were very great difficulties but he trusted that they might be overcome.

Dr. PARKES said his recollection was that Dr. Christison said the difficulties would be entirely overcome. However, if Dr. Wood's recollection was right, it would be all the better for the present argument, which was on the probability of failure. As to Ireland, he need say nothing to prove that the combination could not be effected there.

Mr. HARGRAVE: Why?

Dr. PARKES: For two reasons. After the close of the session of 1869, a Committee was appointed to confer with various Licensing Bodies upon different topics, and especially about these combinations. In the successive capacities of secretary and chairman, he had to confer with those bodies, and wrote a great many letters on the subject. The Irish members of the Council, no doubt, would remember being bothered with many letters, and the answers led him to believe that the Irish bodies would not combine. The whole thing put him in mind of the circulation of some meteoric bodies. At first it seemed as if a junction would be made; then the bodies rushed rapidly like a comet to the sun, and all at once they began to recede, and went off into infinite space. Again, Sir Dominic Corrigan had told them that it was impossible that they should join. [Sir D. CORRIGAN: No.] Then the hon. baronet said something so like that, that he (Dr. Parkes) could not tell the difference. Dr. Gull had expressed a desire to convert Sir Dominic, but though Dr. Gull, with his persuasive accents, could carry the whole Council with him in nearly everything, there was one thing he could not do, and that was, convert Sir D. Corrigan. Charm he never so wisely, he would not accomplish that; and if Sir Dominic was not converted, no Conjoint Board would be formed in Ireland, because Sir Dominic had power to prevent it, and would prevent it. The only way in which he could be converted was by Act of Parliament. (Laughter.) Therefore, in view of this state of things and the prospect before them, the Council ought to decide whether its resolution was to be a mere sham or not. If the Licensing Bodies did nothing, what ought to be the action of the Council? If they meant to go to Government, it was of extreme importance that the Council should be in London when the Bill was read a second time before the House of Commons; and the best thing that could be done seemed to him to be to give the Executive Committee the power proposed in the resolution. If the thing was left alone altogether, the result would be threefold. The Council would lose credit; it would also lose its initiative; and it would hand that initiative over to other persons, who would carry a Bill such as the Council would not desire.

Dr. GULL said he had the greatest possible pleasure in seconding this. No one sitting at that table could doubt the desirability that the Medical student who had acquired the requisite amount of knowledge for his Profession should be examined once for all, and not sent from A to B, and from B to C and D, each of whom took a little honey from the comb—a little money out of the bag which did not contain much. Besides that, they wanted an uniform standard of examination. There were standard weights and measures for things of the least possible value, and surely they ought to have something

like an approach to a standard of intellectual qualifications for so important a Profession.

Dr. ALEXANDER WOOD moved the previous question. He cordially approved of what the Council had done as to expressing its wishes on the subject, sending out its opinions to the Licensing Bodies, and inviting them, before the close of the year, to show what they had done in this direction; and there was no man at the table more anxious than he was of seeing a certain uniformity introduced into Medical examinations. But he felt that the Council would assume an unwise attitude if it passed this resolution. Dr. Parkes had said at one stage of the proceedings that everything was *couleur de rose* with regard to the prospects of combination; but now he sought to dragoon them into it by troops, because otherwise there was no chance of combination. There was something which he would not sacrifice even for the Conjoint Board, and that was the independence of the Profession. Some persons seemed to be quite prepared to lay the Medical Profession under the heels of the Government; but he strongly objected to this. Government was striving to get the whole of the education of the country under its control; and he could not conceive anything more disastrous in a free country than that it should succeed in doing so. He therefore opposed the idea of the Council going to Government for any measure of the kind; and, most of all, he would oppose any motion that put into the hands of the Executive Committee a power which should be in the Council only.

Dr. ANDREW WOOD supported the proposition made by Dr. Parkes. It was not the Government who were seeking to rule them with a rod of iron, or to trample on their necks. If the Government were to be ever so quiescent, there were other parties who would force on the subject. It was the duty of the Council to give counsel to the Licensing Bodies as to the best plan of maintaining their rights in such a way that they should not clash with the interests of the general public. If Licensing Bodies held particularly valuable privileges, it should not be forgotten that they held them only for the public benefit. Whenever the time came that such privileges were inconsistent with the general good, then would be the time for taking away the privileges. He believed, however, that the two could be harmonised; and if in England, Scotland, and Ireland they would all go to work with a feeling that the combination was possible, it would be done. Their motto should be—*Possumus quia posse videmur*. There were difficulties in Scotland which had to be overcome; but it was the part of wise men and wise corporations to endeavour, by their own action, to do that which otherwise might be forced upon them in a way which would be highly objectionable. The Council ought not to draw back after what it had done, and, above all, it ought not to entertain any jealousy of Government. In all the negotiations of last year not the least desire had been shown on the part of Government to override the Licensing Bodies or to tyrannise over the Medical Profession; nor was there any disposition on the part of any individual member of the Government to do anything that would affect the independence of the Profession. As to Ireland, why should the thing be impossible in that country? Sir Dominic was not Member for all Ireland, nor was he a Daniel O'Connell, who could dictate to all Ireland. He did not believe, however, that Sir Dominic quite meant all he said. (A laugh.) Their Irish friends were sometimes carried away by their *perfervidum ingenium* to utter words which were not intended to convey all that the same words would when uttered by men on this side of the Channel. (A laugh.)

Mr. HARGRAVE was astonished that anyone should say that it was impossible to carry out the scheme in Ireland. It was a perfect insult to Ireland to say that they could not sit down and agree to the combination if they thought it advisable to do so.

Sir D. CORRIGAN explained that he had never proposed that men should not be thoroughly examined before they entered the Medical Profession, but he always advocated that the Licensing Bodies should be left as they are, and that men should go where they pleased. He objected to the examination by a Conjoint Board being the first step. What he had said was that the difficulties in the way of combination in Ireland appeared to be insurmountable. The two universities could scarcely be expected to unite. The College of Surgeons and the College of Physicians had been in communication on the subject ever since 1865, and they had arrived at no result. Dr. Parkes had blown hot and cold. In the report everything was flattering, and there were no insurmountable difficulties; but in the speech he (Dr. Parkes) had last made, the thing was represented as impossible, not only in Ireland but in England.

How was that discrepancy to be explained? For his own part, he thought the two statements to be totally irreconcilable. The resolution now under discussion proposed to place the Council, tied hand and foot, into the power of the Executive Committee, and he must therefore oppose it. He was against going to Government at all, for when did Government show any consideration for the Profession? The Lunacy (Ireland) Bill was an example of the way in which Government dealt with the Medical Profession, and he would not agree to trust the Lord President of the Privy Council or any Member of the Cabinet with drawing up a Bill.

Dr. BENNETT pointed out that the resolution did not propose to do anything of the kind indicated by Sir D. Corrigan; but simply to authorise the executive committee to urge upon the Lord President of the Privy Council the desirability of such Medical legislation as would carry out the objects of the Medical Council. It was his opinion that if the Council meant these Joint Boards to be formed (as they did), they ought to say very plainly that if they were not carried out by voluntary effort, it would be imperative that Government should interfere; and he had no apprehension that Government would do anything of which the Council would not approve. By consent, Dr. Alexander Wood withdrew his motion of the "previous question," and moved the following amendment:—"That a meeting of the General Medical Council be held early in 1872, to receive the proposals of the bodies for Conjoint Examinations, and to consider whether any, and what steps should be taken to carry out the resolutions of the Council in favour of such combinations."

Dr. STORRAR seconded this, and it was carried. It was then put as a substantive motion, and adopted.

REGISTRATION OF MEDICAL STUDENTS.

The report of the Committee was read as follows:—

REPORT.

1. The following table has been compiled from the returns according to Recommendation 6, sec. v. (Professional examination), of the Recommendations of the Council, 1866 (see vol. iv., p. 311)—viz., "that returns from the Licensing Bodies be made annually on January 1, to the General Medical Council, stating the number and names of the candidates who have passed their first as well as their second Examinations, and the number of those who have been rejected at the first and second examinations respectively."

This table has been submitted in form of proof to the registrars of the Licensing Bodies for revision, and the Committee have every reason to believe it correct.

Table for 1870.

M.D. and M.C.

‡ Of these, thirty took M.B. and C.M., and two M.B. alone.

§ Of these, fifty took M.B. and C.M., four M.B. alone, and four M.D. In addition, twenty-eight M.B.'s gave in their theses for M.D., which were approved by the Medical Faculty, and they were accordingly promoted to that degree.

2. The subjoined is a statement of the numbers of students registered in the following years. The numbers are:—

1866	936
1867	927
1868	927
1869	1164
1870	1160

(Signed) D. EMBLETON, Chairman.

This report was referred to the Executive Committee.

VISITATION OF EXAMINATIONS.

The Report of the Committee on this subject was read as follows:—

The Committee on this subject, appointed on the 8th inst., beg to report—

1. That in their opinion the time has now come when an interchange of visitors between the three Branch Councils would strengthen confidence in the visitation, and would tend to assimilate the character of the examinations of the various Boards.

2. That with the view of carrying out the resolution of the Council of July 8, a Committee of Visitors be appointed to make arrangements what examinations should be visited, and for carrying out the visitation.

3. That the Committee of Visitors consist of eight, four to be elected by the English Branch Council, and two by the Scottish and Irish Branch Councils respectively.

4. That each examination reported on shall be visited by a due proportion of members of the Branch Councils, other than the one in that division of the kingdom where the examination is conducted.

5. That it is not desirable that visitations should take place in the case of those Examining Boards with regard to which it shall appear to the Visitation Committee that there is a reasonable prospect of a conjoint examination being formed.

(Signed) ALEXANDER WOOD, Chairman.

The consideration of this report was postponed to the next meeting of the Council.

The following resolutions were then agreed to without discussion:—

Moved by Dr. A. SMITH; seconded by Dr. STORRAR: "That the powers and duties heretofore delegated to the executive Committee, except those delegated by sections 6, 7, and 8, of chapter viii. of the Standing Orders, shall be vested in the Committee until the next meeting of the General Medical Council."

Moved by Dr. A. SMITH; seconded by Dr. STORRAR: "That the cordial thanks of this Council are due, and are hereby tendered, to Dr. Andrew Wood, for his services as Chairman of the Business Committee, during the present session of the Council."

Moved by Dr. A. SMITH, and seconded by Dr. STORRAR: "That the thanks of the Council are hereby cordially tendered to Dr. Paget, the President, for his efficient services during the present session of the Medical Council."

The proceedings then terminated.

ORIGINAL COMMUNICATIONS.

CASE OF FRACTURE OF THE EPIPHYSIS OF THE TIBIA AND FIBULA RESULTING IN GANGRENE.

By THOS. GIBSON, M.D., M.R.C.S.

J. D., a boy, aged 15, was engaged in March last assisting to remove some earth from the side of a house with a wheelbarrow, and when between the shafts it suddenly tilted, and the shaft nearest the outside of the right knee struck it forcibly, and produced very great displacement of the knee inwards, immediately below the knee-joint. When called to the case soon after the accident—the patient being about a mile from my residence—and on getting him to bed and the trousers removed, at first sight I thought that I had a case of complete dislocation of the knee-joint inwards to deal with, but on manipulation I found it otherwise. The fracture was easily reduced by extension and coaptation, and a "Hide's" splint applied to both sides of the knee-joint and a long splint to the outside of the leg also, after carefully bandaging the limb from the toes upwards. But the most serious part of the accident, to my mind, was the perfect numbness of the large toe immediately after reducing the fracture, and the cold feel of the part, so much so that I immediately took down the bandages and laid the limb into position upon cushions, elevating the knee-joint and keeping the fracture in position by all the available means I had at hand. On visiting the case next morning I found that there was extensive vesications all along the calf of the leg and into the popliteal space, and that the large toe especially, as well as the other toes, had begun to assume a bluish-black appearance. Still, there was not very great swelling of the foot, nor had the vesications increased; but there was considerable swelling about the neighbourhood of the joint, and considerable pain was also felt at and around the joint. I ordered warm fomentations to the joint, taking away everything but a soft pillow from under the knee, and likewise placed a hot bran poultice to the foot, both of which were repeated frequently, and gave a pill every three hours, with cal. opio, and a febrifuge mixture, with antim. tart. The pain, however, at the end of the third day was most excruciating, the gangrene more developed, and every indication that if amputation was not at once resorted to the patient would sink. In fact, with the objection that the friends have generally in country places to amputation, and the distance from any Hospital or Infirmary—about forty miles—renders this proceeding one of considerable anxiety to the country Practitioner in this district; but on my explaining to the friends the absolute necessity for it they gave their consent, and I am happy to say that the operation which was then undertaken was followed by the recovery of the patient in a very speedy manner. The limb was taken off about the middle third of the thigh, and so extensive was the injury to the joint from congestion and gangrene that there was nothing to spare. On examining the limb it was evident that the veins had, by the fracture at the epiphysis, been so injured that phlebitis had been set up by compression of their coats, and also from the obstruction to the flow of blood upwards that coagula had formed in them, so as effectually to stop all circulation; and this had evidently been the result at once, or else the large toe would not so soon have put on the peculiar appearance and given warning of danger before either bandages or splints had been applied.

Bedford.

MIDWIFERY NOTES.

By FRANCIS R. HOGG, R.H.A.

If there is one branch of the Profession more than another deserving of high remuneration, it is that of midwifery—terribly anxious, always uncertain, nine cases going on well, the tenth perhaps most complicated, two lives as well as the reputation and the bread of the civil Practitioner at stake, all his previous successes possibly obliterated by some fearful result sometimes beyond the control even of the most skilful.

Case 1.—A., primipara, aged 28; breech presentation, labour, delayed by pelvic exostosis; with considerable difficulty feet brought down, traction tried, the head remaining immovable. After ineffectual attempts to introduce the forceps, or to perform craniotomy with maternal safety, further traction unfortunately

brought the body away, leaving the head behind. The bulk was gradually diminished by the blunt hook, which, firmly inserted into the fetal cranium, could be conveniently used with considerable force, and at last Surgeon Manley, V.C., overcame the difficulty, Dr. Butler, Civil Surgeon, thus far having kindly assisted. The patient under chloroform two hours, no hæmorrhage. Subsequent peritonitis was treated by leeches, mercurial inunction, warm dilute carbohic acid vaginal injections, turpentine fomentations, hypodermic injections of morphia, anodyne applications, opiate suppositories. Result: A good recovery.

Case 2.—B., at St. Thomas Mount, Madras, her second labour, through intense heat, was followed by puerperal mania, hatred to husband, child, and accoucheur the prominent features. At Woolwich, in the seventh month of next pregnancy, reduced to death's door through morning sickness, at last seeks Medical advice. For fifteen days every remedy tried in vain, but, before inducing premature labour, a hypodermic injection of morphia was applied over the stomach. Not merely did the vomiting cease immediately, but in six hours labour came on. She swallowed quantities of brandy, and in an exhausted condition gave birth to a weakly infant. Within two hours profuse hæmorrhage occurred, checked by another hypodermic injection of morphia over the uterus. Soon after vaccination, infant contracted variola. Result: Mother and child now well.

Case 3.—C., seven days before labour in the winter, when in a ward with nine patients, attacked with erysipelas of the head; eyes closed, features lost. Excepting toughness of membranes requiring puncturing, the labour in a special ward was natural. The infant (unavoidably brought up by hand) three days after contracted disease, and tinct. ferri perchlor. was given in the bottle. Result: No other patients attacked; mother and child now well. I had a scratched hand, but using carbohic acid and carron oil sustained no injury.

Case 4.—D. awoke suddenly out of sleep to find three inches of funis dangling out of the vagina; foot presentation, and feeble pulsation. Traction made; child still-born, followed by another (breech) presentation, also dead. Aborted thrice previously with twins. A twin premature birth also occurred. She was a twin, her husband a twin, the same age to a day as herself, and her mother twice bore twins.

A REPORT OF THE

LAST ILLNESS OF HER MAJESTY
WILHELMINA FREDRIKA ALEXANDRA
ANNA LOUISA, QUEEN OF SWEDEN.

BASED ON AN ABRIDGEMENT OF THE NOTES DAILY TAKEN OF
THE CASE.

(Translated from the "Hygiea" for April, 1871.)

By J. W. MOORE, M.D. M.Ch. Dub., L.K.Q.C.P.I.,
Ex-Scholar Trinity College, Dublin.

From the very commencement of the current year her Majesty the Queen, then just returned from a winter journey to Holland, where she had been present at her mother's decease, had occasionally suffered from considerable *malaise*, which did not, however, eventuate in any actual indisposition, or interfere with the daily promenades, usually taken in an open carriage, irrespective of the changes of the weather and the temperature.

When, in the beginning of the month of February, his Majesty the King fell seriously ill, her Majesty overstrained her not very great strength during a period of two or three weeks, staying for a large portion of the day in the sick-room, where she shared the nurse-tending, and read aloud for several hours daily. A slight laryngeal catarrh, with hoarseness and tolerably considerable prostration of strength, but without pyrexia, shortly showed itself, so that her Majesty was obliged to take to her bed for some two days. The symptoms were at this time of a very transitory character, and disappeared after the employment of the treatment commonly adopted in this affection.

Her Majesty afterwards felt perfectly well—the *malaise* above alluded to excepted—until March 13, when a second attack of laryngeal catarrh began to show itself, with symptoms exactly corresponding to those observed in the previous illness, but combined with a more pronounced degree of prostration than was commensurate with the other symptoms. The expectoration was trifling, and no fever appeared; yet, on March 16 and 17, a violent but very transitory pain, neuralgic in cha-

raeter, set in in the forehead and neck. The catarrh diminished as regarded the mucous membrane of the trachea, but nevertheless gradually spread down towards the lungs, accompanied with the usual physical signs, so that on March 19 her Majesty was again obliged to take to bed. The malady after this made uninterrupted progress; the loss of strength was also on the increase. The expectoration varied; it was at times tolerably easy, at times distressing, in consequence, partly, of a viscid condition of the mucus, and partly of a difficulty in coughing up to which her Majesty had been subject for several years back. The appetite failed and sleep diminished, but no fever or increase of temperature set in before March 24, when these symptoms appeared in a slight degree, and the morbid process commenced to extend to the finer air-passages, especially in the left lung (capillary bronchitis). The patient slept better than during the preceding nights.

On the morning of March 25 Professor Malmsten was called in in consultation. During the day the expectoration was difficult, and the sputa viscid, with purulent masses mixed through them. No appetite. Physical examination announced an extensive capillary bronchitis, with an intimation of commencing consolidation in the lowest part of the left lung. The temperature in the evening was a little heightened; the pulse 82; the rate of respiration 40 in the minute.

28th.—The accumulation of mucus gradually increased in both lungs, and the patient's state began to be more dangerous. The following night was a restless one, notwithstanding the use of a hypnotic. The evening temperature was 103.3° Fahr.; the pulse 108; the respirations 60 per minute.

27th.—In the forenoon some expectoration occurred after the administration of a remedy intended to effect this end, when the fever and the accumulation of mucus somewhat lessened, but the changes in the lungs continued to be almost the same as on the preceding day. The fever and the temperature of the body were also towards evening slightly diminished, while the respiration was less hurried (the temperature 102.2° Fahr.; pulse 96; the respirations 50 per minute).

28th. Towards morning the cough was again very troublesome. On examination of the chest the consolidation in the lower third of the left lung appeared fully developed (broncho-pneumonia of the left side). The fever and loss of strength continued, and were on the increase; great thirst. In the evening the patient's state was worse, and the difficulty of breathing increased in consequence of the continued accumulation of mucus. A restless night was spent, and it became possible to recognise consolidation over the base of the right lung also (double broncho-pneumonia). The temperature was 104° Fahr.; pulse 106; the respirations 60 per minute.

29th.—Two hours' natural good sleep were enjoyed towards morning. The fever and the dyspnoea were subsequently diminished in some small degree, and the muco-crepitus became somewhat looser. During the day the patient took a few cups of beef-tea and of tea. In the afternoon, consequent on the fresh increase of accumulation of mucus, a very violent dyspnoeal attack occurred, during which the pulse became almost imperceptible. On this, as on the preceding days, her Majesty complained little of any sufferings, but exclusively of the loss of strength and prostration, which incessantly increased. The consolidation seemed to be spreading in both lungs. The temperature was 103.9° Fahr.; pulse 108; the respirations 52 per minute. At night a sedative remedy was ordered, which for some hours produced the desired effect.

30th.—The accumulation of mucus again increased at night, and a fresh attack of dyspnoea occurred at 2 a.m., after which the weakened and extremely hurried respiration was constantly attended with a mucous r le in the trachea. The strength now utterly gave way, the pulse became almost imperceptible, and a quiet delirium set in. This state continued until towards the morning, when the pulse again rallied somewhat, and her Majesty swallowed a few cups of tea. The delirium disappeared about half-past ten in the forenoon, so that her Majesty was able in perfect consciousness to take her last farewell of her illustrious relations and others present. The death-agony meanwhile gradually made progress, and her Majesty the Queen died calmly and peaceably at twenty minutes past eleven in the forenoon. (a)

VINCENT LUNDBERG.
P. H. MALMSTEN.
EDW. EDHOLM.

Stockholm, April 3, 1871.

(a) In accordance with the command of his Majesty the King, no autopsy was made. The body was embalmed by means of an injection arsenic on March 31, pursuant to the protocol drawn up on the subject.

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

ROYAL FREE HOSPITAL.

EXCISION OF THE LEFT ELBOW FOR DISEASE OF THE JOINT, IN A WOMAN AGED 61, THE SUBJECT OF OCCLUSION OF THE AXILLARY VEIN.

(Under the care of Mr. JOHN D. HILL.)

[Reported by Mr. MURPHY, House-Surgeon.]

THIS case was interesting as regards the age of the patient and the difficulties which arose in the after-treatment, owing to occlusion of the axillary vein.

Patient has always enjoyed good health; has never suffered from rheumatism or gout. The only history of injury to the elbow is that of a twist received in a fall about eight years ago. This sprain, however, occasioned no inconvenience, and it was not until two years ago that the patient noticed anything wrong with the joint. At that time it suddenly became swollen and painful. Notwithstanding treatment, the elbow remained much in the same condition, sometimes better, sometimes worse, but becoming gradually more contracted and rigid, until about three months ago, when, without any apparent cause, it was attacked with throbbing pain and heat, and a fluctuating tumour formed at the outer and back part of the joint. This abscess was punctured at the Hospital, and a small quantity of unhealthy pus escaped. Since that time there has been constant pain in the part, with occasional numbness in the fingers. Her general health has also been failing. On admission (June, 1869), the elbow was found greatly enlarged, bent at a right angle, and immovably fixed in this position. The swelling was tolerably firm, and concealed the bony prominences. There was no fluctuation about the joint. The sinus left by the abscess above-mentioned led to bare bone. The forearm and upper arm were œdematous, and the superficial veins of the whole limb enlarged. In the axilla the deep vein could be felt as a firm cord. The anastomoses of the cephalic and acromial veins about the shoulder were very visible. The skin was dusky and somewhat brawny. Patient could not use the fingers, wrist, or elbow without pain.

June 23.—Mr. Hill excised the elbow-joint in the usual manner by a single longitudinal incision, removing the articular surfaces with a chain-saw. The ligaments were found reduced to pulp, the cartilages of the joint ulcerated in patches, and the joint surfaces of bones eroded at points. The limb was put up in the rectangular position from the first; an inside and an outside splint, interrupted opposite the wound to facilitate change of dressings, being used. Care was taken to keep the cut ends of the bone a little apart, leaving a space between them to prevent bony union. During the after-treatment the occlusion of the axillary and deep veins of the upper arm gave much trouble; at first inducing venous hæmorrhage from the incision, and subsequently retarding the healing of the wound, and causing much anxiety as regarded the hand, which on several occasions became much congested and swollen. Owing to this condition, also, the splints could not be fixed with sufficient firmness to prevent a certain amount of movement between the ends of the bones; and this mobility kept up a degree of irritation in the soft parts. The wound healed slowly by granulation in ten weeks' time; and now the splints are abandoned and the patient carries the arm in a sling. There is a fair amount of flexion, extension, pronation, and supination in the joint, and very trifling pain is occasioned by moving it beyond the free points. The patient can also move the fingers freely. Her general health is excellent.

ROYAL INFIRMARY, EDINBURGH.

EFFECT OF PREGNANCY ON A FIBROID OF THE UTERUS.

(Under the care of Dr. MATTHEWS DUNCAN.)

[Communicated by Dr. J. R. HARDIE.]

A. E., aged 29, is married, and is the mother of three children; she has been under observation for the last three years on account of a fibrous tumour of the uterus, the history of which may be of interest, especially at the present time, when so much attention is being given to this subject in the Medical journals.

A. E. had enjoyed good health up to the time that her second child was born, when she had an attack of what she calls child-bed fever. Twelve months after the fever she aborted at the third month, and since then she has aborted twice—at the eighth week and at the seventh week respectively. About four years ago a tumour was detected by her ordinary Medical attendant, low down in her abdomen, in the region of the right iliac fossa.

When first examined in the Infirmary she was about five months gone with child; a tumour, about the size of a foetal head, occupied the right iliac fossa—it was closely connected with the uterus. As pregnancy advanced this tumour was observed to increase in size, and to become soft, which gave it a feeling as if filled with fluid. On returning, five months after her confinement—which was quite natural—the tumour had diminished in size, being then no larger than a turkey's egg. The probe entered the uterus three and a half inches. At this time she expressed herself as enjoying good health, complaining of nothing. A year and a half after her confinement the tumour had again increased in size, so as to fully occupy the upper part of the cavity of the pelvis. About this time she missed a monthly period, but at the following period she menstruated very profusely. When examined during the attack of suppression of the menses, the tumour was found to project above the symphysis pubis, to be about the size of the fist, and quite movable; on the other hand, after the menorrhagia, the uterus and tumour were observed to have shrunk into the pelvis.

Remarks.—It is a question of moment to patient and Practitioner—one which has been answered both in the negative and the affirmative—whether or not a fibroid of the uterus may disappear spontaneously. On the solution of this question our belief regarding the efficacy of remedies towards promoting this much-desired object will in a great measure be modified. The case before us undoubtedly proves that a change in size may be produced by the supervention of pregnancy, that the disease increases with the advent of pregnancy, and that after parturition, when the uterus undergoes involution, the fibroid partakes in the diminution of bulk consequent on this. In the case reported, the varying size of the tumour under different conditions was carefully examined and noted at the time. When first seen A. E. was pregnant; at that time the tumour was as large as a foetal head. She did not make her appearance again until five months after confinement, so that an opportunity of judging of the full effects of involution of the uterus on the dimensions of the fibroid was not afforded us. At that time, however, a change in size was to be observed: it was reported as being not larger than a hen's egg. The next report was made eighteen months after confinement; then it had increased in size so as to fully occupy the cavity of the pelvis. During the whole of this period little or no treatment was had recourse to, so that the case illustrates what takes place when this disease is left to the unaided efforts of nature.

HEALTH OF INDIA.—In the North-Western Provinces the death-rate of February was, per 1000—cholera, 0·0; small-pox, ·03; fevers, ·63; bowel complaints, ·11; injuries, ·01; all other causes, ·15—total, ·98. There were 50 deaths from suicide (17 males and 33 females); 71 from wounds (46 males and 25 females); 357 from accident (188 males and 169 females); 80 from snake-bite and wild animals (40 males and 40 females); population, 83,014,921. In the general provinces the death-rate of February was, per 1000—cholera, 0·0; small-pox, 0·0; fevers, 0·8; bowel complaints, 0·1; injuries, 0·02; all other causes, 0·16—total, 1·1. There were 25 deaths from suicide (9 males and 16 females); 9 from wounds (7 males and 2 females); 76 from accident (48 males and 28 females); 36 from snake-bite and wild animals (14 males and 22 females); population, 6,701,239. In the Punjaub and its dependencies the death-rate of February was, per 1000—cholera, 0·0; small-pox, 0·15; fevers, 0·94; bowel-complaints, 0·06; injuries, 0·0; all other causes, 0·43—total, 1·59. There were 4 deaths from suicide (3 males and 1 female); 4 from wounds (3 males and 1 female); 127 from accident (86 males and 41 females); 10 from snake-bite and wild animals (5 males and 5 females); population, 16,859,219.

HIGHGATE SMALL-POX HOSPITAL.—The half-yearly general Court was held last week at the Hospital. The report stated that for the half-year ending June 30, 706 patients had been admitted into the Hospital, 827 out-patients were vaccinated, and 86 Medical Practitioners were supplied with 516 charges of vaccine lymph. The half-yearly receipts and expenditure showed that £6172 16s. had been received, and £4206 10s. expended.

SATURDAY, JULY 15, 1871.

THE GENERAL MEDICAL COUNCIL.

IN our last number we commented on the proceedings of the Council during the first day only of the session, though we published the minutes of the second and third day also. These will have been read with much interest, and we doubt not that the acquittal of Mr. W. H. Kempster has met with very general approval. Mr. Kempster was charged with having been guilty of infamous conduct in a Professional respect, in that he had allowed Mr. W. Goodson, an unqualified Practitioner, to practise under colour of his name, and that he had signed certificates of the death of patients whom he had not personally attended. The evidence in support of the charges was very weak, and Mr. Kempster proved that Mr. Goodson was an ordinary assistant, and had practised only in that character, and that whatever he had himself done in the way of signing death certificates was in accordance with "the usage of the Profession." It is certain that it is largely the custom of Medical men to employ unqualified assistants, though we are very glad to learn from Mr. Baxter Langley's evidence that, "as to the proportions of unqualified and qualified assistants, there has been a very remarkable change within the last few years," the tendency to have qualified assistants having greatly increased; and it is also certain that it is not a very rare thing, though very objectionable, for a Medical Practitioner to sign a death certificate when the patient had for some time, or even all through the illness, been seen by the assistant only, and not by himself. Mr. Langley says that "it is a wide-spread custom, arising out of the necessities of the case, particularly where the assistant is resident at a long distance from the principal." We hope that this "custom" is really only followed in very exceptional cases, but it is easy to understand that in a wide-spread country practice a case may now and then occur when a Medical man must either sign a certificate of death on information derived from his assistant only, or, supposing the assistant to be unqualified, a certificate must be altogether refused, while it is well known that the popular impression is that the refusal of the certificate implies that there was something wrong or suspicious about the death. Anyhow, under all the circumstances, it would have been very harsh and unjust to have punished Mr. Kempster for having, in quite exceptional cases, followed what was shown to be a not very rare Professional usage, and the Profession at large will be glad that the Council unanimately acquitted him of the charge preferred against him. The Council then resolved

that the facts which the investigation of the case had brought to their knowledge had impressed them "with the conviction that an amendment of the laws in force in regard to death-registry is most urgently required; and that a copy of this resolution be forwarded to the Secretary of State for the Home Department"—one more subject being thus added to the long list of those which Mr. Bruce believes, or affects to believe, that he has "under consideration."

These matters occupied the Council during the whole of the second day's sitting.

The third day was devoted to the consideration of Dr. Parkes' resolutions on the Education Report. These, and the results of the debates on them, we published last week. The first, recommending "that the instruction in pharmacy should be separated from that in therapeutics, and that the former should be obtained at an early, and the latter at a later, period of the Professional curriculum," was carried as proposed by Dr. Parkes. The second, recommending that the Professional instruction in midwifery should be extended, was lost, as also were the amendments proposed to it. The third and fourth were carried in slightly altered shape. These were—3rd, "That it is desirable that systematic instruction in pathological anatomy should form part of Professional education"; and 4th, "That it is desirable that class examinations should form a necessary part of class instruction." All the resolutions were of the permissive kind, each beginning with the words "It is desirable that" such and such a thing should be done. The Council does not venture beyond that; but a just and proper acknowledgment was made of the readiness, and even eagerness, with which the Licensing Bodies have adopted the suggestions of the Council.

On the fourth day Dr. Fleming moved, "That it is desirable that clinical instruction in Medicine and in Surgery should not be conducted so much by formal lectures in class-rooms as appears from the evidence before the Council to be the case at present; but that Hospital students should be divided into classes of limited numbers, so as to enable them, individually, to observe cases of disease, and to be examined upon them conversationally at the bedside or in proximity to it. Further, that it is desirable that, when possible, all students should serve as clinical assistants or dressers." This led to a long discussion, which showed that the general opinion was against the motion, as meddling or unnecessary. Sir Dominic Corrigan was, of course, against it; he seems to be nothing if not obstructive, but some of his observations were certainly true, if not polite; thus he remarked that "there are many qualified men who can neither teach nor learn," and that it would not be just to force students to attend the teaching of such men. To himself we feel that he was painfully unjust; he said that "he himself had found that pupils left him either because his brains were wearing out, or because from some cause or other he failed to interest them." The first suggested reason will be scouted by everyone, and we cannot imagine Sir Dominic failing to interest any medical student, while Irish students must surely worship him. No doubt they will rush forward to clear themselves from the reproach Sir Dominic's native modesty has laid them open to.

Dr. Gull moved as an amendment—"That the Council express their sense of the importance of making clinical instruction year by year more practical and more consonant with the phenomena of disease, and less dependent upon formal clinical lectures." Dr. Christison thought the amendment would be still better than it was if it stated that the Council "had observed with pleasure that great improvements had been going on in the mode of clinical instruction," and Dr. Parkes opposed any resolution on the subject, "because at the present time every Licensing Body had instituted a clinical examination," a recognition of the improvements made in examinations, which the barest justice to the Licensing Bodies demanded. Dr. Fleming, in proposing his resolution, stated

that the College of Surgeons of England now required, to their great credit, that every student should be engaged for three months in actual clinical work, but he did not state, as he might have done, that the Apothecaries' Society, and the College of Physicians of London, also require that all students shall have actually served as clinical clerks and dressers.

Eventually both the original motion and the amendment were rejected.

At the beginning of this, the fourth day of the session, Dr. Bennett made a statement with regard to arrangements for the formation of a Conjoint Examining Board for England, which will be read with great interest. After many schemes for this object had failed, one has been now agreed upon by a Conjoint Committee of the Royal Colleges of Physicians and Surgeons, which has apparently every prospect of being carried into effect. The principle of the scheme is—in the first place, a combined Board of the two Colleges, with such provisions as will facilitate the co-operation of other bodies who may wish to join them. The two bodies will not directly appoint their examiners, but will agree in the formation of a Committee of Reference, which Committee will look out for the best examiners that can be obtained, and submit those names to the several co-operating bodies for approval. The examinations will be conducted by these examiners, and the qualification obtained by the successful candidates will be a conjoint qualification in Medicine and in Surgery, as the result of the examination. Liberty will be left to the co-operating bodies still to confer their honorary distinctions and degrees, whilst each will abstain from independent action in giving admission to the Medical Register.

Mr. Quain said that, as representing the College of Surgeons, he did not dissent from anything said by Dr. Bennett. Dr. Gull stated that the University of London was willing to put all its privileges aside, and make its students submit to the examination of this Conjoint Board. Dr. Humphry said that the University of Cambridge entered heartily into the scheme, and were quite willing that their students should be subjected to the examination, provided they could insure that the Board was a sufficient one, and that the examiners were appointed in a proper manner. And he further stated that he believed this was the feeling of the University of Oxford also. And Dr. Embleton intimated the assent of the University of Durham.

The Profession will hail with great satisfaction the strong hope thus held out of the speedy formation of a Conjoint Examining Board for England; but we are sure that with that satisfaction there will be mingled a feeling of surprise and regret that the scheme does not include the Society of Apothecaries. Dr. Bennett stated that "scheme after scheme had been discussed and abandoned, in consequence of the objections to it, sometimes coming from the universities, but more frequently from the Apothecaries' Company, who were so bound by their Act of Parliament as to make it very difficult for them to accede to propositions to which otherwise there was reason to believe they would gladly assent." If the scheme is eventually carried out without the co-operation of this Society, there will certainly be a very wide-reaching regret that a body which has, since 1815, done more than any other single licensing authority to raise the status, enlarge the education, and improve the examination of the General Practitioner, should be left out, and effaced in this way. It is very difficult to believe in the absolute necessity of such a sacrifice. Surely, the Apothecaries Act must have been drawn with a skill which has been lost in these later times, if it is really impossible to find in it some loophole, by which the Society might join in the scheme did they heartily and with singleness of mind desire it.

The Council also resolved that the resolutions of February 26 and 28, 1870, on the formation of Conjoint Examining Boards, copies of which will be found in the minutes of this day's pro-

ceedings, should be again sent to each Licensing Body, together with a letter, "urging that the arrangements for the formation of such Boards shall be undertaken without delay, and shall be communicated to the President of this Council before the close of the present year." Sir Dominic Corrigan opposed the resolution, and "did not think that the plan could possibly be carried out in Ireland." But Dr. Apjohn stated that the University of Dublin were prepared to co-operate; and Dr. Christison said that he saw no difficulty in the way on the part of the Universities of Scotland.

The rest of the day was occupied by the discussion of a motion by Dr. Storrar for recommending that students should have the option of passing in chemistry before beginning their Professional study; but the motion was not carried.

On Saturday, the fifth day of the session, the Council got through various matters of routine, and details of necessity; but nothing of much public interest or importance came before them. The third-class certificates of the Board of Public Examiners in Literature and Science, Cape of Good Hope, were recognised as fulfilling the conditions of the preliminary examination. The Executive Committee was appointed. The report of the Finance Committee, showing an increase of income and a diminution of expenditure, was received and adopted. Dr. Sharpey resigned his office as one of the Treasurers to the Council, after holding it for ten years, and Dr. Bennett was elected in his place. The Committee appointed to consider and report on the returns from the Army and Indian Medical Boards sent in their report, recommending a slight alteration in the form of the returns, so as to make more clear the proportion of actual rejections of the candidates for commissions, and their report was adopted, and ordered to be recommended to the consideration of the Boards concerned. A report was received from the Pharmacopœia Committee, which certainly had not much in it, but which led to a slight passage of arms between Dr. Aquilla Smith, one of the members of the Committee, and his colleagues; Dr. A. Smith denouncing the report as being only so much waste-paper, and declaring that the Committee had not done its duty. But of course his colleagues did not agree with him, nor did the rest of the Council; the report was adopted, and the Committee reappointed. A Committee was also appointed to consider the best method of resuming the visitation of examinations. But the most interesting discussion of the day was caused by a resolution of Mr. Quain's, to the effect that when it is necessary to inflict any penal measure upon a registered Practitioner, it should not be necessary that such proceeding should be moved and seconded. It does seem objectionable that any individual member of the Council should be made to appear to take any specially active or prominent part in such proceedings; but there may be some difficulty in determining how such cases can be properly and well put before the Council except by a proposer and seconder, who shall have made themselves thoroughly acquainted with the particular circumstances of each case. Sir Dominic Corrigan objected to any change; said no inconvenience had arisen from the existing practice, and thought the Council ought to wait "till they were attacked and vilified." Mr. Quain replied that he thought, on the contrary, their laws should be such as to prevent anything of the sort, and remarked, "Suppose it occurred in Ireland, and we waited till somebody was shot;" to which Sir Dominic characteristically replied, "We always do"; but however congenial such a mode of proceeding, or of not proceeding, may be to an Irish temperament, it does commend itself to an English one, and the matter was "referred to the Executive Committee, to report on the most desirable mode of procedure in the case of motions having reference to any penal measures."

On Monday, the sixth day of the session, the amended report of the Committee on Professional Education came before the Council, and was very carefully considered and discussed, but we must content ourselves to-day with a very brief notice of

that part of the day's proceedings which had reference to the establishment of Conjoint Boards. Dr. Parkes moved, "That in case the arrangements for Conjoint Examining Boards are not complete in each division of the kingdom by the close of the year, in accordance with the recommendations of the Council on the subject, the Executive Committee shall be authorised to seek an interview with the Lord President of the Privy Council, and to urge upon him the desirability of such Medical legislation in the session of 1872 as may carry out the object the General Medical Council had in view in passing the resolutions of February 26 and 28, 1870, and of July 7, 1871."

In supporting his motion, Dr. Parkes took a very gloomy view of the prospects of any voluntary formation of Conjoint Examining Boards. He was of opinion, he said, that "the resolution already passed on this subject would be entirely nugatory, and there would be no Conjoint Boards formed in the several divisions of the kingdom." He does not believe that even the proposed arrangement for England will be carried out, unless, indeed, some way is found of gaining for it the co-operation of the Apothecaries' Society. Other members of the Council were, however, more hopeful, and it was not thought desirable, at any rate at present, to suggest threats of Government interference, and the following motion was carried instead of Dr. Parkes's:—"That a meeting of the General Medical Council be held early in 1872, to receive the proposals of the bodies for conjoint examinations, and to consider whether any, and what, steps should be taken to carry out the resolutions of the Council in favour of combinations."

The rest of the business was merely formal, and the session closed on the Monday afternoon. It has been, on the whole, certainly rather a grave and funereal-toned session. The talking has been unusually short and to the point, and even Sir Dominic Corrigan has been subdued and comparatively silent. We shall probably have more to say next week on the last day's proceedings.

THE SMALL-POX EPIDEMIC.

For some weeks past we have been marking the indications of decline in the epidemic of small-pox in London, and they are now so obvious that none can mistake them. In the week ending June 16 the average number of vacant beds daily in the Small-pox Hospitals of the Asylum Board was 247; in the week ending June 23 it was 307; and in that ending the 8th inst., last Saturday, it was, we are informed, 628. We have been also recording lately, week by week, a diminution of fresh cases, as returned by certain of the Health Officers of the metropolis. In St. Pancras especially, where the outbreak has been more severe than in any other part of the North of London, the number of fresh cases in the week has fallen to 26. But what will give most satisfaction generally to the public mind is the reduction that has taken place in the mortality from 240, 232, and 235 deaths in the three previous weeks to 167 last week. This is the lowest mortality since the end of January. After distributing the Hospital deaths it is found that all parts of London have participated in the improvement. In the West the deaths have fallen from 23 to 20, in the North from 66 to 41, in the Central districts from 11 to 10, in the East from 60 to 31, and in the South from 75 to 62. The fatality, we are told, was greatest last week in Somers-, Camden-, and Kentish-towns, and in Bermondsey, Battersea, and the St. George sub-district of Camberwell. Local outbreaks have also occurred at Homerton and in the Strand Union. Small-pox continues also to be fatally prevalent in Southampton, Weymouth, and Grimsby; in the two weeks ending last Saturday the annual death-rate from the disease was equal to 14, 21, and 24 per 1000 respectively in these three registration sub-districts. In Manchester and Salford the small-pox deaths were 15, against 23 in the previous week; and in Newcastle and Sunderland 60, against 79 in the previous week.

THE WEEK.

TOPICS OF THE DAY.

WE have before us the draft scheme for an Examining Board for England prepared by the Committee of the Royal College of Physicians of London and the Committee of the Royal College of Surgeons of England. This scheme has yet to be submitted to the Governing Bodies of the two Colleges, and therefore cannot at present be considered anything more than a proposal, which may, or may not, be accepted by the parties who are required to enter into the contract. The fate of a former scheme which had secured the approval of the Committees not only of the two Colleges but of the representatives of the Society of Apothecaries, and was afterwards rejected by the Council of the Royal College of Surgeons, by no means suggests the certainty that this scheme will have a better fate. It is, at the best, an imperfect one, and avowedly so. It will not constitute a Conjoint Board in the full sense of the term for England, for the first clause in it sets forth that—"In view of the legal difficulties which prevent the Society of Apothecaries taking part in the formation of an Examining Board in this division of the United Kingdom," it is resolved, etc. Now, we shall not discuss the question whether the legal difficulties referred to are real or supposed. For our own part we believe that they may all be overcome by help of the section of the Act of 1858, which enables the Medical Licensing Bodies to combine under the direction of the General Medical Council. But leaving this point, we would say that this scheme cannot be a satisfactory one, inasmuch as the Licensing Body which, next to the Royal College of Surgeons, confers the greatest number of licences of any of the Licensing Bodies in the United Kingdom, takes no part in it. Whilst this is the case, the University of Durham, which, we believe, conferred *one* Medical degree last year, is to be allowed the same amount of power in the nomination of examiners as the University of London. Again, although the scheme is confessedly for the examination of the rank and file of the Profession—for general Practitioners, in fact—there is not the slightest provision that any general Practitioner shall have anything to do with the nomination or appointment of examiners, or shall have a seat at the Examining Board. These are our reasons for considering this scheme as unsatisfactory as it is confessedly imperfect. A minor objection is that the machinery proposed—that of a large Committee of Reference for the nomination of examiners—seems to us a very complicated one, and creates a new body, which will be open, as time goes on, to the same charges that have been brought so unsparingly against the examinational bodies it is intended to replace. The following are some of the particulars of the scheme:—"That a Board of Examiners be appointed in this division of the United Kingdom by the co-operation of the Royal College of Physicians of London, the Royal College of Surgeons of England, and of such other of the Medical Authorities in England as can legally take part in its formation, it being understood that liberty being left to such co-operating Medical authorities to confer, as they may think proper, their honorary distinctions and degrees, each of them will abstain from the exercise of its previous independent privilege of giving admission to the Medical Register. That the Board be constituted of examiners, or of examiners and assessors, appointed by the several co-operating Medical Authorities." Whilst, however, the Medical Authorities are to appoint the examiners, they are not to nominate them. This is to be done by a Committee of Reference, which is to be composed of eight representatives of the Universities, or one representative of Medicine and one of Surgery appointed by each of the four English Universities, and by four representatives of Medicine appointed by the Royal College of Physicians of London, and by four representatives of Surgery appointed by the Royal College of Surgeons of England. This Committee of Reference is to determine the number of examiners to be assigned to each subject of examination, and to

nominate the examiners, and to arrange and superintend the examinations. There is also a provision by which University students shall be admitted to the final examination on payment of a moderate fee. On passing, the students will be entitled to receive the licence of the Royal College of Physicians and the diploma of Member of the Royal College of Surgeons of England. It would be premature further to discuss these proposals; but it is believed in some quarters that there are legal difficulties in more directions than one which may impede the carrying out of this confessedly imperfect attempt at a one-portal system.

Dr. Dalrymple has so far succeeded in his attempt to diminish the evils caused by habitual drunkenness, as to have obtained from the Government the promise of a select committee next year. His calm and able statement produced its effect. Of course, the arguments of expense to the ratepayers, infringement of personal liberty, and that the Bill, if it passed, would be a law for the poor and not for the rich, were urged by Dr. Dalrymple's opponents. But the fact that the Government has promised a select committee proves that his cause is making progress. We protest against Mr. Henley's unwarrantable remark that "if drunkenness had increased, he suggested that the unfortunate habit of Medical men to prescribe stimulants to pick people up might have something to do with it." It is very probable that the machinery of Dr. Dalrymple's Bill may be improved on, but the principle it embodies, of putting a restraint on those who cannot control themselves, is an important and beneficent one.

Lord Shaftesbury has shown that there is good reason for legislation in the matter of children's labour in the brick-fields. We look with suspicion generally on sensational statements, but the evidence in this case is clear and convincing. The Israelites in Egypt did not make bricks under worse circumstances than English children now do. A child of eight or ten years old, is condemned to work thirteen hours a day, and to carry on its head a weight of forty-three pounds a distance of fourteen or fifteen miles daily. This is a common occurrence. We should like to see a careful report on the hygienic condition of these poor creatures.

Dr. Duffin has been appointed Physician, and Mr. Henry Smith Surgeon, to King's College Hospital. These are the well-deserved rewards of long service to the Hospital.

In the case of *Craig v. Jex Blake*, our readers will recollect that Miss Jex Blake has come before the Court of Sessions on a bill of exceptions, founded on the ruling of the judge, Lord Mure. The judges disallowed the exceptions, and granted expenses. In his summing-up, the Lord President is reported to have said:—

"The defender, in addressing the meeting of contributors to the Royal Infirmary, was quite entitled to speak of the memorial of the Medical students, and of the weight to be attached to it, and the opinions and feelings of those who subscribed it; and accordingly she did discuss the memorial of the students generally as judges of that question, and in considering the weight to be attached to their feelings and opinions, she was also perfectly entitled to advert to their conduct, and she did advert to that conduct, and commented upon it in pretty severe terms, with reference particularly to a riot which had taken place at the College of Surgeons, in which it was said that the rioters were the students who were opposed to the proposal of admitting the females to the Infirmary. It appeared to him that all that was quite legitimate, and entirely covered by the privilege of any member of the court of contributors speaking on this subject. But that was not what was complained of. The matter complained of was, that the defender, instead of speaking of the students generally, and the weight to be attached to their views and of their conduct generally, spoke of the pursuer individually, and said of him 'that he was one of the leaders of the riot, and that the foul language he used could only be explained on the supposition she had heard asserted, that he was intoxicated.' Now, the question was, whether these words were covered by privilege, and that again resolved into the question whether in the performance of the

duties, or the exercise of the functions, in which the court of contributors were engaged, any one contributor had a right to speak of the pursuer individually. He was very clearly of opinion that the defender, as a member of this meeting of contributors, had no right to speak of the pursuer individually, and had no legitimate occasion to speak of the pursuer. The right to speak of the students collectively or of those students who had signed the memorial to the managers, was perfectly legitimate; but to speak of a student individually—and a student who had not been proved to be one of those who signed the memorial—was entirely beyond any privilege that could be accorded to a party situated in the position in which the defender was. The distinction between one kind of discussion and the other, he need not more particularly point out; but the way to test the right of the defender to speak of an individual was to consider whether it was at all necessary in the performance of the duty, or legitimate in the exercise of the right proper to the defender, to make any allusion to an individual at all. He must say that what was here done by the defender was entirely in excess of the only privilege she enjoyed."

ROYAL COLLEGE OF SURGEONS.

At the meeting of the Council of the College for the election of officers, held on Thursday, the following appointments were made—President, Mr. George Busk, F.R.S., Consulting-Surgeon to the Seamen's Hospital, Greenwich, *vice* Sir William Ferguson, Bart., whose term of office had expired. The Vice-Presidents elected were—Mr. Henry Hancock, Surgeon to the Charing-cross Hospital, and Mr. Thomas Blizard Curling, F.R.S., Consulting-Surgeon to the London Hospital. At this meeting of the Council Mr. Thomas Spencer Wells, of Upper Grosvenor-street, and George Crichtett, of Harley-street, the recently elected members of Council, were sworn in, and took their seats. Mr. Timothy Holmes, B.A. Cantab., was elected Professor of Surgery and Pathology; Mr. W. H. Flower, F.R.S., re-elected Professor of Comparative Anatomy and Physiology; Mr. Erasmus Wilson, F.R.S., re-elected Professor of Dermatology; and Dr. Humphry, F.R.S., elected Lecturer on Anatomy and Physiology. Mr. T. M. Stone was re-elected Clerk, having completed a term of forty years in the service of the College.

OUR FOREIGN VISITORS.

The general press announces the Emperor and Empress of Brazil, the Prince and Princess Imperial of Germany, and Prince Oscar of Sweden, among other foreign visitors to us this season, whilst we, on our part, have pleasure in welcoming M. Ricord and M. Demarquay from Paris this week, who have come to bring the Cross of the Legion of Honour to Colonel Lindsay, the head of the National Society for Succour to the Sick and Wounded during the late War. We trust the Medical men, who did the real work of the Society, will not be forgotten. MM. Ricord and Demarquay were present on Wednesday at the Samaritan Hospital, assisting at an ovariectomy performed by Mr. Spencer Wells, when there were also present, as distinguished visitors, Dr. Fordyce Barker, Sayre, and Peters, of New York; and Dr. Sander.

INTERNATIONAL COURTESIES.

It is intended to entertain at a complimentary banquet MM. Ricord and Demarquay, who are now in London on a mission, from the Government and Société de Secours Internationale, of sympathy and acknowledgment of the assistance rendered by English Surgeons and others working under the Red Cross to the sick and wounded soldiers of France in the late war. This occasion will be taken for expressing publicly the esteem and affection in which the Profession in England hold their eminent colleagues across the Channel, and of uniting with this expression of regard and friendship that of our high appreciation of the devotion and zeal with which our Medical brethren in France, worthily represented by MM. Ricord and Demarquay, have fulfilled the high mission of Medicine during the siege of Paris and throughout the war. Sir William

Fergusson, Bart., F.R.S., will preside. The Committee of Management includes Mr. Busk, President of the Royal College of Surgeons; Mr. Paget; Mr. Hilton, President of the Pathological Society; Mr. Curling, President of the Medico-Chirurgical Society; Mr. Hancock; Mr. Gay; Sir Henry Thompson; and Mr. Erichsen. Gentlemen wishing to take part in this act of international courtesy are requested to send their names *at once* to Sir Henry Thompson, 35, Wimpole-street, or to Mr. Ernest Hart, 42, Harley-street, Hon. Secs.

MIDDLESEX HOSPITAL REPORTS.

WE, this year, again take occasion to commend the Registrar's reports from the Middlesex Hospital. These are not Hospital report in the same sense as the well-known volumes so long issued from Guy's, but, in a statistical form, contain a vast deal of useful information, the value of which increases year by year. Thus the Medical Registrar, Dr. John Murray, gives us some details of the post-mortem appearances in each of the 120 autopsies made in the course of the year, and in certain diseases more extended information. Another table and abstract on the subject of rheumatism, acute and subacute, cannot fail to be interesting, especially as regards complications and the course of the disease. The alkaline treatment was generally used. The condition of the heart is also noted in each case. Another appendix contains particulars of the cases of chorea treated in the wards. Turning next to the report of the Surgical Registrar, Mr. Henry Morris, we encounter, first, a tabulated list of the injuries for which patients were admitted, with results; and next, that which promises, in time, to be the most useful of all the cancer tables. This is the more valuable, as in Middlesex Hospital there are special wards set apart for these diseases, wherein patients, in accordance with the words of the foundation, are to be kept until "released by death or relieved by art." An erysipelas and pyæmia table follows, next comes hernia, next compound fractures and operations, and finally the result of ninety-one post-mortems. We most heartily commend the style and plan of these reports to other Registrars as being something more than the mere barren catalogues of figures and names of diseases which we too frequently encounter.

THE ALLEGED CURE FOR LEPROSY.

THE inquiries of the Leprosy Committee, as well as subsequent events, especially the appointment of Dr. Gavin Milroy to make special inquiry into the efficacy of Dr. Beauperthuy's mode of treatment, have drawn special attention to that horrid disease. A Parliamentary paper which now lies before us contains a correspondence between Dr. Bakewell, Officer of Health for Trinidad, the Government, and the Royal College of Physicians. Dr. Bakewell was the first to report upon Dr. Beauperthuy's mode of treatment, and to draw attention to its success; for this he is deserving of the highest credit, but he is grieved that his mead of praise and reward has hitherto not been greater. We think, however, that Dr. Bakewell should rejoice that a man of such mark and of known equity as Dr. Gavin Milroy should have been selected to inquire into the efficacy of this mode of cure. It is no disparagement to a man that a suggestion he has made as to a mode of treatment should be rigorously tried—if it sustains the trial, then are his claims all the clearer; if it fails, then is it better that the thing should be tried efficiently and skilfully than badly and at hap-hazard. Under no circumstances can Dr. Bakewell's services in the matter be overlooked.

THE PUBLIC HEALTH BILL.

THE Bill to abolish the Poor-law Board, and to constitute a Local Government Board in its place, states in its preamble that it is expedient to concentrate in one department the supervision of the laws relating to the public health, the relief of the poor, and local government. The division of power is one

of the great obstacles to sanitary improvement. The Report of the Vaccination Committee called special attention to the division of power between the Poor-law Board and the Privy Council, by which the number of vaccination officers was actually reduced just as the need of vaccination was generally felt. Mr. Forster's Vaccination Bill has put vaccination under the Poor-law Board, and it is clear that questions of the public health can be best dealt with under Poor-law administration.

POOR-LAW MEDICAL OFFICERS' ASSOCIATION.

THE annual assemblage of this Association will be held at the Freemasons' Tavern, Great Queen-street, Lincoln's-inn-fields, on Wednesday, July 26, at 4.30 p.m. precisely, when, as we understand, several subjects of much importance to the service and the Profession will be brought before the meeting. The question of Poor-law Medical reform is just now attracting very considerable public attention; and as Mr. Corrance has given notice of his intention to bring on a discussion of the subject in the House of Commons on the 21st inst., it is most desirable that, whatever may be the conclusion at which the House shall arrive after hearing his statement, there should be no appearance even of falling off in earnestness on the part of the friends of the cause. We therefore trust there will be a full attendance of members and friends of the Association. In the evening, at half-past six, the annual banquet will take place. Gentlemen desirous of attending the dinner should at once write and announce their intention of so doing to Mr. J. Wickham Barnes, Honorary Secretary, 126, Gower-street, Bedford-square. We also urge on all gentlemen interested in this question to immediately communicate with such M.P.'s as they may happen to know, and urge them to attend and support Mr. Corrance's motion.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

THE Library (on account of the alterations in progress connected with the meeting room) will be closed during the months of August and September (closing on Saturday, July 29th, and re-opening on Monday, October 2nd). No books can be taken out of the Library during the above period, but those in the possession of Fellows at the time of the closing, may be retained till the re-opening of the Library. The front-room will remain open as a reading room for periodicals till the 12th of August, as usual.

ST. ANDREWS MEDICAL GRADUATES' ASSOCIATION.

THE members of the Association held their summer session on Friday, July 7th, at Maidenhead. At these summer sessions business is wisely subordinated to the pleasures of an outing. And when, as this year, some of the best and truest English scenery was within reach, and a glorious summer's sun was adding to its beauty, it is no wonder that we have to record a success. The day was closed with a dinner at Hindle's Hotel. Dr. Day, of Stafford, President of the Association, was in the chair, and among the honorary members present were—M. Jules Sarazin, of Paris, and Mr. Serjeant Robinson.

TESTIMONIALS TO SURGEONS.

Two hundred poor patients of the Kentish Town Dispensary presented, on Monday last, a testimonial to Messrs. Henry and William Rawlins, of Highgate-road, upon their retirement from the office of Surgeons to the Kentish Town Dispensary, which appointment they had held for many years.

Mr. Richard Ley, on his retirement from practice at South Molton, was on the 6th inst. presented with a substantial token of esteem, in the shape of a handsome tea-service and other plate. The inscription on the plate was as follows:—"Presented to R. Ley, Esq., by the parishioners of Chittlehampton, Warkleigh, Chittlehamholt, and Satterleigh, in grateful acknowledgment of his many years' kind and unwearied attention as their Medical officer."

A WELL-MERITED TESTIMONIAL.

WE are glad to state that Professor Halford, of Melbourne, has been presented with a testimonial, consisting of a handsomely bound book and a purse of 120 sovereigns, as a recognition of the merits of his method of treating cases of snake-bite by the injection of ammonia. The presentation was made by Mr. J. Wilberforce Stephen, M.L.A., at Scott's Hotel, in the presence of a considerable number of Medical and lay gentlemen. In making his acknowledgment, Professor Halford gave an interesting explanation of the circumstances which had led to his discovery, and expressed his belief that his mode of treatment was capable of extension to constitutional diseases. An influential committee was then appointed by those present to wait upon the Government, in order to ask that a sum of money might be placed at the disposal of Professor Halford to enable him to make experiments in this direction. It is to be hoped that the Government will grant the prayer of the petitioners.

MISTAKEN ECONOMY.

MR. CHADWICK, M.P., in acknowledging the toast of the House of Commons at the annual dinner of the Statistical Society, on Saturday, presided over by Dr. Farr, referring to the Census, said that for a paltry sum of £12,000 or £14,000 they had been deprived of a great series of invaluable statistics which would have shown how the people of England and Ireland were housed. It was time to express their indignation that an opportunity which occurred only once in ten years should have been lost.

THE CONTAGIOUS DISEASES ACTS.

THE Commission on these Acts held its final meeting on Friday last, when the report was signed by the Commissioners generally. Separate dissents were drawn up from certain portions of the report. These dissents were signed by several of the Commissioners. The report was at once placed in the hands of the Government. It will be laid before Parliament, most probably, next week.

CHOLERA AT SECUNDERABAD.

THE Indian correspondent of the *Pall-mall Gazette* states that, on the night of May 25, a sudden outbreak of cholera occurred among the 18th Hussars stationed at Secunderabad. In forty-eight hours, fifty-three cases and twenty deaths had occurred. The regiment was immediately moved out into camp, about ten miles from cantonments, and the epidemic disappeared as suddenly as it had commenced. The disease does not appear to have been prevalent in the district, or to have attacked the other troops (European or native) in the station. Secunderabad is one of the largest military stations in the Madras Presidency, and has been the scene of many devastating epidemics. The site has been frequently condemned—but there the barracks are, and there the troops must be.

FROM ABROAD.—MORTALITY RETURNS OF BERLIN FOR 1870—SUDDEN DEATH AFTER OPERATION—DR. E. MÜLLER ON THE PREVENTION OF SMALL-POX EPIDEMICS.

GEH-MED. RATH MÜLLER has recently published the official return of the mortality of Berlin during 1870. The entire number of deaths amounted to 25,594, exceeding that of 1869 by 2919. The population amounting to about 700,000, the proportion of deaths is about 1 to 27. The births during the year, amounting to 31,943 (16,491 boys, and 15,452 girls), exceeded that of the former year by 1842, and was in the proportion of 124 to 100 deaths. The six winter and spring months furnished 11,538 deaths to the 14,056 deaths of the summer and autumn months; the mortality every year being highest in these months, owing to the prevalence of diarrhoea and cholera among children. Of the 25,294 deaths, 13,921, or 54.39 per cent., were males, and 11,673, or 45.61 per cent.,

females; and of the 31,943 new-born children, 16,491, or 51.62 per cent., were males, and 15,452, or 48.38 per cent., females. The ages at the time of death, excluding 1472 (829 males and 643 females) returned as born dead, were as follows:—By the first year, 10,074—5548 males and 4526 females; between the first and second year, 2182—1084 males and 1098 females; from the second to the fifth year, 1533—794 males and 739 females; between 5 and 15, 707—323 males and 384 females; between 15 and 20, 451—258 males and 193 females; between 20 and 30, 1931—1152 males and 779 females; between 30 and 40, 1747—998 males and 749 females; between 40 and 60, 2771—1672 males and 1099 females; between 60 and 70, 1344—672 males and 672 females; between 70 and 80, 964—401 males and 563 females; above 80, 354—139 males and 215 females.

In referring to the causes of death, we have first to notice that 1472 infants, or 4.6 per cent., were *still-born*—viz., 829 boys, or 5.2 per cent. of male births, and 643 girls, or 4.1 per cent. of female births. Besides these, 1043 infants died from debility soon after birth—viz., 599 (187 illegitimate) boys and 444 (147 illegitimate) girls. From *variola* there occurred 166 deaths (less than in 1869 by 73), 91 in males, and 75 in females. Of these deaths 85 occurred during the first two years of life, 28 between the second and tenth year, 2 between the tenth and twentieth year, 26 between 20 and 40, 17 between 40 and 60, 6 between 60 and 70, and 1 between 70 and 80. From *scarlatina* there were only 95 (55 males and 40 females) deaths, the number having been 600 in 1868, and 187 in 1869. From *measles*, on the contrary, the deaths increased from 172 in 1869 to 223 (110 males and 113 females) in 1870. *Pertussis*, too, proved fatal to 247 (88 males and 159 females) in 1870, and to only 195 in 1869. Of these deaths, 126 took place during the first year, 79 in the second, and 19 during the third year. The deaths from *gastro-nervous and typhus fevers* rose from 567 in 1869 to 701 (409 males and 292 females) in 1870. From *dysentery, diarrhoea, and cholera* there died 3562 (1956 males and 1606 females), the great bulk of the deaths occurring in children under 2 years of age, the *diarrhoea ab lactanticum*, as usual, taking on an epidemic form in summer. *Diphtheria* has been on the decrease from 1867, and in 1870 there were only 555 (255 males and 300 females) deaths, being 318 less than in 1869. The number of these was 82 in the month of December, and only 96 for the three months May, June, and July. From *croup*, too, there died only 191 (117 males, 74 females), as compared with 334 in 1869, the winter months proving especially fatal. Of deaths from *inflammation of the brain*, 1028 (572 males and 456 females) are returned, 761 being children under 3 years of age. From *organic disease of the brain and spine* there are returned 299 (214 males and 85 females) deaths, almost all occurring in persons above 30 years of age. *Apoplexy* produced 772 (429 males and 343 females) deaths. *Inflammation of the air-passages* produced 700 (369 males and 331 females) deaths, all but 51 occurring in children. From *inflammation of the pleura and lungs* there were 1191 (680 males and 511 females) deaths, more than half these occurring in children under 3 years of age. From *phthisis* there died 3403 (1951 males and 1452 females) persons. There were 196 (141 males and 55 females) deaths from *suicide*, the greatest number (91) taking place in February. The forms of death were—in 92 (69 males and 23 females), hanging; in 28 (22 males and 6 females), drowning; in 36 (17 males and 19 females), poisoning; in 19 males, shooting; in 9 (5 males and 4 females), cut-throat; in 8 (6 males and 2 females), charcoal fumes; and in 4 (3 males and 1 female), precipitation. There were also 309 (227 males and 82 females), lives lost during the year from accidents.

At the present time when sudden deaths after chloroform are diligently recorded, we are apt to forget that these were also met with in operations prior to its discovery; and, doubtless, in some of the instances in which it has been administered, and death has ensued, this has really not been due to its influence.

Professor Fischer, of Breslau, relates (*Berliner Woch*, June 12) an interesting case of such sudden death from shock, which occurred in his clinic; but we are not sure that some pessimist may not think that even here chloroform had something to do with the occurrence. The case was one of excision of the left upper jaw of a man 56 years of age, on account of a large sarcomatous tumour. He had become much reduced, and had had repeated attacks of syncope. The heart, on examination, was found normal in its action. According to Professor Fischer's usual practice, the patient was allowed to take only a few inspirations of chloroform, so as to deaden the pain arising from the division of the skin and separation of the soft parts. From the slight sleep produced by this he completely awoke, and complained loudly of the pain. No more chloroform was administered, and the operation was quickly brought to an end without any unfavourable circumstance, and with the loss of very little blood. But no sooner had the jaw been removed than the patient collapsed, his countenance becoming pale, his pulse small, and his respiration irregular. No stridor was audible, nor was there any cyanosis. After a long pause in the respiratory movements a few deep and prolonged inspirations occurred, and the action of the heart became suddenly arrested. Artificial breathing and tracheotomy were speedily had recourse to, with no other effect than the production of some slight respiratory movements. The autopsy exhibited all the principal organs unaffected with disease; the brain was anæmic, and the heart was entirely void of blood; while the spleen, liver, and kidneys were gorged with it. The Professor believes that there can be no doubt that this was a case from "shock," although had the patient been more completely chloroformed the death would certainly have been unjustly attributed to the anæsthetic.

Dr. E. Müller, Director of Vaccine in Berlin, observes in a recent paper, that although the immediate effect of the epidemics of small-pox, which not infrequently occur even since the introduction of vaccination, is to induce the public to more readily resort to this, a more durable consequence is that every epidemic is seized hold of by the opponents of vaccination as a proof of the non-preservative power of vaccine, and as a means of lowering it in public estimation. It is, therefore, time to thoroughly examine the causes why, in spite of the compulsory performance of vaccination, and of the fact that there are few individuals who have passed childhood that have not been vaccinated, yet epidemics of small-pox are continually occurring. Experience long since taught that vaccination only conferred temporary security; but although this led to the practice of revaccination, the execution of this has never been rendered legally compulsory, except in the army, where it has been attended with the most brilliant results. For other persons it has only been recommended, and it must be confessed that this recommendation as regards the mass of persons, has been attended with but slight effect. It must also be confessed that had revaccination to be performed on a very great number of persons, as is necessary for the extinction of a small-pox epidemic, a sufficient supply of the necessary lymph would almost everywhere have been wanting. It has only been since the employment of the mixture of lymph and glycerine that such large quantities of lymph could be provided and stored away, so that the revaccination of the adults of entire localities might be at any time provided for. This greatest hindrance of revaccination having been removed, it may now be hoped that on any epidemic appearing it will be at once brought to an end by a general revaccination. But an indispensable condition for this is that this second vaccination must be just as carefully executed as the first. Too little attention has been paid to the subject, and Medical students are taught nothing about it. Carelessness as to the quality of the lymph employed not infrequently prevails, so that individuals often come to the Berlin establishment in whom revaccination having been previously performed without

success by their own Medical men, now succeeded perfectly. In fact, according to Dr. Müller's experience, a first revaccination almost always produces in adults more or less true cow-pock, so that when he hears, as is often the case, that a great number of persons have been revaccinated without any result, he always feels justified in doubting the quality of the lymph employed. Revaccinations of this kind are not only mischievous to the persons concerned, by leading them to conclude that they stand in no need of protection; but they also do great harm on the occurrence of later epidemics by inducing the belief that they have been useless or mischievous. Practitioners who have not the means of obtaining lymph derived from children should entirely abstain from revaccination. Instead of this, too many, fearing to disappoint the wishes of the public, make use of lymph of the origin and character of which they have no assurance. Matters are not much mended by employing animal lymph; for Dr. Müller has convinced himself by his own and other persons' experiments, that this lymph cannot always be transferred to man. Epidemics of small-pox will only cease when revaccination has become general, and when none but reliable lymph is employed.

PARLIAMENTARY.—LUNACY REGULATION BILL—THE ORDER OF THE BATH—THE VACCINATION ACT AMENDMENT BILL—THE PHARMACY BILL—FACTORIES AND WORKSHOPS—ILL-TREATMENT OF CHILDREN IN BRICKFIELDS—REMOVAL OF THE SCHOOL OF MINES—HABITUAL DRUNKARDS BILL.

On Thursday, July 6, in the House of Commons, Mr. Watkin Williams gave notice that on the second reading he would move that the Lunacy Regulation Bill be read a second time on that day three months.

In reply to Lord R. Grosvenor,

Mr. Goschen said that the principles which directed the selection of officers of the civil branches of the Navy for the honour of the military branch of the Order of the Bath were embodied in the statutes of the Order. There was no intention of giving any distinction connected with the Bath permanently in virtue of an office; no such distinction could be gained except by meritorious service. As to whether it was intended that the head of the Medical branch was always to be recommended as Knight Commander of the Order, and, if so, whether the head of the paymaster branch was to be recommended for a similar distinction, he was not aware that there was a head of the paymaster branch; there was no office corresponding to that of the Medical Director-General; and if there were he should venture to submit that these comparisons were odious.

In reply to Mr. Pell,

Mr. W. E. Forster said he should be very glad if he were allowed to go into Committee on the Vaccination Act Amendment Bill to-night. In the chief part of the Bill improvements had been introduced, with regard to which there was no difference of opinion, and he should like to proceed with that part. He had no intention of bringing on that portion of the measure with respect to which amendments were to be proposed by the hon. member for Norfolk.

Mr. W. E. Forster having moved the second reading of the Pharmacy Bill, after some discussion, the second reading was postponed until Monday week.

On Monday, in the House of Lords,

The Factories and Workshops Act Amendment Bill, which is to transfer the power to carry out the Factories and Workshops Act from the local authorities to the Factory Inspectors, was read a second time.

On Tuesday Lord Shaftesbury carried his motion for an address to the Throne on the subject of the sufferings of children and young persons employed in brickfields.

A conversation upon the proposed removal of the Royal School of Mines to South Kensington was raised by the motion of Lord Salisbury for the production of a letter by Sir R. Murchison against the transfer recommended by the Science Commission. Lord Ripon said that it would be better the document and the comments of the Commissioners should be published together, and promised that no action should be taken without the assent of Parliament.

On Wednesday Mr. Dalrymple's Habitual Drunkards Bill came on for discussion. It provides for the enforced seclusion for a period of twelve months of habitual drunkards, either by their own voluntary action, by the intervention of families, or by a magistrate's committal in cases where a man has been

convicted of drunkenness or some offence arising out of it three times within six months. In support of his measure Mr. Dalrymple quoted carefully collected statistics as to convictions for drunkenness, and he met the objection on the score of interference with individual freedom by urging that the public good must prevail, and by dwelling on the evils produced by confirmed drunkenness.

After some discussion Mr. Dalrymple consented to withdraw the bill on Mr. Bruce's promise that a Select Committee should be appointed next year.

ROYAL COLLEGE OF SURGEONS.

THE annual dinner of the Fellows of the College took place, as usual, after the elections into the Council on Thursday last, at the Albion Tavern, under the efficient chairmanship of Mr. H. D. Carden, of Worcester, supported by the Presidents of the Royal Colleges of Physicians and Surgeons (Dr. Burrows and Sir William Fergusson, Bart.), the Director-General of the Medical Department of the Royal Navy (Sir A. Armstrong), the President of the Medical Council (Dr. Paget), Mr. Dalrymple, M.P., Dr. Sayre, of New York, etc.

After the usual loyal and patriotic toasts, Mr. Dalrymple, M.P., proposed the Medical Council, to which Dr. Paget responded in a long and eloquent speech.

"The Medical Corporations, in Alliance with those of America," drew forth a most eloquent speech from Dr. ORSBORN, of Bitterne, Southampton, which was received with well-deserved cheers. He said: I have the honour of proposing the next toast—an honour I should most fully appreciate, were it not for the consideration that I am altogether unqualified for this important duty, which ought to command greater erudition, a more familiar acquaintance with the institutions that are the subject of the toast, and a higher degree of eloquence than I can possibly attain. The toast is the Medical Corporations of this Kingdom; and when we remember the great and important influence these institutions have exercised, and must of necessity continue to exercise, over the destinies of our Profession, it is impossible that such a toast can be received with indifference in an assembly composed of Medical men. The Royal College of Physicians has fostered some of the ablest men who have adorned the ranks of our Profession, and contributed to its scientific advancement men whose names will go down to posterity surrounded with a halo of brightness which the lapse of ages can never dim—which the revolution of centuries can never impair. And to us in the present day it is a matter of congratulation that the mantle of these distinguished individuals has fallen upon one who, as President of the College, is fully competent to sustain the honour which has involved upon him with dignity, and with credit and advantage to the institution over which he so ably presides. Of the College of Surgeons I am bound to speak in terms of admiration and respect. We cannot mention that noble institution without calling to mind the memory of one whose name will ever rank amongst the greatest of our race—one who was a giant in his day—for in relation to Anatomy and Surgery Hunter was as great as is Shakspeare in relation to our dramatic literature. He can never be surpassed, probably will never be equalled; and his vast labours have raised to his memory a monument noble as it is enduring. Other luminaries of greater or lesser magnitude have shone forth on its horizon, but amongst these there are probably few who will reflect greater honour on this noble institution than will he who is at present the occupant of its Presidential chair, whose practice, skill, and grand Surgical achievements have won for him a reputation that has extended throughout the civilised world. And now, gentlemen, let me say one word on behalf of the Society of Apothecaries, a body which has deserved well of our Profession, of which I would fain speak in terms of considerate respect. I cannot forget that probably one of the proudest moments of my life was that when I escaped from its portals carrying with me its licence to practise. It may not have done all that we could have wished, but it has done much towards promoting a higher standard of Medical education, and in this respect has contributed towards the advancement of the science of our Profession, and its practice as an art. (Great cheering.) Gentlemen, I have the opportunity and the privilege of associating with this toast "the representative institutions of America," and I do so with the greater pleasure, from the circumstance that we are this

day honoured by the presence of Dr. Sayre, a distinguished member of our Profession, from New York—a gentleman who has won renown by his practical knowledge and bold achievements in Surgery. We all feel a great interest in everything relating to our Transatlantic brethren. We know them to be characterised by a strong tendency "to go a-head"; we are cognizant of the valuable improvements they have made in Surgical practice, and of their researches in scientific and practical Medicine; and we are willing to acknowledge that we are indebted to them for many important additions they have made to the literature of our Profession. Gentlemen, I am persuaded you will join with me in the expression of a hope that those difficulties which have for some time existed and led to an estrangement between the two peoples may speedily be removed, and that henceforth there may be between them no other rivalry than such as may arise from a desire to see which can contribute the most largely towards the promotion of the interests and welfare of our common race. Let us hope, gentlemen, that those clouds which have been so long looming in the distance may now be dispersed, and that there may burst forth over both nations an unclouded sunshine of prosperity and peace. (Great cheering.)

Dr. BURROWS, Sir W. FERGUSSON, and Dr. SAYRE returned thanks.

Sir WILLIAM FERGUSSON, who was received with great applause, returned thanks for the College of Surgeons. He expressed gratification with the manner in which the toast had been so pleasingly brought before the meeting by Dr. Orsborn. The President of the College of Physicians had responded in such comprehensive terms that he might rest satisfied with declaring his assent to all that had been said by his friend, Dr. Burrows. He thought, however, that it was incumbent on him to say a little more. He was glad to perceive that this toast of the College of Surgeons had been so well received; yet after all, they were only drinking their own health as it were, for they in a manner represented their own College. In doing so they had, however, evinced their respect for the sister institutions, and in particular for the College of Physicians. He was specially glad to corroborate the statements of Dr. Burrows about the harmony which prevailed between the two Colleges in regard to the development of a Conjoint Board for the examination of those desirous of entering the Medical Profession. For the College of Surgeons, he could say, with the utmost sincerity, that the best feelings prevailed towards the Physicians. There were respect, affection—he might almost say love—towards the sister institutions, and so much did the latter feeling prevail, that a bond of matrimony seemed not far distant, which would give a strength and unity to the Profession as a whole such as had often been talked of, but had never yet been realised. The Council of the College of Surgeons had cordially gone into the consideration of a scheme for a Conjoint Board of Examination, and he was strongly of opinion that on such a Board these sister institutions, which represented so large a portion of the Profession in England, should have a proportionate position. A Board of Examiners distinct from these institutions had been proposed, but he was firmly impressed with the opinion that, whilst other kindred institutions were duly represented, the main pillars of the proposed one-portal should be formed by and from the two Colleges which had so long and so fully represented the Profession in this country. It was well that, on such an occasion as this, the fellows should toast their own institution. They must bear in mind that it was the head-quarters of some fifteen thousand of the Practitioners in Britain, and whatever defects there might be about it, there was much that they might all be proud of. He would only refer to the great museum which was their own, and, in particular, as evidence of the activity which prevailed within the walls of the College, to those numerous additions to the collection which had been made since last year, and which had been specially displayed that day for their inspection. Some of these were rare, others unique, and such, therefore, as had never been seen previously. (a)

"The Provincial Schools," by Mr. HENRY HANCOCK, Vice-President of the Royal College of Surgeons, was well received. He said he rose to propose the health of a body of gentlemen who did good service, and who did so, to within a few years ago, under difficulties. He alluded to the lecturers at the provincial schools of Medicine. A very few years ago these gentlemen were placed in a most anomalous position; they were told that they were competent to teach the theoretical portion of Medical study, or they might teach the practical—either one

(a) The interesting preparations of the young hippotamus skeleton, stomach, etc., which had attracted particular attention, were thus alluded to.

or the other—but that they were incompetent to teach both, and the student was obliged to come up to London to complete his studies. At the present time that anomaly no longer existed; they now had a fair field and no favour, and he sincerely trusted that the provincial schools would not only vie with each other, but with the schools of this great metropolis, in their endeavours to maintain and promote the welfare, the dignity, and progress of our noble Profession. (Cheers.)

Mr. VOSE SOLOMON, of Birmingham, replied in a short and effective speech.

“The Metropolitan Schools,” by Professor HUMPHRY, F.R.S., of Cambridge, like the toasts of Dr. Orsborn, and Mr. Paget, was one of the great speeches of the evening, and was received with enthusiastic cheers. He said he had no doubt of the hearty acceptance of the toast he had been requested to propose, which was that, if not of the authors of our Professional existence, yet certainly of our nursing mothers, from whom we had drawn milk rich with the very cream of knowledge, and which were among the most important institutions in the country, for what would those corporate bodies of which mention had just been made be—what would the Profession be without the metropolitan Medical schools? And by that is meant the metropolitan Medical teachers, who have a great work to perform, and are under a great responsibility. They had received a noble heritage—the heritage of a banner inscribed with the names of Abernethy and Cooper, of Lawrence and Travers, of Bright and Latham, and others of equal renown, and they bear that banner bravely forward, and will hand it on illuminated with additional names no less bright than those of their predecessors. Professor Humphry doubted not that those who heard him had left their respective schools with the same feelings of filial regard and honest respect for their teachers, which he had carried away with him from St. Bartholomew’s thirty years ago, and many rejoiced with him to see some of their teachers here present still active and young, and fresh in work. The feelings which he carried away with him from London he had retained during the interval; and now that he was, by the suffrages of the Fellows, brought again into contact with those teachers on the Council of the College of Surgeons, and on the Committees of the Colleges of Physicians and Surgeons—who had held so many meetings, and done so much to promote the matrimonial alliance that had been alluded to between the two Colleges—he could honestly say that increasing knowledge of these gentlemen in another capacity had been productive of increased respect. He found them actuated by the simple, sincere desire to promote the welfare of the Profession; and their efforts to maintain the position, and, if possible, add to the influence and dignity of their respective corporate bodies, are consequent on the conviction which the Professor and, he believed, those present fully shared, that the prosperity of those bodies is intimately associated with the prosperity and status of the Profession. He spoke of the good work which is being done in the metropolitan schools, and concluded by associating with the toast the name of Mr. Holmes Coote, so well known to the Fellows by the practical and scientific work he had done, and to the students by the ability with which he instructed them, and the courtesy which he showed them. (Cheers.)

Mr. HOLMES COOTE replied that the great honour thus conferred upon him was unexpected. He felt much gratified to think that the London schools of Medicine still retained the confidence of the Profession; and he thought that much of that confidence was acquired by the greater freedom of Professional intercourse, and the valuable Medical and Surgical contributions which could now be readily obtained from all known quarters. The schools of England, Scotland, and Ireland—the patient reports, so admirably got up and printed, from our brethren in America—these are advantages which those of the past age did not enjoy. I thank Professor Humphry (said Mr. Coote) for his kind words of me. What shall I say of him? Entering this great Profession supported by his unwearied industry and great talent, he has gained for himself, both in Surgery and science, a name which will be imperishable.

“The Chairman,” by Mr. JAMES PAGET, F.R.S., was received with many cheers, both as a tribute to Mr. Carden and as an expression of the hearty feeling on the part of the Fellows at the happy recovery of the learned speaker. He said, as an old and esteemed friend, a distinguished Surgeon, and one of the best representatives of the provincial division of the Profession, Mr. Carden’s great knowledge, skill, and common sense had gained for him the complete confidence of both the Profession and the public in a wide field of practice, and in the same field his personal character had won respect, not only for himself but for all his brethren; and for this all were indebted

to him; for the estimation in which the Profession was held depended more on the provincial than on the metropolitan members. They lived nearer to their neighbours, their social influence was more felt; the good they did and the good tone of their lives were more closely observed, and misconduct was more evident and more likely to be regarded as discreditable to the whole Profession. Mr. Carden’s health, therefore, as that of a good Surgeon and a good example, ought to be drank very heartily. (Loud and prolonged cheers.)

Mr. CARDEN acknowledged, in an eloquent and grateful speech, his obligations to Mr. Paget personally, and the Fellows generally, for so much kindness, and before sitting down proposed the health of Mr. Thomas Carr Jackson, the honorary secretary, to whose valuable assistance and experience himself and co-Fellows were so much indebted for these agreeable reunions.

Mr. JACKSON expressed his obligations to the Chairman and Fellows for so kindly supporting him; and his statement that the greatest, as he was the most popular, Surgeon of the day, Sir W. Fergusson, had consented to take the chair at the next annual festival, was received with applause.

The great interest taken in the Council elections by provincial Fellows was proved by the large number who attended to record their votes—viz., Messrs. Adams, Maidstone; Allard, Tewkesbury; Ambler, Hemel-Hempstead; Anderson, Derby; Bell, Brown, Hutchins, Rochester; Carden, Worcester; Cattlin, Brighton; Crosse, Norwich; Curling, Ramsgate; Dalrymple, M.P., Norwich; Fox, Broughton, Hants; Green, Bristol; Havers, Berkampstead; Holman, Hurstpierpoint; Hulme, Guildford; Jones, Brackley, Northampton; Lowe, Burton-on-Trent; Lawes, Gosport; Lush, Weymouth; May, Reading; Monckton, Rugeley; Morris, Spalding; Nankwell, Chatham; Nicholls, Chelmsford; Orsborn, Bitterne; Orton, Narborough; Pern and Wiblin, Southampton; Pranker, Langport; Ryott, Newbury; Scriven, Cirencester; Smith, Stevenage; Smith, St. Mary’s Cray; Southam, Manchester; Spurrell, Belvedere; Symonds, Oxford; Thomas and Sail, Birmingham; Thomson, Ross; Ward, Huntingdon; Winchester, Maidenhead.

REVIEWS.

Essay on Growths in the Larynx. By MORELL MACKENZIE, M.D.
Lond., M.R.C.P., etc. Pp. 263. J. & A. Churchill.

THIS book is undoubtedly the most complete and original essay on new formations in the larynx which has appeared in this country. In the preface the author states that his essay "is based on an experience of nearly 150 cases of laryngeal growth. It includes detailed reports of 112 cases, of which 26 have been previously published, and 86 are now brought forward for the first time." This comparatively large number of cases of an infrequent class of diseases has been submitted to careful analysis and comparison. A large number of the histories are illustrated by beautifully executed coloured engravings of the morbid growths, and others by excellent woodcuts. All cases of carcinoma and of "false excrescences," the result of syphilitic ulceration and subsequent cicatrisation, and of gummata, are excluded. The work is therefore a treatise on those new formations in the larynx which, at least in many instances, are, by the aid of the laryngoscope, susceptible of cure or of amelioration. And, in fact, of the 112 cases detailed 100 underwent treatment. Of these seventy-seven are reported as cured, and eighteen as improved. There were two deaths in the series. Besides his own cases, Dr. Mackenzie appends a tabular account of all published cases treated by other Practitioners since the invention of the laryngoscope. Having said thus much as to the general characters of the work, we will glance at a few of the topics on which Dr. Mackenzie treats.

The first section of the book contains an historical sketch of the progress of our knowledge of laryngeal growths, and of the rise and progress of their Surgical treatment. The first noticed operation for the removal of a laryngeal growth by the mouth was one by Regnoli in 1836. The patient was an old man of 70. On opening the mouth widely the tumour, about the size of a hen's egg, could be seen at the back of the throat, and it was found to be attached by a peduncle to the arytenoid cartilages. Tracheotomy was performed, and the growth removed through the mouth; but the operation had to be repeated, and ultimately the old man sank. In this section Dr. Mackenzie gives his experience of the frequency of these growths. He writes—

"When we compare the cases observed with the laryngoscope with the specimens found in pathological museums, we are struck with the enormous antagonism, as to the comparative frequency of laryngeal growths. In the museums of the Royal College of Surgeons and the various London Hospitals, there exist altogether only thirty-four specimens of true laryngeal growth, whilst in my own practice I have seen, with the laryngoscope, in the course of ten years, more than four times as many cases. Dr. Krishaber remarks that laryngeal growths 'are to be met with in two or three per cent. of cases of disease of the larynx, exclusively local and chronic.' In referring to this passage, Mr. Durham observes that his own experience would lead him to 'the conclusion that they are much less frequent even than this.' I am unable to say how frequent laryngeal growths are in comparison with other chronic local affections of the larynx, but I find, on an approximative analysis, that in relation to all other throat affections, including those of the pharynx, these cases have occurred in my private practice in the proportion of $1\frac{1}{2}$ per cent., whilst they have been present in only $\frac{1}{2}$ per cent. of the cases under my care at the Hospital for Diseases of the Throat, and of my throat cases at the London Hospital. The larger percentage occurring in private practice is not due to a greater liability of the upper and middle classes to this affection, but to the accidental circumstance that the most common symptom—loss of voice—is of more consequence to the educated and wealthy than to those engaged in manual labour."—P. 6.

The second section treats of the causes of laryngeal tumours. The question of the influence of dyscrasia is discussed at some length. Dr. Mackenzie's experience leads him to the conclusion that, putting aside specific manifestations, "Neither syphilis nor phthisis, nor any other constitutional condition, appears to favour the growth of these neoplasms. He thinks that the inspiration of irritating vapours, and occupations which necessitate the using of the voice, especially out of doors, exert an influence favourable to their production, and he gives a table which proves that they are most frequently met with between the ages of 20 and 60. Out of 100 cases 28 were those of persons between 40 and 50. The sections on symptoms and diagnosis will well repay

study. A careful description is given of the laryngoscopic appearances observed in the various kinds of growths, which he ranges under the heads of "papillomata, benign epithelial growths, fibromata, fibro-cellular growths, myxomata, lipomata, fasciculated sarcomata, cystic growths, adenomata, and angeiomata!" The same classification is used in the section on pathology, which is illustrated by some well-executed microscopic drawings. In the section on treatment, which resolves itself into internal or laryngoscopic treatment and removal by extra laryngeal methods, Dr. Mackenzie exhibits a perfect practical acquaintance with all the details of the subject. His comparisons of the merits of the operations which he discusses, and the rules which he lays down for the guidance of the Practitioner, are by no means the least valuable portion of a book which we can cordially recommend to our readers. We may add that the volume before us forms the second of a series of essays on throat diseases.

NEW BOOKS, WITH SHORT CRITIQUES.

Temperature Variations in the Diseases of Children. By WILLIAM SQUIRE, L.R.C.P. Lond., etc. London: J. and A. Churchill. Pamphlet.

*** We must, first of all, congratulate Mr. Squire on the result of his labours; secondly, we must bear testimony to the care manifested in the brochure containing them. Were every man in the position of Mr. Squire to devote equal attention to the scientific material to be obtained from his practice, the gain to Medicine would be great. In a former treatise, Mr. Squire gave us the results of his inquiries into the normal temperatures of children; here we have a similar account of those manifested in their morbid states. This latter will be of extreme value to Practitioners who, though in theory or practice acquainted with the disease temperatures of adults, may yet know little of those of infants. To these we heartily commend the little work.

GENERAL CORRESPONDENCE.

MIDWIFERY AND THE MEDICAL COUNCIL.

LETTER FROM DR. J. BRAXTON HICKS.

[To the Editor of the Medical Times and Gazette.]

SIR,—Will you pardon my intruding on your space, but I ask for information? Are we to understand that the Medical Council, by their recent decision, consider that midwifery proper requires no more instruction than botany, and that the diseases of women and children require none at all?

I am, &c., J. BRAXTON HICKS.
9, St. Thomas's-street, S.E.

GOOD VACCINE LYMPH.

LETTER FROM MR. JOHN GREENE.

[To the Editor of the Medical Times and Gazette.]

SIR,—In your number for July 1, appeared an article entitled "Syphilis and Vaccination," containing some remarks on heifer vaccination. I have practised this method for upwards of two years, and have inoculated more than fifty animals with transmitted spontaneous cow-pox, and now desire to publicly express an opinion thereon. I think that it would be rather impracticable, and certainly unnecessary, for Government to introduce vaccination from the heifer to the arm on a large scale. The affording to the public of an opportunity of choice between the rival methods should be left entirely in private hands for the system to find its own level.

I will confine myself here to stating that in heifer vaccination we have a perfectly reliable means, entirely free, when properly applied, from that uncertainty which has been attributed to it by an eminent Government authority, and that, in some secondary vaccinations, where lymph of long human descent has repeatedly failed, it will produce a well-marked pock.

The point that I would urge most strongly upon Government, is the employment of animal vaccination on a limited scale to multiply virus from recent primary stocks, to which the Profession shall have access in due order and under proper restrictions. By a system of periodical renewal, the employment of weak vaccinoid lymph through the kingdom would be avoided. The evil produced by the use of altered lymph is (in conse-

quence of its wide prevalence) of immeasurably greater gravity than an isolated or dubious case of syphilitic inoculation, since it leads to a weakened protection, the spread of small-pox amongst the vaccinated, and to anti-vaccination agitation of a powerful kind.

I have recently published a pamphlet entitled "Good Vaccine Lymph," where, amongst other arguments in favour of this particular reform in our vaccination administration, I have cited the commands of Jenner himself, given in a forgotten paper, "Instructions for Vaccine Inoculation," where he says that on the appearance of the slightest deviation in the course of the vaccine vesicle—inferring in the event of its being regularly reproduced by a certain lymph stock—we should at once have recourse to "the most active kind of virus," and that "common prudence" indicates this procedure.

I am very strongly impressed with the importance of these forgotten remarks of Jenner, taken together with other circumstances within the observation of any Medical man, and I do heartily trust that Government will consider this proposition, not only with the light of science, but with the light of "common prudence," as Jenner mildly puts it.

The evil of the employment of lymph of long descent is one that increases with the lapse of time. Small-pox-marked persons are again appearing pretty often in our streets. Another generation or two at the present retrograde rate of effective vaccination, and the art will be in danger of being lost, particularly if a political revolution, and consequent social disorganisation, should happen to coincide with a bad and unscientific application of the great prophylactic.

I am, &c., JOHN GREEN, L.R.C.P., etc.
Birmingham, July.

OBITUARY.

THOMAS HAWKES TANNER, M.D. St. And., F.L.S.,
M.R.C.P.,

WAS born in London. His father was for many years on the Army Medical Board. He was educated at a private school at Totteridge, in Hertfordshire, and studied Medicine at King's College. He was an industrious student, and gave promise of being a good Practitioner. Having graduated at St. Andrews, and become a member of the Royal College of Physicians of London, he commenced practice in Charlotte-street, Bedford-square. His habits of industry soon bore good fruit, his practice rapidly extending and his reputation increasing. Ill-health, however, for a time interfered with his progress. On his marriage, about ten years since, he removed to Henrietta-street, Cavendish-square, where his practice increased to such an extent that he was occupied for too many hours a day. Yet he found time at night to compile several works, which have had more or less success. There can be no doubt that this overwork took serious effect upon him, as was evidenced in his jaded look and his attenuated frame. Until three months ago, he pursued his regular practice, though occasionally sorely wearied and overcome. Symptoms of brain affection supervened upon general *malaise*, and he expired at Brighton on the 7th inst., in the 47th year of his age.

Dr. Tanner contributed some papers to the periodicals, and occasionally reviewed books, and wrote short leaders for one of our contemporaries. He published several works, the principal of which were his Practice of Medicine, which passed through several editions—his Index of Diseases; the Diseases of Infancy and Childhood; and the Signs and Diseases of Pregnancy. As a Physician he was painstaking and suggestive. His diagnostic powers were not of the highest order, but were above the average. He was, if anything, too ambitious of practice. Whilst he held himself out chiefly as a Physician for the diseases of women and children, he wished to take high rank as a general Physician—

"To shine a Tully and a Wharton too."

Take him, however, altogether, he was a man of whom we may well be proud, and whose death in the prime of life will be generally lamented. If he was not a great, he was a well-informed and sagacious practitioner, and a compiler of useful and practical works. In person he was somewhat below the middle height, and of a spare and delicate frame. He looked older than he really was, from being bald early in life. He had a good forehead, handsomely chiselled nose, and a mouth of firmness and decision. His eyes were dark, intelligent, and had, for a Physician, the admirable characteristic of earnestness. His manner and address were pleasing.

SIR JAMES FREDERICK PALMER, M.R.C.S., ETC.,
DIED at his seat, Burwood-hill, near Melbourne, Australia, on April 23 last. He was the son of the Rev. John Palmer, of Torrington, Devon, prebendary of Lincoln, and nephew of the first Marchioness of Thomond, and great nephew of Sir Joshua Reynolds. He was born in 1806, was speaker of the first Legislative Council of Victoria, 1851-6, and president of the second Legislative Council of Victoria, 1856-70, and in 1857 received the honour of knighthood. In 1831 he married Isabella, daughter of John Gunning, Esq., Inspector-General of Hospitals.

Sir James Palmer was for many years in practice in London, and resided in Golden-square. He was educated at St. George's Hospital, of which he had been House-Surgeon. On two vacancies for Assistant-Surgeon, he entered into a contest for the office. He was defeated on both occasions, chiefly by the influence of Sir B. Brodie. He was so much disappointed and annoyed at the last defeat, that he determined to emigrate, and did so. He arrived at Melbourne before the gold fever had set in, and succeeded in amassing a considerable fortune. He was a man of good ability as a Surgeon, and of considerable literary attainments. He edited the life and works of Hunter, which were published in four volumes shortly before he left London.

In person he was about the middle height, and inclined to corpulency. He had an open expression of countenance, and of a florid complexion. He had the appearance of a well-to-do intelligent farmer.

JACOB VALE ASBURY, M.R.C.S., L.S.A.,
DIED June 21, 1871, at his residence, Enfield, Middlesex, in the 80th year of his age. He was apprenticed to Mr. Dewint, of Stone, Staffordshire, and his early years were passed in the mining districts of that county, where he became popular, and laid the foundation of his skill in Surgery from his practice among the fearful accidents then so common in such localities. His diplomas bear date 1816. He was a student of the Middlesex Hospital, and for seven years the pupil and demonstrator of Joshua Brooks, with whom he afterwards continued on terms of intimate friendship. About 1818 he visited Enfield as Medical friend and companion to a gentleman of position in the neighbourhood. In 1820 he married Dorothy, third daughter of the late Charles Jacomb, Esq., of Guilford-street, Russell-square, when he commenced practice on his own account. From this period his success in life was one of steady progression. He was shortly after appointed Medical officer to the parish. Having removed to Enfield, "in 1826," says a correspondent, "he performed one of the greatest operations of Surgery then recorded on a poor child, Jane Distoll, aged 9 years, and received from the more influential inhabitants of Enfield a memorial presentation of a silver salver of considerable value, on the back of which is engraved the state of distortion of the child's leg, with its restoration after the operation. On the front the inscription bears record of his skill and humanity in the cure of an extraordinary and almost hopeless case of distortion," whereby the use of her right leg was restored.

In 1833, he published a Treatise on Epidemic Cholera, in the treatment of which he was eminently successful. The late Charles Lamb, his friend and patient, bore witness to his successful treatment of cholera in a witty acrostic on his name. Jacob Vale Asbury was on terms of intimate friendship with John Abernethy, Tom Hood, Edward Turner Bennett, and others of note and scientific celebrity. His success as a country practitioner was almost beyond precedent, his reputation extending far beyond the limits of his own neighbourhood. Enfield was in former years the resort of the aristocracy, of whom there were none but sought him as a valued friend and their Medical adviser.

Towards the close of the year 1852, in consequence of the severity of railway accidents, he turned his whole attention towards the construction of machinery to be applied to railway-carriages to lessen the force of collision in the event of trains or carriages being brought into undue contact with each other. This machinery was intended to be applied to the bed of each carriage, and also to be introduced into a safety luggage-van or break, which he named "Asbury's Diastosticon." His patent for these inventions bears date February 4, 1853. In earlier years he invented two Surgical instruments—one for the puncture of the tympanum, the other for the extraction of fishhooks.

THOMAS MOSTYN, DEPUTY INSPECTOR-GENERAL
OF HOSPITALS,

DIED at Alpha House, Fairview, Dublin, on the 6th inst. The

deceased, who was Honorary Surgeon to her Majesty, was in receipt of a reward for meritorious services. He was for about twenty years Surgeon of the 27th Inniskillen Regiment. He served in the Peninsular from January, 1811, until the end of the war, including the siege of Badajoz, April, 1812; was at the battles of Salamanca, Vittoria, and the Pyrenees; the storming of San Sebastian with the volunteer party; at the battles of Orthes and Toulouse. He served in the American war, including the action at Plattsburg; was present on June 18 at Waterloo. He received the war medal, with eight clasps, for Badajoz, Salamanca, Vittoria, Pyrenees, San Sebastian, Nivelle, Nive, and Toulouse. He served with the 27th Regiment in the Kaffir wars of 1834-35 and 1846-47, for which he also received a medal.

DR. W. HUNTER, SURGEON-MAJOR (LATE OF THE COLDSTREAM GUARDS),

DIED at Largs, Ayrshire, on the 28th ult. Dr. Hunter became Assistant-Surgeon February 10, 1814; Surgeon, September 4, 1836; Surgeon-Major, March 16, 1838; and retired upon half-pay September 2, 1845.

MEDICAL NEWS.

APOTHECARIES' HALL.—The following gentlemen passed their Examination in the Science and Practice of Medicine, and received Certificates to practise, on Thursday, July 6, 1871:—

Bowes, John Ireland, Elham, Canterbury.
Pope, Harry Campbell, Tring, Herts.
Willcocks, Isaac, West Looe, Cornwall.
Williams, Ralph Worthington, Hurst, near Ashton-under-Lyne.

As an Assistant in Compounding and Dispensing Medicines:

Nutt, William Anthony, Barnstaple, Devon.

The following gentlemen also on the same day passed their first Professional examination:—

Mahomed, F. H. A. A., Guy's Hospital.
Webb, William Edward, King's College.

APPOINTMENTS.

* * * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

CAMPBELL, W. MACFIE, M.B. and C.M. Edin.—Junior House-Surgeon to the Liverpool Northern Hospital.

DAVIES, WILLIAM JAMES, Registered under Pharmacy Act, 1868.—Dispenser at the Hackney Union.

DUFFIN, ALFRED B., M.D. Edin., M.R.C.P. Lond., F.R.C.S. Eng., L.S.A.—Physician to King's College Hospital.

LANSDOWN, F. POOLE, M.R.C.S.—Re-elected Surgeon to the Bristol General Hospital.

SMITH, HENRY, F.R.C.S. Eng.—Surgeon to King's College Hospital.

SYMES, EDMOND WEST, M.B. Edin., M.R.C.S. Eng. (late Assistant Resident Medical Officer).—Senior Resident Medical Officer to the Leeds Public Dispensary, *vice* J. M. Fothergill, M.D. Edin., resigned.

MILITARY APPOINTMENTS.

13th HUSSARS.—Surgeon John Noble Shipton, from the 2nd, to be Surgeon, *vice* Surgeon-Major John Sheldon Furlong, M.D., appointed to the Staff.

ROYAL ARTILLERY.—Staff Assistant-Surgeon William Stevenson, M.B., to be Assistant-Surgeon, *vice* Arnold Royle, appointed to the Staff.

53rd FOOT.—Staff Assistant-Surgeon Warner Atkinson to be Assistant-Surgeon, *vice* William Snowdon Hedley, M.D., appointed to the Staff.

63rd FOOT.—Staff-Surgeon John Harrison Robotham to be Surgeon, *vice* George Peacocke, M.D., deceased.

MEDICAL DEPARTMENT.—Surgeon-Major John Sheldon Furlong, M.D., from 13th Hussars, to be Staff Surgeon-Major, *vice* Staff Surgeon Julius Wiles, appointed to the 2nd Foot. Assistant-Surgeon William Snowdon Hedley, M.D., from 53rd Foot, to be Assistant-Surgeon, *vice* Warner Atkinson appointed to the 53rd Foot. Assistant-Surgeon Arnold Royle, from the Royal Artillery, to be Staff Assistant-Surgeon, *vice* William Flack Stevenson, M.B., appointed to the Royal Artillery.

BIRTHS.

BELLAMY.—On July 6, at 59, Margaret-street, Cavendish-square, the wife of Edward Bellamy, F.R.C.S., prematurely, of a son, stillborn.

COTTER.—On May 24, at James Town Barracks, St. Helena, the wife of Staff Assistant-Surgeon L. K. Cotter, M.B., M.C., of a daughter.

KING.—On July 10, the wife of William Talbot King, Surgeon, 74, Victoria-park-road, of a daughter.

LONG.—On July 3, at the residence of her father, Colne Lodge, Cromer, the wife of Mark Long, M.D., of a daughter.

MACEWAN.—On July 10, at Weymouth, the wife of D. MacEwan, M.D., R.N., of a son.

MARRIAGES.

GRANT—MAITLAND.—On April 11, at St. Mary's, Poona, Bombay Presidency, John Hay Grant, Esq., Civil Service, to Amy Frances, eldest daughter of Dr. Maitland, Deputy Inspector-General of Hospitals, Bombay Army.

HALL—ELY.—On July 6, at St. Mary's, Stoke Newington, Charles Frederick Hall, B.A. Oxon., Bengal Civil Service, to Dora, sixth daughter of the late George E. Ely, M.D., Rochester.

HASLEWOOD—ASHTON.—On July 5, at Castleton Church, Derbyshire, A. O. Haslewood, M.R.C.S., son of the late W. Haslewood, M.D., of Darlington, to Mary How, younger daughter of the late Robert How Ashton, Esq., of Castleton.

MANSER—BAILEY.—On July 5, at St. John's Church, Blackheath, Frederick Manser, M.R.C.S., of Tunbridge-wells, to Jane Maria, eldest daughter of Thomas Peter Bailey, Esq., of Blackheath.

NORTON—ADAMS.—On July 5, at St. Mary's Church, Bungay, Suffolk, Howard John, second son of J. H. Norton, M.D., Nant-glas, near Llanelly, South Wales, to Marion Jane Burman, eldest daughter of Edward Burman Adams, M.R.C.S., of Bungay, Suffolk.

SHERRING—BILLINGS.—At St. Matthew's, Oakley-square, N.W., W. M. Sherring, of Lincoln's-inn-fields, Solicitor, to Emily Sophia, only daughter of the late William Billings, Surgeon, R.N.

SKAE—CUMBERLAND.—On June 15, at St. Stephen's-in-the-Fields, Toronto, Canada, Edward Macpherson Skae, Esq., C.E., fourth son of David Skae, M.D., F.R.C.S. Edin., to Julia Elizabeth, eldest daughter of F. W. Cumberland, Esq., M.P.P., of Pendarves, Toronto.

STOKOE—WEICHBRODT.—On July 11, after banns, at St. Saviour's, South Hampstead, Richard Stokoe, Esq., H.M.'s Indian Army, youngest son of Richard Stokoe, M.D., Peckham-rye, to Fanny, only daughter of the late John Weichbrodt, Esq.

TEEVAN—ROBINSON.—On July 11, at Christ Church, Kensington, William Frederic Teevan, F.R.C.S., eldest son of the late William Teevan, Esq., of Bryanston-square, to Georgina, elder daughter of the late Francis Robinson, Esq., of Windsor.

DEATHS.

DURIE, WILLIAM, K.H., late Assistant Inspector, Ordnance Medical Department, Royal Artillery, at Toronto, Canada, on June 14, in his 92nd year.

FALCONAR, MARY RANDOLL JANE, widow of Lieutenant-General Chesborough Grant Falconar, K.H., and second daughter of the late William Kennedy Inverness, Fellow of the Royal College of Physicians, Edinburgh, at Falconberg Lodge, Greenhill-park, Edinburgh, on July 4.

HAMILTON, ELEANOR ANNS, the beloved wife of Robt. Hamilton, M.D., at 1, Hawick-place, Victoria-street, S.W., on July 7.

HESTER, JAMES, M.D., second son of James T. Hester, of Hastings, late of Oxford, at Wangaratta, Australia, after a few days' illness, on May 1.

HAMILTON, W. B., M.D., F.R.C.S.E., at Garnock-street, Dalry, Ayrshire, on July 10, aged 52.

LANSDOWN, JOSEPH GOODALE, thirty years Surgeon to the Bristol General Hospital, at Bristol, on July 6, aged 67.

MAY, WILLOUGHBY, L.R.C.P., and M.R.C.S., at his residence, Teignmouth, South Devon, on July 5, aged 31.

MILLARD, ELIZA FRANCES, wife of J. Millard, Esq., and daughter of the late William Good, M.D., of Connaught-terrace, Hyde-park, on July 5.

MOSTYN, THOMAS, Deputy Inspector-General, Army Medical Department, late 27th Inniskillen Regiment, at Alpha House, Fairview, Dublin, on July 6.

NATHAN, ELIZA, wife of Henry Nathan, Surgeon, Weymouth, at Burton Bradstock, Dorset, on July 5, aged 65.

PEACOCKE, DR. GEORGE, Surgeon to H.M.'s 63rd Regiment, at Hazareebagh, of diphtheria, on June 5.

TANNER, THOMAS HAWKES, M.D., of 9, Henrietta-street, Cavendish-square, at Brighton, on July 7, aged 46.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.

AMPTHILL UNION.—Medical Officer wanted for the Maulden District; Candidates must have the qualifications prescribed by the General Orders of the Poor-law Board. Applications and testimonials to Mr. John Wright, Clerk to the Guardians, Ampthill, on or before July 18.

BLACKBURN AND EAST LANCASHIRE INFIRMARY.—House-Surgeon; must be duly qualified. Applications and testimonials to the Secretary (marked "House-Surgeon") on or before July 18. The duties commence on July 28.

BRADFORD INFIRMARY AND DISPENSARY.—Physician; must be a Graduate in Medicine of the Universities of the United Kingdom, or a Fellow or Member of one of the Colleges of Physicians. Applications and testimonials to Mr. Charles Woodcock, Secretary.

BRIXTON DISPENSARY.—Resident Dispenser. Applications and testimonials to Mr. Hollamby, 29, Branksome-road, West Brixton, S.W., on or before July 18.

BURY, LANCASHIRE.—Resident Medical Officer wanted for the Dispensary. Candidates must be duly qualified. Applications and testimonials to the Rev. E. J. Smith, St. John's Vicarage, Bury, Lancashire, on or before July 25.

COUNTY ASYLUM, LANCASTER.—Assistant Medical Officer; must be duly qualified. Applications and testimonials to the Superintendent.

EVELINA HOSPITAL.—House-Surgeon; must have at least one qualification. Applications and testimonials to the House-Surgeon at the Hospital, on or before July 19.

FARINGDON UNION.—Medical Officer for the Buckland District. Candidates must possess the qualifications prescribed by the General Orders of the Poor-law Board. The gentleman appointed may reside either within or out of the district. Applications and testimonials to Mr. J. Haines, Clerk, on or before July 25.

GENERAL HOSPITAL AND DISPENSARY FOR SICK CHILDREN, BRIDGE-STREET, MANCHESTER.—Resident Medical Officer; must have a Medical qualification and be registered. Applications and testimonials to the Secretary, on or before July 22.

HOSPITAL FOR SICK CHILDREN, 49, GREAT ORMOND-STREET.—Assistant-Physician; must be a Fellow or Member of the Royal College of Physicians of London. Applications and testimonials to be sent in on or before Wednesday, July 19.

Huddersfield Infirmary.—House-Surgeon; must have both Medical and Surgical qualifications, and be registered. Applications and testimonials to Mr. John Marsden, on or before August 14.

Huddersfield Infirmary.—Physician; must be a Graduate in Medicine of one of the Universities of the United Kingdom, or a Fellow or Member of one of the Colleges of Physicians, and be duly registered. Applications and testimonials to John Marsden, Esq., Hon. Sec., on or before July 28.

INFIRMARY FOR CONSUMPTION AND DISEASES OF THE CHEST, 26, MARGARET-STREET, CAVENDISH-SQUARE, W.—Visiting Physician; must be a Member of the Royal College of Physicians, London. Applications and testimonials to Mr. F. Baily, Secretary.

INFIRMARY FOR EPILEPSY AND PARALYSIS, CHARLES-STREET, PORTMAN-SQUARE, W.—Physician; must be a Member or Fellow of the Royal College of Physicians, London. Applications and testimonials to Mr. E. Watherston, Hon. Sec., on or before July 31.

LEEDS PUBLIC DISPENSARY.—Junior Resident Medical Officer. Must be unmarried, and possess at least one legal qualification. Applications and testimonials to be sent to Mr. John Horsfall, 31, Albion-street, Leeds, on or before July 15.

MIDDLESEX HOSPITAL MEDICAL COLLEGE.—Lecturer on Physiology. Applications to the Dean on or before July 22.

ROYAL ORTHOPÆDIC HOSPITAL, 315, OXFORD-STREET.—Resident House-Surgeon and Apothecary; must be M.R.C.S. and L.A.C., or possess the certificate of Medical and Surgical qualifications of some British University, &c. Applications and testimonials to the Secretary.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL.—Teacher of Physiological Chemistry. Further information may be obtained of Dr. Wadham, Dean of the School.

ST. THOMAS'S HOSPITAL.—Resident Assistant-Physician. Candidates must be Members of the Royal College of Physicians, or Medical Graduates of a University of the United Kingdom, and not less than 25 years of age. Applications to the Treasurer, at the Office, 13, St. Thomas's-street, S.E., on or before July 18.

SEAMEN'S HOSPITAL, GREENWICH.—House-Physician and House-Surgeon. Candidates for these appointments must have, at least, one qualification. Applications and testimonials to the House-Governor and Secretary.

SUFFOLK GENERAL HOSPITAL, BURY ST. EDMUNDS.—Physician. Applications and testimonials to the Committee, on or before July 17.

WARWICK COUNTY LUNATIC ASYLUM.—Assistant Medical Officer; must have both Medical and Surgical qualifications. Applications and testimonials to Dr. Parsey, at the Asylum.

WEST LONDON HOSPITAL, W.—Junior Physician; must be a Fellow or Member of the Royal College of Physicians of London, and not practising pharmacy. Applications and testimonials to S. Alexander, Esq., Secretary, on or before July 22.

WIRRAL UNION.—Medical Officer for the Upton District. Candidates must have the qualifications prescribed by the General Orders of the Poor-law Board, and will be required to attend a Board meeting on the day of election, bringing their testimonials and diplomas. Residence within the district required. Election on July 12. Further particulars may be obtained of Mr. P. Gregory, 33, Hamilton-square, Birkenhead.

POOR-LAW MEDICAL SERVICE.

* * The area of each district is stated in acres. The population is computed according to the census of 1861.

RESIGNATIONS.

Faringdon Union.—Mr. H. Maskelyne has resigned the Buckland District; area, 27,290; population, 5201; salary, £126 per annum.

Guisborough Union.—Mr. Alexander Cameron has resigned the Danby District; area, 25,240; population, 2,746; salary, £35 per annum.

Mansfield Union.—Mr. J. J. Bingham has resigned the Sixth District; area, 9,195; population, 1,906; salary, £15 per annum.

Skirlaugh Union.—Mr. Robt. V. Ash has resigned the Workhouse; salary, £25 per annum; and the Skirlaugh District; area, 18,310; population, 2,336; salary, £35 per annum.

Whitechapel Union.—Mr. Thomas Loane has resigned the Fifth District; area, 108; population, 10,970; salary, £90. No fees.

APPOINTMENTS.

Auckland Union.—Rich. T. Manson, M.R.C.S. Eng., L.R.C.P. Edin., to the Howden District. Daniel M. Kechine, L.F.P. and S. Glas., to the Escomb District.

Bridgewater Union.—John M. Ling, M.R.C.S., L.S.A., to the Huntspill District.

Epsom Union.—John Wilton, M.R.C.S., L.R.C.P., L.S.A., to the Sutton District.

Lutterworth Union.—Thos. S. Johnson, M.R.C.S. Eng., L.R.C.P. Edin., to the Third District.

ARTS EXAMINATION.—We understand that a meeting of the Court of Examiners of the Royal College of Surgeons, to receive the report from the College of Preceptors on the recent examination in Arts, etc., for the diplomas of Fellowship and Membership of the College, will be held on Friday, immediately after which the result will be communicated to the 300 or 400 anxious gentlemen.

We regret to notice the death of Dr. Keith Johnstone, LL.D., the well-known geographer.

THE health of Paris, it is gratifying to state, is good; only 872 deaths occurred last week, against 1106 the week before.

CHOLERA, in the 18th Hussars at Secunderabad, is dying out, and the disease has ceased at Bussorah.

DERBY is about to receive free baths as a gift from Mr. Bass, M.P.

THE steamers *Northam* and *Celt* arrived at Cape Town early last month with small-pox on board.

CHOLERA, which had for a brief interval disappeared from Bushire, has again broken out in that city.

SMALL-POX is raging at Shahpore, and is on the increase in Dera Ismael Khan-Umballa.

MR. JARDINE MURRAY was elected President, and Mr. George Latham was elected a Vice-President, of the Sussex and Brighton Medico-Chirurgical Society at the annual meeting on the 2nd inst.

MR. YOUNG, of Kelly, the president of Anderson's University, says the *Glasgow Star*, has informed the trustees that a gentleman has offered £2000 towards founding a chair of Physical Science in that University.

CHANCELLORSHIP OF THE UNIVERSITY OF LONDON.—Sir Edward Ryan is filling, *pro tem.*, by election of the Senate, the place of the late Mr. Grote, as Vice-Chancellor of the London University.

MR. DARWIN.—At the anniversary meeting of the Vienna Academy of Sciences, Mr. Darwin was elected a Honorary Fellow.

INDIAN MEDICAL DEPARTMENT.—A correspondence has recently passed between the Military and Financial Departments at Bombay, regarding the compulsory retirement of the members of the Subordinate Medical Department after the age of 55 years.

THE CONJOINT COMMITTEES.—A meeting of the Committees of the Royal Colleges of Physicians and Surgeons on the Conjoint Board will take place this (Friday) evening, at half-past eight, at the College of Physicians. Mr. Cock not having been re-elected a member of the Council of the College of Surgeons, ceases to be a member of the Committee.

YELLOW FEVER AT BUENOS AYRES.—The health of Buenos Ayres has greatly improved, and although the yellow fever had not completely died out, the number of deaths was so small, that it was hoped the end of it was at hand. Corrientes had suffered terribly from yellow fever.

NATIONAL ORTHOPÆDIC HOSPITAL BAZAAR.—The bazaar held on behalf of this Hospital seems to have been very successful. Among the distinguished visitors were the Princess Louise and the Marquis of Lorne. The daughter of Mr. Carr Jackson, Surgeon to the Hospital, had the honour of presenting a bouquet to her Highness, which was graciously received.

THE LATE DR. HATTON, F.R.C.S.—At a meeting on Thursday last of the Royal National Lifeboat Institution, a contribution of £700 was received from Mrs. Jane Hatton to defray the cost of the Dungeness new lifeboat station in memory of her late husband Dr. Hatton, F.R.C.S., of Belvedere, Kent, who died on January 26, 1871.

THE small-pox in Manchester is spreading at a steady and most alarming rate, as is shown from the following figures:—In the first week in May there were 10 cases of small-pox in the city—18 in the second week, 27 in the third, and 31 in the fourth week. In the first week of June the new cases were 38, in the second week 32, in the third week 48, and in the fourth 102; and last week the new cases were 113.

SMALL-POX IN FACTORIES.—A vaccination circular has just been issued by the Inspectors of Factories, stating that people had been found working in factories on whom pustules caused by small-pox still remained. The circular urges that remedial measures be taken by the employers, and the parents of these, in those places.

HEALTH OF SCOTLAND.—During the month of June, 1871, in the eight principal towns of Scotland the deaths of 2567 persons were registered, of whom 1299 were males and 1268 females. Allowing for increase of population, this is 207 above the average number for June during the last ten years. Of the 2567 deaths, 1194, or 46 per cent., were of children under 5 years of age. In Aberdeen and in Perth, 35 per cent. of the persons who died were under 5 years of age; in Paisley and in Leith, 36; in Dundee, 37; in Edinburgh and in Greenock, 45; and in Glasgow, 51 per cent.

ENGLISH AID TO FRANCE.—Counts de Flavigny and Serrurier, representatives of the International Society for the Relief of the Wounded, and Drs. Ricord and Demarquay, managers of the ambulances of the press, are coming to London for the purpose of expressing to the British nation the thanks, not only of the two great societies they represent but also of the French Government, for the generous relief afforded to their countrymen during those eventful periods. The above-named gentlemen are the bearers of high marks of distinction in the Legion of Honour to the chief promoters of the French relief movement in England, who will, at the same time, receive from them specimens of the best vehicles, constructed under their directions, for the removal of wounded from the field of battle. These are on their way to England.

NOTES, QUERIES, AND REPLIES.

Be that questionedly much shall learn much.—Bacon.

Edinburgh.—We regret to state that Dr. Harthill's advertisements, which appear constantly in an Edinburgh newspaper, are open to adverse comment. It is unusual for a Physician to advertise "remarkable cases," etc.

OUT-PATIENTS HOSPITAL REFORM.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Will you allow me to report in your columns that at a meeting of the Committee, held last week, my balance-sheet was audited, and the accounts examined, from which it appeared that the total receipts amounted to £49 18s. 4d., and the total expenditure to £49 4s. 10d., leaving a balance in hand of 13s. 6d., against which there are some petty expenses due to the secretaries of about 30s. I will not trouble your readers with any further appeal. I am, &c., ALFRED MEADOWS, M.D., Hon. Treasurer.

George-street, Hanover-square.

COMMUNICATIONS have been received from—

DR. RUSSELL; DR. BAKWELL; MR. F. CRACE CALVERT; JUNIOR ASSISTANT-SURGEON; MR. COTTER; MR. C. J. THOMPSON; DR. J. GREENE; DR. WOODWARD; DR. PROCTOR; NERVE; DR. J. BRAXTON HICKS; MR. WHEATLEY; DR. SEDGWICK; DR. ALFRED MEADOWS; DR. THOS. GIBSON; MR. J. CHATTO; DR. J. THOMPSON DICKSON; DR. J. RUSSELL; PROFESSOR LAYCOCK; DR. EDWARDS CRISP; MR. VIZER; MISS LANSDOWN; MR. MARSHALL.

BOOKS RECEIVED—

Needham on Brain Exhaustion—St. Moritz as a Health Resort, by Dr R. W. Hewlett—Good Vaccine Lymph, by Dr. John Greene—The Baths of Bormio, by Dr. R. W. Hewlett—Report of Poor-law Medical Officers' Association—Dr. Whitmore's Monthly Report—Smoking: when Injurious, when Innocuous, when Beneficial, by Dr. John C. Murray.

PERIODICALS AND NEWSPAPERS RECEIVED—

Gazette des Hôpitaux—Gazette Hebdomadaire—Food Journal—L'Union Médicale—The Exeter and Plymouth Gazette—The Delhi Gazette—New York Medical Gazette—Pharmaceutical Journal—Nature—Mechanics' Magazine—Glasgow Herald—Medical Press and Circular—Western Daily Mercury.

APPOINTMENTS FOR THE WEEK.

July 15. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 9½ a.m.; King's, 2 p.m.; Charing-cross, 2 p.m.; Royal Free, 2 p.m.; Hospital for Women, 9½ a.m.; Royal London Ophthalmic, 11 a.m.

17. Monday.

Operations at the Metropolitan Free Hospital, 2 p.m.; St. Mark's Hospital for Diseases of the Rectum, 2 p.m.; St. Peter's Hospital for Stone, 2½ p.m.; Royal London Ophthalmic, 11 a.m.

18. Tuesday.

Operations at Guy's, 1½ p.m.; Westminster, 2 p.m.; National Orthopædic, Great Portland-street, 2 p.m.; Royal Free, 2 p.m.; Royal London Ophthalmic, 11 a.m.

19. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1½ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew's, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas's, 1½ p.m.; Samaritan, 2.30 p.m.; King's College Hospital (by Mr. Wood), 2 p.m.; Royal London Ophthalmic; 11 a.m.

20. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; Royal Orthopædic, 2 p.m.; West London, 2 p.m.; University College Hospital, 2 p.m.; Royal London Ophthalmic, 11 a.m.

21. Friday.

Operations at Westminster Ophthalmic, 1½ p.m.; Central London Ophthalmic, 2 p.m.; Royal London Ophthalmic, 11 a.m.; South London Ophthalmic, 2 p.m.

VITAL STATISTICS OF LONDON.

Week ending Saturday, July 8, 1871.

BIRTHS.

Births of Boys, 979; Girls, 950; Total, 1929.
Average of 10 corresponding weeks, 1861-70, 1925.2.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	618	582	1200
Average of the ten years 1861-70	674.2	616.5	1290.7
Average corrected to increased population	1420
Deaths of people above 90

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1871.	Small-pox.	Measles.	Scarlet Fever.	Diphtheria.	Whooping- cough.	Typhus.	Enteric (or Typhoid) Fever.	Simple continued Fever.	Diarrhoea.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.720 in.
Mean temperature	60.5°
Highest point of thermometer	76.5°
Lowest point of thermometer	48.8°
Mean dew-point temperature	52.6°
General direction of wind	S.S.W.
Whole amount of rain in the week	0.87 in.

BIRTHS and DEATHS Registered and METEOROLOGY during the Week ending Saturday, July 8, 1871, in the following large Towns:—

Boroughs, etc. (Municipal bound- aries for all except London.)	Estimated Population to middle of the year 1871.*	Persons to an Acre. (1871.)	Births Registered during the week ending July 1.	Deaths Registered during the week ending July 1.	Temperature of Air (Fahr.)		Temp. of Air (Cent.)	Rain Fall.		
					Highest during the Week.	Lowest during the Week.				
			Weekly Mean of Mean Daily Values.	Weekly Mean of Mean Daily Values.	In Inches.	In Centimetres.

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29.72 in. The highest was 30.06 in. on Thursday morning, and the lowest was 29.39 in. on Monday morning.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871; the numbers for Edinburgh and Glasgow have been furnished by the Registrar-General of Scotland, while those for Dublin are still the estimated numbers recently used.

ORIGINAL LECTURES.

ON THE INFLUENCE OF THE NERVOUS SYSTEM ON DISEASES OF THE ORGANS AND TISSUES.

By THOMAS LAYCOCK, M.D., etc.

Professor of the Practice of Medicine, of Clinical Medicine, and of Medical Psychology and Mental Diseases, in the University of Edinburgh.

(These lectures have been revised, and somewhat extended, by Dr. Laycock.)

LECTURE IV.

THE TROPHIC CLINICAL ANATOMY OF THE CEREBELLUM AND MEDULLA OBLONGATA.

(Concluded from page 2.)

Trophic neuroses of the medulla oblongata may differ equally in the concomitant sensory or motor neuroses. In many cases of diabetes the skin is more or less anæsthetic, and the cutaneous transpiration abolished. Loss of sexual appetite is common; the patient becomes irritable, morose, melancholic, and, not unfrequently, there is deafness and dimness of vision—all symptoms that point to paresis of the occipito-spinal centres.

Another fact as to these trophic appetites is that in both health and disease they are directed to special things. We shall discuss these in the course of Medical Psychology in summer, as the trophic instincts for air or oxygen, light, heat, and food and drink of various kinds, and for condiments and stimulants. I shall only remark now on their relations to the chemical actions of the tissues. We have seen how necessary to all life, whether vegetal or animal, certain mineral constituents are. Chemists dwell emphatically on flesh-forming or nitrogenous, and heat-producing or carbonaceous foods, but say little or nothing of the foods which contain these mineral constituents—namely, such as chlorine, phosphorus, sulphur, and lime—which are not less essential than nitrogen and carbon. These are chiefly contained in the foods termed herbs and condiments, as onions, garlic, asafoetida, peppers, mustard, watercress, etc. These are all more or less necessary to the due production of vital energy and *vis nervosa*. To another class belong salt, sugar, vinegar, bitters, and alcoholic stimulants; the appetite for these is variously developed under varying conditions of the nerve-centres. Sugar is often desired and unduly taken in cases of oxaluria with biliary derangement. Appetites are sometimes manifested by convalescents which are not so *bizarre* as is usually thought, for they really indicate the need for constituents of living tissue which subserve to vital or nervous energy; for example, a convalescent's desire for bitter beer may indicate the need for a tonic; if a patient longs for ham or salt herring, he probably needs chlorides. Lower animals have medicinal appetites as well as man. There are also diathetic appetites, as the love of the gouty for animal food. In the summer we shall consider the morbid or insane manifestations of these appetites—the neuroses known as bulimia, pica, polydipsia, dipsomania. Pica in a sick dog is one of the most certain signs of rabies, as it is a striking characteristic of dirt- and faeces-eating maniacs. In like manner the appetites for heat and light are morbidly modified; certain epileptics and maniacs automatically strip themselves of all clothing, just as dying persons automatically throw off the bed-clothes.

It is obvious, from a wider consideration of these facts, that we must look beyond the spinal cord and the medulla oblongata for the centres of those instinctive acts which depend upon a due co-ordination of numerous muscles—often, indeed, of the motor mechanism of the whole body. The sensory centres from whence the regulative *vis nervosa* arises, and in which the changes which coincide with the feelings of hunger, thirst, warmth, and corporeal desires generally take place, are probably in the medulla oblongata, but the whole series of sensory and motor phenomena known as the instinctive include a wider range—a series of corporeal-animal centres. The instincts are variously named, according as the animal is carnivorous or herbivorous; and if carnivorous, according as it takes its prey, and as it prefers blood or flesh, or flesh putrid or fresh, and the like. They also differ in character when the maternal instincts for nutrition of the young animal is active. I place the sensory seat of all these so-called animal instincts and appetites of mammals, including man, in the hippocampus lobe.

Let us now consider the clinical anatomy of heat-production.

Vol. II. 1871. No. 1099.

The heat of fever and inflammation has been explained variously, but chiefly by chemical and dynamical theories, such as those of friction and oxidisation. Lately it has been attributed to a paresis of the bloodvessels, due to lesion of the sympathetic or vaso-motor system, whereby there is undue supply to, and accumulation of blood in, the tissues. Traube, however, looking to the great fact that the temperature of the body is uniform in health within narrow limits, attributed fever-heat to a palsy of a moderating centre, which he placed in the medulla oblongata, and in special relation with the vagus system; to changes in the same centre he referred the anorexia, hurried breathing, and quickened action of the heart. This view was a good deal controverted, especially by Virchow, who had a hypothesis of a centre for the regulation of the *eremacausis* of the tissues, so that paresis of this centre by leading to excessive combustion caused the increased heat. In considering the problem we have to include various coincident phenomena which are wholly lost sight of by the experimental physiologists, such as thirst, suppression of cutaneous transpiration, coldness, rigors. Experimental researches point to the medulla oblongata as a thermal centre, for section of it at its junction with the pons varolii has been followed by intense febrile symptoms; from which we may conclude, at least, that in the thermal, as in the chemical processes, the line of regulative activity is along the medulla oblongata downwards. In considering the problem we must not forget, however, that the production of coolness is as much a function of the regulative centre as of warmth. Now that may be exercised in two ways: either there may be an inhibition of heat-production in the tissues by stopping or diverting the supply of combustible stuff; or, the heat being produced, or communicated by hot bodies, is carried off by evaporation, to which end fluid is poured out over evaporating or cooling surfaces. In man the skin and the lungs are such surfaces, and hence a regulation of the sweat glands and of the pulmonary halitus must, from this point of view, be a function of the thermal centres. As a clinical fact, sweats have very important relations to the nerve-centres, and follow those of heat. So that heat, and sweats, and coldness (in fever, *rigors*), and hot dry skin, and cold sweats cannot be separated in observation.

That the nerve-centre of rigors and of the sense of coldness is in this thermal region is probable from numerous clinical observations of localised fever and ague, as of one arm or one-half the body; their anatomical seat is elucidated by one of Cruveilhier's interesting cases (a)—that of a woman, aged 68, who had continual coldness and rigors (*grand frisson qui ne la quittait jamais*). Her skin felt like that of a cold-blooded animal. After using a hot bath, she became generally paretic, ending in left hemiplegia; she had also defective sight, and a sharp pain behind the right ear; but she more especially suffered from very painful cramps, commencing at the feet and extending to the knees and thighs, and then to the arm. They were chiefly on the right side, but usually ended with affecting the left limbs. She had also attacks like epilepsy. On examination, the atlas was found dislocated; the posterior median strands of the medulla oblongata were changed into a grey substance; the cord below was compressed by the atlas, more especially on the right side; and behind and to the left the cerebellum showed a superficial erosion with a brownish-yellow discoloration of its substance. In this case it is to be noted that, with the sensation of cold, there was actual coldness of the skin, and probably of the muscles, causing tissue-cramp. Hence the conclusion that both heat sweats and rigors may be due to general or local debility of trophic nerves and nerve-centres. Goose-skin is often limited to particular regions, and therefore due to changes in particular nerves or nerve-centres. The sweats of phthisis and of debility in general are neurotic. They are sometimes hemiplegic, or limited to the thorax, the face, the scalp, the lower extremities. They are thus often of value in diagnosis, and, being neurotic, are best treated by nervine tonics. Often, however, sweats are beneficial, because they keep the surface cool when there is excessive thermogeny.

All these thermal conditions may be reflex and diastaltic. Numerous facts prove decussation of the thermal nerves. If one hand be made cold by being placed in iced cold water, the other becomes cold also; and this is not due to a general lowering of temperature, because that of the axillæ and tongue remains unchanged. Cooling the hands or feet is an effectual method of causing a paretic urinary bladder to contract. Hemisection of the medulla oblongata or of the spinal cord on a level with the first cervical vertebra is followed by

(a) "Anatomie Pathol. Liv.," xxv.

increased heat on the same side of the head, hand, foot, wrist, and ankle, and on the opposite side of the neck, trunk, thigh, arm, leg, and upper part of the forearm. (b) Hence the conclusion that the thermal nerves of the abdominal parietes, pelvic region, thigh, and upper part of the leg decussate as soon as they enter, or when they leave, the spinal cord. On hemisection in the mid-cervical region, Schiff found the hand and lower portion of the arm to be hotter on the same side as the section, but the shoulder and the rest of the limb to be hotter on the opposite side. Also the foot and ankle were found to be hotter on the same side, but the trunk, thigh, and leg hotter on the opposite side. These results of experiments appear to me very worthy notice, because they explain various anomalies which I have observed clinically. A diagonal or circumscribed area of cutaneous inflammation may sometimes be seen in skin diseases similar to these spheres of heat-production. The law is also specially manifested in cases of diagonal dropsies and in wasting palsies, in which the same crossed morbid action is seen. In all these cases the centric disorder may be unilateral, although the results are shown in the upper portion of the limb, say, on one side, and in the lower portion in the other, for lesion in one half of the cord may affect the direct fibrils on that side and the decussating fibrils entering it from the opposite side. It is probable that the decussation of the sensory nerves of the hands and feet are high up within the cranium, and not in the cord, as is the case with those of the upper arms and thighs, for, being tactile executive instruments, they must have both their special motor and sensory centres within the encephalon. It is for this reason that numbness as well as motor palsy, beginning in both hands or in both feet, is a sign of intracranial centric disease. In like manner, symmetrical gout of the hands and symmetrical affections of the skin like purpura and psoriasis palmaris are associated with trophic nervous debility of centric origin. The hot palms in fever and in various neuroses belong also to this class of symptoms. It is for this reason that the first return of moisture on the palms in cases of fever is so welcome. It indicates returning regulative action of the nerve-centres.

Knowing these general principles of trophic clinical anatomy, we can be more practical in our researches and more readily apply experimental facts. Claude Bernard found hemisection of the spinal cord in the dorsal region to be followed by increased heat of the lower extremity of the same side and diminished heat of that on the opposite side; so that a diseased kidney acting injuriously on the spinal cord on its own side (which it will do) might lower the temperature in the opposite side by acting on the decussating motor or executive fibrils going to that side, and at the same time cause an illusive sensation of heat there by acting on the sensory afferent fibrils. Sweats and rigors may also be thus induced. Irritation of the urethra will excite dangerous, because general, rigors; but then, like the cervix uteri, it is a unified organ in virtue of double decussation of its sensory fibrils, so that irritation cannot be unilateral; nevertheless, creeping, local chills, and goose-skin do occur from localised centric or diastaltic action. Such are these felt about the loins at the beginning of a fever or a "cold."

There are numerous morbid conditions which are plainly due to this diastaltic action of diseased viscera. Thus, in unilateral pneumonia, and in tubercular phthisis chiefly affecting one lung, there is often a hot flush over the cheek of the same side. Sometimes one ear is hotter than the other in head-affections, just as there is venous congestion more manifest on one temple than on the other. But in thus connecting heat, redness, and congestion together, I must caution you against the conclusion so commonly current, that they stand in the relation of cause and effect. In the first or cold stage of fevers and agues, there is no redness or congestion of the skin with the increased heat; on the contrary, it is pale, and the patient shakes as if it were cold. So in a case of paraplegia we had under observation—when the patient was feverish the temperature in the paralysed groins was 104.5°, being 1.5° higher than in the unparalysed axilla; yet there was no redness until ice was applied to the loins. Such facts suffice to show that current theories of heat, redness, and congestion are too limited.

I have said nothing of the influence of emotions on the trophic centres. The facts are so well known and so familiar that I need not specifically point out to you how constantly the nutrition of the body, and of various parts locally, are thereby influenced; how readily the quantity and composition of the bile, gastric juice, milk, urine, saliva, are changed under the influence of angry and depressing emotions; and how

frequently the circulation within the vessels, as well as the action of the heart, is not only modified, but even arrested.

And this latter point raises the question—What and where are the centres (if any) within the cerebro-spinal axis which regulate the condition of the blood in the capillaries, both as regards its composition and the movements of the corpuscles? I shall not now discuss the question of inflammatory as distinct from dropsical effusions; I will only call your attention to the clinical anatomy of purpura and capillary hæmorrhages. There is an epidemic fever (prevalent lately in North Germany, and known in Ireland as the "black" fever, and also "the black typhus" and "black death") in which the chief characteristic is a more or less general purpura, coming on sometimes very rapidly. Anatomical research has shown very clearly that it is a cerebro-spinal meningitis involving the posterior surface of the cord, and of the occipito-spinal region, the anterior spinal region not being involved. This is a significant fact, to which I shall revert when discussing the pathology of the cerebro-spinal axis from another point of view; at present I need only call your attention to the coincidence between the purpura and the condition of the cerebro-spinal centres, and to the conclusion that the intense cases are only glaring instances of a general law in cases of typhus, only that certain vaso-motor and hæmatic centres are involved. Let us look for corroborative or illustrative instances. There is a peculiar condition observed in the case of certain cases of mania, in which a bloody tumour forms, termed *hæmatoma*. This has been attributed to the violence of attendants, because the subjects of it are commonly furious maniacs, but as careful inquiry as I have been able to make has satisfied me that the theory is unfounded. Further, a like careful inquiry has led me to the conclusion that the vascularity and state of nutrition and development of the ear very commonly coincide with similar conditions of the encephalic tissue. (c) My friend, Mr. Jonathan Hutchinson, communicated, in corroboration, an interesting case of hæmatoma of both ears in a woman not insane, but with a physiognomy indicative of proneness to cerebral disturbance, with mental peculiarities, sleeplessness, and a history of insanity in the family. (d) Such facts tend to prove a local centre of nutrition for the ears, and to render it easy to understand how it happened that Dr. Brown-Séguard observed hæmorrhages into the skin of the external ear to follow upon certain injuries to the corpora restiformia of guinea-pigs. (e) States of consciousness are associated with like conditions of the blood and capillaries. I have seen one example of local purpura from fear, and have met with so many recorded cases of general purpura following on a like emotion, that I give this form a place in my nosology as "emotional purpura." (f) Chronic grief will affect the blood, so as to induce chlorosis; but, in truth, in every act of thought, and more especially in acts of apprehensive and emotional attention directed to any part of the body, there is a change in the encephalic centres, such that the circulation within them is changed, and therewith the circulation and nutrition of the blood and of organs and tissues to which the attention is directed are modified too. It is thus we understand the pathology of hysterical hæmorrhages, the localised bleedings in parts of the body corresponding to the localities of Christ's wounds observed in "ecstasies," and both the curative and the morbid effects of the imagination considered as acts of morbid attention. As to the pathology of all these various phenomena, it is necessary to study more closely the vaso-motor clinical anatomy and pathology of the encephalon, which we will do on some future occasion.

ASSISTANCE PUBLIQUE DE PARIS.—The appointment by the French Government of M. Blondel, formerly Inspector-General, to the office of Directeur de l'Administration de l'Assistance Publique, has given great satisfaction to the Profession in Paris. He is well known to them for his remarkable reports on the cholera epidemics, and being of a benevolent and urbane disposition, it is expected that his numerous relations with the Profession and the poor will work harmoniously. "Here, then," says the *Union Médicale*, "we have a post given to a person thoroughly competent to fill it, and a function confided to one who is well aware of all its exigencies." M. Blondel is the author of an important report on the charitable establishments of London.

ORIGINAL COMMUNICATIONS.

THE MADURA FUNGUS-FOOT OF INDIA.

By JABEZ HOGG,

Surgeon to the Royal Westminster Ophthalmic Hospital,
Hon. Sec. R.M.S., etc.

It is now rather more than ten years since Dr. Vandyke Carter, of the Bombay Army, made us acquainted with a certain specific form of microscopic fungus (mycetoma), which he alleges produces among the native population of Madura, and some other districts in India, a peculiar disease, since recognised as the fungus-foot of India.

A number of specimens of the foot have been examined in this country, and Dr. Carter's description of the disease and its histological and pathological characteristics have been generally accepted. It appears, however, that now and then a specimen has failed to satisfy those into whose hands it may have fallen, of the fungoid character of the disease. Dr. Carter speaks of such a specimen as a variety with "numerous rounded bodies of a structureless or finely granular appearance, in which the fungous particles are free from crystalline fringe, and showing a cellular structure, the true nature of which is "degenerate fungi." (a) A specimen of this variety appears to have perplexed Dr. Ballingall, as well as the late eminent microscopist, Professor Quekett, both of whom were in consequence unable to satisfy themselves of the fungoid nature of the disease.

At the end of the year 1869 a foot of, I suppose, the same kind came into my possession for examination, and I must say I was not a little surprised and somewhat disappointed, after a most carefully conducted examination, to be obliged to come to the conclusion arrived at by the authorities just alluded to, that although the foot presented ample evidences of an unusual form of disease, there was no proof whatever that it was due to the growth and destructive ravages of a fungus. Curiously enough, the first few sections which were made and washed in distilled water, for the purpose of freeing them from some apparently crystalline and fatty matters, seemed to afford considerable encouragement, for small quantities of spores and flocculent filaments of a fungus were readily detected. Here, then, I thought, there could be no mistake, and I accordingly put the specimens away for further examination. When, on resuming my work, I at once transferred other sections of the foot to a solution of glycerine and spirit, on examining them I could see nothing like a fungus. I was at first not a little puzzled; a further examination, however, of the distilled water at once showed the source of error in the first prepared specimens. A single dip from the same bottle of distilled water gave me a plentiful crop of the same species of fungus; the spores of which, indeed, abound everywhere, soon to spread with amazing rapidity upon almost everything, ripening and depositing their spores, with powers of self-increase so rapid as to be almost incredible.

The naked-eye appearances of this fungus-foot may thus be briefly stated. The foot was greatly enlarged and swollen, with numerous excrescences, fungoid-looking bodies distributed over the upper part, none on the lower. At first sight these might have been thought to communicate with the internal structures; but on attempting to pass a probe through the centre of any one of them, it could not be made to penetrate more than a short distance, and I doubt very much whether there could have been any actual sinuses leading to the bones during any stage of the disease. The hardening nature of the methylated spirits in which the specimen was preserved may, however, have had something to do with their obliteration. On making a vertical section of the foot, much confusion of parts existed, so that the muscular, fibrous, connective tissue, and vessels seemed to be blended in a semi-gelatinous mass. On removing portions of the bony mass, most of the compact tissue of which had evidently been absorbed, the cancellated interspaces were found occupied by numerous whitish compact bodies, somewhat resembling millet seeds. These bodies, which Dr. Carter says are of a pink colour in the fresh foot, were apparently mixed up with some crystalline material; but fatty matter so predominated that it was almost impossible to free any section from it without resorting to boiling in ether and liquor potassæ. When boiling in the latter was resorted to, nearly all the fatty mass was

held in solution, the residue being a very small quantity of connective and fibrous tissue. A greater portion of the bony mass also disappeared when treated in the same way. On the other hand, when the spores and mycelia of a fungus were subjected to a similar process, sufficient remained behind to enable anyone to recognise its species, and without difficulty. The spores of fungi seemingly resist the action of boiling fluids, as they do prolonged and intense cold. We are therefore under no apprehension of losing all trace of them, while subjecting animal matter to the crucial test of boiling in a destructive reagent. A prolonged microscopical examination yielded only negative results with regard to fungi. The cells and fibres, which Dr. Carter says "are imbedded in black masses of matter," could nowhere be found; neither could any of "the fishroe-like substances, made up of defaced fungous structure," be seen.

The papillæ were hypertrophied and mostly structureless; nothing like fibrillation or a capillary loop could be made out, even in sections from the sole of the foot. The epithelial and other layers were so blended that not a perfectly-formed nucleated cell could be obtained. The pigment, generally so abundant in the skin of the black race of human beings, was nearly all removed. Portions of the sub-filamentous material occasionally presented an appearance somewhat resembling ciliated epithelium. These were readily broken down, and floated about in a mass of granular particles, without nuclei, and only slightly fibrillated. Fat corpuscles abounded, either free or arranged, and massed in cells, in some of which were seen groups of smaller corpuscles, giving a false appearance of nucleated cells. The subcutaneous infiltration of oily particles, and the disintegration of the various tissues, gave to all the specimens placed under the microscope a confused resemblance; and although some few bodies of a "spindle shape" were seen, it is impossible to conceive that they were either "ciliated epithelium," "degenerate fungi," or the altered forms of "a true oïdium," the material contents of the branching tubular canals of which have become altered through some kind of natural quiescence or encystment. If such encystment had taken place in this instance, it had become a complete disguise of all known fungous characteristics, and under such a disguise it was not at all surprising that the late Professor Quekett should fail to come to any "definite opinion of its character."

I have no doubt, however, that the fungoid evidences which have been described by Dr. Carter and other observers in connexion with this remarkable form of disease may be occasionally found. In a specimen more recently sent to this country, and which, by the kindness of Dr. Tilbury Fox, I have been enabled to examine, I have seen evidences of algoid filaments. In this specimen the sinuses are of a considerable size, and, when examined from within outwards, present a somewhat funnel-shaped appearance, but rather leading from than into the bones of the foot. The destruction of the small bones of the foot is curiously complete—the compact tissue being wholly removed, leaving behind only the open spongy portion, in the interior of which large and small nodulated masses of black matter, which, when fractured, look like crystalline masses of stearine, mixed with the colouring matter of the blood. Sections of these bodies present no evidence whatever of fungoid growth; and although in a few other specimens in a semi-fluid condition flocculent filaments were found, I may fairly say that the small quantity of algoid matter mixed in any specimen examined was sadly out of all proportion to the rest of the disorganised matter. Oily particles, blended with fibrous and connective tissues, and often crystalline bodies in indescribable confusion, were the rule; while in a few instances semi-transparent yellowish scales of a more definite character were occasionally seen blended with the fatty and granular particles. A portion of the black mass taken from the interior of a bone proved to be an exceedingly intractable substance. I submitted it first to the action of boiling alcohol and ether, neither of which agents affected in any way the colouring matter or crystalline substance. Benzole, hydrochloric acid, and liquor potassæ were tried in succession, with a negative result. Boiling in sulphuric acid converted a small nodule into a bituminous liquid, but on the addition of water it was immediately precipitated in the form of scales. Hot nitric acid completely dissolved a mass with effervescence, giving off at the same time fumes of nitrous oxide, leaving only a perfectly clear yellowish solution behind. Fragments placed in a platinum spoon, and brought to a blow-pipe heat by a Bunsen burner, burned with a bright flame, and whilst so burning gave off a peculiarly pungent odour, leaving behind an exceedingly minute portion of whitish ash.

(a) Transactions, Bombay Med. and Surg. Society 1860-62, and *Medico-Chirurgical Review*, vol. i., 1863, etc.

The attempted destruction of fungoid matter by the same reagents is not nearly so complete, and not until after long boiling in nitric acid is all trace of spores and mycelia lost. An excellent chemist and microscopist, at my request, submitted a portion of the mass to a chemical analysis, and found it to consist of fatty matter, phosphates of iron and lime, a little carbonate of lime, and a small quantity of an organic substance—albumen—and not a particle of anything like a fungus. (b) In one or two specimens I noticed the spores of a puccinia—"a vegetable parasite"—as well as minute fragments of vegetable tissue—cellulose—which doubtless must have been accidentally introduced.

The Rev. Mr. Berkeley assures us "there is not the slightest ground for supposing that the disease depends on inoculation with the spores of the true parasitic fungi belonging to the rusts and mildews," (a) and certainly Dr. Carter takes a very unusual view of the sinuses, through which he believes such fungus-spores enter. In this specimen of diseased foot they are very large, presenting almost the appearance of having been bored out by an animal rather than a vegetable parasite; but, admitting the sinuses to be either small or large, do they not in every case indicate a pre-existing state of disease, and of a very grave character? How is it proposed, then, to clear up this difficulty, and that of a vegetable parasite, in connexion with this fungoid hypothesis of disease? Another point of scarcely less moment: Does Dr. Carter consider the less frequent variety of diseased foot—that is, the foot in which "degenerate fungi with numerous rounded bodies" are the chief elements of destruction—an earlier or a more advanced stage of the disease than that in which fishroe-like bodies are found? Since in the first the fungi must have passed into a degenerate state, it certainly should be a more advanced stage—that is, so far as ordinary appearance and facts assist us in arriving at an opinion. The destruction of the various tissues in the first specimen of foot is not nearly so great as in those in which the mycelia of a fungus have been found. I cannot believe, therefore, that what Dr. Carter describes as degenerate fungi are fungi at all; although, as Mr. Berkeley justly observes, "they so nearly simulate fungous growths that it is difficult to get rid of the notion that they are not really vegetable growths."

How are we to account for the appearance of a mycelium in connexion with this remarkable form of disease? My own belief is that it is simply an example of a rapidly developed algoid growth in a putrescible substance, occurring after death. One fact certainly seems to me to be established with regard to fungous growths generally. They are so apt to become developed in connexion with any and every organic decaying matter, as to lay open to serious doubt the conclusion that fungus found in connexion with disease is essentially the cause, and not the result, of the disease. It is a matter of some importance that this point shall, if possible, be cleared up, as we are too prone, in matters of pathology, to jump to conclusions upon insufficient data. The eminent mycologist already referred to, the Rev. Mr. Berkeley, not only accepts the hypothesis of the fungus-foot disease, but also describes the fungus as a new species, and assigns to it a new name; and, although "the fungus resembles closely the genus *mucor*," he nevertheless prefers to place it with *chionyphe*, a species "only found under snow," and concludes with what might be regarded as special pleading for a pet hypothesis—as we cannot lose sight of the fact that we are discussing the action of a fungus in a living body, while his remarks have reference only to its action on dead animal matter; and, whatever that action may be, there can be no similarity in the two processes. "It is," he observes, "highly probable that many of our common moulds commence with a similar condition. The first indication of a change in tainted meat is seen to commence with little gelatinous spots of vegetation of various colours, the early stage of some curious species of *aspergillus* or *penicillium*." Hospital gangrene may, he thinks, also depend upon a similar cause. I think neither Mr. Berkeley nor any other observer can produce a particle of

(b) The chemical composition of these masses resembles very closely the white stony concretions submitted to Gmelin in 1821 by Tiedemann, who discovered them in the muscles of a man who died from the combined effects of brandy, dropsy, and gout. Gmelin found them to consist of 73 parts of phosphate of lime, with a trace of iron, 7 parts of carbonate of lime, and 20 parts of animal matter similar to albumen or fibrine. Tiedemann believed them to have resulted from the violent attacks of gout; but this guess proved to be only a step in the later discovery made by Hilton and Owen—that these "concretions" were a species of hydatid—and which the latter observer, in 1833, proved to be the cysts of the dreaded trichina spiralis, and that the supposed concretions were due to calcification of the cysts after the death of the spiralis worm.

(c) Rev. S. M. Berkeley "On the Fungus-foot of India." *Intellectual Observer*, vol. ii., page 248. 1863.

proof in support of such a "probability," which is really no nearer the truth than the many guesses that have been made at a germ theory of disease generally.

To establish Dr. Carter's fungoid origin of the diseased foot, it is absolutely necessary to show that the spores of a vegetable fungus can penetrate the dense structures of the animal body during life; these germinate and destroy, one after the other, the fibrous, cartilaginous, and bone tissues, and ultimately kill the patient. At a glance, the character of the tissues might seem to make this impossible; and Mr. Berkeley evidently has his misgivings on the point, for he writes:—"The little granular bodies are so closely involved in stearine that their germination is scarcely probable." The symptoms are also somewhat inconclusive and unpronounced in favour of fungus, as described by Dr. Carter:—"The foot swells up, is of a dark colour, numerous sinuses appear, with pink stains or streaks, which penetrate the subjacent tissues, and end in spherical groups of bright orange-coloured particles. The sinuses are more or less lengthy and tortuous, and will not usually yield to pressure of the probe," etc. Nevertheless, it is expected that the soft yielding spores of a fungus will find their way through these tortuous sinuses, passing along in an opposite direction to a strong outward flow of sanious discharge, the usual accompaniment of such a condition of disease. Dr. Carter does not for a moment believe that the sporules, although minute enough, could enter through the circulation—a more generally believed opinion, and an equally probable mode of conveying the contagion to the internal parts of the body. The endemic character of the disease would be more easily accounted for in this hypothesis, as it occurs often in districts where the growing crops of rice are at times devastated by "smut," once thought to be the cause of cholera. But it could not be believed to enter through the blood, because in such a case it would be impossible to understand why the spores of a fungus should select a hand or a foot, and find in either a more congenial soil than in any other part of the human frame; or why one foot should be destroyed and the other escape; why the poison should stop at the part where the bones of the leg join the foot, and so forth. The constant occurrence in the internal organs of algoid growths has long been noticed—*sarcinae*, for instance, in the stomach and bladder; but, after the disease has existed for years, it has not been observed to destroy life; indeed, it often produces so little disturbance to health that it is only detected after death. Other so-called fungoid diseases—such as those which some believe to be the cause of cholera, pyæmia, etc.—I need not dwell upon, because they rest their claims to consideration upon the most inconclusive of experiments and observations.

The incubation of the disease demands a passing notice, as, according to Dr. Carter, it more frequently affects the agricultural classes, men in the vigour of life; is not associated with constitutional causes, and is not known to be transmitted—*ergo*, since agricultural labourers go about barefooted, and seldom wash their feet thoroughly, it is thought that the spores of a fungus will penetrate the very hard skin, and produce "worse ravages than the dreaded guinea-worm." Although I can easily understand how the guinea-worm makes its way through the skin of a native, particularly when softened by standing in water, I cannot see how the spores of a fungus should be capable of exerting the same force as an animal parasite provided with a mouth and jaws, and a pre-ordained desire to provide a lodging in the leg or foot of the first animal that comes in its way. It must be conceded, also, if the disease originates in a fungoid growth, there should be no instance of a foot which does not bear some evidence of the characteristic poison. Such a specimen as I have been discussing, without a particle of fungus, places the hypothesis of a fungoid disease in a serious dilemma. My objection is in no wise met by saying that this form of diseased foot is exceptional, for curiously enough two out of three specimens I have examined present no positive evidence of fungus in any portion of the diseased mass, and the appearances observed scarcely come under the designation of flocculent filaments. It appears also to be a form often met with, for Mr. H. I. Carter, F.R.S., in his early examinations of diseased feet, found a large quantity of albuminoid and fatty matters, and attributed the abnormal condition "to fatty degeneration." In subsequent investigations of other specimens he discovered fungi, and changed his opinion, but adds, "I could scarcely overcome the difficulty in believing it possible for a fungus to destroy the bones as well as the other tissues of the foot." Another trustworthy observer (one who has examined several specimens of the disease) writes to me, "Although the soft parts are infiltrated with a lump of truffle-like bodies, I am not prepared

to say that the fungus causes the disease; it rather seems to me probable that the primary disease was caries of the bones, and that the fungus became developed subsequently and accidentally. The latter view is supported by the nature of the foot which you examined." I feel bound to believe that the destructive character of the disease is due to caries occurring in a strumous, scrofulous, or syphilitic constitution. In caries a somewhat similar train of pathological appearances are often met with.

The foot disease of India appears to commence in an error of nutrition, phlegmonous inflammation and diffuse suppuration follow, and spread from one tissue to the other. Specific blood-poisoning, hypertrophy, and increased cell-development soon pass into complete disintegration of tissue-vessels, nerves, etc. The process of retrogression, at first slow, proceeds to rapid destruction, and soon the albuminoid, oleaginous, and crystalline constituents are blended in an incongruous mass. The fatty matters assume, in connexion with the flattened connective-tissue cells, an angular, a spindle, or even a mulberry shape. It is obvious that the colouring matter of the nodulated masses must be derived from the iron of the blood; and sanious fluid, with fat, stearine, and phosphatic matters, blend into the carbonaceous masses—"fishroe-like bodies"—which are seen to fill the cavities of the bones. The slow disintegration of the various structures in the Madura foot-disease is no doubt greatly exaggerated by the ordinary effects of a tropical climate, often an important factor in disease, and one well exemplified in those remarkable forms, elephantiasis and leprosy, both of which doubtless originate in an error of nutrition, and end in a complete metamorphosis of cell-contents.

THE PREPARATION AND PROPERTIES OF THE VARIOUS KINDS OF CHINESE TEA.

By F. PORTER SMITH, M.B. Lond.

It is proposed to review the various stages and processes of growth and manufacture of tea, as supplied by China to the civilised world, with reference to the medicinal and dietetic properties of the various forms of this "necessary of life." It is to the credit of the Celestials that, whilst they do not live under the strict rule of Islam, they have elected to confine themselves chiefly to the use of a drink which has commended itself to all sorts and conditions of men. In no other country is such a store of wealth drawn from the very leaves of trees as in China, where the mulberry-leaf furnishes silk for clothing, and the tea-leaf material for satisfying hunger and thirst.

The tea-plant of China, the *Thea Cantonensis* or *Thea Viridis* of botanists, is not the same as that used in very remote periods by the people of the classical period. They probably used the leaf of the chicory, as well as those of other plants still used in various parts of the country, such as the willow, the holly, the *Sageretia theezans*, and other plants.

Since the seventh century of the Christian era the growth of the tea-shrub has been sufficiently extensive to invite taxation by the Emperor, though to a much less extent than cereal crops, the chief dependence of the people of the "Middle Kingdom," the name by which China is known to its own people. The tea-shrub is met with in Hupeh province as a small, stunted evergreen bush, varying from one to three feet in height, and covered with a precarious growth of young shoots, bearing shining, ovate-pointed and irregularly serrated leaves. It is grown on the hill-sides or terraces of such districts as have a red and rapidly disintegrating sandstone soil, where rice could not well be raised, from the difficulty of irrigation. The shrubs are renewed from young seedlings, after some ten years or so; according to the enterprise of the peasant grower. Formerly the bushes were renewed every five years, but the extraordinary and insatiable demand for tea has led to the exhaustion of the plants, as anything in the shape of tea is bought by the speculative and indiscreet foreign trader. The seeds are often abortive, from the damage done to the tree by the remorseless stripping of the leaves. The seeds require some peculiar treatment, such as the soaking in a prepared liquid, or in an artificial mould made of exhausted oilcake. Several seeds are placed together to insure the growth of a single seedling. The seeds yield a fixed oil, which is said to never turn rancid. The tea oil known to foreign residents in China is the product of the seeds of the *Camellia oleifera*, a plant called by the same name (*Ch'a*) as the tea-shrub. The various kinds of tea—namely, green, black, red, and brick tea—

are all produced by the same kind of shrub, which shows some slight tendency to variation in some such simple characteristics as the length of the leaf, etc. The leaves are picked at three or four periods of the year, commencing with the latter part of April. The bushes are finally clipped to make some of the brick tea, and to encourage the growth of young shoots in the coming spring. The raw leaves are dried in the sun by spreading on mats, and the shrivelled product pressed and rolled by men, who stand in tubs, kneading the leaves into a ball with their naked feet. This operation gives the twist to the leaf, and removes superfluous watery juices. The tea is seldom dried by fire by the small tea-growers; unless the weather be wet and the tea liable to mould from the want of sun-heat. It is stored in bags long enough to collect a quantity, and is then "fired" by placing it in thinnish layers on the convex diaphragm of a large hopper or basket, shaped like a dice-box, with both ends open, which is put over a charcoal fire. The leaf is exposed to this heat (which never exceeds 212°, and is moderated by placing a thick layer of wood ashes over the fire) for about two hours, being stirred up several times, so as to heat the whole of it gradually and thoroughly. Processes of sifting, winnowing, mixing, and picking follow, and a final "firing," to get rid of moisture acquired during the manufacture, fits it for packing in chests. The stalks are usually rejected, as foreign tea-buyers do not like them. They contain all the properties of the leaf, and are largely consumed by the Chinese. The tea ought to undergo no change in the chests, which are carefully closed by soldering. The flowers of the *Aglaiia odorata*, the *Jasminum Sambac*, the *Chloranthus*, and perhaps other plants, such as the *Gardenia*, are used to scent the tea. Dried leaves of the *Salix alba* are used to adulterate tea sometimes, but in the interior of the country such practices are commendably rare. Black tea forms the bulk of the produce, and is preferred by the Chinese for ordinary drinking. Red tea is made from the same kind of tea-shrub, and is of a brownish-black, rather than a red, colour. The infusion is certainly of a deep-red colour, and this may be the origin of the name *Hung-ch'a*, or "red tea," a name given to it by the Chinese. Green tea is made in Hupeh to some extent by picking at the very beginning of the season the fine hairy summits of the youngest branches of the shrubs. Brick tea is made from the clippings of the tea-bushes, the dust of black tea, and from any other description of leaf. Odd stories about blood and other substances being mixed with the tea-leaf and dust are perfectly unfounded. There are "large green bricks" of the coarsest sort, "small green bricks" made of a better kind of tea-leaf, and "small black bricks" made from good tea-dust. The shape of the tea which is used as a means of barter by the Mongol tribes is more like that of a tile than of a brick. In making brick tea the leaves and dust are steamed, pressed in moulds of a uniform size, and carefully dried without access of the sun, or any other direct source of heat.

This tea goes to the Siberian, Buriat, Tungous, Kirghis, and Mongol tribes, who chop it up with salt and butter, or koumiss, after exhaustion of the leaf in the ordinary way. The people of Thibet wisely add a little carbonate of soda to the water used in brewing their tea from slices of the bricks.

If two or three leaves be picked from a tea-shrub and chewed in the mouth, very little in the way of marked impression is made upon the sense of taste. A grassy, slightly bitter, but scarcely astringent flavour is brought out in the mouth. The peasants picking the leaf or passing through the tea shrubberies are seldom seen to gather the leaf and partake of it, as schoolboys do of bramble leaves in English lanes.

Prepared tea-leaf is, in fact, a very different thing from the raw, growing leaf of the shrub. Chinese tea consumed in the country, and prepared by a single "firing," after drying in the sun, is also a very different article from the Congou tea prepared for the English market. On this account, Chinese statements and experience are of no great use in determining the effects of tea as consumed in western countries. Russian tea, which undergoes no special preparation for the short overland journey which it has to make, is more like the Chinese native tea in flavour. Foreign new tea—that is, tea prepared and still in China—is a very different article from the tea when placed in the teapots of English villagers, after being conveyed in an iron ship through the tropics, in large quantities of some ninety or more pounds. Tea is described in the Chinese Pharmacology as cooling, peptic, exhilarating, rousing, both laxative and astringent, diuretic, emmenagogue, and in large concentrated doses as an emetic. It is used as a wash for sore eyes, ulcers, and wounds of all kinds. It is understood by Chinese Physicians that the excessive use of tea renders people thin, anæmic, and weak-sighted. Tea is taken by Chinese

scholars and labourers to stave off the cravings of hunger until a convenient season arrives. Much of the so-called tea taken by the common people in China is nothing but very warm water. Hot water is often taken by them in large quantities when threatened with colds, fevers, and other acute or chronic diseases, apart from considerations of economy. They regard it as antidotal, corrective, solvent, demulcent, diluent, lenitive, stimulant, deobstruent, diaphoretic, diuretic, and lithontriptic in its effects. Such a dose is much more sensible than the inevitable "sixpenn'orth of the best French brandy" which the English rustic gulps down in the emergency of pain or some other symptom. Experience has taught the Chinese that weak tea is much better than cold and impure drinking-water. They are exceedingly particular as to the water used in tea-making. They prefer the comparatively soft water of their large muddy rivers, so often swollen by rain and the melting of snow. They object to tea made from lake water, as they consider it unwholesome and having a tendency to render the mind dull and slow.

(To be continued.)

OBSERVATIONS ON LIGATURE OF THE SUBCLAVIAN ARTERY.—A NEW INCISION SUGGESTED.

By Assistant-Surgeon F. P. STAPLES, Medical Staff.

THAT ligature of the subclavian artery on the living subject is not an easy operation, even in the hands of the most experienced Surgeons, few will question, while, on the dead body, there is no doubt that most Surgeons have seen attempts to occlude that vessel fraught with considerable difficulty, if not with actual unsuccess. To assert such truisms, however, is not my object in writing, but to bring before the notice of Surgeons a method which I have practised for some time, and by which, I venture to hope, the difficulties of ligaturing that vessel in the third stage can be overcome.

Operation.—The patient being placed in the usual position, with his head back and to the opposite side, with his shoulder depressed slightly, but not violently, let the point of the knife be entered at the posterior edge of the sterno-mastoid muscle, one inch and a quarter above the superior margin of the clavicle, and let an incision be carried from that point, in a straight line, to within a quarter of an inch of the attachment of the trapezius to that bone, dividing skin and platysma. This incision should be a little short of three inches. The operator should then lay aside his knife, ligature the external jugular vein in two places, and divide it in the direction of the original incision. The deep cervical fascia should now be divided, and the edges of the wound gently separated, when the posterior belly of the omo-hyoid muscle will be exposed for its entire length. The edges of the wound should now be retracted, and the superior retractor should carry with it the omo-hyoideus; and when this has been done, the white cords of the plexus, with the artery inferior and internal to them, will be observed to occupy the bottom of the wound. The knife should now be laid aside, unless it is necessary to dissect a lymphatic gland out of the way, and the vessel separated from the lowest cord of the plexus with a director, and ligatured in the usual manner. Tying the external jugular vein is not insisted upon, provided it can be easily drawn aside, but generally a ligature would expedite matters, and any branches of this vein which cross the line of incision should, if divided, be treated in the same manner.

What are the advantages claimed for the operation recommended? Why have the stereotyped guides to the artery—viz., edge of anterior scalenus, and tubercle on first rib—not been mentioned? What special advantages has the operation described over that commonly practised—i. e., by incision along or near upper margin of the clavicle?

The advantages claimed for the operation are—1. That the incision is parallel to the normal course of the artery. 2. That the true guide to the vessel—posterior belly of omo-hyoid—is exposed by incision recommended for its entire length. 3. That the edges of incision admit of easy retraction and, in this way, of easy access to the vessel. 4. That the risk of venous hæmorrhage obscuring the final steps of the operation is lessened.

My answer to the second question I have asked is very simple. To feel the edge of the scalenus anticus in a bleeding wound is next to, if not quite, an impossibility, and it does not follow that the tubercle on the first rib is always so well developed as to permit of recognition by the sense of touch;

and, independently of both these Surgical signposts, it has always appeared to me that a far more reliable guide is to be found in the omo-hyoideus.

Regarding the third question—What special advantages are claimed for this operation over that commonly practised?—it may be stated, I think, that, if an incision is made in a line with the clavicle, it is obvious that, when carried deeper, it will not meet with the omo-hyoideus or true guide unless at its outer angle; whereas the incision recommended is parallel to that muscle throughout its entire length. Secondly, in the wound resulting from the ordinarily used incision, retraction can only be made in an upward direction, as the clavicle prevents retraction downwards; whereas, with the incision now recommended, retraction can be made in both directions. Thirdly, in the incision recommended there is no risk of dividing the transverse cervical vessels; whereas, when the incision along the clavicle is used, they are often cut, and, when it so happens, very troublesome bleeding obscures the further steps of the operation.

Barully, Rohilkund.

REPORTS OF HOSPITAL PRACTICE IN MEDICINE AND SURGERY.

MIDDLESEX HOSPITAL.

CLINICAL LECTURE ON A CASE OF INTESTINAL OBSTRUCTION.

(By Dr. HENRY THOMPSON.)

A. B., aged 51, married, was admitted July 6. Has been generally liable to colds; otherwise in good health. Catamenia always profuse until three years ago, when they finally ceased. She then had great pain about the back and umbilicus at the menstrual periods for six months. For the last two years has experienced at times sudden attacks of pain in the hypogastrium, with distension of the abdomen. These attacks have, for the most part, passed away in the course of a few hours. Considerable emaciation during last six months. For two years the bowels have been habitually constipated, but not specially so during the above-mentioned attacks. About four months ago she was seized with violent shooting pains in the hypogastrium, relieved by the application of six leeches. She remained perfectly well until June 30, when she suffered from severe pain in the left iliac region, accompanied by flatus, and followed by absolute constipation, which has continued ever since, but there has been no vomiting up to the present date.

On Admission.—Face extremely pale and sallow; abdomen enormously distended; apparent fluctuation in flanks. Percussion-resonance very imperfect everywhere; dull in left flank when she reclines on that side. Enemata (Ojss.) were administered, but returned immediately, before the whole amount was injected. Pulse 120; respiration 20; temperature 99°. 9.30 p.m.: Pulse 118; respiration 20; temperature 98.8°. Severe pain at umbilicus; pulse irregular in force.

July 6.—Two enemata ordered, Oj. and Oj. ʒvj. Oj. respectively; both returned as before.

7th.—Slept after chloral. Pain and griping in hypogastrium and left iliac region. Another enema slowly injected returned immediately before it could be wholly introduced. A slight degree of apparent dulness over flanks when patient lies on either side, and a feeling like that of fluctuation, but not unequivocally the same. Has been vomiting for the first time, eighth day from invasion. Matters vomited simply viscid and bilious. Urine of specific gravity 1025; non-albuminous.

8th.—Pulse 134; respiration 24; temperature 99.7°; no pain, but slept ill; no vomiting; hands clammy; pulse feeble. Seen by Mr. Lawson, who discovered nothing of moment within the rectum. 9 p.m.: Pulse very weak, 138; respiration 20; temperature 98.4°; severe pain in left iliac region; extremities cold.

9th.—Pulse 136; respiration 20; temperature 98.4°; slept at intervals, but sweated profusely during night; no vomiting; no pain. As much barley-water as the patient can bear to be introduced gently and gradually into the bowel. 4 p.m.: Amussat's operation decided upon after consultation with Mr. Lawson. 5.30 p.m.: Enema caused considerable pain, and returned like the rest. Chloroform having been administered, Mr. Lawson introduced a long stomach-tube eighteen inches into the bowel with the greatest ease; about a quarter of a

pint of the enema and some flatus escaped. The inference was drawn that there was no obstruction at the sigmoid flexure, and it was decided to defer all operative proceedings. 9 p.m.: Pulse 150, very weak; respiration 26; temperature 101.6°; slight delirium.

10th.—Pulse 138; respiration 32; temperature 101°; delirious during night; wandering now and sweating profusely; no action of bowels since June 30. Seen by Mr. De Morgan, Mr. Lawson, and Mr. Hulke. It was decided to give the patient the last chance of life by performing Amussat's operation on the right side. The patient was in an extreme state of collapse when placed upon the operating-table. Not more than one drachm of chloroform was administered during the whole operation, which was performed quickly, and without difficulty. At the beginning there was slight amount of fecal vomiting for the first time. Towards the close, the pulse became extremely weak, and the respiration slow and gasping. Brandy was injected into the rectum and vagina, with temporary amelioration of the pulse, which soon, however, began to lose force rapidly, while the respiration grew slower and more gasping. Almost immediately after the incision into the ascending colon, and the escape of about three pints of liquid feces, the breathing ceased.

Post-mortem, Twenty-four Hours after Death.—Rigidity marked. Thorax: Heart coated with adipose tissue; its muscular walls soft and friable. Lung emphysematous; otherwise healthy. Abdomen: Liver large and fatty. Kidneys normal. There was about an inch and a half of bowel between the caput cæci and the opening into the ascending colon. The peritoneum of both the walls and viscera was smeared over with a creamy yellow lymph, which accumulated towards the surfaces of contact of one coil of intestine with another. The small gut was much distended, and its coils occupied the greater part of the front of the cavity, but below a large blackish slate-coloured coil was seen occupying the hypogastric and left inguinal regions. A thin, semi-transparent omentum passed over the front surface to the lower anterior and left lateral wall; its margin was adherent to the peritoneum, along the left lumbar region external to the colon, and to the front of the abdominal wall, along the line of Poupart's ligament, and the back of the symphysis pubis. The omentum did not reach to the right inguinal region. On cutting off the lower part of the omentum, so as to leave the margin adherent to the abdominal wall, and then removing the greater part of the small intestine, it was found that a fillet of the omentum stretched across from the front wall, near the symphysis pubis, and adhered to the peritoneum binding down the rectum to the sacrum, as well as to the sigmoid flexure at its junction with the descending colon; and to this spot a coil of small intestine, about six inches from the cæcum, was also adherent. This latter, however, was perfectly free from all obstruction, and only adherent by a very short and broad band, attached to its convex surface. The sigmoid flexure lay quite to the right of the fillet of omentum, and was constricted by it, the upper bend being most tightly gripped, and the lower—*i.e.*, at the point of junction of the sigmoid flexure with the first part of the rectum—much less so, allowing an œsophageal tube to be passed through it, nearly to the upper constricted point. The whole of this coil was prevented from sinking in the pelvis into the recto-uterine pouch, and was in consequence pushed up against the band of omentum by a large uterus, six inches long and ten and a quarter in circumference. The uterus contained many fibrous growths within its walls; it completely filled the whole space between the bladder and rectum, and rose above the level of the brim of the true pelvis. The calibre of the constricted coil varied at different parts, from four to five and a half inches in circumference. At the upper seat of the constriction the circumference was one inch and three-quarters; at the lower, two inches and one-fifth. At both these spots the coats of the bowel were thinned, excepting the sub-mucous one, which was converted into a white shining band. The colour of this portion of the bowel was blackish slate, and between the points of constriction the thickness of the gut was increased, owing chiefly to inflammatory œdema. The descending colon was immensely distended, and gave the appearance at its upper end of being the stomach. Much thin yellow fecal matter and flatus occupied the bowel. The intestine everywhere was very lacerable.

Gentlemen,—Practically, the first and foremost point you have to determine in cases of the foregoing character is the seat of the obstruction. As a rule, you will be fairly well guided in this respect by the routine code of regulations issued for the purpose. Early vomiting, sudden and violent pain, early discharge of stercoraceous matter, scanty urine, an undistended

or partially distended abdomen, and rapid collapse are, it is said, the sure signs of obstruction seated in the small intestine, while the converse phenomena, in particular the resonant and voluminous belly, are held to be decisive in favour of the large intestine. Such are the laws laid down by the authorities, and, though not absolutely binding, on an average they will lead you to a correct conclusion. They may be unphilosophical, and it may possibly be that the symptoms are rather determined by the cause and nature than by the seat of the lesion, but you must remember that peculiar lesions specially infest peculiar divisions of the intestinal tube, and are almost appropriate thereto. For most practical purposes, the rules in question may stand, and in accordance therewith we were bound to conclude in our case that the obstruction lay in the lower bowel, where the pathological changes usually discovered on post-mortem examination are strictures and torsions or twistings. Strange to say, at the autopsy we found neither the one nor the other, properly speaking, but an old fibrous band constricting the origin and termination of the sigmoid flexure, so as exactly to isolate it from the adjoining segments of the intestine. Such bands are common enough in the upper division of the tube, but they are infrequent in the lower. Altogether, the case was anomalous in many respects; the absence of borborygmi and of the well-known serpentine writhing and rolling of the bowel was especially remarkable, and perhaps difficult of explanation, unless we suppose that such movements had taken place before admission, but after that date had become impossible from paralysis or inflammation, or that the obstruction in the bowels had not lasted long enough to produce that hypertrophy of the muscular coats above, which some hold to be the essential condition of visible peristalsis. How are we to treat these cases? I speak of obstructions in the large intestine. Full and frequent doses of opium should be administered, with the view of arresting inordinate peristaltic action, and its consequence, undue distension of the gut, which would only aggravate the mischief. Food should be supplied in small quantities at a time, and in the liquid form alone, and simple enemata of warm water, milk, or gruel should be gently and gradually injected into the rectum, in order to reach, if possible, the seat of the obstruction, and overcome the stricture, or twist, or whatever the mischief may be. If I failed in accomplishing my purpose by these measures, I should, in all cases except those of simple constipation, after the lapse of twenty-four hours, or sooner if the writhing of the intestines should continue unabated, or symptoms of collapse should ensue, deliver the case into the hands of the Surgeon, and suggest colotomy—Amussat's operation, as it is commonly called. I should be guided in the selection of the right or left colon by four main considerations—(1) By the *primâ facie* presumption in favour of the left side, which is by many times the commoner seat of the obstruction, (2) by the amount of distension perceptible either in the whole colon or in this or that particular division thereof, (3) by the direction of the before-mentioned writhings and undulations as they seem to bear on a particular point, (4) by the amount of injection which the intestinal tube is capable of retaining, although it must be acknowledged this last criterion is often misleading. I am disposed to agree with Dr. Brinton in deprecating the use of bougies, long flexible tubes, and the like instruments, either as dilators of stricture or as vehicles for the introduction of enemata. Nay, more, I go along with the same authority in protesting against their employment for the purposes of diagnosis. They may do serious damage, and they very often fail in imparting the information we desire. No better example of their fallibility could be adduced than our own case. On July 9 eighteen inches of the stomach-tube were passed through the rectum and into the sigmoid flexure without encountering let or hindrance. It was taken for granted unhesitatingly, but unwarrantably, that the obstruction must be above the sigmoid flexure, and the operation contemplated at the time, with everything ready for its performance—that of colotomy on the *left* side—was at once abandoned. On the following day the operation was performed on the *right* side, just above the ileo-cæcal valve. The woman was too far gone, however, for recovery, and she died in the process. I do not mean to say that if the left colon had been opened on the 9th inst., as originally contemplated, she would have lived; but on principle I mention the fact that a day was lost, and in many cases the loss of a day may be the loss of a life. To the best of my belief, no incision of the colon would have saved or appreciably prolonged the life of this woman, even if we had operated on the very day of admission. I cannot imagine that the disorganisation of the sigmoid flexure would have been averted or arrested thereby; and even if we

had accomplished this great result, there still remained the overlying band of omentum, ready to renew the mischief at any moment. More than this, the walls of the intestine were not simply compressed by the band; they were intrinsically changed, puckered, and contracted. In other words, it was no longer constriction merely, but, to all intents and purposes, virtually, if not nominally, stricture. Let us dismiss now the question of colotomy, which leaves the peritoneum untouched, and turn our attention to the far more formidable operation known as gastrotomy, which lays open the peritoneal cavity. This operation has hitherto been limited almost exclusively to obstructions of the small intestine, and I confess I had not the courage to recommend it in my own case. Had I known for certain from the beginning the true nature of the lesion, I should have recommended it; but I did not, and could not suspect the precise lesion discovered, for, as far as I am able to ascertain from a perusal of the cases on record, it was most anomalous and exceptional. The history and symptoms, properly interpreted, seemed to indicate adhesions of long standing and to imply a condition of the lower intestine capable, indeed, for a while of discharging its functions well enough under ordinary circumstances, but capable also of taking on dangerous action and imperilling life at any moment. The slight and fugitive attacks of pain and distension recorded in the notes would appear to have been rudimentary manifestations of such a capacity; they were only the foreshadowings of that incipient strangulation which was so effectually arrested four months ago, and of that ultimately fatal strangulation which we have failed to arrest. Now, of all cases, those involving old adhesions are the worst adapted for gastrotomy. Nevertheless, if the exact lesion had been known beforehand, an exploratory operation, promptly performed on admission, or, at any rate, before admission, might have saved the life of the patient for the time being; for the case was peculiar in the fact that the adhesions were not extensive, but limited to the points of constriction at the extremities of the sigmoid flexure, leaving a large residue of the band entirely unattached as far as Poupart's ligament. If, then, this band had been divided through the free unadherent residue, and the adhesions been wholly or partially cut away, the constriction might in great measure have been removed, and the bowel restored in some degree to its old integrity of function and its old immunity from disease. Structurally, however, it could hardly have recovered its original calibre. We arrive, then, at this strange climax of a most extraordinary case—that operation which is deemed most suitable to obstruction of the small intestine might possibly have saved the life of the patient for some time to come; on the other hand, that operation which is our last resource, and often a most valuable resource, in obstructions of the large intestine, here not only failed altogether as it was performed, but would inevitably have failed, however and whenever it might have been performed. As to the origin of the constricting band, I cannot with any assurance of certainty determine its date; it may have been formed four months ago, but I am inclined to make it of much older standing, and to date it from the cessation of the catamenia. Perhaps the peritonitis, in which it originated, may have been connected with the development of the fibrous formations in the uterus. Whether the enlarging uterus had anything to do with the beginning of the mischief or not, certainly it would appear to have accelerated the end by circumscribing the range of the sigmoid flexure from below, and so conspiring with the constrictions above. The false membrane attached to the coil of the ileum may, by a process of constant traction, have interfered with the nutrition and functions of the part; but its influence in this respect must have been insignificant as compared with that exercised by the constricting band.

HIGHGATE INFIRMARY.

CASE OF SECONDARY SYPHILIS WITH BUBO AND SOFT CHANCRE.

(Under the care of THOMAS STRETCH DOWSE, M.D., Medical Superintendent.)

M. C. was admitted into the Highgate Infirmary on March 21, 1871. The history is simple enough. About a month prior to her coming to this Infirmary she observed a small sore upon what she termed her privates, which continued to increase in size and was extremely painful. In a short time the glands in the left groin became swollen and tender, accompanied with a vaginal discharge, and very shortly before her admission the body became covered with red spots, and she had sorethroat. When first

examined, the perineum and skin around the anus and vagina were bespattered with nummular mucous elevations, destitute of epithelium, discharging thin ichorous matter, and showing up in dotted outline the hypertrophied sweat ducts. The labia were enlarged, and covered with a thin crust of mucopurulent secretion. Upon feeling carefully for hardened tissue every surface of mucous membrane, which is my usual practice, I came upon an ulcer at the base of the left labium, sharply defined, though irregular in outline, with narrow raised edges of a pinkish tint, the surface very tender, of a light brown appearance, covered with pus, without induration of the surrounding tissue. The vaginal mucous membrane was reddened to the extent of two inches, and discharging freely. There was no other sore, and she denied having had anything of the kind previously. The glands of the left groin were much enlarged, soft and fluctuating, with discoloured cuticle. Over the abdomen and flexor surfaces of anus and thighs the characteristic eruption (roseola syphilitica) was well marked, which soon spread all over the body, became copper-coloured, and desquamated. The tonsils were enlarged; their mucous surfaces, as well as that of the posterior wall of the pharynx, were ulcerated.

The treatment of this case consisted in mercurial fumigations.—half a drachm of calomel for six weeks, nightly. At the end of this time all symptoms of specific taint had subsided. The gonorrhœal discharge ceased in a few days after the application of strong solution of diacetate of lead, followed up with daily plugs of cotton-wool saturated with a solution of tannin and alum in glycerine.

Two points seem worthy of note in this case—1st. The bubonic swelling surrounded by secondary rash. 2nd. The occurrence of secondary symptoms with what is usually designated as the soft non-infecting sore. Perhaps this case may be of interest to those engaged in the study of this class of disease.

SATURDAY, JULY 22, 1871.

THE GENERAL MEDICAL COUNCIL.

In our comments on the proceedings of the Council last week, we had not time for more than a mere mention of the discussion on Dr. Parkes's motion concerning the formation of Conjoint Examining Boards. In the notes on the "Topics of the Day," however, we took the opportunity to point out some of the difficulties in the way of any really satisfactory outcome from the conferences on the present English Conjoint Board scheme. Those remarks, and the speeches made on the subject on the last day of the session of the Council, will have shown our readers that the prospect of any speedy formation of a Conjoint Examining Board—in the full and perfect meaning of the term, at least—is not quite so bright as it appeared to be from the statement made by Dr. Bennett on the fourth day of the session. It is abundantly clear that without the co-operation of the Apothecary

aries' Society, no satisfactory Conjoint Board can be formed. Dr. Parkes pointed out that unless the Apothecaries' Society obtained a fresh Act of Parliament, they would continue to issue their licence—in fact, they *must* continue to do so, we imagine, under their present Act, which compels them to hold a weekly Examining Board for all who choose to apply to be examined, provided they have complied with the educational requirements. The Council could not refuse to place the licences so obtained on the Register; and it is by no means certain that the Society could not compel the Royal College of Surgeons to admit their licentiates to examination; at any rate, there would be Medical authorities in the United Kingdom to whom the licentiates of the Apothecaries' Society could still go for a Surgical diploma, so that the present scheme for an English Conjoint Board would not give us the one-portal system, even in England. We do not find any solid grounds for hoping for one yet in Scotland; and as to Ireland, Sir Dominic Corrigan seems to forbid all hope of success in that division of the kingdom. Dr. Parkes observes that "If Sir Dominic was not converted, no Conjoint Board would be formed in Ireland, because Sir Dominic had power to prevent it, and would prevent it. The only way in which he could be converted was by Act of Parliament." Leaving on one side for the present, however, all question about Conjoint Boards for Scotland and Ireland, we must once more express a hope that a real one-portal system may yet be framed for England. We cannot but think that this may still be done voluntarily by the English Medical authorities, if, throwing aside all jealousies and personal feelings, they will, with real heartiness and singleness of purpose, desire it. Let them genuinely and with thoroughness adopt the motto suggested by Dr. Andrew Wood—*Possumus quia posse videmur*—and we more than suspect that the dreaded legal difficulties will vanish, or, if boldly braved, will turn out to be very tame or very safely chained lions. And, further, we will venture to suggest, for the consideration of the Apothecaries' Society, that if they suffer this imperfect Conjoint Board to be formed, their position will by no means be improved. Parliamentary action will then be sooner or later sought for, and when it does come the Society will stand quite alone. Even should the Society be able to prove indisputably the existence of legal barriers, which they had honestly and truly, though vainly, endeavoured to surmount, their position will have been gravely weakened, while, failing such proof, they will be open to the charge of having shown themselves averse to a necessary and urgent measure of reform.

As to other weak points in the scheme, besides the absence of the Apothecaries' Society, we spoke of some of them last week, and we will now again allude to only one of these—viz., the proposed Committee of Reference. This Committee is to be composed of sixteen representatives of Medicine and Surgery, to be appointed by the Royal Colleges and the Universities, and is to arrange and superintend the examinations, to determine the number of examiners to be assigned to each subject of examination, and to *nominate* the examiners; while the Medical authorities are to *appoint* the examiners on the nomination of the Committee. We confess that this appears to us a very cumbersome piece of machinery, and something not unlike an attempt to shirk responsibility altogether, or to throw it on an irresponsible body. The Committee will be able to say, we do not appoint the examiners, we only nominate them; while the Medical authorities will declare, we do not choose the examiners, we only appoint them on the nomination of the Committee; and each body will be tempted to hold itself free from, or to feel a dangerously lessened, responsibility. But we hope that the scheme may yet be greatly amended, as it has not yet been accepted by the Colleges.

As to the proceedings of the General Medical Council, we have nothing more to say now, except to congratulate them on their balance-sheet for 1870, which actually shows a surplus in their favour.

ON A NEW FORCE, FALSELY SO CALLED.

THE current number of the *Quarterly Journal of Science* contains an article by the editor, W. Crookes, Esq., F.R.S., which has already given rise to a good deal of discussion, and to still more speculation. It is termed "Experimental Investigations of a New Force," and begins as follows:—"Twelve months ago in this journal I wrote an article in which, after expressing in the most emphatic manner my belief in the occurrence, under certain circumstances, of phenomena inexplicable by any known natural laws, I indicated several tests which men of science had a right to demand before giving credence to the genuineness of these phenomena." The tests suggested were the manifestations of this power in the now well-recognised equivalents of foot-pounds, and these tests the author has had an opportunity of carrying out for himself by means of the so-called medium, Mr. Home.

Before proceeding to an account of this inquiry, let us at once say that the force called a new force is not new, and that as *ode* force and animal magnetism it has already been investigated, although not perhaps in this very way, and the investigation has, further, been almost universally unsatisfactory. We may also premise, however, that Mr. Crookes is, both by nature and training, a man little inclined to assign supernatural origin to tangible effects; nevertheless, he has come to the conclusion cited above, or, to put it in words given elsewhere, "these experiments appear conclusively to establish the existence of a new force in some unknown manner connected with the human organisation, which for convenience may be called the 'Psychic Force.'" Unfortunately for any sense of security in these new beliefs, the author adds that "it has but seldom happened that a result obtained on one occasion could be subsequently confirmed and tested with apparatus specially contrived for the purpose." Anyone acquainted with the necessity of trying and trying again—that is, of varying the conditions—before coming to a final conclusion must regret this, if he desires to be a convert.

The two things chiefly tested were Mr. Home's power of diminishing the absolute weight of bodies, and of causing tunes to be played on an accordion so placed that its keys could not be reached. A basket was prepared and placed under a table, so that the hand could be barely introduced between its edge and the table; the other hand of the operator was placed on the table, and his feet held steady by two assistants. The accordion was taken by Mr. Home, his hand being placed under the table so that he held the part furthest from the keys, allowing these to hang down into the basket. After a time it began to move about in a curious manner; by-and-bye sounds were emitted; and ultimately it played a tune. We are not prepared to dispute the facts; still less are we prepared to admit Mr. Crookes' explanation—if explanation it be—to assign all these phenomena to the influence of a new force. But, for the moment, admitting the force, *who* played the tune, which it seems was both well known, and simple? Was it the spirits, of which Mr. Home is supposed by some to be the medium, or was it Mr. Home? If the spirits, we fear their action is too irregular and too unsystematic to admit of anything that deserves the name of scientific inquiry. If Mr. Home himself, then surely Mr. Home and the spiritualists have some small difficulties to get over with regard to their public teaching.

The next experiment is, in every way, more satisfactory. A mahogany board, three feet long, was placed so that one end was leaning on a table, the other (the board being perfectly horizontal) attached to a spring balance. So placed, pressure on the end of the board resting on the table could but very slightly affect the index of the balance. When the apparatus was ready for experiment, the index showed the pressure of the board to be equivalent to a downward pull of 3 lbs. When, however, Home was seated (his hands and feet, as before, being carefully observed), with his fingers resting on

the extremity of the board supported by the table, the index descended to $6\frac{1}{2}$ lbs., and on one occasion, according to a register, to 9 lbs., being an increase of the pull of the board by $3\frac{1}{2}$ lbs. and 6 lbs. respectively. This apparatus was a rough form of lever No. 3—the power acting between the fulcrum and the weight. Did the power and fulcrum exactly correspond, there could be no manifestation of force beyond that of pressure on the fulcrum—that is, on the table. It is plain,

therefore, that the question resolves itself into two parts—the spot where the power was applied, and the degree of that power. Close to the fulcrum much force would be necessary to produce such results; close to the weight, *i.e.*, the balance, only a little more than the $6\frac{1}{2}$ lbs. or 9 lbs. indicated by the balance itself. It is stated that Mr. Home's fingers never extended beyond the fulcrum. In this position, then, the power exerted by them would be *nil*; and if they were applied to the innermost verge of the board, then force would, if acting at all, manifest itself in a contrary direction—that is, as diminishing the weight of the board.

These are the experiments detailed in the article referred to. Others, of course, have been made, and from their totality Mr. Crookes deduces the existence of this *new* force; but whether the force be new or old is, perhaps, beside the question; at all events, the results seem to be distinctly contrary to teaching and experience. The powers of nature act, as far as we know, in accordance with certain laws, and these results seem to be (we do not say, are) different from those to be expected did these laws hold true—in other words, we have a miracle. But miracles were not wont, in olden times, to be manifested by the playing of tunes on accordions, or trifling with the laws of gravitation. For our own part, we should prefer to disbelieve the evidence of our senses than believe that these displays were miracles, in any sense of the word. We do not dispute the facts, any more than we dispute the facts put before our eyes by an Indian fakir or Western juggler. In either instance the utmost care has been taken to elicit the truth—in the case of the jugglers, generally with success, the trick being usually detected; but this is a problem we have not yet solved. Undoubtedly, the playing of an accordion and the depression of a spring balance imply the manifestation of force; but of a *new* force, no; that is a totally different thing. For our own part, we still prefer to hold to the doctrine that force is one and indestructible. It is true these results may be due to a mode of its manifestation whose laws are not yet known to us; but even this we do not admit. Meantime, at all events, we shall not speak of this as a *new force* in any sense of the words.

Since writing the above, a copy of the *Spiritualist* has fallen into our hands. This contains some details of other experiments conducted by Mr. Crookes with the further purpose of testing the nature of Mr. Home's powers. A vessel containing water was placed on the fulcrum, and another floated in it was touched by Mr. Home, so that no direct pressure could be brought to bear by Mr. Home's hands on the lever. In this instance, movements of the spring balance were registered, but they were not so powerful as when the fingers were applied directly to the lever. Similar experiments have been tried in America. Nevertheless, we need hardly say we are not convinced. Why, we repeat, are these powers limited to playing an accordion and diminishing gravity? Some other manifestation would be acceptable.

THE RECENT ELECTIONS AT THE ROYAL COLLEGE OF SURGEONS.

MR. BUSK'S election to the Presidential Chair of the Royal College of Surgeons last week will, we believe, meet the general

approval of those interested in the welfare of the College. The retiring President, Sir William Fergusson, has done excellent service during his tenure of office, and retires according to well-established precedent, with the thanks and best wishes of the Council and Fellows. Mr. Busk, although less known in the public walks of the Profession, has a very high reputation as a cultivator of its fundamental sciences, and has proved himself a valuable and painstaking Member of the Council. We congratulate both Mr. Busk and the College on his election.

The result of the elections on the 6th inst. must also be considered to be in every respect most satisfactory. The four gentlemen elected are worthy representatives of British Surgery, and amply deserve the support which was given to them by the Fellows—a body well able to form an estimate of their character and position. We had previously expressed our opinion that Mr. Wells's return was a matter of certainty, and, although unconnected with any of the large Hospitals, his position and services to the cause of Surgery carried him to the head of the poll. Mr. Critchett followed close upon Mr. Wells, and his success on the first occasion of his going to the poll is sufficient evidence of the great popularity which this eminent ophthalmic Surgeon enjoys and fully deserves. Mr. Le Gros Clark's character as an accomplished Surgeon and high-minded gentleman could not fail to secure him his re-election, and we may trust he will retain his seat on the Council until he enjoys all the honours afforded by the College.

The strenuous attempts made to prevent the re-election of Mr. Busk entirely failed. The weight of high character and scientific eminence preponderated, and, notwithstanding the absence of any Hospital connexion to back him, just as in the case of Mr. Wells, he went ahead of that very popular candidate and well-known Hospital Surgeon Mr. Barnard Holt, who secured a sufficient number of votes to show that his next attempt will be attended with a triumphant success. We confess that we are not surprised at Mr. Cock's failure, and we reiterate our opinion that it is a great pity that this amiable gentleman and excellent Surgeon should have been allowed by his friends to come forward after he has enjoyed all the honours which the College can bestow. Something, however, may be learned by mistakes, and the fact of his having obtained thirty votes less than those gained by the unsuccessful one of the new candidates ought to convince past Presidents that similar attempts to regain power will probably be attended with similar results.

We heartily congratulate the new Members of Council, and the Fellows on the manner in which they have exercised their choice.

THE CENSUS OF 1871.

THE preliminary report of the Registrar-General and his colleagues on the Census of 1871, taken on April 3, although referring more particularly to England and Wales, contains a summary of the population of Scotland, Ireland, and the islands in the British seas, and thus embraces the whole United Kingdom. The Census of Ireland was entrusted to a Royal Commission, that of Scotland to the Registrar-General of Scotland, and the population of the islands in the British seas was enumerated under the supervision of the respective Governors. The population of the United Kingdom on the Census day was 31,817,108, the number of males being 15,549,271, and of females 16,267,837, showing a preponderance of the latter amounting to 718,566. In all official returns it is usual to employ the population in the middle of the year as the standard on which the rates of births, deaths, marriages, and other facts are compared; and the population of the United Kingdom, so calculated, and including the inhabitants of the islands in the British seas, and the army, navy, and merchant

seamen abroad in the three Census years, 1851, 1861, and 1871, was as follows :—

Middle of Years.	Persons.	Males.	Females.
1851 . . .	27,764,034	13,656,998	14,107,036
1861 . . .	29,358,927	14,397,427	14,961,500
1871 . . .	31,883,564	15,581,093	16,302,471

The decennial increase during the two periods was as follows :—

	Persons.	Males.	Females.
1851-61 . . .	1,594,893	740,429	854,464
1861-71 . . .	2,524,637	1,183,666	1,340,971

The decennial rates of increase (per cent.) were :—

	Persons.	Males.	Females.
1851-61 . . .	5.74	5.42	6.06
1861-71 . . .	8.60	8.22	8.96

The annual rates of increase (per cent.) were :—

	Persons.	Males.	Females.
1851-6156	.53	.59
1861-7183	.79	.86

It is thus seen how much faster the population of the United Kingdom has increased since 1861 than it did during the previous decenniad. The total increase of her Majesty's subjects in the United Kingdom since her accession has been 5,900,000 ; and this, as the Registrar-General remarks, has been caused, not by the seizure of neighbouring territories, but mainly by the enterprise, industry, and virtue of her people.

On the proportion of the sexes in the United Kingdom it is remarked that the number of women and girls exceeded the men and boys at home by 925,764 ; after adding the soldiers and sailors abroad to the men and boys at home the excess of females is 718,566.

This preponderance of females at home is, however, probably counterbalanced by their scarcity abroad in 1871, as it was in 1861, it having been shown that during the latter year the excess of males in our own colonies amounted to 317,899, and in the United States to 735,429, giving a total of 1,053,328.

We acquit the Registrar-General of even the intention of a pun, when he remarks, on this subject, that those who seek to extend the sphere of *labour* for women will find, therefore, in Australia and America a most fruitful field for such of the sex as are willing to play a part in the foundation of the great States of the future ! But the fact of the compensating disparity of the sexes abroad remains for the consideration of those who are endeavouring to find employment for women at home in occupations and professions in which they must encounter the competition of men.

The annual rate of increase of population of the United Kingdom between 1861 and 1871 was .828 per cent. per annum, and at this rate the population would double itself in eighty-four years. Its natural increase is 1,173 a day, of whom 705 swell the home population and 468 emigrate. In the last twenty years the nation has added four millions to its numbers, and during the same period has sent out nearly as many more to the British Colonies and United States, where they are multiplying as rapidly as they did at home.

The enumerated population of England and Wales was 22,704,108 souls. This is an increase of 2,637,884 over the numbers living at the last Census, and exceeds the expected amount. It is at the rate of 1.24 per cent. per annum, or 13 per cent. in the ten years ; and should this rate continue the population will double itself in fifty-six years. The rate of increase during the preceding ten years was equivalent to 12 per cent. per annum. The rate of increase of population is the difference between the birth-rate and the mortality—thus, when to 1,000 living 35 are born, and 22 die annually, the rate of natural increase is 13, and the birth-rate remaining constant, this rate of increase varies as the rate of mortality rises above or falls below 22 ; so if the rate of mortality remain constant, the rate of increase varies as the birth-rate rises above or falls below 35. The birth-rate is necessarily limited by human

fertility, but there is no limit to which it may not be reduced ; on the other hand, the death-rate cannot be diminished below a certain figure, but may be raised to an indefinite extent. The increase of population in geometrical progression is maintained nearly all over Europe, but in one country it has been kept in check by a decrease in the birth-rate, effected, not by the restraint from marriage, called by Malthus "moral restraint," but by restraint of some other kind, to which, the Registrar-General observes, the qualifying adjective scarcely applies. In France the marriages have been kept up, but the average births to a marriage have been reduced to 3.1 ; the birth-rate in the last return (1853-68) is 26.35, which only exceeds the death-rate, 23.72, by 2.63 per 1000. The natural annual increase was barely .26 per cent. In England the children born in wedlock to a marriage are 4.3 ; the birth-rate is sustained at 35, and the mortality-rate at 23 per 1000. The difference, 12 per 1000, or 1.2 per cent., shows a natural annual increase nearly five times greater than that in France.

We have in the present notice given only a few of the facts and statements advanced by the Registrar-General. We shall conclude the analysis of the report in a future number.

THE WEEK.

TOPICS OF THE DAY.

THE Medical evidence in the recent trial for manslaughter was, we think, invested with undue importance both by the prosecution and the defence. If it were admitted—which it was freely by the latter—that the case was not one of suicide, but of homicide, it was clearly impossible, on any purely anatomical or Medical grounds, to absolutely assert or deny the truth of the theory set up on either side. From the mere post-mortem examination of the extent, direction, and character of the wound, no absolutely reliable data could be furnished for the unqualified assertion of either of the following propositions :—First, that the wound was the result of a wilful and determined stab delivered in the heat of passion by Mrs. Davy ; or, secondly, that the wound was, if not accidental, at least unintentionally produced in some rapid movement in a struggle between herself and Mr. Moon, he having threatened her with a decanter, and she having snatched up a knife to defend herself. We maintain that, in the case of a wound such as that described in the evidence—a wound entering the antero-lateral surface of the left chest, between the sixth and seventh ribs, having an inward course of five inches, and piercing the pericardium and left ventricle of the heart—whatever may be the probability of the case, no post-mortem examination could decide whether that wound was produced by an aggressive act or by some unpremeditated and unintentional movement in a struggle with an aggressor. Whilst, however, we say this, we would also say that we perfectly agree with the finding of the jury, and entertain no reasonable doubt that the theory of the prosecution was the true one. But our opinion, as also doubtless was that of the jury, is influenced by the facts in evidence as to the antecedents of Mrs. Davy, her ungovernable temper, and her previous threats to take away Mr. Moon's life. The evidence given by Mr. Savory and Mr. Morant Baker derived all its weight from these circumstances, and without them it could only have established a degree of probability which falls far short of certainty. On the other hand, we cannot agree with the witnesses for the defence in the opinion they are said to have expressed, "that it was more probable that the wound resulted from an accident." On the contrary, we think the weight of probability, even as far as the evidence from the post-mortem examination went, was decidedly on the other side ; but that it was possible that in a struggle for the possession of the knife the deceased might have accidentally received the wound or have fallen on the knife was demonstrated in court by Mr. Canton, and proved by Mr. Haynes Walton, who quoted a parallel case which had been treated at St. Mary's Hospital.

The evidence might have been sufficient—inasmuch as it established *possibility*—to have procured the prisoner's acquittal, had her antecedents been of another character.

The acquittal of the young man Edmund Walter Pook for the murder of Jane Maria Clousen, in Kidbrooke-lane, Eltham, has given universal satisfaction. No evidence was adduced which even connected the prisoner with the deed. The Medical evidence given by Dr. Letheby, as to the presence of some spots of blood on some clothes of the prisoner's, was just what Medical evidence should be—clear, scientific, and, above all, the statement of a witness, not of an advocate. It completely established the existence of some spots of blood on the prisoner's dress, but these were amply accounted for by the facts that he had cut his wrist, that he had bound up the wound of a lad who had been injured by machinery, and that he was the subject of epileptic fits, in which he frequently bit his tongue. But tolerably conclusive evidence was given that he was not near the place of the murder on the night in question, and there was not the slightest proof that he had any intimacy or connexion with the deceased. The case will be remembered, however, as a lasting disgrace to the police force. The way in which the police officers, by false statements, endeavoured to entrap the accused into admissions which would support their theory of his guilt, the unscrupulous way in which they suppressed the fact of a bloodstained duster having been found near the spot where the murder was committed because they could not connect the duster in any way with the accused, and the mode in which they hunted up and brought forward testimony of the most worthless character to support their theory of Pook's guilt will not be readily forgotten. The indignation expressed by the prisoner's counsel, the repudiation of the conduct of the police by the Solicitor-General, and the grave rebuke conveyed by the summing up of the Lord Chief Justice, express, in no exaggerated degree, the impression left by the case on the public mind.

A girl, Agnes Norman, aged 15, has been found guilty of attempting to murder a boy of 10 by endeavouring to strangle him during his sleep. The jury recommended her to mercy on account of her youth. There were several other indictments of murder against the prisoner, for wherever she went as a nurserymaid the children died unaccountably. Previously, indeed, to her conviction she had been acquitted, on the ground of insufficient evidence, of the murder of a baby of whom she had the care, who had died under most suspicious circumstances. The sentence on the prisoner is postponed until next session, in order that full opportunity may be given for a consideration of the case. The girl seemed utterly unconcerned during the trial. Surely this is a case in which a Medical commission should be empowered to inquire into her mental condition.

The herbalist, De Baddeley, and his wife, advertised as "the celebrated clairvoyante," have been found guilty and sentenced to twelve months' hard labour for unlawfully supplying a certain noxious drug—namely, ergot of rye—knowing that it was intended to procure abortion. The justice of the sentence is undoubted; but we would only remark that the proceedings of the police for the purpose of establishing the case were of a similar kind to those which in a recent trial brought down public censure upon a Medical man who simply acted under their direction. They obtained evidence against the prisoners by employing a witness to make false representations, and paid her for so doing. Does our law sanction this, even for the punishment of undoubted criminals? Surely the tactics of Jonathan Wild and of the French police are not the models to be imitated by Scotland-yard.

Mr. Gladstone, in announcing that it was the intention of the Government to withdraw the Pharmacy Act Amendment Bill, gave as a reason that the Bill could not be proceeded with without a great deal of discussion. We should think not, seeing that the Bill, as amended by Mr. Forster, would have placed

all Surgeons having open surgeries under the control of the Council of the Pharmaceutical Society.

The deputations which waited on Mr. Stansfeld on Tuesday last, from the Society for Organising Charitable Relief, the Poor-law Medical Officers' Association, and the Metropolitan Branch of the British Medical Association, obtained from that gentleman, in answer to their representations as to the pauperising effect of indiscriminate Medical charity, the assurance that the Poor-law Board was proceeding to urge forward the dispensary system in towns, under the Act of 1867; and he said that "even in the country, where the Board had no power of enforcing its views on this point as yet, the system was being adopted by Guardians, whom he had found generally willing to take advice." We are glad Mr. Stansfeld finds Boards of Guardians so tractable. His experience on this point, we think, is scarcely in accordance with that of his predecessors. He, however, told the deputation frankly that the Poor-law Board could not interfere with institutions supported by voluntary contributions, and he warned them against the over-ruling and over-governing inherent to a centralised system. With regard to provident dispensaries, he said it must be for the public, and not the Government, to establish them.

The lecturers of the Royal College of Surgeons have resolved no longer to admit female Medical students to their public classes. The female Medical movement in Edinburgh seems in a languishing condition.

We are informed that Mr. Reginald Stocker, M.B. Lond., has been elected Medical Tutor at St. Mary's Hospital Medical School. We believe there were eight candidates for the appointment.

REPORT OF THE ROYAL COMMISSION ON THE CONTAGIOUS DISEASES ACTS.

WE hope next week to lay a full abstract of this very able report before our readers, and have only space just now to remark that a daily contemporary, who has from time to time lent its columns to some of the most noisy opponents of the Acts, now urges upon the Government their immediate and absolute repeal, on the ground that the evidence has established their failure. So far from this being the general tenor of the report, we can assure our readers that the Commission has fully recognised the benefits already attained by the Acts, and admits that special regulations for the treatment and control of prostitutes likely to engender and propagate disease are alike just and expedient. The Commission advises the repeal of the Acts of 1866 and 1869, enforcing the periodical inspection of women, and not only maintains the Act of 1864, but advises its extension to certain parts of the metropolis, and to any other towns and districts the authorities of which may apply for the necessary powers and may establish Lock Hospitals. In addition to the extension of the Act of 1864, the Commission advises several measures by which prostitutes and the keepers of houses in which they live are put under strict police supervision.

The Commission also states that the result of their inquiries has been to satisfy them that the police are not chargeable with any abuse of their authority, and that they have hitherto discharged their novel and difficult duties with moderation and ability. So much for the sensational charges brought against the police by the opponents of the legislative control of prostitutes.

THE WINNER OF THE QUEEN'S PRIZE.

THE winner of the great prize this year at Wimbledon—the Queen's Prize—is, if not a member of our own Profession, at all events intimately connected with it. The great object of shooters' ambition has been carried off by Ensign Humphry, Cambridge University. He is a son of the distinguished Professor of Anatomy in the University, and is only 19 years of age. We congratulate both father and son on the honour so honourably obtained.

WIMBLEDON CAMP.

THE health of the camp continues extremely good. Very little diarrhoea has occurred, and the accidents have been limited to a few cut hands and sprains, and two cases of slight wounds from splashes of lead at the targets. A Cheshire officer has suffered slightly from sunstroke. Among the visitors to the Hospital have been the Home Secretary, Lord Sandhurst, and others. The Medical officers in charge are Dr. Temple, V.C., Staff Assistant-Surgeon, for the regulars; and Dr. Mayo, Inns of Court R. V., for the volunteers. Surgeon-Major Wyatt, of the Coldstream Guards, is not in residence at the camp this year, but acts as Consulting Surgeon. The earth system of latrines has worked well, notwithstanding the wet weather, except in one case, where one of the surface-drains of the common gave way, and flooded the pit. The injury was quickly repaired. Two ambulance-waggons from Paris have been exhibited for some days in the camp, one intended for four and the other for five patients; but there is nothing in their construction to call for special remark. They are ordinary four-wheeled waggons, such as the ingenuity of any carriage-builder could devise. They have no new provision for the prevention of jolting, which is the great desideratum. A simple and ingenious spring frame for the support of stretchers on the floor of railway-waggons, the invention of the Comte de Beaufort, is well worthy of attention.

ARMY MEDICAL DEPARTMENT.

MR. STACPOOLE having, on May 17, 1871, moved an address calling for a return of the officers of the Army Medical Department who are now employed in the office of the Director-General, specifying name, rank, and capacity in which these are employed, with the periods from which and to which they have been so employed, as well as a copy of orders or letters which prescribe any assigned period for the employment of military officers at the War Office or Horse Guards, a return containing the following information was laid before the House on June 20:—

“Deputy Inspector-General F. G. Balfour, head of Statistical Branch, from July, 1859, till present date; Deputy Inspector-General H. H. Massy, head of Sanitary Branch, from April, 1867, till present date; Deputy Inspector-General T. Crawford, head of Medical Branch, from February, 1865, till present date; Staff Surgeon T. G. Fitzgerald, Inspecting and Superintending issue of Medical and Surgical supplies, examination of Medical bills, and general Professional duties, boards, etc., from April, 1859, till present date; Staff Surgeon L. Kidd, assistant in Statistical Branch, and general Professional duties, boards, etc., from March, 1867, till present date; Staff Surgeon J. A. Marston, assistant in Sanitary Branch, and general Professional duties, boards, etc., from April, 1867, till present date.

“It has been decided that the office of Director-General shall be tenable for seven years. No period of tenure has been fixed for the other appointments, which are not staff but special appointments. EDWARD LUGARD.

“Article 115 of the Pay Warrant of December 27, 1870.

“All staff appointments, except those of officers on our personal staff, of our Commander-in-Chief, and of officers on his personal staff, shall be held for five years only, unless the officers shall be re-appointed under special circumstances. Service on the General's personal staff shall reckon as full-pay service.

“Article 417 of the Pay Warrant of December 27, 1870.

“The duties of the various departments shall be superintended and directed by the heads of such departments, who shall act under the orders of our Secretary of State. The rate of pay of the heads of the various departments of our army shall be fixed from time to time by our Secretary of State, and the appointments shall be held for five years only, subject to renewal in the event of our Secretary of State considering it beneficial for the public service.—July 19, 1871.”

CHOLERA IN POLAND.

ASIATIC cholera has broken out in Poland, and at Wilna the deaths for the last month have been ten per day.

ST. MARY'S HOSPITAL MEDICAL SCHOOL.

A PORTION of the share of students' fees which we stated a short time ago had been relinquished by the governors of St. Mary's Hospital for the benefit of the Medical School, has been devoted to the foundation of three scholarships in natural science, each of the annual value of £40, and tenable for three years. The first of these, and also an exhibition in natural science of the value of £20, will be awarded in September next, by open competitive examination. Scholarships of this kind afford very valuable encouragement to the acquisition of a fair knowledge of natural science by the student previous to his entry at a Medical School.

WEST LONDON HOSPITAL.

THE Duke of Devonshire, on Saturday, placed the memorial stone of the east wing and central building of the West London Hospital. In the three wards constituting the present building, accommodation is provided for forty-two beds. The address presented to the Duke stated that the number of in-patients during 1870 was 269, whilst the out-patients, who in 1869 were a little more than 13,000, were last year over 20,000. Nearly 8,000 visits have been paid in twelve months by the House-Surgeons; and this had taxed the efforts of the resident Medical officers to the utmost. During 1870, the attendance in the out-patients' rooms reached the enormous number of 61,304.

TESTIMONIAL TO DR. JOHNSTON, MONTROSE.

It is at all times satisfactory to our Profession to know that their labours, if not always so amply rewarded with this world's goods as might be desired, do, nevertheless, find a way to men's hearts, such as do few others. Marks of public esteem bestowed upon one member of the Profession, therefore, may in a certain fashion be appropriated by all, inasmuch as in him the Profession as a whole is honoured. No more satisfactory testimonies of public approbation have of late been given or received than one presented to Dr. Johnston, of Montrose, on the occasion of his retirement from private practice. After a hard-spent life of labour, Dr. Johnston has been able to retire from his Professional duties while yet in the enjoyment of a full measure of health and strength. A committee, most influentially constituted, was promptly formed, and a large sum of money was speedily collected. Subscriptions were only received from personal friends, otherwise the sum ultimately obtained would have been very much greater. Nevertheless, enough was received to provide a handsome dessert service in silver, which was presented to the Dr. and Mrs. Johnston in the Guildhall of the town. We cordially join in the hearty congratulations presented to them on the occasion.

SMALL-POX AT CHORLTON.

LAST week there were fifty-seven small-pox patients in the Union Hospital, an increase of ten on the previous week. Mr. Clements, the Medical Officer, said that no less than forty-six patients suffering from small-pox had been admitted during the month, a number far in excess of any previously recorded. The disease appeared to be gradually spreading over the various townships of the union, but by far the greater number of patients had been furnished by Hulme, other localities contributing in a less degree to the total.

SOCIETY FOR RELIEF OF WIDOWS AND ORPHANS OF MEDICAL MEN.

At a quarterly court of directors, held July 12, Dr. Burrows (President) in the chair, grants to the amount of £1278 10s. were made to fifty-five widows and forty-five children. Two widows and three children were added to the list. The death of one recipient of grants was announced. Two members were elected, and five proposed for election at next court, to be held in October.

YELLOW FEVER IN BUENOS AYRES.

WE are now in receipt of such further details from Buenos Ayres as may serve to supplement our article published on May 20, which brought us down no later than March 8. The deadly plague in that city, which is certainly one of the most striking events of our time, no less calculated to impress the understanding than the ruin of Mendoza by earthquake, or the fatal collapse of Paris under pressure of fire and sword, will no doubt supply materials for further deductions and argument in Medical science and history. Who, indeed, could have foreseen so entire a devastation? what mind could have anticipated so complete a fulfilment of Medical prognostics as opposed to the rude instincts of society? No lesser warning, perhaps, would be available for the education of the popular mind, ever prone to be led away by sophisms that are convenient to immediate profit, and flattering to the purpose in hand. A ready ear is yielded to false counsel, the most healthful axioms are perverted, and thus, in a critical hour, in the place of knowledge we find doubt; instead of decision, there is confusion. Thus, while the pestilence was at its very height—nay, on the very day that is confessed to have been its worst—a member of our honourable Profession came forward to insist that there was no yellow fever in the city, that only ordinary causes were in operation, that only “where the pineapple grows does this fever strike its tooth.” Nay, so far did folly go, that the waters of the Riachuelo, the common Fleet of the town, were commended by one gentleman as sanative. Part interest, part irrationality, such as no process of sifting invented as yet can exclude from sharing in Professional counsel; in all trying circumstances of life there is always more or less of this to contend with. The Medical press, admirable in most respects, seems not wholly purged from such alloy, for in the early days of the pestilence, while allowing its presence to be indisputable, it was content to attribute the existence of the yellow fever to the “special pathological constitution, to the defective hygiene of the domiciles, and the high temperature then prevailing.” In fact, nothing could be more sure than its invasion. Its previous existence in Paraguay (whence, also, the cholera had reached Buenos Ayres), its march through Corrientes, which it depopulated, the unimpeded communication with infected districts—made its coming more than probable, its arrival beyond a mistake. This happened at the beginning of February, or, rather, towards the close of the previous month, infecting first a single quarter—San Telmo. In this taxation of our brethren, which, to be of utility, must be of necessity unsparing, we must not omit a point of some nicety, in which Medical opinion was undoubtedly concerned. We allude to a municipal decree, given in the early days of the pestilence, for all persons attacked in the infected quarter to proceed forthwith, or be conveyed, to the lazaret. Cruel and against right as it appeared, on its first promulgation, the order roused up a large amount of protest from the bosom of the Faculty, who very correctly indicated localisation as the first and most reliable of resources in dealing with any contagion. The order was rescinded after three days under pressure of such ideas. At a later date, however, a degree of reaction occurred, and it was allowed that over a limited area, such as that of the town and suburbs, the action taken had been pernicious. How shall we stigmatise properly the delay of a fortnight which was given to the slaughter-house interest, the *saladeros*, to close their works which spread destruction through the city? It has even been affirmed that they tripled their operations in the time allowed, so as to make good the threatened deficiency in their stock. One sees here the subjugation of public health to material interests, which is only too exuberant in our age. “The society of hogs,” says a witty Spanish author, “is never particularly acceptable—no, not even if one were in hell.” But sure enough it is, there are always plenty to plead for them, to resent the least infringe-

ment of their rights. A moot point was the irrigation of the streets, insisted on by the authorities as preservative, objected to by others as diffusive of the plague and as stimulating it. It will be consoling to those who have sent their alms to the city that there was need of them—for charity has unaccountably received a chill, with some notable exceptions, in which a truly Castilian munificence was apparent. We cannot approve the ready acceptance of theatrical representations on behalf of the indigent by the ruling powers. In time of pestilence the theatre, and even the church gatherings, may be with better judgment avoided. There remains to be noticed one more precaution, the importance of which is insisted on by the press as the chief, or, at least, one of the most principal measures taken for relief of the town. This is the suppression or clearing out of the minor conventual establishments (*conventillos*). Not to delay in describing them, they may be particularised as foci of filth and nastiness. Of these, more than 400 are said to have existed in Buenos Ayres—no less than ninety-three in a single parish. They were notorious centres of infection. It was in the middle of April that their speedy evacuation was resolved on. It now remains for us to mention the names of thirteen members of the Medical Profession who have fallen victims to the epidemic in its later stage. These are as follows:—Drs. Bosch, French, Lucena, Molina, Amoedo, Muñiz, Gil Mendez, Argerich, Riva, Ruiz Moreno, Señorans, Zapiola, and Pietra Nera. The dead are no longer carried in coaches, but by rail, to a new cemetery away from the town. Among the mortuary returns astonishingly few English names appear. In a list of 293 in the middle of April, only four or five names of British nationality occur, and these are wretchedly disguised, as Diego Lenci, Riccardo Arosi (? Harris), aged 52; Carlos Kedeli, aged 35; Miguel Nelando, aged 34; Maria Dalpe, aged 31 (Irish). The dimensions of the plague, its course, and other points of interest concerning it, may probably occupy us later. At present we have been more earnest to lay before the reader grounds of general conclusion and argument deducible from these data than the facts which have led up to them, which are of a more local character and touch us far less nearly.

A RELIC OF BARBARISM.

WE observe that on the 13th inst., before Mr. Justice Lush, at the Oxford Assizes, Rachel Busby, indicted for the wilful murder of her child, at Little Barford, near Banbury, by drowning it in a pool near the cottage where she lived, pleaded guilty, and was sentenced to death. In answer to a question, she stated that she was *enceinte*, and a jury of matrons being empannelled, they confirmed her statement. The convicted woman was then removed to the county gaol, and has since been respited. It may have been all very well in dark and mediæval times to have taken a jury of matrons into consultation on such a point; but in the present advanced state of Medical knowledge, it is an amazing anomaly to have recourse to such means of arriving at a diagnosis in a matter on which the Surgeon of the gaol could have given a much more reliable opinion. The inconsistency of publishing modern books in black-letter manuscript, in preference to using the steam printing-press, would not be more absurd. Nevertheless, this still remains the legal method of determining the question.

HEALTH OF ST. MARYLEBONE.

DURING the second quarter of the present year, which terminated on the 1st inst., the number of deaths registered in the parish of St. Marylebone was 883, of which 408 were males, and 475 females. The deaths during the quarter were 149 less than in the first quarter of the year, and 143 less than in the corresponding quarter of 1870. It would appear that, notwithstanding the ravages of the small-pox, the mortality of St. Marylebone during the last three months has been unusually low.

THE LIQUOR LAW IN MASSACHUSETTS.

IN a lecture on America, delivered on June 12 last in the theatre of the School of Mines, Mr. Thomas Hughes, M.P., gave some information as to what he saw of the liquor traffic question in Massachusetts. Mr. Dalrymple's Bill, proposing legislative interference for the treatment of habitual drunkards in this country, having been withdrawn with a view to the whole matter being investigated by a Royal Commission, Mr. Hughes' sketch of the arrangements at work in that State is most interesting at the present time. We learn that a State Commissioner for the purchase and sale of intoxicating liquors is appointed annually. He is only allowed to sell to regularly appointed agents, and to no other persons. All liquors thus sold are analysed by one of the State Assayers, and the Commissioner can sell none which is not certified by the assayer to be pure. Five agents only are allowed for the whole city of Boston. These are salaried officers, and are allowed to sell only pure liquors, and that, too, at the lowest cash prices. The agents employed by the governing bodies of cities and towns are also paid officers, and are compelled, under heavy penalties, to purchase only of the State Commissioner. The manufacture or sale of intoxicating liquors, except by authorised agents, is unlawful, and subject to heavy penalties. This law is not allowed to remain a dead letter. The State regulations so far are of general application, and their maintenance, as everybody's business, might become lax, or even fall into desuetude, were they not supplemented and rendered more effectual by the power further conferred upon individuals of entirely prohibiting the sale of intoxicating liquors to persons of habitually intemperate habits. It is provided that the husband, wife, parent, guardian, or employer of any person in the habit of drinking to excess may serve notices in writing on sellers not to deliver liquor to the drunkard. If such notice be disregarded within twelve months, an action may lie against the seller for damages not exceeding \$500. Married women may bring such actions, and recover the damages to their separate use. Drunken people may be arrested without warrant, but are discharged on disclosing the name and address of the person who sold the liquor. The rules against the sale of liquors, except according to law, are very stringent. The means of putting them into operation are simple and easily worked, and the penalties are severe. Though not entitled to speak as to the results of this law from personal experience, Mr. Hughes could say that he did not see a single drunken person in New England. The points in the above-detailed system which appear to us to deserve most serious consideration as to their applicability to the liquor trade of this country are—the wholesale trade in liquors being only permitted through a Government agent; the means taken to secure the purity of all liquors sold, both wholesale and retail; and, lastly, the power conferred upon individuals of prohibiting the sale of liquors to habitual drunkards.

PHTHISIS IN MELBOURNE.

THE discussion as to the relative prevalence of phthisis in Victoria has been carried on with considerable acrimony. It is to be hoped that the question may be solved in some definite manner. The following is from the *Australian Medical Gazette*—

“We understand that an application will shortly be made in Parliament, on behalf of Dr. Thomson, for a return of all the deaths from phthisis in the whole of Victoria from 1865 to June 30, 1870—the period for which phthisis statistics have already been compiled for the Melbourne district. We hope that, in view of the great interest and importance of the subject in a national as well as a social and economic point of view, the Government will not only refrain from offering any opposition, but that they will afford every facility for the preparation of the required return. The accuracy of Dr. Thomson's statements respecting the frequency of consumption in this colony has recently received strong confirmation from a disinterested and unexpected source. We are informed that a

life insurance company in this city has lately tabulated the causes of death amongst those insured in its office for a number of years. The result of the investigation showed that about one-third of the deaths among the insured were occasioned by phthisis.”

CURE OF SNAKE-BITE.

Dr. HILL reports in the *New South Wales Medical Gazette* a case in which a woman was bitten on the forearm by a large black snake. Ammonia and brandy were administered, and the bitten part excised soon after the bite was inflicted. After a time drowsiness and vomiting set in. The woman made a good recovery.

A GOOD EXAMPLE.

THE patients of the Royal Free Hospital were on Tuesday evening last invited to an entertainment in the theatre of the Hospital. Readings, recitations, and songs afforded much amusement to the audience.

AMERICAN PHYSICIANS.

ON April 30 last there were 49,798 “Physicians” in the United States. Of these, 39,070 were allopathic, 2961 homœopathic, 2860 electric, 133 hydropathic, and 4770 miscellaneous and not classified.

FROM ABROAD.—THE GASES OF PUS—THE SAVANTS OF FRANCE AND GERMANY.

PROFESSOR MATHIEU, of the Val-de-Grâce Hospital (which, we may mention, the Government are about to discontinue as a Military Medical School), has recently (*Gaz. Hebdomadaire*, July 14) published the results of some investigations which he has been engaged in concerning the gases of pus. Among those which have been extracted is hydrogen, in sufficient quantity to produce the characteristic sound in its burning, even when only a few cubic centimetres of the pus have been operated upon. Besides this, pus contains carbonic acid, a small quantity of nitrogen, and some traces of sulphuretted hydrogen, but never any oxygen. After specifying the results of several analyses of pus derived from various sources, M. Mathieu says—

“The following is the conclusion to be drawn from these analyses:—The products of suppuration have such an affinity for oxygen that they decompose organic substances in order to assimilate this gas, and to set at liberty carbonic acid and an excess of hydrogen. Our researches have been extended to pus which has not come into contact with air, and to pus which has been exposed for a more or less long period to free air. As a consequence of such comparative experiments, it results that the pus of itself can undergo decomposition, for if it be kept external to the body the quantity of hydrogen and carbonic acid may become increased twofold. The pus of glandular abscesses contains a much smaller proportion of carbonic acid than that derived from other sources, but it contains a sensible quantity of hydrogen. Pus of pyæmic subjects contains a very large quantity of gas, indicating the operation of energetic elements of disorganisation. The toxic properties of pus, supposing that they are dependent upon the phenomenon of oxidation, are thus very variable; but I have never yet met with any, even when it has been collected free from the contact of air, which has not contained hydrogen, and which was, therefore, capable of producing decomposition of the animal matters which enter into its composition. Analyses of gases of the blood exhibit no traces of hydrogen. As complementary to these analyses of the gases of pus, I have performed other experiments consisting in the retention of a given quantity of purulent liquid in contact with a determined volume of air. When the temperature of this liquid is raised to the equivalent of that of a wound, an amount of oxygen disappears in two or three hours, which it would require three or four days to effect at the ordinary temperature. Heat is, therefore, a primary element in the production of the change in pus. Agitation of the air is a second cause of speedy decomposition of the pus; for while, after being kept in a state of quietude for three hours, the absorption was but 2.95cc., it was 3.22cc. after only two hours, when the liquid had been subjected to a momentary agitation. The change is effected

still more rapidly if a little dried purulent matter be added to the liquid, the proportion of oxygen absorbed by pus so contaminated being almost double the quantity derived from the same source, and kept the same time, but without receiving such addition. The addition of a putrid liquid also accelerates the absorption of oxygen by a purulent liquid, but in a less proportion. Dried pus, therefore, plays the part of a ferment in laudable pus. . . . Pus, and especially pus which has undergone alteration, is certainly a cause of mortality after traumatic lesions; and as dried purulent dust has thus been shown to render the alteration of pus much more rapid, we can understand the danger of overcrowding and insufficient ventilation of wards containing wounded persons. The above experiments also explain the utility of cold applications to wounds in a state of suppuration, and the necessity of immobility during the treatment of wounds of the joints or bones treated conservatively.

"When a powerfully smelling pus is distilled at a mean temperature of 45° C., which is possible by means of the mercurial pump, a fetid and very alkaline liquid is obtained. My assistant has shown that this alkalinity is due to ammoniacal salts (the carbonate and sulpho-hydrate), and he has also been enabled to separate by ether a small quantity of volatile oil, to which pus about to become decomposed certainly owes its odour. Believing that this liquid might be endowed with deleterious properties, I injected it into the trachea and cellular tissue, but without giving rise to any serious accidents. These facts corroborate the theory held by Professor Verneuil, which attributes to a fixed substance all the phenomena of septicæmia. The volatile products of pus would never prove a cause of poisoning or of propagating putrid infection to a distance. This, indeed, might be deduced *à priori*, as purulent infection never takes on the epidemic form except in subjects in whom there is a lesion of the integuments. The dried purulent dust suspended in the air, and becoming deposited in wounds, hastens on the oxidation of the pus, increases its noxious properties, and multiplies cases of pyæmia."

It is pleasing to find that the rancorous hostility which at first manifested itself amongst French scientific men against those of Germany has much abated; and we doubt not that ere long the relations which were so mutually advantageous will be re-established. Under the circumstances, a display of great irritation was only natural amidst so much suffering and severe exaction, and in face of the fact that the German *savants*, so far from interposing to moderate the vehemence of their countrymen, were their most active instigators. Even the advances they have made towards reconciliation have somewhat of a superciliousness about them. Baron Liebig, indeed, took an early opportunity of an academical address, which we reproduced at the time (*Medical Times and Gazette*, April 22, p. 458), of assuring their late enemies that, now the Germans had gained their object, they were willing to be on the best of terms with them; and that, as far as he himself was concerned, he could never forget the generous hospitality and assistance he received in his younger days from some of those placed in the highest posts of French science, upon whom he had no other claim than, manifesting a disposition for laborious research. The *Gazette Hebdomadaire*, referring to this address, observes:—

"Baron Liebig declares his hearty belief that there does not prevail in Germany any national hatred against the Latin races. Germany, well content with the energetic remedy the cost of which we are paying, is desirous of recalling the hospitality which she received at the hands of the Gay-Lussacs, the Aragos, the Thénards, and others, and, deigning to pardon us, invites us to re-establish our relations with her. We hope that in France we shall be enabled to forget the pitilessness of our enemy in order to be enabled to continue scientific intercourse with him, because higher interests are in view and the well-being of both of us is concerned. But even scientific France herself will require a long period to enable her to forget the miseries of this invasion, and she will call to mind the fable of the serpent and the husbandman. This journal has the more right to speak in this tone, for none other has shown a stronger desire to vulgarise the progress of science, originate wherever it may."

The writer concludes his article by putting a pertinent question to Baron Liebig—viz., whether the report which is so generally accredited be true—that he who has so warmly

testified to the hospitality with which Thénard and other French *savants* received foreigners in his time, manifested any recollection of it on the occasion of Thénard's son (himself a distinguished man of science) being presented to him after being deported to Germany as one of the hostages? At all events, one fact remains certain—and a sad fact it is—that no one word of protest has issued from the educated and scientific classes of German society against the barbarous revival on the part of the military authorities of the practice of seizing innocent and peaceful persons, totally unconnected with the disputes at issue, and holding them as hostages. This practice, which must be regarded as having inflicted a deep disgrace on the German name, has become invested with additional horror by the procedures of those who imitated it in the French Commune. In no former revolution in France had it ever been adopted, and, but for the German example, would not have been thought of in this last one.

PARLIAMENTARY.—PUBLIC HEALTH (SCOTLAND)—FACTORIES AND WORKSHOPS ACT AMENDMENT BILL—SITE OF THE NEW MINT—HABITUAL DRUNKARDS—VACCINATION—THE CONTAGIOUS DISEASES COMMISSION—THE PHARMACY BILL.

On Thursday, July 13, in the House of Lords,

The Public Health (Scotland) Supplemental Bill and the Factories and Workshops Act Amendment Bill passed through Committee.

In the House of Commons,

The Government Bill for Erecting the New Mint on the Thames Embankment, and thereby loading the air with the products of chemical operations, was rejected by a majority of 23.

On Friday, July 14, in the House of Commons, on the motion of Mr. Dalrymple,

A Select Committee was appointed to consider the best means of dealing with habitual drunkards.

On Monday, in the House of Lords,

Lord Buekhurst expressed surprise, and much regret, that up to the present period of the session no measure had been introduced by the Government into their lordship's House relative to vaccination, or any other sanitary measure to check the progress of the alarming disease which for so long a time had been committing great ravages in the metropolis and elsewhere. Every day cases were reported by the press, showing the importance of some energetic measure, and, whatever course might now be adopted by her Majesty's Government, he should be prepared early in the next session to move for the appointment of a Select Committee to inquire into the state of the law as regards vaccination.

In the House of Commons, in reply to Mr. Heygate,

Mr. Stansfeld said it was the practice in sparsely-populated unions to admit of separate vaccination contracts for the months of April and October only. The object of that arrangement was to secure the attendance of a sufficient number of children for vaccination and the supply of fresh lymph. It was true an application had been recently made to the Poor-law Board by the Guardians of the Hambleton Union to sanction such an alteration of the vaccination contract as would enable vaccination to be performed in the month of July, but the Board of Trade had advised them not to assent to the arrangement.

In answer to Mr. Baines,

Mr. Bruce said the report of the Contagious Diseases Commission would be in the hands of the members in the course of a few days. It was signed by twenty-three of the twenty-five members, two being absent—one from illness, and the other on duty. The number of dissents detracted from the unanimity of the report. Two-thirds of the members were in favour of qualified compulsory application of the Acts; one-third (or rather seven) were in favour of strengthening rather than weakening the Acts; six were in favour of repealing all compulsory legislation; and all were in favour of further legislation, with a view of modifying the law to make it applicable to the whole country. Such a report was intended for the information of Government, of Parliament, and of the whole country; and at this period of the session it would be impossible for hon. members to give due consideration to the report, so as to be able to pass a useful measure founded upon it. It was, therefore, not the intention of the Government to introduce a Bill. Strong feelings had been created in the public

mind by the repetition of statements that in carrying out these Acts outrages had been committed upon innocent and virtuous women, and those statements had not been confirmed. Had they been confirmed, it would have been the duty of the Government, under any circumstances, to repeal Acts capable of such abuse; but the Commissioners said that the result of inquiry was to satisfy them that the police were not chargeable with any abuse of authority, that they had discharged delicate and difficult duties with moderation and caution, and that there was no foundation for the charges which had been so rashly made and repeated, and which had contributed to excite public indignation against these enactments. That finding was unanimous, and an examination of the facts showed not only that many of these statements were gross exaggerations, but that the greater part of them were sheer inventions. The House would therefore see that the substitution of legislation for that now in force was a matter which required on the part of the Government deep and anxious consideration, which could not be given to it either by the Government or by private members at this period of the session.

Mr. Gladstone, in the course of his speech on the state of public business, announced that the Government did not intend proceeding with the Pharmacy Bill.

On Tuesday, in reply to Mr. Read,

Mr. W. E. Forster said the Government were very anxious to pass the Vaccination Bill during the present Session, for it carried out the suggestions of a committee, and proposed an important administrative amendment upon a matter respecting which every member must feel that legislation ought not to be postponed.

SMALL-POX RETURNS OF THE ASSOCIATION OF MEDICAL OFFICERS OF HEALTH.

DONATIONS.—The Surgical Aid Society has received twenty-five guineas from J. S. Fletcher, Esq. The Metropolitan Convalescent Institution has received £50 from Lord Overstone. The City of London Truss Society acknowledge £105 from W. C. Coulthurst, Esq., and £105 from "H. O." The Fishmongers' Company have sent a donation of £50 towards completing the buildings of the National Sanitarium at Bournemouth. The Queen has contributed £100 to the same fund.

AUTOBIOGRAPHICAL RECOLLECTIONS OF THE PROFESSION.

No. XIV.

By J. F. CLARKE, M.R.C.S.,

For nearly forty years on the Editorial Staff of the "Lancet."

The North London Hospital—Robert Liston—First Introduction to the "Lancet"—Thomas Wakley's Courage—Literature, Law, and Medicine—Early Reporting—The Medical Societies forty years since—Medical Periodical Literature—Quarterly and Weekly Journals—"Erinensis"—"Scotus"—The "Intercepted Letters."

IN the early part of the year 1834, whilst I was a student, a girl came under my care with a great-toe in a state of necrosis. I was anxious that it should be removed. Accordingly, I sent her up to the North London Hospital. Liston had, some short time before, been appointed Surgeon to the Hospital, and my patient was placed under his care. I was quite a stranger to Liston, but as soon as he was informed by me that I had sent the patient to be operated upon, we became friends at once. This was the commencement of a friendship which ended only with the life of "the master." "I shall take the toe off," he said, "on Thursday; I hope you will be present." I was present. I had never seen him operate before, and was struck with the manner in which he handled the knife. Indeed, altogether, there was something so novel and striking in the proceeding that, simple as it was, could not fail to attract the attention and command the admiration of the spectators. The girl made an excellent recovery. I reported the case in Ryan's *Medical and Surgical Journal*, and continued to attend the Hospital, with the intention of reporting cases as they occurred. Liston had seen my report in Ryan's *Journal*, and spoke to me on the subject. He expressed himself pleased with it, and inquired if I knew who was the reporter. I told him I was. He then suggested that I should become connected with the *Lancet*, and gave me a letter of introduction to the late Mr. Wakley. I entered into an engagement with that gentleman to report Hospital cases, write notices of new books, and, in fact, to make myself "generally useful." For a considerable period I was the main support of the journal. I always, however, made my literary labours subservient to my more strictly Professional duties—in fact, literature was my amusement; practice the business of my life. My duties were not always unpleasant. In the earlier days there was a good deal of adventure and excitement, and I liked my employment. Moreover, there was something in the friendships I formed, and in the fact of my being a "pioneer," as it were, of progress. I served, too, under a man from whom I never for more than thirty years had an unkind word. Whatever were the faults of Thomas Wakley, it is certain he was brave, determined, and manly. He never left his *aide-de-camp* to bear the whole brunt of an assault. He cheered on the forlorn hope which he headed, and having got into a difficulty boldly faced it, and fought his way out of it. There were no little pettifogging manoeuvres to escape responsibility when he had incurred it—no retreating from a position with a fallen crest, and a craven heart, at the threat of an antagonist, or the fear of an action for libel.

Many of the most eminent lawyers of the past and present age have owed their success, not in a trifling degree, to their connexion with the political press as reporters. Foremost amongst these was John Lord Campbell, who commenced the career of a briefless barrister as reporter on the *Morning Chronicle*. That once renowned journal was, at the period when Campbell joined it, edited by Perry—one of the ablest and most independent of journalists. (a) Perry "introduced"

(a) When Sheridan was lessee and manager of Drury-lane Theatre, he displeased Perry by his incompetence and irregularity. The *Morning Chronicle* was silent as to his doings. Meeting Perry, with whom he was on friendly terms, at a dinner party, Sheridan complained that he was neglected by the press. "Well," said Perry, "as far as I am concerned, I have refrained from noting your proceedings at Drury-lane out of charity to you—in fact, I must have condemned them if I spoke of you at all." "Oh," said Sheridan, "my dear fellow, abuse me as much as you please, but pray don't treat me as if I were not worth powder and shot." O'Connell used to boast that he would never have been so popular as he was had he not been "the best abused man in the kingdom." I had a conversation with the late Lord Lyndhurst, who, many years ago, I was

several of his reporters to the successful practice of the law. It is unnecessary to refer to many other well-known cases of later date.

There can be no doubt that the training which reporting gives is of immense advantage in after life to those engaged in that occupation. During my long connexion with the *Lancet*, I have been associated with men who had their "spurs to win." They have owed something of their success in life to that journal, and legitimately so, I think. They who elevated and adorned the literature of Medicine were entitled to publish their lectures and contributions on the practice of Surgery and Physic in the journal whose reputation they had done so much to enhance. (b)

When I joined the *Lancet* there was no regular staff. George Mills, afterwards deputy-coroner, was sub-editor, and there were occasional leader-writers. There was not a reporter connected with the journal. Lambert had so damaged reporting that no one cared to identify himself with that pursuit. Indeed, the difficulties to be overcome were very great, more especially as regards the societies of which I shall speak hereafter. Occasional reports of cases were sent *sub rosa* from some of the Hospitals, but the names of the senders were kept a profound secret. My first reports were from the North London, now University College Hospital. This had been just founded, and the staff was the most brilliant in London. I found plenty of cases worth recording. Samuel Cooper, Robert Liston, and Richard Quain, as Surgeons; John Elliotson, Anthony Todd Thomson, and Richard Carswell, as Physicians, gave clinical lectures regularly. From these and my note-book I kept up a tolerable supply to the journal. There were many incidents connected with my labours at the Hospital which will be referred to at the proper time; but I may say that there were two parties in the institution at "daggers drawn" with each other. The one party was headed by Liston, the other by Elliotson. Elliotson's party was numerically the stronger. A fierce antagonism was carried on for a considerable time. However, I managed to steer clear of these quarrels, and attended chiefly to my duties. Soon after I joined the *Lancet*, Mr. J. H. Horne, now in practice in New Zealand, was engaged to report the London and Westminster Medical Societies. This he did with considerable ability, but he sometimes gave great offence by attaching notes to the different speeches. These notes were his own views of the subjects under debate, and were occasionally anything but relished by the speakers. The consequence was Horne was compelled to beat a retreat. I was now requested to take his place in addition to my other duties, and this I did. The interval between the resignation of Lambert and the appointment of Horne had to some extent calmed down animosities, but these were again revived. Under these circumstances I took my seat on the back form of the Medical Society, at their house in Bolt-court. I had made up my mind to abstain from comments of any kind, and to condense as much as I could with justice to the speakers. I found the task I had undertaken was one of considerable difficulty. I was to a certain extent tabooed by the Fellows, each and all of whom appeared afraid to hold any conversation with me. No abstracts of the papers or cases read were supplied, and the debates were frequently very lengthy and very elaborate. The Members of the Westminster Medical Society were not so exclusive, and I managed to get on with them pretty well. After a time, the mode of my reporting in Bolt-court appeared to give satisfaction. One after another the Fellows spoke to me,

in the habit of meeting at dinner at the house of a connexion of mine. It was at the period the late Lord Truro was Lord Chancellor, and was succumbing to the attacks made upon him by the press, which eventually ended in his resignation of the great seal. "Truro," said Lord Lyndhurst, "has been frightened by the attacks made upon him. He should be gratified by these notices. Had I suffered such attacks to influence my conduct, I should not have been three times Lord Chancellor of England." It is remarkable that Thomas Wilde should have taken so seriously to heart the adverse comments made upon him by the newspapers. But it must be remembered that he was an old man, worn out by more than half a century of the hardest work at the bar. In the full vigour of health and strength the famous "serjeant" would have "laughed to scorn" such attacks.

(b) It has been erroneously supposed that a taste for literature is an obstacle to success in life of lawyers and Doctors. Experience has shown the fallacy of this supposition. Blackstone wrote poetry—was his fame and success as a great lawyer injured by his connexion with the muses? Lord Denman and Judge Talford were great judges; not the less so that one had translated the Greek Anthology, and the other was the author of "Ion." Arbuthnot and Mead were the great Physicians of their time, spite of their proclivities towards poetry and the classics. Jenner lost none of his popularity as the foremost amongst us because he wrote his "Signs of Rain," at the very time he discovered the power of vaccination over the most frightful scourge that afflicts humanity. It is needless to enlarge on this subject; the cases in point are numerous, and most of them familiar to all of us.

and eventually I formed friendships with many of them which have lasted till the present time.

For a long time after my commencing the Societies, we did not report the Medical and Chirurgical, but it was thought advisable to do so. Accordingly I made arrangements for the purpose. I found that there was a strong general feeling against reporting. I was aware, however, that a bye-law existed which permitted reporters to copy official abstracts of the papers read and prepared by the secretaries. I knew, moreover, that these abstracts regularly appeared in the old *Medical Gazette* without any report of the discussions. On applying to Mr. Williams, the sub-librarian, I was informed that the abstracts were never in the library, and I was referred to one of the honorary secretaries on the subject. On applying to him he treated me somewhat brusquely, and declined to give me any assistance or information on the matter. It was Wednesday. At length he said the abstracts should be at the library of the Society on Friday. I reminded him that we went to press on Thursday night, and it was absolutely necessary, if my report were to appear that week, that I should have the abstracts early on that day. He declined to promise. "Very well," I said, "if I find the abstracts appear in the *Medical Gazette* of this week, and I do not have them in time for the *Lancet*, I shall know how to act." The abstracts were forthcoming the following day. For very many years the only published proceedings of the debates of this Society were those which appeared in the *Lancet*. These, indeed, are the only records of what Sir B. Brodie styled "as important—sometimes more important than the papers themselves." At first, it is difficult to describe the labour and harass I endured in taking my reports of the Societies. I never wrote shorthand, so-called, but, of course, had an abbreviated style. Even had I practised stenography it would have been impossible to have employed it with advantage. It is wonderful how some speakers may be condensed without injuring their speeches—in fact with improving them. No greater punishment could be inflicted on some debaters than to report their harangues *verbatim et literatim*. I soon, however, got into "a system," and then the work was easy enough. It was only occasionally, when I was fatigued after a hard day's work in practice, that I found my duties irksome, and to a degree painful. In the course of these papers I shall have occasion, now and then, to refer to some of the difficulties and dangers I experienced in reporting.

At this time (1834) the periodical literature of the Profession was in a transition state. At all events, it had not developed itself into anything like its present importance and power. The old *Medico-Chirurgical Review*, edited by Dr. James Johnson, was a cumbersome quarterly, chiefly filled by what were called "reviews," but which were in reality almost reprints of works issued in the preceding quarter. There were occasionally original reports of cases, and usually a few editorial remarks on passing events; but these were more in the nature of a postscript to a letter than the letter itself. The work was tame, heavy, and unprogressive. The *Medical Repository*, then edited by Dr. Copland, was a quarterly review even duller than the *Medico-Chirurgical*, and was called by the *Lancet* "the Mausoleum." It was a spiritless publication, and died a few years after of inanition. The weekly journals were the *Lancet*, the *Medical Gazette*, and the two London Medical and Surgical journals, Renshaw's and Ryan's. During the ten years of the *Lancet's* existence it had been like Ishmael in the wilderness, "his hand against every man, and every man's hand against him." It had been abusive, unscrupulous, bold; "the wild boar of the forest," as was said of Junius. It exercised considerable influence on the political condition of the Profession, and not a little on its science and usefulness. Mr. Wakley, with his usual sagacity, published all the most important lectures delivered in London, often at great cost, and sometimes with considerable risk. Shortly before this time, the "Intercepted Letters" of Wardrop, some of the most pungent and able articles ever written, had appeared in the *Lancet*. In my sketch of Wardrop I have referred to them. Those who are interested in the history of the Profession at the period referred to, can understand what an immense influence these letters had on the power and circulation of the journal. But in addition to Wardrop's contributions, the letters of "Erinensis" and "Scotus" attracted much attention. It is doubtful whether any articles which appeared in the *Lancet* during my long connexion with it, had more literary merit than those of "Erinensis." His sketches of Irish Medical celebrities had all the truthfulness and vigour of Shiel's "Sketches of the Irish Bar," which had some few years before been published in the *New Monthly Magazine*. But "Erinensis" was superior even

to Shiel in raciness and spirit. Who was "Erinensis"? I cannot answer this question. Many friends with whom I have conversed on the subject, were convinced that they knew him. But I am confident they are all mistaken. He was certainly not a lecturer on anatomy in Dublin, as many have supposed. The letters of "Erinensis" were forwarded to the *Lancet* office anonymously. The payment for them was made in cash to an unknown person at a coffee-house near Temple-bar. George Churchill, who for upwards of twenty years was the publisher of the *Lancet*, and the factotum of Mr. Wakley, declared that "Erinensis" was never personally known to anyone connected with that journal. Like Junius, he might take for his motto, "*Stat nominis umbra*." The shadow of his name is still all that we know of him. But those who would seek to learn the great power that the *Lancet* exerted at this period might find in those remarkable letters some answer to their inquiry. (e) The letters of "Scotus" were able and energetic, but altogether inferior to those of "Erinensis." The author of the letters of "Scotus" is, I believe, still alive, and it is not in the province of these papers, unless under extraordinary circumstances, to refer to persons still living. Contributors to the periodical literature of the Profession of the present day will probably be astonished that, in 1834, it was difficult to get any contributor to attach his name to the article he sent for publication; in fact, he was afraid of being even suspected of writing for such a journal. At this time, with but few exceptions, writers or contributors to periodical Medical literature derived no advantage from the publication of their lucubrations. No; they sought for reputation and practice from connexion with some Hospital or dispensary, no matter how low it was in the scale, or how unimportant in public estimation. It was then thought that such a connexion was the stepping-stone to fame and fortune, and the contests for appointments to these institutions were frequently most costly and difficult. With some exceptions, these severe contests are things of the past; but even now there are men weak and foolish enough to spend time and money to obtain a position which, if they have not talent and acquirement to fill with credit and honour, fails to give them the advantage they sought.

Actions for libel for infringement of copyright, etc., were as "plenty as blackberries" against the *Lancet*. A coalition of almost all the leading Physicians and Surgeons was formed to counteract the "evil influence" of that journal. The *Medical Gazette* had been established by this coalition as a rival journal. But it assumed "quality" and "high breeding." Though it had been established six years, it was insipid and tame. Valuable communications were made to it by the "heads of the Profession," but it wanted the light, witty, and satirical spirit of the *Lancet*. It was edited by Dr. Roderick Macleod, one of the Physicians of St. George's Hospital. He was a gentleman and a scholar, but in no ways fitted to grapple with the Boanerges to whom he was opposed. He was nicknamed "Roderick the Goth," and attacked weekly in the *Lancet* in every way short of libel. The contributions to the *Gazette* were reviewed in such a spirit of harshness and ridicule, that it frightened the timid and disgusted the bold. Still the *Gazette* held on: its circulation was small, but then the journal was "highly respectable." I spoke in my last article of the two journals called *London Medical and Surgical*. Such was the state of the periodical literature of Medicine thirty-six years since. It was a state of things which I hoped to assist in altering, and above all to infuse a healthy and impartial tone into the reports from Hospitals and Societies. It was a work of many years, but at all events I have lived to see a vast improvement in many ways. (d)

THE Hospital for Sick Children, at Brighton, was opened on Friday last by the Bishop of Chichester.

(c) I may state that, some few years since, a man walked into the *Lancet* office in a state of apparently great destitution, and asked for some relief for pressing difficulties—difficulties of common maintenance. George Churchill inquired what claim he had on the *Lancet*. I am "Erinensis," he replied. Churchill tested him on some points with respect to his identity, and, being satisfied with the answers he received, Churchill stated his case to Mr. Wakley, and he was relieved.

(d) In order to show how strong the feeling against the *Lancet* was in some minds, and how lasting it became, the following little anecdote may not be out of place. Since I have been publishing these sketches, I have received numerous letters of inquiry and of information. Amongst one of the former was a request of me to ascertain, if I could, some particulars of the elder Cline. One gentleman, a former President of the College, only I knew who was intimate with that distinguished Surgeon. I was anxious to place some information before the Profession respecting a great Surgeon and a good man—too little known—and I accordingly wrote to the gentleman referred to. He sent him copies of the journal containing my first two sketches, and asked him politely if he could give me some short account of Cline. My letter was never even acknowledged!

THE FRENCH AND RED-CROSS SOCIETIES.

A MEETING between the representatives of the nations of France and England was held on Monday evening at Willis's Rooms, when Drs. Ricord and Demarquay, delegates of the Ambulance Society of the French Press, and Count Serrurier, delegate of the Société de Secours aux Blessés, were entertained at a banquet given by the most distinguished Physicians and Surgeons of this metropolis, under Sir William Fergusson, Serjeant-Surgeon to her Majesty. These gentlemen, who lately arrived in London as representatives of the French Government and the French International Aid Society, were the bearers of thanks and honourable recognition of the friendly assistance rendered to the sick and wounded of the French army by the officers of the British Society, under the presidency of Colonel Loyd-Lindsay. There were present:—Dr. Paget, President of the General Medical Council; Dr. Burrows, President of the Royal College of Physicians; Mr. George Busk, F.R.S., President of the Royal College of Surgeons; Sir Alexander Armstrong, K.C.B., Director-General of the Medical Department of the Royal Navy; Mr. T. B. Curling, F.R.S., President of the Royal Medical and Chirurgical Society; Mr. J. Hilton, F.R.S., President of the Pathological Society; Dr. Gull, F.R.S., President of the Clinical Society; Dr. B. Hicks, F.R.S., President of the Obstetrical Society; Dr. Andrew Clark, President of the Medical Society. The metropolitan Hospitals were represented by:—Mr. J. Paget, F.R.S., Mr. H. Coote, Mr. L. E. Holden, Mr. Savory, F.R.S., and Mr. G. W. Callender, F.R.S., of St. Bartholomew's Hospital; Dr. Barnes, Mr. S. Jones, Mr. McCormack, and Mr. F. Mason, of St. Thomas's Hospital; Drs. B. O. Rees and Pavy, F.R.S., Messrs. Bryant and Durham, of Guy's Hospital; Messrs. Partridge, F.R.S., John Wood, F.R.S., Bowman, F.R.S., and R. Bell, of King's College Hospital; Messrs. Critchett, Couper, and Maunder, of the London Hospital; Messrs. Gascoven, S. A. Lane, and Norton, of St. Mary's Hospital; Mr. H. Hancock, sen., Vice-President of the Royal College of Surgeons, of Charing-cross Hospital; Sir W. Jenner, Bart., Sir H. Thompson, Messrs. J. Erichsen, B. Hill, J. Marshall, F.R.S., Quain, F.R.S., of University College Hospital; Dr. J. Ogle and Mr. F. Hewett, of St. George's Hospital; Mr. Barnard Holt, of Westminster Hospital; Dr. Priestley and Mr. De Morgan, of the Middlesex Hospital; Mr. John Gay, of the Great Northern Hospital. Amongst others, were observed:—Dr. H. Bennett, Dr. Gueneau de Mussy, Dr. Frank, Dr. Gordon, C.B., Dr. Pratt, Dr. Quain, Dr. Tilt, Dr. Vintras, Dr. C. J. B. Williams, Dr. Wiltshire, Count Barozzi da Vignola, M.R.C.S. Eng.; Messrs. Acton, Brodhurst, Bostock, De Méric, Fitzgerald, Ernest Hart, Startin, etc.

After the usual loyal and patriotic toasts given by the Chairman and Dr. Burrows, President of the Royal College of Physicians, and responded to by Sir A. Armstrong, the Director-General of the Naval Medical Department, and Dr. Gordon, that of the evening—"The Health of Drs. Ricord and Demarquay"—was received with great enthusiasm. In proposing it Sir WILLIAM FERGUSSON said that time was specially important to most men in the room, and it had been arranged by those who had conducted the ceremonies of the day that some of the toasts incidental to large social gatherings in this country should be omitted, and he now rose to proceed with the business which was uppermost in the minds of all present. They had with them as guests two distinguished members of the Medical Profession belonging to a neighbouring country, and it was to do honour to them that they were now assembled. Drs. Ricord and Demarquay were as well known to the Profession in England as by their brethren abroad. Their fame had extended over the whole world, and each had achieved for himself great reputation. But it was not entirely on this account that the present greeting had been offered. Hundreds of men of eminence in the Medical Profession came to these shores from all parts of the world, and they were kindly received in our Hospitals and on other occasions; but it was not always deemed needful to entertain them at public festivals. He believed that these gentlemen usually left our shores well contented with such attentions and hospitalities as had fallen to their lot. There was something peculiar in the visit of the guests of the evening. They had come to England, selected by their own countrymen, to perform an unprecedented act of courtesy from our immediate neighbours on the

Continent—from the French nation—bearing a message of thanks to the people of England for warm-hearted kindness and sympathy as well as material assistance rendered at a time when France was suffering hardly under the calamities of war; they had come to offer gratitude and friendship for valuable assistance afforded in the time of their greatest need, and to express to us their earnest hope and desire that the friendship which had so long obtained between the two countries might never be broken. These gentlemen had been specially engaged in administering much of those comforts that the people of England had dealt out with such unsparing liberality. They had been at the head of the Ambulance Corps of the Press, which had rendered such invaluable service to the sick and wounded during the calamities of the siege of Paris. It was on this account chiefly that the gentlemen assembled were desirous of offering the present homage; for all felt that Drs. Ricord and Demarquay, with those of the Profession who had so ably assisted them, had thus put themselves at the head of one of those movements which the Medical Profession were always ready to undertake for the public weal when danger from the scourge of war threatened. This was a feature connected with the Profession which all cherished as one of its most glorious privileges. Despite of disease and danger from bullets, they were sure to be found on such occasions. There had been reason to boast of it since the earliest records of the Profession. Nearly 3000 years ago the Greek army, as it lay before Troy, were encouraged in their works by the circumstance that two eminent men were with them—Podalarius and Machaon. It was in those days that our Profession had acquired the character of godlike, because it could afford assistance under circumstances when no other could. (Cheers.) In other sieges similar traditions had been referred to, and it was one worth special notice on this occasion that a predecessor of their present guests, a great Surgeon of France who flourished 300 years ago, and had been body Surgeon to several sovereigns of France, had on one occasion been the means of raising a siege of Metz, the very city about which so much had recently been said and done. Paré was smuggled within the walls, and, when it was known, the garrison seemed, as it were, to be doubled in numbers, each man felt himself so much impressed with the idea that the great Surgeon was among them. This revived confidence speedily led to the raising of the siege. It was for the honour that the guests had recently reflected on our Profession that we desired specially to testify to them our admiration for their conduct and our sympathy for their sufferings during the period of trial and danger. Each of them had already done such good to their fellow-creatures that they might well have stood aside and let younger men take their posts of danger, but they preferred duty to all other considerations; and all hail to them for their devotion. Their guests in some degree were representatives of that great school of Medicine and Surgery for which Paris had so long been famous, and it was the wish of all Englishmen present to assure these gentlemen of their continued high consideration for that famous school. They must still look forward to aid from it in furthering the progress of the Profession at large. He thought it would be appropriate on the occasion to refer to two remarkable improvements of modern times which had emanated from that school. In former days in this country the eminent Physician prided himself in carrying a sort of badge of his status—a tall, stout, gold-headed cane—and they all knew that such a rod had disappeared. It would be a curious sight for them to see Dr. Burrows, President of the Royal College of Physicians, walking down Regent-street with such an emblem in his hand; but he had no doubt that, if the Doctor were met under ordinary circumstances, a small bit of wood might be found in his pocket or the crown of his hat—a mysterious-looking thing, smaller than a field-marshal's baton (he used that word as their friends had lately been military in some respects), yet with a power and quality little less significant than that famous rod. This was the stethoscope, which in its own way did marvels. It had added a new sense, as it were, to the Physician; it had added a new eye to the mind, and gave him the power to see into the very centre of the human body. The other instance he would take from the side of Surgery. Men in England prided themselves upon the famous Cheselden, who had done so much for lithotomy. He was so famous in his time that Surgeons came from France to take lessons from him. But in modern days the horrors and dangers of that terrible operation had been largely set aside by lithotripsy, and it was to the French school that we owed the commencement of that beneficent proceeding which had conferred health and happiness on many, from the sovereign on the throne to the lowly

peasant or humble artisan. It was for this the Surgeons of France might well be proud. (Cheers.) MM. Ricord and Demarquay, these gentlemen have deputed me to address you. I would, for their sake and yours, that the task had fallen to someone more able to fulfil it. (Cheers.) In the name of everyone present, I have to offer you good and kind wishes. I request that you will convey to your brethren in Paris our continued profound respect and esteem, and ever cordial hopes that this visit of yours may be the means of cementing more firmly those bonds of friendship which we desire to see permanently uniting these two great nations. (Prolonged cheers.)

Dr. RICORD, who was received with hearty applause, spoke in English. He said it was with most pleasurable emotion that he rose to thank the eminent chairman for the kind and flattering manner in which he had proposed and the company had received the toast; his emotion was heightened when he looked round and saw so many faces of friends, some of them dear ones—many of them he was proud to acknowledge his former pupils; in fact, it almost seemed as if he was once again under the shade of the old lime trees in the Hôpital du Midi, encouraged by their presence and approbation. It was no small satisfaction to find himself again among them and supported by such a distinguished gathering of English *confrères* met together with such kind intentions and good feelings towards the Profession in France—feelings which he was sure would be most heartily reciprocated. Since the happy time to which he alluded, France had passed through much affliction, sorrow, and suffering; at times so great was the danger, and so depressed were they, that he often gave up all thought or hope of seeing such friends again. The siege of Paris had been more or less to them—to the Society of the French Press Ambulances, to the Medical Profession both in Paris and England; in fact, far and wide—the siege of Paris had been the source of anxiety and some very arduous work. Those more immediately and actively engaged in the work had to fulfil their Professional duties under various and most trying conditions of danger and difficulty. In the ambulances of the French Press Fund they had but short time to call together and organise a numerous staff of workers and assistants of all sorts. One thing was most satisfactory, and that was the alacrity with which, at his (Dr. Ricord's) call, there came together 150 Doctors, Surgeons, and dressers belonging to the civil Hospitals, some of the most eminent Surgeons, members of the Société de Chirurgie, or of the Académie de Médecine; they had the good fortune to be joined, and most ably assisted, by Drs. Gordon, Markheim, and Wyatt, and with such a staff they had been able to establish fourteen permanent ambulances and five perambulating, or *ambulances volantes*, as they were called. Owing to the investment of Paris their labours were more particularly confined to the capital, while the operations of the French branch of the International Red Cross Society were happily extended over the provinces at large, enabling them to care for 25,000 sick as well as wounded who had passed through their hands. Dr. Ricord felt it would be the blackest ingratitude as a Frenchman were he to pass over in silence the great sympathy and material help so kindly, so generously extended to them by their English *confrères*, several of whom devoted their time, their talents, and their energy to a labour of love and brotherly sympathy, thus setting an example which had been most nobly and most munificently followed by the generous British public. He seized that opportunity by their presence that evening to eulogise the conduct of Drs. Frank, MacCormac, and Markheim, of the Anglo-American Ambulance, and of Dr. Pratt, who came from that noble country, America, where he (Dr. Ricord) had spent some of his earlier years. After expressing an earnest hope that happy Old England would never have to go through such scenes as they had encountered, and renewing his gratitude to this country, he eulogised some of our great men, as Sydenham, the two Bells, Hunter, Lawrence, Sir Astley Cooper, Sir Benjamin Brodie, who once received him out of compliment to his father, when, said Dr. Ricord, I was obliged to tell him, to his great surprise, that I was my own father. Such men as these were called in France "*une brillante pleiade*." After alluding to the civil war, unparalleled in history, ancient or modern, unequalled either for the ferocity of the wretched leaders of a misguided and half-starved populace, or for the anguish it caused all honest people, Dr. Ricord concluded by again thanking them in his own name, in the name of the French Profession, honoured by such a meeting, expressing a hope that the banquet would be the bond of sympathy and friendship for ever, not only between English and French Doctors, but between the English and French nations. (Great cheers.)

Dr. DEMARQUAY, who spoke in French, said: I attribute to my connexion with my illustrious master, Ricord, and with the great Medical bodies of France this brilliant reunion, and the marks of sympathy with which you honour me. In that connexion allow me to express my deep gratitude for the sympathy which you have testified to France, full of misfortunes, conquered, saddened by an unexampled civil war, but at this time courageously uprising from her defeat. To appreciate our friendship and gratitude, you must mentally place yourselves in a great city, beleaguered so that nothing could enter it, and in which the first necessities of life were beginning to fail. In that city the echoes from without told us how many of you had quitted your families and occupations, and, moved by noble impulses of the heart, had come to tend our wounded. The French Profession, which showed in the most painful circumstances as much courage as devotion, from the Ricords and Nélatons to the youngest of our students, learnt with profound emotion your chivalrous acts, and they have established a lasting friendship between the Surgeons of England and France which time will only consolidate. The visit and the splendid gifts brought by Colonel Loyd-Lindsay added to our debt of gratitude, and then came the convoys from the Lord Mayor of London. Under the flag of Geneva the ambulances were saved until the advent of the Commune. Our task then became more difficult. Our Secretary-General was thrown into the cell of Troppmann, and with difficulty escaped the fate of the illustrious Archbishop of Paris and M. Bonjean, that noble victim of the French magistracy. Dr. Chenu was imprisoned, and with the utmost difficulty were we enabled to procure his release and to fulfil the arduous duties of our numerous ambulances of the Press. But we strove to reach the height of our duties, and our courageous companion, your compatriot, Dr. Markheim, was among those who never faltered in positions of extraordinary danger. I drink to "The Union of English and French Surgery," which up to this day have the honour of having chiefly contributed in Europe to the welfare of humanity by the extent and importance of their labours.

Mr. PAGET, in earnest and felicitous language, proposed "The Sociétés de Secours aux Blessés of France and England," to which Count SERURIER and Captain BRACKENBURY replied.

Dr. GULL proposed "The Press and its Good Works." Those delegates who were now here were the representatives of a noble work of the French press—its ambulances; founded and sustained by the exertions of the press. The Crimean Fund of the *Times*, the funds for the relief of the sufferers around Sedan, Metz, and Paris, were examples of the good works of the English Press. Than Dr. Russell no more apt representative of their works could be found. The present gathering was due to the initiative of Mr. Ernest Hart, a leading mind in the Medical press, aided by the exertions of Sir Henry Thompson. He coupled with this toast the names of Dr. William Russell and the Hon. Lewis Wingfield.

Dr. RUSSELL said the press usually preserved a decorous silence as to its good works. It had sometimes, he feared, to answer for exciting passions, and producing unpleasant irritation. Such works as those alluded to redeemed its character. A long experience of wars gave him a continually growing horror of its cruelties. He trusted that the influence of the press might be used to avert the causes of war, to mitigate the sufferings incidental to it, and to support those who devoted themselves to such noble work as that which he had seen under the Red Cross.

THE PARIS WAR-BALLOONS.—M. Tissandier has just communicated to the Academy of Sciences an account of the various balloons employed during the siege of Paris. The first four "aerostats," as it is now the fashion to call them, which left Paris between September 23 and October 1, were old balloons, which had been repaired. They all escaped beyond the Prussian lines. The other balloons, which were constructed during the siege, "cubed" 2000 metres; and of these, sixty-four left Paris between September 21 and January 18. Of these, five were taken prisoners by the Germans, at Verdun, Chartres, Wetzlar, Ferrières, and Rottenburg. Two of the aerostats were carried out to sea, and have never been heard of. One, the *Ville d'Orleans*, traversed the North Sea, and descended in Norway, after a voyage of 1600 kilometres, performed in fifteen hours. These sixty-four siege balloons carried about 9000 kilogrammes of dispatches, representing 3,000,000 letters, at three grammes per letter, 354 carrier-pigeons, and ninety-one passengers, besides the sixty-four aeronauts.

THE PSYCHIC FORCE.

(From a Correspondent.)

MR. CROOKES is so well known in the scientific world as the discoverer of the metal *Thallium*, and the editor of the *Chemical News* and of the *Quarterly Journal of Science*, that any statement that he may make regarding matters pertaining to Physics is, at least, deserving of respectful consideration; and if it should so happen that his statement is supported by Dr. Huggins, the eminent spectroscopic astronomer, it carries with it a double weight. Some of our readers may possibly recollect that about a year ago Mr. Crookes wrote an article in which, after expressing in the most emphatic manner his belief in the occurrence, under certain circumstances, of phenomena inexplicable by any known natural laws, he indicated several tests which men of science had a right to demand before giving credence to the genuineness of these phenomena. During the year that has elapsed since the publication of this paper he has had opportunities for pursuing the investigation of the mysterious phenomena to which he alludes, and which, we may state, are those which are usually referred by a certain class of credulous believers to spirit-influences. His experiments are now published, and "appear conclusively to establish the existence of a new force, in some manner connected with the human organisation, which, for convenience, may be termed the Psychic Force." This is assuredly a bold and startling assertion, and yet we must admit that Mr. Crookes has apparently established it on a sound experimental basis.

It seems from his observations that this force does not equally manifest itself in all persons of apparently similar bodily frames and constitutions, and that, even in those who are endowed with it, it is very far from constant in its manifestations, being sometimes powerful and on other occasions perfectly inert, in so far as any manifestations are concerned. It is in the class of persons termed "mediums," from their assumed intervention between the material and the spiritual worlds, that this force is most powerfully developed, and amongst them the celebrated Mr. Home stands pre-eminent in the possession of this remarkable and, somewhat rare endowment. "It is mainly owing (says Mr. Crookes) to the many opportunities I have had of carrying on my investigations in his presence that I am enabled to affirm so conclusively the existence of this force."

Having upon some half-dozen occasions witnessed the remarkable phenomena which occur under Mr. Home's influence, and especially (1) the alteration in the weight of bodies, and (2) the playing of tunes upon musical instruments (generally the accordion, for convenience of portability), without any direct human intervention, under conditions rendering contact or connexion with the keys impossible, Mr. Crookes invited that gentleman to his house, (a) where, in the presence of a few scientific inquirers, these phenomena could be submitted to crucial experiments.

With this view he prepared certain test-machinery, which Mr. Home had no opportunity of previously seeing, consisting of a cage for the accordion experiments, and of an apparatus for determining alteration in weight. The cage was composed of two hoops, of about two feet in diameter, connected by narrow laths, so as to form a cylinder open at both ends. A netting of copper wire, in meshes of about two inches by one, surrounded the sides of the cage, which was of such a height that it could just slip under the dining-room table, but was too close to the top to allow of the hand being introduced into the interior, or to admit of a foot being passed under it. The other apparatus consisted of a mahogany board, three feet long, nine and a half inches wide, and one inch thick, with feet composed of strips of mahogany one and a half inches wide, screwed on at each end. One foot rested on the end of a strong table, while the other extremity of the board was supported in a horizontal position by a spring balance hanging from a firm tripod stand. The pointer of the balance indicated that the board thus arranged exerted a downward pressure of three pounds.

Reversing the order in which the experiments took place, we shall begin with those made with the board, inasmuch as they

(a) We ought to observe that the results which are recorded in this article were not obtained on the first trial, when it seems that Mr. Home's psychic force was at its minimum. It is not very clear, from Mr. Crookes' paper, whether it was on the second or the third of his visits that these phenomena were exhibited.

seem the least open to any criticism. Everything was arranged in position before Mr. Home entered the room, and he does not seem even to have been informed of the object the experimenters had in view. Sitting in a low easy chair, he "placed the tips of his fingers lightly on the extreme end of the board which was resting on the table," while Dr. Huggins and Mr. Crookes sat, one on each side, watching for any effect that might be produced. "Almost immediately the pointer of the balance was seen to descend. After a few seconds it rose again. This movement was repeated several times, as if by successive waves of psychic force. The end of the board was observed to oscillate slowly up and down during the time." In evidence that he was exerting no downward pressure (although, if he had done so, it could not possibly have caused the distal end of the board to descend, but, on the contrary, to rise), he placed a small hand-bell and a little card match-box between the tips of the fingers and the board. "The very slow oscillation of the spring balance became more marked," and Dr. Huggins, on watching the index, saw it descend to $6\frac{1}{2}$ lbs., and almost immediately afterwards to 9 lbs. As the normal weight of the board, suspended horizontally, was 3 lbs., there is some force measured by an increased weight, varying from $3\frac{1}{2}$ lbs. to 6 lbs., to be accounted for.

During this experiment Mr. Home's feet, as well as his hands, were closely watched by all in the room—viz., Mr. Crookes and his brother, his chemical assistant, Dr. Huggins, and Mr. Serjeant Cox.

We now take up the other set of experiments, and shall allow Mr. Crookes to describe them for himself. "Mr. Home took the accordion (a new one specially purchased for the occasion) between the thumb and middle finger of one hand, at the opposite end to the keys. Having previously opened the bass key myself, and the cage being drawn from under the table so as just to allow the accordion to be passed in, keys downward, it was pushed back as close as Mr. Home's arm would permit, but without hiding his hand from those next to him. Very soon the accordion was seen by those on each side to be waving about in a somewhat curious manner; then sounds came from it, and, finally, several notes were played in succession. Whilst this was going on, my assistant got under the table and reported that the accordion was expanding and contracting; at the same time it was seen that Mr. Home's hand, which held it, was quite still, his other hand resting on the table. Presently the accordion was seen by those on either side of Mr. Home to move about, oscillating and going round and round the cage, and playing at the same time. Dr. Huggins now looked under the table and said that Mr. Home's hand appeared quite still, while the accordion was moving about emitting distinct sounds. Mr. Home still holding the accordion in the cage as before, his feet being held by those next him, and his right hand resting on the table, we heard distinct and separate notes sounded in succession, and then a simple air was played. As such a result could only have been produced by the various keys of the instrument being acted upon in harmonious succession, this was considered by those present to be a crucial experiment. But the sequel was still more striking, for Mr. Home then actually let go the accordion, removed his hand quite out of the cage, and placed it in the hand of the person next to him, the instrument then continuing to play whilst no one was touching it."

The effect of electricity was then tried, a current from two Grove's cells being made to pass round the insulated wire cage. Mr. Home again held the instrument as before, and it immediately sounded and moved about vigorously, but it was uncertain whether the current had any part in this performance. "The accordion was now," says Mr. Crookes, "again taken without any visible touch from Mr. Home's hand, which he removed from it entirely; I and two of the others present not only seeing his released hand, but the accordion also floating about with no visible support inside the cage. Mr. Home presently re-inserted his hand in the cage, and again took hold of the instrument. It then commenced to play—at first chords and runs, and afterwards a well-known sweet and plaintive melody. Whilst this tune was being played, I took hold of Mr. Home's arm below the elbow, and gently slid my hand down it, until I touched the top of the accordion [which it must be recollected was always held with the keys downwards]. He was not moving a muscle. His other hand was on the table visible to all, and his feet were under the feet of those next to him."

Such is Mr. Crookes's wonderful story, corroborated in so far as the facts are concerned by Dr. Huggins, who, with commendable caution, adds that, "while the experiments appear to show the importance of further investigation," he wishes it to be understood that he expresses "no opinion as to the cause

of the phenomena which took place"; and Mr. Crookes himself is almost equally cautious, for he observes that, respecting the nature of the force (which for convenience of language he calls *Psychic*) and the correlation between it and the other forces of nature, "it would be wrong to hazard the most vague hypothesis." As might have been *a priori* expected from the characters of the observers, they do not even refer to the spirit hypothesis as explanatory of this new force.

If, as can hardly be doubted, the experiments we have recorded are repeated, we would venture to suggest that the cage should not be placed under a table—which, if the phenomena are due to a force emanating from Mr. Home, is a worse than useless part of the apparatus. We should likewise be glad to learn whether the accordion, when not touched by Mr. Home's hand, can play a tune with which that gentleman is not familiar; whether he can call upon it for any special tune known or unknown to himself; whether it will commence and continue playing while Mr. Home is engaged in reading, conversation, or playing on some other instrument—as, for example, the violin; and whether a psychical agent, totally unacquainted with music, can evoke these mysterious phenomena.

In conclusion, we must express our profound satisfaction that so difficult an investigation has been taken up by men so thoroughly qualified for the task as Mr. Crookes and Dr. Huggins.

REVIEWS.

Subject and Object, as connected with our Double Brain, and a New Theory of Causation. By R. VERITY. London. 1870. Pp. 86.

THIS little book, which is composed of six chapters, treating respectively of (1) The Origin and Causation of Consciousness, (2) The Origin and Causation of Perception, (3) A New Theory of Causation, (4) Dual Constitution of First Causation, (5) Our External and Internal Objectivity, and (6) A New Method of Inquiry by Causation, obviously falls rather under the department of psychology than of physiology. From his study of "the human brain and its comparative anatomy," the author arrives at the conclusion "that conscious life and personal sensation begin in the *optic thalami*." These, again, he observes, "fulfil the function of *sensory centres*, as the *corpora striata* fulfil that of *motor centres*. . . They crown the summit of the *sensory tract*, whose fibres plunge into their substance. Downwards they are connected by bands and filaments with every part of the *sensory, spinal, and cerebellar* systems; and upwards on each side with the *anterior, middle, and posterior lobes*; with the *corpus callosum*; with the *corpora striata*; with the *quadrigemina, the fornix*, and the complex apparatus of expression at the base of the brain which terminates in the *tuber cinereum, the corpora albicantia, and the commissure of the optic nerves*. . . In short, there is no part of the nervous system with which they are not directly or indirectly connected; so that, whilst by their order and arrangement our consciousness is ever changing in form and expression, and undergoes endless modifications, yet, owing to the perfect anatomical mechanism by which the unity of the *thalami* and the brain is effected, we never feel otherwise than one and the same individual. We are one and we are many, and this is the character of our consciousness." The author then goes on to prove to his own satisfaction that all forms of excitement are carried to these organs, which not only connect them with sensations, but make them part and parcel of our conscious selves, and discusses the important question whether both *thalami* are necessary for all forms of consciousness. Upon this point he comes to the conclusion that "there are present in one hemisphere the subject who is conscious, and in the other the feeling of which he is conscious." By this hypothesis (for we can call it nothing more) he explains the curious phenomena of double consciousness after recovery from brain fever or injuries of the head, the unconsciousness of the true somnambulist and of the magnetised clairvoyant, etc., there being in these cases partial interruption between the two *thalami*. We must let Mr. Verity explain his views regarding sleep and dreams in his own words:—"The isolation of each hemisphere from contraction of the folds of the *callosum* and consequent pressure of the subjacent parts on the *thalami* may reasonably be regarded as the proximate cause of sleep. Hemispheric intercommunication and consciousness are then simultaneously suspended. But when excitements of portions of the brain overcome this contractile tendency and traverse the connecting commissures, both the hemispheres become partially engaged, and a confused state of consciousness results. Then is sleep broken by dreams. Sleep

is thus as much a positive as a negative state of the brain, proceeding from contraction of the *corpus callosum* upon itself as a ball!"

The author sums up his observations on the origin and causation of consciousness with the remarks that "the *thalami* and the *anterior lobes* are the essential anatomical conditions of self-consciousness and personality;" that, "through the duplicate and reflex action of the *thalami*, we are conscious we feel ourselves one and the same person; that, through the *anterior lobes*, we know it, and know that we know it, and that through both we obtain a perfect synthesis of our *ego*;" and that, "were it not for the second hemisphere, we should have not a conscious but an automatic life."

The succeeding chapters discuss topics which do not fall within the scope of a Medical journal—as, for instance, "Our External and Internal Objectivity"—and we therefore now bid our author farewell, leaving our readers to decide for themselves as to the soundness of those of his views which we have laid before them. In one point we are in complete accordance with Mr. Verity—namely, "that to revive our interest in metaphysical and psychological studies, they must be founded on the facts and discoveries of anatomy and physiology."—P. 59.

PROVINCIAL CORRESPONDENCE.

LIVERPOOL.

July 18.

THE health of the borough has been improving very markedly for some weeks past, small-pox having declined, while, owing to the low temperature and abundant rain, the usual summer diarrhoea so fatal to the children of Liverpool can scarcely be said to have shown itself. There were twenty-seven deaths last week from variola, and twenty-six and thirty-six in the two previous weeks respectively.

One of the last public acts of the late Lord Derby—if not his last—in Liverpool was to lay the foundation-stone of the new Southern Hospital, which is now rapidly nearing completion. The building is designed for the accommodation of over 200 patients, and in its hygienic arrangements is admirable.

No other town in the kingdom presents so many facilities for the acquisition of biological treasures from all parts of the world as Liverpool, and her noble free public museum, growing every day in importance and scientific value, is a standing proof that her advantages in this respect are not neglected. A not unfrequent contributor to its treasures has been Captain Perry, who commands one of the Brazilian line of steamers, and who to thorough seamanship unites a most enthusiastic love of natural history. This gentleman set an example a few days since which we hope will be abundantly followed, by presenting to the museum of the School of Medicine a valuable collection of insects and fishes brought by himself from Brazil. When making this gift, the donor generously stated that he intended it only as an instalment. The value of such presentations cannot be too highly estimated, now that the study of the forms of animal life is becoming so increasingly important to science. The rapid progress made by the Medical School of this town within the past few years, and the increasing number of students who year after year attend its classes, render it especially desirable that its various departments should be as complete as possible; and, if for no other reason than this, we hope to see many others—and especially many of the Medical officers—who set out from this port to all parts of the earth in charge of ships' crews and passengers, and not a few of whom received their Professional education in the town, emulate the generous example of Captain Perry.

GENERAL CORRESPONDENCE.

MR. KEMPSTER AND THE GENERAL MEDICAL COUNCIL.

LETTER FROM MR. W. H. KEMPSTER.

[To the Editor of the Medical Times and Gazette.]

SIR,—I think I may fairly ask you for a small space in your journal to enable me to explain several matters which do not come out clearly in the report of my recent case at the Medical Council. In the first place I have to thank the Medical Council for the great impartiality evinced by them during the investigation, and their kindness at the termination of the case,

and more especially the President, who conducted the proceedings in a manner worthy of our most distinguished judges. But I still feel that I have grave cause of complaint against the Medical Council, or rather against the English Branch Council, in their not having given me any intimation that certain charges were made against me, and were being investigated by them. I ought to have been invited to tender an explanation, which I should have readily done, after which I am sure that the case would never have assumed the complexion it did. It was mentioned that the Council were obliged to frame the charge as one of "infamous conduct in a Professional respect," as they have no power to erase a name from the Register for any other cause. But surely the fact that they can pass but one sentence—that of Professional extinction—should render them careful not to put their powers lightly or too readily into force, as they must be aware that the fact of having been tried on such a charge might, to many men, be absolute ruin.

No notice has been taken of the fact that Mr. Goodson was, during the time embraced by the charges, a Medical student, attending Hospital practice and lectures, and that he is now qualified.

It was also not sufficiently understood that a "Medical certificate of death" is not a legal document in the ordinary acceptance of the phrase, as it is not required by, nor mentioned in, any of the numerous Acts of Parliament relating to registration, and is merely a form issued by the Registrar-General for the convenience of the local registrar, and the only information in it of vital importance is the *cause* of death.

Battersea, July 18. I am, &c., W. H. KEMPSTER.

THE BEAUPERTHUY TREATMENT OF LEPROSY.

LETTER FROM DR. BAKEWELL.

[To the Editor of the Medical Times and Gazette.]

SIR,—I was very much pleased to see in your number of July 1st a letter from Dr. Dalton, of Demerara, on the subject of Dr. Beupersuy's treatment of leprosy, which strikingly corroborates what is stated in my reports on the treatment.

The Parliamentary paper lately published, which may be had from the Queen's printers for 6d., gives all my reports, and a full account of the treatment, and to it I would refer any of your readers who may wish to know more about it than has been given in the brief communications I have addressed to you. I have to thank you for having so kindly inserted them, and thus very powerfully aided in making known a method of treatment which will, I feel convinced, commence a new epoch in the history of this hitherto incurable malady. Although the subject excites little interest in England, it would be difficult to exaggerate its importance in hot countries.

The method will now have a fair trial, and I have, I suppose, now done with it. It has been a hard struggle to get it established, and the more so as Dr. Beupersuy has not yet published a line about it. Few men ever worked harder to bring into notice a discovery of their own, than I have for another man's. I shall now consider myself at liberty to try it with those modifications which have suggested themselves to me, and which will, I think, render it more useful. It happens, by a curious chance, that one of the first cases I have had during the few days since I commenced practice here, is one of elephantiasis, on which I intend to try it. I believe the cashew-nut oil will be useful in many cases as a slow but powerful counter-irritant. It may be procured from Messrs. Savory and Moore, who have my receipt for preparing it.

I may just add that I have had a letter from Dr. Brassac, Physician of the 1st class to the French Navy, who was sent out to Venezuela to investigate the treatment, in which he says that he has been for some months employing it with results similar to those obtained by Dr. Beupersuy and myself.

I am, &c., R. H. BAKEWELL, M.D.

Northgate House, Leicester, July 9.

SOCIÉTÉ PROTECTRICE DE L'ENFANCE.—We are glad to find that this useful Society has resumed its labours. It has notified that it is now prepared, as heretofore, to undertake the gratuitous surveillance of children placed at nurse, and to transmit information concerning their health to their parents. The Society defers its distribution of prizes to deserving nurses until next January. It will then also award its prize for the best essay on the following subject:—"The excessive mortality of infants during the first year of their existence, and the means of preventing it."—*Union Méd.*, July 13.

LEGAL INTELLIGENCE.

DYTE v. THE ST. PANCRAS GUARDIANS.

At the Court of Exchequer, Guildhall, before Mr. Baron Pigott and a common jury, an action was brought by Mr. D. H. Dyte to recover £127 6s., the amount of salary claimed by him in lieu of notice, on account of his alleged illegal dismissal from the post of Medical Officer of the Highgate Infirmary. The evidence went to prove that the plaintiff had been engaged by the St. Pancras Guardians as Medical Officer of their new Infirmary at Highgate. As the Infirmary was going to pass out of the hands of St. Pancras, and be transferred to the Central London Sick Asylum District, all the appointments (the plaintiff's among the number) were originally made for three months. At the end of that time, it not having been possible to complete the arrangements of the transfer, the plaintiff and the other officers were continued in their respective appointments, with the understanding that they were to remain until the transfer took place, and this arrangement received the sanction of the Poor-law Board. On May 24, it being thought tolerably certain that the Infirmary would be transferred at Midsummer, formal notices were served upon the plaintiff and other officers to terminate their engagements on June 24; and the chairman, in handing the notices, said they were given only to protect the Guardians from liability for the salaries beyond that date, as it was thought the Infirmary would then be transferred, but in the event of its not being transferred, the notices were to go for nothing, and matters were to continue as hitherto. The Infirmary was not transferred until September 29, but the defendants still acted upon the notice with regard to the plaintiff, and appointed Dr. Claye Shaw his successor. All this, it was alleged, had been done entirely from party motives, a new Board of Guardians having been elected during the plaintiff's tenure of office. The facts stated on behalf of the plaintiff were not disputed. The defence was that no legal contract had ever been made, as all contracts made with corporate bodies must be under seal; and that the statement made by the chairman did not bind the Board; consequently, the notice was valid. His Lordship said that as there were no facts in dispute, there was nothing to go to the jury. The plaintiff must therefore be nonsuited, but with leave to move the Court to set aside the nonsuit and enter a verdict in his favour for the full amount claimed, subject to the points of law reserved.

TESTAMENTARY CAPACITY.

THE difficulty of solving the question of a testator being "of a sound disposing mind" has perhaps never before been presented in such a singular and perplexing form as in the case of the late Major Nisbet, whose will has recently been the subject of dispute in the supreme courts of Scotland. These courts have sustained the validity of the will, although it was made and executed by the testator while an inmate of a lunatic asylum, and only two months before his death, no announcement of his recovery of mental health having been made either to his friends or the authorities, and no step having been taken for his removal from the asylum. Almost all the Medical men who from time to time visited and examined him during the nine years of his restraint expressed their opinion of his recovery being almost hopeless. The Court of Session has, however, found that, though the best Medical opinion may unanimously declare recovery to be impossible, that opinion must nevertheless yield to *fact*, and the judges have unanimously declared that in this case the fact of the recovery has been proved by the evidence of Medical witnesses who subsequently and specially examined the testator about the time of the execution of the will, and by the circumstances attending its execution, as well as by the rational character of the will itself. This evidence seemed to be supported by the Medical gentleman under whose care the testator was, who, only five days before the will was made, made his first entry in the books of the asylum that the patient had recovered from his nine years' attack of insanity. There was, also, other Medical evidence, to the effect that the recovery had taken place at the time of making the will, and, according to some, for three or four weeks before; but the general tendency of the evidence was to fix the recovery at a point of time remarkably close to the date of the execution of the will. It was, however, proved that the will, a most rational one, had been drawn up from instructions written by the testator himself, and which were so clear and well expressed that the adverse Medical witnesses were obliged to admit that "if the testator wrote those instructions he was sane when he wrote them."

The case of Major Nisbet is a most instructive one upon the point that not only is a speedy recovery possible in a long-standing case of insanity, where recovery had been declared by competent Medical men to be hopeless, but such recovery is capable of distinct proof to the extent of giving effect to a will whose execution followed so closely upon recovery.

PAST CHILD-BEARING.

THE Court of Chancery seems to have arrived at something like a definite conclusion as to the age at which a woman may be presumed to be past child-bearing. In *re* Widdow's Trusts (40 Law Jour. Rep., N. S., 380), Vice-Chancellor Malins made an order for payment out of Court of two sums to two ladies respectively. One of the ladies was a widow, past 55; the other a spinster, aged 53 and 8 months. In both cases the parties were entitled absolutely, subject to the contingency of having children. In a more recent case (*Conduitt v. Soame*), Vice-Chancellor Wickens declined to act upon the presumption where the lady was in her 53rd year. Fifty-three appears to have been the earliest age at which the presumption had ever previously been acted upon (see *Forty v. Forty*, before Vice-Chancellor Kindersley, February 11, 1853). In that case, though the lady was unmarried, security was taken for the repayment in the event of her having lawful issue. We may therefore consider the question as definitely settled, that in such cases the lady must have passed the age of 53 years. It is difficult to understand upon what theory the Court of Chancery has proceeded in making this presumption. Medical science and the statistics of Medical jurisprudence afford no certain data on which such a presumption can fairly be based. Numerous instances are on record of women far more advanced in life bearing children. Vice-Chancellor Wickens seems to have taken the safe course in refusing to go beyond the existing precedents.

VACCINATION ACT.

A CASE of considerable importance under the Vaccination Act, 1867 (*Reg. v. Bovett*), has been tried at the recent Bridgwater Sessions, before the Recorder, which will extend the means of enforcing the provisions of the Act. The 31st section provides that a justice, on being duly informed that a child under 14 years of age is not vaccinated, "may summon the parent or person in whose custody such child is, to appear with such child before him at a certain time and place," and the justice may then, if the child is not vaccinated, order it to be vaccinated. The same section also provides that if the parent or such person neglect to obey such order for vaccination, and shall not show good cause or excuse, he shall be liable to a summary conviction in a penalty of twenty shillings. The penalty, however, can only be inflicted for disobedience to the order to vaccinate, and not for disobedience to the order to appear with the child before the magistrate. The defendants in the case had refused to appear and to produce the child, and were therefore proceeded against by way of indictment at common law, for a misdemeanour in refusing to obey an order of justices duly made under a statute, and the learned Recorder held that this indictment was good. Although it was decided in the Court of Queen's Bench so recently as only May 9 last that the production of the child before the magistrate was not a condition precedent to the making of the order for vaccination, and that the order might be made notwithstanding the absence of the child, provided the magistrate was satisfied on the evidence that the child had not been vaccinated, and was within the statutable age (*Atkins v. Dutton*, 24 L. J. Rep., N. S., p. 507), this will not exonerate the person having charge of the child from the consequences of disobedience to the statutory duty imposed upon him, and he would in such case be liable to an indictment for refusing to produce the child, even though he might attend himself before the magistrate, as was the case in *re* *Atkins v. Dutton*. Under the 20th section of 6 & 7 Wm. IV., c. 86, it is enacted that "every father or mother of every child born . . . shall, within forty-two days of the day of every such birth, give information, on being requested so to do, to the said registrar . . . as to particulars of such birth." It was held in *Reg. v. Price* (11 Ad. and Ell., 727) that a parent, on being so requested to give information and refusing to do so, could be indicted for a common law misdemeanour, as there was a statutory duty imposed upon him. The same principle is involved in cases of disobedience under the Vaccination Act, the disobedience being in fact aggravated as an act of disobedience not merely of a request, but to a statutory order (or summons) of duly constituted magistrates.

OBITUARY.

THOMAS HAWKES TANNER, M.D., F.L.S.

(From a Correspondent.)

In the premature death of Dr. Tanner, which took place on the 7th inst., we have another illustration of the fate which too commonly befalls the most successful of our Profession. It seems but a few years ago that the name of Tanner became, as it were, familiar as household words; and when at the zenith of his fame, in the full flood of success, and just beginning to reap the rich rewards of his gallant struggle, he is cut down like a flower, and his life sacrificed by the very means by which he strove to make that life a success.

Thomas Hawkes Tanner, the son of Thomas Tanner, who was for many years Secretary to the Army Medical Board, was born on July 9, 1824, and received the greater part of his education at Charterhouse. In 1843 he entered as a student in the Medical Department of King's College, London; and at King's College Hospital he gave early promise of that which was to be the distinguishing characteristic of his future career, and the groundwork of his success as a Practitioner, in the number and character of the appointments which he held, being successively in- and out-patient dresser, clinical clerk, and finally House-Physician, in which latter capacity he won the friendship and admiration of that greatest of clinical teachers, Todd, from whom he learnt what proved to be the chief source of his success in after-life—careful and painstaking observation of disease, and sound views in his treatment of it. At the termination of his career as a student he was elected an associate of King's College, and having obtained the membership of the Royal College of Surgeons, and the degree of M.D. at the University of St. Andrews, he commenced practice in Charlotte-street, Bedford-square, in the year 1847. He was soon afterwards elected Physician to the Farringdon General Dispensary, and in 1850 he became a member of the Royal College of Physicians. In 1851 he was elected Physician to the Hospital for Women in Soho-square, and from that time he appears to have devoted his attention more particularly to the study of gynaecology, though at the time he was also Lecturer on Forensic Medicine at the Westminster Hospital Medical School. In 1858 he took a very prominent and active part in the foundation of the Obstetrical Society of London, of which he was one of the first secretaries; and much of the success of that Society during its earlier career was undoubtedly due to his energy and perseverance, for an indomitable pluck and a determined will were two of the distinguishing traits in Tanner's character, which contributed in no slight degree to his success in overcoming the many difficulties which beset the path of a self-made man. At the conclusion of his Secretariat, Tanner was elected one of the Vice-Presidents of the Obstetrical Society; he was also a corresponding Fellow of the Academy of Surgery of Madrid. In 1860 the Council of King's College determined to appoint two Assistant-Physicians for the diseases of women and children at the Hospital, and Dr. Tanner was appointed, together with Dr. Meadows, to that office. This appointment he resigned in the year 1863, having previously given up all his other public duties, as his practice now began to increase so rapidly, that with the literary work to which he now assiduously devoted himself, and which, no doubt, contributed largely to bring about the disease of which he finally died, his time was more than occupied, and he had little opportunity for that pleasure or recreation which might have prolonged his life.

Dr. Tanner will probably be remembered hereafter more as an author, although he was equally successful as a practical Physician. As a writer, judged by the popularity of his works, as evidenced by the large and numerous editions through which they have passed, he has, we believe, been unequalled. In 1854 he wrote the first edition of his "Manual of the Practice of Medicine," and, if we be rightly informed, few works on Medicine have ever met with so much success; its popularity has increased with each edition and addition to its size and price; originally a small pocket manual of three shillings and sixpence, it has at last reached its sixth edition, in two large volumes, at nearly ten times the original cost. In addition to this he was the author of a work on the "Signs and Diseases of Pregnancy," and of a "Practical Treatise on the Diseases of Infancy and Childhood," besides smaller works on "Clinical Medicine," an "Index of Diseases," "Memoranda on Poisons," a "Clinical Report of Cancer of the Female Sexual Organs," and papers in various journals, transactions of societies, etc.

Dr. Tanner has at great cost, and with much labour, care, and thought, collected a magnificent library, many of the books being very rare and costly. He was, himself, very fond of general literature, and his library is in many respects unique. His writings fairly reflect the character of his mind: wide in scope, comprehensive in grasp, they give evidence of vast study, of careful thought, matured judgment, and, at the same time, of great practical application.

In his social relations, it is not too much to say of Dr. Tanner that those who knew him best loved him most; he was warm-hearted, generous, kind, a man full of deep sympathies, being always ready to lend a helping hand to friend or stranger, wherever he saw distress or anxiety and had it in his power to allay it. Among his patients, rich and poor alike, he was loved as a true friend, and respected as a wise counsellor. For several years he had suffered from slight symptoms of renal disease, following an attack of scarlet fever in 1854, which latterly became more strongly marked; but it was not until about two months before his death that his condition began to cause anxiety, and he was compelled to relinquish his Professional duties. Still it was hoped that rest and freedom from all anxiety would restore him at least to partial health. This, however, was not to be; symptoms of uræmia set in, which were speedily followed by convulsions, and after several weeks of great suffering, he died on the 7th inst., being within two days of his 47th birthday. He was buried at Highgate on Thursday, the 13th inst., and leaves a widow and four children.

JOSEPH GOODALE LANSDOWN,

A NATIVE of Bristol, born in 1804, educated at Tiverton Grammar School, apprenticed to the late Mr. Henry Daniel. He commenced his Professional career at the Bristol Royal Infirmary; he then went to St. Bartholomew's and Aldersgate-street School; and obtained his diplomas in 1827-28. After visiting the Continental Hospitals he settled in Bristol, and was elected one of the first Surgeons to the Bristol General Hospital in 1832, an office he held until 1861, when he was appointed Honorary and Consulting Surgeon. He was a skilful operator, and one of the first to use anæsthetics in Surgery. In midwifery he used chloroform extensively. He was devoted to his Profession, and worked unceasingly at a large practice. He made some short communications on anæsthesia in its early days to some of the journals; but his time was so fully occupied that he rarely put his thoughts on paper. He seldom took a holiday, but worked without intermission, until the end of 1870, when he was obliged to retire, owing to the encroachments of a large thyroid tumour, which so compressed his trachea as ultimately, on July 6, to cause his death. He was a man of genial disposition, beloved by a large circle of patients and friends.

ARTHUR WILLIAM DUMVILLE, F.R.C.S., L.S.A.,

Was one of the Consulting Surgeons to the Manchester Royal Infirmary. He died at his residence, Ardwick-green, on the 8th inst., in his 59th year. He was educated at the Manchester Grammar School. He was a pupil of Dr. Smith's, and served his apprenticeship under the late Mr. Fortington. He had been ailing for the last eighteen months, but his illness did not assume a serious aspect until three months ago.

CHOREA OF THE TONGUE FROM EMOTION.—M. Amédée Latour, describing the bombardment of Chatillon, thus speaks of its effects on himself—"During the first days I had tremblings at every discharge of cannon, together with strong and frequent palpitations of the heart and tremor of the hands. My tongue was seized with a kind of insupportable chorea; which, indeed, I have often experienced on the occurrence of vivid emotions, of which, during my life, I have had my share. It is a strange phenomenon, which I have seen nowhere described. The muscles of the tongue are seized with convulsions, which cause the organ to execute irregular movements to the right and left, fix it against the palate, or curve it back on the frænum—keeping it in constant motion, and occasioning a most unpleasant and irritating sensation. Speech is impeded, and articulation painful, so that it is impossible to read aloud, and to converse is a matter of difficulty. These lingual movements are entirely independent of the will, which can neither arrest nor modify them whatever effort be made. Sleep suspends them; but they reappear soon after waking. This inconvenience lasted during the first week, but after then, as I became accustomed to the noise, the lingual and cardiac muscles resumed their normal action."—*Union Méd.*, July 6.

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen passed their Primary Examinations in Anatomy and Physiology at a meeting of the Court of Examiners on the 18th inst., and, when eligible, will be admitted to the Pass Examination:—

Bell, G. Waruer, student of University College.
Burton, J. Randell, of Guy's Hospital.
Church, H. Macdonald, of the Edinburgh School.
Cory, Frederic W., of the London Hospital.
Douglas, S. William, of University College.
Erith, W. E. N., of University College.
Fair, R. Campbell, of Canada.
Fitzpatrick, Matthew J., of Dublin.
Poster, W. C. K., of University College.
Hinchiff, Edwin, of the Edinburgh School.
Imlach, Francis, of the Edinburgh School.
Irving, J. Christopher, of Guy's Hospital.
Jeunings, John D., of the Birmingham School.
Johnson, Francis, of the London Hospital.
Kirby, Albert E., of the Leeds School.
Ritchie, James, of the Edinburgh School.
Steil, George R., of University College.
Stowers, James H., of St. Bartholomew's Hospital.
Stuart, John B., of the Liverpool School.
Vouse, Arthur J., of the Leeds School.

The following gentlemen passed on the 19th inst.:—

Barber, Oliver, of University College.
Boddy, Evan M., of Guy's Hospital.
Bradford, Peter, of University College.
Bridges, R. Seymour, B.A. Oxon., of St. Bartholomew's Hospital.
Collins, W. C. G., of St. Bartholomew's Hospital.
Davenport, William Y., of Guy's Hospital.
Dawes, Richard St. M., of University College.
Eskell, Maurice, of University College.
Grindrod, Charles F., of St. Mary's Hospital.
Groves, H. J. F., of Guy's Hospital.
Hart, John M., of St. Bartholomew's Hospital.
Hartley, Charles, of the Charing-cross Hospital.
Holden, Lonsdale A., of St. Bartholomew's Hospital.
Hughes, Richard D., of Guy's Hospital.
Lang, Henry C., of University College.
Moffatt, G. T. B., of St. Bartholomew's Hospital.
Nunez, Daniel, of Guy's Hospital.
Rugg, Harold, of University College.
Symons, J. G. R., of University College.
Townend, Joseph H., of Guy's Hospital.

The following gentlemen passed on the 20th inst.:—

Atkinson, Francis E., of St. Mary's Hospital.
Blackburn, Herbert B., of Guy's Hospital.
Coulter, William, of the Belfast School.
Ellis, Hyacinth D'A., of Birmingham.
Ford, Montague, of the Charing-cross Hospital.
Gard, William J., of Guy's Hospital.
Gibson, H. C. M., of University College.
Gray, T. W. F., of the Charing-cross Hospital.
Greenwood, John W., of St. Thomas's Hospital.
Grogono, W. A., of the London Hospital.
Heddy, W. Jackson, of Guy's Hospital.
Johnson, C. G., of St. Thomas's Hospital.
Keer, George E., of Guy's Hospital.
Kirkpatrick, Arthur, of the Liverpool School.
Lakin, Charles, of Birmingham.
Llewellyn, Rees R., of the London Hospital.
Mavor, W. S., of St. Thomas's Hospital.
Messiter, Matthew A., of Birmingham.
Pridmore, Campbell W., of the Westminster Hospital.
Redman, Edwin M., of University College.
Samuels, Robert F., of the Liverpool School.
Sinclair, Daniel A., of St. Thomas's Hospital.
Vawdrey, Theophilus G., of University College.
Welchman, E., of St. Thomas's Hospital.
Wherry, G. E., of St. Thomas's Hospital.
Wilkins, J. Sutherland, of Guy's Hospital.

COLLEGE EXAMINATIONS.—It is stated that at the Primary Examination for the diploma of Membership of the Royal College of Surgeons, which was brought to a close on the 20th inst., 109 candidates presented themselves, and of this number 45 had been rejected (and some of them more than once) at previous examinations. On the present occasion 16 were rejected on the first day, the same number on the second, and on the third and last day, 11, making a total of 45 out of 109. The Pass Examination commenced yesterday, when upwards of 100 candidates presented themselves.

APOTHECARIES' HALL.—The following gentlemen passed their Examination in the Science and Practice of Medicine, and received Certificates to practise, on Thursday, July 13, 1871:—

Briggs, Henry Myddleton, Birmingham.
Lyons, Isidor Isaac, St. John's-wood.
Richards, George Pickering, Newman-street, Oxford-street.
Rix, Benjamin, East Mion, Hants.
Thornton, William Pugin, Canterbury.
Williams, Edward, Llandyssul, South Wales.

As Assistants in Compounding and Dispensing Medicines:—

Gould, Eli, Reddal-hill, near Dudley.
Holmes, Nathaniel W., Chorlton-on-Medlock.
Pollard, William, Wakefield.

The following gentleman also on the same day passed his first Professional examination:—

Garrard, William Arthur, Guy's Hospital.

APPOINTMENTS.

* * * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

BOOTH, E. J. H., M.R.C.S. and L.S.A.—Medical Officer to the Mirfield District of the Dewsbury Union.

BROWN, MR. JAMES—Assistant Resident Medical Officer to the Leeds General Infirmary, *vice* Mr. John Snell, resigned.

BUCKLEY, DR.—Medical Officer and Vaccinator for the Clane and Timahoe North Dispensary District of the Naas Union, co. Kildare, *vice* Dr. O'Sullivan, deceased.

CROSSKEY, WALTER FRANCIS, M.D. Glasgow, and C.M.—Medical Officer for the Workhouses and the Lower District of the Lewes Union.

MORRILL, ARTHUR HORATIO, M.R.C.S. Eng., L.S.A. Lond.—Resident Surgeon to the Branch Dispensary of the Cheltenham General Hospital and Dispensary, *vice* John Humphreys, M.R.C.S. Eng., L.S.A. Lond., resigned.

PALFREY, JAMES, M.D.—Physician-Accoucheur to the out-patients at the General Lying-in Hospital, *vice* Alfred Meadows, M.D., resigned.

PIERCE, FRANCIS, M.B., M.R.C.S. Dub.—Medical Officer to the Upton District of the Wirral Union.

POGSON, WILLIAM, M.R.C.S. Eng., L.R.C.P. Edin., and L.M.—Medical Officer for the Templenewsam District of the Hunslet Union.

REID, DR. JOHN HENRY—Medical Officer to the Kilkeel Dispensary District No. 2 of the Kilkeel Union.

ROE, JOHN RICHARD, L.R.C.P. Edin., L.M., etc.—Medical Officer to the Fourth District of Bridgnorth Union.

SCOTT, W. G., M.B. and C.M. University of Edinburgh—House-Surgeon to the Blackburn and East Lancashire Infirmary, *vice* R. A. Morrish, M.R.C.S.; resigned.

SCULLY, JOHN, L.D.S.—Assistant Dental Surgeon to the Dental Hospital of London.

THURSFIELD, WILLIAM, M.D. Aber., L.R.C.P. Lond.—Medical Officer to the Third District and Workhouse, Bridgnorth.

TURNER, JAMES SMITH, M.R.C.S. and L.D.S., Assistant Dental Surgeon to the Middlesex Hospital—Lecturer on Mechanical Dentistry at the School of Dental Surgery, Dental Hospital of London.

WILSON, HENRY, F.R.C.S.I.—Junior Surgeon to St. Mark's Ophthalmic Hospital, Dublin.

WORKMAN, CHARLES J., M.D.—Ophthalmic Surgeon to the Teignmouth, Dawlish, and Newton Infirmary.

BIRTHS.

ANSTIE.—On July 11, at 16, Wimpole-street, the wife of F. E. Anstie, M.D., of a daughter.

BLANDFORD.—On July 15, at 71, Grosvenor-street, Grosvenor-square, the wife of G. Fielding Blandford, M.D., of a daughter.

BOGGS.—On July 14, at Paris, the wife of Alexander Boggs, M.D., late of her Majesty's Indian Army, of a daughter.

HOUSTON-DAWSON.—On July 10, at 9, Carlton-terrace, Kilburn-park, the wife of S. Houston-Dawson, M.D., of a son.

KORTEGARN.—On July 11, at Bonn, Prussia, the wife of Dr. Arthur Kortegarn, of a son.

REID.—On July 14, at Melville House, Pembroke, the wife of Douglas A. Reid, M.D., J.P., late 90th Light Infantry, of a son.

SANDS.—On July 15, at 5, Gordon-cottages, Holland-road, Brixton, the wife of John Lee Sands, M.D., R.N., H.M.S. *Excellent*, of a daughter.

WRIGHT.—On July 8, at the Hollies, Summer-hill, Birmingham, the wife of M. Hall Wright, M.R.C.S., of a son.

MARRIAGES.

AYRES—RIDLEY.—On July 15, at St. James's Church, James William, eldest son of the late Alfred Charles Ayres, Surgeon, of Ramsgate, to Clara Ernestina, second daughter of William Ridley, Esq., of Moore Park, Middlesex.

BUCKLEY—WILSON.—On July 13, at Walcot Church, Bath, Henry Child Buckley, M.D., of Bradbury Hall, Llanely, Carmartheushire, to Maria Isabella, eldest daughter of James Wilson, F.R.S.A., of Glen Avon, Bath.

GEDDES—BURY.—At the Register Office, District of St. Pancras, and, on July 13, at the Positivist School, Chapel-street, Bedford-row, James Geddes, of the Bengal Civil Service, to Emily, youngest daughter of the late John Bury, of Coventry, Surgeon.

HOUGHTON—RANSOME.—On July 13, at the parish church, Flixton, Ceoric Houghton, Esq., of Preston, to Gertrude, youngest daughter of the late Joseph Atkinson Ransome, F.R.C.S., Consulting Surgeon to the Manchester Infirmary, of Ashawe Hall, Flixton, and St. Peter's-square, Manchester.

PEPPIN—HERDMAN.—On July 12, at Walcot Church, Bath, Henry Cole Peppin, Staff Assistant-Surgeon, second son of the late Arthur Bedford Peppin, Staff Assistant-Surgeon, of Trinchinopoly, to Agnes Clara, second daughter of James Herdman, Esq., of 11, Camden-crescent, Bath.

ROBERTS—ROBINSON.—On July 13, at the parish church, Bolton-le-Moors, Frank Weraet Roberts, Ivy Lodge, Castlenau, Barnes, to Margaret Agnes, younger daughter of the late J. M. Robinson, F.R.C.S., of Bank House, Bolton.

ROBERTSON—NORTON.—On May 12, at St. Peter's Church, Melbourne, — Robertson, M.R.C.S. Eng., of East St. Kilda, near Melbourne, to Joanna Kate, only daughter of Charles Norton, Esq., Melbourne.

TEEVAN—ROBINSON.—On July 11, at Christ Church, Kensington, William Frederic Teevan, F.R.C.S., eldest son of the late William Teevan, Esq., of Bryanston-square, to Georgina, eldest daughter of the late Francis Robinson, Esq., of Windsor.

TINSON—ARNOTT.—On July 12, at St. Stephen's Church, Gerald Edward Tinson, Esq., of Cleavelands, Cheltenham, to Emily Sophia Helen, youngest daughter of Dr. James Aruott, of 8, St. Stephen's-crescent, Westbourne-park.

DEATHS.

GRAHAM, ROBERT BUCHANNAN, Surgeon, at Embleton, on July 13, and Eleonor Jaue Isabella, wife of the above, on July 8, aged 33.

LEE, LEONARD JOHN, M.R.C.S., late of Bishopsgate-street Within, City, son of the late Joseph Lee, Esq., of Devonshire-square, at St. Brelade's Bay, Jersey, on June 25, in his 32nd year.

MILES, DR. HERBERT ERASMUS, Surgeon of the Royal Artillery, only surviving son of John Miles, M.D., Eastbourne, at Colaba, Bombay, after a short but severe illness, on June 16, aged 38.

MOUNCEY, JAMES AINLEY, Surgeon, third son of the late James Mouncey, Esq., of Salford, at Walworth, on July 16.

REYNOLDS, WILLIAM, Surgeon, at Odun Hall, Appledore, North Devon, on July 16, aged 50.

STOKES, SUSANNAH, the beloved wife of J. M. Stokes, M.D., of Melbourne, at Wellington, New Zealand, at the residence of R. Stokes, Esq., on April 25.

WATTS, GEORGE, Surgeon, at Thatcham, on July 16, aged 71.

WHITELAW, WILLIAM PETER, second son of W. Whitelaw, M.D., at Kirkintilloch, N.B., on July 11, suddenly, aged 2 years and 5 months.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.

BIRMINGHAM AND MIDLAND FREE HOSPITAL FOR SICK CHILDREN.—Resident Medical Officer; must be duly qualified and registered. Applications and testimonials to the "Medical Committee," on or before August 3. Election on August 7.

BRADFORD INFIRMARY AND DISPENSARY.—Physician; must be a Graduate in Medicine of the Universities of the United Kingdom, or a Fellow or Member of one of the Colleges of Physicians. Applications and testimonials to Mr. Charles Woodcock, Secretary.

BURY, LANCASHIRE.—Resident Medical Officer wanted for the Dispensary. Candidates must be duly qualified. Applications and testimonials to the Rev. E. J. Smith, St. John's Vicarage, Bury, Lancashire, on or before July 25.

FARINGDON UNION.—Medical Officer for the Buckland District. Candidates must possess the qualifications prescribed by the General Orders of the Poor-law Board. The gentleman appointed may reside either within or out of the district. Applications and testimonials to Mr. J. Haines, Clerk, on or before July 25.

GENERAL HOSPITAL AND DISPENSARY FOR SICK CHILDREN, BRIDGE-STREET, MANCHESTER.—Resident Medical Officer; must have a Medical qualification and be registered. Applications and testimonials to the Secretary, on or before July 22.

GUISBOROUGH UNION.—Medical Officer for the Danby District. Candidates must have the qualifications prescribed by the General Orders of the Poor-law Board. Applications and testimonials to Mr. W. Wetherill, Clerk, on or before July 25. Election the same day at 2 o'clock p.m.

HEREFORD GENERAL INFIRMARY.—Resident House-Surgeon; must be M.R.C.S. and L.S.A. Applications and testimonials to T. Owen Fowler, Esq., Savings Bank, Hereford. Election on July 17.

HOSPITAL FOR SICK CHILDREN, 49, GREAT ORMOND-STREET.—Assistant-Physician; must be a Fellow or Member of the Royal College of Physicians of London. Applications and testimonials to be sent in on or before August 2.

HUDDERSFIELD INFIRMARY.—Physician; must be a Graduate in Medicine of one of the Universities of the United Kingdom, or a Fellow or Member of one of the Colleges of Physicians, and be duly registered. Applications and testimonials to John Marsden, Esq., Hon. Sec., on or before July 28.

HUDDERSFIELD INFIRMARY.—House-Surgeon; must have both Medical and Surgical qualifications, and be registered. Applications and testimonials to Mr. John Marsden, on or before August 14.

INFIRMARY FOR EPILEPSY AND PARALYSIS, CHARLES-STREET, PORTMAN-SQUARE, W.—Physician; must be a Member or Fellow of the Royal College of Physicians, London. Applications and testimonials to Mr. E. Watherston, Hon. Sec., on or before July 31.

METROPOLITAN FREE HOSPITAL, DEVONSHIRE-SQUARE, E.C.—Assistant-Physician; must be a Member of the Royal College of Physicians, or pledged to become such within twelve months. Applications and testimonials to Mr. Geo. Croxton, Secretary, on or before July 24.

MIDDLESEX HOSPITAL MEDICAL COLLEGE.—Lecturer on Physiology. Applications to the Dean on or before July 22.

ROYAL FREE HOSPITAL, GRAY'S INN-ROAD, W.C.—Junior House-Surgeon; must be M.R.C.S. Applications and testimonials to the Secretary on or before July 27.

SEAMEN'S HOSPITAL, GREENWICH.—House-Physician and House-Surgeon. Candidates for these appointments must have, at least, one qualification. Applications and testimonials to the House-Governor and Secretary.

WEST LONDON HOSPITAL, W.—Junior Physician; must be a Fellow or Member of the Royal College of Physicians of London, and not practising pharmacy. Applications and testimonials to S. Alexander, Esq., Secretary, on or before July 22.

POOR-LAW MEDICAL SERVICE.

APPOINTMENTS.

South Molton Union.—Richard Ley, jun., M.R.C.S. Eng., L.S.A., to the Ninth District.

Tamworth Union.—Edward Callaway, M.R.C.S. Eng., L.S.A., to the Tamworth District and the Workhouse.

Westbury-on-Severn Union.—Charles Whatmough, M.D. Edin., M.R.C.S. Eng., L.S.A., to the Fourth District.

UNIVERSITY OF DUBLIN.—SCHOOL OF PHYSIC IN IRELAND.—The Medical Scholarships have this year been awarded to—1. Andrew Clarke, Scholar of Trinity College; 2. George A. Pearce.

THERE will be a competitive examination of candidates for the Royal Naval Medical Service on August 9.

THE sum of £83 was distributed among the various claimants of the Naval Medical Compassionate Fund on the 11th inst. The meeting was presided over by Dr. J. W. Johnston, Inspector-General.

A CORRESPONDENT of a Bristol paper states that the son of Dr. Jenner, the nephew of the discoverer of vaccination, is now, through adverse fortune, living in a cottage with barely the necessaries of life.

AT the dinner in aid of the funds for providing furniture and fittings for the new St. Thomas's Hospital, which was held on Wednesday, £11,000 were subscribed. The sum required is £20,000.

LIME-JUICE AND SCURVY.—The owners of the barque *Lebanon*, Hartlepool, have been fined for not supplying the crew with a sufficient quantity of lime-juice, which caused a severe attack of scurvy.

PROCEEDINGS OF THE ROYAL COLLEGE OF SURGEONS.—From a report of the proceedings of the Council at its meeting on the 13th inst., which has just been suspended in the hall of that institution, it appears that a letter from Messrs. Wilde, the solicitors of the College, was read, inclosing, as requested by direction of the President, a copy of the conviction and of the sentence to six months' imprisonment of Frederick Henry Morris, admitted a Member of the College in 1856, and tried at Deizes on March 27 last for an indecent assault on Sarah Gould; whereupon it was resolved "That in the opinion of this Council the criminal offence of which Mr. Morris has been convicted is of such a nature as to render him unfit to remain a Member of the College, and that in pursuance of clause 3, section 17, of the by-laws relating to the misconduct of Fellows and Members, he be removed from being a Member of the College." It is understood that the delinquent has since been struck off the register of the General Medical Council. The other matters contained in the abstract have already been published in the *Medical Times and Gazette*.

A PHYSIOLOGICAL REVIEW OF THE LATE WAR.—M. Beaunis, Professor of Anatomy at Strasburg, thus prefaces a series of papers on the campaign of 1870-71 which he is publishing in the *Gazette Médicale*:—"Accustomed to a particular line of observation, I have sought to apply to this war the procedures of investigation which are most familiar to me, and have studied it as one studies a scientific problem or a serious malady. I have thought that the facts of the life of a nation are susceptible of analysis in the same way as we analyse the phenomena of the circulation in living beings, and by the same intellectual procedures. A physiologist by profession, I have thought that it may prove of utility to observe otherwise than as a moralist or a Christian the convulsions and agony of an entire people, just as in the laboratory we observe the agony of an animal in order to detect the hidden springs of life. . . . Is war, indeed, anything else than a *gigantic vivisection*? and may it not prove useful to investigate on the living the instincts, the interests, and the passions which are exposed naked in all their vigorous reality, and to observe at work all these hidden and powerful springs of action which are as regards social events what contractility and innervation are in physical life? A people is under certain circumstances a real disease, and the social *ataxy* is subjected like the morbid ataxy to certain fatal laws which must be known in order that order may be re-established. No Physician can regard this comparison as a strange one, and it would be easy to carry it to its furthest limits, still remaining within the strict truth. Does not France at this moment resemble, beyond the possibility of mistake, a convalescent from a grave fever? and has she not traversed all the phases of the disease?"

NOTES, QUERIES, AND REPLIES.

He that questioneth much shall learn much.—Bacon.

Mr. John Forster, Clare, Adelaide, South Australia.—Your letter, with enclosure, received with thanks.

Rusticus.—We had thought everybody knew the composition of Condy's fluid. For long it has been no secret that it is a solution of manganate or permanganate of potass.

A. N.—The fee appears large, but regarding the distance, the time of night, and the urgency of the case, we think it a reasonable charge.

A Fellow of the Society.—The Lettsoman Lectures were founded some years since, and they are delivered annually by some one of the Fellows of the Society, selected at the annual meeting.

A Young Member.—There will be an examination for the Midwifery Licence of the Royal College of Surgeons on the 31st instant. It is doubtful when there will be another after that date, owing to the operations of the conjoint examinations to which you allude. See advertisement in this day's *Medical Times and Gazette*, and write to the Secretary.

Jacobus.—Wadd makes no mention of a miniature of Wiseman; there is an oil painting in the Council-room of the Royal College of Surgeons. Write to the Clerk of the Barber-Surgeons' Hall, Monkwell-street.

PENSIONING POOR-LAW MEDICAL OFFICERS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I hope this session will not be allowed to pass without something being done by the Government in the way of pensioning Poor-law Medical Officers, and I am quite sure the President of the Poor-law Board is anxious to help us. I therefore ask all my Medical brethren who are Poor-law Officers to write to the President during the next week, praying that we may be paid a pension out of the Consolidated Fund after twenty or twenty-five years' service, irrespective of age. The poor as well would be benefited by such an arrangement, for few of us can give the same attention to the poor after we have arrived at the age of 50 as we could when only 30. Hoping that you, as you always have done, will continue to lend us your valuable aid,

Oswestry, July 18.

I am, &c.,

ROBERT WILLIAMS.

Dr. R.—There will not be the slightest difficulty in obtaining permission to view the Par Consols Mine on addressing Major Davis, R.M., Fowey, Cornwall. From our experience of the great kindness and courtesy of this gallant veteran, he will give you and other members of the Association every facility when attending the annual meeting of the Association in the ensuing month at Plymouth. Dr. Arthur Davis, of Fowey, his son, will send you a report of the Cottage Hospital founded by himself on applying for it.

Plymouth.—The Board of Guardians of this town are at present in a state of excitement respecting their Medical officers. It appears that they have not only determined to reduce the number of these gentlemen, but also to diminish their pay—this, too, be it remembered, when the town contains a much larger number of inhabitants than when the Medical gentlemen now in office were appointed. The consequence has been that letters have been addressed to the Poor-law Board on the subject. These letters, after stating the facts, request the Board not to sanction the proposed alterations. One of these letters—an able one—is from Mr. Daniel M'Carthy, a guardian, who says at the conclusion of his communication—

"I may add that the number of our out-door paupers at present in Plymouth exceeds 3200. The population of the town is by the recent Census upwards of 66,000. For several years there have been four Medical officers to attend to the wants of the out-door; I and certain other guardians hold that if the present staff be reduced a great hardship will be inflicted upon the poor themselves, an injustice perpetrated against the Medical staff, and the best interests of the ratepayers sacrificed to a false and vicious economy."

The Board, after a long discussion, eventually decided to refer back the matter to the Relieving Officers Committee, to bring up a report in due time. It is to be hoped that the report will be of such a character as to prevent the guardians doing an act of injustice to the poor and the Profession.

ARMY MEDICAL DEPARTMENT.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—We are a curious community—some getting in by a tremendous fluke, rest on their oars, never touching a book again; others, hard workers, Fellows of the Colleges of Surgeons, Doctors of Medicine of London, prize-men from Scotch and Irish universities, only requiring encouragement and substantial recognition to develop into skilful Surgeons and profound Physicians. With the advantage over London and provincial Hospital teachers, whose writings so greatly influence the readers of Medical literature, our rich fields of observation extend far and wide, and records amply testify that in science, as well as in outbreaks of fever and epidemic diseases, whether at home or abroad, we have not been found wanting. If the authorities were to improve the retirements, reduce the numbers, and increase the pay, willing horses would not only elevate the Army Medical Department, but also benefit the world at large by stimulating the zeal to learn, to practise, and to teach the difficult priceless secrets of our Profession. Allow me to introduce a water-drinking brain-picker, Donald McGrigor, in spectacles and gaiters, the personification of virtuous respectability, ever with a Blue-buck under his arm: deservedly he rises to comparative eminence. Dr. Tupp is a puzzle—a hard-working, honest enthusiast; purchases every new book, has no pursuits otherwise; morning, noon, and night about the Hospital, even in his sleep dreaming of drains and diet-sheets, yet he is neither popular nor successful; fussy and fidgetty, the patients hate the sight of him. Tomkins, once in his pea-coat pardonably mistaken for the first lieutenant of a penny steamboat, a lawyer up to all the dodges of falling sick in emergencies, getting off foreign service and unpleasant duties, in spite of astute finesse, occasionally finds himself high and dry at Ragabag or Cholera-pore. Scrivens is a theoretical Christian, great at refreshing meetings, revivals, and Dissenting tea-parties; distributes peculiar tracts about the wards, to the annoyance of the chaplain, but, as to legitimate work, on a par with the wily Tomkins. Potts, weighing twenty-six stone, knows every actor, tight-rope dancer, and waiter in creation; is an "Archangel in Freemasonry," a "Social Buck," an "Antediluvian Buffalo"; always in good spirits, kind, attentive; a clever Practitioner, with a wonderful memory; his entrance into the Apollo Music Hall is the signal for the chairman dropping the sacred hammer, to

turn out three intimate friends to make room, and, respectfully taking charge of the "Doctor's" curly broad-brimmed hat, to place him in the seat of honour.

In conclusion, alas! alas! regardless of chewing a tooth-pick, knickerbockers, and the youthful swagger induced by a galvanic belt and Mrs. Allen's hair-restorer, the raw recruit of a sentry, with unintentional irony, now invariably presents arms, under the impression that he is rigidly paying the compliment due to a venerable field officer instead of a

JUNIOR ASSISTANT-SURGEON.

The Alexandra Palace is, we hear, about to be opened on the tontine principle. Every subscriber has what are termed right certificates, to which are attached certain privileges, in proportion to the price paid. These include admission to the Palace and grounds, participation in art unions, giving a chance to each 21s. subscriber of securing five prizes of £500 each. In 1886 the whole property will be sold, and the proceeds divided amongst the tontineers. To provide against loss in the event of death, an insurance office has agreed, in consideration for the payment of 1s. on every 21s. right, to refund 20s. of every such guinea upon the death of the life so insured, should it occur before the close of the tontine. No subscriber, it is said, incurs any liability, as it is a trust matter.

IRISH AND ENGLISH SYSTEMS OF POOR-LAW MEDICAL RELIEF.

The following is a letter addressed to Dr. Rogers, President of the English Poor-law Medical Officers' Association, by Dr. Maunsell, on the Irish and English systems of Poor-law Medical Relief:—

"1, Harrington-terrace, Dublin, July 6, 1871.

SIR,—The question of Poor-law Medical relief is one not to be looked at merely as to how far it would benefit our Profession; to do so would be too narrow-minded. The course you have taken will, I venture to predict, prove successful, and benefit the poor, the public, and the Profession. I had the pleasure of meeting Mr. Corrance whilst over in Ireland, and I regret your countrymen do not come more frequently to visit us: perhaps we might be able to give some additional hints on other matters as well as on the Dispensary system. We entered very fully into the subject, and I think that the views of Mr. Corrance are in perfect accordance with mine. The subject is one which comparatively affects us but little, though it is true that half the Medical men of the United Kingdom are connected with Poor-law Administration in some way, and probably that 10,000 of us might have £100,000 additional added to our incomes; but the real consideration is, that the public would have a saving, from an economical point of view, of several millions, and I think that it can be proved. We do not even pretend to be as rich as you, yet our Poor-law expenditure for (say) 5,000,000 population, was but £815,973 for 1870, while yours for (say) 20,000,000, was, according to a return made at the instance of Sir Michael Hicks Breach, June 22, 1868 (the last that I can just now lay my hands on), £7,498,059, figures which do not include vaccination and registration expenses, which ours do; in fact, you pay, estimating comparatively the population, considerably over £4,000,000 more than we do. You can afford to do so, no doubt, as your Poor-law valuation is over £118,000,000, against ours of £13,000,000. Whether you wish to expend, or, rather, throw away, 4,000,000 a year is a matter for your own consideration. The faults of our system have been on many occasions referred to, and I caution you against them. A chief one is the indiscriminate issue of tickets. There are over 30,000 irresponsible persons qualified to issue tickets where and when they please to the 1000 Poor-law Medical Officers of Ireland. Not only this, but they allow their customers and members of their families to do so also. This leads to great abuse of the system, expenditure to the rate-payers, and injustice to us. In our Medical Charities Act there is no definition of the term 'poor person,' nor, indeed, could there well be, because there is an idea abroad that our fee is a pound, a whole pound, and nothing but a pound. How well founded a fact it may be I need not now discuss, but the result is an abuse of the issue of tickets to Dispensary Doctors in Ireland. This I know, however, will not obtain with your service. There are other subjects which I may have occasion to discuss with you in some subsequent letter, and in which both services may mutually help each other, such as the whole payment of your salaries by the State instead of half, as at present, increase of salary according to duration of service, and fixed superannuation. These are among the principal objects of our Association. The shortcomings of your Poor-law system, and the consequent expense of it, are, in my humble opinion, principally these. An idea has existed almost up to the present that existing pauperism was the only thing to be dealt with, and little notice has ever been taken of prevention of pauperism. This is what an efficient Poor-law Medical Service effects. The famine and fever of 1848 necessitated it in Ireland. I trust that such an impulse to reform may not be wanted in England, but that you may be obliged to introduce it from prudential motives. At present you appear, notwithstanding your enormous charities (estimated by the Bishop of London at £4,000,000 annually for London alone), to spend another £4,000,000 a year on poor relief that you need not—at least, that you do so in excess of the comparative expenditure for this country. Poor-relief comes under two heads in England, out- and in-door relief. In Ireland we have a third Law Medical Relief on a very well-arranged principle, but capable of improvement. Mr. Smith's return to the House of Commons, and the analysis which you have given of it at your annual meeting, July, 1870, gives a full account of our sickness and death-rate.

"Our Poor-law expenditure, which probably in the course of argument before the House of Commons will have the most weight attached to it, I give you. The abuse of out-door relief may be very great, and in the consideration of Poor-law expenditure is of the most vital importance. In 1817, in a debate on the presentation by Mr. Calvert of petitions from two parishes in Dorsetshire, complaining of the burden of the poor-rates, which in one accumulated to 19s., and in the other to 21s. in the pound, Lord Castlereagh expressed his conviction that in cases where 19s. or 20s. in the pound poor-rates were paid, 15s. of that would be found to be wages paid in the shape of poor-rates. For this reason the expenditure on out-door relief, if extended to the supplementing of wages, will form a very important item in Poor-law expenditure, and probably might be taken advantage of to a very considerable extent by that class of men from amongst whom Poor-law guardians are elected. Medical relief, however, is of another nature; it is open to us all to require it, and it can hardly be abused. With regard to the supply of medicines for our 1000 Dispensary Medical Officers, the cost is £32,000 a year. You number close upon 4000 men, and taking this into consideration, you appear to pay among you

£120,000 out of your salaries for medicines. Does this form another item in out-door relief? Men in our Profession are certainly no worse than those of other professions; but I do not see clearly why we should be expected to be so very much better, as apparently we are. Relieving officers are not expected to give food out of their own pockets—why should the Doctor give Medicine? It is possible, in some instances, out-door relief under your system is ordered when medicine only would be ordered under ours. With regard to the total number of persons admitted into our workhouses during the year 1870, I find it to be 183,135; expense in maintenance £381,844, or a little over £2 per head; of these but 49,749 were admitted in sickness. Out-door relief of 53,885 persons, at a cost of £59,101, or a little more than £1 a head; and 784,424, under the Medical Charities Act or Dispensary system, at 2s. 6d. per head. Under your system, in-door relief appears to cost over £8 per head, and out-door relief over £4 per head. I do not find any intermediate stage whereby the person is attended as under our Medical Charities Act. I find that you have Medical men connected with the Poor-law, whose salaries vary from £3 to £500 a year. It could not possibly be an object to any Medical man to hold the former appointment, except to keep some other person away, and the work is done, I presume, on the farm scale. There is one more remark it is necessary to make, and that is, that you have no permanent head as we have. Your registration, vaccination, and sanitation are split up—they are in different, and, I fear, very often in very discordant hands. If I might make a suggestion, it is that what you want is system and consolidation. You have, however, struck the note, which is, that until some improvement on the present Poor-law system of England is effected, money to the extent of some £4,000,000 annually will be completely thrown away. We will take care that all our members are informed of Mr. Corrance's motion, and will endeavour to interest them in it, as far as we can.

"I remain yours very truly,

"Dr. JOHN T. MAUNSELL, Hon. Sec.

Poor-law Medical Officers' Association, Ireland.

"To Dr. Rogers, President Poor-law Medical Officers' Association, England."

COMMUNICATIONS have been received from—

Dr. WHITELAW; Mr. T. C. WHITE; Dr. J. FAYRER; Mr. M. H. WRIGHT; Mr. F. DURHAM; Dr. J. E. NEILD; Dr. CHEADLE; Dr. R. H. BAKEWELL; Dr. A. GARDEN; Messrs. STEAD and Co.; RUSTICUS; Mr. LAWSON TAIT; Mr. D. HARTLEY; Dr. G. JOHNSTON; Mr. T. BURBIDGE; Dr. R. DOUGLAS POWELL; Mr. F. T. PROCTER; Dr. WHITMORE; Dr. BOGGS; Messrs. At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29'76 in. The highest was 29'90 in. at the end of the week, and the lowest was 29'43 in. on Tuesday.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871; the numbers for Edinburgh and Glasgow have been furnished by the Registrar-General of Scotland, while those for Dublin are still the estimated numbers recently used.

MR. BARNARD HOLT'S SURGICAL BAG (Registered).

ARNOLD & SONS, 35 & 36, WEST SMITHFIELD.

Extract from THE LANCET, April 22nd, 1871.

"The Bag is perfectly portable, and is of a size not to offend the eye or be inconvenient to carry. In this *multum in parvo* there is almost everything that can be required in military or civil practice."

Extract from MEDICAL TIMES AND GAZETTE, May 13th, 1871.

"Thus the Surgeon, if he desires to take with him some small case that will go into his pocket, can readily do so. On the other hand, should he be summoned to a railway smash, or go suddenly on foreign or military service, he has but to snatch up the Bag, and there, ready packed, he will find instruments for every disease or injury requiring operation."

Extract from MEDICAL PRESS AND CIRCULAR, May 31st, 1871.

"Here is a more compact contrivance than any yet submitted to Surgeons. The Bag contains every instrument in daily use or for any Surgical emergency, and is extremely portable; and the interior of the Bag so arranged that any instrument can be at once selected without disturbing the rest."

Price, complete with Instruments, 50 Guineas; or Surgical Bag, with Trays (without Instruments), 3 Guineas.

Sole Manufacturers, **ARNOLD & SONS**, Instrument Makers, by Appointment, to Her Majesty, St. Bartholomew's Hospital, Seamen's Hospital, &c., &c., 35 & 36, WEST SMITHFIELD, LONDON.—Established 1819.

THE NEW PATENT AMERICAN ARTIFICIAL LEG.

SOLE LICENCEES:

F. WALTERS & CO.,
16, MOORGATE-STREET, LONDON.

BROUGHAMS.

MR. OFFORD

Invites inspection of his large STOCK, in various shapes, sizes, and colours, very light and roomy, with many improvements. Cash prices as low as first-class work can be made for. Can be jobbed or paid for by yearly instalments.

PATENTEE OF THE
INDIARUBBER GLASS FRAMES
AND SELF-ACTING STEPS, &c.

79, Wells-st., Oxford-st.

SILVER MEDAL AWARDED 1867.—JUROR 1862.

MORSON'S PREPARATIONS OF PEPSINE.

MEDICINAL PEPSINE

(Poudre Nutritive, or "Pepsine Acide Amylacée" of the French Codex)

Contains the active digestive principle of the gastric juice, purified and rendered permanent and palatable. Dose—15 to 20 grains.

PEPSINA PORCI,

A concentrated and NEUTRAL preparation of Pepsine, free from any disagreeable taste or smell. Dose—5 to 10 grains.

These preparations of Pepsine are carefully examined and tested by a professional Chemist, and certified to answer to the tests indicated. Every bottle containing the preparations named, and bearing the Trade Mark of T. MORSON AND SON, is sold with a guarantee to that effect.

PEPSINE WINE, PEPSINE LOZENGES, PEPSINE GLOBULES,

Are convenient forms for the administration of Pepsine.

SACCHARATED WHEAT PHOSPHATES,

A Dietetic Preparation, supplying an important deficiency in the ordinary Food of Invalids and Children.

Manufactured by **T. MORSON and SON**, Pharmaceutical Chemists,

31, 33, and 124, SOUTHAMPTON-ROW, LONDON, W.C.

ORIGINAL LECTURES.

CLINICAL LECTURE
ON THE
USES AND APPLICATION OF HODGE'S
LEVER-PESSARY.

By ROBERT BARNES, M.D. Lond.,

Obstetric Physician to St. Thomas's Hospital; Examiner in
Midwifery and the Diseases of Women to the University of London, the
Royal College of Physicians, and the Royal College of Surgeons, etc.

PART I.

I AM so frequently asked for some practical information as to the uses of Hodge's lever-pestary, and the manner of applying this invaluable instrument, that I have thought it useful to make the subject the text of one or two brief clinical lectures or demonstrations.

In studying gynecology we are met by a serious obstacle: a great part of the work of exploration for diagnosis and of Surgical treatment is performed under the bedclothes or the dress; comparatively little is subjected to the faithful eyes. To impart, then, clear ideas of the nature of the diseases of the pelvic organs and of their management, it is absolutely necessary to resort freely to verbal description and illustrations by drawings. I have therefore taken some pains to construct a series of diagrams which will enable you to follow with full intelligence, step by step, I trust, the diagnostic and Surgical manipulations.

The morbid condition which the lever-pestary is especially adapted to relieve, is retroversion and retroflexion of the uterus. The more we reflect upon the great frequency of this condition, the distress it entails, and the general efficacy of the instrument in curing it, the better shall we estimate the debt of gratitude under which our distinguished American brother has placed us by putting this admirable contrivance in our hands.

It is right to premise that Professor Hodge extends the application of his lever-pestary to many other morbid conditions besides retroflexions of the uterus. I would not so much as insinuate that the Professor has ever so little given the reins to his hobby as to exaggerate the uses of his invention. I know from experience that it is often of great service in chronic metritis, especially in inflammation with engorgement and hypertrophy of the cervix, in vaginitis, and several other diseases. By counteracting prolapsus, by securing comparative "rest" of the organ, by maintaining it at its proper elevation, it tends remarkably to counteract congestion, to restore freedom of local circulation, and thus to promote the cure. But the special subject of the present lecture is retroflexion of the uterus. I will not now discuss the causes of this displacement; they form the subject of a controversy which will probably be carried on for some time to come. One camp contends that it is a primary condition entailing congestion, inflammation, and other evils; another camp contends that it is secondary, and produced by the congestion or inflammation which is often found associated with it. The rational course is to look at both sides of the shield. I have no doubt that retroflexion follows labour. The uterus remains bulky from imperfect involution, and the heavy fundus is driven back by the superincumbent pressure of the intestines; it may be the consequence of adhesions, the reliquæ of peritonitis. The body of the uterus may in like manner be bent backwards by a tumour in its walls, by its bulk being increased by hyperæmia or hypertrophy, or by other morbid conditions. But close observation has convinced me that primary retroflexion is far more frequent. I meet with it frequently in women who have never had children or sexual relations. In fact, it is a frequent cause of sterility. In most, if not in all, of these cases I believe that the retroflexion is congenital. Until the advent of puberty, little or no inconvenience is felt; there is nothing to draw attention to the existence of the displacement. But when menstruation sets in, when the uterus under the ovarian stimulus grows and undergoes periodical engorgement, then trouble begins. The flexion at the neck aggravates beyond the physiological degree the menstrual hyperæmia of the body; the excretion of the menstrual discharge is impeded; a severe form of dysmenorrhœa becomes established; the bladder may become irritable; the enlarged body of the uterus projects into the rectum in the hollow of the sacrum, obstructing its canal like a ball-valve. Hence constipation, and gradual retrograde or ascending difficulty

invades the whole alimentary canal; a degree of paralysis of the intestines ensues; coprostasis leads to decomposition of fæces in the intestine, to flatulence; then other dyspeptic evils follow: loss of appetite, attended, perhaps, by vomiting under the pain of dysmenorrhœa, blood-degradation, general impairment of nutrition. These surely entail disorder of the nervous system. Henceforth the patient's life is one of constant, or, at best, of intermittent suffering, under which she may break down altogether. You may exhaust the Pharmacopœia in treating the stomach, the liver, the brain, or the spinal cord; but so long as you leave the cause untouched, the patient will continue to suffer.

How are you to detect this cause? Let us first inquire what are the symptoms which indicate uterine or ovarian disorder? what are the symptoms which justify physical exploration of the pelvis? If you see dysmenorrhœa to a severe degree, attended or not by menorrhagia, followed by leucorrhœa; if you learn that the sexual function is endured with difficulty; if you see the patient's general health becoming impaired under the repeated suffering; and if you learn that ordinary general and local treatment, fairly tried, have failed to bring relief—I think myself, and I know that most patients will be of the same opinion, that you ought to ascertain the condition of the organs whose functions are performed with so much distress. The time has come to give up the vain chase of the disease through its consequences, and to apply our attention directly to the organs which are obviously at fault. I admit that general means, medicinal and hygienic, should have a fair trial. Not seldom dysmenorrhœa is relieved by time and mitigated by medicines; but, on the other hand, more often still, dysmenorrhœa and its consequent ills are intensified by repetition, until the local condition and the remote disorders, working in a vicious circle of action and reaction, become so firmly established as to imperil the success of any treatment. We assume, then, that the case calls for full clinical investigation. The finger and the uterine sound are the instruments of diagnosis. Direct touch necessarily precedes every other mode of examination. You feel, then, for the central point—the os uteri. In retroflexion or retroversion of the unimpregnated uterus this is generally found a little lower in the pelvis than is normal, and nearer the centre. In the natural state of slight anteversion the os uteri is directed backwards; in the abnormal state of retroflexion the os usually points downwards, perhaps a little forwards. Feeling the os, you of course ascertain its form and the condition of the intra-vaginal portion of the cervix. Associated with congenital retroflexion of the uterus, the vaginal portion is often found conical, and the os small and round, barely admitting a sound. Where this complication exists, something more than restoration of the body of the uterus to the normal position will commonly be required. But this subject may be put aside for the present. Your next step is to explore the roof of the vagina *in front of the cervix uteri*. Here, if the uterus is in normal condition, you may feel the solid rounded mass of its body through the vaginal wall; and, by combining the intra-vaginal touch with the extra-abdominal touch—that is, by pressing down with the other hand the abdominal wall above the symphysis pubis, so as to meet the finger inside—you may take note exactly of the position and size of the uterus between them; and if the uterus is not there, its absence will be made manifest. (See Fig. 1, p. 122, which represents anteversion of the uterus.)

You next proceed to explore in like manner the posterior vaginal *cul de sac*. If you feel a hard, even, rounded mass *behind the cervix* through the vaginal wall, tender to the touch, you have strong presumptive evidence, strengthened by the absence of the body of the uterus from its normal position in front of the cervix, that this mass is the retroflexed uterus (see Fig. 2, which represents retroflexion of the uterus).

Rectal examination affords additional evidence. The finger in the rectum will even travel round the outline of this post-cervical tumour to a greater extent than can the finger in the vagina, and thus help materially the diagnosis. When by long practice you have acquired skill, you may be quite satisfied with this evidence. But this *tactus eruditus* itself is not acquired without a course of cross-testing by other methods; and to arrive at complete demonstration of uterine flexions the sound is necessary. Before passing the sound you must carefully consider the probability of pregnancy. In the great majority of single persons, and of those who have lived a married life for some years without children, the probability is strongly in the negative. The presumption is also in the negative in those who, having had children, seek relief from the consequences of retroflexion. Among these consequences is frequently acquired sterility. Two things help in forming an opinion: the date

FIG. 1.—Anteflexion of the uterus. Diagnosis by combined intra-vaginal and supra-pubic touch.

FIG. 2.—Retroflexion of the uterus. Diagnosis by supra-pubic touch.

of the last menstruation, and the bulk of the uterus. If the bulk be sensibly increased and a period have been missed, of course you will not use the sound. At the same time you will remember that increased bulk of the uterus is an almost constant attendant upon retroflexion. To pass the sound you give the end of it such a curve as the idea you form of the degree of flexion of the uterus may indicate. For example, if you feel the fundus of the uterus falling below the level of the cervix, and feel an acute angle of flexion, the curve given to the sound must be considerable. But in the majority of instances a moderate curve will be enough. And by a little manœuvre—that is, by lifting up the fundus of the uterus by your finger whilst the sound is passing the os uteri internum, the seat of chief flexion—you straighten the whole organ somewhat, and thus wonderfully facilitate the passage of the sound. The first stage of the introduction of the sound is best effected by passing the end into the os externum, as far as the os internum, with the concavity of the curve directed forwards; then turn the point backwards, so as to bring the concavity backwards, whilst the guiding finger lifts up the fundus. At the same time you must carry the handle towards the symphysis pubis (see Fig. 3).

When the sound has gone the normal length of two inches and a half, as measured by the protuberance, you may very gently—lest adhesions oppose—ascertain the mobility of the uterus by bringing the point forwards again, so as to place the uterus in anteversion. Your finger behind the cervix now loses the firm rounded body, which, carried forwards, may be felt by the hand outside pressed down upon the symphysis. On withdrawing the sound, the tumour behind the cervix is reproduced, that is, the uterus has fallen back again. Then the demonstration is complete.

It was at one time supposed that this restitution or *redressement* of the uterus by the sound, if repeated frequently, would cure the retroflexion; but experience

FIG. 3.—Diagnosis of retroflexion by the sound. On turning the sound with its concavity forward, the fundus of the uterus moves from A to B, where it may be felt by supra-pubic touch.

has proved this to be a delusion. Remove the sound, and the uterus commonly falls back again. Lift up the uterus gradually, as the lever pessary will do, extend the support it requires over a long space of time, and the structural change which is necessary for permanent cure will be effected. The action and mode of applying the lever-pessary we will discuss next time.

(To be continued.)

ORIGINAL COMMUNICATIONS.

CLINICAL REMARKS

ON THE SEVERAL FORMS OF PULMONARY PHTHISIS.

By R. DOUGLAS POWELL, M.D., M.R.C.P.,

Senior Assistant-Physician to the Hospital for Consumption and Diseases of the Chest, Brompton;

Assistant-Physician to the Charing-cross Hospital.

(Continued from page 7.)

Case of Catarrhal Pneumonia, non-hereditary—Significance of Fever and of the Signs of Softening; their Relation to one another—Gradual change in Physical Signs; Supervention of Pulmonary Fibrosis—A Second Case briefly Referred to—Further Progress of such Cases; a Hint as to their Management.

It will, I think, be most convenient to follow up the remarks upon the case described in the last paper by detailing one or two other cases which will serve to illustrate the transition, which not very unfrequently occurs, of pneumonic into fibroid phthisis. Bearing in mind the relation of the tissues to one another, which are affected in these two forms of phthisical disease, as pointed out in the first paper, we perceive that the transition of the one form into the other is pathologically very easy; it is also, I am persuaded, clinically often to be observed.

I do not mean for a moment to contend that all cases of fibroid phthisis commence as catarrhal pneumonia; the question as to the etiology of fibroid phthisis is not for the moment before us. I only wish to refer to catarrhal pneumonia as one of the several processes upon which fibrosis of the lung may supervene.

John B., aged 29, a butcher's assistant, came under my notice last March. He was a broad-chested, powerfully-made man, of medium height and florid complexion. He had led a rough but sober life, having followed his present business, which included the slaughtering of animals, for some years in Australia, and had enjoyed excellent health until shortly before Christmas, when, after getting wet, he caught a severe cold, which was followed by a cough, which has increased since and resisted treatment. Up to and at the time, however, of his attendance, he was still following his employment, but he now did so with difficulty, complaining of his cough and of increasing weakness, with decided emaciation. His father had died of consumption, brought on, the patient stated, by intemperance; there was no other hereditary tendency to the disease.

The chest, as before said, was broad and well-formed, without flattening or obvious impairment of expansion. The heart's apex beat in natural situation. At the left clavicular and sub-clavicular region the percussion note was dull, the dulness extending to the fourth rib; posteriorly, the resonance was defective at the left supra-spinous fossa. Scattered over the dull regions there was coarse crepitation, mingled with a still larger humid crepitus. These moist sounds were abundant, and masked to a great extent the respiratory murmur, which was decidedly harsh, but not distinctly bronchial. Its vesicular quality became gradually restored as the stethoscope was passed downwards. At the posterior base there were some scattered sibilant râles. On the right side the percussion note was good, and the breath sounds were natural.

The disease in this case began, then, with a cold on the chest—*i.e.*, a more or less general bronchial catarrh—which became localised (a) at the left apex, and extended there into the alveoli, producing catarrhal pneumonia; yet he continued his daily work, though constantly losing strength, for three or four months, during which time the catarrhal process ran on insidiously to a more deeply inflammatory degeneration of the alveolar walls. The disease had been acquired by exposure, the family tendency being very slight. The whole build of the

chest was not that of a man who inherited any tendency to phthisis. The physical signs at the present stage show consolidated lobules of blocked alveoli, which are softening with varying degrees of rapidity; the coarse crepitation answering to the redud crepitation of pneumonia, the larger click being due to more profound destruction of tissue (softening).

There are two data defective in this history:—1. Fever. 2. Rusty sputa, or hæmoptysis. Though, however, the patient could give no definite and trustworthy information as to fever, we know for certain that he must have had intermittent attacks of fever; for it is a matter of clinical experience that we never get the signs of pulmonary consolidation and resolution or softening, dulness and crepitation, without there having been with each increment of pneumonia a period of elevation of temperature. A remarkable case well illustrating this occurred some two years ago in the Brompton Hospital under Dr. Sanderson's care, in which a woman had for weeks together daily attacks of fever of an intermittent character, and post-mortem one of the lungs was completely, and the other partially, consolidated by lobular pneumonia of different dates. The patient whose case we are now considering had, on the occasion of his first visit, a quick pulse and a somewhat red tongue, and though there was no elevation of temperature at the time, it is very likely that at night it was a little raised.

It is here, however, perhaps, well to remember that we may have dulness and large or small liquid rhonchus without there being any fever present at the time; the fever may have passed away, but the consolidation which accompanied the fever cannot disappear so rapidly, but must run through a series of pathological and chemical changes essential for its removal by absorption or elimination—changes which are not accompanied by fever, and which may proceed *pari passu* with the rebuilding of the frame exhausted by the previous fever. This reflection is of very great importance in a therapeutic point of view; for if, for instance, we were to treat ordinary basic pneumonia with antipyretics so long as the stethoscope revealed tubular breathing and moist sounds to be present, we should get results deplorable in direct proportion to our auscultatory skill; and this remark applies with equal force to the lobular consolidations and softenings of phthisis. We should be acting as foolishly, if we regarded them as indications for treatment of an antiphlogistic kind, as if we continued to wrap up our damaged water-pipes after the thaw had set in instead of hastening to adopt measures to repair the breach as soon as the frost had gone. Rusty expectoration is by no means a constant symptom of catarrhal pneumonia—not so constant, indeed, as it is of the croupous variety. It appears to depend partly on the degree of intensity of the pneumonia and the congestion with which it is attended, but also very largely upon the constitutional peculiarities of the patient.

To pursue the case, however, one step further. The patient was treated with an alkaline mixture containing small doses of iodide of potassium and with cod-liver oil. The next note of importance was taken on April 27, when the expansion of the left side of the chest was noted to be decidedly impaired, the dulness had increased in hardness but not in extent, and was very marked, especially between the left margin of the sternum and the mid-clavicular line. In the space marked out by these two vertical lines (left sternal and mid-clavicular) the respiration was extremely feeble, and not attended with any rhonchus; the heart's impulse was diffused to the second interspace, though the apex was only half an inch higher than natural. To the left, again, of the mid-clavicular line the respiration was still feeble, and the rhonchus much diminished, the dulness being somewhat increased. At the apex posteriorly there was bronchial respiration and imperfect pectoriloquy; the bronchial râles at the base had cleared up. The resonance of the right lung extended to the left margin of the sternum.

These signs showed—1. That the disease had not extended; on the contrary, the signs of bronchial irritation at the base had cleared up. 2. A wasting of the parenchymatous texture of the lung had taken place; degeneration, absorption, and expectoration had removed the morbid contents of the alveoli, and some of the lung tissue itself, leaving, perhaps, at the apex a small cavity; the general result being collapse and agglutination of air cells. Hence a considerable reduction in the bulk of the lung and the retraction of its anterior margin *away from the median line*; so that between the left sternal line and a line drawn from the point of junction of the inner and middle third of the clavicle to the apex of the heart there was probably at this date no lung at all. 3. An encroachment of the enlarging right lung, a slight shifting of the heart to the left, and a flattening of the chest wall to make up for the lost space. The chest-wall flattening is, however, very slight, and not yet

(a) This bare statement is a clinical one only. We find in almost all cases of phthisis one apex affected first. Why cachectic bronchial catarrh should so strongly differ in this respect from ordinary bronchitis remains a mystery, but the fact is not the less clinically important.

noticeable until the patient draws a breath. The man has powerful parietes, and in such cases the displacement of heart and encroachment of opposite lung precede, often for a long time, any obvious flattening.

It is remarkable with what rapidity these changes are taking place, and there can be no doubt that the connective tissue of the bronchial and perivascular and pleural sheaths is now undergoing rapid development, and that the case is now not merely one of catarrhal pneumonia which has subsided after having caused a certain loss of lung substance, but that an interstitial pneumonia is proceeding; the case has changed its type to one of peribronchial, or rather pulmonary, fibrosis, or fibroid phthisis (one variety). That the disease is not yet arrested is probable from the patient still losing slightly in weight and becoming more anæmic; but it is now clearly localised.

During the next month he lost two pounds. He was during this time taking an acid preparation of iron, with a little quinine and the oil. Notwithstanding this slight loss of weight, he had improved generally; cough and expectoration had diminished, and he felt stronger. On June 8 he was still better, and had gained one pound since last report. He had very little cough; all moist sounds had disappeared except a slight friction(?) on cough at the outer side and a little above the left nipple. He has since steadily improved.

Dr. Andrew Clark related at the Medical Society a few months ago (vide *Lancet*, May 6, 1871) a case very similar to the above. The subject of his paper, a boy of 14, had been a patient of mine at Brompton some five or six months before he came under the notice of Dr. Clark, and my view of the case was similar to that of Dr. Clark as to the condition present, which he described by the name "peribronchial fibrosis." But the case appeared to me, in its earlier stages, to be one of catarrhal pneumonia, undergoing the process of softening, upon which pulmonary induration supervened, in consequence partly of ordinary cicatricial collapse, partly from the vascular bronchial and pleural sheaths taking on an active growth. I should prefer to regard the case with that above described, as belonging to a section of the large class of pulmonary fibrosis, or fibroid phthisis, since, though in both cases there was undoubtedly at first more or less general bronchial catarrh, still it was the apex pneumonia, of an intensity sufficient to deeply affect the fibrous framework of the lung at that part, but not sufficient to lead to its destruction, which set going, as a subsequent result, that active hyper-growth which produced such important modifications in the morbid structure and physical signs. As I look upon this new disease, or phase of the disease, as affecting the whole framework of the portion of lung involved, I think the more general term pulmonary fibrosis a better one under which to include it.

This disease—fibrosis—has, I think, little or no tendency to spread beyond the limits of the original disease which gave rise to it, and, provided the patients are careful to keep up their general health, and to avoid fresh catarrhs, they do well. The indurated portions of lung usually enclose, however, some nodules of dry cheesy matter, and one or two small excavations, which are often the seat of a necrotic crumbling process, which continues for a long time without affecting the general health, merely causing a slight irritative morning cough. This process is, however, very favourable to the uncovering of vessels of considerable size, without their becoming obliterated by the coagulation of their contents. Small ectasias of these pulmonary branches, or even considerable aneurisms, are thus more apt to arise in these indurated lungs than in others, and the possibility of severe or fatal hæmoptysis must not be absent from our minds in framing a prognosis. Also, hæmoptysis occurring in cases of this kind must for the same reason be regarded with greater anxiety than in ordinary cases of phthisis.

There is only one special remark concerning the treatment of cases of phthisis which have assumed the fibroid character which seems called for, and it is this—that though such cases require careful *surveillance*, and for several years (where practicable) carefully selected climates to suit the different seasons of the year, they do not require the persistent administration of tonic medicines and cod-liver oil. They improve immensely under such remedies up to a certain point, which may be readily recognised by the Medical attendant, and cannot be better described than by saying that it amounts to the most perfect health attainable by a patient who has had a certain area of respiratory surface cut off. If beyond this point we persevere with iron and oil, and too nourishing or stimulating a diet, we may still further increase weight and heighten colour, but the pulse quickens, the patient gets more short of breath; he becomes, in a word, plethoric, and liable to

pulmonary congestion and hæmoptysis, or dyspepsia and diarrhœa; and a rapid neutralisation of all the good results obtained, with great danger of fresh and perhaps fatal renewal of the old disease, is the consequence of too great anxiety, both on the part of the patient and the Doctor, to again arrive at a degree of health and bodily vigour which is impossible with a permanently damaged lung.

(To be continued.)

YELLOW FEVER IN THE RIVER PLATE.

By WM. NATHANIEL HIRON, L.R.C.P. Lond.,
M.R.C.S. Eng., L.S.A.L.;

Admitted to practise in Monte Video; ex-Surgeon-Major Argentine Army
on the Medical Staff of the Popular Health Commission
during the Epidemic.

THE city of Buenos Ayres has been visited, during the latter part of January, February, March, April, and May of 1871 with a most severe epidemic of yellow fever. The same disease appeared during the latter part of 1870 in the city of Asuncion—capital of the Republic of Paraguay—where it raged with a certain violence. Cases of the same disease were observed in this city during the preceding summer, 1869-70, supposed to have been imported from Rio Janeiro. The town of Corrientes, capital of the province of the same name in the Argentine Confederation, and on the line of direct communication between Buenos Ayres and Asuncion, was most severely visited by the plague at the commencement of the present year. A few cases (less than a dozen) of this disease occurred in Buenos Ayres in the autumn (April) of 1870, during the time this disease was raging in Rio Janeiro, and were believed to have been imported thence; but the affection did not spread outside the hotel in which the cases occurred.

On the appearance of the disease in Buenos Ayres, a Medical man of Monte Video published in the journals of that city a statement expressing his belief that the affection was not the specific yellow fever, but a bilious remittent fever. Arriving in Buenos Ayres about this period, and desiring to assure myself about the real nature of the fever, I went daily to the lazaretto, and there saw all the symptoms described as essential to the fever, and was able to ascertain the frequent accession of urinary suppression and the common presence of albumen in the urine. About this time, also, a Medical man, who had been very assiduous in attending the sick, himself sickened and died of the fever. This seemed to prove the contagion.

The population of Buenos Ayres numbers some 180,000. It is generally believed that at least 100,000 very wisely fled the city, and of those who remained probably three-fourths sickened and one-fourth died. Various and very varied computations have been made of the extent of the fatality of the epidemic. The official returns appear to have been most loosely kept, and only give between 13,000 and 14,000 as the extent of the mortality; my own impression is that about 20,000 (under, rather than over, this amount) have perished. I hope to be able to send you amended official statistics, which we are promised soon.

Of some seventy Medical men who remained at the post of duty, fifteen have died, and probably half sickened. In the town of Corrientes, five died out of seven, and two apothecaries of three that were there when the epidemic commenced.

I believe yellow fever existed in Barcelona in the autumn of 1869; I am not sure if it may not have been later. There is some talk about an importation of the disease thence. I cannot find confirmation of this idea, and think with all the yellow fever we have had near us a cause close at home may be accepted. You must understand, it is very difficult to ascertain facts of this kind in this country. There is not the least doubt, however, that quarantines, although imposed, have been simply farcical during all the time the disease was raging in Asuncion, and even at Corrientes, in the same Republic. It is said that two *employés* of the steamer *Provedor*, which ran between this port—Corrientes—and Asuncion, came ashore suffering from the fever; also that a patient escaped from the quarantine lazaretto, and brought the disease to the city. Possibly, more may be made public upon this matter; if so, I will inform you. For a considerable period before the outbreak of the epidemic an exceptional season prevailed: the preceding winter, spring, and early part of summer had been exceptionally dry, the summer hot. This condition had prevailed throughout these parts.

Buenos Ayres is a city without drainage, in which the population occupies a small area in proportion to its number; the streets are narrow, and, rents being very high, it is usual for many people to live in one house. The most complete disregard for all hygienic rules exists, and the *débris* from the slaughter of the cattle has been hitherto discharged into an almost stagnant inlet of the river in most unpleasant proximity to the city. The odour from this source has been, with a favourable wind, almost insupportable, even in the centre of the city. The method of making streets has been to fill up with offal before macadamising. Such filthy water-closets I have never met with anywhere, although one gets to a certain extent prepared by what one encounters on the Continent in Europe.

The city of Monte Video at first imposed a stupid quarantine of three days' duration; after a time it was increased to twelve days, then to twenty days, and finally the port was closed entirely. In the town of Rosario a quarantine of fifteen days was imposed from the first. After a time, the port here also was closed. Both Monte Video and Rosario have saved themselves from the plague. The disease springing up in one parish, was for a long time confined to that parish; and in the early period, although cases passed from this parish to others, they did not seem to originate the disease in the parishes whither they went; and this has happened throughout the epidemic in the country districts where cases have been imported from the city, and have been fatal, but have not called forth the disease in others. However, in time, the disease spread throughout the city. Immediately after the Carnival, the disease doubled in amount, and was probably truly attributed to the intermixture of the people during that season; for this reason, the festivities of Holy Week were very properly dispensed with.

The influence of meteorological conditions was remarkable:—Cold increased greatly the number of deaths, but seemed to be followed by a smaller number of new cases; heat augmented the number of new cases; and rain combined with heat appeared to favour most the progress of the epidemic. An arrest seemed to be put to the disease by several days of extreme cold, followed by very heavy rains, even although the temperature which followed was again higher, though not so high as previous to the week of climatic crisis.

The temperature is very variable here; the thermometric ranges are great, even in a period of twelve hours; rain falls rarely, but in considerable quantity within a short period. Thus generally three or four hours in midday may be quite hot, and yet the remaining part of the day cold, and the night exceedingly so; it seemed as though a continuously low temperature was necessary to affect sensibly the plague.

It seems that fevers of varied type (probably malarious) exist here, but to a limited extent; and that yellow fever has not yet found a habitat. It was here about 1858, and again last year; but last year it appeared to extinguish itself in the place where it broke out in the autumn, and the first cases this year were in quite a different, and sufficiently distant, part of the city.

The greatest sufferers by the plague have been the Italians, who are the poorest part of the population, and live in the worst hygienic conditions, and, besides, are the most ignorant and the least disposed to apply for Medical assistance. These are the occupants of the "Convent Mos," a term which may be literally rendered "fever dens." You will readily understand that the number of Medical men should have been insufficient to cope with this colossal plague; national prejudices also impeded that beneficent united action which should have been cultivated at all cost.

The importance of early treatment was clearly apparent; the proportion of mortality increased terribly with every day of unassisted fever. The fatal symptom was urinary suppression—but very, very few recovered after this symptom set in. I estimate that the natural mortality of the disease, unassisted, was not more than 40 per cent. of the attacked; Medical treatment reduced it about 20 per cent., and in the decline of the epidemic it was probably less.

Statements about diminution of ozone in the atmosphere, and of electrical aberrations, were made, but they were entirely unsupported by acceptable evidence. It was the opinion of the Professor of Chemistry in the University (who unfortunately himself succumbed to the disease), from some partial experiments he made, that the amount of ozone was not diminished.

The towns on the line of infection are Monte Video, Buenos Ayres, Rosario, Parana, Corrientes, and Asuncion. The disease existed in Asuncion during summer, in Corrientes during summer and the early part of autumn, in Buenos Ayres during the latter half of summer and autumn. The summer through-

out was hot and dry; during this Asuncion and Corrientes suffered. The temperature in Buenos Ayres during the epidemic was very variable, and there were several very heavy rainfalls, but also a few light rainfalls with general moisture, and, when the epidemic fell, a more maintained low temperature. Although exposed, then, to similar climatic conditions, Parana, Rosario, and Monte Video were not infected. They, however, took the alarm, and exercised rigid quarantines.

Males suffered in much greater proportion than females. The mortality amongst children was small. Plethoric habits were bad subjects, and lymphatics seemed to have a better chance.

We hope that the cold of winter will be sufficiently maintained to prevent, as hitherto, the fever taking up its abode here. Everything prompts such hope. The streets of the most infected quarters were sprinkled with tar, at the recommendation of the lamented Professor of Chemistry in the University.

The disease generally began with some sensation of cold, giddiness, and (usually) nausea; occasionally vomiting. Then followed intense headache and pain in the back; often, too, with general pain, high fever, very injected eyes, and rapid pulse. The urine, at first, highly charged with colouring-matter and lithates. The tongue was generally lightly coated, sometimes heavily so. The bowels constipated. Any early vomit was of ingested substances. A yellow colouring of the conjunctivæ was generally early apparent. In the second stage great adynamia prevailed, with a remarkably slow pulse (often not more than 40 per minute). Jaundice proceeded. Bleedings from nose and mouth, occasionally from the bowels; still more rarely with the urine, and very rarely from the vagina, with petechiæ. Sometimes ecchymosis in the cellular tissue, and generally in the conjunctivæ. Vomits of decomposed blood, often very copious. Hiccough occasionally. Generally albumen in the urine, and suppression of this secretion in many cases, but rarely, indeed, relieved, and of all but certain fatal augury. In this stage the urine highly charged with bile. Some patients died within sixty hours, overwhelmed by the disease; the majority about the fourth or fifth day. Some cases put on typhoid symptoms, and lasted twenty, thirty, even forty days; generally, but not invariably, recovering. With some frequency, parotid abscess.

The fever, as a fever, was of continuous type, but aspects of periodicity frequently presented themselves to me, on which I have formed my opinion and based my treatment. A high range of temperature was rapidly attained, and maintained, with the exception of differences of fractions of a degree between the night and morning temperatures, the night returns being slightly higher than those of the preceding morning; the decline was quite gradual. These statements are based on a few observations taken in the lazaretto. I was not working there, or would have tried to have furnished more complete accounts. Seeing about sixty patients daily in different quarters of the city, it was impossible that I could undertake this investigation.

The autopsies, of which I saw a number in the lazaretto, disclosed inflammatory injection and ecchymosis of the coats of the stomach and the intestines, generally extending as far as the ascending colon. Very frequently one found coffee-grounds liquid in the stomach, and green-paint stuff in the intestines. The liver presented notable appearances. The first stage (seen in those who had died early) seemed to be one of active congestion, followed speedily, as it were, by a stuffing (pardon the expression) of the organ with bile, and giving it the rhubarb aspect. The gall-bladder generally only contained some bile, and was never distended, but rather somewhat empty: once the connective tissue surrounding it was infiltrated with ecchymosed blood. The kidneys were almost invariably dyed with biliary colouring-matter, and, in anuric cases, congested in the cortical part, to all appearance, with an ecchymosed look in the pyramidal portions, and true ecchymosis about the calyces and pelvis. The spleen occasionally seemed a little swollen and immoderately firm, but its changes were almost *nil*. The cavities of the heart showed the biliary staining in their lining membranes, particularly about the valves; generally a very dark and fluid condition of the blood; sometimes post-mortem or intermediate clots, always with the biliary colour. The lungs generally natural; once with apparently passive sanguinary infiltration in one lower lobe. The brain and spinal cord, negative appearances; once much fluid in the ventricles and subarachnoid space (the subject had died in uræmic convulsions); but in other—even anuric—cases, negative appearances.

Cases seemed to terminate thus: A few, early in the disease, *comme foudroyés*, yet with exalted temperature, but senseless;

the majority, with convulsions just before death—generally anurics, yet many anurics seemed to die in syncope; and several by syncope generally having this concentrated pulse of small number. Quite a few seem to me to present, since their attack, the anæmia and malaise usual in paludal cases, and some of the cases of the typhoid form had the dysentery one so commonly meets with in those cases. The greater number recovered perfectly.

All kinds of ideas upon the nature of the fever and its treatment were emitted in the newspapers. At first, all seemed determined to refuse the diagnosis of the native Faculty, and sustained it was not true yellow fever. However, I have explained to you that the fact of an importation having occurred appeared highly probable. Then we had cases which gave colour to the idea that it was contagious; and, to stop all doubt, came albuminuria and suppression of urine. Now the journalists are at the statistics; the natives uphold the official 13,000, and the foreigners assert that double that number have died. Also, in treatment, we have had vomitives lauded and vomitives condemned; and the same of purgatives, mercury, quinine, etc.; of homœopathy, hydropathy, and "Let me alone, please," etc.

I have spoken to you of the periodic aspect one could not fail to remark in many cases of the disease; I have told you that the generally continuous type of the fever, its infection or contagion, and the urinary symptoms proved to us that we had to deal with the disease described as "specific yellow fever;" certainly, though hourly, one could recognise in the disease the same nervous expressions one is so conversant with in the experience of tropical fever—let it be shore fever, or marsh fever, or heat fever. Where is the difference; what is the difference; is there a difference in these fevers? And if there is a difference, is it a difference of nature or of form? And does malaria exist, or does it not exist? And if they exist, are they always necessarily local and not portable, intransmissible from place to place? And is a pernicious fever—let it be an intermittent, a remittent, or a continued fever—simply the expression of the result of weather changes on the frame, or caused by some agent that is disengaged from the soil under certain local and meteorological conditions? And are malaria the products of topographical or geological conditions, and are they caused by organic or inorganic decomposition? How imperfect is one's knowledge when one cannot prove one's science; one should be scientific to be a sure Physician.

We had one plausible theory from an Italian chemist: bilious remittent, the product of vegetable decomposition, yellow fever, the same plus animal decomposition, both produced by a neglect of sanitary laws, coupled with atmospheric aberrations, and generally local in their nature and effects.

If I find, then, that antiperiodic treatment is efficacious against "specific" yellow fever, do I utter an heresy in saying that this fever must not be expelled from the family—the common family—of which it bears the impress, and to which it stands in the closest and most intimate relation? Yellow fever, certainly, necessitates a most vigilant and active treatment, but the basis of that treatment is quinine in antiperiodic doses. Shall we deny that a miasma, the malaria, may not under certain conditions, climatological and local, become contagious or infectious (as contagious and as infectious as may be expressed by its existence in the sick man as an infection-centre, and around him, by his presence, for a

limited distance), and be portable from point to point; being intensified and producing an intense disease, so intense that you shall get but a glimpse of its real nature, but that glimpse shall suffice to the initiated to recognise an old acquaintance, and to counsel the adoption of the same means of repelling him as have sufficed to control other of his brethren.

We are told that yellow fever is a disease of the West, and does not exist in the East; yet, was it not anciently called "mal de Siam"? Has any Medical man seen the two diseases, each in its native home? What is this malarious yellow fever one reads of?—is it never infectious?—for truly the contagiousness of specific yellow fever is more an infectiousness than anything else; and the urinary symptoms are not satisfactorily sufficient as a basis of distinction—this symptom is merely a question of degree. Quinine will not cure yellow fever alone, but neither will it cure a severe bilious remittent alone.

(To be continued.)

ON ORCHITIS AFTER LITHOTOMY.

By ALEX. GARDEN, M.D.,
Civil Surgeon, Saharanpore.

ORCHITIS and abscess of the testicle after lithotomy are complications, rare indeed, but still liable to occur in a certain proportion of the cases operated on. During the last seven years I have had the opportunity of watching carefully more than 250 cases of lithotomy, of which 130 have been operated on by myself, and the remainder by the sub-Assistant-Surgeons under my immediate supervision. Amongst these cases orchitis, with or without abscess, has been met with six times, giving a proportion of about one in forty-two. Mr. Jonathan Hutchinson alludes to this subject in his lecture on "Orchitis from irritation of the Prostatic Urethra" (vide *Medical Times and Gazette*, April 17, 1851, No. 1085), and gives the proportion from his own experience as one in forty; but this he considers as probably much above the true average. Mr. Hutchinson's and my own averages are very much the same, but the truth of his suggestion is, to a certain extent, borne out by the result of more extended figures. I have by me an abstract of all the cases of stone in the bladder that have been operated on in the Suddur Dispensary during the twenty-three years commencing with August, 1848. The total number, exclusive of females, is 983, in only one of which was lithotripsy performed: but from this total 183 cases must be deducted as imperfect in details, the particulars having been obtained from half-yearly returns, in which results only are entered. The number of cases of lithotomy left for comparison is 799. The total number of cases of orchitis is sixteen, giving an average of one in fifty, which is considerably lower than those given above. This is probably correct, at any rate for India, though, of course, it is quite possible that it might be much modified if the experience of other districts was available for comparison. There are other points of interest in connexion with this subject, which are shown in the subjoined statement of the sixteen cases above alluded to—

No.	Year.	Age.	Duration of symptoms.	Health at the time of operation.	Weight of calculus.	Date on which		Side affected.	Abscess or not.	Remarks.
						Urine first passed by urethra.	Orchitis appeared.			
1	1848	28	2 years	Good	360 grains	6th day	17th day	?	..	
2	1849	10	4 "	Good	480 "	11th "	18th "	Double	..	
3	1849	3	1 "	Good	240 "	10th "	10th "	Double	..	
4	1849	60	3 "	Bad	1480 "	18th "	27th "	Left	Abscess	
5	1851	50	5 "	Good	300 "	11th "	11th "	?	..	Secondary hæmorrhage; plugging.
6	1854	40	4 months	Good	220 "	11th "	21st "	Left	Abscess	Stone broken.
7	1854	11	5 years	Bad	766 "	20th "	36th "	Left	..	
8	1854	40	3 "	Good	200 "	6th "	8th "	Left	..	
9	1856	30	2 "	Bad	840 "	3rd "	23rd "	Right	..	
10	1856	52	1 "	Good	50 "	6th "	16th "	Double	Abscess	
11	1865	22	3 "	Bad	480 "	13th "	7th "	Left	Abscess	Secondary hæmorrhage; plugging.
12	1866	3	1 "	Good	40 "	..	2nd "	Left	..	
13	1866	25	6 months	Good	12 "	7th "	6th "	Double	Abscess	
14	1869	25	2 years	Good	201 "	9th "	15th "	Right	..	Three calculi.
15	1869	15	5 "	Bad	510 "	..	18th "	Right	..	Four calculi.
16	1869	16	1 "	Fair	34 "	2nd "	8th "	Right	..	Stone broken.

The last six on the list are the cases which have come under my own observation, and of which the following are short abstracts:—

Case 1.—G. L., aged 23; admitted November 29, 1865. Duration of symptoms three years; for five months his sufferings have been intolerable. He is greatly emaciated and very weak; pulse very small and weak; no appetite; gets no rest on account of pain in the bladder; great tenderness in the hypogastric region; micturition frequent; urine alkaline, pale, with a thick ropy sediment, consisting chiefly of pus and mucus cells and phosphates; has undergone treatment at the hands of the hakeems by diuretics and purgatives. His means are good, and he has undergone no privations. Under the use of dilute nitro-muriatic acid, and laudanum, with carefully regulated nutritious diet, he improved much. At his own urgent request I performed lithotomy on December 12, and removed a calculus weighing 480 grains. There was free venous bleeding at the time of the operation. On the second day he showed symptoms of collapse with tympanitis, but rallied under the use of stimulants and turpentine stupes. On the third day there was a little redness of the scrotum, which soon disappeared. Secondary hæmorrhage to the extent of twelve ounces occurred also. This was controlled by the introduction of a tube and plugging. On the fifth day he complained of pain at the brim of the pelvis in the course of the left spermatic cord. On the sixth day the plug was removed. There was no return of hæmorrhage. On the seventh day the left testicle was swollen and painful, and there was considerable redness and œdema of the scrotum. On the eighth day fluctuation was distinguished in the body of the testis. Two ounces of thin purulent fluid were evacuated. On the tenth day the swelling was less, there was no pain, and the discharge of matter was very slight. On the fourteenth day there was no discharge, and the wound was nearly healed. On the sixteenth day urine was first passed by the urethra. On the twenty-second day urine was passed entirely by the urethra. On the twenty-sixth day he was discharged cured.

Case 2.—O. C., aged 3; admitted January 27, 1866. Duration of symptoms one year; general health good; urine clear. Lateral lithotomy was performed by the sub-Assistant-Surgeon, and a stone weighing forty grains removed. On the second day the scrotum was red, swollen, and painful. On the third day the left testicle was inflamed, the body swollen and painful. On the fifth day the urine first passed by the urethra; inflammation of the testicle much less. On the eighth day the inflammation had entirely disappeared, and there was little or no swelling. On the eighteenth day he was discharged cured.

Case 3.—B. G., aged 25; admitted August 12, 1866. Duration of symptoms, six months; general health good. On August 13 I performed lithotomy, and removed a calculus weighing twelve grains. On the sixth day the left testicle was swollen and painful. On the tenth day urine first passed by the urethra; the testis was much enlarged, chiefly the body, the epididymis being but slightly affected. The scrotum was red, shining, hard, and painful at the lowermost portion. The right testicle was inflamed also. On the twelfth day fluctuation was felt in the right testis. Four ounces of rather offensive pus were evacuated. On the fourteenth day there was but slight discharge. On the twenty-fifth day he was discharged cured.

Case 4.—S., aged 25; admitted May 9, 1869. Duration of symptoms, two years; general health good. On May 9 I performed lithotomy, and removed three calculi weighing 201 grains. On the ninth day urine passed by the urethra in great part. On the fifteenth day the right testis was inflamed. On the twenty-second day no orchitis; urine entirely by urethra. On the twenty-fifth day discharged cured.

Case 5.—O., aged 15; admitted May 30, 1869. Duration of symptoms, five years; general health bad; sufferings intense; urine phosphatic. On June 1 I performed lithotomy, and removed four calculi weighing 510 grains. After opening the urethra, and on attempting to pass the scalpel along the groove of the staff into the bladder, an obstacle was met, which proved to be three small calculi, lying in the enlarged prostatic portion of the urethra. After removing these, the finger could be passed readily into the bladder through the dilated orifice. The largest of the four calculi was removed without difficulty. On the third day a little faecal matter was passed through the wound. On the sixth day he could retain his urine and pass it in full stream by the wound voluntarily. On the eleventh day but a slight trace of faecal matter by the wound. On the eighteenth day the right testicle was inflamed. On the nineteenth day the testis was swollen, but not painful. On the

twenty-seventh day the urine passed first by the urethra; the testicle was normal. He subsequently died from dysentery.

Case 6.—S., aged 60; admitted October 13, 1869. Duration of symptoms, one year; general health fair. On October 14 I removed two calculi weighing thirty-four grains. One was very friable, and lodged at the mouth of the bladder, and was broken by the sound. On the second day most of the urine passed by the urethra. On the fourth day the urine was passed entirely by the urethra. On the eighth day the body of the right testis was inflamed. On the twelfth day he was discharged cured.

Rare as orchitis after lithotomy is, it seems to occur almost under some epidemic influence, as in most years when met with two or three cases have occurred close one after the other, whilst at other times year after year has passed without a case. Thus, in 1849, 1854, and 1869, three cases happened in each year, and two each in 1856 and 1866; but since October, 1869, I have not myself met with a case, and during the eight or nine years from 1856 to 1865 not one is recorded. In this long period most of the imperfect cases before alluded to were operated on—viz., between May, 1856, and January, 1858, and in July, August, September, and October, 1859. Very possibly cases may have occurred during these periods. It may, however, be that this occurrence of several cases in quick succession is but another example of those inexplicable chances so frequently met with in Surgical practice, where several cases of the same accident are seen rapidly one after the other, and then never again for months—e.g., recently, in two successive days, three children were brought to me with foreign bodies introduced by themselves into their nostrils. This could hardly be looked upon as an epidemic!

Has age any influence on the occurrence of orchitis after lithotomy? The number of cases is almost too small to frame a definite reply from, but it would seem that the young are much less liable to it than adults or those in advanced life. This will be seen by comparing the percentages of cases operated on at the different periods of life with those of the cases of orchitis in similar periods.

In 824 cases these were as under. The cases of orchitis are placed beside them for comparison:—

Periods.	Percentage of Total Cases.	ORCHITIS.	
		Percentage.	No. of Cases.
1 year to 20 years	. 50.59	31.25	5
21 years to 40 years	. 30.58	43.75	7
41 years to 60 years	. 16.50	25.00	4
61 years to 85 years	. 2.30	—	—

From this it appears that whilst a little over one-half of the cases are under 20 years of age, not one-third of the cases of orchitis occurred during the same period. On the other hand, the liability is the same for all ages above 20. The youngest age at which it was met with was 3 years; the oldest, 60 years. Of one circumstance there can be no doubt, and this probably has some bearing on the subject as a cause, predisposing or exciting—viz., that the urinary organs are much less likely to be seriously diseased amongst the young than in those of more advanced life.

On the other hand, the duration of the disease does not seem to exert much influence. Of the 824 cases, 32 per cent. had suffered for one year or under, the number of cases of orchitis being six, or 37.5 per cent., and 68 per cent. had suffered for more than one year, the cases of orchitis being ten, or 62.5 per cent.

The state of health at the time of operation, as might be supposed, seems to have considerable influence. In the total cases it was good, in 77.4 per cent. the percentage of orchitis being 62.5. In the case of those in bad health the position is reversed. A good general condition of health, however, is very far from a guarantee against the appearance of the disease.

The weight of the stone, which apparently so strongly influences the mortality after lithotomy, does not seem to be a cause, in any way, of orchitis. The weights varied from 12 grains to 1480 grains.

The left testicle is rather more often affected than the right; or, if we remember that, when both are affected, as a rule the left is first inflamed, much more so.

In fourteen cases in which the side is mentioned, it was as follows:—Left testicle alone, six cases; right testicle alone, four cases; both testicles, four cases.

It is a fair supposition that this greater liability of the left side is in some way connected with the position of the incision in lateral lithotomy.

The inflammation I believe to invariably commence in the prostatic portion of the urethra, and to extend along the cord to the testicle. If the cord be examined, it will in most cases

be found at some time or other affected. In one of my cases it was markedly so, and first drew the patient's attention. I am not so certain on this point with regard to the inflammation that occurs in the second testicle when both are affected. The portion chiefly and mainly inflamed is the body. It is rare to find much swelling of the epididymis, as in gonorrhœal orchitis.

Suppuration of the body of the testicle occurs in a considerable proportion of the cases—viz., in five out of the sixteen. Most often it is in the left testicle. It is remarkable with what rapidity, in some cases, the matter forms: until it is evacuated the sufferings are most intense.

In many cases it is difficult to understand the occurrence of the inflammation, in the absence of anything peculiar in the operation or the case itself. Mr. Hutchinson suggests that a small fragment broken from the stone during extraction may become impacted in the orifice of the ejaculatory duct, and give rise to the inflammation; and in a certain number of cases this may possibly be the case, but I can hardly think that it is the only cause. He has never known orchitis follow lithotrity, but one would imagine that the impaction of a fragment would be certainly as likely to occur after this operation as after lithotomy. I can offer no evidence of my own, as my experience has been entirely of lithotomy, owing to want of lithotrity instruments.

In two of the cases secondary hæmorrhage rendered the introduction of a tube and plugging necessary, and in one of these, for certain, the inflammation followed directly on it, and, we may fairly conclude, was caused by it. Preceding cystitis may also be well supposed to act as a cause.

In the two cases in which the stones were broken, one can well understand that a small fragment may have become impacted.

Multiple calculi may also influence it, owing to the generally lengthened nature of the operation and the greater chance of bruising and irritation by the more frequent introduction of the forceps.

Another point worthy of remark is, that in only 25 per cent. of the cases did the orchitis precede the first passage of the urine by the urethra. In some it commenced on the same day, and in others not for days after. Patients often complain of pain and smarting at this time, and it is possible that the healthy healing process may deteriorate into inflammation in certain cases.

On the subject of treatment it is not necessary to say much. The disease is, as a rule, very tractable, and only acts unfavourably by retarding recovery somewhat; it is never fatal. When abscess has formed it must be opened as soon as possible; otherwise, a few leeches along the cord, an aperient, and cold lotion locally are all that is required.

Saharunpore.

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

DR. L. A. SAYRE'S METHOD OF TREATING HIP-JOINT DISEASE.

WE have quite recently had the opportunity of meeting Dr. Sayre, during his short visit to this country, at two of our London Hospitals, and at one of them—the Middlesex Hospital—we had the satisfaction of hearing him explain his views and illustrate his treatment of cases of hip-joint disease. Dr. Sayre's hip-extension splint has for some years been known in England; but from ignorance of, or want of sufficient attention to, many little details in the mode of application, it has not met with the success in the hands of others that Dr. Sayre has established for it in his own. Whatever may be the views entertained by different Surgeons as to the etiology or pathology of hip-joint disease, none who have had experience of such cases can have failed to see the ill-effects produced upon the general system by the long-continued inactivity which the treatment ordinarily employed necessitates, and to desire some means by which extension and proper rest to the affected joint could be supplied without confinement to the bed and house.

By long experience, obtained at the Bellevue Hospital, New York, and in practice, and by a thorough knowledge of and attention to the pathology and anatomy of the joint, Dr. Sayre has employed and perfected a splint by which Surgeons

can obtain these desirable results. He regards the majority of cases of hip-joint disease as the result, not of a strumous or tubercular dyscrasia, but of some local cause—a blow, or twist, or sprain, which, though very slight, may set up an inflammation of the synovial membrane of the joint, or cause a "blood blister" between the end of the bone and its investing interarticular cartilage. This not being observed at the time of its occurrence, is not quieted or subdued by immediate rest, but goes on developing slowly into a grave disease. With these views strongly impressed upon him, he was convinced of the propriety of overcoming the affection by purely local means, instead of relying upon medicinal remedies to correct a supposed scrofulous condition or hereditary defect of the body.

The familiar and characteristic position of the limb in the second stage of the disease—viz, one of flexion upon the body, abduction and rotation outwards—Dr. Sayre explains by the action of the ilio-femoral or accessory ligament, which, passing over the front of the capsule from the inferior iliac spinous process to the anterior intertrochanteric line of the femur, is intimately blended with it, and keeps it close to the neck of the bone. When the quantity of fluid normally contained in the capsule is increased by inflammation of and effusion into the joint, the capacity of the capsule itself must be increased, and this can only be done by the unfolding of the capsule; hence, the limb is flexed, abducted, and rotated outwards, to take off the pressure or tension of the accessory ligament, and thereby to permit the more complete relaxation of the capsule. That this is the result of an increase of the quantity of fluid in the capsule, Dr. Sayre has proved by injecting quicksilver into a joint after death and after the cessation of rigor mortis.

But another result of the joint-mischief is an atrophy of the muscles about the joint, accompanied by their contraction. Two conditions of contraction of muscles are recognised—one in which the muscular structure is not incapable of being stretched and extended by force, and the other in which, as after very long-continued want of use, the fibres become irremediably altered and shortened. The former condition Dr. Sayre calls the "contracted," the other the "contractured" state, and it is this latter which requires in some cases to be overcome by subcutaneous section of the "contractured" muscle before the limb can be brought into its proper position.

Now, in hip-joint disease the adductor muscles, which become tensely contracted, would draw the limb inwards and adduct it, did not the distension of the capsule above described prevent this; hence, one of the sources of the acute pain suffered in the second stage of the disease is the conflict between the muscles tending to adduct the thigh, and the resistance produced by the effusion into the joint, which keeps the limb abducted. Another cause of pain is the pressure upon the diseased surface due to the contraction of the muscles around the joint.

When the capsule ruptures, and the pus escapes into the surrounding tissues, the third stage of the disease has arrived; the pain is often considerably diminished, and the position of the limb is changed. The limb is adducted and drawn inwards; the muscles, in fact, being no longer resisted by the fluid in a distended capsule, have it all their own way. If the opening in the capsule be small, then the change will occur slowly; if large, then rapidly; and this it is which gives rise to the apparent spontaneous luxation of the femur, the occurrence of which Dr. Sayre denies. This so-called luxation, he says, is brought about by an enlargement of the acetabulum, the end of the bone being still contained within its capsule, and not by a slipping of the end of the bone out of the capsule.

In the diagnosis of the early stage of the disease, Dr. Sayre places much stress upon the dropping of what he terms the string of the buttock—i.e., the gluteo-femoral fold—the flexed position of the knee and hip as the child stands bearing the whole of his weight upon the sound limb, and the want of the rectangular decussation of the two imaginary lines, one along the central line of the abdomen, and the other from the anterior superior spinous process on one side to that on the other. In hip-joint disease, even in the early stage, in order to get these lines to cross at right angles, the leg must be flexed. Another point of importance is ascertained by placing the child naked upon a hard bed, floor, or table, when, if there be no disease, the spine will lie along the surface, the popliteal spaces will touch the bed or floor, and the lines will cross at right angles, as already mentioned; but if there be disease of one of the joints, the hand can be passed between the table and the lumbar spines, until the affected limb is flexed on the abdomen, when the arch in the spinal column disappears.

In the treatment of hip-joint cases everything depends upon the extension being kept up continuously and properly. The

straightening is to be done by degrees; at first it should be employed in the line of deformity, and then gradually brought from this into a straight position. The mode of extension used is the weights and pulleys, until the straight position has been obtained, taking care that the point upon which traction is made is above the knee, so as not to strain the ligaments of that joint. Afterwards, the extension-splint is worn during the day, and the weights and pulleys are applied during the night.

This splint consists of two pieces of steel, the ends of which are made to slide one within the other by means of a key, thus forming an upright extending along the outside of the thigh from two inches above the condyles of the femur to the crest of the ilium, the length of which can be increased or diminished, as greater or less extension is required. It ends below in a little roller, and a buckle is attached to its outer side, by which the webbing keeping it in place is fixed. Two flattened arched pieces, at an interval of two inches, pass from the lower portion of the steel rod over the front of the thigh to another short straight piece along the inside of the thigh, which connects the two cross-pieces, and is parallel with the outer and longer rod. A roller and buckle are fitted similarly to the lower end of this short inner steel rod, and the whole is fixed around the thigh by a strap which passes over the posterior half of the circumference from the outer to the inner straight rods. At the upper extremity a concave plate of steel well padded and about three inches long and one broad is attached by a ball and socket-joint; this is adjusted to the pelvis immediately below the crest of the ilium. To each end of this plate the ends of a perineal pad are fastened by buckles, so that the counter-extension is made on the perineum, and the child supports its weight on this perineal pad (instead of on the hip-joint), from which it is transmitted by the steel upright to the condyles of the femur.

In applying the instrument, two strips of strong inelastic adhesive plaster—that spread on mole skin Dr. Sayre prefers—two or three inches wide, and long enough to extend from just above the ankle to three inches above the knee, are fixed to the leg without warming the plaster; and after removing all loose scarf skin, by thoroughly washing and wiping the limb, some webbing should be sewed fast to the lower end of the plaster, for the purpose of fixing the pulleys for night extension, and then the plaster is to be fixed with a roller carried from just above the ankle to above the knee. When the condyles are reached with the roller, the ends of the strips of plaster are to be turned down, and the roller applied back over the sticking surfaces. By these means the plaster is first secured by the roller, and then the roller is made firm by the plaster, so that the whole can be made to remain in place for three or four months. So much to provide for night extension. Next two fan-shaped pieces of plaster, with webbing (just wide enough to pass over the rollers and fit the buckles at the end of the uprights of the splint) attached to their narrow ends, are applied to the sides of the thighs, so that the broad extremities are towards the pelvis, and the pointed ends opposite the place upon which the lower part of the instrument is to be fixed. The plaster is then covered with a roller, and the upper ends of it, having been cut into strips, are turned back strip by strip over the bandage, and so made to hold the bandage in its place.

The instrument is then placed over the thigh, and the lower end fixed by being buckled to the webbing attached to the fan-shaped pieces of plaster, and by buckling the strap which passes behind the thigh; then the perineal pad is fastened to the plate below the crest of the ilium; and, lastly, extension is made by lengthening the steel uprights by means of the key. After the adjustment of the splint, the child may be allowed to stand and walk; but it will be often necessary that, at first, a thick-soled boot be worn on the sound side, as, owing to the obliquity of the pelvis, the well leg will for a time be apparently shorter than the extended diseased one.

We had the satisfaction of seeing this treatment applied to a little boy who had all the symptoms of the second stage of the disease well marked, and in a few minutes after the adjustment of the splint the child was quite free of pain, and could walk and sit with no other inconvenience than was caused by the stiffness of the plaster on first being applied.

The advantages of this instrument are beyond all argument. By its aid, where properly adjusted, recovery can be made from this tedious and destructive disease without the deformity of an ankylosed joint, and without the constitution being undermined by long confinement.

Instruments the same in principle and to obtain the same results are made for the knee- and ankle-joints; and by means

of some "wire breeches," Dr. Sayre is enabled to send patients who are submitted to exsection of the joint, when that operation is required for the third stage of hip-joint disease, into the open air a day or two after they have undergone the operation.

SAMARITAN HOSPITAL.

FIBROID OUTGROWTH FROM THE UTERUS—ASCITES—REMOVAL OF FLUID AND TUMOUR—RECOVERY.

(Under the care of Mr. SPENCER WELLS.)

A MARRIED French dressmaker, aged 46, was admitted on June 6, 1871, in a condition of extreme suffering—indeed, almost moribund. Her abdomen was enormously distended, measuring fifty-three inches in circumference—thirty-two from sternum to pubes, and thirty-eight across from one anterior superior spine of ilium to the other. Her legs were hard and œdematous, and there was a large vaginal rectocele, although the uterus was kept up by a stem and inflated pessary. Mr. Wells tapped immediately after admission, and removed fifty-nine pints of clear straw-coloured fluid from the peritoneal cavity. A hard, nodulated, movable tumour could then be felt, filling the lower part of the abdomen, extending four inches above the umbilicus, and with a partially separable nodule, which reached the false ribs on the left side. The vaginal rectocele was not much diminished by the removal of the fluid. The cervix uteri was high and movable, and only slightly affected by movements of the tumour. On inquiring next day into the history of the case, Mr. Wells was reminded that he had seen the patient eighteen months before with Dr. Ferriani, of Leicester-street, had then made the diagnosis of a fibroid outgrowth from the uterus, and had said that it might be removed if it ever produced symptoms dangerous to life. The patient had also the following written opinion of M. Nélaton, dated July 6, 1867:—

"Corps fibreux utérine très-volumineux forment une masse très-considérable. Je pense que toute opération doit être proserite."

She was married twenty years ago; had twins, born two years after marriage; had never been pregnant afterwards, and believes that the abdomen had been increasing for at least fifteen years. The vaginal prolapse had appeared within the last year, and the dropsy within the last three or four months. There had been no appearance of catamenia for eight or nine months.

Considerable relief was afforded by the removal of the fluid, but it began to accumulate again very fast, and her condition became so pressing that Mr. Wells removed the tumour two days before the usual operating day. An incision was made in the median line from above the umbilicus to two inches above the pubes; it was about nine inches long. Six pints of ascitic fluid escaped, and a solid tumour was exposed, springing from the right side and back part of the fundus uteri. The chain of a large écraseur was tightened slowly around the bridge of connecting tissue between the tumour and the uterus, and the tumour was cut away and then removed, after separating large shreds of adhering vascular omentum. On still further tightening the chain, it cut through the uterine tissue, and there was very free bleeding. On attempting to seize the bleeding vessels with forceps or tenaculum, and apply ligatures, the friable uterine tissue repeatedly gave way. Solid perchloride of iron and the actual cautery were equally ineffectual. Mr. Wells accordingly transfixed the fundus uteri near the bleeding surface by two long needles, passed at right angles, and tied strong silk tightly behind the needles. Bleeding was thus stopped, and the needles were fixed outside the wound, so as to act like a clamp. The wound was then closed by sutures.

There was a good deal of pain on recovering from the operation, and 135 minims of laudanum were given by mouth and rectum during the first six hours. The pulse, six hours after operation, was 88; the temperature 98.8°. There was a little oozing of blood, and Mr. Wells applied perchloride of iron. Twelve hours after operation oozing was more considerable, but it was stopped Dr. Bantock, who applied more iron and firm pressure over the pins. Twenty-four hours after operation the pulse was 112; temperature 101.4°. She was sick and thirsty, but not in pain. On the second day the pulse was 120; temperature 102.4°. The urine was scanty and concentrated. Citrate of potash was given, freely diluted. From the third to the sixth day from three to four grains of opium were given daily on account of pain. The pulse ranged between

100 and 120; and the temperature between 100° and 102.4°. On the seventh and eighth days the stitches were removed. On the ninth day, as Mr. Wells was changing the dressing, the needles and ligature, with the included tissue, all came away, and there was very free bleeding, which was not checked by perchloride of iron. Mr. Wells therefore passed a large curved needle through the bleeding surface, and tied strong silk behind it and left it. This stopped all bleeding at the time; but it recurred twice in the afternoon, and was stopped by Dr. Bantock, who applied perchloride of iron, and made strong pressure by firm pads and circular strips of adhesive plaster all round the abdomen. The pin and ligature came away on the thirteenth day without bleeding. The bowels acted on the same day. Extreme flatulent distension of the abdomen then became a distressing symptom, but the pulse only ranged from 96 to 108, and the temperature from 98.6° to 101.2°. Two grains of quinine were given every four hours with good effect; and she was sitting up on the sixteenth day. The vaginal rectocele still remained as a hard mass protruding from the vulva, but it gradually disappeared after a free discharge by the rectum on the nineteenth day of muco-purulent fluid.

The patient was seen by MM. Ricord and Demarquay on their visit to the Hospital on July 12. She was then walking about, and very cheerful. She went to Brentwood on July 15—thirty-three days after operation—and on the following day some uterine discharge came on, which lasted two or three days, and was thought to be a return of the catamenia, which had been absent for several months. She rapidly regained strength at Brentwood, and recovery may be considered as complete.

We believe this is the first time in which a fibroid tumour of the uterus has been correctly recognised before operation, and removed successfully by abdominal section, in any British Hospital.

BIRMINGHAM GENERAL HOSPITAL.

VERY LARGE INTRA-THORACIC FALSE ANEURISM CLOSING THE SUPERIOR VENA CAVA BY ADHESION, AND GIVING RISE TO A COMPENSATING VENOUS ANASTOMOSIS IN THE WALL OF THE CHEST AND ABDOMEN.

(Under the care of Dr. RUSSELL.)

IN the *Medical Times and Gazette* of May 20, I reported a case of supposed thoracic aneurism, which was rendered remarkable by a singular venous anastomosis conducted through the thoracic and abdominal walls, in order, as it was imagined, to compensate for more or less complete closure of the superior cava. The patient left the Hospital, but subsequently returned, and his death has enabled us to verify the accuracy of the supposition just mentioned, by exhibiting the superior cava completely closed through the pressure of an aneurism of unusually large size. I may just re-state that the aneurism seems to have dated from an injury to the chest three years before death, but that no symptoms of importance occurred prior to the last eight or ten months. When the patient left the Hospital the tumour formed by the aneurism, though well-marked, would not have struck the eye very forcibly. On his return, though only a fortnight had elapsed, it had increased with extraordinary rapidity, and had attained most formidable dimensions. It then projected from the right side of the chest, possessing both the magnitude and the exact appearance of a female breast distended by lactation, with the nipple at the apex. No bruit was audible, but simply a double cardiac sound. The patient suffered from constant severe pain between the tumour and the scapula, for the relief of which he was kept generally under the influence of chloral. Both pupils continued firmly contracted, as was the case when he was first seen, but one of them was dilated by atropine. The paroxysms of laryngeal dyspnoea, mentioned formerly, were averted by perfect quiet. Our fears of fatal rupture of the aneurism were relieved by the occurrence of death apparently from coma. There was no œdema of the face or upper extremities, but latterly the face was very bloated and congested.

Sectio Cadaveris.—Our pathologist, Mr. Rickards, made an injection of the veins in the wall of the chest and abdomen. Owing to his being hurried, the operation was not completely performed; he was, however, sufficiently successful to demonstrate that the dilated and tortuous superficial epigastric veins communicated freely with the internal mammary, whilst branches from the former also joined the intercostal veins. He also traced the long thoracic vein joining the circumflex ilii,

and also sending one branch at least to an upper intercostal. All these veins, and others not dissected, were greatly dilated. The great pectoral muscle was readily reflected from the aneurismal tumour, but the lesser pectoral was intimately incorporated with its prominent apex. The tumour projected through the bony wall of the chest, by having destroyed a portion of the right fourth rib three inches from its insertion into the sternum, and having pressed apart the third and fifth ribs. An opening was thus formed three inches in vertical diameter, and extending laterally from the remnant of the fourth rib on the left to the axillary line on the right. Fragments of the carious rib were entangled in the aneurismal wall. The aneurism, itself of immense size, occupied the whole anterior portion of the right chest, the lung lying entirely behind it, quite out of view, and being greatly compressed, though forming no part of the aneurismal wall. It adhered firmly to the diaphragm below, to all the upper ribs on the right, and on the left to the pericardium, which was itself closely attached to the right ventricle of the heart. Thus the heart and the aneurism formed one mass, having, together with the thoracic aorta, the weight of 4 lbs. 10 oz. The main part of the tumour was formed by an enormous false aneurism springing from the right side of the dilated ascending aorta, the vessel communicating with the sac by a large opening two inches by three in diameter. The aneurism must have nearly equalled the size of a small adult head; its cavity would have contained two clenched fists; it measured four inches and a half vertically and six inches transversely. Near to the heart its wall was lined with dense laminated fibrine, two inches in thickness; elsewhere its wall was much thinner; in front, indeed, it was so thin that in dissecting the tumour from the bone the cavity was opened; it contained a quantity of loose fibrine. The heart was much enlarged; the right ventricle was considerably dilated, and was quite full of loose coagulum; the left ventricle was considerably hypertrophied; the valves were healthy. The aorta, just above the opening through the diaphragm, presented a shallow pouch composed of a complete plate of calcareous matter, two inches in diameter. The superior vena cava passed behind the aneurism, and at the height of an inch and a half above its opening into the auricle was completely closed by perfect organic union of its walls, evidently through simple apposition. The right internal jugular was seen to be greatly distended (the corresponding vein on the other side was not examined). The inferior cava in its entire length was also very much dilated, and quite crammed with coagulated blood. The right bronchus was much compressed by the aneurismal tumour; the right vagus was also subject to compression, but not to a great amount; the left vagus was quite free. Mr. Rickards was prevented by want of time from dissecting the sympathetics, but from the position of the tumour there did not seem *à priori* evidence of their having been exposed to pressure. The pupils after death were of medium size; but, as already stated, during life could not be made to dilate above one-fifth.

THE RURAL HOSPITAL, TEWKESBURY.—It has been decided to erect a building specially adapted for a rural Hospital, at a cost of £1100.

SMALL-POX AT CHORLTON.—There were last week fifty-six cases of small-pox in the workhouse—twenty-four males and thirty-two females. Twenty-one deaths from this disease had occurred since Christmas, and it had been observed that of these only one had been vaccinated, and that in infancy. The number of cases the week before was fifty-seven.

THE CHOLERA AT ST. PETERSBURG.—The entire number of cases which have occurred between August 29, 1870, and June 11, 1871, is 4622—viz., 3034 males and 1588 females. Of these 2609 (1692 males and 917 females) have recovered, and 1848 (1252 males and 596 females) have died.—*Gazette Médicale*, July 29.

VITAL STATISTICS OF MELBOURNE AND SUBURBS FOR FEBRUARY, 1871.—Population, April, 1861, 140,000. The Registrar-General reports the deaths of 188 males and 169 females; total, 357 deaths during the month. The deaths of children under 5 years amounted to 231; the deaths of persons over 5 years numbered 126. The entire mortality was equivalent to 2.55 deaths to each 1000 of the population. The average daily mortality was 12.55. The average mortality in February during the ten preceding years was 366. Males contributed 53 per cent., females 47 per cent., and children under 5 years 65 per cent. of the entire mortality. Sixteen violent deaths occurred during the month.

SATURDAY, JULY 29, 1871.

THE ROYAL COMMISSION ON THE CONTAGIOUS DISEASES ACTS.

THE report of this Commission, to which we briefly alluded last week, is a document in every way deserving careful study; and although the members of the Commission were far from unanimous (which, indeed, was well-known from the first to be impossible), no one can say they have not devoted sufficient care to the subject, though he may complain that they have approached it with too much caution.

The misfortune attaching to these Acts seems chiefly this: it is possible to view them from three sides; thus, some devote themselves to their sanitary aspects; some, again, to their moral bearing; others, still, to the political part of the question—and so each persists in ignoring the importance of his neighbour's point of view, and magnifying the value of his own. This is unfortunate, for, as their sanitary value has been proved (to our satisfaction) beyond a doubt—though, also, we hold that morals have been bettered instead of made worse—and we look upon their political importance as *nil*, nevertheless, the union of the intemperate opponents of the Acts on all of these grounds has created a small, active, and (let it be confessed) disagreeable party.

The former portion of this report deals with the history of legislation on the subject and reports of previous committees on the same, the evidence of some of the principal witnesses before these last being in part cited. After this come the results of the Commissioners' own inquiries. Next they point out that if the laws are good for soldiers and sailors they must be good wherever contagious diseases prevail, and censure the unscrupulous opposition got up against the Acts; after which the Commissioners proceed to point out that "the Medical witnesses experienced in the administration of these Acts are nearly all agreed that the periodical examination of the public women is essential to the system." Many authorities worthy of all respect support this opinion. Next comes the statistical information on the subject supplied by the Army and Navy Medical Departments—statistics which undoubtedly show the benefits derived from these Acts; but these have been so frequently discussed in our columns that we refrain from entering further into the matter. The Acts being limited in their operation, it is plain that soldiers and sailors, men of nomadic habits, and often coming from unprotected parts, are liable to spread the disease, and thus to greatly increase the percentage both among men and women at a given station. This would cease were the Acts more

generally applied. But if we consider the condition of the women themselves, and the masses of animated infection which have been got rid of under these Acts, their usefulness from a sanitary point of view becomes still more apparent.

Let us now inquire for a moment into their moral and political effects, for it is with regard to these that the Acts have been chiefly combated; and here we cannot do better than quote two of the sections of the report, which are well worth general attention as indicating the grounds of opposition taken up by those who have been fighting against the Acts:—

"Among the papers referred to this Commission by your Majesty's Government, and which we print in the Appendix, is a memorial to the Secretary of State, 'adopted at a conference of delegates from associates and committees formed in various towns for promoting the repeal of the Contagious Diseases Act,' and signed F. W. Newman, chairman. We do not propose to criticise this paper at length, nor should we have thought it fair to notice it at all, as representing the views of the opponents of the Acts, had it come before us under less respectable credentials. The memorial reads more like a vindication of the rights of prostitution than a grave argument against the Acts on moral and political grounds. Prostitutes, it is urged, 'value their personal liberty as highly as other women do,' and to shut up a diseased street-walker in a Hospital until she is cured would be 'to change the whole structure and arrangement of her life; the relations which she may have formed would be abruptly ended; milliners, dressmakers, sempstresses, domestic servants, etc., who eke out a precarious existence, or provide themselves with coveted luxuries in the form of dress, etc., by recourse to occasional prostitution, would at once lose their business connexions, or if in situations would be discharged.' One of the best apologies for these Acts, if they need apology, consists in the fact that they deter the class of women referred to in the above-quoted paragraph from resorting to prostitution to 'provide themselves with coveted luxuries,' or even 'to eke out a precarious existence.' The rest of this paper consists mostly of frivolous objections to the machinery of the Acts."

"The objections urged by the opponents of the Acts, which are worthy of serious notice, may be stated as follows:—1. That the Acts are designed to provide sound prostitutes for soldiers and sailors, and that this is implied in their title. 2. That such legislation, by rendering vicious indulgence less hazardous, has a direct tendency to promote immorality. 3. That the protected districts are, in fact, resorted to by libertines, and that married men and youths are induced to visit the registered women by the security they are supposed to offer of freedom from contagion. 4. That the practice of registering prostitutes, and subjecting them to a periodical examination for the purpose of ascertaining whether they are in a fit condition to follow their trade, is in itself an outrage upon public decency and morality. 5. That such a system is virtually a recognition by the State of the trade of prostitution. 6. That the compulsory Surgical examination of the women at stated intervals is calculated to remove any lingering sense of shame in the subjects of such operation, and to harden them. 7. That the increased gains of prostitution consequent upon the improved condition of the women offer a temptation to girls to enter upon this way of life. 8. That it is unfair to exempt men from the restraints and regulations to which women are subjected. 9. That the Acts are opposed to the principles of constitutional law."

The audacity of the memorial referred to is something sublime, and the dignified rebuke of the Commissioners most amply justified; but it ought to teach the religious party opposed to the Acts what they must submit to if they receive as allies the political enthusiasts to whom religion is as nothing, and what they are pleased to call "political freedom" everything. An alliance of such men as the Rev. Drs. Guthrie and Rigg with Professor Newman and Mr. Baxter Langley is ominous of future dissension.

As to the objections here stated, of which the first is that the Acts are designed to provide sound prostitutes for soldiers and sailors, we may say that undoubtedly it is the duty of the State to keep these men as efficient as possible, although we refuse to acknowledge that it is the duty of the State to provide them with the means of sinning with impunity. The question is—Has the State gone too far in what it has done? That remains to be seen. With

regard to objections 2 and 3, they rest on no ascertained foundation of fact. Undoubtedly a certain number of men are kept back by the fear of acquiring disease; but there is a sufficient number so absolutely reckless that disease or no disease is all the same to them, provided their passions are for the time being gratified. Then, again, it must be considered what is the tendency where prostitution is at a minimum. Experience undoubtedly shows that it is to increase seduction and illegitimacy; at best, it is a choice between two evils.

Next, as to the outrage on public decency and morality inflicted by registering and examining prostitutes; we can hardly see the force of this objection. We are quite prepared to admit that prostitution itself, as it now exists, is an offence and a scandal to public morality. We cannot see that registering names already too well known, and examining women from time to time—in their own interest, quite as much or more than in that of the public—adds anything to this offence. They say that this is State recognition, and against this recognition the thunderblasts of the divines are chiefly directed; but surely recognition or no recognition does not alter facts. There the thing exists, and is continually obtruding itself on our notice in all its horrid detail; and what is the good of trying to ignore it? If any good is to be done, it must be recognised, inasmuch as it already exists. The ostrich does not escape by hiding its head in the sand. The next objection stated is, that compulsory examination is calculated to debase and harden women; on this subject we have but to point to facts. Properly conducted, it is notorious that they do nothing of the kind.

It must be admitted that with diminished numbers the gains of the class must increase; but, on the other hand, the diminution in the number of profligate women is in itself a very great advantage. It is unfair, say they, not to subject men to like restraints. Quite so, were the conditions similar—that is, were there a class of male prostitutes—which Heaven forbid! Meantime, the two sexes are on a totally different footing. The acts, they say, are opposed to the principles of constitutional law. This objection we simply put on one side; street-walking and harlotry generally are equally so.

We pointed out, last week, that the Commissioners admit that the Acts have been carefully worked, not a single instance of abuse or ill-treatment having been proved, notwithstanding assertions to the contrary; and this, considering the powers placed in the hands of the police, must be pronounced satisfactory. But when we turn to the recommendations of the Commissioners we have but little reason to be pleased. One division of them would have the Acts entirely abolished, another would have them maintained and extended; the consequence is a compromise: periodical examinations are to be abolished, and the original Act of 1864 enforced. Accordingly, information having been laid that a certain woman is diseased, she is to be examined, and, if so found, to be sent to Hospital and there detained until well; women applying voluntarily are also to be detained. We need only point out that women, as a rule, do not apply for relief until they are unable to continue their trade; that in the case of syphilis it may be some weeks after infection before any sore makes its appearance, whilst the infecting party may not be known to the infected; and that experience acquired in working the Acts of 1866 and 1869 shows that information thus given is seldom reliable. The voluntary system does not work, because patients leave before they are cured, on the most frivolous pretences, or on no pretence at all. The Commissioners accordingly recommend that power be given to detain them until well; but this would never work in an ordinary Hospital. With one of the recommendations of the Commissioners we cordially agree—that is, that the Acts should be carried out under the Home Secretary, rather than by the War Office and Admiralty; but their recommendation to do away with periodical examinations, whilst admitting that "it is the most effectual mode of dealing with venereal disease," we can only regard as a symptom of weakness. We,

therefore, incline to give more support to the protest signed by such men as Dr. Paget, Dr. Wilks, and Mr. Holmes—a protest which, in our eyes, is more weighty than the whole report.

THE CENSUS OF 1871.

(Concluded.)

In our previous number we noticed some of the most striking points recorded by the Registrar-General with reference to the population of England and Wales and of the United Kingdom generally. The history of the amazingly rapid growth of London since 1801, when the first English Census was taken, is full of interest to politicians, social economists, and Physicians. In 1801 the population of the area of 77,997 acres comprised within the bills of mortality was 958,863; the same area in 1861 contained 2,803,989 inhabitants, and in 1871 its population amounted to 3,251,804. The superficial space for each person in 1871 is .02 of an acre. There are 41.69 persons to each acre, and 26,682 persons to a square mile. In the Welsh division, the most thinly inhabited part of the country, there are 3.60 acres to each person, .28 persons to each acre, and 178 persons to a square mile.

On the Census night, 1871, it was found that only 74,732 persons slept within the boundaries of the City proper; at the Census of 1861 the number in the City was 112,063. The decrease, therefore, in the ten years amounted to 37,331, or nearly one-third of the number recorded in 1861. In order to determine the numbers in the City, the Corporation took a day census in 1866, by which it was found that, in addition to the ordinary sleeping population, the mercantile men engaged in the City daily amounted to 170,313. The numbers have probably increased since that date. In the early ages the City covered rather more than a square mile of ground, and remained stationary during the middle ages; but the settlement of a numerous population beyond its limits rendered necessary the extension of the bills of mortality in 1604, and again at various intervals till 1846, when the area included in the bills of mortality assumed its present dimensions. In order, however, to arrive at a correct idea of the population of London, it must be estimated according to other boundaries as well as those of the municipality and the bills of mortality. The population within the Parliamentary boundaries on the Census night was 3,008,101; within the limits of the Metropolitan Local Management Act, 3,264,530; within the London School Board District, 3,265,005; and within the police circle, extending in radial lines from twelve to fifteen miles from Charing-cross, and covering 687 square miles, equivalent to a square of territory 26½ miles to the side, 3,883,092.

The population within the tables of mortality has gone on increasing at a decreasing rate, because the building area is limited, but the actual population within the twelve to fifteen miles has increased rapidly and steadily, or rather at a slightly increasing rate of 1.88 per cent. per annum.

The population of the ring round the district of the Metropolitan Board of Works in 1851 was 318,499, in 1861 it was 418,731, and in 1871 it is found to have increased to 631,288. It has, therefore, very nearly doubled itself in twenty years, and during the last ten years has increased 4.19 per cent. per annum, or more than 50 per cent. This area, with its rapidly increasing population, being shut out from the system of sewers lately created, there is no adequate system for its sanitary purification. The Registrar-General is, therefore, quite justified in the expression of the opinion that it is in imminent danger. We would urge upon the local boards the advisability of taking prompt action upon this warning of the Registrar-General. The work is a necessity which cannot be avoided or postponed, except at the risk of ever-present and ever-increasing sickness and mortality among a population which has shown such a rapid rate of increase. The magnitude, expense, and difficulties of the work will increase the longer it is deferred. True economy of money, health, and life dictates that not a

day should be lost in taking, at least, the initiatory steps for the establishment of such system of sanitation as may be most suitable to the local circumstances of each district.

The facts and figures which we have extracted from the report now before us appear to us of a sufficiently interesting nature to redeem in a great measure the study of vital statistics from the character of dryness, with which they are frequently charged. If we had space at our disposal, we could show by further extracts that in the Registrar-General's office the enumeration of vast numbers and the compilation of statistical details are diversified by the study of antiquarian and archaeological lore, the relevancy of which to the subject actually in hand, or the suitability of the poetical language in which the results are sometimes expressed—however much such means may have relieved the tedium of office work—is to us hardly apparent.

PROMOTION IN THE ARMY MEDICAL DEPARTMENT.

IN reply to Mr. D. Dalrymple's question as to whether promotion by selection is, under the new order of things, to be the rule in the Army Medical Department as well as in the other branches of the army, Mr. Cardwell stated, on Monday night, that, according to the warrant at present in force, promotion to the rank of Inspector and Deputy Inspector-General of Hospitals is by selection.

Whatever the system may be theoretically, its practical result has been to produce a state of stagnation in the promotion of army Medical officers. We have on more than one occasion pointed out the evils resulting from former promotions by selection, pure and simple, of very young men to the administrative ranks. We do not question their ability, or the propriety of their promotion at the time, but the result is, that, while still in the prime of life, they continue at the head of the list, to the direct injury of men of whom many are at least their equals in general ability, and senior to them in years, and consequently liable to removal from the department at the age of 65, at which retirement becomes compulsory, before having attained to the higher and more lucrative ranks. Latterly, selection has, with a few striking exceptions, been so tempered by seniority that men who have on former occasions been passed over still hold on in the justifiable hope—which in some cases has been fulfilled—of their turn coming at last on the grounds of seniority. The consequence is that other men, who, whatever their opinion of themselves may be, are generally reputed as not eligible for promotion, still stop the way.

Selection must, however, be tempered by something or other. We know that seniority has not proved itself the desired adjunct, and must therefore look for something else. We have frequently expressed our opinion as to the nature of the remedy to be employed—namely, the return to the old system of limiting tenure of the inspectorial ranks to a fixed period, and improved terms of retirement to the senior officers of these ranks. We know no reason why, according to Article 978 of the Royal Warrant of 1870 on Pay Promotion and Non-effective Pay, a regimental colonel of the Royal Artillery or Engineers of not less than thirty years' service, who relinquishes the prospect of succeeding to command of a brigade or battalion, should retire on £600 per annum, and by Article 989 of same Warrant a deputy controller of thirty years' service, ranking as colonel, can retire on £602 5s. per annum, while, according to Article 1007 of the same Warrant, a deputy inspector-general of Hospitals of thirty years' service, and ranking as colonel, can only obtain £465 7s. per annum. Or why the retired pay of a controller, ranking as major-general, after twenty years' service, should be £730 per annum—Article 989—while that of an inspector-general of Hospitals, ranking as major-general, should, after twenty years' service, be £547 10s., and after thirty years' service £684 per annum—Article 1007.

We have also ere now remarked upon the fact that the age

for compulsory retirement from the administrative ranks of the Control Department is 60—Article 294 of same Warrant—while in the Medical Department the retirement of inspectors and deputy inspectors-general does not become compulsory till the age of 65.

The above-stated defects and anomalies must, in our opinion, be rectified before the stream of promotion in the Army Medical Department can become other than "unfriendly, melancholy, slow."

THE SMALL-POX EPIDEMIC.

DURING the last two weeks the small-pox deaths in London have fallen to 133 and 135, and the diminution seems to have been pretty equal throughout the metropolis. The returns of the Metropolitan Health Officers point also to a great reduction in the extent of the epidemic. At the same time, however, the Medical officers of the Homerton Hospital tell us in their last report that the death-rate has been exceedingly high, and that a large number of the cases admitted have been of the hæmorrhagic type. Large numbers of unvaccinated children are being received into all the Hospitals, and this fact has induced the Asylum Board to call the attention of the several parish authorities to this evidence of neglect. We wonder whether they expect anything to come of this. So far from multiplying precautions, boards of guardians are just now congratulating themselves that the epidemic is dying out, and are rather disposed to relax than to augment their efforts for its suppression. An authoritative warning that they are not yet out of the wood ought nevertheless to be given, and that it is quite within the range of probability that, although the small-pox may subside during the summer, a renewal of the outbreak may occur towards the close of the year. Should such unfortunately happen, and should the threatened epidemic of cholera become a fact, they will have plenty of work on their hands, and the Asylum Board's Hospitals will be none too many for the wants of the metropolis. Surely, with such a prospect as the Registrar-General holds before their eyes this week, guardian boards should bestir themselves in such a manner as shall insure, at all events, not having two enemies to confront. An invincible barrier to the one may be certainly raised by universal vaccination and revaccination, and the other may be shut out by such sanitary measures as are equally well ascertained to be effective against our Asiatic foe. If they cannot or will not do these things, the sooner local administration in sanitary matters is abolished, or the sooner local administrators can be made to feel that they are personally responsible for the evils arising out of their *lâches*, the better.

THE WEEK.

TOPICS OF THE DAY.

THE scheme for the formation of a Conjoint Board of Examiners has been accepted in its general plan by the Royal College of Physicians and the Royal College of Surgeons; but there are still important financial questions to be settled, and these, we believe, have been referred to a committee for consideration. It is clear that the Royal College of Surgeons will not be justified in throwing away any part of the revenue which they now spend in a manner so useful and beneficial to the Profession and the nation for the sake of a confessedly imperfect attempt at the formation of a Conjoint Board, which cannot possibly be a final arrangement, and which, in our opinion, is not calculated to diminish, but to increase, the competition between the English College and the Colleges of Surgeons in the sister kingdoms. It would be simply a suicidal act for the Council of the College of Surgeons to sacrifice a large part of the annual income which is now spent in maintaining the Hunterian Museum and their splendid library, for the mere sake of taking part in a partial scheme which may not even include all the Examining Bodies in England,

and which, it seems probable, will not be readily followed by the Examining Bodies in Ireland and Scotland. In the present state of public business and of political parties, it is clear that there will be no more chance of a Medical Bill passing next session than there has been in the present. The Medical Profession in Ireland are not likely to bring about a fusion of Trinity College, Dublin, and the Queen's University; and while these two bodies remain separate there can be no one-portal system as far as Ireland is concerned. Under these circumstances, we maintain that the Royal College of Surgeons of England is not justified in diverting funds, which have hitherto gone to support the grandest monuments of Medical culture and science in the whole empire, into other channels for the sake of setting up a Conjoint Board which is confessedly imperfect as regards England alone. The Council of the Royal College of Surgeons would be wanting in their duty to the Fellows and to the public if they were to give their sanction to any diminution of the College revenues. Of the Universities, the University of London, we hear, on Tuesday decided to accept the scheme of the Colleges.

We are glad to see that a question is to be put in the House of Commons by Mr. Bentinck on the subject of fees to Professional witnesses in the law courts. The question has been suggested by the case of Mr. Oliver Pemberton, who was subpoenaed to go from Birmingham to Carlisle to give his Professional evidence in the trial of the assailants of Murphy, the "Protestant lecturer," and was only allowed one guinea per diem and second-class railway fare. The miserable scale of fees allowed to Professional witnesses by the law has long been felt an injustice by Medical men. We are glad that Mr. Pemberton's just remonstrance has brought the matter prominently forward.

An appeal has been made in the columns of the *Times* newspaper to the public for a subscription to aid an old man, Mr. Stephen Jenner, who is said to be the grandson and sole representative of the discoverer of vaccination. Poor Stephen Jenner was originally intended for the Medical Profession, but from misfortune his career as a student was not completed. He supported and brought up a family, eking out a very small income by exerting some ability he possessed as an artist. He is now an aged man, living on 10s. a week in a cottage in the parish of Berkeley. He was sitting at breakfast with his grandfather when the latter was taken with the apoplectic fit from which he died.

The Committee on Baby-farming have resolved to recommend compulsory registration of births and deaths, compulsory registration of nurses receiving two or more alien children to nurse under one year of age, and compulsory registration of private lying-in establishments.

There is a vacancy for a Physician to the Fever Hospital, occasioned by the retirement of Dr. John Harley and his appointment at St. Thomas's. An honorarium of £100 a year is attached to this office. There is also a vacancy for an Assistant-Physician to the Children's Hospital, Great Ormond-street. There are already several candidates for this appointment.

At a meeting of the weekly board of the Westminster Hospital on Tuesday, the 25th inst., to receive applications for the appointment of Surgeon and Assistant-Surgeon, Mr. Pearse, the senior Assistant-Surgeon, was recommended for the appointment of full Surgeon. Two gentlemen applied for the vacant Assistant-Surgeoncy—Mr. Cooke and Mr. Roberts. Mr. Cooke has been studying for some time at the Westminster Hospital with the view of qualifying himself for a staff appointment, and has recently obtained the Fellowship of the College. Mr. Roberts has held several public appointments, and will have the advantage of the St. George's influence. These two gentlemen have intimated their intention of canvassing the governors. The election is advertised for August 4.

In the action between Dr. Dyte and the St. Pancras Guardians, of which we published an account last week, it will be remembered that Dr. Dyte was nonsuited on a mere point of law. The St. Pancras Guardians contended that there was no legal contract, although they could hardly deny that there was an understood one. Dr. Dyte had leave from the judge to move the Court to set aside the nonsuit, and enter a verdict in his favour for the full amount claimed, subject to the point of law reserved. This, of course, he will do, and we hope he will be successful in obtaining a victory over his notorious and tricky opponents.

The inquest, at Dublin, on the unfortunate Head-Constable Talbot resulted in a simple verdict of death "from the effects of a gunshot wound, under which he was suffering when conveyed to the Hospital" four days before death. An attempt was made, in the interests of the man who is in custody on the charge of having fired the shot, to throw discredit on the Surgical treatment of the case; but the evidence was hopelessly unassailable and straightforward. The proceedings on the last day were enlivened by "a difference" between one of the Hospital Surgeons and the prisoner's counsel, which was very judiciously and successfully treated by the coroner by an adjournment for twenty minutes, in order to allow the gentlemen "to cool somewhat."

CERTIFICATES OF DISINFECTION.

At the Islington Petty Sessions, held on July 20, Mr. and Mrs. Chauffot, of 37, Albert-street, Barnsbury, were summoned for an offence against the 39th section of the Sanitary Act, 1866, in that they had knowingly let to a Mrs. Fowler two parlours in the above house, in which, just previously, a Mrs. Moxon had had small-pox, without having the rooms previously "disinfected to the satisfaction of a qualified Medical Practitioner, as testified by a certificate from him." It appeared from the evidence that Mr. Chauffot, who occupied the second floor of the house, had small-pox in May, being attended by Mr. Eugene Goddard, and that the Moxons took the parlours on June 3, at which time Mrs. Chauffot told them that her husband had not had small-pox, but only an attack of rheumatic fever. On June 10 Mrs. Moxon also was attacked with small-pox, and was attended by Dr. Carey, of Barnsbury-road. She recovered, and the Moxons moved to other lodgings on June 24. While Mrs. Moxon was ill, the sanitary inspector, Mayes, called at the house, and handed to both Mrs. Moxon and Mrs. Chauffot a copy of Dr. Ballard's printed directions, which include a summary of the principal penal sections of the Sanitary Act, and full directions for making a proper disinfection. On June 26—that is to say, on the Monday following the Saturday on which the Moxons left—Mrs. Chauffot let these rooms to Mrs. Fowler, without saying anything about the small-pox. The inspector finding this to be the case, informed Mrs. Chauffot that she had broken the law, and served her with a notice for disinfection. Mrs. Chauffot called then on Dr. Ballard, at the Vestry Hall, who asked her for the Medical certificate, when she said that the rooms had been disinfected under the direction of her Medical man, and presently she returned with the following certificate written on the back of her notice for disinfection:—"I certify that the house 37, Albert-street, Islington, occupied by Mr. Chauffot, has been duly disinfected and fumigated according to my directions and to my satisfaction.—(Signed) Eugene Goddard, M.R.C.S. Eng., etc., July 3, 1871." Mr. Goddard was put into the witness-box in support of the prosecution, and said that he knew nothing whatever about Mrs. Moxon, nor about the two parlours. All he knew was that he attended Mr. Chauffot for small-pox, and that his directions for keeping the patient in one room had been faithfully carried out. He gave directions that sulphur should be burned, the room (second-floor room) washed with carbolic acid, and any woollen garments that had been in contact with the patient

dipped in the acid. On being shown his certificate, he stated that he only intended it to apply to the second-floor back room. The word "house" was put in inadvertently; it ought to have been "room." He did not know of his own knowledge that any disinfection had been carried out, but he gave the certificate, as such certificates were commonly given, on the faith of the female defendant's statement, that she had carried out his instructions. In reply to the charge, the defendants stated that the parlours had been disinfected, and produced a witness, who said that she burned sulphur in them on June 27, washed the floors and paint with chloride of lime on the 28th, and with soft soap on the 29th. Nothing had been done with the papered walls or ceiling. The Bench convicted the defendants, and inflicted a mitigated penalty of forty shillings. The Chairman said that with regard to the certificate given by Mr. Goddard, the Bench felt that he had acted very improperly, and trusted that in future no Medical man would give a certificate unless he could certify by personal observation that the disinfection had been properly carried out. Unless this was done the certificate was of no practical use whatever.

In these remarks we most heartily concur. The object had in view by the Legislature in requiring a Medical certificate clearly was to insure, so far as such a thing can be insured, that the contagion deposited in an infected room shall be destroyed or rendered absolutely innocuous. "Contagion" is not a thing like dirt, which can be seen, and its destruction or removal ascertained by mere inspection. It is a subtle matter often most difficult to eradicate; and in view of this difficulty, and at the same time to protect as far as possible the privacy of a dwelling-house, the law is satisfied if any Medical man asserts that he is satisfied that the proceedings adopted have been sufficient to bring about the requisite result. Of course Medical men will differ in opinion as to what is sufficient for this purpose, but that is a thing which cannot be helped. The Health Officer of Islington, judging from the directions he has issued for ordinary disinfection, is not satisfied very easily. His programme demands fumigation with sulphurous acid, washing of the floor, ceiling, and walls with carbolic acid, stripping and burning of paper from the walls, and, finally, limewhiting and scrubbing—and probably few competent judges will be found to affirm that less than this will insure the destruction of a deposited contagium; and he has taken great pains to indoctrinate all the Medical men in his district with his views. Anyhow, it is obviously necessary in so important a matter as this that a certificate should only be given when the Medical man has, according to his lights, satisfied himself that the contagium has been destroyed. Great credit is due to the Sanitary Committee of the Islington Vestry, and to their officers, for their courage in prosecuting this case in the face of the Medical certificate, which they had reason to believe was obtained and presented merely with the object of blinding their eyes. We have been given to understand that this is not the first occasion on which it has been attempted to foist certificates, similarly loosely given, upon the Medical Officer of Health, but that Dr. Ballard has on every such occasion informed the persons presenting them that, if their validity were persisted in, he should obtain a summons and put the certifying Surgeon into the witness-box. He has now fulfilled his threat, and until the decision of the Islington Justices is overruled, it must be understood that the law will not permit of evasion in such a matter, where the welfare of the public is so deeply concerned.

DUST-BINS AND DISEASE.

THE amount of preventible disease that occurs through negligence and filth is almost incredible. Dr. Whitmore, in his last report of the health of St. Marylebone, says—"I regret to have occasion again to refer to nuisances existing in this parish, for which many of the wealthy classes are responsible. I allude to the filthy and most offensive state of their

dust-bins. The decomposition of this animal and vegetable matter is, undoubtedly, injurious to the health of those persons who are compelled to pass the greater portion of their time in the basements of houses where such nuisances are permitted; and many cases of sickness from diarrhoea, and even fever, have come to my knowledge, which I could not attribute to any other cause."

THE APPROACH OF CHOLERA.

THE *Times* has remarked on the probability that cholera may again visit this country, and warns us that it is of vital moment we should show a bold front to the enemy by the formidable means of defence we have at our disposal to ward off this destroying foe. Two Medical officers of the Bengal army—Surgeon-Major Atchison, and another signing himself "Surgeon Bengal Army"—have written to the *Times*, advocating the necessity of hygienic measures being adopted; and we must endorse their views on this subject, as their experience in a land where this fatal disease may be said to be endemic must be considerable. We have had a lesson taught us with reference to the recent epidemic of small-pox, which has assumed such high proportions among us, due, we are fully impressed, to the neglect of ordinary hygienic measures.

That epidemic disease may be warded off and materially modified in its virulence by proper preventive means there can be little doubt—indeed, some of the recent arrangements in several of our provincial towns to segregate patients affected with small-pox have been attended with happy results.

There is one point mentioned in a letter to the *Times*, signed "Surgeon, Bengal Army," which we think might be carried out in London without much difficulty—namely, flushing the streets with water, having previously sprinkled carbolic acid or Condy's fluid on their surface. The plan of irrigating the streets was carried out in Paris during the reign of the late Emperor with great benefit to public cleanliness and comfort, and we would urge the authorities to adopt this plan of freeing our streets from offensive and deleterious rubbish. The addition of carbolic acid would act in a most beneficial way as an antiseptic, purifying the streets as well as the drains.

THE MEDICAL COMMISSIONERS' REPORTS.

DR. BREWER, M.P., has given notice of his intention to ask the Secretary of State for War if he would lay upon the table of the House so much of the reports of Drs. Gordon and Wyatt in relation to their recent sojourn in Paris, and in connexion with the French army, as will throw light upon the character and treatment of wounds received during the late war and siege, and any successful or defective system of hygiene which the reports may contain, for the guidance or caution of the military or civil Medical and Surgical Profession. This is the course which we have already suggested, and which, if adopted, would be certain to confer a benefit upon the Profession in general, and hardly likely to compromise us in our diplomatic relations with the French Government.

SECTARIAN MEDICINE.

SOME excitement has been caused in Kingston with reference to the appointment of a Medical officer to the Dispensary of that place. At a meeting held last week to fill the vacancy caused by the resignation of Dr. Ledwith, the following facts were elicited. Considerable agitation had been raised to secure the election of a Roman Catholic to the vacant office. A lengthy correspondence had passed between the solicitor to St. Michael's Society and the Poor-law Commissioners. In the letters of the former the Commissioners were requested to take steps to cause the appointment of a Roman Catholic Doctor to the post, who would have the confidence of the sick poor of Kingston. The Commissioners, in reply, stated that every effort should be made to elect an efficient Medical officer, without any reference to his religious opinions. Ten candidates

were selected. After two ballots had been taken, the choice of the Committee fell upon Dr. O'Flaherty, who was elected by a majority of one over Dr. Beatty. Dr. Boyd was the favourite of the Roman Catholic members of the Committee, five or six of whom resigned because a guarantee would not be given to appoint a Medical officer of that religion. It is probable that, had these gentlemen remained at their post, Dr. Boyd would have been elected. We think the Poor-law Commissioners acted with great propriety in refusing to endorse a very foolish and mischievous proposal—a proposal calculated in every way to foster discontent and bad feeling.

IRON SMALL-POX HOSPITALS.

DR. WHITMORE, in his report on the iron small-pox Hospitals in St. Marylebone, gives the results of the treatment of cases for a period extending over twenty-four weeks. During this time 219 patients were admitted suffering from small-pox and from four other diseases; but these were sent away immediately. Of these 215 cases, 123 were males and 92 females.

"The number of patients who died from the disease was 37, of whom 19 were males and 18 females; these constituted 17.2 per cent. of all the cases under treatment, or about one in every six. This corresponds very closely with the rate of mortality amongst the patients in nearly all the other small-pox Hospitals; and when it is considered that a large proportion of our cases consisted of the worst types of the disease, the number of fatal cases is by no means excessive. Of all the cases admitted, 170 had been vaccinated, 4 had been inoculated, and 41 were altogether unprotected either by vaccination or a previous attack of small-pox. Amongst the fatal cases, 20 are reported to me as having been vaccinated and 17 unvaccinated, from which it will appear that amongst those patients who had been vaccinated 11.7 per cent. died from the disease, and amongst those who had not been so protected 41.4 per cent. died. With regard to several cases reported as having been vaccinated, Mr. Crosse, the Medical attendant, observes that 'many had no marks of vaccination, and in several they were very indistinct, so as to be altogether doubtful.'"

Dr. Whitmore thinks much may be said in favour and much against the adaptability of the Hospitals for the purpose employed. They were lofty, capacious, well ventilated, and free from damp. They were subject, however, to draughts of cold air. It was difficult to keep the male and female patients, particularly when convalescent, apart, and the closet accommodation was very defective. The following practical remarks are of high importance:—

"On the question of future provision for epidemic outbreaks in the metropolis, such as the one from which we are now suffering, I am of opinion that large permanent buildings for the purpose are not desirable for many reasons. In the first place they are costly, and entail increased taxation; secondly, no reasonable number of such buildings would provide sufficient accommodation should the epidemic be unusually severe; and lastly, on the subsidence of such epidemic they would be comparatively empty. In the place of permanent buildings, I would suggest the construction of a considerable number of temporary iron Hospitals, which can be put up, as has been proved, in less than a week, and which immediately upon the outbreak should be erected on appropriate sites round London. From week to week, or day to day, their number could be augmented as the epidemic increased, and as it declined they could be taken down and stowed away, to be kept in readiness for the next visitation."

THE CHARGE OF POISONING AT CAMBRIDGE.

A CASE is being investigated at Cambridge which illustrates the difficulty of Medico-legal investigations. A woman, named Charlotte Day, is in custody on a charge of poisoning her husband with arsenic. The man died under suspicious circumstances and with suspicious symptoms. Some bread and pudding of which he had taken were submitted to Dr. Liveing, who, in one analysis, found no poison, but in a second analysis was convinced that he had discovered the presence of arsenic. Dr. Letheby has since been employed in the case, and has failed to discover any trace of poison in the stomach of the deceased.

DEATH FROM INCAUTIOUS USE OF PURGATIVES.

LAST week an inquest was held at Bridlington Quay, to inquire into the circumstances attending the death of a maiden lady, named Anne Dowsland, aged 47 years. It appeared in evidence that the deceased had been out of health for some time, and was suffering from an "asthmatical cough." She was in her usual state of health on Monday week, and went out. It appeared that she had purchased two boxes of pills, one from a "Medical herbalist," and the other from a "Dr. Rooke." These were purgatives. She took both kinds of pills at one and the same time, and was heard to say "that she could not understand what it was that made her inside feel like burning coal." She was very much purged up to the time of her death, which occurred somewhat suddenly on the Sunday following. She had taken several doses of the pills. Dr. Allison stated that he had attended the deceased in March and April last, when she suffered from cough, pain in the chest, and difficulty of breathing. After several weeks' treatment, which consisted principally of warmth, rest, and suitable nourishment, her general health improved, and she was able to attend to her ordinary avocations. He had, assisted by Dr. Nelson and Mr. John Allison, made an examination of the body, which presented an extremely emaciated appearance. The lungs were in a state of very great congestion, and in places engorged with decomposed blood, but free from tubercles and the usual indications of consumption; the heart, liver, and kidneys seemed in a healthy condition; the stomach was quite empty, and showed no decided signs of disease; several feet of the intestines were in a state of inflammation, the whole being perfectly empty. Witness was of opinion that the diseased state of the lungs must eventually have proved fatal. Drastic purgatives which produce inflammation would have a depressing influence upon a person suffering from extreme exhaustion. No Medical Practitioner would sanction the employment of extreme purgatives in such a case. It was his opinion that under the existing circumstances the taking of these pills would have a tendency to accelerate death. After a brief address from the coroner, the jury returned a verdict of "Death from natural causes, accelerated by incautiously taking purgative medicine, thereby producing fatal exhaustion." This case is a type of a class which are constantly coming under the notice of Medical Practitioners. There is no more mistaken opinion than the one generally entertained, that "opening medicine can never do harm."

THE "DISCHARGED FEMALE PRISONERS' AID SOCIETY."

THE *Daily News* of the 25th inst. contains the description of an institution which, during the past five years, has grown into considerable dimensions and importance under the auspices of some benevolent ladies who have devoted themselves to care for and, if possible, reclaim the lowest and most degraded class of female convicts. It is a startling, and, at first view, by no means agreeable fact, that nearly 4000 female convicts are at large with tickets-of-leave, and that the majority of these are in London; but it is satisfactory to be informed that in one of the western and most fashionable districts of London many hundreds of domestic servants are ticket-of-leave women, whom their employers have engaged with full knowledge of their antecedents, and that not infrequently the worst criminals are transformed into extremely good domestic servants. This transformation has been effected by the means adopted by the "Discharged Female Prisoners' Aid Society," which has opened several establishments throughout London to supply a home for released female convicts, to assist those to earn an honest livelihood who have given proofs of amendment, and to give employment to all released female prisoners who will comply with the prescribed rules, and who will work for their maintenance. The parent establishment of the Society is near the Nine Elms Station of the South-Western Railway. The Lady Superintendent is Miss

Lloyd, and the Honorary Treasurer is Mrs. Meredith, whose address is "Nine Elms House, 6, Upper Belmont-terrace, Wandsworth-road, S."

The women received into this establishment are employed at laundry-work. Some reside in the house, and others come at eight o'clock in the morning and go away at six in the evening; these bring their dinners with them. They earn about 1s. 6d. per diem, and tea is provided for them in addition to their wages. The work done by these women is not only advantageous to themselves, but confers immense benefits upon the poorer classes of the neighbourhood, who have great difficulties in getting their clothes washed at home, but who, for the small charge of 6d. per dozen articles, can have their soiled clothes disinfected (if necessary), washed, mangled or ironed, and made ready for use again. The clothes of families suffering from infectious diseases are disinfected and washed by the newly-discharged convicts in a shed entirely separate from the others. Carbolic acid is employed freely, and the danger of infection is not considered to be very great. The Lady Superintendent is most anxious to have a disinfecting-chamber, in which the clothes could be thoroughly baked, but funds are wanting to supply this. As a means of reclamation to the unfortunate women themselves, and of supplying to the poorer classes a sanitary benefit of almost incalculable value, the institution to which we allude is one of national importance, and we trust that the humane and enlightened efforts of the ladies who have established it may not be rendered unavailing in their struggle with the moral and physical ills of life through public apathy and want of the necessary funds.

FROM ABROAD.—MILITARY REORGANISATION IN FRANCE—
PUNCTURE IN GASTRO-INTESTINAL PNEUMATOSIS.

ARMY organisation is a vital topic of the day in France, and M. Lagneau, in a paper read at the Académie de Médecine on the 18th instant, stated what he terms the Medical and Anthropological Considerations of the subject. These he sums up as follows:—1. Defective stature should no longer be admitted as a ground for exemption from military service. Such exemptions, owing "principally to the diversity of the ethnic elements," prevail very unequally in the different departments, and would in some of these, were the men accurately measured, free from service one-eleventh of those examined. Boudin, Larrey, and others have shown that, with respect to military aptitude, these men are often of a better conformation than those of a higher stature. 2. In like manner, slight defects should cease to secure exemption—such as flat-foot, varices, varicocele, bad dentition, stammering, harelip, myopia, strabismus, *teigne*, etc. These minor infirmities do not render their subjects unfit for certain military duties, while they abstract from the service of the country a still larger number of men than does deficient stature. Regarding these exemptions in relation to their unequal geographical distribution, which is often due to the different ethnological conditions of the population, they will be found to favour the transmission of the infirmities (often hereditary) that give rise to them by facilitating the marriages of the persons so exempted, who are left in their homes, while the valid men are sent to the army. 3. Legalised dispensations from service should be allowed only when the importance of the social duties for which they are claimed clearly overrides the duty of every man to join in the common defence. 4. Military service should be rendered obligatory upon all by the abolition of drawing by lot and of substitutes; but it should be limited in the time of peace to the period strictly necessary for the acquisition and retention of military instruction. Not only is this an equitable and, in a military point of view, an indispensable obligation, but it is also advantageous in its anthropological bearing, by allowing of a reduction in the time of service, to which end, also, the proposed drilling in lyceums and schools will contribute. The importance of such reduction is seen from the fact, that in time

of peace the mortality among soldiers is almost double that furnished by civilians of the same age. Moreover, the more the duration of military service can be abridged, the fewer will be the obstacles to the marriage of young men, while the number of illegitimate births (which are followed by great mortality) will be also fewer. In order to favour the contraction of marriage, the men, after having acquired military instructions, might be called out in successive levies, according to their social position, the unmarried being levied before the married men of the same age. 5. Men having similar geographical and ethnographical relationship should be incorporated in the same regiments, battalions, and companies. This rule, as MM. Colin and Behier have observed, would tend much to the prevention of nostalgia, while it would allow of the application to the soldiers of the different corps of hygienic rules in harmony with their former habits and their special ethnical peculiarities. 6. Soldiers should be kept in rural camps of instruction, and not in barracks in towns. MM. Boudin, Levy, and numerous other authorities have shown that the overcrowding of soldiers favours the development of phthisis and of typhoid and eruptive fevers. In the camps mortality is diminished, and venereal diseases (from which, in some years, one-eighth of the whole force suffers) are less frequent. In these, too, when distributed over different regions of the country, rules of regimen and hygiene conformable to former habits and present aptitudes can be carried out; while the attracting of the young men from the country, with its train of ill-consequences, is avoided. In time of war, also, the rural camps are far preferable to city barracks, the overcrowding of which favours the production of grave epidemic diseases, such as typhus, cholera, etc. 7. The Military Medical Body should be rendered independent of the Military Intendance. As M. Chenu and others have amply shown, the maintenance of the sanitary condition of the army absolutely requires that the Medical officers, who alone are competent to the task, should solely be charged with the proposal and execution of the hygienic measures deemed necessary for the health of the soldier, the Intendance having no power to oppose or delay the application of these.

In relation to this last point, we may refer to an important letter which has been published in the *Journal des Débats* by M. Legouest, the distinguished military Surgeon, and reprinted in the *Gazette Hebdomadaire*, July 21. In this he calls upon French statesmen to seize the opportunity of passing the new military law to remedy this crying grievance of the Medical service, which not only cripples its energies, wounds its dignity, and wastes its power, but acts powerfully in preventing young Medical men from joining the service, the recruiting of which becomes every day more difficult. How the public suffers from this predominance of the Intendance and annihilation of all Medical initiative and executive power, he exhibits by the great sickness and mortality of the French armies as compared with the American and English, in the first of which the Medical element is entirely unfettered, and in the last possesses much liberty of suggestion, direction, and action. He says that, enlightened by numerous publications and the operation of recent events, the commanding officers and the public at large have severely condemned the present system. That such a public opinion should be thoroughly aroused he deems essential; for, as he adds, it has been long acknowledged that something must be done, and the best intentions to do it have been exhibited; but the Ministers of War, one after the other, have up to the present time had their convictions shaken by routine regulations, and, tired out rather than persuaded, have left to their successors the task of rendering common sense triumphant.

The tremendous discussion on purulent infection which has now occupied the Académie de Médecine for some months past—during which the orators, one after another, read masses of written matter equivalent to bulky pamphlets—has almost excluded all other subjects. Professor Fossagrives, of

Montpellier, however, succeeded recently in getting in a paper on "Puncture in Gastro-intestinal Pneumatosis." He observed that although of such common occurrence in veterinary practice, it was first practised in France by M. Nélaton, at the suggestion of Recamier. Since 1866 M. Fonssagrives has himself had several opportunities of observing the harmlessness of puncture of the intestine in cases of pneumatosis in which the symptoms seemed to threaten death. The operations were performed by a hydrocele trocar, and were not followed by any inflammation. He thinks, however, that an exploratory trocar should be preferred. In some researches he has made upon the subject he finds that it has been performed ninety times on about sixteen individuals, having been practised fifty times in the same subject. He thinks that the operation should be more commonly resorted to, without allowing the symptoms to become so much advanced.

In the discussion which ensued, M. Bouley wished merely to call the attention of the Academy to the innocuity with which puncture of the abdominal organs is performed in all the domestic animals. In them it has, indeed, very often to be practised, especially in the herbivora. Its success in the ruminants led to its application to the horse, and it is now a matter of ordinary practice. M. Depaul referred to a case of a young woman under M. Alphonse Guérin, who was relieved of what seemed very threatening symptoms by means of four successive punctures. He has himself repeatedly seen cases in which puncture was indicated, and he referred to one in which the pneumatosis proved fatal at the end of pregnancy, the Practitioners called in in consultation not sanctioning the operation. The accoucheur, either at the end of pregnancy or after delivery, sometimes meets with most serious cases of pneumatosis for which puncture is indicated. He recently met with a case of a young woman brought to the point of death from asphyxia due to gastro-intestinal pneumatosis. Two punctures discharged a large quantity of fetid gas mixed with other matters, and the patient was saved. M. Piorry has practised puncture with success in a certain number of cases in which the accidents were most alarming. He observed, however, that it is not sufficient to merely give discharge to the gases by puncture, but that the causes or anatomical lesions which give rise to the intestinal occlusion should first be most carefully sought for by every means of exploration, and especially by percussion. Very frequently it will be found that a mere accumulation of faecal matters at the end of the large intestine has caused the occlusion, and admits of remedy by means of purgative enemata, without any operation. The place of election, when this is necessary, should be on the level of the caecum, at the point where this portion of intestine is not covered by peritoneum. M. Barth observed that in cases of peritoneal tympanites, which are exceedingly rare, and in gastro-intestinal tympanites, which is far more common, puncture may be practised without danger. He has himself successfully practised it in a considerable number of cases. Unfortunately, we cannot always tell the precise point of the intestine at which the obstacle is situated, nor yet its precise nature; but in such cases he does not hesitate to make several punctures, whether at the same time or at intervals of some days. The puncture is followed by no ill-effects, since the intestinal fibres, being simply separated by the trocar, retract on themselves after the escape of the gas, and so prevent any effusion into the peritoneal cavity. M. Huguier adverted to the fact that he had caused an instrument to be constructed, with the view of rendering impossible the effusion of gaseous and other matters into the peritoneum in consequence of puncture. It consists in a very sharp-pointed needle, adjusted in a trocar canula, which he terms an *aiguille porte-canule*. It separates the intestinal fibres without dividing them. M. Huguier has many times employed this instrument with success in cases of strangulated hernia, thus saving the patient from the danger attendant upon kelotomy. In cases of internal strangulation we cannot

always disperse the tympanites by intestinal puncture, for although we may empty the punctured loop, other loops may be so disposed as not to be capable of evacuation, and the symptom remains unrelieved. M. Verneuil, on principle, is a partisan of intestinal puncture in strangulated hernia and internal strangulation; but he is by no means certain of the practical efficacy of the procedure, which often fails to attain its end, nor even of its harmlessness. There is also a great want of precise indications for its employment. M. Giraldès has practised intestinal puncture both in adults and in children without having met with any accident. In his opinion it is in certain cases an operation of great utility, and especially in internal strangulations, which are due, in his opinion, in one-half the cases to a twisting (*enroulement*) of the intestine upon itself. The puncture giving issue to the gas causes a cessation of this condition. M. Fonssagrives reminded the Academy that he had collected references to eighty cases in which the operation had been performed without any accident occurring, and that with the hydrocele trocar. He believes that the needle invented by M. Huguier would give still greater security. He also repeated that he had only recommended this operation in extreme cases, in which the gastro-intestinal pneumatosis gave rise to asphyxia, and other means had been used in vain. He is of opinion that the arch of the colon is the preferable point for making the puncture. M. Richet has met with a case of essential peritoneal pneumatosis, a case which M. Barth states to be so rare that he only knows of one on record. It occurred in a woman somewhat above 60 years of age, who habitually suffered from more or less considerable abdominal swelling after meals, which after a while disappeared. On one occasion, however, this was not the case, and the patient seemed menaced with asphyxia. M. Richet, when called to the case, was struck with the absence of all outline of any intestinal convulsion, and concluded that the gas which had become developed was contained in the peritoneum. He made a puncture by means of an exploratory trocar guarded by its canula, and the force of the jet of completely inodorous gas was such as to extinguish a candle at more than two feet distance. The patient was already in a dying state, and was not saved, nor was any autopsy allowed. M. Guenau De Mussy had entered some five or six years ago upon an investigation, the results of which were published in the *Gazette Hebdomadaire*, as to the causes which determine the retention of gases within the intestine. He came to the conclusion that it is not always necessary that peritonitis should have previously existed, giving rise to bridles, against which the intestinal folds became strangulated. He believes, with M. Huguier, that there is sometimes produced a sort of bend (*genouillement*) of the intestine, which gives rise to the formation of valves that isolate the intestinal folds from each other and prevent their intercommunication. The puncture of one fold would not, in such instances, liberate the air contained in other folds. This fact enables us to explain differences in the results of puncture. When tympanites is situated in the small intestine, the natural curvature of the folds becomes exaggerated by the distension, and puncture is insufficient; but when the large intestine is the seat of tympanites, the absence of flexion and the large calibre of the folds allow of the gas being easily evacuated, and in such cases puncture is highly useful.

PARLIAMENTARY.—CONTAGIOUS DISEASES—PERSONAL SECURITY OF WOMEN—PAYMENT OF PROFESSIONAL WITNESSES—THE MEDICAL SERVICE IN INDIA—PUBLIC HEALTH AND LOCAL GOVERNMENT —METRIC SYSTEM—LUNATICS (IRELAND) BILL.

ON Monday, June 4, in the House of Commons,

Sir J. Elphinstone gave notice that on Tuesday he would ask the Secretary of State for the Home Department what protection the Government are prepared to afford to the public against the obscene and disgusting papers which the members of the late deputation on the Contagious Diseases Act threatened to force into their hands, and which they said it was

their duty to send broadcast, and the subjects of which they declared should be discussed by women and children; and whether such persons can be prosecuted for such proceedings under the Act termed Lord Campbell's Act.

Mr. Jacob Bright asked the First Lord of the Treasury whether he was aware that, in the borough of Southampton, from September last year to June of this year, twenty-nine women went to prison, seven of them going a second time, and two a third time, in some cases with hard labour, rather than submit themselves to the hands of the State Surgeon; whether it was not true that there were, over a considerable portion of the kingdom, agents of the Admiralty and of the War Office, whose business it was to watch women in order to subject them to similar usage; and whether, in the opinion of the Government, the personal security of women in this country was now what it ought to be or such as the law carefully guarantees to men.

Mr. Gladstone: I need not say, Sir, that I have no original knowledge of the facts to which the question of my hon. friend refers; but I have made inquiry, and I understand that the facts are as follows: That between September of last year and June of the present year twenty-nine persons (women) were sent to prison; seven of them were subsequently committed for a second time, and two of them were sentenced a third time, but were only sent to prison twice. With regard to the second question, I am not aware, and cannot learn, that there are over any portion of the kingdom any agents of the Admiralty and of the War Office whose business it is to watch women in order to subject them to similar usage. I understand that the Act of Parliament devolves certain duties upon the police force of the country. These duties are performed, but the War Office and the Admiralty, I am assured, have no agents whatever employed for the purpose indicated by my hon. friend. With regard to the third question, which refers rather to a matter of opinion than of fact, her Majesty's Government have advised the Crown to appoint a Commission, in order to examine whether the personal security of women has all the guarantees on which it ought to rest by the Act. The Commission, as my hon. friend knows, has reported, and the Secretary for the Home Department stated to the House on a former evening that, although he was not prepared to make any immediate proposal on the subject, the report of the Commission is a very proper subject for the consideration of Parliament.

Mr. Bentinck said he would on Thursday next ask the Secretary of the Treasury whether his attention had been drawn to the fact that Mr. Oliver Pemberton, a Surgeon, of Birmingham, had attended as a witness at the Carlisle Assizes in reference to the case of the lecturer Murphy, and had stated that he had only been allowed his second-class fare and a guinea; and also whether the Treasury proposed to take steps to carry into effect the recommendation of the learned judge who presided on that occasion, and who expressed his opinion that a great deal more ought to be allowed.

Colonel Sykes asked the Under-Secretary of State for India whether Drs. Gopaul Chunder Roy and Krishna Dhurr Ghose, who came to England to compete for commissions in the Medical Service in India, and had obtained the prescribed degrees in Medicine and Surgery, but were debarred from reaping the reward of their studies and outlay by the competitive examinations being from time to time postponed on the ground of Medical officers not being required in India, might, nevertheless, be now allowed to compete, with a view to their being placed on a supernumerary list to fill up vacancies as they occur, to avoid otherwise the total and grievous loss to them of their time and money, as their present ages would debar them from competing at any future examinations.

Mr. Grant-Duff: I regret that we have no powers to do what my hon. and gallant friend wishes. When the Government of India informs us that it wants such and such a number of Medical officers, we announce that such and such a number will be selected by competitive examination; but we cannot ask some score or hundred Medical students to enter for a competitive examination, in which the prize would be the chance that the successful candidates might at some indefinite future period be employed as Indian Medical officers. I don't think that would be a fair proceeding either to the Medical schools or to the Government of India.

Colonel Sykes asked when the next competition would be held?

Mr. Grant-Duff: I have not the remotest idea.

The House went into Committee on the Local Government Bill.

On Tuesday,

Sir J. Elphinstone, who had given notice of his intention to ask the Home Secretary whether the Government were prepared to afford protection to heads of families and the public against the "literature" on an indelicate subject which the members of a late deputation threatened to force into their houses, postponed the question until Thursday, in consequence of the absence of the Secretary for the Home Department through illness.

Mr. Baines then gave notice of the following question for the same day:—To ask the Secretary of State for the Home Department (after the question of the hon. member for Portsmouth) whether it will be possible, consistently with the freedom of the press and the rights of the subject, to prevent or punish the discussion of a law of the land, which stands condemned in its fundamental provision by the report of the Royal Commission, and for the repeal of which nearly half a million of persons have petitioned the House this session, on the grounds of justice and morality; whether it will be unlawful to publish in pamphlets or otherwise the report and evidence of the Royal Commission, which this House is itself in course of publishing in Parliamentary papers; and whether the only effectual method of preventing further violations of delicacy will not be to repeal or suspend the principal provision of the Acts which have offended and distressed so large a portion of the community, and which provision is unanimously recommended to be repealed by the Royal Commission.

Sir C. B. Adderley obtained leave to bring in a Bill, founded on the report of the Sanitary Commission, to consolidate and amend the laws relating to public health and local government. In explaining it Sir Charles was interrupted by the customary attempt at a "count out," and this proving unsuccessful, he went on to point out the complications and anomalies, the expense and inanity of our present system, its conflicting jurisdictions and overlapping areas, etc. The Bill, consolidating more than forty statutes, first of all repeals all existing sanitary statutes. Consequently, out of the 450 clauses of the Bill nearly nine-tenths are intended to re-enact certain portions of them. It simplifies areas, concentrates all authority into one department, and there are also other provisions relating to audit and borrowing powers. As a matter of course, Sir Charles added, it was not intended to proceed further with the Bill this session.

On Wednesday,

Mr. J. B. Smith's Weights and Measures (Metric System) Bill was rejected after a long debate on the second reading by a majority of 5—82 to 77.

The Lunatics (Ireland) Bill was withdrawn.

POOR-LAW MEDICAL OFFICERS' ASSOCIATION.

THE annual meeting was held on Wednesday last, at the Freemasons' Tavern, Great Queen-street.

Dr. JOSEPH ROGERS, of Dean-street, Soho, presided, and apologised for the non-attendance of several of the members who had promised to be present should their Professional avocations allow of their doing so. Dr. Woodward, of Worcester, Mr. Corrance, M.P., and other gentlemen had written, expressing their desire to attend, and he was extremely sorry at not seeing them present. However, he hoped to see a larger attendance at the dinner. With regard to the financial position of the Association, he had a very satisfactory report to make. They had a considerable balance in the hands of the treasurer, and arrears of subscriptions were coming in every day. They had, however, some work in progress which would tax all their energies and somewhat reduce their means, but there was nothing that need give them any uneasiness in that respect. Mr. Corrance, M.P., had wished to be present to announce publicly his intention of bringing in a bill relating to the laws of the sick poor, and he (Dr. Rogers) was in a position to state that such a measure would receive a large amount of support in the House of Commons. He was glad to find that the Legislature was beginning to recognise the fact that the health of the poor affected materially the position of those who had to maintain them. As the first business of the meeting was to elect the officers of the Association for the ensuing year, he felt that an early opportunity should not be lost of declaring his desire of retiring from

the position in which they had so kindly placed him. Indeed, he was not quite sure whether it would not be to the advantage of the Association if some gentleman occupying a higher social position were elected as their President. He had spoken to Mr. Corrance, M.P., on the subject; but when doing so, he doubted whether it would be hardly fair to ask a county member to undertake duties in addition to those he had to perform, or whether Mr. Corrance would like to occupy such a position before the world and his constituency as President of their Association. Still, he named the matter to that gentleman, and, after some consideration, he said that, if it should be the pleasure of the Association to elect him, he should be happy to undertake the position of President, and do all that he possibly could to advance the interests of their Association, providing that they would allow him to advocate them in a broad and not in a merely Professional point of view. He (Dr. Rogers) would gladly retire in favour of Mr. Corrance; but, if they elected that gentleman, it would be desirable to have the real presidential work performed by some other member, leaving Mr. Corrance to be their representative in the House of Commons. However, that was a matter which the meeting would have to decide.

Mr. BENSON BAKER thought they ought to consider well before they followed out the line suggested—namely, the election of Mr. Corrance as their President. He would prefer the duties being performed by one of their own number, as heretofore.

Mr. MILWARD, of Cardiff, maintained that they ought to do all they possibly could to retain the services of Dr. Rogers. He was the very life of the Association, and he should certainly move his re-election as their President. (Applause.)

Dr. DUDFIELD, in seconding the motion, maintained that they ought not to have a mere ornamental President. Dr. Rogers had worthily filled the office, and it would be a great mistake if they did not re-elect him.

Mr. J. W. BARNES (hon. secretary) spoke of the admirable manner in which Dr. Rogers performed his duties.

The resolution having been carried unanimously,

Dr. ROGERS, in reply, said that he would perform the duties of their President as long as his health would permit, and he returned them many thanks for the renewed honour they had conferred upon him. (Applause.)

On the motion of Mr. BENSON BAKER, seconded by Mr. MILWARD, the metropolitan vice-presidents elected were Dr. Dudfield, Dr. E. Jones, Dr. J. Dixon, and Dr. C. Welch; and for the provinces—Dr. Brett (Watford), Dr. Clarke (Leicester), Mr. Mathews (Horsham), and Dr. Sheen (Cardiff). The Council were elected, and the hon. treasurer, hon. secretaries, and auditors were appointed as before.

Dr. ROGERS then proceeded to address the meeting, as usual at the annual meeting. He said that on the last occasion he told them that Dr. Brady, in conjunction with a distinguished member of the House of Lords, would introduce a Bill during the present session of Parliament upon Poor-law Medical relief. He also stated that Mr. W. H. Smith would move for a Royal Commission to inquire into the operation of the Poor-laws in London. Why Dr. Brady had not carried out his intention he knew not, but he presumed it was from ill-health. As regarded Mr. Smith, he made a gallant attempt to carry out his views, and some excellent speeches were delivered during the course of the debate; but he (Dr. Rogers) was sorry to say that the remarks of Mr. Smith were listened to by a very thin House—indeed, during the course of the evening it might have been counted out if any member had been vicious enough to do so. When they considered the great war that had convulsed Europe, the outcry that had been raised as to our unpreparedness for war, the great alterations which had been proposed in military arrangements and the Ballot Bill, a rational explanation, he thought, was afforded for the indifference with which the House viewed the social question of Poor-law Medical relief, and many other measures of the people. Perhaps no session had ever been more remarkable than the present with regard to matters of this kind. Immediately after the meeting last year he attended, by special invitation, the meeting of the British Medical Association at Newcastle, and the principal result which accrued was the formation of an influential committee, which subsequently went as a united deputation to Mr. Goschen, and laid before him propositions for a district scheme of Poor-law Medical reform. The meeting last November was probably one of the most satisfactory ever held, as on that occasion they were honoured by the presence of many Medical Officers of Health, who not only attended for the purpose of evincing sympathy, but of determining the feasibility of a more harmonious co-operation in securing a better knowledge of the

features of preventible disease, and of facilitating disease registration. The report of that meeting produced a great effect. Shortly after the November meeting the report of the Royal Sanitary Commission was published, and they then learned that—influenced, doubtless, by the facts brought forward at their previous meeting, and notably at that in May, 1870—they had decided that Medical officers, from the nature of their duties, were the fittest persons to be entrusted with preventive duties. He must, however, express his regret that the report was so illogical, that whilst it recommended that rural officers should be employed, urban officers were to be kept in the same anomalous position as before. He could not understand why the metropolis with its 3,200,000 inhabitants should be left out in the cold. He was satisfied that the existing arrangements were most unsatisfactory. As a member of a Board of Works he had noted the dependence of the Medical officers on the district Medical officers for information, and he believed the happiest results would accrue from the confiding larger powers of prevention to Medical officers; indeed, he held that they should be *officiers de santé* of first instance. Another part of the report of the Commission recommended inspection, but it was silent as to whether it should be Medical or otherwise. He thought they had had enough of central itinerant inspection, made up mainly of briefless barristers, who had never had, and never would have, any sympathy with the difficulties of local officials. Within the last forty-eight hours he had received a very painful letter from a young man, who had been the subject of a Poor-law inquiry in one of the western unions. Some time ago he (Dr. Rogers) told him to be careful, above all things, to avoid an official inquiry, because the department would be sure to crush him. In this instance the inquiry was forced upon him from the intolerable conduct of the master of the workhouse, and he (Dr. Rogers) received information that a certain official not belonging to that district was to be sent down by the Poor-law Board. The instant he heard that he wrote to the young man, telling him to be upon his guard, for the man who was going to conduct the inquiry would prove to be no friend of his. And so it turned out. He was perfectly satisfied that the young man was made the subject of persecution, and all because he dared to stand up in antagonism to the local board of guardians. Some modification of the Poor-law arrangements with regard to matters such as that was most urgently needed. Inquiries of that kind ought to be conducted by men of their own Profession, who would have sympathy in their breasts, and not by barristers, who owed their favours exclusively to Court favouritism or intrigue. He would urge the appointment of county and (where necessary) city or borough health officials, debarred from private practice and irremovable, who should superintend all matters relating to the public health, and to whom the district Medical officers should stand in relation as deputy health officials, and that hereafter, when the scheme had been put into working order, all such high appointments should be given to district Medical officers exclusively, and that duties such as those performed by Dr. Letheby should be their peculiar appanage. He could not conceive why Medical men should be debarred from position. The Church has its bishops and archdeacons, its rectors and its prebendaries; and the lawyers had their positions; but Medical men had none whatever. They might display enormous capacity, but yet would only remain mere parochial or Medical officers of a district. This was not a right state of things, and he trusted they would show themselves to be sufficiently united to obtain an alteration in the law. One of the subjects touched upon by the Association had been that of public vaccination. Early in the year they found that Dr. Seaton was urging forward consolidation appointments, and they accordingly sought an interview with Mr. Simon. They did not object to rational consolidation, but they decidedly demurred to the summary and wholesale dismissal of Medical officers simply to carry out the views of Poor-law officials. Could anything be more monstrous than the whole of the district Medical officers of such a parish as St. Pancras being summarily dismissed, and one man only being selected to fill the offices they had held. Another thing was that, if the scheme of consolidation was carried out, there would only be thirteen public vaccinators for the whole of the metropolis with its three and a half millions of inhabitants. During the interview he referred to Ireland, and pointed out that in that country the system of vaccination was complete, and there was not that miserable inefficiency which they witnessed here. Every dispensary was a station, and every district Medical officer a public vaccinator. When they went to Mr. Forster, however, he impugned the correctness of his (Dr. Rogers) statistics; but they had been supplied from official

sources, and common sense ought to have told him they were reliable. In the town of Birmingham they had suddenly cut down the number of public vaccinators from eight to one, and the result was, that there was a large diminution in the amount of vaccination. It took a considerable length of time for the public to find out the stations which the Privy Council in their wisdom had set up. The scheme had been carried out so far that Dr. Seaton had admitted that if it was extended it was possible they would all come to grief. It behoved them, therefore, to stand up and make a gallant fight, and if they did they might reasonably expect success. Passing on to another matter, he had to tell them that in the month of March their excellent friend, Mr. Corrance, put a notice on the paper of the Central Chamber of Agriculture that it was desirable to have a discussion on Medical relief, and he desired him (Dr. Rogers) to open it before the meeting. From a variety of causes its consideration was delayed until June, when he had the honour to address a large and influential gathering of noblemen and gentlemen, who had come from all parts of the kingdom. Although his remarks at first were received coldly—indeed, almost hostilely—yet he succeeded in obtaining a hearing. His facts were not only listened to, but they found their way to the understanding of his auditory; and not only did he get a vote of thanks for his address, but a resolution condemnatory of the present system was passed, and a copy of the resolution was ordered to be sent to the Poor-law Board, and the consideration of the subject recommended to the notice of every branch chamber in the Kingdom. From that he was convinced that the facts on which his case was based were irresistible, and only needed publicity to secure acceptance and adoption from the great bulk of the thinking portion of the community. During the last six months they had seen a further change of chiefs at the Poor-law Board. Mr. Goschen, to whom they were certainly much indebted, was gone to the Admiralty, and Mr. Peel he did not know where. In common with many others, he regretted the change that had been made. Mr. Goschen was a man of much capacity, and, being of business habits, had infused his spirit into the department over which he had rightly presided. Then, again, he was a man who thought for himself, so that the staff, though they might now and then have succeeded in misleading, did not control him. Again, he saw deputations alone; but since his transference the old *laissez aller* had returned, and most of those officials to whose obstructive incompetence the break-down of the department was mainly due were again to the fore. They present themselves before deputations and obtrude their opinions where they are not required. One of the most recent legislative changes in immediate prospective was the consolidation of the Medical Department of the Privy Council, the Local Government Office, and the Poor-law Board. That was certainly a step in the right direction, and he claimed that it had been largely pushed forward by their Association; nevertheless, it was to be regretted that the farce of a nominal board was to be preserved—probably that was due to the circumstance that Mr. Gladstone held that the consideration of Poor-law matters did not require any particular gifts of intelligence. Matters were different during the *régime* of Lord Palmerston, for his Lordship was in the habit of going through the department every day, and he knew exactly how business was being conducted. Fancy how matters stood at the present time, when seven and a half millions were spent in connexion with the administration of the Poor-law, which was considerably more than the entire revenues of some of the Continental kingdoms. Medical men had suffered from the want of statesmen at the Poor-law Board, and the sooner they had statesmen there the better it would be for them and the community at large. Gentlemen present might, Dr. Rogers proceeded to say, have seen in the Medical journals that the Select Committee on Scotch Poor Relief had recommended material alterations in the arrangements for giving Medical relief. Nothing could be more miserable than the Scotch system, and on several occasions he had drawn attention to it. The late Lord Advocate, Mr. Gordon, who was one of the Scotch Board of Supervisors, brought it prominently before the public, and pointed out the advantages to be derived from the system adopted in Ireland. Recently they had had a deputation—not a united, but a conglomerate deputation—to the Poor-law Board. It was got up in this way. They knew that Mr. Corrance's motion was coming on, and they felt it was desirable to strengthen his hands as much as possible, and accordingly they saw Mr. Stansfeld, and drew his attention to the importance of some reformation being made in respect to Medical relief in large places. Mr. Stansfeld, however, did

not seem to understand what the deputation really wanted, and this was the unfortunate conclusion they came to. There was no doubt that in consequence of a reduction of Poor-law Medical officers a large amount of voluntary Medical aid was given at our Dispensaries and Hospitals. Besides, the Medical officers had been saddled with such conditions that it was impossible they could fulfil all the obligations that had been cast upon them. Whilst the Medical officers of Bethnal-green, Rotherhithe, and Southwark were trammelled with difficulties, those at the West-end had but little to do—indeed, their offices were mere sinecures, and they received their salaries for almost nothing. The whole system was rotten to the core, and nothing but a searching investigation could show the large amount of work which was necessary to be done by voluntary Hospitals and other institutions, to say nothing of how the poor were deprived of the relief to which they were entitled. Dr. Rogers then observed that on previous occasions he had contrasted the Irish and English annual reports, but this year the opportunity was denied him, owing to the English report not being ready for his perusal. As regarded the Irish, he was happy to state that it still devoted a large portion of its space to Medical relief subjects. The English, doubtless, when they saw it, would, as heretofore, avoid the question altogether. The sickness of the poor in this country is totally and entirely disregarded, whilst nearly five-sixths of the Irish report is devoted to that purpose, and hence the success. Another matter to which he wished to call their attention was this. They knew that their excellent friend and honorary member, Mr. Corrance, who had been in Ireland, had put a notice on the paper of the House of Commons to the effect that he would move a resolution condemnatory of the existing system of Medical relief, and urge the adoption of a modification of the Irish system. The subject was to have been discussed in June, but it was adjourned to July 21, when his notice stood second on the list. There was a doubt whether Sir J. Lubbock's notice on technical education would not occupy the evening, but notwithstanding, Mr. Corrance went to work to get a house, and about 130 notices were issued, and with such success that at half-past nine a large number of members were present, but Sir John and his friends, Mr. Mundella and Dr. Lyon Playfair, had arranged to exhaust the evening, and had actually brought their wives and daughters to hear their speeches. Seeing there was no chance of successfully bringing the subject on, Mr. Corrance, at half-past eleven, resolved to abandon it and go away. It was his intention, however, early next session, in co-operation with Sir D. Corrigan and M'Cullagh Torrens, to make a statement in the House, and to introduce a Bill with regard to Medical relief in this country. In conclusion, Dr. Rogers said that their case was so good, and demanded so thoroughly and completely their consideration, that he hoped they would continue to be united as before; for he was satisfied that if they were only true to themselves they would gain all the objects they sought. (Applause.)

Mr. LORD said he had no intention of taking part in Medical politics, but he could not help stating that he disagreed with some of the remarks of the President. He thought he had pictured matters much too gloomily. Instead of condemning the authorities, much blame rested upon Medical men themselves. They were not true to each other, and hence their difficulties. He was pleased to see the re-election of Dr. Rogers, for a more fitting man to fill their Presidential chair did not exist.

Dr. STALLARD wished to thank Dr. Rogers and the Council for the excellent advice they were prepared to give at all times.

Mr. J. W. BARNES said that the view of Dr. Seaton with regard to the desirability of having few stations, in order that a proper supply of lymph might be kept up, was erroneous. In St. Pancras, where they had arm-to-arm vaccination, a proper supply had always been obtained. If all the lymph was taken to the stations, great inconvenience would be felt, and numbers of children would go unvaccinated.

Mr. BENSON BAKER said that disastrous consequences might ensue if there was only one vaccinator in a district. If he were called in to attend a woman suffering from small-pox, he could not, in the anomalous state of the law, vaccinate the child at her breast; but he believed this state of things would soon be altered, for a clause had been introduced into the amended Vaccination Act, giving power to Medical men to vaccinate in houses where an epidemic raged.

Dr. ROGERS thought the fear as to an insufficient supply of lymph was a mere craze on the part of the Privy Council.

Mr. LORD then moved a cordial vote of thanks to Dr. Rogers for presiding, and the meeting terminated.

In the evening a dinner was served at the hotel.

REVIEWS.

St. Moritz as a Health Resort. By R. WHITFIELD HEWLETT, M.D. and M.S. Lond., L.R.C.P.L., etc., Physician to the English and American Hospital, Naples. London: J. and A. Churchill. 1871. Pp. 39.

The Baths of Bormio. By R. WHITFIELD HEWLETT, M.D., etc. London: J. and A. Churchill. 1871. Pp. 53.

BOTH these little works may be confidently commended to the notice of the Profession and the public, for both of whom they are intended. The second of the two, "The Baths of Bormio," is an epitome, and in some parts a literal translation, of a German brochure, "Die Thermen von Bormio," by Dr. Meyer-Ahrens, a well-known German Physician, and is perhaps in some parts written a little too much *ad populum* to please the Professional taste. But it contains much real and very useful information, and is supplied with a good and impartial, though short, introduction from the pen of Dr. Hewlett himself. He had had some personal knowledge of the baths, and all that he says of their qualities and advantages is well worthy of careful consideration, and must be held to add considerably to the weight and value of the opinions expressed in the body of the pamphlet. The baths of Bormio seem destined to take an important place among our health resorts, and this account of them will be found of real and great use to all who wish for a true and scientific account of their value.

The first of the two pamphlets—that on "St. Moritz as a Health Resort"—is really "by" Dr. Hewlett. His object in writing it was "to describe St. Moritz as it is—its merits, no less than its drawbacks—the relative value of its atmosphere and its waters, the class of cases for which it is and for which it is not suited, and to suggest the steps which ought to be taken by the communal authorities, no less than by the landlords, to improve a state of things that is in many respects most defective." The first chapter, on "The Engadine," appeared some months ago in our own pages; the remaining chapters are on "St. Moritz," on "The Treatment of Lung Consumption by Mountain Air," on "Indications for Residence and Treatment at St. Moritz," and on "Appropriate Halting-

places *en route*" to that place. We have no heart to say much of the work, for since it appeared Dr. Hewlett's short and useful career has finished; his pen is for ever laid aside, and his ears are closed alike to praise and blame. But, while no one can read the pamphlet without feeling that it is the production of a highly educated and accomplished Physician and careful observer, its chief value consists, we think, in the sober and well-balanced opinion given on St. Moritz, and on the risks that may attend the treatment of lung consumption by the air of high altitudes, as well as the great benefit that may be gained by that treatment.

FOREIGN CORRESPONDENCE.

HOLLAND.

(From our own Correspondent.)

ROTTERDAM, July 24.

SMALL-POX IN HOLLAND.

The following are the official monthly returns for May:—

Towns.	Population Jan. 1, 1871.	Deaths from all causes, with still-born, in 10,000 inhabitants.	Deaths from small-pox.	Deaths from scarlet fever.	Deaths from measles.	Deaths from angina diphtheritica.
Amsterdam	281805	35.1	348	1	5	2
Rotterdam	123097	45.2	212	—	—	—
The Hague	93083	27.2	72	—	1	—
Utrecht	60587	32.8	38	—	1	—

The small-pox mortality in April for Utrecht was 140, instead of 117.

COLONIAL CORRESPONDENCE.

VICTORIA, AUSTRALIA.

MELBOURNE, May 20.

THE Medical Board are moving the Government to take charge of the Amended Medical Bill, which now more than a year ago the Board drafted and issued to the Profession. In any case, whether the Government or a private member bring it in, it will very shortly be discussed in the Legislature, and if passed in anything like the shape in which it has been framed it will confer considerable advantages upon the Profession, for the present Medical Act is simply a mockery as to any provision against irregular practice and the excluding from the Register all unqualified and disqualified persons. The Amended Bill contemplates, moreover, an alteration in the constitution of the Board, which is now altogether nominee, but which it is proposed should be partly nominated by the Governor in Council, and partly elected by the entire body of the Profession. It gives ample power to deal with black sheep, both those who have been struck off the British Medical Register, and those who may have been guilty of unprofessional conduct here. It gives power also to the Board to decide as to what qualifications shall be eligible for registration. At present the Board has virtually no power in this particular, and in the few instances in which it has demurred to register a diploma, the applicant has compelled it through the agency of a supreme court mandamus. The consequence is that the Register includes all sorts of diplomas from every quarter of the globe—the homœopaths figuring very prominently. Indeed, one of the most "fashionable" Doctors in Melbourne is a man whose only qualification is an M.D.-ship of the Homœopathic College of Pennsylvania. It is said that he is doing almost the most lucrative practice in Collins-street—the Medical quarter of Melbourne. You may infer from this that homœopathy is rather in the ascendant here. Of the four daily papers in Melbourne, two of them openly advocate homœopathy, one of them being edited by a homœopathic practitioner, whose qualification has proved too "irregular" even for the Government to recommend for registration.

Concurrently with the Amended Medical Bill, a Pharmacy Bill is to be introduced into Parliament. Hitherto, the druggists have been under no legislative control whatever. But the Pharmaceutical Society, established about sixteen

years ago, has lately been revived, and a Bill, based upon the English Act, has been prepared. It is expected there will be a good deal of opposition to this, as nearly all the storekeepers of the country sell drugs.

Professor Halford has been presented with a money testimonial, subscribed by the Profession and the public, in recognition of his claims as the discoverer of an efficient means of treating snake-bite, by the injection of liquor ammoniæ into the veins. He has, as a matter of course, been subjected to a great deal of abuse from the baser sort in the Profession, and he has been continually charged with having appropriated to himself merits that did not belong to him. He never claimed, however, either to have discovered ammonia as a remedy for snake-bite, or that injection into the veins was a means of introducing some remedial agents into the system. But he certainly claims, and with good reason, to have been the first to show that a large quantity of liquor ammoniæ may be thrown into the circulation with perfect safety, and the numerous cases now on record of recovery from snake-poisoning after the ammonia injections are, at any rate, most favourable demonstrations of its antidotal qualities. It is easy, of course, to say that the persons bitten would have recovered if no ammonia had been injected at all; but if the narrators of the cases are to be believed, the collapse in every instance has been so extreme as to preclude the possibility of recovery if some powerful restorative had not been employed.

Dr. L. J. Martin, who recently returned from a visit to the old country, read a paper, at the last meeting of the Medical Society, "On the Progress of Obstetric Science," in which he reviewed the practice he had had the opportunity of seeing while in England, Ireland, and Scotland. He brought with him quite a magazine of new instruments, and the interest shown in the examination of these was very great. It is felt that much good must come from these periodical visits to the old country; for, at such a distance, we are a little in danger of growing rusty, unless we are continually reminded of the progress being made at home. Dr. Martin is generally and deservedly regarded as one of our rising men. He is a thoroughly sound Practitioner, and his large experience in obstetric practice gives considerable weight to any opinion expressed by him. Since his return he has operated once in ovariectomy with entire success. The case was a most unfavourable one, being a very large multilocular cyst, and most difficult to dislodge. Dr. Tracy also performed ovariectomy the same week at the Lying-in Hospital, this being his thirteenth case. It also was a complicated case, from the number and extent of adhesions, but it has done well. Dr. Tracy employed the actual cautery with good effect in controlling the hæmorrhage caused by the tearing off of the adhesions.

The Alfred Hospital, which was lately opened, has been recommended by the Charitable Institutions Commission as a convalescent institution. You are probably aware that in this colony the charitable institutions are subsidised by the State to the extent of three-fourths of their incomes, and that therefore the Government has something very much more than a nominal right to prescribe the conditions under which they shall exist. In this case, it is admitted that the Charitable Institutions Commission, who have for many months been engaged in taking evidence upon the state of the Victoria charities, have every reason for their recommendation as to the Alfred Hospital. In defiance of all remonstrance, the founders—or, more properly, the suggestors—insisted upon its being built in a locality quite remote from the districts in which both ordinary Hospital patients are to be found and casualties are likely to occur. It is in what we are accustomed to regard as the aristocratic suburb. It is an elegant building, and quite an ornament to the neighbourhood, and, so far, it fulfils the intentions of its projectors; but it is not wanted where it is, and is never likely to be wanted, for ordinary Hospital purposes; but as a pretty and pleasant retreat for the convalescent it may do well enough, albeit, lying low and flat, the drainage will always be a difficulty.

At the Melbourne Hospital they are building an operating-room; but, instead of building it so as to afford ready access to the wards, they are putting it up altogether apart and detached from the main building. The consequence will be that patients, after being operated upon, will have first to be carried into the open air in order to reach any of the wards. The pig-headedness of the Committee of this charity, however, is coming to be proverbial.

The Government have decided not to appoint a commission to examine into the causes and means of treatment of diphtheria, as has been urged upon them by some restless members of the Profession, anxious to air their own particular theories on this

subject. Diphtheria, it is true, appears to be becoming endemic among us, but I do not think that even those who have had most experience of it in this part of the world can add anything to what is already known of its pathology and accepted as rational in its treatment. The Central Board of Health, presided over by our most indefatigable and conscientious Government Medical officer, Dr. McCrea, was referred to by Sir James McCulloch, the Chief Secretary, and Dr. McCrea reported, and most properly, that there was no need for a commission to investigate diphtheria.

GENERAL CORRESPONDENCE.

DR. BAKEWELL AND THE COLONIAL OFFICE.

LETTER FROM DR. R. H. BAKEWELL.

[To the Editor of the Medical Times and Gazette.]

SIR,—In your remarks on the alleged cure of leprosy you have unintentionally done me an injustice, by stating that "I am grieved that my meed of praise and reward have not been greater." I never expected any praise, as the method was not mine, but I was determined it should not be extinguished by official delays and Circumlocution Office red tape. What I am really grieved at is that I cannot get the Colonial Office to pay my little bill! For two months' work in Venezuela, during which time I was forcibly detained in a besieged town, and living under martial law, and for the work of all the reports published in the Parliamentary paper, the Secretary of State has awarded me the magnificent sum of £50. But I can't get it. The Colonial Office has no money, and is obliged to go begging to the colonies to pay this £50. I suppose it will have to be collected, like the money for Dr. Gavin Milroy, by contributions of seventieths from all the tropical colonies.

It is not, therefore, because my reward is no greater, but because I can't get any reward at all, that I am "grieved"—deeply grieved. My little account has been "standing over" now for three years. I am, &c.,

Northgate, Leicester, July 15.

R. H. BAKEWELL.

A RELIC OF BARBARISM.

LETTER FROM MR. HUGH WEIGHTMAN.

[To the Editor of the Medical Times and Gazette.]

SIR,—As a barrister of the Oxford Circuit, present on the occasion of the trial at Oxford of Rachel Busby on the 13th inst. for the murder of her child, you will, I am sure, permit me to impugn the correctness of the report upon which you have based your observations contained in last week's number of your periodical. The case, as reported, I might characterise as simply impossible. But were it possible for a judge so far to forget the law he has to administer, no censure could be too severe. Mr. Justice Lush, however, is not the judge thus to forget himself. But your animadversion is directed rather against the law itself, and here you have been led into error by the reporter.

First, as to the facts. The jury of matrons did not arrive at a verdict without calling to their aid a Medical man. So far from it, they stated their inability to determine the precise point at issue—viz., whether the convicted woman was quick with child—without Medical assistance, which was at once supplied. Unaided, they could only satisfy themselves that the woman was with child, but the point to be decided was whether she was quick.

Secondly, as to the law. In case the woman convicted and sentenced to death pleads her pregnancy in stay of execution, "the judge must direct a jury of twelve matrons or discreet women to inquire the fact; who may, if they please, be assisted by the opinion of a Medical man, who must be examined as a witness in open court (Reg. v. Wycherley, 8 Car and Payne, 262), and if they bring in their verdict *quick with child* (for barely *with child*, unless it be alive in the womb, is not sufficient), execution shall be stayed," etc. (Black. Com., c. 31 of Reprieve and Pardon). In Rachel Busby's case the judge was careful to inform the jury of matrons that a Medical man would assist them in their investigation if they had any doubt upon the subject.

An independent Medical man is usually appointed in such cases in preference to the Surgeon of the gaol, as suggested in your remarks; and such was the case here.

To a legal mind twelve matrons assisted by a Medical man

seem the very fittest tribunal on the point in question. Medical men acting alone have sometimes, even in high quarters, made mistakes, and surely no Medical man could desire that the determination of so grave a question as the life or death of an unborn child should depend upon his single judgment! Would, then, a jury of men be a preferable council to a jury of matrons or discreet women, most of them having had personal practical experience of the various stages of pregnancy?

It is very desirable that the two Professions of law and Medicine should work harmoniously together in all that relates to Medical Jurisprudence, and I am sure, therefore, you will not hesitate to give the same publicity to this explanation as, in the discharge of your duty, you have given to the censure contained under the head of "A Relic of Barbarism."

I am, &c., HUGH WEIGHTMAN,
Barrister-at-Law.

Temple, July 24, 1871.

DR. SANSOM ON CHLORALUM.

LETTER FROM MR. JOHN GAMGEE.

[To the Editor of the Medical Times and Gazette.]

SIR,—Dr. Sansom has himself furnished evidence in my favour. Had it been possible for him to show that, as a commercial article and as a pharmaceutical preparation, as a remedial agent and contagion destroyer, chloride of aluminium had ever been introduced in any country, he would have done so in reply to my letter. I must ask you to reproduce the subjoined paragraph, which only occupies twenty-six lines and two words in the twenty-fourth chapter of Dr. Sansom's work devoted to the antiseptic method in Surgical practice.

In his letter of the 26th ult., Dr. Sansom quotes authorities who had indicated the antiseptic or preservative powers of chloride of aluminium as applied experimentally to dead animal matter; and in my earliest paper on the subject I stated that the fact of the chloride of aluminium having the power of arresting decomposition might not be altogether unknown, and I spoke of its trial by Manchester cloth-dressers.^(a) No one, however, had taken the trouble to study it, and explain how it differed from all other compounds known, and not a single instance is on record in which the salt has ever been employed, prior to my suggestion, in the treatment of sickness or injury.

In his chapter on the antiseptic method in Surgical practice, Dr. Sansom says—"The error, however, must not be committed of regarding it as a novel antiseptic application." I beg to state that if there be any merit in the introduction of new agents in therapeutics, Dr. Sansom wronged me and misled his readers. I have yet to learn that anyone before me ever foresaw the many applications which in twelve months have led to a great demand for chloralum, a demand which in all probability will shortly exceed that of all other antiseptics and disinfectants in the market.

When Mr. Lund's statement on the irritating nature of chloralum appeared in the *British Medical Journal*, I wrote to him, and in a letter I had from him on November 19, the substance of which was communicated to the same journal, the following words occur:—"I am glad to say that my general impression as to the advantages to be derived in Surgical practice from the use of the chloride of aluminium is very favourable. . . . In the fetor of open cancer it is first-rate. It has itself no smell, and it does more completely and readily destroy the wretched stench which cancerous patients have to undergo, and which, I believe, helps to damage the health by loss of appetite and personal comfort." I then learned that the irritation produced in the case reported had been due to an impure solution of chloride of aluminium confined closely under a guttapercha covering. Surgeons are using chloralum very extensively, and Mr. Spencer Wells assured me recently that he scarcely passes a day without using or prescribing it.

I shall not trespass too long on your space, and whilst gladly believing that Dr. Sansom erred from want of evidence (which I think he would have found abundantly luxuriant had he searched for it where it could be found), I expect in him henceforth what he professes in his preface—the embodiment, not of a simple advocate of carbolic acid, but of an inquirer in the broadest acceptance of the term. I assert that, had Dr. Sansom chosen to give a complete statement of what has been learned respecting the action of the chloride of aluminium, he might have reproduced several records of great interest from the Medical journals since last August, and I could have sup-

(a) Vide *Lancet*, August 29, 1870.

plied him with facts which he could ill have crammed into twenty-six pages of his work instead of twenty-six lines.

London, July 5. I am, &c., JOHN GAMGEE.

EXTRACT FROM DR. SANSOM'S "THE ANTISEPTIC SYSTEM,"
PAGE 258.

"Chloride of Aluminium.—This agent has been more recently advocated by Mr. John Gamgee, and has been introduced into commerce under the name of chloralum. The error, however, must not be committed of regarding it as a novel antiseptic application. It has been long known, and many experiments have been made with it both in this country and in France. A reference to the table recorded by Dr. Angus Smith will show that this agent is far from occupying the highest place under those circumstances of albuminous material in a moist state which obtain in wounds. Mr. Gamgee has, however, shown that chloride of aluminium is very soluble and manageable, and it has the advantage of being free from all poisonous property. Its power is very manifest in preventing the ill odour of putrescent material; moreover, its expense is small. It is a powerful astringent. This quality, though valuable in cases wherein hæmorrhage is to be dreaded, is not an unmixed good, for an agent which so strongly contracts the capillaries is scarcely *prima facie* likely to promote rapid union of lacerated parts. Mr. Lund, of Manchester, found that a solution of chloride of aluminium of a specific gravity of 1020 was irritating to the sound skin, unless the disengaged vapour had free exit. In a case of bruise of the arm he used it according to antiseptic principles, but extensive sloughing took place, and it had to be discontinued. The position of this salt as a Surgical antiseptic must be considered as yet *sub judice*."

REPORTS OF SOCIETIES.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

TUESDAY, JUNE 27.

MR. CURLING, F.R.C.S., President, in the Chair.

THE Report from the Committee appointed to examine Mr. Hutchinson's cases of Vaccino-Syphilis was read.

A paper by Dr. WILLIAM OGLE was read, "On Dextral Pre-eminence." 1. After a very brief account of the chief explanations which have been given of right-handedness, the author advances numerous arguments against the most generally accepted doctrine that it is based on conventional agreement, enforced by educational influence, and has no natural foundation in our physical conformation. Of these arguments the following are the chief:—The preferential use of one side is not limited to the arm, but extends to the leg, which is not subjected to education as the arm. The tendency to use one side preferentially manifests itself before education begins, and often persists in spite of the efforts made to overcome it. Left-handedness resembles many physical malformations in being hereditary, in running in families, and in attaching itself rather to the male sex than to the female. Statistics are given of its relative frequency in the two sexes. Men are not the only animals with a tendency to use one side preferentially. The author gives an account of his observations in this matter on monkeys and on parrots. 2. Having shown that there must be some one or other structural foundation for right-handedness, the author next considers what this may be. He shows that in right-handed persons the left hemisphere is proved to be pre-eminent over the right by its lodging the faculties concerned in speech, etc.; and that in left-handed persons the right hemisphere has a similar superiority. This latter statement, the probability of which was suggested by the author several years ago (*St. George's Hospital Reports*, vol. ii., 1867), is supported by three cases of aphasia in left-handed persons, accompanied by left hemiplegia, which the author has himself seen, and a fourth recorded by Dr. Jackson. So that right- and left-handedness would seem doubtless to depend on a natural predominance of the left and of the right hemispheres respectively. 3. Inquiry is then made whether any structural differences between the two hemispheres can be detected; and it is shown that while the left is the more complex in right-handed persons, the contrary is the case in left-handed individuals. This latter statement is based on the examination of the brain in two left-handed subjects. The specimens were

exhibited, and also tracings of them by Dr. Broadbent. 4. Finally, the question is considered—What is the cause of the greater development, as a rule, of the left hemisphere? It is argued that it depends probably on the left hemisphere receiving a freer supply of blood than the right one. The results of the author's observations as to the relative sizes of the arteries on the two sides of the neck are given; from which it appears that the left arteries are, as a rule, slightly larger than the right ones. It is also shown that, independently of the size of the vessels, the stream of blood is less hindered on the left side than on the right. Lastly, it is shown that this explanation is consistent with, and corroborated by, the peculiarities of the cerebral blood-supply in those other animals which, like man, manifest a tendency to use one side preferentially to the other—such as parrots.

Mr. SAVORY, in expressing his admiration of the very able paper presented to the Society by Dr. Ogle, said that he must also express surprise that the question of dextral pre-eminence had been treated with reference to the extremities only. We found a corresponding departure from symmetry in every part of the body. Every microscopist knew that he had a favourite eye; and it was always more easy to wink with one eyelid than with the other. The septum nasi was not in the median line; and the power of smell of the larger nostril was superior to that of the other. Mastication, without any reference to decayed or painful teeth, was performed usually on only one side of the mouth. Every nursing woman suckled her child more at one breast than at the other; and almost everyone slept constantly upon the same side. With regard to the complexity of the cerebral structure, he should have liked to hear something about the ganglia at the base of the brain, the so-called sensory ganglia, as well as about the hemispheres; although he admitted the great difficulty of such an investigation. In respect of the blood-supply, he thought that the general teaching of physiology was opposed to considering this as a cause of growth, and led us to regard it rather as an effect of nutrition. The well-known transplantation of a cock's spur, by Hunter, as well as the periodical activity of certain organs, seemed to point in this direction.

Dr. CHARLTON BASTIAN, like Mr. Savory, felt doubtful of the correctness of Dr. Ogle's suggestion that greater blood-supply might be a cause of increased growth. With regard to the general question, he thought the view taken about the reason of dextral pre-eminence would depend upon whether we regarded man as the result of a single creative act, or of a complex process of evolution. He had lately made a post-mortem examination of the head of a man who had in his lifetime been remarkable for great intellectual power, and who had been from childhood blind of the right eye. In that case there was a very remarkable excess of size of the right over the left hemisphere, the former measuring longitudinally, over the vertex, five-eighths of an inch more than the latter. Four or five years ago he had made and published a series of observations on the specific gravity of the brain-substance, and had satisfied himself that the grey matter of the left hemisphere was specifically heavier than that of the right. For this he was at the time unable to suggest any explanation; but now, coupling it with the fact that the grey matter of the posterior lobes is specifically heavier than that of the anterior lobes, on account of the greater admixture of white communicating tissue in the former, he thought that the greater weight of the grey matter of the left hemisphere might also possibly be due to the larger proportion of communicating fibres required by its greater complexity of structure and greater functional activity.

Mr. BRUDENELL CARTER suggested that examinations of the brains of adults who had undergone amputation of an upper extremity in early life might throw important light upon the question.

The PRESIDENT, on account of the lateness of the hour, and of the number of papers still to be read, then stopped the discussion, and called upon Dr. Ogle to reply.

Dr. OGLE, after thanking the Society for the reception accorded to his paper, said that he had not been unmindful of the desirableness of investigating the condition of the sensory ganglia, but that the difficulties in the way of doing so had as yet been too considerable to be overcome. As regarded the question of blood-supply, he had plainly stated in his paper that it might be either a cause or a consequence of increased growth, and he thought the balance of evidence was in favour of the former supposition. In very young rabbits, after section of the vaso-motor nerve in the neck, he had observed hypertrophy of the ear on the side operated upon, attended, in some instances, by increased growth of hair. He acknowledged the importance of Dr. Bastian's observations about the different

specific gravities of different parts of the brain, and thought that these observations told in favour of his argument.

A paper was read by Mr. W. SPENCER WATSON, "On the Indications for Operative Treatment, and on a New Operation, 'Keratomy,' after Severe Injuries of the Eyeball;" with cases. In the case of penetrating wounds, the occurrence of glaucomatous symptoms is shown to be the most urgent indication for operative treatment—viz., either linear extraction, or iridectomy. At a later stage, after the subsidence of the acute symptoms, iridectomy may be required, or the removal of the cataract indicated, and these operations are most likely to be successful when all signs of active congestion have disappeared. Cases in illustration are given. The prospect of the complication of sympathetic ophthalmia is always possible when the stage of congestion, with pain and photophobia, is much prolonged, and whenever a foreign body is left in the injured eye. Under these circumstances, the removal of the injured eye is sometimes necessary; but if constitutional treatment can be properly carried out, the removal of the injured eye may be postponed or altogether averted. A case in illustration is here given. In traumatic and idiopathic cases of suppurative ophthalmitis the operation of keratomy is proposed, and in one case has been performed successfully by the author. Its object is to establish a fistulous opening in the cornea, through which the morbid products of the inflammation may escape freely, until such a time has elapsed that the tissues may have recovered. It is suggested that in some cases of threatened suppurative ophthalmitis, keratomy might prevent the anticipated mischief.

Dr. FREDERICK BARHAM NUNNELEY read a paper on "The Modifications produced on the Temperature of the Body by the Local Application of Cold and Heat." Experiments, detailed in the paper, have yielded the following results:—1. That immersion of one extremity in iced water did not cause any alteration in the temperature of the other extremities or the body generally, unless the subject of experiment was in a state of more or less nervous exhaustion, or there was decided coolness of the surrounding air, when a fall of temperature occurred. 2. That a slight rise of temperature in the body generally, and a more considerable one in the extremities, followed immersion of a hand or foot in water hotter than the blood, amounting under the tongue to about 1° Fahr., and in the extremities from 1° to 3° Fahr., above the normal standard. 3. And that if at this time any one of the extremities was put into cold water, a fall of temperature below the normal, slightly marked in the body generally, and much more so in the extremities, very shortly commenced. If the hand or foot was now withdrawn from the water, reaction became established, and the natural temperature was slowly attained. Such results would appear to show that, for cold to act locally, a disturbance of the conditions which maintain the normal balance of temperature is necessary first of all—such as is caused by undue heat; and suggest the idea that these variations of temperature may be regarded, in many respects, as parallel to those attending a slight rigor, and that they are not always the result of reflex agency.

A paper by Mr. FRANCIS MASON was read, "On a Simple Method of Removing Silver Wire when employed in Cases of Ununited Fracture." The object of the paper is to describe a plan of fastening the broken fragments with a needle and a loop of wire so arranged that in withdrawing the needle the loop of wire is released, and thus may be removed without pain to the patient and without injuring the bone or soft parts.

At the conclusion of the meeting, the PRESIDENT drew the attention of the Fellows to the change in the times of assembling which had been adopted at the last annual meeting, and which would commence with the next session—namely, that the first meeting of the Society would be on the second Tuesday in October instead of in November. He further mentioned that, to allow of the alterations connected with the Society's meeting-room being previously carried out, the library would be closed during the months of August and September.

SICK AND WOUNDED IN THE GERMAN ARMIES.—The *Volkstaat* observes "that there is an unwillingness in influential circles to allow the full extent of the German losses in the late war to transpire. The Central Bureau of Information in Berlin has just published a report, showing that the institution has, within the space of twelve months, authenticated 663,000 sick and wounded cases, and that of these only 78,000 belonged to the French, the remaining 585,000 to the German army. These frightful figures, which besides make no claim to completeness, are, according to this, far below the truth."

LEGAL INTELLIGENCE.

RIGHTS OF A CHILD "EN VENTRE SA MÈRE."

A SOMEWHAT curious case, under what is known as Lord Campbell's Act, has just been decided by the Court of Admiralty. The ship *George and Richard* was damaged in a collision with a ship called the *Eleutheria*, and Philip Noyes, one of the crew of the former ship, was killed. His widow proceeded against the *Eleutheria* under Lord Campbell's Act, and claimed damages in respect of a child with which she was then pregnant. It was held by Sir R. Phillimore that the child was entitled to recover for the loss sustained of its father, although the damages could not be actually assessed till the child was born. The maxim, not only of the English, but also of the Roman law, that a child *en ventre sa mère* is to be considered as actually born if any question arises for its benefit, has been amply confirmed of late years by Lord Westbury as Lord Chancellor, in the case of *Blasson v. Blasson* (11 L. J. Rep., N. S., p. 353), but this fiction of law, which treats an unborn child as actually born, applies only for the purpose of enabling such child to take a benefit to which it would have been entitled if actually born; but whether compensation for the loss of a father can be looked upon as a benefit is a nice question that a court of appeal may yet have to decide. In the case decided by Sir R. Phillimore the action of the Court was suspended till the birth occurred, as, if the child were still-born, the claim would, of course, prove abortive.

OBITUARY.

RICHARD WHITFIELD HEWLETT,
M.D. AND M.S. LOND., etc.

WE deeply regret having to announce the death of this accomplished and promising Physician at Naples, on the 21st inst., from typhoid fever. The son of the highly valued and well-known Surgeon to Harrow School, and nephew to the not less well-known and trusted Apothecary to St. Thomas's Hospital, Richard Whitfield Hewlett naturally chose to enter the Medical Profession, and as naturally brought to its study and practice habits of the most untiring and persevering industry, and a love of hard, orderly, genuine work, while he impressed everyone by his thoroughness, straightforwardness, and high-principled integrity of character. Educated at Harrow School, at King's College, London, and at Vienna, he gained prizes and honours innumerable. At King's College Hospital he filled most, if not all, of the junior Hospital appointments, such as those of Junior and Senior House-Physician, and the like; and in taking the degrees of Bachelor of Medicine, Doctor of Medicine, and Master of Surgery in the University of London, he appeared amongst the most distinguished of the "honour-men." When he had no more victories to win in this way, he settled down at Harrow, joining his father in practice in that place; and to his perseverance and energy Harrow was indebted chiefly for the establishment of a most useful and successful Cottage Hospital. After a few years' residence at Harrow, however, he was tempted to give up general practice, and to woo fortune as resident Physician at Naples, where he settled two or three years ago. He held the appointment of Physician to the English and American Hospital there, and seemed in a fair way to obtain the success that his talents, acquirements, and industry so fully entitled him to hope for, when, alas! like so many of our promising young brethren, he fell a victim to one of the diseases he had devoted his life to combat. Exhausted by ministering to the wife and some of the children of a Medical friend through their fatal illness, he somehow caught typhoid fever, and, after having struggled through the worst period of the disease, and apparently entered safely that of convalescence, he somewhat suddenly died, on the 21st of this month. He was only about 32 or 33 years of age, and has left a widow and infant daughter to mourn, with many others, the loss of so sterling a character, and the sudden and early closing of so distinguished a career.

HERBERT ERASMUS MILES, M.D.,

SURGEON of the Royal Artillery, died on June 16, at Colaba, Bombay, aged 38. He entered the service in December, 1854, and became Surgeon in November, 1867. He served on the Medical staff during the Crimean War in 1855—medal, with

clasp, for Sebastopol, and Turkish medal; served with the 83rd Regiment in the Indian campaign of 1857-58; was present at the attack on Nimbekeira; was severely wounded during the defence of the fortified Square of Neemuch, in November, 1857, although suffering from a gunshot wound. He served in Medical charge of the detachment 83rd Regiment, and wing of the 12th Native Infantry; was present during the field operations against Arvah, and subsequent destruction of the adjacent strongholds; served in Medical charge of the 83rd Regiment prior to, and was present during, the siege operations against Kotah, and its capture by assault—medal with clasp. He also served in Medical charge of troops in the Persian Gulf during the war in 1856—medal with clasp.

THOMAS C. BRADY, M.R.C.S.,

LATE Surgeon 8th Regiment, died on July 12, at Geneva, where he had been residing for the benefit of his health. He entered the service in May, 1852; became Surgeon, September, 1860; was placed on temporary half-pay in 1868. He served on the Medical staff and in the 57th Regiment from May, 1854, to December, 1865, including the battles of Balaklava and Inkerman, siege and fall of Sebastopol, attack of the Redan on June 18 (honourably mentioned in despatches), and expedition of Kinburn—medal with clasps. Knight of the Legion of Honour, and Turkish medal.

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—At an extraordinary meeting of the College on Monday, the 24th inst., the following gentleman was duly admitted a Member of the College:—

Yeo, J. Burney, M.B. Lond., 60, St. James's-street, S.W.; and the following gentlemen, having duly conformed to the by-laws and regulations, and passed the required examinations, were granted Licences to practise Physic, including therein the practice of Medicine, Surgery, and Midwifery:—

Bayley, Robert Luther, M.D., 86, High-street, Stourbridge.
Cottle, Ernest Wyndham, B.A. Oxon., M.R.C.S., Southampton.
Curling, William, 86, Guildford-street, Russell-square, W.C.
Deeping, George Davidson, Castle-terrace, Newark.
Ellis, William Hodgson, M.B. Toronto, Toronto.
Ewart, John Henry, M.R.C.S., Gipsy-hill, S.E.
Goddard, Eugene, M.R.C.S., 27, Pentonville-road, N.
Lewis, Lewis, M.R.C.S., 3, Argyll-square, W.C.
Lycett, John Allan, M.R.C.S., Middlesex Hospital, W.
Moore, Edward William, M.R.C.S., Grove-park, Chiswick, W.
Noakes, Samuel Silverthorne, M.R.C.S., Charing-cross Hospital, W.C.
Parrott, Edward John, M.R.C.S., Buckland, near Tring.
Power, Thomas, 72, Stepney-green, E.
Ransom, Frederick Parlett Fisher, King's College Hospital, W.C.
Strafford, Thomas, M.R.C.S., Ripley, Derby.
Waller, Walter Augustus Ewen, M.R.C.S., Guy's Hospital, S.E.
Waterhouse, Frederick, M.R.C.S., Pontypridd.
Yarrow, George Eugene, M.D. Heidel., M.R.C.S., 87, Old-street, E.C.

The following candidates, having passed in Medicine and Midwifery, will receive the College Licence on their obtaining Qualifications in Surgery recognised by the College:—

Coltart, William Wilson, St. George's Hospital, S.W.
Duke, Douglas William, 3, Belvedere-place, Upper Norwood, S.E.

APOTHECARIES' HALL.—The following gentlemen passed their Examination in the Science and Practice of Medicine, and received Certificates to practise, on Thursday, July 20, 1871:—

Aikin, Charles Edmund, 7, Clifton-place, W.
Baldock, Alfred, Charterhouse-square.
Biggs, Moses George, Welford, Northamptonshire.
Bryan, Francis Chas., Delamere-crescent.
Fosbroke, George Haynes, Bidford, Redditch.
Furner, Willoughby, King's-road, Brighton.
Harris, Michael, Hackney.
Tombs, George Augustus, Cirencester.

Asan Assistant in Compounding and Dispensing Medicines:—
Bradley, John, Bingley, Yorkshire.

The following gentlemen also on the same day passed their first Professional examination:—

Basson, George, University College.
Brodrigg, Charles Aikin, St. Mary's Hospital.
Brodrigg, Francis Benjamin, St. Bartholomew's Hospital.
Brumwell, James Parker, Guy's Hospital.
Carey, Richard John, University College.
Davis, George Augustus, University College.
Lawton, Herbert Alfred, St. Thomas's Hospital.
Morgan, William Lewis, London Hospital.
Moxon, John, King's College.
Shapley, Harry Tom, London Hospital.
Webber, William Littleton, St. Bartholomew's Hospital.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—ARTS EXAMINATIONS.—At the last preliminary examination for the diplomas of Fellowship and Membership of the Royal College of Surgeons, which was conducted by the College of Preceptors, when 313 candidates presented themselves—viz., 82 for the first-named distinction and 231 for the latter—for the Membership 98 passed, including 7 who failed to reach sufficient marks for the Fellowship, and 133 were rejected. Of the 82 for the Fellowship, 48 passed, and 9 for Membership, 15 to be re-examined, and 10 failed. Thus, out of the total number of candidates—viz., 313—there were 100 who passed for Membership and 55 for the Fellowship of the College; there are 15 who will have to be re-examined in some subjects, having previously passed examinations for Membership; and 143 were altogether rejected. The following gentlemen are reported to have passed for the Fellowship, viz. :—

Alsop, T. O. F.	Fisher, S. H.	Pendleton, H. N.
Baker, H. M.	Giles, B. F.	Phelps, P.
Boase, W. F. F.	Graham, J. T.	Phelps, W.
Boswell, A.	Green, H.	Pickering, C. F.
Boyd, J. S. N.	Guppy, H. B.	Poynder, G. F.
Briggs, W. H.	Halcy, W. C.	Scully, J.
Bubb, B.	Hovell, T. M.	Smith, T.
Bull, W. H.	Johns, W. S.	Stericker, W.
Cant, W. E.	Kellie, G. T.	Stephenson, W. A.
Chambers, E.	Kempe, J. A.	Stewart, F. G.
Collenette, F. de B.	Kirby, S. J. J.	Stocker, C. J. W.
Collyns, R. T. P.	Leftwick, R. W.	Tate, A. L.
Currie, C. A.	Mackenzie, L.	White, W. H.
Davies, T.	Musgrave, R. P.	Wilkins, R. B.
De Gruyther, E. J.	Newby, C. H.	Woodcock, R. F.
Evans, T. D. F.	Norman, A. S.	Young, A. S. W.

To the above list are to be added the following gentlemen who entered for the Membership examination, and reached the standard required for the Fellowship, viz. :—

Allen, J. W.	Ellam, C. J.	Vernon, M. H. H.
Blackley, W. P.	Fellowes, H. T. A. B.	Walker, W. H.
Cotterill, J. M.		

The following passed for Membership, viz. :—

Allinson, H. C.	Greensill, J.	Norman, W.
Angelo, H. A.	Guppy, W. G.	Palmer, F. C.
Angove, W. T.	Hall, C. R.	Parker, A. F.
Archer, R. K.	Harding, R.	Pettigrew, A. J. W.
Astley, C. J. D.	Harvey, F. G.	Rawes, G. B.
Barnes, J. J. F.	Hay, W. A.	Reid, R. C.
Bately, R. G.	Hector, S. O.	Rowbotham, A. J.
Beddoes, C. C.	Heubeck, F. E.	Russell, A. P.
Bickers, J. U.	Hodgson, W.	Ryley, J.
Birch, De B.	Holwell, E. B.	Scallon, E. O.
Bond, J. W.	Hornsby, G. H.	Sherwell, L. E. H.
Boys, A. H.	Innes, H. J. D.	Sincock, J. B.
Cane, H.	Jackson, G. H.	Smart, A.
Capon, H. J.	James, H. W.	Smyth, F. S.
Carcenac, E.	James, W. C.	Speed, H. A.
Carroll, J.	Johnson, T.	Stamp, W. D.
Carter, F.	Latham, F. J.	Tailer, G. A.
Clippingdale, S. D.	Latham, G.	Taylor, D. P. H.
Cock, W.	Lawton, J. W.	Thompson, A. H.
Cree, P.	Leslie, G. H.	Thompson, H. Y.
Cross, H. E. F.	McCarthy, J. M.	Tidy, H.
Da Costa, E. R.	Maggs, W. A.	Todd, H.
Danberry, C. A.	Mark, H. R.	Toll, J. T.
Davey, W. T.	Marsh, O. E. B.	Tonks, J.
Davies, J.	Marsh, W. G. H. B.	Tuke, G. M.
Diggle, C. F.	Maylard, A. E.	Underhill, G.
Douglas, A. L.	Miller, H. E. F. G.	Walcott, R. C. S.
Edmunds, R.	Miskelly, W. J.	Walker, G. A.
Evans, W. M.	Mitchell, W. F.	Whitby, E. V.
Ewen, H. W.	Mogg, J. W. O.	Whitley, F. G. H.
Fisher, F. B.	Morgan, E. S.	Williams, A. G.
Friend, H. E.	Moses, J. G.	Williams, E. L.
Frobisher, W. M.	Nicholls, W. C.	Wilson, A. H.
Grayling, J. F.		

The next examination in Arts will take place in December.

The following gentlemen, having undergone the necessary examinations for the diploma, were admitted Members of the College at a meeting of the Court of Examiners on the 25th inst., viz. :—

Barrow, Frank Edward, Woolwich-common, of Guy's Hospital.
 Brabant, Thomas Hughes, Chippenham, of St. George's Hospital.
 Bryan, Francis Charles, L.S.A., Northampton, of St. Mary's Hospital.
 Canton, Frederick, Great Marlborough-street, of St. George's Hospital.
 Clarke, Frederick Howard, L.S.A., Devonport, of Guy's Hospital.
 Conolly, Stephen Fullom, Kilburn, N.W., of the Charing-cross Hospital.
 Curling, William, L.R.C.P. Lond., Ramsgate, of the London Hospital.
 Domville, Edward James, Exeter, of Guy's Hospital.
 Eardley-Wilmot, Robert, Chandos-street, W., of King's College.
 Edginton, Robert William, Stow-on-the-Wold, of the Birmingham School.
 Edis, John Butler, Peterborough, of the London Hospital.
 Fitt, Samuel Weekes, L.R.C.P. Edin., Trinidad, West Indies, of King's College.
 Hannay, Robert Strickland, Belfast, of the Dublin School.
 Heygate, William Harris, L.S.A., West Haddon, Northamptonshire, of University College.
 Holden, Alfred Fletcher, Cape of Good Hope, of University College.
 Hopkins, Frederick Fraser, Henley-in-Arden, of the Birmingham School.
 Hughes, Evan Thomas, L.R.C.P. Edin., and L.S.A. Lond., Tanyrallt, Anglesea, of the Glasgow School.

Hughes, Hugh Robert Greig, Bangor, North Wales, of the Edinburgh School.
 Hutson, Charles, Barbadoes, of St. Bartholomew's Hospital.
 Johnson, Charles Hargitt, L.S.A., Hull, of Guy's Hospital.
 Kiddle, John Nelson, Adelaide-road, N.W., of Guy's Hospital.
 Lammiman, Cleland, Commercial-road East, of St. Bartholomew's Hospital.
 Ledyard, William Edward, M.B. Toronto, Toronto, Canada, of St. Thomas's Hospital.
 Lyons, Isidor Isaac, L.R.C.P. & L.M. Edin., and L.S.A. Lond., Alexandra-road, St. John's-wood, of St. Bartholomew's Hospital.
 M'Donald, Wallis, L.R.C.P. Edin., Teignmouth, Devon, of St. George's Hospital.
 Smith, Gilbert, B.A. Dub., Blackrock, co. Dublin, of the Dublin School.
 Southey, Henry Edward, L.S.A., Ely, Cambridgeshire, of Guy's Hospital.
 Spencer, Francis Henry, L.S.A., Chippenham, of King's College.
 Thompson, Joseph, L.R.C.P. Edin., Kirkby Stephen, Westmoreland, of the Glasgow School.
 Thurland, Francis Edward, Thurstaston, Cheshire, of St. Bartholomew's Hospital.
 Walter, Clement Cuthbert, Dover, of St. George's Hospital.
 Watson, William George, L.S.A., Sydney, Australia, of University College.
 Willecocks, Isaac, L.S.A., West Looe, Cornwall, of St. Bartholomew's Hospital.
 Williams, Edward, L.S.A., Aberbank, Llandyssil, of University College.
 Wybrants, Robert Bath, L.K. & Q.C.P. Ireland, Shepton Mallett, of the Dublin School.
 Younger, Edward George, L.S.A., Blackheath-hill, of Guy's Hospital.

APPOINTMENTS.

* * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

CATON, RICHARD, M.D. Edin.—Demonstrator of Practical Physiology and Histology in the Liverpool Royal Infirmary School of Medicine.
 GARRINGTON, ARTHUR M., M.D., M.R.C.S. Eng.—Surgeon to the Borough Gaol of Portsmouth.
 HARRIS, MICHAEL, M.R.C.S., M.B. Mass.—House-Surgeon to the Evelina Hospital.
 NEWTON, R. CLARK, M.R.C.S.E., L.M., and C.M.—Visiting Surgeon for the out department of the Lying-in Hospital, Newcastle-on-Tyne.
 ROGERS, MR. ROBERT.—Dispenser at the Plymouth Public Dispensary.
 WATTIE, C. LINDSAY, M.B., C.M.—Resident Assistant Medical Officer to the Hospital Ship for Seamen, Cardiff.

MILITARY APPOINTMENTS.

BREVET.—Surgeon-Major Joseph Fayrer, M.D., C.S.I., Bengal Medical Department, to be Honorary Physician to the Queen, *vice* Campbell Mackinnon, M.D., C.B., late Inspector-General of Hospitals, Bengal Medical Department, deceased.

BIRTHS.

ADCOCK.—On July 24, at Sandgate, Kent, the wife of John Adcock, M.D., Army Medical Staff, of twins, son and daughter.
 EASTON.—On July 23, at 20, Connaught-terrace, Hyde-park, the wife of John Easton, M.D., of a daughter.
 HOOPER.—On July 21, at 67, High-street, Wandsworth, the wife of Dr. J. Harward Hooper, of a daughter.
 JONES.—On July 17, at Ashbrook-place, Brecon, the wife of Dr. Talfourd Jones, of a daughter.
 RANSOM.—On July 17, at Low Moor, Yorkshire, the wife of W. F. Ransom, L.R.C.P., M.R.C.S. Eng., L.S.A. Lond., of a son (stillborn).
 READ.—On July 18, the wife of Thomas Read, R.C.S.E., Dental Surgeon, 8, Holles-street, Cavendish-square, W., of a son.

MARRIAGES.

CADELL—McCRAE.—On July 20, at the Chapel, Charterhouse, George Cadell, Madras Forest Department, son of William Molle Cadell, Madras Civil Service, to Mary Amelia Morrison, youngest daughter of the late Farquhar McCrae, M.D., formerly of the 6th Dragoons.
 CALICHIOPULO—MACLIMONT.—On July 13, at Corfu, John Villetta Calicchiopulo, Esq., son of the late Sir Altavilla Villetta Calicchiopulo, K.C.M.G., President of the Ionian Legislative Assembly under the British Government, to Anna, widow of Robert MacLimont, M.D., and second daughter of the late Charles Colville Ingate, Esq., Patras, Greece.
 ELLERY—CLARK.—On July 20, at Plympton St. Mary, Devon, R. Ellery, L.R.C.P., M.R.C.S., L.S.A., of Ridgway, Plympton, to Elizabeth Mary, third daughter of James E. Clark, Esq., of Underwood, Plympton, Devon.
 HUTCHISON—MEREDITH.—On July 25, at St. John Baptist, Bathwick, Bath, John Hutchison, Esq., of Doncaster, to Helen T. Meredith, younger daughter of the late Edward Taylor Meredith, M.R.C.S., L.S.A.
 MATTERSON—DARNELL.—On July 20, at St. Edward's Church, Dringhouses, near York, William Key Matterson, Lieutenant 1st Battalion 22nd Regiment, eldest son of W. Matterson, M.D., of York, to Jessie de Mowbray, only daughter of Robert Mowbray Darnell, late 11th Light Dragoons, of Dringhouses, York.
 OAKES—CANE.—On July 25, at the Church of St. Bartholomew, Sydenham, Augustus Henry Oakes, second son of the late Lieut.-Col. R. M. Oakes, 1st Life Guards, to Jane Alice, second daughter of the late William Henry Cane, M.D., of Uxbridge.
 OBBARD—JOSEPH.—On May 17, at Madras, Thomas Obbard, Captain Madras Staff Corps, 2nd Wing Subaltern 17th Regt. M.I., to Hosanna Lily Marion, eldest daughter of Surgeon J. M. Joseph, M.D., L.S.A., 17th Regt. M.I.

ROBERTS—MONTEITH.—On July 22, at the parish church, Beckenham, Henry David, third son of the late Dr. Roberts, of Mitcham, Surrey, to Janet Anderson, daughter of the late John Monteith, of Calcutta.

THOMSON—OMOND.—On July 25, at 43, Charlotte-square, Edinburgh, George Webster Thomson, Free Church, Kirkcaldy, to Mary, daughter of Robert Omond, M.D., F.R.C.S.E.

DEATHS.

BERNARD, SYLPHIA, relict of the late Dr. Bernard, at 2, Alma-terrace, Parker's-piece, Cambridge, on July 9, in her 80th year.

BRADY, Dr. THOMAS, late Surgeon of her Majesty's 8th Regiment, at 14, Rue des Alpes, Geneva, on July 12.

CLARKE, WILLIAM, M.R.C.S., late of Colombo, Ceylon, at Shallowford House, Morton-bridge, Stafford, on July 21, in the 60th year of his age.

KEBBELL, AUGUSTA LOUISA, the second and beloved daughter of William Kebbell, M.D., at 7, Upper Brunswick-place, Brighton, on July 20, aged 15.

LUCAS, JANE POWER, daughter of the late Dr. Philip Bennett Lucas, of Arundel-gardens, Kensington-park, W., on July 23.

MCDERMOTT, JANE ELIZA, widow of the late James Bryan McDermott, at 8, Craven-street, Strand, and eldest daughter of the late David Rees, M.D., on July 23, aged 62.

MILES, Dr. HERBERT CHALMERS, F.S.S., Surgeon Royal Artillery, only surviving son of John Miles, M.D., Eastbourne, at Colaba, Bombay, on June 16, after a short but severe illness.

PRITCHETT, GEORGE W., retired Surgeon, at North-hill House, Plymouth, on July 18, aged 65.

ROSS, WILLIAM HAMILTON BROWN, L.R.C.S. Edin., Surgeon-Major in H.M.'s Forces, lately retired from Bengal Medical Service, at 149, Upper Lewes-road, Brighton, on July 19, aged 55.

SHIRLEY, HENRY JAMES, F.R.C.S., late Surgeon Worcester Militia, and Assistant-Surgeon to H.M. Cavalry Staff, Canterbury and Shorncliffe, at 4, Grove-terrace, Highgate-road, on July 25.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.

BIRMINGHAM AND MIDLAND FREE HOSPITAL FOR SICK CHILDREN.—Resident Medical Officer; must be duly qualified and registered. Applications and testimonials to the "Medical Committee," on or before August 3. Election on August 7.

BIRMINGHAM, PARISH OF.—Dispenser; must be duly registered under the Pharmacy Act, 1868. Applications and testimonials to W. Thompson, 1, sq., at the Parish Offices, Paradise-street, on or before August 14.

BOURNEMOUTH GENERAL DISPENSARY.—Resident Surgeon; must have both Medical and Surgical qualifications and be registered. Applications and testimonials to B. A. Rugg, Esq., for the President of the Dispensary, on or before August 28.

BRADFORD INFIRMARY AND DISPENSARY.—Physician; must be a Graduate in Medicine of the Universities of the United Kingdom, or a Fellow or Member of one of the Colleges of Physicians. Applications and testimonials to Mr. Charles Woodcock, Secretary.

HEREFORD GENERAL INFIRMARY.—Resident House-Surgeon; must be M.R.C.S. and L.S.A. Applications and testimonials to T. Owen Fowler, Esq., Savings Bank, Hereford. Election on August 9.

HOSPITAL FOR SICK CHILDREN, 49, GREAT ORMOND-STREET.—Assistant-Physician; must be a Fellow or Member of the Royal College of Physicians of London. Applications and testimonials to be sent in on or before August 2.

Huddersfield Infirmary.—House-Surgeon; must have both Medical and Surgical qualifications, and be registered. Applications and testimonials to Mr. John Marsden, on or before August 14.

INFIRMARY FOR EPILEPSY AND PARALYSIS, CHARLES-STREET, PORTMAN-SQUARE, W.—Physician; must be a Member or Fellow of the Royal College of Physicians, London. Applications and testimonials to Mr. E. Watherston, Hon. Sec., on or before July 31.

UNIVERSITY OF DURHAM COLLEGE OF MEDICINE, NEWCASTLE-ON-TYNE.—Medical Tutor. Applications and testimonials to Luke Armstrong, Esq., College of Medicine, Newcastle-on-Tyne, on or before August 31. It is particularly requested that no original testimonials be sent.

POOR-LAW MEDICAL SERVICE.

* * The area of each district is stated in acres. The population is computed according to the census of 1861.

RESIGNATIONS.

Bridgwater Union.—Edward Carse has resigned the Middlezoy District; area 6997; population 2317; salary £36.

Briarworth Union.—Dr. J. C. Pritchard has resigned the Second District; area 12,185; population 3494; salary £78.

APPOINTMENTS.

Bridgnorth Union.—John R. Roe, Licentiate in Medicine, Royal Coll. Surgeons Ire., Diploma in Medicine Royal Coll. Phys. Edin., to the Fourth District; and Wm. Thursfield, M.D. Aberdeen, L.R.C.P. Eng., M.R.C.S.E., to the Third District and Workhouse.

Elton Union.—John Brickwell, M.R.C.S., L.S.A., to the Stoke District.

Halifax Union.—Thomas Henry Turney, M.R.C.S. Eng., L.S.A., to the Sowerby District.

Luton Union.—Norman Shanks Kerr, M.D. Glasg., Master of Surgery Glasg., to the Markyate-street District.

Northleach Union.—Richard Jocelyn Swan, M.R.C.S.E., L.M. Dub., to the Second District.

THE Surgeoncy of Chatham Dockyard will shortly become vacant.

THE Parliamentary Report from the Select Committee on Protection of Infant Life was issued on Wednesday.

DR. PALFREY, of Finsbury-square, has been elected Physician of the General Lying-in Hospital, York-road, Lambeth.

No deaths had occurred from fever at Buenos Ayres between June 21 and 27.

THE *Cambrian* arrived at the Cape on the 18th ult., having small-pox on board. Small-pox has broken out in Cape Town.

THE sanitary condition of Paris is satisfactory. The mortality last week was only 859, notwithstanding the heat; and no case of cholera occurred.

THE fashionable Physician of Cairo, Egypt, Thomas Monroe, was a slave, and ran away from his proprietor at Charlestown, South Carolina, twelve years ago.

THE late Deputy Inspector-General of Hospitals, Thomas Mostyn, whose obituary appeared in our issue of July 15, served for an uninterrupted period of forty-seven years, thirty-three of which he was full Surgeon in the 27th Inniskillens.

THE schooner *Example* arrived at Waterford on Friday, from Kingstown, having on board a case of small-pox. Dr. Burkett, on examination, declared the case to be one of the very worst description.

ASIATIC cholera is entering Western Europe through Russia, where, Dr. Zuelzer says, it is fast advancing on the German frontiers. At its present rate of progress it may reach Germany in two or three weeks.

VACCINATION AND SMALL-POX.—The half-yearly vaccination returns ending June 30, presented to the Kidderminster Board of Guardians, showed there were only two cases which had exceeded the time allowed by law, and the vaccination inspector reported that there were no cases of neglect within the district.

ROYAL MEDICAL COLLEGE.—At a meeting of the Council of the Royal Medical Benevolent College, the Rev. Dr. West spoke of the desirability of introducing lay boys, which had hitherto been impossible from want of funds. Mr. Erasmus Wilson offered to erect at his own expense a suitable building for their reception, the estimated cost of which will be £3000.

REGISTER OF VACCINATION.—Richard Vickers, a commercial traveller, was fined 20s. by the Manchester magistrates, on Tuesday, for neglecting to cause his child to be vaccinated. He contended that the non-vaccination of his child had not been demonstrated; but the Bench held that he was liable to be fined, he not having sent the required certificate to the registrar of the district.

At a meeting of the Parliamentary Bill Committee of the British Medical Association, held on Wednesday, July 19, at 37, Soho-square, Mr. Corrance, M.P., attended and explained the scope and purpose of his motion on Poor-law reform, and the following resolutions were unanimously passed:—"1. That this Committee, having heard Mr. Corrance's views on the subject of Medical relief to the poor through the Dispensary system, similar to that carried out in Ireland, provided the distribution of tickets for Medical attendance be restricted to the relieving officers, subject to confirmation by the guardians at their next meeting, is of opinion that his proposed measure will be beneficial to the poor, the ratepayers, and the public. 2. That the Parliamentary Committee, having considered the 'Local Government Bill,' are of opinion that the measure is calculated to add greatly to the facilities for carrying out the various Acts relating to public health, and that they most cordially approve of the Bill. 3. That this Committee, having considered the Lunacy Regulation Bill for Ireland introduced by Sir Dominic Corrigan, fully approve of the terms of the Bill, and that the Secretary be instructed to communicate with Sir Dominic Corrigan, in order to take steps to aid in passing this measure. A sub-committee was appointed to consider the amendments of the Pharmacy Bill, and also to draw up certain regulations which it is considered desirable should be introduced into the Bill."

THE following is the list of officers of the Royal College of Physicians nominated by the Council in the present year:—*Censors*: James Risdon Bennett, M.D.; Sir William Jenner, Bart., M.D.; Francis Sibson, M.D.; William Munk, M.D. *Treasurer*: Frederic John Farre, M.D. *Registrar*: Henry Alfred Pitman, M.D. *Harveian Librarian*: William Munk, M.D. *Member of Council*: Henry Bence Jones, M.D., in place of George Burrows, M.D., now President. *Examiners*:

Anatomy and Physiology—Lionel Smith Beale, M.D., and Frederick William Pavy, M.D.; Chemistry, *Materia Medica*, and Practical Pharmacy—Alfred Baring Garrod, M.D., and Alfred Swaine Taylor, M.D.; Medical Anatomy and the Principles and Practice of Medicine—William Richard Basham, M.D., and Herbert Davies, M.D.; Midwifery and the Diseases peculiar to Women—John Hall Davis, M.D., and John Braxton Hicks, M.D.; Surgical Anatomy and the Principles and Practice of Surgery—William S. Savory, Esq., F.R.C.S., and Campbell De Morgan, Esq., F.R.C.S. *Curators of the Museum*: The President; Frederic John Farre, M.D.; William Wegg, M.D.; Francis Sibson, M.D.; Reginald Southey, M.D. The following is an extract from regulations—"of voting":—"At the meetings held for the election of Censors, Treasurer, Registrar, Members of Council, Members of the College, Examiners, Librarian, or Curators of the Museum, the ballot shall be conducted as follows:—A list containing the name or names of the Fellow or Fellows, or other person or persons nominated to the office or offices to be filled up, shall be sent round to each Fellow of the College, at least one week before the day of election, and each Fellow present shall, at a meeting of the Fellows to be holden by them for that purpose, place in the urn such list, striking out the name or names of any Fellow or Fellows, or other person or persons of whom he disapproves for the office or offices respectively."

PROFESSIONAL EXAMINATIONS.—The following were the questions in Surgery, etc., submitted to the 114 candidates who offered themselves for the diploma of Membership of the Royal College of Surgeons on Friday last, viz.:—1. Mention the articular surfaces of the superior maxillary bone; describe the operation for its removal, and the parts cut through in the operation. 2. Describe the operation of extirpation of the globe of the eye; and state the injuries or diseases which render the operation advisable. 3. Name the parts cut through in the following operations, viz.:—Harelip, umbilical hernia, amputation of the thumb at the carpo-metacarpal joint, and in ligature of the ulnar artery in the middle of the forearm. 4. Enumerate the various kinds of ulcer which occur on the tongue, state the cause and characteristic appearance of each, and write in full prescriptions for their appropriate treatment. 5. Give the Surgical anatomy of the ischio-rectal region, and describe the dissection necessary to display it. 6. Mention the diseases or other conditions which may render laryngotomy or tracheotomy necessary. Describe the mode of performing those operations, and state your reasons for preferring one to the other. The following questions in Medicine were submitted on Saturday, viz.:—1. Mention the duration of the incubation and subsequent stages in small-pox, measles, and scarlet fever, and describe the eruptions in those diseases, and state how you would severally distinguish them from each other. 2. When would you consider a patient who had had small-pox or scarlet fever free from the risk of conveying the disease to others. 3. Mention some of the preparations of iron and lead in the Pharmacopœia, giving the doses and purposes for which they are employed. Write a prescription for a case of hæmoptysis. The next examination for Membership will take place in November.

THE HUNTERIAN MUSEUM.—On Friday last his Imperial Majesty the Emperor of Brazil, accompanied by his Excellency M. de Almeida Areas, the Brazilian Minister, visited the Royal College of Surgeons. He was received by Mr. George Busk, F.R.S., President of the College, and Prof. Flower, F.R.S., the Conservator of the Museum, where he spent upwards of an hour in examining the magnificent collection. His Majesty displayed a remarkable familiarity with the principal subjects illustrated in the Museum, and an acquaintance with recent English scientific literature, showing, by his remarks and the interest he took in various specimens in the collection, that comparative anatomy and zoology are included among the numerous branches of knowledge in which he is well versed. He particularly wished to see the skeleton of the *Ornithorynchus paradoxus* of Bennett and the allied monotreme, the *Echidna*, and placed them side by side to observe their distinguishing characteristics. He was also much interested in the young hippopotamus, in the pathological department; Professor Wilson's dermatological collection and the extensive series of calculi particularly attracted his Majesty's attention. On leaving, he expressed himself as highly gratified with the arrangement of the collection and the facilities it afforded for study. On the same morning he paid an early visit to Dr. Hooker, F.R.S., at Kew, to Professor Owen, F.R.S., at Sheen Lodge, and to Earl Russell, in Richmond-park. In the afternoon, accompanied by the Empress, he met a select party of men eminent

in various branches of science at the house of Mr. W. Spottiswoode, the Treasurer of the Royal Society, the following being among those present:—Lord Houghton, the Dean of Westminster, Professors Ramsay, Stokes, Flower, and Huxley, Sir Philip Egerton, Drs. Hooker, Sharpey, Carpenter, A. Farre, Gull, Sibson, and Gueneau de Mussy, Messrs. Bowman, Lassell, Lockyer, G. Jeffreys, Sylvester, Huggins, Captain Galton, etc. His Majesty appeared much pleased with the opportunity of becoming personally acquainted with men many of whose names had long been familiar to him, and said that he should, on his return to Brazil, follow the course of English scientific investigation with still greater interest than before.

NOTES, QUERIES, AND REPLIES.

He that questioneth much shall learn much.—Bacon.

Dr. Guisan.—Your communication received, with thanks, July 25.

Harriman.—We question if much good could be done at this date—seven years after the occurrence.

Bulbus.—Arbuthnot's life is included in the prefaces of Johnson's "Poets." He was a man of the highest morality and independence.

A Bayswater M.D.—Under the circumstances of the case, we think the patient had clearly placed herself under his care. It would have been only proper for him to have called the following morning, and if no mention had been then made of a fee, a gentle reminder would not have been out of place.

A Rejected One.—There will be an examination in Arts, etc., at the Society of Apothecaries in September next. If you are successful there, you could at once enter on your Professional studies.

Dens Sapientiæ, York.—There will be an examination for the Dental diploma of the College of Surgeons early in the ensuing week. The examinations for the diploma of Membership of the College, for the present session, were brought to a close yesterday (Friday). The examination for the "L.M." will take place on Monday next.

Stapleford, near Nottingham.—We have received a preliminary prospectus of what appears to us to be a most objectionable scheme to "supply medicines of the best quality, added to the most experienced Medical advice in the diseases of the industrial classes resident in the rural districts, full 50 per cent. under the charges usually made by Medical men in private practice." The following somewhat startling announcement is made. Surely Dr. Chambers will scarcely be pleased with the manner in which his name is used. It is certainly a somewhat novel position for a Physician of his eminence in the Profession to be placed in. The italics are our own:—

"Metropolitan Consulting-Physician—Dr. Thomas King Chambers, 64, Brook-street, Grosvenor-square, London, M.D. of Oxford University, Fellow of the Royal College of Physicians, London, Consulting-Physician to St. Mary's and the Lock Hospitals, and Honorary Consulting-Physician to His Royal Highness the Prince of Wales.

"Resident Consulting-Surgeon—Dr. Yelverton Bosquet, Fellow of the Obstetric and Anthropological Societies of London, Member of the British Medical and Surgical Association, Member of the Society of Emulation of Paris for Chemical Science, Member of the Archæological Society of Ireland, and Author of various Essays upon the subject of Civilised Man suffering from Disease.

"Purveyors of Medicines and Medical Appliances—Messrs. Clarke, Bleasdale, Bell, and Tollington, Wholesale Druggists, York.

"Purveyors of Surgical Appliances—Messrs. Maw and Thomson, Loudon.

"N.B.—The above-named Institution is now amalgamated with the London and Provincial Confidential Medical Consultation Agency, instituted for the purpose of providing the highest resources of modern Medical science in those intricate, difficult, and often concealed diseases affecting the blood, the nervous system, and the sexual organism, which hold the most intimate relations with the higher and more sacred aspects of modern male and female social life."

The prospectus proceeds to speak of the advantages which institutions of the kind have afforded to suffering humanity, and states that fifty of them are now in operation; but it does not say where they are situated.

An English Poor-law Guardian.—The Irish Poor-law Medical Association consists of upwards of 1000 members. It held its first annual meeting in the Rotunda, Dublin, on June 5. The objects of the Association are as under. A full report of the meeting may be obtained by application to J. Atkinson and Co., printers, Grafton-street, Dublin:—

"1. That the Medical officers of each union shall elect from amongst their number a union representative.

"2. That the union representatives of each county shall elect from amongst their number a county representative, who shall be in communication with the Parliamentary representatives of that county.

"3. That the county representatives shall invite every member of the Medical Profession in each county to join this Association, their interests (as far as they go) being identical with those of the Poor-law Medical officers.

"4. That, in any union or county in which it may be deemed advisable to do so, any member of this Association, although not being a Poor-law Medical officer, may be elected by ballot to be either the union or county representative.

"5. That the thirty-two county representatives shall form the council of the Association.
 "6. That a meeting shall be held quarterly and alternately in each of the provinces of Ireland.
 "7. That an annual meeting shall be held, when the general president, treasurer, and secretary for the year shall be appointed.
 "8. That the annual subscription for each member shall be 2s. 6d. (There being 1000 Poor-law Medical officers in Ireland, this would produce an income of £125 per annum, which would cover printing, postage, and stationery."

Plymouth.—The Committee of Guardians have addressed a letter to the Poor-law Board in reference to the decrease in the number of their Medical officers and the reduction of their salaries, mentioned in our last issue. The Committee defend themselves on the ground that their alteration of the districts took place because it was considered to be more convenient that each Medical officer's district should be similar in extent to those of the relieving officers, so that there might be one Surgeon to each relieving officer's district. The Committee were of opinion that it was "possible for three gentlemen not much engaged in private practice to perform with efficiency all the duties within such districts." The salaries were equalised, as the districts were about equal. Eight gentlemen, including all the late parochial Medical officers, became candidates for the appointments upon the terms specified. The Committee declare that it is the earnest desire of the guardians to expend the funds intrusted to their charge in a prudent manner, but at the same time it has been their first consideration to provide an adequate and efficient staff of Surgeons to the poor. So the matter at present stands. We shall look for the decision of the Poor-law Board on propositions which we think neither just nor generous.

COMMUNICATIONS have been received from—

Dr. GARRINGTON; Mr. ELLERY; F. T.; Mr. RAWSON; Mr. GRABHAM; H.; Mr. THOMAS DIXON; Dr. STURGES; J. T.; MESSRS. CONDY and Co.; Mr. H. MOODY; Dr. HALBERTSMA, of Utrecht; Mr. J. BYRNE; Dr. CATON; Dr. HANDFIELD JONES; Mr. WEIGHTMAN; Dr. FALCONER; Mr. D. ROBERTS; Mr. J. CHATTO; Mr. H. ARNOTT; Dr. BARNES; Dr. SABDEN; Dr. PHILLIPS; Dr. F. PORTER SMITH; Dr. CHOLMELEY; Mr. T. SPENCER WELLS; Mr. H. MORRIS; Dr. TALFOURD JONES; Mr. BOSANQUET; Dr. E. HEINRICH KISCH.

BOOKS RECEIVED—

Dr. Tripe's Report on the Sanitary State of the Hackney District—The New Sydenham Society's Biennial Retrospect of Medicine and Surgery for 1869-70—Puerperal Temperatures, by Dr. William Squire—Thoughts, Philosophical and Medical, selected from the works of Francis Bacon—The Lisdoonvarna Spas and Seaside Places of Clare, by Dr. E. D. Mapother—Dr. M. H. Henry (New York) on Amputation of Redundant Scrotum in the Treatment of Varicocele—Hospital Statistics: A Suggestion for the Disentanglement of the Financial Perplexities of Hospital Accounts, by Charles Kemble, M.A. (Oxon.)

PERIODICALS AND NEWSPAPERS RECEIVED—

Nature—Bridlington Quay Observer—Pharmaceutical Journal—Western Daily Mercury—The Yorkshire Post—The Overland Ceylon Observer—Mechanics' Magazine—Medical Press and Circular.

APPOINTMENTS FOR THE WEEK.

July 29. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 9½ a.m.; King's, 2 p.m.; Charing-cross, 2 p.m.; Royal Free, 2 p.m.; Hospital for Women, 9½ a.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

31. Monday.

Operations at the Metropolitan Free Hospital, 2 p.m.; St. Mark's Hospital for Diseases of the Rectum, 2 p.m.; St. Peter's Hospital for Stone, 2½ p.m.; Royal London Ophthalmic, 11 a.m.

August 1. Tuesday.

Operations at Guy's, 1½ p.m.; Westminster, 2 p.m.; National Orthopædic, Great Portland-street, 2 p.m.; Royal Free, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

2. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1¼ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew's, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas's, 1½ p.m.; Samaritan, 2.30 p.m.; King's College Hospital (by Mr. Wood), 2 p.m.; Royal London Ophthalmic; 11 a.m.

3. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; Royal Orthopædic, 2 p.m.; West London, 2 p.m.; University College Hospital, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

4. Friday.

Operations at Central London Ophthalmic, 2 p.m.; Royal London Ophthalmic, 11 a.m.; South London Ophthalmic, 2 p.m.

VITAL STATISTICS OF LONDON.

Week ending Saturday, July 22, 1871.

BIRTHS.

Births of Boys, 1075; Girls, 1035; Total, 2110.
 Average of 10 corresponding weeks, 1861-70, 1946.7.

DEATHS.

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29.78 in. The highest was 30.00 in. at noon on Sunday, and the lowest was 29.48 in. at 3 p.m. on Saturday.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871; the numbers for Edinburgh and Glasgow have been furnished by the Registrar-General of Scotland, while those for Dublin are still the estimated numbers recently used.

ORIGINAL LECTURES.

CLINICAL LECTURE

ON INSTANCES OF SUCCESSFUL
TREATMENT OF DEGENERATIVE DISEASE
OF KIDNEYS.

By C. HANDFIELD JONES, M.B. Cantab., F.R.S.

GENTLEMEN,—Among the diseases which claim the care of the Physician, there are few more frequent or more grave than those which concern the kidneys. Bright's disease (or diseases) especially is a foe whom we have every reason to dread, and too often we must admit the fruitlessness of our best efforts at resistance. One cause of our failure is that the cases come to us at too late a period, when secondary disease has become firmly established; and another is that they do not remain under treatment long enough, and are not placed under favourable circumstances for attaining a solid cure. Now and then, however, we have better success, and the study of the means which appear to accomplish the desired end seems to me very instructive. I shall relate to you two such cases:—

Case 1.—E. H., aged 14, girl, admitted July 28, 1865. Has not been well for three years since she had rheumatic fever; had chorea last year; anasarca of legs came on a month ago. Her mother states that she has seven living, all very healthy but her. There is no phthisis in family, and no scarlet fever has occurred for years. Her face looks rosy and well, but her eyelids swell in the morning, and her legs are swelled a good deal when she is up. Breath short on exertion; no cough. Heart's action regular; loud systolic murmur at base; prolonged systolic murmur at apex, and in left side and in left back; heart is not hypertrophied; apex beat is in normal site. Urine is tolerably free, pale; specific gravity 1016; is loaded with albumen; deposits a good deal of white sediment. The sediment consists of casts, mostly granular, of medium size, not numerous; of very numerous altered pus or mucous corpuscles, showing composite nuclei; and of renal epithelial particles, with a few glomeruli.

August 30.—The urinary sediment contained very numerous pus corpuscles, some large homogeneous casts, and crystals resembling those of uric acid.

About a fortnight later the latter were replaced by phosphatic prisms.

October 4.—The urine was loaded with albumen, and the sediment was full of large glomeruli.

18th.—Sediment of same character.

28th.—Urine scantier; specific gravity 1027; loaded with albumen. Both hands puffed; left always most. General condition much as before. Up to this date she had used the following remedies:—Ferri pot. tart. gr. x., liq. potass. ℥xx., aq. ʒjss., ter die; pulv. jalap. co. ʒss., alt. aur., till August 2; then liq. pot. arsenit. ℥iv. ter die till August 12; then ant. pot. tart. gr. ʒ, tinct. calumb. ℥v., aq. ʒss., ter die, vel. 4tis hōris, till September 8, when she began tannini gr. iv., aq. ʒj. ter die. On September 23 she was ordered syr. ferri iodid. ʒj. ter die; and besides, on 30th, a hot-air bath every other night. On October 6, ealomelanos gr. ʒ, o. n., and ant. pot. tart. gr. ʒ, tinct. calumb. ℥x., aq. ʒj., ter die. On October 28 I ordered pot. acetat. gr. xx., ferri acetat. gr. ij., mist. ammon. acetat. ʒj., ter die.

November 15.—Dropsy almost disappeared. The urine was still highly albuminous; specific gravity 1019; deposited but little sediment; the sediment contained a few glomeruli, clusters of oil-drops, no casts, a little renal epithelium.

22nd.—Is free from dropsy. Wishes to leave Hospital. Urine then deposited a pretty copious sediment, consisting of glomeruli and fat-drops, either free, or in cells, or in groups; there was little actual renal epithelium, a few nuclear corpuscular casts, and a very few short fragmentary granular; specific gravity 1020; acid. She was taking, besides the mixture, cod-liver oil dragées, which she had begun September 8.

December 30.—Continues well. Catamenia have appeared, after six months' absence. Urine clear, but slightly albuminous; specific gravity 1012; deposited abundance of uric acid, but no trace of glomeruli.

February 17, 1866.—Came to see me at Hospital. She looked well, and free from any trace of dropsy. Catamenia were present.

23rd.—Doing well until lately, but urine is much more albu-

minous again; specific gravity 1019; deposits a light, flocculent sediment, consisting of epithelial scales, and a few very short and imperfect casts, but no glomeruli.

March 14.—Continues in very fair case; the mitral murmur has quite disappeared.

28th.—Urine pale; specific gravity 1018; contains some albumen, and a very little diffused sediment, which consists mainly of scaly epithelial particles, and flakes of the same, with a very few homogeneous casts of medium width. There is some puffing of the face and feet.

April 11.—Doing well; goes out every day; no dropsy; good colour of face.

26th.—Face gets a little puffed at the time of the catamenia.

May 9.—Is doing well; no dropsy; can walk three miles a day. Urine, specific gravity 1022; palish; contains some albumen, but deposits no casts or renal epithelium, only a good deal of scaly. She has been taking, since April 2, quin. disulph. gr. j., liq. ferri peracetat. ℥xv., acidi acet. dil. ℥xxx., aq. ʒj., ter die.

23rd.—Is not nearly so well; affected by the severe cold easterly winds; has taken cold. Urine is red, as from blood in it, and is turbid; the sediment contains very numerous blood corpuscles, but no casts, or evident renal epithelium; it is much more albuminous than at the last date. To remain in bed. Mist. ammon. acet. ʒj., potass. acet. gr. xx., ter die.

26th.—No better; no dropsy. Urine deposits a very large amount of dark sediment; specific gravity 1011; the deposit shows only a few corpuscles, but a large amount of punctiform pigment matter. Tannini gr. vij., acidi muriat. ℥j., aq. ʒj., quat. die.

June 1.—Urine almost clear, very slightly albuminous; specific gravity 1011; on standing twenty-four hours, it deposits a large amount of crystalline uric acid, with a few corpuscular casts, some of them of rather large size. Appetite bad; stomach sick.

7th.—Doing well. Urine pale; specific gravity 1013; not albuminous; deposits a white sediment, consisting chiefly of scaly epithelium; no casts. Is taking quin. disulph. gr. j., liq. ferri peracet. ℥xv., acid. acet. ℥v., aq. ʒj., ter die.

13th.—Doing well (her nose swells in mornings); this is especially the case some days before the catamenia; has regained appetite.

July 13.—Has just returned from a month's stay at Walton; looks well, but not vigorous. Catamenia regular; her feet do not swell at all, but the eyelids are puffed in mornings. Urine clear, bright; specific gravity 1025; clouds slightly with NO₂.

After this I saw no more of her until May 17, 1871, when I hunted her out, and found her behind a counter in a fancy workshop, in a healthy locality, looking rosy and quite well. Her sister informed me she had "got on so nicely."

May 26, 1867.—At my request her mother called on me, and brought me a bottle of her urine. She stated that her daughter was fairly well, but that a little swelling of her face was noticed occasionally. The catamenia were regular. She ran about, her mother said, actively, and was not put out of breath by exertion more than any person in ordinary good health would be. Urine of full yellow colour; specific gravity 1030; gave with NO₂ a perceptible albuminous cloud; deposited no casts or renal epithelium, but some scaly and some oxalate of lime. After boiling with nitric acid and being left to stand, a distinct albuminous sediment fell down, mingled with numerous masses of uric acid.

Case 2.—J. C., aged 26, carver and gilder, admitted October 25, 1870. Ill one month with distension of abdomen and anasarca of the legs; the last fourteen days the penis and scrotum have been involved. He never had rheumatic fever, and Mr. Wall, who was my House-Surgeon at the time, assures me that the renal disorder was not the sequel of scarlatina. Denies taking spirits. Tongue clammy, red at fore part and puckered, coated at back. Abdomen contains a good deal of fluid, and so do the legs. The heart-sounds are normal. Breath short. Both lower backs are dull, and are the seat of rather small crepitations; higher up the breath-sound is fairly good. Urine, specific gravity 1020; highly albuminous; deposits a white sediment containing casts and some renal corpuscles. The sediment is not in large quantity. The urine amounts to about a pint a day. Broth diet. Liq. ferri peracetatis, ℥x., mist. ammon. acet. ʒss., ter die.

November 8.—Ophthalmoscope does not show anything morbid in the eyes. Urine still highly albuminous; contains a good deal of light deposit, in which I find no casts, only some diffused renal epithelium. His abdomen contains much fluid, and his legs also, but he expresses himself as feeling decidedly better. He has pulv. jalap. co. gr. xl. o. mane, and a hot-air bath every night, with which he perspires freely.

26th.—No trace of anasarca; circumference of abdomen less. Urine deposits a scanty sediment, consisting solely of renal corpuscles; contains a large amount of albumen; specific gravity 1015.

December 6.—Was doing well on 3rd, but yesterday the urine became bloody, and is so to-day. He is remanded to bed, to be dry-cupped on the loins, and to take tinct. uvæ ursi ʒj., tannini gr. iv., inf. pareiræ, ʒj. ter die.

7th.—Urine much more free from blood.

10th.—Urine clear, pale, acid; specific gravity 1008; deposits no sediment; contains apparently less albumen.

21st.—Doing well; up and about; taking the liq. ferri peracetat mixture since 10th. Went out soon after.

January 4, 1871.—Came to Hospital looking well. Urine pale, clear; specific gravity 1010; notably albuminous. Pt. c. mist. oleo morrh.

February 15.—Looks wonderfully well; is able to work; complains that he does not get enough. Urine hazes with NO_3 ; contains a very slight trace of floating matter. Weight 114 lbs.; when he left Hospital was 106 lbs. Still takes the peracetate.

May 13.—Weight 117 lbs. Urine of good colour, clear; no sediment; is quite free from albumen.

In the first of these cases, if not in both, it seems certain that the renal disease was not of an acute kind; not, I mean, an inflammation provoked by scarlet-fever poison or a chill to the cutaneous surface. In E. H. there was a history of three years' previous ill-health, and the disorder had come on gradually. In J. C. this was not so completely ascertained, but I think there is almost no doubt that such was the case.

This is a very important point to establish, for I hold entirely with Dr. Prout that degeneration is carefully to be distinguished from inflammation as a substantially different process. Taking typical instances, we may say that the latter is a violent perturbation of the nutritive actions in a previously healthy organ, which lasts a varying but not long time, and then has a natural tendency to yield and to give place to the normal state; while the former commences latently and quietly, without overt cause, proceeds during a long time in a way of slow increase, and does not attract attention by its secondary effects until grave lesions have been produced in the organs primarily diseased. The two states are no doubt often blended; inflammation may supervene on degeneration, and sometimes this order may be reversed; but, nevertheless, it seems to me certain that the two processes are essentially different, and that this is important from a therapeutic point of view. If I diagnose inflammation as the principal factor of disorder, my therapeutical efforts will be directed chiefly to moderate hyperæmia, and to restore retentive power to attenuated capillaries, and consequently my chief remedies will be bloodletting, purgation, antimony, and astringents. But if I diagnose degeneration as the chief morbid agent, my endeavour will be mainly to improve the general nutrition of the body, and specially that of the kidneys, and I shall think much less of regulating the blood-flow and the state of the vessels. There is about as much difference between typical instances of degeneration and inflammation as there is between phthisis and simple pneumonia. I say this, well knowing, of course, that the late Professor Niemeyer and others have tried to persuade us that in the great majority of cases phthisis is but the result of pneumonia—a view which, however, appears to me to be singularly ill-supported by facts, and to assume that as the rule which is, in fact, the exception. Given a certain *quality* of system, inflammation may no doubt be followed by tubercle, or cheesy deposit, or by various degenerative changes, but, apart from this shaping influence, its products simply tend to liquescence and resorption. Much the same may be said of degeneration and inflammation. The occurrence of the latter may materially promote that of the former, but it is very far from being a necessary antecedent.

Holding these views, I rank, of course, good hygiene very high in the treatment of degeneration, and am much inclined to give it, except in the acute sequelæ, the first place. Dr. Markham recently mentioned to me the case of a man, aged 30, whose urine was highly albuminous, but who recovered completely by a residence in Spain. Dr. G. Johnson speaks of the great and extraordinary benefit which the subjects of renal disease derive from a sea voyage, and that, too, under circumstances apparently the most unfavourable. Dr. Maclaren says "that sea life has wonderful recuperative power; it is the very antithesis of town life in a crowded locality." (*British and Foreign Medical and Chirurgical Review*, 1871, vol. i.) But to too many of our patients such recreatives as sea voyages and fine climates are out of the question, and it is incumbent upon

us to endeavour to supply them with a remedy which may to some considerable extent meet their necessity. The change which ensued in the first case I have narrated was certainly striking, as soon as she began to take the combination of acetates; and as the good effect continued under the use of the iron acetate, I am much inclined to regard that as the most effective agent. In the second case it was given exclusively, and the good results were very remarkable. I think I have seen the same drug useful in other instances, and I am therefore much disposed to recommend it to you. At the same time you will not, I am sure, imagine that I expect it always to prove successful, or always to be the best remedy. Too often I know it will fail altogether, or be advantageously replaced by some other ferruginous preparation. Nevertheless, I quite think, after a pretty extensive trial, that it is one of the best remedies for chronic renal degeneration which we possess.

The degenerative character of the disease in the first case seems to be strongly affirmed by the persistence of some slight traces after the lapse of six years. This would scarcely be the case if the disorder were purely inflammatory, for in these we know the albumen disappears in a few weeks or less from the urine. The length of time during which the improvement has been maintained is very satisfactory; the disorder, in fact, may be said to have been cured. The considerable gain of weight in the second case, backed by the improvement in the general appearance, is good evidence how much the nutrition of the whole body improved under the treatment. In both cases the occurrence of smart attacks of hæmaturia during cold weather, and after the patients had got about, is noteworthy, as also the ready subsidence of these under appropriate measures. You will learn from this to be on your guard against such mishaps in the cases under your care. Though cold is not the only, nor perhaps the most frequent, yet it is undoubtedly a very adequate cause of internal congestions. Lastly, I ask you to observe that both these patients were young—a matter of great moment. Degenerations, as Prout and others since his day have noted, belong especially to advancing age, and the Anno Domini disease (as one of my patients termed it) is sadly refractory to remedies.

ORIGINAL COMMUNICATIONS.

OBSERVATIONS ON OUTBREAKS OF CHOLERA IN SHIPS AT SEA. (a)

By ROBERT LAWSON,
Inspector-General of Hospitals.

At the solicitation of Dr. Milroy I have arranged the memoranda in my possession regarding outbreaks of cholera in ships at sea for submission to this Society. In addition to the interest these narratives excite, some conclusions may be drawn from them of the utmost importance in the present state of epidemiology. In investigating such points we have frequently to deal with slight manifestations of disease, which, in the default of a knowledge of their causation, many attribute to chance; but Nature does nothing by chance, and never presents us with a result, however trivial it may appear, which she has not brought about by the action of a sufficient cause; and no one can succeed in explaining her laws who neglects even the slightest indications she presents of their operation.

Most of those present are aware that I have supported the view that the concurrent action of at least three classes of causes is necessary for the development of epidemics—viz.: (1) General causes, one of which I have indicated, in connexion with fever and cholera, by the term Pandemic Wave; (2) those connected with locality, as distinguished from the persons who reside in it; (3) causes connected with persons, as distinguished from those depending on locality. If the latter classes be fully developed, intense disease may be excited under the influence of the general causes; while, if they be less developed, notwithstanding the operation of the general causes, sporadic cases or small groups only may make their appearance, or the inhabitants of certain localities may escape altogether, while those of others in their vicinity (and often mixed up with them in the most extraordinary manner) may display a large amount of sickness.

When examined for a sufficient length of time, and over an adequate space, the course of Pandemic Waves is found to be

(a) Read before the Epidemiological Society, June 10, 1871.

uniformly from south to north according to a definite law, and their position from year to year can be indicated on a map by lines of equal magnetic dip. This has been done in the map on the wall (b) for January 1 of each consecutive year. These lines, it will be seen, in some places pursue nearly the same direction as the parallels of latitude; in others, as down the western shores of Europe and Africa, they cross the parallels of latitude at considerable angles. The whole system of isoclinals has a motion to the westward, each portion, however, maintaining nearly the same angle with the parallels of latitude as represented on the map. From this it follows that where the isoclinals pursue nearly the same course as the parallels of latitude, they present little change of latitude on any given meridian for a considerable number of years; but where they are more oblique, as on the west coast of Europe and Africa, their motion to the northward, on any meridian, is so rapid that in a few years it becomes sensible, and requires to be allowed for. This change at London is equal to 1 1/4 days per annum in the arrival of the wave, and the same may be employed as far as St. Helena; at the Cape the change amounts to 1 2/3 days per annum. As the isoclinals in the map are their positions in 1840, the corrections named must be applied for the number of years which may have elapsed in any particular case within the limits mentioned. The position of the advancing edge of the wave for any period of the year 1840 may be found by simple proportion from the lines on the map, and this must be corrected in the manner indicated for subsequent years.

It is obvious that if there be a series of waves proceeding from south to north which can influence the frequency of cholera in communities otherwise favourably circumstanced for its manifestation, we should find from time to time that ships passing in the opposite direction experienced one or more outbreaks of cholera in the positions where they run into these

waves, and that there should be intervals between them, of greater or less extent, comparatively free from the disease; the same should be experienced when they go from south to north, provided only they proceed more rapidly than the wave; while, if their course be nearly east or west, they may continue from commencement to end of voyage in the same waves. Having premised these explanations, the details of various outbreaks may now be given, and it will be seen how far they support this view.

The first case to which I have to draw your attention is that of H.M.'s ship *Apollo*, which carried the 59th Regiment from Cork to Hong-Kong in 1849. The first account of the occurrences in this ship to which I had access was that by Dr. Bryson, late Director-General of the Naval Medical Department, in a small volume "On the Infectious Origin and Propagation of Cholera," published in 1851. I have recently been so fortunate as to meet the Medical officer who was in charge of the troops in the *Apollo*—Dr. Fraser, 10th Hussars—and have been favoured with the perusal of his journal and reports, which afford many details not given in Dr. Bryson's account.

The *Apollo* was a frigate-built ship, having beneath the upper or weather deck a gun deck with ports on each side, and below this the orlop, which had small side scuttles, which could be opened in fine weather only. The gun-deck was occupied by the officers abaft, and by the crew on the starboard side forward, and a portion of the troops on the port side; the remainder were on the orlop. The latter, of course, could not be so efficiently ventilated as the former. The troops, including women and children, amounting to 593 persons, embarked on June 12, and the ship sailed on the 17th. Cholera had prevailed in Cork and its vicinity previous to the troops going on board, but there had been none in the ship herself up to this time. Subsequently the course of the disease was as follows:—

Date, 1849.	Ship's Position at Noon.		Winds.		Temperature.	Weather.	Cholera.		Remarks.

The first case of cholera occurred in a soldier who had had diarrhoea for some days, and on the morning of June 18 he went on deck, after getting out of his hammock much heated, and placed himself under a water-tap, and let the water run over his body. Collapse ensued immediately; there were slight cramps with the characteristic evacuations, and he died in seven hours. No other case presented itself until nine days afterwards, from which they continued to crop up until July 10. On the 14th and 15th there was heavy rain, and another case occurred on the 16th; the 17th was also rainy, followed by a case on the 18th. From the 19th to the 22nd inclusive the ship seems to have been becalmed, as her position altered but a few miles daily, and during that period there were twelve attacks, including the quarter-master of the 59th (the only officer attacked) and seven of the crew (the first among them), and six deaths. On the 23rd there were two attacks, including one of the crew (the last of these affected). The ship seems to have got a breeze on the afternoon of the 22nd, and in the course of the 23rd to have met the S.E. trade, and for some days there was another lull in the attacks, but on the 29th and 30th, while

in the S.E. trade, there were five attacks and four deaths, and on August 6 and 12 another two, after she had passed out of the trade altogether.

During the prevalence of the malignant disease Dr. Fraser states diarrhoea and colic prevailed to an unusual extent, and appeared to keep pace with it, increasing as it increased, and disappearing generally with its disappearance. The diarrhoea was generally of such an aggravated form that he thought many of the cases, if not most, would have been returned during an epidemic in England as true Asiatic cholera, presenting as they did profuse vomiting and purging, great prostration, remarkable sinking of the features, and even slight cramps occasionally; but he carefully refrained from designating any case cholera in which the characteristic rice-water evacuations were not present, and the natural secretions suppressed.

The appearance of the men soon after embarkation attracted the attention of the officers on board, both naval and military. Dr. Fraser describes them as attenuated and without spirit, their eyes sunk in their heads. They were on two-thirds allowance, as was customary at that time. Preserved meat was served out every fourth day; the contents of many of the cases were found putrid, and great quantities of it were thrown

(b) See also map in Sanitary Report for the Army for 1866, p. 383, and Epidemiological Transactions, vol. iii., p. 216.

overboard on every occasion on which it was issued. The men had an excessive dislike to the preserved meat, and were fully persuaded it was the chief cause of the disease among them. They also had a strong aversion to the cocoa issued for breakfast, and, on representation, tea was substituted for that, the issue of preserved meat stopped, and oatmeal-gruel given in the evening, from about the middle of July to September 7.

Whether the issue of preserved meat to the crew was suspended during this period is not mentioned, but Dr. Fraser has since informed me he thinks it was not.

It will be remarked that though cholera had been in the ship for a month previously, none of the crew were attacked before July 19. There were two wide tubes on each side for allowing heated air to escape from the orlop, but as they terminated on the gun deck, instead of being carried into the open air, they merely relieved the lower deck of impure air by diffusing it on that above. Dr. Bryson states that these tubes were not opened until July 17, two days before the occurrence of the first cases among the crew, and he adds, "the greater number of the cases on this deck occurred among the men belonging to the messes close to the apertures of the tubes, or to the main hatchway, by which the impure air also escaped;" and he concludes that the disease was communicated from the lower deck to that above by means of this air. Dr. Fraser had made a diagram showing the relative position of the various messes, and of these tubes and the hatchways; and those members of which were attacked were also indicated. From this it appears the messes were numbered from 1 to 8, No. 1 being the foremost, No. 8 the aftermost. There was a gun between 1 and 2, another between 2 and 3, and a third between 3 and 4. One of the tubes was between the second gun and the third mess, the other between Nos. 4 and 5 messes, while Nos. 4 and 8 messes were about equidistant from the main hatchway, and 5, 6, and 7, of course, nearer it; No. 2 mess also was directly abreast the fore hatchway. Now, the cases presented themselves as follows:—

In No. 1 mess, away from hatchway and tubes—one case on 19th, one on 23rd.

In No. 3 mess, beside a tube, but away from a hatchway—one case on 19th, one on 20th, one on 21st.

In No. 8 mess, in vicinity of main hatchway, away from a tube—one case on 19th, two on 20th.

So that No. 2, near a hatchway, Nos. 4 and 5, with a tube between them, and as near the main hatchway as 8, and No. 6 and 7, still nearer it, altogether escaped. It is obvious, therefore, that mere vicinity to the outlets from the lower deck, and presumably to the emanations from it, could not have been the active cause of these attacks among the crew, though, no doubt, during the close, calm weather existing from the 19th to the 22nd, the vitiated air from the lower deck would be less rapidly diffused, and, so far, more injurious, than either before or after, when there was a good breeze. If, as Dr. Fraser thinks, the crew continued to use the preserved meat, it is possible that some more tainted than the rest was consumed by the messes which suffered.

The authorities at Rio Janeiro would not allow the *Apollo* to communicate with the shore, but directed her to proceed to the Ilha Grande, about sixty miles to the westward, where her crew and passengers were disembarked, and the holds cleared out. These were found clean, dry, and free from offensive effluvia, and none of the persons engaged in the work were attacked, nor, indeed, did any more cases of cholera occur during the remainder of the voyage. After leaving the Ilha Grande, on September 7, the *Apollo* called at the Cape, where she seems to have taken in water, at least; subsequently she touched at Booroo, where more water was taken on board, and immediately after its employment was commenced bowel complaints became frequent, and there were more admissions from this form of disease in January than in the four previous months. On February 1 the use of the Booroo water was discontinued, and some which had been obtained at the Cape substituted, and the number of cases of diarrhoea at once diminished. Though not connected with the cholera in the *Apollo*, this fact in the narrative of her voyage was too significant to be omitted.

The next case to which I will direct the attention of the Society was that of the *Renown*, which took the 1st Battalion 9th Regiment from Gibraltar to the Cape in 1865. The *Renown*, a fine ship of 1293 tons, with a crew of fifty-two persons, sailed from Kingston for Gibraltar, with troops on board, on August 3, 1865, and arrived on 17th, and there does not seem to have been any bowel complaint among them or the crew during the voyage. The head-quarters 1st Battalion 9th Regiment, including sixteen officers, 353 men, twenty-eight women, and

sixty-five children, embarked in this vessel on August 21, part at 6.15 a.m., and the remainder at 5 p.m. The men were in five companies, designated A, B, D, F, and K. There was a single berth deck extending the whole length of the vessel, which was extremely well ventilated with side scuttles, stern lights, and shafts leading to the open air above the upper deck. The Hospital, as is now the practice, occupied a part of the port side abreast the main hatchway. The companies were berthed as follows:—On the starboard side forward was A, followed by F, which occupied the space abreast the main hatchway, and farther aft were the band and drums. On the port side forward was B Company, followed by K, which occupied the space up to the Hospital bulkhead; D Company was in the centre of the vessel in front of the main hatchway, between K and part of F. The women and children were in the after part of the deck.

On the morning of August 22, a man of F Company, who had embarked on the morning of the 21st, and been employed during the day in assisting to get the baggage on board, was attacked with cholera; he was landed immediately, and died in a few hours. Though the disease had been at Gibraltar for a month previously, no case had occurred in the 9th Regiment, nor in the barracks from which they came, up to the time of their embarkation, and as no fresh case occurred up to the evening of the 23rd the ship then sailed for the Cape, and everything went on well for several days. On the 29th a young child had an attack of diarrhoea, from which it recovered by the 31st. On the 30th another child was affected with diarrhoea, but was well by September 3. From this date the attacks became more numerous, as indicated in the following table:—

Date, 1865.	Ship's position at Noon.		Winds.		Temperature.	Diarrhoea and Dysentery.		Cholera.	
	Latitude.	Longitude.	Direction.	Zone.		Admitted.	Died.	Admitted.	Died.

Subsequent to September 20 no one was attacked with bowel complaint or cholera, and there was no death after that date. The ship reached the Cape on October 9.

The provisions on board the *Renown* were all of excellent quality. A quantity of water had been taken on board at London, and some at Gibraltar, which was stowed partly in casks and partly in tanks; and though that in the casks was somewhat coloured by them, yet it was considered good. There was a distilling apparatus on board capable of making 500 gallons of fresh water daily, and from the time of the appearance of the cholera, water from this only was employed for cooking and drinking. The cargo consisted of a general assortment of goods for the Indian market, with iron, and shingle mixed with sand, for ballast; under and around the main hatchway there was a quantity of the latter, which, when I was on board the ship in Algoa Bay in November, was damp, but did not present any trace of mud mixed with the sand. Unpleasant odours from the hold were not complained of during the voyage. After cholera appeared the people were kept as much as possible on the upper deck during the day, and every means employed for ventilating the berth deck as freely as possible, and, as the weather was fine throughout, all the ventilating apertures were constantly open. But for the care taken with these points many more cases might have occurred.

As regards the immediate cause of the cases in the *Renown* the following facts are material:—It will be remembered that a man of F Company, which was berthed alongside the main hatchway, was attacked the morning after he embarked, and sent on shore at once. The next cases were those of another

man of the same company and of a child who was accommodated in the women's berth at one side, but abreast a small scuttle which led down to the after hold, which was occasionally open. This was the child of a sergeant of F Company, who, with his wife and another child, had been attacked with dysentery on September 3. The attacks and deaths occurred in the different companies, and among the women, children, and crew, as below:—

Company, etc.	ATTACKED.		DIED.	
	Dysentery and Diarrhoea.	Cholera.	Dysentery and Diarrhoea.	Cholera.
A Company	—	—	—	—
B	1	1	—	1
D	4	—	—	—
F	4	10(c)	—	7(c)
K	3	2	—	2
Women	3	1	—	1
Children	12	2	3	2
Crew	—	2	—	2

Bearing in mind the position of the different companies, and of the women and children in the ship, and the fact that the first case in the regiment and ship was a man of F Company, which subsequently suffered most, and that the others were affected nearly in proportion to their proximity to the hatchways, it is pretty clear that emanations from the hold were instrumental in developing the disease. The crew were all berthed in the poop or fore-castle, which did not communicate with the hold. Of these, the Surgeon, a man of broken-down constitution, and one seaman, whose duties required him to be frequently near the hatchway, or in the hold, were the only persons attacked with cholera, both of whom died. To complete the history it may be added that the men sick of cholera were treated in the Hospital, the women and children in the women's berth. The bodies of those who died were removed on deck at once, and buried soon after, and their bedding and clothing thrown overboard. The bedding and clothing of those who recovered were freely exposed to the air for some time before being used again.

The *Renown* was placed in quarantine on her arrival at Cape Town, and a few days after left for Saldana Bay, where the troops were disembarked, and the vessel thoroughly fumigated and whitewashed, and the bedding used by the troops destroyed. Towards the end of October she proceeded to Algoa Bay, where she arrived on November 1, still in quarantine, and anchored three miles off Port Elizabeth. There had been no case of cholera or bowel complaint among the crew since the troops disembarked. On November 8 she was admitted to pratique, and on the 9th the head-quarters of the 96th Regiment embarked, and the vessel sailed the same afternoon for Bombay. On November 12 one of the 96th, who had had slight diarrhoea for some days previous to embarkation, was attacked with vomiting and purging, the evacuations being like rice-water, but being seen to immediately collapse did not ensue. The man slept on the port side near one of the hatchways, a place clean and well ventilated. There had been one case of a similar nature, but with some collapse, on shore at Port Elizabeth on October 30.

(Corresponding details were given for a number of other ships, both in the Atlantic and Indian Oceans, which we have been obliged reluctantly to omit for want of space. After these, the author, in the original paper, sums up the evidence as follows.)

If, now, we analyse these details, we find that, in the Atlantic, the *Apollo* in 1849, the *Renown* in 1865, the *Windsor Castle* and *Lord Warden* in 1866, left places where cholera was prevailing when they sailed, and all of them immediately previous to, or soon after, going to sea, had one or more cases of this disease on board. After being at sea for some time with few or no attacks, these again became more numerous, and after a while ceased. In the *Apollo* and *Renown* there was a second outbreak; and in the *Jumna*, in 1867, which had not come from a place where the disease existed, her first case was experienced at sea, in nearly the same latitude. The *Windsor Castle*, again, had another case after she was far to the east of the Cape of Good Hope. In the Indian Ocean, the *Gertrude* and *Oriental* in 1859, the *Queen of the North* in 1864, the *Salamanca* in 1865, and the *Durham* in 1866, all left places where cholera existed at the time, and all of them experienced attacks at sea at varying intervals after leaving the land. The *Gertrude* even had two deaths to the south of Mauritius.

We can now examine whether the positions in which these

(c) Including the first case at Gibraltar.

ships experienced their outbreaks agree with those which from other data I have assigned to the choleric waves proceeding from the southward.

When the *Apollo* left Cork, Ireland was under the epidemic of that year, though the second year of the wave there. The next wave, on June 27, would be met with in latitude $37\frac{1}{2}^{\circ}$ N., on the meridian of $14\frac{1}{2}^{\circ}$ W.; and on that day this ship, in latitude $35^{\circ} 21'$, had the first case for nine days, and an outbreak commenced which lasted till July 23, after which there was a respite for six days. The following wave, on the meridian of 33° W., would be met with in latitude 5° S., on July 27; and it was after passing this point that the *Apollo* had her second outbreak, commencing on July 29.

The *Renown* sailed from Gibraltar when the Mediterranean was under the first year of the wave. After the first case, she had no more until she was at 12° N., when the disease commenced again, and continued until she reached $2\frac{1}{2}^{\circ}$ N., when it ceased, and did not recur until three days after, when she got into $4\frac{1}{2}^{\circ}$ S. Having a strong trade at this time, her daily runs were much greater than those of the *Apollo*. The *Renown* would enter the advancing wave on September 15, when its position on the meridian of 30° W. was about $1\frac{1}{4}^{\circ}$ S.

The *Windsor Castle* and *Lord Warden* both sailed when England was under the influence of the first year of the wave of the epidemic of 1866. In their progress south, both encountered a fresh wave a little to the north of the Cape de Verd Islands. On August 6, when the former was in this vicinity, the wave on the meridian of 22° W. would be at 18° N.; and on September 15, when the other was passing the wave on the meridian of 20° W., would be at $20\frac{1}{2}^{\circ}$ N. The outbreak, in the *Windsor Castle* commenced about 10° N., within the limit here given for the advancing wave, and that in the *Lord Warden* in 23° N., only a short distance outside its estimated position. In the *Windsor Castle*, the last attack was on September 15, when she was in $37^{\circ} 20'$ S. and $38^{\circ} 41'$ E., the preceding case having occurred twenty-six days before. At this point she was within the influence of another wave, which, on the meridian of 39° E. on that date, would have reached 31° S., and of which distinct indications were soon after experienced all along South Africa.

The case of the *Jumna* differs from that of the other ships already mentioned, in that no cholera existed in England when she left, nor at St. Vincent when she touched there; and the first indication of cholera occurred in her at sea. On July 17, when the attack commenced, the estimated position of the advancing wave on the meridian of $14\frac{1}{2}^{\circ}$ W. was 3° N., little more than 200 miles from her place at noon on that day, and choleraic diarrhoea continued to manifest itself until she reached $19\frac{1}{2}^{\circ}$ S., ten days after. It will here be observed that the *Apollo*, *Renown*, and *Jumna*, in years with odd numbers, met these waves in nearly the same latitude, while the *Windsor Castle* and *Lord Warden*, in even years, met with them considerably further to the northward.

In the Indian Ocean, the *Gertrude*, soon after leaving Calcutta, encountered a wave on June 1 at 15° N., near the meridian of 90° E., and the first few cases, up to June 16, occurred in this. The next case manifested itself on the 20th in 11° S., the estimated position of the approaching wave at that time being 13° S. on the meridian of 80° E., or 120 miles only from her actual place. Under this wave, too, she had two cases to the south of Mauritius. The *Oriental* encountered the same wave on June 30 in about 18° N., and in her the outbreak commenced at once.

When the *Queen of the North* left Bombay cholera was pretty active there, and she showed traces of it on her way south. On February 7 she reached the estimated position of an advancing wave in 4° S. and 80° E., and on the following day an outbreak of extreme violence commenced, there having been 37 attacks among 298 persons on board in the next seven days, of whom 24 died. The following year the *Salamanca* left Kurrachee, where cholera was prevailing at the time, and she had some cases immediately after. On May 10 she would meet the same wave mentioned above in connexion with the *Queen of the North* in 16° N., and the following day she experienced a considerable increase in the number of cases and of choleraic diarrhoea.

The *Durham* had left the land about ten days before the first case presented itself, and the second occurred ten days later, when on the equator, and five other cases proved fatal in the next twelve days. There were three cases, however, which recovered, and a large number of choleraic diarrhoea during this period, the dates of occurrence of which are not available, so that the exact point where the outbreak became intensified cannot be made out satisfactorily. The estimated position of

the wave the *Durham* encountered about this time was on March 21, in latitude $3\frac{3}{4}^{\circ}$ S. on the meridian of 90° E.

The manifestations of cholera under these different waves were not confined to the ships mentioned in connexion with them, but many traces of their influence were found elsewhere as well. The *Gertrude*, though in the same wave as the *Oriental*, had her first case much nearer to the line, and the activity of the causes of the disease on shore corresponded with this, as both in Ceylon and Madras it was much less severe than a few months before, while on the west coast of Hindostan, and still more on the east coast of Africa, it was then very prevalent. As already stated, the *Gertrude* had two cases to the south of Mauritius. There was a considerable outbreak in 1859 at Mauritius; there were also some indications of cholera in the Cape Colony, and a severe epidemic at Zanzibar, commencing in December, clearly showing that the choleric influences were felt over a very large area, and among communities quite independent of each other.

The series of outbreaks, of which that in the *Queen of the North* to the south of the line in 1864 was the earliest, was a very striking one. The epidemic, as shown above, was followed by that of the *Salamanca* in latitude 14° in May the following year. The same year a very severe epidemic ravaged the district on the west coast of Hindostan from 10° to 12° N., which commenced in May. In the same latitude, on the west of the Arabian Gulf, H.M.S. *Penguin* captured some slave-dhows with cholera on board, and one of her people was attacked in April and another in May. The disease also commenced at Aden in May, and subsequently extended into Laheg. At this time, too, it was prevalent nearly as far south as Zanzibar. To the west of Africa, in the middle of the Atlantic, the *Renown* met the same wave on September 16 in $4\frac{1}{2}^{\circ}$ S., and in 1866 the *Windsor Castle* and the *Lord Warden* ran into it to the north of the Cape de Verd Islands. In the course of 1866, too, cholera prevailed under its influence in Abyssinia, at Mecca, and along the Euphrates as far as Turkistan; and in 1867 there was a severe outbreak, extending from Constantinople, through Southern Europe, Sicily, and Malta, embracing Tripoli, Tunis, and Algiers in Northern Africa. The influence of this wave was experienced in England and north of France in 1868 in a manner sufficiently decided to leave no doubt of its presence, though the form of the disease was mostly simple cholera, and the resulting mortality was not so greatly increased as to entitle it to be designated an epidemic.

In like manner, the case in the *Newcastle* and the outbreak in the *Jumna* can be traced from the Cape. In February, 1865, there was a considerable number of severe cases of sporadic or common cholera, and a good deal of choleraic diarrhoea at Cape Town. In October there was a case of ordinary cholera at Port Elizabeth, and another in the *Renown* at sea on November 12. There were also several cases in coolie ships in quarantine at Mauritius in 1865, and two cases on shore in September. In April, 1866, the *Newcastle* had one case midway between Cape Town and St. Helena, and in the end of 1866 cholera became epidemic at Rio Janeiro. In 1867 H.M.S. *Jumna* had an outbreak in the eastern part of the Atlantic, near the African coast, and in 1868 the further progress of this wave was indicated by the epidemic which commenced at St. Louis on the Senegal in the beginning of December.

The last wave the facts given above embrace is that which was first indicated by the death of the seaman of the *Windsor Castle*, to the south-eastward of the Cape, in September, 1866. In October of that year, a lady, who had not been out of the colony, died in Cape Town of cholera, and in December choleraic diarrhoea suddenly showed itself all over Maritzburg, in Natal; and in February, 1867, choleraic diarrhoea became very common at Cape Town and Port Elizabeth. In January, 1868, cholera appeared at Buenos Ayres and Monte Video as an epidemic, showing, as in the instances previously given, that the choleric influences were very widely spread, and were progressive, and that the aggravation of the disease in ships was merely an indication of a cause or series of causes of general operation.

RIBERI PRIZE.—For the third triennial reward of this prize of £800 the committee has received 150 manuscript or printed memoirs, from more than fifty competitors, so that its labours will prove to be no sinecure. The fourth award is to be made in 1874, the subject being "Nervous Diseases in general, and some of them in particular." Manuscripts or works printed during 1871-73 in the Latin, Italian, or French languages are to be deposited at the Turin Royal Academy of Medicine by December 31, 1873.

MIDWIFERY NOTES.

By FRANCIS R. HOGG, R.H.A.

(Continued from page 75.)

If a case goes wrong, a man clever at the forceps knows no fear; but supposing he is (as, unfortunately, I am) a bungler, never attaining average proficiency, instrumental assistance may be deferred till too late; a more serious operation has to be performed, whereas a few hours before one far simpler would have sufficed.

Case 5.—A small, deformed, bull-necked primipara, aged 37, during labour had six epileptiform convulsions; the os rigid undilatable, gradually yielding to tartar emetic and chloroform; face presentation in a pelvis laterally contracted. After fourteen hours, dating from commencement, Dr. Bone and myself, by means of the blunt-hook fixed into fetal eye, got down the head, in two hours the shoulders, and eventually a large, gas-distended, putrid foetus; the placenta removed piecemeal. Early in the labour, her abdomen had a singular globular appearance, and was uniformly blue. Result, a good recovery.

Case 6.—Called by another Medical officer; find prolapsed funis, rigid os, hand presentation in small pelvis. Under chloroform two hours, feet brought down, head jammed, craniotomy necessary. Did very well four days, when rigors set in, and death unexpectedly took place.

Case 7.—Rheumatic primipara, aged 36, had a good easy labour, but the sixth night, although secretions were satisfactory, shivering and præcordial spasm came on, quickly subsiding under local hot applications. Next morning, looking and stating she felt much better, at eleven o'clock wished to get up to gain strength; at half-past two suddenly died. Doubtless a case of pulmonary thrombosis, but reasons prevented a post-mortem examination taking place.

Case 8.—Aged 33, married seven years, had four children; spent six years in India, there suffering from Delhi boils and rheumatic fever. At Portsmouth, on a hot summer's day, when quickening at four and a-half months with fifth child, fell insensible, paralysed right side with aphasia. Albuminuria; aortic valvular disease noticed and treated. Labour peculiar; the pains vigorous and rapid, yet she could make no sound. The child, after a few weeks, died of convulsions. She lingered on a few months.

Case 9.—A pallid soldier, servant, aged 26, with consumptive father, mother, brothers, and sisters, needs must marry a buxom handsome girl, aged 26, whose mother was bronchitic, she herself having easily undergone variola and measles. Through carrying a pail of water she aborted three months after marriage. Three months subsequently, without any particular reason, he was suddenly paralysed—loss of power of left arm, left leg; aphasia—but under three months' Hospital treatment, the condition improving, enabled him to return to easy duties. Immediately, though her husband continued a pitiable object, only just able to crawl about, without even sufficient prehensile power to hold a plate, the wife conceived. Excepting post-partum hæmorrhage, the labour natural; the child, though felt up to the last moment, a still-born girl, affected with double talipes, had the great-toes turned up, the legs crossed, the thumbs turned in, and other indications of muscular spasm.

Case 10.—Aged 24; small pelvis; states that one still-born and three living children have with difficulty been instrumentally delivered, the placenta on each occasion adherent, considerable hæmorrhage, great debility, tedious recoveries. During pregnancy menstruates up to quickening; experiences no particular sensations; the breasts never alter. Cannot nurse. Now four months pregnant. Premature labour will be induced in the seventh month, but the previous history raises the anxiety as to firmer placental adhesion, greater hæmorrhage.

Case 11.—From the seventh to the ninth month of third pregnancy large bumps formed on the head, spontaneously subsiding two days after delivery.

Case 12.—Married in 1860 a syphilitic (subsequently paralysed) husband; soon fell pregnant; uterine hæmorrhage occurring frequently; forceps delivery; putrid child; adherent placenta; hæmorrhage. Milk fever followed by scarlet fever. Pregnant again in 1863; still-born child; none since. From that time to this—eight years, in fact—milk has remained in the breasts, the secretion at each menstrual period excessive. A worthy chemist, with a soul far above pomatum, "Bunter's nervine," and "Stedman's powders," sagaciously advised her to go out eternally wet-nursing. Why is it the gentlemanly

young men at Weiss's shop are not similarly consulted in surgical cases?

To the theorist of the library or the laboratory these laconic notes are unsatisfactory—too much of the "Alfred Jingle" style; but the busy Practitioner, understanding the never-ending wear and tear of daily work, knows fully how little leisure can be spared for elaborate case-taking.

THE PREPARATION AND PROPERTIES OF THE VARIOUS KINDS OF CHINESE TEA.

By F. PORTER SMITH, M.B. Lond.

(Concluded from page 96.)

It will be remembered that the leaf used in the making of Congou tea (black) is first dried in the sun, and then compressed, so as to part with any superfluous moisture. This must lead to a concentration of the principles contained in the leaf. The tea-leaf is stored in bags, and generally subjected to a preliminary "firing" in addition to the formal "firing" previously described, in view of any delay which may occur during the collection of such large quantities as are necessarily prepared at one time for the foreign market. Certain chemical changes tending to the oxidation of the chemical constituents of the natural leaf must take place in the repeated exposure to a moderate heat, and during the storing together in loose heaps of the half-dried leaf freely exposed to the atmosphere. Nothing like fermentation ever takes place, as this would issue in the destruction of the leaf, which is carefully kept from becoming heated or mouldy during the process of making up the whole "chop." A kind of maturation occurs, issuing in the formation of more extractible matter, capable of solution and circulation. The final "firing" has something of the same effect upon the tea-leaf as the kiln-drying has upon the germinating barley passing into malt—it fixes the composition of the tea-leaf, and renders any further change as unlikely as undesirable. The tea-leaf is then at its best, and any idea of ripening upon the voyage is simply absurd. It follows from the low temperature at which the tea is dried that no empyreumatic products can be met with in properly prepared tea. And yet there is a degree of austerity produced in the ordinary black tea which causes it to produce nausea, sickness, and diarrhoea when taken in the shape of a strong infusion prepared from the new spring tea just ready for the voyage to Europe. This is especially the case with badly-secured leaf, which may be assumed to have been purposely exposed to a high temperature in order to fit it for the foreign market. All or most of these effects pass off by the time that the tea reaches the foreign consumer. The more stable the tea, the better it will turn out. Any change on the voyage is for the worse, according to the experience of the most competent judges. Thirty pounds of the green leaf produce from eight to ten pounds of the sun-dried leaf. One hundred pounds of the sun-dried leaf lose eight pounds of weight in "firing," and produce ten pounds of stalks, fifteen pounds of tea-dust, and the rest good marketable Congou tea. New tea produces in China laxative effects upon foreigners, as prepared for exportation. This effect is not permanent. As a rule, black tea, under the same circumstances, has a decided diuretic effect, even in hot weather, when perspiration is abundant. It excites in many a strong craving for food, and causes a degree of sleeplessness. The narcotic effect of new tea is asserted by Johnston in his "Chemistry of Common Things," but has never been noticed. The large proportion of nitrogen in tea, amounting to nearly 6 per cent., prepares us to find powerful properties in it. That tea is a stimulant there can be no manner of doubt. This probably depends upon the presence of the theine, a soluble crystalline substance, which resists the moderate temperature at which the leaf is dried. The peculiar taste of green tea falsely suggests the presence of more than the usual amount of that astringent principle which, in the shape of tannin, is present in about equal quantity in both the black and green tea. The properties of tea as an astringent are turned to account by the Chinese, who prescribe it in diarrhoea when acidulated with vinegar. Cold tea, to which a small quantity of dilute sulphuric acid has been added, is an excellent diet-drink for use in hot weather when there is a tendency to diarrhoea. That the use of tea to a large extent has a peculiar effect upon the nervous systems of both animal and organic life there can be no doubt. This is the reverse of a sedative influence. Some of the craving of the Chinese for opium is

connected with their incessant drinking of tea, especially upon an empty stomach. The effect of tea is to excite, and this property may be turned to excellent effect in cases of opium-smoking, and in uræmic poisoning. If good new Congou tea be given in the latter disease, there is the additional advantage of the diuretic effects of the infusion. In all cases in which coffee is most to be prescribed, tea is much more convenient, accessible, and powerful. It is obvious that the high temperature at which coffee berries are roasted must be fatal to the presence of much caffeine, a principle identical with theine. This latter substance has been recently proposed by Mr. Lewis Thompson (*Medical Times and Gazette* for February 10, 1871) to be brought into use as a tonic remedy in typhoid diseases, neuralgic affections, and in senile gangrene. Large quantities of weak tea, however, tend to the occurrence of sciatica and other forms of neuralgia. The experiments of Peligot seem to prove that, as might be assumed from the presence of so large a proportion of nitrogen, tea is, as the Frenchman said of the coffee, both "meat and drink." Old women who boil their tea-leaves are right, for they thereby extract much more of the theine. The antidotal power of tea, so strongly insisted upon by the Chinese, is worth a trial, especially in cases of poisoning by tartar emetic or corrosive sublimate. A statement appeared in an English paper, some few years ago, to the effect that tea is an aphrodisiac, and that its extensive use partly explains the fertility of the Chinese population. It is remarkable that, as the Chinese have made the subject of aphrodisiacs a very profound study, no reference is made to this effect in Chinese Medical works. As Liebig has suggested that theine goes to make taurine, a biliary substance, it is possible that the spermatic secretion may be increased by a course of strong tea. Of the effect of tea upon the menstrual secretion the Chinese have no doubt. It may be that in this way the female population of Great Britain have actually hit upon a perfect cure for their "irregularities," as they are called in quack advertisements.

The use of tea in certain forms of dyspepsia is a common Chinese practice. If taken as a plain drink between meals it seems to give tone to the stomach. It is obvious that the "tea" of our domestic tables, a compound of milk, sugar, and much water, is not the article intended to be spoken of in these pages. The sooner *infusum theæ* is placed in the British Pharmacopœia as a recognised article of the *Materia Medica*, the more likely are we to place its employment upon a scientific basis, and thus to rescue a very important drug from the contempt of familiarity. A tincture of tea is not a desirable preparation, as theine is only sparingly soluble in cold alcohol. An extract of tea, carefully prepared, would be an excellent preparation for trying the effects of tea in the delirium of fever and the stupor of intoxication.

The Chinese are under the impression that foreigners are compelled by some instinctive necessity to send and buy the tea of the land of "the Glory of Summer." Of the influence of tea upon the sobriety of our countrymen and countrywomen there can be no doubt. When our poor people cease to waste their tea-leaves, and begin to eat them as a dish, like the people of Mongolia and Siberia, another important step will have been taken in the direction of completely utilising the properties of this most important article of diet and Medicine.

Brick tea might economically be introduced into use on board our ships of war, as it is cheap, portable, good, and much less perishable than ordinary tea.

HACKNEY DISTRICT BOARD OF WORKS.—Dr. Tripe, the Medical Officer of Health, reported to the Board, at their meeting last week, that he had received information that no more patients were to be admitted to Mrs. Gladstone's Small-pox Hospital in Brook-road, Clapton, and that the establishment would in all probability be closed in a fortnight, and the iron house erected in the rear of the premises pulled down. There had been seventy-six deaths in the district during the fortnight; eleven had resulted from small-pox, against twenty-six in the preceding fortnight.

POPLAR AND STEPNEY SICK ASYLUM DISTRICT.—The Board elected under Mr. Gathorne Hardy's Act have constructed a large building for the sick poor of Poplar and Stepney in Devons-road, Bromley. The officers and clerks have been appointed, and the building was opened on Thursday. This asylum is for the accommodation of the sick, bedridden, and infirm of the Poplar and Stepney district. It is certified to contain 572 patients' beds. Fever and small-pox cases are not to be admitted.

YELLOW FEVER IN THE RIVER PLATE.

By WM. NATHANIEL HIRON, L.R.C.P. Lond.,
M.R.C.S. Eng., L.S.A.L.;

Admitted to practise in Monte Video; ex-Surgeon-Major Argentine Army
on the Medical Staff of the Popular Health Commission
during the Epidemic.

(Concluded from page 126.)

Two ideas appear to me essential in treating yellow fever: the fever must be diminished, and the essential poison of the disease neutralised. Two safe and apt remedies are at hand—purgatives and quinine, usable together, and not opposed—regarding the disease in this light.

Vomitives are very seldom necessary or advisable in this disease; the tendency to vomit is generally to be repressed. But if there are evidences of stomach oppression, and quite in the early period of the disease, the remedy is certainly useful. In the early period purgatives are absolutely indispensable; there is always constipation and fever, and they must be pushed till the fever abates.

The distressing headache is signally relieved by pediluvia of hot water and mustard, followed by the employment, constantly, of an evaporating lotion. The pain in the back is alleviable by sinapisms, and this and the general aching of the frame by the use of stimulating liniments.

Mercury is useful as a purgative and alterant of the secretions of the bowels; its constitutional action has seemed to me quite disadvantageous. Of course we have never employed general bleeding; I have cupped over the loins in urinary suppression, but without advantage; leech-bites give trouble when the second stage comes on, from the exudation of blood.

During my attendance at the lazaretto I was able to appreciate the marvellous results in restraining hæmorrhage of the ergot of rye. Given in doses of the powder of five grains every hour, or in pills, it controls most perfectly the hæmorrhages, and even the black vomit. I have not seen this remedy mentioned in any treatise on yellow fever. It is most valuable, and its employment a true advance in the treatment of the disease.

Baths of all kinds gave me no results; nevertheless, hot hip-baths in the urinary suppression should always be tried. The wet sheet was often agreeable to the patient, but it did not answer my expectations in the general result. The cold douche in the lethargic state also disappointed me.

Quinine was administered by an empiric in clysters, and, if we bear in mind that the autopsies showed the large intestine to be unaffected, are theoretically correct. However, as I never employed solutions of quinine, the stomach nearly invariably tolerated the remedy. My plan was to give ten grains of quinine, made into four pills, with extract of gentian every night and morning, at intervals of twelve hours between each dose, employing neutral saline purgatives between times, and combating symptoms as they arose.

Vomiting was often very difficult to allay. Chloric ether succeeded best, and ergot if there was black vomit. Hiccough was often most troublesome, and generally of fatal augury. Opium controlled it best in full doses. The gastric oppression was somewhat relieved by the use of poultices of linseed-meal and mustard. The urinary suppression was the intractable and fatal symptom. In one of my cases black vomit ceased, and the urine returned, after two days' absence, during the use of the ergot of rye. I have heard it has also returned during that of nux vomica, and also of phosphorised glycerine. Perchloride of iron failed, to my knowledge, in producing it. Acetate of lead and opium in pills were spoken well of in the hæmorrhages. I never found the ergot to fail, if it were good, and so was satisfied with it. I believe chlorine solutions and carbolic acid were employed internally; I do not know with any specially good result. The digestive functions were naturally sufficiently impaired, and great care was necessary with diet during convalescence. At first, in the early part of the disease, an absolute diet seemed best, and plain barley-water the most suitable beverage. I have said that yellowness of the conjunctivæ was an early symptom. It seemed to me the earliest most reliable sign; the next albuminuria.

Gastric irritability was very marked. Palpation of the epigastrium so easily produced vomiting, that it was always well avoided. I believe that when quinine has been previously used in the treatment of "specific" yellow fever, it has been used too exclusively. If the stomach evidently requires unloading, it must be unloaded—just as you would unload it in a tropical fever, if it were indicated—before you give quinine.

The same holds good of purging, with this advertence, that as yellow fever is a rapid disease you cannot wait until you have entirely subdued the feverishness before administering the quinine, but must be content to begin when you observe you have made an impression by your evacuant plan. As you can cure malarious fevers without quinine, so you may cure yellow fever of the specific type without it. The Paraguayans cure their milder paludals with such simple treatment as would be adopted in a common cold—in fact, they call their milder paludals colds. But just as a tropical fever is pernicious, so is quinine valuable.

There is question as to how far all these fevers are the product of meteorological, topographical, or geological conditions, and whether they are merely expressions of the effect of climatic or weather peculiarities, or depend upon some special terrestrial emanation, or are due to local meteorological influences upon vegetable and animal decomposition; and as to what relation typhus and typhoid fevers bear to the severe tropical fevers; and as to the action of quinine, whether antiseptic or neurostenic. Fevers being diseases which affect the whole system, naturally will require numerous remedies; and where the nervous implication is the eloquent and serious expression, neurostenics claim a first place. I enclose extracts from the *Buenos Ayres Medico-Chirurgical Review*:—

"February 8.—In the early part of the present fortnight information was given by Dr. Larrosa that in Bolivar-street there had arisen some cases of yellow fever, due, doubtless, to the special pathological constitution, to the indifferent hygiene of the houses, and to the great heat of the weather. The Municipal Council of Health caused the house to be disoccupied immediately, burnt some of the furniture, and disinfected the remainder and the house itself. The disease does not seem to have made much progress, and appears to be stationary in the district where it began.

"February 23.—The small epidemic of yellow fever diminishes notably in the district where it began, although a few cases present themselves in the northern and western districts of the city. The connexion of the cases (of many of them) in the other districts with those in the parish first infected has been clearly proved. However, some cases do not show any such connexion, so we keep a prudent reserve about the future of the epidemic. The fact of many being saved in this epidemic, and the spirit of contradiction which exists in all, has caused that some have denied that yellow fever exists; but it is not the less certain on this account, and has made somewhat more than 200 victims. The fever contracted in assisting the sick has carried off one of the most notable Medical men of the Republic.

"March 8.—Yellow fever has much increased, particularly in houses where many persons are congregated together, especially amongst Italian emigrants. 800 have died of the fever in the last fortnight, the Italians in a proportion of 70 per cent. of the deaths. The *Nacion* newspaper has commenced the crusade against the Riachuelo, our little Ganges—a focus of corruption which infected the atmosphere with miasmas, favouring and feeding the development of diverse epidemics.

"March 23.—This fortnight's review offers us a very unconsoling picture. Now it is not only in certain districts that the fever exists. Without much difficulty, it has advanced until it has dominated completely the population, and its victims have fallen by hundreds daily. The atmosphere we breathe is completely infected. The daily statistics are very incomplete.

"April 8.—In the past fortnight the epidemic has been general; the whole of this extensive city is invaded. The funeral *cortéges* pass constantly through the streets. The exodus to the country is considerable. During certain hours of the day, and principally at nightfall, the closed doors and solitude of the streets give this great city a mournful and sepulchral appearance. There have been days in this fortnight when the number of deaths from the fever has amounted to 700.

"April 23.—The yellow fever has acquired colossal proportions, and has taken possession of all quarters of the city. All the well-to-do families take the efficacious precaution to leave for the country. We should further this emigration amongst all classes of society by all possible means.

"May 8.—The sanitary state of the city is more agreeable this fortnight, for the epidemic beats its retreat notably. Thirteen worthy and ever-to-be-remembered colleagues have succumbed to the cruel influence of the epidemic now disappearing.

"May 23.—The epidemic undoubtedly bids us farewell, since, in spite of the large number who return from the country, the death-rate does not increase, and there are very few new cases."

Dr. Aguirre, writing in the *Review* of March 23, says:—“We have yielded to the temptation to make some experiments with the sulphate of quinine, and repentantly have we recognised with how much truth others previously had prescribed it, for given in the first period it does not abate the inflammatory symptoms, but increases the agitation and anxiety; given later and in larger doses, it produces a hypostinisation which predisposes to irremediable adynamia.”

Dr. Sturrios, writing in the *Review* of May 23, says:—“We give a singular case of yellow fever. A patient, who had passed through all the stages of the disease, and was still in the third, presenting hæmorrhage from the mouth and much epigastric anxiety, suddenly one night was seized with tonic contractions of the muscles of relational life (voluntary meant), accompanied by pains and parodying tetanic convulsions. The first fit lasted six hours, causing the patient to suffer cruelly. On the following day the attack repeated itself, almost at the same hour, threatening seriously the life of the patient, for the contraction of the muscles of the chest rose to such a point that the agony of asphyxia appeared imminent. This attack lasted four hours. A third access repeated itself the third day, and was like the second; it lasted three hours. The fourth and last fit was very short and mild. Quinine was given as an antiperiodic until cinchonisation was obtained, it being then that the attacks disappeared; chloral and syrup of belladonna were used at the same time.”

Dr. Reynal, parochial Medical Officer of the Piedad District, wrote to the *Republica* newspaper in April, stating that he had only lost ten patients out of 140 in using quinine in solution in large doses. He states as follows:—

“Computing the number of patients treated by a general method with those who had been saved thereby, I did not hesitate to abandon such plan, and adopt as basis of my treatment the sulphate of quinine. In a few days the result justified my resolution, since I found that, of 140 patients to whom the remedy had been given in the first period, and many in the second period, I only lost ten, and even those not in spite of the quinine, but on account of its being badly given. I continue employing it, and with the same result. I do not make any pretension to offer this as a novelty, nor, still less, as an infallible remedy, but as being more certain and based upon analogy, facts, experience, and judgment. My plan of administration is as follows:—Sulphate of quinine grs. xxx., water ζ iv., citron-water ζ j. Of this I give two tablespoonfuls every two hours until cinchonisation supervenes. I only precede the administration of the remedy by a vomitive or purgative if there are manifest signs of gastric and intestinal embarrassment; and when such signs are wanting, as is usual in the invasion period, I do not lose time, but give the quinine immediately. Four-and-twenty hours do not pass before the cinchonism manifests itself, and in a few hours the headache is replaced by heaviness, the fever ceases, and there only remains the prostration consequent upon the medication and the battle between the system and the disease. In mild cases, a vomitive, a purgative, sudorifics, or even the sole powers of the constitution itself, are sufficient; but, at first, who can anticipate a benign disease, and say, so far and no more shall the fatal essence of the miasma reach? So I do not hesitate, but to all, without exception, give quinine, harmonising the dose with the pronouncement of the fever. The results obtained authorise me to recommend quinine as almost infallible in the first period, doubtful in the second, and entirely useless in the third.”

I preferred to give quinine in pills, and obtained my object by exhibiting it in such form. The stomach is so affected in the disease that it should hardly tolerate such a nauseous bitter draught as a solution of quinine. As I constantly gave purgatives, I did not employ quinine in enemas, as I have said such treatment was pursued by an empiric who had seen this method adopted in countries where yellow fever is endemic. I believe pretty good results followed this person's treatment.

It seemed to me that the contagiousness of the fever might be assumed to be a local infectiousness, existing in the place where a patient lay. The importation of the disease seems certain. Albumen generally existed in the urine, and suppression of that secretion was a frequent and almost invariably fatal symptom.

The origin of the term “mal de Siam” for this disease is thus accounted for by the *Siglo Medico*, a Spanish Medical journal:—That at the end of the seventeenth century three vessels (one called the *Oriflamme*) arrived at Martinique from Siam, and that coincidentally with the arrival of these ships a disease, of a severity unknown previously, sprang up. But it asks the question—“Did the ships bring the disease with them or get it in this

port?” The matter has been explained by averring that the *Oriflamme* previously touched at a Brazilian port, and there took the disease aboard. But the writer of the article referred to says this is not proved, and believes that the arrival of unacclimatised persons at the Antilles in these ships was the determining cause of the appearance of the disease. It is well to bear in mind that Martinique and Siam occupy analogous latitudes in the different hemispheres, and that any disease brought by the vessels probably might have encountered favourable conditions for its development, and yet it may not have differed so much from any endemic disease, except in the element of deadliness; but this very serious difference makes it appear a new disease, and really causes it to merit such distinction politically.

The Medical Officer of the port of Monte Video made his public statement at the commencement of the epidemic, that the epidemic must be a bilious remittent on account of a similar announcement by a Brazilian Medical man who wrote from Asuncion, Paraguay, to that effect, and, I believe, based his opinion on the beneficial results which followed antiperiodic treatment, to the efficacy of which Dr. Newkirk, a Canadian living in Asuncion, gave me his personal testimony afterwards.

In Corrientes the same phenomena were observed as here; a large part of the population fled, and of those who remained a great proportion died, one-fourth of the population remaining. The poverty in which so many working families will be plunged by the loss of their chief supports must naturally be very great, and the number of orphans to provide for be very large. The neighbouring republics of Chili and the Banda Oriental have come splendidly to the help of the desolated city, as also has the Empire of Brazil. Since men suffered to a much larger extent than women, and both than the younger members of families, it is natural to anticipate distress of a considerable amount in consequence of the epidemic; fortunately, our winters are not of the severe northern type; frosts are neither frequent nor severe, and snow unknown.

The epidemic of this year does not seem to be in the least connected with the few cases that occurred in one establishment during the summer—or, rather, autumn—of the previous year. That outbreak appeared to extinguish itself in the *locale* where it sprang up; it was notoriously imported from Rio Janeiro. The epidemic was notified this year as springing up in an opposite quarter of the city. There is also no doubt that the first yellow fever appearing in Paraguay, twelve months before the great outbreak, was connected with Brazil. Where did the Rio epidemic of 1869-70 arise?

The winter temperature in Buenos Ayres should be an extinguisher to the yellow fever poison, and, it is to be hoped, will prove such, as it has done previously. Buenos Ayres is favourable enough for epidemics from its insanitary conditions, but it is probably not worse than most New-World cities, where sanitary progress is generally the last point thought of.

Buenos Ayres.

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

THE MIDDLESEX HOSPITAL.

THREE CASES OF STRANGULATED HERNIA.

(Under the care of Mr. HULKE.)

[Communicated by Mr. DAVIDSON, House-Surgeon.]

Case 1.—*Strangulated Oblique Inguinal Hernia—Herniotomy—Sac Opened—Wound Dressed on Lister's Method—Remarkably quick Recovery.*

A LABOURER, aged 50, who had been ruptured for twenty years, and had been in the habit of wearing a truss, was admitted with acute strangulation, of one hour's duration, on January 5, 1871, at 4.30 p.m. The left side of the scrotum was distended to the size of a foetal head; it was hard and tense; the upper part of the swelling was tympanitic, the lower part dull on percussion. He was suffering intense pain. The House-Surgeon tried the taxis in a hot bath without any impression on the rupture. Half an hour later he began to retch dark bilious fluid; he was tossing about restlessly from the great severity of the pain; he had a small, weak, rapid pulse, and the rupture was sensibly larger. The rupture had

been strangulated on a former occasion, and was then reduced by the taxis under chloroform after the use of ice. He was seen at 6 p.m. by Mr. Hulke, who placed him under chloroform, and tried the taxis for a few minutes, but without avail, and then operated. The external abdominal ring, at which the constriction seemed seated, and some fibrous bands outside the sac were divided, after which, the rupture continuing irreducible, the sac was opened. It contained several feet of small intestine, and some omentum; these were now returned without difficulty. The wound was dressed strictly on Professor Lister's plan, and opium was given. The dressings were removed on the fifth day, when the wound was found soundly healed, and a fortnight after the operation he left the Hospital. The first stool was passed on the eleventh day. Here the very large size of the rupture, the free exposure of its contents by the unavoidable opening of the sac, and the acuteness of the strangulation were unfavourable to the recovery of the patient, while the healthy state of the coverings, undamaged by an indiscriminate employment of the taxis, rendered the wound peculiarly suitable for Professor Lister's mode of dressing.

Case 2.—Strangulated Femoral Hernia of Several Days' Duration—Herniotomy—Sac Opened—Recovery.

A woman of spare habit, aged 60, who had been ruptured fourteen years, but had never worn a truss, was admitted with strangulation of at least three days' duration on February 17, 1871, at 6.20 p.m. She had a tense, hard, globular swelling, of the size of an orange, in the right groin, in the situation of a direct inguinal hernia. A cord-like prolongation extended from it in the direction of the saphenous opening. The skin covering the rupture was red and inflamed, and agglutinated to it, so that it could not be pinched up in a fold. She was very prostrate, had a small, weak pulse, and often retched. The taxis had been very assiduously tried before she was sent to the Hospital. No delay being admissible, chloroform was given, and herniotomy at once performed. The sac had two compartments—one above, the other below, Poupart's ligament. The upper one contained only omentum; the lower included, also, a small knuckle of purplish, almost black, intestine, which adhered to the inner side of the sac, making it impossible to at once reach Gimbernat's ligament in the usual manner. A director was therefore passed upwards along the omentum, and the inner end of Poupart's ligament was divided. Slight compression now partially emptied the gut, and, its adhesions to the sac being separated, it was returned. The omentum, not being much congested, and not thickened, was also reduced; but for this it was necessary to enlarge the opening by notching Gimbernat's ligament. The wound was washed with an aqueous solution of carbolic acid, and dressed with a compress dipped in carbolised oil. Peritonitis ensued. Opium was freely given. The sac and the cellular tissue around it sloughed, and the belly was covered with a large linseed poultice. The bowels were first opened a fortnight after the operation. She was convalescent on March 27; but her final recovery was retarded by a small sinus, which for some time prevented her wearing a truss, and by an obstinate eczema of the leg.

The extreme prostration of the patient, the nearly gangrenous condition of the gut, the sloughing of the wound, and the occurrence of peritonitis, made the prognosis doubtful. Mr. Hulke attributed her recovery to the free use of opium and a strictly simple diet, of which milk formed a principal share.

Case 3.—Strangulated Femoral Hernia of Two Days' Duration—Herniotomy—Sac Opened—Recovery.

A laundress, aged 67, who had been ruptured ten years, was admitted on May 10, 1871, with strangulation. She had in the left crural region a tense globular rupture of the size of a hen's egg. She had been retching frequently for thirty hours, throwing up stercoraceous matter. Her pulse was 104, small and weak. Mr. Hulke at once operated, without further trial of the taxis. The sac enclosed a knuckle of dark claret-coloured gut. After Gimbernat's ligament and the neck of the sac had been cut, a further impediment was found in the transverse band lying just inside the crural canal within the belly. It was divided, and the gut went back without difficulty. The wound was washed with an aqueous solution of carbolic acid, and a compress dipped in carbolised oil laid upon it. It suppurated, but healed kindly, and one month after the operation she left the Hospital wearing a truss. The first stool was passed on the seventh day. Opium was freely given here, as in the other cases.

SATURDAY, AUGUST 5, 1871.

CHOLERA.

ARE we ever to be ringing the same changes? It seems as if it were only yesterday that long lists of deaths from cholera were being issued from the Registrar-General's office every day, in order that the public might know where, and how, and why the destroyer was sniting us. We suppose that with the single exception of small-pox there is no similar enemy with whose tactics we are better acquainted. Keen spies have been busy in the camp every time it has made an invasion, and there are now few of its secrets of much practical value to us which they have failed to elicit. With the knowledge we have, we ought, in our insular position, to be able to look calmly, and without any anxiety for our own safety, upon the advances that cholera may make towards the sea that divides the European Continent from Great Britain. We, at all events, ought to be safe, because prepared. There should be no foothold for cholera on our shores. Let us look back for five years. We had a warning then; we knew pretty nearly as much about the mode in which cholera spreads as we do now. We knew that foul water containing excremental matter, and especially a certain kind of excremental matter, propagated the disease; and we knew how filth and sanitary negligence would prepare for it congenial quarters. Yet, for all that, little pains were taken to exclude the foe; and we paid heavily for our practical disbelief in the teachings of science. Is all this going to be repeated? If we are better informed, even than we were in 1866, are we at the same time wiser? or are we again going to deal with the scourge under the influence of panic, instead of raising bulwarks against it upon scientific principles, as Lord Carnarvon tells us is our ordinary practice? The question has been asked in both Houses of Parliament, what precautions her Majesty's Government were prepared to take, and what local governments were doing, or capable of doing, to protect the population from its ravages? The reply of Mr. Forster, that "the real power of guarding against disease rested with local authorities," is not a very quieting one for nervous people, especially for such as take an interest in the revelations of the delinquencies of local sanitary authorities made almost day by day by the Medical Inspectors of the Privy Council. But the country must not be left to the mercy of people whose only idea is to economise and save the rates. Parliament has placed upon them certain definite duties, and conferred powers to match. The duties are clear, and the powers are sufficient. They may provide

wholesome water for their populations, and a wholesome system of management of excremental and sewage matters; and now, if at any time, it ought to be seen that they are performing the duties which they have accepted. We have been watching cholera in Russia for the last two years; it is doubtful whether it has ever been completely absent from that territory since our epidemic of 1866. In August last year it broke out at St. Petersburg, and last April at Wilna, in Western Russia, upon the river Niemeu. This town is in free railway communication with the Baltic ports of Riga and Königsberg, and there is daily communication with our western ports. The last report from Berlin is that it has certainly entered Riga, where preparations have been made for its reception, Hospitals established, and Medical men told off for duty. At Tambow, in Central Russia, of 30,000 inhabitants, 458 died of cholera in the week ending July 13. With our knowledge of what Newcastle, Sunderland, Hull, Grimsby, etc., still are, and the certainty that cholera would be quite at home in any one of them, although we do not rank with the nervous people, we think we have good reason to feel anxious that the local sanitary boards at our several ports should be stirred up into activity, and that, should the first line of our defence be forced, every town and every village in the kingdom should be prepared to resist the advance of the epidemic. Up to the present time no case of cholera has, we believe, been reported at Hull; but, on the other hand, Mr. Radcliffe has been despatched to investigate the facts relating to fatal cases in vessels trading between Hull and the Baltic ports. We should not be astonished any day now to hear of it in Hull, Grimsby, or Liverpool. The annual death-rate from diarrhoea in the week ending last Saturday was equal to 3 per 1000 in London, 5 in Manchester and Salford, 2 in Liverpool, and 5 in Leeds. In London, 17 deaths were referred to cholera and choleraic diarrhoea, against 4 and 9 in the two previous weeks. Four of these were of adults between 40 and 60 years. There is no fear of the central authority of the country neglecting its part in the work of special preparation. The Privy Council took its first public step in this direction on July 29 by the issue of an order, under the 52nd Section of the Sanitary Act, empowering local authorities to deal with infected ships and persons before they enter a port, and directing what they are to do.

NEW INSTRUCTIONS FOR VACCINATORS UNDER CONTRACT.

We think we can trace in these instructions an implied regard to the opinions held by those who maintain at any rate the possibility of the transference of enthetic disease from the vaccifer, and to the doctrine now held by many persons that the admixture of blood with the lymph taken is not only slovenly, but dangerous. In the face of the evidence adduced by Mr. Hutchinson before the Committee of the House of Commons, whatever view may be held as to the accuracy of that observer's inferences, some such practical rules are very proper to be given, and, apart from any consideration of the danger of introducing syphilis, are such as should be universally observed. With regard to erysipelas, it is well known that, when it is prevalent in a locality, vaccinators have been compelled now and then to suspend their operations for a time altogether. It is also satisfactory to notice that some instructions are given as to the mode of judging of the success of a revaccination. Such information was very much needed, not only by public vaccinators, but by Medical Practitioners generally, who will be glad to learn, upon the authority of the skilled advisers of the Privy Council, that revaccination vesicles, so long as they show evidence of the system being impressed, by the formation of an areola, are to be held as affording the supplementary protection which is needed. The caution, also, as to using liquid lymph, preserved otherwise than in sealed tubes, which has been kept more than eight hours

may seem superfluous to some Practitioners, but it will not be so to all. A few years ago, one of the Privy Council inspectors stated that he met with one Medical man who carried lymph about in his pocket stored in a bottle until it was decomposed, and even then did not hesitate to use it. This was an extreme case of lamentable ignorance, and it is to be hoped was altogether exceptional; but we are sure that lymph is often kept in this way too long. The warning as to the avoidance of revaccination lymph derives additional force from the facts recently announced by Dr. Barbour, of the Stockwell Hospital. A series of instances came under his observation there, in which small-pox was taken within a few weeks of revaccination from some secondary pocks by a Practitioner who was not at all scrupulous, apparently, in this matter. Another rule laid down we also consider highly commendable—namely, to change the lymph in use when, as a rule, an areola is developed on the eighth day after vaccination. We are aware that many good vaccinators do not hesitate to vaccinate from pocks around which the areola has been developed on the eighth day; but its appearance so early shows that the vaccine has not passed deliberately enough through its phases. The more energetic varieties of lymph—those, for instance, which have passed through but few human transmissions—are all comparatively slow in developing the areola, and hence its early formation is one of the most reliable marks of weakening of the virus.

PROFESSOR HALFORD AND THE TREATMENT OF SNAKE-BITE.

THE presentation of a testimonial to Professor Halford, of Melbourne, in recognition of his labours towards the discovery of a cure for snake-bite, has, we regret to say, led to some controversy relative to the real part Dr. Halford has played in respect to one particular mode of treatment in cases of snake-bite—we mean the treatment by injection of ammonia into the veins. If the question discussed resolved itself into the single and simple point, Who first systematically taught that in cases of poisoning from snake-bite ammonia may be thrown into the venous current with good, and, it is not too much to say, with startling results in certain cases? there would be little difficulty in settling the matter at once and definitively in behalf of Dr. Halford; but, most unfortunately, other issues have been raised, out of which has come much complexity, and therewith obscurity and doubt. For our parts, we have all along said and done everything we could in encouragement and support of Professor Halford. We have felt it possible that as a stranger in a strange land he might require the voice of the Profession of the old country, by one of its accredited organs, in his support. We have felt it right to uphold his claims against able opponents; and from the fact that at this moment we allow a matter affecting no one but the Professor himself to occupy our time and space, we prove to the fullest of our ability the desire we have that in everything reasonable he should be sustained.

Let us, then, briefly refer to the facts. The opponents of Dr. Halford urge two things. They insist that the practice of injecting ammonia into the veins for the cure of snake-bite is not a proved success, and that, if it were, the claims of originality made for or by him are greatly exaggerated, or, in plainer language, are not true. A leader in the *Melbourne Daily Telegraph* of May 20 sets this part of the discussion forth in a rough and ready way that would surprise us here did the *London Daily Telegraph* give it us. It has been alleged, so runs the argument, that Dr. Halford professes to have been the first physiologist who put ammonia into the veins of living animals and demonstrated that the experiment was safe; this, it is said, is not true. It has been alleged that Dr. Halford was the first to use ammonia as a cure for snake-bite; and this, it is averred, is not true. It has been alleged that Dr. Halford was the first to suggest that ammonia should be introduced into

the veins after snake-poisoning; and once more it is affirmed that this, also, is not true. To the argument thus set forth—with not a little vehemence, by the way—we may remark that the labour of writing it might well have been spared. Our colonial contemporaries are like the artists of the Royal Polytechnic, who raise marvellous ghosts in order to show how quickly they can dismiss them. It is never for a moment pretended by any of the supporters of Professor Halford, and least of all, we imagine, by the Professor himself, that he was the author of these original projects in their individual sense. The experiments of injecting ammonia into the veins, which the *Melbourne Daily Telegraph* alludes to as having been performed many years ago by Dr. Richardson, are familiar to physiologists. The practice of applying ammonia to a snake-wound and of giving ammonia by the mouth after snake-bite, is a practice well understood, and one that has been carried out probably for more than a century past; and the suggestion of injecting ammonia by a vein after snake-bite may also, as we are assured, have been made by Jahr—although on that point we are not certain. We admit so much readily, and if we were Professor Halford himself, we should be proud to admit it; but this we do not admit: that because these facts present themselves when they are called for, therefore Dr. Halford is to be stripped of all credit. This were indeed to use up history for enmity with a vengeance. True it is that one man injected ammonia by the veins into the living body, and the thing could be safely done; true it is that other men practised the administration of ammonia for snake-bite; but it was Professor Halford who injected ammonia into the veins for the specific purpose of counteracting the effect of snake-poison. For that act he deserves all the distinction that has flowed, or may hereafter flow, from the success of so simple an operation. We will say nothing at this moment on the perfection of the process—we will make no claim for its absolute success—but if it give but a moiety of success, it is a boon which ought to be truly, faithfully, and frankly recognised.

It would be our wish to remain silent at this point were it possible, but Dr. Halford himself has sent us a pamphlet that raises, quite unnecessarily, another issue. He claims in this paper, as we read it, priority for having suggested the injection of ammonia into the vessels after apparent death from chloroform. Whether the claim were worth raising at all, we doubt; but certain it is, that if he will look back to the *British and Foreign Medico-Chirurgical Review* for 1863, he will discover that the idea, and the practice, too, of injecting ammonia into the vessels in order to excite the motion of the heart after death from chloroform and other narcotics, is considered and described at length in an essay on the treatment of suspended animation by Dr. Richardson; the essay being, in fact, the condensation of a report, by the same author, on the treatment of suspended animation, made to the British Medical Association at its meeting in the Royal College of Physicians of London in 1862. On this point, therefore, Professor Halford is in error; and he is in error also when, in describing the experiments at which he assisted Dr. Richardson in injecting ammonia into the veins, he says that Dr. Richardson used carbonate of ammonia. In the original essay recording these experiments, and published between fourteen and fifteen years ago, it is said that ammonia was used; there is no mention of carbonate of ammonia having been employed. With these exceptions, our sympathies go with Dr. Halford. He learned—doubtless from Richardson's experiments, some of which he saw carried out—that ammonia can be injected with safety into the veins of living animals, and that so injected it raises the action of the flagging heart; he had heard, necessarily, that ammonia had been administered with success for snake-bite; and, by putting the two elements of knowledge together, he secured a result which, should it prove not half so useful as could be wished, is a result the best of men might fairly be proud of.

THE SMALL-POX EPIDEMIC.

THERE is a further decline of fatal cases in London reported—namely, from 135 to 122 deaths in the week. The vacant beds in the Asylum Boards Hospitals amounted on July 21 to 560, the average for the week being 514. Under these circumstances, the Board have thought fit to reduce the accommodation they have provided to the extent of 400 beds. The Convalescent Hospital at Islington has been altogether closed, but, anticipating the possibility of an increase during the later autumn and winter months, the building will be retained for the present. The Fever Hospital at Homerton, also, has been emptied of small-pox cases, and is now being disinfected preparatory to being applied to its legitimate use. We are glad to note, also, at last, that not only are the cases demanding admission less numerous, but are also reported from all the Hospitals to be of a milder type. We learn, also, that the mortality from small-pox has declined in all the principal towns where it was epidemic except Newcastle.

THE WEEK.

TOPICS OF THE DAY.

THE following are the names of the Members of the Royal College of Physicians who were elected to the Fellowship on Thursday last week:—Thomas Bishop, M.D., Paris; Arthur Leared, M.D., Old Burlington-street; Gilbert William Child, M.D., Oxford; John Hitchman, M.D., Mickleover, Derby; Augustus Drake, M.B., Southernhay, Exeter; Edward Cope-man, M.D., Norwich; Willoughby Francis Wade, M.B., Birmingham; Philip Frank, M.D., Northampton House, Piccadilly; Thomas Stevenson, M.D., Guy's Hospital; Charles Theodore Williams, M.D. Oxon.; William Tilbury Fox, M.D., Sackville-street; Edward John Waring, M.D., Maida-vale; Philip John Hensley, M.D., Henrietta-street, Cavendish-square. It is no secret that there was a prevalent feeling amongst the Fellows that the list of Members nominated by the Council was a very unsatisfactory one. Without hinting the slightest disrespect to the nominees of the Council, it was felt that no adequate reason could be given for their selection, or for the omission of many names of Members whose qualifications for the Fellowship, whether from distinction in the practice of Medicine or in Medical or general literature, were at least as high, if not far higher than those possessed by any of the new Fellows. The feeling of the College was shown in one instance by the rare incident of blackballing; whilst, even of the members elected, few escaped without adverse votes. We would not be supposed for one moment to detract from the Professional status of the Physicians who have been selected above their fellows; several of them are men of eminence, but in the list of Members there are many names which would have done even higher honour to the College roll. The fact is, the present system of election is a vicious one. It was thought that the system of sending in recommendations signed by a certain number of Fellows would be an improvement on the old one; but this is not the case. One reason is, no doubt, that the nomination papers are sent in privately, and are kept secret by the Council; they are not suspended openly, as in the Royal and other Societies. It is clear that a system of this kind opens the door to canvassing and the exercise of covert influence.

It is an encouraging sign of the times that English artisans are becoming more alive to the effects of unhealthy employments, and are themselves taking measures to avoid or to render them less injurious. Sanitary reformers who have desired to lengthen the lives of persons employed in dry-grinding and other deadly trades, by inducing them to use means by which deleterious dust may be excluded from their air-passages, have often found that obstacles were not raised by employers, but by the employed, who, through idleness, or prejudice, or

indifference, preferred to work as their short-lived fathers had done before them. We are very glad to notice that a more intelligent spirit has been aroused in certain of our manufacturing districts. This is exemplified by a memorial which has been lately sent to the Medical Department of the Privy Council by weavers in the Todmorden District. The memorialists pray that a Medical Inspector may be sent "to inquire into the sizing system generally, especially into the use and effects of China clay, and such other ingredients as may be necessary to make China clay adhere to the warp." The memorial sets forth as a ground for making this request—

"That for several years a material called kaolin, or China clay, has been introduced into the manufacture of calicoes and other grey goods; that in some mills sizing, including China clay, is laid on the warps to the extent of 40, 60, and even 100 per cent.; that before the American war the percentage was 20; that ingredients believed to be poisonous are used to make the China clay adhere to the warps; that to prevent the warps breaking, through the dryness of the atmosphere, it is necessary to close the ventilators in the weaving-sheds; that through the closing of the ventilators, the weavers are compelled to inhale the dust of the China clay that rises from the warps, mixed with the poisonous ingredients; that, working in these sheds, they suffer from excessive heat and thirst, and are greatly distressed, especially in summer, when they are frequently compelled to leave their work to breathe the fresh air outside; that the inhalation of this dust causes difficulty of respiration, loss of appetite, bronchitis, and consumption; that the strong may bear up for a time against the injurious effects of the sizing, but that it tells upon them, apparently creating, certainly accelerating, lung diseases; that many are compelled to give up weaving, being forbidden by Medical men to return to the weaving-sheds while China clay is used; that others work for a few weeks, and are then compelled to abstain for days or weeks; that the beginning of fatal illness may apparently be traced to the working in weaving-sheds wherein China clay is used."

We hear on good authority that the Privy Council intend to institute the inquiry for which the memorialists pray.

There have been several cases of murder by lunatics investigated lately, and in more than one of these the murderer was known to be insane before the commission of the crime. One instance was that of a man who destroyed his wife, but had been to a Roman Catholic priest a day or two before, who had refused to confess him on the ground that he was not in his right mind. Another case was that of Charles Sleight, a teacher, who murdered a deaf and dumb woman, the matron of the Deaf and Dumb Asylum at Hull. His conduct before the murder had led both his victim and her brother to state that his head was affected. These cases point a moral that the English Legislature is slow to learn. If the persons in question had, at least, been placed under Medical treatment and surveillance with temporary restraint, the crimes would certainly have been prevented, although some Medical man might have been made the victim of an action for false imprisonment.

At a meeting of the Members of University College on Saturday last, Lord Belper was elected President of the College in the place of the late Mr. Grote. The Council of the College, at their meeting on the same day, conferred the title of Physician to University College Hospital upon Dr. Charlton Bastian, F.R.S. Mr. Berkeley Hill, Mr. Christopher Heath, and Mr. Marcus Beck were appointed teachers of practical Surgery. The recently established Sharpey Scholarship was conferred on Mr. E. A. Schafer.

The University of Edinburgh has conferred the honorary degree of Doctor of Laws on Professor Andrews, of Belfast; Dr. Carpenter, Registrar of the University of London; Professor Allen Thompson, of Glasgow; and Dr. G. E. Paget, President of the Medical Council.

Dr. Dalrymple, the Member for Bath, is about to proceed to Canada and the United States to collect information as to the working of the American system of treating habitual drunkards.

The female Medical student movement in Edinburgh has received another check—perhaps the most serious that it has yet met. At a meeting of the Senatus of the University on the 28th of last month, the opinion of the Solicitor-General for Scotland and of other leading members of the Scottish bar was read, to the effect that the proceedings of the University as to the admission of women to the study of Medicine were wholly illegal *ab initio*. We can only say that we know that the illegality of these proceedings has been all along suspected by some of the most distinguished Professors of the University; but the party of progress urged on the University Court that the experiment should be tried, and, as it turns out, have thereby greatly damaged the cause they wished to serve. The ladies who have been induced to commence a Medical career with male Medical students in the schools of Edinburgh have really little for which to thank their friends, who have used them as a forlorn hope. They must have wasted a considerable portion of money and time, and they are no whit nearer establishing the right or propriety of young men and women studying anatomy together than they were in the beginning. One of their number has been cast in considerable law expenses, from which she is to be relieved by public subscription, and not one of them is nearer obtaining a Medical diploma than when she commenced. On the other hand, the results of the experiment have shown that the admission of male and female students to the same Medical classes will assuredly result in damage to the character of the Medical school as a place of Medical education, which permits it. If women think that they have a vocation for the study and practice of Medicine, let them pursue both; but do not let them intrude into the Medical schools and dissecting-rooms which are already occupied by men, to the injury of the institutions which admit them, and to the outrage of public decency.

Dr. John Murray has been elected to the vacant Assistant-Physiciancy at the Children's Hospital, Great Ormond-street.

PENSION TO DR. GAVIN MILROY.

THE pension of £100 per annum awarded to this able and indefatigable public servant will meet with the cordial approbation of his Professional brethren. Dr. Milroy has not only furnished reports on several very important sanitary questions, and on epidemics at home and abroad, but has conferred immense benefit on the commercial interests by his admirable papers on contagion and quarantine. Those best acquainted with the services rendered to his country by Dr. Milroy will be the first to appreciate his claims to the pension, and to acknowledge that no such *honorarium* could have been more properly bestowed.

COMMUTATION OF PENSIONS.

WE observe, by the *Gazette* of the 1st inst., that Staff Surgeon-Major P. H. Roe and Assistant-Surgeon W. Haughton, M.B., late of the Royal Artillery, have been permitted to commute their pensions. The Chancellor of the Exchequer, therefore, has not yet fulfilled his intention expressed at the early part of this session of withdrawing the privilege conferred by the "Pensions Commutation Act of 1869." We have already pointed out that the benefits of commutation on the Government scheme are rather questionable, the scale of allowance being much lower than that which could be obtained in the money market. We find that, judging from the number of officers of all ranks who have commuted their pensions; and whose names have been retained on the Army List for August, our opinion appears to have been generally held throughout the service. Only twenty-eight have retired under the Pensions Commutation Act, and of these thirteen belong to the old Commissariat Department, and only two are Medical officers; but by the retirement of the two above-mentioned the number of the latter is increased to four.

HONOURS TO ENGLISH SURGEONS.

So much pleased were the Société de Secours aux Blessés, of France, at the cordial reception given to their representatives by the Medical Profession, that they have presented the cross and diploma of the Society to Sir W. Fergusson and Mr. Paget as representatives of English Surgery. The same honour has been conferred on Mr. Ernest Hart for services rendered in the ambulances of the battle-fields around Sedan and Metz. These international courtesies cannot be too highly estimated; they do more to cement friendship and good feeling than anything that diplomacy or legislation can effect.

THE SYME MEMORIAL FUND.

It is gratifying to state that the Edinburgh University Endowment Association has approved of a proposal made by Dr. Murchison, on behalf of the subscribers to the "Syme Memorial Fund." This proposal is to the effect that on Dr. Murchison handing over £2000 to the Association towards founding a "Syme Surgical Fellowship" in Edinburgh University, they should add £500 for the same object. A Fellowship will thus be established of the annual value of £100. This Fellowship is to be open to competition amongst Bachelors of Medicine of Edinburgh University of not more than three years' standing. The prize will be awarded to the competitor presenting the best thesis on a Surgical subject, giving evidence of original research and practical talent. The Fellowship will be tenable for three years, and its award will be in the hands of the Senate.

MEDICAL OFFICERS OF THE ROYAL ARTILLERY.

The prospects of Medical officers in this branch of the service are likely to be unfavourably affected if the proposed change of organisation from the brigade to the battery system be carried out. Each brigade of artillery is now under the Medical charge of a Surgeon or Surgeon-Major, and each battery under that of an Assistant-Surgeon, so that the Surgeon of a brigade having two or three batteries with the head-quarters has the services of a corresponding number of Assistant-Surgeons at his disposal for the Professional duties connected with those batteries. But if the unit of the artillery be changed from the brigade to the battery, it is at once evident that the position of the Surgeons of brigades will be seriously compromised. The proposed plan is, we believe, in high favour with the combatant officers of the artillery, as it would give a remarkable impetus to promotion among them. Each battery, with its 200 men and six guns, would be a nice independent command for a field officer; but it would hardly give sufficient employment to two Medical officers, and a Surgeon or Surgeon-Major would scarcely appreciate the position of Medical officer to a battery without an assistant. If the scheme be effected, it will afford a strong argument in support of the unification of the Army Medical Department and the establishment of the general staff system, and may even prove to be a step in that direction.

HEALTH OF SOUTHAMPTON.

This much maligned town is now said to have recovered its normal health. The small-pox somewhat heavily affected the inhabitants some months since, but there is every reason to believe that the extent and virulence of the epidemic were much exaggerated. It was stated at the police-court a day or two since by the mayor, that last week there was only one case of small-pox in the town, and that was in a child. It is to be regretted that when an epidemic, however slight, breaks out in any of our watering-places, a "hue and cry" is at once raised in some quarters, and sensational paragraphs written with a view of being quoted. This was notably the case with Hastings some time since, and with Eastbourne last year. Such "tactics" cannot be too strongly condemned.

QUEKETT MICROSCOPICAL CLUB.

The sixth annual meeting of this important society was held at University College, on Friday, the 28th ult. The number of members now amounts to 550. The annual address was given by the President, Dr. Lionel Beale, who gave a summary of the history of microscopical investigations during the past year. The following were elected office-bearers for the year 1871-72:—President, Dr. Lionel Beale; Vice-Presidents, Dr. R. Braithwaite, Mr. A. Durham, Mr. C. J. Leaf, and Mr. Henry Lee; Members of Committee, Mr. W. H. Golding, Mr. T. Greenish, Mr. E. Marks, and Mr. F. Oxley; Treasurer, Mr. R. Hardwicke; Secretary (foreign correspondence), Mr. M. C. Cooke; Honorary Secretary, Mr. T. C. White. The usual *conversazione* was held after the meeting, at which various objects of microscopical interest were exhibited.

DEATHS BY MISADVENTURE.

"JURORS," particularly coroners' "jurors," are by no means "conjurors," and often arrive at verdicts difficult to understand. We are by no means desirous of undervaluing the coroner's court, although it must be acknowledged that it seems, in some respects, to have more "antiquity than usefulness." A short time since a coroner's jury returned a verdict of "Death by misadventure" in a case in which a chemist had substituted a scruple for a grain of morphia. It is true that they, at the same time, "admonished the chemist to be more careful in future." Now, this is erring, no doubt, on the side of mercy; but how many verdicts have been recorded of manslaughter against Medical Practitioners, not from carelessness or "misadventure," but simply from a case taking an unfortunate turn, notwithstanding every care and skill had been taken and practised? Whatever advantage the coroner's court may occasionally have as a preliminary inquiry in some cases, there can be no doubt that it sometimes acts with peculiar and disastrous injustice in cases of alleged malpraxis on the part of the Practitioners of Medicine.

OVERWORK AND DISEASE.

We are glad to observe that the directors of the London and North-Western Railway have made some important alterations for the benefit of the pointsmen and signalmen in their employment. At the main junctions and stations the ordinary working day is to be reduced from twelve to eight hours, and at less important points these hours are to be observed on alternate weeks. Nor is this change being effected at the expense of the men themselves; on the contrary, their wages are to be advanced. There is, no doubt, a close connexion between the long hours of labour often exacted from signalmen and pointsmen and the occurrence of railway accidents; moreover, in many instances a state of ill-health was induced which inflicted great hardship on the men and their families.

"A PRETTY QUARREL AS IT STANDS."

The duties of Inspecting Medical Officers are not always pleasant or free from annoyance; cases have occurred to show the contrary. The latest is that of Dr. Stevens, the Government Medical Inspector. Having been commissioned to inquire into the health of Longton, he felt it to be his duty to characterise it as the "filthiest" place he had ever visited. Upon this announcement being made, the worthy mayor of the "filthiest" place waxed wroth, and in a plain, but not polite, way declared that Dr. Stevens had uttered a "lie." An explanation or retraction was, of course, demanded, but the mayor declined to make an apology or to explain. Dr. Stevens has placed the matter in the hands of his solicitor. There is not, of course, a mayor of Malpas "village," but there is some person no doubt who represents the intelligence and "dignity" of that unwholesome little place. Let Dr. Stevens be on his guard, for he

thus characterises it:—"It may be stated shortly, that in every conceivable variety of sanitary defect Malpas village emulates the most neglected inhabited spot that has ever been reported on."

DANGERS OF HIGH-HEELED BOOTS.

EVERYONE who has noticed the height to which the heels of women's boots is now carried, must have marvelled much how the wearer could maintain her equilibrium. Walking on stilts is nothing to it. It may be questioned how far the "Grecian bend" has become fashionable from a certain power it gives the wearers of the "high heel" to balance themselves. But there are more evils attending the odious custom than mere falls. The other day Dr. W. H. Paneash, of New York, "after performing an operation on a little girl whose feet had been injured by wearing high-heeled shoes," said, "This is the beginning of a large harvest of such cases."

"FLEXIONS, TORSIONS, AND DISPLACEMENTS OF THE UTERUS."

UNDER this title, Dr. Protheroe Smith delivered a course of lectures at the Hospital for Women at the beginning of this year. Passing over the first lecture, which was an exhaustive review of the literature of a quarter of a century on these subjects, Dr. Protheroe Smith expressed disapprobation of intra-vaginal and intra-uterine instruments as a rule. After speaking of the ordinary causes of such abnormal conditions, he accounted for the frequency of such dislocations by the incessant and excessive efforts of menstruation of the unmarried and of the sterile, confirming his opinions by some novel views of the physiology of menstruation. Thus, when this function is not interrupted by pregnancy and lactation, the uterus, contrary to the primæval law which requires women to "increase and multiply," is over-taxed, and consequently becomes often diseased and displaced. Another frequent cause of uterine dislocations, Dr. Protheroe Smith affirms, is the loss of the angle of 140° , the normal state existing between the spinal axis and that of the pelvis thus presenting a mechanical cause of displacements of this movable pelvic organ. After removing any organic or inflammatory disease of the uterus and its adjuncts, he proposed to remedy this defect by his "pelvic band," by which he restores the natural lumbo-spinal angle of 140° . Having experienced great success in the treatment of uterine deflections since adopting this plan, he strongly advocated the aid of *external* mechanical treatment, and deprecated that by intra-vaginal and uterine instruments, especially when metallic. Dr. Protheroe Smith concluded his course of lectures by stating that spino-pelvic deformity is a frequent cause of derangement of the contained viscera; that their frequency is in keeping with the advance of civilisation, and that they are, with few exceptions, menstrual as to the period of their occurrence; that the primary condition of the uterus itself, forming a predisposing, and at times the exciting, cause of flexions, is hyperæmic or inflammatory engorgement, the frequent result of excessive irritation and uninterrupted menstrual efforts, etc.; that in cases requiring intra-vaginal or intra-uterine treatment, all inflammatory and other organic affections of the uterus and neighbouring viscera should first be removed, and extreme care and gentleness observed, and all pain avoided.

HABITUAL DRUNKARDS IN FRANCE.

A DEPUTY of the National Assembly of France has submitted to the Assembly a project of law regarding drunkenness, and the best means of putting down that vice; and the House has agreed to take the matter into consideration. The Bill proposes that for a time, and as a punishment, habitual drunkards should be deprived of their civil rights; and thus the worthy deputy seems of one accord with Dr. Dalrymple. The national sobriety of the French has been their boast for centuries; and their almost entire freedom from a disgraceful vice was the

more commendable, as, until recently, it appeared quite compatible with their acknowledged genial conviviality. The French, as a people, though never total abstainers, did not get tipsy; France, though temperate, was never at any time a teetotaler. The French, until recently, were accustomed to take their wine like gentlemen, but declined to be turned into hogs by that illustrious magician, Circe, simply because they paid their moderate *devoirs* to the god of wine. Is it that the English "luxury" complained of by General Trochu has taken the form of inebriety? It is said of the First Napoleon that there was a settled idea in his mind that the English were continually tipsy; so, one morning, being desirous of paying a high compliment to the wife of a member of Council at St. Helena, his first inquiry of the lady was, "How often does your husband get drunk?" What would the great Corsican have thought of France in this year of grace?—for, be the causes what they may, concurrent testimony confirms the report that the French are no longer a sober people; but whether the Bill of the honourable deputy will have the effect of reclaiming them to the paths of temperance is an exceedingly doubtful question. Some malignant fate seems to have steeped them to the lips in that fiendish compound—gunpowder, petroleum, and brandy.

MEDICAL INSTRUCTION IN NEW YORK.

WE have read with considerable interest the latest annual circular (1871-72) of the Bellevue Hospital Medical College. The Faculty—a term apparently equivalent to that of "Professional staff" in this country—includes a list of names of Practitioners of European celebrity, amongst which may be found those of F. H. Hamilton, Professor of the Practice of Surgery; Lewis A. Sayre, Professor of Orthopædic and Clinical Surgery, who has just paid us a visit, and has been expounding to highly appreciative audiences at several of our metropolitan Hospitals his special treatment of hip-joint disease; A. B. Mott, Professor of Surgical Anatomy; Austin Flint, Professor of Medicine, and Austin Flint, jun., Professor of Physiology; and William A. Hammond, whose name is too well known in this country to require any special reference. With the session for 1871-72 the College enters upon the second decade of its existence, and we believe that there is no exaggeration in the statement contained in the circular, that "in the number of matriculants and graduates the College is now second to none other in America." This remarkable success is attributed by the Faculty to the plan of instruction, which constitutes the leading feature of the College—namely, the union of clinical and didactic teaching. The collegiate year embraces a winter and a summer session. The winter session is divided into a preliminary and a regular term, the first extending from September 13 to October 10, and the second from October 11 to March 1. The summer session extends from March 11 to July 1. Lectures both clinical and didactic are given during the preliminary term, but attendance on them is not compulsory for graduation, for which the requirements are as follows:—"Three years' pupilage with a *regular Physician in good standing*, (a) inclusive of the time of attendance at Medical lectures; attendance on two full courses of lectures, the last being in this College; certificates of at least one course of practical anatomy or dissections; proper testimonials of character; an acceptable thesis in the handwriting of the candidate; and a satisfactory examination in each of the departments of instruction. The examination in Surgery will in future include ophthalmology. The candidate must be 21 years of age." The resources for clinical instruction seem to be very abundant. Bellevue Hospital receives annually from 10,000 to 12,000 patients, and there is a lying-in department in which the annual number of births exceeds 500. The students also have access to the Small-pox Hospital and the Charity Hospital in Blackwell's Island (the latter containing about 1000 patients), the

(a) We should like to know how the "good standing" is determined.—ED.

Fever Hospital, the Hospital for Epileptics and Paralytics, the Nursery Hospital, the Insane Asylum, etc. Recitations are a new feature to us, at least, in connexion with Medical schools. We are told that, "for the benefit of those who desire a thorough drilling upon the different departments during the progress of the course, the Faculty has organised a recitation class, which will be continued throughout the regular session." These recitations will be held five evenings in the week, and will embrace all the regular subjects. Besides these recitations, there are special courses to private classes. It may excite the envy of our English students to learn that the fee for the dissecting ticket, which includes subjects and all incidental charges, is ten dollars. With regard to the expense of living, we are informed that "good board may be had at a convenient distance from the College at from five to seven dollars (or, on an average, about thirty shillings) per week," and that "pains are taken to provide a list of boarding-houses in the vicinity, so as to suit the wishes and means of students." Such vague ideas commonly prevail in this country regarding the American Medical colleges (many of which institutions are, as we have reason to know, mere diploma-shops), that we are glad to have this opportunity of directing attention to one possessing a teaching staff that would be no discredit to any European school.

FROM ABROAD.—PROFESSOR VIRCHOW'S "AFTER THE WAR"—
EFFECTS OF DEFICIENT FOOD ON THE MILK—CRIMINAL ABORTION
IN THE UNITED STATES.

Soon after the breaking out of the late war, Professor Virchow published in his *Archiv* an interesting paper (see *Medical Times and Gazette*, October 22, 1870, p. 484), in which, after dwelling upon the ignorance that had given rise to its declaration, and the patriotic feeling aroused in its pursuit, he expressed his warmest hopes that the ground of common humanity on which our Profession in either nation could meet would be the means of mitigating some of the horrors of the conflict, and of facilitating reconciliation after its conclusion. To this end he rested great hopes upon the instrumentality of the Geneva Convention. To the June number of the *Archiv* he has contributed an article entitled "After the War," in which he repeats his hopes and wishes that men's minds may now become engaged in the pursuits of peace and instruction. His anticipations of the influence of the Red Cross have, we fear, been scarcely realised, for he dwells in this paper a good deal on the non-observance of its rules on the part of the French combatants, who, indeed, he says, were never made acquainted with them by their Government, while for the German soldiers they had been made a subject of special instruction. At present, statements upon this subject are too loose and unconfirmed to admit of their final reception; but we fear there can be little doubt that the neutrality supposed to be secured by the Geneva Convention was frequently and sometimes intentionally violated on both sides. The last number of the *Lyon Médical* contains a circumstantial narration of what looks very like a marked instance of the latter. Professor Virchow, while bearing witness to the passionate statements of some of the French writers, blames his own countrymen for their too eager recriminations, and their not making allowance for the natural feeling of irritation which must prevail after such disasters. He thinks, however, that some of the scientific men, and especially M. Giraudeau in our own columns, and Professor Chauvin at Lyons, have indulged in charges and assertions which, as wholly devoid of probability or truth, ought not, under any circumstances, have been made. His paper is too long for reproduction in our pages, but is well worth perusal by those whose patience is not already tired out by similar controversies from less able pens. One point, however, we may notice, as it has its literary and abiding interest. The Lyons Professor, in his somewhat fiery address, declares that Virchow, although he had been himself a pupil of Küss, of Strasburg, omits all mention of his right to priority in the

doctrines of the "Cellular Pathology." All who know Professor Virchow's loyalty and exactitude will be prepared for a crushing reply. It is to the effect that he had never been a pupil of Küss, never having, indeed, studied at Strasburg; and as he never met Küss personally until 1861, while his lectures on "Cellular Pathology" were published in 1858, it is evident that no oral statement could have been appropriated in them. Yet, although unconnected with his doctrines on pathology, Professor Virchow has been the only writer in Germany who has acknowledged the merits of Küss as a pathologist, having frequently quoted him in his *Archiv* and also in his *Handbüch*; in fact, bestowing an amount of recognition upon him entirely wanting among his own countrymen until recent political events had rendered his name famous. His small work, "De la Vascularité et de l'Inflammation," published in 1846, is one of real merit, decidedly contributing to an advance in our knowledge of inflammation; but it has no one idea in common with the doctrine developed in the "Cellular Pathology."

At the Académie des Sciences, on the 10th ult., M. Decaisne read an interesting paper on "The Modifications which Human Milk undergoes in consequence of Insufficient Food." He observes that most of the observations that have hitherto been published upon this subject have been made on animals, but the siege of Paris has furnished him with the opportunity of examining it in women. The present paper is based upon an examination of the milk of forty-three suckling women living upon insufficient food, and it concludes as follows:—1. The effects as observed in women are very analogous to those produced in animals. 2. They vary according to constitution, age, hygienic conditions, etc. 3. Insufficient alimentation always induces, in varying proportions, a diminution in the amount of butter, casein, sugar, and salts, while it generally increases that of the albumen. 4. In three-fourths of the cases the proportion of albumen was found to be in an inverse ratio to that of the casein. 5. The modifications in the composition of the milk by means of a reparative alimentation are always manifested in a remarkable manner in four or five days.

It is gratifying to find that of late some serious steps have been taken in the United States towards a more effectual repression of that notorious scandal, the practice of criminal abortion. Enlightened members of our Profession have long lifted up their voices against it, but seemingly with little effect; and it is to be hoped that the co-operation which they have of late received on the part of some of the judges and public prosecutors, late as this has been in manifesting itself, may be attended with better results. At present, however, it is very doubtful how far such efforts are backed up by the opinion of the community at large, and especially of the female portion of it; and a practice that has prevailed so long, so openly, and so extensively, even in respectable spheres of society, will require a considerable amount of official denunciation, and several examples of the infliction of disgraceful punishment, before public opinion can be generated of sufficient force to hold it in effectual check, although it may be resorted to in a more clandestine manner than at present. However, to a certain extent some of the sentences that have been recently passed will have a good effect—or rather, we should say, the terms in which they are delivered may arouse the public conscience, for the sentences themselves have usually been very inadequate as applied to such hardened criminals as practised abortionists. In this country we should think it indeed a strange and poor compliment to a judge to pass a vote of thanks to him for performing his duty, and it shows the gravity and urgency of the case that the New York Academy of Medicine should have deemed it desirable to come to the following resolutions:—

"Whereas the pervading crime of abortion as a regularly advertised business has in this city and county been hitherto opposed by the Medical Profession without the uniform and efficient co-operation of the State officers and the courts which has been desired and reasonably expected: Resolved, that the advent of any administration which will secure it such long-

desired support as shall enable it to successfully contend against the wide-spread crime, practised in too many instances by malefactors possessing or pretending to possess Medical diplomas: Resolved, that Judge Bedford, by his manner of conducting the trials of those notorious abortionists and enemies to mankind, Wolff and Lookup, by the high moral tone of his addresses to, and by his clear and specific instructions given to, the juries; and finally, by his prompt and just sentences, eminently honoured the name he bears, has done efficient service to society, has merited the commendation and shall have the cordial approval of the New York Academy of Medicine, as he doubtless will of every member of the Profession who properly estimates his duty and morality: Resolved, that a copy of this expression of the Academy be sent to Judge Bedford," etc.

How difficult the subject is to deal with in a community where such lax ideas on the matter have prevailed, is seen in the recent conviction of Dr. James Cutter (a man moving in the best circles of the Profession), on his own confession, for having performed criminal abortion. The recklessness exhibited was remarkable, for the woman operated upon was an utter stranger to him, and he only complied with her wishes to save her, as he believed, from impending ruin, no prospect of payment ever having had its influence, as she was poor and wretched. The punishment awarded by the law is seven years' imprisonment; but the judge, of less stern resolve than Judge Bedford, taking into consideration the contrition of the prisoner, the large number of his Medical brethren of high standing who petitioned in his favour on the ground of previous good character, and the fact that "numerous of the most prominent business men of the city of Newark" requested the court to substitute fine for imprisonment, passed a sentence of payment of 500 dollars, which, of course, was no sooner said than done. It is evident that while Physicians in high repute can thus lightly lend themselves to criminal actions, and judges, on their detection, visit them with merely nominal penalties, much—very much—remains to be done before a healthy public feeling can be generated. We feel somewhat curious to know whether the Medical societies and associations to which Dr. Cutter may belong will accept this legal whitewashing as a sufficient reason for continuance of his membership.

PARLIAMENTARY.—THE APPROACH OF CHOLERA—CONTAGIOUS DISEASES ACTS—LOCAL GOVERNMENT BOARD BILL—FACTORIES AND WORKSHOPS AMENDMENT BILL.

On Thursday, July 27, in the House of Lords,

Lord Carnarvon, after some remarks on the apprehended approach of cholera, said he feared it was now too late for any legislative measures to meet the emergency. He referred to the Commission on Water Supply, and the measures recommended by the Sanitary Commission, and asked for a statement of the intentions of the Government.

Lord Kimberley, who said he regarded the existing alarm as to some extent unfounded, described the precautions about to be taken by the Government, and urged by them upon the local authorities. Mr. Stansfeld's Bill, bringing all the powers of local government into one department, would be a great step in this direction.

Lord Shaftesbury hoped that next year the question of water-supply and Sir C. Adderley's Sanitary Consolidation Bill would receive due consideration.

In the House of Commons,

In reply to Mr. A. Herbert,

Mr. Gladstone stated that distinct notice would be given when that part of vote 9 of the Army Estimates which provided for the expenses of the police in carrying out the provisions of the Contagious Diseases Acts might be discussed.

Mr. Hardy asked the Vice-President of the Council whether he had any information as to the approach of cholera, and whether he considered that there were now existing sufficient powers in the central and local governments of the country to protect the population from its ravages.

Mr. W. E. Forster said: As I only saw the question in the business-paper this morning, I shall not be able to answer it so fully as I otherwise might. The latest information I have received on the subject is to the effect that cholera has for the last two years been in Russia, and since August of last year in

St. Petersburg. Since April of this year it has been in Wilna and other western places; recently, it has increased in St. Petersburg, but not nearly so much there as some months ago, and the disease is said to have some diffusion in the western provinces of Russia. We need not assume that this bodes any immediate danger to this country. We have no knowledge of any cases in Germany, but I have requested the Foreign Office that special inquiry on this point may be made at Berlin, and that if cholera is, or arises, in Germany, returns about it may be systematically forwarded to us. While thus there is no reason for immediate alarm, or for any particular action of central authority, there is ample reason that local authorities should exert themselves in the removal of nuisances, and should watch with extreme care over the sources of water-supply within their districts. Water companies should be mindful that the greatest disasters produced by cholera in this country have been due to their distribution of sewage-tainted water, and every care should be used by them, in good time, to prevent the recurrence of any such mischief. Their customers, too, should watch them narrowly. Authorities and water companies, acting as advised, need not be afraid of wasting their trouble; for, whether cholera comes or does not come, they will be preventing other diseases. The danger of cholera is one against which the central Government can do scarcely anything—not because the law gives insufficient jurisdiction, but because, from the nature of the case, everything depends on local action. The Medical Department has given to local authorities in systematic memoranda, and is constantly in various ways giving anew, the best information which it can afford in aid of the local exercise of sanitary powers.

The House went into Committee on the Local Government Board Bill. On Friday this Bill passed through Committee.

On Monday, July 31,

In answer to questions from Sir J. Elphinstone and Mr. Baines touching the literature of the Contagious Diseases Acts controversy,

Mr. Bruce said that if it were conducted with discretion no law could interfere with it, but if it degenerated into a tone of grossness it would be for the courts to say whether it came within Lord Campbell's Act.

On Tuesday,

Dr. Playfair asked the Vice-President of the Committee of Council whether the cases of Asiatic cholera reported as existing at Hull did not occur in ships several days before they reached that port, and whether any case of Asiatic cholera had been as yet reported within this kingdom.

Mr. W. E. Forster: In answer to the question of my hon. friend, I have to state that I received a telegram from Hull shortly after I answered the question put the other evening, that there had been a case of cholera at Hull, and I requested Mr. Simon to send down one of the inspectors. A report was received the next day, which I find, on examination since, is quite confirmed. It is to the effect that it was not a case of cholera that had been imported into Hull; it was the case of a ship coming from Cronstadt, in which a man died two days after leaving Cronstadt, and five days before reaching Hull. In another ship a man had died of cholera at Cronstadt thirteen days before arrival at Hull. There was no case of cholera after arrival at Hull. The Medical Department has no information of any case of Asiatic cholera in this country.

The Local Government Board Bill was read a third time.

The Factories and Workshops Acts Amendment Bill was read a second time.

The order for the second reading of the Public Health and Local Government Bill was discharged, and the Bill withdrawn.

ROYAL ALBERT ASYLUM, LANCASTER.—The Emperor and Empress of Brazil and their *suite* honoured this Institution with a visit on Friday last. The Imperial party was received by Dr. De Vitre, the Chairman of the Central Committee; Dr. Shuttleworth, Medical Superintendent; and Mr. Diggins, the Secretary. The Emperor made numerous inquiries of Dr. Shuttleworth respecting the causes of idiocy, the system of treatment, and the results. Before leaving, their Imperial Highnesses greatly commended the complete arrangements for the training and comfort of the children. The erection of the whole building will, it is expected, be completed by next spring.

PALATABLE CASTOR OIL.—Castor oil may be rendered as "sweet as honey" to take by combining it with equal parts of pure glycerine with which a few drops of cinnamon oil have been previously rubbed up.—*Boston Journal*, May 18.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

REPORT OF THE FORTY-FIRST MEETING.

EDINBURGH, 1871.

THE British Association for the Advancement of Science holds this year its forty-first meeting in the good old city of Edinburgh. It is now twenty-one years since the Association met on the same classical soil, and then it met to celebrate one of the best and most successful of its many successes. Sir David Brewster presided on that occasion, and from that day until now there has been a cherished and often repeated northern desire that the success should be obtained again. How the Edinburgh deputations have fought for a few years past for every inch of the ground they have won, all frequenters of the meetings of the Association know, and some rivals of the Edinburghians know too well. The northern men this year have things their own way, and will, we doubt not, give an account of their stewardship that will bear remembrance.

Edinburgh is considered by the Dryasdust school the very cradle of scientific associations; and it has, in fact, been suggested that it were a pity the Social Science Association and the British Association for the Advancement of Science could not this year make an amalgamated meeting in commemoration of an event some 253 years ago, when such a combined meeting did, forsooth, take place under royal presidency. Our contemporary, the *Athenæum*, in its last impression, records, with some sense of humour, that King James of Scotland and England—Sir Solomon or Sir Fool, according to taste of loyalty—presided over a meeting of philosophers in the Scottish metropolis, and discussed with them various social and scientific questions. Ought sheriffs to hold office by hereditary right and descent? was one of these subjects, on which the King—he was a jealous King on matters of hereditary descent—held his view against the sheriffs. When he heard discussed a scientific question (says the chronicler)—viz., “On the Nature of Local Motion,” during the debate Aristotle was so freely referred to by certain of the speakers, that the King congratulated them on knowing as much about Aristotle as Aristotle knew about himself—a remark which satisfied everybody. A little later, and his Majesty listened to a third disputation, “Concerning the Origin of Fountains or Springs,” whereupon the Solomon had the pleasure of setting men up and hitting them down, and of taking two or more sides on every point, to his royal heart's content. He concluded by giving out a series of bad puns on the names of the debaters, one of which puns was really not so bad had it not been levelled at a man so much more kingly than the King. The philosopher punned against was one Professor Charteris, of whom, said the King, “his name agrees with his nature; charters contain much matter, yet say nothing, and, nevertheless, put a great deal into men's minds.” “The Philosopher,” adds our contemporary historian, “delighted with the Monarch's follies, hired a poet to immortalise the royal wit. The poet put all the bad puns into worse verse, and the Association broke up in a state of jubilation.”

At our meeting, now in its beginning, in Edinburgh in 1871, we shall have no royal president of hereditary descent, but we shall have, nevertheless, a man who, in these working days, has done right royal work, and won a knighthood by labour as enduring and noble as any knight of the olden race. Professor Sir William Thomson, to whom Professor Huxley resigns the chair, is in every sense the man—we may say, without affectation, the Scotchman—for the occasion. His researches on electricity, his great knowledge and persevering activity in the perfection of oceanic telegraphic communications, and his extended and suggestive views on the relations of matter and force, mark him as the man of the century who should preside at a meeting of men of science, where the special is lost in the general and the men in the society they represent.

Professor Thomson is ably seconded by the presidents of the other sections. Over chemistry this year, Dr. Andrews, whose researches on ozone are so familiar to all our readers, presides; and over biology, in which section the physiologists have their say, and which is, consequently, the chief centre of attraction for the Medical part of the Association, the newly-elected Professor of Natural History, Dr. Allen Thomson, holds presidential rule.

The prospects of the present meeting are good, although

many obstacles stand in the way. One or two other meetings of a similar kind are at hand in England. In Ireland the approaching Royal visit is the great source of attraction; and the fact that Parliament is still at work is no small disadvantage, seeing that there are a few men in Parliament whose presence is always important in this Parliament of Science. Against these obstacles there is the double set-off that France and Germany are at peace, and that the scholars in science of those two great countries are expected in force.

INSTRUCTIONS FOR VACCINATORS UNDER CONTRACT.

1. EXCEPT so far as any immediate danger of small-pox may require, vaccinate only subjects who are in good health. As regards infants, ascertain that there is not any febrile state, nor any irritation of the bowels, nor any unhealthy state of skin; especially no chafing or eczema behind the ears, or in the groin, or elsewhere in folds of skin. Do not, except of necessity, vaccinate in cases where there has been recent exposure to the infection of measles or scarlatina, nor where erysipelas is prevailing in or about the place of residence.

2. In all ordinary cases of primary vaccination, if you vaccinate by separate punctures, make such punctures as will produce at least four separate good-sized vesicles, not less than half an inch from one another; or, if you vaccinate otherwise than by separate punctures, take care to produce local effects equal to those just mentioned.

3. Direct care to be taken for keeping the vesicles uninjured during their progress, and for avoiding afterwards the premature removal of the crusts.

4. Enter all cases in your register on the day when you vaccinate them, and with all particulars required in the register up to column nine inclusive. Enter the results on the day of inspection. Never enter any results which have not been inspected by yourself, or your legally qualified deputy. In cases of primary vaccination, register as “successful” only those cases in which the normal vaccine vesicle has been produced; in cases of revaccination, register as “successful” only those cases in which either vesicles, normal or modified, or papules surrounded by areolæ, have resulted. When the vaccination of an unsuccessful case is repeated, it should be entered as a fresh case in the register.

5. Endeavour to maintain in your district such a succession of cases as will enable you uniformly to vaccinate with liquid lymph directly from arm to arm; and do not, under ordinary circumstances, adopt any other method of vaccinating. To provide against emergencies, always have in reserve some stored lymph—either dry, as on thickly-charged ivory points, constantly well protected from damp; or liquid, according to the method of Dr. Husband, of Edinburgh, in fine, short, uniformly capillary (not bulbed), tubes hermetically sealed at both extremities. Lymph, successfully preserved by either of these methods, may be used without definite restriction as to time; but with all stored lymph caution is necessary, lest in time it have become inert, or otherwise unfit for use. If, in order to vaccinate with recent liquid lymph, you convey it from case to case otherwise than in hermetically sealed capillary tubes, do not ever let more than eight hours intervene before it is used.

6. Consider yourself strictly responsible for the quality of whatever lymph you use or furnish for vaccination. Never either use or furnish lymph which has in it any, even the slightest, admixture of blood. In storing lymph, be careful to keep separate the charges obtained from different subjects, and to affix to each set of charges the name, or the number in your register, of the subject from whom the lymph was derived. Keep such note of all supplies of lymph which you use or furnish as will always enable you, in any case of complaint, to identify the origin of the lymph.

7. Never take lymph from cases of revaccination. Take lymph only from subjects who are in good health, and, as far as you can ascertain, of healthy parentage; preferring children whose families are known to you, and who have elder brothers or sisters of undoubted healthiness. Always carefully examine the subject as to any existing skin disease, and especially as to any signs of hereditary syphilis. Take lymph only from well-characterised uninjured vesicles. Take it (as may be done in all regular cases on the day-week after vaccination) at the stage when the vesicles are fully formed and plump, but when there is no perceptible commencement of areola. Open the vesicles with scrupulous care to avoid drawing blood. Take no lymph

which, as it issues from the vesicle, is not perfectly clear and transparent, or is at all thin and watery. From such a vesicle as vaccination by puncture commonly produces, do not, under ordinary circumstances, take more lymph than will suffice for the immediate vaccination of five subjects, or for the charging of seven ivory points, or for the filling of three capillary tubes; and from larger or smaller vesicles take only in like proportion to their size. Never squeeze or drain any vesicle. Be careful never to transfer blood from the subject you vaccinate to the subject from whom you take lymph.

8. Scrupulously observe in your inspections every sign which tests the efficiency and purity of your lymph. Note any case wherein the vaccine vesicle is unduly hastened or otherwise irregular in its development, or wherein any undue local irritation arises; and if similar results ensue in other cases vaccinated with the same lymph, desist at once from employing it. Consider that your lymph ought to be changed if your cases, at the usual time of inspection on the day-week after vaccination, have not, as a rule, their vesicles entirely free from areolæ.

9. Keep in good condition the lancets or other instruments which you use for vaccinating, and do not use them for other Surgical operations. When you vaccinate, have water and a napkin at your side, with which invariably to cleanse your instrument after one operation before proceeding to another.

THE PHYSIOLOGY OF MIND IN THE LOWER ANIMALS.

INDEPENDENTLY of Mr. Darwin, who has devoted a considerable part of the first volume of his "Descent of Man" to this question, Dr. Lindsay, Physician to the Murray Royal Institution for the Insane, Perth, has for the last two years "been studying the subject of Mind in the lower animals, both in its normal and diseased conditions," and the result of his investigations—in so far as the physiology is concerned—is given to us in the April number of the *Journal of Mental Science*. "My object," says Mr. Darwin, "in this chapter (the second) is solely to show that there is no fundamental difference between man and the higher mammals in their mental qualities;" and, "with respect to animals very low in the scale, I shall show that their mental powers are higher than might be expected." Dr. Lindsay clearly holds similar views, when he observes that "certain of the lower animals possess, quite as much as man does, a natural disposition or character which includes both *virtues* and *vices*—amiable and unamiable, noble and ignoble qualities. Not only, however, is there frequently a character pertaining to the species, but among certain animals (as the dog) there is an *individuality*, occasionally quite as marked as that which exists in man." We shall endeavour in this article to lay before our readers a sketch of the leading results at which these well-qualified observers have arrived.

To begin with the *virtues* of animals, we meet with numerous examples in which maternal affection is exhibited by animals in various ways. "Rengger observed an American monkey (a *cebus*) carefully driving away the flies which plagued her infant; and Duvancel saw a *hylobates* washing the faces of her young ones in a stream." (a) Certain female monkeys kept by Brehm in North Africa died from grief when they lost their young; and this naturalist observed that orphan monkeys were always adopted by some of their older companions. That "blood is thicker than water" is a proverb apparently believed in as fully by monkeys as by men, as the following anecdote will show:—An old baboon in the Zoological Gardens had adopted a rhesus monkey; but when a young drill and mandrill were placed in the cage, she saw that they were nearer relatives than the rhesus, and at once adopted them and disinherited the rhesus, who, like other disinherited heirs, subsequently did all in its power to annoy its supplanters.

Motherly love is moreover exhibited to a great extent by the female dog, and by numerous mammals, even down to the cetaceans. Is there a single reader of these pages who has not enjoyed the chapter on "Our Dogs," in Dr. John Brown's "Horæ Subcivæ"—who does not know the history of "Toby, Wasp, Rab, and Company"? "If such there be," we can only say that he has a pleasure to come. It is there recorded that

"once, when Wasp had three pups, one of them died. For two days and nights she gave herself up to trying to bring it to life—licking it and turning it over and over, growling over it, and all but worrying it to awake it. She paid no attention to the living two, but was as one possessed, and neither ate, nor drank, nor slept, and was in such a state of excitement that no one could remove the dead pup." For the history of how, on the third day, she committed its body to the depths, and then, on her return home, "sought out the living two and devoured them with her love," we must refer to Dr. Brown's enchanting pages. Could any human mother's love exceed that of Wasp?

Brotherly love is cultivated by various animals, according to Dr. Lindsay. We doubt whether some of the cases of social and gregarious animals, as the communities of bees, wasps, ants, and the shoals of fishes, and the herds of antelopes, buffaloes, etc., are quite to the point, but dogs are often much attached to one another, and it is no uncommon sight to observe a large and very little dog on the most affectionate terms. Perhaps the prairie dogs (which our readers doubtless know are not dogs, but rodents) exhibit this feeling as much as any animals. Professor Jillson, (b) who kept two of them for some time, describes them as "very affectionate, seldom quarrelling, and often standing with their forepaws on each other's shoulders, rubbing their noses together," and, on being brought together after a short accidental separation, "the demonstrations of affection which followed would put to shame many a couple of higher intelligence." Amongst other virtues which Dr. Lindsay notices in animals are (1) generosity and benevolence, (2) gratitude, (3) fidelity, (4) courage, (5) emulation, (6) caution, (7) obedience, (8) patience, (9) industry, and (10) providence. Many of these virtues are also referred to and illustrated by Mr. Darwin. Our limited space prevents us from touching upon more than a few of these heads. There can be no doubt that, while many animals are far from feeling any sympathy for their fellows in distress, some undoubtedly exhibit a benevolent interest in cases of old age, suffering, or danger. Numerous well-authenticated anecdotes of dogs, rats (a blind individual being led by a straw), and other mammals exhibiting this virtue are on record, and both Mr. Darwin and Dr. Lindsay refer to cases in which it has been exhibited by birds. The former quotes observations by Captain Stansbury of a blind old pelican that was kept positively fat by the humanity of its friends, and by Mr. Blyth of Indian crows similarly feeding their blind companions. As illustrative of a form of courage almost amounting to heroism, and quite distinct from the mere instinctive courage of the bulldog, we may mention the story of a noble-minded baboon recorded by Brehm and quoted by Mr. Darwin. A great troop of baboons was crossing a valley in Abyssinia, when those in the rear, which were still on the low ground, were attacked by dogs. All, however, after a short skirmish, succeeded in ascending the heights on the opposite side excepting a young one, about six months old, who, loudly calling for aid, climbed on a block of rock and was surrounded. One of the largest males, seeing the perilous state of affairs, came down from the rocky eminence on which he was safely perched, slowly went up to his young friend, coaxed him, and triumphantly led him away, the dogs being too much astonished to make an attack. A little American monkey in our Zoological Gardens some years ago exhibited a rare amount of physical courage and attachment to its keeper. It lived in the same large compartment with a fierce baboon, of which it was dreadfully afraid. Yet when this ferocious monster attacked the keeper, the monkey rushed to the rescue, and, by screams and bites, so distracted the baboon that the man was able to escape. If we compare the conduct of the Abyssinian baboon and the American monkey with that of the Fuegians, who, when their parents get old or fall ill, bury them alive, or of the Koraks, (c) who explained to some recent travellers the different ways in which they killed their old people when they became unfitted for a nomadic life, we fear that "the paragon of animals"—at all events as represented by these unsophisticated races—will hardly benefit by the contrast.

With these and many other *good* qualities are associated many of an opposite kind, some of them amounting to *vices*. Amongst these vices Dr. Lindsay specially mentions obstinacy, laziness, dishonesty, vindictiveness, cowardice, treachery, etc. Passing over this section of the memoir, we come to the consideration of "certain other mental qualities that constitute important features in disposition and character, but which scarcely belong to the category either of virtues or vices," as vivacity,

(b) *The American Naturalist*, for March, 1871.

(c) See Kennan's "Tent Life in Siberia," page 222, one of the most instructive and amusing books of travel published for many years.

(a) Darwin, "The Descent of Man," vol. i., p. 40.

curiosity, and pride. As illustrative of vivacity he refers to the mocking-bird, which carries its playfulness to the extent of serious practical joking, decoying and terrifying other birds, and to a Capuchin monkey, which, according to Humboldt, was in the habit of catching a pig every morning, and riding it for the rest of the day. The curiosity of animals is admirably illustrated by an anecdote which Brehm tells regarding monkeys. Their horror of snakes is well known, yet certain of his monkeys could not resist the temptation of occasionally lifting up the lid of a box in which they knew the snakes were contained. For a most amusing account of the mode in which Mr. Darwin, with various modifications, repeated the snake experiment upon the London monkeys we must refer to page 43 of his first volume.

"Hardly any faculty," says the author to whom we have just referred, "is more important for the intellectual progress of man than the power of *attention*." Both the writers whose labours we are at present noticing dilate considerably on the amount of this power that is exhibited by certain animals, and they point out that the faculty is as variable amongst creatures of the same species as amongst school children. Dr. Lindsay gives a sketch of an interview which a member of the staff of the *New York Times* had with a trainer of dogs for theatrical performance. This dog-teacher observes that poodles are the best dogs for the stage, and that it is surprising to know the difference it makes to train a dog from an *intellectual stock*. "That poodle's grandfather ran one hundred nights in 'The Orphan's Friend,' and his grandson learns 'most anything at one showing.'" Mr. Darwin tells us of a monkey-trainer who bought his animals at five pounds apiece, but offered double the price if he might keep three or four of them for a few days, and then make his selection. The success of a monkey on the stage mainly depending on its power of attention, he could learn in that short period which were promising and which were hopeless pupils—a monkey that during its lesson allowed himself to be diverted by (for example) a fly on the wall was at once placed in the latter category.

Few persons who have been careful observers of animal life can doubt that not only the higher mammals, but certain birds and insects possess a considerable amount of reasoning power. Monkeys, probably, as might be expected, stand next to man as reasoners. Rengger's Paraguay monkeys, on first receiving eggs for food, smashed them, and thus lost most of their contents; but they speedily hit upon the process of cracking one end of the egg and picking off the fragments of shell with their fingers. Lumps of sugar were often given them, wrapped up in paper, and Rengger sometimes put in a wasp with the sugar, so they occasionally got stung. After this had once or twice happened, they always held the packet to their ears to detect any movement before opening it. Mr. Darwin quotes two stories of thoroughly-broken retrievers which, under special circumstances which fully warranted their proceedings, killed wounded birds, showing, as he says, "reason, though not quite perfect."

The remarks on the *language of animals* by both our authors are deserving of much attention. Leroy, better known as "the Naturalist of Nuremberg," more than a century ago asserted that animals have a spoken language, and a much later writer of high authority, the late Archbishop Whately, maintained that man "is not the only animal that can make use of language to express what is passing in his mind, and can understand, more or less, what is so expressed by another." The dog, since being domesticated, has learnt to bark in at least four or five distinct tones, each expressive of a different feeling, and all perfectly intelligible both to man and to his fellow-dogs. There is a monkey in Paraguay, described by Rengger, which utters at least six distinct sounds that are clearly understood by its fellows. "Articulate language is, however (says Mr. Darwin), peculiar to man." To this statement we should decidedly demur if he did not subsequently add that "it is not the mere power of articulation that distinguishes man from other animals; but it is his large power of connecting definite sounds with definite ideas." We have met with parrots which undoubtedly do not always speak at random, but in some instances associate a meaning with the words they utter. A publican in Melbourne is recorded as having succeeded in evading being detected in Sunday trading by having taught his parrot to cry out "Police!" whenever those dangerous officials came in sight. That animals have the power of communicating their ideas to their fellows is beyond any possibility of doubt, although we may never understand the mode of their communication. Sir Emerson Tennant tells us in his "Natural History of Ceylon" of two crows that enviously watched a chained-up dog enjoying a bone. After two or three futile attempts

to rob him of his prize they retired for a time, and then returned with an *insouciant* air, as if they had no concern with either dog or bone. On a sudden, however, when the dog was at the length of its tether, one bird seized him by the tail, and as he turned his head to attack the aggressor, the other hopped off in triumph with the prize. Surely so deep-laid a scheme as this must have required a somewhat complex form of language.

The last attribute to which we shall advert as being common to animals as well as man, is *consciousness*, or an appreciation of right and wrong. We all know the "conscience-stricken tail" of the guilty dog. As the American dog-trainer to whom we previously referred observed, "Dog human-nature will show itself *there*." Mr. Bennett gives an instance of consciousness of wrong-doing in the Ungka ape, which quietly restored a piece of soap he had taken when he saw that his theft had been observed; and Du Chaillu describes a similar case in a young chimpanzee; while Brehm tells us that when the baboons in Abyssinia plunder a garden they silently follow their leader, and if an imprudent young animal makes a noise he receives a slap from the others to teach him silence and obedience—but as soon as they are sure that there is no danger, all show their joy by much clamour. (See Darwin, *op. cit.*, vol. i., p. 79.) Some animals have not only got a code of ethics, but inflict punishments upon those of their companions who infringe upon this code. Cases have been more than once observed of a jury of rooks sitting on some unfortunate sinner, and terminating the assize by becoming his executioners, and pecking him to death; and many instances are recorded in which ants, failing to discharge their public duties—as, for instance, to take their part in assisting at the funerals of their fallen comrades after a battle—have been seen to be at once sacrificed as examples to the rest.

May we, without shocking the feelings of our readers, venture to suggest that possibly some of the higher mammals, and especially the dog, may have an approach to a feeling of *religion*? We do not stand alone in this belief. Leroy—probably one of the best observers of animal life that ever existed—points out that the special affection of a creature for one of a superior order may be considered a semi-religious state of mind; and his predecessor, Bacon, must have had this feeling when he observed that "man is the *god* of the dog"—a statement commonly credited to the poet Burns. This view is strengthened, as Mr. Darwin observes, by the very different behaviour of a dog when returning to his master after a temporary separation, to his conduct when again meeting his old fellow-companions.

We trust that we have adduced sufficient evidence to convince even the most sceptical that, to use the words of Dr. Lindsay, "certain of the lower animals possess *mind of the same nature as that of man*; that there is no mental attribute peculiarly or characteristically human; and that there is, therefore, no essential mental distinction between man and other animals;" or, to put it as Mr. Darwin does, that "the difference in mind between man and the higher animals, great as it is, is certainly one of degree, and not of kind."

THE CURE OF INEBRIATES IN AMERICA.

ABOUT a year and a half ago we discussed this subject in especial reference to the labours of Dr. Albert Day, at the Washingtonian Home, Boston, and subsequently at the New York State Inebriate Asylum, Binghamton. Since that time we have received two additional Binghamton reports—namely, those for 1869 and 1870. The former of these reports bears the signature of Dr. Day, is written in the same genial and hopeful spirit as his former reports, records many remarkable cases of cure, and affords no indication of any impending changes in the institution, which he had worked up, against many drawbacks, into a state of thorough efficiency. In the latter, which is signed by a Dr. Daniel Dodge, there is positively not even a passing allusion to the labours of his predecessor, who, as we have been informed on good authority, felt compelled early in the spring to send in his resignation, in consequence of the factious opposition that he encountered from certain influential members of the committee, from whom he had every right to expect cordial support. Whether he published an account of doings in connexion with the Hospital that were not intended or suited for publication, we do not

know, and do not care to inquire; but, at all events, the place knew him no more, and not only is he totally ignored, as we have already remarked, by his successor, but, at the "kind invitation" of that person, John M. Pomeroy, Esq., a late inebriate, gives the results of his inquiries and observations, and "offers some remarks in reference to the Asylum and its best interests," which are "published by direction of the Superintendent." It will hardly be credited that this Dr. Daniel Dodge has directed the late inebriate to write as follows respecting Dr. Day and himself:—"The institution has passed through a troubled existence, and it has at length been placed upon a sure basis. For the first time since its foundation, we find its internal management in the hands of a man who unites Medical science with administrative ability, and who commands the respect of every patient." We don't grudge Daniel Dodge the "respect" of the sots by whom he is surrounded, for any respect that more creditable admirers may have entertained for him will probably be lost by the total absence of Professional etiquette that he seems to have exhibited. Statistics, unfortunately, do not speak so favourably for Dr. Daniel Dodge as we should have inferred from the late inebriate's eulogistic statements. Our readers, in going over the following numerical results, must bear in mind that Dr. Day had charge of the Asylum not only during the whole of 1869, but till at least the end of April, 1870, and that it was only during the last eight months of the latter year that Dr. Dodge was Superintendent.

	1869.	1870.
Number of patients received during the year	244	220
Average number per week	71	60
Largest number per week	97	72
Smallest number per week	55	48
Paying patients	205	181

The deleterious influence of Dr. Dodge is perceptible in all these comparisons. As in a paper on "Restraint as a Remedy in the Treatment of Inebriety," published in the "Proceedings of the American Association for the Cure of Inebriates," Dr. Dodge admits that "previous to the last six months we [*i.e.*, Dr. Dodge] paid no more attention to this subject than usually falls to the lot of all Practitioners," and as he tells the trustees that he had in some measure to learn the peculiar practice essential to the treatment of drunkards, we need not refer further to his report, to which we have nothing special to object, except the statement (which he makes as if it were a highly creditable one) that he had "printed and widely disseminated two addresses delivered by patients," one being the obnoxious article by Mr. Pomeroy already noticed.

We feel bound in honour to our readers to place these unpleasant facts on record, because we *did* hold up Binghamton, both in these pages and elsewhere, as a model institution, and *do* hold a very different opinion regarding it under its present management, and we are in a position to add that our present views are in accordance with those of the leading New York Physicians.

Whether the "American Association for the Cure of Inebriates" will do any real service we cannot yet tell. The proceedings of their first meeting, held last November in New York, are now lying before us. At that meeting, seventeen "Physicians, superintendents, and friends of inebriate asylums" were enrolled as members, and papers were read "On the Pathological Influences of Alcohol and the Nature of Inebriation," by Dr. Davis; "On the Philosophy of Intemperance," by Dr. Parrish; "On the Disabilities of Inebriates," by the Inmates of the Pennsylvania Home; on his "Experiences at the Washingtonian Home," by Mr. Lawrence; "On Restraint as a Remedy in the Treatment of Inebriety," by Dr. Dodge; "On the Relation of the Church to Inebriates," by the Rev. J. Willett; "On Inebriate Asylums as they relate to Questions of Social and Political Economy," by Dr. Albert Day; "On the Moral and Social Treatment of Inebriates," by Dr. Wardner; and "On the Statistics of Inebriety," by Dr. Parker.

These papers, as might be expected, vary extremely in their value. Dr. Davis, of Chicago, after noticing experiments on alcohol by Boker (*sic*) and Boucherdet (*sic*), tells us that the fact that "its presence in the system reduces the temperature was first fully established by the result of a series of experiments performed by myself in 1850." "The tests were applied to both wine and whisky,"—by which we presume he means drinkers of those fluids. We fear that this gentleman's facts are not more accurate than his grammar. For example, he tells us that "the eminent Dr. Todd testified strongly to the sustaining and beneficial influence of alcoholic drinks in the low forms of fever, yet statistics show that in the London fever Hospitals, with which he was connected, the ratio of mortality increased *pari passu* with the increased use of alcoholic drinks

as remedies." If these pages should by chance reach the eyes of Dr. Davis, we trust he will name the fever Hospitals he refers to and give his authority for his statement regarding the increased mortality. Our English Physicians will, however, doubtless thank him for the information that "fevers placed in tents, with plenty of fresh air and nourishment," give "a mortality of only one in seventeen," when they have clearly elaborated the meaning of that very remarkable statement. We trust that the printer is responsible for the "censorium" to which the morbid impressions of drunkards are transmitted.

There is much that is worth reading in the essay on "The Philosophy of Intemperance," but Dr. Parrish, like Dr. Davis, takes occasional liberties with the English language. If we allow him to speak of "scientists," "extremists," and "hereditation," we must take exception to "pravity," nor can we admit that there are "qualities" which yield intoxicants (see page 26). Amongst the causes of intoxication he especially notices "constitutional susceptibility" and "hereditary predisposition," and then proceeds to discuss, without any very definite mode of arrangement, "the Law of Inebriety," "the Relation of the Inebriate to Society," "Intemperance as a Disease," "Temperance Societies," "Inebriate Institutions," and "Insanity in connexion with Drunkenness."

A single paragraph will suffice to show the character of the paper on the "Disabilities of Inebriates," communicated by the Inmates of the Pennsylvania Sanitarium. These unfortunate persons "respectfully submit six propositions for the consideration of the Association," one of which is—"That our sorrows and sins are made texts for sermons; our symptoms and misfortunes are caricatured by lecturers and performers; and we are exposed alike to odium and ridicule, which has a most depressing and damaging effect upon our mental and moral nature." We may add that (probably in consequence of a clergyman being one of the members of the Association) they propound the serious theological question:—"Were they upon whom the tower in Siloam fell the worst of criminals?" and that they conclude their astounding paper with the expression of a hope "that they, whose possession has seemingly more than equalled that of the ancient maniac of the tombs, may yet be found sitting at the feet of Divine Wisdom, clothed, and in their right minds." As far as we can understand the nature of the wish expressed by these *modern* maniacs, we heartily reciprocate it; but we cannot help expressing our opinion that the publication of this paper does not redound to the credit or good sense of the Association.

Mr. Lawrence's "Experiences at the Washingtonian Home," and Dr. Albert Day's paper on "Inebriate Asylums as they relate to Questions of Social and Political Economy," are the most valuable of this miscellaneous collection of memoirs. Both these gentlemen refer to the terrible prevalence of drunkenness at the present day amongst women of all classes—from the poor and degraded to the rich and respectable; and while the former advocates special asylums for females, the latter states that in the Greenwood Institution, Massachusetts, which he established on leaving Binghamton in the spring of last year, ladies and gentlemen sat at the same table, "and participated in becoming social amenities," without any apparent drawback. The Rev. J. Willett stated, in confirmation of Dr. Albert Day's view, that in the King's County Home, of which he is Superintendent, both sexes are included under the same roof.

Dr. Parker's article on the "Statistics of Inebriety" is, perhaps, as complete as we have any right to expect. After treating of the relative chances of duration of life in temperate and intemperate persons at the ages of 20, 30, and 40, and the annual loss in a money point of view caused by alcohol in the city of New York, he proceeds to consider the proportion of cases cured. "During the past two years [*i.e.*, from November, 1868, to November, 1870, during eighteen months of which Dr. Day had charge of the Institution] 476 patients have been treated at Binghamton, of which number 163 have remained well since their discharge, 94 have relapsed, and 219 have not been heard from. This gives 63½ per cent. of those heard from that have remained cured."

From the report of the Sanitarium at Media, Penna., drawn up by the Superintendent, Dr. Parrish, we learn that 168 patients have been admitted since its opening in June, 1867, and that sixty-seven, or about 40 per cent., were cured, who (as he calculates) are a saving each year to the State of 133,200 dollars.

Mr. Lawrence, who succeeded Dr. Day at the Washingtonian Home at Boston, thinks that 33½ per cent. of the patients are *permanently* cured, and a large percentage of the remainder greatly benefited.

Of the patients admitted into the Inebriates' Home in Brooklyn, the Rev. Mr. Willett believes that fully one-third recover permanently.

Of seventy-one patients discharged from the Washingtonian Home in Chicago, Dr. Wardner reports thirty-nine cured, eight doubtful, fifteen hopeful, and nine hopeless.

In one of our former articles on this subject, we showed that, taking an average of twelve years' experience, the cures effected in the cases treated by Dr. Day at the Washingtonian Home and at Binghamton amounted to above 60 per cent. We learn from the present paper that, during the short time the Greenwood Institute had been opened (scarcely six months), sixty patients had been admitted, "about 70 per cent. of whom he believes he shall cure, they being from the better class of cases."

We may observe, in conclusion, that no less than six institutions for the reception and treatment of drunkards were represented at this first meeting of the Association by Medical Superintendents, that the speedy opening of the Maryland Inebriate Asylum is announced, and that other similar institutions are in contemplation. There are probably other refuges in existence in the western and southern States, of which we have no personal knowledge. It is only by the perusal of Mr. Whymper's volume of "Travels in Alaska" that we know that, for some years back, such an establishment has been doing good work at San Francisco. The experience of our American brethren has placed their utility beyond all question.

PROPOSED JOHN HUNTER MEMORIAL WINDOW.

THERE is a subscription set on foot to place a memorial window to John Hunter in the new parish church which is being erected at Kensington. John Hunter's country house, "Earl's-court," stands in the parish of Kensington, where it remains but little changed to this day. Mr. Frank Buckland, whose part in burying John Hunter in Westminster Abbey we all remember, has been pleading for subscriptions to the John Hunter window in the number of *Land and Water* for July 8. He gives an account of a pilgrimage he made to Earl's-court, which is so full of interest that we cannot refrain from reproducing a part of it.

"John Hunter built this house himself. It was originally a plain brick building, in the form of a square; but as his practice increased he added to it on both sides. It is just the sort of house the great anatomist would have built. There is not the slightest attempt at effect or useless ornamentation. His favourite room was evidently the large room on the ground-floor, looking out on the park. In this room there is plenty of space for his papers, books, instruments, microscopes, and all the paraphernalia of a working physiologist. Mrs. Hunter's rooms were evidently upstairs, and the panels of the doors are ornamented with drawings painted in water-colours. No doubt John Hunter had as great a horror of feminine interference in his studio as have many philosophers of the present day. All round the house is a covered cloister dug about six feet into the earth. I expect John Hunter had two reasons for making this cloister, which is very like a prolongation of areas to the London houses. Firstly, this cloister would keep the house dry, and, secondly, it would form a grand place for keeping live stock. I have no doubt, therefore, that in this cloister he kept many of his smaller animals used for experiments, such as dormice, hedgehogs, bats, vipers, snakes, and snails, for his researches on torpidity; and hutches full of rabbits, whose unfortunate fate would be to have their ears frozen to prove points connected with blood-circulation.

"It would also be a good place to hang up skeletons, or dry preparations, or to macerate bones. Nobody more than myself knows the value of an area—I am sorry to say my own area in Albany-street is terribly small—to a London house, especially when one has a great many dissections on hand; and I have no hesitation in saying that John Hunter made a great many of his preparations now in the Museum of the College of Surgeons in this cloister-like area.

"The entrance into these cloisters leads through a subterranean passage, very dark, and like an enlarged fox's earth. This passage, again, I warrant, was one of Master John's contrivances, for through his burrow he could wheel a tidy-sized

cart or truck, and drag into his den anything, from a giant's body up to a good-sized whale; and I have no doubt that the *Balaenoptera Rostrata*, 17 ft. in length, described in his works on whales, was once carted down this passage into the area, to be cut up, and figured, and described. The entrance to where the stables originally stood was not far from this burrow, and John could easily have whipped anything into the stable-yard down his fox's earth and into the area, without Mrs. Hunter knowing anything about it; and I'll be bound to say she used occasionally to 'lead him a life,' and kick up a row if any preparation with an extra effluvia about it was left on the dissecting-table when the great Surgeon was obliged to go out on his Professional duties.

"At one end of his burrow there is a mysterious-looking door, which leads into a small room, now used as a general receptacle for rubbish. Up in the corner were a lot of bones. I eagerly examined them, but they were only kitchen bones. In another corner of this room there is a largish-sized copper boiler standing out of the wall. Two doors fit on the top of this boiler, which close it up quite tight. Ah! if this old boiler could only tell what it had boiled! One giant, we know, was boiled up in it, for in 1787 John Hunter wrote as follows to Sir Joseph Banks: 'I have lately got a tall man. I hope to be able to show him to you next summer.' This tall man was no doubt O'Brien, the Irish giant, whose skeleton is now in the Hunterian Museum at the College of Surgeons, alongside the skeleton and coffin-plate of 'Jonathan Wild,' the great thief-taker of Jack Sheppard's time. O'Brien (or Byrne) was said to be over 8ft. high. In the *Annual Reporter Chronicle*, June, 1783, we read:—'The giant expressed an earnest desire that his ponderous remains might be sunk out at sea; but if such were his wish it was never fulfilled, as Mr. Hunter obtained his body before interment of any kind had taken place.' Elsewhere we read:—

"In the dead of night the body was removed in a hackney coach, and having been carried through several streets, was transferred to Hunter's own carriage, and conveyed immediately to Earl's-court. Fearing lest a discovery should take place, Hunter did not choose to risk the delay which the ordinary mode of preparing a skeleton would require; accordingly, the body was cut to pieces, and the flesh separated by boiling; hence has arisen the brown colour of the bones, which in all other respects form a magnificent skeleton."

"John Hunter is said to have given £500 for the body of O'Brien. I doubt if he did anything of the kind, for I well recollect old Mr. Clift (who was John Hunter's assistant), telling me when a boy a very different story. In Bristol Museum, if I recollect right, there is, or was, a stocking of O'Brien hanging against the wall. If I recollect right the inscription says, 'This is the stocking of O'Brien, the Irish giant, who lies buried in the Cathedral churchyard.' At all events, there can be no doubt that O'Brien was wheeled down John Hunter's fox's earth, cut up in the area, and boiled down in John's universal preparation-maker.

"As I searched about in the copper, I fancied the great John behind me, with his high cheek-bones, bright intelligent eyes, expressive eyebrows, and white hair curled behind, and his hands in his pockets, smiling his satirical smile at me, and saying, 'So, Master Frank, there you are again; you found me in the vaults of St. Martiu-in-the-Fields, and got me buried in Westminster Abbey, twelve years ago, and now I find you actually in my house investigating my private skeleton-making copper. Never mind, my son; keep up my memory, and perhaps I will give you a wrinkle that may be of use to you about salmon, from my notes, a cartload of which (as Sir William Fergusson rightly said, in his last oration in my honour at the College) Sir Everard Home burnt, and which are now lost to your generation.'

"Close to the boiler are the old (now tumble-down) pig-styes, and it was doubtless in these very pig-styes that John Hunter kept the little pigs which he fed with madder, so as to cause their bones to become red. (See preparations in the College of Surgeons.) This was doubtless also the place referred to when he wrote—'I gave pigs a preference to any other animal, as being easily managed, and breeding perfectly well under the confinement necessary for experiments. I selected a sow, and cut a slit in her ear to distinguish her from the others.' Hence his valuable paper on the functions of the ovaria.

"In the farmyard by the pig-stye, no doubt, were kept the cocks and hens whose spurs John Hunter cut off and planted into their combs; likewise the ducks used for the table, and also for experiment, for he writes:—'I took two ducks, and fed one with barley, the other with sprats, for about a month, and killed both at the same time. When they were dressed,

the one fed wholly with sprats was hardly eatable, it tasted so strongly of fish.'

"Above the stable was the pigeon-house, in which lived the pigeons, from the observation of which he was enabled to write as follows:—"During incubation, the coats of the crop in the pigeon are gradually enlarged and thickened, like what happens to the udders of females in mammalia in the time of uterine gestation. If we allow either of the parents to feed the brood, the crop of the young pigeons, when examined, will be discovered to contain the same kind of curdled substance as that of the old ones, which passes from thence into the stomach, where it is to be digested."

"This, then, is the philosophical explanation of the vulgar story of 'pigeon's milk.' The poor cocks and hens, the turkey-cocks and the geese in the farmyard, the eagles, owls, and hawks in the hayloft, and the ostrich in the cow-house, were all likewise subjected to experiment to prove that the air-cells in birds' bones and feathers communicated with the lungs, for he writes:—"I next cut the wing through the os humeri in another fowl, and, tying up the trachea, as in the cock, found that the air passed to and from the lungs by the canals in this bone. The same experiment was made with the os femoris of a young hawk, and was attended with a similar result." In the stable-yard were chained up wolves, jackals, and dogs, whence he obtained those curious hybrids, 'one of which, being three-parts dog, I gave to my friend, Mr. Jenner, of Berkeley,' likewise boxes for the accommodation of the opossums, 'which I have often endeavoured to breed in England. I have brought a great many, and my friends have assisted me by bringing them or sending them alive, but I could never get them to breed, so that I am left to conjecture as to many parts of their economy.' Here also was in his kennel the dinglo, of which John says, 'he is capable of barking, although not so readily as a European dog; he is very ill-natured and vicious, and snarls, howls, and moans, like dogs in common.' In the stables he doubtless kept the donkeys, and the mules, and the celebrated free marten, 'which I had from Benjamin May, Esq., of Denham, near Uxbridge, who knew my anxiety to ascertain this point.' In the stables also were possibly stalled the zebra and the mare by which he carried out the experiments on the reproduction of forms, marks, and colours in animals, by crossing a quagga with a mare, which mare continued, after a lapse of five years, to reproduce in three successive births *hippo-tigrine* markings.

"After Merriman and myself had examined the house, we went into the field in front of John Hunter's sitting-room. In the middle of the field there is a hollow. This was formerly a pond, in which John Hunter tried experiments to force Scotch river mussels to form pearls after the manner of the Chinese experiment.

"Close to the mulberry tree at one corner of the field is an artificial mound of earth very much the shape of an ancient burial tumulus such as we see on the Downs. The west side of this mound has a passage in it leading to three cellar-like vaults. This is even now called the 'Lion's Den,' and there can be no doubt that John Hunter used to keep his lions and leopards in this place.

"His sitting-room windows face this den, so that he could readily watch the animals from his easy chair. This is doubtless the den from which his leopards escaped, the incident of which is thus recorded:—"Two leopards broke from their confinement, and got into the yard with the dogs; a fierce encounter immediately commenced, the noise of which alarmed the neighbourhood, and quickly brought out Hunter to inquire into its cause. He found one of the leopards engaged with the dogs, whilst the other was making his escape over the wall, and instantly, though quite unarmed, he ran up and laid hold of both the animals, which fortunately submitted to be led back to their den and secured. When the danger was over, however, he became so agitated at the recollection of it that he fainted."

"I closely examined these dens, but could find nothing but a very old decrepid wheelbarrow, which might have been John Hunter's from the look of it. In the largest den, however, I found a post and iron chain, such as are used for tying up cattle. The block of wood at the end of this chain is very old and worm-eaten; the chain also was very much worn. I think there can hardly be a doubt that this was the post to which John Hunter used to tie up the little bull which the Queen gave him, and which little bull nearly killed the great John; for the story goes that one day when wrestling with the bull the beast knocked him down, and would have gored him severely had not one of the servants driven the animal off with a stick.

"On the top of the 'Lion's den' there is a little rampart made of bricks and tiles, after the fashion of the top of a castellated tower. The legend is that John Hunter kept a gun here, which he used to fire off occasionally—a sort of private fortress, in fact. Gun or no gun, there is an excellent look-out from the top of the 'Lion's den.' In John Hunter's time Earl's-court was quite in the country, and from the 'Lion's den' he would have had a good view of Westminster Abbey, little thinking he would ever be buried there. Near this place is a gateway, but neither I nor Merriman could make out whether this was a 'dummy' gateway or intended for use; but, depend upon it, John Hunter put it there for some purpose. His town house was situated about the middle of the eastern side of Leicester-square, and extended through into Castle-street, and here he established his museum. He used to drive a pair of bay-stone horses to and fro from Leicester-square to Earl's-court. Foot writes:—"On being told of his death at St. George's Hospital, on the 16th of October, 1793, on the same day I recollect having seen his bay-stone horses returning through Piccadilly home without their master, and this circumstance introduced to my reflection the sympathy which Virgil has attributed to the war-horse of young Pallas in his funeral procession":—

' Post Bellator Equus positus insignibus Æthon
It lachrymans."

"As I stood on the 'Lion's den,' I imagined this same carriage, with the high-stepping bay stallions, their coachman in tears, turning in for the last time to the very gateway after Mr. Foot had seen them in Piccadilly on October 15, seventy-eight years ago, and I pictured to myself the consternation and grief spread like wildfire through the establishment by the sad news of the master's sudden death. From that day the glories at Earl's-court then set. There can never be another John Hunter.

"I have thus endeavoured to describe Earl's-court, the residence of our great and illustrious founder. During my visit there I almost imagined that I was in the presence of the great man himself, so little is the place changed. I wish, therefore, to call the attention of my brother Medical men, and the scientific world in general, to the above facts. Mr. Merriman has kindly informed me that he will send to anybody who asks for it a picture of John Hunter's house and the 'Lion's den' as they now stand, from drawings made by Mr. Arthur Roberts.

"Earl's-court may disappear, but the memory of John Hunter will still be kept up in Kensington by the memorial window which it is proposed to erect in the new church. The larger the subscriptions, the more beautiful will be the memorial."

The subscription-list has already been headed by Sir William Fergusson, Mr. Charles Hawkins, Mr. Paget, and other distinguished members of the Profession. Individual subscriptions are limited to twenty-one shillings, and will be received by Messrs. Frank Buckland, 4, Old Palace-yard, and John J. Merriman, 45, Kensington-square, Kensington, W.

REVIEWS.

Practical Lithotomy and Lithotripsy; or, an Inquiry into the Best Modes of Removing Stone from the Bladder. By Sir HENRY THOMPSON, Surgeon-Extraordinary to H.M. the King of the Belgians, Professor of Clinical Surgery, and Surgeon to University College Hospital. Second Edition, considerably Enlarged. London: J. and A. Churchill. 1871.

It is not from any want of appreciation of the value of this work that we have not sooner noticed the appearance of a second edition. The author has won for himself so distinguished a reputation, that of late years he has enjoyed very exceptional opportunities of studying the treatment of cases of vesical calculus—opportunities which, being afforded by his Professional brethren, he regards "as a precious trust, devolving upon him an onerous duty to them in return." Any carefully made deductions from so vast an experience command an attentive hearing and a warm welcome, and we are glad to observe that in this new edition the whole subject has undergone careful revision. Many valuable hints are added for the treatment of occasional difficulties, and the question of the comparative merits of the two procedures is considered with a completeness which is as new as it must be welcome to Surgical readers. Besides numerous alterations and additions in the body of the work, three new chapters have been added upon the results of lithotomy and lithotripsy, and upon the employment of the latter procedure in cases complicated by serious organic disease, as stricture of the urethra or grave disease of the kidney or bladder. It is specially

interesting to note that a strictured urethra, which has hitherto been regarded as an insuperable obstacle to lithotrity, may now be regarded with less dread. We are not sure that Sir Henry Thompson was the first to crush for stone with a stricture complicating the case, but he has himself had four or five examples with excellent results. The stricture is temporarily relieved by means of "continuous dilatation" during the three or four days preceding the crushing. Perhaps the most important addition to the volume is an appendix giving a brief report of 204 adult cases of lithotrity occurring consecutively in the author's practice from 1863 to 1870. Although the mean age of the patients was 61, and although two or three of the fatal cases were crushed simply because lithotomy (the preferable operation) was refused, the mortality was only 13 in the 204, constituting a rate of recovery of 93½ per cent. With so favourable an experience as this, it is little wonder that the author regards lithotrity as an eminently successful operation; and we would recommend all those who have occasion to treat from time to time patients with stone, to peruse carefully this new edition of the most practical modern work on the subject.

The Medical Jurisprudence of Insanity. By J. H. BALFOUR BROWNE, Esq., of the Middle Temple, Barrister-at-Law. London: J. and A. Churchill, New Burlington-street. 1871.

WE are always ready to welcome a work on this important subject; and although it has received some attention from the pens of our own Profession, as in Dr. Taylor's admirable work upon Medical Jurisprudence, Dr. Guy having also in his "Forensic Medicine" devoted an important chapter to unsoundness of mind and its legal relations—and, besides these, Dr. Ray, an American, and Dr. Pagan, a Scotchman, having written works exclusively on this subject—we have not until this instance been favoured with a similar treatise by a lawyer. This work, written as it is by a lawyer who has undoubtedly profited by his somewhat exceptional opportunities of becoming acquainted with the phases of mental disease, is peculiarly interesting and worthy of some consideration. It is of the utmost importance to place the questions with regard to the legal relations of persons who are insane upon a definite basis, and this work will do much to bring about this desirable end. That the study and treatment of mental disease must be looked upon and dealt with in the same manner as that of fever or any other bodily ailment, has only of late years dawned upon our Profession. For some time there seems to have been an impression that no special training was necessary to enable a Medical man to deal with insanity. That time has passed away, and there are now, we are glad to say, lectureships of insanity in connexion with almost all our Hospitals. Owing to the fact that this special education has been neglected, the subject has been only partially understood; and, in consequence of this defective knowledge, the evidence of Medical men in courts of law in relation to mental unsoundness has been in many cases of a very unsatisfactory nature. If a man does not understand a thing, it is utterly impossible for him to explain it clearly to others. This has led to a constant war between Medical men and lawyers with regard to all questions of insanity; and while the former have asserted that the legal definition of insanity was narrow and absurd, the latter have satisfied themselves by saying that the Medical definition was all-embracing and confused. There is possibly some foundation in both opinions, though it would certainly require more than an ordinary intellect to embrace the two.

The author has endeavoured, and not without success, to describe insanity in such a manner as to enable members of both professions to understand what it really is, and to arrive at some definite conception as to the various forms in which it is wont to appear. His work is certainly calculated to be of use to Medical men, as well as of great service to his own profession, which is conservative of much that is bad, as it has been most conservative of the dicta of some of those who have spoken of insanity without knowing anything about it. Thus, Lord Coke's description of the four kinds of men who may be looked upon as *non compos mentis*, although it is absurd in every particular, still finds acceptance in the eyes of lawyers, and a place in every legal work which has to do with lunacy and the relations of lunatics to the State. So Lord Lyndhurst's definition of irresponsibility in connexion with mental aberration—which no one who knew anything of mental disease would admit to be in any way correct—is still quoted by lawyers and judges with approval. If the Medical Profession has been at fault, as Mr. Balfour Browne repeatedly asserts, the legal Profession is not free from blame. However that may be, this book will do much

to obviate the necessity of such censure in the future. In many respects this work has merit; the author understands the subject well, for the book throughout is written with considerable force. This force, however, seems occasionally to be exercised wantonly. He sometimes delights in beating the air. A sound drubbing does the air no harm, but no good. Mr. Browne's momentum is sometimes too great for the work he has to do. It seems unnecessary to keep a pistol with which to snuff a candle, however excellent a shot you are; snuffers will do as well, and make less noise. Mr. Browne sometimes seems to forget he is writing a "practical treatise," and he indulges in a good deal of cheap vituperation about the "incompetent Medical Profession," which might have been omitted with advantage. Still, the work is philosophical, and contains much that will be useful, even to those who have made a study of insanity. There is a good deal that is original, besides those half clever conceits which abound in it, and which in the eyes of some will seem ornaments, while in the eyes of others they will appear blemishes. The author starts with the legitimate assumption that a man should be allowed to do whatever he is capable of, and that he should not be punished for any action which he could not possibly avoid. He examines with particular care the condition of choice in human conduct, and shows in what cases insanity will interfere with this freedom, and how such interference with healthy function should modify the relations which a man bears to the State and the community in which he lives. In regard to the much-disputed questions of partial-insanity, whether moral or intellectual, his exposition and remarks are clear and sound. The difficult questions which arise in connexion with this subject have never been better dealt with, and the distinction drawn between insanity and eccentricity in the chapter upon the legal relations of moral mania is an excellent piece of psychological analysis.

One thing is to be remarked in connexion with this work, and that is the willingness of the author to regard much as insanity which members of his profession have hitherto been in the habit of regarding simply as crime; and yet he draws a clear and easily appreciated distinction between moral insanity and moral turpitude; and it is almost the first time that this distinction has been satisfactorily drawn. That this is a matter of much importance will be evident to those who have had any experience in the criminal practice of our courts of law, where only too often those who are, in the truest sense of the term, guiltless of the crimes with which they are charged are condemned to useless and unjust punishment, which must aggravate the diseases under which they labour.

We particularly commend to the younger members of our Profession the last chapter in this work—"On the Examination of Persons supposed to be of Unsound Mind"—for the most lamentable mistakes are often made from the want of a proper knowledge of examination, and the most absurd nonsense written which has no bearing whatever on the mental condition of the patient.

There was certainly a necessity for such a book as that which Mr. Balfour Browne has written, and there can be little doubt but that it will meet with the appreciation it deserves.

GENERAL CORRESPONDENCE.

"QUICK WITH CHILD."

LETTER FROM DR. C. R. BREE.

[To the Editor of the Medical Times and Gazette.]

SIR,—One word to Mr. Weightman. A child in utero is alive from the first day of conception. Therefore, his remark, "for barely *with child*, unless it be *alive* in the womb, is not sufficient," displays the truly horrid state of the law. For what is the information required? To stay execution. Women who have gone half their time feel the child move, and hence they are termed "quick with child." But at any time previously to the woman "quickening," she contains in her womb a human living being, that has committed no crime, and to kill whom, whether done by the law, judge, jury, or hangman, is essentially a murder.

I reciprocate all Mr. Weightman says about the two professions working harmoniously together. But surely such harmony cannot be interfered with by the expression of a Medical opinion that a dozen old women are totally incapable of performing the solemn and important duty of deciding whether two human beings or one are to be hanged. It is often a most difficult thing to discover whether a woman is with child or not, and eminent and experienced men are sometimes deceived.

Surely a dozen old gossiping women are not a fit tribunal to decide such a question.

The law requires immediate alteration. No woman should ever be allowed to say (for that, I contend, is the sole question)—is there or is there not a live child in utero. The quibble about the period of quickening is not worth a moment's thought. A child may not be "quick," according to this meaning, on Tuesday, but it may on the Wednesday. It may have "quickened" weeks, and not one old woman in twenty could prove it. All this shows the absurdity and positive injustice of the present state of the law. We have several Medical men in Parliament: why do not they have the disgraceful state of the law amended? A "living child" is *always alive in utero*. Excuse the apparent paradox. It is necessary to be paradoxical sometimes, or people will not see the difference between the ignorance of barbarous ages and the real truths of science. The "quick with child" notion ought no longer to disgrace our statutes.

Colchester, July 29. I am, &c. C. R. BREE, M.D.

REPORTS OF SOCIETIES.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, JULY 5.

Dr. BRAXTON HICKS, F.R.S., President, in the Chair.

Dr. HUGH MILLER (Glasgow), Mr. Robson Roose (Brighton), and Mr. Fred. Turton (Wolverhampton), were elected Fellows of the Society.

Mr. CURGENVEN exhibited a Knotted Umbilical Cord.

Dr. PROTHEROE SMITH showed a new Expanding Cylindrical Speculum Uteri. It consists of a truncated cylinder divided longitudinally at its upper third into four hinged blades. At the centre of each hinge a vertical sliding-rod is affixed, having a deep notch at its inferior extremity. The base of the cylinder is surrounded by a movable ring or rim; within are placed four small wedge-shaped springs corresponding with the notches already mentioned as belonging to the vertical rods. This ring is rotated by the handles of the speculum when pressed together, the effect being to force the wedge-shaped springs within the notches of the vertical rods, and thus, by drawing down the rods, to produce lateral expansion of the blades. One or more of the blades may be left stationary whilst the others are expanded, or any of the blades may be made separately to collapse or expand at will.

Dr. HEYWOOD SMITH said that this speculum, when expanded, not only drew forward the cervix uteri, but revealed the whole of its external aspect, as well as afforded a free view of the *cul de sac* all round the uterus.

Dr. WHITEHEAD exhibited two instruments for producing vesication previous to vaccination, the one with ammonia, the other with boiling water or the flame of a spirit-lamp.

Dr. HEYWOOD SMITH exhibited a Marine Vaginal Irrigator, which had been given him by an instrument maker. It was made of gum-elastic, closed at one end, and closely perforated with holes to permit the passage of the sea-water into the vagina during bathing.

Dr. BARNES said a similar contrivance had been shown at the exhibition of obstetrical instruments.

Dr. BARNES read a note on the Rupture of an Intra-peritoneal Hæmatocele into the Peritoneal Cavity. One case was recorded by Dr. West, and another as having occurred in Seyfert's practice; but the occurrence was so rare that Dr. Barnes adhered to the opinion expressed by him at the preceding meeting—that puncture was required only when toxæmic symptoms, consequent on an unhealthy change in the blood-clot, manifested themselves.

Dr. PROTHEROE SMITH related three cases, in each of which, after the sudden disappearance of a retro-uterine tumour, severe peritoneal symptoms became developed.

Dr. PLAYFAIR read the particulars of a case of Sudden Death in the Puerperal State. Although no post-mortem examination was permitted, the symptoms were characteristic of death from pulmonary thrombosis. The patient was a typically healthy woman, but when convalescent from her confinement had a slight attack of pleurisy. Dr. Playfair believed that this increased the hyperinosis already existing, and he concluded that inflammatory affections in the puerperal state, though they may not be severe in themselves, were for the above reason to be much dreaded.

Mr. SCOTT had in his recollection three cases proving the danger of the occurrence of inflammation in a system previously debilitated by illness. In each of the cases peritonitis supervened, and death occurred suddenly after slight exertion in bed. On a post-mortem examination, a distinct clot was found in the pulmonary artery.

Dr. ROUTH asked if the heart had been examined, as the symptoms might have been those of cramp or spasm of the heart. In such a case it would probably be advisable to prescribe alkaline salts, such as the subphosphate of soda, and especially ammonia.

Dr. WILTSHIRE inquired whether the urine had been examined, seeing how frequently pleurisy was a complication of Bright's disease. The hyperinotic condition of the blood was probably suddenly increased by the hearty breakfast of which the patient had partaken shortly before death.

Dr. TILT read a paper "On the Diagnosis of the Least-known Varieties of Uterine Inflammation." The author admitted that all the uterine tissues were inflamed in super-acute, in acute, and in chronic metritis, and he explained by what signs these three varieties of metritis might be recognised, mentioning that while the acute variety was very rare, the chronic was a disease of frequent occurrence. Dr. Tilt believed that one of the uterine constituents could not be long inflamed without the adjacent tissues becoming more or less diseased, and that in the cases called internal metritis or endometritis, because inflammation of the lining membrane of the womb was their leading pathological condition, there was often a thickening of the uterine walls, to be explained by congestion in most cases, and occasionally by inflammation. In the more chronic stages of internal metritis the uterine walls were said to become thinner, and to be softened by fatty degeneration—a circumstance that should teach caution in the use of the uterine sound. The author discussed the symptoms of internal metritis, and he was thereby led to deny that fundal metritis—that is, inflammation of that portion of the endowomb which lies between the insertion of the Fallopian tubes—had any particular symptoms by which it could be distinguished from ordinary cases of internal metritis. Dr. Tilt asked the Fellows to compare Dr. Routh's cases of fundal metritis with those he had himself published in his work on uterine inflammation, promising that they would find the same liability to metrorrhagia and to purulent discharges capable of becoming intensely acrid, the same tendency to obstruction to the free exit of the fluid secreted in the body of the womb, the same kind of very acute uterine pain aggravated by any kind of pressure, whether made by the finger or the uterine sound. He reprobated the use of the latter in acute metritis.

After some remarks by the President,

Dr. PLAYFAIR, although he did not doubt that often the body of the uterus was largely involved, considered that Dr. Tilt underrated the importance and frequency of morbid conditions of the mucous membrane lining the cavities of the cervix and uterus. Grave alterations were very generally present in such portions of the mucous membrane as were accessible to sight, and it was reasonable to infer that by continuity of tissue similar alterations existed in the more deeply seated portions of the mucous membrane. He believed that all who had tried intra-uterine medication in such cases would bear witness to its remarkable curative power. The application was easy, as the os uteri was always morbidly patulous, and one of the first symptoms of improvement was the closure of the os.

Dr. HENRY BENNETT said that arrest of uterine involution was much more frequently the cause of an increased size of the uterus in child-bearing women than actual inflammation. It was also a frequent mechanical cause of uterine displacements and flexions of all kinds. For many years he had carefully weighed the uteri of all the child-bearing women who died under his care, and found that in all who presented lesions of the cervix subsequent to parturition the uterus had not returned to its natural weight. Dr. Bennett thought Dr. Tilt was scarcely warranted in saying that internal metritis in non-parturient women was a common disease. If confounded with inflammation of the mucous membrane lining the cervical cavity, of course it would appear to be common. The principal diagnostic signs of internal metritis in his experience were—a patulous state of the os internum, an aggrandised state of the uterine cavity, and a muco-sanguineous discharge. The inflammation, when it extended to the uterine cavity, seemed to paralyse and relax the cervical muscular fibres, which constitute what he had termed the sphincter of the uterine cavity.

Dr. ROUTH said that in these cases of enlarged uterus, with internal metritis, it was the fundal portion which increased; and he believed it to be contrary to clinical observation to deny that this part might be exclusively attacked with inflammation. The nervous supply of the fundus uteri, derived from the renal plexus, and being indirectly connected with the semilunar ganglia, was *a priori* evidence that we might expect more general and severe symptoms than when the body of the uterus only or the cervix was attacked. He could not agree with Dr. Bennett, that because disease of the uterus was cured by active measures to the cervix, therefore the disease was in the cervix. Blistering or cauterising the cervix relieved, not only the cervix, but the whole organ. The internal os was occasionally liable to severe inflammatory lesions, attended with agonising pain; and such cases were, he believed, incurable.

Dr. FORDYCE BARKER, of New York, assented to most of the statements and doctrines in the paper; but, although it was generally believed that acute non-puerperal metritis was a very rare affection, he suggested that cases of sudden suppression of the menses, attended with intense uterine pain and other pelvic symptoms, with fever, quick hard pulse, headache, and sometimes more or less cerebral disturbance, were not very rare, and that they really were cases of acute metritis, which terminated frequently by resolution, leaving no permanent lesion of the organ. Dr. Barker could hardly understand the term fundal endometritis. The distinctions between inflammation of the lining membrane of the cervix and that of the body of the uterus could readily be understood, as the histological and physiological differences between the two membranes were now accepted in science. But if the term fundal endometritis implied a difference which could be recognised and required different therapeutical measures from chronic inflammation of other parts of the body of the uterus, he could not as yet comprehend it. He would ask whether pain was not the most fallacious of all symptoms in establishing the existence or the character of uterine disease. Again, as regards the pain produced by the introduction of the sound in the so-called fundal endometritis, was it not the usual fact that on the first introduction of the sound, when the point reached the fundus, pain (sometimes very severe and persistent) was complained of; while in the same persons a tolerance of the instrument was acquired after it had been used a few times?

Dr. PROTHEROE SMITH fully recognised the active metritis described by Dr. Barker. Regarding the uterine canal as a whole, consisting of vagina, cervix uteri, body, fundus, and Fallopian tubes, there were, he believed, corresponding differences in the symptoms marking the occurrence of inflammatory and catarrhal affections of these different parts. When the tubes were primarily affected, the discharge was watery and colourless, and ejected spasmodically with painful expulsive efforts; whilst, when the cavity of the fundus and body was attacked, it would be productive of considerable supra-pubic pains and irritable bladder, and at first the discharge would be thin and often tinged with blood. Again, the glairy secretion, tumefaction, and everted uterine lips marked similar affections of the cervix. Yet all these, if allowed to run their course, soon merged into one disease affecting the entire canal.

Dr. TILT, in reply, said that he did not see how he could express himself more strongly than he had in appreciation of the value of treatment directed to the cervix; but he often found that this was insufficient to cure chronic metritis and internal metritis, and he believed that the future improvement of uterine pathology lay in the study of the inflammatory diseases of the body of the womb. With regard to his dissent from the views entertained by Dr. Routh respecting fundal endometritis, Dr. Tilt said the whole question was now placed before the Profession, and he confidently left it to the decision of future observers.

OBITUARY.

JOHN WHITE, M.R.C.S.E.

WE regret to have to announce the death of Mr. John White after a short illness, on July 28, at his residence, Storey's-gate, Westminster, at the age of 73 years. Mr. White became a Licentiate of the Society of Apothecaries in 1819, and a Member of the Royal College of Surgeons (England) in 1821. His practice in Westminster extended over a period of more than forty years. Added to considerable Professional knowledge and skill, he had also acquired for himself a name for kindly sympathy and courteous urbanity amongst all classes of his patients, by many of whom he was warmly esteemed and

respected as a sincere friend, and in whose memory he will long hold a position it will be hard, if not impossible, to efface.

MR. CHARLES R. GODFREY, R.N.,
STUDIED at St. Bartholomew's Hospital under Messrs. Paget and Skey, and Dr. West. He entered the service in 1855, as Assistant-Surgeon on board H.M.S. *Duke of Wellington*, and was present at the bombardment of Sweaborg, for which he received a medal. He served in the *Tyne*, the *Spy*, and the *Sealark*, during which period he was stationed off South America. He was appointed to the *Euryalus*, March, 1862, attached to the naval force engaged in the capture of Kahding, China, under Sir James Hope. He served in the *Euryalus* at the operations before the batteries of Kagosimo, Japan, for which he was commended by Admiral Kuper, and promoted November 9, 1863. He returned in charge of the *Vulcan* (vice Dr. Mitchell, invalided), November, 1864. Appointed to the *Victory*, May, 1865, and to the *Barracouta*, May, 1866, for service on the North American and West Indian stations. He returned January, 1869, was appointed to Melville Hospital, October, 1869, and died of heart disease, July 25, 1871.

MEDICAL NEWS.

ROYAL COLLEGES OF PHYSICIANS AND SURGEONS, EDINBURGH.—DOUBLE QUALIFICATION.—The following gentlemen passed their first Professional Examinations during the July sittings of the examiners:—

Arnold, Howard, Antrim.
Baird, James, Alloa.
Chambers, Theodore Stewart, Jamaica.
Flamstead, William, Bengal.
Goodenough, William Hecsmann, Carlisle.
Jackson, Richard, Lancaster.
O'Hanlon, William Palliser, Bandon, Cork.
Steedman, Daniel M'Kenzie, Cape Town.

The following gentlemen passed their final examinations, and were admitted L.R.C.P. Edin. and L.R.C.S. Edin.:—

Anderson, William, Glasgow.
Bonnar, Thomas Walker, Dunfermline.
Clarke, Arnold, Cavan.
Hindle, James, Lancaster.
Jackson, Alfred, Yorkshire.
Kane, John, Adelaide.
Keys, Robert Atchison, Strabane.
Leadman, Alexander Dionysius Hobson, Bradford.
Mackie, John, Roxburghshire.
M'Kay, John Hector, Nova Scotia.
Nixon, Thomas, Lincolnshire.
Oliver, William, Coleraine.
Pentland, Henry Thomas De Montaville, Quebec.
Pickering, Thomas Fenna, Cheshire.
Renton, William, Knaresborough.
Rutherford, Robert Acheson, county Leitrim.
Stafford, John Francis, Wexford.
Stewart, George James, Craignish.
Todd, James John, Rathfriland.
Wallace, Samuel Lane, Londonderry.
Young, William Edward, Belfast.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen, having undergone the necessary examinations for the diploma, were admitted Members of the College at a meeting of the Court of Examiners on the 26th ult., viz.:—

Bishop, Edward Stanmore, Manchester, student of the Manchester School.
Briggs, George Chapman, L.S.A., Horncastle, of King's College.
Cheyne, George Edward, Thornton-heath, of St. Bartholomew's Hospital.
Clarke, John Clelland, M.B. Edin., Coleraine, Ireland, of the Edinburgh School.
Fendick, Thomas Rawing, Mylne-street, Clerkenwell, of St. Bartholomew's Hospital.
Garton, William, St. Helen's, Lancashire, of St. Thomas's Hospital.
Hugman, William, Guildford-street, of St. Bartholomew's Hospital.
Morison, Bentham Paynter, L.S.A., Portclev, Pembroke, of Guy's Hospital.
Newman, Ashwin Conway, L.S.A., Winchcombe, near Cheltenham, of Guy's Hospital.
Norman, Joseph Clement, Colchester, of St. Bartholomew's Hospital.
Pratt, Charles William, Plymouth, of St. Mary's Hospital.
Pye-Smith, Rutherford John, Hackney, of Guy's Hospital.
Read, Charles, Guildford-place, Russell-square, of St. Bartholomew's Hospital.
Reed, James, L.S.A., Stoke, Devonport, of Guy's Hospital.
Rogers, Charles Claude, Cork-street, Bond-street, of Middlesex Hospital.
Scully, John, Wimpole-street, of the Middlesex Hospital.

Ten candidates having failed in the two days' examinations (July 25 and 26) to acquit themselves to the satisfaction of the Court of Examiners, were referred to their Hospital studies for six months.

The following gentlemen passed on the 27th ult., viz.:—
Allen, Marcus Henry, Brighton, student of St. Bartholomew's Hospital.
Aylen, Thomas Vaughan, L.S.A., Southsea, Hants, of St. Bartholomew's Hospital.

Barrow, Henry John Waller, Woolwich, of Guy's Hospital.
 Brookfield, John Stoops, B.A., M.B., and M.C. Univ. Edin., Halifax, Nova Scotia, of the Edinburgh School.
 Cartwright, John Peplow, Oswestry, Shropshire, of St. Bartholomew's Hospital.
 Davies, David Arthur, Swansea, of University College.
 Elkington, Ernest Alfred, Birmingham, of the Birmingham School.
 Hadley, Clement, Birmingham, of the Birmingham School.
 Hazel, William Francis, L.S.A., Oakley-square, N.W., of King's College.
 Hill, Charles Hamor, L.S.A., Teddington, of St. Bartholomew's Hospital.
 Latimer, Henry Arthur, L.S.A., Plymouth, of Guy's Hospital.
 Marley, William Lane, Padstow, Cornwall, of the Middlesex Hospital.
 Mayne, Thomas, Stonehouse, Devon, of University College.
 McDonald, Michael Sweeny, Glasgow, of the Hull School.
 Meredith, William Appleton, Wimpole-street, of University College.
 Monks, Frederick Aubin, L.S.A., Hoxton, of Guy's Hospital.
 Morgan, Edward Rice, L.S.A., Swansea, of King's College.
 Payne, George Speke, Hartfield, Sussex, of St. Bartholomew's Hospital.
 Phillips, George Arthur, Whitwell, Herts, of St. Bartholomew's Hospital.
 Rees, Albert Barnes, Swansea, of St. Bartholomew's Hospital.
 Saunders, Arthur Rich, Haverfordwest, of University College.
 Slack, George Frederick, Montreal, of the Charing-cross Hospital.
 Thrupp, James Godfrey, Marylebone-road, of St. George's Hospital.

Five candidates having failed to acquit themselves to the satisfaction of the Court of Examiners, were referred to their Hospital studies for six months.

The following gentlemen passed on the 28th ult., viz. :—
 Adcock, Hugh, L.R.C.P. Edin., and L.S.A., Hunstanton, student of Guy's Hospital.

Benham, William Thomas, M.B. & C.M. Aber., Bristol, of the Bristol School.

Bland, William Chas., L.S.A., Notting-hill, of St. Bartholomew's Hospital.
 Bodman, Francis Henry, M.B. Aber., Devizes, of St. Bartholomew's Hospital.

Chambers, John Louis, L.S.A., Hackney-road, of the London Hospital.
 Clark, Henry Edward, L.R.C.P. Edin., Glasgow, of the Glasgow School.

Coleman, William Franklin, M.D. Queen's Univ. Canada, Toronto, of the Canadian School.

Gibson, Charles Henry, L.R.C.P. & S. Edin., Dublin, of the Edinburgh School.

Grayson, Francis Dorrell, Henley-on-Thames, of Guy's Hospital.
 Hincheliff, Edwin, M.B. Edin., Victoria, Australia, of the Edinburgh School.

King, William Louis, Great Malvern, of University College.
 Lucas, Thomas Pennington, L.S.A., Leominster, of the Westminster Hospital.

Noad, Henry Carden, L.R.C.P. Lond., Hereford-road, W., of St. George's Hospital.

Ransom, Frederick Parlett Fisher, L.R.C.P. Lond., Elenham, Norfolk, of King's College.

Robertson, Hugh, M.B. Toronto, Toronto, of St. Thomas's Hospital.

Warren, George Milton, M.D. Toronto, Toronto, of St. Thomas's Hospital.
 Watson, Walter George, L.S.A., Talbot-road, W., of St. Mary's Hospital.

Williams, Richard, L.R.C.P. Edin., Farnham, Surrey, of the Glasgow School.

Five candidates having failed to acquit themselves to the satisfaction of the Court of Examiners, were referred to their Hospital studies for six months.

The following gentlemen, having undergone the necessary examinations, were admitted Licentiates in Midwifery at a meeting of the Board on the 31st ult. :—

Evers, Benjamin, L.R.C.P. Edin., Fulham-road.

Mondelet, William Henry, M.D. McGill College, Montreal, Emigration Service.

Smith, Eldred Noble, M.R.C.S., Worth, near Crawley, Sussex.
 Willis, Julian, M.R.C.S., Great Northern Hospital.

Dental Surgeons.—The following gentlemen passed the necessary examinations, and received the diploma in Dental Surgery, at a meeting of the Board on the 1st inst :—

Gingell, George, Moreton Ongar, Essex.

Marsh, Henry, Chester.

King, Richard Francis Henry, Newark.

Rose, Harry, Albany-street.

Stevens, Mordaunt Augustus de Bronquus Capel, M.R.C.S., Paris.

Vasey, Charles Lyon, M.R.C.S., Cavendish-place.

ROYAL COLLEGE OF SURGEONS, EDINBURGH.—Mr.

Thomas George Gordon Ritchie, of Prestonpans, passed his first Professional Examinations during the July sittings of the examiners; and the following gentlemen passed their final Examinations and were admitted Licentiates of the College:—

Ferguson, Daniel, Glasgow.

Gibson, George, Dublin.

Lombe, George, St. George, county Down.

Mahony, Philip, India.

Moore, Samuel William, London.

Parry, Lloyd Davenport, Argyll.

Sanderson, Thomas Drummond, Edinburgh.

Scott, William Gifford, India.

Strathy, Frederick Rolph Lec, London, Canada.

Trimble, James, Enniskillen.

APOTHECARIES' HALL.—The following gentlemen passed their Examination in the Science and Practice of Medicine, and received Certificates to practise, on Thursday, July 27, 1871 :—

Brittin, Frederic George Morris, Wansford, Northamptonshire.

Clarke, John Clelland, Coleraine, Ireland.

Hartridge, Gustavus, Yalding, Kent.

Norman, George, Stockwell-park-road, Brixton.

The following gentlemen also on the same day passed their first Professional examination :—

Birch, Robert, King's College.

Groves, Matthias, St. Bartholomew's Hospital.

Lungley, Frank, Guy's Hospital.

Macleay, Allan, St. Thomas's Hospital.

Oates, James Pimlott, Birmingham General Hospital.

Strugnell, F. W., St. Bartholomew's Hospital.

Venning, Edmund, University College.

Waylen, G. S. A., St. Bartholomew's Hospital.

THE APOTHECARIES' HALL OF IRELAND.—At the Examination in Arts, held on July 21, the following gentlemen received Certificates entitling them to commence their Medical studies :—

Baldwin, Thomas

Bricknell, Edward S.

Burns, Joseph Henry

Burroughs, Wolfenden H.

Byrne, William Patrick

Castles, Joseph William

Flamery, James

Giles, William Henry

Gorman, Patrick

Hoey, John

Johnston, Roden

Ryan, William

Walker, Henry

Walshe, John Lemon

The following gentlemen having passed their Professional examinations, obtained the Licence to practise :—

Barber, Alexander, Coleraine, co. Derry.

Mason, William, Sackville-street, Dublin.

Palmer, Joseph Mansergh, Armagh.

Rice, Thomas David, Tralee, co. Kerry.

POOR-LAW MEDICAL SERVICE.

** The area of each district is stated in acres. The population is computed according to the census of 1861.

RESIGNATION.

Bodmin Union.—Mr. G. C. Carter has resigned the Second District; area 13,700; population 2661; salary £30 15s.

APPOINTMENTS.

Castle Ward Union.—Robert Torrance, L.R.C.P., to the Stamfordham District.

Farnham Union.—Walter Wilson Young, Bachelor of Medicine and Master of Surgery Edin., to the Aldershot District.

Westhampnett Union.—George C. Carter, L.F.P. & S. Glasg., L.S.A., to the Rumboldswyke District.

Whitechapel Union.—Joseph Loane, M.R.C.S. Eng., L.S.A., to the Fifth District.

APPOINTMENTS.

*** The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

BASTIAN, Professor H. C., M.D., M.A., F.R.S.—Physician to University College Hospital.

BECK, MARCUS, M.S., M.B.—One of the Teachers of Practical Surgery to University College Hospital.

BOURNES, HENRY A., F.R.C.S.—Medical Attendant on the Royal Irish Constabulary, Killala, co. Mayo.

DAPHY, G. R., M.R.C.S., L.S.A.—House-Physician to the Scamen's Hospital, Greenwich, *vice* Dr. Henry C. Martin, resigned.

DICKSON, J. THOMPSON, M.A., M.B. Cantab., M.R.C.P.—Physician to the Infirmary for Epilepsy and Paralysis, Charles-street, Portman-square, W.

HEATH, CHRISTOPHER, F.R.C.S.—One of the Teachers of Practical Surgery to University College Hospital.

HILL, BERKELEY, M.B., F.R.C.S.—One of the Teachers of Practical Surgery to University College Hospital.

MCGREGOR, M.B., C.M.—Medical attendant to the Loyal Earl of Lonsdale Lodge of Odd Fellows, Bampton, Cumberland.

MADDEN, HENRY J., M.D.—Medical Officer to the Ballycastle Dispensary and Medical Attendant to the Royal Irish Constabulary, Ballycastle.

MEADOWS, ALFRED, M.D., M.R.C.P. Lond.—Lecturer on Midwifery and the Diseases of Women and Children to St. Mary's Hospital Medical School.

MURRAY, JOHN, M.D., M.R.C.P.—Assistant-Physician to the Hospital for Sick Children, New Ormond-street.

POPE, H. CAMPBELL, M.R.C.S., L.S.A.—House-Surgeon to the Seamen's Hospital, Greenwich, *vice* Mr. W. Crochley, South Clapham, resigned.

SYMONS, Mr. HENRY E.—Demonstrator of Practical Physiology at St. Bartholomew's Hospital Medical School.

NAVAL AND MILITARY APPOINTMENTS.

ADMIRALTY.—The following appointments have been made :—John Haran, Esq., promoted to the rank of Staff Surgeon in her Majesty's Fleet, with seniority of June 8, 1871. Staff Surgeon Arthur Adams has been placed on the retired list of his rank, from the 27th inst.

MEDICAL DEPARTMENT.—Staff Assistant-Surgeon James Bowyer Baker, to be Staff-Surgeon, *vice* Alexander Frederick Bradshaw, placed on the Supernumerary List while serving on the Staff of the Commander-in-Chief in India. Staff Assistant-Surgeon William Alexander Duke, from half-pay, to be Staff Assistant-Surgeon, *vice* James Bowyer Baker, promoted.

BIRTHS.

DALTON.—On July 26, at the Royal Dockyard, Pembroke Dock, South Wales, the wife of Staff Surgeon W. Ruffell Dalton, R.N., of a son.

FLOWER.—On August 1, at 39, Lincoln's-inn-Fields, the wife of Professor W. H. Flower, F.R.S., of a son.

HAMILTON.—On July 26, at Garnock, St. Dalry, the wife of the late W. B. Hamilton, M.D., F.R.C.S.E., of a daughter.

- PURVIS.**—On July 28, at Royal-hill, Greenwich, the wife of John Prior Purvis, M.R.C.S.E., of a son.
- SARTH.**—On July 21, at 2, Portugal-street, Grosvenor-square, the wife of Dr. Heywood Smith, of a daughter.
- STILES.**—On July 29, the wife of Edward M. Stiles, M.R.C.S.E., of a daughter.
- WORLEY.**—On July 26, at 43, De Beauvoir-road, N., the wife of Dr. W. C. Worley, of twin daughters, prematurely.

MARRIAGES.

- BAXTER—HUGHES.**—On July 29, at St. George's, Hanover-square, James, eldest son of H. J. Baxter, of Duke-street, to Edith Blanche, eldest daughter of the late Thomas Hughes, M.D., many years of Regent-street, W.
- BONNER—BOIS-ANGERS.**—On July 26, at St. Peter's Church, Brompton, William Augustus Bonney, M.R.C.S.E., L.S.A., of 320, King's-road, S.W., to Anna Maria Alice Polixene Poulain de Bois-Angers, only child of Victor Poulain de Bois-Angers, M.D., M.R.C.S.E., of 124, Fulham-road, S.W.
- BUNKER—FENWICK.**—On July 27, at St. Mary's Church, Wimbledon, Joseph Bunker, Surgeon Royal Artillery, to Elizabeth, second daughter of John Fenwick, Esq., of Tudor-lodge, Wimbledon-park.
- CREW—FRODSHAM.**—On July 20, at St. John's, Hackney, John Crew, L.R.C.P. Lond., of Higham Ferrars, to Agnes Dixon, youngest daughter of the late John Frodsham, Esq., of Clapton.
- DAYRELL—ORR.**—On July 27, at East Drayton, Notts, Richard Dayrell, Esq., son of the late Thomas Dayrell, rector of Long Marston, to Evangeline E. A. Orr, daughter of the late Samuel Orr, M.D., Innishannon, Ireland.
- EDWARDS—BOWIE.**—On July 26, at Christ Church, Kensington, William Henry Edwards, M.B., eldest son of the Hon. William Henry Edwards, F.R.C.S., of Antigua, West Indies, to Annetta Antonia Louisa, daughter of the late William Bowie, Esq., of Edinburgh.
- GOYDER—THOMAS.**—On July 20, at St. Mary's, Moseley, David Goyder, M.D., of Bradford, Yorks, and son of the Rev. D. G. Goyder, of Wivenhoe, Essex, to Ann Eliza, second daughter of Robt. Thomas, Surgeon, Rawdon, Leeds.
- HANKS—HORSFALL.**—On July 26, at Dundee, John James, eldest son of James Hanks, M.D., Suaith, Yorkshire, to Mary, only child of the late Charles Horsfall, Esq., of Ravensthorpe, near Thirsk, and stepdaughter of Alfred Bankary, Esq., of 27, Green-park, Bath.
- HOPGOOD—TUCKER.**—On July 25, at the parish church, Falmouth, the Rev. J. B. D. Hopgood, M.A., eldest son of Joseph Hopgood, M.R.C.S., 130, Portsdown-road, Maida-vale, to Theodora, youngest daughter of the late Rev. W. Tucker, Vicar of Lannarth, Cornwall.
- JULIUS—HARGREAVE.**—On August 1, at St. Mary's Church, Putney, Surrey, Frederic C. Julius, M.D., to Sarah Hannah, widow of the Hon. Judge Hargreave, late one of the judges of the Landed Estates Court, Ireland.
- LIGERTWOOD—CLAY.**—On July 29, at Christ Church, St. Pancras, Thomas Ligertwood, M.D., F.R.C.S.E., Royal Hospital, Chelsea, late 8th Hussars, to Celia, only daughter of the late William Besley Dunsford, of Swindon, Wilts, and widow of Robert Thomas Clay, Esq., of 2, Regent's-park-terrace, Gloucester-gate.
- MOTE—SHINE.**—On August 1, Thomas, youngest son of James Mote, of Hemingford-road, Islington, to Anna Maria Jane, only daughter of the late William Lamb Shine, M.R.C.S.E.
- MUCKLESTON—HOLMES.**—On July 27, at St. George's, Hanover-square, the Rev. Edward Muckleston, M.A., Rector of Haseley, Warwick, only son of the late Capt. Muckleston, J.P. for the county of Salop, to Emily, eldest daughter of the late Trafford Holmes, M.D., of Southedge House, Hipperholme, York.
- ROSSER—HOLMES.**—On July 27, at Holy Trinity Church, South Tottenham, Walter Rosser, M.B., of Glenalmond, Perth, to Elizabeth Sarah, only daughter of James Holmes, Esq., of Tottenham-green, Middlesex.
- TINDALE—WALKER.**—On July 26, at St. John's, East Dulwich, Wentworth Raynes Tindale, M.B., of Hampton, Middlesex, younger son of the late John Tindale, Esq., of Rose-villa, Almondbury, Huddersfield, to Sarah Frances, third daughter of Joseph Walker, Esq., late of Millshaw, near Leeds.
- TUCKER—BENNETT.**—On July 27, at Bruton, Somerset, J. Dunning Tucker, Surgeon, of 54, Great Marlborough-street, London, to Mary, eldest daughter of T. O. Bennett, Esq., of Bruton.
- WARD—BUSZARD.**—On August 1, at the parish church, Lutterworth, Richard Ward, M.A., of the Midland Circuit, Barrister-at-law, to Maria Catherine, eldest daughter of Marston Buszard, M.D.

DEATHS.

- GODFREY, CHARLES RICHARD,** Surgeon R.N., at Melville Hospital, Chatham, on July 25, aged 41.
- LOWE, MARIA,** the beloved wife of W. H. Lowe, M.D., at Balgreen, near Edinburgh, on July 31, after a short illness.
- PAXON, LEONARD FRANCIS,** third son of George Kirkman Paxon, Surgeon, of Dorking, drowned while bathing, on July 19, in his 20th year.
- SHIPMAN, ROBERT,** Surgeon, at Grantham, on July 25, aged 54.
- SHIRLEY, HENRY JAMES, F.R.C.S.,** late Staff Assistant-Surgeon, and formerly Surgeon of the Worcestershire Militia, at 4, Grove-terrace, Highgate-road, on July 25.
- ROSS, WILLIAM HAMILTON BROWN,** Surgeon-Major, late of the Bengal Medical Service, at 149, Upper Lewes-road, Brighton, on July 19, aged 55.
- WHITE, JOHN,** Surgeon, after a short illness, at 1, Prince's-street, Storey's-gate, on July 28, aged 72.
- WHITTLE, BRAMLEY, M.R.C.S.,** at Sidbury, on July 23, aged 62.

VACANCIES.

- In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.
- BATTERSEA.**—Medical Officers of Health for the Eastern and Western Districts for this parish. Applications and testimonials, under seal, to the Board, Battersea-rise, on or before August 8.

- BIRMINGHAM AND MIDLAND FREE HOSPITAL FOR SICK CHILDREN.**—Resident Medical Officer; must be duly qualified and registered. Applications and testimonials to the "Medical Committee," on or before August 3. Election on August 7.
- BIRMINGHAM, PARISH OF.**—Dispenser; must be duly registered under the Pharmacy Act, 1868. Applications and testimonials to W. Thompson, Lsq., at the Parish Offices, Paradise-street, on or before August 14.
- BOURNEMOUTH GENERAL DISPENSARY.**—Resident Surgeon; must have both Medical and Surgical qualifications and be registered. Applications and testimonials to B. A. Rugg, Esq., for the President of the Dispensary, on or before August 28.
- HAMPSTEAD SMALL-POX HOSPITAL.**—Assistant Medical Officer; must have both Medical and Surgical qualifications and be registered. Candidates to attend at a meeting of the Committee, at the Hospital, on Monday, August 7, at 3 o'clock.
- HEREFORD GENERAL INFIRMARY.**—Resident House-Surgeon; must be M.R.C.S. and L.S.A. Applications and testimonials to T. Owen Fowler, Esq., Savings Bank, Hereford. Election on August 9.
- HUDDERSFIELD INFIRMARY.**—House-Surgeon; must have both Medical and Surgical qualifications, and be registered. Applications and testimonials to Mr. John Marsden, on or before August 14.
- MIDDLESEX HOSPITAL, W.**—Physician; also Assistant-Surgeon. Applications and testimonials to Mr. H. N. Custance, Secretary-Superintendent, on or before August 22.
- PLYMOUTH.**—Medical Officer for the Northern District of this town. Candidates must have the qualifications prescribed by the General Orders of the Poor-law Board. Applications and testimonials to Mr. J. W. Matthews, Clerk, on or before August 8. Election on the 9th.
- QUEEN'S COLLEGE, BIRMINGHAM.**—Medical Tutor and Joint Demonstrator of Anatomy. Applications and testimonials to the Secretary on or before August 31.
- SOUTH-WESTERN PROVIDENT DISPENSARY.**—One Attending Medical Officer (honorary), having double qualification; must be resident in Chelsea.
- UNIVERSITY OF DURHAM COLLEGE OF MEDICINE, NEWCASTLE-ON-TYNE.**—Medical Tutor. Applications and testimonials to Luke Armstrong, Esq., College of Medicine, Newcastle-on-Tyne, on or before August 31. It is particularly requested that no original testimonials be sent.
- WEST DERBY UNION.**—Assistant Medical Officer to the Workhouse. Candidates must have the qualifications prescribed by the General Orders of the Poor-law Board. Applications and testimonials to Mr. W. Cleaver, Clerk, on or before August 10.
- WESTERN GENERAL DISPENSARY, 264, MARYLEBONE-ROAD, W.**—Assistant-Dispenser. Apply at the Dispensary.

VACANCIES.—Medical Officer to the Oldbury Board of Health; Fourth Assistant Resident Medical Officer to the General Infirmary, Leeds; Medical Officer and Public Vaccinator for Unst, Shetland.

MR. WILLIAM THOMAS has been elected Joint Professor of Anatomy at the Queen's College, Birmingham.

THE City Corporation has voted £105 to the Great Northern Hospital.

THE Paris Academy of Sciences is occupying itself seriously with the question of the cattle disease, which has raged so fearfully in France since the war.

THE weekly mortality in Paris is still decreasing. Only 778 deaths occurred last week.

PROFESSOR BILLROTH.—This distinguished Surgeon has received the iron cross in recognition of his services during the late war.

A COTTAGE Hospital has been opened at Dorking. Mrs. Hope, of Deepdene, gave the site and £250 in money, and Mr. Cubitt, M.P., contributed £1000.

A MEMORIAL will shortly be erected at St. Andrews to the late John Adamson, M.D., under the name of the "Adamson Institute."

IN the Manchester baby-farming case, the woman Frances Rogers has been sentenced to twenty years' penal servitude.

MR. FRANCIS BRODERIP, it now appears, was the benefactor who in 1866 gave an anonymous donation of £20,000 4 per cent. Brazilian Bonds to the funds of the Middlesex Hospital.

THE small-pox has broken out among the workmen in the Gloucester Canal Extension Works at Berkeley—Dr. Jenner's own parish. Two men have died, and many are seriously ill.

M. ALPHONSE GUÉRIN discovered during the siege of Paris that amputations simply dressed with cotton wool, and left undisturbed for about three weeks, would heal of themselves.

M. BROCA has ascertained that the muscular contraction of fractured legs, which so often seriously impedes the operation of setting, may be obviated by compressing the femoral artery.

COLNEY HATCH LUNATIC ASYLUM.—The summer entertainment to the inmates, which was to have taken place on Monday, has been postponed indefinitely, in consequence of the prevailing epidemic of small-pox, though not a single case of small-pox has occurred within the Asylum.

THE foundation-stone of the Home for Convalescents in connexion with the Manchester Royal Infirmary, which is being erected at the cost of Mr. Robert Barnes, was laid on Saturday. The site of the institution is an estate of twenty-three acres, near the railway station at Cheadle. The home will accommodate 140 patients.

CHOLERA has broken out at Berhampore, says the *Times of India*, and one of the first victims of the disease, we are sorry to say, has been Dr. John White, the Civil Surgeon of the station. Dr. Ewart has been called to Berhampore. The type is not considered to be epidemic. The disease has made its appearance among the artillery at Triniulgherry.

CHOLERA IN MOSCOW.—On July 17, 100 persons were attacked with cholera in Wilna, and 40 died; on the 18th, 62 were attacked, and 30 died; on the 19th, the cases of illness rose to 281. At Riga, Hospitals are already established for the exclusive use of cholera patients, and Physicians are kept on duty day and night. The epidemic is approaching the Prussian frontier.

EAST LONDON HOSPITAL FOR CHILDREN.—In consequence of the daily increasing demands upon this charity, active measures are being taken to raise funds for the erection of a new Hospital in the neighbourhood.

BATHS FOR SOLDIERS.—Two of the large shipbuilding docks in the disused dockyard at Woolwich have been cleared out and fitted up as swimming baths for the use of the soldiers. They will accommodate 700 at a time.

HYDROPHOBIA has broken out in several hunting kennels. The "Quorn" have lost all their entry, and many of the Albrighton have died, whilst still more serious fears are entertained for the huntsman and one of his assistants of the latter pack, both of whom are bitten. The disease has spread amongst some of the Scotch packs.

STRANGE CASE OF HYDROPHOBIA.—Ruth Simpson, a girl, 13 years of age, living with her parents, at 25, Lennox-street, Liverpool, was about eighteen months since bitten by a dog kept in the house, and about three months ago was bitten by another dog. A few days since all the symptoms of hydrophobia set in, and the poor child died in great agony on Thursday week.

ELEVATION OF TEMPERATURE AS A PRECURSOR OF ERYSIPELAS.—M. Vernenil related some cases to the Société de Chirurgie in proof that a sudden elevation of temperature (two or three degrees Cent.) indicates the speedy supervention of erysipelas when there is no other alteration in the general state of the patient or the condition of the wound.—*Union Méd.*, July 27.

THE annual meeting of the Society for rendering Aid to the Sick and Wounded in War was held on Tuesday. The report stated that the subscriptions reached nearly £300,000. The surplus of the Society was £73,212, and it was proposed that this sum should be invested in the names of Prince Arthur, the Earl of Shaftesbury, and Colonel Loyd-Lindsay. It was suggested that her Majesty should be solicited to become the patroness of the Society, and that a charter of incorporation for investing the sums should be instituted.

DINNER BY THE GOVERNOR AND COURT OF THE APOTHECARIES' HALL, DUBLIN.—Previous to the close of their official year, the Governor and Court of Examiners of the above Society gave a dinner on Thursday, the 27th ult., at the Exhibition Palace, Earlsfort-terrace. Among those who received invitations were the following:—Dr. Banks, President of the King and Queen's College of Physicians, Ireland; Mr. Wharton, President of the Royal College of Surgeons, Ireland; Dr. Stokes, D.C.L., F.R.S., and Sir Dominic Corrigan, Bart., M.P., Physicians-in-Ordinary to the Queen; Mr. Adams, Regius Professor of Surgery, and Mr. G. H. Porter, Surgeon-in-Ordinary to the Queen; Sir William Wilde, Surgeon-Oculist to the Queen; Professor Haughton, D.C.L., F.R.S.; Sir William Carrol, Professor Macnamara, Professor Benjamin George MacDowel, Dr. Churchill, Dr. Ringland, Mr. Albert Walsh, Dr. G. Johnston, Dr. Hargrave, Dr. Denham, Dr. Kidd, Dr. Cruick. The usual loyal toasts having been received with all the honours, Dr. Banks, in replying to the "Health of the President of the King and Queen's College of Physicians," dwelt upon the benefit and mutual advantage of the representatives of the whole Profession thus meeting together. Mr. Wharton, as President of the Royal College of Surgeons, in returning thanks, spoke of the desirability of a union of the several branches of the Profession, and the formation of an Irish conjoint board of examiners. The "Health of the Governor and Court of the Apothecaries' Hall" was proposed

by Dr. Banks. The "Health of the Rev. Professor Haughton," in connexion with Trinity College, was warmly responded to. Dr. Haughton, in returning thanks, mentioned the continuous efforts made by each of the Medical educational bodies of Ireland in the cause of advancing the Profession. He pointed out the great benefit that would accrue from unanimity, and asserted for Ireland the right to regulate the education of her youth in accordance with that respect for the Deity which had from the very earliest ages of Christianity marked the teaching of her schools.

THE APOTHECARIES' HALL OF IRELAND.—At the annual meeting of the General Council, convened pursuant to the Statute of Incorporation on August 1, 1871, the following were elected office-bearers for the ensuing year:—*Governor*: Robert Montgomery, Esq. *Deputy-Governor*: Joseph A. Dirham, Esq. *Court of Directors and Examiners*: Thomas Collins, Charles Holmes, Arthur Harvey, Charles H. Leet, Charles F. Moore, Henry P. Nolan, Jerome O'Flaherty, Edward J. O'Neill, George B. Owens, John Ryan, James Shaw, John Shea, and George Wyse, Esqs. *Examiners in Arts*: George Atkinson, A.M., M.B. Dub., and John William Moore, M.D., M.C.H. Dub. *Secretary and Representative in the Medical Council of Education*: Charles Henry Leet, M.D., M.C.H.

COMPOSITION AND QUALITY OF THE METROPOLITAN WATERS IN JULY, 1871.—The following are Dr. Letheby's returns to the Association of Medical Officers of Health:—

Names of Water Companies.	Total Solid Matter per Gallon.	Oxygen required by Organic Matter, &c.	Nitrogen.		Hardness.	
			As Nitrates &c.	As Ammonia.	Before Boiling.	After Boiling.
	Grains.	Grains.	Grains.	Grains.	Degs.	Degs.
<i>Thames Water Companies.</i>						
Grand Junction	18.13	0.107	0.120	0.002	13.8	3.6
West Middlesex	17.10	0.070	0.118	0.000	13.2	3.3
Southwark & Vauxhall	17.23	0.092	0.110	0.005	13.6	3.4
Chelsea	17.93	0.111	0.110	0.003	13.8	3.5
Lambeth	18.63	0.079	0.111	0.002	14.0	3.6
<i>Other Companies.</i>						
Kent	27.93	0.010	0.212	0.000	20.0	5.8
New River	17.40	0.023	0.120	0.001	14.0	3.3
East London	18.33	0.037	0.129	0.002	14.3	4.0

Note.—The amount of oxygen required to oxidise the organic matter, nitrites, etc., is determined by a standard solution of permanganate of potash acting for three hours; and in the case of the metropolitan waters the quantity of organic matter is about eight times the amount of oxygen required by it.

The water was found to be clear and nearly colourless in all cases but the following, when it was more or less turbid—viz., in those of the Grand Junction and the Chelsea Companies.

The average quantity of water supplied daily to the metropolis during the preceding month was, according to the returns of the Water Companies to the Association of Medical Officers of Health, 111,190,422 gallons; and the number of houses supplied was 487,650. This is at the rate of 34.1 gals. per head of the population daily.

NOTES, QUERIES, AND REPLIES.

Be that questioneth much shall learn much.—*Bacon.*

I. K. Q. C. P. Ireland.—You have a prescriptive right to call yourself Doctor or Dr., but not to sign yourself M.D.

Small-pox.—Vaccine lymph in tubes can always be obtained from Mr. Faulkner, Endell-street, W.C.

E. W. P.—One Preliminary will cover the others. You must reside for an Oxford or Cambridge degree.

X.—We do not know whether any new appointments are to be made. Write to the Medical Officer of the Privy Council.

Hibernicus.—It has been satisfactorily proved that the number of cases imported into Ireland during the five months ending July 13, 1871, was fifty-eight, which, added to thirty-four cases imported in 1870, makes a total of ninety-two cases in the period referred to.

Plymouth.—At a meeting of the Board of Guardians, held on Wednesday, the 26th ult., the election of a Surgeon in the room of Mr. May, resigned, was brought forward. It appeared that there was only one candidate for the vacant office, and it was moved that an adjournment for a fortnight of the election should be made, in order to the issuing of further advertisements, so as to obtain more candidates. Eventually this motion was carried. How can the Plymouth Guardians expect even a single candidate for a vacant office the duties of which they have increased, whilst they diminished the amount of payment. We trust what is called the "combination" amongst Surgeons will exist so long as it is attempted by an unscrupulous Board to treat them with insult and injustice.

A Reader.—Physicians and Apothecaries.—In the "Diary and Correspondence of Lord Colchester" is to be found the following curious statement:—"The practice of Physicians is so much altered of late years that, even in Dr. Mead's time—who died in 1754—no Physician visited the ward of any Hospital, nor ever saw the greater number of his patients. The business was conducted by consultations held at the Physician's house with the apothecaries, who related the patients' cases. Dr. Mead used to go into the City to Batson's Coffeehouse, and meet all the apothecaries and prescribe. Dr. Friend and Dr. Radcliffe were both of them members of the House of Commons."

Etiquette.—In the first instance, a communication of the kind referred to should undoubtedly be made to a Medical journal. We can find no excuse for giving the information in the form of a circular to the various newspapers. Such a proceeding assumes too much the character of advertising, and admits of an explanation not creditable to the writer of the letter. It may be argued that "poisoned gloves" is a subject interesting as much to the public at large as to the Profession. This is true; but we still contend that the information should, in the first instance, have been made to a Medical journal, whence it would have been quoted by the newspapers.

THE "LANCET" AND HOSPITAL OUT-PATIENT REFORM.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.
SIR,—Last week I addressed a letter to your contemporary inquiring whether it was true, as stated in the *Daily News*, that the late deputation to Mr. Stansfeld "asked for the assistance of the Poor-law Board in encouraging the establishment of provident Dispensaries, in discouraging free Medical out-relief, and in placing the out-door Medical relief under the Poor-law Board," as in the *Lancet* report, which was considerably longer than that in the *Daily News*, no mention was made of any such requests. The *Lancet* suppresses my letter, as on a former occasion it suppressed an amendment which I moved at the meeting in April last. I am, &c.,
21, Fitzroy-square, W., July 29. H. NELSON HARDY.

COMMUNICATIONS HAVE BEEN RECEIVED FROM—

DR. HANDFIELD JONES; MR. J. HUNTER; MR. W. R. DALTON; MESSRS. S. KING and Co.; MR. C. H. COLLETTE; MR. G. REED; MR. J. MARSDEN; DR. DAY; MR. W. N. HARDY; MR. ADDISON; MR. T. WORTH; DR. BASTIAN; DR. BREE; MR. G. COWELL; MR. VENMAN; MR. F. R. HOGG; MR. B. ARMITAGE; MR. MONTEITH; MR. J. ROBERTSON; DR. SHUTTLEWORTH; MESSRS. A. and C. HARSTON; DR. BARNES; INSPECTOR-GENERAL LAWSON; DR. LAYCOCK; MR. J. CHATTO; X.; T. A. D.; MR. H. E. SYMONS; MR. S. WHITFORD; DR. NEWMAN; DR. PROTHEROE SMITH; DR. LETHEBY; DR. W. KRAMER.

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29.49 in. The highest was 29.82 in. at 9 a.m. on Friday, and the lowest was 29.24 in. at 9 a.m. on Tuesday.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871; the numbers for Edinburgh and Glasgow have been furnished by the Registrar-General of Scotland, while those for Dublin are still the estimated numbers recently used.

† Observations imperfect, owing to removal of station.

CLINICAL LECTURE

ON THE

USES AND APPLICATION OF HODGE'S LEVER-PESSARY.

By ROBERT BARNES, M.D. Lond.,

Obstetric Physician to St. Thomas's Hospital; Examiner in Midwifery and the Diseases of Women to the University of London, the Royal College of Physicians, and the Royal College of Surgeons, etc.

PART II.

THE SELECTION OF A PROPER INSTRUMENT.

IN choosing a lever-pessary we must bear in mind the principle of its action. It is a lever, and we must take care to use it as a lever. It is very easy to impair or to destroy this, its essential character, by using too large a pessary. This is the case when the instrument puts the vagina tightly on the stretch. It then acts very much like the old ring-pessary, which prevents the uterus from falling chiefly by expanding the vagina and resting upon the floor of the pelvis. The lever-pessary requires no bearing upon the solid structures of the floor of the pelvis, and ought not to stretch the vagina. A lever must be mobile. It depends for its efficacy upon its responding to the natural movements of respiration. At every inspiration, the diaphragm, descending, drives the abdominal viscera downwards, and the anterior wall of the vagina, with the cervix uteri and the base of the bladder closely adherent to it, descends. Now, if a bar or lever be so placed in the vagina that one end rests upon the anterior wall, whilst the other is applied to the upper part of the posterior wall, so as to impinge upon the depressed fundus of the uterus, it is obvious that with every inspiration the anterior arm of the lever, carried down by the descending anterior wall of the vagina, will cause the posterior arm to ascend, and thus lift up the fundus uteri. This is precisely how the lever-pessary works. Its action is in strict harmony with the physiological movements of the organs. It is gentle, gradual, and safe. It preserves the natural contractile condition of the vagina. And this gradual action is the great condition of cure of a retroflexion. At the seat of flexion, if this has existed long, there is change of structure—perhaps some degree of atrophy. Before the uterus can maintain itself erect, this spot of impaired structure must be restored to its normal integrity. This is a process of nutrition for which time is required; hence the lever-pessary must usually be worn for a considerable time, counted by months—perhaps for a year or more; but all the while it is doing good.

The Material of the Pessary.—The best is undoubtedly vulcanite, on account of its perfect smoothness, and inalterability under exposure to the heat and discharges of the vagina. It is, therefore, perfectly clean; and when you have determined by observation, the suitable size and shape, it is well to have one made in vulcanite for continuous use. But in the first instance it is more convenient to use the ordinary gutta-percha ring mounted on copper wire; this you can fashion yourself to the proper shape.

The size is determined by the capacity of the vagina and vulva, and by the degree of descent of the uterus. In single women one of very small size is commonly best; the elasticity and firm apposition of the walls of the vagina maintain the pessary in position. The touch gives you an estimate of the capacity and tonicity of the vagina. A ring $1\frac{1}{2}$ in., or 2 in., or $2\frac{1}{2}$ in. in diameter is generally large enough. It must be moulded, after warming, to the shape seen in Figs. 1 and 2. In married women, especially in those who have borne children, a ring of $2\frac{1}{2}$ in., 3 in., or $3\frac{1}{2}$ in. may be necessary. It is important that both ends should have but a moderate curve—should be, in fact, nearly straight. This enables the lower end to adapt itself better to the symphysis pubis and urethra, and the upper one to the rounded uterus. The lower arm is bent backwards, the upper one forwards, as seen in Figs. 2 and 3.

The introduction is effected in this way. The patient lies on her left side. The forefinger of the left hand is first passed as a guide just inside the vulva, and presses the perineum slightly backwards. The pessary held in the right hand is then passed with its flat in a line with the vulva—that is, in the conjugate diameter of the pelvis, as seen in Fig. 1. As soon as the upper end enters the vulva it is directed somewhat backwards, so as to avoid pressing against the

FIG. 1.

FIG. 2.

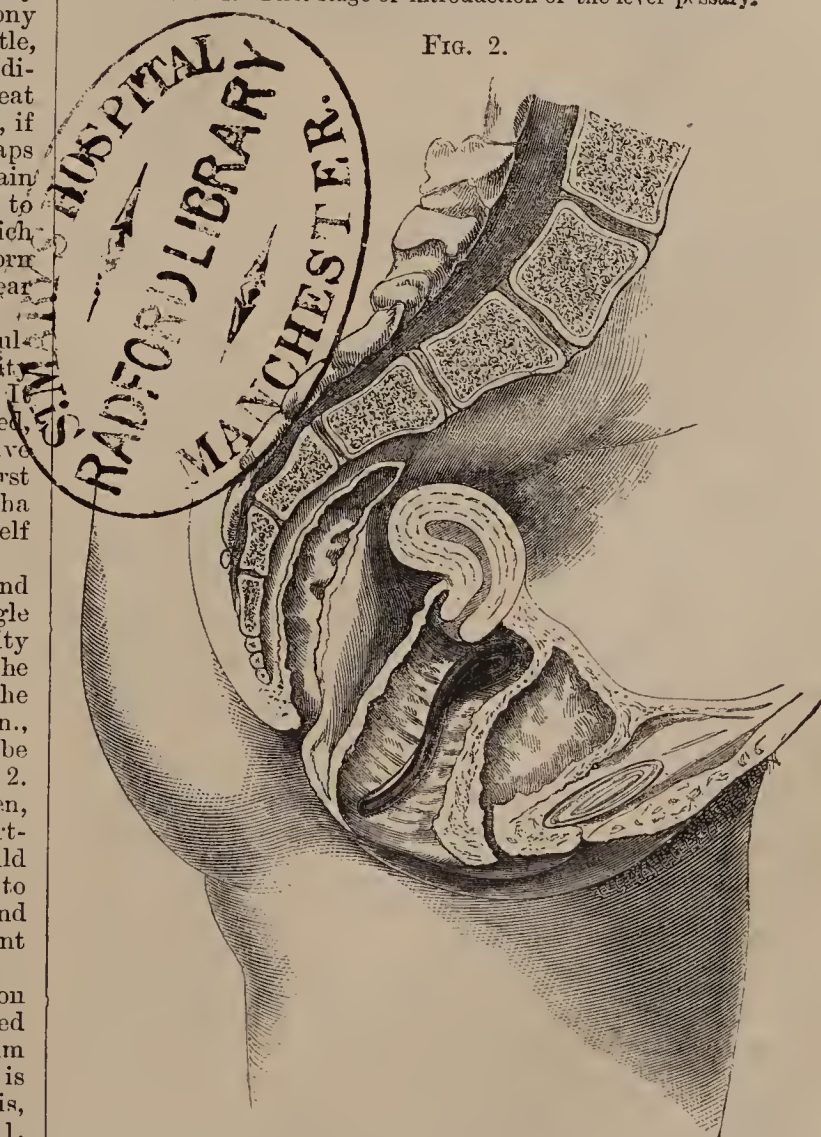

FIG. 2.—Second stage of application of the lever-pessary.

symphysis. When it is wholly inside the vagina the guiding finger applied to the lower arch turns the pessary half round on its long axis, so as to bring its flat into the transverse diameter of the pelvis, as in Fig. 2. The effect of this manœuvre is often to carry the upper arch in front of the os uteri. The guiding finger, therefore, passed inside this arch must press it back under the os, when it will immediately rise to its proper position behind the os and below the retroflexed body of the uterus, as seen in Fig. 3. The riding of the

FIG. 3.

FIG. 3.—Lever-pessary *in situ*. The lower limb at A is the position in expiration. On inspiration it is carried back to B, and the upper limb, rising, carries the body of the uterus forward to the position marked by the dotted outline.

pessary over the os sometimes causes a little pain. *In situ*, the os falls inside the upper loop, and displacement, provided the size and form are right, is nearly impossible. The adaptation of the lever depends upon the structure of the vagina—upon its anterior wall being shorter than the posterior; so that the anterior arm of the lever must be lower than the posterior one, which naturally rises into the *cul de sac* behind the cervix, to which place it is guided by the cushion between the lower part of the posterior wall of the vagina and the rectum, which forms an inclined plane rising towards the fundus of the vagina. The last thing to do is gently to push up the lower or anterior arch behind the symphysis with the tip of the finger. In single women the passage of the vulva is generally painful, and sometimes the displacement of the uterus is attended by such a severe degree of hyperæsthesia that the use of chloroform is indicated alike to facilitate diagnosis and the application of the instrument.

When *in situ* a well-chosen pessary should give no pain. If the vaginal wall is found much stretched, the pessary should be removed and a smaller one tried. Pain sometimes is felt from the pressure of the upper arch upon the tender congested uterus. Where there is any serious amount of inflammation, some days' rest in bed, perhaps weeks, should be used first. But generally the little uneasiness at first experienced soon wears off, and, as the pessary begins to act, sensible relief from the troubles due to the retroflexion is obtained. The pressure upon the bowel is gradually taken off, and after a time, aided by tonics and other means, the constipation is often materially lessened.

To remove the instrument, manœuvres in the inverse order of those used for introduction are necessary. There is no occasion, however, to bring the upper loop first in front of the os uteri.

All you have to do is to hook the forefinger into the lower loop, which is directly behind the symphysis pubis, and whilst drawing it downwards and backwards to rotate it on its long axis, so as to bring the flat into correspondence with the vulvar fissure, as in Fig. 1, and then to extract in the axis of the pelvic outlet.

Some few patients acquire the knack of introducing and removing the instrument themselves, but generally it is an operation that requires skill. It is worn continuously. It interferes with no function. Moderate exercise is beneficial, both by improving nutrition and general health, and also by promoting the specific lever-action of the pessary. It is always desirable to see patients who are wearing the pessary from time to time—that is, once in two or three months. After a while, as the uterus rises, it may be useful to substitute a larger instrument. When endocervicitis or uterine catarrh or hæmorrhage complicates the displacement, as is not uncommonly the case, further local and general treatment will be necessary to accelerate the cure.

CASE OF

SUDDEN DEATH FROM SUBACUTE INFLAMMATION OF THE AORTA,

PRODUCING INCOMPETENCY OF AORTIC VALVES AND DILATATION OF LEFT HEART—AUTOPSY.

By WALTER MOXON, M.D.

A MAN, aged 36, a refugee from Paris, a baker by trade, was admitted into Guy's Hospital, suffering from symptoms of heart disease. He had never had rheumatic fever; there was no account of syphilis, but his wife had had several miscarriages; he was pale, and suffered moderately from dyspnoea. A diastolic murmur of regurgitant aorta was plainly audible; no pulse could be felt in his left arm. Still, he was far from being entirely bedridden and disabled, and appeared to have a considerable time to live; indeed, he was rather of a merry turn, and in the evening of the day of his death had been singing, shortly after which he went to his bed, and they said he had a fit; but he was found to be dead by the House-Physician, who was summoned at once.

On inspection, the body was well formed and well nourished, and entirely free from dropsy. There was a general purplish cast of the surface. The head was not examined; the probability of such a sudden death being due to brain disease was practically nothing. As to the lungs and their covering, all parts were healthy, with one trifling but significant exception. This exception was, that slight adhesions of the pleura existed on both sides along the course of the aorta, and they did not exist in any other part. The aorta was diseased: its valves appeared perfect in structure, but by the yielding of the softened aorta the orifice they should close had become too wide for them, so that they were stretched flat, leaving a triangular opening between them, instead of meeting on a triradiate line as is proper. A free regurgitation was thus allowed, and this regurgitation no doubt had given rise to the great dilatation of the left ventricle which was present—a dilatation that greatly exceeded the hypertrophy which accompanied it. The weight of the heart was sixteen ounces. The whole of the aorta down to the coeliac axis was diseased: its coats were swollen and softened, and, instead of the usual yellowish opacity, had an almost starch-like, bluish, half-pellucid appearance, blotched with fattily degenerated patches, and wrinkled through irregularity in the distribution of disease. It was plain that the heart had no proper disease, but it failed through disease of the aorta. It is so commonly assumed now that disease of the aorta is always due to degeneration, passive and connected with senility, that this case acquires a certain importance from its showing reason for rejecting that supposition as regards its own causation; for, at the age of 36, advanced senile changes are unlikely, and the character of the disease in the aorta itself, marked by softening of the coats into a flabby but half cartilage-like looking state, does not conform to conditions of degeneration, while the pleural adhesions already mentioned, taken with the appearance of the diseased vessel, may be accepted as proving the active and, in short, inflammatory nature of the change. The disease acquired a greater intensity at one spot, and its inflammatory character was best shown there. This spot was

the origin of the left subclavian artery, where a mass of sub-fibroid material larger than a horse-bean lay in the vessel's coat, and quite shut up the subclavian, thus accounting in an interesting way for the absence of pulse in the left arm observed during life. All the blood in the heart's cavities was fluid, as is usual in the case of sudden death from whatever cause.

The case gives an example of what must never be forgotten in dealing with disease of the aortic valves—namely, the liability to abruptly sudden death while yet the patient is free from dropsy and the other signs of mechanical failure of the heart's efficiency. This risk of sudden death scarcely exists at all in mitral disease. It would occupy much space to trace the probable causes of this difference, but attention should be given to the strongly marked difference of aspect between a patient suffering from mitral disease and a patient suffering from aortic disease. Aortic cases are pallid, tawny, anxious, and breathless, even when free from dropsy. Mitral cases, on the other hand, have a congested look, and have either none or a bearable neuralgic pain, very different from the suffocative anginous distress of aortic disease, and they do not generally suffer gravely before dropsy begins to appear. Of the two evil conditions which follow from obstruction of the circulation—viz., deficiency of blood in front of the obstruction, and congestion behind it—aortic disease suffers more from the former, and mitral disease more from the latter. It also appears that aortic disease in some way tends more quickly to deprave the quality of the blood.

NOTE ON A SPHYGMOMETER.

By C. HANDFIELD JONES, M.B. Cantab., F.R.S.

It is very evident that it would be desirable to have some means of measuring with tolerable accuracy the strength of the pulse. At present we can only judge of it by our consciousness of the amount of muscular force we exert in compressing it. We say that a pulse is strong, or weak, or compressible, but we do not express the degree of strength numerically, as we do the rate when we count it watch in hand. The following

is a short description of a little instrument which I hope may meet this want:—It consists of a spiral spring contained in a brass tube, and attached at its lower end to a metal rod, which projects from the tube nearly two inches, and terminates in a flattish oval button. The rod carries a pointer which indicates on a scale the number of grammes equivalent to different degrees of pressure. For most cases I think a scale extending from fifty-eight grammes to 600, and occupying about 1.8 inch in length is convenient, the degrees corresponding to multiples of fifty-eight. But for weak pulses I use a much weaker spring, whose pointer travels over 1.8 inch when a pressure of 320 grammes is applied. In using the instrument the observer places his finger on the radial artery, just beyond the styloid process of the radius, and applies the button over the artery, as near the finger as possible. He then makes pressure on the artery till he finds that the pulsation ceases to be perceptible to the examining finger, and then notes the position of the pointer. By alternately making and relaxing pressure, it is easy to find pretty correctly the force expressed in gramme-weights which arrests the pulse.

Occasionally I have found that compression of the radial, though it greatly weakened, did not quite obliterate the pulse. This happens, I suppose, when the radio-palmar branch, which completes the superficial palmar arch, is of large size, and so its pulsation is perceptible to the finger. Even in this case I think it will often be possible to discover when the main current is arrested.

Another and more elegant form of instrument for the same purpose can be obtained by adapting a much stronger spring to Dr. Gibson's stethometer, and graduating the dial as in the above-mentioned scale. This, as well as the simpler form of the instrument, will be obtainable before long, I hope, at Mr. Hawksley's, Blenheim-street, Bond-street, and

may be inquired for under the name of a sphygmometer. As to the practical utility of this little invention, I affirm nothing at present. In a short time, as I am using it a good deal, I hope to form some conclusion about it. I only say that it seems to me a rational procedure to use some such instrument, and that this is simple, handy, uncostly, and easy of application.

REMARKABLE CASES OF "LE PETIT MAL."

By J. THOMPSON DICKSON, M.A., M.B. Cantab., M.R.C.P.,

Physician to the Infirmary for Epilepsy and Paralysis, Charles-street, Portman-square.

The following remarkable cases of "le petit mal" were lately under my observation, and they are of special interest as illustrations of the extreme mobility of some nervous systems when brought within the influence of even very slight subjective impressions.

In the late inordinate demand for vaccination, several applicants requested me to operate upon them, and among these were the epileptics whose histories I am about to detail. Two of the patients were young ladies, of an age between 15 and 16, the other was a boy 12 years old.

The first case is one of the girls. In her the signs of puberty are complete, and her physical development is considerably advanced. At school she has given abundant evidence of good intellect, and, though vivacious and volatile, constantly displays a remarkable amount of good sense. She was brought to my house for vaccination, and I had just commenced to scarify the skin of her arm when I noticed that she became ashy white, her lips became blanched, and her face bloodless; the next instant she became unconscious, and fell forwards upon a table against which she was standing. Almost the next moment she stood up, gazed vacantly round the room, and then re-presented her arm for the completion of the vaccination. I asked her what was the matter? She said "she did not know, she only felt a little faint;" and asked if she might have a little water. She was altogether unaware of the fact that she had fallen. I afterwards questioned her upon her general condition, and I learned from her that she often feels a sensation which she describes as "faint," but which, on interrogating her more closely, she described as giddiness; and this, she said, "is always followed by headache." I have been informed that some three or four years ago this girl had a fit, but it is vaguely described, and no account has been taken of any seizure that may have occurred since the time of its occurrence. Incidentally her mother had noted that she frequently complained of headache. She was under my care shortly before the occurrence of the seizure described, suffering from *suppressio mensium*.

This girl's mother is epileptic; I have known the mother to be in the *status epilepticus* for twenty-four hours at a time. This child, however, was born before the malady had shown itself in the mother. But a brother of the mother was insane, and a maternal uncle of the mother was an amental epileptic; thus in the third generation the hereditary predisposition has, at an early age, become manifest in the development of a highly mobile organisation, and though the positive manifestations have been but slight, the consequences hereafter may be very great.

The second case occurred in the other girl, in whom the signs of puberty are incomplete, though her physical development is rapidly maturing. She, however, partakes more of the child and less of the woman than my first case. The extreme mobility of this young lady's nervous system I was quite aware of, and I was more than ordinarily struck with an observation I made upon it a few days before I vaccinated her. I was dining one evening at her father's house, and she playfully asked me to mesmerise her, and I, willing to gratify and amuse the child, made an attempt to do so, but for some time without any effect. After some minutes she laughed, saying, "It is impossible to influence me;" but within the next minute she was almost completely under the nervous influence. Of course, I instantly desisted, and refrained from pushing the experiment further; but I noted the extreme suddenness with which her nervous organisation had changed from a state of great excitement to one of very passive control. But to return. Whilst vaccinating her, just as I had completed the scarification of the skin, I observed her turn deathly pale, and the next instant she fell into the arms of her mother, who was standing by. Her mother placed her on the floor, and for about forty seconds the patient was death-like and

motionless; she was then seized with a convulsion, in which all the flexors were thrown into spasm (the fit exactly resembled one of the eclamptic attacks I have often produced in guinea-pigs by section of the spinal cord). She then turned on her right side, and then sat up, asking "what the matter was." I gave her my hand, and she stood up, looked round the room, and again asked "what the matter was." I desired her to lie down on a sofa, which she refused to do, saying, "I'm all right." She was, however, easily persuaded, and when lying down said, "I hope I have not had a fit." On questioning her, she told me that she had a headache, and felt giddy and confused, and that it was not the first time she had felt so, though she had never told anybody. A few days afterwards I learnt from her that she is subject to frequent attacks of vertigo, and to occasional headache of an almost overpowering kind. She is a girl of very brilliant intellect, and possessed of abilities of a very high order; she has extraordinary vivacity. At the same time, she is devoted to reading and study, and will brood over books for many hours together. I learnt, too, that she was occasionally subject to somnambulism; and I also learnt that a brother of her mother had died insane. A sister of my patient died of cerebral disease which had manifested itself as epilepsy, and her father, although a man of large mental calibre, is the subject of vertigo. I have not been able to learn for certain whether the taint extended back to a former generation (the subject is one of extreme delicacy with the family), but the mother hinted to me on one occasion that her grandfather was at one time insane.

The third case occurred in a boy of 12 years of age, whom I have had under my care for three years, the subject of "le haut mal." His epilepsy, which commenced during dentition, was neglected, and continued with more or less severity until three years ago, when I commenced systematically to combat the condition. He was at one time subject to seizures which threw him into the *status epilepticus*, sometimes lasting for four-and-twenty hours together, but he had not had any form of attack for eighteen months before the day on which he came to me to be vaccinated. His mother brought him in compliance with his own wish, and after he was vaccinated he sat down on a chair whilst his brother was being operated upon. After some four or five minutes, he put his hand up to his right ear, and said he had a pain in the ear. On placing my hand upon that organ I found it intensely cold. After sitting for one or two minutes longer I saw him become blanched. He then got up and ran towards the door, and had just touched the handle when he reeled round on the right foot and fell forwards. I reached him in time to catch him in my arms, and I laid him, rigid and insensible, but unhurt, upon the floor. He was insensible about thirty seconds. He then became slightly flushed, was seized with one very slight convulsion, opened his eyes, and the next instant fell asleep. He slept about ten minutes, after which he sat up, and said he felt very ill. He did not know what the matter had been with him; he said all he remembered was that somebody had shaken him. His mother asked me the question whether it was a fit or whether he had "only fainted." On the morning of the day on which the occurrence took place, it was noticed that the child refused his breakfast. His breath had a fetid odour, and he admitted that his bowels had been confined for some days.

In this case the family history pointed to hereditary taint. The child's maternal grandfather died of cerebral disease, though the malady did not appear in any of his children or grandchildren, or in any member of their families, until this child's first attack. On the paternal side the family history is good. Although the exciting cause of the fit I have described was undoubtedly the intestinal irregularity, the case teaches much from the fact of the slightness of the determining circumstance. He admitted that he did not feel the vaccination; it was to him, therefore, merely an idea. The phenomenon was, consequently, subjective; but subjective impressions are as exhausting to the cerebral cells as objective, and, as shown by the cases I have given, readily upset the nervous equilibrium or balance of control.

It now behoves us to draw the lessons furnished by these cases. The special interest attaching to the two first-mentioned is the fact that they were first, or almost first attacks, and therefore there was perhaps some excuse for their friends mistaking the manifestations for faintings. The mother of the second-mentioned, however, recognised, and at first admitted, the epileptic character of the affection, though she afterwards persuaded herself, and insisted among her relations, that the attack was only a faint. The cases, however, were all instances of genuine epileptic seizure, and all reached the degree of complete loss of consciousness. It is certainly remarkable how

unwilling relations and friends are to admit the fact of epilepsy, and how ready they often are to stifle their fears with the assumption that the patient has "only fainted." Herein, too, lies one of the nice distinctions that I have several times before drawn attention to—viz., the overlapping of epilepsy syncope. I grant that syncope may occur in a patient who has not the least epileptic tendency, and, again, that epilepsy may (and frequently does) occur without the slightest resemblance to syncope; but, at the same time, it is certain that the form of epilepsy which we call "le petit mal" bears in its outward form so strong a resemblance to syncope that it is of the highest importance to study minutely all the circumstances of a patient the subject of fainting, lest, under the assumption that the attack is a mere faint, we overlook the graver condition. And I would here repeat that epilepsy is more common than is generally admitted, and that its pathognomonic symptom is sudden loss of consciousness.

The next lesson we may learn from these cases is a confirmation of the fact I have before several times demonstrated—namely, that the proximate cause of the epileptic phenomenon is cerebral anæmia. So intimate is the association and connexion between the vessels of the face and the interior of the skull, that the blood-carrying state of the former may be taken as an index of the sanguiferous condition of the latter; and, in the cases under consideration, the blanched bloodlessness of the face certainly spoke eloquently of the anæmic state of the brain, which resulted in loss of consciousness. The loss of consciousness, again, was complete and without affectation—a circumstance never attendant upon mere fainting.

In the cases of the girls, both professed to be brave, yet both afterwards admitted that they had been afraid of the operation for vaccination; their courage was forced and unnatural, and upon realisation of the fact that they had not been hurt, the relaxation of the tension at which their nervous energy had been held became an irritant to their brains. In the ordinary healthy brain, the relaxation of mental strain, however severe, would never have been followed by a degree of exhaustion sufficient to set up that cerebral irritation which is required to contract the smaller arterial vessels and capillaries; but we have seen that my patients are subjects of hyper-excitability—or, at the least, of mobility—from hereditary cause, and thus they are eminently susceptible of the influence of very slight irritation.

I mentioned in connexion with the second case that the girl was highly intellectual and that her father was a man of large mental calibre, and the fact is noteworthy as comparing with many assertions as to the intellectual capacity of epileptics. A very little reflection will show that the want of mental power observable in epileptics is a question of degree, of continuance, and of time. Epileptics may be born with little or no intellectual capacity; but the brightest intellect may become the subject of epilepsy. The subject of hereditary taint, however mobile and unstable his nervous power may be, may yet possess extraordinary mental capacity and great intellectual brilliancy; nevertheless, when once the tissue-change which brings about this dire affection has seized upon the individual, the onward course is downward, and the tendency of all epileptic subjects is, either with rapid or slow steps, certainly and surely towards hopeless imbecility.

I may be asked how I would treat these cases; and I answer that the essential of treatment is to endeavour to teach the patients themselves to exercise such judgment in all their actions that they may, if possible, prevent recurrence of the attacks. Every effort must be made to ward off attacks and to nourish the brain-tissue in such subjects. All exhausting influences, particularly excitement and long abstinence from food, must be carefully avoided, and the due performance of all natural functions adequately and normally sustained. Epileptic patients, particularly young girls, are often self-willed. It is, therefore, highly necessary to win their confidence, in order to persuade them of the necessity of adopting rules and habits of living which are essential to their good.

Girls are often captious and capricious about their food, and neglect to take it with that regularity which in an epileptic is necessary to avoid exhaustion. To starve at one meal-time and eat inordinately at another is a certain means of nursing epilepsy, since it brings about alternate irritation and exhaustion. Irregularity in attendance to the calls of nature, also, is a neglectful habit to be watched and remedied. Constipation is a frequent attendant of epilepsy, is often increased by neglect, and is a very frequent excitant of an epileptic seizure.

Precaution also must be observed in regard to direct excitement. Not long since I witnessed a young lady in a ball-room, drop, as though dead, into her partner's arms whilst she

was waltzing. Her loss of consciousness was complete, and, though she was able almost instantly afterwards to walk to a chair, it was some minutes before she recollected where she was. She told me that she was quite aware of her malady, that she was subject to seizures of the kind, and she never could waltz for many minutes without feeling giddy, but that the temptation to waltz whenever she had the opportunity was so great that she found resistance of it almost impossible. In "le petit mal," as, indeed, in epilepsy of every degree, there is no circumstance too small to be worthy of notice. In my experience, the smallest detail has often proved to be of material importance in diagnosis of obscure cases.

VERY LARGE CYSTIC TUMOUR OF LEFT BREAST, OF TWO YEARS' DURATION—REMOVAL—RECOVERY.

By W. NEWMAN, M.D. Lond., F.R.C.S. Eng.,
Surgeon to the Infirmary, Stamford.

E. S., 58, widow, was admitted under my care into the Stamford and Rutland Infirmary, on June 2, 1871. She has a very large tumour of the left breast, and gives the following history:—

Has had one child seventeen years ago. Always had good health until two years back, when she noticed a lump about the size of a pigeon's egg at the anterior and inner part of the left breast. This lump has gradually become larger, and has grown irregularly; but for the last month or two it has made very rapid increase, and the surface has become knotted and lobulated. In the first instance there was very little pain, but for the last twelvemonth the pain has been pretty constant, and of dull, aching character; sometimes severe darting through the breast has been felt, and the uneasiness has of late been much increased by any movement.

She is a stout, healthy-looking woman. Her impression is that the growth followed upon a sharp blow upon the breast, and she maintains stoutly that the whole duration has not lasted more than two years. The tumour measures twenty-four inches in circumference at the base, and eighteen inches at a line drawn from the chest wall above over the prominence of the mass to the chest wall below. At the base it is hard to the touch, but above there are numerous and large cysts thinly covered by very tense integument, and affording very distinct fluctuation. On the under surface protrudes a fungoid mass, which has only very recently made its appearance; it is about the size of a large walnut, and is sloughy and dark-looking; there has not been any hæmorrhage from this point. The axillary glands are not enlarged, and the mass can readily be moved upon the pectoralis muscle. Many large veins are seen to ramify between the prominent lobules.

June 5.—The breast was supported for two hours in raised position, so as to favour as far as possible the return of blood from its vessels. At 2 p.m. chloroform was given, and I proceeded to remove the mass. Two elliptical incisions were made—one at the inner, the other on the outer side—and the coverings rapidly dissected down to the fascia covering the pectoralis major. The tumour was drawn well away from the body, and a few rapid cuts sufficed to effect its complete removal. The fibres of the underlying muscle were not even exposed. There was but little hæmorrhage, and only three ligatures were needed. The edges of the wound were brought together with wire sutures. Wet lint applied, and a light sand-bag put over so as to keep the flaps well down upon the chest.

Chloroform sickness was troublesome for the next two days; but the local conditions went on very well, and the constitutional disturbance was but little. Pulse never exceeded 108; and temperature was not noted above 102°.

9th.—Sutures removed; some blush on the flap near to the axilla, and retention at this lowest point of sanious discharge. This was remedied by change of position and some outside packing.

15th.—Takes food well. Wound discharges freely and healthily; at the upper part the healing is nearly complete.

July 1.—Wound healing well; gets up each day.

18th.—A mere trace of unhealed line at lower half of wound. Discharged cured.

The tumour on removal weighed 7½ lbs. I sent it at once to the museum of the Royal College of Surgeons, and Mr. Goodhart, the pathological assistant, has kindly forwarded the following careful description of the mass:—"The tumour measures (diameters) 10 inches by 6½ inches. The skin excised shows

the nipple, and below it an oblong, irregular ulceration, with two rounded masses projecting from it, forming a fungous-looking mass. The integument around the nipple is distended, but there is no adhesion of the growth to it and no retraction. The subcutaneous surface of the tumour is very irregular from the projection towards the surface of many cysts of similar shape to those protruding from the ulcerated spot. They all contain a very viscid gelatinous fluid, in which float a few round cells with very granular contents and some fatty squamous epithelium. The whole growth is surrounded by a thin fibrous capsule, outside which is a thin layer of adipose tissue. No remains of the proper breast-tissue can be found, and no adhesions to the muscle beneath appear to have existed. On making a section of the mass, a large quantity of thick and viscid milky-white fluid came away from the cysts in its interior. The milky appearance was due entirely to the presence of much squamous epithelium in a state of advanced degeneration. Having washed this away, the greater part of the tumour still remained solid, a few cysts only becoming empty. The whole tumour, however, is cystic in its nature, the solid part consisting of large cysts, entirely filled with secondary and tertiary cysts projecting from the lining membrane of the parent cell."

I have thought this case deserving of permanent record from the fairly clear history of the growth, and from the careful pathological description with which I have been courteously favoured. The enormous size of the mass, its singularly easy removal, and the extremely short time occupied in its increase, are, too, all points which deserve the notice of the practical Surgeon.

ON RHEUMATISM.

THE RHEUMATIC POISON: WHERE AND WHAT IS IT?

By J. JAMES RIDGE, B.A., B.Sc., B.S., M.D. Lond.

Nor so very long ago there was a notable discussion upon the treatment of rheumatism, which gave a rude shock to the long-established faith on the subject, and disturbed the widespread confidence of the Profession in the routine treatment of the disease by alkalies. Some bold and irreverent spirits even ventured to assail the foundation of the alkaline treatment, and to question the "acid" character of the disease. What effect has all this had? Is the alkaline treatment less frequently adopted, or its foundation-hypothesis abandoned? Taking the reports of eases in the journals as a guide, we can hardly come to that conclusion. Some, no doubt, have thrown it up and adopted an expectant plan; some, perhaps, doubt, yet keep to the same line of treatment, and use the same phrases, and astonish their patients still by the learning they display in discovering "acidity of the blood"; but the majority have no such scruples to restrain them.

With a view to clear the way for some scientific and correct theory of the nature of rheumatism, I propose to pass in review the arguments upon which the opinion that there is excess of acidity in this disease is generally rested. I believe it will be found that there is, to say the least, no sufficient ground for such an opinion.

The presence of a special "acrimony" was early assumed to exist in the blood in rheumatism, in accordance with the then prevalent humoral theory. Cullen was one of the principal of the few opponents of this idea, and as his remarks are so pertinent, and have just as much force if applied to the more modern doctrine of an "acid poison," it is worth while to hear him. When, however, he leaves criticism, and builds up a theory of his own, he is more open to objection. But if his language is translated into that of modern pathology, he is certainly, in my opinion, nearer the solution of the problem than his opponents, or their successors. He says—"The proximate cause of rheumatism has been imputed to a peculiar acrimony, of which, however, in ordinary cases, I can find no evidence; and, from the consideration of the remote causes, the symptoms, and cure of the disease, I think the supposition very improbable." Again—"While I cannot, therefore, find either evidence or reason for supposing that rheumatism depends upon any change in the state of the fluids, I must conclude that the proximate cause of acute rheumatism is commonly the same with that of other inflammations not depending on a direct stimulus." Sir C. Scudamore is one of the few who have held a similar opinion. His remarks, quoted by Garrod in Reynolds' "System of Medicine," are very appropriate in this connexion, though some of the expressions seem to me to

require modification. He says—"It may be stated that the predisposition to rheumatism consists in a deficiency of healthy tone in textures connected with joints and muscles, and in nerves, so as to be affected in this peculiar manner by the influence of variable temperature. If we lose sight of the humoral term rheumatism, we shall come to the simple fact that, in a condition of susceptibility, cold or a sudden reduction of temperature makes a particular impression on the vessels and nerves near the surface, and produces a painful affection of certain textures, which is attended with more or less inflammation, the phenomena of which are of so peculiar a nature that we either consider the disease specific, inasmuch as the symptoms differ in their constituent character from those produced by other inflammations, or we may view the effect in the light of common inflammation, modified on the one hand by the nature of the exciting cause—the external one, cold—and, on the other hand, by the particular species of textures which become affected."

These views, although supported by such high authority, appear to have produced no permanent impression on Medical opinion. Among the causes of this the following may probably be included:—1. The strong hold of the humoral theory upon the Profession. 2. The influence of the *idolum fori*, set up by the use of the specific term rheumatism, which immediately led to the idea of some peculiarity in the disease. 3. The ingenious theory of Dr. Prout, which presented a definite poison—lactic acid—in place of the indefinite "acrimony"; a theory which was very acceptable to the rising school of philosophical and chemical Physicians; and, finally, a theory which, by the rational treatment it suggested, being found to be so very much less injurious than that before adopted, as, by comparison, to seem highly advantageous, appeared to be uncontestedly established. The apparent success of the alkaline treatment has thus formed the strongest argument for the favourable reception of the acid theory; and as the explanation which Cullen attempted has become yearly more antiquated and seemingly absurd by the progress of discovery and thought, so his opinion as to the simple nature of rheumatism has been consigned to the same limbo. In considering the *pros* and *cons*, it has seemed to me that the acceptance of the acid theory by the Profession has been, if not too hasty, at least too unquestioning, and that very little examination is required to reveal that this theory rests upon a very unsubstantial basis. To challenge most of the arguments is almost enough to destroy them; and when all have been arraigned, I think it will be found that Cullen's explanation is at least superior in the negative virtue of not misleading us.

Dr. Garrod,(a) after noticing the above anti-humoral views of Cullen and Scudamore, briefly observes—"Similar objections to those which have been raised against Cullen's views of gout apply to the above attempted explanation of the pathology of rheumatism." What, then, are these objections which, *mutatis mutandis*, apply to rheumatism? On referring to his article on gout and substituting rheumatism, etc., we read—"It has been demonstrated beyond doubt, by clinical evidence, that the blood is invariably altered in (for, "gout, from the presence of uric acid in the form of urate of soda," I suppose we must read) rheumatism, from the presence of excess of some acid, probably lactic or acetic; that the secretions from the blood are likewise influenced; that symptoms are usually present before the development of the articular inflammation; lastly, the presence of chalk-stones, which have no analogue in rheumatism.

Let us first examine these objections in order, noticing afterwards some other arguments which have been adduced.

a. "The blood is invariably altered." This is unquestionable. To prove the theory of a *materies morbi* from this, however, something more is necessary. It must be shown that the alteration is something *sui generis*. But this is just what has never been done. The fibrin is doubtless much increased, but not more than in some other (so-called) simple inflammations. Other constituents are also altered, but only in a similar manner. Of the existence of any peculiar acid, lactic or otherwise, Dr. Garrod himself admits that "no proof has been given." It has been asserted that the serum is sometimes acid, but he always found it distinctly alkaline. It is clear, then, that, so far from favouring the acid theory, clinical evidence as regards the blood is, on Dr. Garrod's own showing, directly opposed thereto. Of the experiments of Dr. Richardson on the effect of injecting lactic acid into the peritoneum I shall have something to say under another head.

b. "The secretions from the blood are influenced." 1. *The Sweat*.—In the condition of this secretion a clear proof of the

presence of the *materies morbi* is maintained to exist. Lactic acid is said to be a normal constituent of the sweat, and in the copious sour-smelling perspirations which are generally present it is asserted that excess of lactic acid escapes from the system. Others are more indefinite, and are content with saying that the poison, whatever it is, is removed in this way. Dr. Fuller rests his belief that the poison is identical with some natural excretion of the skin, on the grounds (1) that rheumatic stiffness in old people is produced when the skin's action is interfered with; and (2) that Nature's means of relieving the symptoms by perspiration suggest a relationship between rheumatism and cutaneous excretion.

It will be easy to show the fallacy of the first opinion. Thus, the sweat is frequently neutral, and sometimes alkaline, in this disease. Next, sour-smelling and acid perspirations are not peculiar to rheumatism. As Dr. Gull has remarked, they are often present in phlebitis, especially that form following injuries of the head, as well as in arterial embolism. The sour smell has been considered abundant proof of the great acidity of the sweat, and, *ergo*, of the system generally. It has apparently been forgotten by many that the smell is due to decomposition, to the presence of butyric, caproic acids, etc., and that lactic acid has no odour. The same smell has been produced many a time during hot weather without any suspicion of rheumatic poison. Lactic acid is itself a product of decomposition, and may be formed thus in the sweat, if not its only origin, but it is not present in such quantities or with such constancy as to warrant us in concluding that the disease is due to the diffusion of this substance through the system, when we know, on the other hand, that the blood remains alkaline, and that no lactic or other abnormal acid has been discovered therein.

Further, as regards Dr. Fuller's propositions, the first is explicable on another theory with equal facility, if not with greater, since the stiffness generally corresponds with the locality where the cold has impinged, or there is a general sensation of chill to indicate that central nerve-centres are influenced. The second is a pure assumption, and, in the words of Dr. Gull, "I know of no facts to show that this excess indicates a special pathology, or may be regarded as a salutary process whereby the system is relieved of a *materies morbi*."(b)

The idea that some subtle intangible poison is excreted with the perspiration is almost too indefinite to grapple with, and may be used to explain every disease in which sweating occurs. The difficulty of proving a negative is proverbial, and we may therefore leave this shadow, to discuss substantial arguments.

2. *The Urine*.—This has been another stronghold of the supporters of the acid theory. Some have spoken as if the acid poison of rheumatism had been actually detected therein, as if the acidity usually present was an accurate measure of the acid circulating in the blood—which, however, we have already seen to be an *ignis fatuus*. It will no doubt be very difficult to convince (*sic*) that there is no proof of the existence of this terrible acid to be derived from the condition of the urine. Is there no difference between the urine of rheumatism and that of other febrile diseases? None whatever. In very acute cases the peculiarities of febrile urine are very strongly marked, but there is no radical difference. No special acid has been discovered. Failing the presence of any particular acid, it has been asserted that the excess of acidity, the deposit of urates, etc., are due in a general manner to excess of acid in the system. Apart from the fact that such excess has never been proved, Parkes makes the very pertinent observation,(c) that the apparently excessively acid reaction of the urine to test-paper is due in great part, if not altogether, to concentration; also that Professor Vogel found the free acidity to be greatly reduced. The acidity of recent urine is due to the presence of acid phosphate of soda; but the amount of excreted phosphoric acid is very little altered in this disease, which tends to confirm the idea that the acidity and the deposit are due to concentration. As regards the deposit of uric acid and urates, these are increased to a comparatively small extent, and not more than in many other diseases: their deposit is due to the cooling of the urine, their relative and absolute increase, and the development of acid after discharge.

We have thus seen that neither the urine nor the sweat gives the slightest encouragement to the idea of an acid *materies morbi*.

3. *The Saliva*.—This has been asserted to be acid, and to prove thereby the acid diathesis. Miller(d) says that the

(c) Parkes on Urine.

(d) "Organic Chemistry."

(a) Reynolds' "System of Medicine," vol. i., Art. "Rheumatism."

saliva is usually alkaline in health, but has been observed to be acid in various forms of inflammatory disease. This would be sufficient to establish my position that there is nothing peculiar in the saliva in rheumatism. But the condition of the saliva is quite the reverse. In rheumatism, as well as in fevers and other inflammatory disorders, it is alkaline, and not acid. It is true that if test-paper be applied to the tongue, the blue litmus will be more or less reddened, but this is due to the presence of mucus, and partly, perhaps, to decomposition of saliva. In health the mouth is continually washed with fresh secretion, and so is generally maintained in an alkaline condition. This alkalinity is increased during meals, for large supplies of fresh saliva are then secreted, and all old mucus is removed. But if the secretion is viscid and scanty, as in fevers, it soon becomes acid, chiefly from admixture with mucus, partly from decomposition, and partly from absorption of the carbonic acid of the breath. In such a case, however, let the mouth be well rinsed with pure water; then, if saliva can be secreted in sufficient quantity, let a drop be allowed to overflow from the open mouth (the tongue being kept quiet) on to the test-paper: it will invariably be found to be alkaline. If there is not sufficient saliva for this, pass the paper lightly over the surface of the tongue; it is then alkaline, also, though in a less degree. If you have to press the paper on the tongue to get enough moisture, it may be acid, though often slightly alkaline. This alkalinity diminishes in two or three minutes, and with scanty saliva soon disappears. Rheumatic fever is no exception to this rule. I have been thus minute in respect to this symptom, because it is not only an argument lost to the other side, but tells against them. It is also a fact that the acidity seems unquestionable without the above precaution.

The acid poison of rheumatism, according to the indications of the secretions, must, if it exist, be a veritable Proteus. "The acid is in the blood;" but it is undemonstrable there. "The skin excretes it;" yet the sole result is a sour smell. "It comes away in the urine;" but it cannot be found there. "At any rate it renders the urine acid;" it is not certain, however, that it always or often is in reality more acid than usual. "The saliva, secreted from this vitiated blood, shows what the nature of the blood is by its acidity;" this, I assert, is often more alkaline than usual. "At any rate other secretions are altered;" of this we have even less proof.

I feel almost ashamed to continue to slay the slain, yet I feel also that all the arguments employed must be exhausted as far as possible, that this question may be set at rest. So we have to consider Dr. Garrod's next objection.

c. "Symptoms are present before the development of articular inflammation." This point may be well conceded, yet it fails to establish the theory that the symptoms are due to the circulation of a poison in the blood. Doubtless, premonitory symptoms are present in the so-called zymotic diseases; but it is very illogical to draw the conclusion that rheumatism has any affinity with zymotic diseases, because there are generally premonitory symptoms. All asses are animals; Physicians are animals; but it does not follow that all Physicians are asses, though, of course, it might still be true in particular cases. On the other hand, we know of other diseases in which premonitory symptoms of a precisely similar nature occur, which, however, have never been attributed to the presence of a *materies morbi*. Moreover, these are diseases which are admitted to be produced by the same general exciting cause as rheumatism, and which, I believe, are identical therewith in their essence. Such, for instance, is pneumonia; such, also, is pleurisy; and such, also, are the thousand-and-one manifestations of catarrh.

The admission I have made above simply compels me to admit, also, that the fever of rheumatism is not merely symptomatic fever. This I readily do, and in this I depart from the views of Cullen and Scudamore. But there is no doubt that after the joint affection occurs symptomatic fever does exist, and that it in general bears a close relation with the articular inflammation.

I claim, then, that these premonitory symptoms do not prove, or nearly prove, the existence of a poison, much less of an acid poison, and are as readily and more naturally explicable in another way.

I have now replied to three of the four objections to Cullen's theory of gout, which, Dr. Garrod says, equally apply to his theory of rheumatism. The fourth, "the presence of chalk-stones," does not apply to rheumatism, since no one maintains that there are any similar deposits of the rheumatic poison.

(To be continued.)

REPORTS OF HOSPITAL PRACTICE IN MEDICINE AND SURGERY.

DISPUTED POINTS IN THE DOCTRINE OF SYPHILIS.

(Continued from Vol. I., 1871, page 691.)

In the former series of our queries we dealt almost entirely with primary sores and their immediate consequences. We would now consider the constitutional symptoms which flow from these. To our first query relating to these, we have received answers which well deserve attention. This was—"Are hard sores invariably followed by secondary symptoms?"

Mr. Berkeley Hill promptly replies, "No; certainly not." Mr. Langston Parker says "No," as does Mr. James Lane; whilst Dr. Barton says, "Invariably, by some sign or signs of the second stage of the disease," and Mr. Maunder says "Yes." Mr. Henry Lee says—"The specific adhesive inflammatory sore is always, in my opinion, followed by secondaries; but there are other kinds of hard sores." So Dr. McDonnell says—"I have met with a few cases of tolerably well-marked hardness around sores which proved in after years not to have been syphilitic." So Mr. Gascoyen and Mr. Shillitoe agree in saying that, as a rule, hard sores are followed by secondaries, but not invariably. Thus, the former writes—"Hard sores are almost invariably followed by constitutional syphilis. The very few cases in which this does not obtain form exceptions to a general rule."

Surely such replies, and those we elicited with regard to hard and soft sores, must make many who are given to pronouncing definite judgments on imperfect grounds hesitate before they give their next prognosis as to the probable cause of a sore and its consequences to the system. One thing is clear: soft sores are not infrequently the precursors of constitutional symptoms, and hard sores are not invariably followed by them—in short, neither hardness nor softness can be taken as an infallible sign of the primary lesion of syphilis or the reverse.

Our next inquiry was—"What form of secondary symptom is most invariably observed after a hard sore?" The answers to this question have not had the same precision as the others, evidently from a misapprehension of what we wished to elicit. We desired to know what form of cutaneous eruption, let us say, was most frequent as a symptom of constitutional infection. Mr. Henry Lee tells us the papular and scaly eruptions; Mr. Shillitoe says the erythematous and papular; Mr. Maunder, rose rash; Mr. Langston Parker, roseola; Dr. Barton, roseolar and papular eruptions. More replies have been sent by other gentlemen. These we now insert:—

Mr. Gascoyen writes—"The form of constitutional disease most usually found after a hard sore is an eruption on the skin, which may vary in severity from a slight transient roseola to large ulcerating tubercles of the integument. In females one of the most common manifestations of syphilis are mucous papules of the vulva and anus." Mr. Berkeley Hill says—"The most common form of skin eruption for which a patient with early syphilis applies for relief is the *papular*; but I don't think this is commonly the first to appear, because, if a patient with initial syphilis and indolently enlarged inguinal glands is carefully examined when a sufficient period has elapsed for the skin eruptions to be developed, the eruption most usually found is the *macular*. The patient himself is often quite unaware of his macular rash until his attention is directed to it by the Surgeon. I have no reason to doubt the correctness of the ordinary doctrine that the variety of sore has no influence in determining the variety of the skin eruption (so-called 'secondaries')." Dr. McDonnell writes this—"Any form may follow a 'syphilitic' sore. I would say that mucous patches in the mouth, skin eruptions, and glandular swellings are the symptoms which seldom fail to present themselves."

Most of our readers are aware that it is customary to divide the eruptions of syphilis into two great groups, the early and late—the early being mostly superficial and widely disseminated; the late affecting the deeper tissues, and being much more circumscribed than the former. As a rule, it may be said that roseola is the first to manifest itself; and in cases where it is said not to have existed, in a good many instances, this depends on its being overlooked by the patient. Next comes the papular or miliary syphilide, which is also common. As it

passes away it leaves behind it a discoloured spot covered with scales, which constitutes one form of what is called by some syphilitic psoriasis or syphilitic lepra. Vesicular syphilides are rare; if they occur at all, it is early in the disease. The two most important of the syphilitic eruptions which remain to be noticed are the pustular and the tubercular. But of the former there may be said to be two varieties—one early, the other late—whilst tubercles are rarely, if ever, the first syphilitic manifestation observed.

The next question was—What lesions, primary or secondary, are capable of propagating the disease? Mr. Maunder's reply is concise, and perhaps conveys the truth as exactly as possible. He says—"Chancere and moist secondaries." Dr. Barton says—"Simple sores propagate themselves indefinitely. Syphilis is propagated by the primary sore, by secondary moist lesions, by condylomata, sores about the mouth, etc." Mr. James Lane writes thus—"All primary lesions, and probably all secondary lesions which furnish a secretion, may communicate disease, the earlier secondary lesions being more virulent than the later ones. I believe that secondary disease may be communicated by frequent cohabitation, or other modes of contact, without the intervention of any primary lesion." Whilst Mr. Shillitoe says—"All forms of ulcerating syphilitic sores, whether primary or secondary, are capable of producing constitutional symptoms." Mr. Lee says—"Any part of the skin or mucous membrane, and probably of any internal organ, specifically inflamed, will furnish an infecting secretion." Mr. Gascoyen says—"All primary sores are capable of propagating the disease; but the most virulent are those which are of recent date, or are secreting pus. Of the secondary lesions, mucous papules are the most poisonous, but the matter from a serpiginous ulceration, or from the more severe forms of pustular syphilides, will also spread the disease." Whilst Mr. Berkeley Hill writes thus—"I have no knowledge from my own observation to show that syphilis—*i.e.*, constitutional syphilis—is ever propagated by the discharges of any venereal sores. In every instance of my own observation the disease has always been apparently propagated by the secretion of general eruption, etc. But as cases are on record where syphilis has been intentionally propagated for experimental purposes by inoculating the secretions of hard sores, I do not doubt the contagious quality of those secretions. Hence, to answer this question, I should say—The secretions of all early forms of syphilis—namely, the indurated sore, the moist papule, the ulcer of the tonsil, and the pustular eruptions. The blood has also, by experiment, been shown capable of conveying the poison in a communicable shape during the early stages of the disease at least."

The question whether constitutional syphilis ever affects a child, the mother being unaffected, is one of much interest. Several of our authorities say they have not sufficient evidence on the subject; others say they doubt it; but men with such large practical experience as Mr. Henry Lee and Mr. Gascoyen say the thing is possible. Mr. Gascoyen says—"Yes, occasionally. I have met with two or three instances where a child, the offspring of a syphilitic father, was the subject of constitutional syphilis, whilst the mother remained unaffected. But in each of these cases the child did not present any trace of disease until some weeks after birth."

Next comes the most practical point of all. Query: What form of treatment do you ordinarily adopt (*a*) for hard sores, (*b*) for soft sores? Mr. Henry Lee says—"(*a*) Calomel vapour baths, (*b*) sulpho-carbolate of zinc lotion." Mr. Shillitoe says—"(*a*) Mercurialisation, to a greater or less degree, in all cases of hard sore. (*b*) Cleanliness, dieting, rest if much inflammation, with usually steel or some tonic. Locally, a variety of simple lotions; most frequently tartrate of iron, from ten to twenty grains to the ounce." Mr. Gascoyen deals thus with the disease:—"The treatment I adopt for (*a*) hard sores is to keep the sore covered with a simple unirritating lotion, and to give mercury, generally in the form of blue pill, in such doses as will not make the gums tender. Directly I find this to be the case I diminish the quantity, or altogether omit the dose for a time. I usually continue the mercury until the sore has quite healed, and all the hardening at its base has disappeared; for unless this be done it is not unusual to have a recurrence of the induration, followed by a re-opening of the sore. For (*b*) soft sores I use a simple lotion, with opium, and, unless they be very irritable, touch them every second or third day with some form of escharotic. But I do not give mercury unless they become sluggish and indisposed to heal. If, however, this be the case, I at once resort to that drug, in the same form and same doses as mentioned above." Mr. Maunder gives for the hard sore a mercurial, for the soft

an astringent lotion; whilst Dr. McDonnell rarely adopts specific or mercurial treatment for any form of primary lesion. Mr. Langston Parker gives mercury in hard sores, either by vapour or inunction. Mr. James Lane also gives mercury for hard sores. Mr. Berkeley Hill gives mercury for the first, with astringents or detergents for local treatment. "For soft sores," says he, "I employ chiefly acetate of lead lotion, or black wash, or weak solutions of carbolic acid." Dr. Barton gives us the following:—"For simple sore, nitric acid, afterwards dressing with a solution of chloride of lime (ʒij. of Hunt's sol. chl. lime to ʒviij. of water). Sometimes a *second* application of the acid is necessary; no other treatment is required. Syphilitic sores I treat locally with either black wash or the chloride of lime solution; never cauterise them. In some cases I think it best to postpone constitutional treatment until the signs of the second stage have appeared; in others I commence the treatment at once, which is by the inunction of 15 gr. or 20 gr. of ung. hyd. once daily, until induration disappears as the sore heals."

Finally, as regards points unnoticed, Mr. Henry Lec writes thus:—"My decision is—*a*. The local suppurating sore. *b*. Specific adhesive inflammation, of which there are three principal varieties—(1) circular red patches of mucous membrane desquamating; (2) tubercle without ulceration; (3) Hunterian chancre." Mr. Shillitoe gives us this last word of advice on the treatment of tertiary: "If iodide of potassium in full doses or other ordinary remedies fail, I strongly recommend Zittman's treatment."

In conclusion, we beg leave to tender our best thanks and those of our readers to the gentlemen who have so kindly given us their best attention and their best information. Truly we think the result has been of no slight value.

GUY'S HOSPITAL.

COMPOUND DISLOCATION OF RIGHT ELBOW— AMPUTATION OF THE ARM—NEW METHOD OF CONTROLLING HÆMORRHAGE.

(Under the care of Mr. BRYANT.)

AN old woman, aged 77, who had fallen down upon her right hand on some stone steps, was admitted under Mr. Bryant with a compound dislocation of the elbow-joint. On examination, it was found that the ulna was displaced backwards without fracture of the coronoid process, a portion of the inner condyle of the humerus was detached, and there was a lacerated wound along the inner side of the biceps tendon. From the nature and extent of the injury, associated with the age of the patient, Mr. Bryant was induced to amputate at once. This he did by having the arm raised so as to empty the vessels of the limb, by gravitation, as much as possible of blood, and then, without applying the tourniquet, he controlled the brachial artery with the fingers of his left hand while he amputated just below the middle of the arm. The patient is now doing well.

On examining the joint after it had been removed from the body, it was seen that, besides the injuries alluded to, the head of the radius was comminuted and the upper end of the lower fragment or shaft of the bone dislocated forwards, the uneven end of which having been pushed inwards as well as forwards, had, no doubt, at the time of the accident produced the wound in the skin and soft parts on the inner side of the biceps. Instead of securing the artery by ligature or by torsion, which is the method chiefly employed at this Hospital, Mr. Bryant used an instrument which had been brought to his notice by Dr. Fleet Speirs, of New York. This instrument is called the artery constrictor, and consists of a flattened metal tube, six inches (more or less) in length, open at both ends, with a sliding steel tongue running its whole length, and having a vice arrangement at one end and a hook-shaped depression at the other, by which the artery can be grasped. It is then made to contract upon the artery by means of the vice at the upper end, which forces it within the sheath. In principle its action is the same as that of torsion, but the integrity of the external coat is more thoroughly preserved, while the continuity of the vessel is maintained.

Mr. Bryant informs us he had made some satisfactory experiments with the constrictor previous to using it upon the case now described, and he is of opinion it will be of good service in cases where torsion is impracticable—as, for instance, in the cure of aneurism.

LARGE ULCER ON LEG TREATED BY SKIN- GRAFTING.

Mr. Bryant has at the present time under his care a middle-aged woman with a large ulcer on the front of the leg, on

whom he has practised the skin-grafting treatment. When we saw this patient, ten days after the operation, there was in the centre of the ulcer a nearly circular patch of new skin, of a pinkish colour and of the size of a shilling. In the centre of this patch could be distinctly seen the minute transplanted portion of skin, well defined from the newly developed tissue by being of a paler pink colour than the latter. The edges of the ulcer were rapidly closing in towards the central growth, whereas before the transplantation they were making no progress whatever. Mr. Bryant is led to the opinion, from his experience of this treatment, that not only is a new centre established, but that the margins are themselves stimulated in the healing process by the presence of the engrafted skin.

ENCEPHALOID TUMOUR OF THE AXILLA IN A MAN 48 YEARS OF AGE—REMOVED.

(Under the care of Mr. DURHAM.)

The patient is a copper vessel maker, and two years ago, while at work, he injured, with a piece of hot copper, a small mole on the right arm, a little above the elbow. The mole then began to grow, and when as large as the top of his index finger was removed by a ligature, which was applied for six weeks. After removal the skin over the spot remained somewhat raised and red, and five months ago a similar growth appeared on the same spot. At the same time a smaller tumour showed itself in the right axilla. On admission, a hairy mole was seen two inches above the condyle of the humerus, and to the inner side of this two or three small tubercles, situated in a diamond-shaped depression, about one inch in length. Several minute tubercles were noticed in the skin of the neck, back, and arms. In the right axilla a smooth even swelling extended from between the axillary folds to the thoracic wall, in a line on a level with the nipple, and curving upwards and inwards towards the middle of the clavicle. The anterior fold of the axilla was blended into the tumour, which reached to the apex of the space, but did not extend beneath the clavicle. Posteriorly it was limited by the latissimus dorsi, and reached as low as the level of the inferior angle of the scapula. The tumour was firm, but elastic to the touch. The skin covering it was slightly reddened, and in places more than normally fixed. There was no difference in the radial pulse on the two sides, and the right arm, though a little swollen, did not pit on pressure.

Mr. Durham proceeded to remove the growth by making a vertical incision over it through the skin, which he dissected off from the tumour. He next freed it from the soft parts below and on each side, having to remove some of the fibres of the pectoralis major muscle, to which it was closely adherent. He then, with great care, detached it from the apex of the axillary space, and in so doing had to expose the axillary vein for some distance, and to cut through three or four veins which joined the axillary; but little blood, however, escaped from these, and only one artery—viz., one of the upper thoracic arteries—required a ligature. Lastly, Mr. Durham removed the small growth on the arm, to which a ligature had been attached before the patient was admitted.

After removal the tumour weighed one pound, and measured in the long axis of its section four and a half inches, and in its transverse two and three-quarter inches. It was of an ochry yellow colour, having minute cheesy yellow spots disseminated in a grey structureless material. At one part was a rounded and apparently encapsuled mass, of a blood-red and mottled colour, convex on section, and giving the appearance of being a solid intra-cystic growth. One or two smaller but similar masses were present, but were of a softer and more brain-like consistence than the former, and yielded a thick curdy fluid on scraping. On making sections into some parts of the larger encapsuled portion, a similar curdy white fluid escaped. Microscopically, the structure was seen to be almost entirely cellular, being composed of irregularly rounded mononucleated cells, of different sizes; some of the cells contained more than one nucleus. The growth from the arm consisted of layers of epithelial cells, which extended deeply as far as the subcutaneous adipose tissue, and were there seen amongst the normal elements of that structure. No nest-like groups of cells were anywhere seen in it.

DISLOCATION OF HUMERUS BENEATH THE CORACOID PROCESS, OF TWENTY-FOUR DAYS' STANDING—IRREDUCIBLE.

(Under the care of Mr. BIRKETT.)

The patient, a middle-aged man, had fallen forcibly on the point of his left shoulder twenty-four days previously. He had soon after the accident been seen by one or two Medical

men, who had cursorily examined him, but without having him stripped. On applying to the out-patient department the day before we saw him reduction under chloroform had been attempted in the surgery, but without success, and the man was in consequence admitted into the Hospital. Attempts were again made to effect reduction, both by Mr. Birkett and Mr. Durham, but to no purpose, the head of the bone resisting every endeavour which skill and tact in manipulating, as well as justifiable force, could bring to bear upon it.

Mr. Birkett, in remarking upon the case to the students, took occasion to impress upon them the importance of always examining a patient after an injury with the part naked. Had this precaution been taken in this case, and especially had the two sides of the body been compared with each other, the nature of the injury would at once have been detected; whereas, owing to the neglect of this, the opportunity of remedying the damage had been irrevocably lost.

Mr. Birkett further observed that the impediment to reduction in this case was not due to adhesions about the head of the bone in its new position, but no doubt to the smallness of the rupture in the capsule of the joint. In such cases he considered intelligent manipulation was more likely to do good than forcible measures; but failing with the former, he was induced to try the latter means, which, however, had been equally unsuccessful. The difficulty in pressing the elbow of the luxated limb to the side of the chest was as great as before, which was a characteristic sign—first, that the head of the humerus was still dislocated, and, secondly, that no fracture had occurred in the forcible attempts made at its reduction.

VENOUS CAPILLARY NÆVUS IN CUTANEOUS AND SUBCUTANEOUS TISSUE OF BACK—REMOVED BY EXCISION.

(Under the care of Mr. BIRKETT.)

This was a nævus situated a little to the spinal side of the posterior border of the scapula. It was rounded in shape, rather larger than a five-shilling piece, and prominent. The skin covering it was very thin, of a bright red colour in the centre, and of a dark blue appearance at its circumference. It did not pulsate, and could be much diminished in size by pressure. Another smaller but similar tumour existed four inches lower, and still nearer the spinal column.

Mr. Birkett removed the larger one by transfixing the tissues beneath the centre of the nævus, and cutting out wide of the nævoid growth on one side, and then completely detaching it by cutting from without inwards on the other side. Three or four vessels which bled rather freely were controlled by torsion, and a small remnant of the nævus which extended along the deep fascia beneath the superficial structures was teased away by forceps, and the edges of the wound brought together by sutures.

Mr. Birkett prefers to excise rather than to ligature such nævi as the above. In excising, however, we must look for a great alteration in the characters of the tumour directly an incision is made, as the before turgid swelling immediately collapses. Mr. Birkett thinks it better as a rule to cut through the tissues around the growth than to transfix as he did in this case, as the skin-wound is made much more evenly and accurately. On looking into the tumour after removal, it was seen to be composed of large veins and capillaries, the former of which had given the blue appearance to the circumference of the growth. The structure of nævi, Mr. Birkett added, was often compared to that of the corpus spongiosum and corpora cavernosa, but this was not invariably the case. Some time ago he had removed one which was so like those structures that he had it placed in the museum side by side with a piece of a corpus cavernosum to exhibit the great similarity between them. But in the specimen now removed there was scarcely any connective tissue between the vessels, and therefore the resemblance to those erectile tissues was not so great. This was much more like thyroid gland structure.

LONDON HOSPITAL.

CAPILLARY BRONCHITIS—DEATH.

(Under the care of Dr. RAMSKILL.)

[Reported by Mr. STEPHEN MACKENZIE.]

JAMES J., aged 31, labourer, admitted March 27, died the same night. All the history that could be elicited from his wife was that he had been in his usual health until a fortnight previous to his admission. He was then taken with a cough and shortness of breath, for which he attended Victoria-park

Hospital. He continued at work until the 25th, when he was obliged to give up. He remained at home, but not all the time in bed, until the 27th, when he walked to the Hospital. On the evening of admission his breathing was found to be laboured, but not excessively so. On examining his chest it was found to be hyper-resonant in front, and rather dull posteriorly. Scattered over the chest were sibilant and sonorous râles with prolonged expiration. Very little air entered the chest posteriorly at the base, and there was crepitation at this part. There was no cardiac bruit; no œdema of feet. During the night his breathing became more difficult, and he died rather suddenly at 4 a.m.

At the autopsy the lungs were found to be very bulky and dense; on section the lung substance was of a dark colour, and standing out from it were beads of pus which had escaped from the divided bronchial tubes. There was no collapse in any part of the lungs, nor did any part sink in water. The anterior borders and apices were very emphysematous. Bronchial tubes: From the first division to the last they contained pus, which in the last completely occupied the calibre of the tubes. In the first three divisions the longitudinal muscular fibres were very distinct, and in the terminal ones the transverse fibres were unusually prominent. Heart: The right auricle and ventricle were greatly distended, the former with a partly decolorised, the latter with an almost wholly decolorised clot, which extended some distance into the pulmonary artery. The left ventricle was flaccid, and contained some dark coagulated blood. The left auriculo-ventricular orifice admitted with ease the tips of four fingers, whilst the right was so dilated that with a little straining the whole hand could be passed through. The liver was congested. The spleen firm and rounded, cutting with a sharp edge. Kidneys firm, sharply edged, stellate veins on surface very prominent. Stomach almost empty; its mucous surface was covered with tenacious thick mucus, beneath which were numerous ecchymoses.

MIDDLESEX HOSPITAL.

NOTES OF CASES UNDER THE CARE OF DR. JOHN MURRAY.

Slightly marked Spasmodic Asthma rendered permanently Severe after an Attack of Bronchitis.

ATTACKS of spasmodic asthma are generally observed to be immediately dependent on some idiosyncrasy, an extreme example of which is mentioned by Dr. Hyde Salter, and may be here cited—viz., "cat asthma"—the sufferer being peculiarly sensitive to the effluvium from that animal. Usually, however, certain articles of diet excite attacks, while a large number of cases originate from, or owe their severity to, attacks of bronchitis. The last cause appears to have been the case in the present instance, although it should be observed that an unusual peculiarity presented itself, if the patient's statement may be relied upon—viz., that she began to suffer from the regular attacks after recovery from the bronchitis. The patient, a female 64 years of age, had had only one attack of asthma before, and that thirty years previously. Last winter she passed through an attack of bronchitis, after recovery from which she became subject to asthmatic seizures, occurring once a fortnight and coming on "all in a minute." These attacks last not more than a few minutes, during which she becomes blue and exhausted, then brings up a little phlegm and is relieved. The case presents in many respects the ordinary symptoms of true asthma. The patient, moreover, like most asthmatics, is an intelligent, clever-looking person. The chest is prominent, but there were no abnormal sounds when we saw her in the out-patient room, she being at the time quite free from an attack. Dr. Murray had ordered ten-minim doses of ethereal tincture of lobelia, which have apparently diminished the frequency and the severity of the attacks.

Exophthalmic Goitre—Graves' or Basedow's Disease.

An extremely interesting, although in many respects not well marked, example of this disease is at present under Dr. Murray's care. The subject of the affection is an unmarried dressmaker, about 47 years of age, tall, large-boned, and greatly emaciated. She came seeking relief for extreme "nervousness," which assumed at times the character almost of chorea, so fidgety was she, especially when spoken to. Her face became at times flushed, and she appeared to cry. There was very slightly marked proptosis, but the thyroid was enlarged. The action of the heart was very rapid, and its impulse strong. Over the thyroid a double murmur was heard,

and the excessive and turbulent action of the heart was accompanied by diastolic roughness at the base like friction; the cardiac area was slightly increased; there was marked epigastric pulsation; she complained of a sense of heat, intermittent in character, and the temperature in the axilla was slightly elevated; she was occasionally sick; the catamenia were irregular, and, when present, excessive; she was anæmic. She, however, did not present many other symptoms said to be found in this disease; there was no evidence of diminished power of the upper eyelid, as pointed out by Von Graefe, the upper eyelid following the movements of the eyeball upwards and downwards with facility; neither was there any pain over the cervical sympathetic ganglia, nor over the "cilio-spinal" region of the cord. However, the symptoms present were such as to justify the belief that the case was one of exophthalmic goitre. The patient was ordered half-drachm doses of infusion of digitalis, with tincture of the perchloride of iron, under which treatment or belladonna Dr. Murray was of opinion the case would almost certainly improve.

Obscure Paralysis of the Left Upper Extremity.

Cases have been reported in which paralysis of an extremity has been alleged to have occurred from the person lying on the limb. The following case appeared to be one of such a character:—The patient, aged 27, presented himself with the left upper extremity partially paralysed—a condition which he attributed to his arm hanging out of bed for several hours. On close inquiry, however, he admitted that he neither knew that his arm had so been suspended or that he had lain upon it. His story may have been, therefore, pure fancy. But on full examination of the limb and the patient's general condition, the cause of the paralysis was not traced. He had been in the Middlesex Hospital two years previously with typhoid fever; since which time he had been in rather delicate health. For the past four months he had suffered from pain in the left side, and numbness in the legs after sitting for some time, which, however, left on assuming the erect posture. The history of his seizure dated from three weeks ago, when he woke up one morning with great numbness of the whole arm. He could not put his hand to his head or rotate it, and he could not close his hand, which was blanched, and felt as if dead, and there was partial loss of sensation, extending downwards from about the insertion of the deltoid muscle. He was anæmic and debilitated, but in other respects apparently quite healthy. He was seen the same morning by Mr. Lucas, the Resident Medical Officer, as a casual patient, who prescribed iodide of potassium, with galvanism. When seen by Dr. Murray three weeks after the commencement of the symptoms, the arm and the patient's general condition were as described, but less marked, he having improved under treatment. There was now considerable difference between the size of the right and left arms, which, however, may be entirely explained by his being right-handed, and by the fact of his being an iron-plate worker, and therefore accustomed to use his right hand most. There was a difference of an inch in the circumference of the forearms and half an inch of the arms. The axillary temperature was 98.2° on both sides. Although there was no reliable evidence to be obtained from the patient that he had lain on his arm, or otherwise caused local injury to the nerves, in the absence of any other apparent cause, Dr. Murray was inclined to believe that the mischief was likely due to some such cause. The patient had been taking for the last three days a mixture containing ten minims of tincture of the perchloride of iron and four minims of liquor strychnia, three times a day, and now the improvement was very marked.

A RETURN has just been printed, by order of the House of Commons, which gives the number of deaths in the metropolitan districts in the years 1868, 1869, and 1870 upon which a coroner's jury have found a verdict of "Death from starvation," or "Death accelerated by privation." In the central division of Middlesex there died of "starvation, privation, etc.," in 1868, 8 persons; in 1869, 16; in 1870, 37. In the eastern division of Middlesex there died from the same causes, in 1868, 24 persons; in 1869, 11; in 1870, 30; and in the first two months of the present year, 1871, which are also included in the return for this district, 21 more deaths are added to the list.

PRECAUTIONS AGAINST CHOLERA.—The authorities on the Tyne have made stringent arrangements for the Medical inspection of ships coming from the Baltic. They have also determined to establish a floating Hospital on the river. Similar arrangements are being made on the Wear and at Hartlepool.

SATURDAY, AUGUST 12, 1871.

VERY POPULAR SCIENCE.

YEAR after year some new fancy startles and amuses the public who come to see the philosophers at play at the meeting of the British Association for the Advancement of Science. Whether people really gain much information, we have no means of judging, but, unfortunately, it is quite certain that science loses repute. The scientific man who advances a speculative, fanciful idea, unsupported by evidence, for the purpose of astonishing or amusing unscientific people, drags science through the dirt, and is unworthy of the position he has attained. Many an earnest worker and thinker has lately felt humiliated by the curious antics performed in public by some of those who have risen to eminence in the eyes of the people; and it is very remarkable that the chief offenders have been men who have taken a most distinguished position in the department of Physics, and from this vantage-ground have made themselves ridiculous as well as conspicuous by giving utterance to very positive assertions upon subjects the details of which they have most imperfectly considered or have not thought over at all.

An eminent Physicist thinks nothing of offering an opinion concerning the best practical method of vaccinating babies, or suggests the only perfect method of protecting himself from the invasion of contagious poisons; or he trespasses upon the province of the engineer, and delivers himself *ex cathedra* upon the method of sinking wells and supplying all London with the only pure water. The public applauds, and he is encouraged to propound some still more extravagant doctrine, in order to satisfy his craving for applause. Nay, Physicist endeavours to outdo Physicist, not in the rigid exactness of physical investigation, but in the extravagance of his conjectural imaginings. "There is grandeur," he exclaims, "in the idea that that most wonderful of all Nature's works, man, should have been evolved from an arboreal baboon, whose more simple ancestors, living in the dim twilight of the past, slowly perfected themselves in obedience to the fixed laws of zoological evolution." But physical evolutionists have been terribly puzzled to account for the formation of the original primeval jelly-speck. No doubt, as they tell us, it resulted from collocations of particles not previously arranged; but they admit that the laws governing the collocations in question have yet to be discovered. Such an admission is unsatisfactory to the physical mind, so it proceeds to evolve from the depths of

its imagination some new hypothesis by which the difficulty involved in the admission of an original creation—a primary fiat—may be avoided, and the beginnings of life explained according to *natural laws*.

The President of the British Association, Sir William Thomson, at the meeting just concluded at Edinburgh, comes to the rescue, and presents the following solution of the riddle for the entertainment of the assembled scientific and unscientific ladies and gentlemen:—"Tracing the physical history of the earth backwards, on strict dynamical principles, we are brought," he observes, "to a red-hot melted globe on which no life could exist. Hence, when the earth was first fit for life, there was no living thing upon it." And this is the very simple way in which, according to the President, our barren globe became peopled: a fragment from the ruins of some other world, "carrying seed and living plants and animals," (!) alighted on our barren planet, and thus supplied it with life. The germs thus deposited would soon increase, and in this simple manner our earth was overrun with low forms of life, from which the higher gradually proceeded by evolution. Sir W. Thomson said that he had taxed the patience of his audience so severely that he thought it better not to discuss the *objections* to his hypothesis. He therefore contented himself with maintaining that it was not "unscientific." It would, however, be as futile to attempt in these days to decide what was scientific and what unscientific, what philosophical and what unphilosophical, as it would be to define a philosopher, a biologist, a materialist, a spiritualist, or an evolutionist. Nor shall we offend our readers by suggesting *seriatim* the many obvious objections to this last and most grotesque conjecture of the physical imagination, but shall merely direct their attention to a paragraph from the address of Prof. P. G. Tait, President of Section A:—

"There must always be wide limits of uncertainty (unless we choose to look upon Physics as a necessarily finite science) concerning the exact boundary between the Attainable and the Unattainable. One herd of ignorant people, with the sole *prestige* of rapidly increasing numbers, and with the adhesion of a few fanatical deserters from the ranks of science, refuse to admit that all the phenomena, even of ordinary dead matter, are strictly and exclusively in the domain of physical science. On the other hand, there is a numerous group, not in the slightest degree entitled to rank as Physicists—though in general they assume the proud title of Philosophers—who assert that not merely Life, but even Volition and Consciousness, are mere physical manifestations. These opposite errors, into neither of which it is possible for a genuine scientific man to fall, so long at least as he retains his reason, are easily seen to be very closely allied. They are both to be attributed to that Credulity which is characteristic alike of Ignorance and of Incapacity. Unfortunately there is no cure—the case is hopeless—for great ignorance almost necessarily presumes incapacity, whether it shows itself in the comparatively harmless folly of the Spiritualist, or in the pernicious nonsense of the Materialist."

NEC SEMPER ARCUM TENDIT APOLLO.

"—Carpe diem,
 Cras ingens iterabimus æquor."

From time to time, as seasons pass and emergencies arise, we are accustomed to address to our readers a word of counsel or of gratulation, to send out a note of warning or of thanks; but it is not often that we speak to the hardest-worked Profession in the world on the subject of what to many is a sound off-gladness—that is, holidays. Of the two other learned professions, the church and the bar, neither can compare with ours in the absolute necessity for sticking to work. A clergyman may get a neighbour to fill his pulpit, or, at the worst, may secure the services of some unattached curate; but who among struggling Medical Practitioners can venture to make such an experiment?—one, indeed, that might be fatal to his hopes of success. Again, the bar tenaciously cling to their long vacation; and although in this they may be imitated by the heads of our own Profession, who among the rank and file, who

constitute its great bulk, could venture, unless absolutely compelled to do so by ill-health, to leave his patients so long to themselves? And yet in our Profession there is greater need for a period of rest than in either of the others; for they have their quiet nights' rest, however short, but this to the members of our Profession is rarely secure, to many certain of interruption. To them, also, it is possible for a time to get rid of the cares and toils of professional work; not so with us. Most frequently there is some case looming in the distance, close at hand, or in actual progress, which tasks all our skill and ingenuity, and which can but rarely, for the time being, be absent from our thoughts. Many more considerations might be urged why holidays, when possible, should be readily embraced by Medical men, but there is only one we care to adduce—the many melancholy instances known to all of men who have succumbed to actual hard work. And if example be better than precept, we have the universal example of the heads of our Profession to fall back on. These, if consulted, will tell us that the time spent *en vacance* they consider spent wisely and well; in point of fact, continuous work in London is only possible at the risk of breaking down utterly. But as a prolonged vacation is not possible to all, and as it is important that the limited period available for this purpose should be utilised to the uttermost, a few words may be said on the *art of holiday-making*. Men are so differently attuned that any detailed directions on the subject would be worse than useless. Nevertheless, there are some so obvious that a moment's reflection is sure to enforce them on everyone. We take it, then, the essence of holiday-making is as complete a break in the tenor of one's life as possible; and though the run round the Nore, the Sunday at Brighton or Margate, which are so popular with Londoners, are good in themselves, they are very far from being an unmitigated good. Thus, there is the breakfast generally earlier than usual, the hurrying and scurrying to catch the boat or train—enough to upset anybody for the day. It is true, there is complete relaxation from the ordinary labours of life, but then there is the cramp of the confined railway-carriages or the little ease of the steamboat; there is the drinking of more beer or wine than usual, to relieve the *ennui* occasioned by the lack of ordinary employment, the smoking of many cigars at unusual times, the dinner unsatisfactory, and bolted or partaken of at a time to which you are altogether unaccustomed, and the return home dog-tired, dissatisfied, and very likely ill. Such is the history of many a so-called holiday; and though it may be looked upon as a type of a vulgar class, still there are other ways of spending short vacations equally unscientific and unsanitary. Of these, we may take a short tour on the Continent as the type. Such tours are of undoubted service in enlightening the mind, and are a thorough change, as far as mental work is concerned; but the bodily fatigue of rushing from place to place, "doing" this church and that picture gallery, the change in diet not lasting long enough to do good, but only to upset, with, finally, the lack of domestic sanitation of every kind, so common on the Continent, all combine to render a week or ten days' tour abroad a nuisance rather than a safety-valve. They are wise in their generation who spend their time in places like Brighton or Margate, Yarmouth or Scarborough: there at least a man may take his *otium cum dignitate*, he can enjoy the pleasures of life with the benefit of sea air, he may choose his own time when to dine and when to sup (and these are no unimportant matters when a man is laying in his stock of health for the year), and he may dine and sup like a Christian. But wiser far is the man who with as light luggage as possible—and it is amazing how little is required—sets out to seek for himself one of the quiet English hamlets, where he may revert to the simple manners of wholesome English life, and, having but little to entangle him, may move from place to place, as suits him, seeking out those charming bits of scenery found but in England, though to

many utterly unknown. To the bachelor, the knapsack life is delightful—the sense of freedom and unrestraint is in itself a pleasure. Then, again, the old coaching days secured for England a multitude of inns, mostly commodious, almost always comfortable. These may be made head-quarters, and the country scoured for the purposes of sight-seeing, as times and seasons serve. Usually an arrangement can be come to with regard to board and lodging which insures good fare at half the ordinary charges, provided a week's residence is guaranteed. Now, by this knapsack life, we do not mean the absurd practice of binding oneself down to five-and-twenty or thirty miles a day—there is about as much sense in this as sending a stout, short-winded City man to do the Higher Alps; we mean that easy dawdling along, enjoying each bit of scenery, with plenty of time to go out of the way to secure a fine view, dining here and supping there, each place of rest being fixed upon with due regard to comfort and convenience. Then are acquired health and strength, with complete change in one's mode of life, without any violent wrench or dislocation. Distrust those enormous distances done, and those tremendous passes surmounted; it is not thus one reaps the full benefit of one's holiday.

But to paterfamilias, with his numerous olive branches, this kind of thing is impossible; well, for him, too, we have a recipe. There are yet, thank Heaven, many unsophisticated sea-side hamlets where lodgings may be had at a cheap rate, and where wives and daughters need not spend half the day in changing their costumes. There is a sound rule for selecting such places: always fix upon one three or four miles from a railway; once it has been tapped by a railway such a pleasant place is doomed. There the little ones may dabble in the sea under the maternal superintendence; the *pater* himself may lie on the grass over the cliffs, indulging to his fill in the *dolce far niente*. For him the regular sea-side watering-place would be purgatory; but he may go where bathing-machines, with all their accompanying horrors, are unknown, and where he, with his family, may enjoy a rational holiday at a reasonable cost. There is but one hint we would give him. Let him be careful to provide himself beforehand with everything beyond the bare necessaries of life. Mutton can always be had, beef more rarely; bread, sound and wholesome, of country make, is everywhere obtainable; butter is such as is not to be had in London; the vegetables not to be compared with, in the same breath, those we use every day. But there we must stop. The tea is usually execrable, the coffee worse, the beer not always good; but these things are easily remedied if due warning be given, or they may be borne—better that, far, than the second-rate splendours of a semi-fashionable watering-place.

THE CHOLERA.

THERE is not much more to report as to the progress of cholera, but what little there is is highly significant. Asiatic cholera has entered Germany. During the first three days of August, seventeen fatal cases occurred in Königsberg, the first being that of a Polish merchant, who arrived at Königsberg from Wirballen. In Riga, seventy-five deaths from cholera were reported between July 5 and 22; and a death from the disease has occurred on board a ship arriving at Hull, and on board one arriving at Dundee, both during the passage; while the last Registrar-General's Report shows that in London the deaths from diarrhoea, which have been below the average, rose last week to 225.

These accounts suffice to show that cholera is actually once more knocking at our very doors, though it is only some ten days since, in answer to questions in Parliament, the Government informed us that the alarm expressed about the approach of cholera was "to some extent unfounded"; that they had no knowledge of any spread of cholera on the Continent that boded immediate danger to this country; and that there was

no reason for immediate alarm, or for any particular action of central authority. The Privy Council, however, as we noted last week, had taken action, had sent Mr. Radcliffe to visit some of our ports and rouse up the local sanitary authorities, and had issued an order empowering and directing them to deal with infected ships and persons before they could enter a port. Probably very few people believe, however, that cholera will be kept out of the country in that way; and the most pertinent and home question is, supposing cholera amongst us, are we in any sense and any degree better armed against it than on former occasions? The epidemic of 1866 impressed upon us clearly and forcibly some invaluable lessons as to the mode of propagation of the disease, and the measures by which it might be effectually controlled. What use has been made of what we then learnt? Has Government done anything whatever to help us to that first of all needs and protections—an ample supply of pure, wholesome water? Have we any readier or more effectual means of preventing overcrowding and contagion—of separating and providing for the sick? We suppose the universal reply will be, that, so far as Government is concerned, we are no whit better off than we were five years ago; that everything to defend ourselves against our Asiatic enemy will have to be done in the midst of a panic; and that, however bravely and well we may fight, we shall owe no thanks to Government. Happily, we have a strong and determined guide and adviser in the Medical Officer of the Privy Council, and we may feel assured that all that Department can do will be well and effectually done; and the Medical Profession will, as usual, do its duty zealously, courageously, and skilfully. But it is bitterly disappointing that, with all that is so well proved and known of our great need of definite, clear, and strong sanitary measures, and with what is called a strong Government, year after year passes, and no help is given in our fight against preventible disease. We, in this journal, are no politicians—we care not whether Radicals, Whigs, or Tories are in power, so long as we can see the public health cared for; and we have a right to complain loudly when we see session after session of Parliament spent in party strife, and over political panaceas and crotchets, while overcrowding, dirt, disease, and death are left by Government to work their will against the health and lives of the people.

THE WEEK.

TOPICS OF THE DAY.

THE *Gazette* of Friday, August 4, contained the following announcement:—

“*Whitehall, August 2.*—The Queen has been pleased to direct letters patent to be passed under the Great Seal granting the dignity of a baronet of the United Kingdom of Great Britain and Ireland unto James Paget, of Harewood-place, in the parish of St. George, Hanover-square, in the county of Middlesex, Esq., Serjeant-Surgeon Extraordinary to Her Majesty, and the heirs male of his body lawfully begotten.”

We only represent the universal feeling of the Profession when we express very great satisfaction at the bestowal of this honour on one of the most accomplished and philosophical Surgeons and on one of the most excellent men that has ever adorned Medicine in any age or country. Comparatively early in his career, Sir James Paget has achieved a success which is hardly to be surpassed; but we believe there is not a Medical or Surgical Practitioner living who would assert that the success was disproportionate to his merits. We heartily congratulate Sir James Paget on his baronetcy, we heartily congratulate the Profession on the honour bestowed upon one of its worthiest members, and, lastly, we congratulate the advisers of the Crown on having, in this instance at least, advised an exercise of the Royal prerogative against which, not only no dissentient voice will be raised, but which will command universal approval.

Dr. Ballard, the indefatigable Health Officer of Islington, has accepted a Medical Inspectorship under the Privy Council. The Medical Officer of the Privy Council is to be congratulated on thus obtaining the services of one of the most distinguished sanitarians in Europe. The Islington Vestry has lost a first-rate Medical Officer, and the country has gained one. How little the former appreciated the value of Dr. Ballard's services is proved by the fact, that although the population of the parish since 1856—Dr. Ballard's period of service—has increased from 100,000 to much over 200,000, the Vestry have just reduced the salary of the Medical Officer to £250 per annum—a sum at which they expect to obtain a suitable successor to Dr. Ballard. They have even deliberated on the question whether the salary of their Medical Officer of Health should not be £200. The new officer will have to reside in Islington, where it seems likely that cholera may give him plenty of work. We hear, however, that the leading Practitioners of the district are not likely to come forward as candidates. We do not wonder at it, for the Islington Vestry must be pleasant people to work with.

At St. Mary's Hospital Medical School, Dr. Handfield Jones has been appointed Clinical Lecturer in Medicine, and Mr. Spencer Smith, Clinical Lecturer in Surgery. Dr. Broadbent has been appointed Lecturer on Medicine, in conjunction with Dr. Chambers; and Mr. Gascoyen, Lecturer in Surgery, in conjunction with Mr. J. R. Lane. Dr. Nunneley has been appointed Lecturer on Histology and Experimental Physiology.

A committee has been formed of the late Dr. Miller's colleagues at King's College, for the purpose of founding a memorial of their late distinguished *confrère*. Dr. Guy is the treasurer. It is intended to raise a fund for a bust or portrait of Dr. Miller, and the institution of a prize or scholarship in connexion with King's College, and bearing his name. The subscription is to be limited to one guinea.

ROYAL VISIT TO ST. VINCENT'S HOSPITAL, DUBLIN.

On the afternoon of Thursday, the 3rd inst., H.R.H. the Prince of Wales, H.R.H. Prince Arthur, H.R.H. Princess Louise, and the Marquis of Lorne, accompanied by his Excellency the Lord Lieutenant of Ireland, the Countess Spencer, and a distinguished party, paid a visit to the above Institution in Stephen's-green. Their Royal Highnesses were received by his Eminence Cardinal Cullen, and by the following members of the Medical staff of the Hospital, by whom they were conducted through the various wards:—Dr. Mapother, Mr. O'Leary, Mr. William Izod O'Dogherty, Surgeon-Dentist; Mr. Boland, Apothecary, etc. The illustrious visitors expressed their gratification at the perfect neatness and cleanliness of the Hospital. On leaving they were loudly cheered by a large concourse of people who had assembled in front of the building.

ARMY MEDICAL DEPARTMENT.

THE competitive examination for admission to the Medical service of the army commenced at the London University, at 10 a.m., on Wednesday, the 9th inst. Thirty-five candidates presented themselves. Ireland contributes, as usual, much the larger number—namely, twenty-one; England twelve, and Scotland two. The proportion of candidates from the English schools is, we believe, rather larger than heretofore, and may be considered indicative of a diminution of the ill-will with which the Army Medical Service has for so long been regarded by English students. The class of candidates at present undergoing examination is considered rather above the average, and includes five Bachelors of Arts of Dublin, one of Oxford, and one Master of Arts of Cambridge. None of the candidates possess degrees from the London University. The number of vacancies, we understand, is not yet definitely settled, but it will probably be about twelve.

VACCINATION IN THE METROPOLIS.

THE Government report on vaccination, just made public, shows that in the year ending Michaelmas, 1870, 41,444 vaccinations were performed. Of these, 40,842 were successful—namely, 35,266 under one year old, and 5266 above a year old. The births registered in the same period were 112,250, or more than three times the number of infants under one year old, successfully vaccinated. The vaccinations in private practice have to be added, but those in poor districts would fall short of making the number what it should be. There can be no doubt that in places where the clauses of the Vaccination Act are vigorously carried out, a very large proportion of the children are vaccinated. Thomas W. Yardley, prosecutor under the Vaccination Act for St. Giles and St. George's, Bloomsbury, in a letter to the *Times*, gives us the following facts:—He states that in his district the number of births in the year ending Michaelmas, 1870, was 1836, and of these 96 died before vaccination could be performed, and 1503 were duly certified as successfully vaccinated, leaving only 237 unvaccinated, or, more properly, uncertified as vaccinated; showing, as Mr. Yardley says, that even with our present means, which are far from satisfactory, vaccination may be rendered much more effective than it appears to have been generally by the returns.

AID TO HOSPITALS.

THE upspringing of special Hospitals in all quarters of London, and the calls upon the charitable by the late war, have interfered materially with the income from voluntary aid of our unendowed Hospitals. In the far east and the far west this has been demonstrated. The London Hospital and St. George's Hospital have suffered severely from the above and other causes. Appeals to the rich and influential inhabitants of Belgravia and Tyburnia have resulted in assistance inadequate for the purpose, and not creditable to the neighbourhood. The London Hospital is in debt, and its income has fallen off. Accordingly, an association has been formed by the tradesmen of East London for the purpose of raising funds in its aid. Hitherto the donations to this Hospital have been on a scale of munificence rarely equalled. We trust the present movement may have results which will put to shame the shortcomings of West London.

A PELVIS COMMITTEE.

AMONGST the useful works chalked out by the Obstetrical Society is the collection of specimens of the pelvis (male and female) of the various races, together with, if possible, foetal heads at term; the collection of abnormal female pelvis, or casts; the collection of histories, drawings, or photographs, and descriptions of abnormal pelvis, where it is not possible to procure the pelvis themselves, or casts. To carry out this work a "Pelvis Committee" has been appointed. It is suggested that, as the vacation will be scattering the Fellows of the Society in various directions, they might lend material aid to the Committee, and at the same time attain a pleasant and instructive motive for their wanderings, if they would undertake to visit such museums and collections as may fall in their way; taking note of the objects of interest they may contain, and opening communications with the authorities, with a view to the procuring casts, photographs, descriptions, etc. Gentlemen about to start on their tour, who may wish to help in this way, are invited to write for instructions and introductions to the secretaries, Dr. Wiltshire and Dr. Heywood Smith.

THE CHOLERA.

THE Corporations and Town Commissioners throughout Ireland have been peremptorily called upon to look to the thorough cleansing of the various cities and towns under their control, owing to the threatened approach of cholera from the East.

DECLINE OF SMALL-POX IN LONDON.

SMALL-POX is steadily but largely on the decline in the various Hospitals of London. On Saturday last a report from the various Hospital Committees was read at a meeting of the Metropolitan Asylums Board. These reports proved the decline in the epidemic. In most of the Hospitals no less than half the beds are vacant.

SMALL-POX IN MANCHESTER.

MANCHESTER has suffered severely from the epidemic of small-pox. We are happy to state that the malady is rapidly disappearing. The report of the Officer of Health of the Manchester City Council is highly satisfactory. On June 19 the number of unvaccinated persons was 611, and the 29th ult. they had been reduced to 209. The diminution was confirmed by the return of cases of small-pox. On the 15th ult. the cases had come down to 105 from 113, and on July 29 to ninety. The number of deaths had been, for the week ending July 8, eight; July 15, twenty-one; and July 22, nine. The Medical Officer attributes much of the decrease of the disease to the energetic action of the Health Committee.

DR. HAUGHTON AND ROYALTY.

WE extract the following from the *Dublin Evening Telegraph*. The subject is attracting a good deal of attention in Dublin, and the narrative and the comments will not be without interest to our brethren on this side of the Irish Channel. The anecdote is highly characteristic:—

"The Rev. Dr. Haughton is a bold little man. Everybody knows him for a man of European reputation, a Fellow of Trinity College, a clergyman, a Doctor, member of all sorts of learned societies, a good lecturer, zoologist, and, of course, as secretary to the Zoological Society, having charge of the gardens in the park. The Lord Lieutenant's secretary wrote to Dr. Haughton, asking him to summon a meeting of the Council on Sunday to receive the Prince of Wales and the rest of the Royal party. Dr. Haughton wrote a very polite rejoinder, saying he would do nothing of the kind. The secretary called on Dr. Haughton, believing there must be some mistake, but was informed there was no mistake on the Doctor's part. We think Dr. Haughton has acted very independently, and has shown a proper dignity in this business. To visit the gardens on a Sunday is legitimate recreation, and the Prince and his friends can get in like other people, except that probably they need not pay a penny a-piece at the door. That the Council should meet on a Sunday and go through the tedious form of welcome is totally unnecessary, and would not be proper. Dr. Haughton's conduct is what we might have expected from him, though we doubt, from what we have seen for the last two days, if there are a dozen who would do likewise."

THE DUBLIN RIOTS.

WE observe that some of our daily contemporaries, mentioning the injuries inflicted during the recent riots in Dublin, frequently allude to the sufferers having been taken to "St. Stephen's" Hospital. The Hospital in question having been founded and endowed by a member of the Medical Profession, we think it would be only fair that, when mentioned, it should be designated by its correct title, "Dr. Steevens's Hospital," in accordance with the wishes of its benevolent founder.

THE 18TH HUSSARS AT SECUNDERABAD.

DOCTOR BRADY gave notice early this week of his intention to put some questions to the Secretary of State for War, on Thursday, the 10th inst., concerning the mortality caused among the 18th Hussars at Secunderabad by the recent outbreak of cholera; the site and sanitary condition of the station and barracks; any recommendations which have been made on these matters by the local military and Medical authorities; and the reasons for keeping the 18th Hussars for seven years at a station reported to be so unhealthy as Secunderabad. The questions are probably being put, and the replies given, as we are going to press.

HEALTH OF MAURITIUS.

By latest accounts from Mauritius, we learn that during April and May malarious fevers had become much more prevalent in the southern and eastern parts of the island, which had hitherto comparatively escaped. The disease is limited mostly to the coolie labourers. During April, in the Maheburg district, 57 deaths occurred, and the death-rate at Grand Port during April became double, and during May treble, what it had been during the corresponding months of the previous year, having increased to 179 as compared with 60. The reappearance of the disease during the early winter months has caused considerable anxiety among the local authorities. The Colonial Legislature is not in a position to carry out the necessary sanitary measures, and altogether the health prospects of the colony are very gloomy. The troops thus far have enjoyed tolerably good health.

SANITARY IMPROVEMENTS IN CALCUTTA.

THE influence of sanitary improvements on the public health in Calcutta has been strikingly exemplified during the last six years. Dr. Tonnerre, the health officer of the town, reports the death-rates as under:—In 1865 they were 23,242; in 1866, 20,283; in 1867, 12,097; in 1868, 13,733; in 1869, 12,795; and in 1870, 10,102. He thinks this improved condition of the population is mainly due to the vast sanitary improvements which have been made in the city and its environs.

FROM ABROAD.—PROPOSED TAXING OF THE FRENCH SCIENTIFIC PRESS—LYONS *versus* NANCY—M. FAUVEL ON THE COURSE OF THE CHOLERA.

IN the present stress for taxable objects the French Scientific Press seems to be likely to be subjected to great hardships, and especially a portion of its Medical branch. The Bill before the Assembly contemplates subjecting it in common with the political press to the *cautionment* or deposit of money (18,000 francs) to meet liabilities, to a stamp and to increased postage. The *cautionment* acts very partially, as it only applies to journals which appear oftener than once a week, of which we believe there are only three Medical. To be sure this will give them the right to discuss political or Medico-political subjects, which hitherto they have been prohibited doing. Indeed, such prohibition has heretofore been carried out in the most ridiculous manner, such questions as the supply of water to Paris or the decrease of population in France having been amongst those interdicted. Still, the journals in question consider sinking so large a capital too high a sum for the accordance of a privilege which would not be expected to be withheld under the present more liberal *régime*. As to the stamp, M. Latour has calculated that as far as the *Union Médicale* is concerned a stamp of two centimes would lead to a loss of half the profits, while one of from three to five centimes would be attended by a deficit of from six to sixteen thousand francs. To calculate upon meeting this by an increase of subscribers or throwing its payment upon them is futile, especially in the present impoverished state of the Profession, and it is to be feared that the payments to contributors will have to be diminished. The amount of increased postage has not yet been determined on; but M. Latour takes the occasion to protest against the present practice in France of charging according to weight instead of by the dimensions or number of sheets. To this he in part refers the great falling off, as compared with former times, in the quality of the paper employed for printing, the object being to obtain this as light as possible. This is the case with modern books, while the newspapers are composed of the most flimsy and detestable material.

The Syndicat, or Association of the Scientific Press, has just presented a petition to the Assembly, in which the prospective evils of the proposed legislation are powerfully set forth. It is observed that, seeing the immense advantages conferred by

the Scientific Press, it would seem to be the duty of those in power to encourage its efforts, instead of placing obstacles in its way; and under most *régimes* it has usually enjoyed immunities denied to the general press. As at present most of the scientific journals are carried on at little or no profit, the imposition of any tax or increased postage must lead to the suppression of many of them. With them, indeed, the resort to the post is obligatory, as, their subscribers lying scattered about, parcels of their journals cannot be sent by the railway, as is the case with the political journals. Neither additional subscribers nor advertisements can be hoped for to meet the proposed increased taxation.

The provoking thing is, that after all this mischief has been done, the gains of the national exchequer will be infinitesimal. Estimating the entire mass of scientific weekly journals at a maximum of 100,000 copies, and the additional tax at two centimes, this will only produce 104,000 fr. per annum. Even losses may ensue, for many of the journals will come to an end, or their subscribers will diminish in number. The petitioners quote the *Gazette des Hôpitaux* as an instance pregnant with instruction. Formerly, when submitted to a stamp duty, only 1200 copies were printed, and their postage produced 3000 fr. When the stamp duty had been abolished, the price of the journal was diminished, and while the number printed reached 7000, the postage increased to 20,000 fr. If the stamp is reimposed, and the journal returns to its former price, all this will be reversed. While, as is probable, if it be published only once, instead of (as at present) thrice, a week, in order to avoid the *cautionment*, the sum it pays for postage will be reduced two-thirds, and even much less, by reason of the certain falling off of subscribers. Moreover, it is to be expected that many journals will follow the example of the *Courrier des Familles*, and get their printing done in Belgium, where both paper and printing cost so much less as to more than cover the extra postage.

The question of the transfer of the Medical Faculty of Strasburg to Lyons or Nancy still excites much interest in French Medical circles, and last week M. Léon Le Fort addressed an excellent letter on the subject to the Budget Committee of the Assembly, strongly advocating the superior claims of Lyons. He points out that the notion of translating this Faculty to Nancy is a mere matter of sentiment, which is in clear contradiction to the necessities of Medical education. Strasburg, placed in the very midst of German-speaking people, had served as an intermedium between scientific Germany and France, its professors, by their publications and analyses, keeping the French, utterly ignorant as they are of foreign languages, to some extent acquainted with the scientific movement going on in Germany. It is evident that Nancy could perform no such function as this, for the intercourse and union of peoples is not an affair of mere distance. We (for this observation applies to us as much as to the French) are far better acquainted with what is going on in the United States than with what is done in Holland, and especially in Russia. Nancy may be near the frontier, but it is, in all matters of the intellect, solely and emphatically a French town, in which German is no more spoken than at Lyons. Again, for teaching law, theology, letters, and the physical sciences, lecture-rooms, libraries, laboratories, and museums suffice; but for Medicine it is quite a different matter. It is at the Hospital, and only at the Hospital, that this can be learned, for the patient is the book which conveys instruction alike to the pupil and the professor, and it is only in large towns, and even in large manufacturing centres, that Medical studies can be effectually carried on. It is not the shopkeeper or *rentier* who has recourse to Hospitals, but the working man. Happily for itself, Nancy is in this matter in a very bad position, having but few inhabitants, small manufactories, and few poor. Lyons is in exactly an opposite condition, and if there are to be two Faculties in France, one should be at Paris and the

other at Lyons (Montpellier is usually assumed in the discussion to be a mere accidental superfluity); and Nancy, indeed, could only put in a claim after Marseilles, Lille, Bordeaux, Rouen, Nantes, etc. Lyons is richly supplied with Hospitals, some of which, as the Venereal and Lying-in Hospitals, are also important in their special point of view. Finally, there is the recruit of the professorial body to be taken into account, and it is to be hoped that eventually there will be organised among the French Faculties and schools an imitation of the system of promotion among professorial chairs that has been found so eminently serviceable to science in Germany.

In the meantime the question has become somewhat complicated, by the fact that several of the Professors and Agrégés of the Strasburg Faculty have united themselves together in order to establish a Free Faculty, having for its object to constitute a bond of union between France and Germany. Of course this would signify a consent of the Prussian Government, concerning which as yet we have heard nothing.

In regard to the possible invasion of a new epidemic of cholera, M. Fauvel, a great authority on the subject in France, has just read a note at the Académie de Médecine. His view of the matter is more reassuring than that derivable from the correspondents of the political journals. He observes that the present epidemic is remarkable for the comparatively few persons who have been attacked, and by the slowness of its development and extension. At St. Petersburg, where it has now prevailed for a long time, it scarcely excites any attention. M. Fauvel, being a strong partisan of the doctrine of importation, is chiefly concerned with tracing the route which the epidemic has pursued. Since the great epidemic of 1865 the cholera has scarcely ever been absent from Kiew. In the winter of 1869, however, it was but little observed there, but in February, 1870, it showed itself at Moscow, and by July had penetrated to the countries watered by the Don and the shores of the Sea of Azof and of the Black Sea. Odessa and the other cities engaged on a large scale in the corn trade have paid their tribute to it, but only on a very moderate scale. Since September it has disappeared from those localities. The shore of the Black Sea belonging to Turkey has been completely exonerated—a fact, according to M. Fauvel, due to the severity of the quarantine there established. At the same time, the cholera took an opposite course towards the north, making its appearance at St. Petersburg on September 5. Little was said about it at the beginning of winter, but it became more intense in February, reached its apogee in March, and diminished in May. Up to that time there had been only 1294 cases, with 754 deaths, and no reliable statistics have since been published. In July a recrudescence occurred, as many as fifty persons being attacked per diem. What is of more consequence is the disposition of the epidemic to extend westwards, a dispatch dated July 29 having announced that cholera had reached Wilna on the Prussian frontier, which it has not yet, however, traversed. It also prevails at Riga, which is a fact of importance, owing to the commercial relations of this town with England. On the other hand, cholera has raged violently in India, and has prevailed since 1869 in Persia, where there was a recrudescence in 1870, owing to an annual afflux of pilgrims. Last year it extended to Africa towards Zanzibar, and is extending towards the south. Amidst all this, the pilgrimage to Mecca has this year escaped the scourge, and has been performed under the most favourable conditions. From this direction nothing is to be feared, the north-east being the point of danger; and here M. Fauvel observes it is not imminent, and need not cause alarm as long as the epidemic has not entered Germany.

PARLIAMENTARY.—PAYMENT TO MEDICAL WITNESSES.

In the House of Commons, on Thursday, August 3,

In answer to Mr. C. Bentinck,

Mr. Bruce said he had no personal knowledge of the allowance

made to Mr. Oliver Pemberton, Surgeon, of Birmingham, for attending the Carlisle Assizes as a witness on the Murphy riots—second-class fare and a guinea; or of the opinion expressed by the Lord Chief Baron that the allowance ought to be largely increased; and no communication on the subject had been received by the Treasury, which had power to increase allowances under special circumstances.

REPORT OF THE POOR-LAW BOARD.

No. I.

THE twenty-third annual report of the Poor-law Board, just issued, brings down the history of that Department to May 31 last. It enters much less fully than recent previous reports into matters affecting the sick poor or the Medical Profession, and we have therefore but few portions of it to bring under special notice.

Before entering upon a consideration of those portions which relate to Medical relief, the Dispensary system, and the small-pox epidemic, it will be well to see what the Poor-law Board has to say in reference to poor-rates and pauperism. Whether it be in consequence of the probability of approaching changes in the constitution of the Board, or because it has reached comparatively smooth water since the passing of the Union Chargeability Act and the Metropolitan Poor Acts, the report is somewhat dull reading by the side of many of its predecessors. It is satisfactory, however, to find that but £7,644,307 was expended for the relief of the poor during the year 1869-70, as against £7,673,100 in the year 1868-9; being a decrease of £28,793, or at the rate of 0·4 per cent. A turning-point seems to have been reached in respect to this item, and the anticipations indulged by Mr. Göschel in the last report to have been to a certain extent verified. In each of the years ended Lady-day, 1867, 1868, and 1869, there was an increase in the total expenditure and in the rate per head on the population, as compared with the several years immediately preceding; whereas in the year ended Lady-day, 1870, there has been a decrease of £28,793 (or 0·4 per cent.), as above stated, in the expenditure, and a decrease of 1½d. in the rate per head on the population.

As regards the classes of persons relieved, it may, of course, be accepted as a cardinal point that the nearer we can approach to a system under which relief shall be given to none but the sick, the aged, and children, the nearer we shall be to perfection. The first step in that direction appears to have been taken, for we find that, as regards adult able-bodied paupers, there was a decrease in the numbers relieved in July, 1870, as against July, 1869, of 361, or 0·2 per cent.; and in January, 1871, as compared with January, 1870, of 4465, or 2·3 per cent.

But though the past parochial year may, as regards the above-mentioned items, contrast favourably with its immediate predecessors, the report acknowledges a serious increase in the cost of relief during the past ten years. Comparing 1870 with 1861, we find that the following have been the rates of increase in the metropolis:—In-maintenance 52·5 per cent., out-relief 97·8 per cent.; total relief (including salaries, etc.) 76·2 per cent. In the North-Western division (including Lancashire and Cheshire):—In-maintenance 79·3 per cent., out-relief 46·9 per cent.; total relief (including salaries, etc.) 57·1 per cent. In the remainder of the country:—In-maintenance 37·1 per cent., out-relief 12·1 per cent.; total relief (including salaries, etc.) 21·1 per cent. From the figures given above, taken in connexion with tables in the report showing the numbers of paupers of all classes relieved during the same years, it appears that the rate of increase in the number of paupers in 1870 over 1871 is considerably less than the rate of increase in the expenditure. This the report states may be partly accounted for by some of the following causes, viz.:—a more liberal scale of relief; improved accommodation; a rise in the prices of provisions, clothing, and buildings; increased salaries, and additions to the administrative staff. It must also be borne in mind that during the decennial period above referred to there have occurred the cotton famine (1862-4), the commercial crisis (1866), and the distress in the East of London (1866-68). In 1865-7, too, there was the agitation for increased accommodation for the sick poor, and, as regards the metropolis, this may in great part account for the increase. If the fact be so, it is but the natural result of the determination of the public that

the sick and infirm should be properly cared for, and is a result at which none will be inclined to grumble, provided the money has been wisely laid out.

Before quitting this portion of the subject, it seems but fair to quote from the report in regard to certain of the effects of recent legislation:—"During the period of ten years from 1861 to 1870, three Acts of Parliament have been passed making important changes in the administration of relief, and in the incidence of its cost. In 1861 the Irremovable Poor Act (24th and 25th Vic., c. 55.) was passed, which limited the power of removal by a reduction of the period of residence conferring irremovability from five years to three, and extended the area of residence from the parish to the union. It also directed that the contributions of the several parishes in a union to the common fund should be made according to their rateable value, instead of according to their annual expenditure.

"In 1865 the Union Chargeability Act (28th and 29th Vic., c. 79) was passed, carrying the same principles into further operation by reducing the period of residence which confers irremovability to one year, and extending the charge upon the common fund in unions for the relief of the poor, which had been previously confined to certain classes only, so as to include the relief of all the poor in the union.

"In 1867 the Metropolitan Poor Act (30th Vic., c. 6) was passed, providing for the establishment of district asylums for the reception and relief of the sick, insane, and infirm classes of paupers in the metropolis, and for the building of dispensaries; and also providing for the establishment of a common poor-fund, raised by contributions from the several unions and parishes, according to their annual rateable value, out of which the relief of certain classes of paupers in the whole district should be paid. The two former Acts apply to the whole kingdom, the last to the metropolis only.

"Whether or not the first two Acts may have had any effect in occasioning an increase of the aggregate expenditure throughout the kingdom we have no evidence to show; but there can be no doubt that the limitation of the power of removal must have tended to augment the charge upon the towns as compared with the rural unions. With regard to the Metropolitan Poor Act, one of its principal objects was the extension and improvement of the accommodation for sick paupers, and it therefore authorised measures to be taken for the erection of several large and expensive asylums and other buildings, for the cost of which, as well as for the enlargement and improvement of the existing workhouses and sick wards, loans have been obtained during the last three years to the amount of £1,424,972. At the same time the large increase in the metropolis, which we have already mentioned, took place in the current expenditure for in-maintenance and for out-relief. The commercial crisis in the year 1866 may be considered to have been in a great measure the cause of this increase, although the effect of the crisis does not appear to have been fully felt by the labouring population for some months subsequently. The expenditure for out-relief in the metropolis for the year ended at Lady-day, 1866, was £233,569, in the year ended at Lady-day, 1868 (two years afterwards), it had increased to £378,212, being a difference of £144,643, or 62 per cent. During the same interval the price of wheat had risen from 43s. 6d. to 67s. 6d. per quarter, an increase of price which would affect the cost, not only of out-relief but also of in-maintenance. At the same time the alteration in the law of removal which took effect at Lady-day, 1866, would tend to prevent the metropolitan unions and parishes from relieving themselves from the burden which the commercial crisis had brought upon them by limiting their power of removing persons who had become chargeable to those only who had not been resident in the union or parish for one year without receiving relief. Moreover, the circumstances to which we have referred in our annual report for the year 1867, as having been the immediate cause of the passing of the Metropolitan Poor Act, combined with the existing distress and the then prevalent popular feeling, had the effect of inducing a more liberal administration of relief; and it may be inferred that the guardians would not be less willing to incur additional expenditure when, under the provisions of the Act, the relief of certain classes of paupers became a charge, not on their union or parish, but on the common fund raised by contributions from all the parishes and unions in the metropolitan district. With regard to the expenditure necessary for providing adequate relief for the sick poor, there can be no doubt that whatever is required for their proper care and treatment, both Medically and otherwise, will be fully approved and readily granted, although even this expenditure requires to be carefully watched."

(To be continued.)

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

REPORT OF THE FORTY-FIRST MEETING.

EDINBURGH, August 9, 1871.

INTRODUCTORY.

THE work of the Association has proceeded steadily and well thus far. The opening address of the President, Sir William Thomson, F.R.S.—somewhat, perhaps, too long in delivery, and, as many hearers of it felt, somewhat diffuse—was nevertheless a powerful production. It indicated quantity, truly, rather than intensity, but that is only saying that it indicated the natural life of the speaker. It was, of course, well received. It dealt with various subjects: the early history of the Association, the establishment of physical laboratories and observatories, terrestrial magnetism, the kinetic theory of gases, spectrum analysis, the gravitational theory, and the nature of comets. The part of it most likely to interest our Medical readers is the following having reference to

THE ORIGIN OF LIFE ON THE PLANET.

The essence of science, as is well illustrated by astronomy and cosmical physics, consists in inferring antecedent conditions, and anticipating future evolutions, from phenomena which have actually come under observation. In biology the difficulties of successfully acting up to this ideal are prodigious. The earnest naturalists of the present day are, however, not appalled or paralysed by them, and are struggling boldly and laboriously to pass out of the mere "natural history stage" of their study, and bring zoology within the range of natural philosophy. A very ancient speculation, still clung to by many naturalists (so much so that I have a choice of modern terms to quote in expressing it), supposes that, under meteorological conditions very different from the present, dead matter may have run together or crystallised or fermented into "germs of life," or "organic cells," or "protoplasm." But science brings a vast mass of inductive evidence against this hypothesis of spontaneous generation, as you have heard from my predecessor in the presidential chair. Careful enough scrutiny has, in every case up to the present day, discovered life as antecedent to life. Dead matter cannot become living without coming under the influence of matter previously alive. This seems to me as sure a teaching of science as the law of gravitation. I utterly repudiate, as opposed to all philosophical uniformitarianism, the assumption of "different meteorological conditions"—that is to say, somewhat different vicissitudes of temperature, pressure, moisture, gaseous atmosphere—to produce or to permit that to take place by force or motion of dead matter alone, which is a direct contravention of what seems to us biological law. I am prepared for the answer, "Our code of biological law is an expression of our ignorance as well as of our knowledge." And I say yes: search for spontaneous generation out of inorganic materials; let anyone not satisfied with the purely negative testimony of which we have now so much, against it, throw himself into the inquiry. Such investigations as those of Pasteur, Pouchet, and Bastian are among the most interesting and momentous in the whole range of natural history, and their results, whether positive or negative, must richly reward the most careful and laborious experimenting. I confess to being deeply impressed by the evidence put before us by Professor Huxley, and I am ready to adopt, as an article of scientific faith, true through all space and through all time, that life proceeds from life, and from nothing but life. How, then, did life originate on the earth? Tracing the physical history of the earth backwards on strict dynamical principles, we are brought to a red-hot melted globe on which no life could exist. Hence, when the earth was first fit for life, there was no living thing on it. There were rocks solid and disintegrated, water, air all round, warmed and illuminated by a brilliant sun, ready to become a garden. Did grass and trees and flowers spring into existence, in all the fulness of ripe beauty, by a fiat of Creative Power? or did vegetation, growing up from seed sown, spread and multiply over the whole earth? Science is bound by the everlasting law of honour to face fearlessly every problem which can fairly be presented to it. If a probable solution, consistent with the ordinary course of nature, can be found, we must not invoke an abnormal act of Creative power. When a lava stream flows down the sides of Vesuvius or Etna it quickly cools and becomes solid; and after a few weeks or years it

teems with vegetable and animal life, which for it originated by the transport of seed and ova and by the migration of individual living creatures. When a volcanic island springs up from the sea, and after a few years is found clothed with vegetation, we do not hesitate to assume that seed has been wafted to it through the air, or floated to it on rafts. Is it not possible, and if possible, is it not probable, that the beginning of vegetable life on the earth is to be similarly explained? Every year thousands, probably millions, of fragments of solid matter fall upon the earth. Whence came these fragments? What is the previous history of any one of them? Was it created in the beginning of time an amorphous mass? This idea is so unacceptable that, tacitly or explicitly, all men discard it. It is often assumed that all, and it is certain that some, meteoric stones are fragments which had been broken off from greater masses and launched free into space. It is as sure that collisions must occur between great masses moving through space as it is that ships, steered without intelligence directed to prevent collision, could not cross and recross the Atlantic for thousands of years with immunity from collisions. When two great masses come into collision in space, it is certain that a large part of each is melted; but it seems, also, quite certain that in many cases a large quantity of *débris* must be shot forth in all directions, much of which may have experienced no greater violence than individual pieces of rock experience in a land-slip, or in blasting by gunpowder. Should the time when this earth comes into collision with another body—comparable in dimensions to itself—be when it is still clothed, as at present, with vegetation, many great and small fragments carrying seed and living plants and animals would undoubtedly be scattered through space. Hence, and because we all confidently believe that there are at present, and have been from time immemorial, many worlds of life besides our own, we must regard it as probable in the highest degree that there are countless seed-bearing meteoric stones moving about through space. If at the present instant no life existed upon this earth, one such stone falling upon it might, by what we blindly call *natural* causes, lead to its becoming covered with vegetation. I am fully conscious of the many scientific objections which may be urged against this hypothesis, but I believe them to be all answerable. I have already taxed your patience too severely to allow me to think of discussing any of them on the present occasion. The hypothesis that life originated on this earth through moss-grown fragments from the ruins of another world may seem wild and visionary; all I maintain is that it is not unscientific. From the earth stocked with such vegetation as it could receive meteorically, to the earth teeming with all the endless variety of plants and animals which now inhabit it, the step is prodigious; yet, according to the doctrine of continuity, most ably laid before the Association by a predecessor in this chair (Mr. Grove), all creatures now living on earth have proceeded by orderly evolution from some such origin.

THE SECTIONS.

On Thursday morning the sections met in their respective rooms for work, and, as all the sections were held in and within the walls of the University, every possible convenience was given to everybody to see and to hear. To the old Edinburgh men, scattered far and wide over the world, this picture of the science of the world, as it now is congregating in the class-rooms of the fine old building in which, with endless hopes and fears, they passed their academic life, will come back with singular force and sympathy.

I shall, as in former years, confine my notes to the work done in the sections devoted to Biology, Chemistry, and Economics, selecting from these such papers as bear chiefly on practical Medicine, and following the order, as nearly as is practicable, in which the papers were read.

BIOLOGY.—SECTION D.

This section is divided into three departments—Anatomy and Physiology, Zoology and Botany, Anthropology. The section altogether was presided over by Dr. Allen Thomson, Professor of Anatomy in the University of Glasgow^(a); and the Presidents of Departments were:—For Anatomy and Physiology, Dr. Allen Thomson, Professor of Anatomy in the University of Glasgow; for Zoology and Botany, Dr. Wyville Thomson, Professor of Natural History in the University of Edinburgh; for Anthropology, Professor Turner, M.B., Professor of Anatomy in the University of Edinburgh.

(a) *Erratum*.—In our last impression, lines 3 and 4 from the bottom, for words "the newly-elected Professor of Natural History," read "the Professor of Anatomy in the University of Glasgow."

ADDRESS TO SECTION D.

By Professor Allen Thomson, M.D., F.R.S., President.

Professor Allen Thomson opened the Biological Section with an address which delighted an audience much too large to be comfortably accommodated. In the address the learned Professor paid a great compliment to Darwin. The following passages were received with much satisfaction:—

UNITY OF BIOLOGICAL SCIENCE.

The comparative anatomist must be an accomplished embryologist in the whole range of the animal kingdom, or in any single division of it which he professes to cultivate. The zoologist and the botanist must equally found their descriptions and systematic distinctions on morphological, histological, and embryological data. And thus the whole of these departments of biological science are so interwoven and united that the scientific investigation of no one can now be regarded as altogether separate from that of the others. It has been the work of the last forty years to bring that intimate connexion of the biological sciences more and more fully into prominent view, and to infuse its spirit into all scientific investigations.

CULTIVATION OF BIOLOGY IN SCHOOLS.

There is another topic to which I can refer with pleasure as connected with the cultivation of biological knowledge in this country, and that is the introduction of instruction in natural science into the system of education of our schools. It is so obvious, that whatever knowledge, easily acquired, and even though of the most elementary kind, tends to enlarge the range of observation and thought, must have some effect in removing its recipients from grosser influences, and may even give information which may prove useful in social economy and in the occupations of labour. Nor need I point out how much more extended the advantages of such instruction may prove if introduced into the system of our secondary schools, and more freely combined than heretofore with the too exclusively literary and philosophical study which has so long prevailed in the approved British education. It is obvious, too, that while this more immediately useful or beneficial effect on the common mind may be produced by the diffusion of natural knowledge among the people, biological science will share in the gain accruing to all branches of natural science, by the greater favour which will be accorded to its cultivators, and the increased freedom from prejudice with which their statements are received and considered by learned as well as by unscientific persons. (Applause.)

THE SPIRITUALISTIC PHANTASY.

I cannot conclude these observations without adverting to one aspect in which it might be thought that biological science has taken a retrograde rather than an advanced position. In this, I do not mean to refer to the special cultivators of biology in its true sense, but to the fact that there appears to have taken place of late a considerable increase in the number of persons who believe, or who imagine that they believe, in the class of phenomena which are now called spiritual, but which have been long known—since the exhibitions of Mesmer, and, indeed, long before his time—under the most varied forms, as liable to occur in persons of an imaginative turn of mind and peculiar nervous susceptibility. It is still more to be deplored that many persons devote a large share of their time to the practice—for it does not deserve the name of study or investigation—of the alleged phenomena, and that a few men of acknowledged reputation in some departments of science have lent their names and surrendered their judgment to the countenance and attempted authentication of the foolish dreams of the practitioners of spiritualism and similar chimerical hypotheses. The natural tendency to a belief in the marvellous is sufficient to explain the ready acceptance of such views by the ignorant; and it is not improbable that a higher species of similar credulity may frequently act with persons of greater cultivation, if their scientific information has been of a partial kind. It must be admitted, further, that extremely curious and rare, and to those who are not acquainted with nervous phenomena, apparently marvellous phenomena present themselves in peculiar states of the nervous system, some of which states may be induced through the mind, and may be made more and more liable to recur, and greatly exaggerated by frequent repetition. But making the fullest allowance for all these conditions, it is still surprising that persons otherwise appearing to be within the bounds of sanity should entertain a confirmed belief in the possibility of phenomena, which, while they are at variance with the best established physical laws, have never been brought under proof by the evidence of the senses, and are opposed to the dictates of sound judgment. It is so far satisfactory in the interests of true biological

science that no man of note can be named from the long list of thoroughly well-informed anatomists and physiologists who has not treated the belief in the separate existence of powers of animal magnetism and spiritualism as wild speculations, devoid of all foundation in the carefully tested observation of facts. It has been the habit of the votaries of the systems to which I have referred to assert that scientific men have neglected or declined to investigate the phenomena with attention and candour; but nothing can be farther from the truth than this statement. Not to mention the admirable reports of the early French academicians, giving the account of the negative result of an examination of the earlier mesmeric phenomena by men in every way qualified to pronounce judgment on their nature, I am aware that from time to time men of eminence, and fully competent, by their knowledge of biological phenomena, and their skill and accuracy in conducting scientific investigation, have made the most patient and careful examination of the evidence placed before them by the professed believers and practitioners of so-called magnetic, phreno-magnetic, electro-biological, and spiritualistic phenomena; and the result has been uniformly the same in all cases when they were permitted to secure conditions by which the reality of the phenomena or the justice of their interpretation could be tested—viz., either that the experiments signally failed to educe the results professed, or that the experimenters were detected in the most shameless and determined impostures. I have myself been duly convinced of this by repeated examinations. But, were any guarantee required for the care, soundness, and efficiency of the judgment of men of science on these phenomena and views, I have only to mention, in the first place, the revered name of Faraday, and, in the next, that of my life-long friend, Dr. Sharpey, whose ability and candour none will dispute—(applause)—and who, I am happy to think, is here among us, ready, from his past experience of such exhibitions, to bear his weighty testimony against all cases of *levitation*, or the like, which may be the last wonder of the day among the mesmeric or spiritual pseudo-physiologists. (Applause.) The phenomena to which I have at present referred, be they false or real, are in great part dependent upon a natural principle of the human mind, placed, as it would appear, in dangerous alliance with certain tendencies of the nervous system. They ought not to be worked upon without the greatest caution, and they can only be fully understood by the accomplished physiologist, who is also conversant with psychology. The experience of the last hundred years tends to show that there will always exist a certain number of minds prone to adopt a belief in the marvellous and striking in preference to that which is easily understood and patent to the senses; but it may be confidently expected that the diffusion of a fuller and more accurate knowledge of vital phenomena among the non-scientific classes of the community may lead to a juster appreciation of the phenomena in question, and a reduction of the number among them who are believers in the impossible. As for men of science who persist in submitting to such strange perversion of judgment, we can only hope that the example of their less-instructed fellow-countrymen may lead them to allow themselves to be guided more directly by the principles of common sense than by the erratic tendencies of a too fervid imagination. (Loud and prolonged applause.)

REPORT ON THE PHYSIOLOGICAL ACTION OF ORGANIC CHEMICAL COMPOUNDS.

By Dr. Richardson, F.R.S.

Dr. Richardson read the first report in the Department of Anatomy and Physiology. He commenced with *Chloral Hydrate*, treating of four points in relation to it:—(a) The question of a dangerous and of a fatal dose. (b) The quantity of hydrate that can safely be given in limited periods of time. (c) The treatment to be adopted in cases of poisoning by the hydrate. (d) The chronic evils from indulgence in the substance as a narcotic luxury. Respecting the treatment of persons under poisonous doses of chloral the author discussed three lines of treatment as all important—viz., sustainment of the animal temperature in a warm air; sustainment of the body by the administration of food; and artificial respiration. On the subject of habitual use of the hydrate he spoke very strongly, urging that to the vices of alcoholism and opium-eating there was now being added that of using chloral hydrate as a narcotic. He described the dangers of this growing practice, and, in terms which were received with the most earnest demonstrations of acquiescence on the part of the audience, protested that chloral hydrate was purely a medicine, and that when it was employed in the absence of Medical science and experience it ceased to be a boon, and became a curse to mankind.

Anhydrous Chloral was the next substance described. This is the fluid from which chloral hydrate is made by the addition of water. It is a fluid yielding a very irritating vapour, but it can be applied freely to the skin, where, without pain, it acts rapidly, taking up water and becoming transformed as it is absorbed into chloral hydrate. It causes, nevertheless, some loss of structure at the part to which it is applied, and some after-narcotism from the absorption of the hydrate. It will prove of great service in neuralgia, in the local treatment of cancer, and in other external forms of disease. *Meta-chloral* was next introduced. It is a fine white powdery substance, insoluble in water, and made by the action of sulphuric acid on anhydrous chloral. Administered internally it is a narcotic like chloral hydrate, but it is slower in its action and less active. Some new researches on *Nitrite of Amyl* were next adduced, in which the action of that substance on the circulation of the lungs was defined. It was shown that the vascular paralysis caused by the nitrite extends to the vessels of the pulmonary tract, and that the extremest congestions and hæmorrhages can be induced by it in the inferior animals, representing states closely resembling some conditions running, at least, side by side with tuberculous deposit. It was also explained that in some animals affected with scaly disease of the skin and loss of fur the continued inhalation of the nitrite vapour induced a free capillary circulation and effected a rapid cure. *Nitrate of Ethyl* and *Nitrate of Amyl* were taken up in continuation, and a comparison was made between the action they produced and the action of the respective nitrites, the differences being due to the additional equivalent of oxygen in the nitrates. The action of *Sulpho-urea*, a new organic compound, in which sulphur represents the oxygen of common urea, was brought under notice after the discussion of the nitrates; and, finally, *hydramyle* and *chlor-hydramyle* were considered at length in respect to their uses and applications as rapidly acting narcotic vapours. In a second part of the report Dr. Richardson treated on three topics: The condition of the minute circulation under the action of narcotics; the relation of convulsive action to the contraction of the minute bloodvessels; and the effect of condensation of the water of the tissues and its fatal accumulation on the skin and the mucous and serous surfaces—the bronchial surfaces especially—during states of the body when the animal temperature is undergoing decrease.

A most interesting discussion followed, in which Dr. Donkin, Dr. Marcet, Dr. Brunton, and Dr. Sharpey took part.

REPORT ON PHYSIOLOGICAL EXPERIMENTATION.

Dr. Arthur Gamgee read the following statement:—A committee consisting of ten individuals having been appointed at the last meeting of the British Association, held at Liverpool, to consider the subject of physiological experimentation, in accordance with a resolution of the General Committee, the following report was drawn up and signed by seven members of the Committee:—“1. No experiment which can be performed under the influence of an anæsthetic ought to be done without it. 2. No painful experiment is justifiable for the mere purpose of illustrating a law or fact already demonstrated. In other words, experimentation without the employment of anæsthetics is not a fitting exhibition for teaching purposes. 3. Whenever, for the investigation of new truth, it is necessary to make a painful experiment, every effort should be made to insure success, in order that the suffering inflicted may not be wasted. For this reason no painful experiment ought to be performed by an unskilled person with insufficient instruments and assistance, or in places not suitable to the purpose—that is to say, anywhere except in physiological and pathological laboratories under proper regulations. 4. In the scientific preparation for veterinary practice, operations ought not to be performed upon living animals for the mere purpose of obtaining greater operative dexterity.—Signed by M. A. Thomson, Oxford; John H. Balfour and Arthur Gamgee, Edinburgh; G. M. Humphrey, Cambridge; William Flower, Royal College of Surgeons, London; J. B. Sanderson, London; George Rolleston, Secretary, Oxford.”

ON THE PRESSURE OF THE ATMOSPHERE AS AN AUXILIARY FORCE IN CARRYING ON THE CIRCULATION OF THE BLOOD.

By Dr. A. Buchanan.

Dr. Buchanan, who spoke from brief notes, explained his views respecting the circulation of the blood, and the effect of atmospheric pressure as an auxiliary to the circulation. Dr. A. Wilson, in 1774, first raised the question of the “suction power of the right heart, but it was not until Carson, who about the year 1816, if we remember correctly, wrote in support and elaboration of Wilson’s views, that the subject received full consideration. Carson was of opinion that the

contractile left heart asserted sufficient power to fill the arterics and capillaries by its stroke; but he held that the left stroke was not sufficient to fill the right side of the heart. The filling of the right side was due, he thought, mainly to the action of the lungs. The arguments of Carson were strongly opposed by Arnott, and Dr. Buchanan's essay was intended once more to revive the controversy in favour of Carson.

ON THE NUTRITION OF THE MUSCULAR AND PULMONARY TISSUE IN HEALTH AND IN PHTHISIS, WITH REMARKS ON THE COLLOID CONDITION OF MATTER.

By Dr. Marcet, F.R.S.

Dr. Marcet, in this communication, compared the nutrition of lung and of muscle in the normal condition of the subject, and then passed to consider the changes which occur in both sets of organs during phthisis pulmonalis, when the muscles are undergoing rapid wasting. He proceeded afterwards to treat on the colloidal condition of certain of the structures of the body, and specially of the blood, including in his remarks a description of the colloid condition of matter generally. It would be difficult to condense into a few lines of abstract Dr. Marcet's interesting contribution, the whole of which we hope to see in full.

ON THE PLACENTATION OF THE CETACEA.

By Professor Turner, M.B.

The learned and industrious Professor of Anatomy of the University of Edinburgh must surely have been gratified by the audience that attended his demonstration on the "Placentation of the Cetacea," on Friday morning. In return the audience had occasion to be grateful for an admirable paper. Dr. Turner first glanced at the labours of preceding anatomists, and then passed to describe his own dissections and researches made on a whale that had been sent him from Kirkwall during the past year. The paper was illustrated by a series of injected preparations, which for beauty, not less than instruction, could not be surpassed.

A discussion followed, in which Professors Sharpey, Huxley, Carpenter, Priestley, and Dr. Donkin took part.

ON THE CILIATED CONDITION OF THE INNER LAYER OF THE BLASTODUM IN THE OVA OF BIRDS, AND IN THE OMPHALOMESENTERIC VESSELS.

By B. T. Lowne.

A short, concise, descriptive paper. Professors Sharpey, Carpenter, Allen Thomson, and Dr. Lankester joined in the discussion.

ON SOME RUDIMENTARY STRUCTURES RECENTLY MET WITH IN THE DISSECTION OF THE LARGE FIN-WHALE.

By Professor Struthers, M.D.

The whale dissected and now in part described by Professor Struthers measured sixty-eight feet in length, and was found in the North Sea, some thirty or forty miles off Aberdeen. On its being towed into Peterhead, he proceeded to examine it. The colour was white on the belly, dark on the sides, and black on the back. In examining the bones and muscles, he found a sixteenth pair of ribs. The position of these was a remarkable one for a rib to occupy in a mammalian animal, suggesting a sternal rather than a vertebral rib, and somewhat resembling the abnormal ribs of the crocodile. The muscles he spoke of as rudimentary structures, whose function was not distinct but low. As abnormal or unusual rudimentary structures could be understood only through variability and inheritance, so normal rudimentary structures were to be explained, not by the fictions of final cause, or of so-called type, but by the law of inheritance and the influence of function. The one, as part of a great scheme of evolution, had brought them into existence, and the other, by fitness and use, had preserved them from becoming extinct.

Professor Turner, Professor Macalister, and Dr. Murie took part in the debate, the latter expressing his satisfaction at finding the observations he had made in 1867 confirmed by the researches of Professor Struthers.

ON THE CAUDAL AND ABDOMINAL MUSCLES OF THE CRYPTOBRANCH.

By Professor Humphry, F.R.S.

Professor Humphry read a paper on the Caudal and Abdominal Muscles of the Cryptobranch. He gave a general description of them, and drew the following inferences:—First, that the abdominal muscles are an extension and expansion of the caudal muscles. Secondly, that the several abdominal muscles are derived from one simple muscular sheet, which is segmented into planes by the difference in direction of the muscular fibres at different depths. Thirdly, that the fibres of the external and internal oblique muscles are continued into

those of the rectus, a gradual alteration in their direction from an oblique to a straight course being found as they approach the middle line. Fourthly, that the ilium and the ribs are ossifications in the course of the intermuscular septa, and chiefly in those parts of the thickness of the septa which correspond with the plane of the internal oblique.

ON THE USES OF THE UVULA.

By Sir Duncan Gibb.

Anatomists describe the action of the uvular muscle as an elevator which shortens the uvula. It is, however, a sentinel to the fauces, especially in the act of deglutition; for when any substance comes into contact with it, it excites the action of all the neighbouring muscles until it is got rid of. It possesses a function of not less importance, in holding the soft palate tense and firm in the medial line against the wall of the pharynx during the act of deglutition itself, and thus prevents the passage upwards of fluid or solid substances behind the nose. This was supported by experiments upon a person who had lost the bones of the nose, permitting of a view of the action of the soft palate from its nasal aspect during deglutition with or without food. Under either circumstance, a double arch was seen in the form of two convex swellings, held in a state of firm tension by the action of the uvula passing down the centre of the soft palate, with its end resting flat against the wall of the pharynx. The tension ceased the moment that the constrictors of the pharynx had fully exerted their influence over the substances swallowed. Whilst the uvula has its special uses in the act of deglutition, it exerts a not less decisive influence upon the voice when uttered in a very loud tone, or in singing the higher registers, in both sexes. Then its character as a levator or shortener is exerted. If this power is impaired by removal of the muscular (not the membranous) end, then the singing powers are damaged. The elongation of the uvula and its effects formed a subject of observation, a distinction being made between its elongated membranous end and the true muscular end. Speech, the author said, was modulated by the soft palate and uvula, and the motor power of the latter is unquestionably exerted in pronouncing the letters K, Q, and X, with their associations, more especially the gutturals of the various languages.

ON CERTAIN ABNORMALITIES OF THE LARYNX.

By Sir Duncan Gibb.

In this paper the author described a rare instance of absence of both arytenoid cartilages in a girl of eighteen. Likewise, one in which the epiglottis possessed the shape of a trefoil leaf, and two others in boys of fissure of the same cartilage.

REPORT ON THE HEAT OF THE BLOOD DURING ARTERIALISATION.

By Dr. Arthur Gamgee, F.R.S.E.

Dr. Gamgee's report was one of the reports written specially for the Association. It opened with a review of what had been done by previous observers, and expressed the opinion that the labours of Dr. John Davy were probably valueless. He then described the results of his own research, and stated that the specific heat of blood was absolutely the same as that of water. Experiments made by himself, and several of them in conjunction with Professor Tait, were recorded. The earlier experiments he made were unsatisfactory, and no positive proof was obtained of the heating of blood when it absorbs oxygen, but this year he had worked with improved apparatus. He described the apparatus he had devised, and proceeded to state the results at which he had arrived. From his experiments on the heat of arterialisation of perfectly reduced blood, he has arrived at the conclusion that the mean rise in temperature during the absorption and combination of oxygen with the blood-colouring matter of perfectly reduced blood amounts to 0.097 of a degree Centigrade. The maximum heating found was 0.111° C., and the minimum 0.083° C. The author then made observations on the total amount of heat units representing approximately the heat due to the arterialisation of the whole blood passing through the lungs in a day. The amount of blood passing through the lungs in one day amounts to more than ten tons, and it was estimated that the heat from the arterialisation of the whole blood amounted to 527 heat units (the heat unit taken being the kilogramme of water heated 1° C.), an amount more than sufficient to heat the whole quantity of air inspired, and to saturate it with moisture at the temperature of the body.

In the discussion, in which Professor Rutherford, Mr. Ray Lankester, Professor Williams, and Professor Allen Thomson joined, Professor Rutherford expressed his deep sense of the great value of the report by Dr. Gamgee, while Dr. Allen Thomson defended the labours of Dr. John Davy, and regretted they

had been spoken of in the manner he had heard. He suggested that the observations made on Dr. Davy should be changed before the report was printed, to which suggestion the author gave his assent.

AN EXPERIMENTAL INQUIRY INTO SOME OF THE RESULTS OF INOCULATION IN THE INFERIOR ANIMALS.

By Dr. John Clivene.

This paper was a history of a series of attempts to inoculate cancer into rabbits from the human subject. The author's conclusions may be summarised as follows:—1. Cancer cannot be produced in rabbits from the human subject. 2. Cysts, containing cheesy matter, arise at the points of inoculation. 3. The cysts do not differ from the local appearances which arise after the application of any irritant to the subcutaneous tissue of the rabbit.

In the discussion, Professor Williams said he had had experience of inoculation both in rabbits and birds. The birds he had experimented upon (fifty or sixty) had all died, the cause of their deaths being the inoculation; but he did not find it so with rabbits. He thought that in birds inoculation produced a special or acute infection.

ON THE DIETARY IN THE ENGLISH AND WELSH WORKHOUSES.

By Dr. Edward Smith, F.R.S.

The author first observed on the fact that schemes of dietary are agreed upon by the combined action of the local authorities, the guardians of the poor, and the central authority; and showed that, as the dietary should correspond with that of the labouring classes, it must vary in different localities, and be based upon knowledge. The dietary is thus prepared by the guardians and examined and sanctioned by the Poor-law Board. He explained the steps which have recently been taken by the latter to give advice to the former and to establish greatly improved dietaries. This was initiated by the Hon. C. P. Villiers, who first made the appointment of Medical Officer to the Board, and carried into effect by the Earl of Devon and his successors as Presidents of the Poor-law Board. It is now laid down by that authority that the foods to be selected shall be those in ordinary use in the several localities, and that the kind and quantity of food shall be adapted to the wants of the several classes of inmates. The chief differences of food are found in the quantity of meat supplied and the mode in which it is served, and the use of oatmeal, cheese, milk, and puddings. In many of these points the dietaries in Dorset and Westmoreland were contrasted. Then he showed, from inquiries made by him for the Government some years ago, that the quantities of food obtained by the working classes per adult weekly were, in Dorset—bread stuffs, 13 lbs.; sugar, 3½ oz.; fats, 4½ oz.; meat, 7¼ oz.; milk, 12 oz.; and cheese, 12½ oz.; while in Westmoreland the quantities were—bread stuffs, 12½ lbs.; sugar, 10¾ oz.; fats, 6¾ oz.; meat, 21½ oz.; milk, 120 oz.; and cheese, 2 oz. He then showed what is the typical diet of children at various ages, and to able-bodied and aged adults, and the quantity of the several foods in workhouses. Children under 2 years of age get milk, bread, and rice pudding; from 2 to 5 years, pudding on three days, meat and potatoes on three days, and soup or other food on one day. From 5 to 9 years there is one other day of meat and potatoes, and commonly one of soup. From 9 to 16, that of adults. For able-bodied, bread and gruel at breakfast and supper, varied by broth or cheese in the several localities; at dinner, meat in some form on four days, and pudding or cheese on three days. For aged, tea and bread-and-butter at breakfast and supper; at dinner, meat in some form five days, with pudding or cheese or other food on two days. The standard of measurement of the sufficiency of this food is that which he gave to the Government when advising on the Lancashire cotton famine—viz., 4300 grains of carbon and 200 grains of nitrogen daily; and the model dietary which he had framed for the midland counties supplied more than this to the adults. He then pointed out that, whilst the above-mentioned quantity of food supported the health and strength of the inmates, except perhaps as regarded children, there are still many workhouses where the dietary is very unsatisfactory. In some, gruel and bread are given at breakfast and supper to nearly all the inmates, or where meat in a separate form is not given, or where a very small quantity, as 2 oz. or 3 oz. of raw meat two or three times a week, or where bread and cheese alone are given to some classes in eighteen out of twenty-one meals weekly, or where soup containing no meat is given thrice a week, or where meat when given is given only when cold; whilst, on the other hand, there are workhouses in the manufacturing districts where meat and bread are given in great excess. He was of opinion that the time may arrive when the

Government will prepare several schemes of dietary for different parts of the country; but, in the meantime, improvements are now in rapid progress. He exhibited tables showing the quantities of food taken by the working classes, and the dietary which he had recommended for use in workhouses in the midland counties; and he also read the details of the dietary which Professor Christison had proposed for the Edinburgh charity workhouse in 1854, supplying oatmeal and buttermilk at breakfast and supper, and meat soup with bread at dinner.

Dr. LANKESTER considered this paper was of great practical importance to the country at large. Wealthy John Bull fed himself well, but he forgot to do so with his paupers and prisoners, while it was of first importance to the nation that they should be well fed. The dietaries that had been reformed in England were the prison dietaries. When he was in Ireland, he pointed out that the prison diet was far too low, the consequence of which was that prisoners came out in a weak state, unable to work, and with nothing to do but steal. In many parts of England the dietaries of the workhouse were infinitely worse than prison dietaries. The strength of pauper children specially ought to be kept up (and he was glad to learn that, in many instances, their food had been increased), so as to enable them to grow up strong, useful, honest men and women. English people generally gave sympathy to a prisoner, but a pauper got none, the wish being that they should be starved out. The whole question lay in the great difficulty the Poor-law Board experienced in moving local boards, and it was a matter for congratulation that the Government had selected Dr. Smith to look after these important national affairs.

ON RESTORATION OF THE TAIL IN PROTOPTERUS ANNECTEUS.

By Professor Traquair.

Two specimens of the protopterus annecteus were described, in which the external configuration and internal structure rendered it evident that a considerable portion of the tail had been broken off, and that in the one case a less, and in the other a greater, amount of restoration had taken place. Anatomists were familiar with the restoration of lost tails in lizards, and in the long-tailed amphibia, also with the renewal of portions of the fins in fishes; but no case of the restoration of the caudal axis in adult fish had been as yet recorded. In the first specimen shown, which measured 8½ inches in length, the body was truncated abruptly 3⅔ inches behind the origin of the ventral fins. This truncated termination of the body was fringed by a delicate membrane projecting half an inch backwards in the middle, and containing a pointed central axis. Professor Traquair gave a detailed account of what he observed in dissecting the fish, and stated that the restored portion of the tail measured one-fifth of an inch in length, and showed not only a reproduction of the notochord, but also of the neural and hæmal arches, spines, and fin-supports, these elements remaining, however, entirely cartilaginous, and being much more irregularly disposed than in the normal tail. Both externally and internally, the line of demarcation between the old and new textures was very distinctly seen.

ON THE MORBID APPEARANCES NOTICED IN THE BRAINS OF THE INSANE.

By Dr. J. Batty Tuke and Professor Rutherford.

Dr. Tuke pointed out the importance of localising brain-function, and that the means to this end at the disposal of the physiologist were nearly exhausted. Comparative anatomy had done its work; and experimentation, although it had done much to demonstrate certain leading facts of importance, had left much which was doubtful, and more that it had not attempted to explain. Moreover, sources of fallacy existed in this method of inquiry from the difficulty which existed of localising artificial injuries, and of reaching deep-seated portions of the brain. Disease, however, injured in a finer and more delicate manner than the knife, and it was held that much might be elicited regarding the functions of the brain by observing the parts of the organs implicated in disease and the perversions of the nervous system which are associated with them. It being generally acknowledged that the intellectual powers are manifested through the grey matter of the cerebrum, and as in insanity these faculties were impaired, exaggerated, or perverted, the authors asserted a belief that, by examining the brains of the insane a hope existed of discovering a road for arriving at a solution of the functional difficulty. The time had passed when the terms mental disease, insanity, or madness, conveyed to the minds of Physicians the idea that the psyche, the mind or its faculties, were the entities which were the subject of disease. By a process of ratiocination rather than of demonstration the pathologist had arrived at the conclusion that abnormal

physical manifestations are dependent upon primary or secondary morbid changes in the nerve tissue; that insanity is a symptom of disease, not a disease itself, and that in the brain the *materies morbi* must be looked for. Six years ago the authors commenced a systematic microscopic examination of the brains of the insane, and with this most important result: that in every single instance a marked departure from healthy structure was observed. The process by which the brain-matter was made fit for the microscope was related, also a list of twelve different parts of that organ which had in a majority of cases been examined. The morbid appearances may be classified under the following heads:—Changes: 1st, in the neuroganglia; 2nd, in the nerve cells; 3rd, in the nerve fibre; 4th, in the bloodvessels; 5th, granulation in surface of cerebral convolutions, etc.; and 6th, amyloid and colloid bodies. After describing the various forms of disease, which were illustrated by diagrams and microscopic sections, the paper concluded with the following statements:—We are not prepared to designate the individual parts of the brain specially affected in different forms of insanity; but we may say generally, that the corpora striata are the portions most frequently found affected, and that the cerebellum is the organ least frequently subject to disease. Further, that the white matter is much more liable to evident structural morbid change than the cortical substance in comparatively recent cases, and that where the intellect has been in abeyance for prolonged periods, the structure of the grey matter of the cerebral convolutions is difficult of demonstration; the layers are found indistinct, as the cells are few in number, and generally small in size. We do not wish it to be thought that we have found in cases of insanity any changes in the cerebrum which may not be found in other parts of the central nervous system in diseases not involving the intellect. The seat of these morbid conditions is the great point to be considered in the different cases; and in this direction we propose immediately to direct our attention by analysing the series of microscopic sections at our command, and by carefully comparing the physical signs observed during life with pathological conditions. The great conclusion to which our researches have as yet led us is, that in the fifty-three cases of chronic insanity which we have examined, we have found distinct structural changes in the brain of each. This in itself is a fact having a most important bearing on the physiology of the brain, and one which, if followed up, may be reasonably expected to dissipate much of the mystery which hangs over the functions of its various parts. Our object in bringing this paper before the Association is the hope of enlisting others in an inquiry which is so vast that we feel a host of investigators will be needed to prosecute it.

Professor SANDERS spoke most favourably of the proposed system of inquiry, and alluded to the preliminary researches of Drs. J. Batty Tuke and Rutherford in complimentary terms.

Dr. PYE-SMITH suggested the importance of a parallel series of investigations on nervous diseases not complicated with insanity.

The President, Dr. ALLEN THOMSON, said that the paper was one of the most important and interesting which had been laid before the section; it coincided with the views he had all along theoretically maintained.

BRITISH MEDICAL ASSOCIATION.

VISIT TO PLYMOUTH.

FIRST PART—TUESDAY AND WEDNESDAY.

(From our Special Correspondent.)

August, 1871.

THE sun is shining as it has not shone for the past six months, and Plymouth (it being understood that Devonport and Stonehouse are included in the comprehensive term) is looking its brightest and best. If, therefore, the members of the British Medical Association do not enjoy all the pleasures of the neighbourhood, both in and out of town, it will not be the fault of the weather.

All arrangements for the comfort of the visitors appear to be most complete, and the local secretary, Dr. Littleton, has been indefatigable in his endeavours to render smooth all rugged places, and to place every facility for the enjoyment of science and scenery in their way.

A reception-room is provided at the Eye Infirmary, which is quite contiguous to the railway station, where names and addresses of members are at once put down, a ticket of admission to meetings and sections, together with a neatly compiled and compact programme, containing an excellent map of "the three towns," is placed in the hands of each visitor, and where all required information can be obtained from the attendants. On Tuesday afternoon I visited the annual museum; but finding the room still in some disorder, and most of the cases still unpacked, a notice of its contents must be postponed for the present.

After dinner there was a general move to the Assembly Room at the Royal Hotel, Plymouth, where the first general meeting was held. Here between 200 and 300 persons were assembled; amongst whom were the Earl of Mount Edgcombe, the Mayors of Plymouth and Devonport, and many members of the Plymouth Town Council.

The first business was the presentation of an address from the Corporation of Plymouth, in which the members of the Association were cordially welcomed, and the best wishes of the Mayor and Town Council were given for the success of the meeting.

Dr. CHARLTON briefly and forcibly replied to the address, remarking that this was the first occasion on which such an honour had been paid to the Association by any town which had been visited by it; for while at Newcastle the Corporation had welcomed the Association to that town, no address had been presented. He lamented the fact that the past year had been one rather of stagnation than of progress in regard to Medical reform, but rejoiced somewhat in believing that the delay had produced the conclusion, that no measure of Medical reform would be satisfactory which did not embrace full representation of the whole Profession in the Medical Council. He then introduced Mr. Whipple, the President-elect, eulogistic terms.

Mr. WHIPPLE, who was but indistinctly heard, owing to the deficient acoustic properties of the room, remarked that, from the difficulty of choosing one out of so many branches of science which presented themselves to the mind's eye, he had decided on avoiding science, and on taking Plymouth as the subject of his address, considering that, if he adopted such a course, the minds of those who had hard work to perform in the various sections would proceed thereto with greater vigour if they were not impaired by any homœopathic treatment of his own. He then gave a rapid yet comprehensive sketch of the history of Plymouth, and called attention to the fact, as a matter of Medical interest, that the pavilion system of constructing Hospitals took its origin from the Naval Hospital at Stonehouse, which was built more than one hundred years ago. Mr. Whipple concluded by saying that Plymouth would doubtless derive lasting benefit from the visit of the Association, and by welcoming most heartily all who were present.

Dr. SIBSON proposed a vote of thanks to Dr. Charlton, the late President. The motion was seconded by Dr. RADCLIFFE HALL, and carried with acclamation.

Dr. CHARLTON, in returning thanks, said he hoped ere long to see carried a substantial and valuable measure of Medical reform.

The Hastings Medal was then presented to Dr. Fothergill, of Leeds, by the PRESIDENT, who spoke in choice terms of the services rendered by the recipient to Medical science; and Dr. Fothergill responded in a suitable manner.

Mr. WATKIN WILLIAMS read the report of the Council, which stated that the number of members had increased by 202 during the past year. The Council regretted the want of activity in the matter of legislation, but hoped a measure of Medical reform would become law next session. The efficient management of the branches was praised, thanks being given to the officers, and it was mentioned that a new branch had been opened in South Wales. Referring to the *Journal*, the Council stated that an inquiry by a committee had been instituted, which had arrived at the conclusion that there were grave defects in the organisation of the Association. They recommended that the general secretary should reside in London, and give personal attention to, and be responsible for, the finance and management of the *Journal* office. A deficit was shown in the accounts, but that would be wiped off in the present year. The Council regretted the withdrawal of the "five members of Council," but hoped they would yet return. As there had been only one essay forwarded for the Hastings Medal, the adjudicators recommended that it should be withheld.

Mr. HUSBAND, President of the Council, moved the adoption

of the report in a long and very impressive speech, and Mr. HECKSTALL SMITH seconded the motion.

Dr. J. G. DAVY attacked the Council and its report very vigorously, and suggested a modification of it.

Dr. SIBSON and Mr. CLAYTON defended the Council.

Mr. GAMGEE would vote for the rejection of the report, for he considered that there was sufficient work for a Professional secretary, as well as for a business manager in London.

The motion for the adoption of the report was then put, and carried by a large majority, only five voting against it.

The meeting, which was on the whole rather stormy, considerable warmth being manifested by several of the speakers, was adjourned at eleven o'clock.

On Wednesday morning a public breakfast was held at the Royal Hotel, Devonport, after which some of the party visited the Dockyard and the large iron-clads in the harbour, while others inspected the Royal Albert Hospital, until the time arrived for the meeting at the Devonport Town-hall. Notwithstanding the extreme heat, at eleven o'clock the spacious and well-appointed hall was well filled.

The proceedings were commenced by the Mayor, Mr. MAY, giving a few words of welcome to the Association, after which

Mr. WOOLLCOMBE, the Town Clerk, read a congratulatory address from the Corporation of Devonport.

Mr. WHIPPLE responded in suitable terms.

Dr. CHADWICK, of Leeds, proposed that the next meeting should be held at Birmingham, and that Mr. Alfred Baker be the President-elect.

Dr. HOUGHTON seconded the motion in an eloquent speech, and it was carried unanimously; after which Mr. BAKER accepted the office.

Mr. HUSBAND then stated that the wish of the Council was, that Mr. Watkin Williams should continue as secretary until the end of the year, the sum of £200 being presented to him, instead of the usual salary, for that period; he therefore proposed a resolution to that effect, accompanying it with a vote of thanks to Mr. Williams, for his unwearied labours in conducting the affairs of the Association.

Dr. FALCONER, of Bath, seconded the motion, and after a few remarks from Mr. Gamgee and Dr. Stewart it was unanimously carried.

Dr. GEORGE JOHNSON then delivered the Address in Medicine. The subject which he chose was "Nature and Art in the Cure of Disease." He adduced arguments drawn from pathological changes in support of the doctrine that such processes are frequently curative. With regard to the province of art, he enlarged on the value of eliminative treatment.

After the address, the meeting adjourned.

THE

MEDICO-LEGAL ASPECT OF INSANITY.

THE NATURE OF THE CAPACITY REQUIRED BY LAW FOR MAKING A WILL, AND FOR ENTERING INTO OTHER CIVIL CONTRACTS.

As it not unfrequently happens that Medical men, like clergymen, are suddenly called upon not only to attest but even to draw up the will of a patient whose state will not admit of delay, and as Medical men frequently are required to depose to the state of mind of a deceased patient, the validity of whose will is disputed, it may be useful to inquire what state of mind is deemed by law to incapacitate a person from thus disposing of his property.

It is of course superfluous to say that idiots, lunatics, and persons of unsound mind are incapable, both by common and by statute law, of making wills. The single exception to this rule is that of a lunatic during a lucid interval. But yet a person may be incapable (because incompetent) of making a will, though neither an idiot, lunatic, nor, in the words of the statute of wills (34 and 35 Hen. VIII., c. 5, s. 14), *de non sane memory*, in the ordinary acceptance of that phrase. The law requires a competency of mind for this purpose, and "that competency," said Sir John Nicholl in a case reported in 2 Haggard's Ecclesiastical Reports, p. 122, "must be judged of from a consideration of all the circumstances of the case." Sir E. Coke says: "It is not sufficient that the testator have a memory, when he makes his will, to answer familiar and usual questions, but he ought to have a disposing memory so that he is able to make a disposition of his lands with understanding and reason; and that is such a memory as the law calls sane

and perfect." And in Combe's case (Moore's Rep., p. 759), all the judges decided that "the sane memory for the making a will is not at all times when the party can answer to anything with sense, but he ought to have judgment to discern and to be of perfect memory, otherwise the will is void."

The question, in fact, in these cases is whether the testator was of sound disposing mind when he made his will, having such a degree of recollection about him as would enable him to know what his property was, and who those persons were who then were the objects of his bounty (Greenwood v. Greenwood, 3 Court App.); and, as Sir J. Nicholl said in the case before mentioned, "this must be judged of from a consideration of all the circumstances of the case." A further case has decided that "a man might not be insane, and yet not equal to the important act of disposing of his property by will" (Mountain v. Bennett, 1 Cox, pp. 353—357).

But, on the other hand, an idiot is incapable of making a will, even though reasonable and wise in itself, for the presumption of law is against the validity of all and every the legal acts of an idiot, yet if a rational will proceeded from a reputed idiot, it would be strong evidence to prove that he was not an idiot in fact (Swinb. on Wills, by Powell, vol. i. p. 128). Of course the imbecility of old age, known as second childhood, incapacitates, as also drunkenness at the time, or that insanity which is the result of excessive intoxication. Yet a man may be excited by liquor, he may be under the influence of stimulants even prescribed medicinally; but in order to avoid a will made by him under such circumstances, it must be shown that he was so excited, or conducted himself so extravagantly, as to be at that moment legally disqualified from giving effect to his own act (3 Haggard's Eccles., Rep. 608; see also Cory v. Cory, 1 Vesey sen., 19).

It is well known that upon this point of incapacity evidence of the most contradictory kind frequently occurs; but be it observed that a large proportion of such evidence is evidence of mere opinion. In the next place, there is no fixed standard by which each witness forms his opinion of incapacity, and no two witnesses, possibly, having seen the party at precisely the same time. The true criterion by which the capacity of a testator is to be examined, especially where there is such contradictory evidence, can only be drawn from his acts at the time. The evidence, on this point, of his Medical attendant, at the time of the execution of the will, is worth all the mere opinions of witnesses who may have seen the testator at different times and under different circumstances.

It should be borne in mind that a person who signs his name as witness to a will, by this very act, testifies the sanity of the testator. Should such witness attempt afterwards to prove that the testator did not know what he was doing on the occasion, he would, in the language of Lord Mansfield, "instead of finding credit, deserve the pillory." Lord Eldon, however, has not gone so far as totally to exclude such evidence, but has very properly said that it should be received with the utmost caution and most scrupulous jealousy. As, however, no respectable Medical man would be likely so far to forget himself, either in witnessing under such circumstances, or in impeaching his own act afterwards, we need not dwell upon this point, further than to say that such testimony is in practice never relied on unless corroborated.

Of course, where general lunacy has been established, the parties alleging a lucid interval must show that the alleged lunatic was at the time of making his will capable of judging of the act he was performing. But it has been said with much justice by Sir William Wynne in Cartwright v. Cartwright, 1 Phill. Eccles. Rep., pp. 90-121, that "the strongest and best proof that can arise as to a lucid interval is that which arises from the act itself, which is the thing to be first examined; and if it can be proved and established that it is a rational act, rationally done, that is sufficient. Unquestionably," continued the judge, "there must be complete and absolute proof that the party who had framed a wise and rational will did it without any assistance. If the fact be that he has done as rational an act as can be, without any assistance from another person, nothing more is necessary to be proved." The rule of law in the case of lunatics with lucid intervals of course inverts the order of proof and of presumption, the onus of proving the lucid interval resting upon those who desire to take advantage of it; and where the will of such a person is not wholly free from folly or caprice, the difficulty of proving that it was nevertheless made during a lucid interval is of course enhanced. On the other hand, every person is presumed to be of sound mind until the contrary be shown; therefore it is incumbent on the party attempting to defeat a will on the ground of the testator's

insanity, to prove the existence of such disability (Swinburne on Wills, vol. i., p. 119; Evans v. Knight and Moore, 1 Add. 382). But still the question remains, what amount of capacity would be deemed sufficient to establish the testator's competency. In a case decided by the judicial committee of the Privy Council their Lordships were of opinion that in order to constitute a sound disposing mind, a testator must not only be able to understand the nature of his bequest, but also have capacity to comprehend the extent of his property; and that the protection of the law is in no cases more needed than it is in those where the mind has been too much enfeebled to comprehend more objects than one, and more especially when that one object may be so forced upon the attention of the invalid as to shut out all others that might require consideration. Upon the whole, it appears that the capacity for making a will does not rest upon the question of sanity or insanity, but rather upon competency or incompetency. A disposing mind at the time, and a free and unrestrained or uninfluenced power of volition, seem to be the main ingredients—a disposing mind, of course, embracing a power of comprehension of at least more objects than one. A man may be perfectly sane, and yet be deemed incompetent to make a will. It was observed by Sir J. Nicholl in a case before quoted, that "it is a great but not an uncommon error to suppose that, because a person can understand a question put to him, and can give a rational answer to such a question, he is of perfect sound mind, and is capable of making a will for any purpose whatever, whereas the rule of law—and it is the rule of common sense—is far otherwise." The competency of mind "must be judged of by the nature of the act to be done, and from a consideration of all the circumstances of the case." As, however, insanity must be an entire bar to any such power of deliberation and judgment as is implied in the term "a disposing mind," we will briefly refer to the legal definition of insanity which incapacitates in all civil cases. Delusion has been generally laid down as essential to constitute insanity, and the absent or present delusion forms the only test of absent or present insanity. Mere extravagances or eccentricities are not sufficient. Sir John Nicholl said, in the case before quoted, "that no case had ever come under his notice where insanity had been held to be established without any delusion ever having prevailed, nor was he able to understand what is meant by 'a lucid interval' if it did not take place when no symptom of delusion can be called forth at the time. How but by the manifestation of the delusion is the insanity proved to exist at any one time? The disorder may not be permanently and altogether eradicated, it may be liable to return; but if the mind is apparently rational upon all subjects, and no symptoms of delusion can be called forth on any subject, the disorder is for the time absent—there is then an interval. It may often be difficult to prove a lucid interval, because it is difficult to ascertain the total absence of all delusion." But, as we shall presently see, a person during such a lucid interval is deemed perfectly, not partially, sane. Where delusion exists in the mind of a person on one or more particular subjects, it has been termed, through want of a precise definition, partial insanity, and in civil cases this kind of insanity, if existing at the time the act is done, without a lucid interval, invalidates the act. This subject is clearly elucidated in the observations of Lord Lyndhurst, reviewing the judgment of Sir J. Nicholls before mentioned. "The only point of law," said his Lordship, "that has been agitated, has arisen out of an expression made use of by the learned judge in the court below. He speaks of *partial insanity*. . . . But I think the argument founded upon that phrase proceeds upon a misapprehension of what was meant by the learned judge who occasionally used it. All that the learned judge meant to convey was that it was no objection to the imputation of unsoundness, that it manifested itself only or principally with reference to one particular question or one particular person. It was not meant that a person could be partially insane and sane at the same moment of time; to be sane, the mind must be perfectly sound, otherwise it is unsound. All that was meant was that delusion may exist only on one or more particular subjects. In that sense the very same term is used by no less an authority than Lord Hale." (Dew v. Clark, 5 Russ. 166, 168.)

Deeds executed by lunatics during their lucid intervals are valid equally with wills, and a deed executed by a party whilst under confinement in a lunatic asylum has been held good, it being clearly shown to the satisfaction of the Lord Chancellor (Eldon) that it was executed during a lucid interval. Thus not only in the case of wills, but also in the case of deeds, may Medical men be called upon to attest the execution of an instrument by a person up to that time of un-

doubted insanity, and at the moment of execution an inmate of a lunatic asylum, and yet, as in a case reported in 5 Dowling, P.C. 236, betokening at the time the greatest possible lucidity of intellect, doing it under a sense of his situation, and under the impression that no time was to be lost, and to protect himself against a relapse. The responsibility attaching to the position of a Medical attesting witness under such circumstances can scarcely be overrated. It may be here mentioned that the same amount of incapacity which would invalidate a will would likewise invalidate a deed, even though the incapacity involved fell short of that of the strict definition of an idiot.

But under no circumstances can any person who, since June 24, 1742, has been found a lunatic by inquisition, either in Great Britain or Ireland, contract marriage, even during a lucid interval, till the commission has been superseded.

How far mere weakness of mind, if no insane derangement existed in the strict sense, accompanied by clandestinity, inferring fraud and intervention in the other party, might invalidate a marriage, we will not stop here to inquire. Suffice it to say that to marry a *non compos*, the custody of whom has been granted to the Great Seal, is a contempt of the Court of Chancery, for which the offender and all concerned may be committed for the term of their natural lives. We reserve our remarks on the responsibility of persons of unsound mind in criminal cases for a further occasion. W.

REVIEWS.

A Treatise on Gout, Rheumatism, and the Allied Affections. By PETER HOOD, M.D. London: J. and A. Churchill. Pp. 417.

THIS is a work worthy of consideration, not only from the importance and difficulty of the subject, but from the position of the author, inasmuch as it is not the theoretical production of one who desires increased practice, but of one who aims at giving "the matured results of long practical experience." In his preface the author says:—"It may possibly seem to some of my juniors that I now and then use words suggestive of a time at which their studentship had not commenced, and that my phrases step beyond the limits of the now accepted groove." To us such a mode of treating the subject will be far from unwelcome, nor do we think that, in spite of textbooks, our Profession is content to settle down into any universally accepted groove. The key to Dr. Hood's treatment is contained in the fact that he aims at treating the patient rather than the disease—a principle whose soundness we gladly corroborate. But now as to the contents of the book.

Chapter I. is introductory, and deals with the history of the disease. There is not much that is new here, the most important novelty being Stirling's account of the sufferings of the Emperor Charles V. from gout, and the errors of diet committed by the monarch. Anthony White's account of his own malady, and some account of the views of Scudamore, Gairdner, and Garrod.

Chapter II. is descriptive, and in most works this is a chapter we are strongly tempted to cut; for where can we find a description of the disease equal to that by the immortal Sydenham? Nevertheless, we have here some interesting material, not the least being the author's own views on the treatment of disease. He bewails the abandonment of judicious bloodletting, and still more that of catharsis, especially in cases of "local visceral congestion"; and tries to show that the use of stimulants is but another mode of attaining the same end—the depletion unloading the capillaries, the brandy stimulating the action of the heart to overcome capillary congestion—the former being most useful for strong, the latter for weak individuals. The remainder of the chapter is occupied with an account of the complications or terminations of gout in different subjects.

The causes of gout are next discussed, and this is perhaps the most ticklish part of the whole book. The popular theory at the present moment is that gout is entirely dependent on excess of uric acid in the system, and that its inflammatory symptoms are caused by deposits of urate of soda in the ends of bones and the neighbourhood of joints. It is exceedingly difficult to understand why such an exceedingly narrow view of the causation of the disease should have obtained so widely, nor could it, we think, have done so had it not been for the deluding ease with which the existence of the acid could be demonstrated. Neither can we, on the other hand, give in our adherence to the views of Dr. Gairdner, who held that all depended on venous congestion. No doubt

there is venous congestion, especially in the neighbourhood of the inflamed joint; but to acquire a just knowledge of the origin of the disease, we must search into the causation of this, also. In truth, both excess of uric acid as well as venous congestion are of the nature of symptoms rather than of causes. Dr. Hood does not seem inclined to accept any one cause as the cause of gout, except we take the word "cause" in its very widest sense. Thus he says—"I regard gout as being essentially a result of the imperfect elimination of excrementitious matter from the blood, and this imperfect elimination as being due to a variety of causes, among which the chief would be impaired nervous action, congestion of blood due to local causes, and congestion of blood due to imperfect performance of the functions of the heart." Had Dr. Hood stopped short with the enunciation contained in the former part of the sentence, we would have been most heartily with him; but whilst, from our point of view, he excludes some of the most competent factors of the accumulation of what he calls excrementitious matters, he includes others we cannot accept. That, however, gout is due to the circulation of something which may, with slight stretch of the imagination, be called excrementitious, is, in our opinion, certain. Uric acid is one of these, but only one of many; we even question if it is the most important.

The subject of Gouty Inflammation is discussed in Dr. Hood's next chapter, a considerable portion of which is occupied with a discussion of Dr. Bence Jones's views on the subject. Now, Dr. Jones's views on the subject are very well worth attention, but they only include a portion of a great subject. Inflammation is something more than hyper-oxidation; just as it is something more than blood stasis and migration of white corpuscles. Increased local nutrition and proliferation of the protoplasmic masses in the neighbourhood, all have to be considered. Doubtless, all of these are modified in the peculiar inflammation of gout, but it would be difficult to say which is most so. We are certainly inclined to give more importance to what might be called the vital than to the merely chemical part of the process. It is, however, in what relates to the treatment of gout we would expect to learn most from Dr. Hood, who is nothing if not what it is fashionable to call a practical man. It is quite evident that many of his opinions as to the causation of gout are founded on the results of his treatment, in accordance with the old rule that the cure shows the nature of the disease—a rule with which, in many instances, we should be sorry to find fault.

In a first attack of gout with a robust constitution, strong pulse and fever being present, a purgative to open the bowels and stimulate the liver is at once indicated; afterwards, to allay the fever, salines, as citrate of potass or soda, sweet spirit of nitre, with tincture of henbane, may be given. To relieve pain the author recommends morphia or laudanum. Subsequently the bromide or iodide of potassium may be given twice or thrice a day; the bowels should be kept open, and liquid nourishment alone taken. As a local application Dr. Hood strongly recommends whisky. It is quite true that in Scotland, where whisky is chiefly used, gout is rare, but there the habitual practice is to allow it to sink to the sore, the dose being taken internally, and its local use would be considered a waste of the gifts of Providence. As to colchicum, Dr. Hood on the whole pronounces against its use, although its wonderful efficacy in allaying pain cannot be overlooked; in this we quite agree with him.

We should have liked to have followed Dr. Hood through other portions of his valuable and interesting book did space permit, but we have sufficiently indicated its scope, and the best service we can do our readers now is to refer them to its pages, where seekers after truth will in nowise meet with disappointment.

COLONIAL CORRESPONDENCE.

VICTORIA, AUSTRALIA.

MELBOURNE, June 17.

ON June 1 died Dr. David John Thomas, of this city, the senior Practitioner of the colony. Dr. Thomas came to Victoria thirty-three years since, and, with the exception of a six years' visit to Europe—namely, from 1853 to 1859—he had practised continuously in Melbourne. No man was better known in Australia, nor more deservedly respected. He was thoroughly in love with his Profession, and he never ceased to study the art of healing. He died, after six hours' illness, of

apoplexy. At one time Dr. Thomas had by far the largest and most lucrative practice in Australia, and when he went to England in 1853 he was a rich man; but by the time he returned everything had greatly changed, so that his course for some time had been an uphill one. He had, nevertheless, not relaxed in the earnestness and ardour which always characterised him. His failing health necessarily rendered him less able to bear the fatigues of general practice; but, as a consultant, he had for many years been in general request. His operations at the Hospital always attracted a crowd of spectators, and the interest of these occasions was enhanced by the pithy little speeches he almost invariably made in explanation of the cases. He contributed most of the Hospital Reports to be found for some years past in the *Australian Medical Journal*, and he seldom failed to take part in the discussions at the Medical Society. Personally he was much liked; for, though impulsive, excitable, and at times irritable, he was a man of a warm and kindly disposition. At the annual Medical dinner he was ever the cheeriest and merriest of them all, and, though his perception of the humorous now and then showed itself in a practical form, it was always of a kind that even the subjects upon whom he practised could not help but be amused at. He will ever be remembered as one of the pioneers of Medicine in Victoria; but, still better, he will be remembered as a member of the Profession who never failed to uphold its dignity and maintain its privileges.

The subject of fraudulent admission into our public charities has lately a good deal occupied both public and Professional attention. People know so little of each other here, that it is very easy for a person to represent himself as destitute, and not be found out in the imposture. Very recently, a man admitted into the Melbourne Hospital was discovered to be in the possession of several hundreds of pounds, and this case, it is well known, is only one among many. It has long since been proposed that an officer should be appointed, having the duty of examining into all cases of a doubtful character; and, judging from the earnestness with which the subject is being just now investigated, it is possible this remedy will at any rate be tried. What with the indiscriminate admission of Hospital patients, however, the infinite multiplication of friendly societies, and the general disposition of a large section of the public to repudiate their Doctors' bills, it is a little difficult for the Profession to live—saving always, of course, those few fortunate members of it who, from various causes, are able to command the public, and whom the public never think of not paying. The committee of the new Alfred Hospital, with the possibly laudable intention of making some people pay who otherwise would not, have adopted the principle of admitting pay-patients at the rate of £2 a week. One effect of this arrangement, however, will be to take so much out of the pockets of the honorary staff and put it into the coffers of the Hospital. Besides which, it will admit a class of persons who, on the strength of the paltry sum thus contributed, will consider themselves entitled to grumble at everything about them, just as if they were living in an hotel, and paying ten guineas a week, exclusive of Medical attendance. The pay-system has not worked well in other Hospitals in this colony where it has been tried, and it is not likely to work well at the Alfred. The regulation is just now the more inopportune, inasmuch as it rather confirms the general belief that the Alfred does not fill; and this pay-system looks like a surreptitious mode of getting patients from a class that it was never intended to accommodate.

The testimonial lately presented to Professor Halford, in recognition of his labours as the discoverer of what abundant evidence has proved to be an efficacious remedy for snake-poisoning, has excited the anger of the small virulent section of the Profession who neither work nor discover, but who consistently malign and disparage those who do. I think I mentioned in my last that three of the daily newspapers in this city have homœopathic leanings, one of them being edited by a man who holds a homœopathic qualification which the Medical Board very properly will not recognise. Another ranks among its leader-writers, a rabid homœopath, and he has lately lent himself most discreditably to the task of throwing doubt upon Professor Halford's discoveries by misquoting from Jahr's *Materia Medica*, so as to make it appear as if Jahr had suggested the injection of liquor ammonia as a remedy for snake-poisoning. The *Australian* very properly exposed this literary fraud, and the *Australian Medical Journal* has republished the paragraph with comments.

I suppose the antagonisms existing in the Profession here are not more active than exist in other parts of the world; but if there is any difference in the activity it is in favour of us here

—unquestionably it is, so far as quantity is concerned. Nothing certainly can be bitterer than the virulence with which the hostility towards Professor Halford is kept up, and, so far as I can see, for no reason at all beyond the reason for which Dr. Fell was similarly hated. Professor Halford's friends, however, far outnumber his enemies; and, as he continues to work, no matter how hard these curs may bark, the conclusion to which one may fairly come is, that they will tire of barking before he tires of working.

I am happy to say that the two cases upon which ovariectomy was performed at the Lying-in Hospital by Dr. Tracy and Dr. Martin, and which at first seemed so unpromising, have both done well, and are now convalescent.

PROVINCIAL CORRESPONDENCE.

BIRMINGHAM.

AUGUST 7.

THE guardians of the poor of this parish have at last resolved to give the Dispensary system a fair trial. In September, the out-door poor, instead of attending at the surgeries of the District Medical Officers, will be seen at the parish buildings, where the necessary alterations are being made for their reception. Two of the Medical officers will attend daily, and see all the cases which present themselves. This new arrangement has given great satisfaction, and will, no doubt, be found to work beneficially. Such an important step as this has not, however, been taken without having met with considerable opposition. The guardians have had to be educated ere they could take into their mental grasp all the important and essential details which it possesses; and this instruction has been much advanced by the impetus given by the voice of the Poor-law Board and public opinion. One of their own number—much to his credit be it said—has done most useful service in this undertaking. He is a member of our own Profession, too, and it is to his indefatigable exertions that practical effect has been given to the Dispensary question. Although he has been opposed, and even abused, time after time, he has with praiseworthy pluck and persistency stuck to his text, and carried out his plans. This is a victory for him which must afford him much satisfaction. I am only sorry to add that it will be the only reward he is likely to obtain.

Small-pox is not prevalent in Birmingham. There have been a few isolated cases of the discrete variety which have done well, and there are no signs of this disease assuming an epidemic character. The town for the time of year is peculiarly healthy. Diarrhœa, which usually prevails extensively at this season, is not at all prevalent. The Women's Hospital has secured the confidence and support of the public, and is in a fair way of becoming one of the most thriving and popular institutions in the town. Its Medical staff is complete, and consists of some of the best young talent in the provinces. How far this new institution will interfere with the welfare of the midwifery department of the Queen's Hospital is a question possessing many points of interest, which I will leave others to discuss. Since a special ward has been set apart in the Queen's Hospital for the treatment of the special diseases of women, many operations of an important nature have been performed by the able Surgeon-Accoucheur of the department, and have been attended with marked success. As an illustration of the influence of the Medical Profession in public matters and works of charity, I may mention as an instance the Idiot Asylum at Knowle. This institution owes its existence to our distinguished Physician, Dr. Bell Fletcher, who is always foremost in good works; and it has, under his judicious care, attained a high position. Last week a musical festival was held at Solihull for the benefit of it, which was a success financially.

The working-men's fund for the enlargement of the Queen's Hospital represents the respectable sum of upwards of £5000—the working-men themselves having contributed nearly £4000 towards this amount. Another appeal has been made to those who have not yet subscribed, and it is hoped and expected that the money required for the contemplated additions to this excellent charity will soon be amassed. The Queen's Hospital, then, with its new attractions, will stand second to none in the provinces as a Hospital and a clinical school.

A sad case of death by misadventure has just occurred here. An assistant to a Medical man sent to a patient an embrocation containing aconitè instead of a draught, which quickly caused

death. An inquest has been held, and adjourned for the purpose of having the stomach of the deceased analysed. Whether or not there be any gross negligence on the part of the accused, I will not presume to say until after the completion of the investigation. But such a fatal mishap is pregnant with fearful instruction, and, occurring in the practice of any one, must necessarily be attended with consequences highly detrimental to his interests and reputation.

I am pleased to record the fact that Dr. Wade has been made a Fellow of the Royal College of Physicians, on the nomination of the Council, and that Drs. Jolly and Thomas have been added to the Professorial staff of the Queen's College, which, from their ability as teachers, must be benefited by the connexion. Our local papers are full of the miserable pittance which was doled out to Mr. Oliver Pemberton by the Carlisle jury last week. He, being called upon to give evidence in Murphy's case, received the paltry fee of £1 1s., with second-class railway fare, to compensate him for absence from his extensive practice two days. Most properly, he has complained of such totally inadequate remuneration, and, from the attention of Parliament having been directed to the case, it is hoped and expected that in future Medical witnesses will receive fair and equitable remuneration.

GENERAL CORRESPONDENCE.

"QUICK WITH CHILD."

LETTER FROM MR. WEIGHTMAN.

[To the Editor of the Medical Times and Gazette.]

SIR,—As Dr. Bree has addressed "one word" on this subject to me, personally and by name, I have no alternative but to ask permission of you to return the compliment. Dr. Bree says—"A child in utero is alive from the first day of conception." I would rather express it, "from the very moment of conception." But Dr. Bree does not say how soon after conception a child in utero may die. The remark of which he complains—"for barely *with child*, unless it be *alive* in the womb, is not sufficient"—is not my remark, although the Doctor attributes it to me, but it is that of the once eminent Judge, Sir William Blackstone, as by a more attentive perusal of my former letter would at once appear. But how that remark "displays the truly horrid state of the law" I confess I cannot discover.

The first object of the law is to ascertain whether the woman's plea that she is with child, is true. This, as Dr. Bree truly says, "is often a most difficult thing to discover, and eminent and experienced men are sometimes deceived." The next step is to ascertain, if possible, whether, if with child, the child is alive or dead. The terms "the quick and the dead," are familiar to all. There is no mystery about them. The one is the antithesis of the other. Dr. Bree will admit that a woman may be with child, and yet be carrying in her womb a dead, nay, a putrid child; and if such were the case, it would not be sufficient to stay execution. This is all that is meant by Judge Blackstone's words, before quoted. There is no "quibble about the period of quickening" in the legal mind. That period is universally acknowledged to be at conception; but to say, as Dr. Bree asserts, that, "previous to quickening the woman contains within her womb a human living being," is a contradiction in terms. The fact of the child being felt by the woman to move, is not the "quickening" itself, but simply the best evidence that the child is at that time alive, or "quick"—in other words, that it has not ceased to exist since conception. But the embryo foetus may be alive, but not have acquired as yet the power of motion. Doubtless a "living child is always alive in utero." This is a self-evident truism; but there may be a dead child in utero. The "quick with child" notion, as attributed by Dr. Bree to the lawyers, though of "barbarous ages," never existed except in Dr. Bree's imagination, and certainly it is not to be found in any of our "statutes," and consequently cannot "disgrace" them. The very reverse of Dr. Bree's suggestive "quibble," that "a child may not be quick on Tuesday, but it may on the Wednesday," is the only common-sense view—viz., that a child may be quick or alive on the Tuesday, but not quick or alive on the Wednesday. It is very easy to denounce the law as disgraceful—to talk about the murder of innocents—to indulge in strong adjectives—to sneer at Judge Blackstone—to speak of "matrons or discreet women" as "old gossiping women," "a dozen old women"—and to try to mystify the simple word "quick" by

attributing to it a meaning which was never yet attached to it by any but the vulgar; but the real desideratum is how to improve the legal process of discovering the proof of the woman's plea that she is *enccinte*. Possibly the process might be simplified by allowing the proof of being with child to be sufficient, without requiring further evidence of the child being alive in the womb, but taking the chance of it's being then alive. But even in this investigation Dr. Bree would dispense with the services of the "dozen old women." Yet what tribunal would he substitute for them? Would the opinion of any one Medical man be satisfactory in what "is often a most difficult thing to discover"? If not, would a jury of twelve Medical men improve matters? Judging from the differences of opinion among Medical witnesses, might we not reasonably fear "Quot homines, tot sententiæ," to say nothing of the difficulty of empannelling upon a sudden emergency twelve Medical men? A jury of any other men, on such a delicate matter, would be quite out of the question. The woman at the bar is entitled by inalienable right to a jury of twelve persons, male or female, to decide the point. What, then, remains but a jury of her own sex, deferring, as in practice they do in all matters of science, to the opinion of the Medical man appointed to assist them, but, at the same time, not wholly ignoring their own physical experience on a subject of special interest to their sex, and of which, under Medical guidance, they may surely be supposed not utterly incompetent to express an opinion; always remembering that the prisoner in this, as in the determination of every other fact, is entitled to the benefit of a doubt: and that maxim, in the absence of most conclusive evidence to the contrary, will always result in a verdict respiting execution of the sentence.

The query—Why do not the half-dozen medical men in Parliament "have the law amended"?—as if, indeed, the whole country were under a Medical dictatorship—I dismiss, with an apology for having already occupied so much of your valuable space; but misunderstandings between the two professions had far better be ventilated than secretly cherished.

I am, &c.,

Temple, August 7.

HUGH WEIGHTMAN.

OBITUARY.

ROBERT SHIPMAN, F.R.C.S., ETC.,

DIED on July 25, at Grantham, where for more than thirty years he enjoyed the esteem and confidence of a large and influential circle of friends. In his public capacity as alderman, mayor, and magistrate, his unvarying uprightness of character, and uniformly straightforward, kind, and gentlemanly bearing commanded the respect of all. The poor always received from him the greatest kindness and consideration. Amongst his Professional brethren he was ever known as most courteous and strictly honourable. His death will long be deplored by all; especially by those who have either benefited by his undoubted skill or enjoyed the pleasure of his friendship.

BRANLEY WHITTLE, M.R.C.S., L.S.A.,

Was born at Croydon in 1809, and was apprenticed to Mr. Dix, at Long Buckby, in Northamptonshire. He was a student at Guy's Hospital, and spent some time at the Paris Hospital. He practised for upwards of thirty years in Norfolk-street, Strand, as a General Practitioner. In 1864 he partly retired from practice, residing in Longton, in Dorsetshire, and in 1867 he removed to Sidbury, in East Devon, where he died of heart disease, aged 62 years.

MEDICAL NEWS.

UNIVERSITY OF ABERDEEN.—During the past year, the following candidates, after the usual examinations, received Degrees in Medicine and Surgery:—

The Degree of M.D.

Dutt, Russick Laul, M.R.C.S.E., L.S.A., Calcutta.
Ghose, Kristo Dhan, M.R.C.S.E., L.M.S.C., Calcutta.
Matthews, Josiah Wright, L.F.P. & S. Glasg., and L.S.A. Lond., Port Natal.

At the same time, the following gentlemen received promotion to the Degree of M.D.:—

Arbuckle, Hugh Wight, M.B., Thorne, Doncaster.
Brown, Charles Robert, M.B., C.M., Beekenhams, Kent.
Coleman, Matthew Owen, M.R.C.S., M.B., Surbiton, Surrey.
Coutts, James Allen, M.B., C.M., Banchory-Ternan.
Crowther, Edward Lodewyk, M.B., C.M., Alford, Lincolnshire.
Cullen, James, M.B., C.M., Chumparun, Bengal.
Dyer, Thomas Birch, M.B., C.M., Bethlem Royal Hospital, London.

Hocken, Charles Edward, M.B., Wood-green, Middlesex.
Keith, Joseph Forbes, M.B., C.M., Aberdeen.
Nicol, Patrick, M.B., C.M., Bradford.
Simpson, George Alexander, M.B., C.M., London.
Wood, Alexander, M.B., C.M., Edwardesabad, Bengal.
Woodford, Edward Russell, M.B., C.M., Ventnor, Isle of Wight.
The Degree of M.B.

Benham, William Thomas, Bristol.
Bovill, Edward, M.R.C.S. Eng., London.
Brotchie, Theodore Rainy, Aberdeen.
Carless, Edward Nicolls, Devizes.
Carmichael, Archibald, M.A., Maryculter.
Chiappini, Peter Alexander, Cape of Good Hope.
Cobban, Alexander Richard, Whitfield, Berkeley.
Creighton, Charles, M.A., Peterhead.
Crombie, Charles Mann, Aberdeen.
Davidson, Charles, Aberdeen.
Davidson, George Farquhar, Aberdeen.
Edwards, William Henry, M.R.C.S.E. (St. Bartholomew's), Antigua.
Edwardes, Lewis, M.R.C.S. Eng., Wimbledon.
Fasken, William Andrew Durnford, M.R.C.S. Eng., London.
Goodhart, James Frederic, L.R.C.P. Lond., M.R.C.S. (Guy's), Brighton.
Gordon, John, Gray's Hospital, Elgin.
Hay, Frederick, Hull.
Jotham, George William, Kidderminster.
Knaggs, Samuel Thomas, L.K. & Q.C.P.I., L.R.C.S.I., Newcastle, New South Wales.
Lawrence, Nathaniel, Longside.
Lowson, David, Aberdeen.
M'Culman, Hugh, Caithness.
Maclean, John Cassilis Birkmyre, M.A., Kiltarn, Ross-shire.
Marshall, Lewis Walter, M.R.C.S. Eng., Bristol.
Milne, Thomas, M.A., Ellon.
Raitt, Thomas, Aberdeen.
Shepherd, James, M.A., Aberdeen.
Simpson, James, Aberdeen.
Waldo, Henry, Clifton.
Walsham, William Johnston, L.S.A. Lond. (St. Bartholomew's), London.
Wharry, Charles John, M.R.C.S. Eng., L.S.A. Lond., Woolwich.
Williams, Alfred Henry, London.
Wilson, Alexander, M.A., Rayne.

The Degree of C.M.

Benham, Wm. Thomas.	Knaggs, Samuel Thomas.
Bovill, Edward.	Lawrence, Nathaniel.
Brotchie, Theodore Rainy.	Lowson, David.
Carless, Edward N.	Maclean, John Cassilis Birkmyre.
Carmichael, Archibald.	M'Culman, Hugh.
Chiappini, Peter Alexander.	Marshall, Lewis Walter.
Cobban, Alexander Richard.	Matthews, Josiah W.
Creighton, Charles.	Milne, Thomas.
Crombie, Charles Mann.	Raitt, Thomas.
Davidson, Charles.	Shepherd, James.
Davidson, George Farquhar.	Simpson, James.
Edwards, William Henry.	Waldo, Henry.
Fraser, George Innes.	Walsham, William Johnston.
Goodhart, James Frederic.	Wharry, Charles John.
Gordon, John.	Williams, Alfred Henry.
Hay, Frederick.	Wilson, Alexander.
Jotham, George William.	

Of the above-mentioned Candidates, Archibald Carmichael, James Frederic Goodhart, David Lowson, William Johnston Walsham, and Alexander Wilson received their Degrees in Medicine and Surgery, with *Highest Academical Honours*; Russick Laul Dutt, Kristo Dhan Ghose, Samuel Thomas Knaggs their Degrees in Medicine, with *Academical Honours*; and John Cassilis Birkmyre Maclean, Lewis Walter Marshall, and Thomas Milne their Degrees in Surgery, with *Academical Honours*.

The Theses of James Frederic Goodhart on "Artificial Tubercular Tuberculosis and its relation to Cellular Pathology, and the growth of Tumours;" of Samuel Thomas Knaggs on "The Sagacity of Nature's plan as exhibited in the arrangement of the Tendons of the Digits of Vertebrate Animals;" and of William Johnston Walsham on "The Thermometer as an aid to the Diagnosis and Prognosis of Disease," were considered deserving of high commendation.

At the same time Louis Richard Connor was certified as having passed all the Examinations, and is entitled to receive Degrees on his attaining the necessary age; and, at the late Graduation Term, the following were declared to have passed part of their Examinations:—

Burrell, Alexander.	Lawrence, Alfred E. A.
Butler, Anthony.	Lawson, William.
Campbell, William.	Lechler, Henry Martin.
Connon, Charles James.	Low, David.
Elliot, Frederick William.	Maedonald, John Davidson.
Farquharson, Patrick D.	M'Kenzie, Murdoch.
Fehrsen, James M'Call.	Mitchell, Andrew.
Ferguson, John Edward.	Moir, Forbes Fraser M.
Forsyth, Alexander.	Newcombe, Charles Frederic.
Garden, Robert John.	Reid, James.
Garner, John Edward.	Rigby-Hughes, John.
Gibbes, Cuthbert C.	Robertson, George James.
Godson, Clement.	Sinclair, William Japp.
Gosse, Charles.	Smith, George Washington.
Gray, Robert Aikman.	Stephen, James.
Greig, Charles Cormack.	Swaine, Frederick Robert.
Hoolc, Pemberton Abel.	Williamson, William H.
Inglis, James.	Wright, Francis James.
Law, James.	

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—At an extraordinary meeting of the College, on Monday, the 7th inst., the following Members were admitted Fellows:—

Child, Gilbert William, M.D., Oxford.
 Copeman, Edward, M.D., Upper King-street, Norwich.
 Drake, Augustus, M.B., Southernhay, Exeter.
 Fox, Tilbury, M.D., 43, Sackville-street.
 Hensley, Philip John, M.D., 4, Henrietta-street, Cavendish-square.
 Hitchman, John, M.D., Mickleover, near Derby.
 Leared, Arthur, M.D., 12, Old Burlington-street.
 Stevenson, Thomas, M.D., Guy's Hospital.
 Williams, Charles Theodore, M.D. Oxon., 78, Park-street, Grosvenor-square.

And the following gentleman was admitted a Licentiate of the College:—

Noad, Henry Carden, St. George's Hospital.

APOTHECARIES' HALL.—The following gentlemen passed their Examination in the Science and Practice of Medicine, and received Certificates to practise, on Thursday, August 3, 1871:—

Barrow, Frank Edward, Woolwich.
 Barrow, Henry John Waller, Woolwich.
 Benham, William Thomas, Royal Infirmary, Bristol.
 Bland, George, Dalston.
 Henson, Walter Knowsley, Hull.
 Wade, Reginald, Cross, Somerset.

The following gentlemen also on the same day passed their first Professional examination:—

Fairbank, William, St. Bartholomew's Hospital.
 Floyer, B. Bernard, Middlesex Hospital.
 Hall, Frank Algernon, St. Bartholomew's Hospital.
 Harvey, William, St. Bartholomew's Hospital.
 Powell, Joshua, University College.
 Thompson, Francis Henry, St. Thomas's Hospital.
 Triggs, John B. B., University College.
 Welchman, Edward, St. Thomas's Hospital.
 Vincs, Edward Prince, King's College.

APPOINTMENTS.

* * * The Editor will thank gentlemen to forward to the Publishing-office, as early as possible, information as to any new Appointments that take place.

ALLEN, MARCUS, M.R.C.S., L.R.C.P., L.M.—Resident Accoucheur at St. Bartholomew's Hospital.
 BARFF, Mr., M.A. Christ's College, Cambridge—Professor of Chemistry to the Royal Academy.
 BURMAN, J. WILKIE, M.D. Edin., late Assistant Medical Officer, Devon County Lunatic Asylum, Exminster—Assistant Medical Officer to the West Riding Lunatic Asylum, Wakefield.
 DRINKWATER, WILLIAM, L.R.C.P. Edin., M.R.C.S. Eng.—Medical Officer and Public Vaccinator to the Workhouse and Bicester District of the Bicester Union.
 EVANS, G. H., M.A., M.D., Fellow of King's College, Cambridge.—Resident Assistant-Physician at St. Thomas's Hospital.
 HAYWARD, W. H., M.R.C.S.E., L.S.A., etc.—Medical Officer to the Oldbury Board of Health.
 MAGRATH, JOHN, L.S.A. Lond.—Assistant Resident Medical Officer to the Leeds Public Dispensary, *vice* Edmond West Symes, M.B. Edin., appointed Senior Resident Medical Officer.
 MATHEWS, GEORGE C., L.R.C.S.I., L.R.C.P. Edin., and L.M. Edin.—Medical Officer to the Moate Dispensary District of the Athlone Union.
 O'FARRELL, G. PLUNKETT, M.B., B.A., M.R.C.S., etc.—House-Surgeon to St. Peter's Hospital, Berners-street, W., *vice* S. G. Sloman, jun., L.R.C.P., M.R.C.S., resigned.
 ROBERTS, DE. FREDERICK—Assistant-Physician to the Hospital for Consumption, Brompton.
 SLOAN, WILLIAM, M.D., L.F.P.S. Glasg.—To the Division of the Blair Iron Works rendered vacant by the death of Dr. Hamilton.
 THOMPSON, GEORGE, L.R.C.P. Lond., M.R.C.S.E.—Medical Superintendent of the Bristol Borough Lunatic Asylum.
 THOROWGOOD, JOHN C., M.D. Lond.—Junior Physician to the West London Hospital at Hammersmith.
 YOUNG, WALTER W., M.B. Edin., C.M., etc.—Medical Officer to the Aldershot District of the Farnham Union, comprising the parishes of Ash and Aldershot.

NAVAL AND MILITARY APPOINTMENTS.

ADMIRALTY, August 2.—The undermentioned Assistant-Surgeons have been promoted to the rank of Surgeon in her Majesty's Fleet, with seniority of this date:—William Yarde, M.D.; Charles John Fennell; Edward Jones Butler, M.D.; Matthew Coates; William Pattullo, M.D.; Thomas Alexander O'Flaherty, M.D. Also, Mr. George Bruce Newton has been promoted to the rank of Staff Surgeon in her Majesty's Fleet; Mr. Newton has been specially promoted for services in the suppression of small-pox, etc., in Japan.
BREVET.—Inspector-General of Hospitals Archibald Gordon, M.D., C.B., on half-pay, to be Honorary Surgeon to her Majesty, *vice* Thomas Mostyn, deceased.
ROYAL ARTILLERY.—Assistant-Surgeon George Traynor, from 46th Foot, to be Assistant-Surgeon, *vice* Henry Harrison, who exchanges.
4TH FOOT.—Assistant-Surgeon Henry Harrison, from Royal Artillery, to be Assistant-Surgeon, *vice* George Traynor, who exchanges.

BIRTHS.

BUCHANAN.—On August 4, at Staines, Middlesex, the wife of John Hamilton Buchanan, M.D., of a son.
 EASTWOOD.—On August 2, at Dinsdale-park Retreat, Darlington, the wife of J. W. Eastwood, M.D., M.R.C.P.L., of a daughter.
 HUMBLE.—On June 4, at Patagones, South America, the wife of the Rev. George A. Humble, M.D., M.R.C.P., of a son.
 MILLAR.—On August 5, at 48, Albany-street, Edinburgh, the wife of John Millar, M.D., F.R.C.P.E., of a son.
 PEARSON.—On August 2, at 23, Upper Phillimore-place, Kensington, the wife of David R. Pearson, M.D., of a son.
 RIDDELL.—On August 4, at St. Mary's-terrace, Maida-hill, the wife of G. Dalziel Riddell, Surgeon Madras Army, of a son.
 WOODMAN.—On August 2, at Chichester-place, Southernhay, Exeter, Devonshire, the wife of John Woodman, F.R.C.S., of a son.

MARRIAGES.

GAUVREAU-CATTLEY.—On July 15, at Portland, Maine, U.S., Elizear Gauvreau, M.D., of Redwood, California, to Caroline Cattley, *relict* of Henry B. Cattley, Esq., of Doctor's-commons, second daughter of the Hon. W. Swabe, of 26, Kensington-garden-terrace, Hyde-park, W.
 HOGG-WILLIAMS.—On August 2, at St. Simon's Church, Chelsea, Dr. James Hogg, Dronfield, to Mary Elizabeth, eldest daughter of Samuel Williams, Esq., London.
 LOWRY-TUCKER.—On August 5, at Otford, Thomas Harvey Lowry, M.D., to Jane Frend, daughter of the late Captain William Tucker, R.N.
 MILLER-FORDYCE.—On August 2, at Brucklay Castle, Aberdeenshire, by the Rev. Archibald Gardiner, M.A., Alexander Gordon Miller, M.D., F.R.C.S.E., Edinburgh, to Jessie, third daughter of the late Captain Alexander Dingwall Fordyce, R.N., of Brucklay and Culsh.
 PALMER-TYLER.—On August 2, at All Saints, Loughborough, William Grimes Palmer, M.R.C.S.E., eldest son of William Grimes Palmer, M.R.C.S.E., to Eliza, niece and adopted daughter of John Tyler, Esq., of Thorpe Villa, Loughborough.
 PERRY-BLAKE.—On August 3, at Christ Church, Highbury, by the Rev. Gordon Calthrop, M.A., Vicar of St. Augustine's, George Perry, Esq., son of the late George Michael Perry, M.R.C.S., to Catherine, second daughter of G. J. Blake, Esq., of Aberdeen-park, Highbury.
 POOLE-BRIDGE.—On August 9, at St. John the Evangelist's, Westminster, Hubert John, youngest son of Henry Poole, Esq., the Old Rectory, Smith-square, Westminster, to Edith Sarah, second daughter of Alexander Bridge, M.D., Argyle-place, Regent-street.
 RICHARDS-SOUTHEY.—On July 29, at St. James's Church, Piccadilly, G. Pickering Richards, L.R.C.P. Edin., L.S.A. Lond., L.M., to Mary Ann Southey, only daughter of the late William Southey, Esq., of 5, Bury-street, St. James's.

SHEA-SCHROETER.—On August 8, at St. John's Church, Eltham, Kent, Charles Edward, third son of John Shea, M.D., F.R.G.S., to Margaret Martha, fourth daughter of Frederick A. Schroeter, Esq., of Nottingham, Kent.

DEATHS.

ANDERTON, HENRY, L.R.C.P., F.R.C.S., at his residence, Newferry-park, near Birkenhead, formerly of Woolton, Lancashire, on August 1, in his 82nd year.
 ASPRAY, CHARLES, Surgeon, at 8, Newton-road, Bayswater, on August 2, aged 66.
 BROWN, ELIZABETH CRANSTOUN, eldest child of the late Andrew Brown, M.D., of Weymouth, at Reading, on August 1, of erysipelas, aged 17.
 DUNWOODIE, JOHN, Surgeon R.N., at Portsmouth Dockyard, on August 7, aged 38.
 GOWLAND, JOHN EDWARD, M.D., at 29, Great James-street, Bedford-row, on July 23, aged 41.
 HARDWICK, HANNAH, the wife of John Hardwick, Surgeon, at Hillside, Worle, Somerset, on August 2.
 MACLAREN, GEORGE DAVID, Deputy-Inspector of Hospitals and Fleets, at Brockhurst Cottage, Gosport, on August 3.
 RONALDS, JOHN, Esq., son of the late Dr. Henry Ronalds, at Brentford, on August 6, in his 41st year.
 SAVAGE, CHARLOTTE, widow of the late Arthur Savage, Surgeon R.N., and second daughter of the late Michael Morrah, Esq., of Worthing, at 3, Clarence-terrace, Southsea, to the inexpressible grief of her sorrowing family, on August 3, in her 66th year.
 THORNEY, ROBERT SAMUEL, M.R.C.S.E., L.S.A., at Long-street, Devizes, on August 5, aged 48.
 WOOTTON, DR. HENRY ABERGAVENNY, late of the Bengal Service, at Dumfries, on July 26, aged 81 years and 4 months.

VACANCIES.

In the following list the nature of the office vacant, the qualifications required in the Candidate, the person to whom application should be made, and the day of election (as far as known) are stated in succession.
BIRMINGHAM, PARISH OF.—Dispenser; must be duly registered under the Pharmacy Act, 1868. Applications and testimonials to W. Thompson, 1 sq., at the Parish Offices, Paradise-street, on or before August 14.
BOURNMOUTH GENERAL DISPENSARY.—Resident Surgeon; must have both Medical and Surgical qualifications and be registered. Applications and testimonials to B. A. Rugg, Esq., for the President of the Dispensary, on or before August 28.
BRADFORD INFIRMARY AND DISPENSARY.—Physician; must be a Graduate in Medicine of one of the Universities of the United Kingdom, or a Fellow or Member of one of the Colleges of Physicians. Applications and testimonials to Mr. C. Woodcock, Bradford, on or before August 30.
CHESTER GENERAL INFIRMARY.—Visiting Surgeon; must have both Medical and Surgical qualifications. Applications and testimonials to the "Chairman of the Board of Management," on or before August 28.
COVENTRY PROVIDENT DISPENSARY.—Surgeon; must be a Member of one of the Colleges of Surgeons of London, Dublin, Edinburgh, or Glasgow, and must hold in addition a Licence from one of the Royal Colleges of

Physicians, or from the Society of Apothecaries. Applications and testimonials to the "Honorary Secretary," on or before August 31.

Huddersfield Infirmary.—House-Surgeon; must have both Medical and Surgical qualifications, and be registered. Applications and testimonials to Mr. John Marsden, on or before August 14.

Middlesex Hospital, W.—Physician; also Assistant-Surgeon. Applications and testimonials to Mr. H. N. Custance, Secretary-Superintendent, on or before August 22.

Norfolk and Norwich Hospital, Norwich.—House-Surgeon; must have both Medical and Surgical qualifications. Applications and testimonials to Mr. T. R. Tallack, on or before September 8. Election on September 16.

Parish of Unst, Shetland.—Medical Officer. Applications and testimonials to Mr. White, Inspector of the Poor.

Queen's College, Birmingham.—Medical Tutor and Joint Demonstrator of Anatomy. Applications and testimonials to the Secretary on or before August 31.

University of Durham College of Medicine, Newcastle-on-Tyne.—Medical Tutor. Applications and testimonials to Luke Armstrong, Esq., College of Medicine, Newcastle-on-Tyne, on or before August 31. It is particularly requested that no *original* testimonials be sent.

POOR-LAW MEDICAL SERVICE.

* * The area of each district is stated in acres. The population is computed according to the census of 1871.

RESIGNATIONS.

Barnsley Union.—Mr. E. Crockett has resigned the Wombwell District; area 6709; population, 4675; salary £20 per annum.

Holborn Union.—The First District is vacant; salary £105 per annum.

St. Giles and St. George, Bloomsbury, Parishes.—Mr. F. Barton, Assistant Medical Officer at the Workhouse, has resigned; salary £150 per annum.

APPOINTMENTS.

Chesham Union.—Edward H. Carter, M.R.C.S. Eng., L.S.A., to the Third District.

Easington Union.—Samuel Bright, L.R.C.S. Ire., to the Thornley District.

Great Yarmouth Parish.—Wm. E. Wyllys, L.R.C.P. Edin., L.R.C.S. Edin., to the Northern District.

Mansfield Union.—Wm. A. Stamford, M.R.C.S. Eng., to the Sixth District.

Skirlaugh Union.—Charles Solomon, L.R.C.P. Edin., L.R.C.S. Edin., to the Workhouse and the Skirlaugh District.

Wigton Union.—Harrison Mitchell, M.D. & C.M. Edin., to the Ireby District.

Wirral Union.—Francis Peirce, M.B. Trin. Coll. Dub., L.R.C.S. Ire., to the Upton District.

THERE have not been any fresh cases of small-pox in Llanfyllin for upwards of a month.

THE Medical Officer reported last week to the Fulham Board of Guardians that there was not a single case of small-pox in the parish.

THE Guardians of St. Marylebone have resolved to erect a Dispensary and relief station in York-court and East-street.

SMALL-POX ON BOARD SHIP.—The steamship *Somersetshire* was detained at Melbourne in quarantine a fortnight, owing to small-pox being on board.

COMMUNIST PRISONERS.—Amongst the first sixteen Communist prisoners to be tried are Jourde, a Medical student, aged 27, and Rastoul, a Physician, aged 45.

DEATHS IN PARIS.—The general health of the inhabitants of Paris is daily improving. Only one case of a choleraic nature is reported. The small-pox has almost, if not entirely, disappeared.

COUNT DE FLAVIGNY, the President of the Society for Succour to the Sick and Wounded, has awarded 100 bronze medals to English ladies who distinguished themselves, by their devotedness and intelligence, in the French ambulances.

ACCORDING to the reports of the District Medical Officers of Health of the metropolis, diarrhoea is much less prevalent in London than it was at this time last year. It must be remembered, however, that we have still before us a season which may give rise to many cases of this complaint.

THE Registrar-General has supplied a special report for the convenience of people leaving town at this season in search of health, with reference to the state of the forty-seven principal English watering-places. The report gives a table of the recent death-rates from all causes. It must be remembered, however, that the death-rate is by no means an infallible criterion of the health of any particular locality. There may be much sickness with little comparative mortality; and much mortality with little comparative sickness.

HYDROPHOBIA.—Elizabeth Foster, aged 10 years, residing with her parents at 16, East-street, Manchester-square, in March last was attacked by a stray dog in the street, rolled over, and very severely bitten in the arm. She was at once taken to the Middlesex Hospital, where her injuries healed in due course. A few days ago, however, symptoms of hydrophobia began to show themselves, and they rapidly became so alarming, that on Friday morning it was necessary to take her to the London University Hospital. When admitted she was in a perfectly rabid state. The poor girl died the same night.

GUY'S HOSPITAL.—MEDALLISTS AND PRIZEMEN.—At the examination of students in Medicine and its allied sciences, which took place on August 7, the following were the awards for 1870-71:—The Treasurer's Gold Medal for Medicine, George Davidson Deeping, Newark; the Treasurer's Gold Medal for Surgery, Henry Edward Southee, Canterbury.

Prizes.—Third Year's Students: C. H. Golding Bird, Brunswick-square, London, first prize, £40; George Turner, Portsea, second prize, £35; Thomas Eastes, Folkestone, honorary certificate; Edmund Arthur Burgess, Bethnal-green, London, honorary certificate. Second Year's Students: F. Akbar Mahomed, Brighton, first prize, £35; George F. Masterman, Croydon, second prize, £30. First Year's Students: Arthur Henry Jones, Peekham, first prize, £30; Charles Edward Barnard, Tasmania, second prize, £25; Henry Clarke, Anerley, £10 10s., and William Harry Hansard, Epsom, £10 10s. (equal); Hugh Alexander Cookson, Stowmarket, honorary certificate; Thomas Simmons Morley, Barton-on-Humber, honorary certificate; Robert Neale Smith, Brighton, honorary certificate; Carlos Duran, Costa Rica, honorary certificate.

NOTES, QUERIES, AND REPLIES.

He that questioneth much shall learn much.—Bacon.

Lanka.—Messrs. Spottiswoode and Co., New-street-square, E.C.—price 6d.

Aston-cross, Birmingham.—We think it better to postpone our report of, and comments on, the coroner's inquest held last week at this place. Until the analysis by Dr. Alfred Hill is completed and put in evidence the case must necessarily be incomplete, and therefore it is undesirable to pre-judge the verdict.

Honour.—The first Physician who was created a baronet was Sir Hans Sloane. This was the first hereditary honour ever conferred upon a member of our Profession. Sir Henry Halford was offered a peerage, but declined it, because he would "not be able to accept a fee." Sir Henry had large landed property, and could have sustained the character of a peer without continuing to practise as a Physician.

M.D.—The cane carried by Mead, referred to in an article on the Royal Academy in a late number of this journal, is now in the Royal College of Physicians, and may, on application to the urbane Secretary, be seen by any member of the Profession. This cane originally belonged to Radcliffe, who bequeathed it to Mead. It was subsequently in the possession of Askew, Pitcairn, and Baillie, the leading Physicians of their time. Mrs. Baillie, some short time after the death of her husband, presented the cane to the College. The arms of each of its possessors are on its handle. Dr. McMichael, for several years the Librarian of the College, was the author of a most entertaining little book, entitled "The Gold-headed Cane," which in reality consists of biographical sketches of the five above-named eminent Physicians.

Turning-points in Life.—Goldsmith being plucked by the examiners at Surgeons' Hall in 1758 is regarded by one of the ablest of his biographers as the turning-point in his career. Finding him not qualified to be a Surgeon's mate, they "left him qualified to heal the wounds and abridge the sufferings of all the world." While the door of Surgeons' Hall was shut upon him that day, "the gate of the beautiful mountain," in Mr. Forster's figure of speech, was slowly opening. The turning-point in the life of Smollett—that which made him an historian and a novelist—was probably his entering as a Surgeon's mate in the Royal Navy. This gave him time to read and opportunities of studying human nature in sailors. To the first we may have owed his history; to the second, certainly, his "Roderick Random."

ADVICE GRATIS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I have never been in India, and hope—with the help of Providence, "outfitting," and exchanges—never to go; but, in the language of the first ruffian of melodrama, a time will come when the Bazaar at Cawnpore will be a poor substitute for Regent-street; bumping on a camel, or mounted on an elephant, instead of a broken-knee'd quadruped; when tigers, snakes, ants, and scorpions will cause greater annoyance than the homely cockchafer or the Norfolk Howard; and Cornelius Sullivan, the soldier-servant, who whiles away many a dull hour by thrashing his wife, laying down the law at the canteen, or conceiving plans for robbing me, will be supplanted by a number of cut-throat scoundrels without any clothes on.

When the retirement amounts to a pound a day, my wild dream is to settle down at Cheltenham; there turn an honest penny by treating Indian dyspeptics—ringing the changes on bicarbonate of potash, quinine, dilute acids, and Cocker's pills. Should a penurious patient become troublesome, the plan will be to suggest further advice, change of air, or to insult the old nabob. If that fails, invite him to dine at Bangalore Villa, and at dessert pleasantly allude to cases of malignant scarlet fever and virulent variola visited that day. As to midwifery, when once the chance occurs, never will another case be attended; but stethoscope in hat, gum-lancet in waistcoat-pocket, driving in a buggy (violently reading the *Medical Times and Gazette*), and attending sick children might pay.

The pen was taken up to write on Indian diseases, but somehow the current of ideas runs in the direction of an introductory lecture. "Lamented colleague;" "old faces welcome the new;" "germ theory;" microscopes, endoscopes, and all the other scopes; varied with a dash of quotation out of Pye Chavasse, or Longfellow, or any other great poet.

That young bear, the sucking Practitioner, should be very careful about some points, little of themselves, but all-important in the competition of an over-stocked Profession. If he is not bred and born a gentleman, let him try and become one by only associating with such. He should dress becoming to the position as a member of a grave and honourable calling; his visits should be short, every word to the point, and no gossip. A kind, gentle manner consoles and cheers like the bright sun in the sick-room; and he should endeavour as much as possible to conceal from the patient the working of his mind; for the symptoms and tactics of to-day may be changed on the morrow. If a man dearly loves, and is loved in return by a healthy girl, let him marry early by all means; but if he takes this leap in the dark simply as a speculation—part of the stock-in-trade, to secure practice—he deserves to have a sickly wife, who, in the long hours of her husband's absence and the want of society, may repent her choice, and not be ready to welcome him with affection and sympathy at hurried meals. For the work never ends. Every other occupation has stated hours of rest; even the elergymen can take two or three pegs (as we say in India), feeling certain of being undisturbed at night; but we must ever be on guard—"semper parati." A hard-working, temperate old Practitioner once said, "I have been up three nights at a labour, for which a guinea will be claimed and fought for in the county court; there decided against me, the patient swearing I was drunk."

When, after long anxiety, the battle has been lost, and we stand at the grave of the bread-winner of a family, the cherished wife, or the only passionately-beloved child, sorry comfort is it to think we did our best. Sadly we turn away from the mourners with one beautiful passage of the solemn burial service ringing consolation into our ears—"Be ye stedfast, unmovable, always abounding in the work of the Lord, forasmuch as ye know that your labour is not in vain." I am, &c.

CHUTNEY CURRIE, M.D.

THE CHOLERA "PERFECT CURE."

Although to all appearances cholera may be on the advance towards us through Eastern Europe, and it is well, therefore, to be prepared with every appliance for the encounter with the enemy, we protest in the name of the Profession and common sense against the publication by lay papers of newly discovered and unfeeling remedies for the disease. What possible good can result from the announcement by an evening contemporary, in its letter from Paris, that "Dr. Lisle says that he has cured twenty-one cases of cholera out of twenty-six by administering a solution of five parts sulphate of copper to 100 parts distilled water, about thirty drops, to which add ten drops of Sydenham's laudanum and 4 oz. of sugar and water. Dr. Drouet advocates a solution of castor-oil in collodion being applied with a brush to the abdomen. The mixture forms a waterproof film which prevents perspiration, and vomiting and cramps are instantly arrested?"

Such statements are worse than useless—they are absolutely harmful. Much as remains to be learned of the nature and treatment of cholera, this much is certain, that such remedies in the presence of the real disease will be found as ineffectual as any of the thousand-and-one other cures which have been tried and found wanting. We have some tolerably correct ideas as to the prevention of cholera by sanitary measures, and it is to these that the public attention should be directed, instead of being distracted and misled by announcements of alleged remedies.

APPOINTMENTS FOR THE WEEK.

August 12. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 9½ a.m.; King's, 2 p.m.; Charing-cross, 2 p.m.; Royal Free, 2 p.m.; Hospital for Women, 9½ a.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

14. Monday.

Operations at the Metropolitan Free Hospital, 2 p.m.; St. Mark's Hospital for Diseases of the Rectum, 2 p.m.; St. Peter's Hospital for Stone, 2½ p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

15. Tuesday.

Operations at Guy's, 1½ p.m.; Westminster, 2 p.m.; National Orthopædic, Great Portland-street, 2 p.m.; Royal Free, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

16. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1¼ p.m.; Middlesex, 1 p.m.; London, 2 p.m.; St. Bartholomew's, 1½ p.m.; Great Northern, 2 p.m.; St. Thomas's, 1½ p.m.; Samaritan, 2.30 p.m.; King's College Hospital (by Mr. Wood), 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

17. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; Royal Orthopædic, 2 p.m.; West London, 2 p.m.; University College Hospital, 2 p.m.; Royal London Ophthalmic, 11 a.m.; Royal Westminster Ophthalmic, 1½ p.m.

18. Friday.

Operations at Central London Ophthalmic, 2 p.m.; Royal London Ophthalmic, 11 a.m.; South London Ophthalmic, 2 p.m.; Royal Westminster Ophthalmic, 1½ p.m.

VITAL STATISTICS OF LONDON.

Week ending Saturday, August 5, 1871.

BIRTHS.

Births of Boys, 1040; Girls, 1036; Total, 2076.

Average of 10 corresponding weeks, 1861-70, 1971'6.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	723	659	1382
Average of the ten years 1861-70	804'1	770'8	1574'9
Average corrected to increased population	1732
Deaths of people above 90

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1871.	Small-pox.	Measles.	Scarlet Fever.	Diphtheria.	Whooping- cough.	Typhus.	Enteric (or Typhoid) Fever.	Simple continued Fever.	Diarrhoea.

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29.75 in. The highest was 30.02 in. at the end of the week, and the lowest was 29.48 in. on Sunday morning.

* The figures in this column are the unrevised numbers enumerated in April last, raised to the middle of the year by adding 1-40th of the rate of increase which prevailed between 1861 and 1871. As the population of Dublin and its suburbs showed a decline between the Censuses of 1861 and 1871, the enumerated number in April last has been inserted above for that city, the population being assumed to be now stationary.

ORIGINAL LECTURES.

ON THE INFLUENCE OF THE NERVOUS SYSTEM ON DISEASES OF THE ORGANS AND TISSUES.

By THOMAS LAYCOCK, M.D., etc.

Professor of the Practice of Medicine, of Clinical Medicine, and of Medical Psychology and Mental Diseases, in the University of Edinburgh.

(These lectures have been revised, and somewhat extended, by Dr. Laycock.)

LECTURE V.

A CLINICAL TROPHIC AND VASO-MOTOR ANATOMY OF THE BRAIN AND CORD, FROM A NEW POINT OF VIEW.

I SAID in a former lecture that a clinical trophic anatomy should enable us to observe and treat two kinds of morbid neurotic changes—viz., those which occur in the nerves and nerve-centres themselves, and those which occur in organs and tissues in consequence of those changes. We have only studied the latter class; we will now study the former.

Let me premise as a fundamental fact that, apart from certain morbid states of the blood and of the auxiliary tissues, or what have been termed coarse and mechanical diseases of the brain and nervous system, every change in a nerve or nerve-centre is, for the most part, the result of a change in some other portion of the nervous system. So that, to understand the true causes of numerous neuroses, it is necessary to trace the order of events which lead up to them. This we have done generally, and without special reference to the kind of morbid changes which take place; now we have to specialise them as far as is practicable and practical.

In my lecture on the Clinical Observation of Diseases of the Brain and Nervous System, I explained to you the general rules to be observed so as best to ascertain the various changes therein which constitute the predisposing, exciting, and proximate causes of neuroses in general. When, however, we have to consider those of special nerve-centres, it is necessary to determine, at least, two things—viz., the seat of trophic changes in the nerve-cells and nerve-fibrils, and the relations of vaso-motor action to these changes. As to the nature of the trophic and dynamic changes, I need only remind you of this—that no anatomical research, however minute and microscopic, whether conducted in living or in dead tissue, can reveal to us those molecular changes upon which the varying functions of the nerve-centres depend. All we can say positively of these, as of molecular chemical changes, is, that there are such changes, and that each kind must occur in its own proper portion of the nervous system, in accordance with the functions of that portion, and according to fixed laws. All visible structural changes in nerve-tissue are coarse diseases, and coincide with destruction or abolition of function. They indicate the results of trophic disorder, often of long standing, but not the causes of the disorder itself.

In respect to the vaso-motor activity of these nerve-centres we know more—but little that is positive and practical. We have not determined the vaso-motor relations of the nerve-centres to each other; anatomical and physiological research have failed as to the most fundamental centres—the sympathetic ganglia; so that our ignorance of their functions is generally admitted. When we turn more especially to those ganglia which regulate the activity of the bloodvessels that supply the encephalon—viz., the cervical ganglia—we have not only to deal with the carotid and vertebral systems, but with that of the thyroid body and its relations to the functions of the brain and spinal cord. Looking at these relations from the anatomical and vaso-motor points of view, we cannot avoid the conclusion that the thyroid body has more complex trophic functions than is generally suspected. This is shown by its twofold blood- and nerve-supply. The *nervi molles* (so-called) are the branches of the system of the superior cervical ganglion which accompany the arteries of the carotid system; these also accompany the superior thyroideal artery as a limb of that system, whereas the inferior thyroideal artery belongs to the system of the vertebral arteries, and receives nerve-fibrils from its own ganglion, the middle cervical. We may reasonably conclude, therefore, that as the innervation and arterial supply of the thyroid body are double, the functions are double. That these functions are in connexion with those of the other cervical

ganglia is probable from the intricate anatomical relations of the whole chain; these are so close that the thyroideal ganglion is sometimes integrated (an important fact) with the lower cervical, while it has commissural connexions, not only with the superior cervical above, but with the cardiac ganglion below. Now, no one, so far as I know, except myself, has called attention to the clinical relations of these facts to goitre, and cretinism, to vascular bronchocele and “Graves’ disease,” and to the functions of the ovaria and uterus. (a)

How much considerations of this kind should make us hesitate in drawing conclusions from experimental researches into the functions of the cervical sympathetic is plain enough; and it is precisely such considerations which enable us to understand why, with all the laborious research I have alluded to, it is a general complaint that we know so little, practically, of the pathology of the sympathetic system. According to vaso-motor theories, the cervical sympathetic ganglia should regulate the encephalic circulation; consequently, in encephalic neuroses like epilepsy and its serious accompaniments of morbid brain-nutrition, leading to insanity and dementia in fevers with delirium, and in insanity in general, the pathological anatomy of these centres should elucidate the pathology; yet how little of this is known! They have been found red and swollen in a few cases of death from hydrophobia and from typhus; but of their state in insanity, epilepsy, hysteria, and various vaso-motor affections of its encephalic tissues, the circulation within which is supposed to be regulated by these ganglia, we have few, if any, observations. The cause of this neglect is not far to seek: it is the chaotic conflict of views as to the anatomy and physiology of the sympathetic system. Feeling strongly these difficulties, I have lately adopted a new method of observation of this great group of encephalic neuroses, which certainly helps to simplify bedside work and to clear up numerous doubtful and embarrassing problems. I shall, therefore, explain it to you. To this end I will first, however, explain the guiding principles of the method.

I have already on various occasions indicated the clinical and practical uses of those great laws of evolution and development which are termed transcendental, and which hitherto have had little attention from Practitioners and teachers. I once again turn to this department of biological science for help. It is generally yet erroneously thought, in accordance with scientific terms, that the nerves “arise” and are developed from the nerve-centres, and the arteries from the heart and large vessels. Hence the numerous discussions as to the “origin” of the sympathetic, and of the “roots” of various nerves both spinal and encephalic. Now, in the development of the embryo the nerves are formed independently of the nerve-centres, and the arteries appear before and act independently of the heart; so that the evolution of the vascular system, with its accompanying nerves, is not like that of the branches of a tree from a common trunk, but like that of a river from a number of rills, or like that of veins. The function of the central ganglia is to unify trophic changes in tissues and the actions of the vessels and of their accompanying nerves; but these changes and actions can and do go on independently of either heart or nerve-centres. If we go a step further and inquire to what uses vessels and nerves are subservient, we learn at once that they subserve to cell-function, and that cells can be grouped together, each group having distinct functions to perform in the body politic. My late friend and colleague, Professor Goodsir, first promulgated the doctrine—afterwards confirmed by Virchow—that not only is the entire organism composed of simple or developed cells, each having an independent vitality, but that there is also a grouping of cells into departments around one capital or central cell. A common and striking example of this kind is the primordial cell of the ovum. I have pointed out in my psychological text-book how the laws of the fundamental processes which go on in these cell-groups may be formulated for practical use as the correlative laws of life and thought. (b)

Guided by these facts, I take an area of blood-supply as indicative of an area of cells and tissues in functional and trophic relation with each other, and with a common source of blood and of regulative vis nervosa, both vaso-motor and trophic. These areas may be marked out in the encephalic tissue, and as special centres of functional cell-activity, in two ways—viz., by the descriptive and pathological anatomy of the arteries, and by the observed functional and trophic changes in the corresponding areas of blood-supply; only, instead of looking at the arterial trunks as they give off

(a) See “Mind and Brain,” second edition, p. 476.

(b) *Ibid.*, vol. i., p. 385.

branches, we must consider them as made up of branches. I think Serres was the first to show, in his "Anatomie Comparée du Cerveau," published in 1824, that the development of the encephalic nerve-centres is dependent on the development of the arteries, and that the nerves, whether sympathetic, spinal, or encephalic, grow as it were towards the nerve-centres with which they are finally connected. Since, as the areas become more and more comprehensive, a larger blood-supply is needed and more regulative vis nervosa required, it follows that with an increased extent of central control the arteries get larger and the nerves thicker; so that each important trunk or branch of nerve and of artery may be held to indicate a centric trophic area. Guided, therefore, by this principle, I have divided the cerebro-spinal axis into distinct yet mutually dependent arterial areas, each presumably with its sympathetic ganglia, its commissural connexions, its correlative cranial and other structural developments, and its sphere of physiological and pathological changes in organs and tissues. The method is so wholly new that it is as yet imperfectly developed; you will, however, find these arterial cerebro-spinal areas set forth in a tentative way in my psychological text-book.(c) On future occasions I shall apply them to the study and treatment of hysteria, epilepsy, and insanity; at present we will see how far they will help us to a knowledge of the relations of the encephalic vaso-motor or trophic centres to neurotic diseases of tissues, both within and without the cranium.

Serres, in the work I referred to, lays down two laws of development of the central nervous system—viz., the law of symmetry or of symmetrical halves, and the law of conjugation or of integration of the two halves of the nervous system into one organ. The cerebellum, for example, is fundamentally double—a lateral leaflet coming from each restiform body, representing in fishes that which in man constitutes the hemispheres. The median lobe (or superior vermiform process) is developed in relation with the tubercula quadrigemina. The arterial development follows the same laws. On each side there are symmetrical arteries, and where there is conjugation of nerve-centres we find conjugation of arteries either by integration or by anastomosis of the trunks. When the centres are distinctly ganglionic, united by commissural nerve-fibrils, we shall have arterial trunks united by anastomosing arteries; but where the two symmetrical halves combine, both by commissure and ganglion, there may be union of the arterial trunks of each half, either by complete integration into one trunk or by a cross anastomosing branch; so that anastomosis and integration of arteries, and *vice versa*, represent commissural union of nerve-centres in relation to them. The aorta is thus constituted out of two lateral vessels. It has, therefore, a corresponding ganglionic and commissural centre somewhere in the cord or the encephalon. The integration of the two vertebral arteries into the basilar artery at the lower border of the pons Varolii, and in exact accordance with its length, indicates that the pons is the commissural centre of those groups of cells to which the blood is distributed from thence. This great vascular area is in functional relation, therefore, with the most complete commissural centre of the encephalon and its dependencies—the "vital knot," as the French anatomists, with much propriety, term it. Nor is this coincident unity of arteries and development of correlative trophic centres a solitary fact, as we shall soon see, but a general law. After the union of the two vertebrals with the basilar artery, two subordinate areas of innervation in connexion with the pons are marked out by two distinct sets of branches from the basilar. One of these includes the cerebellar arteries, and supplies the cerebellum, pons Varolii, medulla oblongata, and the upper portion of the spinal cord. This cerebellar vascular area is further divisible into two areas, supplied by the posterior and anterior cerebellar arteries respectively. Of these, the posterior is that which corresponds with the commissural connexions of the cerebellum with the cord; for, although often found to be given off from the basilar, it is not unfrequently a branch of the vertebral artery on one side, and of the basilar on the other. These two cerebellar vascular areas indicate, therefore, a group of different nerve-centres, which may be referred to the two commissural vermiform processes; for while the posterior or cerebello-spinal artery is ultimately distributed to—which means in development that it primarily arises in—the inferior vermiform process and the sides of the median fissure, and the inferior surface of the cerebellum, the superior cerebellar artery supplies the superior vermiform process (median lobe), the velum interpositum, and the valve of Vieussens. A small branch arises in the internal auditory meatus, and this seems to correspond

to that branch of the auditory nerve which has been traced to the cerebellum. Tinnitus aurium and spectral voices thus acquire a diagnostic significance as to the state of the circulation in cases of brain disease of this occipito-spinal region. A few branches go to—*i.e.*, in development, come from—the under surface of the sphenoidal lobe, thus connecting this cerebellar branch with the function of that lobe.

To understand clearly, however, the important clinical relations of these areas to epilepsy and insanity commencing therein, we must include the blood-supply of the basilar region of the cerebrum and of the ganglionic centres situate therein. We know little of the functions of several of these; but so much is certain, that they appear early in the scale of development, and are obviously in essential connexion with the corporeal centres proper. The two posterior cerebral arteries of the basilar area indicate the bond of union. They supply blood to the inferior surface of the posterior lobe, to the crura cerebri, tuber cinereum, and corpora albicantia, while a choroid branch connects the velum interpositum and tubercula quadrigemina with the basilar area, as well as with the vascular choroid plexus. All these encephalic nerve-centres and tissues are therefore within this great occipito-spinal and corporeal area of vaso-motor activity, to the neuroses of which the vaso-motor activity of the vertebral arteries is the clue. Their vaso-motor connexion with the vascular areas supplied by the internal carotid system is indicated by the posterior communicating arteries. According to my view, these correlate a corresponding commissure, and this, I think, is the fornix or great inferior longitudinal commissure of the hemisphere. So that the posterior communicating arteries are to the fornix of each hemisphere what the basilar artery is to the pons Varolii.

Looking, then, at the anatomy, physiology, and pathology of the encephalon from this new point of view, we can broadly allocate function, blood-supply, and trophic change to three distinct regions, any one of which may be involved morbidly without the other manifesting change, yet connected with each other, and of which each symmetrical half may be involved without affecting the other half; these are—(1) the corporeal region, including the medulla oblongata supplied by the cerebellar arteries; (2) the animal, supplied by the posterior cerebral; and (3) the mental proper, or intellectual, supplied by the internal carotid arteries. The commissural union, or conjugation of this last-mentioned region, is indicated by the anterior commissure; and its correlative arterial development is either the anastomosing anterior communicating artery, or, as is sometimes found, integration of the two anterior communicating arteries, so as to form one trunk like the basilar. Thus the circle of Willis is constituted so as to represent in the arterial system the commissural connexions of the encephalon.

Various difficulties and objections at once arise at first consideration of these facts and conclusions. Primarily, it will be said that these anastomosing branches are simply for the purpose, and no other, of equalising the circulation within the brain, and providing against any cutting off of the blood-supply to any particular part; this is what the anatomical books teach. Now, seeing that one half of the brain may do the work of both halves, just as one kidney may do the work of both, it is important that there shall be a ready diversion of the proper supply of blood to the working half; and to that extent the explanation is satisfactory. But we have to consider more than the working of a hydraulic machine when we turn to the changes which occur in the blood, in the capillaries, and in the cells and tissues to which the blood is distributed during functional activity of a portion of brain-tissue; so that, although the equalisation of the blood-supply be attained, we have still to explain the vaso-motor and trophic changes in the respective nerve-centres in relation to each other, which my method helps.

STATUE TO SIR HUMPHRY DAVY.—A statue to this famous chemist is to be erected in Penzance—the town of his birth—at a cost of £600.

A DOUBTFUL HEALTH-RESORT.—According to recent information, the climate of Minnesota has entirely changed within the last fifteen years; since the forests have been cut down and a large tract of wild land brought into cultivation. It is now doubted whether the climate of Minnesota is any longer beneficial to consumptive invalids. An invalid residing at St. Paul, Minnesota, for the benefit of his health, writes to the *New York Tribune* corroborating the above account, and states that, of those who go to Minnesota in the early stages of decided consumption, between 5 and 10 per cent. only recover.

NOTES OF A

CLINICAL LECTURE ON FRACTURE OF THE PATELLA.

By JONATHAN HUTCHINSON, F.R.C.S.,

Surgeon to the London Hospital, the Blackfriars Hospital for Skin Diseases, and the Royal London Ophthalmic Hospital.

[Reported by Mr. E. NETTLESHIP.]

GENTLEMEN,—The patient before us presents a good example of the ordinary fracture of the patella. His right patella has been broken across transversely below the middle, so that the upper fragment is larger than the lower one. In this case the disproportion between the two fragments is greater than usual, the lower portion forming not more than a fifth of the bone. He has now been in the Hospital several weeks, and the two portions are very close together, so that he will have, in all probability, a very useful limb. When he first came in there was a considerable interval between the fragments, and his knee was swollen by effusion. The effused fluid was absorbed after a few days' rest in bed, and we then put his limb on a straight back-splint and applied strips of plaster from below the lower fragment upwards, so as to fix this portion of the bone, and other strips from above the upper fragment downwards, so as to bring this portion of the bone downwards to the lower fragment. The limb has been allowed to lie flat on the bed.

I do not purpose now to give you a complete account of fractures of the patella, preferring, rather, to make some remarks on the most important points in the kind of fracture before us, under the headings of *Cause of Separation of the Fragments—Treatment—Mode of Repair.*

In most patients suffering from transverse fracture of the patella, if we examine the bone several hours or a day or two after the accident, we find the fragments separated from one another by a considerable interval, from a quarter of an inch to an inch. We also find, most likely, considerable effusion into the joint. At first thought we shall, perhaps, be inclined to ascribe the separation of the fragments to contraction of the rectus muscle; but that it is really due to quite another cause will be apparent when we examine a little further. We shall probably find, in the first place, that the rectus muscle is not in a state of contraction, or that it becomes so only under the pressure of the fingers or at the patient's will. It is true that muscles possess a certain small amount of *elasticity* in addition to their *contractility*, and this elasticity, when unopposed, will tend to draw the fragments apart; this force is, however, comparatively unimportant, and for practical purposes it may be safely neglected. We must bear in mind that the patella is firmly attached by its entire circumference to tendinous or ligamentous structures of great strength. Now, when the bone is broken across the fibrous attachments on each side, the tendons of the vasti remain entire, and they are amply sufficient to hold the portions of the patella in place, and prevent their separation, so long as there is no distending force exerting pressure from within. Soon, however, fluid is effused by the synovial membrane, the joint is distended, and what was before a mere fissure through a bony part of the joint-capsule becomes a wide gap. This is the state in which we generally find the knee-joints of patients admitted with fractured patella. In a few cases, however, scarcely any effusion takes place, and it is precisely in these rare cases that the broken portions of the patella never become separated to any appreciable extent. Those cases in which the joint does not become distended, and the fragments are not separated, are the most favourable of any as regards good union; the case will be unfavourable just in proportion to the *amount* and *duration* of the effusion—*i. e.*, the extent and duration of the separation of the fragments. The further the fragments are apart the more difficult will it be to bring them together, and the longer they remain separated the less likely are they to unite by bone.

You will readily see, then, that the principles of treatment are to prevent effusion if it has not occurred, to favour absorption of fluid which has been poured out, and to bring the fragments of the patella into close and permanent apposition.

It is unnecessary that I should go into detail on any but the method of carrying out the last-named principle.

The plan which I invariably adopt, and which has been carried out in the case before us, is to put the limb on a straight back-splint, and by that means bring the lower fragment as high as possible, and by pieces of cross-strapping maintain it there; then to bring down the upper fragment by strapping and firm bandaging as near as may be to the lower fragment,

and keep it there by readjusting the strapping as often as it gets at all loose. Many Surgeons after doing all this proceed further to elevate the whole limb into the air, with the intention of shortening the distance between the origin and insertion of the rectus muscle. I never adopt this practice, because I believe it to be quite useless, and very uncomfortable to the patient. The advocates of the elevation plan defend it by appealing to a constant state of partial contraction of the muscles, which is supposed to be mainly instrumental in causing the separation of the fragments; and they assert that by lessening the distance between the ends of the muscle they diminish the consequence of this contraction.

I do not for a moment deny that the origin and insertion of the rectus femoris muscle are brought nearer together by elevating the thigh, or by raising the body. I assert, however, that the muscle when left to itself is not in a state of constant contraction; but, on the contrary, that it very soon relaxes completely, and that, therefore, any arrangement for shortening the distance between its attachments is uncalled for. I repeat, also, what I have already mentioned, that it is not to contraction of the rectus but to synovial effusion that the separation of the fractured portions of bone is due, and that it is, therefore, useless to make any special provision for insuring the relaxation of the muscle. I am even of opinion that elevation of the limb may be injurious, for we place it in a constrained position, and I think that muscles when in positions of discomfort are more likely to take on irregular and violent action than when allowed to rest in their ordinary postures.

A few words as to the mode of repair in transverse fracture of the patella. I am inclined to think that bony union is not so rare as it is supposed to be. I have dissected one specimen of union by bone, and I have seen several cases in which I had not the slightest doubt that bony union had taken place. The last case that I discharged from the Hospital was, I believe, one of this kind. I have quite lately seen a gentleman who was treated by his brother, a Surgeon, twenty years ago, for fracture of the patella, and whose limb has during that time been in every respect as good as it was before the accident. There is in him a groove across the patella marking the seat of fracture, but on examination I felt no doubt whatever as to the repair having been by bone. The most favourable cases, as I have before mentioned, are those in which no effusion occurs, or in which the effusion is comparatively slight, and disappears rapidly, and which are treated by prolonged rest in bed, these being the cases in which there is little, if any, separation of the fragments. When the fragments of the patella are separated widely, and for a long time, then bony union is very unlikely to occur.

ORIGINAL COMMUNICATIONS.

ON RHEUMATISM.

THE RHEUMATIC POISON: WHERE AND WHAT IS IT?

By J. JAMES RIDGE, B.A., B.Sc., B.S., M.D. Lond.

(Continued from page 187.)

THERE are three or four other arguments which have been adduced to prove the existence of a *materies morbi* in rheumatism which require examination.

d. It is said that "the peculiar character of the inflammation" is a proof of the specific nature of the cause. The advocates of this view ground their opinion on the well-known fact that the inflammation in acute articular rheumatism seldom terminates in suppuration or gangrene. The language which many of them have employed would lead us to imagine that there is, or that they think there is, some hard-and-fast line of distinction between "rheumatic" inflammation and "common" inflammation. They seem to consider them as two distinct diseases, either of which may affect an individual. And surely this ought to be the case if a special poison is present in the former which does not exist in the latter. On the other hand, there is the view which regards inflammation as the same action under all circumstances, and which considers the particular termination to be far more, if not altogether, influenced by the peculiarities of the tissue affected, and by the hereditary or acquired constitution of the individual, than by the cause of the inflammation. (a)

(a) Of course the immediate influence of traumatic causes must be excepted, such as eschars from fire, etc.

I admit that in pyæmia we have an example of a special cause influencing the termination towards suppuration, and it might be supposed that another poison, the rheumatic, might influence the termination away from suppuration. In answer to this, I would remark that there is nothing so remarkable in a subcutaneous articular inflammation *not* suppurating as to require a special explanation; the explanation is rather required when such inflammations *do* suppurate. We see cases of "common" articular inflammation terminating by resolution every day, under circumstances also—namely, with lesion of texture—when we might expect suppuration to occur. I allude to the legion of sprains, dislocations, fractures near and even into joints; yet how rarely do these cases end in suppuration! Further, when such suppuration does occur, when it is not due to the severity or peculiarity of the lesion, do we not see in that evidence of constitutional tendency to suppuration? We are accustomed to associate struma with such a tendency. Why? Because we see a simple arthritis—say of the knee—produced by cold or a blow proceed to ulceration of cartilage and disorganisation of the joint by pus; whereas, the same kind of inflammation in ordinary persons; set up by the same causes, after a while, if the lesion is not too severe, generally subsides. Why should we regard the latter to be specific inflammation, while the former is not? No one does so; and yet this very thing is done with regard to rheumatic arthritis.

Now, it is well known that, though uncommonly, rheumatism does sometimes terminate in suppuration. Sir Thomas Watson(b) notices that the inflammation of the synovial sacs may be of such intensity as to end thus; that in other cases the areolar tissue round the joints may become affected and suppurate; and that, if the serous tissues within and round the heart are attacked, the products of the inflammation are just the same as when inflammation of the same textures of the common kind is anyhow produced. This being admitted, we must conclude that the rheumatic poison, if it exists, does not interfere with the process of suppuration, since, when present most intensely, such an event is more likely to occur. Further, it may be the exciting cause of suppuration under circumstances which show that the event is influenced by the health-status of the individual. Thus the probability that pus will be formed is much increased if the rheumatism occur in scarlatina. This, no doubt, is due to the increased tendency to pus-formation in this disease. Yet this tendency is greater as regards mucous membranes and parenchymatous tissues, and hence such a result of the rheumatic inflammation is not as frequent as we might have expected.

As has been casually noticed above, the character of the tissues affected to some extent accounts for the diminished frequency of suppuration; for, *cæteris paribus*, fibrous tissues are less prone to suppurate than the other tissues, which are morbidly affected by cold. Therefore, when cold does affect them, we ought to be prepared to expect greater resistance to suppuration.

Again, the hereditary character of rheumatism is well established. Now, it is quite as easy to suppose that a person can inherit a tendency for serous and fibrous inflammations to resolve as to suppurate. The former would express a higher grade of health than the strumous constitution. As regards the skin, etc., we already know of such hereditary differences. The flesh of some people is popularly known as "good healing flesh"—*i.e.*, there is not a very great tendency to suppuration; the fibrine exuded is firm, healthy, and easily organised. On the other hand, the flesh of some is just the reverse. And these peculiarities are transmitted to children with the same caprice as other hereditary diseases or qualities, and as rheumatism itself. I do not assert that such a state of constitution is all that is necessary to predispose to rheumatism—if that were true it would follow that all healthy individuals were specially liable to rheumatic affections; but a person with a healthy constitution is more liable to rheumatism than to the manifestations of struma. This will readily be granted. But I believe that it is also, as a general rule, true, that acute rheumatism is more common among non-strumous or slightly strumous individuals than among those in whom the strumous constitution is strongly marked. In the latter a cold is more likely to set up intense and suppurating action in one joint, while the rest escape. Such an action is not called rheumatic; but why should it not be? If, it is said, "Because it ends in suppuration and disorganisation of the joint," the reasoning is illogical. Thus, "Rheumatism is a specific disease because it does not usually terminate in suppuration. All inflam-

matory actions which have suppuration as their usual or frequent event (*e.g.*, strumous joint affections, even though excited by cold) are 'common inflammations,' and *vice versa*. Therefore, those numerous joint affections which are excited by cold, yet do not usually or frequently end in suppuration, are peculiar and specific, and they are rheumatic; therefore rheumatism is a specific disease—*q. e. d.*—to everybody's satisfaction.

I must here briefly refer to Dr. Richardson's experiments with lactic acid. He injected this substance into the peritonæum of animals, and found, on killing them after some time, evidences that endocarditis had occurred, while there was no trace of peritonitis. Dr. Gull remarks(c) "such experiments appear to me to prove only this, that the acids named (lactic and acetic), entering the blood, may cause endocarditis and some other pathological changes simulating those of rheumatism; but I cannot recognise in them the rheumatic state as I am acquainted with it at the bedside." This must be the conclusion we should arrive at. It may be true that lactic acid produces the same changes in the heart that are found in rheumatism; but, even if all the clinical phenomena were the same, which they are not, it would be illogical to conclude that lactic acid is the cause of rheumatism. If all A is B, it does not follow that all B is A. Endocarditis may be caused by lactic acid; but this is not, therefore, the cause of every endocarditis. Lactic acid has never been proved to exist in the blood specially in rheumatism, and so the whole falls to the ground.

We may therefore conclude, I think, that no peculiarity of cause has been demonstrated to exist, and that the peculiarity of the course of the disease, if there really is any, is sufficiently accounted for by the previous constitution of the individual, the usual circumstances of the patient, and the position of the inflammation. We are not compelled to assume the presence of any *materies morbi*, and without such compulsion it should not be done.

e. "The peculiar character of the accompanying fever." This stands in close relation with the preceding. Sir T. Watson, in the lecture before referred to, says—"The severe inflammatory fever has no tendency to degenerate into a typhoid form, and that is a striking feature in the complaint. Neither is the intellect affected except when carditis takes place. . . . With this exception, we do not find patients in acute rheumatism delirious. Throughout all this febrile disturbance there is no coma, no marked trouble of the stomach or bowels, no vomiting, no diarrhoea, no petechiæ, no aphthæ, no sordes about the mouth—all of which are of ordinary occurrence in the course of common continued fevers." This he explains by the fact that the poisons are different in origin and in kind.

Now, we may rely on the fact that the actual poison of rheumatism (if it exists) has never been isolated by any chemical process. Such being the case, a supporter of the poison-theory might point to these continued fevers as analogous, for in them the poison which doubtless exists has never been isolated. But all the invisible poisons which we know of, whether invisible germs external to the body, or the no less invisible and unknown septicæmic agents derived from pus, etc., within it, produce those typhoid symptoms which Watson mentions, the recognised results of blood-poisoning. These continued fevers, therefore, furnish no argument in favour of an invisible poison in rheumatism on the ground of analogy, since the analogy confessedly fails in one of the most characteristic effects of all the recognised invisible poisons. On the other hand, if the poison be grosser, and produce its effect chemically, or by reason of its accumulation in the blood, as the supporters of the acid-theory maintain, we surely have a right to expect that such poison should be visibly demonstrated. But if this dilemma is avoided by asserting the peculiar nature of this invisible *materies morbi*, I submit that this is no explanation, and certainly gives no guidance to the correct treatment. It is a theory, therefore, which at the most can only be admitted when every other fails.

It is well known, however, that the typhoid condition is by no means incompatible with rheumatism, and not only that, but is a direct result of it, and that even more frequently than suppuration. Facts, if anything, therefore, seem to show that usually there is no blood-poisoning in rheumatic fever, but that when it occurs (secondarily) the usual symptoms present themselves. Such a result may also be produced by causes external to the essential cause of rheumatism acting previously to this, and simultaneously with it. This subject requires more extended notice than my space now permits.

(b) "Lectures on the Principles and Practice of Physic," vol. .

(c) Loc. cit.

I must now briefly refer to some other arguments which have been brought forward.

f. "The symmetrical development of the joint-symptoms." The *materies morbi* is supposed to roam about in the blood seeking which joints it shall attack. If, for instance, one knee is attacked, it is said that local circumstances have rendered the joint obnoxious to the poison, and that the fact of the other knee often sharing in the trouble is a proof of the correctness of this explanation, since no joint is so likely to resemble the one knee-joint in its local condition as the other. Hence it is thought probable that all the joint-symptoms are due to the circulation of morbid blood.

This theory, no doubt, explains the frequent symmetry of the disease very plausibly. But it is not of much value as an argument, since it does not establish the presence of a poison. All the symmetry can be explained with equal plausibility another way—namely, by the symmetrical arrangement of the nerve-supply, as I hope hereafter more particularly to show. I grant that if the existence of the poison had been demonstrated, this argument would powerfully confirm its existence, but then we should not require its support.

g. "The shiftings of the disease from one joint to another." Here, also, the symptom is attributed to the poison pouncing down first on one part and then on another. This explanation is even more vague than in the preceding case. Supposing we saw the poison, which we do not, we can give no reason why it should thus transfer itself bodily from one joint to another. The inflammation set up in a joint has been supposed to be the consequence of a process of elimination in the part. Now, if a knee-joint is thus eliminating a definite quantity of poison which has wandered into the blood, one would imagine that the purity of the blood would be thereby increased. If that is so, I cannot understand how the poison can be supposed to leave a favourite nidus to attack a comparatively healthy joint. We are not now considering the case of an accession of poison to the blood, but of its shifting about. It has never been suggested that the process of inflammation repels the poison; on the contrary, it renders the joint more liable to attack. I think, then, it may be fairly demanded that some rational explanation of this extraordinary occurrence should be given before we are asked to take it as a proof of the very existence of a poison. Some may say that the fresh joint is attacked by a fresh detachment of poison, and that the subsidence of the first inflammation is a coincidence. But I do not doubt that by the exercise of a little ingenuity, *plus* imagination, most diseases could be explained in a similar way. We may take any symptom of any disease, and say, "a poison does this," and "the *materies morbi* acts thus," and so long as we are expected to believe it until we can prove the negative, we may well accept it humbly. If, however, I can establish any other theory capable of explaining the symptoms even tolerably well, I should feel myself justified in neglecting such a universal explanation of every difficulty. I do not forget the cases which Dr. Fuller mentions, where alarming symptoms occurred on the sudden subsidence of the inflammation in one part till another was attacked: these must be explained, and, I believe, can be, without any resort to the above hypothesis.

As I have now mentioned Dr. Fuller, I will make two or three remarks on the arguments for the lactic-acid theory, and against any other, which he brings forward in his well-known work on rheumatism. Some of these have been noticed under the preceding heads. But he seems to consider that the only thing he need do to prove his point, is to show that rheumatism is not a local disease (and he puts a very strict limit to the term local), and therefore must be a constitutional disease. He adds other positive arguments to show its constitutional origin, and then he considers it proved that there must be a *materies morbi*. He all along proceeds on the supposition that all the symptoms, as he asserts of particular ones, are "under any other supposition utterly inexplicable." But though, as regards the presence of lactic acid, "seeing" might be "believing," he does not venture to attempt to show it to us. His objections to cold as the cause of the disease are beside the mark, because he takes great pains to point out that some of the effects of cold are incapable of producing the affection, while the way in which, as I believe, it does so is quite unnoticed.

There is just one more argument in favour of the acid-theory which, I confess, I am almost ashamed to mention. But I am afraid it is one which, more or less unconsciously, will influence the judgment of some *practical* men. It is this:—

h. "The alleged cure by alkalis"—used, *i.e.*, as neutralisers of the poison. Alkalis neutralise acids. Alkalis are administered in rheumatism, and the patients recover, while the urine

becomes neutral or alkaline. Therefore, the alkali has neutralised an acid which maintained the morbid action. There is, it is well known, a conviction, held by no mean authorities, that the alkaline treatment has little or no influence in shortening the disease. Apart from this, if we allow that alkalis do act beneficially, of course it is possible they can do this otherwise than by their neutralising power. And surely, if such enormous quantities of alkali as are sometimes given barely suffice to neutralise all the acid, we might fairly expect to get the lactate or other salt demonstrated in the blood or elsewhere, at least in some minute quantity. Yet, if we inquire for it, echo answers, "Where?"

The above examination seems to show that the prevalent theory of the nature of rheumatism rests upon a very unsound basis. Its true pathology is not likely to be discovered so long as such an incubus remains upon the mind; we must cease to regard it as a disease altogether *sui generis* if we would discover its proper place. At all events, we must not do so unless obliged or in despair. But this point, I trust, has not yet been arrived at. If the dust which the prevalent theory throws into our eyes can be successfully expelled, I believe it will be seen that rheumatism is as much intertwined with, or passes into, other diseases, as, for instance, bronchitis; and, by studying these natural affinities, it seems to me that a much more correct notion of its pathology can be obtained. In so doing we should find still further arguments to negative the idea of a poison, acid or otherwise. I hope to be able to notice some of them in a future paper.

(To be continued.)

YELLOW FEVER IN THE RIVER PLATE.

(Supplementary.)

By WM. NATHANIEL HIRON, L.R.C.P. Lond.,
M.R.C.S. Eng., L.S.A.L.;

Admitted to practise in Monte Video; ex-Surgeon-Major Argentine Army
on the Medical Staff of the Popular Health Commission
during the Epidemic.

THE administration of calomel pushed to ptyalism has been vaunted in the daily papers as an excellent method of treatment in this fever, and an exemption from urinary suppression in those treated in this mode has been proclaimed. Since this symptom is the essentially fatal one in the disease, it would be well if facts enabled one to announce any remedy as preventive. My own experience, however, obliges me to condemn any specific use of mercury. It has seemed to me, however, of great advantage in many cases as a purgative, and something more, also, probably from its special soliciting effect upon the entire glandular system of the digestive apparatus; but when it has produced any degree of ptyalism, it has caused me regret—in one case it certainly increased the jaundice.

I have to rectify my statement with reference to the epidemic of last year (1870). The disease was not confined to an hotel, but to the "block" of houses of which the hotel was one, and to persons from different adjacent parts who had communicated with the infected centre. The outbreak existed from the end of March to the end of June. The number of deaths has been stated at 100; in the lazaretto thirty-two persons were received during the period.

I have good evidence of the importation of the disease this year (1871) from patients of mine residing in the block in the San Telmo parish where the disease broke out. A sailor came ashore with the fever to this port, and then it spread gradually about the same neighbourhood. Persons residing in the "block" affected last year assure me that this *locale* has scarcely suffered this year from the outbreak, although adjacent "blocks" have been sufficiently attacked; yet posteriorly to the appearance of the disease in the distant quarter of San Telmo—a part a mile distant at least from the infection-spot last year. My friend Don Ignacio Pirovano—a very distinguished native Surgeon at the Hospital de Hombres—gives me his testimony in favour of the value of antiperiodic doses of quinine for calming the neuralgic pains, which are such distressing symptoms in the disease.

Thinking on the natural history of the fever we have combated, and the asserted "single paroxysm" character of the disease, I desire to offer the following observations. Following descriptions we read of three stages, thus:—1st, febrile; 2nd, apyrexia; 3rd, adynamic; and I would express my ideas on the disease as being—1st stage, attack; 2nd stage, remission; 3rd stage, abortive repetition. Or, better, thus:—1st stage, attack, then interval, remission; then 2nd stage, attack aborting from

adynamic impotency to carry out the phenomena. The liver is described as being in a condition of acute fatty degeneration; it seemed rather to me to be: 1st, sanguineous; and 2ndly, biliary congestion. Its colour is not the buffy of a fatty organ, but a true rhubarb yellow—biliary colour.

In this month's "Review of the Buenos Ayres Medical Association" is the letter of the Medical Officer of the Port of Monte Video, stating his opinion of the nature of the disease which had then recently appeared in Buenos Ayres. Appended to it is the following document:—

"I, the undersigned, Doctor in Medicine and Surgery, at the request of Dr. Garviso, Medical Officer of Health of the Port of Monte Video, give the following information:—

"Through a person in whom I have complete confidence, who has come from Paraguay, I have learnt that, when there existed in that city that which was called yellow fever, Dr. Joaó Adriaó Chaves, Chief Medical Officer of the Brazilian Marine Hospital in Asuncion, one who understands what is true yellow fever, was of opinion that the existing disease was only 'pernicious remittent fever,' and not the epidemic and contagious yellow fever.

"FRANCISCO M. D'ARANJO.

"Monte Video, February 7, 1871."

There is also in the "Review" a statistical list of the mortality, which gives 13,727 as the total number of deaths from the epidemic between January 27 and June 1. I am still, however, of opinion that my estimate, that nearly 20,000 persons perished in the outbreak, is nearer the truth.

Speaking of the fever, the "Review" says—"It is not infrequent to meet with cases of diarrhoea amongst convalescents from the disease, and, in many, abscesses in different parts of the body."

Dr. Wilde, a distinguished native Physician, in a letter to the newspaper *La Republica*, dated February 22, 1871, thus summed up the affair of the denials that the Buenos Ayres fever was specific yellow fever:—"It follows, then, that of all those who have denied that this fever exists, not one has found himself in presence of a patient attacked by it."

So great was the dominion of the epidemic in this city during a certain period, that its organs sallied daily from the press, and the "Bulletin of the Epidemic" and the "March of the Epidemic" well employed the *gamins* for some time.

The municipality are said to have disoccupied the house first affected in the city. It is to be regretted that preventive measures were not carried out to a much further extent. The only way to extinguish an epidemic naturally is to separate every affected person, house, or district entirely from the rest and healthy parts. A real advance will have been made when such a plan is thoroughly carried out without consideration for social position or personal convenience.

My own estimate that about 20,000 persons perished in the plague is based upon considerations of numbers—the number stated to have fled, those remaining, the probable number unattacked, the natural mortality of the disease, the effect upon mortality of Medical attention or assistance. Other statistics only rest on probabilities, except the official, and that is too improbable.

Dr. Newkirk, who was at Asuncion during the plague, assures me that the mortality was small, and that quinine was very generally and extensively used. He believes, too, that quinine was prophylactic, and that its continuous use in a healthy person during an epidemic caused any disease that showed itself to be mild and tractable. The denial that the disease was yellow fever in Paraguay is said to have arisen from the desire of the Brazilians to disclaim the odium of having imported such a pestilence there. Amongst them quinine was largely employed.

In reference to a statement I read, that "the febrile stage furnished as a rule no extreme heat of body" (Essay on Yellow Fever issued by the United States Sanitary Commission), I must say that in the fever I observed the heat of the body was generally pungent and the stage generally well marked. Where it was not so, it was always of unfavourable augury. A gentleman of my acquaintance who was attacked in the epidemic of 1858 suffered again this year.

Professor Murray writes in the *Argentine Pharmaceutical Review*:—"It is needless to say that the fever was first imported in 1857 from Monte Video; the second time, in 1870, from Rio Janeiro, where it remained localised in a small radius about the Rome Hotel. . . . It is known that some of the Paraguayan prisoners who returned from Brazil to their country last year had the fever, and that many of them died. There is no doubt that they carried the germs of the disease from Brazil. . . . Afterwards we learned that the disease had invaded the town of Corrientes, and that it was

very fatal, from want of assistance the mortality ascending, it is said, to 25 per cent. of the entire population. . . . Nevertheless, the authorities here did nothing, a quarantine only existing in name. . . . We may be perfectly certain that the disease has been imported into this city, since it began in the parish of San Telmo, where, according to general report, the person who came sick from Corrientes went to lodge."

The following facts have come to my knowledge:—Of eleven *practicantes* (dressers) of the Hospital de Hombres, eight took quinine in doses of three grains daily; all these had fever of a benign form. Three took no quinine; these had the fever very severely, and one died. The evidence of a prophylactic influence is another proof in favour of my idea of the nature of yellow fever.

I desire to express my great indebtedness to the authorities of the lazaretto of the city; to the Physician, Dr. Don Pedro Mattos, and to his adjutants, Señors Doncel, Gil, and Scherer, for the exceeding courtesy and warm friendship they have ever shown me. I rejoice, too, to read the just tribute paid by the English Chaplain of Legation to this institution, which so well performed its duties to all nationalities.

I have tried to draw attention to the fact of there being a period of remission in specific yellow fever between the first and third stages. The third stage appears to me an intensification of the first, in that there is not only an absence of fever, but a greater expression of such a pyrexia state in adynamia. Still arises the question whether the bleedings of the third stage are not the expressions of local congestions, relieving themselves at the point elected from impotency of the capillary system, to arrest sanguineous loss. The remarkable effect of the ergot of rye in restraining these losses lends colour to the idea.

The influence of quinine to arrest malarious phenomena is generally explained by asserting that it is an antidote to the poison in some such way as antidotes are understood in chemistry. Rather would it seem to me that quinine in all these diseases is an antidote to the effects of the poison on the system. Its prophylactic action seems more to prove that, as a fortifier of the nervous system, it renders us less liable to succumb to the malarious poison.

The malarious poison evidently produces a profound impression on the nervous system, as its primitive expression or primary effect; undoubtedly, the essential poison of yellow fever produces also its primary effect on the nervous system, and in this allies itself with the malarial poison, and thus far is like it; and for the effects of both miasms quinine may be a remedy, although their essence may mutually differ in intimate nature, addressing itself to the results of the poisoning, and not to the poison itself; yet its effects are similar—so the nature of malarial and yellow fever poison may not be too different—a question of intensity, perhaps, only such an intensity as shall imply portability and tenacity of existence in the poison. Attending to the prominence of nervous phenomena in these diseases, it would be quite philosophical to entitle them nervous fevers—fevers whose notable effects are lesions of innervation.

The following statement in Dr. Metcalf's essay for the United States Sanitary Commission well exhibits the importance of studying the connexions between the different forms of fever:—"In proportion as countries previously malarious are cleared up and thickly settled, periodical fevers disappear; in many instances to be replaced by typhoid or typhus." I believe Dr. Oldham denies the existence of malaria, and attributes its proclaimed effects to be simply the results of chill. I have not seen his work, but hope to be able to obtain it. Such an idea was very present to me during my military service in Paraguay. I have previously stated that the Paraguayans call their remittents colds, and often cure them with such simple remedies as suffice for a common cold; still, I cannot help believing that there are malaria—miasms—specifically affecting the constitution of dwellers amongst them, and giving to all diseases occurring in such localities a particular impress of paludism; my idea rather being that the common cold in a malarious district is not different from that occurring in a non-malarious locality, except in that it is produced in a malarious constitution, and thus is so different that it appears another disease.

The newspaper *La Republica* publishes a mortuary sheet, in which former statistics are amended, and the total number of deaths stated at 17,084. I am told that these data are obtained from the municipal authorities. Their only merit is a greater approach to correctness than the former list. More one cannot say of them. Some of the statements in this publication induce me to add a few more observations:—

"Three hundred and fifty gravediggers respected by the fever." The cemeteries are situated on the outskirts of the population. Coffins were exposed for many hours before being interred, from the press of work.

"Seventy-two deaths in one conventillo." Lodging-houses; fever dens.

"Mustard at 10s. a pound." Mustard baths and sinapisms excellent.

"The president flies." A gross calumny. Mr. Sarmiento, although naturally residing outside, came regularly to the city during the worst of the epidemic. "Medical men bolt." "The sick all condemned (*sic*) to be sent to the lazaretto." The best of measures, unfortunately not fulfilled. "Provincial government at its post." It appears that the disease has existed in the city for a period of six months, the first half of this year 1871; fortunately we are now in mid-winter, and may hope that, as heretofore, the disease will be thoroughly extinguished.

Buenos Ayres.

REPORTS OF HOSPITAL PRACTICE

IN

MEDICINE AND SURGERY.

GUY'S HOSPITAL.

For the notes of the following cases we are indebted to Mr. Donald Hood, M.R.C.S., L.R.C.P. :—

COMPOUND FRACTURE OF TIBIA AND FIBULA.

(Under the care of Mr. BIRKETT.)

J. F., 48, scaffold builder, a healthy, strong, and temperate man, of medium height, was knocked down while unloading a barge by a waggon, the hind wheel passing over his left leg. Admitted June 16, having a compound fracture of the tibia and fibula in the lower third. There was a small wound on the inner side, without much bleeding or displacement of bones. The wound was at once covered with pieces of lint soaked in a mixture of carbolic acid $\mathfrak{z}\text{ij}$, and tinct. benzoini $\text{co. } \mathfrak{z}\text{vj}$, and the leg placed on a back splint.

17th.—A good deal of swelling of the limb, but little or no constitutional disturbance. Complains of pain in the calf of the leg.

July 4.—Two side splints applied, the inner with interruption. Progressing well. Wound healed.

28th.—Splint taken off. Leg in good position; one-sixth of an inch shortening. Put up in gum and chalk.

This case did well throughout.

COMPOUND FRACTURE OF RIGHT HUMERUS.

(Under the care of Mr. BIRKETT.)

W. L., 35, fitter; healthy; well nourished; of temperate habits. Fell from a scaffold twenty-seven feet high. Does not know whether he struck anything in his fall. Picked up unconscious, and brought to the Hospital in that state. Admitted June 19, under Mr. Birkett, with a compound fracture of the right humerus about the junction of the lower with the middle third. Remained unconscious about six hours. He cannot describe how the accident happened. There was a wound on the inner side of the arm, about two inches above the inner condyle; but little bleeding. This was covered at once with lint soaked in carbolic acid and tinct. benzoini co. , and the arm placed on a right-angled inside splint with interruption.

21st.—Doing well.

24th.—During the night had severe rigors and diarrhoea. Complains of intense headache, pains, thirst, and general malaise. Wound looks red, swollen, and is painful. The lint to be removed, and poultices to be applied. Pulse 110. To take the following mixture :— Quiniae disulph. $\text{gr. } \text{vj}$, acid sulph. dil. $\text{m}\mathfrak{v}$, tinct. ferri perchlor. $\mathfrak{z}\text{ss}$, ex mist. camph. $\text{co. } \mathfrak{z}\mathfrak{j}$. 4tis hōris. Brandy $\mathfrak{z}\text{x}$; milk Oij .

25th.—Feels somewhat better. Diarrhoea still continues. Wound looks better. Very slight discharge. Pulse quieter, 96. Little perspiration; no perceptible odour.

26th.—Gradually improving. To have an injection of $\text{gr. } \frac{1}{3}$ of morphia at night.

27th.—Had three or four hours' sleep; diarrhoea has stopped; to take half doses of medicine; brandy reduced to $\mathfrak{z}\text{vj}$.

July 11.—Has been doing well since last report; wound scabbed over.

24th.—Convalescent; wound entirely healed.

August 1.—Bones in very good position.

FRACTURE OF RIBS—HÆMOPTYSIS—DOUBLE FRACTURE OF HUMERUS.

(Under the care of Mr. BIRKETT.)

P. C., labourer, of good general health; crushed between the shaft of an engine and the wall. Admitted June 14. Seemed in great agony, being semi-delirious; there appeared to be severe injury to chest and right arm; he was spitting blood. There was well-marked emphysema, and fracture of three or four upper ribs. Being put under chloroform, the humerus was found to be fractured through the middle of the shaft, and again immediately above the condyle. The arm was bandaged from the fingers upwards, and placed on an inside right-angled splint. A flannel roller was applied round the chest. To take vin. antimon. $\text{m}\mathfrak{x}$, ex aqua $\mathfrak{z}\mathfrak{j}$. 4tis hōris.

June 15.—More comfortable; emphysema has not increased; spits little blood. Pulse 98; respiration 44.

16th.—Pulse 88; respiration 34. Skin hot and dry.

19th.—Pulse 100; respiration 34. Feels very weak; no symptoms of lung mischief.

27th.—Has been progressing favourably. To take $\text{m}\mathfrak{x}$. of tinct. ferri perchlor. out of quinine mixture. The skin over the chest is sloughing.

July 3.—Large granulating surface extending over right pectoral and upper sternal region.

21st.—Has been doing well since last report, and now walks about the ward.

August 1.—Splint removed; wound on chest nearly healed; arm in good position; is to keep on the splint for another week.

KING'S COLLEGE HOSPITAL.

For the following cases we are indebted to Mr. E. B. Roche, M.R.C.S., House-Surgeon to King's College Hospital, Lincoln's-inn-fields :—

PHOSPHATIC CALCULUS—LITHOTOMY.

(Under the care of Sir WM. FERGUSSON.)

J. P., aged 18, admitted into King's College Hospital, under Sir Wm. Fergusson, suffering from stone in the bladder. He says that ever since he can remember he has suffered from pain on attempting to walk fast or run, frequently followed by the passage of blood with the urine. Always has pain and difficulty in passing water, which is voided frequently, but has never noticed the stream stop suddenly. He has followed the occupation of a saddler for the last four years, which requires almost constant sitting; but the least exertion, or even standing for any length of time, increased the pain, and caused the urine to become bloody. Is tolerably easy when sitting, and suffers pain during defecation. During the last six months the pain and bleeding have much increased. Up to a month before his admission he had never mentioned his condition to anyone, being, he says, "ashamed to speak of it." Unable any longer, to keep his sufferings to himself, he told his friends, and they at once applied to a Surgeon, who sounded him, and discovered a calculus. On admission, the sound being passed, it was found that a large stone was present.

Sir Wm. Fergusson, on July 8, by the lateral operation, cut into the bladder, and attempted to extract the stone, which, however, broke down under the grasp of the forceps, and it was with difficulty that a firm hold was obtained, and the stone removed. A number of pieces were removed by means of the scoop. After the operation the patient was restless, and complained very much of the pain caused by the passage of the urine through the wound. At night he was rather feverish. Liq. morphiae hydrochl. $\text{m}\mathfrak{xxx}$. was administered.

The day following there was considerable abdominal tenderness, and some swelling. Ordered tinct. opii $\text{m}\mathfrak{xv}$, sp. æther nit. $\mathfrak{z}\mathfrak{j}$, every six hours, with hot fomentations. Slept a little, and the pain was somewhat diminished. Continued the fomentations.

In two days the tenderness completely subsided. The water flowed freely from the wound. A fortnight after the operation the urine first passed through the urethra in very small quantity, and was tinged with blood. The amount passed by the urethra increases daily, and the patient is now recovering.

The stone was uric acid, with a coating of phosphates, and in shape somewhat resembled a pear.

INJURY TO HEEL—DIVISION OF PERONEI TENDONS.

(Under the care of Mr. WOOD.)

F. M., aged 15, admitted under the care of Mr. Wood, complaining of inability to walk without suffering very severe pain.

He was employed as an errand boy in a grocer's shop, and had to carry heavy weights. He says that up to twelve months ago his foot was all right, and he could walk well upon it. An accident then occurred, a loaded timber-cart passing over his right heel, tearing off the heel of his boot. On attempting to stand he suffered great pain, and was quite unable to bear any weight upon it. He was laid up for nine weeks, and then began to get about; but any prolonged attempt to walk caused much pain, and though this has somewhat improved, he is unable to go any distance. On admission, the arch of the right foot was seen to be almost completely lost; the outer edge of the foot was drawn a little upwards, the peronei tendons being unusually tense, and the base of the fifth metatarsal bone was approximated to the external malleolus to a slight degree. He walked with great difficulty. Mr. Wood, by a subcutaneous incision, divided the tendon of the peroneus brevis near its insertion, then, by another puncture about an inch internal to the first, he divided the tendon of the peroneus tertius. The tension of these being now relieved, the peroneus longus tendon was found to be rigid, and was accordingly divided about two inches above the external malleolus. Pads of lint were firmly strapped over the punctures, and the foot next day was put upon a splint so arranged as to keep up extension and counteract the deformity of the foot. At the end of ten days the splint was removed, and a dextrine bandage applied, strengthened along the sides of the foot. When this was dry, the patient was able to walk well and without pain, putting the foot firmly upon the ground, and bearing all his weight upon it.

HOSPITAL FOR DISEASES OF THE THROAT.

CASES UNDER THE CARE OF DR. MORELL-MACKENZIE AND MR. EVANS.

Case 1.—*Syphilitic Adhesion of the Vocal Cords.*

T. D., aged 33, formerly a farrier in the Life Guards, was admitted into the Hospital, May 11, 1871, wearing a canula. Eighteen months previously he had been admitted on account of extreme dyspnoea and complete aphonia, which had existed for nearly two years, and was due to tertiary syphilitic disease of the larynx. Tracheotomy had been performed at the time, and the patient left after a few weeks, wearing the tube.

On his re-admission, an examination with the laryngoscope showed a web extending from one vocal cord to the other, and occupying the anterior five-sixths of the glottis. He was, of course, able to breathe well through the canula, but there was absolute loss of voice. Under these circumstances it was determined to make an incision in the median line, through the thyroid cartilage, and to divide the web; and, in order that it should not again unite, it was proposed that the patient should wear a double-branched canula, one branch consisting of the ordinary tracheal tube passing downwards, and a second similar tube passing upwards, between the vocal cords, and being attached externally to the first tube. This was accordingly done on May 16. The patient did very well for the first three days, but on the evening of the third day it was seen with the laryngoscope that the upper portion of the tube was producing an ulcer on the right arytenoid cartilage, and great pain was experienced in swallowing.

On the following evening, May 20, both tubes were removed, as it was deemed important to allow as full a current of air as possible to pass through the trachea. It must, however, be understood that the upper laryngeal canula was obliged to be removed, because of the irritation it produced, before all chances of reunion were over.

He appeared perfectly well for the first few days, but on May 25, one or two severe attacks of dyspnoea having occurred, the tracheal canula was replaced.

June 1.—On laryngoscopic examination, it was found that the greater portion of the web had been destroyed, and that more than three-fourths of the area of the glottis was free.

The man is now acting as under-porter at the Hospital, and it is proposed shortly to remove the tube. At present he is wearing a canula with a pea-valve, and an oval opening on the upper surface of the tube.

Case 2.—*Subacute Inflammation of the Larynx necessitating Tracheotomy.*

R. H., aged 33, a seaman, was admitted into the Hospital, June 15, 1871, on account of extreme dyspnoea and hoarseness. He stated that the difficulty of breathing had commenced in the previous November, but he had been able to continue work

in the docks until a few days before his admission. He had been losing flesh for some weeks, and was often disturbed at night.

On examination with the laryngoscope, the whole of the right side of the larynx was seen to be red and œdematous. The symptoms increasing, tracheotomy was performed on June 22. The patient did well in every respect; the inflammatory swelling very gradually subsided, and the voice became normal. His health had so much improved that he gained 9 lbs. in weight in six weeks after the tracheotomy. Under these circumstances the tube was removed on August 1. The patient has had no bad symptom since, and is now attending as an out-patient.

Remarks.—Dr. Morell-Mackenzie observed that in the first case he had pursued the plan of treatment which he had found successful in two previous instances, but in this case the result was as yet only partially successful. Owing to the adhesion of the vocal cords, the man had been completely aphonic, but he was now able to speak well. At the time that it was originally intended to dispense with the tracheal tube there was a good deal of inflammatory swelling, consequent on the recent operation, and hence the patient was unable to breathe without an artificial opening. All thickening having now subsided, there is every reason to believe that the patient will soon be able to breathe perfectly well through the natural passages. The second case was very interesting as illustrating the value of perfect rest in cases of subacute laryngitis. It is extremely rare, after disease has extended over several months, for the larynx to entirely recover its healthy condition. It is almost an invariable law, that, when tracheotomy is performed for chronic disease of the larynx, the tube must be worn during the remaining life of the patient.

SATURDAY, AUGUST 19, 1871.

CONFUSION SCIENTIFIC.

THE general impression produced upon an intelligent, thoughtful mind in search of information concerning the progress of those departments of science most nearly connected with the advance of Medicine can hardly be satisfactory; for while many most absurd notions are repeated and forced into undeserved popularity, observations of great value but too often pass unheeded, or are only referred to with affectedly disguised contempt. Moreover, for years past it has been noticed that a system of something very like puffing has been indulged in by more than one scientific person invested by the public with very high authority. "The beautiful researches of that distinguished investigator" is a phrase which occurs somewhat too frequently in the remarks of many an advocate of some very far-fetched doctrine which people are not likely to believe in; while, on the other hand, facts which have been advanced

against the pet hypothesis are dismissed by the suggestion that, "unless we desire to restore the reasoning characteristic of the savage, we shall be little influenced by the statement," etc. Amid the rival assertions and conflicting arguments, the public is bewildered, and, losing sight altogether of the real interest and importance of the questions at issue, is reduced to being amused with the mere incidents of the battle and laughing at the "fun."

To people of a thoughtful turn, however, the recent meetings of the British Association for the Advancement of Science may afford food for more serious reflection. An earnest man may doubt whether any increased light has been thrown upon the debated question of the nature and origin of man by the very free talk that has been indulged in, and he will not feel certain that he has learnt anything new concerning spontaneous generation by the recent discussion. The *public* may, perhaps, be quite decided as to the merits of the great ape controversy; but is the question one likely to be settled by public acclamation or the clapping of hands? As regards spontaneous generation the difficulty of deciding what to believe is even greater, for one advocate of the doctrine seems to have proved that if organic matter, and even certain inorganic matters, be exposed to a temperature of 300°, and then kept *in vacuo* for a time, the conditions are very favourable for the development of those "collocations" of particles which result in the formation of living organisms of a very simple form; while another says that only at 400° is every living form certainly destroyed, and he therefore maintains that the creatures supposed to be formed anew have been really developed from germs which withstood the influence of a temperature of 300°. The very confident assertions made by Dr. Bastian, backed and supported as they have been by a writer in the *Saturday Review*, would probably have satisfied any person of ordinary intelligence that the origin of living beings in these days from non-living matter was simply a well-established fact. And yet the evidence against spontaneous generation seems to other minds, long engaged upon this and kindred investigations, hardly worthy of serious discussion, so opposed is it to the results of numerous careful and apparently accurate observations. Thus the public is confused, instead of being enlightened and taught.

But it is doubtful if the confusion in the public mind exceeds the confusion of many of the scientifics themselves. Dr. Tyndall rediscovered, by the aid of a strong light, multitudes of solid particles in the air, such as had been seen by previous generations in a sunbeam. Without showing that one of these motes was alive, he spoke of all the particles as if they had been proved by him to be living germs capable of propagating disease. It is obviously possible, in spite of all that he has said, that there might not have been one single "germ" present; but it is quite certain that *all* the particles were not living or of a germ nature. But Professor Lister thinks that suppuration is excited by organisms getting into wounds from the air. Dr. Tyndall praises Mr. Lister's speculations about suppuration, in the hope that he will make much of the germs found for him. Professor Lister acknowledges the compliment, and, from the remarks he made at the recent meeting of the British Medical Association, seems only too glad to accept Dr. Tyndall's particles as the very germs he is in search of. But, unfortunately, other philosophers affirm, and just as confidently, that the germs in the air are fictions of the imagination, but that real live germs abound in water, and are to be found upon ordinary surfaces; so that, in spite of all that has been said and done, there is a nice series of questions still to be answered. What is a germ? Are the motes of a sunbeam germs? Does suppuration depend upon Dr. Tyndall's motes or germ-particles of another kind? Unfortunately, we are not likely to get replies to these questions.

Confusion has been rendered worse confounded by the

circumstance that numerous writers have not distinguished clearly between living particles of the nature of fungi and living particles derived from the living matter of the higher living organisms in the manner suggested by Dr. Beale, and described by Dr. Sansom in his new work, "The Antiseptic System." Even Dr. Sanderson's observations are open to this criticism; he seems to entertain the opinion that the active material constituting the contagious virus of small-pox, vaccine, and some other fevers is really a vegetable organism—a microzyme—an opinion at variance with the fact that the so-called microzymes are numerous only when the virus has lost its contagious properties, not when it possesses them in an eminent degree; that is, immediately after it has been withdrawn from the seat of its formation. The hypothesis now so highly favoured in this country, and advanced as a full explanation of the origin and spread of contagious diseases as well as the formation of abscess, actually rests upon the assumption of the invariable introduction from without of the supposed vegetable organisms or microzymes. One single case, therefore, in which such bodies were discovered in a closed cavity in the substance of the tissues, would invalidate the doctrine and favour the view long held by many, that the vegetable organisms which are actually found in some cases simply grow in fluids in a state of chemical change, in which state of change or commencing decomposition materials are formed suitable to the nutrition, growth, and multiplication of the particles, and that after all these "vegetablegerms" have nothing whatever to do with the origin of the disease or with any particular morbid affection. The whole theory that putrefactive change is due alone to the introduction of living organisms from without, at this time rests upon the most unsatisfactory data.

To us it appears as if the champions of the many conflicting scientific views preferred firing long shots at one another from a distance, to the danger of close quarters. Each evades the objections urged by those opposed to him, and is called a strong or weak brother, according to the skill he displays in intellectual fencing. Each appeals to the evidence of experiment, but neither believes in the experiments of his opponents. Each professes to love truth above all things, and now and then one affirms that "he hates a lie," apparently losing sight of the terrible alternative which presents itself. In too many cases the advocate makes the best of his own ease, and utterly ignores the arguments of his opponents.

But this wordy, windy philosophy is opposed to the spirit of science, and simply serves the evanescent interests of an individual or the cause of a party. It is perfectly manifest to every impartial looker-on that all the strange doctrines taught, and urged with an intensity that renders it unwise on the part of anyone to express any doubt, cannot be accepted as if they were true; while some persons will be disposed to think that the truth rests quite peacefully in some quiet nook not yet explored or dreamt of by the gladiatorial actors, who absorb the entire space of the scientific arena for the display of their own special feats of skill.

THE CHOLERA.

At Königsberg the cholera continues to increase, though not very rapidly. On Saturday, the 12th, forty persons were attacked, and nineteen died; and on the 13th there were thirty-eight seizures and sixteen deaths. The police authorities had ordered that no vessel should leave the port without its crew having been medically examined. At Neufahrwasser, some cases of cholera had occurred on board ship. Two ships arrived in the Thames on Saturday from Cronstadt, and it was reported that in each of them a man had died of cholera; but on inquiry it appeared that both the men had died at Cronstadt, and it is not certain whether they had died on board or not. The clothes of one man were burnt on board; the clothes

of the other were landed, and almost immediately destroyed at the Board of Works. A telegram has stated that a case of cholera had occurred in Paris, but this statement has not been confirmed. On Tuesday, the 15th, the *Times* published a letter from Dr. James Edmunds, stating that, at half-past two o'clock that morning, he had been called up to a typical case of Asiatic cholera in Charlotte-street, Portland-place. We felt it difficult to know whether to admire most the gentleman's rapidity and decision in diagnosis, or his promptness and energy in making that diagnosis known to the public. But it appears, as we had ventured to hope it might, that the Medical Department of the Privy Council does not agree with Dr. Edmunds in diagnosis. In answer to a question put in the House of Commons, Mr. Forster stated that the Medical Officer of the Privy Council had sent a Physician to examine the case, and "he was glad to find, from the report made, that there was reason to believe that the case was not one of Asiatic cholera, although there were symptoms at first which might have excited suspicion." The patient was a respectable artisan, and a school-teacher, and "had been taken ill on his return from a school treat; he was then—Tuesday afternoon—much better, and there was reason to suppose it was sporadic cholera." Mr. Forster added that "he could have wished that Dr. Edmunds had waited a few hours before writing to the papers, and not excited needless alarm until he had ascertained whether he was right or wrong in his suspicion. It was his first duty to communicate with the sanitary authorities of Marylebone, and he trusted that in all other cases of the kind, whether in London or in the provinces, that course would be adopted by Medical men."

The Medical Department of the Privy Council has published an excellent and instructive document, which will be found in our pages, on cholera and the precautions to be taken against it. The Registrar-General's Report again shows, as might be expected, an increase in the deaths from diarrhoea, the number being 299, of which only 31 were of children above one year and adults. To cholera and choleraic diarrhoea 15 deaths were referred, 13 of them of infants not exceeding one year.

We had intended to speak again this week of the laches of Government in respect of sanitary legislation, and to point out more fully and more particularly how our rulers wilfully sin against knowledge in this matter; but the subject has been so admirably well, and, for an official, so boldly, treated by the Medical Officer of the Privy Council in his thirteenth annual report, that we cannot do better than refer our readers to what Mr. Simon says. He points out very clearly and forcibly that the death-rate in this country is at least one-third higher than it would be if our actual knowledge of the principal causes of disease were properly and well utilised; and that the average yearly number of preventible deaths in England and Wales amounts now to about 120,000. Of course, each of these 120,000 represents also a group, larger or smaller, of cases of disease which, though not ending in death, cause unfitness for work, suffering, and poverty, and often leave behind physical depression and injury. Mr. Simon observes that disease hinders national prosperity, and tends to the deterioration of race; that this "needless animal suffering" is a matter for "indignant human protest"; and that it falls chiefly and most severely on the most helpless classes—on those who have the strongest claims on a Government able really to "justly measure and to abate their sufferings." And the evil thus left to flourish and run riot does not affect life and health only. Few who have at all studied the subject will differ from Mr. Simon, when he goes on to assert that, as things are at present, "civilisation and morals suffer equally with health"; that all our efforts for the spread and improvement of education must fail while unaccompanied by the amendment of sanitary laws; and that human life cannot be elevated morally, while "physically it is so degraded and squandered." Mr. Simon thinks that considerations such as these invest the subject of sanitary legislation, or

preventive Medicine, with a degree of national importance to which very few subjects can pretend; but, he observes, "its relative position among such subjects is not a point on which he would presume to speak." That is to say, we suppose, that his official position will not allow him to say openly that the subject is of more real and immediate importance than secret voting, abolition of purchase, or many other matters that have occupied the Legislature this year. He remarks that he cannot too forcibly express his official knowledge that the matter most urgently needs the attention of the Legislature; but in all probability the annual penalty of 120,000 lives for neglect of the subject will be paid for several years to come, while this year cholera will, we fear, also add largely to the roll. It must, however, be acknowledged that Government is not alone to blame in the matter. Ample experience has taught how her Majesty's Ministers may be forced not only to take subjects into "serious consideration," but to proceed to legislate on them; and there can be no doubt that our sanitary law would have been now in a very much less imperfect and chaotic state had its amendment been pressed on the Government with anything like the urgency and persistence that have been expended on some other matters. But sanitary science lacks the charms that attract agitators; it is not opposed to common sense and knowledge, and so finds no favour in the eyes of the anti-vaccinationists; it offers no immediate sensible personal glory or gain, and has therefore no pretence to the regard of those who agitate for woman's rights or the female franchise; it is not so sensational as the anti-contagious diseases subject, though 120,000 preventible deaths a year might be deemed somewhat sensational, nor has it any charm of nastiness or pruriency; its does not, like the Maine liquor-law legislation, attract those who would "damn the sins they have no mind to"; and it cannot well be made the subject of tall talk and passionate appeals to class prejudices. It is, therefore, neglected on all sides, except by quiet, hard-working, well-informed scientific and professional men, who have neither time nor taste for agitation or popular platform displays.

METROPOLIS WATER-SUPPLY.

THE fate of the Metropolis Water (No. 2) Bill hangs in the balance. Will it or will it not pass during the present session? is a question that must, at the present moment, press heavily on the Water Companies, and perturb the breast of many a director. No doubt the companies heartily wish it success; for, in its present form, as amended by the Select Committee, it may be described as essentially a water companies' Bill. The Bill, as originally introduced by the Government, had some good points and many doubtful ones; but the present Bill has been so denuded, at the instance of those who represent vested interests, of most points in it that were likely to prove useful, that we should almost consider it, if not a national, at least a metropolitan, misfortune were the proposed measure to be accepted as a final settlement of the questions at issue. Let us see in what respects the Act of 1852 has failed to secure the beneficial results expected from it, and how these failures are proposed to be remedied. We shall also inquire what provisions any measure that is to command the confidence of sanitarians must contain. In doing this the lamentable defects of the Bill now before Parliament will be only too apparent.

The Act of 1852 has secured for London many undoubtedly great improvements in its water-supply, whilst it has entirely failed in giving the householder, or any considerable body of householders, any effective voice in controlling that supply. Thus, the Act has restricted the sources of supply—in itself an immense advantage—and has prevented the adoption of any new sources of supply until these shall have been approved of by the Board of Trade; it has secured the covering of all

reservoirs within five miles of St. Paul's, and it has put a stop to the conveyance of water for domestic use within the metropolitan area in uncovered aqueducts. It has failed, however, to secure the effective filtration of water before distribution; nor has it been more successful in securing a constant supply, although both these desiderata are expressly contemplated in the statute. The supply of a pure water, above all suspicion of contamination, can scarcely be said to have been contemplated, inasmuch as water is permitted to be taken from the Thames and other sources in places where it has already received a large amount of excremental pollution.

Now, how are the defects of the present statute proposed to be remedied by the Bill. First of all, it proposes to amend the Act of 1852, and not to repeal it. This slovenly method of patching and renovating old and defective legislation is, to our mind, most reprehensible, and we are glad to see that the very important sanitary measure introduced by Sir C. Adderley will, when it becomes law, set aside this vicious system by repealing all the old sanitary statutes, and re-enacting their provisions, when advisable, in one comprehensive statute. It is always difficult to construe two Acts as one Act, and loopholes of escape from inconvenient provisions are too frequently afforded by this slipshod mode of saving trouble. Let us next see how it is proposed to secure those two great desiderata—a constant supply and a pure supply; for what is, above all things, needed is a constant supply of pure drinking-water. The Bill states that every metropolitan water company may, and shall, when required to do so in the manner directed, provide a constant supply of pure and wholesome water for domestic purposes within the district supplied by such company. The "manner directed" is this:—The metropolitan authority (generally the Metropolitan Board of Works) shall, if they are of opinion that there should be in any district a constant supply, make application to the company for such supply. It may be fondly imagined that the metropolitan authority will, in the event of the measure becoming law, as speedily as possible require the companies to furnish a constant supply in their respective districts. Be it so; yet it does not follow that a constant service will be thereby secured, for any company has only to show that more than one-fifth of the premises in its district are unprovided with proper fittings, and the demand may be refused. It is true that the metropolitan authority may in this case require the occupiers or owners to provide the prescribed fittings, and, in the event of contumacy, may itself provide them at the owner's cost. Let, however, the Metropolitan Board once attempt to put this clause in force, and the owners of small house property, who form a powerful element in vestries, will at once move these to return members to the Metropolitan Board pledged not to enforce this (to them) odious provision. The Board of Trade has, indeed, power to enforce a constant supply, but only where the metropolitan authority refuses to make, or unreasonably delays making, application for it, or when the health of a district is, or is likely to be, affected prejudicially from the absence of such supply; and it does not appear that the Board of Trade can dispense with the clause as to the necessary fittings, and can enforce their provision by the owners or occupiers of houses. We cannot see how, in the face of these obstacles, a constant supply is to be secured by the proposed statute. A salutary clause by which it is contemplated that groups of houses in poor and crowded courts may receive their water-supply from a standpipe in the court is marred by the omission of stating by whom the order of the Board of Trade on the requisition of the nuisance authority is to be enforced, and by no provision having been made as to the incidence of the water-rate in such cases. These considerations force upon us the conclusion that the Bill cannot, if it passes, do anything of importance in procuring a constant supply of water to the metropolis. We do not even consider that the 32nd Section of the Bill, by which the

absence of the prescribed fittings for a constant supply is to be deemed a nuisance under the Nuisances Removal Act, unless the contrary be shown, will render the measure effective.

As regards the quality of the water to be supplied, the original Bill made effectual filtration an essential—the mode of filtration to be prescribed by one of the Secretaries of State—and contemplated the fixing of a definite standard of purity, the purity or impurity of the water to be determined daily by a paid Government analyst, a penalty being imposed for impurity. Now, whatever differences of opinion there may be as to the evidence of injurious pollution of potable water, we imagine that few would doubt the expediency of fixing some standard of purity, below which no company's water should be allowed to fall. Unfortunately, all these clauses disappear in the amended measure. No mention is made of filtration; the appointment of the water-analyst is dispensed with, but, in lieu thereof, a water-examiner is to be appointed, who shall be paid by the companies, and who is from time to time to examine the water supplied. Anything more loose and inefficient than this could scarcely be devised.

At the time we are penning this the Bill, having passed through the House of Commons, has been read a second time in the Upper House. Possibly it may soon become law. We should not be disappointed, however, were we to see it made one of the innocents.

THE WEEK.

TOPICS OF THE DAY.

THE supervision of the Thames and the port of London, in this time of threatened importation of Cholera, has been committed by the Medical Department of the Privy Council to Dr. George Buchanan, whilst the ports of the North-east coast are being visited by Mr. Netten Radcliffe. The Profession may well rest assured that no pains will be spared by these gentlemen to rouse the local authorities to a sense of the impending danger, and that every means of defence which can be, will be employed. On Tuesday, at Hull, the master of the steamship *Kelso* was fined in the full penalty of £20 for having offended against the recent Order in Council. The *Kelso* had arrived at Hull from Cronstadt, and, although warned to anchor at the place appointed by the nuisance authority, she had steamed directly into dock. The defence set up was, that the master did not receive the order to stop until it was too late to do so without great risk to the ship, and that the ship was perfectly free from infection. The magistrate, however, evidently impressed with the necessity of making an example, declined to grant an application for a mitigation of the fine.

The explosion of fifteen tons of gun-cotton at Stowmarket, and the consequent death or injury of a number of people, is one of those penalties which civilised man seems continually called upon to pay as the price of advancing science and art. Of course, such accidents are in theory avoidable, but in reality they recur with terrible certainty. Most of the gunpowder magazines have been at one time or other blown up, and every year brings its explosions of nitro-glycerine. Some peculiar interest, however, attaches to this accident at Stowmarket, for it seems that the unfortunate Messrs. Prentice were under a strong impression that an explosion was impossible, and their belief was founded upon certain experiments recently made by Government officials. These experiments are thus described in a recent article in the *Times*:—

"With a view of demonstrating the non-explosive property of compressed gun-cotton when fired by the ordinary application of heat, a number of wooden boxes, each containing twenty-eight pounds of gun-cotton discs, were stacked on one another, and surrounded with similar boxes full of clay, so as to represent the weight of the superincumbent mass when the boxes were stacked in tiers, as they would be in store. An ordinary electric tube having previously been inserted into one of the boxes of gun-cotton, was then fired. Many of the spec-

tators, knowing what would occur in the case of gunpowder, were prepared for a violent explosion. To their astonishment, however, the gun-cotton of the individual box merely inflamed, without igniting that in the other boxes, and without disturbing the pile in any way. The experiment was then repeated by kindling a fire in the pile with shavings and tar. A considerable bonfire was the result. The outsides of the boxes burnt bravely for some ten or fifteen minutes, until at length the flame found access to the gun-cotton in one of the boxes. This was followed by a dull puff and a bright mass of flame, but there was no explosion. The materials of the bonfire were then scattered by the artillerymen in charge, in doing which a box of gun-cotton, partially charred on the outside, inflamed while being dragged by one of the men over the incandescent *débris*. Had this been a barrel of gunpowder several lives would, in all probability, have been sacrificed; as it was, the incident only caused a laugh at the agility with which the man jumped backwards. How, then, can we possibly explain the awful catastrophe at Stowmarket? Suddenly, unexpectedly, treacherously, a magazine of compressed gun-cotton explodes, dealing death and destruction on all sides."

It is a curious coincidence that the only portion of the body of one of the Messrs. Prentice which permitted identification was a foot, the ankle of which was marked with a scar, the result of an injury sustained in an explosion which occurred some years ago.

The Vaccination Amendment Act has been passed at a late sitting by a scanty House of Commons. The privilege of non-compliance with the Act may, therefore, be purchased from henceforth by the payment of a fine of 20s. Was there ever a more clumsy piece of legislation? The whole thing was argued on the third reading in the House of Commons, and the illogical 10th clause, which enacts that the full fine shall be only once inflicted was defended on the ground that people had conscientious and sincere objections to vaccination. No doubt they have; and therefore we, in the interests of vaccination, have always held that it was mistaken policy to endeavour to enforce it by fines and imprisonment. Virtually, the Vaccination Act will be now systematically and legally infringed, whereas, by adopting the German plan of making all social privileges contingent on vaccination, on the ground that vaccination is for the benefit of society, and not merely for the benefit of the individual, the chief occupation of the anti-vaccination fanatics, which is to preach the injustice of prosecution and penalties, would be gone.

We are glad to see that the Admiralty have determined on representations made by the Royal Society to fit out an expedition, which will start next year, and will be absent four years, to extend, and, if possible, complete the information to be obtained by deep-sea dredgings and soundings. The expedition will visit every part of the ocean whence it is believed knowledge may be obtained. The observations already made by Professors Carpenter, Wyville Thompson, and Mr. George Jeffries, if confirmed, must go far to affect all previous theories as to geological formation and geological time. If these observations are to be trusted, the deep-sea temperature is not an equable one of 39°, as previously supposed, but descends to just above freezing-point, and it is so modified by currents that an arctic and a temperate fauna may coexist at a short distance from each other, and strata of different characters may be thus forming contemporaneously. There is a constant interchange going on between the waters of the poles and the equator, modifying the temperature of northern climates, and producing deep and superficial currents. The process of chalk formation is still being carried on by countless myriads of globigerinæ, and in the dark caves of ocean, where light was believed never to reach, are creatures possessing highly organised eyes. It may be that these results contain the germs of discoveries which will go far to dispel much of the imaginative science of the present day. Under any circumstances we rejoice that our Government has undertaken to prosecute an investigation which cannot be fruitless, and may give a much deeper insight into biological as well as geological truth.

FOREIGN DECORATIONS.

THE recent discussion in the House of Commons on the acceptance by a British subject of the decoration of a foreign order, bears chiefly upon the cases of Deputy Inspector-General C. A. Gordon, C.B., and Surgeon-Major Wyatt, to whom the French Executive Government offered the distinction of "Officier de la Legion d'Honneur" in recognition of their services to the wounded during the siege of Paris. Neither of these officers having received any acknowledgment from our own authorities of their services, and of the risks they encountered during the most arduous and anxious episode of modern times, it seems hard that any point of official etiquette and routine should stand between them and the honour conferred upon them by the French Provisional Government. In the case of Surgeon-Major Wyatt, indeed, if we be rightly informed, no official objection can be raised against his accepting and wearing the insignia of the higher order of the Legion of Honour, of which he is already a member, in consequence of his services in the Crimea, and he is, therefore, entitled to accept any subsequent promotion in the order which may be offered to him. Hence would arise the very striking anomaly of the junior officer being entitled to accept and wear a decoration, while the senior employed on the same duty is not permitted to do so. We, therefore, hope that in the consideration which the subject is about to receive from the Government some means may be found of removing the disability in the case of Dr. Gordon, and in any future similar instances which may arise.

A QUESTION OF "NEGLIGENCE."

A CASE of considerable importance with respect to the responsibility of Medical Practitioners who retail drugs was tried last week at Croydon. The case was *Trotter v. Downes*. The defendant, Mr. Downes, is a Medical Practitioner in Southwark, where he has an open surgery. He has been established for upwards of thirty years. He has two "pupil assistants and one senior." It appeared from the evidence that the plaintiff, a working woman, called at the defendant's shop, and asked one of the junior assistants for "Rochelle salts." He, however, declared that she asked for "Rochter salts." He supplied her with half an ounce of carbonate of potash or "salts of tartar," a spoonful of which she took in water. She stated that she required the drug for the bile; but this was denied by the assistant, and his denial was confirmed. The medicine gave her great pain, and she vomited violently; but, though considerable depression and prostration followed, it was admitted on all hands that no serious injury resulted. A Medical Practitioner of the name of Alexander, who was called to attend her, gave evidence to that effect; and though another Practitioner gave some evidence on her behalf, the injury was proved to amount to only temporary discomfort. Several Practitioners appeared on the part of the defendant. We give in detail the following particulars of the mode in which the "action" against the defendant was got up. It must be remembered that, though the defendant was only mulcted of a "farthing damages," he will have to pay his own heavy law expenses; he has been taken away from his practice, his mind harassed, and his reputation jeopardised. We are rejoiced to record the sensible summing up of Baron Bramwell, and trust that the result of this case may prevent the institution of many "actions" for "negligence" for the future. It appeared that an attorney's clerk, who lodged in plaintiff's house, came to defendant to claim compensation, and he said that if she could see him, and he found that she had sustained any damage, he would compensate her; and he subsequently, in order to avoid the vexation of an action, offered to pay as much as £40 or £50, but in vain. A writ was issued, and an action entered against him, though he had done the best he could to remedy the consequence of an error on the part of an assistant in his absence, and which

had, according to the evidence, done no real injury at all. It appeared that the attorney's clerk entertained sanguine expectations of the fruits of the action, and even the sum of £200 was mentioned as the probable amount of damages. The result, however, it will be seen, was very different indeed. The woman gave evidence as a witness, and was supported by her daughter. According to her story she had been quite laid up; there were serious symptoms, and even paralysis spoken of as imminent. For the defence several eminent Medical witnesses, who had examined the woman, were called, and their evidence showed that there was no real injury at all—nothing beyond the temporary effect—nothing really serious; and witnesses were called who proved that the woman had spoken of the circumstance as a means and an occasion of obtaining money as damages. After a long trial, the learned Baron summed up the case dispassionately to the jury. If, he said, the assistant had understood the woman as asking for Rochelle salts, and had given her the carbonate for it, or if he had not taken care to ascertain what it was she wanted, the defendant would be liable; but if he gave her what she asked for, then, as she did not ask for directions about its use (though it would have been better to have given them), the defendant was not liable. Even, however, though the jury found for the plaintiff, there would remain the question of damages, as to which the learned Judge observed there were many circumstances which required consideration; the case must be looked at as a whole; and there was strong evidence of undoubted witnesses that the woman had sustained no real injury at all. Moreover, there was great reason to suspect that it was the attorney's clerk, rather than the woman, who was interested in the action. The jury, after a brief consultation, gave a verdict for the plaintiff for one farthing.

THE LOCAL GOVERNMENT BOARD.

BEFORE our next issue the Poor-law Board will probably have ceased to exist. The Act constituting the Local Government Board (34 and 35 Vic., cap. 70) received the Royal assent on the 14th inst. It provides that the new Board shall be deemed to be established from the date of the warrant appointing its first president, and it is understood that this appointment will take place at once. We learn that arrangements have been made to avoid any hiatus in the proceedings of the several departments amalgamated. In view of the apprehended epidemic of cholera, it would be very undesirable were a hitch to occur in the central machinery. It will be a comfort in future to know exactly where to write in case of alarm or doubt, and to realise that the *Times* is not the only channel available on being called to a "typical" case of cholera. The Local Government Board will exercise all the powers hitherto vested in the Poor-law Board; the powers vested in one of her Majesty's principal Secretaries of State in respect of registration of births, deaths, and marriages, public health, local government, drainage (sanitary matters), baths and wash-houses, public improvements, towns improvement, artisans' and labourers' dwellings, returns of local taxation; and the powers vested in the Privy Council in respect of prevention of disease and vaccination.

CHOLERA IN RUSSIA.

THE authorities in Russia are "up and doing" with respect to sanitary precautions against cholera. "Committees" have been formed in all the towns, and the Government are rendering all the assistance in their power. The dirty habits of the people render precautions doubly difficult of being carried out, and, in fact, constitute the principal danger to be met. The Medical Department of the Minister of the Interior has sent a reinforcement of Doctors to places where they are wanted; but the demand has been such that students have been sent from the Medical Academy.

SPECIAL PENSION TO AN ARMY MEDICAL OFFICER.

SURGEON-MAJOR T. PARK, who lately retired on half-pay from the Royal Artillery, in consequence of having, during the performance of a Surgical operation, sustained an injury resulting in the permanent contraction of some of the fingers of the right hand, whereby its operative efficiency has been seriously impaired, has, we are glad to hear, obtained a pension of £200 per annum. The injury occurred before Mr. Park's promotion to the rank of Surgeon-Major, and the rate of compensation is that granted to him as Surgeon holding the relative rank of Major. We are glad of the opportunity of recording this just recognition by the War Office authorities of the claims of Medical officers to compensation for loss or impairment of the function of a limb, resulting from injury sustained during the performance of their special duties as Surgeons, on the same scale as combatant officers who may suffer similar results from wounds received in action. There cannot be the slightest doubt as to the complete analogy of the cases, but the instances of Medical officers being permanently maimed as the result of their peculiar risks are, happily, so rare, that a considerable time will probably elapse before it will be necessary to apply the precedent lately established in the case of Surgeon-Major Park.

THE NATIONAL ARTILLERY ASSOCIATION CAMP, SHOEBURYNNESS.

WE are glad to hear that no serious cases of disease or accident have occurred to mar the success of the week. About 120 patients have received Medical treatment, the majority of the cases of illness being caused by the effects of the sun on the face, which has produced great ecchymosis of eyelids and forehead. Many cases of diarrhoea and colic occurred, especially at the outset of the meeting, and one case of small-pox, which was immediately removed to the Royal Artillery Hospital, and placed in a ward situated away from the main building. The camp was provided with Hospital and Dispensary tents, containing regulation medicine chests and instruments, by order from the War Office. The staff consisted of Mr. J. Wickham Barnes, F.R.C.S., Surgeon, and Messrs. Corbett and Willing, Assistant-Surgeons. These gentlemen are unanimous in recommending that on all future occasions volunteers should come provided with head-gear as worn in India, and loose holland blouses. They also desire to express their thanks and obligations to Colonel Chermiside, R.A., the Camp Commandant, and to Dr. Harrison, R.A., for their kind courtesy and attention.

WHERE DOES THE FAULT LIE?

AFTER the care bestowed on the framing of the Artizans' and Labourers' Dwellings Act, it would seem that its provisions in one important point are all but a dead-letter. Under the statute places unfit for human habitation have been condemned by the Medical Officer of the Holborn District, and by the local authorities, and yet they have not been demolished. The excuse is made that the owners have shut up the condemned houses, and therefore the Board have no legal right to pull them down. In one instance, the owner of some of these houses, after abandoning them, had allowed the premises to be reoccupied, and they are at present in use, despite of the provisions of the Act of Parliament. It will be a reflection on the District Board if they prove themselves unable to give the poorer classes the benefit of a law especially framed for their protection.

A CHANGE.

PARIS, so late the scene of so much crime and disease, is now said by *Le Temps* to be one of the healthiest cities in Europe. In Berlin, Barcelona, Florence, Brussels, and London the mortality has exceeded that of Paris. There has been no death from cholera, and the mortality from small-pox has become quite insignificant. The exemption is due, *Le Temps* says, to the excellent sanitary arrangements, which are carried out with unusual vigour and vigilance by the authorities.

UNHEALTHY STATE OF THE ROYAL ORTHOPÆDIC HOSPITAL.

An inquest was held on Tuesday last in the Board-room of the above Hospital on the body of Henry Charles Bard, aged 5 years, who had died in the Hospital on the previous Thursday from an attack of diphtheria. The inquiry attracted great attention, and was much protracted in consequence of an allegation by the Medical officer that the death of the child had been accelerated by the unsanitary condition of the Hospital. Mr. M. W. Bourne, the Resident Medical Officer, deposed that the child, on his admission to the Hospital on August 1, was in good health, and this was not affected in any way by an operation on the foot to which he was afterwards subjected. On the 7th, the child was seized with diphtheria, and notwithstanding that he had the advantage of the attendance of most of the Medical staff, he died. Mr. Bourne was firmly of opinion that the attack of diphtheria was accelerated, if not produced, by the very defective sanitary condition of the Hospital. The witness, on commencing his duties in the institution, had found the general and sanitary arrangements as "bad as they could possibly be." This was the case in respect to the diet, the cooking, the cleanliness, and the knowledge and attention of the matron and nurses. He had sent in a written report to the Committee on the state and condition of the Hospital. The witness was cross-examined by the Chairman of the Committee, but his evidence was not shaken in any material point. Mr. Tamplin and Mr. W. Adams agreed in the main with Mr. Bourne, Mr. Tamplin stating that he had frequently called the attention of the Committee to the general want of care and cleanliness on the part of the nurses, and the dirty state of the patients. Mr. Adams had seen the deceased some weeks before his admission into the Hospital, and had then declined to admit him in consequence of the unsanitary condition of the place. He believed that a regularly trained nurse at the head of the nursery department would effect a beneficial change. After some remarks from a member of the Committee, and a long and able summing-up of the coroner, the jury agreed to the following verdict:—"That the deceased died from diphtheria; and we recommend the Committee to adopt and act upon the suggestions of their Medical officers, especially with respect to the appointment of a regularly trained nurse." Now the foregoing facts are discreditable in a high degree to the managers of the Hospital, who cannot advance the excuse of poverty for the disgraceful condition of the institution which they "manage." The course pursued by the Medical staff is worthy of commendation, and will, it is hoped, be followed in all cases requiring such a decided and independent mode of action.

FEVER AT GLASGOW.

An alarming outbreak of fever has occurred amongst the girls employed at Airdrie cotton-mill. In the early part of last week a dozen of those girls employed in the manufacture of winseys from foreign-grown wool were seized with the fever. One of the cases ended fatally in three days, and six new cases have occurred this week. It is rumoured that the imported wool contained fever germs. At all events, all those who have been attacked were employed in that part of the factory where this wool is kept and manufactured. A searching inquiry will, no doubt, be instituted into the matter. The outbreak has caused considerable excitement in Glasgow.

THE WITHDRAWAL OF TROOPS FROM CANADA.

It has been decided that all troops shall be withdrawn from Canada on or before October 31, 1872. Canada has always been a healthy and favourite foreign station, and its loss will be felt by no class more than by Medical officers. Formerly it was a station for an Inspector General of Hospitals, but, since the withdrawal of a portion of the garrison, the Medical superintendence devolved upon a Deputy Inspector-

General, so that all ranks of the Army Medical Department will be affected by the recent and approaching changes.

THE NORTH RIDING INFIRMARY.

It is with much regret we notice that two of the honorary officers of this institution have been compelled to assert their position as independent Medical men by sending in their resignation in consequence of the action of the governors of the institution. The Hospital, in consequence of the enormous development of that region, is rapidly assuming very great importance. It is, therefore, of the first consequence that the best and most experienced men in the place should be returned as its officers; but that, under existing circumstances, seems impossible. The original rules of the Hospital provided for the suspension of the paid officers—the House-Surgeon and Secretary—by the House Committee. This was perfectly reasonable; but when these rules came to be revised some little time ago, a clause was inserted, giving them the same power over the honorary officers of the establishment, and this, as far as we can make out, without in any way consulting them in the matter. This, of course, was altogether too much, and led to the prompt resignation of two of the most distinguished Medical Practitioners of Middlesbro', who had been officers in the institution. If we reflect that this rule placed the reputation, both social and Professional, of our brethren in the hands of men ignorant not only of the etiquette which governs our Profession, but of that which governs polite society, we cannot but commend them on the step they have taken.

FROM ABROAD.—CONTRACTION OF THE PULMONARY ARTERY—THE CHOLERA OF ST. PETERSBURG—THE MEDICAL CONSTITUTION OF PARIS.

At a recent meeting of the Paris Hospital Medical Society, M. Constantin Paul read a very interesting paper on "Contraction of the Pulmonary Artery." It was founded on a case which came under his care at La Charité, this leading him to an examination of other recorded cases. From a consideration of these he arrives at the following conclusions:—1. The pulmonary artery is not only the seat of congenital affections, but may also become the seat of disease acquired during extra-uterine life. 2. Among these lesions there is one of great importance—viz., a contraction of the pulmonary artery, acquired subsequent to birth. 3. This contraction is sometimes found on a level with the sigmoid orifice, being produced by adhesion of the valves, together with a contraction of the orifice, and sometimes even of the calibre of the artery at this level. In general, it is the result of endocarditis. 4. The contraction may occur at the level of the *infundibulum*, and forms a pre-arterial contraction. This is more commonly the consequence of a myocarditis. 5. The contraction may have its seat in one of the branches of the bifurcation of the artery; but M. Paul has never met with it in the trunk of the artery, as is seen in contraction occurring during the early months of intra-uterine life. 6. Beyond the contraction, the artery is in general dilated. 7. There is almost always a consecutive hypertrophy of the right ventricle. 8. Valvular contraction may be accompanied by insufficiency of the same valves. 9. There may exist at the same time a lesion of the tricuspid and of the valves of the left heart. 10. The symptom which is proper to the contraction of the pulmonary artery is a systolic bellows-sound, that is more or less rasping (*râpeux*), and which extends over the cardiac region, but is at its maximum at the level of the pulmonary orifice, sending a characteristic prolongation in the course of the vessel. 11. The contraction does not give rise to cyanosis. 12. In the acquired contraction the *foramen ovale* is closed. 13. Still, myocarditis developed during extra-uterine life may give rise to, at the same time, a pulmonary contraction and a communication between the two hearts. 14. A contraction of the pulmonary artery, accompanied by a persistent *foramen*
